MS. S. EATON
Director
Advanced Reactor Licensing Division

Canadian Nuclear Safety Commission
280 Slater Street
Ottawa, ON
K1P 5S9

Dear Ms. Eaton:

DNNP – Submission of Site Geotechnical Investigation Reports for Excavation and Stockpiling and Request for Closure of Commitment D-P-9.2

Reference: 1. OPG Letter, M. Knutson to S. Eaton, "DNNP – Notification of Document Changes to NK054-REP-01210-00078, Darlington New Nuclear Project Commitments Report", September 29, 2022, CD# NK054-CORR-00531-10708.

The purpose of this letter is to submit the "Darlington New Nuclear Project Phase 1 Geotechnical Investigation Report Volume 2", NK054-REP-01210-00175 Sheet 00002 Rev 001 (Enclosure 1) and the "Darlington New Nuclear Project Soil Characterization Report", NK054 -REP-07730-00053 (Enclosure 2) for information and closure of commitment D-P-9.2. This submission is pursuant to Licence Condition 15.1 of the DNNP Power Reactor Site Preparation Licence, PRSL 18.00/2031.

The enclosed reports fulfill the requirements of commitment D-P-9.2 as described in the DNNP Commitments Report submitted under Reference 1. Attachment 1.1 of Reference 1 provides the mapping of the Joint Review Panel recommendations to commitment D-P-9.2. Additionally, OPG has developed a soil management plan to guide soil management during the site preparation and construction activities on the DNNP site. OPG requests CNSC's concurrence to close Commitment D-P-9.2 by March 14, 2023.

EVS 4DIM Player Instructions for Use

1.0 INTRODUCTION

1.1 General

Ontario Power Generation (OPG) has commenced the federal approvals process for site preparation, construction, and operation of a new small modular nuclear reactor to be constructed within the eastern portion of the Darlington site. The proposed new project is herein referred to as the Darlington New Nuclear Project (DNNP).

Golder Associate Ltd., a member of WSP (Golder) has prepared this report for ES Fox. Fox Limited Nuclear Services (Fox), on behalf OPG, in accordance with the Engineering Specification, Darlington New Nuclear (ESDNN) for the Onshore/Offshore Geotechnical Investigation - Darlington New Nuclear Project (DNNP), Document No. NK054-REP-01210-00117-R002 and subsequent clarifications (collectively called the "Specification" or "ESDNN").

The geotechnical investigations for DNNP have been divided into three phases, as follows:

- Phase 1 – Onshore Power Block;
- Phase 2 – Offshore/Onshore Intake/Discharge Tunnels; and
- Phase 3 – Onshore Additional Boreholes.

The Phase 1 geotechnical field investigation for the onshore power block was carried out from June 2021 to November 2021 and the geotechnical laboratory testing was completed in December 2022. Based on the completed Phase 1 investigation and in accordance with the Specification Golder has prepared this Geotechnical Interpretation and Design Parameters Report.

The reader is referred to the "Important Information and Limitations of This Report" which follows the text and forms an integral part of this document.

1.2 Purpose and Overview

The purpose of the Phase 1 geotechnical investigation was to advance exploratory holes and conduct in situ geotechnical, geophysical and laboratory testing to obtain the required geotechnical data, as outlined in the Specification, and to provide geotechnical engineering interpretation and design parameters for the DNNP.

The results from the Phase 1 geotechnical investigation are presented in two volumes. Volume 1 – Factual Geotechnical Data Report (Golder Report No. 21451329-001) is presented under separate cover and provides the procedures and equipment used for the field investigations and laboratory testing and the resulting factual subsurface information from the investigations and testing. Volume 2 – Geotechnical Interpretation and Design Parameters Report (Golder Report No. 21451329-002) presented herein provides the interpreted subsurface stratigraphy and the geotechnical engineering parameters associated with each stratigraphic unit, including estimates of the parameter variability, for use in the design of the DNNP.

The interpreted design values provided herein are highly dependent on the stress conditions and structural interactions inherent in the detailed design aspects of the project, which are currently evolving. The designers may need to re-interpret the in situ and laboratory results and parameters based on the subject matter and circumstances being examined such that the parameters correspond to strain/stress levels expected from the permanent and transitory loads being analyzed as the project details evolve. The detailed interpretations are best

left to the specialist designers who best understand the intended use of those parameters and the conditions under which they are to be applied. Golder cannot be responsible for the interpretations and soil parameters provided in the report if applied to unanticipated analyses or boundary conditions.

1.3 Coordinate, Datum and Unit Systems

All coordinates given in this report are referenced to the North American Datum of 1983 (NAD83CSRS), Universal Transverse Mercator (UTM) Grid Projection Zone 17N. All elevations presented in this report are referenced to the Canadian Geodetic Vertical Datum of 1928 (CGVD28).

This report is presented using the International System of Units (SI), where length is quantified in metres (m), force in newtons (N), and pressure in pascals (Pa). Kilonewtons (kN) are used to quantify large values of force, and kilopascals (kPa), megapascals (MPa) and gigapascals (GPA) are used to quantify large values of pressure or stiffness. Centimetres (cm) and millimetres (mm) are used to quantify small values of length and kilometers (km) to quantify large values of length.

A list of symbols and terms used in the report is provided in Appendix A.

2.0 SITE DESCRIPTION

The proposed DNNP site, as shown on Figure 1 (following the text of this report), is located within the eastern portions of the existing Darlington Nuclear Generating Station (DNGS) at 1 Holt Road South, Bowmanville, Ontario. The DNNP site is located outside of the protected area (PA) and is bordered by Lake Ontario to the south, an existing storage building and a gravel parking lot and laydown area to the west, a roadway (Second Line) to the north and undeveloped lands to the east. The site is currently utilized for a laydown area, except for the northeast portion of the site, which is vegetated with grass and trees. The site slopes moderately within the vegetated areas and gently within gravel surfaced areas, generally sloping downward from northeast to southwest.

Within the localized power block area, ground surface elevations range from approximately 99.0 m in the northeast (grassy area) to 88.5 m in southeast (laydown area). A forested slope with a rise of about 5 m to 6 m separates the grassy area from the laydown area. A roadway (Third Line) runs east-west through the site, bisecting the power block area, before turning to connect with Holt Road to the north.

Currently, no structures are present within the site with the exception of two small structures north of Third Line. Some drainage swales are also present within the laydown area. A steep bluff separates the DNNP site from Lake Ontario waters in the south.

3.0 STRATIGRAPHIC MODEL

3.1 General

Based on the results of the current Phase 1 geotechnical investigation and to align with the stratigraphic units indicated in the OPG Engineering Specifications, Table 3-1, below, lists the stratigraphic units (from surface to depth) used as the basis for the reporting of subsurface conditions in this report. Figures 2, 3 and 4 (following the text of this report) display section locations and interpreted subsurface cross-sections of the DNNP site.

Table 3-1: Stratigraphic Reporting Units

Unit No.	Description
1	Topsoil / Fill
2a	Surficial Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay
2b	Surficial Glaciolacustrine Deposits – Silty Clayey Sand to Silty Sand/Sandy Silt
3	Upper Till
4a	Intermediate Glaciolacustrine Deposits – Silty Sand to Sandy Silt
4b	Intermediate Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay
5	Lower Till
6a	Blue Mountain Formation Bedrock
6b	Lindsay Formation Bedrock
6c	Verulam Formation Bedrock

The following subsections of this report present a three-dimensional (3D) conceptual stratigraphic model and provide general descriptions of the soil and rock stratigraphy encountered in the Phase 1 geotechnical investigation. Appendix A provides the abbreviations and terminology for soil and rock descriptions.

3.2 Three-Dimensional Stratigraphic Model

A 3D conceptual stratigraphic model of the Phase 1 investigation area was produced using the commercial software program Earth Volumetric Studio (EVS) Pro, developed by C Tech Development Corporation. This software uses kriging routines to interpolate and extrapolate subsurface conditions between and beyond the borehole locations to replicate the stratigraphy in three dimensions, while also integrating geostatistical data presentation capabilities and the ability to produce cross-sections or fence diagrams along specified cut lines.

The 3D model is based on the results of the Phase 1 geotechnical investigation, selected bedrock data from previous investigations and LiDAR data provided by OPG and is enclosed as an electronic file transfer accompanying this report. The stratigraphy displayed in the 3D model is simplified from the detailed stratigraphic data presented in the borehole logs, based on our understanding of the site and the engineering behaviour of the various subsurface materials encountered at the site.

The 3D model can be rotated and tilted and viewed from any direction to illustrate areas of rapidly changing conditions or potential anomalies. A free viewer (the “Standalone 4DIM Player Installation”) can be downloaded at https://client.ctech.com/ and instructions for use are also enclosed.

The 3D model shows several views of interest, as follows:

1) All borehole/drillhole stratigraphy in soil and rock;

2) All borehole Standard Penetration Testing (SPT) ‘N’ values in soil;

3) All borehole SPT ‘N’ values in soil less than 50 blows per 0.3 m of penetration;

4) All drillhole Rock Quality Designation (RQD) values in rock;

5) All drillhole RQD values in rock less than 50%;

6) Piezometric surfaces from the January 5, 2022 monitoring event; and

7) Sections A-A’, B-B’, C-C’, D-D’, and E-E’ depicting the interpreted stratigraphy.

The above views can be accessed by toggling through the upper menu using the “play” bar in accordance with the enclosed instructions.

The 3D model is an integral part of and enclosure to this report following the appendices and included with the electronic submission. It is important to note that the 3D model provides a general overview of the subsurface conditions. The reader’s attention is drawn to the detailed discussion of subsurface data (Volume 1) and this geotechnical interpretation and design parameter report (Volume 2).

3.3 Soil Stratigraphy

3.3.1 General

The stratigraphic soil unit thicknesses encountered in the Phase 1 boreholes are summarized below in Table 3-2 and shown in section view on Figures 2 and 3. The detailed Record of Borehole and Record of Drillhole logs and soil laboratory testing results per borehole are available under separate cover (Appendix A of Volume 1 – Factual Geotechnical Data Report). For reference, particle size distribution and Atterberg limits results are also presented in Appendix B, grouped by stratigraphic soil unit.

Table 3-2: Summary of Stratigraphic Soil Units Encountered in Phase 1 Boreholes

Borehole ID	Ground Surface Elevation (m)	Subsurface Unit Thickness (m)				
		Unit 1	Units 2a & 2b	Unit 3	Units 4a & 4b	Unit 5
BH1	89.62	1.14	3.05	4.26	12.81, 0.53	1.22, 2.28

(a) Borehole terminated within this soil unit.
Note: Subsurface unit thicknesses are combined for Units 2a and 2b and for Units 4a and 4b. Where multiple unit thicknesses are provided for a given unit in a borehole, the soil unit is interlayered with other unit(s).
– indicates soil unit not encountered in listed borehole.

3.3.2 Unit 1 – Topsoil / Fill

Topsoil and/or fill (Unit 1) consisting of poorly graded sand with gravel to sandy lean clay was encountered at ground surface at all borehole locations. Unit 1 varied in colour from brown to black to grey. This surficial unit extended to depths between about 0.5 m and 3.5 m below the existing ground surface. Cobbles and boulders were encountered within Unit 1 in BH11 and BH61. Rootlets and organic staining as well as shale bedrock fragments were commonly observed within this deposit.

The SPT results in Unit 1 produced ‘N’ values ranging from 1 to 98 blows per 0.3 m of penetration, indicating very loose to very dense degree of compactness.

3.3.3 Unit 2a – Surficial Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay

Deposits of sandy lean clay to lean clay (Unit 2a) were encountered below the topsoil/fill layer. Unit 2a was brown to grey in colour and consisted of silt, clay, fine to coarse sand and trace to some subrounded to subangular gravel. This unit ranged in thickness between about 0.2 m and 6.1 m and extended to depths between about 1.2 m and 8.1 m below the existing ground surface.

The results of SPT carried out within Unit 2a yielded SPT ‘N’ values ranging from 2 to 26 blows per 0.3 m of penetration, indicating a soft to very stiff consistency. In situ vane testing carried out within Unit 2a yielded undrained shear strength values of about 30 kPa to over 100 kPa, indicating a firm to very stiff consistency, but more typically firm to stiff. The results of Atterberg limits testing carried out on selected samples from Unit 2a indicated low to medium plasticity fines.

3.3.4 Unit 2b – Surficial Glaciolacustrine Deposits – Silty Clayey Sand to Silty Sand/Sandy Silt

Deposits of silty clayey sand with gravel to silty sand/sandy silt (Unit 2b) were encountered below Unit 2a. In some boreholes, Units 2a and 2b were observed to be interlayered. Unit 2b was brown to grey in colour and consisted of silt with some clay, fine to coarse sand and subrounded to angular, fine to coarse gravel. This unit ranged in thickness from about 0.2 m and 6.1 m and extended to depths between about 1.4 m and 9.4 m below the existing ground surface. Cobbles were encountered within Unit 2b in BH1S and BH66S.

SPT carried out within Unit 2b resulted in SPT 'N' values ranging from the static weight of the hammer to 18 blows per 0.3 m of penetration, indicating a very loose to compact state of packing. In situ vane testing carried out within Unit 2b yielded undrained shear strength values of about 30 kPa to over 100 kPa, indicating a firm to very stiff consistency, but more typically firm to stiff. The results of Atterberg limits testing carried out on selected samples from Unit 2b indicated non-plastic to low plasticity fines.

3.3.5 Unit 3 – Upper Till

Deposits of silty sand with gravel to sandy lean clay with gravel (Unit 3) were encountered below the surficial glaciolacustrine deposits (Units 2a and 2b). Unit 3 is described as a till layer generally consisting of a heterogeneous mixture of gravel, boulders, and cobbles in a matrix of silty sand. This deposit was brown to grey in colour and consisted of silt, clay, fine to coarse sand and subrounded to subangular to angular, fine to coarse gravel. Unit 3 ranged in thickness from about 0.9 m to 13.5 m and extended to depths between about 3.0 m and 18.6 m below the existing ground surface. Figure 5 (following the report text) provides elevation contours of the top of Unit 3 over the investigation area. At borehole locations BH1SB, BH11SB and BH66SB, drilling was terminated within Unit 3, so the full vertical extent of the unit is unknown at those locations.

The results of SPT carried out within Unit 3 yielded SPT 'N' values ranging from 5 to greater than 100 blows per 0.3 m of penetration, indicating a loose to very dense state of packing, but more typically very dense packing. The results of Atterberg limits testing carried out on selected samples from Unit 3 indicated non-plastic to low plasticity fines.

3.3.6 Unit 4a – Intermediate Glaciolacustrine Deposits – Silty Sand to Sandy Silt

Deposits of silty sand to sandy silt (Unit 4a) were encountered below the upper till layer (Unit 3). Unit 4a was brown to grey in colour and consisted of silt, clay, fine to coarse sand and subrounded to angular, fine to coarse gravel. Boulders and cobbles were also present within Unit 4a. This unit ranged in thickness between about 0.1 m and 10.7 m and extended to depths ranging from about 4.3 m to 29.2 m below the existing ground surface. Drilling was terminated within Unit 4a in BH20, so the full vertical extent of the unit is unknown at that location.

SPT results showed SPT 'N' values from 39 to greater than 100 blows per 0.3 m of penetration, indicating a dense to very dense state of packing, but typically very dense. The results of Atterberg limits testing carried out on selected samples from Unit 4a indicated non-plastic to low plasticity fines.

3.3.7 Unit 4b – Intermediate Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay

Deposits of sandy lean clay to lean clay (Unit 4b) were encountered below Unit 4a. In some boreholes, Units 4a and 4b were observed to be interlayered. Unit 4b was grey in colour and consisted of silt, clay, fine to coarse sand and trace to some subrounded to angular gravel. This unit ranged in thickness from about 0.1 m to 5.2 m and extended to depths ranging between about 16.8 m and 29.2 m below the existing ground surface.

The results of SPT carried out within Unit 4b produced SPT 'N' values ranging from 15 to greater than 100 blows per 0.3 m of penetration, indicating a very stiff to hard consistency. The results of Atterberg limits testing carried out on selected samples from Unit 4b indicated low to medium plasticity fines.

3.3.8 Unit 5 – Lower Till

Below the intermediate glaci-lacustrine deposits (Units 4a and 4b), deposits of silt with sand to lean clay (Unit 5) were encountered. Unit 5 is described as a lower till layer generally consisting of a heterogeneous mixture of gravel, boulders, and cobbles in a matrix of silty sand and silty clay. This deposit was grey in colour and consisted of silt, clay, fine to coarse sand and subrounded to angular, fine to coarse gravel. Unit 5 varied in thickness from about 0.5 m to 6.3 m and extended to depths ranging between about 19.2 m and 33.6 m below the existing ground surface. Unit 5 was not fully penetrated in BH1S, BH8S, BH11S, BH18S, BH28S, BH57, BH66S, BH70S and BH83S.

SPT results from Unit 5 showed SPT 'N' values ranging from 31 to greater than 100 blows per 0.3 m of penetration, indicating a dense to very dense state of packing, but more typically very dense. The results of Atterberg limits testing carried out on selected samples from Unit 5 indicated non-plastic to low plasticity fines.

3.4 Bedrock Stratigraphy

The bedrock underlying the site consisted of the Paleozoic sequence (Blue Mountain Formation, Lindsay Formation and Verulam Formation) which is typically subhorizontally bedded. The top of the bedrock surface is shown on the interpreted subsurface cross-sections on Figures 3 and 4 and on the plan of elevation contours on Figure 6 (following the text of this report). These figures are based on readily available top of rock information from boreholes drilled for the current drilling program and previous investigations of the site; data between boreholes has been interpolated.

The top of bedrock surface is undulating relatively locally and slopes gently to the south from an elevation of about 67 m near the northern extent of the site to an elevation of about 62 m near Lake Ontario. Over the majority of the site, the bedrock surface contact has an elevation of approximately 64 m. This bedrock surface is consistent with the mapped subhorizontal dip of the Paleozoic sequence observed within the vicinity of the project area.

Subsurface rock conditions may vary between and beyond the borehole/drillhole locations. It should be noted that the interpreted stratigraphy shown in the 3D model and in the sections on the figures is a simplification of the subsurface bedrock contacts. Variations in the stratigraphic boundaries between boreholes/drillholes will exist and are to be expected.

The Paleozoic sequence at the site is subdivided into 3 units as described below:

- Unit 6a – Blue Mountain Formation; moderately weathered to fresh, very thinly to medium bedded, dark grey to dark brownish grey, fine grained, faintly porous, slightly to moderately reactive to hydrogen chloride (HCl), weak to strong Shale with thin, grey, limestone interbeds;
- Unit 6b – Lindsay Formation; slightly weathered to fresh, very thinly to medium bedded, light grey to grey, fine to medium grained, faintly porous, slightly to moderately reactive to HCl, weak to medium strong to very strong Limestone with grey shale interbeds; and
- Unit 6c – Verulam Formation; fresh, very thinly to medium bedded, grey, fine to medium grained, faintly porous, moderately reactive to HCl, medium strong to very strong Limestone with dark grey, shale interbeds.

A summary of the elevations of top of bedrock and bedrock unit thicknesses is presented in Table 3-3 below.

Table 3-3: Summary of Stratigraphic Bedrock Units Encountered in Phase 1 Drillholes

Drillhole ID	Ground Surface Elevation (m)	Depth to Top of Bedrock (m)	Top of Bedrock Elevation (m)	Subsurface Unit Thickness (m)

(a) The full thicknesses of the Lindsay Formation and Verulam Formation were not determined in these boreholes.

3.5 Groundwater Depths and Elevations

3.5.1 Historical Data Review

Water Well Records

Water well records were obtained from the Ministry of the Environment, Conservation and Parks (MECP). Eight water well records were reported for wells in proximity to the Phase 1 investigation area. Of the eight well records, four were reported as abandoned 51-mm or 76-mm diameter monitoring wells/test holes for which little information is provided and those are not discussed further. One well was recorded as a water supply well (i.e., used for stock watering and therefore likely related to a former site use) and three as observation wells. Of the observation wells, two were completed in bedrock and one was completed in overburden. A summary of relevant information from the four water well records is presented below in Table 3-4, including the inferred stratigraphic units in which the wells were completed. The geodetic datum for the elevation data in the water well records was not specified, although they are generally assumed to be reported in metres above sea level. For the purposes of the following discussion, the reported elevation data were assumed to be comparable to the elevation data obtained from the field investigation presented in this report.

Table 3-4: Summary of MECP Water Well Record Information

Well Record No.	Construction Date (mm-yy)	Well Use	Well Status	Grade Elevation[(a)] at the Time of Construction (m)	Well Depth / Elevation[(a)] (m)	Stratigraphic Unit	Groundwater Depth / Elevation[(a)] (m)
7103807	Feb-08	MO	OTH	102.7	97.5 / 5.2	Unit 6 –Bedrock	–
7106419	May-08	OTH	OTH	103.0	27.4 / 75.6	Unit 4 – Intermediate Glaciolacustrine Deposits	–
1904004	Oct-74	ST	WS	94.5	38.4 / 56.1	Unit 6 –Bedrock	18.3 / 76.2
7103806	Jan-08	MO	OTH	100.0	34.4 / 65.6	Unit 6 –Bedrock	–

(a) Elevations in table referenced to metres above sea level.
MO = monitoring; ST = stock; OTH = other; WS = water supply; – = no data.

Of the four water well records, one historical groundwater depth of 18.3 m, in October 1974, was reported in the bedrock water supply well; this corresponds to an approximate elevation of 76.2 m. The historical groundwater elevation is lower but similar to the groundwater elevations measured in the bedrock as part of the subject geotechnical investigation (see Section 3.5.2 below).

Lake Ontario Stage Fluctuations

Information provided online from Fisheries and Oceans Canada (*Historical Monthly Mean Water Levels from the Coordinated Network for Lake Ontario*, obtained from tides.gc.ca, accessed March 2022) indicated that the stage of Lake Ontario over the period of 1918 to 2019 (all available data) ranged as follows:

Table 3-5: Water Levels from the Coordinated Network for Lake Ontario (1918-2019)

Description	Elevation (m IGLD)	Elevation (m CGVD28)
Average	75.10	75.17
Minimum	74.24	74.31
Maximum	75.91	75.98

IGLD = International Great Lakes Datum; CGVD28 = Canadian Geodetic Vertical Datum of 1928.

Over the monitoring period, the stage in Lake Ontario fluctuated by 1.67 m, with the highest stage being 0.81 m higher than average, and the lowest stage being 0.86 m lower than average.

3.5.2 Current Program

Groundwater depths and elevations from the Phase 1 geotechnical investigation are presented in Table H-1 of Appendix H, Volume 1 – Factual Geotechnical Data Report (Golder Report No. 21451329-001). A summary of the minimum and maximum groundwater depths and elevations by stratigraphic unit is presented in Table 3-6 for each of the six main monitoring events.

Table 3-6: Summary of Groundwater Depths and Elevations from Phase 1 Investigation

Stratigraphic Unit		Monitoring Date	Groundwater Depth (mbgs)		Groundwater Elevation (m)		n
No.	Description		Min	Max	Min	Max	
1, 1/3	Fill, Fill/Upper Till	16-Nov-21	0.33	1.77	85.80	87.07	2
		29-Nov-21	0.38	1.63	85.75	87.21	2
		5-Jan-22	0.37	1.25	85.76	87.60	2
		26-Jan-22	-	-	-	-	0

mbgs = metres below ground surface; n = number of values.

The groundwater depth and elevation data represent the conditions on the selected dates they were measured, and seasonal and annual fluctuations should be anticipated.

Some of the data presented above in Table 3-6 may not represent static water level conditions due to well development activities on-going during the field program. Hydrographs of groundwater elevations at selected monitoring wells installed within the Upper Till (Unit 3), Intermediate Glaciolacustrine (Unit 4), Lower Till (Unit 5) and shallow Bedrock (Unit 6a) Units are presented as Figures H-1 to H-4, respectively, in Appendix H of Volume 1 – Factual Geotechnical Data Report. The influence of development activities on groundwater elevations is particularly evident on the Figure H-3 hydrograph for the lower till (Unit 5).

Groundwater elevation data and the inferred groundwater contours and groundwater flow directions from the January 5, 2022 monitoring event are presented on Figure 7 (Unit 3, upper till), Figure 8 (Unit 4a, intermediate glaciolacustrine deposits), Figure 9 (Unit 5, lower till) and Figure 10 (Units 6a and 6b, shallow bedrock) (figures following the report text). As shown on the figures, the groundwater flow direction in the upper and lower till (Units 3 and 5, respectively) is inferred to be toward the southwest, and in the intermediate glaciolacustrine deposits (Unit 4a) and shallow bedrock (Units 6a and 6b) to be toward the south-southeast. The contours are based on data from the new monitoring wells installed within the investigation area as part of Phase 1, which are limited in aerial extent, and have not been considered with contemporary groundwater elevation data from the existing monitoring well network at the site.

As noted previously in Table 3-5, the recorded stage elevation of Lake Ontario over the period of 1918 to 2019 ranged from elevations 74.31 m to 75.98 m, which is inferred to include stage elevation conditions under a wide range of climatic conditions, including dry periods and flooded conditions. All of the static groundwater elevations measured as part of this investigation, as summarized in Table 3-6, were at a higher elevation than the recorded lake levels, from which groundwater discharge to Lake Ontario is inferred.

Based on the groundwater elevations at the tri-level monitoring wells BH12 and BH50 and a nearby monitoring well installed in the shallow bedrock, as recorded during the six main monitoring events, the following summary of vertical gradients between the stratigraphic Unit 3 (Upper Till), Unit 4a (Intermediate Glaciolacustrine), Unit 5 (Lower Till) and Units 6a/6b (shallow Bedrock) is presented in the two following tables.

Table 3-7: Summary of Vertical Hydraulic Gradients, BH12 Area

Date	Groundwater Elevation (m)				Vertical Gradient					
	Unit 3	Unit 4a	Unit 5	Unit 6	Units 3 to 4a		Units 4a to 5		Units 5 to 6	
	BH12-1	BH12-2	BH12-3	BH14	m/m	Dir.	m/m	Dir.	m/m	Dir.
16-Nov-21	85.43	83.84	79.49	-	-0.25	Down	-0.70	Down	-	-
29-Nov-21	85.47	83.89	79.47	77.09	-0.25	Down	-0.71	Down	-0.28	Down
5-Jan-22	85.72	84.03	82.47	78.56	-0.27	Down	-0.25	Down	-0.46	Down
26-Jan-22	85.19	83.61	79.09	78.49	-0.25	Down	-0.73	Down	-0.07	Down
7-Feb-22	85.24	83.66	79.18	78.41	-0.25	Down	-0.72	Down	-0.09	Down
17-Feb-22	85.46	83.81	79.29	78.52	-0.26	Down	-0.73	Down	-0.09	Down

m/m = metres per metre; Dir. = direction.

Table 3-8: Summary of Vertical Hydraulic Gradients, BH50 Area

Date	Groundwater Elevation (m)				Vertical Gradient					
	Unit 3	Unit 4a	Unit 5	Unit 6	Units 3 to 4a		Units 4a to 5		Units 5 to 6	
	BH50-1	BH50-2	BH50-3	BH60	m/m	Dir.	m/m	Dir.	m/m	Dir.
16-Nov-21	88.05	88.20	80.28	-	0.01	Up	-0.79	Down	-	-
29-Nov-21	88.07	88.21	82.30	80.28	0.01	Up	-0.59	Down	-4.43	Down
5-Jan-22	88.22	88.29	82.63	82.86	0.01	Up	-0.56	Down	0.51	Up
26-Jan-22	87.77	87.91	-	-	0.01	Up	-	-	-	-
7-Feb-22	87.72	87.89	82.43	83.54	0.02	Up	-0.54	Down	2.43	Up
17-Feb-22	87.91	88.10	82.58	83.54	0.02	Up	-0.55	Down	2.11	Up

m/m = metres per metre; Dir. = direction.

As indicated above in Table 3-7 and Table 3-8, BH50 is located near the hydraulically upgradient end of the Phase 1 investigation area, and BH12 is located near the hydraulically downgradient end. At BH50, the vertical gradient between Unit 3 (upper till) and Unit 4a (intermediate glaciolacustrine deposits) is upward whereas the vertical gradient changes to downward at BH12. The vertical hydraulic gradient between the Unit 4a (intermediate glaciolacustrine deposits) and Unit 5 (lower till) is downward at both BH12 and BH50. At BH50, the vertical gradient between the Unit 5 (lower till) and Unit 6 (shallow bedrock) is typically upward whereas the vertical gradient between these units changes to downward at BH12.

3.6 Groundwater Quality

3.6.1 General

Groundwater samples were collected from existing and new monitoring wells and submitted for the analysis of total metals; dissolved metals (selected samples); anions and alkalinity; base neutrals and acids; benzene, toluene, ethylbenzene and xylenes (BTEX); petroleum hydrocarbons (PHCs); and radionuclides. The analytical data, along with the field parameter measurements, are presented in Tables I-1A to I-5 provided in Appendix I of Volume 1 – Factual Geotechnical Data Report (Golder Report No. 21451329-001), and the laboratory certificates of analysis are also provided in Appendix I of Volume 1 – Factual Geotechnical Data Report. As detailed in those tables, the groundwater quality results are compared to the Provincial Water Quality Objectives (PWQO) in Table 2 – *Table of PWQOs and Interim PWQOs* found in *Water Management Policies, Guidelines and Provincial Water Quality Objectives of the Ministry of Environment and Energy* (now the Ministry of the Environment, Conservation and Parks), July 1994, reprinted February 1999 (PIBS 3303E).

It should be noted that the concentrations of metals in discharged groundwater that may enter a surface water body should be obtained from unfiltered samples, consistent with the sampling method for surface water samples. However, the dissolution of suspended sediment in a groundwater sample may occur during sample acidification resulting in artificially elevated concentrations of metals. To reduce the inclusion of suspended sediment in the groundwater samples, the monitoring wells were first developed and then samples were obtained using a low-flow sampling method or bailer while monitoring field turbidity as described in Section 3.11.2 of Volume 1 – Factual Geotechnical Data Report.

A summary of the groundwater analytical results is provided in the following subsections, organized by stratigraphic unit.

3.6.2 Surficial Glaciolacustrine Deposits (Units 2a and/or 2b)

Groundwater samples from the surficial glaciolacustrine deposits (Units 2a and/or 2b) were obtained from one monitoring well, MW045-10. The concentrations of the following parameters were greater than the corresponding PWQO:

Metals

- Total Iron: In the sample from MW045-10 with a concentration of 2.2 mg/L vs. the PWQO of 0.3 mg/L.

Anions, Alkalinity and Field Parameters

No exceedances of the PWQO were identified for these parameters.

Base Neutral and Acids, Total Phenolics, Total PCBs

- Phenols: In the sample from MW045-10 with a concentration of 0.006 mg/L vs. the PWQO of 0.001 mg/L.

BTEX and Petroleum Hydrocarbons

No exceedances of the PWQO were identified for these parameters.

Radionuclides

No exceedances of the PWQO were identified for these parameters.

3.6.3 Upper Till (Unit 3)

Groundwater samples from the upper till (Unit 3) were obtained from four monitoring wells, BH17, MW046-6, MW062-14 and MW066-8. The concentrations of the following parameters were greater than the corresponding PWQO:

Metals

- Total Iron: In the samples from BH17 and MW062-14 ranging in concentration from 1.09 mg/L to 1.93 mg/L vs. the PWQO of 0.3 mg/L. It is noted that the concentration of dissolved iron in the field-filtered sample from MW062-14 met the PWQO. This suggests that the exceedances of the PWQO for total iron may be related to suspended sediment in the samples, and not dissolved iron in the groundwater.

Anions, Alkalinity and Field Parameters

No exceedances of the PWQO were identified for these parameters.

Base Neutral and Acids, Total Phenolics, Total PCBs

- Phenols: In all four samples from BH17, MW046-6, MW062-14 and MW066-8 ranging in concentration from 0.002 mg/L to 0.006 mg/L vs. the PWQO of 0.001 mg/L.

BTEX and Petroleum Hydrocarbons

- Toluene: In the sample from MW066-8 with a concentration of 0.99 µg/L vs. the PWQO of 0.8 µg/L.

Radionuclides

No exceedances of the PWQO were identified for these parameters.

3.6.4 Intermediate Glaciolacustrine Deposits (Unit 4a)

Groundwater samples from the intermediate glaciolacustrine deposits (Unit 4a) were obtained from five monitoring wells, BH12-2, BH50-2, MW061-20, MW065-25, and MW106-29. The concentrations of the following parameters were greater than the corresponding PWQO:

Metals

- Dissolved aluminum: In the sample from BH50-2 with a concentration of 0.102 mg/L vs. the PWQO of 0.075 mg/L. This exceedance is likely related to the dissolution of suspended clay minerals during sample acidification despite sample filtration.
- Total Cadmium: In the sample from MW061-20 with a concentration of 0.0004 mg/L vs. the PWQO of 0.0002 mg/L. The concentration of dissolved cadmium in the field-filtered sample from MW061-20 was reported below the detection limit. This suggests that the exceedance of the PWQO for total cadmium may be related to suspended sediment in the sample, and not dissolved cadmium in the groundwater.
- Total Cobalt: In the sample from MW106-29 with a concentration of 0.0023 mg/L vs. the PWQO of 0.0009 mg/L. The concentration of dissolved cobalt in the field-filtered sample from MW106-29 was reported below the detection limit. This suggests that the exceedance of the PWQO for total cobalt may be related to suspended sediment in the sample, and not dissolved cobalt in the groundwater.
- Total Iron: In all five samples from the Intermediate Glaciolacustrine Unit ranging in concentration from 0.409 mg/L to 4.50 mg/L vs. the PWQO of 0.3 mg/L. It is noted that the concentration of dissolved iron in the field-filtered sample from MW106-29 met the PWQO. Despite field filtering, the concentration of dissolved iron exceeded the PWQO of the field-filtered sample from MW061-20. This suggests that the iron concentration in the Intermediate Glaciolacustrine Unit in some locations may exceed the PWQO even if suspended sediment is removed due to dissolved phase iron in the groundwater.
- Total Phosphorus: In the sample from MW106-29 with a concentration of 0.54 mg/L vs. the PWQO of 0.02 mg/L (PWQO applicable to lake environments). The concentration of dissolved phosphorus in the field filtered sample from MW106-29 was reported below the detection limit. This suggests that the total phosphorus concentration may have been elevated by the dissolution of particulate phase phosphorus during sample acidification.

Anions, Alkalinity and Field Parameters

No exceedances of the PWQO were identified for these parameters.

Base Neutral and Acids, Total Phenolics, Total PCBs

- Phenols: In all five samples from the intermediate glaciolacustrine deposits (Unit 4a) ranging in concentration from 0.007 mg/L to 0.029 mg/L vs. the PWQO of 0.001 mg/L.

BTEX and Petroleum Hydrocarbons

No exceedances of the PWQO were identified for these parameters.

Radionuclides

No exceedances of the PWQO were identified for these parameters.

3.6.5 Lower Till (Unit 5)

A groundwater sample from the lower till (Unit 5) was obtained from one monitoring well, BH67. The concentrations of the following parameters were greater than the corresponding PWQO:

Metals

Total Phosphorus: In the sample from BH-67 of 0.14 mg/L vs. the PWQO of 0.02 mg/L (PWQO applicable to lake environments.

Anions, Alkalinity and Field Parameters

- Field pH: In the sample from BH67, with a field pH value of 9.46, was outside of the acceptable PWQO range of 6.5 to 8.5.

Base Neutral and Acids, Total Phenolics, Total PCBs

- Phenols: In the sample from BH67 with a concentration of 0.007 mg/L vs. the PWQO of 0.001 mg/L.

BTEX and Petroleum Hydrocarbons

No exceedances of the PWQO were identified for these parameters.

Radionuclides

No exceedances of the PWQO were identified for these parameters.

3.6.6 Bedrock (Unit 6a and/or 6b)

Groundwater samples from the bedrock (Units 6a and/or 6b) were obtained from three monitoring wells, BH71, MW044-34 and MW060-34. The concentrations of the following parameters were greater than the corresponding PWQO:

Metals

- Total Boron: In all three samples from the bedrock unit (Unit 6a and/or 6b) ranging in concentration from 0.21 mg/L to 0.74 mg/L vs. the PWQO of 0.2 mg/L. It is noted that the concentration of the dissolved boron in the field-filtered sample from MW044-34 also did not meet the PWQO, and had a similar concentration of 0.576 mg/L. This suggests that the total boron concentration is related to dissolved phase boron in the groundwater.
- Total Iron: In the samples from MW044-34 and MW060-34 ranging in concentration from 0.326 mg/L to 0.574 mg/L vs. the PWQO of 0.3 mg/L. It is noted that the concentration of dissolved iron in the field-filtered sample from MW044-34 met the PWQO. This suggests that the exceedances of the PWQO for total iron may be related to suspended sediment in the samples, and not dissolved iron in the groundwater.
- Dissolved Zinc: In the sample from MW044-34 with a concentration of 0.407 vs. the PWQO of 0.03 mg/L. The concentration of dissolved zinc at this location is anomalous as the concentration of total zinc was below the method detection limit (i.e., <0.02 mg/L). Confirmation sampling for zinc is recommended prior to making decisions on the basis of the dissolved zinc concentration at MW044-34 (e.g., in relation to potential pumped water treatment as part of a dewatering or discharge plan).

Anions, Alkalinity and Field Parameters

- Field pH: In the samples from MW060-34 and BH71, with field pH values of 6.40 and 9.37, respectively, were outside the acceptable PWQO range of 6.5 to 8.5.

Base Neutral and Acids, Total Phenolics, Total PCBs

- Phenols: In all three samples from the bedrock unit (Unit 6a and/or 6b) ranging in concentration from 0.005 mg/L to 0.015 mg/L vs. the PWQO of 0.001 mg/L.

BTEX and Petroleum Hydrocarbons

No exceedances of the PWQO were identified for these parameters.

Radionuclides

No exceedances of the PWQO were identified for these parameters.

4.0 INTERPRETATION OF ADVANCED IN SITU AND LABORATORY TESTING

4.1 General

The methodologies for the in situ and laboratory testing carried out during the Phase 1 geotechnical investigation are detailed in Volume 1 – Factual Geotechnical Data Report. The following subsections discuss our interpretations of the advanced in situ and laboratory testing methods used to derive selected soil and rock material parameters.

4.2 Cone Penetration Testing

4.2.1 General

Cone penetration testing (CPT) with dissipation testing was carried out at 22 locations during the Phase 1 geotechnical investigation. Details of the testing methodology, testing locations and raw data results are provided in Volume 1 – Factual Geotechnical Data Report. The raw data from the CPT soundings was interpreted using the software package CPeT-IT v.2.3.1.9 by GeoLogismiki. The following soil properties were interpreted based on the CPT data and accepted correlations from literature:

- Normalized cone resistance;
- Normalized friction ratio;
- Normalized pore pressure ratio;
- Normalized soil behaviour index and type;
- SPT 'N_{60}' value;
- Relative density;
- Hydraulic conductivity, based on normalized soil behaviour index;
- Overconsolidation ratio;
- In situ stress ratio (coefficient of lateral earth pressure at rest);
- Peak and remoulded undrained shear strengths;
- Undrained strength ratio;
- Drained friction angle;
- Small strain shear modulus; and

- Young's modulus, at 50% of peak strength.

An undrained shear strength cone factor for clays (N_{kt}) of 17 was used for interpretation, based on correlation with the field vane testing data (corrected for plasticity) from the Phase 1 investigation. Plots of the interpreted CPT data and details of the formulas used for the estimated soil properties are provided in Appendix C.

4.2.2 Pore Pressure Dissipation Testing

Eighty-one (81) pore pressure dissipation tests were completed as part of the Phase 1 CPT program. Where dissipation testing was performed in fine-grained material and at least 50% dissipation was achieved over the testing interval, the coefficient of horizontal consolidation was interpreted. Table 4-1, below, summarizes the results of the CPT dissipation testing, which was carried out exclusively in Unit 2a.

Table 4-1: Summary of Cone Penetration Testing Pore Pressure Dissipations, Unit 2a

CPT ID	Testing Depth (m)	Normalized Soil Behaviour Type at Testing Depth[(a)]	Unit 2a Soil Description from Corresponding Borehole Log[(b)]	Time to 50% Consolidation[(c)] (s)	Coefficient of Horizontal Consolidation[(d)(e)] (cm^2/s)
CPT2	2.25	4 – Clayey silt to silty clay	Lean Clay with Sand (CL)	47	2×10^{-1}
	2.58	4 – Clayey silt to silty clay		65	2×10^{-1}
	3.85	4 – Clayey silt to silty clay		100	1×10^{-1}
	5.15	1 – Sensitive fine grained		771	1×10^{-2}
CPT3	3.05	4 – Clayey silt to silty clay	Lean Clay with Sand (CL)	236	5×10^{-2}
	4.58	5 – Silty sand to sandy silt		383	3×10^{-2}
CPT5B	3.38	4 – Clayey silt to silty clay	Sandy Silty Clay (CL-ML)	154	7×10^{-2}
	4.85	4 – Clayey silt to silty clay		498	2×10^{-2}
	6.63	4 – Clayey silt to silty clay		77	1×10^{-1}
	7.83	4 – Clayey silt to silty clay		162	7×10^{-2}
CPT7	2.30	4 – Clayey silt to silty clay	Lean Clay (CL)	187	6×10^{-2}
	2.98	5 – Silty sand to sandy silt		153	7×10^{-2}
CPT11	1.30	5 – Silty sand to sandy silt	Lean Clay with Sand (CL)	1328	8×10^{-3}
CPT12	1.60	5 – Silty sand to sandy silt	Lean Clay with Sand (CL)	223	5×10^{-2}
CPT50	1.90	5 – Silty sand to sandy silt	Lean Clay with Sand (CL)	92	1×10^{-1}
CPT60	2.18	4 – Clayey silt to silty clay	Lean Clay with Sand (CL)	358	3×10^{-2}
CPT62	2.58	4 – Clayey silt to silty clay	Lean Clay with Sand (CL)	128	9×10^{-2}
CPT65	4.83	4 – Clayey silt to silty clay	Lean Clay with Sand (CL) to Lean Clay (CL)	748	1×10^{-2}

(a) Soil behaviour type from CPeT-IT interpretation (Appendix C).
(b) Soil description taken from borehole log with corresponding number (e.g., CPT2 and BH2) at approximate depth of dissipation testing. (See Volume 1 – Factual Geotechnical Data Report Appendix A for borehole logs.)
(c) Time to 50% consolidation from ConeTec Site Investigation Results (see Volume 1 – Factual Geotechnical Data Report Appendix C).
(d) Rigidity index of 90 estimated for Unit 2a from plasticity index and overconsolidation ratio (Keavey and Mitchell, 1986)[1].
(e) Coefficient of horizontal consolidation estimated as per Teh and Houlsby (1991)[2].

[1] Keavey, J. and Mitchell, J.K. (1986). Strength of fine-grained soils using the piezocone. Use of In-Situ Tests in Geotechnical Engineering, GSP 6, ASCE, 668-685

[2] Teh, C.I. and Houlsby, G.T. (1991). An analytical study of the cone penetration test in clay. Geotechnique **41**(1):17-34.

4.3 Pressuremeter/Dilatometer Testing

Pressuremeter testing (PMT) was completed in eight (8) boreholes over the site as part of the Phase 1 investigation. Details of the testing methodology, testing locations and raw data results are provided in Volume 1 – Factual Geotechnical Data Report. Based on the PMT results, soil material parameters were inferred, including stress ratio (coefficient of lateral earth pressure at rest, K_0), Young's modulus, and undrained and drained shear strength parameters. The inferred parameters from PMT in soil are presented in Appendix D.

Dilatometer testing was carried out in nine (9) drillholes over the site. Dilatometer testing results for rock are provided in Volume 1 – Factual Geotechnical Data Report.

4.4 Overcoring In Situ Stress Testing

4.4.1 General

The following section provides the interpretation of the in situ stress measurement data collected at boreholes BH66, BH59, BH7, BH10, BH13 and BH68. Forty-five (45) overcoring in situ stress tests were attempted during the field program and 36 valid tests were interpreted.

4.4.2 Evaluation of Stresses

Based on the deformations measured across the three pairs of buttons of the United States Bureau of Mines (USBM) borehole deformation gauge, the stresses on the plane perpendicular to the axis of the borehole are given by the following expressions (Obert and Duval, 1967)[3].

$$P = \frac{E}{6d(1-\upsilon^2)}\left(U_1 + U_2 + U_3 + \frac{1}{\sqrt{2}}[(U_1-U_2)^2 + (U_2-U_3)^2 + (U_3-U_1)^2]^{1/2}\right)$$

$$Q = \frac{E}{6d(1-\upsilon^2)}\left(U_1 + U_2 + U_3 - \frac{1}{\sqrt{2}}[(U_1-U_2)^2 + (U_2-U_3)^2 + (U_3-U_1)^2]^{1/2}\right)$$

where,

E	is the average deformation modulus
υ	is the Poisson's ratio
d	is the diameter of the pilot hole
U_1, U_2, U_3	are the measured changes in borehole diameter across three diameters at 60° rotation (i.e., the 3 sets of buttons on the USBM deformation gauge)
U	is positive for an increasing diameter
P	is the maximum stress perpendicular to borehole axis
Q	is the minimum stress perpendicular to borehole axis

The direction of P is given by:

$$\theta = \frac{1}{2}\tan^{-1}\left[\frac{\sqrt{3}(U_2-U_3)}{2U_1-U_2-U_3}\right]$$

[3] Obert, L., and Duvall, W.I. 1967. Rock Mechanics and the Design of Structures in Rocks. New York, NY: Wiley.

where,

θ is the angle to P measured counter-clockwise from the direction of the U_1 diameter.

The quadrant of θ may be determined as follows:

If $U_2 > U_3$ and $U_2 + U_3 < 2U_1$ then θ is between 0° and 45°
$U_2 > U_3$ and $U_2 + U_3 > 2U_1$ then θ is between 45° and 90°
$U_2 < U_3$ and $U_2 + U_3 > 2U_1$ then θ is between 90° and 135°
$U_2 < U_3$ and $U_2 + U_3 < 2U_1$ then θ is between 135° and 180°

The above equations are derived for plane strain conditions with zero axial strain ($\varepsilon_2 = 0$) along the borehole. If the effect of axial strain is to be taken into account, an estimate of the axial stress along the borehole is required.

The deformation modulus of the rock is evaluated from the results of the biaxial tests using the following expression and assuming isotropic elasticity:

$$E = \frac{4ab^2P_0}{(b^2 - a^2)U}$$

where,

E is the deformation modulus
a is the inner radius of the overcore
b is the outer radius of the overcore
P_o is the radial pressure on the outer surface of the overcore
U is the average diametral deformation of pilot hole in the overcore

4.5 Geophysical Testing

4.5.1 Vertical Seismic Profiling

The Vertical Seismic Profiling (VSP) method measures variations in compressional and shear wave velocities with increasing depth and can be used to infer rock and soil types, stratigraphy, and soil conditions. In the Phase 1 geotechnical investigation, a surface seismic source was used to generate seismic-waves and a GeoStuff downhole geophone receiver was used to measure seismic velocity at varying distances (depths) from the source.

The downhole geophone receiver measured the wave-train associated with the waves travelling from the source to the receiver. The seismic source was connected to and triggered a data recording system that recorded the response of the downhole geophone, thus measuring the travel time of the wave train between source and receiver. Measurements of the travel times of the generated compressional and shear waves allowed for in situ compression and shear wave velocity values to be determined.

The geophone was positioned at the bottom of the borehole and advanced 1 m upward for each subsequent test to create one-dimensional profiles of compression and shear wave velocities versus depth. The recorded data were subsequently analyzed by splitting the three recorded components (vertical, longitudinal, and transverse) into depth-wave trains. Compression and shear wave arrivals were then selected and best fit to a model to derive layer thicknesses and compression and shear wave velocities in the vicinity of the borehole. These velocities were then used to calculate Poisson's ratio, shear modulus, Young's modulus, and bulk modulus, as per Section 4.5.3, below. The interpreted VSP results are provided in Appendix F.

4.5.2 Full Waveform Sonic

The Mount Sopris QL40-FWS Full Waveform Sonic probe (FWS) utilizes a sonic transmitter and three receivers to measure the primary (compression) and secondary (shear) wave velocities of rock formations. The transmitter and receiver portions of the probe are isolated from each other with a flexible sonic isolator which prevents the transmitted sonic pulses from travelling through the probe. As the calculations for wave velocity require a consistent separation from the transmitter and receivers relative to the borehole wall, centralizers are required for this probe.

Compression and shear wave velocities from FWS were estimated in WellCAD by computing a semblance plot that evaluates the similarities in the full sonic waveforms across the array of receivers in the probe. Graphically, the FWS Semblance Plot is an image log where individual pixels are assigned a colour based on the amplitude of the semblance between the travel times recorded by each of the FWS receivers. The manually selected slowness curves were adjusted using the WellCAD extremum algorithm, and the logs were inverted to generate compression wave velocity and shear wave velocity logs.

The FWS image logs and curves are displayed in Appendix F. The FWS logs include the semblance plot image, the selected compression wave and shear wave slowness curves, the calculated compressive wave velocity and shear wave velocity curves, and calculated dynamic engineering properties (as per Section 4.5.3).

The semblance plot is overlaid with the selected compression wave and shear wave slowness curves, which correspond to the two separate peak values shown in the semblance plot image. The corresponding compression wave velocity and shear wave velocity curves are provided adjacent for comparison. The Poisson's ratio curve is displayed adjacent to the three overlain elastic constants curves: shear modulus, Young's modulus, and bulk modulus.

4.5.3 Engineering Properties

Values for Poisson's ratio (ν), shear modulus (G), Young's modulus (E) and bulk modulus (K) are calculated from compression wave and shear wave velocities as:

Poisson's ratio:
$$v = \frac{0.5\left(\frac{V_P}{V_S}\right)^2 - 1}{\left(\frac{V_P}{V_S}\right)^2 - 1}$$

Young's modulus:
$$E = \frac{V_P^2 \rho (1+v)(1-2v)}{(1-v)} = 2G(1+v)$$

Shear modulus:
$$G = \frac{E}{2(1+v)} = V_s^2 \rho$$

Bulk modulus:
$$K = \frac{E}{3(1-2v)} = \frac{V_P^2 \rho}{\frac{4}{3}G}$$

Where ρ is the bulk density (in Kg/m^3), V_P is the compression wave velocity (m/s) and V_s is the shear wave velocity (m/s).

4.6 Advanced Laboratory Testing of Soil

4.6.1 One-Dimensional Consolidation Testing

Laboratory one-dimensional consolidation testing was carried out as part of the Phase 1 geotechnical investigation. Details of the testing methodology and the raw data results are provided in Volume 1 – Factual Geotechnical Data Report. The following subsections describe the methods and assumptions used in the estimation of consolidation properties from the laboratory results.

It should be noted that some test results indicate that specimens may have been disturbed (although this was not necessarily evident at the time the sample was prepared for testing), and the tests carried out on disturbed specimens may not be representative of actual in situ conditions. Sample disturbance may be inferred from the characteristic shape of the consolidation curve. For example, in the semi-logarithmic plot of void ratio versus applied stress, a curve with a well-defined break between recompression and virgin compression may indicate a relatively “intact” specimen. A gradually rounded curve or a flattened curve between recompression and virgin compression typically indicates a disturbed specimen. The specimen volumetric strain, as defined below, may be considered as a general index of sample disturbance:

$$\varepsilon_{vo} = \frac{e_0 - e_1}{1 + e_0} \times 100$$

Where ε_{vo} is the volumetric strain at the estimated in situ vertical effective stress (%), e_0 is the initial void ratio determined in the laboratory, and e_1 is the void ratio at the estimated in situ vertical effective stress during consolidation testing. Table 4-3 presents the void ratios and initial volumetric strain estimates for the one-dimensional consolidation specimens.

Table 4-2: Summary of Void Ratios and Initial Volumetric Strain from One-Dimensional Consolidation Testing

Borehole ID	Sample ID	Avg. Sample Depth (m)	Strati-graphic Unit	Soil Description from Borehole Log[(a)]	Estimated In Situ Vertical Effective Stress[(b)] (kPa)	Initial Void Ratio	Void Ratio at Est. In Situ Vertical Effective Stress	Volumetric Strain at Est. In Situ Vertical Effective Stress

(a) Soil description from borehole log at sample depth. (See Volume 1 – Factual Geotechnical Data Report (Golder Report No. 21451329- 001), Appendix A for borehole logs).
(b) In situ vertical effective stress estimated assuming unit weight of soil of 20 kN/m^3 and groundwater table at 2.5 m below ground surface.

Preconsolidation Pressure

Two graphical methods were used to estimate preconsolidation pressure: the Casagrande method and the “work” method. The Casagrande method for estimating the preconsolidation pressure is described in ASTM D2435. This method relies upon the presence of a well-defined break in the semi-logarithmic plot of void ratio versus applied stress (in the vicinity of the preconsolidation pressure). In practice, however, stress-strain curves from laboratory consolidation testing are often rounded (to some extent) due to sample disturbance. To address this limitation of the Casagrande method, instead of choosing a *point* of maximum curvature, a *zone* of maximum curvature was bounded by maximum and minimum stress points. The maximum and minimum points were then used to estimate boundary preconsolidation pressures and thus a range of possible pressure values.

The “work” method for estimating preconsolidation pressure given by Becker et al. (1987)[4] relates the energy used to compress clay samples to the stress applied. Specifically, this method fits two linear segments to the plot

[4] Becker DE, Crooks JHA, Been K, Jefferies MG. 1987. Work as a criterion for determining in situ and yield stresses in clays. Canadian Geotechnical Journal. **24**(4):549-564.

of strain energy density versus stress to represent the pre-yield and post-yield behavior of the soil. The “work” method, like the Casagrande method, can be somewhat subjective as it relies on linear interpolations of strain energy density and stress plots that are, in practice, sometimes curved.

For the interpretations presented herein, the pre-yield line was drawn by fitting through at least three data points showing reasonable linearity following initial loading. The post-yield line was similarly drawn by fitting to data that exhibited linearity following a clear break in the work stress curve (the yield zone).

If nonlinearities in post-yield data were observed, the data point with the largest stress was neglected. This method was adopted due to observations that post-yield lines constructed using the largest stress data points overestimated the preconsolidation pressure when compared with ranges obtained from the Casagrande method, and because of similar patterns noted by Becker et al. (1987) at high pressures. Maximum and minimum slope post-yield lines were drawn fitting to data further or closer from the yield zone respectively. From the Casagrande results, it was inferred which samples were normally consolidated or overconsolidated and care was taken in post-yield fits to only include data from beyond the calculated in situ effective stresses in these cases.

If the pre-yield line could not be explicitly determined, a minimum pre-yield line was created fitting to the first three data points and a maximum pre-yield line was fitted through additional points, as boundaries for estimating ranges of preconsolidation pressure. Table 4-3, below, summarizes the preconsolidation pressures and overconsolidation ratios estimated using the Casagrande and “work” methods for the one-dimensional consolidation testing undertaken as part of the Phase 1 investigation.

Coefficients of Consolidation, Volume Compressibility, and Hydraulic Conductivity

Coefficients of vertical consolidation, volume compressibility, and vertical hydraulic conductivity at the end of each consolidation loading step are provided in the laboratory reports in Appendix A of Volume 1 – Factual Geotechnical Data Report. These coefficients vary over the testing duration and are dependent on many factors including stress level, overconsolidation ratio, and strain rate. From the one-dimensional consolidation testing carried out as part of the Phase 1 investigation, the variability of these parameters spans roughly one to two orders of magnitude at low loads (< 50 kPa to 400 kPa) and tends to converge at higher loads.

Table 4-4 summarizes the coefficient of consolidation, volume compressibility, and hydraulic conductivity data determined from the one-dimensional consolidation testing. For reporting purposes, these coefficients are linearly interpolated between end of loading step data and are taken at a stress level of 100 kPa in excess of the estimated in situ vertical effective stress. Table 4-5 presents a summary of the compression index and compression ratio data determined from the one-dimensional consolidation testing.

Compression Index and Ratio

Table 4-5, below, summarizes the compression index and compression ratio data determined from the one-dimensional consolidation testing. The compression index was estimated from the slope of the virgin consolidation portion (steepest linear portion) of the semi-logarithmic stress-strain curve. The compression ratio was calculated from the compression index and the initial void ratio.

Table 4-3: Summary of Preconsolidation Pressure and Overconsolidation Ratio from One-Dimensional Consolidation Testing (Casagrande and Work Methods)

Note: Select consolidation testing results have been excluded from interpretation (see Table 4-3 for details).

4.6.2 Direct Simple Shear Testing

Consolidated undrained direct simple shear (DSS) testing of intact cohesive specimens was carried out as part of the Phase 1 geotechnical investigation. Specimens were generally consolidated to the approximate in situ preconsolidation pressure and then unloaded to the approximate in situ vertical effective stress prior to the undrained shearing stage. This laboratory loading and unloading sequence was intended to allow specimens to develop at rest earth pressure (K_0) conditions within the confining rings/membrane. Additional details of the testing methodology and the raw data results are provided in Volume 1 – Factual Geotechnical Data Report.

Shear Strength Behaviour

As shown in Table 4-8, the laboratory undrained shear strength value for each tested specimen was taken as the corrected peak shear stress, and the undrained shear strength ratio was determined as the ratio of the undrained shear strength to the vertical effective stress at the beginning of the shearing stage.

Deformation Behaviour

The secant shear modulus was determined from the stress-strain results for each tested specimen. Appendix G provides plots of the secant shear modulus versus shear strain from the DSS testing.

Table 4-6: Summary of Undrained Shear Strength from Undrained Shearing of Intact Consolidated Direct Simple Shear Specimens

4.6.3 Consolidated Drained Triaxial Testing

Consolidated anisotropic drained (CAD) triaxial compression testing was completed on reconstituted granular soil specimens as part of the Phase 1 geotechnical investigation. Reconstituted specimens were prepared by moist tamping combined with the undercompaction method, where the initial layer is compacted to lower density than succeeding layers so that the final density of each specimen is approximately uniform. Specimens were anisotropically consolidated prior to the drained shearing stage. Additional details of the testing methodology and the raw data results are provided in Volume 1 – Factual Geotechnical Data Report.

Detailed interpretations of some CAD and CID laboratory results (specifically the tests required for others to determine the “plastic properties of soil) have not been provided since the applicable interpreted design values are highly dependent on the stress conditions and structural interactions inherent in the detailed design aspects of the project. As the project has not yet progressed to the detailed design stage, the detailed interpretations are best left to the specialist designers who best understand the intended use of those parameters and the conditions under which they are to be applied.

Shear Strength Behaviour

Drained shear strength parameters were determined from CAD triaxial testing by constructing effective stress Mohr-Coulomb failure envelopes based on results from three different specimens originating from the same stratigraphic unit in a single borehole. The drained shear strength parameter interpretations are provided in Appendix H. Failure envelopes were interpreted using the ‘p’ versus ‘q’ graphical representation of the Mohr-Coulomb failure criteria. The slope of the failure envelope was used to determine the drained friction angle, assuming a drained cohesion intercept of zero for reconstituted granular soil specimens. The ‘p’ versus ‘q’ method has advantages over the Mohr circle method when considering multiple specimens, as specimen failures can be represented by a set of points, allowing for a line of best fit to be used as an envelope. Resulting failure envelopes were also plotted with effective Mohr circles to show agreement. For interpretation purposes, it was assumed that specimen failure corresponded to the maximum principal effective stress difference attained.

Deformation Behaviour

The initial tangent modulus of elasticity (i.e., initial/small strain Young’s modulus) and secant modulus of elasticity at 50% of the vertical effective stress increase during shearing to failure were determined from the stress-strain results for each tested specimen. Appendix H provides the interpreted elastic moduli parameters from the CAD triaxial testing. Additionally, Poisson’s ratio was estimated by the initial linear portion of the volumetric strain versus vertical strain plot, and the dilation angle was estimated by the linear portion of the volumetric strain versus vertical strain plot following the point of failure. Table 4-7 provides the estimated values of Poisson’s ratio and dilation angle from CAD testing.

Table 4-7: Summary of Poisson's Ratio and Dilation Angle from Drained Shearing of Reconstituted Anisotropically Consolidated Triaxial Specimens

4.6.4 Consolidated Undrained Triaxial Testing

Consolidated undrained triaxial compression testing was completed on intact cohesive soil specimens as part of the Phase 1 geotechnical investigation. Specimens were consolidated either anisotropically or under no lateral strain conditions (i.e., K_0-consolidation) prior to the undrained shearing stage. Additional details of the testing methodology and the raw data results are provided in Volume 1 – Factual Geotechnical Data Report.

Shear Strength Behaviour

Drained and undrained shear strength parameters were determined from Consolidated Anisotropic Undrained (CAU) triaxial testing and K_0-Consolidated Undrained (CK_0U) triaxial testing by constructing Mohr-Coulomb failure envelopes based on results from two to three different specimens originating from the same stratigraphic unit in a single borehole. The Mohr-Coulomb shear strength parameter interpretations are provided in Appendix I. Failure envelopes were interpreted using the ‘p’ versus ‘q’ graphical representation of the Mohr-Coulomb failure criteria and the plotted Mohr circles for both effective and total stress conditions. For interpretation purposes, it was assumed that specimen failure corresponded to the point of maximum obliquity (i.e., maximum effective stress ratio). The failure envelope was derived based on a best-fit line tangent to the Mohr circles produced at different stress intervals.

Additionally, as shown in Table 4-8 for CAU tests and in Table 4-9 for CK_0U tests, the laboratory undrained shear strength value for each tested specimen was determined as the product of half of the deviator stress at failure and the cosine of the drained friction angle (from the Mohr-Coulomb failure envelope). Where only a single test was available for a given stratigraphic unit and borehole, a failure envelope could not be interpreted. In the absence of a failure envelope, the undrained shear strength was conservatively estimated as the product of half of the deviator stress at failure and the cosine of the angle resulting from the tangential line extending from the origin to the effective stress Mohr circle.

Where specimens were consolidated under no lateral strain conditions, the coefficient of lateral earth pressure at rest (K_0) was estimated from the consolidation phase of the triaxial testing (see Table 4-10). It should be noted that due to specimen creep during consolidation, the reported stress ratio at the end of the consolidation stage may not be equivalent to the estimated coefficient of lateral earth pressure at rest.

(a) Soil description from borehole log at sample depth. (See Volume 1 – Factual Geotechnical Data Report Appendix A for borehole logs.)
(b) The End-of-Consolidation Ratio of Horizontal to Vertical Stress may be affected by specimen creep and should not necessarily be considered equivalent to K_0.
(c) Coefficient of Lateral Earth Pressure at Rest estimated from K_0-consolidation phase of triaxial testing, excluding effects of specimen creep, where observed at the end of consolidation.
(d) Specimen considered disturbed due to irregularities in stress-strain response during both consolidation and shearing phases; shear strength interpretation not considered representative.
(e) Vertical effective consolidation stress in excess of estimated in situ conditions; coefficient of lateral earth pressure at rest not determined for this test.

4.6.5 Stress-Controlled Cyclic Direct Simple Shear Testing

Stress-controlled cyclic direct simple shear (CDSS) testing was completed on intact, fine-grained, cohesive soil specimens as part of the Phase 1 geotechnical investigation. Additional details of the testing methodology and the raw data results are provided in Volume 1 – Factual Geotechnical Data Report.

The interpreted results of the stress-controlled CDSS tests are provided in Appendix J, as semi-logarithmic plots of cyclic stress ratio (CSR) versus the number of cycles (N), grouped by stratigraphic unit. CSR values were calculated using the following equation, based on data provided in the associated laboratory reports:

$$CSR = \frac{\tau}{\sigma_c'}$$

Where τ = shear stress, and σ_c' = vertical effective consolidation stress.

A failure criterion of 3.75% or 5% single strain amplitude (the criteria for some tests were changed part way through the lab program) was considered for the stress-controlled tests (up to a maximum of N = 200 cycles). Where the single strain amplitude failure criterion was not achieved after N = 200 cycles, testing was terminated. Plots of Cycles 1 and 200 are provided in Appendix J, where available.

4.6.6 Stress-Controlled Cyclic Triaxial Compression Testing

Stress-controlled cyclic triaxial compression testing was completed on reconstituted granular soil specimens as part of the Phase 1 geotechnical investigation. Reconstituted specimens were prepared by moist tamping combined with the undercompaction method. Additional details of the testing methodology and the raw data results are provided in Volume 1 – Factual Geotechnical Data Report.

The raw data and interpreted results of the stress-controlled cyclic triaxial tests are provided in Appendix K, as semi-logarithmic plots of CSR versus N, grouped by stratigraphic unit. CSR values indicated were as reported by the testing laboratory. (i.e., These values were not independently interpreted.) The CSR for isotropically consolidated cyclic triaxial tests is defined as the maximum cyclic shear stress ($q_{cyc}/2$) divided by the isotropic consolidation stress (σ'_{3c}):

$$CSR = \frac{q_{cyc}}{2\sigma'_{3c}}$$

A failure criterion of 3.75% or 5% single strain amplitude (the criteria for some tests were changed part way through the lab program) was prescribed for the stress-controlled tests (up to a maximum of N = 200 cycles). Where the single strain amplitude failure criterion was not achieved after N = 200 cycles, testing was terminated.

4.6.7 Resonant Column and Strain-Controlled Cyclic Direct Simple Shear Testing

Resonant column and strain-controlled cyclic direct simple shear (CDSS) testing were completed on intact, fine-grained, cohesive soil specimens as part of the Phase 1 geotechnical investigation. Details of the testing methodology and the raw data results are provided in Volume 1 – Factual Geotechnical Data Report.

From the resonant column and strain-controlled CDSS results, plots of shear modulus and damping ratio versus shear strain were developed for each stratigraphic unit, as applicable. Appendix L provides semi-logarithmic plots of the normalized shear modulus versus shear strain, as well as semi-logarithmic plots of the damping ratio versus shear strain. Shear modulus values were normalized to the initial shear modulus value for each individual lab test carried out. The average shear modulus values for each stratigraphic unit and confining pressure, as applicable, are indicated on the corresponding plots in Appendix L.

From the strain-controlled CDSS results, the shear stress versus shear strain cycle plots for Cycle 1 and Cycle 15 of each test are provided in Appendix L. The shear stress, shear strain, and shear modulus values for Cycle 1 and Cycle 15 are also summarized on the corresponding plots. It may be noted that due to variations in shear strain, the shear strain value indicated for Cycle 15 (for a given test) represents an average of the shear strain values for Cycles 2 through 15 for the test.

4.6.8 Resonant Column and Torsional Shear Testing

Resonant column and torsional shear testing were completed on reconstituted granular soil specimens as part of the Phase 1 geotechnical investigation. Reconstituted specimens were prepared by moist tamping combined with the undercompaction method. Additional details of the testing methodology and the raw data results are provided in Volume 1 – Factual Geotechnical Data Report.

From the resonant column and torsional shear tests, plots for shear modulus and damping ratio versus shear strain were determined for each stratigraphic unit, as applicable. Appendix M provides semi-logarithmic plots of the normalized shear modulus versus shear strain, as well as semi-logarithmic plots of the damping ratio versus shear strain. Shear modulus values were normalized to the initial shear modulus value for each individual lab test carried out. The average shear modulus values for each stratigraphic unit and confining pressure, as applicable, are indicated on the corresponding plots in Appendix M.

From the torsional shear test results, the preliminary shear stress versus shear strain cycle plots for Cycle 1 and Cycle 15 of each test are provided in Appendix M. The shear stress, shear strain, and shear modulus values for Cycle 1 and Cycle 15 are also summarized on the corresponding plots. It may be noted that due to variations in shear strain, the shear strain value indicated for Cycle 15 (for a given test) represents an average of the shear strain values for Cycles 2 through 15 for the test.

4.7 Advanced Laboratory Testing of Rock

4.7.1 Triaxial Testing

Triaxial testing was completed on 2 samples from the Blue Mountain Formation and 22 samples from the Lindsay Formation. Constant strain rate (CSR) triaxial tests were performed to determine the elastic moduli and confined compressive strength. A load/unload/reload cycle was completed at the beginning of the tests to calculate two static-elastic constants (i.e., Young's modulus and Poisson's ratio) using the following mathematical equations:

$$(1)\quad E = \frac{\Delta\sigma}{\Delta\varepsilon 1}$$

$$(2)\quad \nu = -\frac{E}{\frac{\Delta\sigma}{\Delta\varepsilon 3}}$$

where $\Delta\sigma$ is the change in axial stress and $\Delta\varepsilon_1$ and $\Delta\varepsilon_3$ are the changes in axial and radial strain, respectively. Equation 1 and the denominator of Equation 2 represent the slopes of the stress versus axial strain and stress versus radial strain curves, respectively. The slopes of these curves were fit between approximately 20 and 80 percent of the reload. After the load/unload/reload cycle was performed, the axial stress was increased until reaching the ultimate strength of the sample.

4.7.2 Constant Force Direct Shear Creep Testing

The results of the constant force direct shear creep tests are presented in the Volume 1 – Factual Geotechnical Data Report, Appendix F. Each creep test consisted of 3 to 4 stages at a constant normal stress with increasing constant shear stress for each stage. The plots of the shear displacement rate vs time provide the creep rate in

mm/day for the test. The creep rate was calculated based on the average rate after the creep rate becomes more or less stable for each test stage.

4.7.3 Swell Testing

The effects of applied pressure on the swelling potential of the Blue Mountain Formation shale bedrock (Unit 6a) were examined by plotting the swelling strain rate (percent strain per log cycle of time) versus the logarithm (to the base of 10) of the applied pressures on the test samples for the free swell and semi-confined swell tests. The average strain rate over a single log cycle of time in days was then estimated from the plots as shown in Table 4-11. For the free swell tests, there is no applied pressure during the test, and for the null test, the strain is kept to a null value by increasing the applied pressure which is then reported as the null pressure.

Table 4-11: Rock Swelling Results for the Blue Mountain Formation

Direction	Sample	Test Type	Depth (mbgs)	Calcite Content	Applied Pressure (MPa)	Strain Rate (% per log cycle time)

5.0 GEOTECHNICAL DESIGN PARAMETERS

5.1 Geotechnical Variability and Uncertainty

Geotechnical variability and uncertainty are considerations in reliability-based design. Geotechnical variability is complex and results from several distinct sources of uncertainty, as depicted below on Figure 5-1 (adapted from Phoon and Kukhawy, 1999)[5]

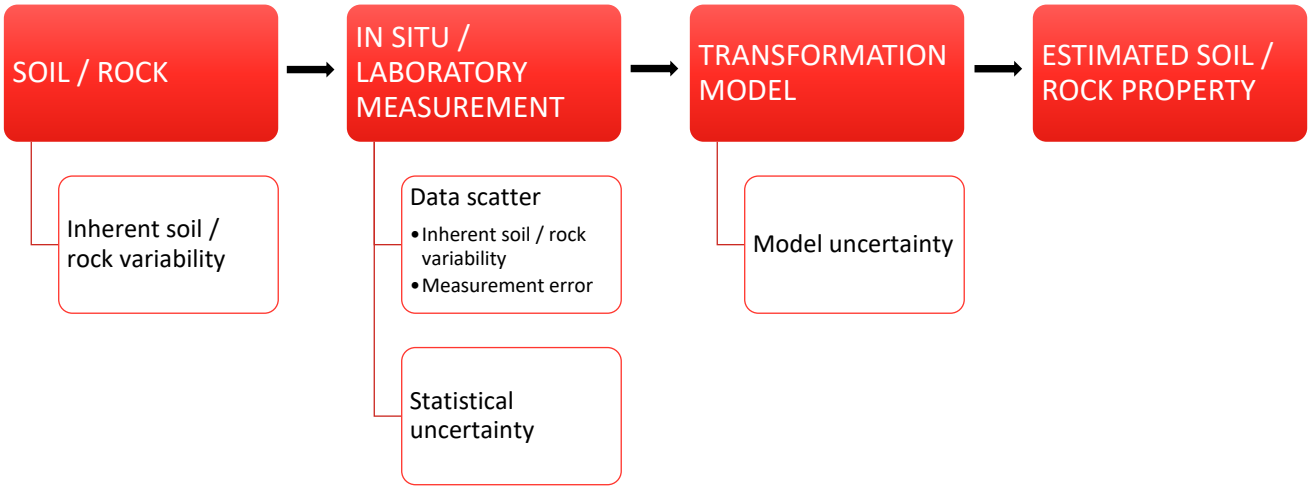

Figure 5-1: Overview of Geotechnical Variability and Uncertainty

Soil and rock are inherently variable materials, derived from, and continually influenced by, natural processes. At the DNNP site, the stratigraphic soil model describes complex inter-layered deposits of glacial origin (both glaciolacustrine deposits and glacial till). The glacial history of the region is recognized as contributing to the geotechnical variability of the site. Similar to the soil units, the bedrock at the site is comprised of sedimentary formations which displayed significant variability due to planes of weakness from shale interbeds.

When sampling the soil and rock there can be sampling bias that is introduced in the sample selection process. In general, for the DNNP project samples were selected based on predetermined testing requirements for each borehole and samples were selected from a variety of depths within each borehole. In some cases, such as the shale from the Blue Mountain Formation, it is not often possible to test the weaker rock as samples of this material cannot be properly prepared for testing without breaking apart (typically along weaker bedding planes). In these cases, sensitivity analysis and engineering judgement are required during design to account for the fact that the range in the data may not capture the minimum values.

When in situ and laboratory methods are utilized to measure soil and rock attributes, the inherent variability along with measurement error typically lead to data scatter. Measurement error may result from equipment errors and procedural or operator errors. Measurement error is minimized through equipment calibration, standardized procedures, laboratory accreditation, etc. The relevant equipment and procedural details for this project are summarized in Volume 1 – Factual Geotechnical Data Report.

[5] Phoon, K.-K. and Kulhawy, F.H. (1999). Characterization of geotechnical variability. Can. Geotech. J. **36**: 612-724.

In situ and laboratory methods are also subject to statistical uncertainty, which may be reduced by increasing the sampling frequency. Further, certain in situ and laboratory measurements are transformed for design purposes, through empirical or other correlation methods (another source of uncertainty). In some cases, there may be an insufficient number of data points to derive a representative understanding of the true statistical variability.

In the context of the present geotechnical investigation, geotechnical variability and uncertainty are addressed by a two-pronged approach:

8) Reduction in uncertainty through use of reliable, calibrated equipment, precision in measurement and testing procedures and sufficient quantity of sampling/testing. (See Volume 1 – Factual Geotechnical Data Report for details).

9) Consideration of total variability associated with each geotechnical property/parameter, including evaluation of statistical parameters (minimum, maximum, mean, standard deviation) and identification of sources of uncertainty particular to each property/parameter.

The following subsections present the geotechnical design parameters for soil and rock based on the Phase 1 geotechnical investigation and discuss the main sources of geotechnical uncertainty affecting these parameters.

5.2 Soil Parameters

5.2.1 Basic Material Characteristics

Based on the results of the Phase 1 geotechnical investigation, summaries of the water content, particle size distribution, Atterberg limits, organic content, specific gravity, and unit weight results from laboratory testing are presented by stratigraphic unit in Tables 5-1 to 5-7, below. Particle size distribution and Atterberg limits results are also presented in Appendix B, grouped by stratigraphic soil unit. Plots of the unit weight and energy corrected SPT ‘N’ values (i.e., ‘N_{60}’ values) with depth, as determined by laboratory and in situ testing, are presented by stratigraphic unit (excluding Unit 1) in Appendix N.

From Tables 5-1 to 5-7 and the plots in Appendix B, the water content, particle size distribution, Atterberg limits, organic content, and specific gravity show reasonable agreement within the respective stratigraphic units. Variation of particle size distribution and organic content are observed in Unit 1 (fill/topsoil), which may be expected in fill materials. Unit 4a (intermediate glaciolacustrine deposits) also exhibits variation in the particle size distribution, as several gradations are noticeably coarser. The present data set indicates that such variation in gradation of Unit 4a is localized (not representative of the overall unit).

The unit weight values for each stratigraphic unit are determined by the following approaches:

- Direct measurement of unit weight in the laboratory;
- Calculation from measurement of specific gravity and water content in the laboratory, assuming fully saturated conditions; and,
- Inference from CPT cone tip pressure and sleeve friction ratio.

As shown in the relevant plots in Appendix N, the different approaches for determining the soil unit weight yield varying results. This variation is attributed to the inherent assumptions and limitations of each approach and as such, judgement should be used in considering these data. These limitations include the following:

- Direct measurement of bulk unit weight in the laboratory is sensitive to the inclusion of gravel in the specimen soil matrix. Large gravel particles within a specimen may yield greater unit weight values in the laboratory than would be considered representative of in situ conditions.
- Calculation of the saturated unit weight based on the laboratory water content relies on a representative water content value. The laboratory-measured water content of coarse-grained material tends to underrepresent the moisture content in situ (resulting in greater calculated unit weights).
- Inferring the unit weight from CPT may allow for general observations of soil properties, but direct application of values by this inferred method is not recommended.

Table 5-1: Summary of Soils Laboratory Index Testing, Unit 1

Stratigraphic Unit	Statistical Parameter	Laboratory Testing Results										
		Water Content (%)	Particle Size Distribution				Atterberg Limits		Organic Content (%)	Specific Gravity	Unit Weight[(a)] (kN/m^3)	
			Gravel (%)	Sand (%)	Silt-Sized (%)	Clay-Sized (%)	Liquid Limit	Plasticity Index			Dry	Bulk
Unit 1 – Topsoil/Fill	Minimum	0.7	1	19	8	2	25	11	0.4	–	16.9	17.9
	Maximum	33.9	51	56	56	29	26	12	7.0	–	21.9	24.0
	Mean	9.0	19	41	30	10	26	12	1.7	–	19.0	21.0

	No. Tests	160	54				47		0	4	14	14

(a) For Unit 5, three (3) out of 50 tested samples were reported by the laboratory as non-plastic.
(b) Bulk unit weight measured directly in the laboratory. Dry unit weight calculated from bulk unit weight and laboratory water content.
– Indicates no data.

5.2.2 Hydraulic and Volume Change Behaviour

Hydraulic Parameters

The hydraulic parameters of the soils encountered in the Phase 1 geotechnical investigation were characterized using the following methodologies:

- Laboratory determination of vertical hydraulic conductivity by one-dimensional consolidation testing on intact Shelby tube and sonic soil core samples;
- Laboratory determination of vertical hydraulic conductivity by flexible wall permeameter testing on intact sonic soil core samples;
- In situ determination of horizontal hydraulic conductivity by porewater pressure dissipation testing (during CPT);
- In situ determination of bulk hydraulic conductivity by single well response testing (rising head and falling head tests);
- Laboratory determination of reconstituted/remoulded hydraulic conductivity by flexible or rigid wall permeameter testing on reconstituted/remoulded sonic soil core samples; and
- Inference of horizontal hydraulic conductivity from CPT sounding data based on soil behaviour type.

Based on the results of the Phase 1 geotechnical investigation, summaries of the hydraulic conductivity values (vertical, horizontal, reconstituted/remoulded, and bulk) estimated from laboratory and in situ testing are presented for Units 2a, 3, 4a, 4b and 5 in Table 5-8 through Table 5-12. Appendix N includes plots of hydraulic conductivity (determined by various methods) with depth for each stratigraphic unit.

Note that no direct measurements of hydraulic behaviour were obtained in Unit 2b.

Table 5-8: Summary of Hydraulic Conductivity from Laboratory and In Situ Testing, Unit 2a

Stratigraphic Unit	Statistical Parameter	Hydraulic Conductivity (cm/s)				
		Vertical[(a)], from one-dimensional consolidation testing	**Vertical,** from permeameter testing	**Horizontal**[(b)], from CPT dissipation testing	**Bulk,** from single-well response testing	**Reconstituted/ Remoulded**, from permeameter testing
Unit 2a – Surficial Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay	Minimum	2×10^{-8}	1×10^{-7}	2×10^{-7}	–	–
	Maximum	1×10^{-7}		5×10^{-6}	–	–
	Geometric Mean	4×10^{-8}		1×10^{-6}	–	–
	Std Dev	4×10^{-8}	–	2×10^{-6}	–	–
	No. Tests	7	1	18	0	0

Std Dev = standard deviation (from geometric mean); – = no data.
(a) Vertical hydraulic conductivity from one-dimensional consolidation testing taken at a stress level of 100 kPa in excess of the estimated in situ vertical effective stress for each test specimen.
(b) Horizontal hydraulic conductivity from CPT porewater pressure dissipation testing calculated using the coefficient of volume compressibility estimated from laboratory consolidation testing.

Table 5-9: Summary of Hydraulic Conductivity from Laboratory and In Situ Testing, Unit 3

Stratigraphic Unit	Statistical Parameter	Hydraulic Conductivity (cm/s)				
		Vertical, from one-dimensional consolidation testing	**Vertical,** from permeameter testing	**Horizontal,** from CPT dissipation testing	**Bulk,** from single-well response testing	**Reconstituted/ Remoulded**[(a)], from permeameter testing
Unit 3 – Upper Till	Minimum	–	–	–	1×10^{-6}	9×10^{-8}
	Maximum	–	–	–	2×10^{-4}	
	Geometric Mean	–	–	–	7×10^{-6}	
	Std Dev	–	–	–	7×10^{-5}	–
	No. Tests	0	0	0	10	1

Std Dev = standard deviation (from geometric mean); – = no data.
(a) Laboratory specimen reconstituted/remoulded to approximate dry density of 23 kN/m^3 and approximate water content of 7%.

Unit 5 – Lower Till	Minimum	5×10^{-9}	1×10^{-8}	–	3×10^{-7}	1×10^{-8}
	Maximum	8×10^{-9}		–	1×10^{-4}	
	Geometric Mean	7×10^{-9}		–	2×10^{-5}	
	Std Dev	2×10^{-8} [(c)]	–	–	5×10^{-5}	–
	No. Tests	2	1	0	12	1

Std Dev = standard deviation (from geometric mean); – = no data.
(a) Vertical hydraulic conductivity from one-dimensional consolidation testing taken at a stress level of 100 kPa in excess of the estimated in situ vertical effective stress for each test specimen.
(b) Laboratory specimen reconstituted/remoulded to approximate dry density of 21 kN/m^3 and approximate water content of 7%.
(c) Due to only 2 data points, the standard deviation may not be statistically valid.

The following provides a discussion of the hydraulic conductivity results from the various test methods utilized for the subsurface investigation. The hydraulic conductivity results relate to the specific soil sample and borehole depth or screened interval that was tested, and results will vary between and beyond the tested depths and locations. The following general discussion is provided:

- Differences between vertical and horizontal hydraulic conductivity are expected in glaciolacustrine units which are generally deposited in thin horizontal or sub-horizontal layers of varying grain size distribution (e.g., layers of sand, silt, and clay). This typically results in vertical hydraulic conductivity that is usually one or more orders of magnitude lower than horizontal hydraulic conductivity. Variability is also expected in the matrix of glacial till deposits which can contain zones of differing grain size distribution (e.g., zones with relatively fewer fines), and also lenses or pockets of coarser- or finer-grained soils.
- Within the same unit, hydraulic conductivity can vary laterally and vertically in response to the variability of grain size distribution within the unit, especially the fines content. Hydraulic conductivity also typically decreases with depth in the near-surface environment due to soil structure and secondary permeability caused by frost action, fractures, joints, roots and root holes and other near-surface processes.
- Differences in laboratory test results are expected to vary depending on the method used for the permeability test. Laboratory tests of sonic soil cores oriented in the permeameter as they were oriented in situ will estimate vertical hydraulic conductivity, while the remoulding or reconstituting of soil samples in the lab deteriorates or removes the native soil fabric and its orientation, soil structure, and secondary permeability, which typically decreases hydraulic conductivity. Laboratory test results are highly dependent on the remoulded/reconstituted density that is achieved (i.e., hydraulic conductivity decreases with the amount of compaction/compression that is achieved). Fine-grained soils tend to be more affected by remoulding than coarse-grained soils, particularly those that are free-draining (i.e., contain 4% or less fines). Also, the re-saturation of remoulded/reconstituted soil samples can result in entrapped air in the void spaces between soil grains, blocking the flow of the permeant water, and resulting in a reduction in hydraulic conductivity on the order of half an order of magnitude.

The following discussion is provided for the results presented in the tables above for each stratigraphic unit:

Unit 2a – Surficial Glaciolacustrine Deposits

The estimated minimum, maximum and geometric mean vertical hydraulic conductivity values were about one to one and a half orders of magnitude lower than the corresponding horizontal hydraulic conductivity values, which is reasonable for glaciolacustrine deposits. The vertical hydraulic conductivity values estimated by the laboratory and one-dimensional consolidation testing methods are within an order of magnitude and show good correlation.

Unit 3 – Upper Till

The estimated bulk hydraulic conductivity of the Upper Till (Unit 3) ranged by two orders of magnitude and is within the range of values expected for glacial till. These results are reasonable given the likely variability in grain size distribution of the till matrix and variability in the degree of secondary permeability at the tested locations. The reconstituted/remoulded hydraulic conductivity result from the laboratory is about two orders of magnitude lower than the geometric mean bulk hydraulic conductivity, which is reasonable given the reconstituting/remoulding process for a fine-grained soil material.

Unit 4a – Intermediate Glaciolacustrine

The estimated bulk hydraulic conductivity values for the Intermediate Glaciolacustrine silty sand to sandy silt deposits (Unit 4a) were within one order of magnitude and show good correlation. The reconstituted hydraulic conductivity value is approximately one order of magnitude higher than estimated from the single-well response tests and is reasonably attributed to the soil sample having fewer fines than the zones that were screened in the monitoring wells.

Unit 4b – Intermediate Glaciolacustrine

The estimated vertical hydraulic conductivity value for the Intermediate Glaciolacustrine clay deposits (Unit 4b) using the laboratory permeameter was about half an order of magnitude higher than the geometric mean of the one-dimensional consolidation test results which shows reasonable correlation.

Unit 5 – Lower Till

The estimated bulk hydraulic conductivity values for the Lower Till varied by about three orders of magnitude. The higher hydraulic conductivity values may suggest the hydraulic response of sandy zones or layers within, above or below the till, but within the screened interval of the tested monitoring wells. For example, the higher hydraulic conductivity ($1x10^{-4}$ cm/s) estimated at BH-78 may relate to the 0.7-m thick wet zone (e.g., potentially containing few fines) identified within the screened interval. The geometric mean and minimum bulk hydraulic conductivity values are reasonable for glacial till. The reconstituted/remoulded hydraulic conductivity result from the laboratory is about one order of magnitude lower than the minimum bulk hydraulic conductivity value, which is reasonable given the remolding process for a fine-grained soil material. The reconstituted/remoulded hydraulic conductivity result from the laboratory is similar to the vertical hydraulic conductivity test results from the laboratory and within half an order of magnitude of the geometric mean vertical hydraulic conductivity value estimated by the one-dimensional consolidation testing method, both of which are reasonable given the remoulding process for fine-grained soil material.

Consolidation Parameters

Summaries of the consolidation parameters from laboratory testing are presented for Unit 2a, Unit 4b, and Unit 5 in Table 5-13, Table 5-14, and Table 5-15 respectively. Plots of the coefficient of consolidation and overconsolidation ratio with depth, as determined by laboratory and in situ testing, are presented for Unit 2a, Unit 4b, and Unit 5 in Appendix N.

Table 5-13: Summary of Consolidation Parameters from Laboratory Testing, Unit 2a

Stratigraphic Unit	Statistical Parameter	Overconsolidation Ratio[a]		Coefficient of Vertical Consolidation[b] (cm^2/s)	Compression Ratio	Compression Index
		Casagrande Method	Work Method			
Unit 2a – Surficial Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay	Minimum	1.8	2.7	9.0×10^{-4}	0.15	0.10
	Maximum	20.6	20.8	4.2×10^{-3}	0.25	0.15
	Mean[c]	7.1	7.7	1.7×10^{-3}	0.19	0.11
	Std Dev	6.8	6.5	1.9×10^{-3}	0.04	0.02
	No. Tests	7				

(a) Summary considers average overconsolidation ratio value determined by a given method for each interpreted test specimen.
(b) Coefficient of vertical consolidation taken at a stress level of 100 kPa in excess of the estimated in situ vertical effective stress for each interpreted test specimen
(c) Geometric mean provided for coefficient of vertical consolidation; arithmetic mean provided for all other parameters.
Std Dev = standard deviation (from arithmetic or geometric mean).

Table 5-14: Summary of Consolidation Parameters from Laboratory Testing, Unit 4b

Stratigraphic Unit	Statistical Parameter	Overconsolidation Ratio[a]		Coefficient of Vertical Consolidation[b] (cm^2/s)	Compression Ratio	Compression Index
		Casagrande Method	Work Method			
Unit 4b – Intermediate Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay	Minimum	1.5	1.7	9.1×10^{-4}	0.14	0.09
	Maximum	2.1	2.6	2.0×10^{-3}	0.23	0.13
	Mean[c]	1.8	2.2	1.3×10^{-3}	0.19	0.11
	Std Dev	0.4	0.7	4.1×10^{-3}	0.06	0.03
	No. Tests	2				

(a) Summary considers average overconsolidation ratio value determined by a given method for each interpreted test specimen.
(b) Coefficient of vertical consolidation taken at a stress level of 100 kPa in excess of the estimated in situ vertical effective stress for each interpreted test specimen.
(c) Geometric mean provided for coefficient of vertical consolidation; arithmetic mean provided for all other parameters. Std Dev = standard deviation (from arithmetic or geometric mean).

Table 5-15: Summary of Consolidation Parameters from Laboratory Testing, Unit 5

Stratigraphic Unit	Statistical Parameter	Overconsolidation Ratio[a]		Coefficient of Vertical Consolidation[b] (cm^2/s)	Compression Ratio	Compression Index
		Casagrande Method	Work Method			
Unit 5 – Lower Till	Minimum	1.3	1.8	1.1×10^{-3}	0.06	0.04
	Maximum	1.8	1.9	1.4×10^{-3}	0.06	0.05
	Mean[c]	1.6	1.8	1.3×10^{-3}	0.06	0.05
	Std Dev[d]	0.3	0.0	3.8×10^{-3}	0.00	0.00
	No. Tests	2				

(a) Summary considers average overconsolidation ratio value determined by a given method for each interpreted test specimen.
(b) Coefficient of vertical consolidation taken at a stress level of 100 kPa in excess of the estimated in situ vertical effective stress for each interpreted test specimen.
(c) Geometric mean provided for coefficient of vertical consolidation; arithmetic mean provided for all other parameters. Std Dev = standard deviation (from arithmetic or geometric mean).
(d) It should be noted that, although theoretically valid, statistical data may not be truly representative of a larger sample population when only two data points are available for analysis, particularly when the resultant yields a standard deviation of zero.

Coefficient of Lateral Earth Pressure at Rest

Based on the results of the Phase 1 geotechnical investigation, the coefficient of lateral earth pressure at rest (K_0) as determined by laboratory and in situ testing is presented by stratigraphic unit in Table 5-16 through Table 5-21. Plots of K_0 with depth are also presented in Appendix N, by stratigraphic soil unit (excluding Unit 1).

Table 5-16: Summary of Coefficient of Lateral Earth Pressure at Rest from Laboratory and In Situ Testing, Unit 2a

Stratigraphic Unit	Statistical Parameter	Coefficient of Lateral Earth Pressure at Rest	
		From Triaxial Compression Testing[(a)]	From Pressuremeter Testing
Unit 2a – Surficial Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay	Minimum	0.41	0.65
	Maximum	0.95	0.68
	Mean	0.61	0.67
	Std Dev	0.19	0.02
	No. Tests	9	2

Std Dev = standard deviation; – = no data.
(a) Coefficient of lateral earth pressure at rest interpreted from consolidated undrained triaxial testing, where specimen consolidated to approximate in situ vertical effective stress under no lateral strain conditions (i.e., K_0-consolidation). Effects of specimen creep, if observed at the end of consolidation, were excluded from determination of K_0.

Table 5-17: Summary of Coefficient of Lateral Earth Pressure at Rest from Laboratory and In Situ Testing, Unit 2b

Stratigraphic Unit	Statistical Parameter	Coefficient of Lateral Earth Pressure at Rest	
		From Triaxial Compression Testing	From Pressuremeter Testing
Unit 2b – Surficial Glaciolacustrine Deposits – Silty Clayey Sand to Silty Sand/ Sandy Silt	Minimum	–	0.49
	Maximum	–	0.91
	Mean	–	0.73
	Std Dev	–	0.22
	No. Tests	0	3

Std Dev = standard deviation; – = no data.

Table 5-18: Summary of Coefficient of Lateral Earth Pressure at Rest from Laboratory and In Situ Testing, Unit 3

Stratigraphic Unit	Statistical Parameter	Coefficient of Lateral Earth Pressure at Rest	
		From Triaxial Compression Testing	From Pressuremeter Testing
Unit 3 – Upper Till	Minimum	–	0.53
	Maximum	–	1.02
	Mean	–	0.69
	Std Dev	–	0.16
	No. Tests	0	11

Std Dev = standard deviation; – = no data.

Table 5-19: Summary of Coefficient of Lateral Earth Pressure at Rest from Laboratory and In Situ Testing, Unit 4a

Stratigraphic Unit	Statistical Parameter	Coefficient of Lateral Earth Pressure at Rest	
		From Triaxial Compression Testing	From Pressuremeter Testing
Unit 4a – Intermediate Glaciolacustrine Deposits – Silty Sand to Sandy Silt	Minimum	–	0.42
	Maximum	–	0.73
	Mean	–	0.57
	Std Dev	–	0.09
	No. Tests	0	17

Std Dev = standard deviation; – = no data.

Table 5-20: Summary of Coefficient of Lateral Earth Pressure at Rest from Laboratory and In Situ Testing, Unit 4b

Stratigraphic Unit	Statistical Parameter	Coefficient of Lateral Earth Pressure at Rest	
		From Triaxial Compression Testing[(a)]	From Pressuremeter Testing
Unit 4b – Intermediate Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay	Minimum	0.43	0.34
	Maximum	1.15	0.70
	Mean	0.83	0.53
	Std Dev	0.28	0.13
	No. Tests	6	7

Std Dev = standard deviation; – = no data.
(a) Coefficient of lateral earth pressure at rest interpreted from consolidated undrained triaxial testing, where specimen consolidated to approximate in situ vertical effective stress under no lateral strain conditions (i.e., K_0-consolidation). Effects of specimen creep, if observed at the end of consolidation, were excluded from determination of K_0.

Table 5-21: Summary of Coefficient of Lateral Earth Pressure at Rest from Laboratory and In Situ Testing, Unit 5

Stratigraphic Unit	Statistical Parameter	Coefficient of Lateral Earth Pressure at Rest	
		From Triaxial Compression Testing[(a)]	From Pressuremeter Testing
Unit 5 – Lower Till	Minimum	0.39	0.39
	Maximum	0.74	0.58
	Mean	0.58	0.49
	Std Dev	0.15	0.07
	No. Tests	6	10

Std Dev = standard deviation; – = no data.
(a) Coefficient of lateral earth pressure at rest interpreted from consolidated undrained triaxial testing, where specimen consolidated to approximate in situ vertical effective stress under no lateral strain conditions (i.e., K_0-consolidation). Effects of specimen creep, if observed at the end of consolidation, were excluded from determination of K_0.

Effective Friction Angle

Based on the results of the Phase 1 geotechnical investigation, the effective friction angle (Φ'), as determined by laboratory and in situ testing, is presented by stratigraphic unit in Table 5-22 through Table 5-27. Plots of effective friction angle with depth (as well as effective friction angles obtained from CPT soundings which terminated upon reaching or slightly penetrating Unit 3) are also presented in Appendix N, by stratigraphic soil unit (excluding Unit1).

Table 5-22: Summary of Effective Friction Angle from Laboratory and In Situ Testing, Unit 2a

Stratigraphic Unit	Statistical Parameter	Effective Friction Angle	
		From Triaxial Compression Testing[(a)]	From Pressuremeter Testing
Unit 2a – Surficial Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay	Minimum	25	-
	Maximum	37	-
	Mean	32	-
	Std Dev	3.89	-
	No. Tests	9	0

Std Dev = standard deviation; – = no data.
(a) Effective Friction Angle interpreted from a set of two to three consolidated undrained triaxial tests, where specimen consolidated to approximate in situ vertical effective stress under no lateral strain conditions (i.e., K_0-consolidation) or consolidated drained triaxial testing, where the specimen consolidated anisotropically to the approximate in situ vertical effective stress.

Table 5-23: Summary of Effective Friction Angle from Laboratory and In Situ Testing, Unit 2b

Stratigraphic Unit	Statistical Parameter	Effective Friction Angle	
		From Triaxial Compression Testing[(a)]	From Pressuremeter Testing
Unit 2b – Surficial Glaciolacustrine Deposits – Silty Clayey Sand to Silty Sand/ Sandy Silt	Minimum	–	29
	Maximum	–	41[(b)]
	Mean	–	34
	Std Dev	–	4.04
	No. Tests	0	6

Std Dev = standard deviation; – = no data.
(a) Effective Friction Angle interpreted from a set of two to three consolidated undrained triaxial testing, where specimen consolidated to approximate in situ vertical effective stress under no lateral strain conditions (i.e., K_0-consolidation) or consolidated drained triaxial testing, where the specimen consolidated anisotropically to the approximate in situ vertical effective stress.
(b) Pressuremeter probe likely straddled Unit 2b and Unit 3 at some locations.

Table 5-24: Summary of Effective Friction Angle from Laboratory and In Situ Testing , Unit 3

Stratigraphic Unit	Statistical Parameter	Effective Friction Angle	
		From Triaxial Compression Testing	From Pressuremeter Testing
Unit 3 – Upper Till	Minimum	36	31
	Maximum	38	48
	Mean	37	41
	Std Dev	1.15	4.66
	No. Tests	3	12

Std Dev = standard deviation; – = no data.
(a) Effective Friction Angle interpreted from a set of two to three consolidated undrained triaxial testing, where specimen consolidated to approximate in situ vertical effective stress under no lateral strain conditions (i.e., K_0-consolidation) or consolidated drained triaxial testing, where the specimen consolidated anisotropically to the approximate in situ vertical effective stress.

Table 5-25: Summary of Effective Friction Angle from Laboratory and In Situ Testing, Unit 4a

Stratigraphic Unit	Statistical Parameter	Effective Friction Angle	
		From Triaxial Compression Testing	From Pressuremeter Testing
Unit 4a – Intermediate Glaciolacustrine Deposits – Silty Sand to Sandy Silt	Minimum	39	35
	Maximum	41	45
	Mean	40	39
	Std Dev	1	2.85
	No. Tests	3	16

Std Dev = standard deviation; – = no data.
(a) Effective Friction Angle interpreted from a set of two to three consolidated undrained triaxial testing, where specimen consolidated to approximate in situ vertical effective stress under no lateral strain conditions (i.e., K_0-consolidation) or consolidated drained triaxial testing, where the specimen consolidated anisotropically to the approximate in situ vertical effective stress.

Table 5-26: Summary of Effective Friction Angle from Laboratory and In Situ Testing, Unit 4b

Stratigraphic Unit	Statistical Parameter	Effective Friction Angle	
		From Triaxial Compression Testing[(a)]	From Pressuremeter Testing
Unit 4b – Intermediate Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay	Minimum	30	29
	Maximum		42
	Mean		34
	Std Dev	-	4.53
	No. Tests	1[(a)]	8

Std Dev = standard deviation; – = no data.
(a) Effective Friction Angle interpreted from a set of two consolidated undrained triaxial tests on Unit 4b, where specimen consolidated to approximate in situ vertical effective stress under no lateral strain conditions (i.e., K_0-consolidation) yielded an effective friction angle of 30°.

Table 5-27: Summary of Coefficient of Effective Friction Angle from Laboratory and In Situ Testing, Unit 5

Stratigraphic Unit	Statistical Parameter	Effective Friction Angle	
		From Triaxial Compression Testing[(a)]	From Pressuremeter Testing
Unit 5 – Lower Till	Minimum	32	26
	Maximum	38	36
	Mean	35	31
	Std Dev	3	3.23
	No. Tests	3	10

Std Dev = standard deviation; – = no data.
(a) Effective Friction Angle interpreted from a set of two to three consolidated undrained triaxial testing, where specimen consolidated to approximate in situ vertical effective stress under no lateral strain conditions (i.e., K_0-consolidation) or consolidated drained triaxial testing, where the specimen consolidated anisotropically to the approximate in situ vertical effective stress.

5.2.3 Shear Strength and Deformation Behaviour

Based on the results of the Phase 1 geotechnical investigation, shear strength and deformation parameters are summarized, as follows:

- Undrained shear strength, as determined by various laboratory and in situ testing methods, is plotted with depth in Appendix N for Unit 2a, Unit 4b, and Unit 5;
- Undrained shear strength ratio, determined from triaxial compression testing and direct simple shear testing, is provided in Table 5-28 for Unit 2a, in Table 5-29 for Unit 4b and in Table 5-30, for Unit 5;
- Effective friction angle and effective cohesion intercept from triaxial compression testing, inferred from pressuremeter testing, and inferred from CPT (where data available), are plotted with depth in Appendix N for Unit 2a, Unit 4b, and Unit 5;
- Effective friction angle (assuming cohesion intercept of zero) from triaxial compression testing, inferred from pressuremeter testing, and inferred from CPT (where data available), is plotted with depth in Appendix N for Unit 2b, Unit 3, and Unit 4a;
- Elastic moduli for different strain levels, as determined by various laboratory and in situ testing methods (and published correlations), are plotted with depth in Appendix N for each stratigraphic soil unit (excluding Unit 1); and,
- Initial tangent elastic modulus from triaxial compression testing and Young's modulus from pressuremeter testing are provided Appendix N for all stratigraphic soil units (excluding Unit 1).

The shear strength and deformation parameters presented herein are considered reasonable in magnitude and variability for the subsurface conditions encountered in the Phase 1 investigation. The following should be considered when selecting strength and deformation material parameters for use in design:

- The glacially-derived subsurface materials at site (particularly the tills and lower glaciolacustrine materials) are highly variable, ranging from fine-grained to coarse-grained material, and ranging from non-cohesive to cohesive behaviour. While geotechnical strength and deformation parameters are commonly understood

within the framework of either undrained or drained conditions, it should be recognized that the in situ materials at the site may not be expected to behave conformably as either undrained or drained.

- Sampling of stiff to hard cohesive materials was generally by sonic coring. While this sampling method may produce “intact” samples, such samples cannot be considered “undisturbed.” More or less disturbance is typically observed depending on the specific drilling conditions and characteristics of the material encountered. Sonic core samples from Units 4b and 5 were typically observed to be more susceptible to sample disturbance than sonic core samples from the other subsurface soil units.
- Consolidated anisotropic drained triaxial laboratory specimens were reconstituted and consolidated to the approximate in situ density and vertical effective stress. However, these reconstituted specimens do not replicate the soil particle fabric and stress history present in situ. Testing results on reconstituted specimens may not be representative of in situ material behaviour.
- Intact laboratory specimens were selected to obtain a reasonable representation of the range of subsurface conditions encountered. However, there remains a potential for sample bias to occur. Intact laboratory specimens selected for testing may be inherently biased towards samples exhibiting greater cohesion and samples excluding larger particles present in situ (e.g., oversized gravels). (i.e., It is more likely that finer-grained, more cohesive materials would provide intact specimens suitable for testing.) Similarly, reconstituted laboratory specimens may be biased towards excluding larger particles.
- Stress-strain modulus values correlated from undrained shear strength and/or SPT N values (from Bowles, 1997)[6] are provided on the plots in Appendix N. These correlated values may be considered as an indicators of material behaviour, but they are not intended to be used directly in design.

Table 5-28: Summary of Undrained Shear Strength Ratio from Laboratory Testing, Unit 2a

Stratigraphic Unit	Statistical Parameter	Undrained Shear Strength Ratio (kPa)	
		From Triaxial Compression Testing[(a)]	From Direct Simple Shear Testing[(b)]
Unit 2a – Surficial Glaciolacustrine Deposits – Sandy Lean Clay to Lean Clay	Minimum	0.55	0.37
	Maximum	1.35	1.40
	Mean	0.78	0.95
	Std Dev	0.25	0.34
	No. Tests	9	6

(a) Undrained shear strength ratio interpreted from consolidated undrained triaxial testing representative of in situ conditions (i.e., where specimen consolidated to approximate in situ vertical effective stress, typically under K_0-conditions.)
(b) Undrained shear strength interpreted from direct simple shear testing representative of in situ conditions (i.e., where specimen consolidated to approximate in situ preconsolidation pressure, then unloaded to approximate in situ vertical effective stress for shearing stage.
Std Dev = standard deviation;
– = no data.

Std Dev = standard deviation; – = no data.

5.2.4 Dynamic Behaviour

The dynamic material parameters in soil from geophysical testing completed as part of the Phase 1 investigation are summarized below in Table 5-37 to Table 5-41. The velocities generally increase with depth through the soil layer as seen in Figure 5-2, below. The dynamic properties through the soil have been calculated in 1 m intervals for each borehole and are shown in Appendix F.

The variability for VSP will be affected by the surface conditions at the time of data acquisition. If the seismic source is hitting a wet or dry surface, rock, compact soil, or soft soil will all have an effect on the data. Variability will also arise from the first arrival picking of the seismic data which would as a result effect the velocity values.

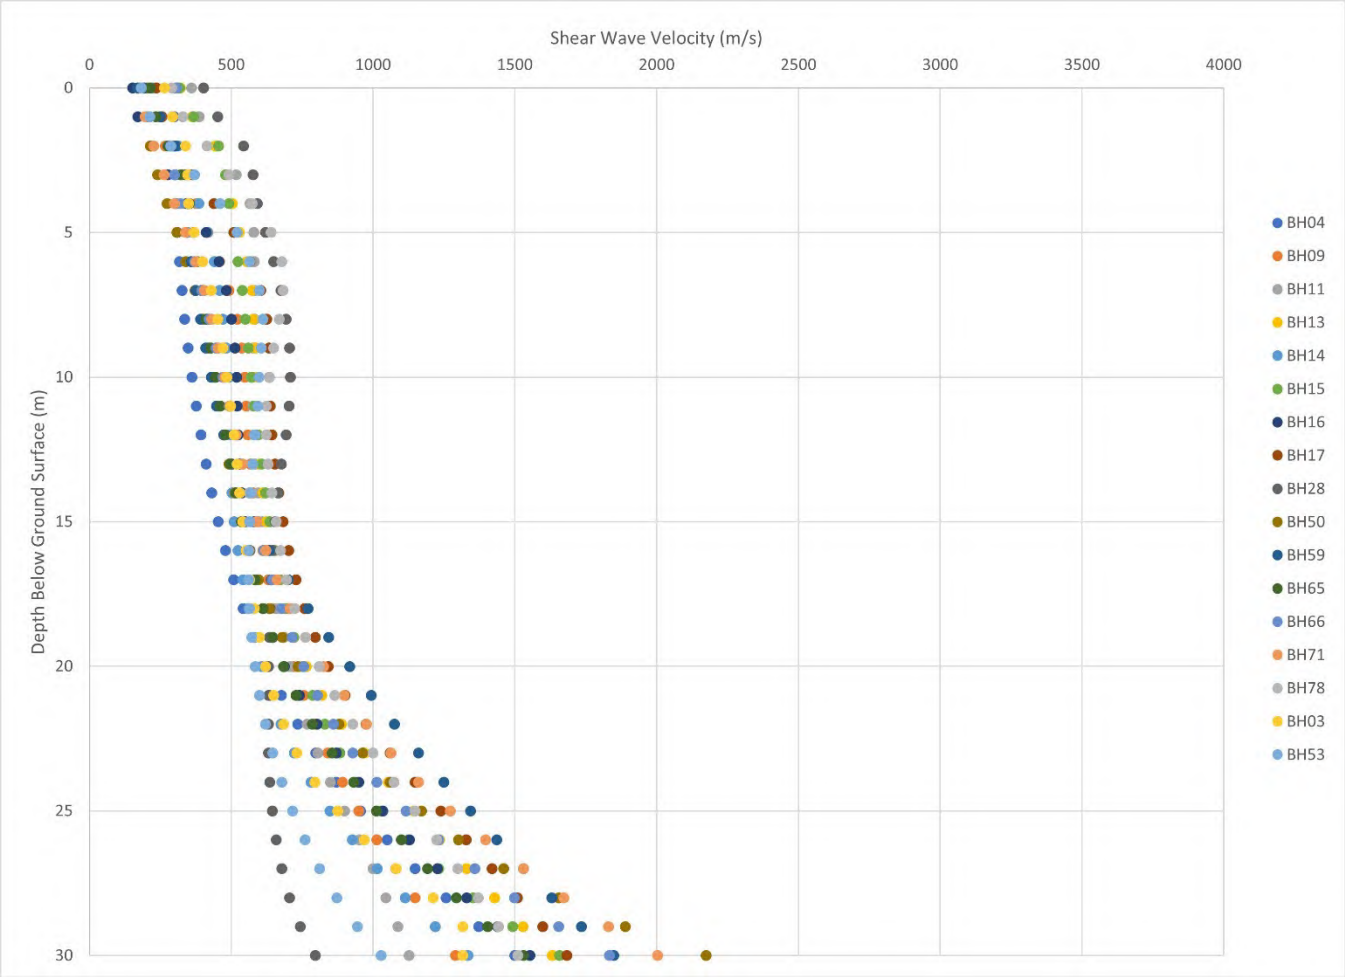

Figure 5-2: VSP Measured Shear Wave Velocities

Table 5-37: Summary of Shear and Compression Wave Velocities from Geophysical Testing, by Stratigraphic Soil Unit

Subsurface Unit	Shear Wave Velocity (m/s)				Compression Wave Velocity (m/s)			
	Minimum	Maximum	Mean	Std Dev	Minimum	Maximum	Mean	Std Dev
Unit 1 – Topsoil/Fill	152	443	266	72	370	1,400	607	135

5.3 Bedrock Parameters

5.3.1 Basic Material Characteristics

Bulk Density

Based on the results of the Phase 1 geotechnical investigation presented in Volume 1 – Factual Geotechnical Data Report, summaries of the bulk density results from laboratory testing (UCS and triaxial testing) are presented by stratigraphic unit in Table 5-42.

Table 5-42: Summary of Bulk Density Test Results by Stratigraphic Rock Unit

Stratigraphic Unit	Bulk Density (kg/m^3)			
	Min	Max	Mean	Std Dev
Unit 6a – Blue Mountain Formation	2543	2681	2641	38.6
Unit 6b – Lindsay Formation	2650	2695	2681	13.5
Unit 6c – Verulam Formation	2657	2726	2679	19.5

Note: Std Dev = Standard Deviation; Mean values are arithmetic.

Rock Quality Designation

The rock quality designation (RQD) values of the bedrock units at the DNNP site are generally high to very high. The Blue Mountain Formation is more weathered and has lower average RQD values compared to the other rock units. Table 5-43 summarizes the range and average RQD values for the borehole logging conducted during the investigation.

Table 5-43: Summary of Rock Quality Designation Summary, by Stratigraphic Rock Unit

Stratigraphic Unit	Minimum (%)	Maximum (%)	Mean (%)
Unit 6a – Blue Mountain	0	100	85
Unit 6b – Lindsay	76	100	100
Unit 6c – Verulam	91	100	100

Note: Mean values are arithmetic.

Slake Durability

Slake durability testing was conducted on the Blue Mountain Formation shale and the results are summarized in Table 5-44. The percent retained (slake durability index) after two wetting/drying cycles is shown in the table.

Table 5-44: Summary of Slake Durability Results, Blue Mountain Shale (Unit 6a)

Moisture Content (%)			Slake Durability Index, I_{d1}			Slake Durability Index , I_{d2}			No. Tests
Min	Max	Mean	Min	Max	Mean	Min	Max	Mean	
0.80	1.62	1.08	99.39	99.67	99.57	98.92	99.43	99.30	12

Note: Mean values are arithmetic.

Bedrock Discontinuity

Structural data was collected in the boreholes using both the acoustic and optical televiewer surveys in each borehole. A total of eleven (11) boreholes were surveyed, resulting in 5,353 measured features. The televiewer data provides information on the dip and dip direction of borehole features within the surveyed hole, as well as the type of feature encountered. Types of features logged included Bedding, Broken Zones, Contacts, Induced Fractures, Filled Joints, Major Open Joints, Minor Open Joints, and Partially Open Joints. The structural data from the borehole televiewer surveys have been plotted as a stereographic projections (stereoplots) as shown in Appendix O. Based on the contoured stereoplots the rock mass structure from all the formations presented on the site (Blue Mountain, Lindsay, and Verulam) is dominated by near horizontal discontinuities (bedding and low angle joints). Approximately 98% of all measured features dip less than 20º. In order for the less prominent inclined joints to be more visible on the stereoplots, all bedding features and discontinuities dipping less than 35º were removed. As seen on the contoured stereoplot, a total of ten features (filled joints and partially open joints) dipping more than 35º were isolated from all the measured data. The limited amount of data for the inclined joints (i.e., joints with dip greater than 35º) is considered insufficient for proper contour plots which are intended to show all of the major joint sets present at the site and as such the results should be considered preliminary until more structural data on the inclined joints can be obtained. From the limited data obtained to date, one major sub-vertical joint set dipping south with the orientations between approximately 190º and 206º can be noted. Note that joint set dipping north with the orientations between approximately 7º and 10º appears to be a subset. Other joint sets as seen on the contoured stereoplots have inclination between approximately 38º and 49º and are dipping south and southwest to west respectively with orientations between approximately 160º and 195º and between approximately 243º and 270º respectively. Refer to Appendix O for more detailed presentation of stereographic projections of all televiewer data measured per each formation, and presentation of all joints dipping more than 35º per formation.

5.3.2 Hydraulic and Volume Change Behavior

Single-Well Response Testing

Single well response testing was carried out at the current monitoring well locations to estimate the hydraulic conductivity of the bedrock adjacent to the screened intervals. Individual test results are presented in Volume 1 – Factual Geotechnical Data Report. The data are summarized by stratigraphic unit in Table 5-45.

Table 5-45: Summary of Single Well Response Testing in Bedrock

Stratigraphic Unit		Estimated Hydraulic Conductivity from Single Well Response Testing (m/s)			
Unit No.	Description	Minimum	Maximum	Geomean	No. Tests
6a, 6b	Bedrock	1×10^{-10}	6×10^{-6}	2×10^{-8}	8

Each hydraulic conductivity estimate represents the bulk hydraulic conductivity of the bedrock within the screened interval of the monitoring well being tested, and the results are considered to be reasonable for the rock types that were tested. Further, acceptable consistency with the results estimated by the packer testing method (see below) is identified. As shown in Table 6-83, Summary of Hydraulic Conductivity Testing provided in Section 6.15.1 of Volume 1 – Factual Geotechnical Data Report, there was also acceptable consistency between the two single-well response test results at each monitoring well location.

Packer Testing

Packer testing was carried out during the field investigation to estimate the hydraulic conductivities of the rock formations. Individual test results are presented in Volume 1 – Factual Geotechnical Data Report. The data are summarized by stratigraphic unit in Table 5-46.

Table 5-46: Summary of Packer Testing in Bedrock, by Stratigraphic Rock Unit

Stratigraphic Unit	Estimated Hydraulic Conductivity from Packer Testing (m/s)		
	Minimum	Maximum	Mean
Unit 6a – Blue Mountain	2×10^{-9}	4×10^{-6}	5×10^{-7}
Unit 6b – Lindsay	5×10^{-11}	1×10^{-6}	7×10^{-8}
Unit 6c – Verulam	1×10^{-10}	9×10^{-8}	2×10^{-8}

Variability of Hydraulic Conductivity

The hydraulic conductivity estimates for the bedrock varied by four orders of magnitude. For these test results, the degree to which primary (e.g., bedding planes) and secondary (e.g., joints and fractures) permeability, and the width and extent of those joint surfaces, intersect the screened interval is expected to be the most significant influence on the hydraulic conductivity estimated at each monitoring well location.

5.3.3 Strength and Deformation Behaviour – Intact Rock

Uniaxial Compressive Strength

Rock samples from the formations observed during the drilling program were tested in the laboratory to determine the Uniaxial Compressive Strength (UCS). Twenty (20) samples from each formation were selected for UCS testing.

Table 5-47 presents the range, mean and standard deviation of the evaluated rock parameters from UCS laboratory testing.

Table 5-47: Uniaxial Compressive Strength from Laboratory Testing, by Stratigraphic Rock Unit

Stratigraphic Unit	Lithology	No. of Samples	Uniaxial Compressive Strength (MPa)			
			Min	Max	Mean	Std Dev
Unit 6a – Blue Mountain Formation	Shale	5	68.1	94.6	79.7	9.7
	Shale/Limestone	15	80.8	138.8	106.2	17.9
	Limestone	0	-	-	-	-
Unit 6b – Lindsay Formation	Shale	0	-	-	-	-
	Shale/Limestone	7	47.8	87.0	66.2	15.1
	Limestone	13	50.6	113.9	80.2	17.5
Unit 6c – Verulam Formation	Shale	1	43.7	43.7	N/A	N/A
	Shale/Limestone	16	13.6	76.0	39.0	17.8
	Limestone	3	42.1	111.5	82.0	35.9

Note: Std Dev = Standard Deviation; Mean values are arithmetic.

From the results, the Lindsay and Verulam limestone samples have similar strengths while the interbedded shale/limestone samples from these formations show variable strengths which reflects the varying amounts of shale and limestone in the samples. The Blue Mountain Formation shale samples had average strengths that were similar to the limestone of the Lindsay and Verulam Formations with a slightly lower maximum value. The interbedded samples from the Blue Mountain Formation show higher strengths than the other formations likely indicating a higher limestone strength.

Young's Modulus and Poisson's Ratio

Young's modulus and Poisson's ratio were evaluated from UCS and triaxial testing. Table 5-48 summarizes the deformation properties (Young's modulus and Poisson's ratio) by stratigraphic unit.

Table 5-48: Deformation Properties from Laboratory Testing, by Stratigraphic Rock Unit

Stratigraphic Unit	Lithology	No. of Samples	Young's Modulus (GPa)				Poisson's Ratio			
			Min	Max	Mean	Std Dev	Min	Max	Mean	Std Dev
Unit 6a – Blue Mountain Formation	Shale	3	17.5	21.6	19.0	2.3	0.28	0.36	0.32	0.04
	Shale/Limestone	9	17.1	49.3	29.1	9.9	0.17	0.44	0.28	0.09
	Limestone	0	-	-	-	-	-	-	-	-
Unit 6b – Lindsay Formation	Shale	0	-	-	-	-	-	-	-	-
	Shale/Limestone	29	22.1	72.3	46.2	12.3	0.15	0.43	0.22	0.06
	Limestone	13	26.7	49.1	33.5	7.4	0.28	0.50	0.36	0.06
Unit 6c – Verulam Formation	Shale	1	(-)	(-)	17.1	-	(-)	(-)	0.21	-
	Shale/Limestone	8	8.3	43.8	22.3	14.0	0.09	0.45	0.29	0.11
	Limestone	1	(-)	(-)	54.8	-	(-)	(-)	0.25	-

Note: (-) Minimum and Maximum values not applicable, only one sample available. Mean values are arithmetic.

5.3.4 Strength and Deformation Behaviour – Rock Mass

Shear Strength

The results for the direct shear tests on bedding and inclined joints are presented in Volume 1 – Factual Geotechnical Data Report. Table 5-49 below summarizes the interpreted friction angle for each rock formation from the tests assuming no cohesion along the open joints and using a best fit trendline on a plot of normal stress and peak shear stress.

Table 5-49: Interpreted Friction Angle for Bedding and Inclined Joints by Bedrock Formation

Stratigraphic Unit	Formation	Joint Type	Friction Angle[(a)] (degrees)
Unit 6a	Blue Mountain	Bedding	35
		Inclined Joint	37
Unit 6b	Lindsay	Bedding	43
		Inclined Joint	47
Unit 6c	Verulam	Bedding	33
		Inclined Joint	(-)

Note: Friction angle is calculated assuming no cohesion across the rock joints.
(-) No direct shear tests were carried out on inclined joints in the Verulam formation.

Normal and Shear Joint Stiffness

The shear stiffness was calculated from the direct shear tests using the shear load versus shear displacement plots. Table 5-50 presents the shear stiffness values for each bedrock formation obtained from the both the direct shear and the direct shear creep testing.

Table 5-50: Summary of Joint Shear Stiffness by Bedrock Formation

Stratigraphic Unit	Joint Type	Shear Stiffness (MPa/mm)			No. of Tests
		Minimum	Maximum	Overall Average	
Unit 6a - Blue Mountain	Bedding	0.21	6.77	2.46	6
	Inclined	1.00	13.88	8.69	2
Unit 6b - Lindsay	Bedding	0.07	9.17	1.90	7
	Inclined	2.24	12.34	5.72	2
Unit 6c - Verulam	Bedding	0.12	1.75	1.05	6
	Inclined	(-)	(-)	(-)	0

Note: Where slope of stress/displacement curve changed within a test, multiple slopes (i.e. stiffness values) were determined.
Overall average values were obtained by determining the best overall slope fit for each test.
No tests were completed on inclined joints in the Verulam formation.

The normal stiffness was calculated from the direct shear creep tests using the normal load versus normal displacement plots. Table 5-51 presents the normal stiffness values for each bedrock formation.

Table 5-51: Summary of Joint Normal Stiffness by Bedrock Formation

Stratigraphic Unit	Joint Type	Normal Stiffness (MPa/mm)			No. of Tests
		Minimum	Maximum	Overall Average	
Unit 6a - Blue Mountain	Bedding	7.85	23.35	10.37	2
	Inclined	9.19	45.61	14.22	2
Unit 6b - Lindsay	Bedding	3.42	45.74	14.72	2
	Inclined	6.01	30.30	11.66	2

Note: Where slope of stress/displacement curve changed within a test, multiple slopes (i.e. stiffness values) were determined.
Overall average values were obtained by determining the best overall slope fit for each test.
No tests were carried out within the Verulam formation.

Geological Strength Index

An assessment of the overall rock mass quality was completed for the boreholes using the Geological Strength Index (GSI). Initially GSI was assessed for each of the borehole runs using RMR (Bieniawski, 1976) [7] assuming it is analogous to GSI over the range of values encountered when the groundwater term is set to dry conditions. The following presents the results of the assessment of GSI per drill run interval. Note that a typical drill run interval was 1.5 m.

The GSI values were determined for each drillhole run using the RMR76 (Bieniawski, 1976) [6] classification system as follows:

RMR76 = P1 + P2 + P3 + P4 + P5

Where: P1 is the strength of intact rock material (rating = 0 to 15);
P2 is the drill core quality, Rock Quality Designation, RQD (rating = 3 to 20);
P3 is the spacing of discontinuities (rating = 5 to 30);
P4 is the condition of discontinuities (rating = 0 to 25); and,
P5 is the groundwater (rating = 0 to 10).

For the GSI calculations, a groundwater rating for dry conditions has been assumed according to standard practice.

The GSI values were grouped into five rock mass classifications, and these are presented in Table 5-52, below.

Table 5-52: Geological Strength Index Classification

GSI Class	Description	GSI
Class I	Very Good	>80
Class II	Good	60<GSI<80
Class III	Fair	40<GSI<60
Class IV	Poor	20<GSI<40
Class V	Very Poor	<20

Table 5-53, below, presents a summary of the GSI values for each rock unit. Most of the bedrock at the DNNP site is considered good rock.

Table 5-53: Geological Strength Index Summary Based on RMR76 Directly, by Stratigraphic Rock Unit

Stratigraphic Unit	Minimum GSI	Maximum GSI	Mean GSI	Std Dev
Unit 6a – Blue Mountain Formation	45	85	67	8
Unit 6b – Lindsay Formation	55	92	81	6
Unit 6c – Verulam Formation	63	84	81	5

Note: Std Dev = Standard Deviation; Mean values are arithmetic.

[7] Bieniawski, Z.T. 1976. Rock mass Classification in Rock Engineering. In *Exploration for Rock Engineering, proc. of the symp.*, (ed. Z.T. Bieniawski) **1**, 97-106. Cape Town: Balkema.

The GSI was also assessed using the following equation from Hoek et al., 2013[8]:

GSI = 2xJcon$_{76}$ + RQD/2

where:
Jcon$_{76}$ is the Joint Condition rating from the RMR 1976
RQD is the Rock Quality Designation

The results, which are presented below in Table 5-54, are somewhat similar to the results in Table 5-53 with the average values typically lower for the GSI values determined directly from RMR$_{76}$.

Table 5-54: Geological Strength Index Summary Based on Jcon and RQD, by Stratigraphic Rock Unit

Stratigraphic Unit	Min GSI	Max GSI	Mean GSI	Std Dev
Unit 6a – Blue Mountain Formation	32	100	81	12
Unit 6b – Lindsay Formation	48	100	95	7
Unit 6c – Verulam Formation	66	100	96	6

Note: Std Dev = Standard Deviation; Mean values are arithmetic.

Rock Mass Strength and Rock Mass Elastic Modulus

The Hoek-Brown mb, s and a parameters were calculated using the RSData (Rocscience, 2021) [9] software using the triaxial test results from the rock samples. Curve fitting of triaxial laboratory data was completed using selected triaxial samples and the unconfined compressive strengths. Some of the outliers were removed from the data set used for curve fitting to derive the Hoek-Brown parameters in order to obtain reasonable results.

The intact rock strength and elastic modulus values can be adjusted to rock mass values using the Geological Strength Index (GSI) values shown in Table 5-53 and the following equations (Hoek, Carranza-Torres and Corkum, 2002) [10]:

Rock Mass Uniaxial Compressive Strength:

$$\sigma_c = \sigma_{ci} \cdot s^a$$

Where:

$$s = exp\left(\frac{GSI - 100}{9 - 3D}\right)$$

and

$$a = \frac{1}{2} + \frac{1}{6}\left(e^{-GSI/15} - e^{-20/3}\right)$$

[8] Hoek, E.; Carter, T.G.; Diederichs, M.S. Quantification of the Geological Strength Index Chart. In Proceedings of the 47th US Rock Mechanics/Geomechanics Symposium ARMA, San Francisco, CA, USA, 23-26 June 2013; pp.13-672

[9] RSData Manual (2021). Manual for the RSData program – version 1, prepared by Rocscience Inc.

[10] Hoek, E., Carranza-Torres, C. and Corkum, B. 2002. Hoek-Brown Failure Criterion – 2002 Edition. 5th North American Rock Mechanics Symposium and 17th Tunneling Association of Canada Conference: NARMS-TAC, 2002, pp. 267-271.

D is a disturbance factor ranging from 0 for TBM tunnels to 1.0 for very poor blasting. Note the disturbed zone around the excavation should be modelled separately using the appropriate disturbance factor.

Rock Mass Tensile Strength:

$$\sigma_t = \frac{s\sigma_{ci}}{m_b}$$

Where:

$$m_b = m_i \cdot exp\left(\frac{GSI - 100}{28 - 14D}\right)$$

Rock Mass Modulus (after Hoek and Diederichs, 2005):

$$E_{rm} = E_i\left(0.02 + \frac{1 - D/2}{1 + e^{((60+15D-GSI)/11)}}\right)$$

The rock mass strength and rock mass modulus design values for each GSI rock class are summarized below in Table 5-55. The rock mass modulus used for design depends on the scale of the application (i.e. the rock mass modulus values will very from the intact values to the rock mass modulus values derived from GSI which is more suitable for large-scale applications). Engineering judgement should be used when selecting a suitable rock mass modulus for design. For rock samples of poor quality, the mean value minus the standard deviation has been used as a lower bound for the intact UCS and modulus. The results are summarized Table 5-55.

Table 5-55: Rock Mass Properties Summary, by Stratigraphic Rock Unit

Stratigraphic Unit	Intact Rock Properties				Rock Mass Properties							
	Mean Intact Strength (MPa)	Mean Intact Modulus (GPa)	σ_{ci} (MPa)	m_i	Geological Strength Index (GSI) Range	Mean GSI	mb	s	a	Rock Mass Strength from GSI (MPa)	Rock Mass Modulus from GSI (GPa)	Rock Mass Modulus from Rock Pressuremeter Tests (GPa)
Unit 6a – Blue Mountain Formation	100	26.6	103.8	12.8	45-85	67	3.952	0.0256	0.502	16.5	17.9	5.91
Unit 6b – Lindsay Formation	75	43.4	82.5	20.0	55-92	81	10.15	0.121	0.501	28.7	38.7	9.75
Unit 6c – Verulam Formation	46	25.0	46[1]	20.0[1]	63-84	81	10.15	0.121	0.501	16.0	22.3	12.29

Note: 1) No triaxial data for the Verulam Formation, therefore σ_{ci} and m_i are assumed.
2) σ_{ci} is the unconfined compressive strength intercept for the generalized Hoek Brown failure envelope.

5.3.5 Shear Creep Rate

The results for the constant force direct shear creep tests are summarized below in Table 5-56 and Table 5-57.

Table 5-56: Summary of Shear Creep Rates for Unit 6a Blue Mountain Formation

Sample ID	Joint Type	Stage	Average Normal Stress (MPa)	Average Shear Stress (MPa)	Creep Rate (mm/day)
BH5-RS-CR-01	Bedding Joint	1	0.77	0.21	0.00316
		2	0.79	0.39	0.00517
		3	0.80	0.66	0.00809
BH5-RS-CR-02	Inclined Joint	1	0.83	0.22	0.00204
		2	0.83	0.45	0.00391
		3	0.87	0.68	0.00579
BH12-RS-CR-04	Inclined Joint	1	0.84	0.21	0.01787
		2	0.82	0.31	0.01818
		3	0.86	0.43	0.03537
BH66-RS-CR-01	Bedding Joint	1	0.40	0.09	0.00558
		2	0.41	0.21	0.00634
		3	0.42	0.31	0.01045

Table 5-57: Summary of Shear Creep Rates for Unit 6b Lindsay Formation

Sample ID	Joint Type	Stage	Average Normal Stress (MPa)	Average Shear Stress (MPa)	Creep Rate (mm/day)
BH12-RS-CR-01	Inclined Joint	1	0.71	0.16	0.00240
		2	0.73	0.34	0.00455
		3	0.74	0.49	0.00672
BH12-RS-CR-03	Inclined Joint	1	0.40	0.10	0.00011
		2	0.41	0.23	0.00352
		3	0.42	0.33	0.00379
BH71-RS-CR-02	Bedding Joint	1	0.41	0.11	0.00549
		2	0.41	0.25	0.01343
		3	0.41	0.34	0.02707
BH78-RS-CR-01	Bedding Joint	1	0.79	0.12	0.00250
		2	0.80	0.30	0.00560
		3	0.81	0.44	0.00753

5.3.6 In Situ Stresses

The in situ horizontal stresses were measured in six (6) boreholes within an area which measures approximately 48 m by 174 m in plan and extends to an elevation of 25.78 m, for the purposes of characterizing the stress regime within the test site. Figure 13 in Appendix E shows a combined plot of all the measured maximum horizontal stresses (P) and minimum horizontal stresses (Q) with elevation. With the exception of the tests carried out in BH13 below 43 m in elevation, the horizontal stress regime within this block is fairly uniform between 60 m and 30 m in elevation with P values ranging from approximately 9 MPa to 15 MPa. Test results in BH13 show a trend of increasing P values with depth below 40 m in elevation. The minimum horizontal stresses (Q) between 60 m and 20 m in elevation are fairly uniform, ranging from 5 MPa to 12 MPa.

Figure E-14 in Appendix E shows a combined plot of all of the measured biaxial modulus (E) values with elevation. The E values range from 35 GPa to 58 GPa. The range of E values is generally consistent with the natural variation of the rock and is fairly typical of the biaxial modulus values for fresh and medium strong limestones. A summary of the in situ stress measurements is presented below in Table 5-58.

The measured directions of the maximum horizontal stresses are generally oriented within the first (NE) quadrant (azimuths from 0 to 90 degrees) with a few exceptions where the directions are oriented within the second (SE) quadrant (azimuth 90 to 180 degrees).

Table 5-58: Summary of In Situ Stress Measurements Test Results

Depth (mbgs)	P			Q			E			Azimuth of P		
	(MPa)			(MPa)			(GPa)			(°)		
Elev. (m)	Min	Max	Mean	Min	Max	Mean	Min	Max	Mean	Min	Max	Mean
32.02 – 61.36	8.03	23.36	11.38	3.89	12.3	7.67	34.95	58.75	48.31	3.3	163.1	68.89
-57.98 – -20.38												

Note: Mean values are arithmetic.

For the sake of comparison, the in situ horizontal stresses (P and Q) and biaxial modulus (E) values measured at the site of the intake tunnel located in the existing Darlington Nuclear Power Station (Lo and Lukajic,1984)[11] are summarized below:

- Between 80 m and 40 m in elevation in the Lindsay Formation, the maximum horizontal stresses (P) range from 10 MPa to 14 MPa whereas the minimum horizontal stresses (Q) range from 5 MPa to 8 MPa.
- Below 40 m in elevation (from 40 m to -100 m), the in situ stresses are fairly uniform with an average P value of 14 MPa and an average Q value of 8 MPa.
- Between 85 and 20 m in elevation, the biaxial modulus (E) values range from 32 GPa to 63 GPa.

[11] Lo, K.Y., Lukajic, B., 1984. Predicted and Measured Stresses and Displacements Around the Darlington Intake Tunnel. Can. Geotech. J. 21, 147-165.

It may be noted that the in situ horizontal stresses and biaxial modulus values obtained from the current overcoring test program carried out at the site are consistent with the set of historical stress data obtained in the same rock formation at comparable depths at the site of the existing Darlington Power Station.

For design purposes, the in situ stress values presented below in Table 5-59 are recommended for the bedrock. The in situ stress in the rock is defined by the constant locked-in stress plus the stress gradient value calculated based on the depth from ground surface (i.e., σ_h = *Locked-in Constant* + 2 x σ_v, where σ_v is the vertical lithostatic stress).

Table 5-59: Summary of Recommended Design In Situ Stress Values

Vertical Stress	Locked-in Near Surface Major Horizontal Stress (P)	Locked-in Near Surface Minor Horizontal Stress (Q)	Horizontal to Vertical Ratio
Lithostatic	7 MPa	5 MPa	2

5.3.7 Rock Swelling Pressures

The results for the swell testing on the Blue Mountain Formation shale are presented in Volume 1 – Factual Geotechnical Data Report and are summarized above in Section 4.7.3.

The swelling characteristics of the Blue Mountain shale, as determined from the laboratory swell tests, will need to be taken into consideration in the design of the underground structures located within this rock formation including any concrete structures and any tunnel linings that are in contact with the shale bedrock. For any structures, such as the tunnel linings or foundation walls, which are directly in contact with the rock, the time-dependent deformation (swelling) of the rock will cause pressure to build up with time at the rock-structure interface. The magnitude of the pressure will depend on the rigidity of the structure, the timing of the construction, the swelling characteristics of the rock, the initial in situ stresses in the rock formation and the design life of the structure. The design of the final structures will need to be based on a rock/structure interaction analysis over the design life of the structure, taking into consideration the structure type (thickness, stiffness etc.) and the rock characteristics (swell rates). Depending on the results, it may be necessary to incorporate a compressible material between the structure and the rock. The structural foundation walls should be checked for all loading cases.

The interpreted swell test results are shown below on Figure 5-3 Figure 5-4 for vertical and horizontal samples, respectively. In generating these plots, the applied pressure for the free swell tests was taken as 0.0001 MPa. The swelling potentials and the applied pressures typically approximate a linear relationship in a semi-log plot. The results indicate that the samples did not swell under the free swell conditions but did show some very small swelling potential for the semi-confined and null tests in some cases. The results for the Blue Mountain shale (Unit 6a) do not show the linear relationship on the semi-log plot that is typical for other Southern Ontario shales; however, if the free swell results are ignored, a best fit linear relationship on the semi-log plot can be assumed for design as shown below as a dashed line. It should be noted that the calcite content, which tends to inhibit the swelling potential of the shale, is considered very high for some of the test samples (i.e., 20.4% to 44.2% for BH65, and 23.2% to 25.7% for BH71) and this could in part explain the atypical results.

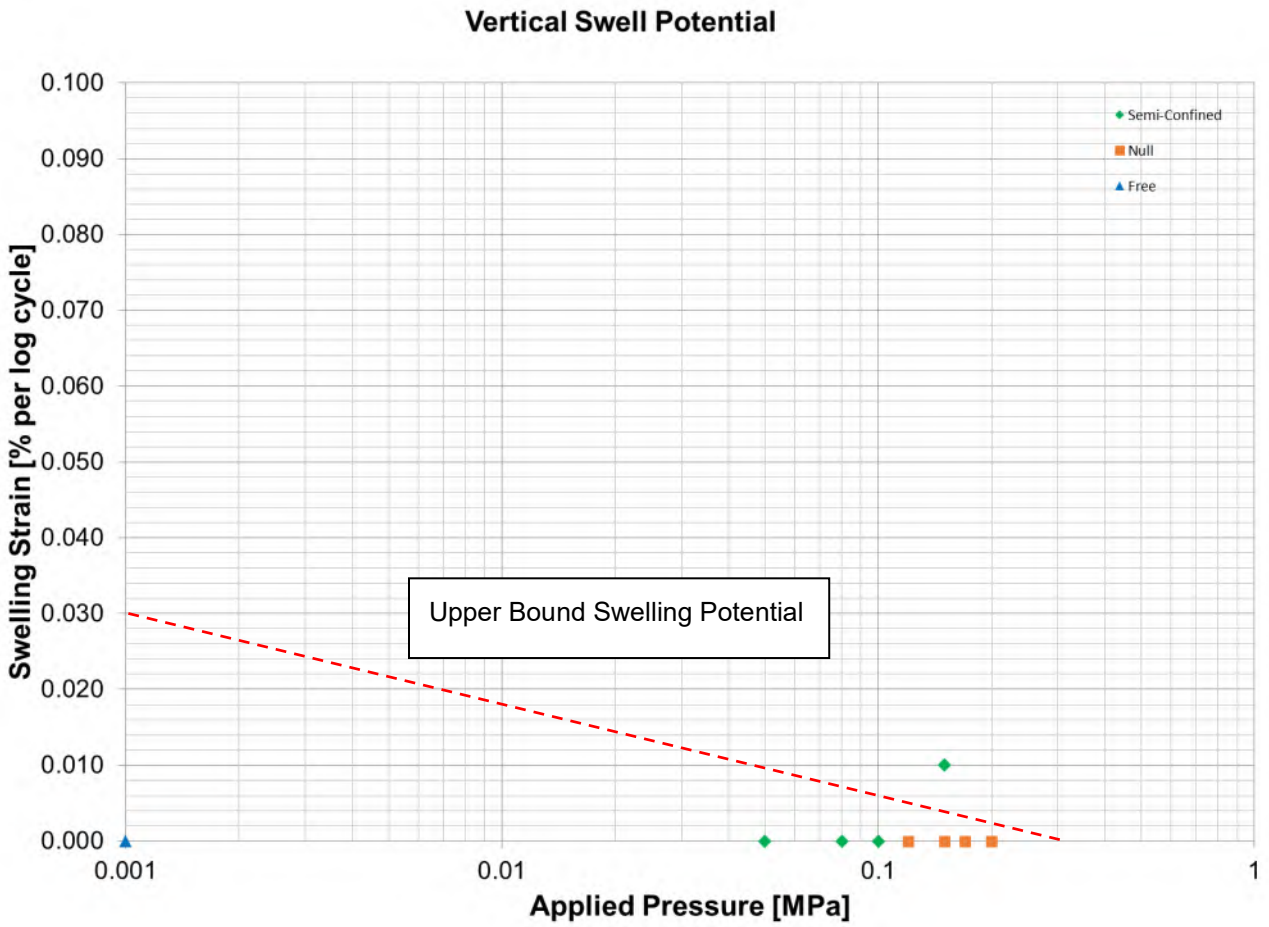

Figure 5-3: Vertical Swell Testing Results for Blue Mountain Shale (Unit 6a)

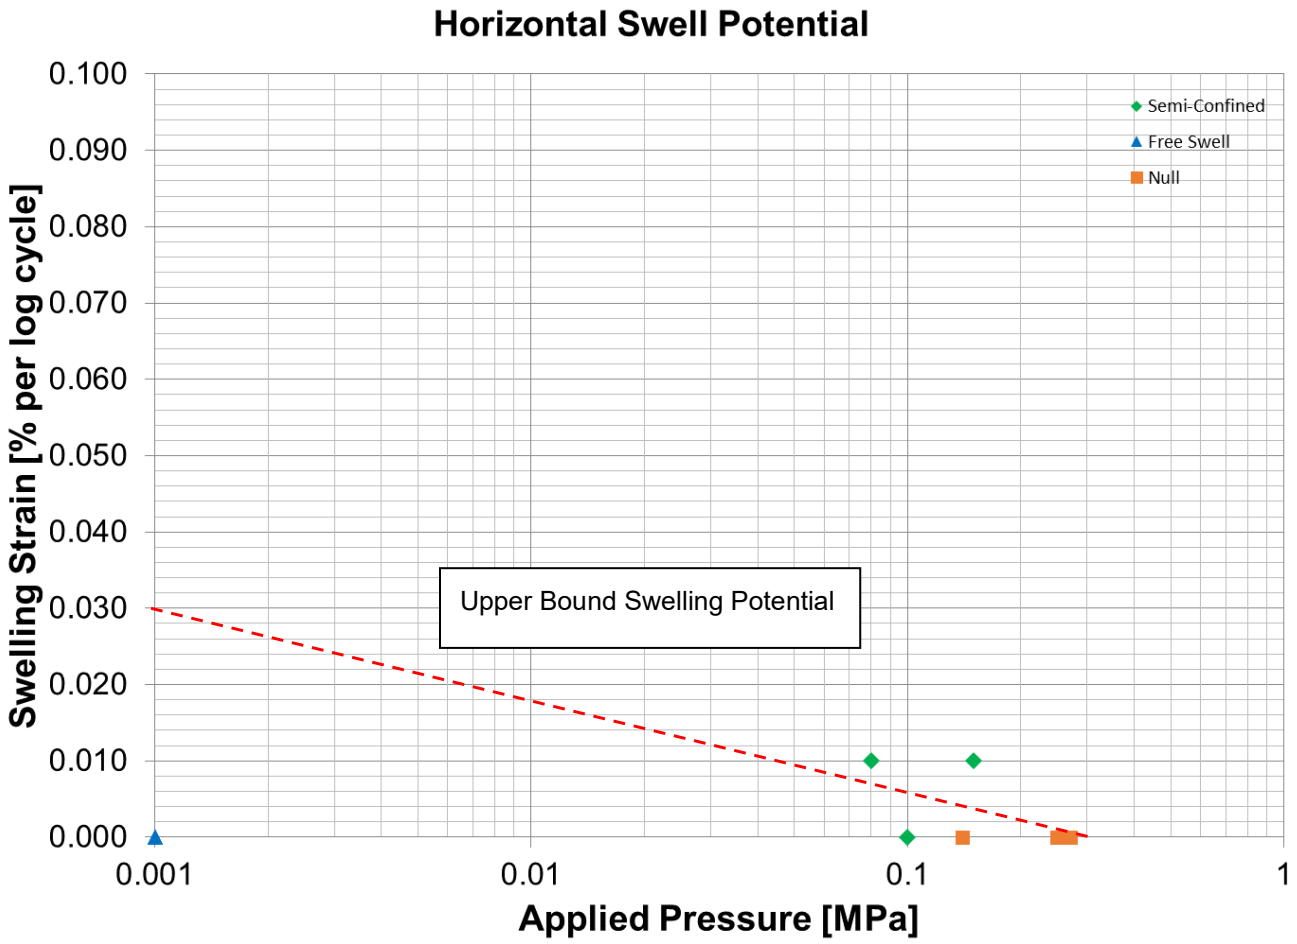

Figure 5-4: Horizontal Swell Testing Results for Blue Mountain Shale (Unit 6a)

5.3.8 Dynamic Behaviour

The results of the dynamic parameters in bedrock from geophysical testing are summarized below in Tables 5-60 to 5-64, which are based on the full waveform sonic probe measurements and the average bulk density measurements of each formation, as summarized above. The velocities remain consistent throughout the rock with some variation in the transition zone from soil to rock. There is also an area of higher velocity at 80-90m that is seen across all boreholes. The velocities are seen in Figure 5-5 and Figure 5-6.

The uncertainty reported in the seismic velocities measured with the FWS probe is considered to be ±5% of the reported velocity values presented in the tables below. The average Poisson's ratio, dynamic shear modulus, dynamic Young's modulus, and dynamic bulk modulus were calculated for each lithology group in each of the 17 boreholes. The min, max, and average values displayed in Tables 5-60 to 5-64 are the average of those values.

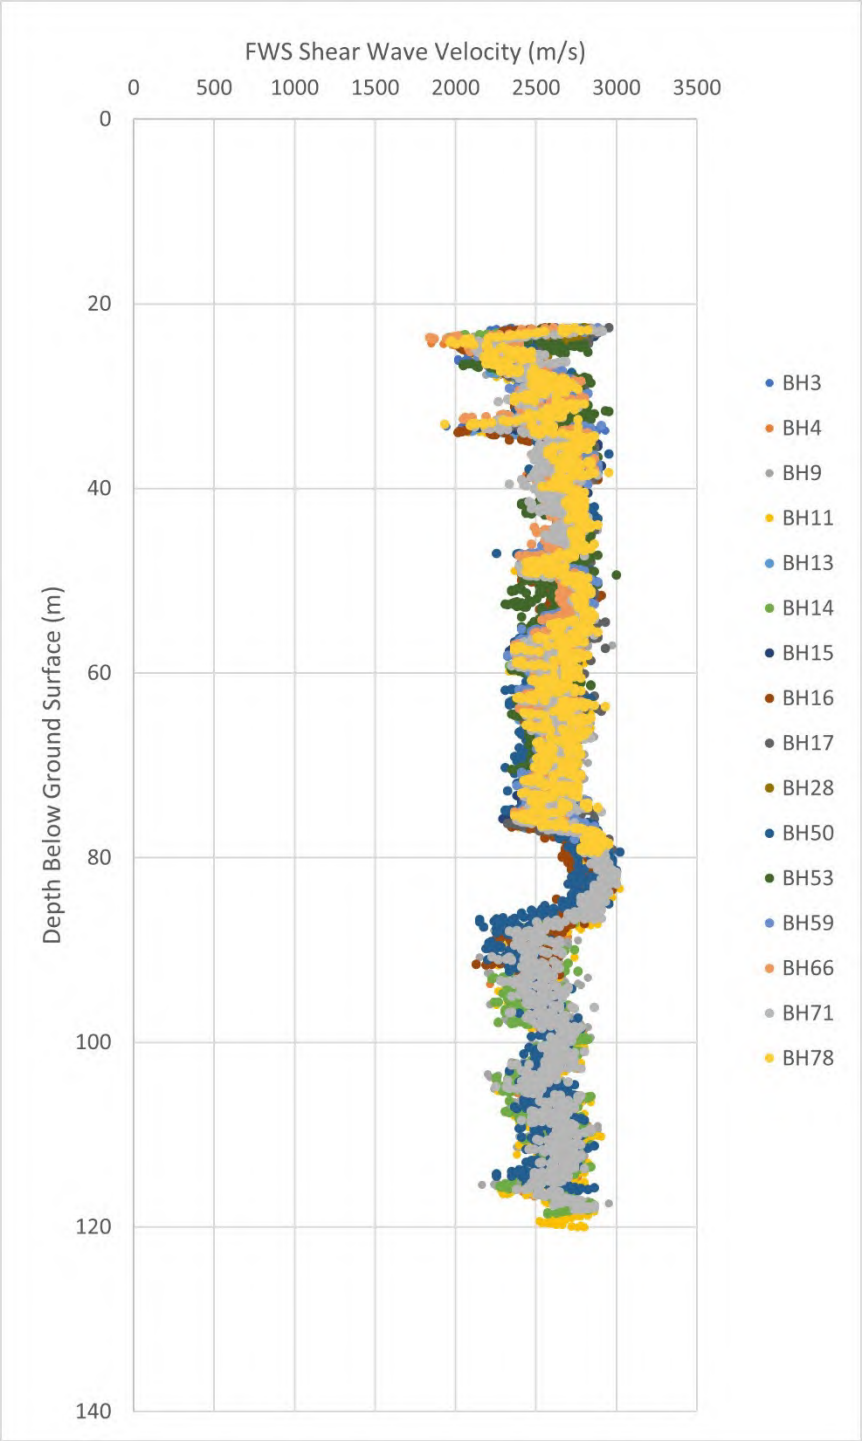

Figure 5-5: Shear Wave Velocity Measured with FWS

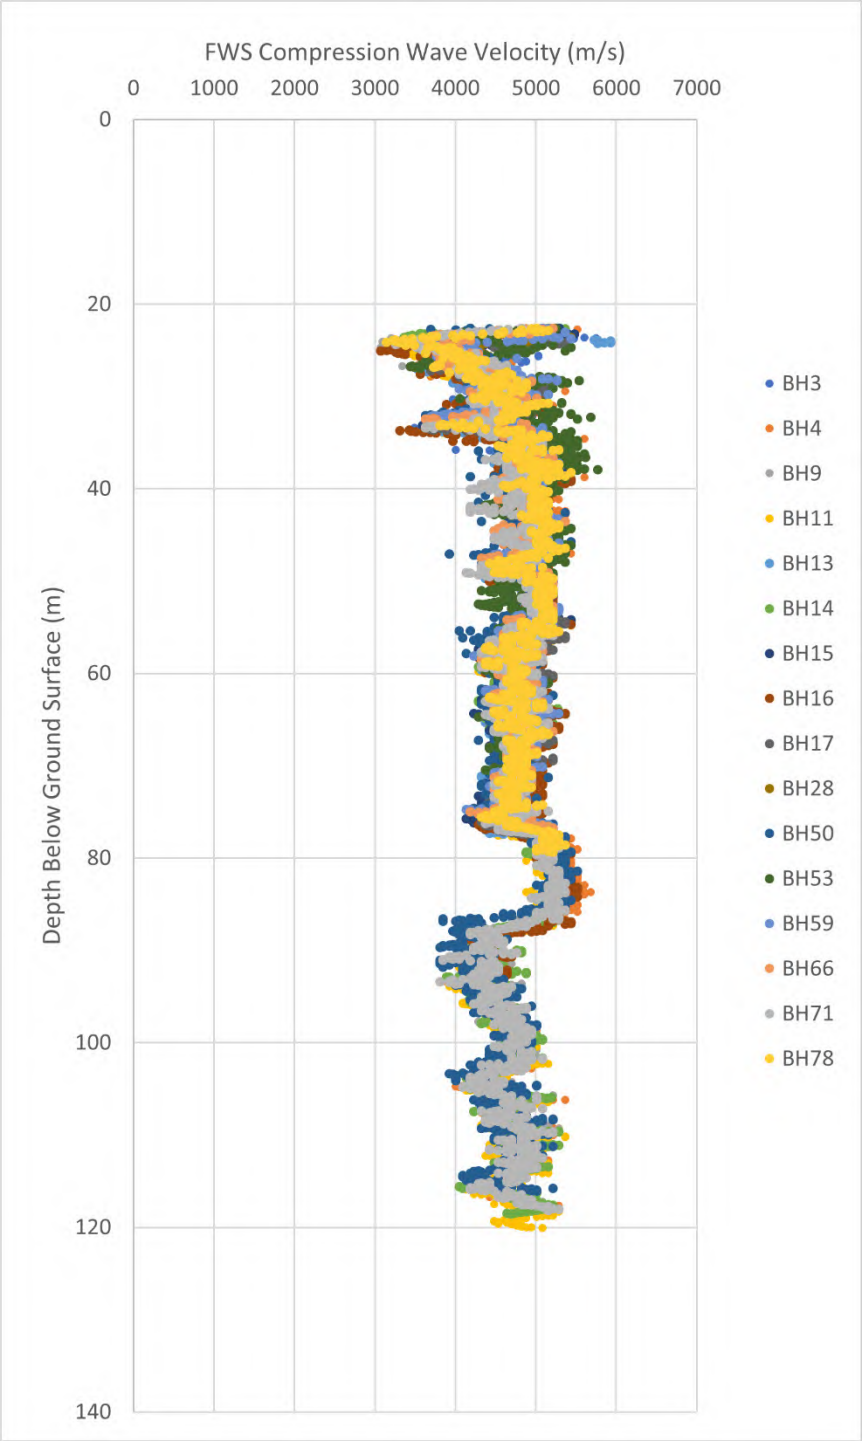

Figure 5-6: Compression Wave Velocity Measured with FWS

Table 5-60: Summary of Shear and Compression Wave Velocities from Geophysical Testing, by Stratigraphic Rock Unit

Stratigraphic Unit	Shear Wave Velocity (m/s)				Compression Wave Velocity (m/s)			
	Minimum	Maximum	Mean	Std Dev	Minimum	Maximum	Mean	Std Dev
Unit 2a – Blue Mountain Formation	1,841	2,953	2,405	127	3,073	5,935	4,283	344
Unit 2b – Lindsay Formation	1,934	3,024	2,640	41	3,202	5,773	4,792	88
Unit 2c – Verulam Formation	2,128	2,801	2,559	39	3,772	5,443	4,570	48

Table 5-61: Summary of Poisson's Ratio from Geophysical Testing, by Stratigraphic Rock Unit

Stratigraphic Unit	Poisson's Ratio			
	Minimum	Maximum	Mean	Std Dev
Unit 2a – Blue Mountain Formation	0.20	0.38	0.26	0.04
Unit 2b – Lindsay Formation	0.27	0.30	0.28	0.01
Unit 2c – Verulam Formation	0.26	0.28	0.27	0.01

Table 5-62: Summary of Dynamic Shear Modulus from Geophysical Testing, by Stratigraphic Rock Unit

Stratigraphic Unit	Dynamic Shear Modulus (MPa)			
	Minimum	Maximum	Mean	Std Dev
Unit 2a – Blue Mountain Formation	12,772	18,186	15,320	1,618
Unit 2b – Lindsay Formation	17,099	19,458	18,696	578

6.0 GEOHAZARD CONSIDERATIONS

6.1 Natural Gas

Methane and hydrogen sulphide gas are known to be present in the bedrock and in the soils of Southern Ontario, typically in granular layers or rock capped by cohesive tills.

Methane gas was encountered in some of the boreholes advanced at the site (refer to Volume 1 – Factual Geotechnical Data Report.

Methane forms an explosive mixture with air and is a potential hazard for excavation and construction work and it should be assumed that it will be encountered in the bedrock and soil at this site. Changes in groundwater pressure which may be caused by dewatering or seepage into excavations/underground spaces can lead to migration/release of gaseous or dissolved methane. Therefore, the absence of methane detection in a particular area should not be construed to indicate that there is no risk of the presence of methane in the future or in other site areas.

6.2 Karst Cavities

No evidence of significant karst cavities was encountered in the geotechnical boreholes. Some zones of lost core were encountered in the boreholes generally within 40 m of the ground surface and ranging from 5 cm to 66 cm in height, but no noticeable drop in the drilling rods was noted and therefore these are thought to be associated with zones of weaker material that had been washed out by the core drilling.

In addition, the previous geophysical reports associated with this site indicate that no significant depressions or changes in bedrock, that may be indicative of large karst, large voids or faults were noted in the nine seismic refraction lines at the site.

After a review of the previous surface geophysical data as well as the numerous boreholes drilled in 2021 for the power block, we confirm that the data supports the absence of karst features at this site.

7.0 SITE SEISMIC CLASSIFICATION AND CONSIDERATIONS

7.1 Seismic Setting and Paleoseismicity

7.1.1 Seismic Source Zones

Eastern Canada lacks evidence for major historical earthquakes because it is located within the stable continental region (SCR) of the North American tectonic plate. Nevertheless, a number of seismic source regions have been defined from the historical and instrumental record of earthquake epicentres and magnitudes. These source zones are used to define areas where earthquakes might be expected in the future, particularly when undertaking

probabilistic seismic hazard analysis (PSHA) for the development of national seismic hazard maps and site-specific earthquake hazard assessments for critical structures.

The Darlington site falls within the regional Southern Great Lakes Seismic Zone (SGLSZ) as defined by the Geological Survey of Canada. The SGLSZ is one of a number of seismic zones within the SCR of the North American tectonic plate. The SGLSZ is defined over a large area that extends from Windsor to east of Kingston and into the United States to the south. The SGLSZ is characterized by relatively low to moderate rates of instrumental seismicity, with only 2 to 3 magnitude (M) 2.5 or larger earthquakes recorded in the last 30 years. Historical records for earthquakes with epicentres located within the SGLSZ includes three moderate (i.e., about M 5) events: 1929 in Attica, New York, 1986 near Cleveland, Ohio, and 1998 near the Pennsylvania/Ohio border.

Wallach et. al. (1998)[12] identified three linear zones of earthquakes in this part of southeast Canada and within the wider SGLSZ. These zones are based on underlying geophysical anomalies with the basement rocks of this part of the North American plate. Mohajer (1993)[13] also argued for a linear seismic zone and Jacobi and Fountain (1993)[14] identified a basement fault system as potential earthquake sources in the region surrounding the Darlington site. . These sources are the Niagara-Pickering linear zone, the Georgian Bay linear zone, the Hamilton-Lake Erie lineament, the Hamilton-Presqu'ile Fault, and the Clarendon-Linden Fault System.

The Niagara-Pickering linear zone trends north-northeasterly, extending from Balsam Lake to the north and Pickering to the west of the Darlington site. Wallach et. al. (1998) defines the Niagara-Pickering linear zone by north-northeast trending topographical lineaments, linear magnetic anomalies, mesoscopic-scale faults, and some macroscopic-scale faults.

Wallach et. al (1998) identifies the Georgian Bay linear zone from Bouguer gravity anomalies and normal faults observed in the rocks within the Rouge River valley. The Georgian Bay zone has a north-northwest trending lineament, crossing just north of Lake Ontario to the west of Pickering and north into Georgian Bay.

Wallach et al. (1998) argues for the existence of the Hamilton-Lake Erie lineament based on mapping a range of mapped small-scale faults. The lineament has a north-northeasterly trend that is subparallel and west of the Niagara-Pickering linear zone. These two zones diverge south of Lake Ontario.

Mohajer (1993) identified the Hamilton-Presqu'ile Fault as another potential earthquake source within the SGLSZ. The Hamilton-Presqu'ile Fault is sub-parallel to the long axis of Lake Ontario. Mohajer (1993) cites a 40 m offset of Paleozoic-age strata as evidence of the fault. He argues that several microearthquakes could have been located on or close to the Hamilton-Presqu'ile Fault at the western end of Lake Ontario.

To the south of the SGLSZ, Jacobi and Fountain (1993) have argued that the Clarendon-Linden Fault System could be a potential source of future large earthquakes. The Clarendon-Linden Fault System strikes north-northeast and crosses Lake Ontario to the east of the Darlington site from Clarendon, New York to Prince Edward County, Ontario. Jacobi and Fountain (1993) consider that stress release on the Clarendon-Linden Fault System

[12] Wallach, J.L., Mohajer, A.A., and Thomas, R.L. 1998. *Linear zones, seismicity, and the possibility of a major earthquake in the intraplate western Lake Ontario area of eastern North America.* Canadian Journal of Earth Sciences 35: 762-786.

[13] Mohajer, A.A. 1993. *Seismicity and Seismotectonics of the Western Lake Ontario Region*. Géographie physique et Quaternaire 47 (3): 353-362.

[14] Jacobi, R. and Fountain, J. 1993. *The Southern Extension and Reactivations of the Clarendon-Linden Fault System*. Géographie physique et Quaternaire 47 (3): 285-302.

as the likely source of instrumentally recorded earthquakes with body-wave (m_b)magnitudes ranging from m_b 2.8 to m_b 4.8 between 1955 and 1971, and the 1928 m_b 5.2 Attica earthquake.

7.1.2 Paleoseismicity

The definition of the source zones described above is based on alignments of geophysical anomalies, limited numbers of instrumental and historical earthquakes, and structural geological observations in near surface rocks. At present, there is no known evidence of larger, pre-historic earthquakes that have resulted in surface fault rupture because such earthquakes have not occurred, or the evidence for surface rupture or coseismic damage is not preserved, or the studies needed to identify past large earthquakes is insufficient to recognize these events. Given the relatively stable geological setting of the region surrounding the Darlington site, the recency of the post-glacial landscape that might preserve past large earthquake effects, it is expected that evidence for large earthquakes, if they have occurred, would be difficult to identify.

Golder's review of available paleoseismic information confirms the lack of historical evidence for surface rupture within the Darlington site, including and absence of faults within the boreholes as logged during the current investigation.

7.2 Design PGA, Magnitude, and Importance Level

In accordance with the report titled *Update of the OPG Darlington Site Probabilistic Seismic Hazard Assessment for the Darlington Risk Assessment (DARA)* numbered K-620117-REPT-0001 R03 and dated June 3, 2021 by Kinectrics, for the 10,000-year return period earthquake a Peak Ground Acceleration (PGA) of 0.168g and an earthquake Magnitude of 7.05 was considered for design. It should be noted that the indicated PGA value of 0.168g is applicable at the ground surface and the PGA value will differ at greater founding depths; this should be taken into consideration when evaluating seismic conditions for final design.

Seismic analysis was carried out for the following structures as outlined below in Table 7-1.

Table 7-1: Summary of Structures for Seismic Design

Structure	Foundation Elevation (masl)	Foundation Depth Below Site Grade (m)	Seismic Importance Level
Reactor Building	52.8	35.2	High
Turbine Building	87.0	1.0	Moderate
Radioactive Waste Building	86.8	1.2	Moderate
Control Building	87.5	0.5	Moderate
TB Facility Annex	87.5	0.5	Moderate
Dry Cask Storage	TBD	TBD	Moderate
Administration Building	TBD	TBD	Low

7.3 Seismic Liquefaction

Liquefaction is a phenomenon whereby seismically-induced shaking generates shear stresses within the soil under undrained conditions. These stresses tend to densify the soil (i.e., leading to potentially large surface settlements) and under undrained conditions generate excess pore pressures. The excess pore pressures also

lead to sudden temporary losses in strength. Where existing static shear stresses are present, the loss of strength can lead to significant lateral movements (i.e., analogous to a slope failure) often referred to as “lateral spreading” or under certain conditions even catastrophic failure of the slope often referred to as “flow slides”. Lateral spreading and flow slides often accompany liquefaction along rivers and other shorelines.

The liquefaction susceptibility of granular soils was evaluated by comparing the penetration resistance required to trigger liquefaction with the available penetration resistance. Liquefaction is predicted to occur when the available penetration resistance is less than the resistance required. The susceptibility of the cohesive soils to cyclic mobility was also assessed.

The methodology used to assess liquefaction potential at the site is consistent with the approach outlined in the Canadian Highway Bridge Design Code (CHBDC) and by Idriss and Boulanger (2008). It involves comparing the cyclic shear stresses applied to the soil by the design earthquake, represented as the cyclic stress ratio (CSR), to the cyclic shear strength, represented as the cyclic resistance ratio (CRR) provided by the soil.

The CRR values with depth were calculated using the borehole and CPT data collected as part of the investigation. Although groundwater levels of 0.3 to 2 mbgs were encountered in the upper soil units as outlined in Section 3.5.2, the groundwater level was considered to be at ground level (i.e., 0 mbgs) during the design earthquake event for the preliminary liquefaction analyses. The results of the initial preliminary liquefaction analyses, using the “simplified” method of estimating the CSR profile based on the 10,000-year design earthquake event outlined in Section 7.1, indicated that layers within the upper clayey, sandy, and silty deposits (i.e., Units 2a and 2b) are potentially liquefiable during the 10,000-year design earthquake event. However, it is also understood that the upper 8 metres of soil will be removed from beneath the Turbine, Radioactive Waste, Control, and TB Facility Annex buildings and replaced with compacted fill material, which will result in the removal of the identified liquefiable soils from beneath these structures. Based on this understanding, the soils at this site may be considered to be non-liquefiable for design under the 10,000-year design earthquake for the Reactor, Turbine, Radioactive Waste, Control, and TB Facility Annex buildings. Seismic settlements are considered to be minimal. This should be confirmed at a further design stage for these structures, and for the Dry Cask Storage and Administration buildings once further foundation and soil excavation information is available.

7.4 Seismic Site Class Determination

It is understood that the seismic design of the nuclear safety structures will be carried out per nuclear standards (e.g., CSA N289). The average shear wave velocities for the upper 30 m of soil and bedrock beneath the building foundations (i.e., Vs_{30}) and corresponding design Site Class are summarized below in Table 7-2.

Table 7-2: Summary Average Shear Wave Velocities for the Upper 30 m Beneath Foundations for Structures

Structure	Vs_{30} (m/s)
Reactor Building	2421
Turbine Building	566
Radioactive Waste Building	632
Control Building	709
TB Facility Annex	618

We would note that the Vs_{30} values presented above are based on the materials extending beneath the founding elevations of the indicated facilities as currently understood. The ultimate designer should carefully evaluate and apply the values as applicable to the actual embedment depths as the design progresses.

The site classification for seismic site response for structures being designed under the 2020 National Building Code of Canada (NBCC) can be determined based on Section 4.4.8.1 of the Code and the results of the geotechnical investigation, including shear wave velocity measurements from geophysical testing. For preliminary design, structures founded at or below about Elevation 87 masl may be designed using a Site Class C designation. Structures founded at or within 3 m of the underlying bedrock may be designed using a Site Class A designation. These should be confirmed for detailed design of any such structures. These seismic Site Class designations also assume that structures founded on or within 3 m of bedrock will be seismically isolated from any adjacent structures founded on overburden.

8.0 FOUNDATION AND CONSTRUCTION CONSIDERATIONS

8.1 General

The onshore power block will include construction of the main power block buildings, located inside the containment area, as well as an administrative building and a dry cask storage building located outside of the containment area, as summarized in Table 8-1 below. The locations of the above-noted structures are shown on Figures 1 and 2.

Table 8-1: Summary of Buildings and Proposed Foundation Details

Location	Structure	Structure Components	Footprint Dimensions[(a)] (m)	Proposed Foundation Elevations
Inside Containment Area	Power Block Building	Reactor Building	34.4 dia.	53.0 m
		Turbine Building	70 x 60	77.0 m and 83.0 m
		Radwaste Building	35.4 x 36.6	77.0 m and 83.0 m
		Control Building	34 x 60	77.0 m and 83.0 m
		Facility Annex	140 x 9	77.0 m and 83.0 m
Outside Containment Area	Dry Cask Storage Building		55 x 25	78.0 to 86.5
	Administrative Building		65 x 28	78.0 to 86.5

The proposed finished grade at the proposed structures is about Elevation 88 m. It is understood that the proposed structures are to be founded on raft foundations, excluding the administrative building which will be founded on shallow spread / strip footings.

It is understood that consideration is being given to sub-excavating the existing soils below the building footprints to about Elevation 80.0 m, and then re-engineering/conditioning the soils to be put back in place. The excavation for the reactor building, which is to extend into bedrock, will require the use of temporary protection systems such as a secant wall system with tie-back anchors.

8.2 Design Frost Penetration

Raft foundations, spread/strip footings, pile caps (if required), and site servicing should be provided with a minimum of 1.3 m of conventional soil cover for frost protection, in accordance with OPSD 3090.101 *(Foundation Frost Penetration Depths for Southern Ontario)*. If adequate soil cover cannot be provided, rigid polystyrene insulation could be installed to compensate for the lack of soil cover and provide protection from frost penetration.

8.3 Below Grade Walls

The design of permanent below-grade foundation walls for the reactor building should take into account the horizontal soil loads, potential hydrostatic pressure as well as surcharge loads that may occur during or after construction. Permanent below-grade foundation walls are considered to be rigid structures and should be designed to resist at-rest lateral earth pressures plus hydrostatic groundwater pressures, calculated as follows:

$$p = K_0 (\gamma h + q)$$

where:

- p = lateral earth pressure acting depth z, kPa
- K_0 = at rest earth pressure coefficient, use 0.5
- γ = unit weight of retained soil, a value of 21 kN/m^3 may be assumed
- h = depth to point of interest in soil, m
- q = equivalent value of surcharge on the ground surface, kPa

Hydrostatic pressures acting behind the walls should be included in calculating the lateral earth pressures unless the walls are designed to be permanently drained. Based on the primarily dense to very dense till soils at the site, a design groundwater level at Elevation 88.0 m is considered reasonable for design.

For all below grade walls, properly filtered perimeter drains leading to a frost-free permanent outlet or a direct outlet to a sewer line should be provided at the foundation level, unless the structure is fully waterproofed/sealed.

8.4 Site Grading and Fill Requirements

In general, the final site grading within the onshore power block area will be within +/- 2 m of the existing site grades. All topsoil, existing fill, organic soils, or other loose / soft / deleterious soils must be completely removed from within the zone of influence of the proposed foundations (taken as 1 m laterally outside the proposed foundations, then outward and downward at an inclination of 1 Horizontal to 1 Vertical). Site grading should be carried out in general accordance with OPSS 206 (*Grading*).

As noted in Section 8.1 above, it is understood that consideration is being given to sub-excavating the existing soils below the building footprints to about Elevation 80.0 m, and then re-engineering/conditioning the soils to be put back in place. Should this be the preferred design option, once excavated, the exposed subgrade should be inspected by qualified geotechnical personnel and proof-rolled (where feasible), in general accordance with OPSS 902 (*Excavating and Backfilling – Structures)*. Any softened/loosened or poorly performing areas of the subgrade soils should be sub-excavated and replaced with engineered fill as directed by qualified geotechnical personnel.

The anticipated soils to be sub-excavated from within the foundations zone of influence include topsoil / fill, surficial glaciolacustrine deposits comprised of sandy lean clay to lean clay, silty clayey sand to silty sand / sandy silt, and till, as shown on Figure 4. It is understood that the re-engineering of the sub-excavated soils is to be designed by others. The environmental suitability of the sub-excavated soils should also be considered.

In the absence of a detailed design, it is not possible to provide a comprehensive appraisal of suitable ground improvement options that may be available to facilitate foundation construction at the site. As such, the following is presented for information only.

Based on the expected extent of the structure footprint and the groundwater conditions at the site, it is considered that full excavation, soil conditioning/amendment and total replacement by the improved material is likely not a viable option at the site. In addition to the large footprint required to manage this option, water management, shoring requirements and other aspects would need to be considered. As such, it is our recommendation not to disturb the competent till strata through excavation at this time. More feasible options include either a piled solution or an in situ approach for reconditioning / stabilizing soil to provide a competent foundation base. While installation of a deep piled solution has the potential to provide better performance than an enhanced soil approach, it is understood that financial considerations may render this prohibitive.

Options that are available for ground improvement to support foundation design should take into consideration guidance outlined in *International Atomic Energy Agency (IAEA) Safety Guide No. NS-G-3.6 - Geotechnical Aspects of Site Evaluation and Foundations for Nuclear Power Plants*, and may include modification of the mechanical behaviour of the foundation material (such as by soil compaction) or the use of an added material to improve the static and/or dynamic soil behaviour. Soil densification, solidification by cement or permanent dewatering are options that can be considered. One approach that may be applicable to enhance the engineering properties of soils, is the use of Cutter Soil Mixing (CSM) to mechanically mix the in situ soils with a binder slurry, typically comprising cement. CSM is a specialized deep mixing technique that can be utilized in almost any soil

type to create strengthened and stiffened soilcrete elements, with typical panel depths in the order of 25 to 35 m. The process is typically contingent on soil type, strength, water content, plasticity, and texture.

As outlined in IAEA Safety Guide No. NS-G-3.6, in order to fully determine requirements for improvement of soil conditions, in addition to the work already completed by Golder to determine the existing in situ profile, and following selection of an appropriate technology by which improvements in the foundation soils are to be made, the following tasks should be performed:

- Determination of the required profile for foundation material;
- Carrying out a field testing programme to verify the effectiveness of the proposed ground improvement methods;
- Once approach is verified, preparation of performance-based specifications for field operations;
- At the completion of the improvement programme, carrying out an investigation to determine whether the specifications were met; and
- Incorporation of any improvement in foundation material into the design profiles used in the assessments.

Ultimately, the requirement for ground improvement and / or soil reconditioning will be based on the final foundation design.

8.5 Temporary Excavations

The anticipated soils to be excavated at the site include topsoil / fill, glaciolacustrine deposits comprised of sandy lean clay to lean clay, silty clayey sand to silty sand / sandy silt, till, as shown on Figure 4. Further, excavations for the reactor building will extend into bedrock of the Blue Mountain formation and Lindsay formation. Temporary excavations should be observed and reviewed during construction to confirm that the soil, bedrock, and groundwater conditions are as anticipated.

The excavations should be carried out in accordance with the guidelines outlined in the Occupational Health and Safety Act (OHSA) for Construction Activities (Ontario Regulation 213). The existing topsoil / fill and surficial glaciolacustrine deposits are classified as Type 3 soils above the groundwater level and Type 4 soils below the groundwater level. The upper till deposit is classified as a Type 2 soil above the groundwater level and a Type 3 soil below the groundwater level. According to the OHSA, temporary excavations within Type 2 and 3 soils should be made with side slopes inclined at 1H:1V or flatter and temporary excavations within Type 4 soils should be made with side slopes inclined at 3H:1V or flatter. Depending on the time of year and, based on the variable nature of fill and native soils, localized flattening of temporary excavations may be required in some areas during construction.

Temporary shaft excavations extending into the bedrock may be carried out with vertical sidewalls. However, the competency of the bedrock to stand vertically will need to be assessed on site during excavation and will need to be monitored on a continual basis. The highly to moderately weathered bedrock may require shotcrete to ensure stability and to protect the rock from ravelling. The slightly weathered to fresh bedrock can be supported with pattern rock bolts and wire mesh or shotcrete. Drain holes installed on a regular pattern should be provided if a shotcrete facing is installed to protect the bedrock.

Excavated material must be stockpiled at a distance away from the excavation equal to or greater than the depth of the open cut excavation. Where sufficient space is not available to stockpile the excavated material at the site, off-site staging of the excavated material intended for reuse would need to be arranged. Care must also be taken

during excavation to ensure that adequate support is provided for any existing structures, roadways and underground services located adjacent to the excavations.

The temporary excavations should be carried out in general accordance with OPSS.PROV 902 (*Excavating and Backfilling - Structures*).

8.6 Temporary Protection Systems

To facilitate construction of the reactor building, which is to be founded on bedrock, and where the side slopes of excavations are required to be steepened to limit the extent of the excavation, some form of temporary excavation support will be required. The selection and design of the temporary protection system will be the responsibility of the contractor. Secant piles, diaphragm walls, or soldier pile and lagging systems are considered feasible at this site. However, we would note that soldier pile and lagging systems do not provide a groundwater cut-off and extensive groundwater control methods would be required. The secant piles or soldier piles would have to be advanced/driven to sufficient depth to provide the necessary passive resistance for the retained soil height, including any surcharge loads behind the protection system within at least a 1H:1V zone relative to the base of the excavation. Lateral support to the secant piles or soldier piles could be provided in the form of struts, rakers and/or tie back anchors.

If conventional solider pile and lagging, secant walls or diaphragm walls are considered as temporary support systems in the overburden for the circular shafts, then, difficulties penetrating through the till soils should be anticipated given that cobbles and boulders are known to be present in such glacial till soils in this region and were encountered throughout the drilling operations at this site. Groundwater seepage will also need to be considered and it is recommended that a watertight protection system be used to control and reduce impacts to the surrounding groundwater level.

The temporary protection system should be designed and constructed in accordance with OPSS.PROV 539 (*Temporary Protection Systems*).

The system must be designed to accommodate the loads applied from earth pressures, water pressures and surcharge pressures from area, line or point loads, as well as the effects of sloping ground behind the system. The loading from construction equipment as well as any material stockpiles within a distance defined by a 1 horizontal to 1 vertical line drawn from the bottom of the excavation to the existing ground surface should be included as a surcharge in the design of the temporary protection system.

8.7 Groundwater and Surface Water Control

Considering sub-excavation within the power block area (excluding the reactor building) will extend to about Elevation 80 m and the groundwater level within the power block area was measured to be up to about Elevation 90 m, it is anticipated that excavations will extend up to about 8 m below the groundwater level. Therefore, dewatering will be required to allow for construction (i.e., excavations, placement of engineered fill and compaction) in dry conditions, or a groundwater cut-off system employed.

Although dewatering operations are considered temporary works and therefore the responsibility of the Contractor, it is anticipated that proactive dewatering in the form of well points or eductor systems to lower the groundwater level to about 1 m below the base of subexcavation will be required prior to excavation / subexcavation operations. Dewatering operations should be carried out in accordance with OPSS.PROV 902 *(Excavation and Backfilling – Structures),* and OPSS.PROV 517 (*Dewatering*).

Water takings in excess of 50,000 L/day are regulated by the Ministry of the Environment, Conservation and Parks (MECP). Certain takings of groundwater and stormwater for construction dewatering purposes with a combined total less than 400,000 L/day qualify for self-registration on the MECP's Environmental Activity and Sector Registry (EASR). Registration on the EASR replaces the need to obtain a Permit to Take Water (PTTW) for water taking and a Section 53 approval for discharge of water to the environment. A "Water Taking Plan" and a "Discharge Plan" are required by the MECP if water is taken in accordance with an EASR. In all cases, discharge must be in accordance with a Discharge Plan (to be developed by a qualified professional). The Contractor is typically responsible for obtaining any required discharge approvals and EASR registration. A Category 3 PTTW would be required for water takings in excess of 400,000 L/day.

Surface water should be directed away from the excavations at all times. Any existing drainage paths / ditches will need to be diverted around the proposed excavation footprint to reduce surface infiltration / seepage.

8.8 Corrosion Potential

Selected soil samples from boreholes BH3, BH51, BH62, and BH78 were submitted to AGAT Laboratories (AGAT) for basic chemical analysis related to potential sulphate attack on buried concrete elements. The concentration of sulphate provides an indication of the degree of sulphate attack that is expected for concrete in contact with soil and groundwater at the site. The sulphate results were compared with Table 3 of Canadian Standards Association Standard A23.1-19 (CSA A23.1) and generally indicate a low degree of sulphate attack potential on concrete structures at of the locations of all tested samples. Therefore, concrete made with Type GU Portland cement is considered acceptable for all substructures.

Selected soil samples from boreholes BH3, BH51, BH62, and BH78 were also submitted to AGAT for basic chemical analysis related to potential corrosion of buried ferrous elements. The pH, resistivity and chloride concentrations provide an indication of the degree of corrosiveness of the subsurface environment. Generally, the results indicate a high potential for corrosion of exposed ferrous metal within the study area, which should be taken into consideration in the design of substructures.

8.9 Inspections and Monitoring

During construction, full time inspections and in-situ materials testing should be carried out by Golder to confirm that the conditions exposed are consistent with those encountered in the boreholes and to monitor conformance to the pertinent project specifications. Materials testing should be carried out in CCIL and CSA certified laboratories, respectively.

IMPORTANT INFORMATION AND LIMITATIONS OF THIS REPORT

Standard of Care: Golder Associates Ltd. (Golder) has prepared this report in a manner consistent with that level of care and skill ordinarily exercised by members of the engineering and science professions currently practising under similar conditions in the jurisdiction in which the services are provided, subject to the time limits and physical constraints applicable to this report. No other warranty, expressed or implied is made.

Basis and Use of the Report: This report has been prepared for the specific site, design objective, development and purpose described to Golder by the Client. The factual data, interpretations and recommendations pertain to a specific project as described in this report and are not applicable to any other project or site location. Any change of site conditions, purpose, development plans or if the project is not initiated within eighteen months of the date of the report may alter the validity of the report. Golder cannot be responsible for use of this report, or portions thereof, unless Golder is requested to review and, if necessary, revise the report.

The information, recommendations and opinions expressed in this report are for the sole benefit of the Client. No other party may use or rely on this report or any portion thereof without Golder's express written consent. If the report was prepared to be included for a specific permit application process, then upon the reasonable request of the client, Golder may authorize in writing the use of this report by the regulatory agency as an Approved User for the specific and identified purpose of the applicable permit review process. Any other use of this report by others is prohibited and is without responsibility to Golder. The report, all plans, data, drawings and other documents as well as all electronic media prepared by Golder are considered its professional work product and shall remain the copyright property of Golder, who authorizes only the Client and Approved Users to make copies of the report, but only in such quantities as are reasonably necessary for the use of the report by those parties. The Client and Approved Users may not give, lend, sell, or otherwise make available the report or any portion thereof to any other party without the express written permission of Golder. The Client acknowledges that electronic media is susceptible to unauthorized modification, deterioration and incompatibility and therefore the Client can not rely upon the electronic media versions of Golder's report or other work products.

The report is of a summary nature and is not intended to stand alone without reference to the instructions given to Golder by the Client, communications between Golder and the Client, and to any other reports prepared by Golder for the Client relative to the specific site described in the report. In order to properly understand the suggestions, recommendations and opinions expressed in this report, reference must be made to the whole of the report. Golder can not be responsible for use of portions of the report without reference to the entire report.

Unless otherwise stated, the suggestions, recommendations and opinions given in this report are intended only for the guidance of the Client in the design of the specific project. The extent and detail of investigations, including the number of test holes, necessary to determine all of the relevant conditions which may affect construction costs would normally be greater than has been carried out for design purposes. Contractors bidding on, or undertaking the work, should rely on their own investigations, as well as their own interpretations of the factual data presented in the report, as to how subsurface conditions may affect their work, including but not limited to proposed construction techniques, schedule, safety and equipment capabilities.

Soil, Rock and Ground Water Conditions: Classification and identification of soils, rocks, and geologic units have been based on commonly accepted methods employed in the practice of geotechnical engineering and related disciplines. Classification and identification of the type and condition of these materials or units involves judgment, and boundaries between different soil, rock or geologic types or units may be transitional rather than abrupt. Accordingly, Golder does not warrant or guarantee the exactness of the descriptions.

Special risks occur whenever engineering or related disciplines are applied to identify subsurface conditions and even a comprehensive investigation, sampling and testing program may fail to detect all or certain subsurface conditions. The environmental, geologic, geotechnical, geochemical and hydrogeologic conditions that Golder interprets to exist between and beyond sampling points may differ from those that actually exist. In addition to soil variability, fill of variable physical and chemical composition can be present over portions of the site or on adjacent properties. The professional services retained for this project include only the geotechnical aspects of the subsurface conditions at the site, unless otherwise specifically stated and identified in the report. The presence or implication(s) of possible surface and/or subsurface contamination resulting from previous activities or uses of the site and/or resulting from the introduction onto the site of materials from off-site sources are outside the terms of reference for this project and have not been investigated or addressed.

Soil and groundwater conditions shown in the factual data and described in the report are the observed conditions at the time of their determination or measurement. Unless otherwise noted, those conditions form the basis of the recommendations in the report. Groundwater conditions may vary between and beyond reported locations and can be affected by annual, seasonal and meteorological conditions. The condition of the soil, rock and groundwater may be significantly altered by construction activities (traffic, excavation, groundwater level lowering, pile driving, blasting, etc.) on the site or on adjacent sites. Excavation may expose the soils to changes due to wetting, drying or frost. Unless otherwise indicated the soil must be protected from these changes during construction.

Sample Disposal: Golder will dispose of all uncontaminated soil and/or rock samples 90 days following issue of this report or, upon written request of the Client, will store uncontaminated samples and materials at the Client's expense. In the event that actual contaminated soils, fills or groundwater are encountered or are inferred to be present, all contaminated samples shall remain the property and responsibility of the Client for proper disposal.

Follow-Up and Construction Services: All details of the design were not known at the time of submission of Golder's report. Golder should be retained to review the final design, project plans and documents prior to construction, to confirm that they are consistent with the intent of Golder's report.

During construction, Golder should be retained to perform sufficient and timely observations of encountered conditions to confirm and document that the subsurface conditions do not materially differ from those interpreted conditions considered in the preparation of Golder's report and to confirm and document that construction activities do not adversely affect the suggestions, recommendations and opinions contained in Golder's report. Adequate field review, observation and testing during construction are necessary for Golder to be able to provide letters of assurance, in accordance with the requirements of many regulatory authorities. In cases where this recommendation is not followed, Golder's responsibility is limited to interpreting accurately the information encountered at the borehole locations, at the time of their initial determination or measurement during the preparation of the Report.

Changed Conditions and Drainage: Where conditions encountered at the site differ significantly from those anticipated in this report, either due to natural variability of subsurface conditions or construction activities, it is a condition of this report that Golder be notified of any changes and be provided with an opportunity to review or revise the recommendations within this report. Recognition of changed soil and rock conditions requires experience and it is recommended that Golder be employed to visit the site with sufficient frequency to detect if conditions have changed significantly.

Drainage of subsurface water is commonly required either for temporary or permanent installations for the project. Improper design or construction of drainage or dewatering can have serious consequences. Golder takes no responsibility for the effects of drainage unless specifically involved in the detailed design and construction monitoring of the system.

APPENDIX A

Symbols, Abbreviations and Terminology for Soil and Rock Description

LIST OF SYMBOLS

Unless otherwise stated, the symbols employed in the report are as follows:

I. GENERAL

π	3.1416
ln x	natural logarithm of x
$\log_{10}$	x or log x, logarithm of x to base 10
g	acceleration due to gravity
t	time

II. STRESS AND STRAIN

γ	shear strain
Δ	change in, e.g. in stress: $\Delta\sigma$
ε	linear strain
ε_v	volumetric strain
η	coefficient of viscosity
υ	Poisson's ratio
σ	total stress
σ'	effective stress ($\sigma' = \sigma - u$)
σ'_{vo}	initial effective overburden stress
$\sigma_1, \sigma_2, \sigma_3$	principal stress (major, intermediate, minor)
σ_{oct}	mean stress or octahedral stress $= (\sigma_1 + \sigma_2 + \sigma_3)/3$
τ	shear stress
u	porewater pressure
E	modulus of deformation
G	shear modulus of deformation
K	bulk modulus of compressibility

III. SOIL PROPERTIES

(a) Index Properties

$\rho(\gamma)$	bulk density (bulk unit weight)*
$\rho_d(\gamma_d)$	dry density (dry unit weight)
$\rho_w(\gamma_w)$	density (unit weight) of water
$\rho_s(\gamma_s)$	density (unit weight) of solid particles
γ'	unit weight of submerged soil ($\gamma' = \gamma - \gamma_w$)
D_R	relative density (specific gravity) of solid particles ($D_R = \rho_s / \rho_w$) (formerly G_s)
e	void ratio
n	porosity
S	degree of saturation

* Density symbol is ρ. Unit weight symbol is γ where $\gamma = \rho g$ (i.e. mass density multiplied by acceleration due to gravity)

(a) Index Properties (continued)

w	water content
w_l or LL	liquid limit
w_p or PL	plastic limit
I_p or PI	plasticity index = $(w_l - w_p)$
NP	non-plastic
w_s	shrinkage limit
I_L	liquidity index = $(w - w_p) / I_p$
I_C	consistency index = $(w_l - w) / I_p$
e_{max}	void ratio in loosest state
e_{min}	void ratio in densest state
I_D	density index = $(e_{max} - e) / (e_{max} - e_{min})$ (formerly relative density)

(b) Hydraulic Properties

h	hydraulic head or potential
q	rate of flow
v	velocity of flow
i	hydraulic gradient
k	hydraulic conductivity (coefficient of permeability)
j	seepage force per unit volume

(c) Consolidation (one-dimensional)

C_c	compression index (normally consolidated range)
C_r	recompression index (over-consolidated range)
C_s	swelling index
C_α	secondary compression index
m_v	coefficient of volume change
c_v	coefficient of consolidation (vertical direction)
c_h	coefficient of consolidation (horizontal direction)
T_v	time factor (vertical direction)
U	degree of consolidation
σ'_p	pre-consolidation stress
OCR	over-consolidation ratio = σ'_p / σ'_{vo}

(d) Shear Strength

τ_p, τ_r	peak and residual shear strength
ϕ'	effective angle of internal friction
δ	angle of interface friction
μ	coefficient of friction = tan δ
c'	effective cohesion
c_u, s_u	undrained shear strength ($\phi = 0$ analysis)
p	mean total stress $(\sigma_1 + \sigma_3)/2$
p′	mean effective stress $(\sigma'_1 + \sigma'_3)/2$
q	$(\sigma_1 - \sigma_3)/2$ or $(\sigma'_1 - \sigma'_3)/2$
q_u	compressive strength $(\sigma_1 - \sigma_3)$
S_t	sensitivity

Notes: 1 $\tau = c' + \sigma' \tan \phi'$

2 shear strength = (compressive strength)/2

LITHOLOGICAL AND GEOTECHNICAL ROCK DESCRIPTION TERMINOLOGY

BEDDING THICKNESS

Description	Bedding Plane Spacing
Very thickly bedded	Greater than 2 m
Thickly bedded	0.6 m to 2 m
Medium bedded	0.2 m to 0.6 m
Thinly bedded	60 mm to 0.2 m
Very thinly bedded	20 mm to 60 mm
Laminated	6 mm to 20 mm
Thinly laminated	Less than 6 mm

JOINT OR FOLIATION SPACING

Description	Spacing
Very wide	Greater than 3 m
Wide	1 m to 3 m
Moderately close	0.3 m to 1 m
Close	50 mm to 300 mm
Very close	Less than 50 mm

GRAIN SIZE

Term	Size*
Very Coarse Grained	Greater than 60 mm
Coarse Grained	2 mm to 60 mm
Medium Grained	60 microns to 2 mm
Fine Grained	2 microns to 60 microns
Very Fine Grained	Less than 2 microns

Note: * Grains greater than 60 microns diameter are visible to the naked eye.

CORE CONDITION

Total Core Recovery (TCR)

The percentage of solid drill core recovered regardless of quality or length, measured relative to the length of the total core run.

Solid Core Recovery (SCR)

The percentage of solid drill core, regardless of length, recovered at full diameter, measured relative to the length of the total core run.

Rock Quality Designation (RQD)

The percentage of solid drill core, greater than 100 mm length, recovered at full diameter, measured relative to the length of the total core run. RQD varied from 0% for completely broken core to 100% for core in solid sticks.

DISCONTINUITY DATA

Fracture Index

A count of the number of discontinuities (physical separations) in the rock core, including both naturally occurring fractures and mechanically induced breaks caused by drilling.

Dip with Respect to Core Axis

The angle of the discontinuity relative to the axis (length) of the core. In a vertical borehole a discontinuity with a 90^{o} angle is horizontal.

Description and Notes

An abbreviation description of the discontinuities, whether naturally occurring separations such as fractures, bedding planes and foliation planes or mechanically induced features caused by drilling such as ground or shattered core and mechanically separated bedding or foliation surfaces. Additional information concerning the nature of fracture surfaces and infillings are also noted.

Abbreviations

JN	Joint	K	Slickensided
FLT	Fault	PO	Polished
SH	Shear	SM	Smooth
VN	Vein	RO	Rough
FR	Fracture	VR	Very Rough
BD	Bedding	SO	Staining Only
FO	Foliation	SA	Slightly Altered
CO	Contact	PC	Partially Coated
PL	Planar	CC	Completely Coated
CU	Curved	IN	Infilled
UN	Undulating	Cl	Clay
IR	Irregular	Sa	Sand
		Si	Silt

FIELD ESTIMATION OF ROCK STRENGTH

Grade	Description	Field Identification	Approx. Range of UCS (MPa)
R0	Extremely Weak Rock	Indented by thumbnail	0.25 - 1
R1	Very Weak Rock	Material can be peeled or shaped with a knife. Crumbles under firm blows from geological hammer.	1 - 5
R2	Weak Rock	Knife cuts material but too hard to shape into triaxial specimens or material can be peeled with a knife with difficulty. Shallow (<5mm) indentations made by firm blows from pick of a geological hammer.	5 - 25
R3	Moderately Strong Rock	Cannot be peeled or scraped with a knife. Hand held specimens can be fractured with single firm blow of geological hammer.	25 - 50
R4	Strong Rock	Handheld specimen requires more than one blow of geological hammer to fracture.	50 - 100
R5	Very Strong Rock	Handheld specimen requires many blows of geological hammer to fracture.	100 - 250
R6	Extremely Strong Rock	Specimen can only be chipped under repeated hammer blows, rings when hit.	> 250

Notes:

1) Handheld specimens should have height approximately 2 times the diameter.

2) Materials having a uniaxial compressive strength of less than approximately 0.5 MPa and cohesionless materials should be classified using soil classification systems.

3) Rocks with a uniaxial compressive strength below 25 MPa (i.e. below R2) are likely to yield highly ambiguous results under point load testing.

FIELD ESTIMATION OF ROCK WEATHERING

Term	Symbol	Description	Discoloration Extent	Fracture Condition	Surface Characteristics
Residual soil	W6	All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported.	Throughout	N/A	Resembles soil
Completely weathered	W5	100% of rock material is decomposed and/or disintegrated to soil. The original mass structure is still largely intact.	Throughout	Filled with alteration minerals	Resembles soil
Highly weathered	W4	More than 50% of the rock material is decomposed and/or disintegrated to a soil. Fresh or discoloured rock is present either as a discontinuous framework or as corestones.	Throughout	Filled with alteration minerals	Friable and possibly pitted
Moderately weathered	W3	Less than 50% of the rock material is decomposed and/or disintegrated to a soil. Fresh or discoloured rock is present either as a discontinuous framework or as corestones. Visible texture of the host rock still preserved. Surface planes are weathered (oxidized or carbonate filling) even when breaking the “intact rock”.	>20% of fracture spacing on both sides of fracture	Discoloured, may contain thick filling	Partial to complete discoloration, not friable except poorly cemented rocks
Slightly weathered	W2	Discoloration indicates weathering of rock material on discontinuity surfaces (usually oxidized). Less than 5% of rock mass altered.	<20% of fracture spacing on both sides of fracture	Discoloured, may contain thin filling	Partial discoloration
Fresh	W1	No visible sign of rock material weathering.	None	Closed or discoloured	Unchanged

Presented below is a list of formulas used for the estimation of various soil properties. The formulas are presented in SI unit system and assume that all components are expressed in the same units.

:: Unit Weight, g (kN/m³) ::

$$g = g_w \cdot \left(0.27 \cdot \log(R_f) + 0.36 \cdot \log(\frac{q_t}{p_a}) + 1.236 \right)$$

where g_w = water unit weight

:: Corrected SPT blow count, N_{60} (blows per 30 cm) ::

$$N_{60} = \left(\frac{q_c}{P_a} \right) \cdot \frac{1}{10^{1.1268 - 0.2817 \cdot I_c}}$$

:: Relative Density, Dr (%) ::

$$100 \cdot \sqrt{\frac{Q_{tn}}{350}}$$

(applicable only to $I_c < 2.4$)

:: Permeability, Ksbt (m/s) ::

$I_c < 3.27$ and $I_c > 1.00$ then $Ksbt = 10^{0.952 - 3.04 \cdot I_c}$

$I_c \leq 4.00$ and $I_c > 3.27$ then $Kbst = 10^{4.52 - 1.37 \cdot I_c}$

:: Overconsolidation Ratio, OCR ::

$$k_{OCR} = 0.33$$

$$OCR = k_{OCR} \cdot Q_{tn}$$

(applicable only to $I_c > 2.4$)

:: In situ Stress Ratio, Ko ::

$$K_O = (1 - \sin\varphi') \cdot OCR^{\sin\varphi'}$$

(applicable only to $I_c > 2.4$)

:: Undrained peak shear strength, Su (kPa) ::

$N_{kt} = 17$ (from field vane testing, corrected for plasticity)

$$S_u = \frac{(q_t - \sigma_v)}{N_{kt}}$$

(applicable only to $I_c > 2.4$)

:: Remolded undrained shear strength, Su(rem) (kPa) ::

$$S_{u(rem)} = f_s$$

(applicable only to $I_c > 2.4$)

:: Drained Friction Angle, φ (°) ::

$$\varphi = 32 + 15.94 \cdot \log(Q_{tn,cs}) - 26.88$$

(applicable only to $I_c < 2.4$)

:: Small strain shear Modulus, Go (MPa) ::

$$G_0 = (q_t - \sigma_v) \cdot 0.0188 \cdot 10^{0.55 \cdot I_c + 1.68}$$

:: Young's Modulus, Es (MPa) ::

$$(q_t - \sigma_v) \cdot 0.015 \cdot 10^{0.55 \cdot I_c + 1.68}$$

(applicable only to $I_c < 2.4$)

Appendix Two Pressuremeter Data Interpretation (duplicated) Two-1

1. Introduction

In-Depth Geotechnical Inc. was retained by Golder Associates Ltd. to conduct Pressuremeter testing in relation to their Geotechnical Investigation for the Darlington New Nuclear Plant Project, in Bowmanville, Ontario.

A factual data PMT Report was presented, dated on April 30, 2022. That report summarized pressuremeter test results in terms of *a)* initial horizontal stresses; *b)* Pressuremeter Moduli; *c)* Unload-Reload moduli; *d)* Yield Pressure; and *e)* Limit Pressure parameters. Those parameters were measured from the Pressure-Volume plots of the corrected field data.

At the request of Golder, this supplementary report presents the inferred soil properties using methods of interpretation accepted by the in-situ testing community. For the purposes of support, Appendix Two, *"Pressuremeter Data Interpretation"* has been attached, as a duplicate, to this Supplementary Report. The same Appendix Two was part and form of the original Factual Data PMT report. Furthermore, the Reader should refer to the Factual Data Report for further details of PMT testing results.

Pressuremeter testing was performed at eight boreholes. The summarized details of tested boreholes are as follow:

Borehole Number	Ground Elevation masl	Number of Tests	Date of Testing (D/M/Y)
BH 4	89.64	6	19-20-21 /07/2021
BH 5	88.97	7	26-27-30 /08/2021
BH 12	87.44	7	27-28 /09/2021 and 12-13 /10/2021
BH 15	87.37	7	24-25-28 /06/2021
BH 19	86.58	5	29-30 /07/2021 and 3-12 /08/2021
BH 55	95.28	9	29-30 /09/2021
BH 63	87.87	6	13-14 /09/2021
BH 67	88.52	6	1-20-23 /08/2021

Ground elevation are presented as provide by Golder Representatives. ***Number of Tests*** indicates the number of completed PMT tests, as not all attempts were successful.

Pre-boring pressuremeter testing was completed using a TEXAM unit. The testing procedure was in general accordance with Procedure B, volume-controlled loading, as outlined in the ASTM D 4719-00 Standard Test Method for Pre-bored Pressuremeter Testing of Soils. The testing equipment was calibrated for pressure and volume losses as indicated in the above-mentioned standard. The Records of Calibration for the PMT probes utilized in this job are attached on Appendix Three. The control unit was de-aired prior to every test. Also, checks were completed to ensure that the probe, tubing, and control unit assembly were fully saturated, and that the probe membrane was leakage-free at high pressures.

2. Pressuremeter Test Results – Inferred Parameters

2.1 Soil Parameters Inferred from PMT test

A general guideline to interpret and infer soil properties based on available PMT test data is attached to Appendix Two. This guideline suggests accepted current procedures to estimate or infer shear strength, deformation properties, and other related soil parameters. These inferred properties are summarized in Table Nos. 2*a*, 2*b*, 2c, 2*d*, 2*e*, 2*f*, 2*g*, and 2*h*, below.

It is recognized that the values of in-situ total horizontal stresses, σ_{h0}, presented in this report correspond to best possible estimates. These estimates were obtained using the *corrected pressure* versus *1/Volume* method, and are used in this report to infer values of the at-rest stress ratio k_0. The following subsurface soil conditions were assumed to apply:

- Ground Surface and Ground Water elevations: as indicated on the Table Nos. 2*a*, to 2*g*, listed in the pages below.
- Average wet and saturated unit weights: γ_{wet} = 20 kN/m^3 and γ_{sat} = 21 kN/m^3
- Total horizontal stresses taken as direct values of p_0 (PMT test results).

It is considered that stresses within the soil mass are defined by geostatic conditions, that is to say:

1. No surcharges are applied on the surface (structural loads from existing buildings nearby are negligible),
2. Static groundwater conditions (no seepage occurs),
3. Surface topography is horizontal (no slopes or excavations), and
4. Total vertical stresses are defined by the *wet* (unsaturated soils) and *saturated* (submerged soils) unit weights, γ_{wet} and γ_{sat}, respectively.

Using the *Pressiorama* and the associated *Pressiorama Cyclique Charts* inferred values of Young's Moduli (E_Y), Classification Index (I_c), and drained friction angle (ϕ') are also shown in Table No. 2.

Table No. 2*a* PMT-Inferred Parameters BH 04-PMT

Notes

1. Ground surface elevation (m) 89.64 | Water elevation (m) 79.70 | Water depth (m) 9.94

2. Wet unit weight of soil 20.0 [kN/m^3] | Saturated unit weight of soil 21.5 [kN/m^3]

3. Observations on Shear Strength Parameters (SSP):
   SSP are considered either for Undrained Conditions (Short Term) or Drained Conditions (Long Term). These two conditions are mutually exclusive.
   Undrained Conditions imply cohesion is c_u , and $\phi = 0$. ***Drained Conditions*** imply negligible cohesion or $c' = 0$, and $\phi = \phi'$
   Based on the Classification Index I_C (Soil Behavior Type), the suggested values of the SSP are highlighted in green (Thick box border)

4. The Classification Index parameter, I_C, is indicative of the soil type of behavior. It does not exactly relate to the Soil Classification types as those obtained via Grain-Size Distribution analyses. I_C varies from 1.0 to 4.5, from soft clays (cohesive) to dense coarse sands (frictional), correspondingly.

3. Closure

The soils inferred parameters presented in this report is based on in-situ PMT testing and interpretation procedures. It should be noted that soil conditions may vary within the site and interpreted data may not be entirely representative of conditions at locations away from the tested borings. Therefore, care should be exercised when extrapolating or inferring subsoil conditions away from the borehole location.

We trust that the present report fulfills your requirements. Should you have any question, please feel free to contact the undersigned.

Sincerely,

In-Depth Geotechnical Inc.

Gabriel Sedran, P.Eng., Ph.D.
President

Appendix Two **(Duplicated)**

Pressuremeter Data Interpretation

Interpretation of Pressuremeter Test Results

Prebored pressuremeter test results are expressed in terms of applied pressure versus radial strain. Both pressure and strain measurements must be corrected for pressure and volume loses using the corresponding probe and system calibration curves.

The typical pressure versus radial strain curve features up to four distinctive portions which characterize the stress-strain behaviour of the soil, namely:

a) The linear pseudo-elastic stress-strain portion of the deformation curve;
b) The departure from linear elastic conditions starting at the yield pressure p_y;
c) The unload-reload portion of the test (usually two cycles are performed); and
d) The development of soil failure, which is represented by the net limit pressure p^*_L.

Based on these test features the following soil parameters are determined or estimated:

1. **Contact Pressure p_o**:

When using the prebored TEXAM unit, the initial contact pressure is taken as the pressure at the intersection of the two lines representing the pseudo elastic and the initial expansion portions of the pressure vs. 1/V plot, as shown in the PMT data sheets, in Appendix One.

2. **Pressuremeter modulus E_{PMT}**:

The pressuremeter modulus is represented by the slope of the pressure versus radial strain curve along its linear portion, and may be calculated as follows:

$$E_{PMT} = (1+\upsilon)(p_2-p_1)\frac{\left(1+\left(\frac{\Delta R}{R_o}\right)_2\right)^2+\left(1+\left(\frac{\Delta R}{R_o}\right)_1\right)^2}{\left(1+\left(\frac{\Delta R}{R_o}\right)_2\right)^2-\left(1+\left(\frac{\Delta R}{R_o}\right)_1\right)^2}$$

where the sub-indices 1 and 2 indicate the beginning and the end of the linear portion of the curve, respectively. These two points are shown in pressuremeter curves with two red oversized circles. For the self-boring probe, the linear portion of the stress-strain response occurs between the very first data point (zero volume increase) and the subsequent two or three data points.

In this determination a value of the Poisson's ratio, typically $\nu = 0.33$ for most soils, must be assumed. For saturated clays a value of $\nu = 0.45$ is suggested.

3. **Yield Pressure** p_y:

The yield pressure indicates the end of the linear pseudo-elastic deformations and the onset of plasticity. This yield pressure is useful in indicating beyond which pressure significant creep deformations may occur.

4. **Unload-Reload Moduli** E_{Unload} and E_{Reload}

The unload and reload moduli are represented by the slope of the unload-reload loop, and they may be used to determine elastic soil deformations upon unloading or reloading conditions such as those typically encountered during excavations.

5. **Net Limit Pressure** p^*_L:

The net limit pressure is a measure of the strength of the soil (either under undrained conditions for cohesive soils, or drained conditions for non-cohesive soils). This parameter is defined as the pressure reached when the soil cavity has been extended to twice its original soil cavity volume V_c (minus the initial total contact pressure p_o).

The limit pressure is not always attained during testing. In such cases, the value of p_L is inferred by plotting pressure versus 1/V for the plastic phase of the deformations. This method of inferring p_L, known as the "upside down curve" method, is described in "*The Pressuremeter and Foundation Engineering*" textbook, by F. Baguelin, J.F. Jezequel, and D.H. Shields, published in 1978 by Trans Tech Publications, Section: Methods of extrapolating pressuremeter curves to p_L. See also ASTM D4719-00, Section 10.6.

It should be noted that radial strains are calculated from the volume of fluid (typically tap water) injected into the probe. In this regard, the radial strains shown in the results are related to the probe expansion, not the cavity's expansion. The cavity initial volume, V_c, is calculate by adding the probe initial volume, V_0, to the volume of water injected into the probe at the initial contact pressure p_0.

6. Some Additional PMT-based Parameters

In addition, two useful ratios, (E_{PMT} / p^*_L) and (p^*_L / p_y), may be used as a general guideline for soil identification, as follows:

for sands $7 < E_{PMT} / p^*_L < 12$

for clays $12 < E_{PMT} / p^*_L$

Many PMT tests completed in the glacial tills present in the geology of the Golden Shoe area (Ontario) registered much higher values than those listed above. In many cases, values for E_{PMT} / p^*_L in excess of 30 have been recorded.

The E_{PMT} / p^*_L value is known as the *mechanical ratio*, and it indicates whether a soil mass behaves in a ductile (high value) or brittle (low value) manner after yield stresses have been reached. This ration It is the PMT equivalent of the soil mechanic's Rigidity Index, e.g., G/σ_{max}.

Inferred Soil Parameters

7. Young's Modulus E_Y

The Pressuremeter modulus E_{PMT} corresponds to large strains, namely for radial strains in the 2 to 5 % range, and it is therefore considered to be a relatively low value of the elastic modulus. In practice, the Young's modulus E can be inferred from Pressuremeter testing using the empirical Menard α factor:

$E_Y = E_{PMT} / \alpha$

Typical values of the Menard α factor are suggested in the following Table:

Soil type	Peat		Clay		Silt		Sand		Sand and gravel	
	E/p_L^*	α	E/p_L^*	α	E/p_L^*	α	E/p_L^*	α	E/p_L^*	α
Over consolidated		1	> 16	1	> 14	2/3	> 12	1/2	> 10	1/3
Normally consolidated	For all values	1	9-16	2/3	8-14	1/2	7-12	1/3	6-10	1/4
Weathered and/or remoulded		1	7-9	1/2		1/2		1/3		1/4
Rock	Extremely fractured				Other				Slightly fractured or extremely weathered	
	α = 1/3				α = 1/2				α = 2/3	

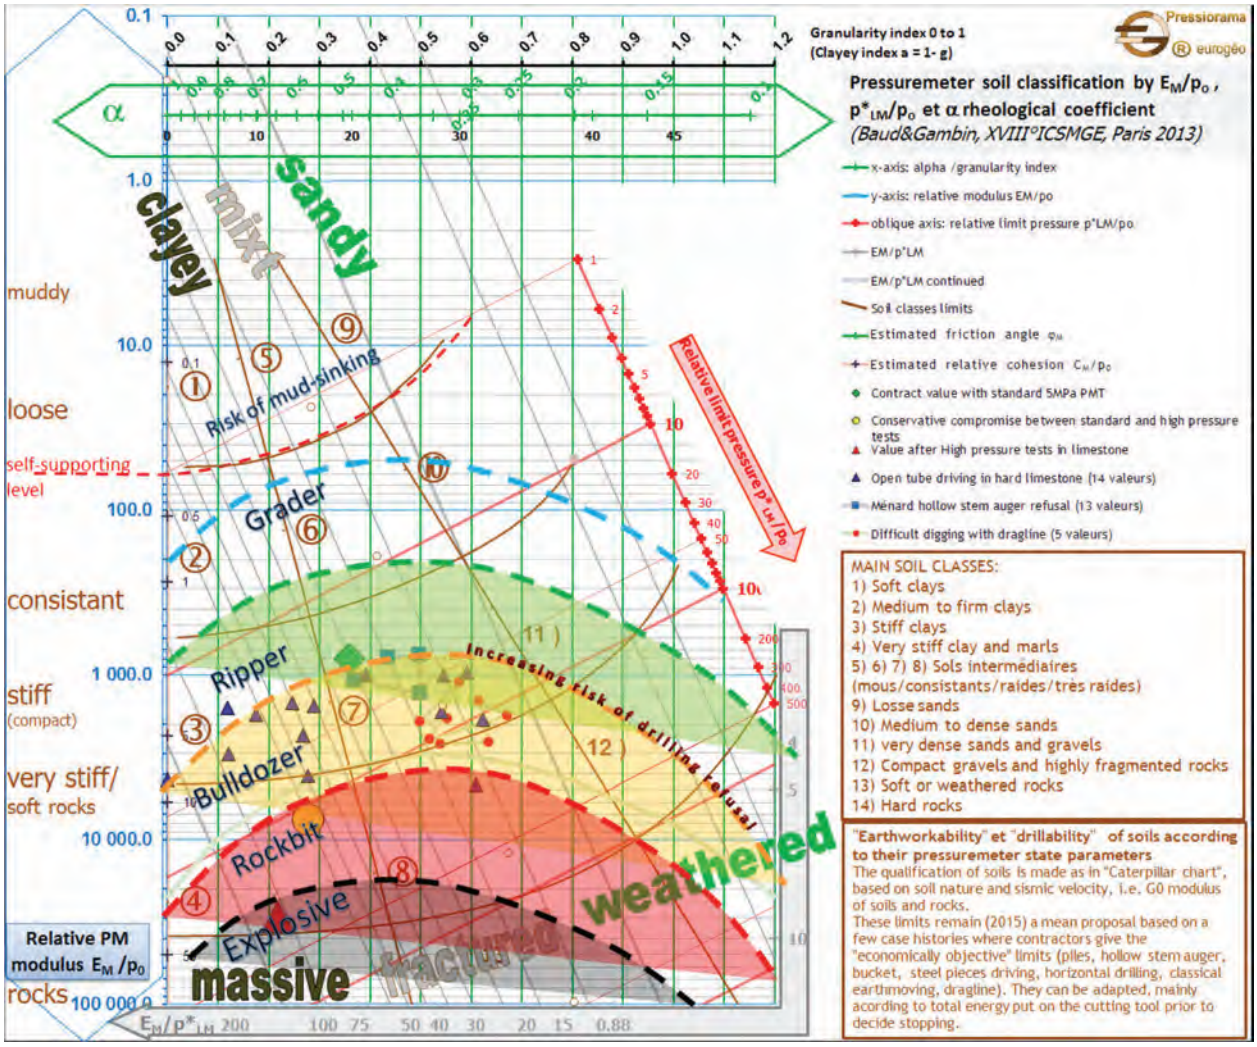

(from 'The Pressuremeter', J.L. Briaud. Balkema, 1992)

Alternatively, better-defined values of the Menard α parameter can be obtained using the following expression, as introduced by J.P. Baud

$$\alpha = \frac{\left(E_{PMT}/P_L^*\right)^{1/n}}{k_E \left(\frac{P_L^*}{p_0}\right)^{m/n}}$$

With $n = 2$; $m = 0.5$; and $k_E = 3.5$.

This expression is based on empirical correlations and may also be visualized in the Pressiorama Chart illustrated in the next page:

Baud J.P., and Gambin M. 2013. *"Détermination du coefficient rhéologique α de Ménard dans le diagramme Pressiorama"*. Proceedings of the 18th International Conference on Soil Mechanics and Geotechnical Engineering. Paris, 2013, Parallel Session ISP 6, International Symposium on the Pressuremeter.

8. Undrained Shear Strength for Cohesive Soil Materials

The undrained shear strength of cohesive soils, c_u or S_u, may be estimated as:

$$\frac{S_u}{p_a} = 0.21\left(\frac{p_L^*}{p_a}\right)^{0.75}$$

where p_a represents a reference pressure (i.e., atmospheric pressure = 100 kPa), after J.L. Briaud ('The Pressuremeter', Balkema, 1992).

9. Drained Friction Angle for Cohesionless Soil Materials

The drained friction angle of cohesionless soils (for $c' = 0$) may be estimated using the empirical correlations illustrated in the graph shown below. This approach is outlined by Baguelin et.al., in *"The Pressuremeter and Foundation Engineering"* (F. Baguelin; J.F. Jézéquel; and D.H. Shields. TransTech Publications. 1978), and it requires some knowledge on the state or conditions of the cohesionless material. This approach only provides a likely range of friction angles for recorded values of the limit pressure.

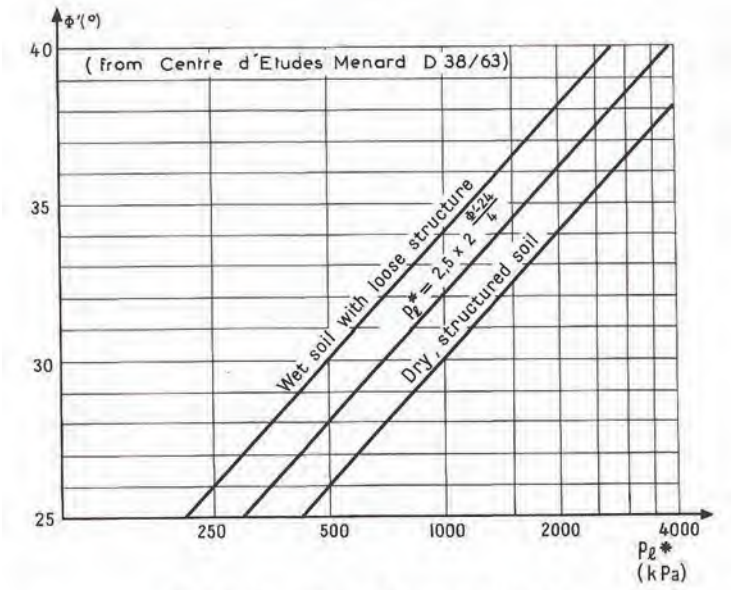

Fig. 6-86: MÉNARD's graph to determine Φ' from p_1^*.

Also alternatively, values of the drained friction angle ϕ' can be inferred using the modified Pressiorama Chart (*Pressiorama Cyclique, in French*) as introduced by Baud.

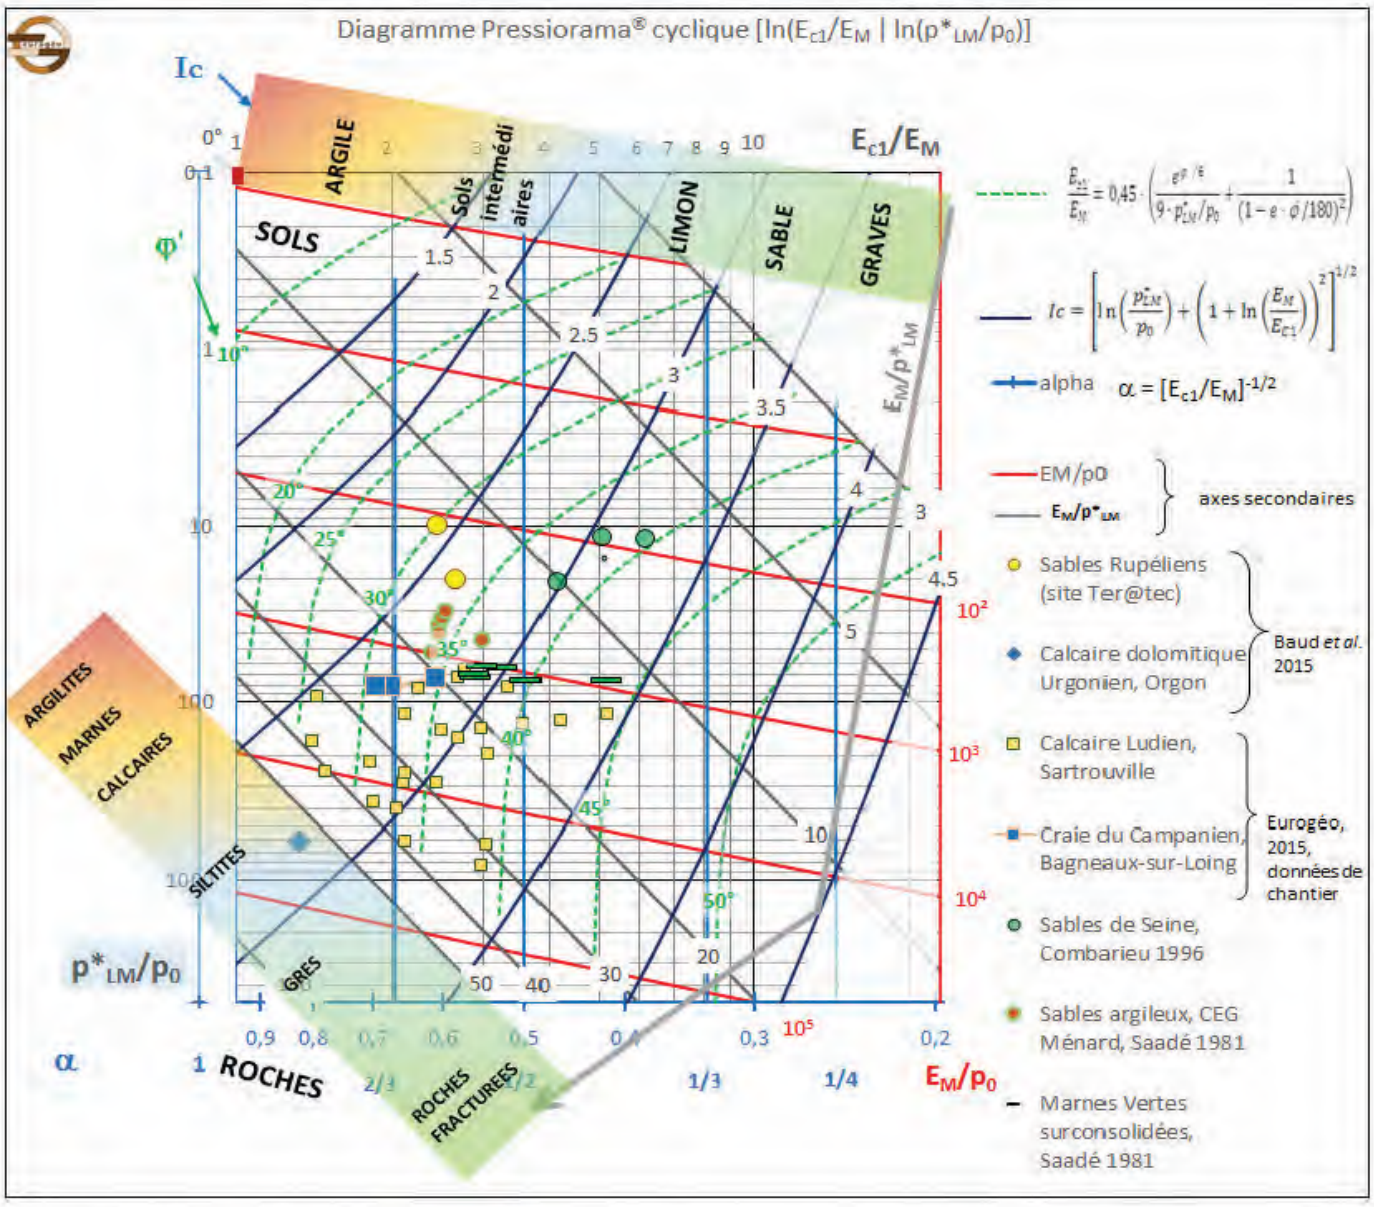

Figure 3. Diagramme Pressiorama® cyclique [ln(Ec1/EM | ln(p*LM/p0].

The values of ϕ' plotted in the modified Pressiorama Chart are calculated with the following expression:

$$\phi' = 5.5\ ln\left(\frac{9}{\alpha^2}\ \frac{P_L^*}{p_0}\right)$$

with values of α calculated/inferred from the modified Pressiorama Chart.

Where this expression provides values of effective friction angle greater than a 45°, a maximum value of 45° should be assumed.

This expression was presented by J.P. Baud, in his publication *"Apport de L'Essai Cyclique a la Classification Pressiométrique des Sols et des Roches"*, Journées Nationales de Geotechnique et de Géologie de l'Ingénieur, Nancy, 2016.

Shear strength parameters suggested in Table No. 3, are based on the guidelines provided by the *Pressiorama* and *Cyclique Pressiorama* charts. It should be noted that these guidelines are subject to changes, or improvements, as the correlations between pressuremeter parameters E_M, p'_L, and p_0 are being adjusted by ever increasing amount of field data. As such, care should be used when using these suggested parameters.

10. Soil Classification Index

Based on PMT testing procedures, soil behavior may be characterized as cohesive or frictional (cohesionless). Using the modified Pressiorama Chart, a Soil Classification Index, namely I_c, can be inferred with the following expression:

$$I_c = \left[\left(1 + log\left(P_L^*/p_0\right)\right)^2 + \left(1 - log(\alpha)\right)^2\right]^{½}$$

A minimum value of 1 would correspond to a cohesive soil, near its state of liquefaction. Whereas, a value of 4.5 would correspond to coarse gravel materials. A value of I_c = 2.7 would apply to a material which behaves mechanically as part frictional (drained for long-term loading conditions) and part cohesive (undrained for the short-term loading conditions). In general, Soil Type Behaviors corresponding to values of the Classification Index I_C are listed as:

1.0 to 1.5	Clays
1.5 to 2.5	Clay-Silt mixes
2.5 to 3.0	Silts
3.0 to 3.5	Sands
3.5 to 4.0	Gravels, and
4.0 to 4.5	Weathered Rocks

APPENDIX E

Overcoring In Situ Stress Testing Interpretations

IN SITU STRESS MEASUREMENTS

1.0 INTRODUCTION

The following document provides a summary of the in-situ stress measurement data collected at boreholes BH66, BH59, BH7, BH10, BH13 and BH68 as part of the geotechnical investigation for the Darlington New Nuclear Project at Darlington, Ontario.

1.1 Evaluation of Stresses from Overcoring Stress Data

Based on the deformations measured across the three pairs of buttons of the USBM borehole deformation gauge described in Steps 3 to 4 above, the stresses on the plane perpendicular to the axis of the borehole are given by the following expressions (Obert and Duval, 1967).

$$P = \frac{E}{6d(1-\upsilon^2)}\left(U_1 + U_2 + U_3 + \frac{1}{\sqrt{2}}[(U_1-U_2)^2 + (U_2-U_3)^2 + (U_3-U_1)^2]^{1/2}\right)$$

$$Q = \frac{E}{6d(1-\upsilon^2)}\left(U_1 + U_2 + U_3 - \frac{1}{\sqrt{2}}[(U_1-U_2)^2 + (U_2-U_3)^2 + (U_3-U_1)^2]^{1/2}\right)$$

where,

E	is the average deformation modulus
ν	is the Poisson's ratio
d	is the diameter of the pilot hole
U_1, U_2, U_3	are the measured changes in borehole diameter across three diameters at 60° rotation (i.e. the 3 sets of buttons on the USBM deformation gauge).
U	is positive for an increasing diameter
P	is the maximum stress perpendicular to borehole axis
Q	is the minimum stress perpendicular to borehole axis

The direction of P is given by:

$$\theta = \frac{1}{2}\tan^{-1}\left[\frac{\sqrt{3}(U_2-U_3)}{2U_1-U_2-U_3}\right]$$

where,

θ is the angle to P measured counter clockwise from the direction of the U_1 diameter.

The quadrant of θ may be determined as follows:

If	$U_2 > U_3$ and $U_2 + U_3 < 2U_1$	then θ is between 0° and 45°
	$U_2 > U_3$ and $U_2 + U_3 > 2U_1$	then θ is between 45° and 90°
	$U_2 < U_3$ and $U_2 + U_3 > 2U_1$	then θ is between 90° and 135°
	$U_2 < U_3$ and $U_2 + U_3 < 2U_1$	then θ is between 135° and 180°

The above equations are derived for plane strain conditions with zero axial strain ($\varepsilon_2 = 0$) along the borehole. If the effect of axial strain is to be taken into account, an estimate of the axial stress along the borehole is required.

The deformation modulus of the rock is evaluated from the results of the biaxial tests using the following expression and assuming isotropic elasticity:

$$E = \frac{4ab^2P_0}{(b^2 - a^2)U}$$

where,

E is the deformation modulus
a is the inner radius of the overcore
b is the outer radius of the overcore
P_o is the radial pressure on the outer surface of the overcore
U is the average diametral deformation of pilot hole in the overcore

1.2 Results of Measurements

All the in-situ stress measurements were carried out within the Lindsay Formation which is a fresh and medium strong to very strong limestone with thin wavy shaly interbeds throughout. In general, due to the relatively competent nature of the limestone in this formation, a high average success rate of 80% was achieved in the overcoring tests. Unsuccessful tests generally resulted from occasional breakages of the rock along the shaly interbeds during overcoring. The depths of the overcoring tests range from 32.02 m to 61.36 m from ground surface (elevation from 57.98 m to 25.78 m). The deepest test (at 61.36 m depth or 25.78 m elevation) was achieved in BH13.

In BH7, pockets of methane gas were encountered during testing between around 40 m to 50 m depth (elevation 48 m to 38 m). These occurrences severely hindered the overcore testing and made it difficult to successfully complete some of the tests. As a result, only 5 interpretable tests were achieved out of 8 attempts in BH7. In order to comply with the requirements of the overcoring testing program which stipulate that 6 interpretable tests are to be achieved in each borehole, an addition interpretable test was completed in BH68, which is located approximately 48 m from BH7, to cover the shortfall in BH7.

Table E-1 summarizes results of the interpretable tests achieved in each of the boreholes. It includes the borehole and test numbers, deformations measured in the EX pilot holes during overcoring as interpreted from the overcoring stress relief plots, the measured horizontal elastic modulus (E) values, and the maximum (P) and the minimum (Q) horizontal stresses interpreted from the test data. The horizontal elastic modulus (E) used for the interpretations were measured from biaxial tests on the overcore samples recovered from the boreholes after overcoring. Where overcore samples could not be recovered due to core breakages during overcoring or core retrieval, E values from other close-by tests were used as indicated. Where overcoring tests were not successful but overcore samples were recovered for biaxial tests, the E values measured from the biaxial tests were also listed with the overcoring test number indicated.

The results obtained in each borehole are presented and discussed below in chronological order of the testing programs conducted in the boreholes:

BH66 (Tests between 54.47 m and 40.57 m elevation)

The maximum horizontal stresses (P) in this hole range from 8.11 MPa to 12.03 MPa and the minimum horizontal stresses (Q) range from 3.89 MPa and 10.18 MPa, showing a fairly uniform stress distribution with depth. Figure E- 1 shows a plot of the in situ horizontal stresses (P and Q) with elevation in this borehole.

The biaxial modulus (E) values of the rock range from 46.21 GPa to 53.17 GPa. All the overcore samples recovered from the test locations were intact. The range of the E values is consistent with the natural variations of the rock. Figure E- 2 shows a plot of the biaxial modulus values with elevation in this borehole.

BH59 (Tests between 57.98 m and 45.73 m elevation)

The maximum horizontal stresses (P) in this hole range from 8.03 MPa to 12.91 MPa and the minimum horizontal stresses (Q) range from 5.07 MPa and 8.77 MPa, showing a fairly uniform stress distribution with depth. Figure E- 3 shows a plot of the in situ horizontal stresses (P and Q) with elevation in this borehole.

The biaxial modulus (E) values of the rock range from 36.63 GPa to 41.32 GPa. Only four (4) overcore samples were recovered from this hole for biaxial tests and all the overcore samples were intact. The range of the E values shows fairly uniform modulus values with depth and is consistent with the natural variations of the rock. Figure E- 4 shows a plot of the biaxial modulus values with elevation in this borehole.

BH7 (Tests between 52.90 m and 33.40 m elevation)

The maximum horizontal stresses (P) in this hole range from 9.59 MPa to 13.70 MPa and the minimum horizontal stresses (Q) range from 6.01 MPa and 9.95 MPa, showing a fairly uniform stress distribution with depth. Despite the presence of gas pockets in this hole between 40 m and 50 m elevation, consistent test results were obtained in the successful tests. Figure E- 5 shows a plot of the in situ horizontal stresses (P and Q) with elevation in this borehole.

The biaxial modulus (E) values of the rock range from 41.78 GPa to 53.16 GPa. All the overcore samples recovered from the test locations were intact. The range of the E values shows that the modulus value at a higher elevation (52.9 m elevation) is lower than those at lower elevations of between 50 and 35 m elevation. Figure E- 6 shows a plot of the biaxial modulus values with elevation in this borehole.

BH10 (Tests between 56.37 m and 33.76 m elevation)

The maximum horizontal stresses (P) in this hole range from 9.41 MPa to 13.63 MPa and the minimum horizontal stresses (Q) range from 6.06 MPa and 10.16 MPa, showing a fairly uniform stress distribution with depth. Figure E- 7 shows a plot of the in situ horizontal stresses (P and Q) with elevation in this borehole.

The biaxial modulus (E) values of the rock range from 44.31 GPa to 58.75 GPa. All the overcore samples recovered from the test locations were intact. The range of the E values is consistent with the natural variations of the rock. Figure E- 8 shows a plot of the biaxial modulus values with elevation in this borehole.

BH13 (Tests between 51.86 m and 20.38 m elevation)

The maximum horizontal stresses (P) in this hole range from 10.38 MPa to 23.36 MPa and the minimum horizontal stresses (Q) range from 8.67 MPa and 12.30 MPa, showing a fairly definitive increase in maximum horizontal stress (P) with depth. This is the borehole where the deepest test (at 20.38 m elevation) was carried out. The minimum horizontal stresses (Q) however show a fairly uniform distribution with depth. Figure E- 9 shows a plot of the in situ horizontal stresses (P and Q) with elevation in this borehole.

The biaxial modulus (E) values of the rock range from 49.16 GPa to 55.53 GPa. All the overcore samples recovered from the test locations were intact. The range of the E values are consistent with the natural variations of the rock. Figure E- 10 shows a plot of the biaxial modulus values with elevation in this borehole.

BH68 (Tests between 49.04 m and 29.47 m elevation)

The maximum horizontal stresses (P) in this hole range from 9.05 MPa to 12.89 MPa and the minimum horizontal stresses (Q) range from 5.02 MPa and 9.54 MPa, showing a fairly uniform stress distribution with depth. Figure E- 11 shows a plot of the in situ horizontal stresses (P and Q) with elevation in this borehole.

The biaxial modulus (E) values of the rock range from 34.95 GPa to 54.59 GPa. All the overcore samples recovered from the test locations were intact. The range of the E values shows a wider variation of the modulus values. However, this range is still considered to be consistent with the natural variations of the rock. Figure E- 12 shows a plot of the biaxial modulus values with elevation in this borehole.

2.0 OVERALL SUMMARY

The in situ horizontal stresses were measured in six (6) boreholes within an area which measures approximately 48 m by 174 m on plan and extends to an elevation of 25.78 m, for the purposes of characterizing the stress regime within the test site. Figure E- 13 shows a combined plot of all the measured maximum horizontal stresses (P) and minimum horizontal stresses (Q) with elevation. With the exceptions of the tests carried out in BH13 below 43 m elevation, the horizontal stress regime within this block is fairly uniform between 60 m and 30 m elevation with P values ranging from approximately 9 MPa to 15 MPa. Test results in BH13 shows a trend of increasing P values with depth below 40 m elevation. The minimum horizontal stresses (Q) between 60 m and 20 m elevation are fairly uniform, ranging from 5 MPa to 12 MPa.

Figure E- 14 shows a combined plot of all the measured biaxial modulus (E) values with elevation. The E values range from 35 GPa to 58 GPa. The range of E values is generally consistent with the natural variation of the rock and is fairly typical of the biaxial modulus values for fresh and medium strong limestones.

The measured directions of the maximum horizontal stresses are generally oriented within the first (NE) quadrant (azimuths from 0 to 90 degrees) with a few exceptions where the directions are oriented within the second (SE) quadrant (azimuth 90 to 180 degrees).

For the sake of comparison, the in situ horizontal stresses (P and Q) and biaxial modulus (E) values measured at the site of the intake tunnel located in the existing Darlington Nuclear Power Station (Lo and Lukajic,1984) are summarized below:

- Between 80 m and 40 m elevation in the Lindsay Formation, the maximum horizontal stresses (P) range from 10 MPa to 14 MPa whereas the minimum horizontal stresses (Q) range from 5 MPa to 8 MPa.
- Below 40 m elevation (from 40 m to -100 m), the in situ stresses are fairly uniform with an average P value of 14 MPa and an average Q value of 8 MPa.
- Between 85 to 20 m elevation, the biaxial modulus (E) values range from 32 GPa to 63 GPa.

It may be noted that the in situ horizontal stresses and biaxial modulus values obtained from the current overcoring test program carried out at the site of the proposed New Darlington Station are consistent with the set

of historic stress data obtained in the same rock formation at comparable depths at the site of the existing Darlington Power Station.

Table E-1: Summary of In Situ Stress Measurement Test Results

Borehole	Test No.	Depth (mbgs)	U_1		U_2		U_3		P	Q	E	Azimuth of P	Remarks

Notes:

Only results of interpretable tests shown. Gas pockets encountered during overcoring of Tests 3 and 4 in BH-7.

U_1, U_2, and U_3 are measured diametral deformations (in microinches and in micrometer) of the EX pilot hole during overcoring. These values are interpreted from the recorded USBM gauge readings.

P = Maximum Horizontal Stress (Major Principal Horizontal Stress).

Q = Minimum Horizontal Stress (Minor Principal Horizontal Stress).

E = Horizontal Deformation Modulus determined from biaxial tests on overcore samples unless otherwise stated.

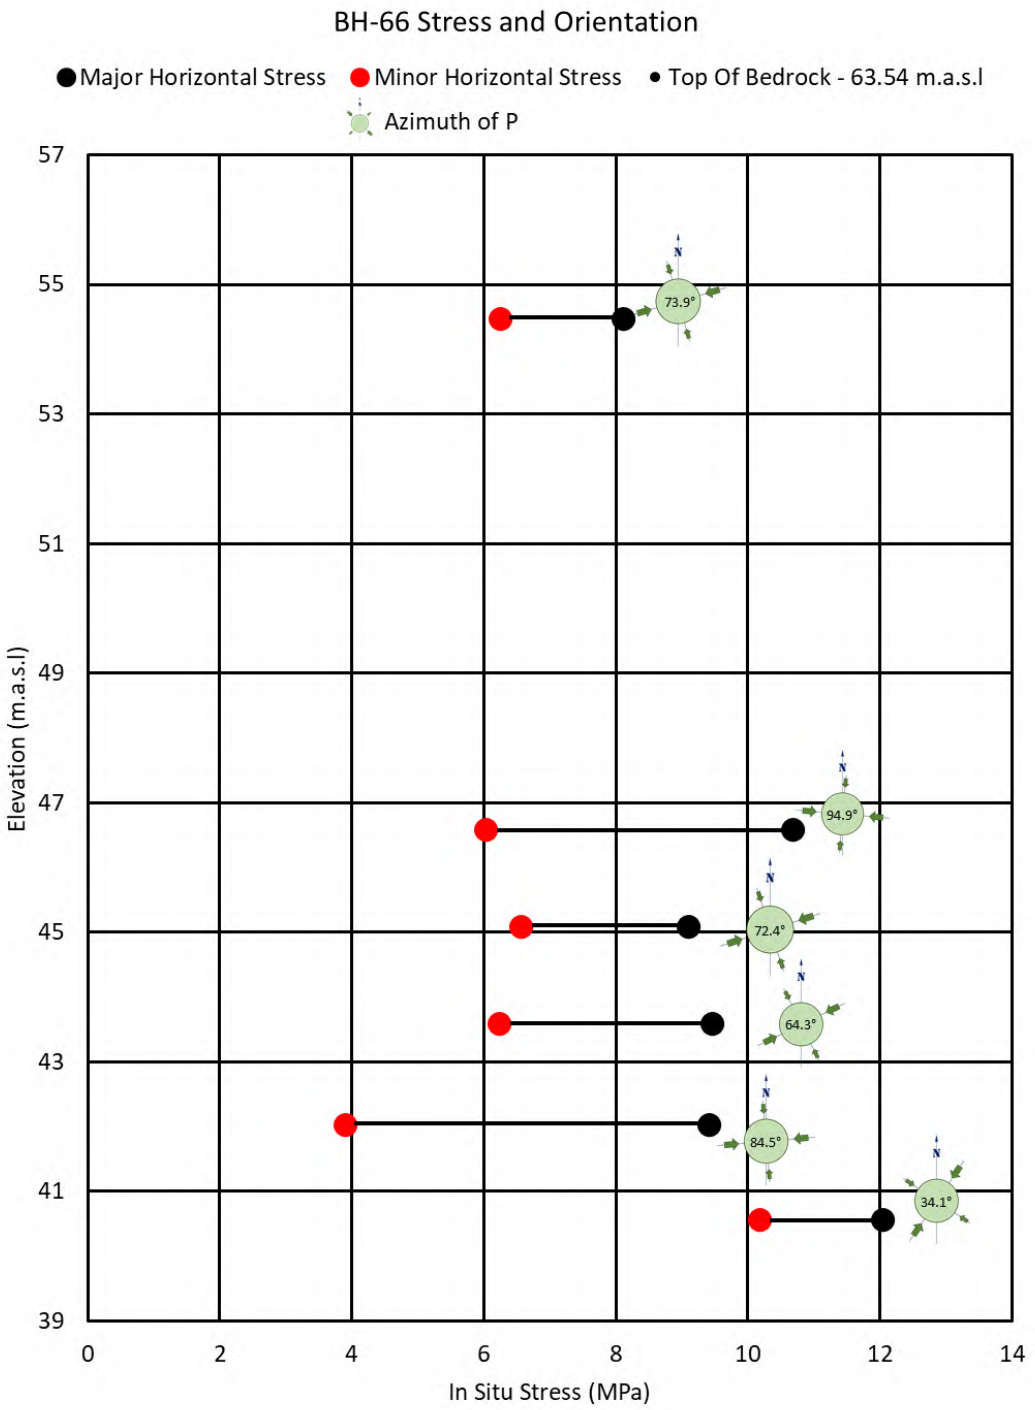

Figure E-1: Maximum (P) and minimum horizontal stresses (Q) for the interpretable tests

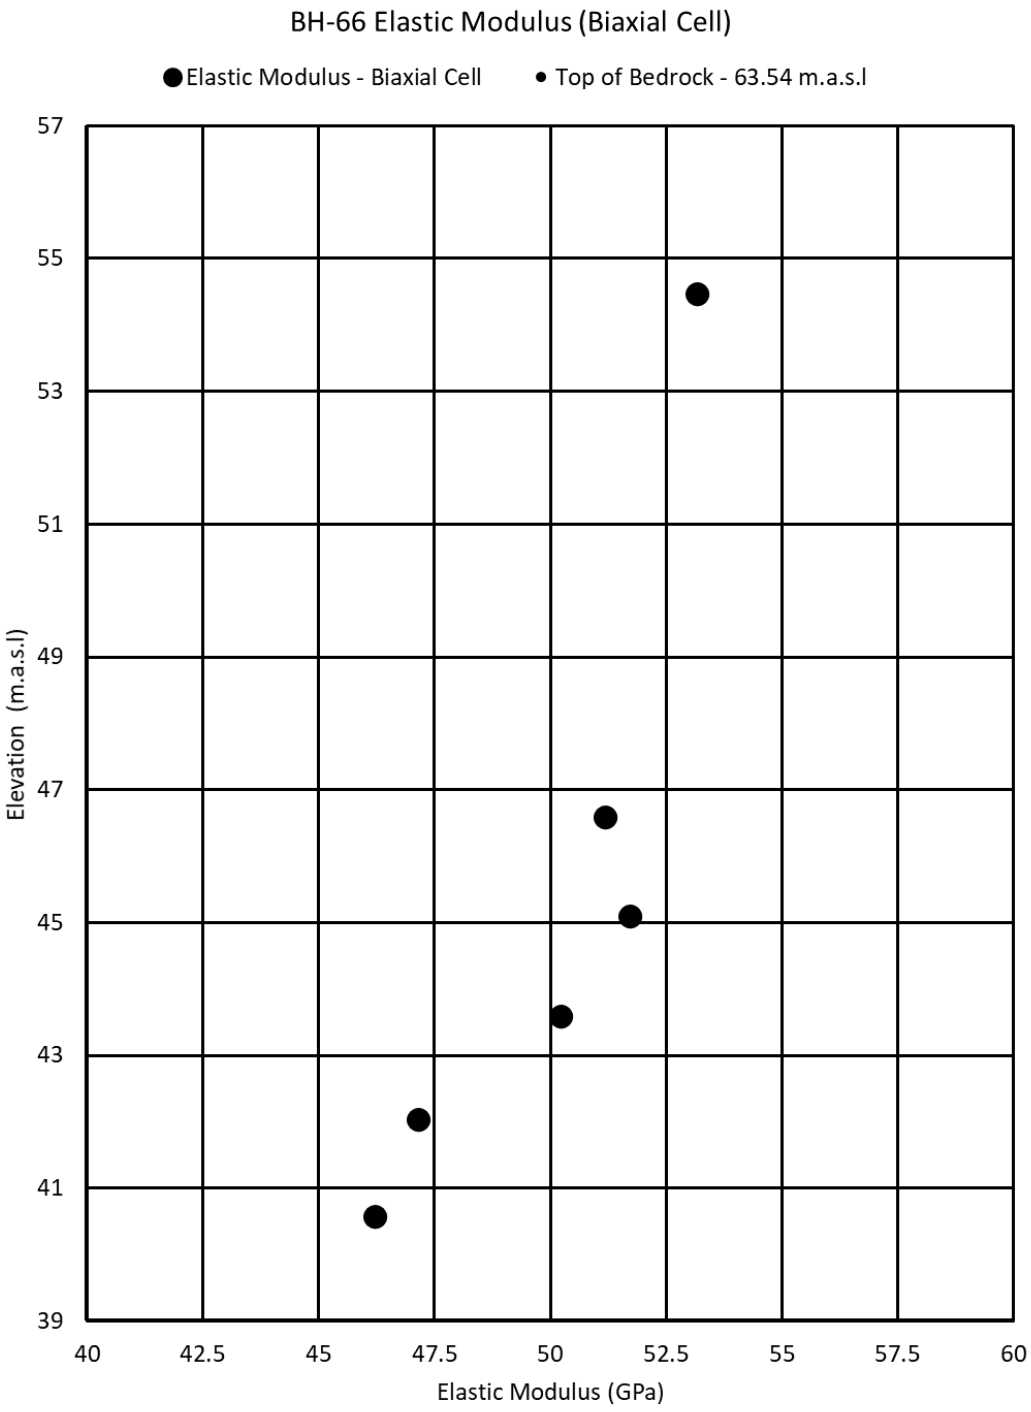

Figure E-2: Horizontal elastic modulus (*E*) of the rock measured from the biaxial tests

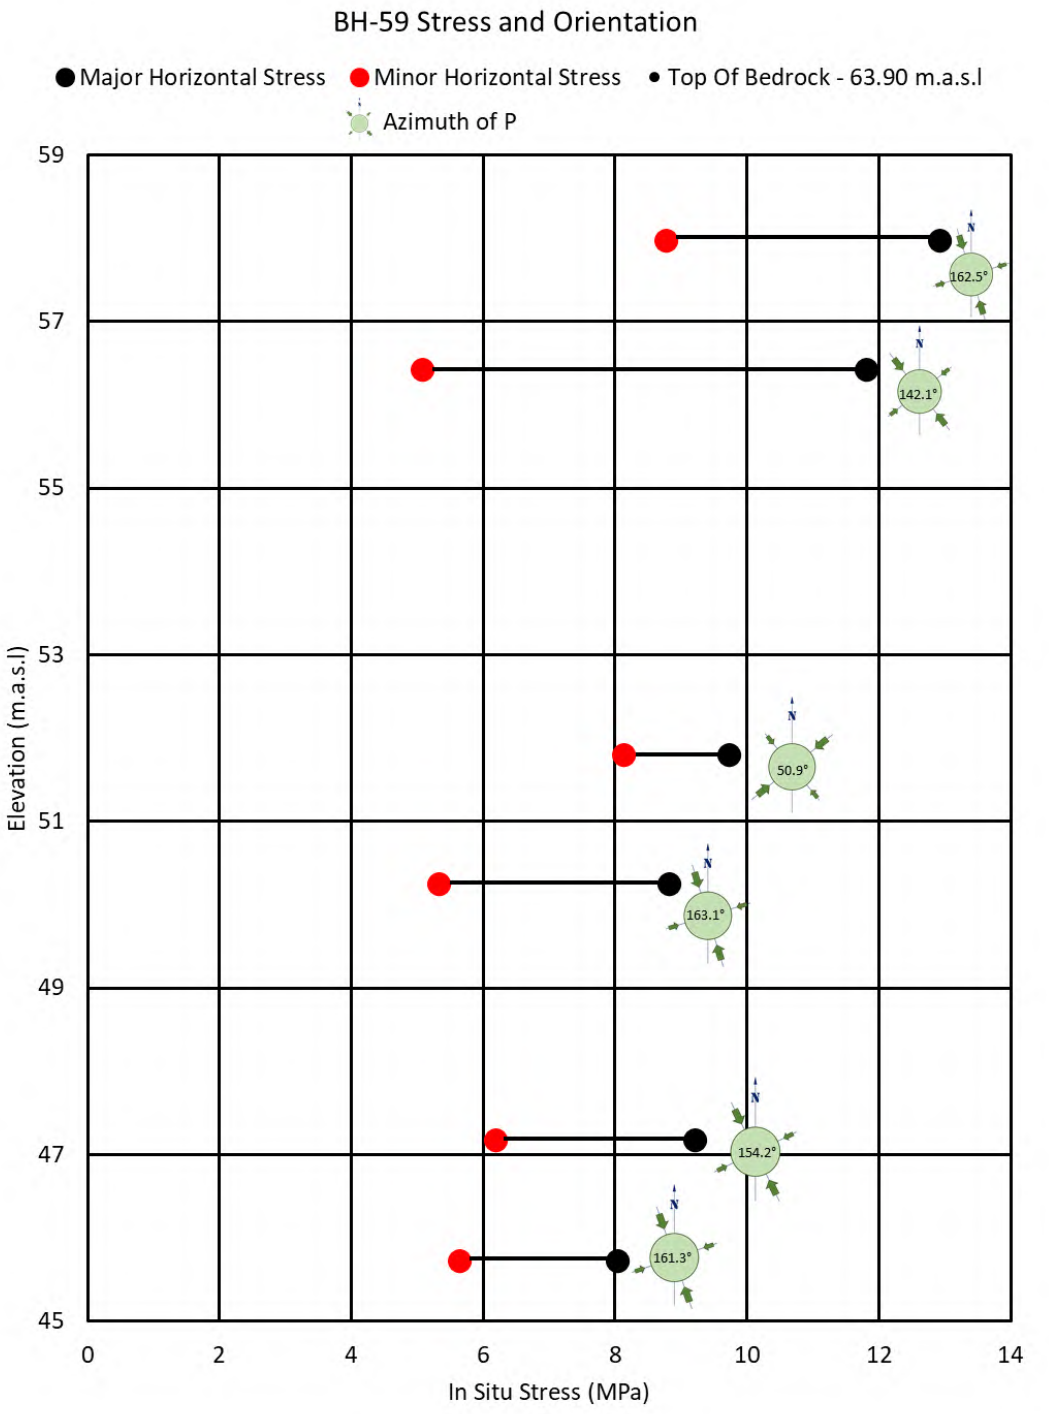

Figure E-3: Maximum (P) and minimum horizontal stresses (Q) for the interpretable tests

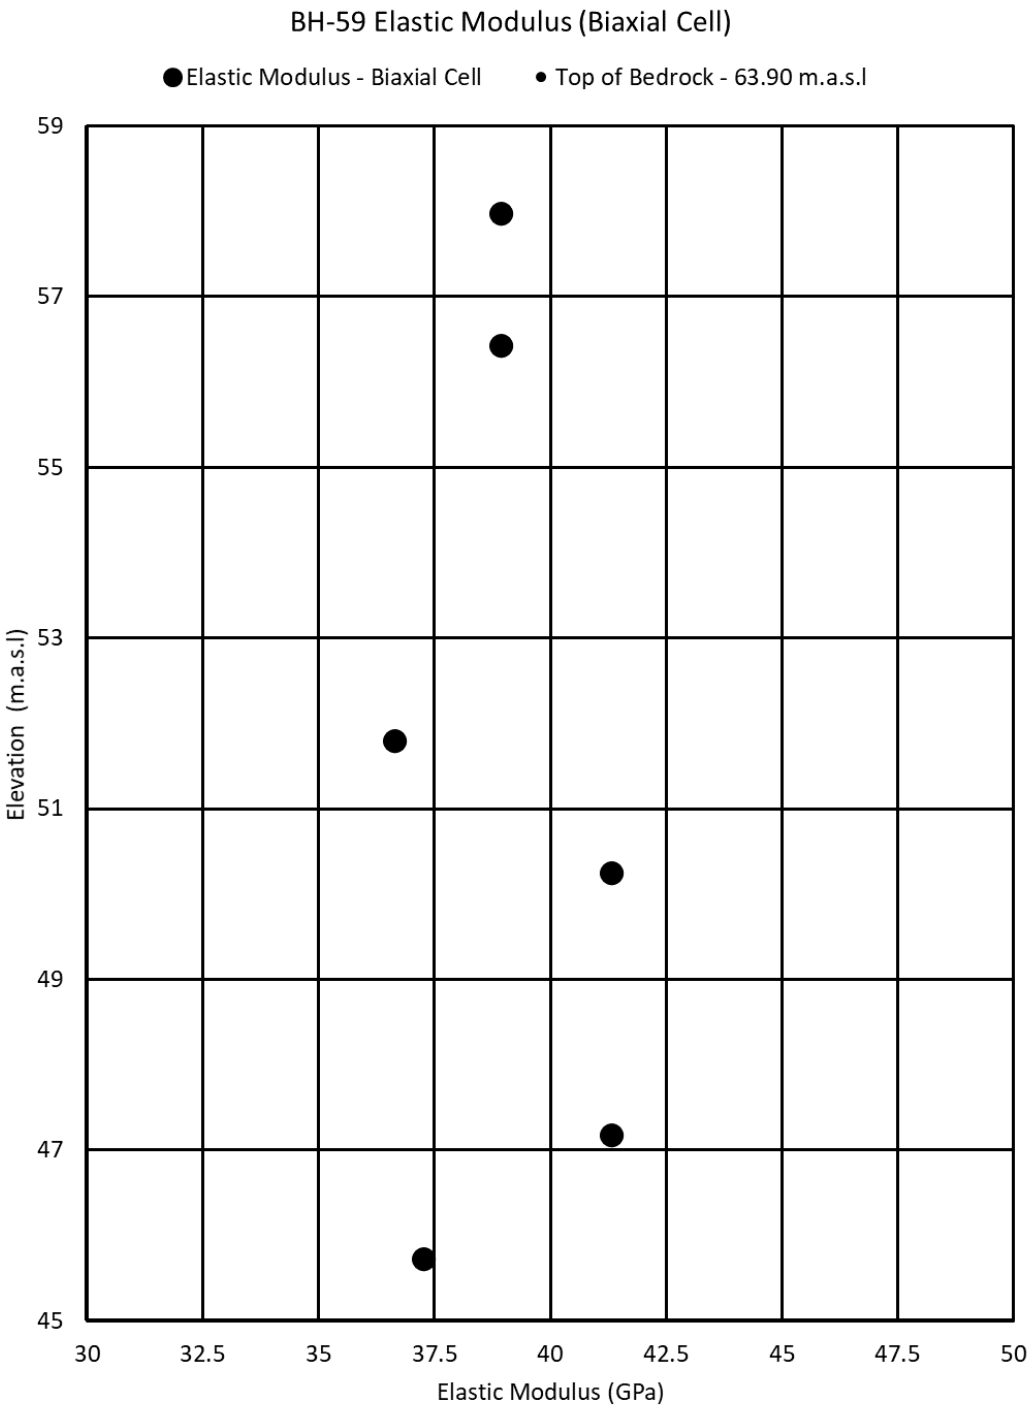

Figure E-4: Horizontal elastic modulus (*E*) of the rock measured from the biaxial tests

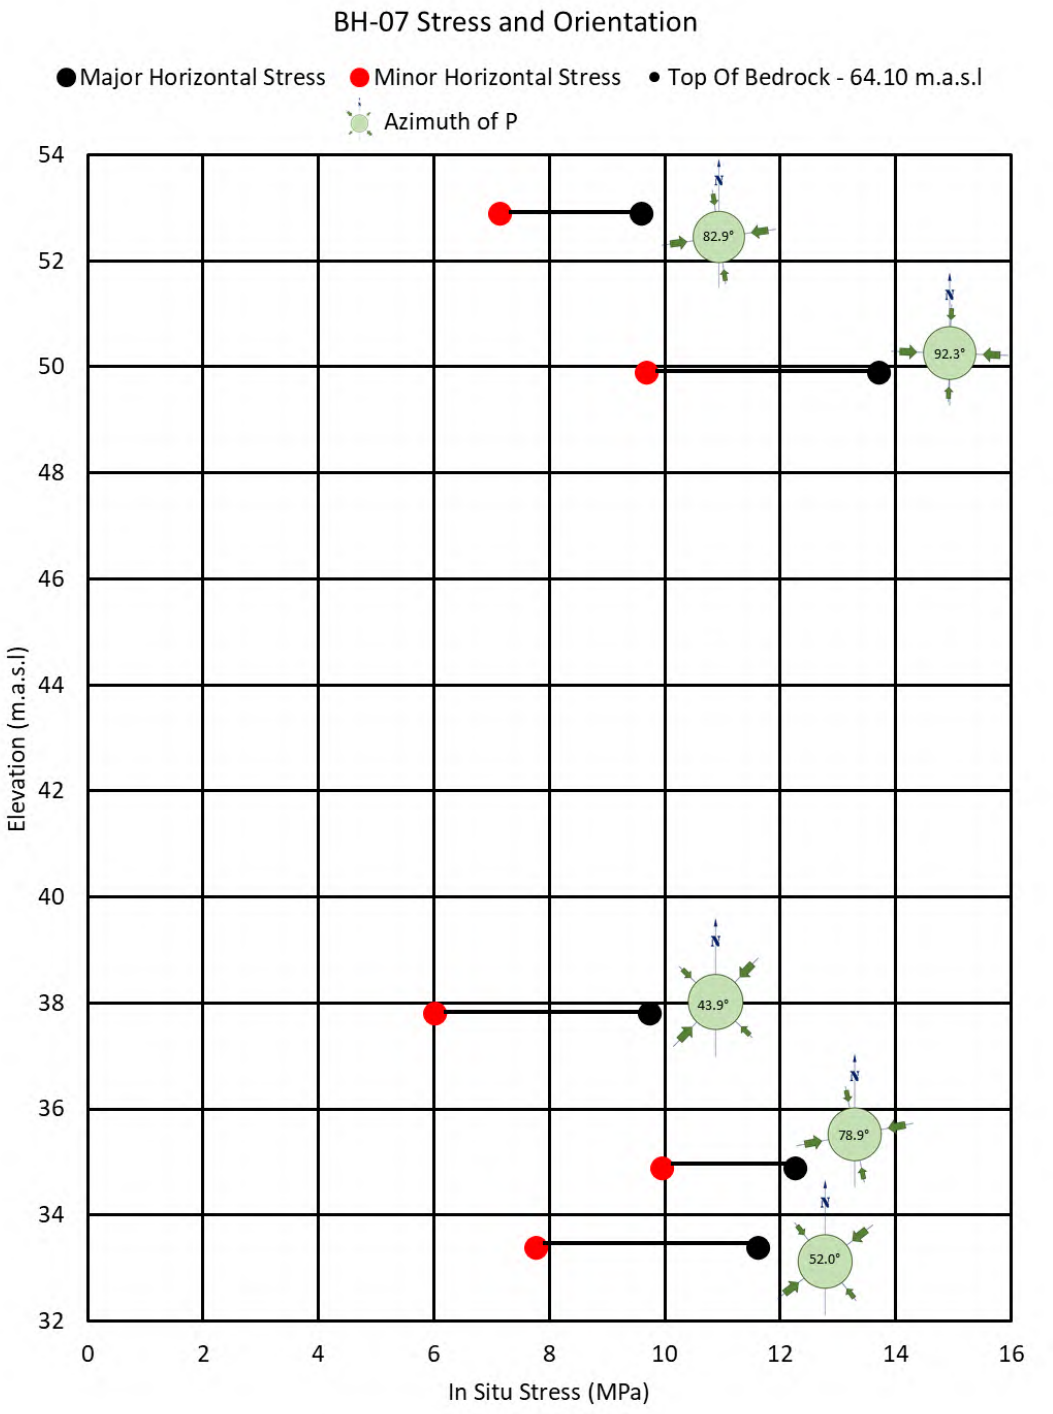

Figure E-5: Maximum (P) and minimum horizontal stresses (Q) for the interpretable tests

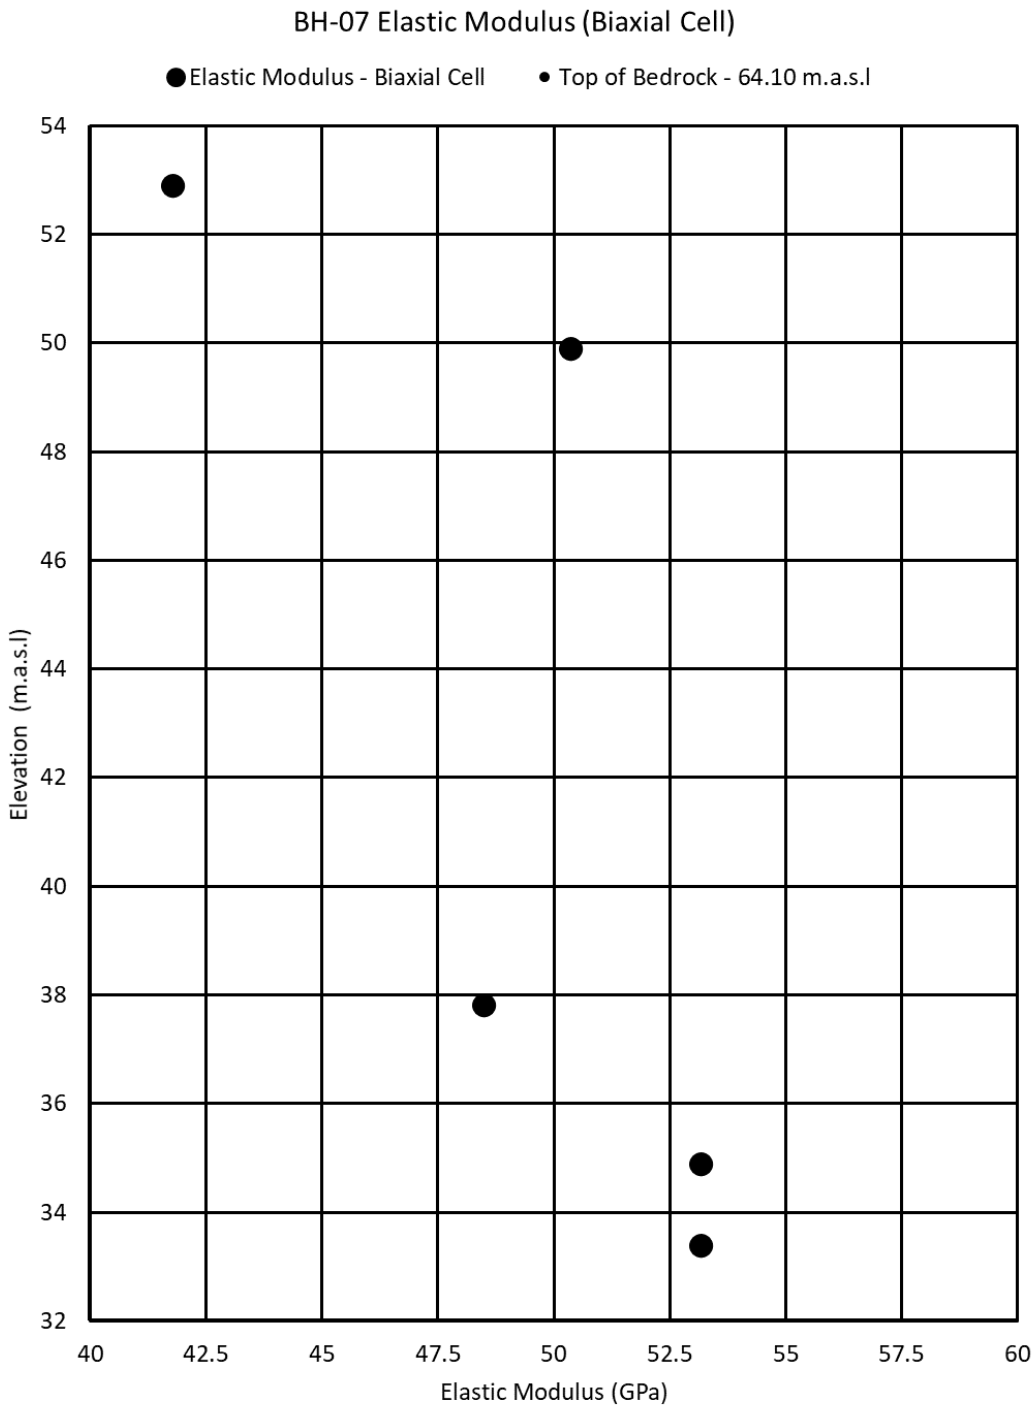

Figure E-6: Horizontal elastic modulus (*E*) of the rock measured from the biaxial tests

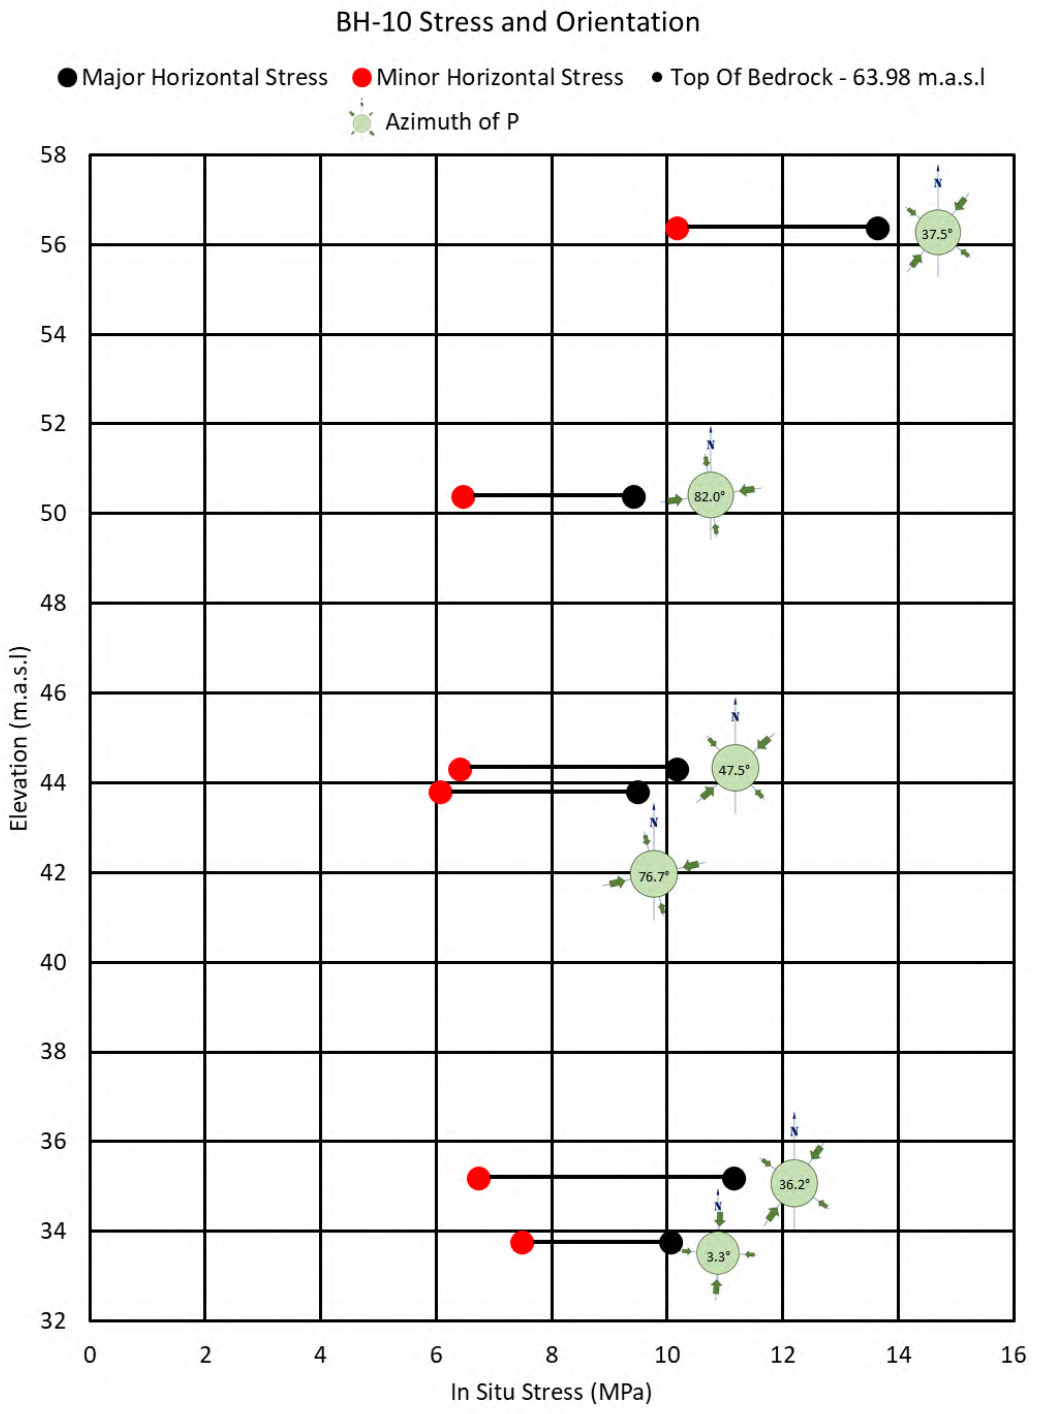

Figure E-7: Maximum (P) and minimum horizontal stresses (Q) for the interpretable tests

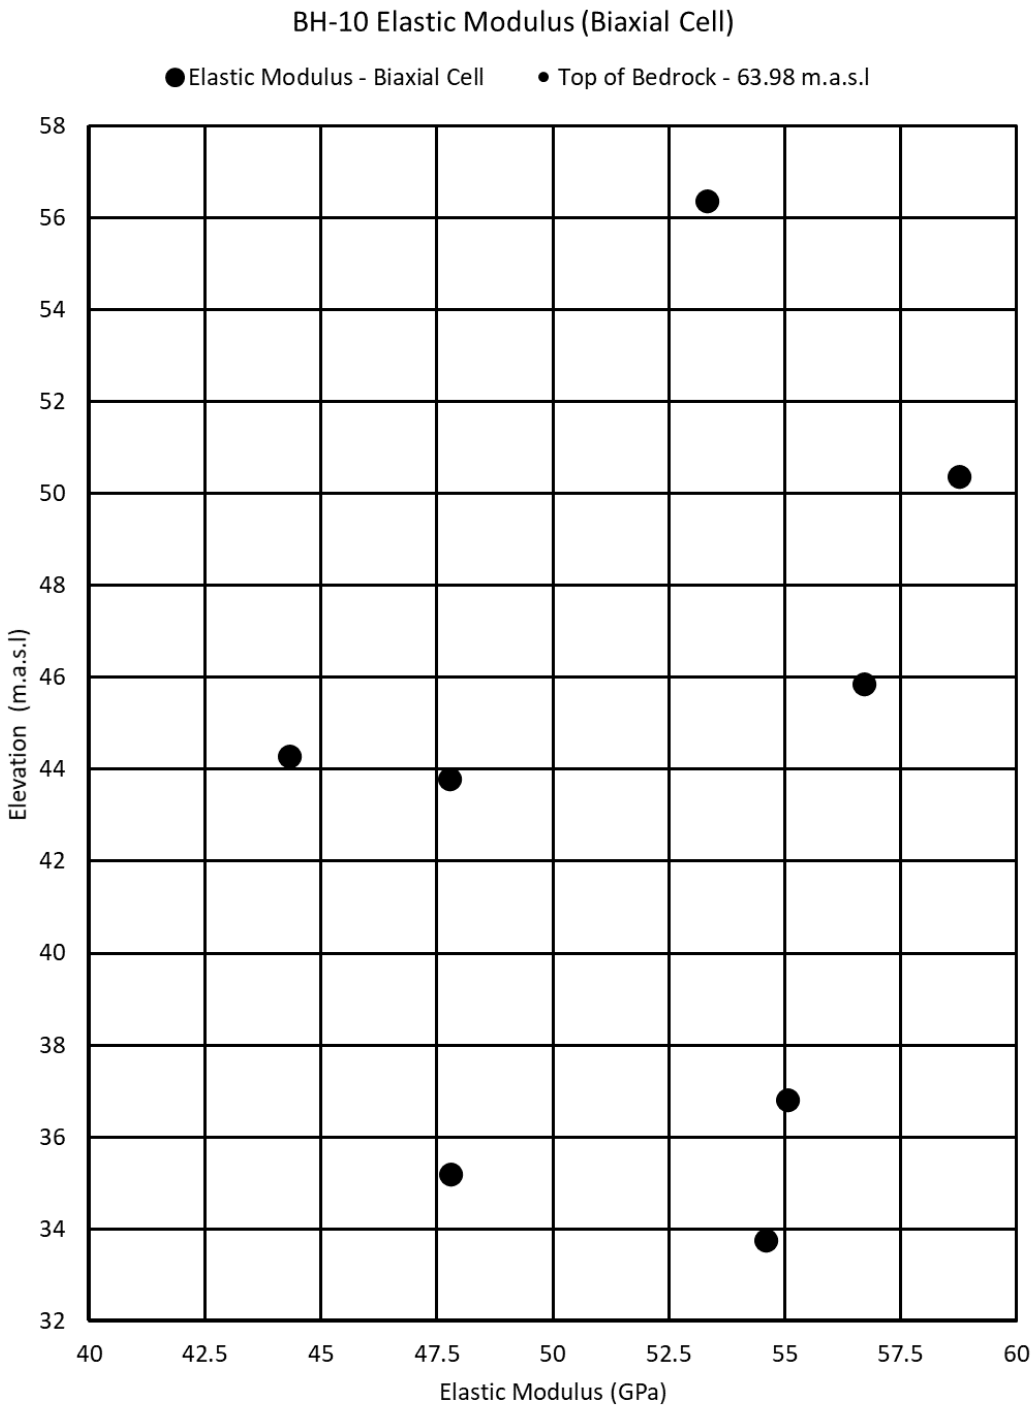

Figure E-8: Horizontal elastic modulus (*E*) of the rock measured from the biaxial tests

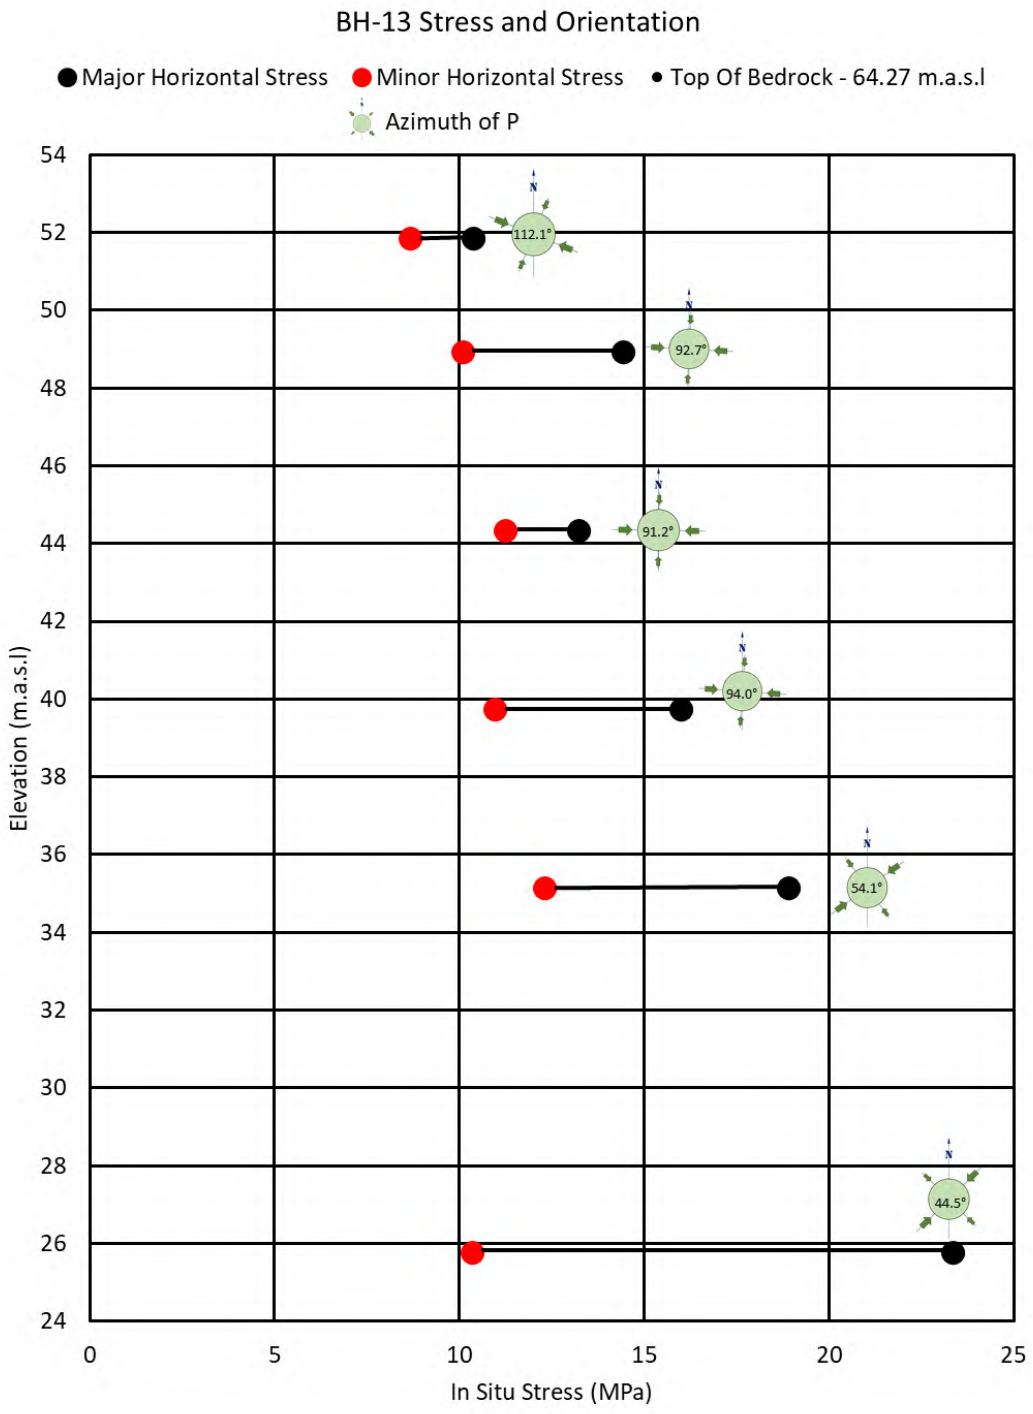

Figure E-9: Maximum (P) and minimum horizontal stresses (Q) for the interpretable tests

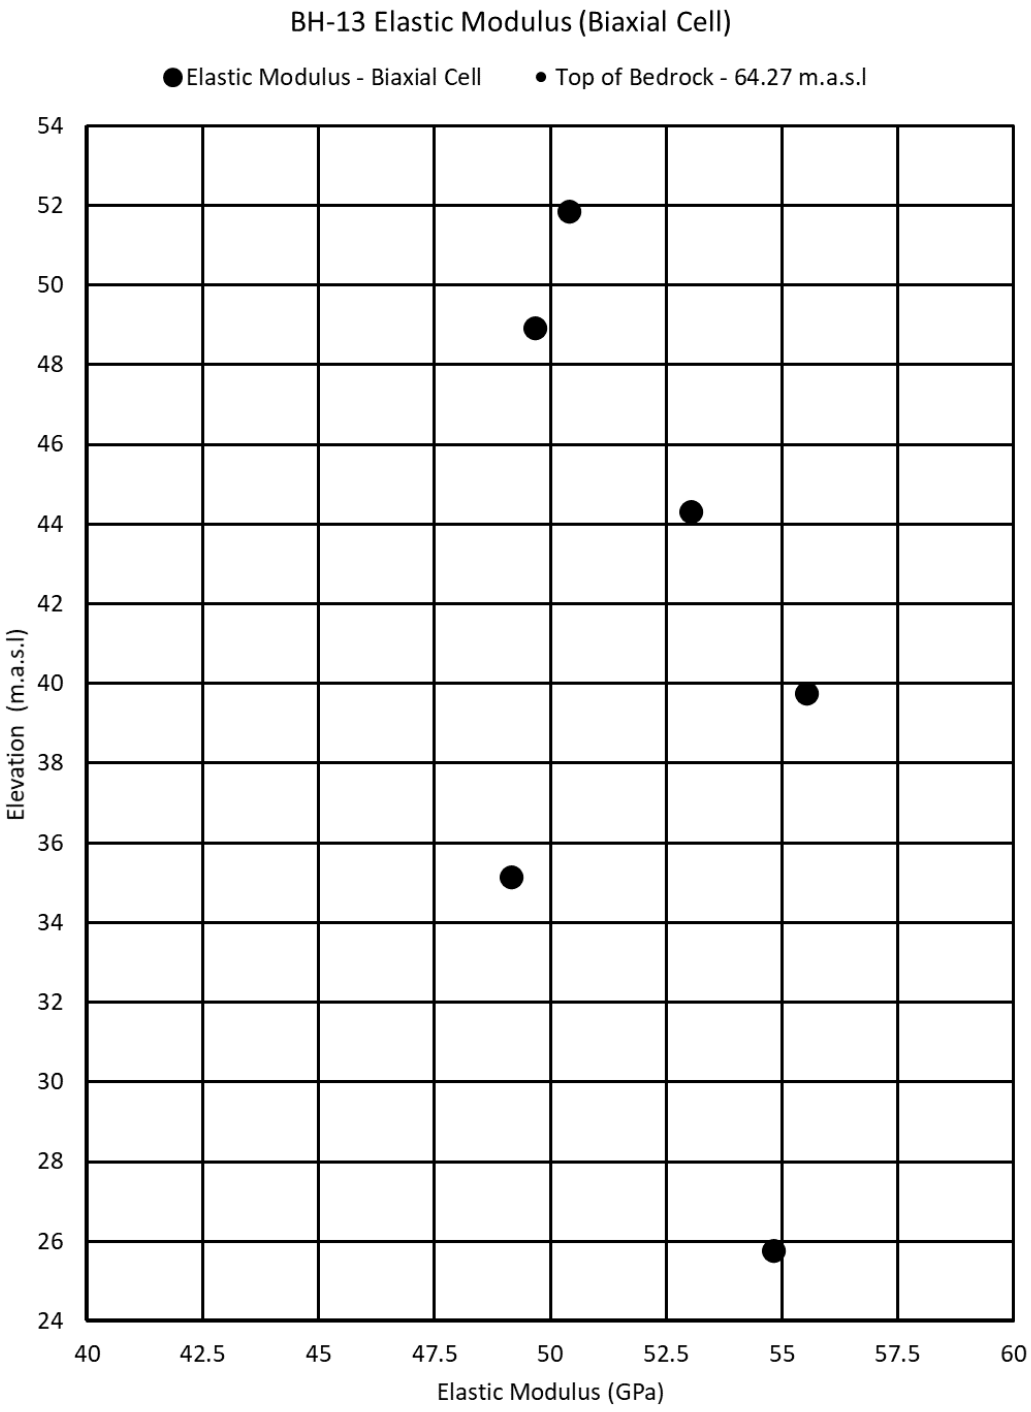

Figure E- 10: Horizontal elastic modulus (*E*) of the rock measured from the biaxial tests

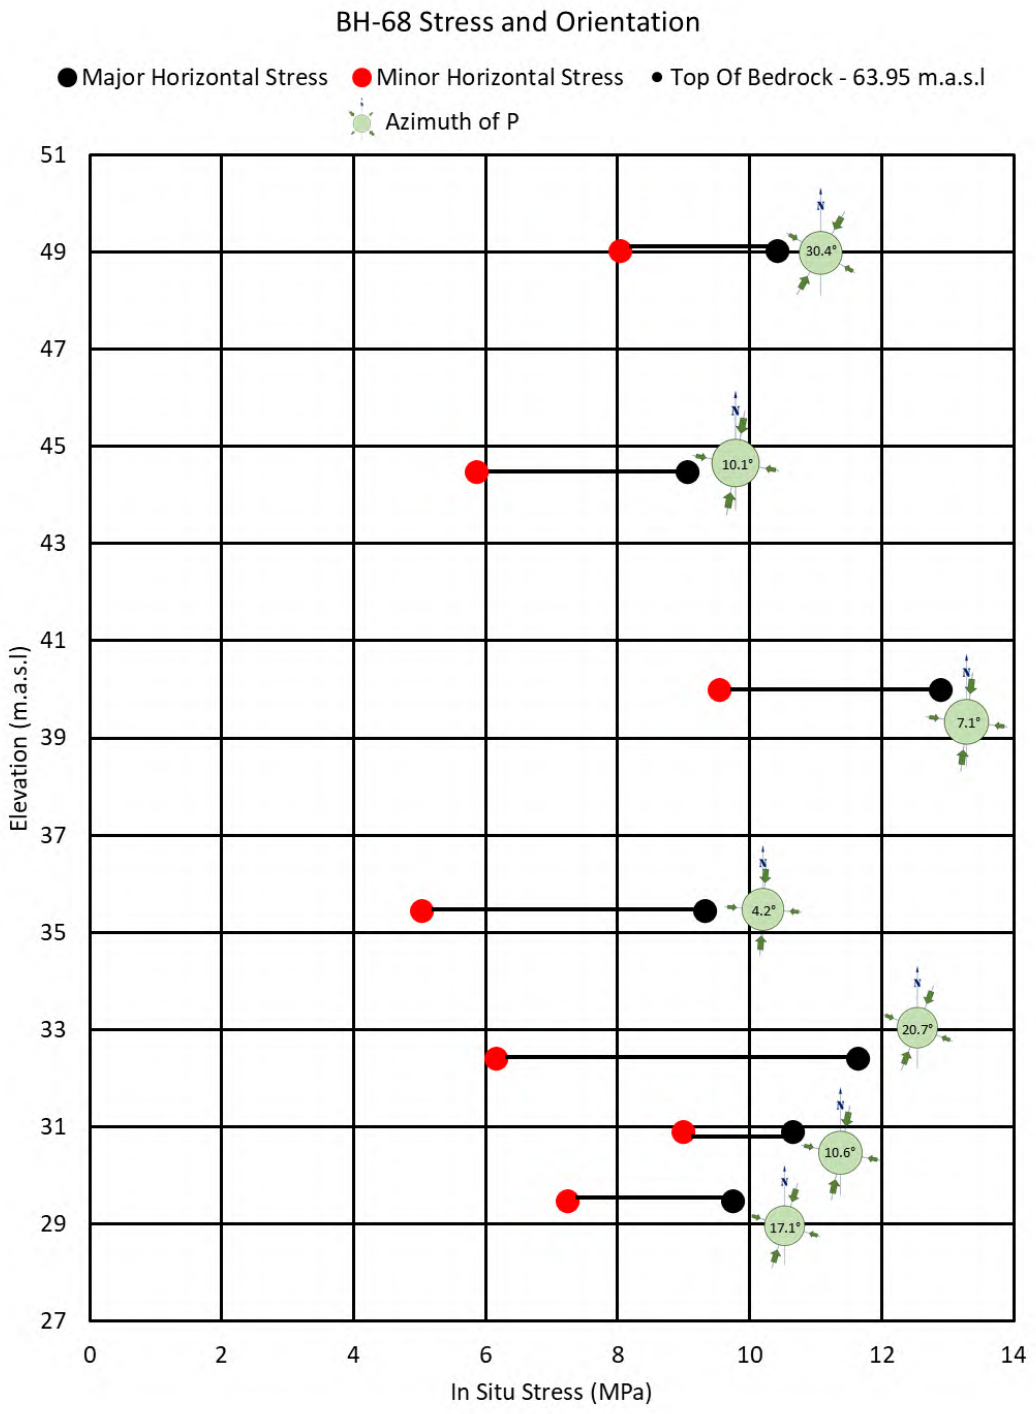

Figure E-11: Maximum (P) and minimum horizontal stresses (Q) for the interpretable tests

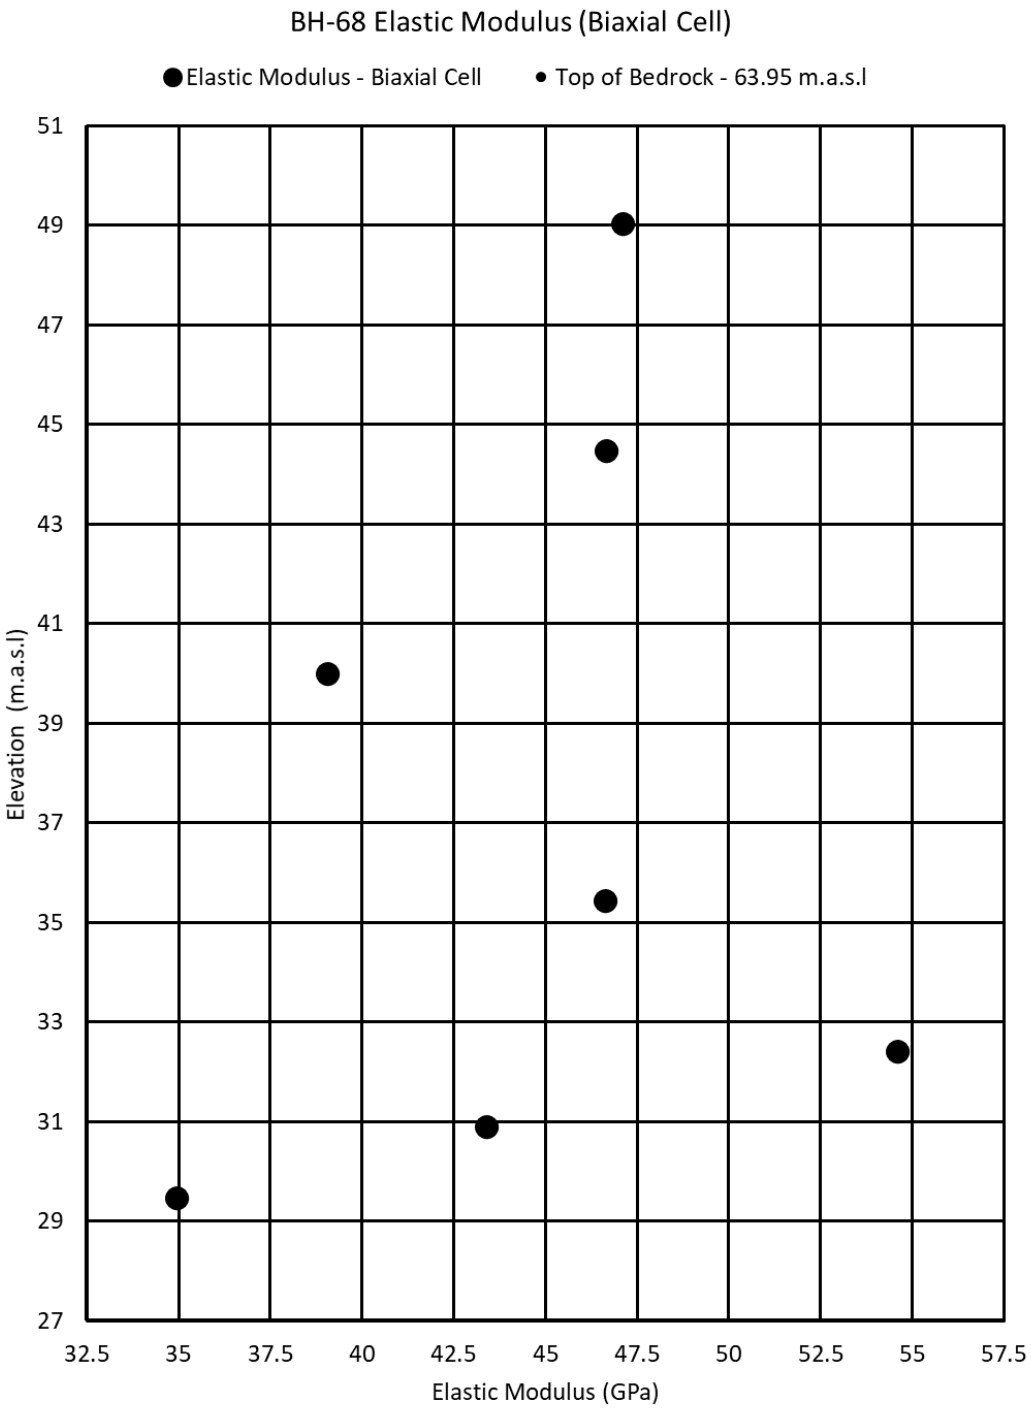

Figure E-12: Horizontal elastic modulus (*E*) of the rock measured from the biaxial tests

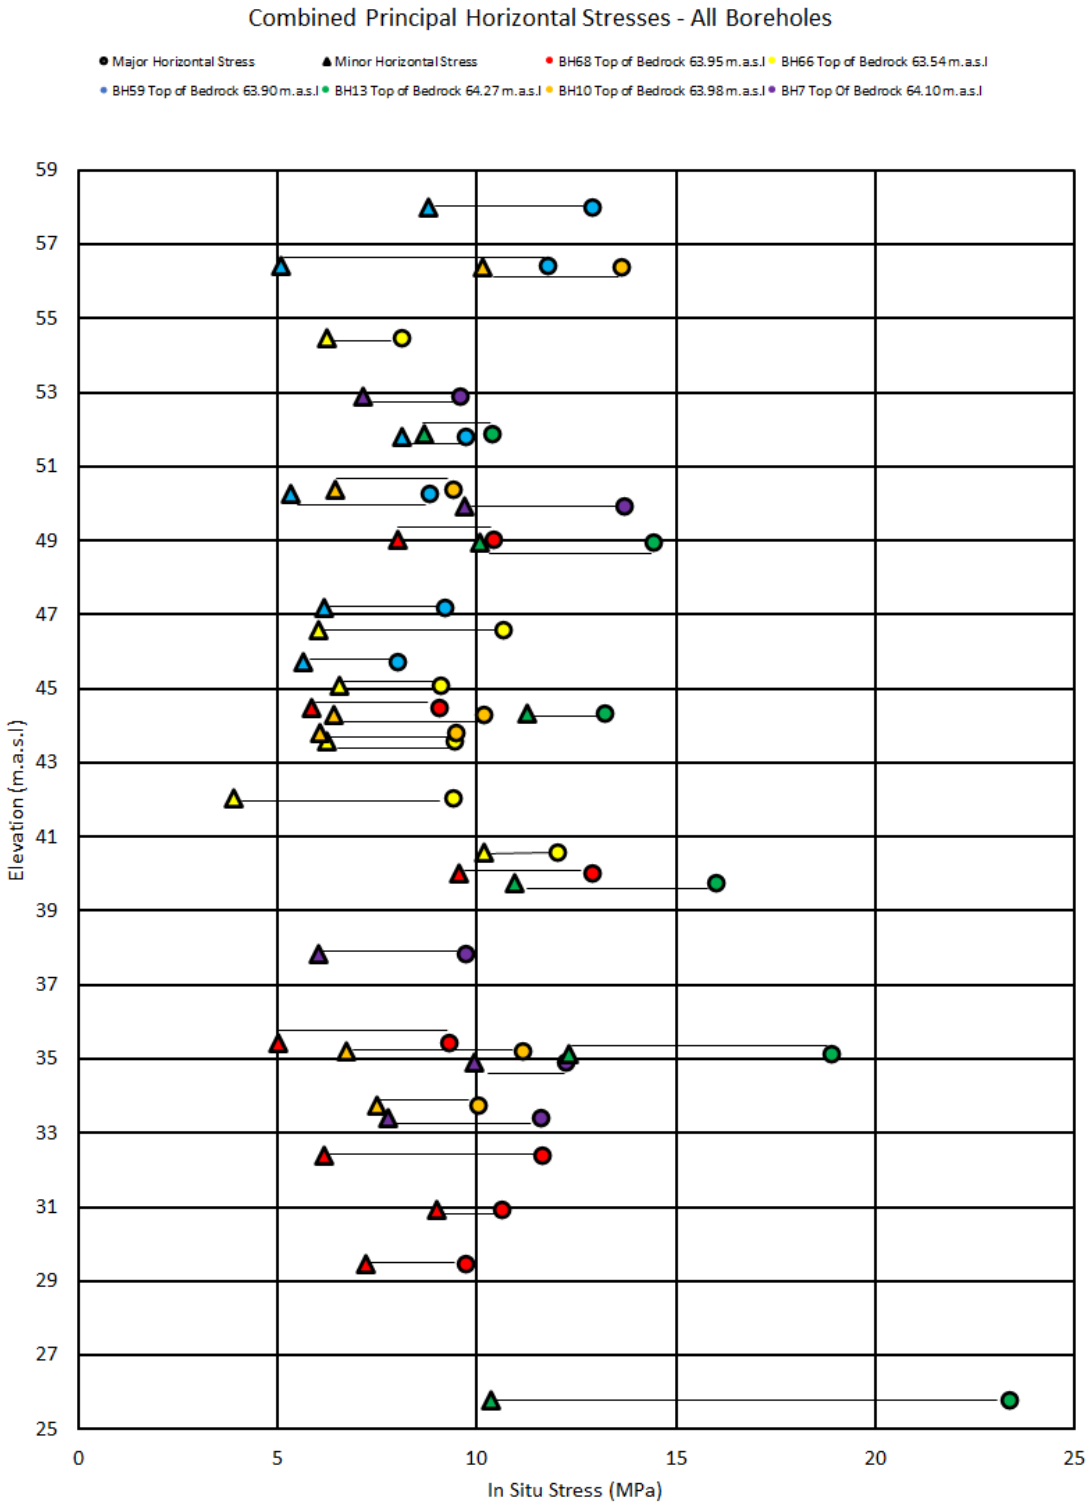

Figure E-13: Combined maximum (P) and minimum horizontal stresses (Q) for the interpretable tests

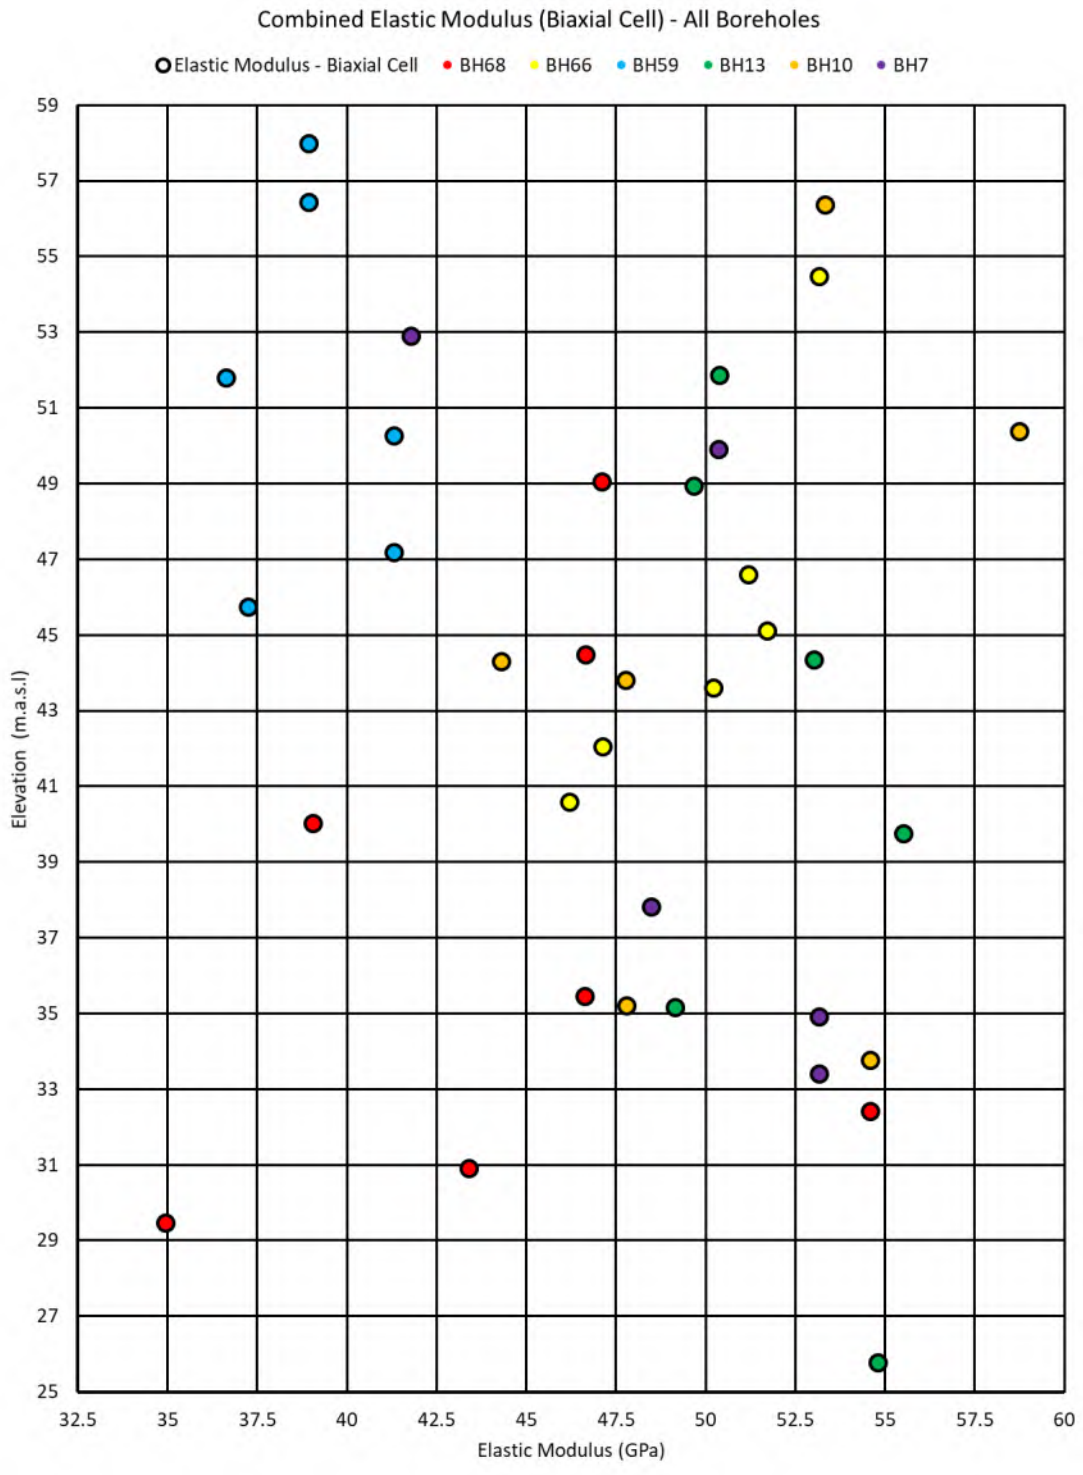

Figure E-14: horizontal elastic modulus (*E*) of the rock measured from the biaxial tests

APPENDIX G

Direct Simple Shear Testing Interpretations

Figure No. G - 1

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH1S
Soil Unit:	2a

Sample ID:	SA2-1
Test ID:	DSS-11A
Depth:	2.98m - 3.04m

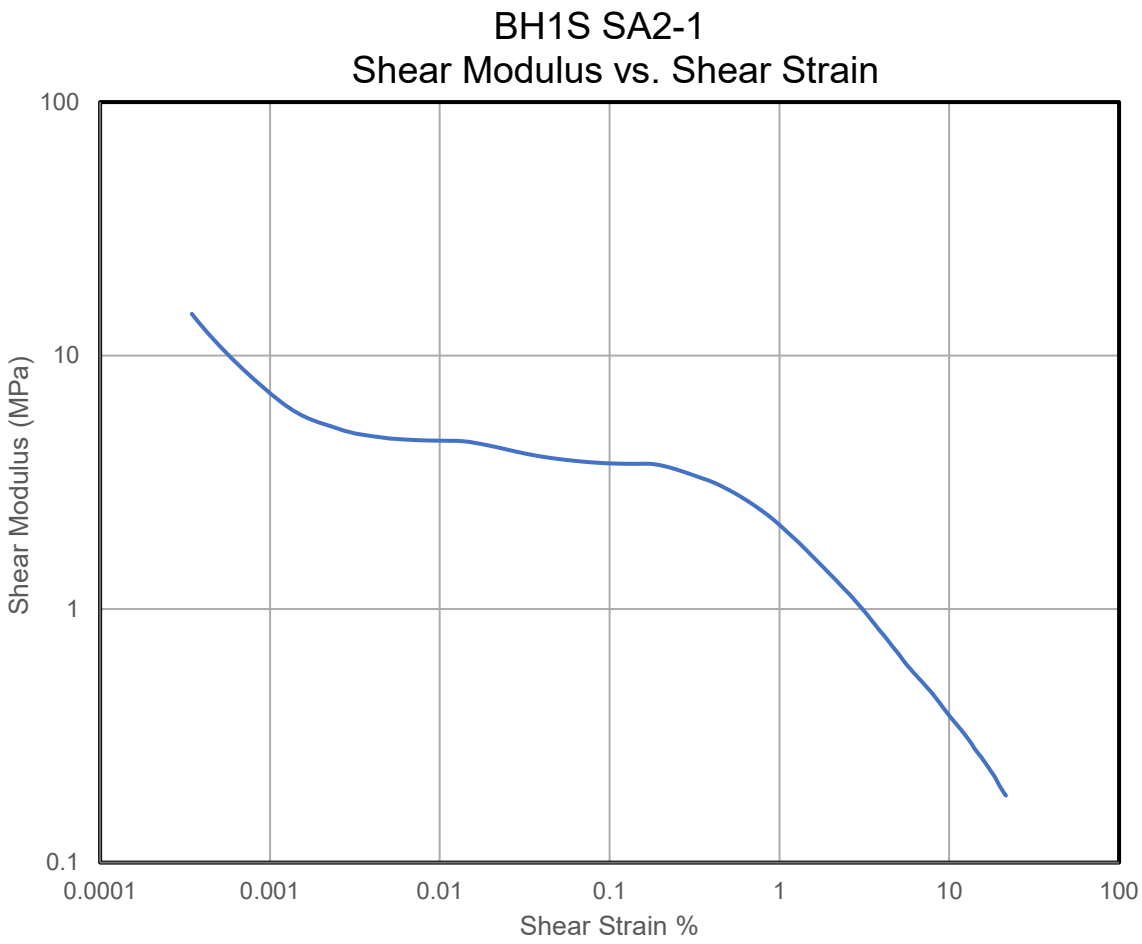

Figure No. G - 2

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH8S
Soil Unit:	2a

Sample ID:	SA2
Test ID:	DSS-14
Depth:	1.60m - 1.68m

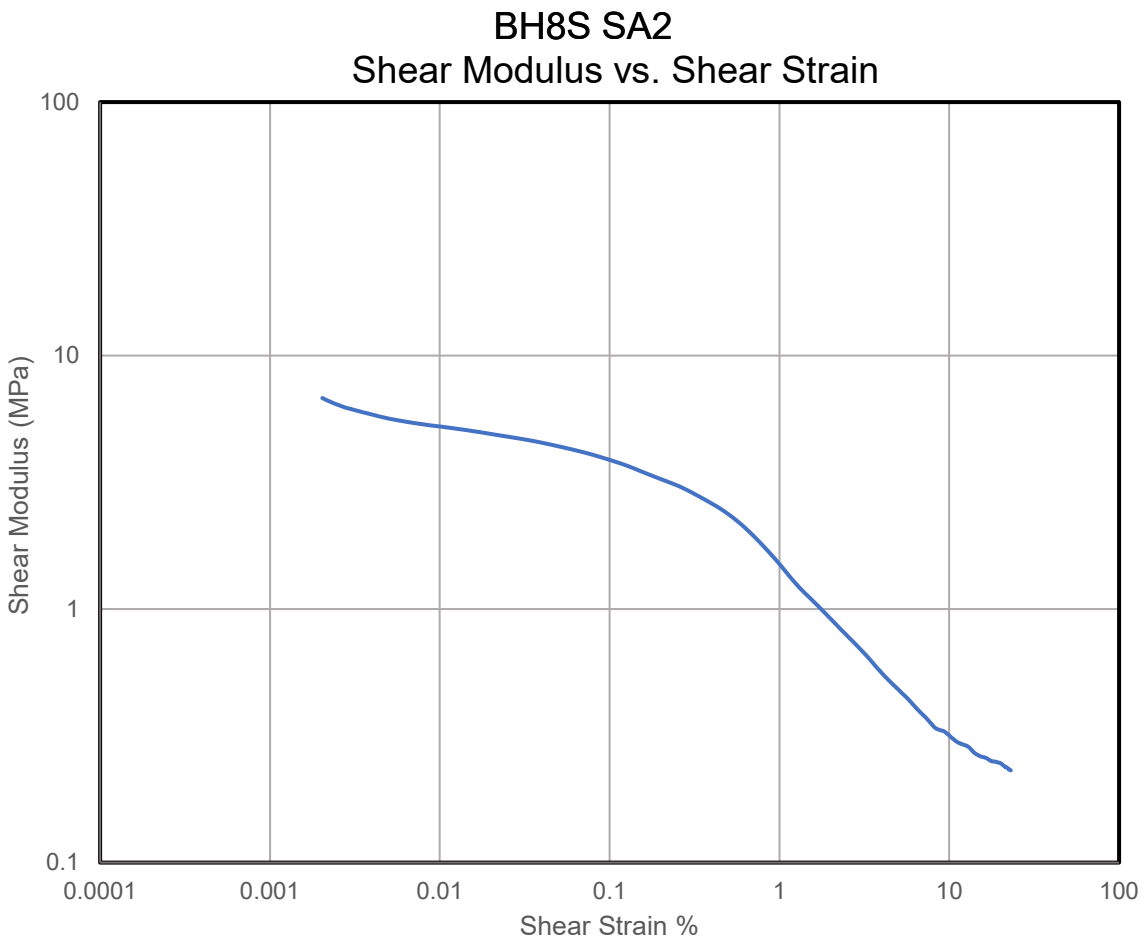

Figure No. G - 3

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH11SB
Soil Unit:	2a

Sample ID:	SA1
Test ID:	DSS-20
Depth:	1.44m - 1.52m

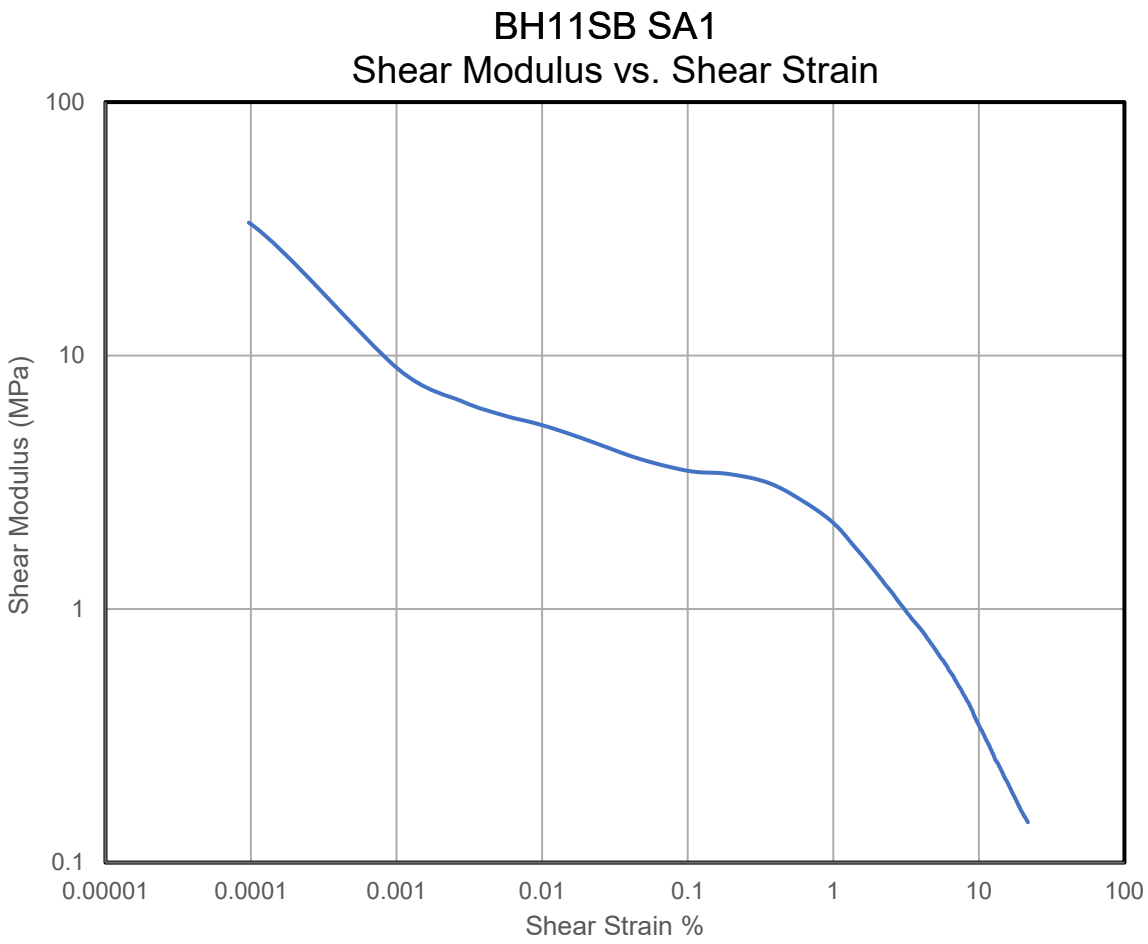

Figure No. G - 4

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH66S
Soil Unit:	2a

Sample ID:	SA3-2
Test ID:	DSS-1A
Depth:	2.98m - 3.04m

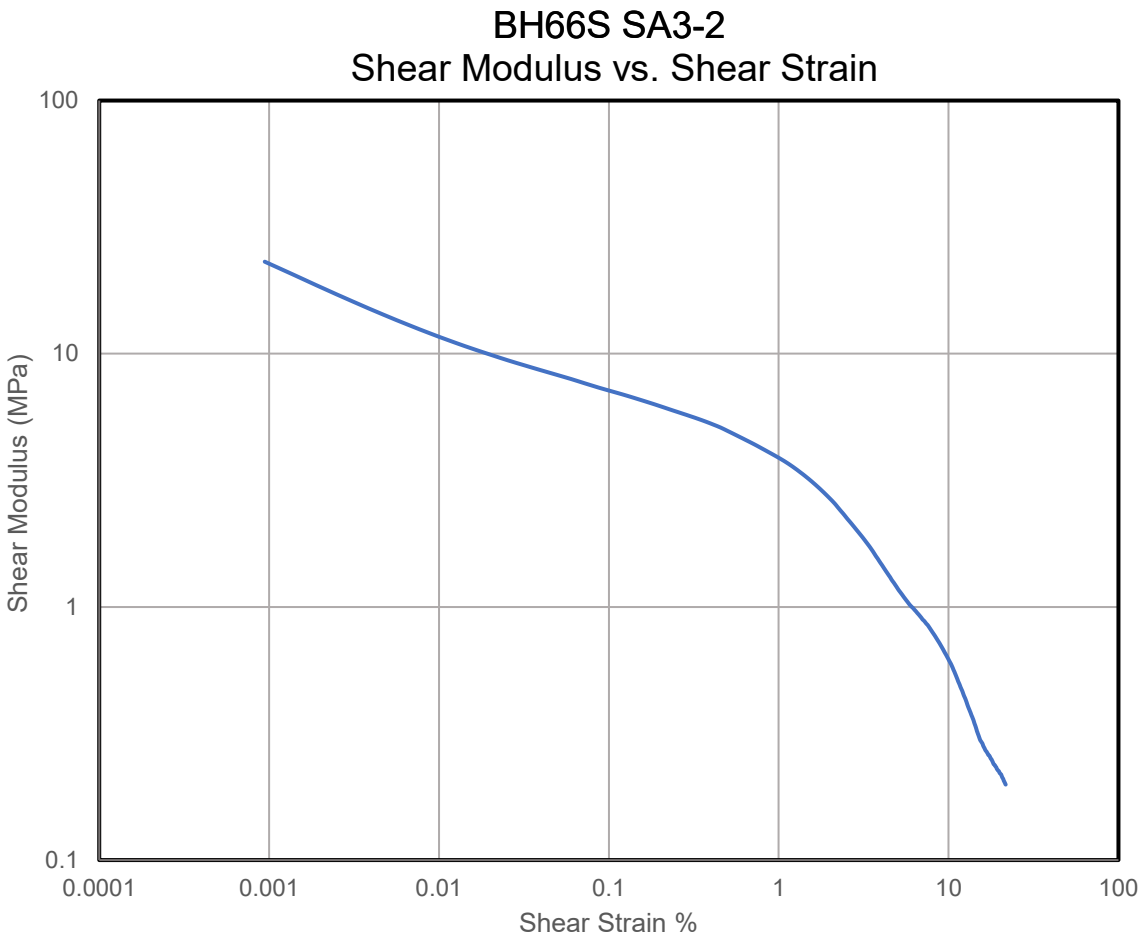

Figure No. G - 5

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH66S
Soil Unit:	2a

Sample ID:	SA6
Test ID:	DSS-3B
Depth:	3.56m - 3.58m

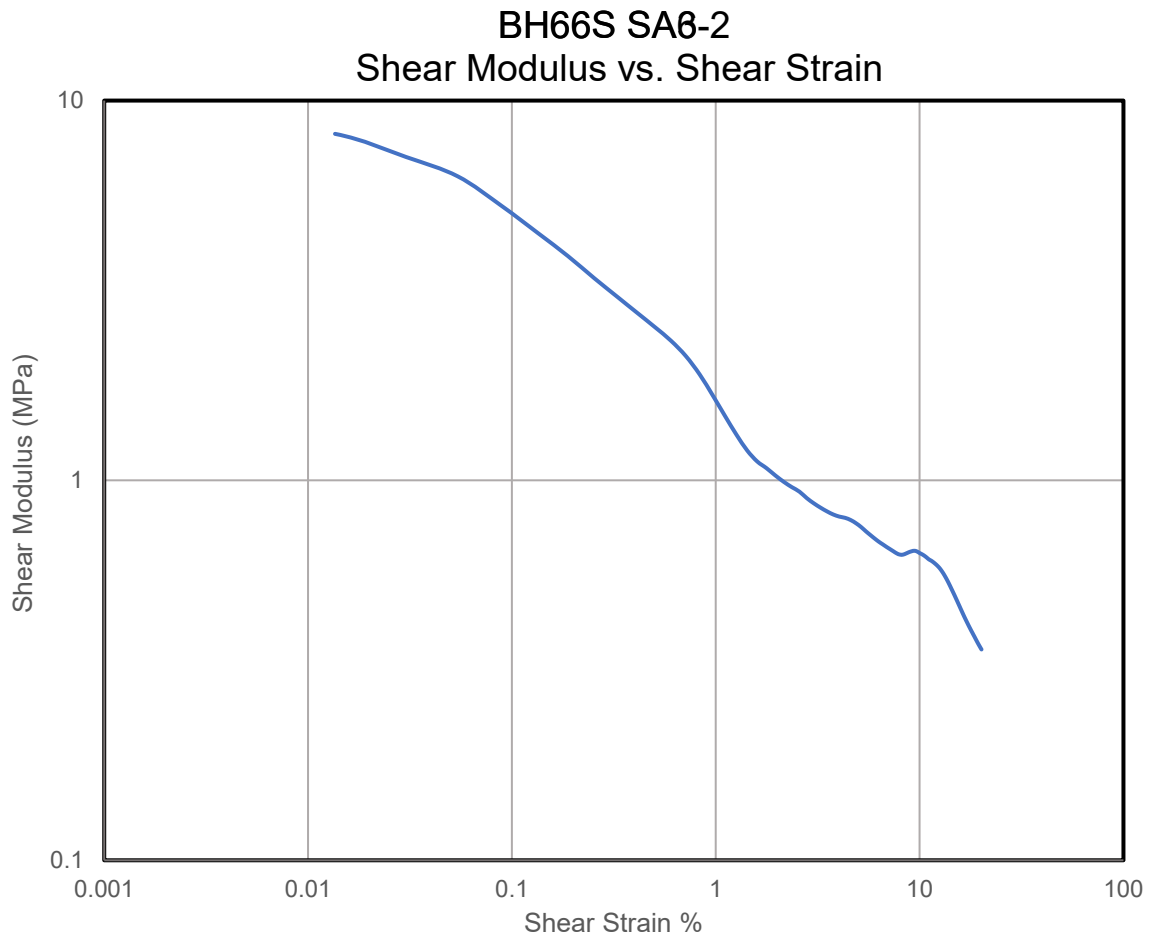

Figure No. G - 6

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH66S
Soil Unit:	2a

Sample ID:	SA7
Test ID:	DSS-2A
Depth:	4.11m - 4.17m

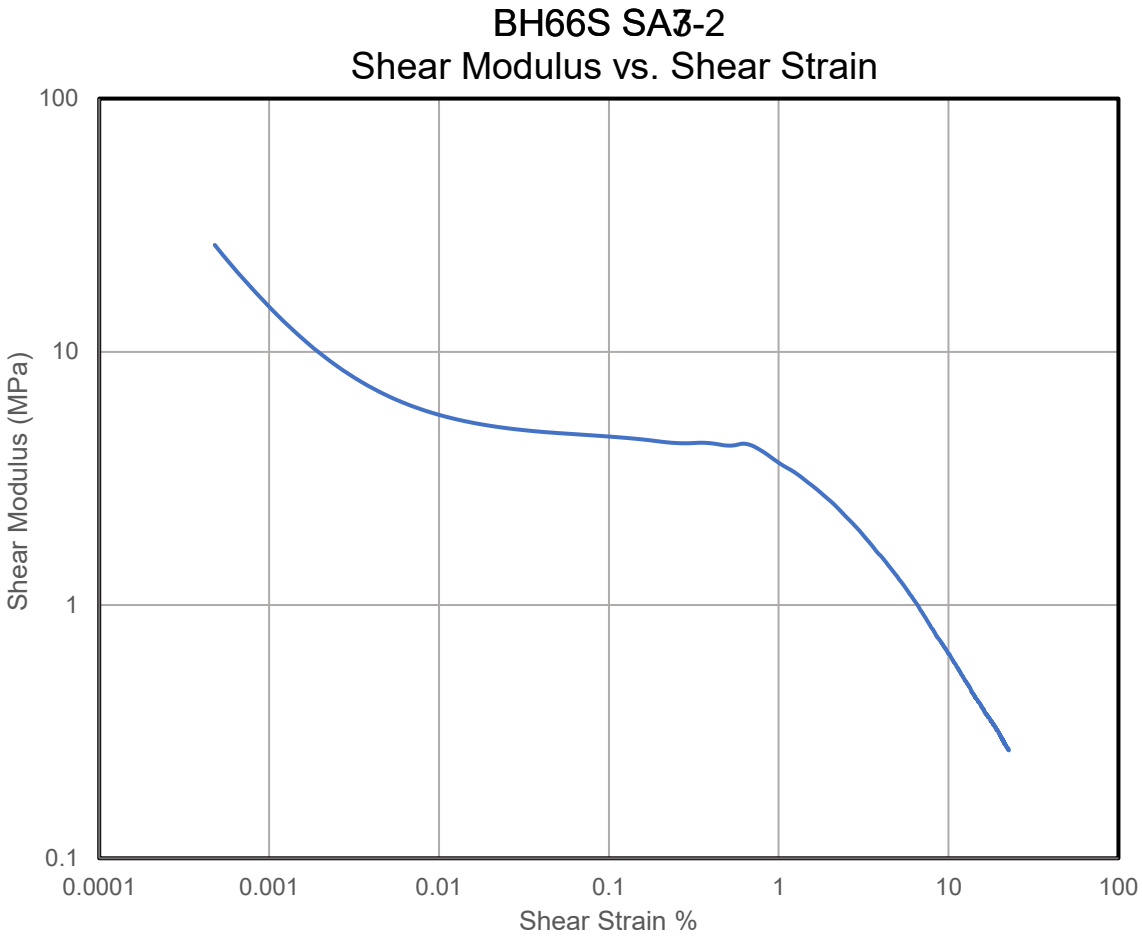

Figure No. G - 7

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH1S
Soil Unit:	4b

Sample ID:	SA14
Test ID:	DSS-12
Depth:	8.79m - 8.84m

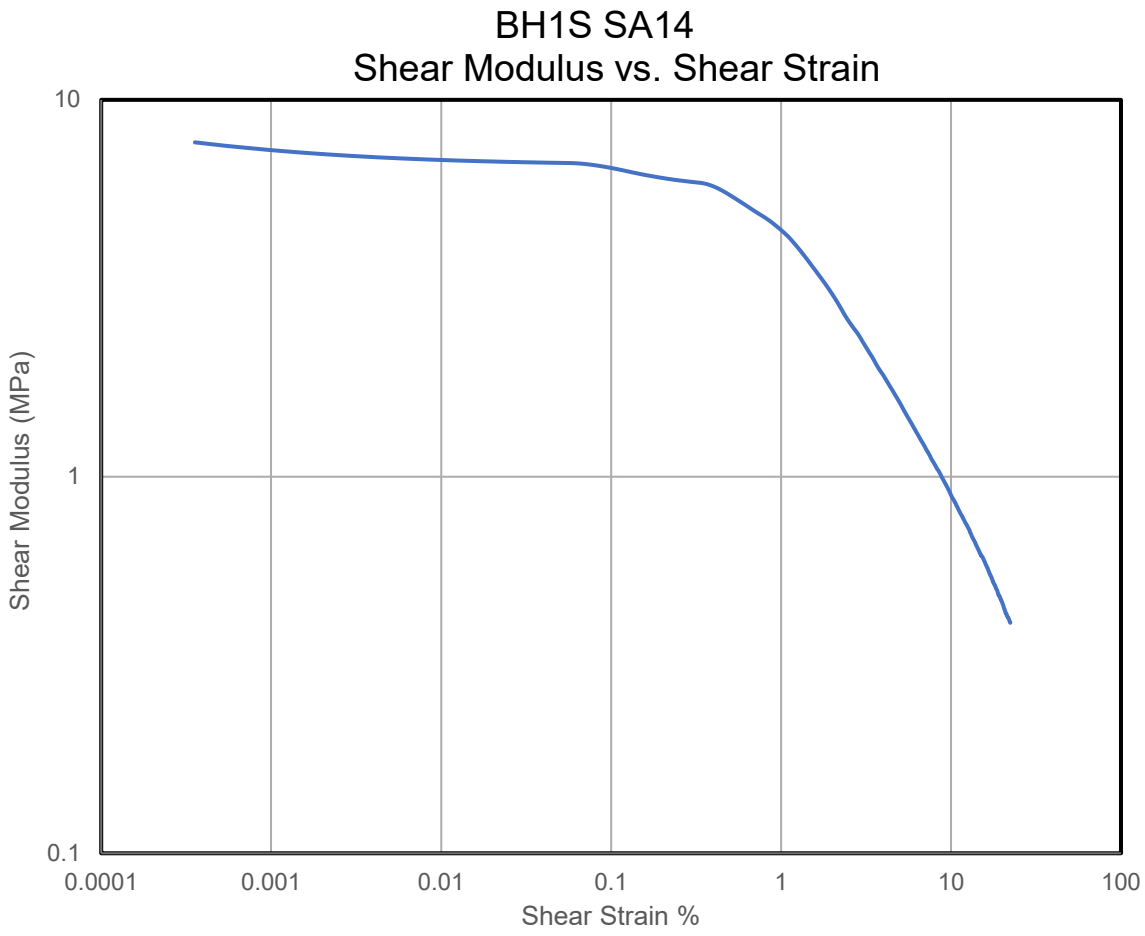

Figure No. G - 8

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH1S
Soil Unit:	4b

Sample ID:	SA26
Test ID:	DSS-13
Depth:	19.46m - 19.51m

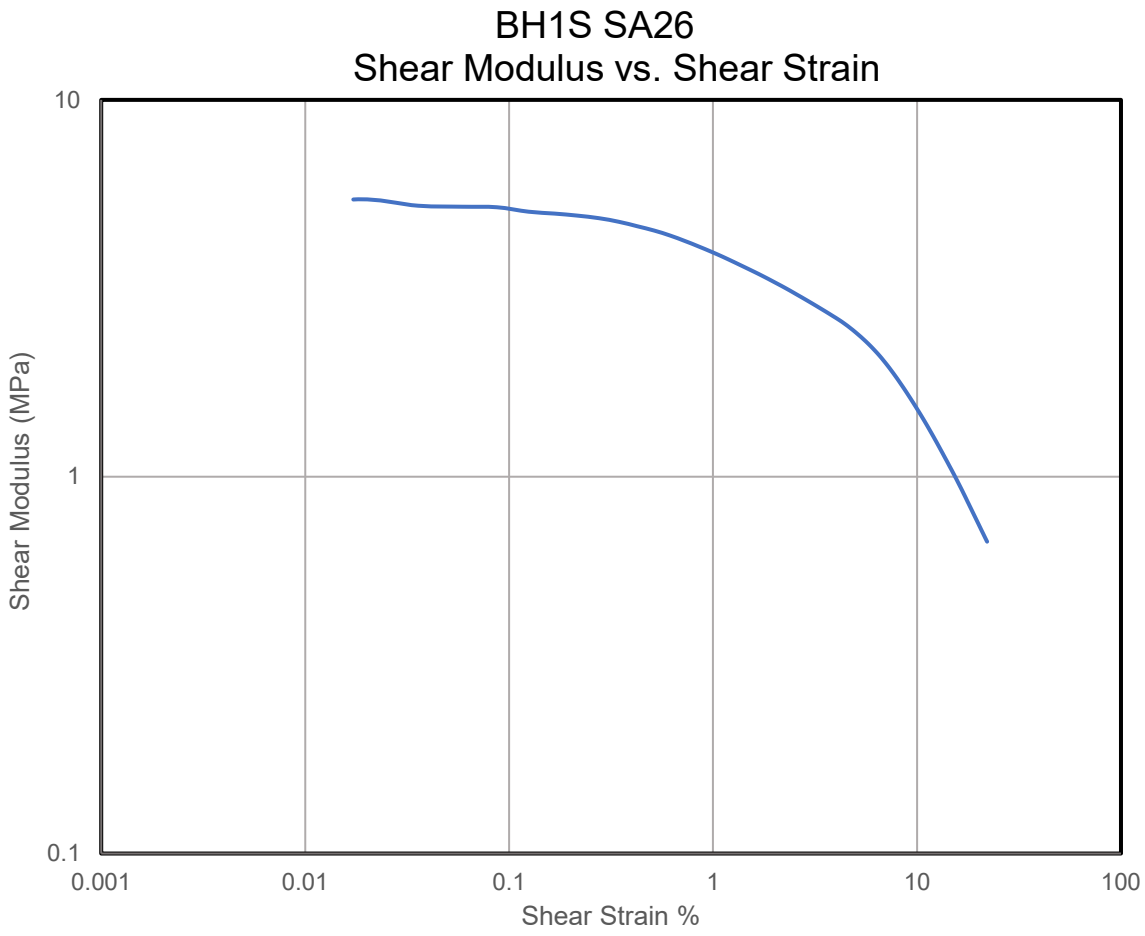

Figure No. G - 9

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH8S
Soil Unit:	4a/4b

Sample ID:	SA6
Test ID:	DSS-15
Depth:	15.57m - 15.62m

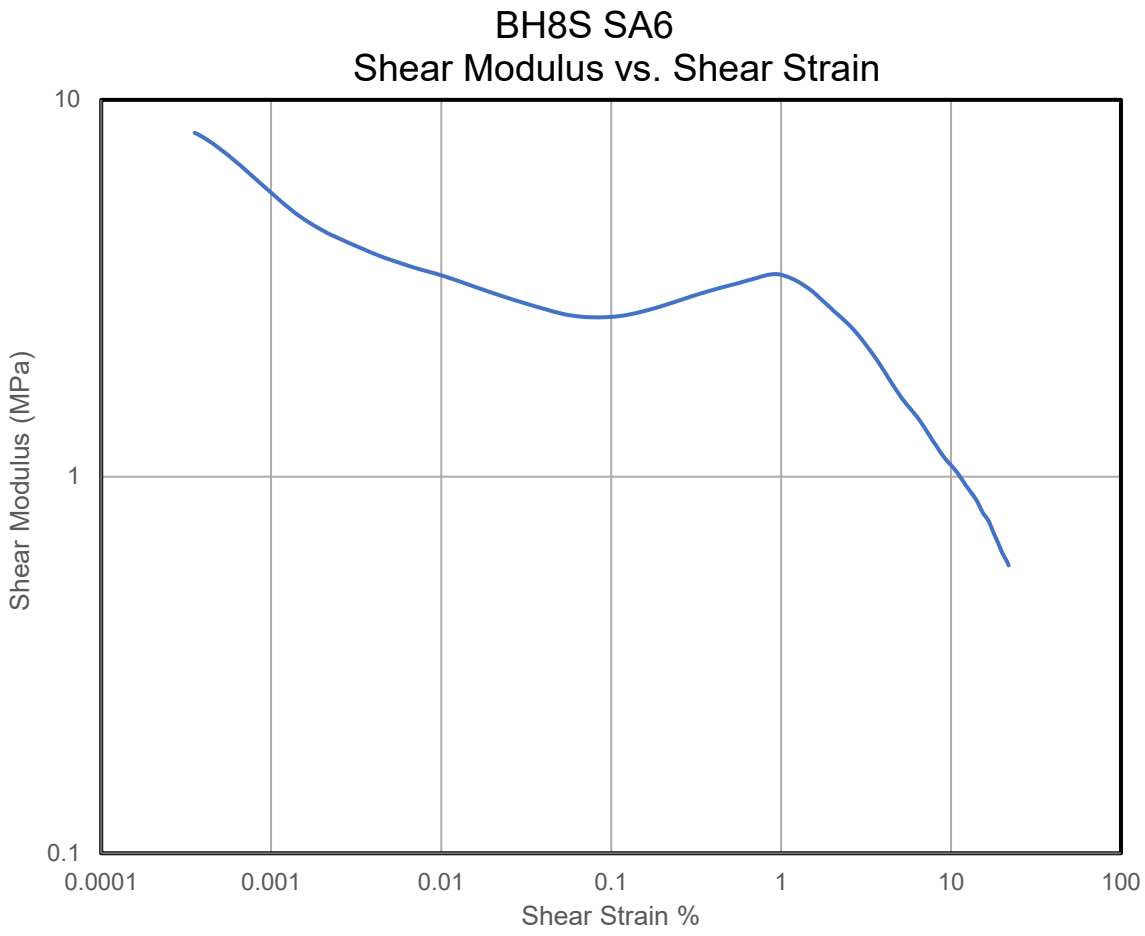

Figure No. G - 10

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH8S
Soil Unit:	4b

Sample ID:	SA7-2
Test ID:	DSS-16
Depth:	16.00m - 16.05m

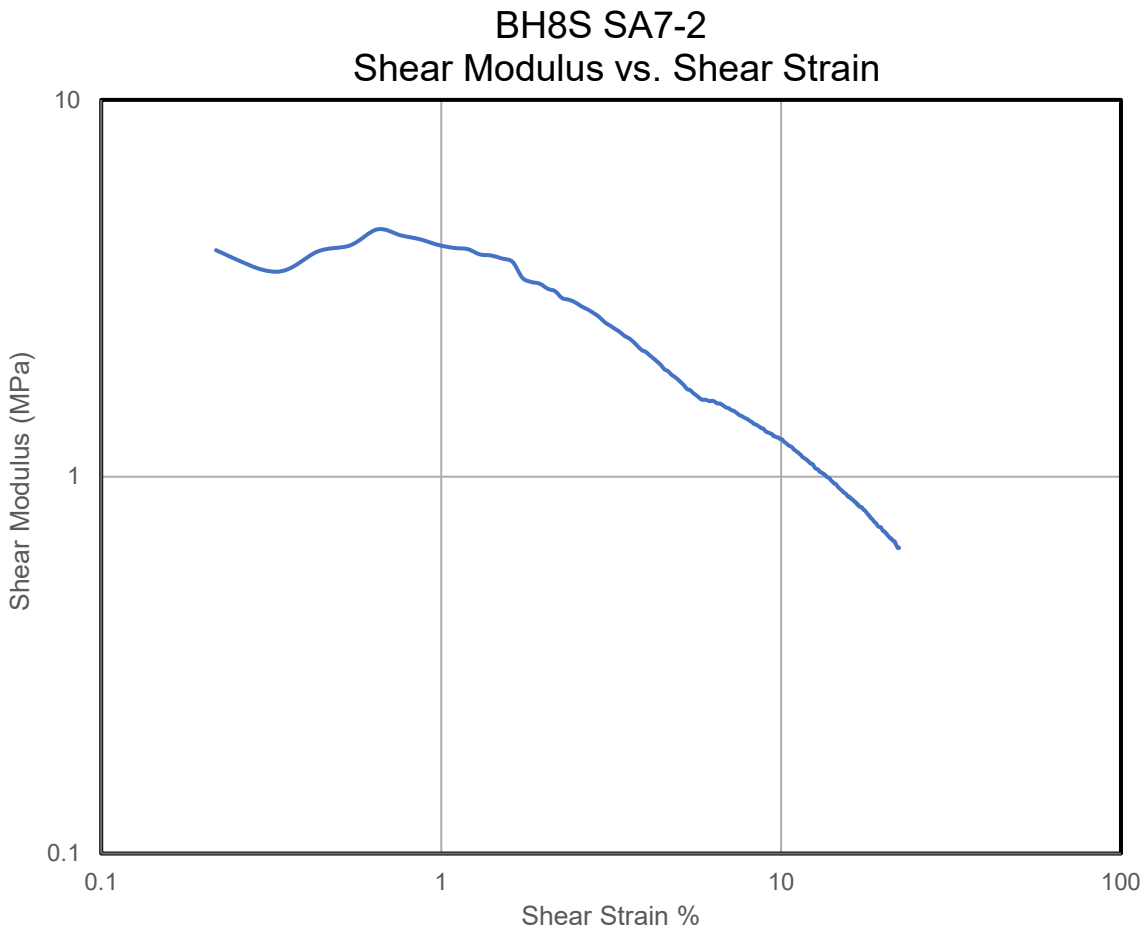

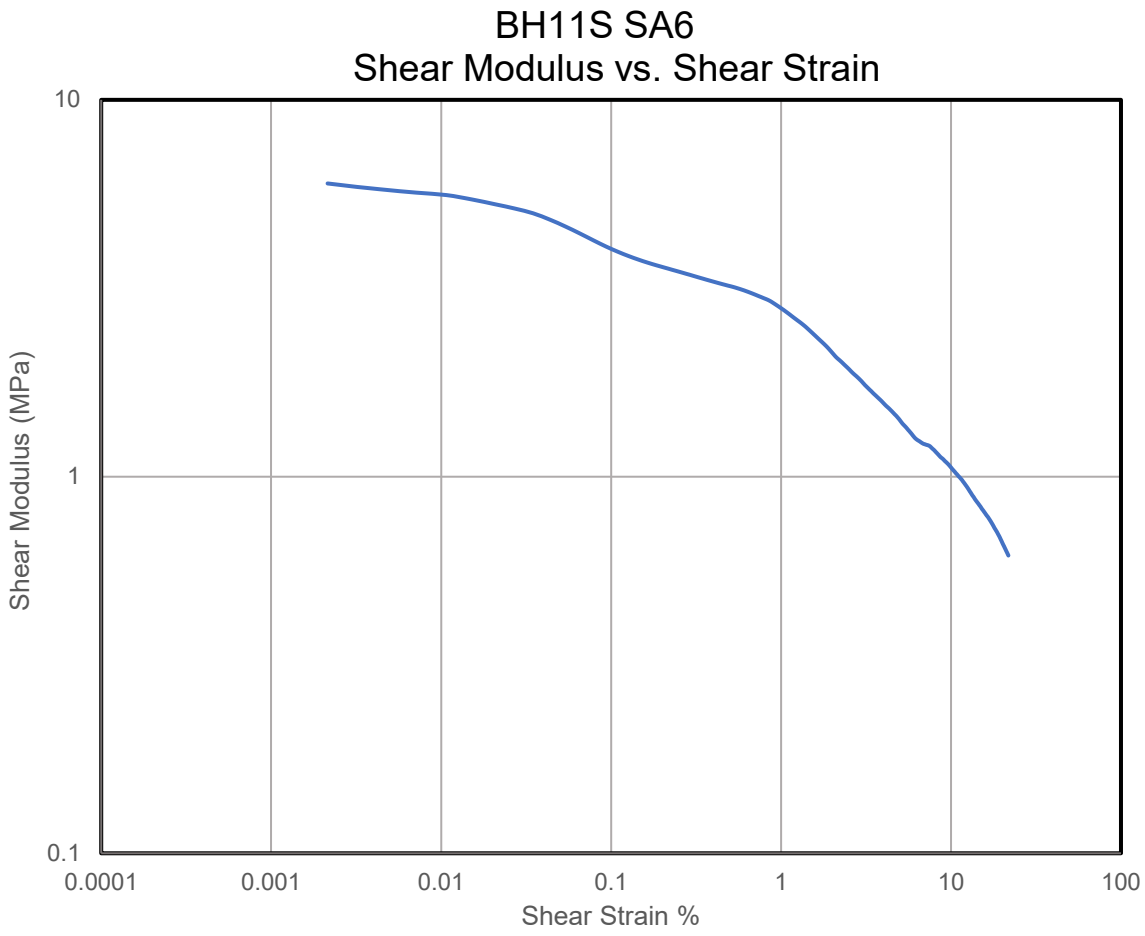

Figure No. G - 11

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH11S
Soil Unit:	4b

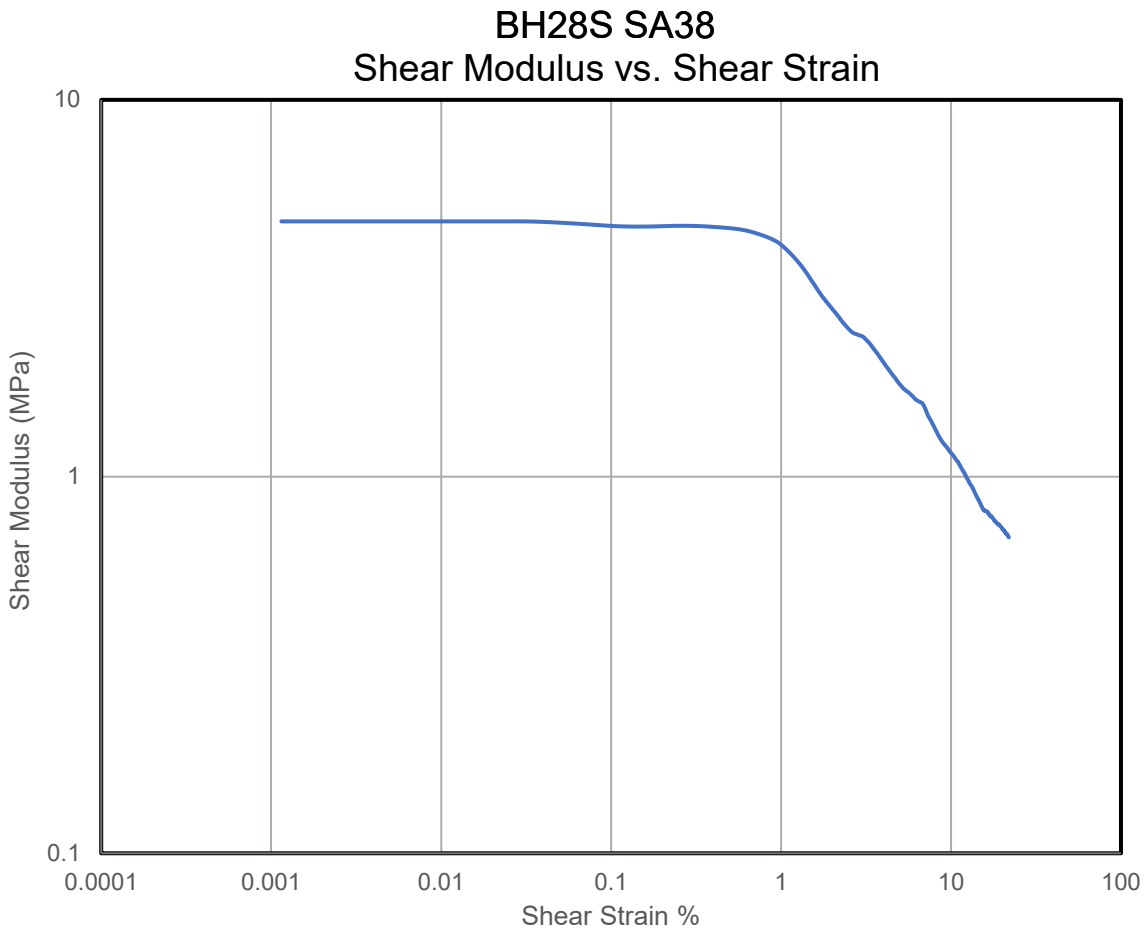

Sample ID:	SA6
Test ID:	DSS-21
Depth:	16.38m - 16.41m

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH28S
Soil Unit:	4b

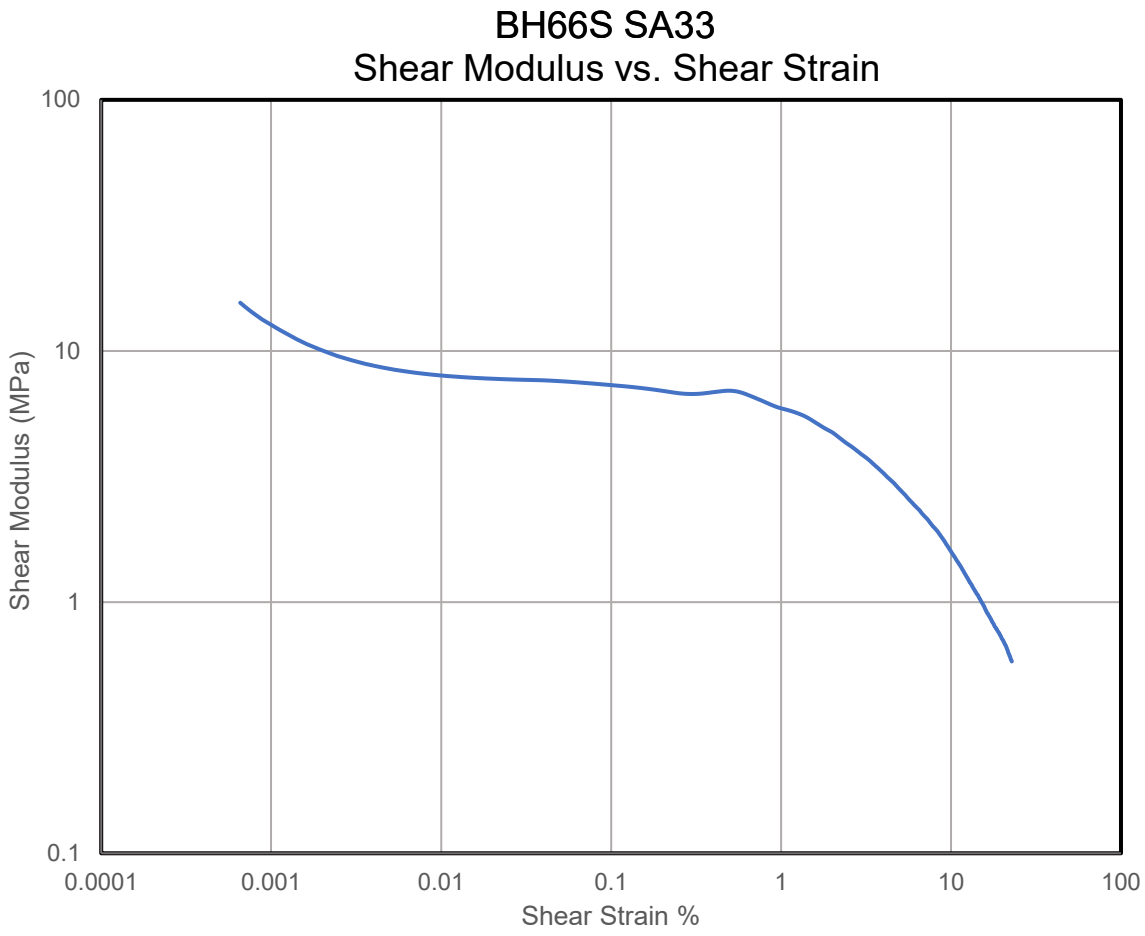

Sample ID:	SA38
Test ID:	DSS-7
Depth:	23.32m - 23.37m

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH66S
Soil Unit:	4b

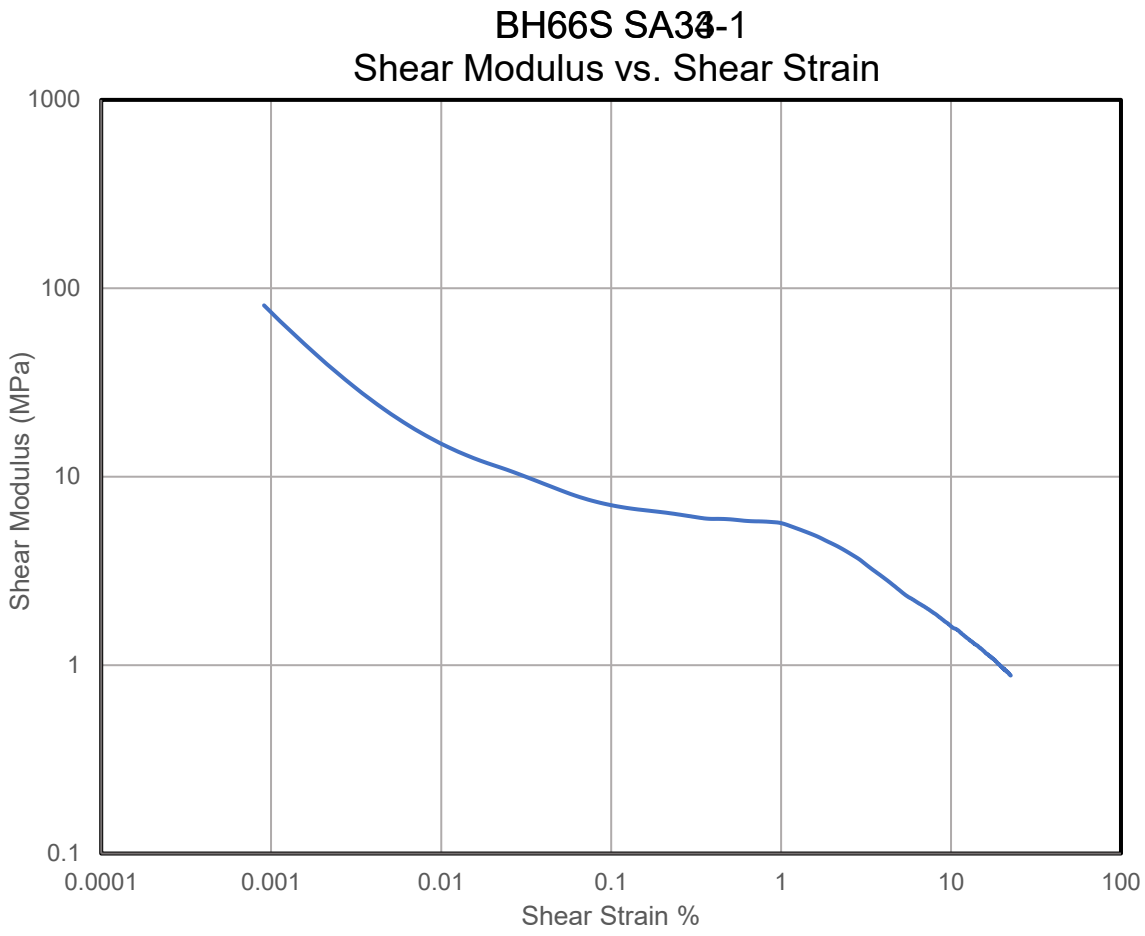

Sample ID:	SA33
Test ID:	DSS-4
Depth:	16.38m - 16.42m

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH66S
Soil Unit:	4b

Sample ID:	SA34-1
Test ID:	DSS-5
Depth:	17.68m - 17.73m

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH66S
Soil Unit:	4b

Sample ID:	SA41
Test ID:	DSS-6
Depth:	19.46m - 19.51m

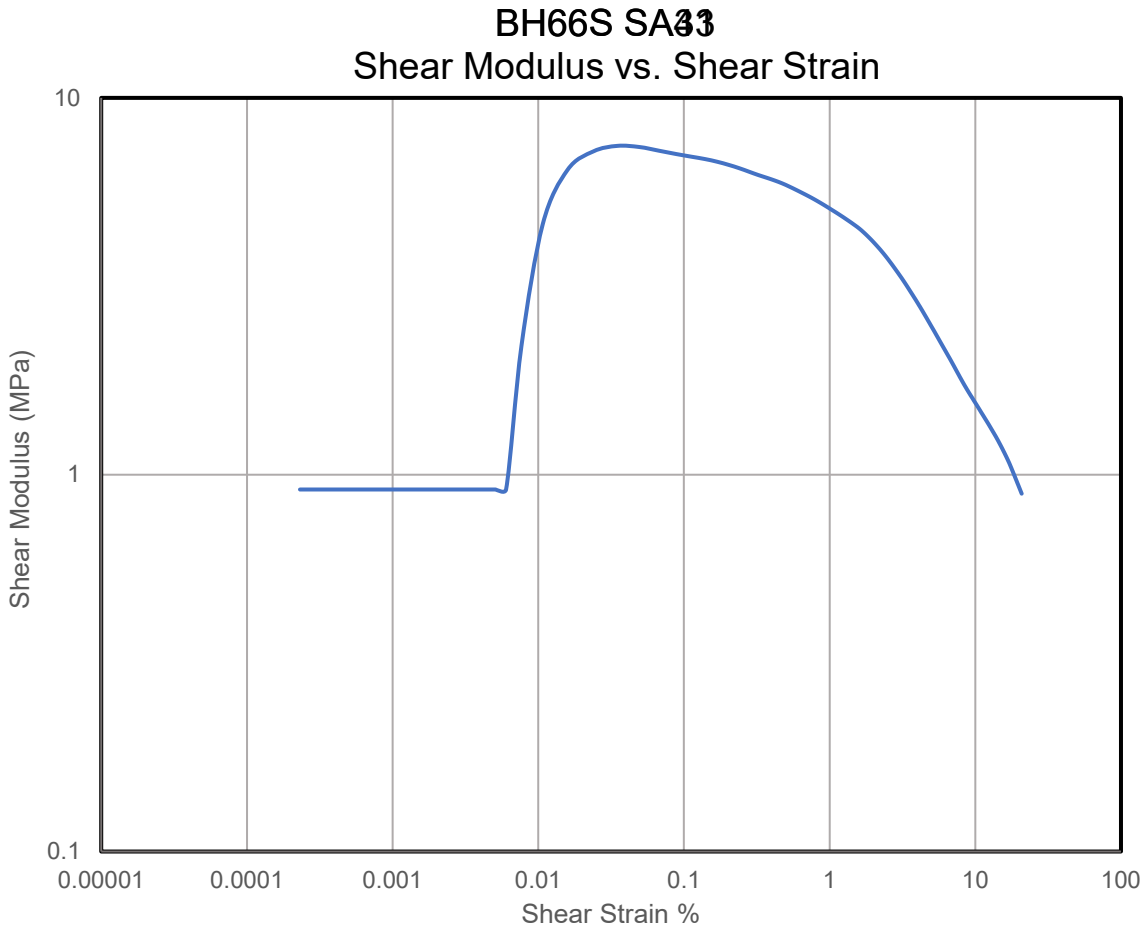

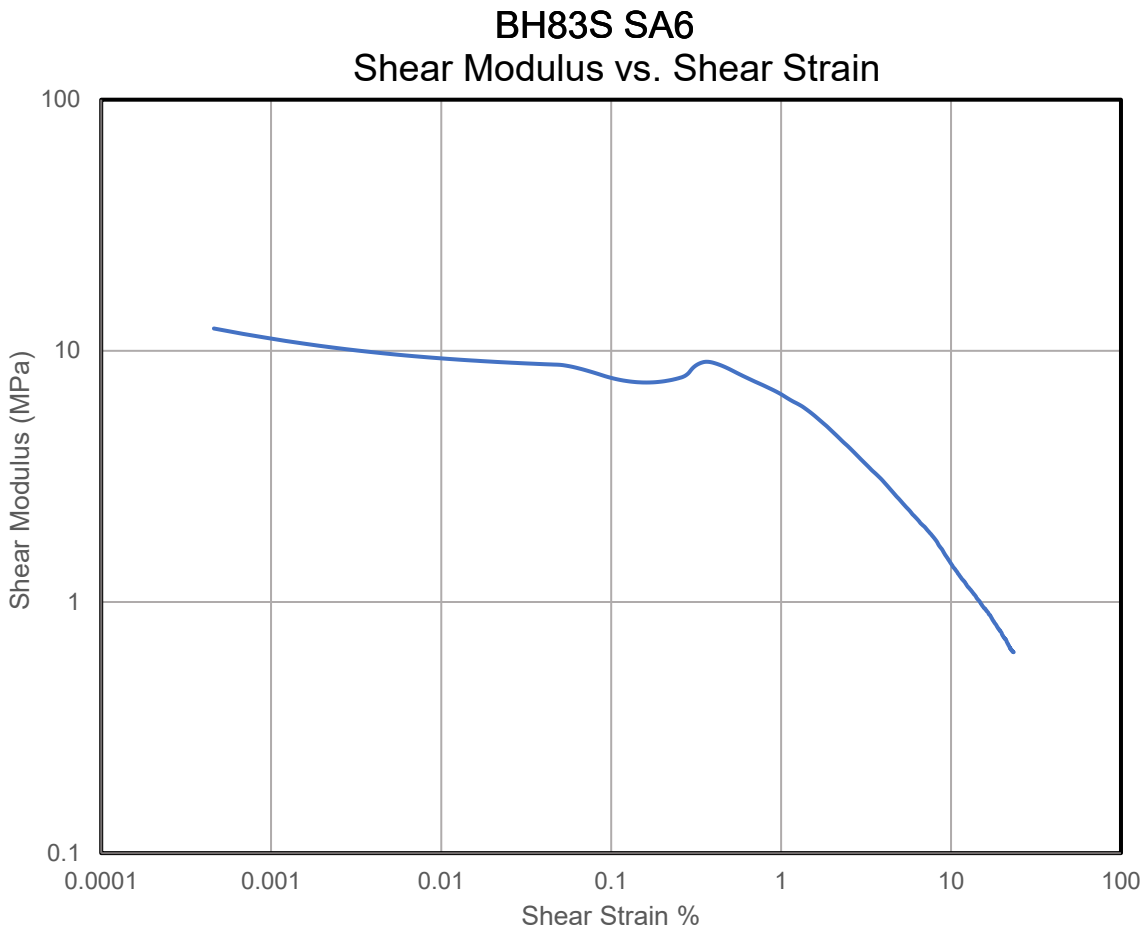

Figure No. G - 16

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH83S
Soil Unit:	4b

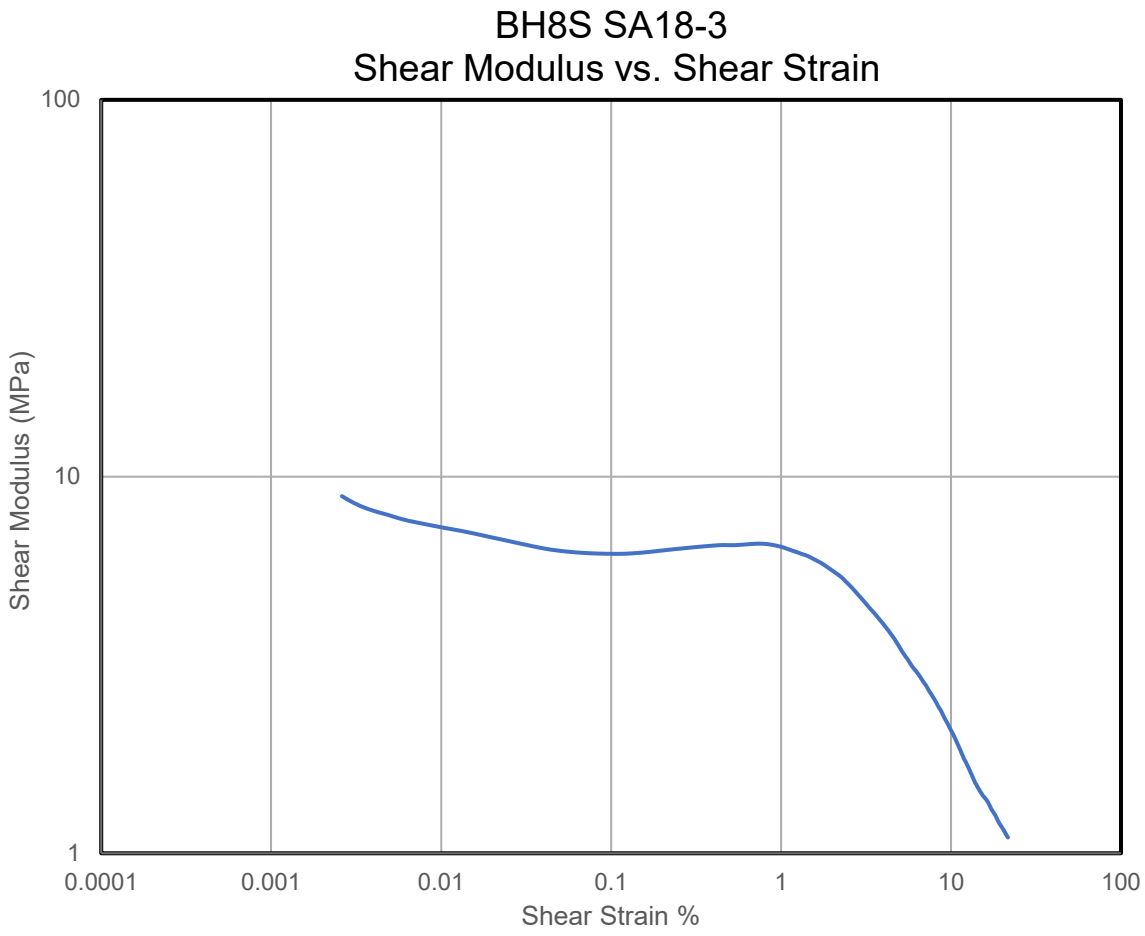

Sample ID:	SA6
Test ID:	DSS-24
Depth:	16.68m - 16.73m

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH8S
Soil Unit:	5

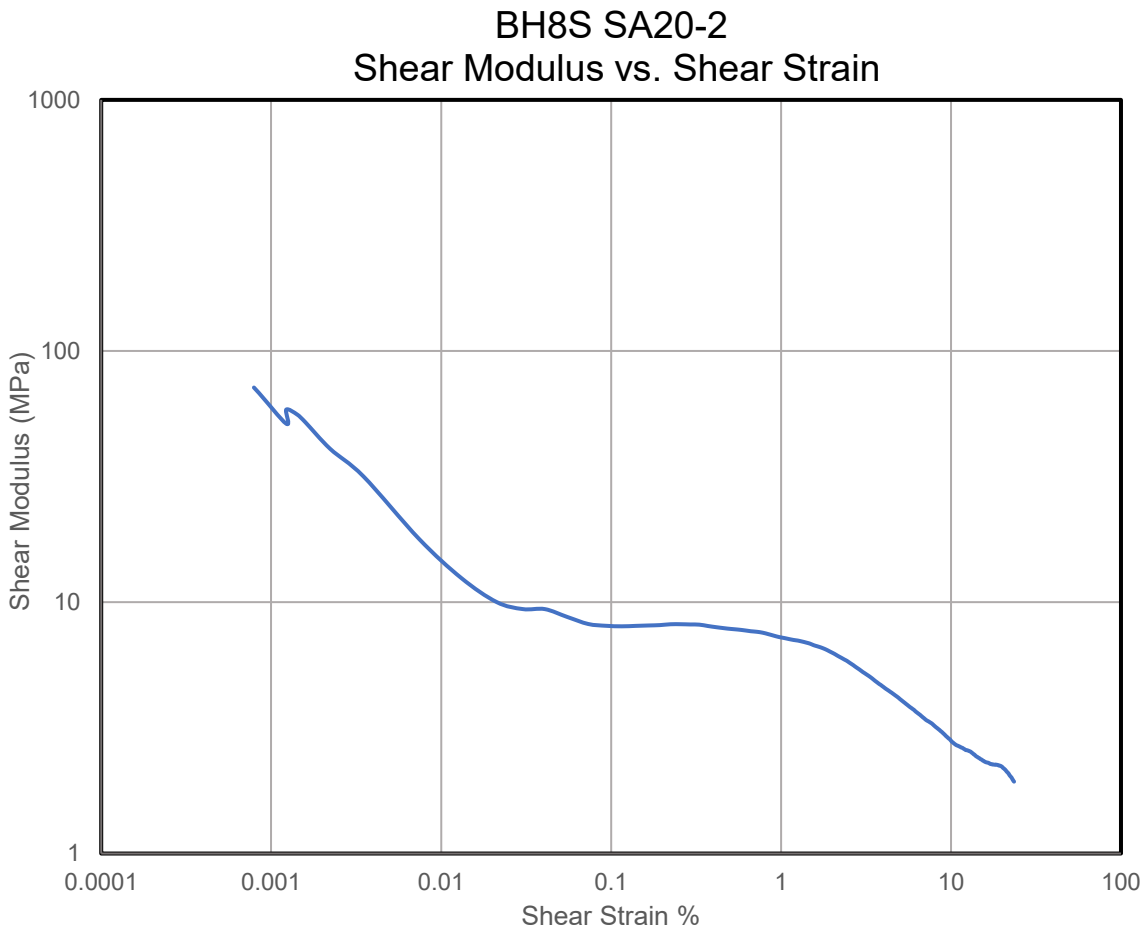

Sample ID:	SA18-3
Test ID:	DSS-17
Depth:	16.38m - 16.42m

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH8S
Soil Unit:	5

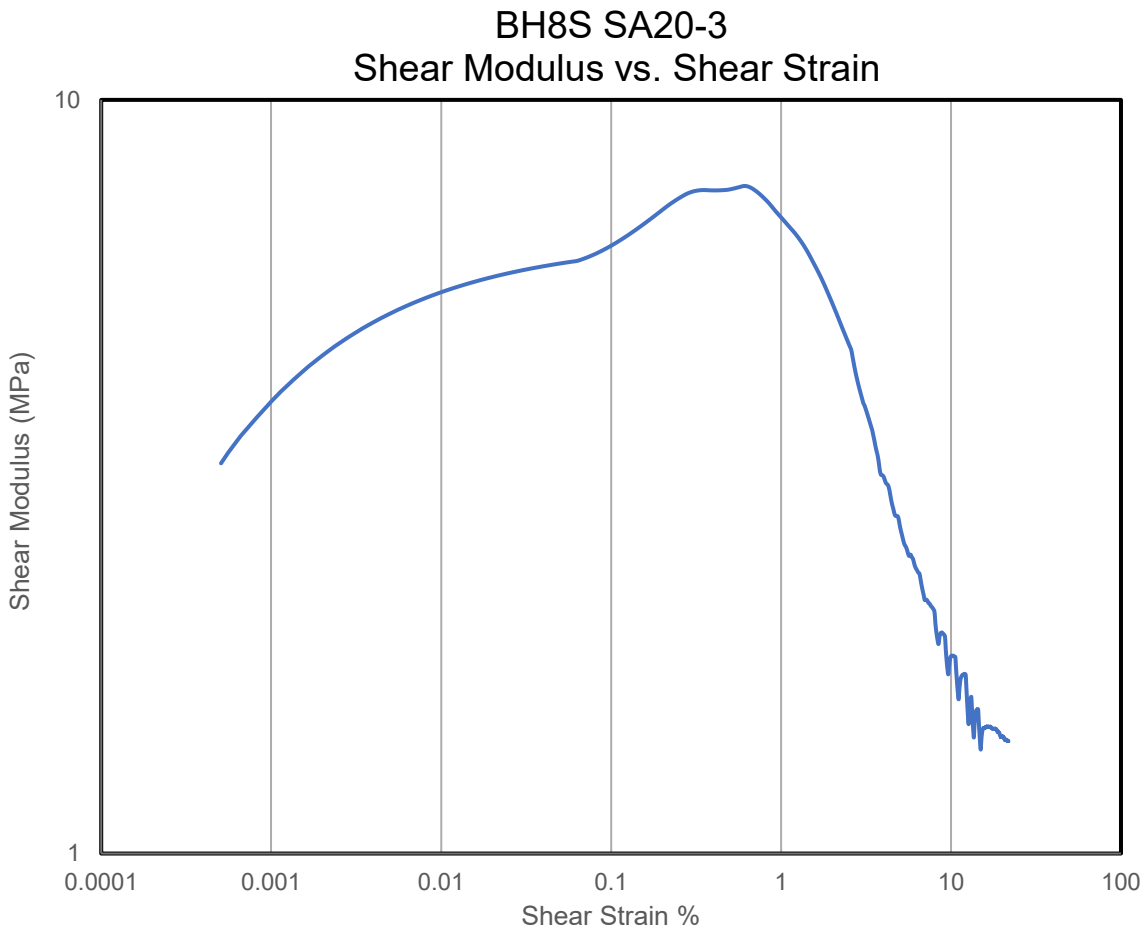

Sample ID:	SA20-2
Test ID:	DSS-18
Depth:	17.68m - 17.73m

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH8S
Soil Unit:	5

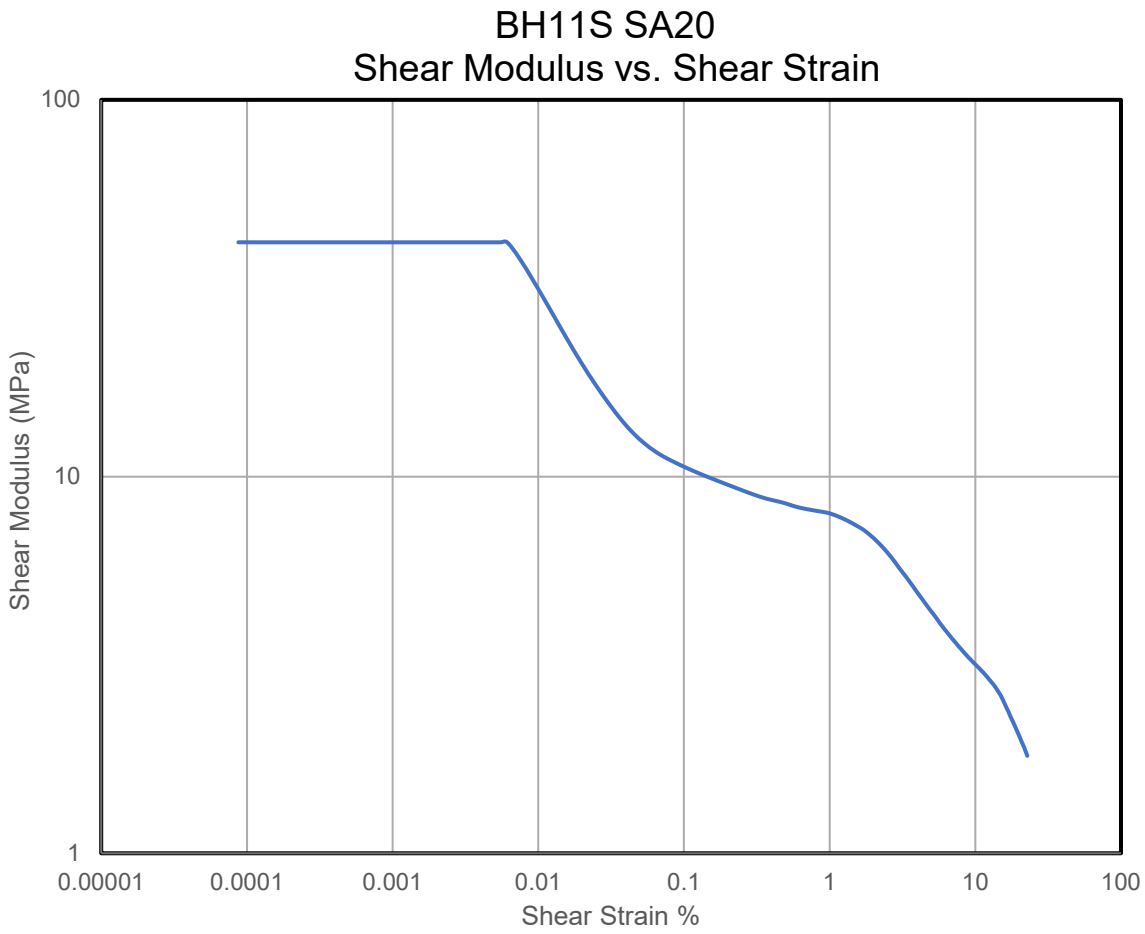

Sample ID:	SA20-3
Test ID:	DSS-19
Depth:	19.46m - 19.51m

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH11S
Soil Unit:	5

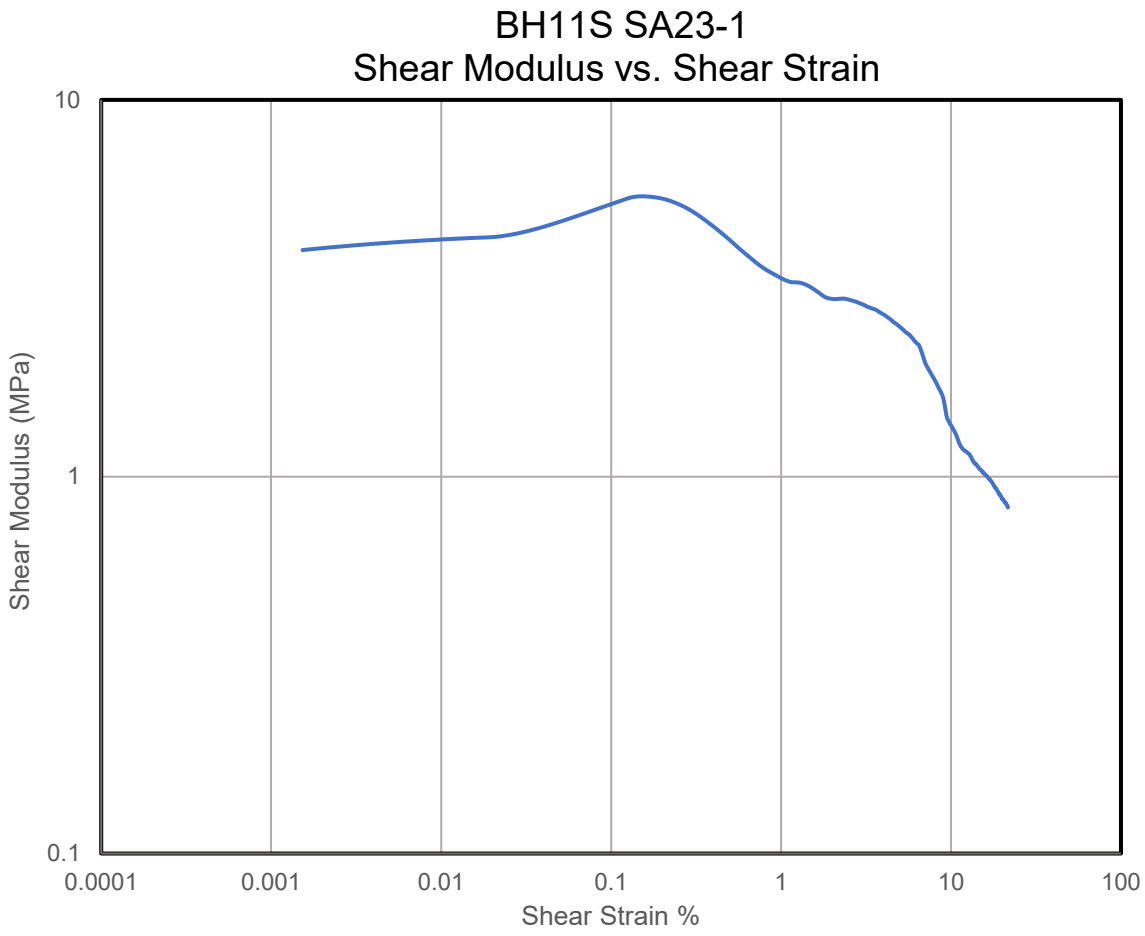

Sample ID:	SA20
Test ID:	DSS-22R
Depth:	19.42m - 19.46m

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH11S
Soil Unit:	5

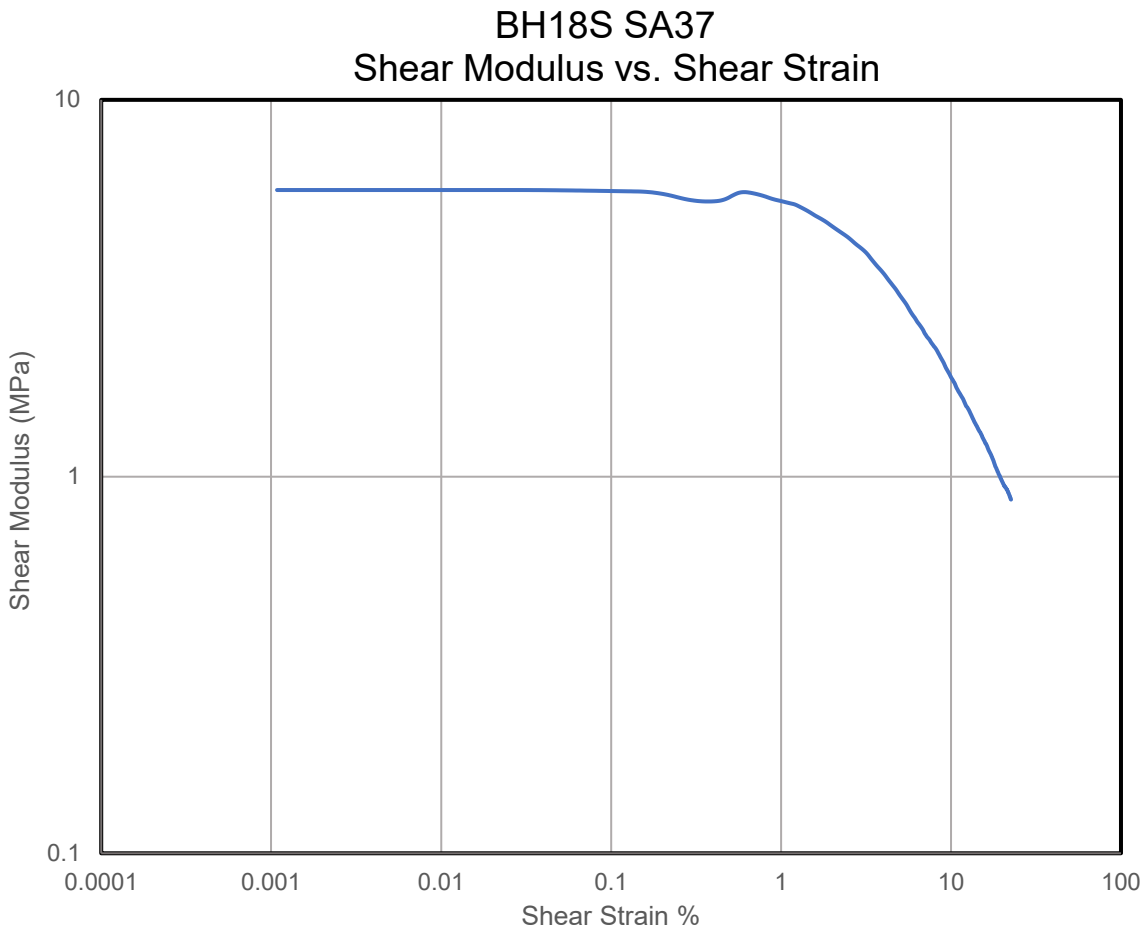

Sample ID:	SA23-1
Test ID:	DSS-23
Depth:	22.00m - 22.05m

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH18S
Soil Unit:	5

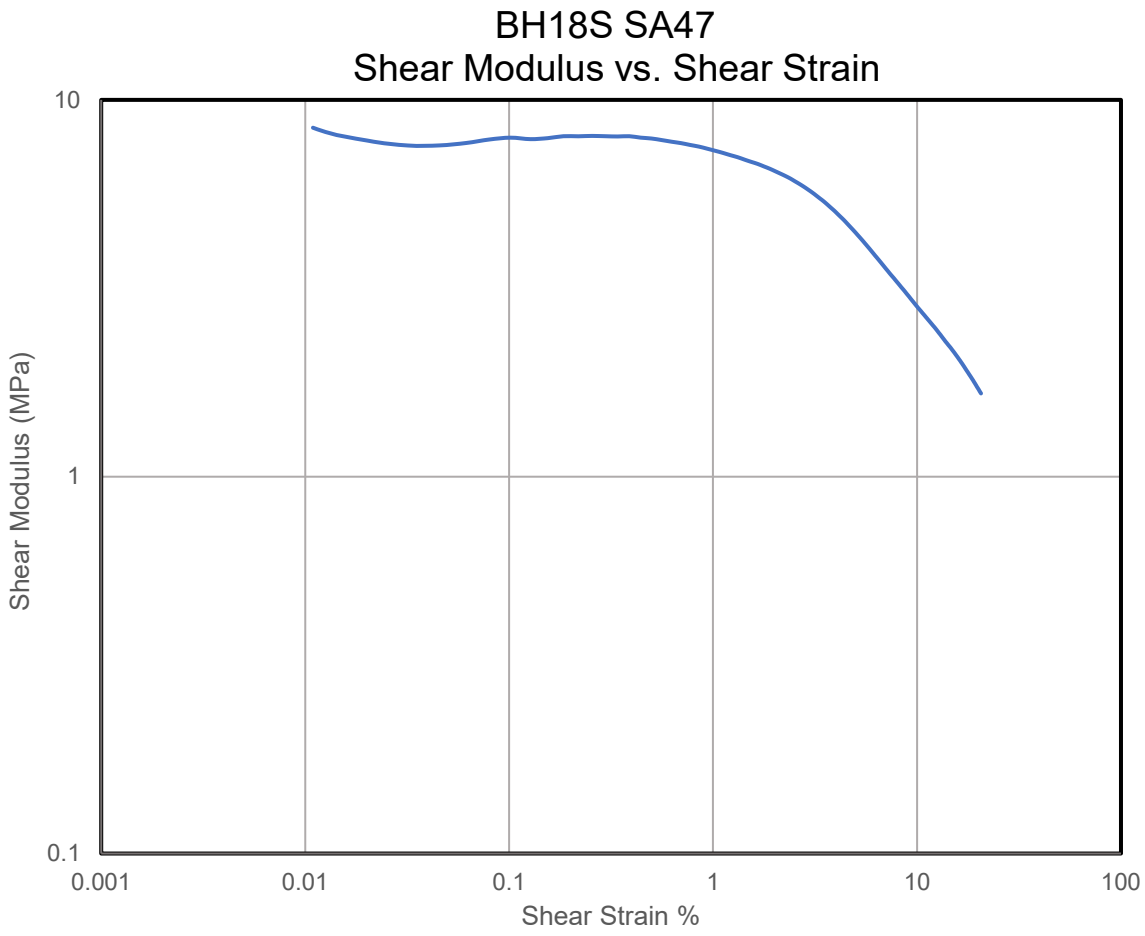

Sample ID:	SA37
Test ID:	DSS-9
Depth:	16.83m - 16.88m

Consolidated Undrained Direct Simple Shear Test

Project No.:	21451329
BH ID:	BH18S
Soil Unit:	5

Sample ID:	SA47
Test ID:	DSS-10
Depth:	22.50m - 22.56m

APPENDIX H

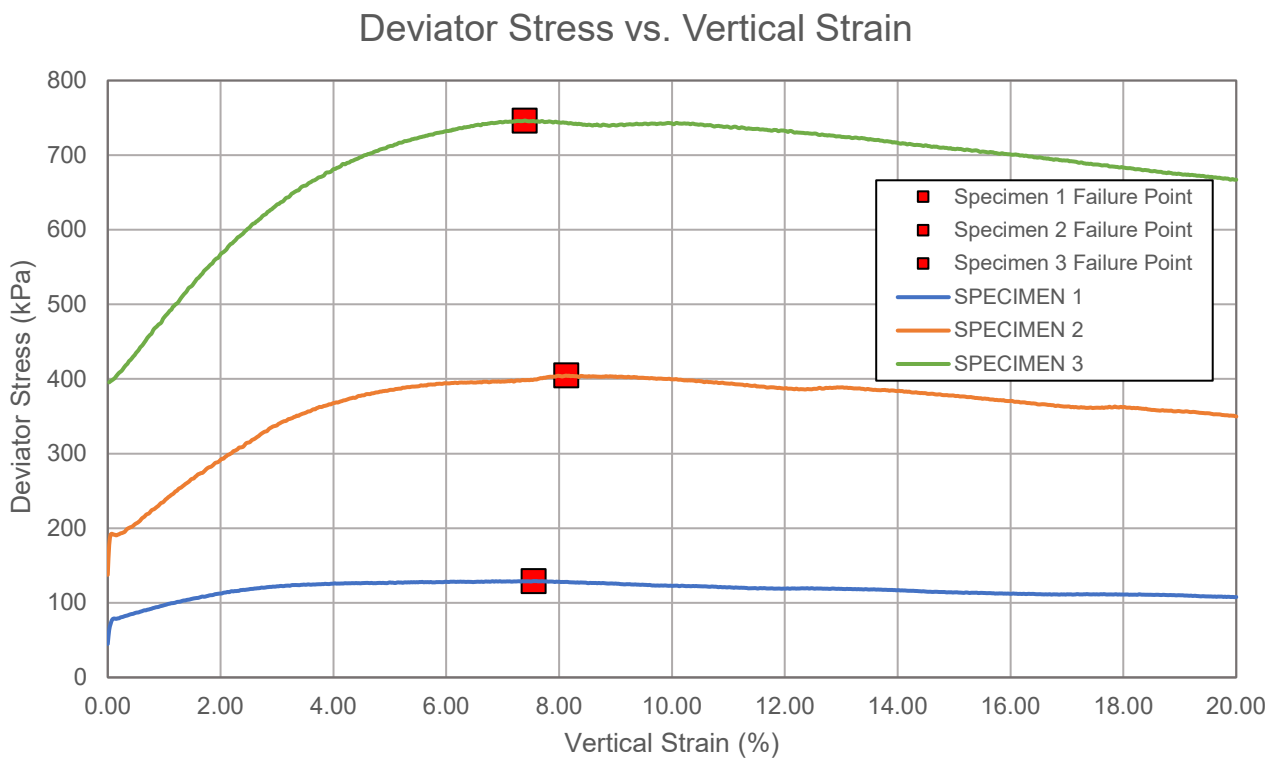

Consolidated Drained Triaxial Compression Testing Interpretations

Figure No. H - 1.1

Consolidated Drained (CAD) Triaxial Test

Project No.:	21451329
BH ID:	66S&66SB
Soil Unit:	2a

	Specimen 1	Specimen 2	Specimen 2
Consolidation Stage:	Anisotropic (Consol. K= 0.51)	Anisotropic (Consol. K= 0.50)	Anisotropic (Consol. K= 0.50)
Sample ID:	66S SA9-1	66S SA10-1	66SB SA10-1
Test ID:	CAD-7	CAD-8	CAD-9
Depth:	4.27 m - 5.31 m	5.33 m - 5.54 m	6.71 m - 7.01 m

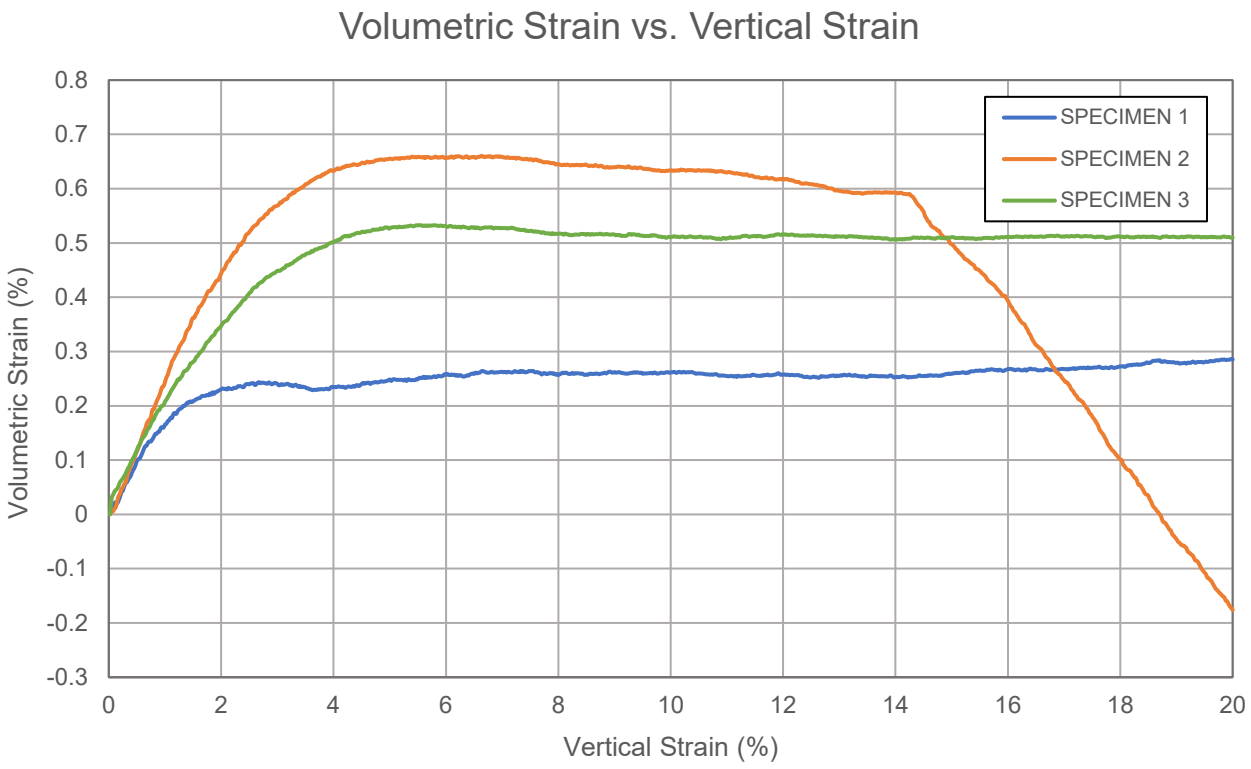

Consolidation of specimen(s) carried out under anisotropic conditions. Ratio of horizontal to vertical effective stress at end of consolidation stage (Consol. K) indicated above for each specimen.

Figure No. H - 1.2

Consolidated Drained (CAD) Triaxial Test

Project No.:	21451329
BH ID:	66S&66SB
Soil Unit:	2a

	Specimen 1	Specimen 2	Specimen 2
Consolidation Stage:	Anisotropic (Consol. K= 0.51)	Anisotropic (Consol. K= 0.50)	Anisotropic (Consol. K= 0.50)
Sample ID:	66S SA9-1	66S SA10-1	66SB SA10-1
Test ID:	CAD-7	CAD-8	CAD-9
Depth:	4.27 m - 5.31 m	5.33 m - 5.54 m	6.71 m - 7.01 m

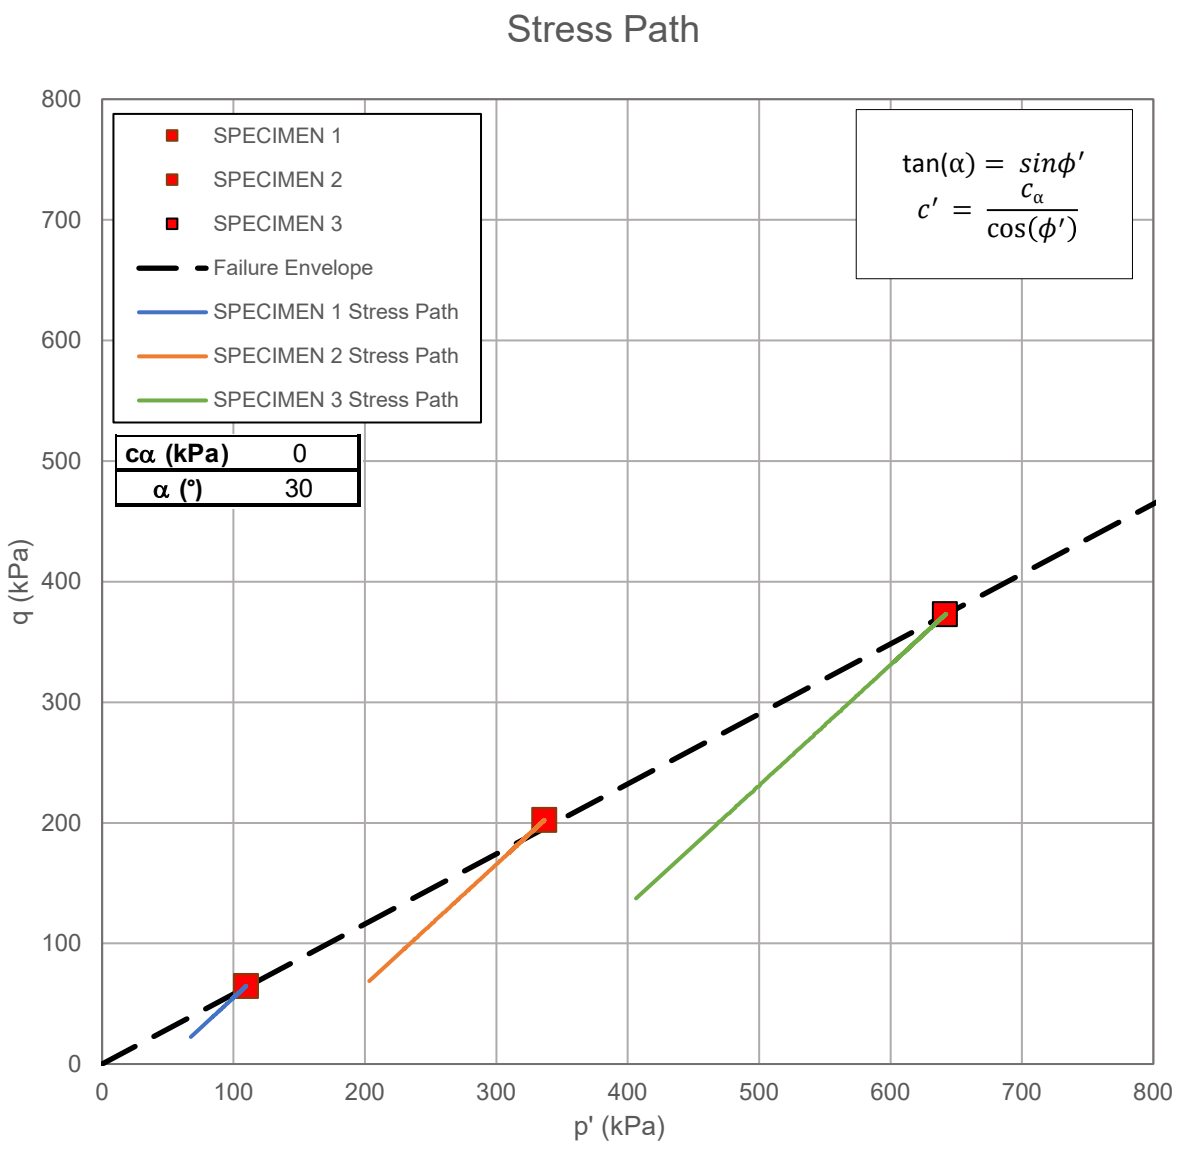

Consolidation of specimen(s) carried out under anisotropic conditions. Ratio of horizontal to vertical effective stress at end of consolidation stage (Consol. K) indicated above for each specimen.

Figure No. H - 1.3

Consolidated Drained (CAD) Triaxial Test

Project No.:	21451329
BH ID:	66S&66SB
Soil Unit:	2a

	Specimen 1	Specimen 2	Specimen 2

Figure No. M5.4

Modulus of Soils by Torsional Shear (Strain Controlled)

Max Shear Modulus G_{max} (kPa) 89905

Project No.	21451329
Soil Unit	BH28S
BH ID	4B
Sample ID	SA45
Test ID	TS-18
Depth Interval	24.88m - 25.11m

Cycle 15

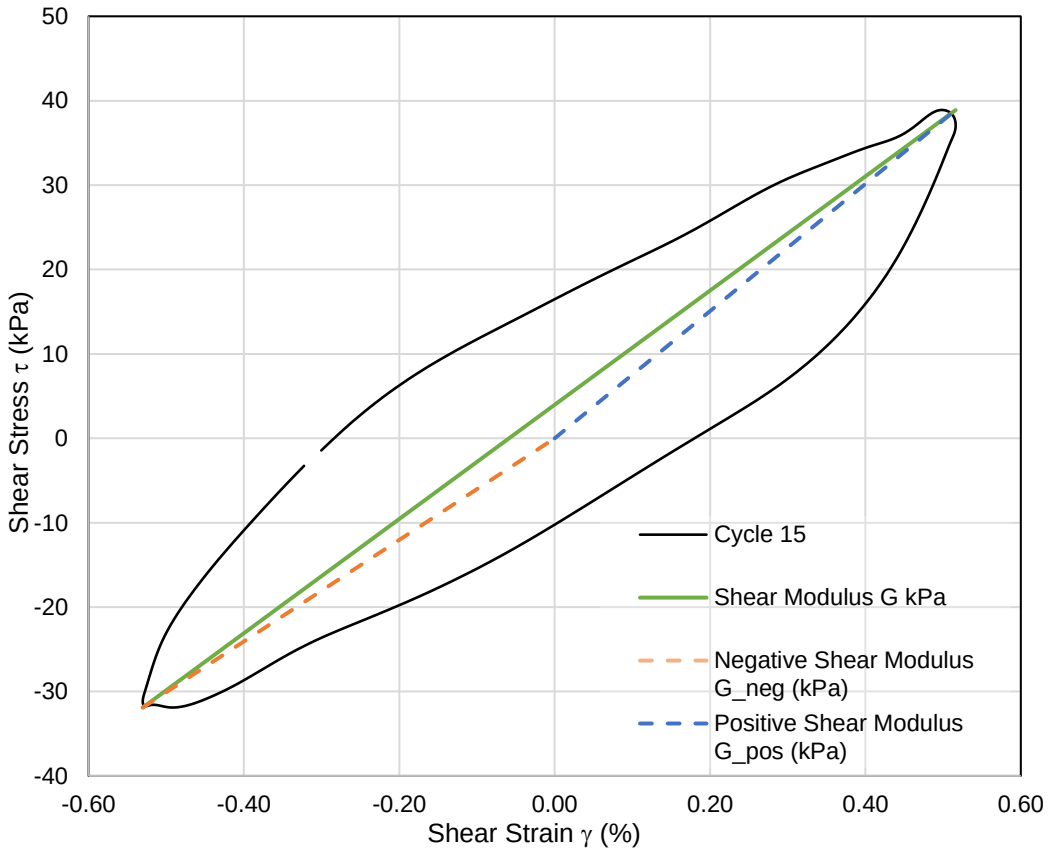

Shear Strain γ (%)	Shear Stress τ (kPa)
-0.5	-31.9
0.0	0.0
0.5	38.9

Shear Modulus G (kPa)	6765.5
itive Shear Modulus G_pos (kPa)	7535.7
ative Shear Modulus G_neg (kPa)	6015.8

G/Gmax 0.075

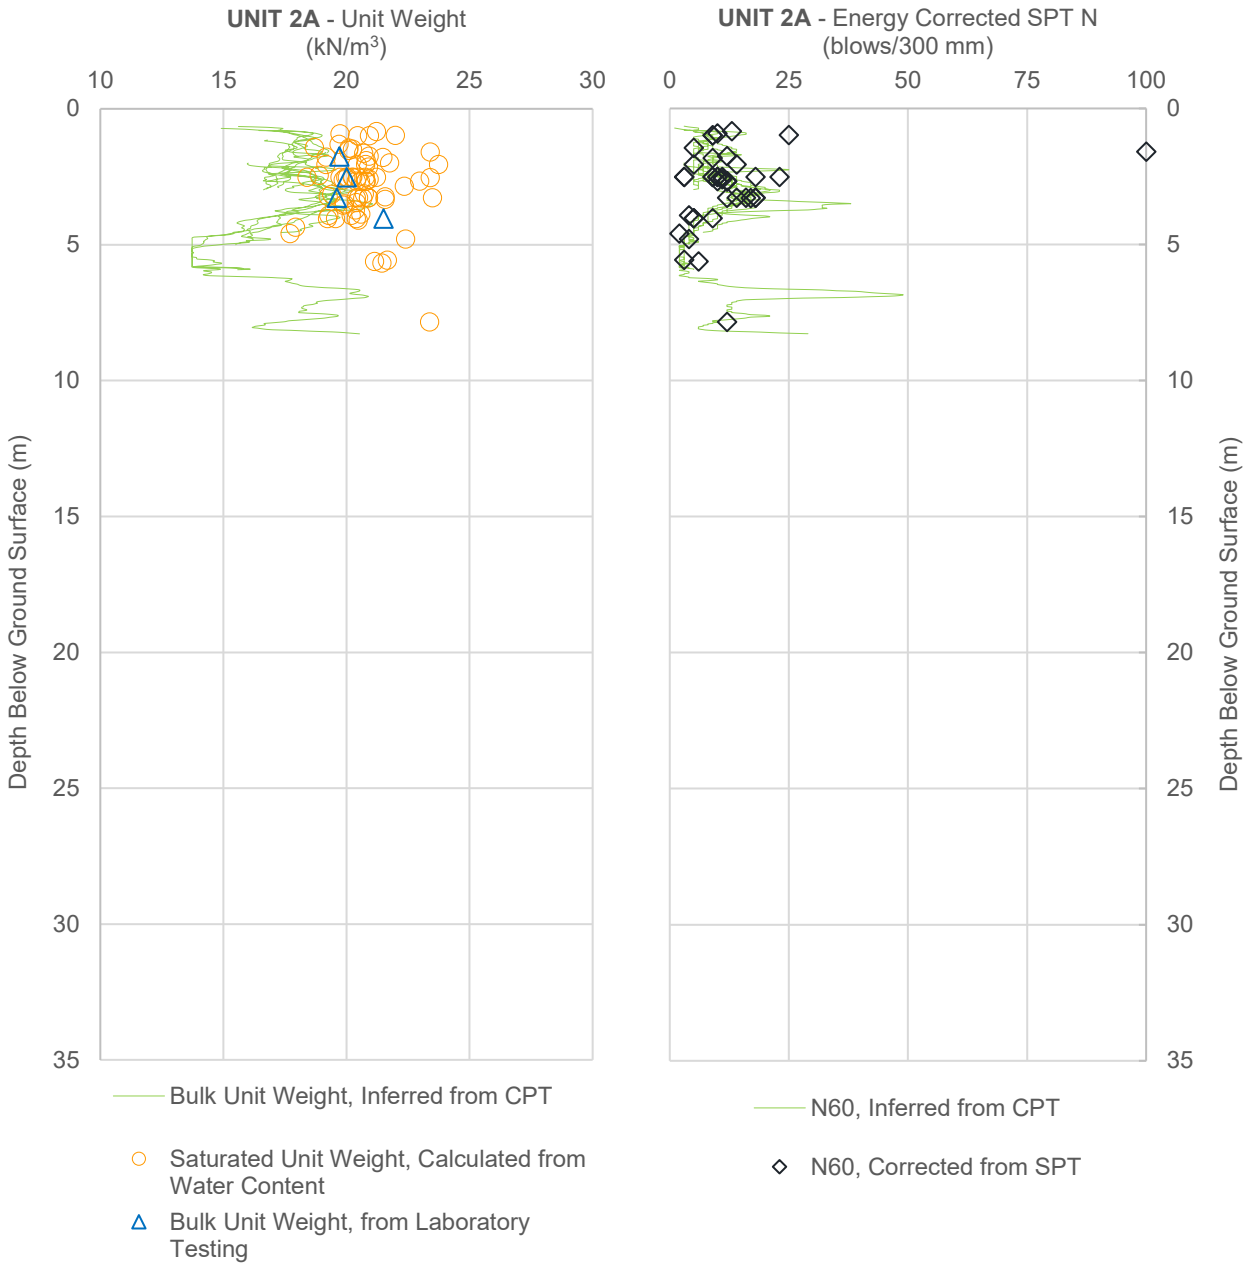

BH28S/SA45/Cycle 15

BH28S/SA45/Cycle 1

APPENDIX N

Interpreted Soil Parameter Profiles, By Stratigraphic Unit

NOTE(S)

1. This figure is to be read in conjunction with the accompanying Golder Associates Ltd. Report No. 21451329-002.
2. Saturated unit weight calculated from specific gravity and water content measured in laboratory (assumes 100% saturation).
3. SPT N_{60} represents the SPT N value corrected to 60% of the theortetical free-fall hammer energy.
4. SPT N_{60} value of 100 indicates practical refusal of split spoon sampler.

NOTE(S)

1. This figure is to be read in conjunction with the accompanying Golder Associates Ltd. Report No. 21451329-002.
2. Horizontal hydraulic conductivity and coefficient of horizontal consolidation from CPT based on Soil Behaviour Type.
3. Horizontal hydraulic conductivity from dissipation testing calculated using coefficient of volume compressibility from laboratory consolidation testing.
4. Vertical hydraulic conductivity and coefficient of vertical consolidation from one-dimensional consolidation testing taken at a stress level of 100 kPa in excess of the estimated in situ vertical effective stress for each tested specimen.
5. For Unit 2a, the ratio of the geometric mean of the horizontal hydraulic conductivity (from dissipations) to the geometric mean of the vertical hydraulic conductivity (from consolidation testing) is approximately equal to 30.
6. Coefficient of lateral earth pressure at rest interpreted from consolidated undrained triaxial testing, where specimen consolidated to approximate in situ vertical effective stress under no lateral strain conditions (i.e., K_0-consolidation).

NOTE(S)

1. This figure is to be read in conjunction with the accompanying Golder Associates Ltd. Report No. 21451329-002.
2. Undrained shear strength from field vane testing corrected for plasticity.
3. Undrained shear strength interpreted from consolidated undrained triaxial testing, where specimen consolidated to approximate in situ vertical effective stress.
4. Undrained shear strength interpreted from direct simple shear testing, where specimen consolidated to approximate in situ preconsolidation pressure, then unloaded to approximate in situ vertical effective stress for shearing stage.
5. From consolidated undrained triaxial testing, effective friction angle and effective cohesion intercept interpreted from Mohr-Coulomb failure envelope constructed from two to three specimen results. Effective friction angle and effective cohesion intercept from triaxial testing plotted as constant value over depth range of samples used to construct failure envelope.
6. Stress-Strain Elastic Moduli correlated from undrained shear strengths from direct simple shear (DSS) and consolidated undrained (CU) triaxial testing (representative of in situ conditions), where $E_s = 500 s_u (OCR)^{0.5}$ (see Table 5-6 in Bowles, 1997).

1.0 INTRODUCTION

This report has been prepared for the Ontario Power Generation (OPG) Darlington New Nuclear Project (DNNP) to meet the objectives described in Section 2.1. The DNNP site location is presented in Figure 1.

2.0 SOIL CHARACTERIZATION PROGRAM DESCRIPTION

2.1 Objectives

The objectives of this investigation are the following:

- To plan and conduct a comprehensive soil characterization program for the DNNP lands to support future preparation of the Hazardous Waste management Plan/Procedure by satisfying the relevant commitments documented under Deliverable D-P-3.6 in the DNNP Commitment Report[1] ("Commitment Report"). Specifically, the commitments are described as the following:
  - *"Prior to site preparation, OPG (Ontario Power Generation) to conduct a comprehensive soils characterization program. In particular, the potentially impacted soils in the areas OPG identifies as the spoils disposal area, cement plant area and asphalt storage area must be sampled to identify the nature and extent of potential contamination."*

  and

- "The presence of contaminated soil or rock will be assessed and managed if encountered to meet regulatory requirements."
- To plan and collect baseline soil quality data at the proposed northeast waste stockpile/landfill area ("NE Landfill Area), as well as south of the CN railway tracks on the DNNP lands as shown on Figure 3 (in case the proposed location of the stockpile/landfill area needs to be changed to the south side of the tracks in the future) to support the relevant commitment document under Deliverable D-P-9.1 of the Commitment Report. Specifically, the commitments are described as the following:
  - *"Prior to Excavation/Stockpiling*
    The geologic elements of a detailed site geotechnical investigation include, but not be limited, to:
    - *Collecting baseline soil quality data at the proposed northeast waste stockpile/landfill area prior to the placement of non-radiological waste."*

2.2 Background

2.2.1 Site Preparation Licence and Commitment

OPG currently maintains Nuclear Power Reactor Site Preparation Licence ("PRSL") 18.00/2022 for the DNNP. The DNNP is located in the Municipality of Clarington, in the Region of Durham, approximately 70 km east of the city of Toronto. The PRSL expires on August 17, 2022 and its renewal is underway.

OPG made a number of commitments during the environmental assessment and licensing process. OPG's commitment statements are organized and grouped into key commitments presented as deliverables and

[1] Darlington New Nuclear Project Commitments Report, NK054-REP-01210-00078

documented in the DNNP Commitment Report (OPG Document NK054-REP-01210-00078). Deliverables are organized in accordance with the licensing phase in which they must be completed.

A Hazardous Waste Management Plan/Procedure (Deliverable D-P-3.6 in the Commitment Report) will be prepared and submitted to the Canadian Nuclear Safety Commission ("CNSC") for review and acceptance no later than three months prior to commencement of PRSL licensed activities. The comprehensive soils characterization program completed as described herein will support the preparation of the Hazardous Waste Management Plan/Procedure prior to site preparation. To support the completion of the comprehensive soils characterization program, soil sampling at the south of the CN railway tracks on the DNNP land (Figure 2) was conducted.

Additionally, OPG will also develop a Site Geotechnical and Seismic Hazard Investigation Program as described under Deliverable D-P-9.1 in the Commitment Report and provide to CNSC, for information, prior to implementation of the program during the site preparation phase. Baseline soil quality data at the proposed northeast waste stockpile/landfill area, as well as at the south of the CN railway tracks on the DNNP lands (Figures 2 and 3) were collected as part of this investigation, as required, prior to the placement of the non-radiological waste to support the geologic elements of a detailed site geotechnical investigation.

2.2.2 DNNP Lands

The DNNP Lands comprise the eastern one third of the Darlington Nuclear ("DN") site and consist of approximately 176 hectares (ha) (436 acres) of land, as measured through this work program, and is bounded by Lake Ontario to the south, Holt Road to the west, St. Mary's Cement to the east and South Service Road of Highway 401 (now Energy Drive) to the north. The DNNP Lands are bisected by the Canadian National ("CN") railway into a southern and northern half of similar size. The area south of the railway tracks, referred to herein as the DNNP Lands South, is 95 ha and generally slopes towards Lake Ontario, while the area north of the tracks, referred to as the DNNP Lands NE Landfill Area, is 81 ha and slopes toward the east. The locations of the DNNP Lands South and the DNNP Lands NE Landfill Area are provided in Figure 1.

The overburden geology at the Site generally consists of fill materials at surface, underlain by the Upper Till (Newmarket Till), Interglacial Deposits (Thorncliffe Formation), and the Sunnybrooke Till overlying shale or limestone bedrock.[2]

3.0 INVESTIGATION SCOPE AND METHODS

Deliverable D-P-3.6 of the *Commitment Report* includes the planning and execution of a comprehensive soil characterization program for the DNNP site, and deliverable D-P-9.1 of the *Commitment Report* includes the collection of baseline soil quality data for the DNNP Lands NE Landfill Area.

The investigation activities included herein were completed between March 25 and May 14, 2021 and included the following tasks:

- **Health and Safety Plan**: Preparation of a Health and Safety / Safe Work Plan.

[2] CH2M Hill Canada Limited and Kinetrics Inc. 2009. Geological and Hydrogeological Environmental Existing Conditions Technical Support Document New Nuclear – Darlington Environmental Assessment. OPG document NK054-REP-07730-00005.

- **Utility Clearances**: Coordination of utility clearances with OPG and/or local utility companies, as appropriate, along with retaining the services of a private locator to assess for possible services in the areas of the proposed test locations.
- **Borehole Advancement**: The borehole drilling program included drilling of 56 boreholes. The locations of the boreholes are provided on Figures 2 and 3.
- **Soil Sampling**: Select soil samples were collected throughout the drilling program from 56 boreholes and from 53 shallow (0.00-0.15m) hand-dug test pits throughout the Site, to supplement the borehole drilling program.
- **Soil Sample Analysis:** Soil samples were submitted for chemical analysis of one or more of the following: petroleum hydrocarbons ("PHCs"), volatile organic compounds ("VOCs"), polycyclic aromatic hydrocarbons ("PAHs"), metals, hydride-forming metals, polychlorinated biphenyls ("PCBs"), and/or other regulated parameters, as noted in Table 8.
- **Reporting**: Golder compiled and assessed the field and laboratory results from the above noted activities into this report.

The locations of samples collected as part of this investigation in the DNNP Lands South are provided in Figure 2. The locations of samples collected as part of this investigation in the DNNP Lands NE Landfill Area are provided in Figure 3. Prior to this investigation, soil samples have not been collected at the sample locations indicated in Figure 2 and Figure 3. The scope of the field work completed as part of this investigation took into consideration the results and recommendations of the *Soil Gap Analysis*[3], which included field observations/walkdowns and a desktop review of relevant environmental reports to identify current and past uses of the DNNP lands with the potential to cause impacts to soil quality. The *Soil Gap Analysis* identified 20 areas of potential environmental concern ("APEC") with corresponding contaminants of concern and to further evaluate the soil conditions in each APEC, relevant environmental reports were reviewed to identify whether any prior investigations of soil quality had been completed that were relevant to an APEC. The intent of this investigation was to collect representation of soil quality data where there was none previously identified. A summary and the location of the APECs is provided on Figure 1. It is noted that no APECs were identified in the DNNP Lands NE Landfill Area.

The *Soil Gap Analysis* recommended conducting a preliminary investigation of soil quality to determine if any significant soil impacts were present, in support of the requirements of D-P-3.6. Additionally as part of this field program, the requirements for baseline soil quality data in support of commitment D-P-9.1 for the DNNP NE Landfill Area were taken into consideration. Accordingly, the scope for the field work completed as part of this investigation included the following:

- Completion of a borehole drilling program on the DNNP Lands South, to further evaluate soil quality for each APEC where a data gap was identified in the *Soil Gap Analysis*. The field work to support this objective included advancing 51 boreholes across the DNNP Lands South to collect the supplemental soil quality information, including 40 boreholes advanced to a depth of approximately 3 metres below ground surface ("mbgs"), 5 boreholes advanced to 6 mbgs, and 6 boreholes advanced to 10 mbgs;

[3] *"Soil Characterization Gap Analysis – Darlington New Nuclear Project"* prepared by Golder for OPG and dated August 13, 2020 (Golder File No. 20137285).

- Borehole locations and depths were determined based on the location and nature of the potentially contaminating activities ("PCAs") and APECs as identified in the *Soil Gap Analysis*, as well as physical access conditions and/or constraints identified in the field during the work. As part of this field work, samples were collected from the most likely zone to be impacted based on the specific PCAs, as well as to provide additional baseline evaluation of the underlying soil quality; and
- Completion of a borehole drilling program in the DNNP Lands NE Landfill Area to provide a preliminary assessment of soil quality in this area, including five boreholes advanced to depths of up to 3 mbgs.

In the absence of an APEC in the DNNP Lands NE Landfill Area, and based on Golder's understanding that this property has primarily been used for agricultural uses that pose a relatively low risk of causing impacts to soil quality, the borehole locations and depths were determined to provide general areal coverage within the proposed NE Landfill stockpile footprint in the most likely zone to be impacted (i.e., the upper fill) based on the known use of the property.

It is noted that OPG may consider a "south" landfill area (located generally on the north and east portions of the DNNP Lands South. Should this be the case, the soil sampling and analysis completed to address D-P-3.6 is also intended to satisfy the intent of D-P-9.1 for collection of baseline soil quality data. Specifically, the sampling program included the collection of soil samples targeting the most likely areas of the Site to contain contamination (i.e., the APEC areas), and the investigation included 32 sampling locations across potential "south" landfill areas, providing general areal coverage as well. Based on current information, the sampling and analysis completed for the DNNP Lands NE Landfill Area and DNNP Lands South will provide baseline soil quality data for their respective areas.

3.1 Field Investigation

The following sections describe the field investigation methods employed during this investigation. Borehole layout was completed on March 25, 2021. Soil sample collection was completed April 8 and May 14, 2021.

Prior to initiating the field work, Golder developed and implemented Site-specific protocols to protect the health and safety of its employees and subcontractors through the preparation of a Site-specific Health and Safety Plan ("Safe Work Plan"). An assessment of potential health and safety hazards at the Site and those associated with the proposed work was completed each day of the field program. A health and safety tail gate meeting was held with OPG staff and Golder's subcontractors each day prior to completion of the field work. The document was reviewed and signed on-Site by field personnel prior to commencing work. Additionally, prior to any intrusive investigations, including drilling, Golder completed public and private utility clearances as appropriate.

A total of 56 boreholes were advanced at the Site (51 on the DNNP Lands South, and five on the DNNP Lands NE Landfill Area). The boreholes were completed by Walker Drilling Ltd. ("Walker") using a Diedrich D120 track-mounted drill rig with 108 mm outside diameter ("OD") solid stem augers. Continuous soil samples (i.e., samples collected at repeating 60-cm intervals for the entire length of the borehole) were collected using a 50 mm diameter stainless steel split-spoon sampler.

3.1.1 Soil Sampling

During borehole advancement, soil samples were collected for visual characterization, headspace screening of combustible and organic vapour concentrations using a portable, intrinsically safe gas detector, and select soil samples were collected directly into pre-cleaned, laboratory-supplied sampling containers and submitted to Bureau Veritas Laboratories ("BVL") for analysis, as per the requirements in the attached Table 8 (Contaminants

of Concern in Soil, Darlington New Nuclear Project). The samples collected from the boreholes were supplemented with 53 shallow (0.00 to 0.15 mbgs) hand-dug test pits completed throughout the project area to further assess surficial soil quality.

A sampling and analysis plan was developed by a team of qualified people based on the information provided in this report. Table 8 following the text of this report was used to develop the sampling plan, and provides information regarding the number of samples and analysis required. In addition to the bulk soil analysis, 10% of the total volume of samples were to be collected for leachate analysis.

Soil samples were obtained from a combination of boreholes and shallow test pits, depending on the required depth of sample collection.

The quality assurance/quality control measures undertaken as part of this field program meet the requirements of O.Reg. 153/04, O.Reg. 406/19 and industry standard protocol. The quality assurance/quality control measures undertaken as part of this field program also meet the requirements of CSA N288.4 (*Environmental Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills*).

Maintaining a database of soil quality data is recommended for the management of data and for future integration into a soil tracking program. Golder has entered all available data into EQuIS and provided an electronic data deliverable.."

3.1.2 Field Screening Measurements

Field measurements of sample headspace concentrations were made using the following equipment:

Equipment	Parameters Detected	Operating Range	Precision	Accuracy	Calibration Standard
RKI Eagle 2	Combustible gas	0-50,000 ppm	NA	±5%	Hexane (100 ppm)
RKI Eagle 2	Total organic vapour	0-2,000 ppm	NA	±5%	Isobutylene (100 ppm)

Instruments were calibrated by Maxim Environmental Equipment prior to delivery to the Site, as well as daily, with the daily calibration checks completed by Golder. The results of soil headspace screening measurements are provided in the Record of Borehole Sheets in Appendix A.

3.1.3 Residue Management Procedures

All residues produced during the investigation (i.e., soil cuttings from drilling) were placed on the ground surface in the general area of the borehole being investigated, unless obvious evidence of environmental impact was noted, in which case the cuttings were placed in sealed drums and stored on Site for subsequent disposal in accordance with OPG's Waste Disposal Guidelines[4]. Two sealed drums of soil cuttings were ultimately generated as part of this investigation and removed from the Site by Ground Force Environmental ("GFL") to one of their treatment facilities as a non-hazardous waste.

[4] Section 3.9.6 *Solid Excavated Materials (such as Soil, Gravel, Asphalt and Concrete* of OPG's "Waste Disposal Guidelines for Solid Waste and Recycling at Darlington" (OPG No. D-INS-79000-10002 R0003)

3.2 Quality Assurance and Quality Control Measures

Golder's quality assurance program for environmental investigations was implemented to ensure that analytical data obtained by the investigation were valid and representative. The quality assurance program included the following measures:

- The use of Golder's standard operating procedures for all field investigation activities;
- The collection of field duplicate samples at a minimum frequency of one duplicate for every ten samples;
- Initial calibration of field equipment was performed at the start of each field day, with a daily checks of calibration, as needed, using a standard of known concentration;
- Soil samples were handled and stored in accordance with the sample collection and preservation requirement of the Ontario Ministry of the Environment, Conservation and Park's ("MECP") "*Protocol for Analytical Methods Used in the Assessment of Properties Under Part XV.I of the Environmental Protection Act"*, July 1, 2011. Samples were collected directly into pre-cleaned, laboratory-supplied sample containers with the appropriate preservative for the analyte group. Upon collection, samples were placed in insulated coolers with ice for storage and transport to the analytical laboratory under chain-of-custody;
- Dedicated sampling equipment and clean disposable Nitrile™ gloves were used at each sampling location to prevent cross-contamination. All non-dedicated sampling equipment (e.g., split-spoons) were decontaminated between sampling locations. Sampling equipment in contact with soil was: cleaned by mechanical means; washed with a phosphate-free, laboratory-grade detergent or equivalent (e.g., LiquiNox) where possible and, if necessary, an appropriate desorbing wash solution; and thoroughly rinsed with analyte-free water;
- Detailed field records documenting the methods and circumstances of collection for each field sample were prepared at the time of sample collection. Each sample was assigned a unique sample identification number recorded in the field notes, along with the date and time of sample collection, the sample matrix, and the requested analyses; and
- The submission of samples to the analytical laboratory in accordance with standard chain of custody procedures.

4.0 REVIEW AND EVALUATION

This section of the report presents a review and evaluation of the results of the drilling and soil sampling activities conducted as part of this investigation.

4.1 Soil Conditions

The soil conditions encountered during the borehole drilling program are presented in the Record of Borehole sheets provided in Appendix A. In general, overburden material consisted of surficial fill, underlain by variable native soils including sandy silt, silty sand, clayey silt and silty clay and gravel.

4.2 Field Screening

The results of headspace vapour measurements are presented in the Record of Borehole sheets in Appendix A, and were used to supplement the soil selection requirements in the attached Table 8 (Contaminants of Concern in Soil, Darlington New Nuclear Project). Headspace readings were measured as part of the investigation, and were used to supplement the soil sampling requirements outlined in Table 8. Headspace readings ranged from non-detect to 60 parts per million ("ppm") at BH21-08 (0.61-1.22 mbgs) for combustible gas vapour, and from non-detect to 25 ppm at BH21-08 (0.00-0.61 mbgs) for organic vapour. No evidence of objectionable odour or obvious evidence of staining or environmental impact was observed throughout the investigation, with the exception of soil samples collected from BH21-7, BH21-8, BH21-14, BH21-17, BH21-18, BH21-19, BH21-20, which exhibited objectionable PHC-like odours and staining within the surficial gravel and/or shallow fill (i.e., within approximately 0.00-1.20 mbgs). The objectionable soil was contained in drums and subsequently removed from the property as a non-hazardous waste as corresponding analytical data did not exceed the threshold for hazardous waste, and was accepted by GFL as such based on their review of the data.

4.3 Applicable Site Condition Standards

The analytical results of the soil samples collected for this investigation were compared to the Table 3 site condition standards (industrial property use, coarse soil texture) presented in the MECP document "*Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act*", dated April 15, 2011 (the "MECP Table 3 Standards"). The site condition standards were selected based on the following rationale:

- The DNNP Lands are considered to be an industrial property use;
- The DNNP Lands are supplied by the municipal drinking water system and does not include any wells that are used or intended for use as a source of potable water;
- The DNNP Lands are not located in an area designated in a municipal official plan as a well-head protection area or other designation identified by the municipality for the protection of ground water;
- The native soil materials were qualitatively observed to consist of coarse textured materials and accordingly, the more stringent coarse textured site condition standards were conservatively assumed to apply;
- The closest water body is Lake Ontario (adjacent to the south); however, there is no intention to reuse any soil at the DNNP Lands at any location that is within 30 metres of Lake Ontario. Water bodies appear to be present on both the DNNP Lands NE Landfill Area and the DNNP Lands South as shown in Figure 3; however, these features appear to primarily be intermittent drainage features, rather than permanent water bodies representing habitat for aquatic receptors. Should soil reuse be anticipated within 30 metres of a water body, more stringent review of the soil quality data will be required as MECP Table 8 standards would apply as well as potentially other restrictions (e.g. CLOCA);
- There are no features on the DNNP Lands that would meet the conditions of an environmentally sensitive site of O.Reg. 153/04;
- In general, the pH of surface soil is greater than 5 and less than 9 and the pH of sub-surface soil meets the requirement that the pH fall within this range. One sample (BH21-30 collected from 1.82-2.44 mbgs) had a reported pH of 11.7. This localized, shallow soil sample is not considered a concern (there is no

associated risk to human health); however, additional assessment of the pH of any excess soil generated during construction in this area may be appropriate to confirm this localized result;

- The intended use of the DNNP Lands is and will continue to be industrial (power generation); and
- The overburden thickness is greater than 2 metres over more than one-third of the DNNP Lands.

In general, the MECP Table 3 Standards (industrial property use, coarse soil texture) are appropriately protective for reuse of excess soil at the DNNP Lands, provided that excess soil is not reused within 30 metres of water body.

4.4 Soil Quality

The analytical results of soil samples are presented in Tables 2 to 7, and the locations of soil samples collected as part of this investigation are represented in Figures 4.1 through 4.10 and Figures 5.1 through 5.7. Laboratory certificates of analysis for the soil samples are included in Appendix B. A total of 217 soil samples (including 29 duplicate soil samples) were collected and submitted for analytical testing. The reported concentrations for 204 out of the 217 samples submitting for testing met the MECP Table 3 Standards. Specifically, the following are of note:

- The reported concentrations for all samples collected from the DNNP Lands South met the MECP Table 3 Standards, with the exception of the following samples:
  - GS21-39 (0.00-0.32 mbgs) in APEC 19b and 19d – the reported concentrations of copper, zinc and arsenic were above the MECP Table 3 Standards;
  - BH21-18-1 (0.00-0.61 mbgs) in APEC 15a - the reported concentration of PHC F1 was above the MECP Table 3 Standards;
  - BH21-19-1 (0.00-0.61 mbgs) in APEC 15a - the reported concentration of PHC F1 was above the MECP Table 3 Standards;
  - BH21-20-1 (0.00-0.61 mbgs) in APEC 15a- the reported concentrations of PHC F1 and PHC F2 were above the MECP Table 3 Standards;
  - BH21-21-1 (0.00-0.61 mbgs) in APEC 15b - the reported concentration of PHC F1 was above the MECP Table 3 Standards;
  - BH21-7-1 (0.00-0.61 mbgs) in APEC 8 - the reported concentration of PHC F1 was above the MECP Table 3 Standards; and
  - BH21-8-1 (0.00-0.61 mbgs) in APEC 8 - the reported concentration of PHC F1 was above the MECP Table 3 Standards.
- The reported concentrations for all samples collected from the DNNP NE Landfill Area met the MECP Table 3 Standards.

The maximum identified depth of soil impacts (i.e., soil samples exceeding the MECP Table 3 Standards, as noted above) in the DNNP Lands South is 0.61 mbgs. The reported concentrations for submitted soil samples at a greater depth (i.e., from 0.61 mbgs to 3.05 mbgs) satisfied the MECP Table 3 Standards.

Golder is not aware of the need to take any immediate action to address soil identified as exceeding the MECP Table 3 Standards; rather, the impacts represented by these samples would only require additional assessment in the context of the soil management and proposed reuse for the soil, should the soil be excavated in the future. Based on the information contained herein, it is likely that the soil could be reused as planned within the DNNP lands; however, site-specific excess soil standards may have to be developed in order to confirm this, prior to placement.

4.5 Data Quality Review

The quality assurance assessment of the field duplicate sample results was conducted considering the MECP document "*Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act*", March 9, 2004 (amended in July 2009 and effective as of July 1, 2011) ("Analytical Protocol") and other relevant technical guidance from the United States Environmental Protection Agency.

The data quality review included the review of field notes, the results of field quality control samples, the result of laboratory quality control samples, noting that the field quality control program is supported by the analytical laboratory's internal quality assurance program that includes the analysis of laboratory blanks, spikes, surrogates and duplicate samples. The findings of the data quality review are presented in Appendix B.

The analytical laboratory did not identify any concerns with the quality of the analyses completed as part of this investigation. The data quality review conducted by Golder did not identify any relevant concerns with the quality of the analyses completed as part of this investigation. The quality assurance/quality control measures undertaken as part of this field program meet the requirements of O.Reg. 153/04, O.Reg. 406/19 and industry standard protocol. The quality assurance/quality control measures undertaken as part of this field program also meet the requirements of CSA N288.4 (*Environmental Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills)* and the requirements of the *Golder Associates Integrated Management System*, which complies with the ISO 9001:2015 quality management system standard.

Accordingly, the analytical data generated during the investigation are valid and representative and may be used in this evaluation without further qualification; it is therefore Golder's opinion that the data quality objectives for this scope of work have been satisfied.

5.0 CONCLUSIONS

The investigation included the collection and analysis of 217 soil samples (including 29 duplicate soil samples) from 109 sampling locations to assess soil quality in the DNNP Lands. Impacts to shallow soil (copper, zinc, arsenic, PHC F1, PHC F2) were identified at seven sampling locations in APECs 8, 15a, 15b, 17a, 19b and 19d in the DNNP Lands South. The maximum known depth of these impacts is 0.61 mbgs. The reported concentrations for all samples collected in the DNNP Lands NE Landfill Area met the MECP Table 3 Standards.

In general, the soil exceedances identified above were marginally above the Table 3 Standards, and would be considered a non-hazardous waste; however, these soils are potentially suitable for reuse at the Site.

The objectives of this investigation, as identified in Section 2.1 of this report in support of D-P-3.6 and D-P-9.1, in the context of the completion of a comprehensive soil characterization program, and the collection of baseline soil quality data at the proposed DNNP Lands NE Landfill Area have been completed; it is noted that the presence of contaminated soil has been assessed, and management practices for the impacted soil identified on-Site will be identified through the development of a project-specific soil management plan.

6.0 RECOMMENDATIONS

The following recommendations are provided, noting that the design of the DNNP project is not complete and that OPG intends, on a preliminary basis, to reuse excess soil generated in the course of these construction activities in an excess soil placement area (i.e., a soil berm, spoils area) located on either the DNNP Lands NE Landfill Area or portions of the DNNP Lands South:

- Further delineation of soil impacts should be completed at seven sampling locations in APECs 8, 15a, 15b, 17a, 19b and 19d, pending final excavation design, for the appropriate management of excavated soils from these areas, if required;
- The suitability of excess soil in the areas of soil impacts for reuse in an excess soil containment structure should be further evaluated through the development of excess soil standards for the containment structure; and,
- A soil management plan should be developed to guide soil management in the course of planned construction activities in the DNNP Lands. The soil management plan should include requirements for soil testing in advance of construction, requirements for construction and requirements for reuse of the excess fill in the containment structure (including requirements for any excess soil that is unsuitable for reuse in the containment structure).

7.0 LIMITATIONS

This report was prepared for the exclusive use of Ontario Power Generation and the Darlington New Nuclear Project. No third parties may rely upon this report. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, is the sole responsibility of such third party. This report is based on data and information collected during this investigation conducted by Golder Associates Ltd. in accordance with our proposal and is based solely on site conditions encountered at the time of the field investigation. In preparing this site assessment, Golder evaluated only conditions on the DNNP Lands and did not evaluate the operations on adjacent properties. Only limited chemical analyses of soil samples were carried out. Regulatory criteria are used for comparison purposes only and are not necessarily enforceable on the owner. It should be noted that the results of an investigation of this nature should, in no way, be construed as a warranty that the site is free from any and all contamination from past or current practices.

Golder did not perform a complete assessment of all possible conditions or circumstances that may exist at the site referenced in the Report. Conditions may therefore exist which were not detected given the limited nature of the assessment. In addition, it is recognized that the passage of time affects the information provided in the Report. Golder's opinions are based upon information available to Golder as of the date of the Report. It is understood that the report forms no more than an opinion of the actual conditions and requirements at the Site and cannot be used to assess the effect of any subsequent changes in any laws or regulations and the environmental quality of the Site or its surroundings.

The activities described and conclusions drawn within this report address only the geo-environmental (chemical) aspects of the subsurface conditions at the subject property. The geotechnical (physical) aspects, including, without limitation, the engineering recommendations for the design and construction of building foundations, pavements, underground servicing and the like are outside the terms of reference for this report and have not been investigated or addressed herein.

The scope and the period of Golder's assessment are described in this Report, and are subject to restrictions, assumptions and limitations. Except as noted herein, the work was conducted in accordance with the scope of work and terms and conditions under contract with OPG.

In evaluating the Site as described (i.e., the DNNP Lands), Golder Associates Ltd. has relied in good faith on information provided by others. We accept no responsibility for any deficiency, misstatements or inaccuracies contained in this report as a result of omission, errors, misinterpretations or fraudulent acts by others. Golder Associates Ltd. accepts no responsibility for any reduction in property value, either real or perceived, or for decisions made as a result of the reporting of factual information herein.

If additional information is obtained during future work at the Site, including excavations, borings, or other studies, and/or if conditions exposed during construction are different from those encountered in this assessment, Golder may be requested to re-evaluate the conclusions presented in this report and provide amendments as required.

O.Reg 153 (2011) Table 3 Standards for industrial/commerical/community property use for coarse textured soil in full depth generic site condition in a non-potable groundwater condition

< Indicates parameter was below laboratory equipment detection limit.

> Indicates parameter detected in excess of soil criteria

- Chemical not analyzed or criteria not defined.

Output generated by GalReport.

TABLE 8 - CONTAMINANTS OF CONCERN IN SOIL
DARLINGTON NEW NUCLEAR PROJECT

APEC	Original Contaminants of Concern	Location ID	Investigation Depth (mbgs)	Number of Samples to be Collected	Contaminants of Concern Requiring Further Investigation
APEC 1	PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-1	3	1	PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 1	PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-2	3	1	PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 1	PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-1	0-0.15	1	PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 1	PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-2	0-0.15	1	PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 2, 3, 4	PHCs, BTEX, VOCs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-3	2	1	BTEX, PCBs, PAHs, VOCs
APEC 2, 3, 4	PHCs, BTEX, VOCs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-4	2	1	BTEX, PCBs, PAHs
APEC 2, 3, 4	PHCs, BTEX, VOCs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-5	2	1	BTEX, PCBs, PAHs
APEC 5	PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	n/a	n/a	n/a	n/a
APEC 6	PCBs, PAHs, PHCs	BH21-6	3	2	PCBs, PAHs, PHCs
APEC 6	PCBs, PAHs, PHCs	GS21-3	0-0.15	1	PCBs, PAHs, PHCs
APEC 7	PHCs, PAHs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-6	3	2	PHCs, BTEX, PAHs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 7	PHCs, PAHs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-3	0-0.15	1	PHCs, BTEX, PAHs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 7	PHCs, PAHs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-4	0-0.15	1	PHCs, BTEX, PAHs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 7	PHCs, PAHs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-5	0-0.15	1	PHCs, BTEX, PAHs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 7	PHCs, PAHs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-6	0-0.15	1	PHCs, BTEX, PAHs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 7	PHCs, PAHs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-7	0-0.15	1	PHCs, BTEX, PAHs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 7	PHCs, PAHs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-8	0-0.15	1	PHCs, BTEX, PAHs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 7	PHCs, PAHs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-9	0-0.15	1	PHCs, BTEX, PAHs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 7	PHCs, PAHs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-10	0-0.15	1	PHCs, BTEX, PAHs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 7	PHCs, PAHs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-11	0-0.15	1	PHCs, BTEX, PAHs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 7	PHCs, PAHs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-12	0-0.15	1	PHCs, BTEX, PAHs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 8	PHCs, BTEX	BH21-7	3	1	PHC, BTEX
APEC 8	PHCs, BTEX	BH21-8	10	2	PHC, BTEX
APEC 9	PHCs, VOCs, BTEX, PAHs, ABN	BH21-9	3	1	PHCs, VOCs, BTEX, PAHs, ABN, OCP
APEC 9	PHCs, VOCs, BTEX, PAHs, ABN	BH21-10	10	2	PHCs, VOCs, BTEX, PAHs, ABN, OCP
APEC 10	PHCs, VOCs, BTEX, PAHs, ABN	BH21-11	3	2	PHCs, VOCs, BTEX, PAHs, ABN
APEC 10	PHCs, VOCs, BTEX, PAHs, ABN	BH21-12	3	2	PHCs, VOCs, BTEX, PAHs, ABN
APEC 10	PHCs, VOCs, BTEX, PAHs, ABN	BH21-13	10	3	PHCs, VOCs, BTEX, PAHs, ABN
APEC 11	PAHs, PCBs, PHCs	BH21-3	3	1	PCBs, PAHs
APEC 11	PAHs, PCBs, PHCs	GS21-13	0-0.15	1	PCBs, PAHs
APEC 11	PAHs, PCBs, PHCs	GS21-14	0-0.15	1	PCBs, PAHs
APEC 12, 14	PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-14	10	3	PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, EC, SAR
APEC 13	OCs, CN-, Metals, As, Se and Sb	BH21-15	3	2	OCPs (Coordinated with APEC 19b: PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR)
APEC 13	OCs, CN-, Metals, As, Se and Sb	BH21-16	3	2	OCPs (Coordinated with APEC 19b: PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR)
APEC 13	OCs, CN-, Metals, As, Se and Sb	BH21-48	3	2	OCPs (Coordinated with APEC 19b: PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR)
APEC 13	OCs, CN-, Metals, As, Se and Sb	BH21-50	3	2	OCPs (Coordinated with APEC 19b: PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR)
APEC 13	OCs, CN-, Metals, As, Se and Sb	GS21-15	0-0.15	1	OCPs (Coordinated with APEC 19b: PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR)
APEC 13	OCs, CN-, Metals, As, Se and Sb	GS21-16	0-0.15	1	OCPs (Coordinated with APEC 19b: PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR)
APEC 13	OCs, CN-, Metals, As, Se and Sb	GS21-17	0-0.15	1	OCPs (Coordinated with APEC 19b: PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR)
APEC 13	OCs, CN-, Metals, As, Se and Sb	GS21-18	0-0.15	1	OCPs (Coordinated with APEC 19b: PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR)
APEC 13	OCs, CN-, Metals, As, Se and Sb	GS21-19	0-0.15	1	OCPs (Coordinated with APEC 19b: PHCs, BTEX, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR)
APEC 14	EC, SAR	N/A	N/A	N/A	N/A
APEC 15a	PHCs, BTEX, PAHs, PCBs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-17	3	2	PAH, PCBs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 15a	PHCs, BTEX, PAHs, PCBs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-17	3	3	BTEX
APEC 15a	PHCs, BTEX, PAHs, PCBs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-18	3	4	BTEX, PAH
APEC 15a	PHCs, BTEX, PAHs, PCBs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-19	3	2	PCBs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 15a	PHCs, BTEX, PAHs, PCBs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-19	3	4	BTEX, PAH
APEC 15a	PHCs, BTEX, PAHs, PCBs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-20	3	2	BTEX, PAH, PCBs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR
APEC 15a	PHCs, BTEX, PAHs, PCBs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	BH21-20	3	3	BTEX, PAH

TABLE 8 - CONTAMINANTS OF CONCERN IN SOIL
DARLINGTON NEW NUCLEAR PROJECT

APEC	Original Contaminants of Concern	Location ID	Investigation Depth (mbgs)	Number of Samples to be Collected	Contaminants of Concern Requiring Further Investigation
APEC 15a	PHCs, BTEX, PAHs, PCBs, Metals, As, Se and Sb, HWSB, CrVI, CN-, EC, Hg, SAR	GS21-20	0-0.15	1	BTEX, PAH

Notes:
1. Samling location identified on Figures 2 and 3 of the workplan
2. "Number of Samples" column does not include duplicate samples (required one duplicate sample for each set of 10 samples collected as part of the field work program).
3. Soil Gap Analysis: "Soil Characterization Gap Analysis – Darlington New Nuclear Project" prepared by Golder for OPG and dated August 13, 2020 (Golder File No. 2013728
4. "Original Contaminants of Concern" ("COC") refers to the COCs associated with each APEC. "Contaminants of Concern Requiring Further Investigation" is specific to this cu
5. Note that specific depths or depth ranges have been evaluated and included on a case-by-case basis throughout this plan, based on PCA/APEC, BH depth and required nur observations during drilling. As such, specific sampling target depths have not been standardized herein.

APPENDIX B

Certificates of Analysis and Data Quality Review

TECHNICAL MEMORANDUM

DATE June 28, 2021 **Project No.** 20368429

TO Eric Hood, Ph.D., P.Eng.,QPESA

FROM Kevan Browne **EMAIL kbrowne@golder.com**

DATA QUALITY REVIEW – SOIL SAMPLES COLLECTED BETWEEN APRIL 8 AND MAY 14, 2021 FROM DARLINGTON NEW NUCLEAR PROJECT LANDS AT 1 HOLT ROAD SOUTH, BOWMANVILLE, ONTARIO

Data quality review was completed for samples collected between April 8 and May 14, 2021 from the Darlington New Nuclear Project Lands located at 1 Holt Road South in Bowmanville, Ontario. The samples were submitted to Bureau Veritas Laboratories for analysis and were reported by the laboratory as sample delivery groups (SDG) C1A5742, C1B0746, C1C0381, C1C4985, C1D2548 and C1D3619. A sample key for all samples submitted for analysis is provided in Table 1. The quality assurance criteria used to assess the data were established based on the methods of analysis.

The reported sample analytical results and the supporting quality assurance/quality control (QA/QC) data were reviewed. Evaluation of the analytical results was based on the chain of custody forms, laboratory certificates of analysis, and the electronic data deliverable submitted by the analytical laboratory. The QA/QC criteria by which the data have been assessed are outlined in the respective analytical methods and the following documents:

- "*National Functional Guidelines for Organic Data Review*", January 2017, United States Environmental Protection Agency, 540-R-2017-002.
- "*National Functional Guidelines for Inorganic Data Review*", January 2017, United States Environmental Protection Agency, 540-R-2017-001.

Field Data

Field forms documenting the sampling event were reviewed for completeness and to evaluate compliance with standard operating procedures. The findings of the review are documented in the field notes. No significant deviations from the standard operating procedures were identified that are likely to impact the validity of the analytical data.

Laboratory Quality Assurance

Electronic Data Deliverables

The reported analytical results in the EDDs were compared to those results presented in the certificate of analysis to confirm that the laboratory consistently reported the results. The reported analyte concentrations in the EDD were spot-checked and found to be identical to those results on the certificate of analysis. No revision of the EDDs was required.

Holding Time

Sample holding times are determined by the sample collection date provided on the chain of custody document and sample analysis date provided by the laboratory. Holding time criteria for each analytical method are provided in the MECP *Analytical Protocol*.

The analytical laboratory did not identify any analyses that were completed outside the recommending holding time criteria.

Laboratory Quality Assurance

The analytical laboratory did not identify any concerns with the analytical data based on the laboratory's internal quality assurance program with the following exceptions:

- C1B0746 (GS21-11 Lab-Dup) - RPD for uranium is outside control limits. The overall quality control for this analysis meets acceptability criteria.
- C1B0746 (GS21-24) - Detection limits for 1-methylnaphthalene and 2-methylnaphthalene were raised due to matrix interferences. The RDL is below the applicable Table 3 site condition standard.
- C1B0746 (Dup 3) - Surrogate recovery for decachlorobiphenyl was above the upper control limit. This may represent a high bias in the results. The reported sample concentrations are all below the reportable detection limits.
- C1C0381 (BH21-11-2) - Surrogate recovery for D5-nitrobenzene was below the lower control limit due to matrix interference. This may represent a low bias in some semi-volatile results. The reported concentrations of all semi-volatile parameters were below the reportable detection limits.
- C1C0381 (Matrix Spike) - The recovery for chromium VI was below the lower control limit. This may be due in part to the reducing environment of the sample. Chromium VI was not detected in any sample.
- C1C4985 (Dup 15, BH21-5-2) - Surrogate recovery decachlorobiphenyl was above the upper control limit. This may represent a high bias in some PCB results. The reported sample concentrations are all below the reportable detection limit.
- C1C4985 (Matrix Spike) - The recovery for chromium VI was below the lower control limit. This may be due in part to the reducing environment of the sample. Chromium VI was not detected in any sample.
- C1C4985 (RPD, lab duplicate) – RPD for fluoranthene, phenanthrene, and pyrene were outside control limits. These parameters were not detected in any samples. No further qualification of the results is required.

Field Duplicate Samples

Field duplicate samples are used as an indication of field and analytical reproducibility. Duplicate samples were collected at 29 locations and submitted for laboratory analysis. The field duplicate sample sets submitted for analysis were:

- Dup 1 and GS21-20;
- Dup 2 and GS21-47;
- Dup 3 and GS21-43;

- Dup 4 and GS21-16;
- Dup 5 and GS21-42;
- Dup 6 and BH21-29-4;
- Dup 8 and BH21-49-3;
- Dup 11 and BH21-6-5;
- Dup 13 and BH21-3-1;
- Dup 15 and BH21-4-1;
- Dup 19 and BH21-2-2;
- Dup 21 and BH21-18-1;
- Dup 22 and BH21-18-2;
- Dup 24 and BH21-18-4;
- Dup 20 and BH21-43-2;
- Dup 27 and BH21-17-1;
- Dup 29 and BH21-17-3;
- Dup 31 and BH21-17-5;
- Dup 32 and BH21-19-1;
- Dup 33 an dBH21-19-2;
- Dup 35 and BH21-19-4;
- Dup 36 and BH21-19-5;
- Dup 37 and BH21-20-1;
- Dup 38 and BH21-20-2;
- Dup 42 and BH21-9-1;
- Dup 45 and BH21-8-1;
- Dup 46 and BH21-8-5;
- Dup 47 and BH21-7-1; and
- Dup 49 and BH21-47-3.

The relative percent difference was calculated for duplicate sets where the reported concentration of detected compounds was greater than five times the reporting detection limit (>5X RDL) in both samples (Table 2). For all duplicate sets, the RPD for each analyte was less than the specified control limits, with the following exceptions:

- Samples GS21-16 and Dup 4 for conductivity;
- Samples BH21-49-3 and Dup 8 for various metals and conductivity;
- Samples BH21-6-5 and Dup 11 for conductivity;
- Samples BH21-4-1 and Dup 15 for PHC F3 and phenanthrene;
- Samples BH21-2-2 and Dup 19 for conductivity;
- Samples BH21-18-1 and Dup 21 for PHC F2 and F3 and PAHs;
- Samples BH21-17-1 and Dup 27 for PHC F1, ethylbenzene and xylenes;
- Samples BH21-19-1 and Dup 32 for naphthalene and ethylbenzene;
- Samples BH21-20-1 and Dup 37 for PHCs F1-F4, PAHs and BTEX;
- BH21-8-1 and Dup 45 for PHC F1, F2, F3, benzene, ethylbenzene and xylenes; and
- Samples BH21-47-3 and Dup 49 for metals, hot-water-soluble boron and conductivity.

It is noted that the reported concentrations of all samples (parent and duplicate) were below the corresponding Table 3 site condition standards, except where the parent sample was found to exceed the Table 3 site condition standard, in which case the duplicate also exceeded the standard. No qualification of the results is required.

Rinsate Blanks

Rinsate blanks consist of organic-free water samples prepared by the analytical laboratory and poured over the non-dedicated sampling equipment into laboratory supplied sampling containers for analysis. These analyses are used to test for possible cross-contamination of samples collected using non-dedicated sampling equipment, to evaluate the effectiveness of the cleaning procedure. The reported concentrations of all analytes were less than the reporting detection limit and no qualification of the sample results is required.

Conclusion

The accuracy and precision of the reported analyte concentrations are acceptable and no qualification of the data was required.

Notes

mbgs	metres below ground surface
PHC	petroleum hydrocarbon
PCB	polychlorinated biphenyl
OCP	organochlorine pesticides
PAH	polycyclic aromatic hydrocarbons
BTEX	benzene, toluene, ethylbenzene and xylenes
HWSB	hot water soluble boron
CrVI	hexavalent chromium
CN	cyanide
EC	electrical conductivity
SAR	sodium adsorption ratio

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the

CERTIFICATE OF ANALYSIS – REVISED REPORT

BV LABS JOB #: C1A5742
Received: 2021/04/21, 14:50
customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) Soils are reported on a dry weight basis unless otherwise specified.
(2) No lab extraction date is given for F1BTEX & VOC samples that are field preserved with methanol. Extraction date is the date sampled unless otherwise stated.
(3) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas Laboratories conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	1.0°C

Revised Report [2021/06/24]: Sampling date updated as per client request.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C1B0746
Received: 2021/04/26, 15:30

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) Soils are reported on a dry weight basis unless otherwise specified.
(2) No lab extraction date is given for F1BTEX & VOC samples that are field preserved with methanol. Extraction date is the date sampled unless otherwise stated.
(3) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas Laboratories conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
(4) Chlordane (Total) = Alpha Chlordane + Gamma Chlordane

(1) Surrogate recovery was above the upper control limit. This may represent a high bias in the results. For results that were not detected (ND), this potential bias has no impact.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	0.3°C
Package 2	0.0°C
Package 3	1.3°C
Package 4	-0.7°C
Package 5	0.7°C

F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK715 [GS21-12] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK718 [GS21-15] : OC Pesticide Analysis: Detection limits were raised due to matrix interferences.

Sample PKK721 [GS21-18] : OC Pesticide Analysis: Detection limits were raised due to matrix interferences.

Sample PKK738 [GS21-35] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK739 [GS21-36] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK740 [GS21-37] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK741 [GS21-38] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK742 [GS21-39] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK743 [GS21-40] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK745 [GS21-42] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK751 [GS21-48] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK752 [GS21-49] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK753 [GS21-50] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK755 [GS21-52] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PKK759 [DUP 3] : PCB Analysis: Detection limits were adjusted for high moisture content.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) The matrix spike recovery was below the lower control limit. This may be due in part to the reducing environment of the sample. The matrix spike was reanalyzed to confirm result.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C1C0381
Received: 2021/05/05, 14:15

Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) Soils are reported on a dry weight basis unless otherwise specified.
(2) No lab extraction date is given for F1BTEX & VOC samples that are field preserved with methanol. Extraction date is the date sampled unless otherwise stated.
(3) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas Laboratories conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

RDL = Reportable Detection Limit
QC Batch = Quality Control Batch
(1) Surrogate recovery was below the lower control limit due to matrix interference. This may represent a low bias in some results.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	0.3°C
Package 2	-0.7°C

Sampling dates updated as per client request.

Sample PMK442 [BH21-51-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK444 [BH21-38-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK445 [BH21-38-4] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK447 [BH21-38-11] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK448 [BH21-22-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK449 [BH21-22-2] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK450 [BH21-37-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK451 [BH21-37-3] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK452 [BH21-37-8] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK453 [BH21-26-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK454 [BH21-26-3] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK455 [BH21-30-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK458 [BH21-30-7] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK459 [BH21-30-10] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PMK460 [BH21-11-1] : ABN Analysis: Due to the sample matrix, sample required dilution. Detection limits were adjusted accordingly.

Sample PMK466 [Trip Blank] : Sample analyzed for F1/BTEX as per client request.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) The matrix spike recovery was below the lower control limit. This may be due in part to the reducing environment of the sample. The sample was reanalyzed with the same results

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

CERTIFICATE OF ANALYSIS – PARTIAL RESULTS

BV LABS JOB #: C1C4985
Received: 2021/05/10, 14:40

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) Soils are reported on a dry weight basis unless otherwise specified.
(2) No lab extraction date is given for F1BTEX & VOC samples that are field preserved with methanol. Extraction date is the date sampled unless otherwise stated.
(3) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas Laboratories conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
(4) Chlordane (Total) = Alpha Chlordane + Gamma Chlordane

(1) Surrogate recovery was above the upper control limit. This may represent a high bias in some results. For results that were not detected (ND), this potential bias has no impact.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	0.0°C
Package 2	0.3°C
Package 3	0.3°C
Package 4	0.0°C

Sample PNJ048 [BH21-27-4] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ049 [BH21-25-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ050 [BH21-25-3] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ051 [BH21-28-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ052 [BH21-28-3] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ056 [BH21-49-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ057 [BH21-49-3] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ058 [BH21-49-4] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ059 [Dup 8] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ061 [BH21-13-4] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ063 [BH21-33-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ065 [BH21-33-4] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ066 [BH21-32-4] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ067 [BH21-34-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ068 [BH21-34-4] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Bureau Veritas Laboratories 6740 Campobello Road, Mississauga, Ontario, L5N 2L8 Tel: (905) 817-5700 Toll-Free: 800-563-6266 Fax: (905) 817-5777 www.bvlabs.com

BV Labs - Partial/Rush Results

Sample PNJ069 [BH21-35-3A] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ070 [BH21-35-4] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ072 [BH21-15-4] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ073 [BH12-50-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ074 [BH12-50-3] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ075 [BH21-50-5] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ077 [BH12-16-4] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ078 [BH21-48-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ079 [BH21-48-2] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ081 [BH21-31-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ082 [BH21-31-2] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ083 [BH21-31-5] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ085 [BH21-6-5] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ086 [Dup 11] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ090 [BH21-23-3] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ091 [BH21-3-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ092 [Dup 13] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PNJ095 [BH21-5-2] : F2-F4 Analysis: Detection limits were adjusted for high moisture content.

F1/BTEX analysis:
Detection limits were adjusted for high moisture content and sample weight.

Bureau Veritas Laboratories 6740 Campobello Road, Mississauga, Ontario, L5N 2L8 Tel: (905) 817-5700 Toll-Free: 800-563-6266 Fax: (905) 817-5777 www.bvlabs.com

Microbiology testing is conducted at 6660 Campobello Rd. Chemistry testing is conducted at 6740 Campobello Rd.

PAH analysis: Detection limits were adjusted for high moisture content.

PCB Analysis: Detection limits were adjusted for high moisture content.

Sample PNJ096 [BH21-1-2] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

O.REG 153 PCBS (SOIL)

Polychlorinated Biphenyl in Soil: Duplicate results exceeded RPD acceptance criteria. This may be due to sample heterogeneity.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

QA/QC Batch	Init	QC Type	Parameter	Date Analyzed	Value	Recovery	UNITS	QC Limits
			Aroclor 1260	2021/05/15	NC		%	40

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) The matrix spike recovery was below the lower control limit. This may be due in part to the reducing environment of the sample. The sample was reanalyzed with the same results

(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(3) Duplicate results exceeded RPD acceptance criteria. The variability in the results for flagged analytes may be more pronounced.

Custody Tracking Form

eCOC Number
T341727-H

Please use this form for custody tracking when submitting the work instructions via eCOC (electronic Chain of Custody). Please ensure your form **has a barcode or a Bureau Veritas Laboratories eCOC confirmation number** in the top right hand side. This number links your electronic submission to your samples. This form should be **placed in the cooler with your samples**.

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C1D2548
Received: 2021/05/17, 14:15

dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas Laboratories conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
(2) Chlordane (Total) = Alpha Chlordane + Gamma Chlordane

BV Labs Job #: C1D2548
Report Date: 2021/05/27

Golder Associates Ltd
Client Project #: 20368429
Sampler Initials: DC

TEST SUMMARY

BV Labs ID: POX996 Dup
Sample ID: RINSATE 2
Matrix: Water

Collected: 2021/05/14
Shipped:
Received: 2021/05/17

Test Description	Instrumentation	Batch	Extracted	Date Analyzed	Analyst
OC Pesticides (Selected) & PCB	GC/ECD	7365732	2021/05/21	2021/05/23	Joy Zhang

Bureau Veritas Laboratories 6740 Campobello Road, Mississauga, Ontario, L5N 2L8 Tel: (905) 817-5700 Toll-Free: 800-563-6266 Fax: (905) 817-5777 www.bvlabs.com

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	-1.3°C

Sample POX996 [RINSATE 2] : SAR Analysis: NC = Not Calculable as Calcium and Magnesium were not detected.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

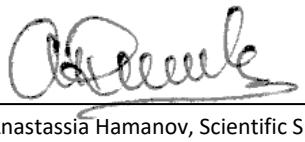

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) Soils are reported on a dry weight basis unless otherwise specified.
(2) No lab extraction date is given for F1BTEX & VOC samples that are field preserved with methanol. Extraction date is the date sampled unless otherwise stated.
(3) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas Laboratories conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
(4) Chlordane (Total) = Alpha Chlordane + Gamma Chlordane

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	-1.3°C
Package 2	1.7°C
Package 3	-3.0°C
Package 4	-0.7°C
Package 5	-0.7°C

Sample PPD787 [BH21-32-1A] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD788 [BH21-32-2] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD789 [BH21-2-2] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD791 [BH21-42-2] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD792 [BH21-42-8] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD795 [BH21-18-2] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD796 [Dup 22] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD797 [BH21-18-4] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD798 [Dup24] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD799 [BH21-18-5] : 210520CCMENONTB

Sample PPD800 [BH21-43-2] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD802 [BH21-43-8] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD803 [BH21-17-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD805 [BH21-17-3] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD806 [Dup 29] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Bureau Veritas Laboratories 6740 Campobello Road, Mississauga, Ontario, L5N 2L8 Tel: (905) 817-5700 Toll-Free: 800-563-6266 Fax: (905) 817-5777 www.bvlabs.com

Sample PPD807 [BH21-17-5] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD808 [Dup 31] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD811 [BH21-19-2] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD812 [Dup33] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD815 [BH21-19-5] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD816 [Dup36] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD819 [BH21-20-2] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD820 [Dup38] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD821 [BH21-20-5] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD822 [BH21-9-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD823 [Dup42] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD825 [BH21-10-3] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD826 [BH21-44-1] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD827 [BH21-44-5] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD830 [BH21-14-6] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD831 [BH21-14-12] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD834 [BH21-8-5] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD835 [Dup46] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional methanol was added to the vial to ensure extraction efficiency.

Sample PPD840 [Dup 49] : F1/BTEX Analysis: Soil weight exceeds the protocol specification of approximately 5g in the field preserved vial. Additional

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) The recovery was above the upper control limit. This may represent a high bias in some results. For results that were not detected (ND), this potential bias has no impact.

(3) The matrix spike recovery was below the lower control limit. This may be due in part to the reducing environment of the sample. The matrix spike was reanalyzed to confirm result.

(4) DL was raised due to matrix interference.
