Maintenance Technical Representative is used to describe a functional role that has been assigned maintenance and reliability technical responsibilities. Positions that fulfill this role may include, but are not limited to, titles such as System Engineer, Component Engineer, Maintenance Specialist or Maintenance Engineer.

Maintenance Technical Representatives are responsible for:

- Conducting component evaluation and categorization.
- Developing Technical Basis for PMs (PMTB).
- Acting as a technical expert to Asset Custodians and Maintenance and Work Management group.

- Investigating causes of equipment failures and initiating corrective actions to prevent recurrence.
- Monitoring the effectiveness of the PM activities and making changes to the strategy based on the results.
- Engaging Maintenance Personnel in assessment activities to promote continuous improvement of the program.
- Benchmarking industry best practices and driving continuous improvement to PM implementation.

4.3 Maintenance and Reliability Subject Matter Experts

Subject Matter Experts (SMEs) are resources knowledgeable in maintenance, reliability, and aging management requirements and standards. SMEs are appointed by the FSM.

SMEs are responsible for supporting the implementation of the Fitness for Service FSA, by providing subject matter expertise in different fitness for service areas. This role may also be performed by the Maintenance Technical Representative. Specifically, the SMEs assist the FSM in:

- Providing Company wide support and guidance on the Fitness for Service function and its interfacing functions within the Management System.
- Developing and maintaining the implementing Fitness for Service functional documents.
- Monitoring compliance to document requirements, assessing record preparation and retention, completion assurance, final distribution and storage of records.
- Planning and conducting various surveillance activities, reviews, and assessments on the implementation of the Fitness for Service function, and participating in internal or external audits as the Fitness for Service SMEs.

4.4 Maintenance Personnel (Workers)

Maintenance Personnel encompasses workers who are formally qualified and licensed for particular certified trades under a provincial or federal jurisdiction. Maintenance Personnel may also include workers who are not certified trades people but have been trained and qualified to perform specific facets of trades-related work such machinery lubrication or verifying functionality of electrical systems (such as Electrical/Mechanical Service Attendants).

Maintenance Personnel are responsible for:

- Performing only work activities that they are trained and qualified to perform.
- Performing work in accordance with instructions and adhering to all the requirements of the supporting documents, permits and clearances.
- Documenting as-found-condition and maintenance results and providing feedback, comments, or recommendations to drive improvements on completion of work.

4.5 Line Management

Line Management includes roles such as Facility Authorities (FAs), Facility Managers (FMs), Managers Responsible for System Health, and Maintenance Managers and Supervisors. Line Management has overall responsibility for the systems in their facility.

Management is responsible for:

- Overseeing the implementation of and the compliance to the Fitness for Service processes within their facility.
- Ensuring that necessary surveillance, monitoring, maintenance, or inspection activities are carried out and providing program metrics to measure performance.
- Implementing actions related to Fitness for Service issues or deficiencies that put facility safety or operations at risk.
- Ensuring Maintenance Technical Representatives are nominated for their area.

4.6 System Specialists

A System Specialist is a person assigned as the system performance owner for the individual system as per the Equipment Reliability Program and provides oversight of system performance improvement.

The System Specialists are responsible for:

- Developing and maintaining System Performance Monitoring Plans (SPMPs) for assigned systems.
- Preparing System Health Reports (SHRs).
- Acting as the lead of the System Health Team (SHT).
- Reporting on system issues and developing improvement actions.
- Monitoring results of improvement initiatives.

4.7 System Health Team

A System Health Team (SHT) consists of people with an interest in the performance of a system such as, the System Specialists, FMs, FAs, System Users / Customers. The members of the SHT support the System Specialist in creating an accurate description of a system’s health and work together to increase the long-term reliability of that system. Together they initiate actions that lead to improved reliability, including the following:

- Monitoring system and equipment performance.
- Identifying common and recurring problems.
- Executing Aging Management plans.

5. Functional Programs

Fitness for Service is an intrinsic part of implementing CNLs Property/Asset Management strategy. Fitness for Service ensures availability of assets as defined by CNLs Strategic Plans and systems specific Asset Management Plans [5]. Fitness for Service involves various activities throughout the period of service life. The Fitness for Service FSA ensures all these activities are managed in a systematic way, by planning and coordinating three specific programs of Fitness for Service: Maintenance, Reliability, and Aging Management. Due to complexity of covering all possible scenarios for specific sites, some latitude has been incorporated into the Functional Programs.

When implemented together, Maintenance, Reliability, and Aging Management interact to provide each program the means to achieve their program specific goals. The aging management and reliability requirements provide information to the maintenance program for the identification, selection and frequency of maintenance activities to maintain the effectiveness of a system. Consistent PM leads to improvements in failure trends. Maintenance activities, both preventive and corrective, compensate for degradation of equipment due to aging. Consideration of operation and maintenance history then provides information on how the maintenance program affects system reliability and understanding of how systems age. This systematic and integrated approach in turn provides important inputs to maintenance and operations (information is fed back into the maintenance program to improve its effectiveness).

Assets such as vehicles and tools are maintained differently than SSCs due to their mobile nature, and the ability, or often requirement, for service to be performed offsite by external bodies.

To ensure efficient implementation, Fitness for Service requires a minimum of maintenance related information to be compiled. At least, a Computerized Maintenance Management System (CMMS), or an equivalent process, is used to control the initiation, planning, scheduling, execution and close-out of maintenance work and to maintain electronic records of maintenance history. An Enterprise Asset Management System (EAMS) may also be used at some of CNL sites. An EAMS allows use of a unified platform for managing assets across the enterprise. An EAMS includes maintenance management capabilities such as those found in CMMS, but offers a broader range of features [6].

The information management system (CMMS or EAMS) interacts with CNL Facility Information System (FIS) to ensure that their basic asset information matches the one in FIS (building and room structure, approval authorities, building contacts such as, Area Owner, FM, FA and designates, etc.)

The Uptime® Elements™ model [7] provides a source of industry best practices to include in CNL's Fitness for Service approach which have provided input into Fitness for Service processes. CNL has not fully implemented all elements of the model. CNL is on a 'reliability journey'. As such, the Uptime® Elements™ model provides a roadmap for CNL to enhance availability and reliability and ensure fitness for service.

Figure 1 presents an overview of the Fitness for Service framework and Figure 2 provides an overview of the Uptime® Elements™ model.

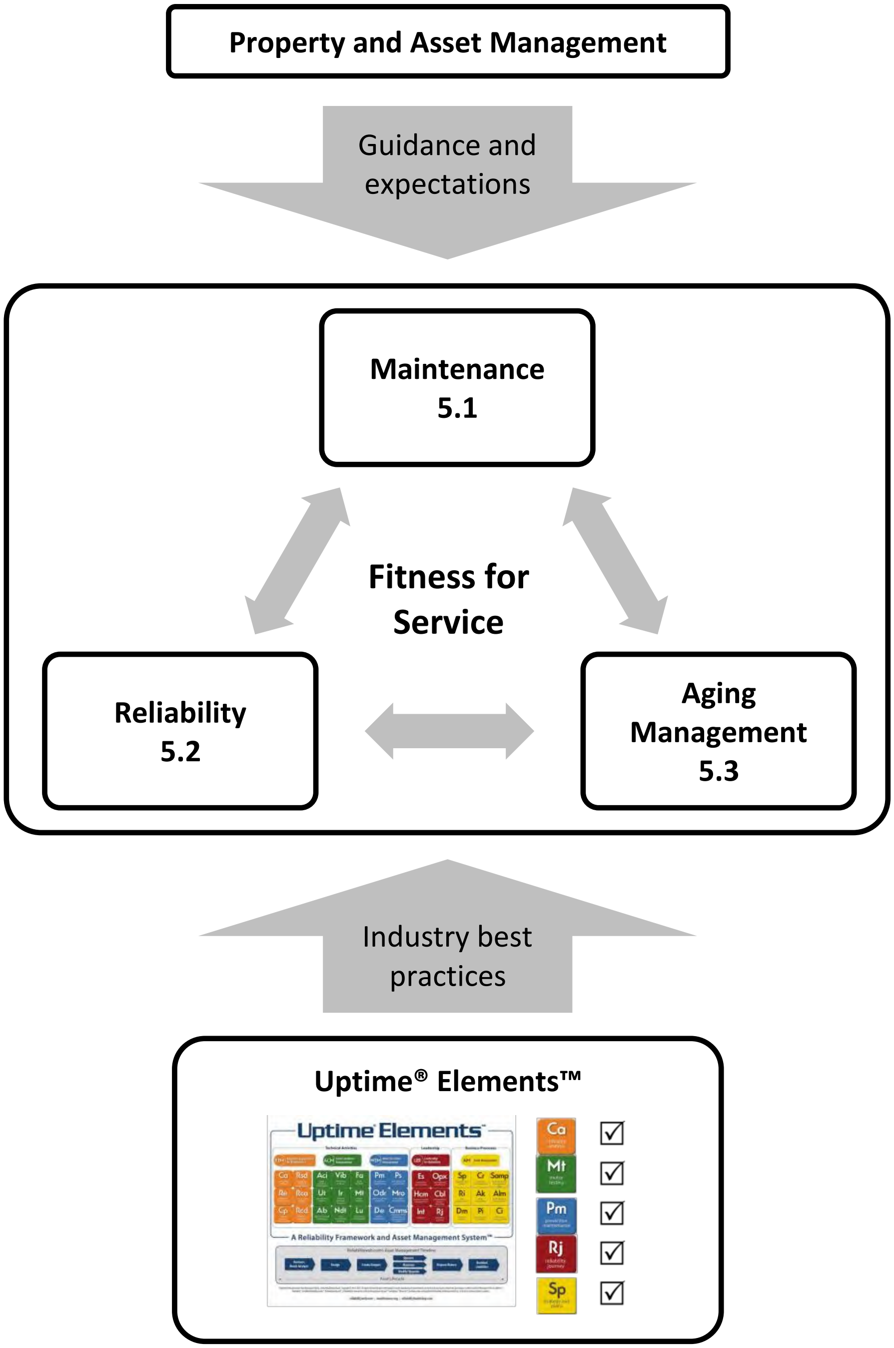

Figure 1: Overview of the Fitness for Service framework.

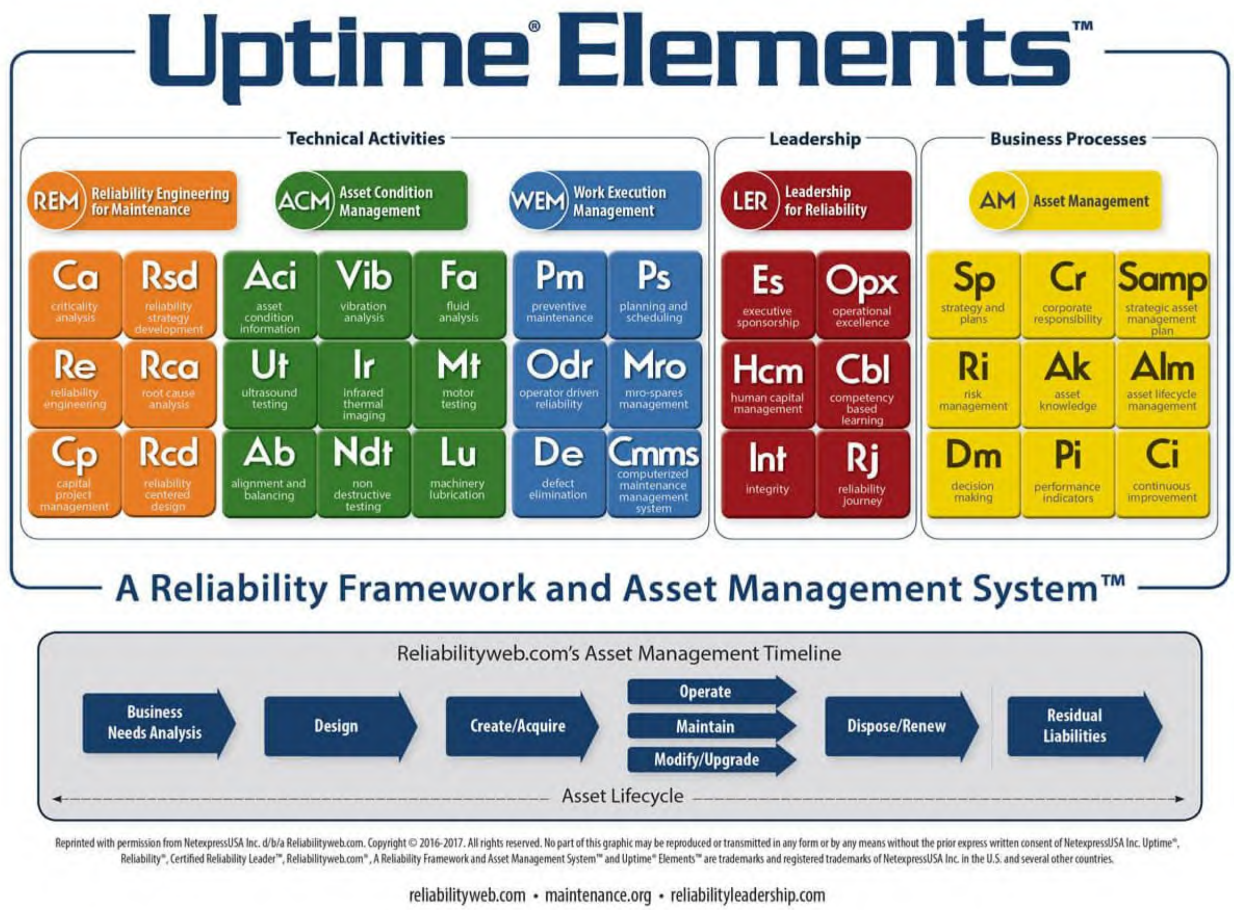

Figure 2: Uptime® Elements™ model overview.

5.1 Maintenance

5.1.1 SSC Maintenance

This section contains an overview of the elements and activities that form the basis for all implementing procedures of the Maintenance process.

The primary objective of the Maintenance process is to provide Asset Custodians with a strategy, identifying which maintenance activities are to be performed, on which SSC's, and at what intervals. The type and frequency of maintenance activities applied to each SSC are commensurate with the importance to safety, design function and required performance.

CNL Maintenance process supports Fitness for Service in ensuring that SSCs are maintained in such a way that they function as per design, and that equipment availability and reliability margins support customer expectations. Elements of this process help to improve the life and reliability of the SSC as well as avoid any unplanned maintenance activities.

Consideration for maintainability must be included early during the design phase. This is done by applying Design for Maintainability (DfM) concepts. DfM allows for the integration of operations and maintenance considerations into project planning and design to achieve effectiveness, safety, and economy of maintenance tasks during the lifespan of an asset.

Figure 3 provides an overview of the maintenance process.

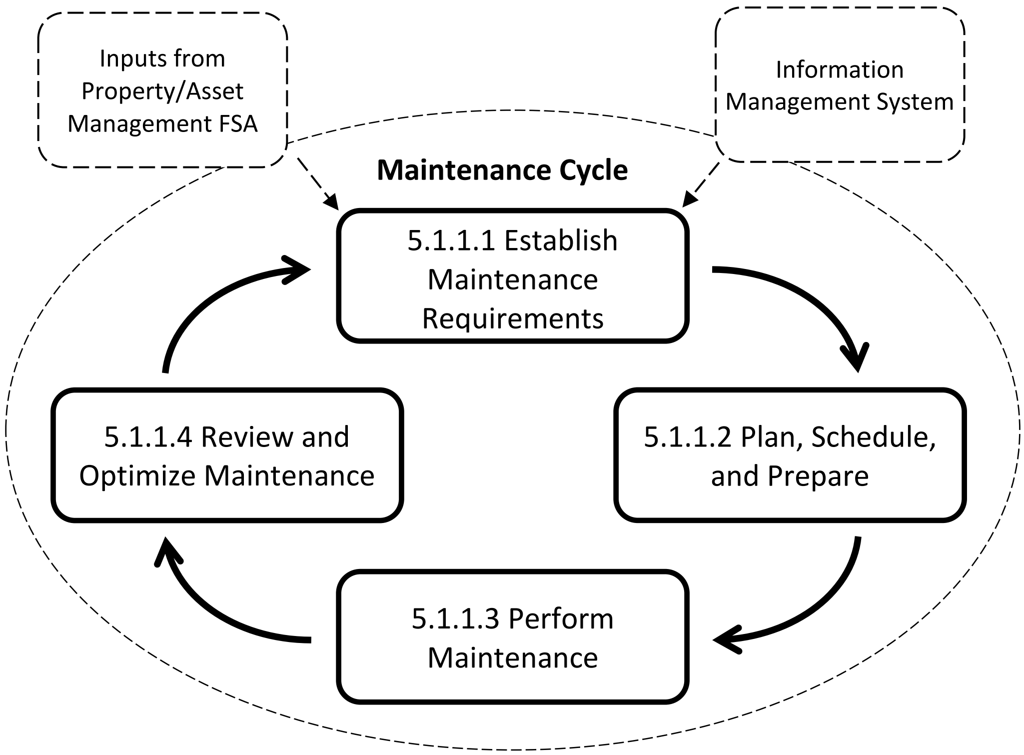

Figure 3: Overview of the Maintenance process.

5.1.1.1 Establish Maintenance Requirements

Establishing maintenance requirements for SSCs forms the bases of the entire Maintenance process. The key elements are listed below in Figure 4.

Figure 4: Establish maintenance requirements.

Identification of SSCs and Their Importance
This area identifies all the SSCs that may require maintenance to meet the program objectives. The primary source of this information is the Master Equipment List (MEL) available in the CMMS or the EAMS. The inclusion of all SSCs to be maintained and the accuracy of the information within MEL is critical to the program throughout the entire lifecycle of the SSC requiring participation and cooperation of all functions. This includes Design Authority and Design Engineering, Construction, Commissioning, Supply Chain, and Configuration Management during initial phases of asset lifecycle but also during latter phases of the asset lifecycle (such as Dispose/Renew). Once SSCs are identified they are categorized based on their relative importance.

Maintenance Categorization
Maintenance Categorization [8] describes the process for categorizing components at CNL. This process provides clear understanding of which components merit most attention and ensures PM and equipment reliability resources are expended on the right equipment. Some of the main inputs to categorization include assets information, expected level of service, reliability, performance, and availability. These inputs are obtained from design documentation, systems specific Asset Management Plans [5], MEL, as well as expressed by the Asset Custodians. The equipment category chosen through this process determines if the PM strategy optimizes reliability or reduces total maintenance cost.

Identification of Maintenance Tasks
Selection of the required PM task and frequency is based on categorization of the SSCs. PM tasks are developed based on design or regulatory requirements, manufacturer's recommendations, OPEX, and codes and standards. This includes applicable maintenance requirements for Pressure Boundary ([9] [10] [11]) and Electrical Safety (Section 5 of [12]). It also considers any reliability results from SHRs (Section 5.2 and [13]) and criticality, duty cycle, and service condition. This technically based maintenance strategy for equipment is documented into PMTB. The objective is to have a maintenance strategy which provides the highest reliability for category 1 and 2 equipment, and the lowest total maintenance cost for category 3 equipment. *Preventive Maintenance* [14] describes the process for implementing PM activities. The process is a living cyclical one starting with the development of PM strategies and developing PM jobs then following the PM work order cycle of planning, scheduling, execution and returning with reviewing results and optimization of the PMs (see additional details in Section 5.1.1.2, 5.1.1.3, and 5.1.1.4). CM activities form a percentage of the overall maintenance strategy for components that are categorized as "Run-to-Failure" (RTF).

5.1.1.2 Plan, Schedule, and Prepare

This element consists of PM jobs and tasks development as well as an integrated set of processes for Work Planning & Control (WP&C). This ensures that maintenance activities are properly screened, planned, scoped, prepared and scheduled for execution. The level of detail of the actions associated with this element are commensurate with the nature of the work. A graded approach is applied so work can be performed in a safe, efficient, and effective manner.

Typically, incoming maintenance work requests are screened to determine how work will be planned, prioritized and executed. Scoping happens at the individual job level and scheduling level to determine what work will be performed and in what given time frame the work will occur. Schedules are developed that integrate all scoped work into a specific work week. Finally work is prepared for stakeholder review to ensure work can be supported and performed as scheduled.

Preventive Maintenance [14] provides details on maintenance planning, scheduling, and preparation considering that those activities are specific to the CMMS or EAMS utilized to manage maintenance activities. In addition, due to the complexities of defining WP&C across CNL, Line Managements are required to develop specifically tailored flow down processes that align with each mission and organizational structure and that adhere with the elements of the overall Maintenance process. *Maintenance Work Planning & Control* [15] provides requirements and guidance on maintenance WP&C process at CNL. In all cases, work is planned in accordance with requirements and standards from the Integrated Work Control (IWC) process [16].

5.1.1.3 Perform Maintenance

This element constitutes the field work portion of the Maintenance process. It is supported by all the other maintenance process elements to ensure that the correct maintenance activities are performed on SSCs at the appropriate time. It also ensures that SSCs are in the proper configuration and maintenance is carried out using approved work instructions and parts.

Some support activities are required for the safe and effective performance of maintenance. Typically, the implementing Line Organization ensures that activities and services such as the following, are established and provided:

- Staffing, hiring, and training for maintenance activities (including skilled trades and contractors).
- Work control and oversight of CNL maintenance personnel and temporary and contract personnel.
- Parts and material management (including consumables).
- Availability and calibration of measuring and test equipment.
- Availability and servicing of maintenance tools.
- Availability of manufacturer’s manuals and equipment files.
- Maintenance shop services.

This element also includes the proper documentation of the as-found-condition and any observations, feedback, or recommendation related to the maintenance activity performed. This will support further review and optimization.

Preventive Maintenance [14] provides details on performance of maintenance activities (PM execution). In addition WP&C processes (developed as per [15]), support the process to ensure the safe, effective, and efficient execution of all work performed by Site Maintenance personnel.

5.1.1.4 Review and Optimize Maintenance

The review and optimization element drives continuous improvement in the Maintenance process but also provides meaningful performance data to the Reliability and the Aging Management process. Implementing processes use the data and metrics from the other elements to provide the feedback loop necessary to assess the effectiveness of those processes. This impacts those elements in the following ways:

- Reviewing PM trade execution feedback, job closing comments, and as-found-condition-codes provides the information required to continually improve the quality of work instruction provided and to make adjustment to maintenance strategy for an SSC (Condition Based Maintenance / Predictive Maintenance).
- Post execution critiques of the scheduled work identify issues and opportunities related to the scoping, planning, scheduling, and preparation elements.
- Maintenance rework tracking can drive improvements in maintenance work practices, as well as help identify chronic equipment performance trends.

- Maintenance data review and maintenance WP&C activities review, are used as inputs to System Health monitoring process to maintain and improve levels of safety and reliability (see Section 5.2).

Review and optimization of maintenance also includes self-assessment and audit on Line Management maintenance related key performance indicators to help assess the overall health of the Maintenance process.

Preventive Maintenance [14] provides an overview of PM review and optimization. *Maintenance Performance* [17] provides further detail on maintenance review and performance measurement.

5.1.2 Non-SSC Maintenance

Fleet Maintenance

The Fleet Maintenance [20] process applies to non-SSC assets that can be described as vehicles (cars, heavy equipment, UTVs), mobile (trailers, portable containers) or combustion powered tools (chainsaws, generators, etc.).

The fleet maintenance process ensures:

- Vehicles are maintained to be safe for operation.
- Vehicles are maintained to be reliable.
- Vehicles are maintained to ensure the validity of their warranties.

Fleet maintenance will be tracked in a CMMS or Fleet Database and maintenance history will be recorded to document maintenance for warranty, recall, and asset management purposes.

5.1.2.1 Tool Maintenance

The tool maintenance process applies to non-SSC maintainable tools. This does not include calibrated monitoring and measuring equipment which is maintained and calibrated under *Care and Control of Calibrated Monitoring and Measurement Equipment* [18].

The tool maintenance procedures ensures that:

- Maintainable tools are safe for operations.
- The tools are available when needed.
- Tool lifecycle costs are minimized.

5.2 Equipment Reliability

The Reliability Program provides a framework (Figure 5) for the collection of data coming from system performance, maintenance activities, and asset condition surveillance, and transforming the data into information to be used to meet the reliability and availability requirements specified by the Property/Asset Management function. The *Equipment Reliability Program* [13] describes this process of monitoring system and equipment performance and recommending appropriate changes or improvements.

The degree of applicability of the Reliability process is proportional to the reliability/availability required on the system and the system complexity. Some systems require few or none of the aspects of the Reliability process, while others will need all aspects of the process and a substantial technical effort and financial investment to achieve their reliability and availability goals.

Which aspects are applicable and recommended for a system are determined on an individual system basis, taking into consideration the complexity of the system, where it is located, reliability/availability targets, accessibility and the quality and condition of the equipment installed. The reliability/availability target are specified, and a strategy to achieve that target is created by taking the aforementioned aspects, and budget, into consideration. It is expected that if targets are not met, the missed targets are not a failure of the Reliability process but will provide guidance towards improved engineering designs, staffing adjustments, or adjusted resources, and lead to a better understanding the reliability budget going forward.

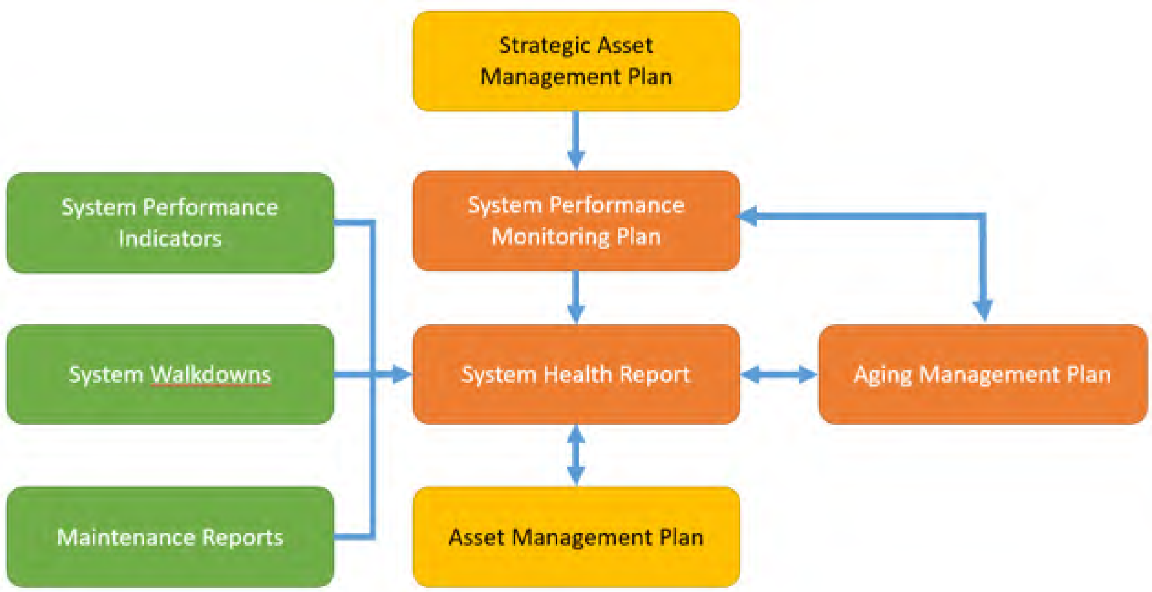

Figure 5: Reliability framework.

Consideration for reliability and availability requirements must be included early during the design phase. This should be done by applying the concept of Reliability Centered Design. Reliability Centered Design ensures that reliability, maintainability, availability, safety, and sustainability are design attributes and are addressed during capital project execution.

5.2.1 Understand Current Threats to Reliability

There are many factors which can compromise the reliability of an SSC. Included below are several measures that are used to indicate when reliability has been compromised. The application of which methods and their level of implementation for determining threats to reliability are determined by the system health team based on the level of reliability required for the system.

System Walkdowns
System Walkdowns should be performed and documented [19] to maintain awareness of system conditions and status. System Walkdowns provide an opportunity to trend the condition of a system, and track reliability. This information is part of the monitoring activities that form the basis of the SHR.

System Parameter Trending
Key system parameters are identified in the SPMPs. Trending and evaluation of these parameters is part of the Equipment Reliability Process and significant trend variations are assessed and reported through the Equipment Reliability Reporting Process. System parameter trending provides valuable information on the reliability of a system.

Aging Management
The changes in reliability of SSCs with respect to age related degradation should be understood. Condition monitoring through preventive maintenance and performance measures determined in SPMPs are used to identify degradation that will impact the reliability of SSCs. SHRs will trend performance over time to identify long-term degradation. SSC Specific Aging Management plans may be used to manage aging. Life management plans and storage with surveillance plans may also be used to manage the aging of SSCs.

5.2.2 Identify and Mitigate Unexpected Failures

Risk mitigation implementation is the process of executing risk mitigation actions. Risk mitigation progress monitoring includes tracking identified risks, identifying new risks, and evaluating risk process effectiveness throughout the work. Below are several measures to utilize for risk mitigation as appropriate to the value and complexity of the asset and the scale of severity of the risk.

System Health Reports (SHRs)
SHRs consolidate information from a number of sources to create a snapshot of the health and reliability of a system. These periodic reports are designed to document and communicate system health status. SHRs are also used to identify potential system threats in a comprehensive and actionable format, based on performance goals and targets to address equipment failures, degraded conditions or improvement opportunities, and provide clear direction and ownership of the decided path forward, including closure criteria.

5.3 Aging Management

Aging Management consists of an integrated set of actions to control the effects of physical aging and obsolescence of SSCs throughout their entire lifecycle, from design to fabrication, construction, installation, commissioning, operations, and decommissioning. Systems specific Aging Management Plans derived from systems specific Asset Management Plans [5] provide applicability and strategies for aging management. *Maintenance Categorization* [8] describes the process for SSCs categorization which supports identifying aging management applicability.

Effective implementation of aging management strategies depends on maintenance activities being carried out at the scheduled frequency and following the proper procedures. The PMTBs developed as part of the PM process [14] include aging management strategies and recommendations documented in SPMPs.

SSCs as-found-condition, maintenance history, and performance data gathered through execution of maintenance activities [14] and maintenance review and optimization [17], as well as other aging related failures or significant degradation, help understand aging challenges and assess aging degradation effects on SSCs. Corrective actions may then be initiated by revising aging management strategies (systems specific Aging Management Plans [5]) and implemented through revision of PMTB and maintenance activities [14].

6. Interfaces

6.1 Internal Interfaces

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Construction	• Ensuring that configuration information is kept up to date with modifications and new installations. • Drawings reflect changes. • Assets properly labeled to match design.	Meetings, email, telephone	Directors, Managers, Department Staff

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
	• MEL is updated (positions & assets). • Manufacturer's manuals and information is properly gathered and turned over. • Construction activities that use the maintenance elements are defined and controlled.		
Commissioning	• Ensuring that configuration information is kept up to date with modifications and new installations. • Drawings reflect changes. • Assets properly labeled to match design. • MEL is updated (positions & assets). • Relevant commissioning data is properly turned over. • Manufacturer's manuals and information is properly gathered and turned over. • Maintenance requirements are established.	Meetings, email, telephone	Directors, Managers, Department Staff
Environmental Remediation Management	• SSCs reviewed and categorized based on importance and life cycle. • PMs are adjusted based on SSC review. • MEL is kept current through the decommissioning cycle for all SSCs. • Ensure maintenance is performed to align with this PDD.	Meetings, email, telephone	Directors, Managers, Department Staff
Design Authority and Design Engineering	• Maintenance of facility configuration documents, drawings to support maintenance, including MEL. • Provide oversight of all SSCs and overall ownership of the MEL.	Meetings, email, telephone	Directors, Managers, Department Staff

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
	• Own technical basis for maintenance activities on safety related and safety support SSCs. • Ensuring the design and safety requirements established for SSCs including maintenance requirements. • Provide engineering support on defining maintenance activities. • Design and implement changes to plant SSCs such that they meet codes, standards and requirements. • Specifying replacement parts. Procurement engineering and ensuring MEL, reflects changes.		
Configuration Management	• Maintenance of facility configuration documents, drawings to support maintenance, including MEL. • Provide oversight of all SSCs and overall ownership of the MEL. • Own technical basis for maintenance activities on safety related and safety support SSCs. • Ensuring the design and safety requirements established for SSCs including maintenance requirements. • Provide engineering support on defining maintenance activities. • Design and implement changes to plant SSCs such that they meet codes, standards and requirements. • Specifying replacement parts. Procurement engineering and ensuring MEL, reflects changes.	Meetings, email, telephone	Managers, Department Staff
Infrastructure Development	• Refer complex real property systems which may benefit from the Reliability process.	Meetings, email, telephone	Managers, Department Staff

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Fire Protection	• Integrated Work Control.	Meetings, email, telephone, walkdown	Department Staff
Occupational Safety and Health	• Provide services to implementing organization (e.g. Integrated Work Control, Hazard identification, work risk reviews, working at height plans, PP&C requirements, IH). • Maintaining processes that support the maintenance cycle.	Meetings, inspections, walkdown, email, telephone	Directors, Managers, Department Staff
Pressure Boundary	• Provide oversight to ensure maintenance activities are compliant to requirements.	Meetings, inspections, email, telephone	Directors, Department Staff
Procurement and Supply Chain	• Establish processes to procure, receive, store, secure and issue spare parts, tools and materials for maintenance. • Ensure qualified suppliers are identified for replacement parts. • Ensure qualified contractor for performing maintenance are provided. • Ensure a process exists to perform PM on materials and equipment in storage. • Manage obsolescence actions / spare parts.	Meetings, email, telephone,	Directors, Managers, Department Staff
Property/Asset Management	• Integrate with Fitness for Service Function to ensure a consistent approach to the management of asset conditions and risks, maintenance, and investment priorities. • Provide Asset Management Plans. • Provide long term strategies for asset management as inputs to Maintenance process.	Meetings, email, telephone	Asset Custodians, Property/Asset Management Advisory Committee, Director Asset Management

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
	• Refer complex real property systems which may benefit from the Reliability process.		
Radiation Protection	• Provide resources required to support work. (E.g. Integrated Work Control, providing radiological work plans, radiations surveys, participate in planning/scheduling).	Meetings, email, telephone	Directors, Managers, Department Staff
Safety and Licensing	• Provide Safety Related systems list and Safety Related equipment list. • Review the output of aging management monitoring to verify the validity of the safety case.	Meetings, email, telephone	Directors, Managers, Department Staff
Waste Management	• Manages the program to ensure that waste materials produced form maintenance activities are properly stored or disposed.	Meetings, email, telephone	Directors, Managers, Department Staff
Electrical Safety	• Provide oversight to ensure maintenance activities are compliant to requirements. • Integrated Work Control.	Meetings, email, telephone	Directors, Managers, Department Staff

6.2 External Interfaces

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
TSSA	• Inspection of Pressure Boundary and elevators related work.	Meetings, formal correspondence, site visits	Directors, Managers, Department Staff
Local or regional Authorities Having Jurisdiction (such as Ontario ESA)	• Inspection of Electrical related work.	Meetings, formal correspondence, site visits	Directors, Managers, Department Staff

1. Scope and Applicability

This Company wide Document applies to all activities unique to Fitness for Service, performed by Canadian Nuclear Laboratories' employees, contractors, and sub-contractors, as well as third parties engaged through external partnerships or collaborations that perform work for and/or on behalf of CNL.

Fitness for service consists of two primary elements: maintenance and equipment reliability. Aging management is accomplished through executing equipment reliability on systems within scope as determined by site licence condition handbooks.

Maintenance applies to all CNL sites and facilities. Implementation of Maintenance elements is commensurate with the importance to safety, design function and required performance.

Reliability and Aging Management apply to all systems important to safety within licensed nuclear facilities. Reliability and Aging Management may also be implemented to complex systems in other facilities using a graded approach.

2. Purpose

The following is a mapping of requirement source documents to the Management System documentation that implements those requirements. It reflects the current operational implementation of the requirements. Given the diverse nature of the CNL business, the dynamic nature of the regulatory environment, and the complexity of the regulations, the mapping is not intended to be complete for every possible requirement.

3. Requirements and Flow down

The list below provides the requirements for the Fitness for Service Program:

- Chalk River Laboratories Nuclear Research and Test Establishment Operating Licence NRTEOL-01.00/2028, Licence Conditions Handbook, NRTEOL-LCH-01.00/2028 Revision 3 / CRL-508760-HBK-002 Revision 3, Canadian Nuclear Safety Commission, February 14, 2023
- Whiteshell Laboratories Nuclear Research and Test Establishment Decommissioning Licence NRTEDL-W5-8.00/2024, Licence Conditions Handbook, NRTEDL-LCH-08.00/2024 Revision 1/WLD-508760-HBK-002 Revision 1, Canadian Nuclear Safety Commission, April 3, 2023.
- Prototype Waste Facilities – Waste Facility Decommissioning Licence, Gentilly-1 Waste Facility WFDL-W4-331.00/2034, Licence Conditions Handbook, WFDL-LCH-W4-331.00/2034 Revision 1 / 61-00580-HBK-001 Revision 0, Canadian Nuclear Safety Commission, 2019 July 15.
- Nuclear Power Demonstration Waste Facility Prototype Waste Facilities – Waste Facility Decommissioning Licence WFDL-W4-342.00/2034, Licence Conditions Handbook, WFDL-LCH-W4-342.00/2034 Revision 2/64-508760-HBK-001, Revision 2, Canadian Nuclear Safety Commission, August 15, 2023.

- Prototype Waste Facilities – Waste Facility Decommissioning Licence, Douglas Point Waste Facility WFDL-W4-332.03/2030, Licence Conditions Handbook, WFDL-LCH-W4-332.03/2030, Revision 0 / 22-508760-HBK-002 Revision 0, Canadian Nuclear Safety Commission, 2021 June 11.
- Port Hope Area Initiative Waste Management Project – Waste Nuclear Substance Licence WNSL-W1-2310.00/2032, Licence Conditions Handbook, LCH-WNSL-W1-2310.00/2032 Revision 0 / 4500-508760-HBK-001 Revision 0, Canadian Nuclear Safety Commission, 2023 January 1
- Aging Management, REGDOC-2.6.3, Canadian Nuclear Safety Commission, March 2014.
- General principles for the management of radioactive waste and irradiated fuel, CSA N292.0-14, Canadian Standards Association, March 2019. Table 3-8
- Agreement for the Management and Operation of Certain Properties and Assets that are the Responsibilities of Atomic Energy of Canada Limited, SOC Agreement (SOCA), 2015.
- Agreement for the Work to be Undertaken on a Target Cost Basis in order to Effect the Closure of the Nuclear Power Demonstration Reactor, NPD Agreement (NPD TCA), 2015.
- Agreement for the Work to be Undertaken on a Target Cost Basis in order to Effect the Closure of the Whiteshell Laboratories, WL Agreement (WL TCA), 2015. Table 3-10
- Management system requirements for nuclear facilities, N286-12 (R2022), Canadian Standards Association, June 2012.
- Quality management systems - Requirements, CAN/CSA-ISO 9001:16 (ISO 9001:2015, IDT), Canadian Standards Association, February 2016.
- Canada Occupational Health and Safety Regulations, SOR/86-304.
- General requirements for pressure-retaining systems and components in CANDU nuclear power plants / Material Standards for reactor components for CANDU nuclear power plants, N285.0-17/N285.6 Series-17, Canadian Standards Association, July 2017. Table 3-14
- Boiler, pressure vessel, and pressure piping code, B51-19, Canadian Standards Association, January 2019.

3. Proactive Strategy for Aging Management			
3.4 Operation	Licensees shall establish and implement processes, programs and procedures to manage ageing and obsolescence of SSCs, to ensure that required safety functions are maintained during the facility operation phase.	*Fitness for Service*, 900-508230-PDD-001	*Shared with Conduct of Operations* Also covered by *Life Management Program for Douglas Point Structures,* 22-20000-680-001 *Periodic Inspection Plan for Whiteshell Laboratories Waste Management Area Concrete Bunkers*, WLD-106100-PLA-001
3.4 Operation	Corrective actions identified by AM plan activities shall be managed within the reactor facility's corrective action program.	*Maintenance Work Planning & Control*, 900-508230-STD-002 *Improvement Action (ImpAct) Corrective Action Program* 900-514000-MCP-004	Shared with *Performance Assurance*, 900-514000-PDD-001
4. Integrated Aging Management			
4. Integrated Aging Management	Licensees shall apply a systematic and integrated approach to establish, implement and improve appropriate programs to manage aging and	*Fitness for Service*, 900-508230-PDD-001	Shared with *Property/Asset Management*, 900-508400-PDD-001

Aging Management			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
	obsolescence of SSCs. Reactor facility management processes shall include requirements to ensure there is a documented overall integrated AM program framework for the reactor facility that addresses the following elements: 1. organizational arrangements 2. data collection and record keeping 3. screening and selection process for aging management 4. evaluations for aging management 5. condition assessments 6. SSC-specific AM plans 7. management of obsolescence 8. interfaces with other supporting facility programs 9. implantation of AM program and plans 10. review and improvement of AM program and plans SSC-specific AM plans shall be implanted in accordance with the overall integrated AM program framework.		
4.2 Data collection and record-keeping system to support aging management	The licensee shall have an appropriate data collection and record-keeping system to support aging management activities and to provide a basis for decisions on the type and timing of aging management actions. Data entered into the system shall be auditable to demonstrate an adequate verification of the data entered, detailed description of the basis for any conclusion, and to trace all applicable sources of information.	*Preventive Maintenance*, 900-508230-MCP-002 *Maintenance Work Planning & Control*, 900-508230-STD-002	Shared with *Information Management,* 900-511300-PDD-001.
4.3 Screening and selection of structures, systems and components	A documented screening and selection process shall be used to establish the list of SSCs to be included in the scope of the overall integrated AM program framework. This process shall include SSCs	*Maintenance Categorization*, 900-508230-MCP-001	*Shared with Safety Analysis*, 900-508770-PDD-001

General Principles for the management of radioactive waste and irradiated fuel			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
4 General requirements			
4.16 Aging management			
4.16.1	An aging management program shall be established to assess and mitigate service-life-limiting characteristics of safety critical components (safety related systems, structures, components, containers, and barriers), with the purpose of assuring that waste packages are maintained and contained in a safe, stable, secure, controlled, and monitored environment.	*Ageing Management Program*, 900-508222-STD-001	Planned to be transferred to Design Authority and Design Engineering
4.16.2	The aging management program shall a) provide for condition assessments of safety critical components; b) provide for the inspection and maintenance of safety critical components; c) confirm that safety critical components remain effective and operational for their intended use;	*Fitness for Service*, 900-508230-PDD-001 *Maintenance Categorization*, 900-508230-MCP-001 *Preventive Maintenance*, 900-508230-MCP-002	Shared with *Property/Asset Management*, 900-508400-PDD-001, and *Management System*, 900-514100-MAN-001

General Principles for the management of radioactive waste and irradiated fuel			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
	d) make allowance for maintenance or replacement of safety critical components; e) be proactive; and f) be auditable and effective.	*Maintenance Performance*, 900-508230-MCP-004	
4.16.3	The effectiveness of the aging management program shall be periodically reviewed using feedback from the program and performance indicators.	*Ageing Management Program*, 900-508222-STD-001	Planned to be transferred to Design Authority and Design Engineering
4.16.4	The aging management program for SSCs in a waste management facility shall demonstrate that a) all SSCs susceptible to aging degradation or aging effects that can, directly or indirectly, have an adverse effect on the safe operation of the facility have been evaluated for the proposed period of operation; ***Note:*** *for example, consideration of the containment system and the monitoring changes in its characteristics.* b) the effects of aging will continue to be identified and managed for the SSCs susceptible to aging degradation during the planned period of operation; and c) all safety analyses involving time-limited assumption are validated for the proposed period of operation to ensure that the aging effects will be effectively managed and the intended function of an SSC will remain within the design safety margins through the planned period of operation. ***Note:*** *Aging effects can include, but are not limited to, corrosion, deformation, and embrittlement.*		

Table 3-9: Site Operating Company Agreement (SOCA).

Site Operating Company Agreement (SOCA)			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
9.2 Maintenance of the Sites, the Facilities and the Assets	CNL shall maintain, service, repair, improve, restore or replace, as applicable, the Sites, the Facilities and the Assets (but not, for greater clarity, the Excluded Resources) in furtherance of the objectives specified in, and as reasonably necessary to perform, the Statement of Work and the other provisions of this Agreement, in each case consistent with the Existing Work Plans and Budget during the Transition-In Phase and otherwise the Accepted Plans, taking into account any demolition or Decommissioning plans contemplated thereby. Without limiting the generality of the foregoing, CNL shall maintain, service, repair, improve, restore or replace, as applicable, and operate the Sites, the Facilities and the Assets in a manner that: (a) except to the extent otherwise contemplated in the Existing Work Plans and Budget during the Transition-In Phase and otherwise in the Accepted Plans, or unless otherwise consented to in writing by the Contracting Officer, ensures that such property and assets are and will continue to be "fit for use". For these purposes, "fit for use" refers to a condition, state or manner that can effectively, efficiently and safely support the satisfaction of the objectives contemplated in the Statement of Work, including as necessary to keep such property and assets current to the extent contemplated by the 10-Year Capital Plan that is included in the Accepted 10-Year Plans and to enable CNL to successfully perform the obligations contemplated in the Statement of Work and the other provisions of this Agreement;	*Fitness for Service*, 900-508230-PDD-001 *Maintenance Categorization*, 900-508230-MCP-001 *Preventive Maintenance*, 900-508230-MCP-002 *Maintenance Performance*, 900-508230-MCP-004 *Maintenance Work Planning & Control*, 900-508230-STD-002	The Fitness for Service Function provides the strategy for resources at CNL to maintain SSC's. The scope of the *Fitness for Service* PDD does not include all CNL assets.

Site Operating Company Agreement (SOCA)			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
	(b) promotes and continuously improves nuclear safety and operational safety; (c) protects the environment, employees and the public; (d) to the extent reasonably possible, taking into account all of the Work to be performed hereunder and Good Industry Practice, minimizes the use of energy resources; and (e) protects the investments of AECL and any third parties in the AECL Resources in order to ensure continuity and reliability of operations, fulfillment of program requirements and protection of life, property and the environment from potential hazards.		
SCHEDULE A - SOC STATEMENT OF WORK 5.3 Site Resource Management and Other Services	5.3.3 CNL shall perform overall integrated planning, acquisition, maintenance, operation, management and disposition of the AECL Resources and CNL-leased facilities and infrastructure. While performing this responsibility, CNL shall align its actions with the long-term planning requirements specified in the SOC Agreement. 5.3.4 CNL shall ensure that all of the AECL Resources are maintained in accordance with the provisions of the SOC Agreement.	*Fitness for Service*, 900-508230-PDD-001 *Maintenance Categorization*, 900-508230-MCP-001 *Preventive Maintenance*, 900-508230-MCP-002 *Maintenance Performance*, 900-508230-MCP-004 *Maintenance Work Planning & Control*, 900-508230-STD-002

7 Support			
7.1 Resources 7.1.3 Infrastructure	The organization shall determine, provide and maintain the infrastructure necessary for the operation of its processes and to achieve conformity of products and services. NOTE Infrastructure can include: a) buildings and associated utilities; b) equipment, including hardware and software; c) transportation resources; d) information and communication technology.	*Fitness for Service*, 900-508230-PDD-001 *Maintenance Categorization*, 900-508230-MCP-001 *Preventive Maintenance*, 900-508230-MCP-002 *Maintenance Performance*, 900-508230-MCP-004 *Maintenance Work Planning & Control*, 900-508230-STD-002	The Fitness for Service Function provides the strategy for resources at CNL to maintain SSC's. Note: this function does not include all infrastructure as defined by this national standard.
8 Operation			
8.5 Production and service provision 8.5.1 Control of production and service provision	The organization shall implement production and service provision under controlled conditions. Controlled conditions shall include, as applicable: […] d) the use of suitable infrastructure and environment for the operation of processes;	*Fitness for Service*, 900-508230-PDD-001

9 Fabrication & Installation			
9.1 General Requirements	Fabrication and installation shall be carried out under a quality assurance program in accordance with Clause 10 and shall include preparation of the following documentation: a) fabrication and installation documents, instructions, and procedures that include verification; b) records to demonstrate the completion of all required tests, inspections, examinations, and treatments, including the qualification of the personnel and procedures used; c) records to demonstrate the acceptance of the inspection and test plan by the authorized inspector; d) permanent and non-permanent records for the applicable period of time (see Clause 12); and e) records showing actual stamping of the nameplate (e.g., a photocopy, photograph, or rubbing).	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
9.2.1 Class 1 components and non-standard fittings	The licensee shall have Class 1 components and nonstandard fittings fabricated and installed to comply with the requirements of the ASME BPVC, Section III, Division 1, NB-4000.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
9.2.2 Class 2components and non-standard fittings	The licensee shall have Class 2 components and nonstandard fittings fabricated and installed to comply with the requirements of the ASME BPVC, Section III, Division 1, NC-4000	*172-508230-PRO-001, CRL Site Infrastructure Work Planning Process* *CRL-508230-PRO-609, Route Sheet for ASME Section III Work*	
9.2.3 Class 3 components and non-standard fittings	The licensee shall have Class 3 components and nonstandard fittings fabricated and installed to comply with the requirements of the ASME BPVC, Section III, Division 1, ND-4000	*172-508230-PRO-001, CRL Site Infrastructure Work Planning Process*	

General requirements for pressure-retaining systems and components in CANDU nuclear power plants			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
9.2.4 Class 1C, 2C, and 3C components and non-standard fittings	The licensee shall have Class 1C, 2C, or 3C components and non-standard fittings fabricated and installed to comply with the requirements of the ASME BPVC, Section III, Division 1, NB-4000, NC-4000, or ND-4000, respectively, except where specific requirements are given in Annex E, in which case these components and non-standard fittings shall be fabricated and installed to these requirements.	172-508230-PRO-001, CRL Site Infrastructure Work Planning Process	
9.2.6 Class 6 or Class Exempt components and fittings	The licensee shall have Class 6 or Class Exempt components and fittings that are required to be registered, fabricated and installed to comply with the requirements of CSA B51	172-508230-PRO-001, CRL Site Infrastructure Work Planning Process *Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
9.2.7 Metallic Inserts	Helical coil or other threaded inserts shall be installed in accordance with the manufacturer's instructions and design requirements	172-508230-PRO-001, CRL Site Infrastructure Work Planning Process	

General requirements for pressure-retaining systems and components in CANDU nuclear power plants			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
9.3Welding and Brazing			
9.3.1	The licensee shall retain records in accordance with Clause 12 to demonstrate that the welding or brazing procedure performed inside Canada on any Class 1, 1C, 2, 2C, 3, 3C, or 4 component meets the requirements of the ASME **BPVC**, Section III, Division 1, NB-, NC-, ND-, NE-, or NF-4300, and that the procedure has been registered with the authorized inspection agency, as required by Clause 6.1.11.1 of this Standard. Annex G contains guidelines that may be used for in-service plugging by fusion welding of Class 1, 2, and 3 heat-exchanger tube or tube sheet holes with a one-inch maximum diameter	CRL-508241-OP-001, Qualifying Welding Procedure Specifications	
9.3.2	The licensee shall retain records in accordance with Clause 12 to demonstrate that the welding or brazing procedure performed outside Canada on any Class 1, 1C, 2, 2C, 3, 3C, or 4 component meets the requirements of the ASME BPVC, Section III, Division 1, NB-, NC-, ND-, NE-, or NF-4300.		
9.4 Support for Class 1, 1C, 2, 2C, 3, 3C, and 4 Components			
9.4.1	The licensee shall have supports fabricated and installed to comply with the requirements of the ASME BPVC, Section III, Division 1, NF-4000.	172-508230-PRO-001, CRL Site Infrastructure Work Planning Process *Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
9.4.2	The licensee shall have integral attachments fabricated and installed to comply with the fabrication and installation requirements for the component to which they are attached	172-508230-PRO-001, CRL Site Infrastructure Work Planning Process *Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
11 Examination and Pressure Testing			

General requirements for pressure-retaining systems and components in CANDU nuclear power plants			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
11.1.1	The licensee shall have documentation to demonstrate that Class 1 components have been examined in accordance with the requirements of the ASME BPVC, Section III, Division 1, NB-5000. The effective date shall be established in accordance with Clause 4.3. Examination procedures and techniques for repairs and replacements may be in accordance with a later edition of the ASME BPVC, Section III, Division 1, NB-5000.		
11.1.2	The licensee shall have documentation to demonstrate that Class 2 components have been examined in accordance with the requirements of the ASME BPVC, Section III, Division 1, NC-5000. The effective date shall be established in accordance with Clause 4.3. Examination procedures and techniques for repairs and replacements may be in accordance with a later edition of the ASME BPVC, Section III, Division 1, NC-5000.		
11.1.3	The licensee shall have documentation to demonstrate that Class 3 components have been examined in accordance with the requirements of the ASME BPVC, Section III, Division 1, ND-5000. The effective date shall be established in accordance with Clause 4.3. Examination procedures and techniques for repairs and replacements may be in accordance with a later edition of the ASME BPVC, Section III, Division 1, ND-5000.		

General requirements for pressure-retaining systems and components in CANDU nuclear power plants			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
11.1.5	The licensee shall have documentation to demonstrate that Class 4 components have been examined in accordance with the requirements of the ASME BPVC, Section III, Division I, NE-5000. For repairs and replacements to Class 4 component(s), the licensee shall have documentation to demonstrate that examination is in accordance with the requirements of the original design. For repairs and replacements, newer procedures and techniques may be used.		
11.1.6	The licensee shall have documentation to demonstrate that supports have been examined in accordance with the requirements of the ASME BPVC, Section III, Division 1, NF-5000. The effective date shall be established in accordance with Clause 4.3. Examination procedures and techniques for repairs and replacements may be in accordance with a later edition of the ASME BPVC, Section III, Division 1, NF-5000.		
11.1.8	The licensee shall have documentation to demonstrate that for examinations performed on any pressure-retaining component, the persons performing the non-destructive examinations were, at the time of the examinations, qualified in accordance with Clause 11.3, and possessed current, valid qualification documentation.		
11.2 Examination Methods			
11.2.1	The licensee shall have documentation to demonstrate that all non-destructive examination procedures performed on Class 1, 1C, 2, 2C, 3, 3C, and 4 components comply with Clause 11.1.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
11.4 Pressure Testing of Components			

General requirements for pressure-retaining systems and components in CANDU nuclear power plants			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
11.4.1	The licensee shall have documentation to demonstrate that all new components have been subjected to a pressure test in accordance with Clause 11.4.		
11.4.3	The licensee shall retain the data report to demonstrate that a pressure test has been performed to the satisfaction of an inspector, who has countersigned the data report (See Table 3-1).		
11.4.4	The licensee shall have documentation to demonstrate that Class 1 component(s) have been tested in accordance with the requirements of the ASME BPVC, Section III, Division 1, NB-6000.		
11.4.5	The licensee shall have documentation to demonstrate that Class 2 component(s) have been tested in accordance with the requirements of the ASME BPVC, Section III, Division 1, NC-6000.		
11.4.5	The licensee shall have documentation to demonstrate that Class 3 components have been tested in accordance with the requirements of the ASME BPVC, Section III, Division 1, ND-6000.		
11.4.6	The licensee shall have documentation to demonstrate that Class 3 components have been tested in accordance with the requirements of the ASME BPVC, Section III, Division 1, ND-6000.		
11.4.7	The licensee shall have documentation to demonstrate that in addition to the requirements of Clause 11.4.4, 11.4.5, and 11.4.6, component(s) classified as Classes 1C, 2C, and 3C have been tested in accordance with the requirements of Annex E.		

General requirements for pressure-retaining systems and components in CANDU nuclear power plants			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
11.4.8	The licensee shall have documentation to demonstrate that components classified as Class 4 have been tested in accordance with the requirements of the ASME BPVC, Section III, Division I, NE-6000.		
11.4.9	The licensee shall have documentation to demonstrate that Class 6 components have been tested in accordance with the requirements of CSA B51.		
12 Documentation			
12.4.1.1	The certificate holder shall complete and submit a data report for each component and for tubular products welded with filler metal in accordance with the requirements of Clause 12.4.		
12.4.1.2	Data reports shall be on forms of the type shown in Figures 3 to 8 and 12. Reports for repairs, replacements, or modifications shall be of the type shown in Figures 9 and 10. Variations of these forms may be used, provided that the applicable essential data and sign-off areas are included.		

12.4.1.3	The data report shall be signed by the certificate holder after all inspections, examinations, and tests required by this Standard have been completed. It shall then be countersigned by the inspector required by Table 3-1, who shall ensure that a) the shop is qualified for the work to be performed; b) the design drawings are registered c) the quality assurance program has been accepted as required by Clause 10; d) the welding procedures are registered; e) the welders and welding operators are qualified; f) non-destructive examination procedures are qualified; g) persons performing non-destructive examinations are qualified and certified; h) materials comply with requirements; i) he pressure boundary integrity dimensions are within drawing tolerances; j) the heat treatment operation has been performed in accordance with specified requirements; k) all required examinations and tests have been performed; l) work is in compliance with the quality assurance program; m) the pressure tests required by this Standard have been completed; and n) the reconciliation statements for differences between the registered designs and the as-built item(s) have been certified by the designer.		
12.4.1.6	The certificate holder other than the licensee shall submit a completed data		

General requirements for pressure-retaining systems and components in CANDU nuclear power plants			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
	report, a certificate of conformance, or a certificate of compliance to the licensee as required by Table 3-1 for supports or separately registered integral attachments. Supports of the same design may be covered by a single data report or certificate of conformance. Note: A data report or certificate of conformance is not required for non-welded supports that are furnished as material.		
13 In-service requirements			
13.1 General requirements	Components covered by this Standard shall be subject to inspections in accordance with CSA N285.4, CSA N285.5, and CSA N285.7.	*Preventive Maintenance*, 900-508230-MCP-002	Shared with *Pressure Boundary,* 900-508140-PRD-001
13.2 Inaugural or baseline inspections	When the pressure boundary of a component that is subject to periodic inspection is repaired, replaced, or otherwise changed, it shall receive, before being put into service, an inaugural or baseline inspection as required by CSA N285.4, CSA-N285.5, and CSA N285.7.	*Maintenance Work Planning & Control*, 900-508230-STD-002	Shared with *Pressure Boundary*, 900-508140-PRD-001
14 Repairs, replacements, and modifications			
14.2 Repairs			
14.2.3	The licensee shall have documentation to demonstrate that the authorized inspector accepted the repair procedure before the repair was undertaken		
14.2.5	The licensee shall have documentation to demonstrate that the authorized inspector has been notified before commencing repairs that involve welding of the pressure boundary.		
14.2.6	Repairs carried out by the licensee on the pressure boundary that include welding shall comply with Clauses 6.1.11 and 9.3.		

General requirements for pressure-retaining systems and components in CANDU nuclear power plants			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
14.2.7	Inspection, examination, and testing of repairs carried out by the licensee shall comply with Clauses 11 and 14.6		
14.2.8	Documentation, in the form of both permanent and non-permanent records, shall be maintained by the licensee as required by Clause 12.		
14.2.9	The effective date for the standards covering materials, including welding and brazing consumables that are used in a repair shall be the effective date of the standard used in the design and construction of the component. However, if the licensee has demonstrated to the authorized inspector that a material manufactured to a more recent standard is functionally, chemically, and metallurgically compatible with the system or component, such a material may be used.		
14.3 Replacement items			
14.3.5	The replacement item shall not have experienced any significant deterioration in storage that might adversely affect its structural integrity or operability.	*Material Control for ASME Section III & Environmentally Qualified Work*, CRL-508140-PRO-005	Shared with *Pressure Boundary,* 900-508140-PRD-001.
14.3.6	The licensee shall have documentation to demonstrate that the procedure for installing a replacement item was accepted by the authorized inspection agency before installation commenced.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001.
14.3.7	The licensee shall have documentation to demonstrate that the authorized inspector was notified before the installation of replacement items involving welding of the pressure boundary.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001.
14.3.8	Replacements carried out by the licensee on the pressure boundary that include welding shall comply with Clauses 6.1.11 and 9.3.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001

General requirements for pressure-retaining systems and components in CANDU nuclear power plants			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
14.3.12	Documentation, in the form of both permanent and non-permanent records, shall be maintained by the licensee as required by Clause 12. The licensee shall have documentation that traces the replacement item to its certified design specification and this documentation shall be available to the authorized inspection agency for review.	*Maintenance Work Planning & Control*, 900-508230-STD-002 *Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001
14.3.13	Replacement items shall be purchased, shipped, handled, and stored in accordance with the licensee's instructions and procedures to prevent damage, deterioration, or loss. These procedures shall ensure that the necessary identification, traceability, and records are maintained by the licensee as specified by this Standard.	*Material Control for ASME Section III & Environmentally Qualified Work*, CRL-508140-PRO-005	Shared with *Pressure Boundary,* 900-508140-PRD-001
14.3.14	The licensee shall identify items with limited shelf life and shall implement procedures to control their storage. The licensee shall quarantine and dispose of items that cease to conform to the requirements of this Standard.	*Material Control for ASME Section III & Environmentally Qualified Work*, CRL-508140-PRO-005	Shared with *Pressure Boundary,* 900-508140-PRD-001
14.5 Modifications			
14.5.2 Existing components			
14.5.2.6	The licensee shall have documentation to demonstrate that the procedure for the installation of modifications was accepted by the authorized inspection agency before installation commenced.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001
14.5.2.7	The licensee shall have documentation to demonstrate that the examination and testing of modifications complies with Clause 11, except for pressure testing, which shall have documentation demonstrating compliance with Clause 14.6.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001

General requirements for pressure-retaining systems and components in CANDU nuclear power plants			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
14.5.2.8	Permanent records required by Clause 12.2.1 shall be included in the history docket.	*Maintenance Work Planning & Control*, 900-508230-STD-002 *Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001
14.6 Pressure testing			
14.6.1 General requirements			
14.6.1.1	For replacement items and items used in a piping system modification, the licensee shall have a pressure test performed in accordance with the requirements of the design and fabrication standards. The licensee may substitute the piping system pressure test for the item pressure test, provided that the requirements of the design standards are met.	*Maintenance Work Planning & Control*, 900-508230-STD-002 *Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001
14.6.1.2	Where a modification consists of increasing the design pressure or temperature of a component, the licensee shall pressure test the component in accordance with the design and fabrication standard.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001
14.6.1.3	When a new self-contained system is added, the licensee shall pressure test prior to operation in accordance with Clause 11.4.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001
14.6.1.4	The licensee shall pressure test the tie-in joints involving welding or brazing of items in accordance with Clause 14.6.2 or 14.6.3, as applicable.	*Maintenance Work Planning & Control*, 900-508230-STD-002 *Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001
14.6.1.5	After welding or brazing on a pressure-retaining boundary, the licensee shall perform a pressure test in accordance with a) Clause 14.6.2 for Class 1, 1C, 2, 2C, 3, 3C, or 4 items; or b) Clause 14.6.2 or 14.6.3 for Class 6 items.	*Maintenance Work Planning & Control*, 900-508230-STD-002 *Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001

Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
14.6.2 Piping system pressure testing			
14.6.2.1	Where a pressure test is required by Clause 14.6.1, unless the welds or repairs are exempted by Clause 14.6.2.2, the piping system shall be filled with fluid and pressurized so that all welding or brazing repairs and tie-in welds are tested in accordance with Clause 14.6.2.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001

14.6.2.7	Where the licensee carries out pressure testing at a reduced pressure, as permitted by Clause 14.6.2.5, and in addition to those examinations required by Clause 11, the licensee shall perform the following: a) For butt welds of Class 1 or 1C component(s), the licensee shall perform an additional volumetric examination using a method different from the volumetric method required by the design and fabrication standards, in accordance with the ASME *BPVC*, Section III, Division 1, NB-5000. For other types of welds, the licensee shall perform a surface liquid penetrant (PT) or magnetic particle (MT) examination. b) For butt welds smaller than or equal to NPS 2-1/2 in Class 1 or 1C component(s) (excluding feeders), the licensee may perform the following in lieu of the second volumetric examination described in Item (a): i) for pipe sizes NPS 3/4 and smaller, a visual inspection of the root pass; or ii) for pipe sizes greater than NPS 3/4 and smaller than or equal to NPS 2-1/2, a visual inspection of the root and fill passes. Welds made in accordance with Item (b) shall be performed using gas tungsten arc welding (GTAW) only and welders shall be qualified on pipe coupons of the same diameter or a smaller diameter than the production pipe size being welded. c) For all welds of Class 2 or 2C component(s), the licensee shall perform a surface PT or MT examination. d) For butt welds of Class 3 or 3C components, the licensee shall perform a volumetric examination. For other types of welds, the licensee shall perform a surface PT or MT examination. The examinations outlined in Items (a) to (d) shall meet the applicable	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001

General requirements for pressure-retaining systems and components in CANDU nuclear power plants			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
	acceptance criteria of the design and fabrication standards. Examinations carried out to fulfill the requirements of the inaugural inspection for a periodic inspection program may be credited towards the requirements specified in this Clause.		
14.6.2.8	Any item within the pressure test boundary that the licensee considers unsuitable for exposure to the test pressure (e.g., instrumentation, pressure-relief devices) may be isolated, or removed prior to the application of pressure.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001.
14.6.3 Operational pressure testing			
14.6.3.4	When conducting an operational pressure test, the piping system pressure and temperature shall be determined by normal system instrumentation, test instrumentation, or through confirmation that the system is operating at its operating conditions. Records of the test shall be maintained in accordance with Clause 12.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary,* 900-508140-PRD-001.
14.7 Alternative pressure testing of Class 1, 2, 3, and 6 systems after repairs, replacements, and modifications			
14.7.1 Requirements			
14.7.1.1 General			
14.7.1.1.1	As an alternative to the requirements of Clauses 14.6.1 to 14.6.3, Clause 14.7 may be used for the pressure testing of a repair, replacement, or modification to the pressure boundary of an existing Class 1, 2, 3, or 6 system.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	Shared with *Pressure Boundary*, 900-508140-PRD-001

Boiler, pressure vessel, and pressure piping code			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
4 General requirements			
4.7 In-service repairs and alterations			
4.7.1	Owners of boilers, pressure vessels, fired-heater pressure coils, and pressure piping shall ensure that pressure equipment is maintained and operated safely	*Preventive Maintenance*, 900-508230-MCP-002	
4.7.2	Repairs and alterations shall not be made to a pressure-retaining component of a boiler, pressure vessel, fired-heater pressure coil, or piping without the prior agreement of the regulatory authority in whose jurisdiction the component is installed. Notes: 1) Subject to the approval of the regulatory authority, Part 3 of the National Board Inspection Code may be used as a guide in developing repair or alteration procedures. 2) Where jurisdictional regulations permit, prior agreement for repair or alteration work may be established by the development of a quality control program that uses the guidelines in Annex B and is satisfactory to the regulatory authority. See also Clause 4.9.3 regarding quality control systems	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
4.7.3	Hot tapping should be considered only when no alternative method is feasible or practical. Regulatory authority acceptance of the proposed procedure, including joint design, welding method, and base material identification, shall be obtained when required. Appropriate safety precautions shall be taken. The hot tapping experience and competency of the company and personnel performing this activity may be considered by the regulatory authority.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	

Boiler, pressure vessel, and pressure piping code			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
4.15 Piping			
4.15	When required by the regulatory authority in the province of installation, the piping fabricator or installer shall furnish an acceptable piping data report to the regulatory authority. Note: See Figures D.5 a), D.5 b), and D.5 c) for sample report forms.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
5 Identification			
5.1 Nameplates			
5.1.1	The nameplate stamping of every boiler, pressure vessel, and Category G fitting (see Table 3-1) shall include the Canadian Registration Number (CRN) or Canadian Central Registration Number (CCRN). The nameplate shall be stamped in accordance with the requirements of the appropriate section of the ASME Code, except for a) fusible plugs; and b) pressure relief valves (PRVs) used in propane service which are only UL listed as described in Clause 12.11. The stamping for other categories of fittings shall include, at a minimum, identification traceable to the manufacturer and to the CRN or CCRN. This identification shall be submitted to the regulatory authority or a central registration agency with the fitting registration	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
5.1.2	When a pressure vessel requiring a nameplate will be exposed to corrosive matter, the nameplate shall be attached in a manner that prevents accumulation of foreign material between the nameplate and the shell, head, or any other part of the pressure vessel subject to internal pressure.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
5.1.3	The designer of a fired-heater pressure coil shall provide a nameplate for the complete heater. The organization	*Route Sheet for ASME Section III*	

Boiler, pressure vessel, and pressure piping code			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
	responsible for the field assembly shall be shown on this nameplate.	*Work*, 172-508230-PRO-003	
5.1.4	Only whole numbers shall be used for specifying pressure and temperature ratings on nameplates.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
5.2 Additional nameplates			
5.2	When an alteration to a boiler or pressure vessel is made, or when such an item is rerated (i.e., when the MAWP, the allowable temperature, or the minimum design metal temperature is changed), an additional nameplate shall be affixed next to the original nameplate of the boiler or pressure vessel. This additional nameplate shall specify a) whether it relates to an alteration or a rerating; b) the name of the company responsible for the change; c) the maximum allowable working pressure and temperature; d) the minimum design metal temperature (where applicable); e) the date of alteration; and f) the CRN.	*Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
8 Piping and fittings			
8.3	Welded joints in a pressure piping system shall not be painted or covered until all required inspections are completed by the owner and/or authorized inspection agency in accordance with the code of construction and the Act.	*Piping Installation/Modification/Welding Record*, 172-508230-FM-005	
8.4	Soldered joints shall not be permitted in services subject to shock or vibration.	*Piping Installation/Modification/Welding Record*, 172-508230-FM-005	
8.5	Bonding of non-metallic joints shall be performed in accordance with the applicable code of construction. Bonding procedure specifications, and	*Pressure Boundary Mechanical Joint*	

Boiler, pressure vessel, and pressure piping code			
Source, Section and Title	**Description**	**Implementing Document(s)**	**Notes/Comments**
	procedure and performance qualification testing, shall be subject to the acceptance of the regulatory authority. **Note:** *For an example of requirements for bonding, refer to Chapter VII of ASME B31.3.*	*Replacement, 172-508230-PRO-002* *Route Sheet for ASME Section III Work*, 172-508230-PRO-003	
12 Pressure relief devices			
12.5 Inspection			
12.5.1	The owner shall periodically visually inspect pressure relief devices to ensure that there are no impediments that will prevent them from operating properly.	*Preventive Maintenance*, 900-508230-MCP-002	Shared with *Pressure Boundary*, 900-508140-PRD-001
12.5.2	The frequency of the periodic visual inspection depends on the operating environment and the manufacturer's recommendations but shall not exceed five years.	*Preventive Maintenance*, 900-508230-MCP-002	Shared with *Pressure Boundary,* 900-508140-PRD-001
12.5.3	The periodic visual inspection shall ensure that a) the outlet and, where applicable, weep hole are open and free to discharge; b) there are no signs of corrosion, cracks, debris, tampering, or other mechanical damage; c) there is no leakage; d) the manufacturer's data plate or markings are present in accordance with the applicable design code; e) the set pressure of the pressure relief device meets the specified requirements for the system; f) the pressure relief device discharge meets the requirements of Clause 12.2.2; g) the discharge capacity of the pressure relief device is equal to or greater than the boiler output capacity stamped on the boiler nameplate and complies with Clause 12.2.1.2; h) the seal (where applicable) has not been broken; and	*Maintenance Work Planning & Control*, 900-508230-STD-002 *Preventive Maintenance*, 900-508230-MCP-002	Shared with *Pressure Boundary,* 900-508140-PRD-001

	i) the rain cap, where applicable, has been installed. Corrective action shall be taken if one or more of the above criteria are not met. **Note:** *See Figure H.1 for diagrams of typical internal and external propane pressure relief valves*.		
12.5.4	In addition to the periodic visual inspection specified in Clause 12.5.3, if the discharge piping in an LPG service governed by CSA B149.2 is fabricated from a material, such as carbon steel, that can corrode and form internal scale, the discharge piping shall be removed to inspect the pressure relief device and the piping. Any scale buildup in the discharge piping shall be removed.	*Preventive Maintenance*, 900-508230-MCP-002	Shared with *Pressure Boundary,* 900-508140-PRD-001
12.6 In-service Testing	Pressure relief devices in steam or hot water service shall have a periodic manual lift or system test. Pressure relief devices with a lifting lever or equivalent device in compressed air service shall have a periodic manual lift test. See Table 3-5 for the frequency of in-service testing.	*Preventive Maintenance*, 900-508230-MCP-002	Shared with *Pressure Boundary*, 900-508140-PRD-001
12.9 Thermal expansion relief devices			
12.9.2	Thermal expansion relief valves shall be inspected periodically as specified in Clause 12.5. **Note:** *Thermal expansion relief valves need not comply with the requirements of Clause 12.7.*	*Preventive Maintenance*, 900-508230-MCP-002	Shared with *Pressure Boundary*, 900-508140-PRD-001
12.9.3	Thermal expansion relief valves shall be replaced or serviced when there is evidence of damage or malfunction.	*Preventive Maintenance*, 900-508230-MCP-002	Shared with *Pressure Boundary*, 900-508140-PRD-001
13 In-service inspection			
13.1	In-service inspection of systems shall be performed as required for the specific installation in accordance with the code of construction or code of inspection adopted by the authority having jurisdiction. Consideration shall be given	*Maintenance Work Planning & Control*, 900-508230-STD-002 *Preventive Maintenance*, 900-508230-MCP-	Shared with *Pressure Boundary*, 900-508140-PRD-001

	to the manufacturer's recommendations. Personnel performing in-service inspection shall be trained and competent in the duties for which they are responsible. **Note 1:** *In some cases, the authority having jurisdiction specifies in-service inspection intervals. Authorities having jurisdiction can be the electrical safety authority, fire services, a government ministry, etc.* **Note 2:** *In-service pressure equipment can be subject to in-service deterioration that can affect its pressure-retaining capability, and, therefore, periodic inspection is warranted to validate its continued suitability for service.*	002	
13.2 Pressure equipment not in service	Pressure equipment not in service shall be adequately protected against damage from environmental conditions. Safety precautions for entering confined spaces shall be followed when inspection and maintenance activities are performed. **Note 1:** *For inspection purposes, equipment not in service should be physically isolated from the process and lock-out safety measures put in place before inspection and maintenance activities begin. Safety procedures should be observed when the vessel is being prepared for inspection*. **Note 2:** *Equipment not in service should be completely disconnected from the process and content removed in accordance with approved procedures. Equipment removed from service that is intended to be returned to operation at a later date should be considered for layup or mothballing. Inspections should be carried out before such pressure equipment is returned to service*.	*Maintenance Work Planning & Control*, 900-508230-STD-002 *Preventive Maintenance*, 900-508230-MCP-002	Shared with *Pressure Boundary,* 900-508140-PRD-001
13.3 Inspection			
13.3.1 General	Periodic inspection of pressure equipment is intended to determine the condition of the equipment and its	*Preventive Maintenance*, 900-508230-MCP-	Shared with *Pressure Boundary*, 900-508140-PRD-001

	fitness to continue to operate safely. Inspection may be external and/or internal. Where appropriate, NDE may be used to collect certain data from equipment in operation.	002	
13.3.2 External inspections	External inspection can be a visual inspection and may be supplemented by NDE and carried out while the pressure equipment is in service to observe its behaviour under operating conditions. During external inspections, pressure equipment (e.g., its external surfaces; appurtenances such as fittings, protective devices, and foundation elements; insulation; equipment identification) shall be examined for nonconformities.	*Maintenance Work Planning & Contro*l, 900-508230-STD-002 *Preventive Maintenance*, 900-508230-MCP-002	Shared with *Pressure Boundary*, 900-508140-PRD-001
13.3.3 Internal Inspection	Internal visual inspection of the internal surfaces of pressure equipment is carried out with the equipment not in service. In lieu of or in addition to visual inspection, NDE can be necessary to properly assess the condition of the equipment.	*Maintenance Work Planning & Contro*l, 900-508230-STD-002 *Preventive Maintenance*, 900-508230-MCP-002	Shared with *Pressure Boundary*, 900-508140-PRD-001

4. Requirements Applicability

The licence conditions handbooks are each applicable only to their associated site. All other requirements identified above are applicable to all sites, with the exception of the requirements referenced in Table 4-1.

SECTION **PAGE**

TABLE OF CONTENTS

SECTION **PAGE**

FIGURES

APPENDICES

1. PURPOSE

The Periodic Inspection Plan (PIP) for the Whiteshell Laboratories (WL) Waste Management Area (WMA) bunkers describes methods for conducting scheduled inspection surveys of these facilities. The inspection is defined as examination, measurement and testing work done to ensure the bunker systems are functioning as designed and the bunkers remain fit for service.

The PIP includes:

- the scope of inspection;
- general inspection requirements;
- locations of components to be examined;
- methods of examination, measurements and testing;
- frequency and amount of examination, measurements and testing;
- acceptance criteria; and
- reporting and documentation requirements.

In terms of defining an activity (e.g., inspection), “shall” is used to express a requirement, i.e., a provision that the user is obliged to satisfy in order to comply with the PIP; “should” is used to express a recommendation or that which is advised but not required; “may” is used to express an option or that which is permissible within the limits of the PIP; and “can” is used to express possibility or capability.

2. SCOPE

2.1 Scope of Periodic Inspection Plan

The scope of examination is the concrete waste storage bunkers in the WL WMA.

The two types of bunkers considered in this assessment are:

- Low-Level Waste (LLW) bunkers;
- Medium-Level Waste (ILW) bunkers; and
- The exterior concrete of the Shield Modular Above Ground Storage (SMAGS) Building.

The scope does not include:

- groundwater monitoring for identification of contaminant and groundwater flow conditions [1], [2]; and
- the condition of the waste packages and waste inside the bunkers or SMAGS.

2.2 Guidance for the Periodic Inspection Plan

The PIP shall follow the methods provided in ACI 201.1R-08 [3], Guide for Conducting a Visual Inspection of Concrete in Service. Further to ACI 201.1R-08, because the durability of concrete bunkers is impacted by the environment, consideration of the groundwater and soil in contact with the concrete is necessary. This is accomplished by reviewing water chemistry data, soil chemistry and soil physical characteristics. Water chemistry data are collected for the PIP by laboratory analysis of groundwater samples extracted from monitoring wells located within and adjacent to the WMA boundary. Soil chemistry and soil physical characteristics data are obtained by analysis of core samples as required. Baseline information is available on the soil [4].

Groundwater flow and contaminant conditions are being quantified by monitoring and testing in a series of nested-wells placed at strategic locations inside and outside the WMA.

3. ACRONYMS AND DEFINITIONS

3.1 Acronyms

CNL	Canadian Nuclear Laboratories
CNSC	Canadian Nuclear Safety Commission
LLW	Low-Level Waste
ILW	Intermediate-Level Waste
PIP	Periodic Inspection Plan
WL	Whiteshell Laboratories
WLO	Whiteshell Laboratories Operations
WLCP	Whiteshell Laboratories Closure Project
WMA	Waste Management Area

3.2 Definitions

Abnormal/Environmental	A category of events that occurs during a postulated accident or an unusual environmental event, or both.
Bunker Performance	An evaluation of the performance of a component by review of data from examination, test/analysis or measurement of a bunker system attribute (e.g., concrete crack patterns). Bunker performance can be defined as acceptable, acceptable once specific issues are addressed, or unacceptable.
Bunker System	Roof, wall, floor slab, sump, footing or adjacent confining material (e.g., clay soil or groundwater).
Component	An element or part of a bunker system such as a roof, wall, floor slab, sump or adjacent confining material (e.g., clay soil).
Evaluation	An assessment of the results of an examination, test and/or analysis that determines whether a bunker system performs its design functions. Also see bunker performance.
Examination	Investigative activities (typically visual or non-destructive testing) to ensure integrity of a structure.
Facility Authority	The Facility Authority for the WMA facility is responsible for ensuring health, safety, environmental protection, and licensing compliance for all work at WMA. The Facility

	Authority is responsible for assigning a Facility Manager for the WMA.
Facility Manager	The WMA Facility Manager is responsible for ensuring all WMA operations are performed safely in compliance with the site licence, and in accordance with applicable Canadian Nuclear Laboratories (CNL) policies and procedures. This includes operational safety, environmental protection and licensing compliance issues.
WL Licensing Manager	The manager is responsible for coordinating all interactions between CNL-WL and the Canadian Nuclear Safety Commission (CNSC), obtaining and maintaining the CNSC Licence for WL.
Inspection	Examination, measurement, or testing to ensure the bunkers are functioning as designed and they remain fit for service. Note: Inspection can include visual assessments, non-destructive tests, invasive techniques and instrumented monitoring of a structure. The Inspector will provide the results and conclusions to the Facility Manager who will have them reviewed by a registered engineer.
Inspector	A registered engineer engaged by the WL Facility Authority to perform periodic inspections of the WMA bunkers.
Site and Nuclear Operations	Site and Nuclear Operations is the “owner/operator” of the WL WMA, responsible for ensuring the PIP is conducted as well as other jobs in the WMA.

4. RESPONSIBILITIES

4.1 Facility Authority

The responsibilities of the Facility Authority within the scope of the PIP are to:

a) Assign a registered engineer to perform periodic inspections of the WMA bunkers; and

b) Report the summary of the PIP inspections and actions in the Annual WL Safety Report, or in another suitable document, which would be submitted to the CNSC.

4.2 Facility Manager

The responsibilities of the Facility Manager within the scope of the PIP are to:

a) Ensure that the work of the PIP is carried out in accordance with CNL and WL Standard Policies and Procedures; and

b) Ensure that the personnel required to complete the work in the PIP are available and qualified.

c) Ensure that maintenance issues are dealt with through the site maintenance and planning system.

4.3 Inspector

The responsibilities of the inspector within the scope of the PIP are to:

a) Carry out the inspection duties specified in this plan; and

b) Report on the results of the inspection survey.

5. INSPECTION REQUIREMENTS

The overall requirement of the PIP is to ensure that the bunkers and SMAGS remain fit for service. The inspection shall be done in a cyclic manner. The inspection process includes an annual examination and a detailed examination of the bunkers and SMAGS as required, while those structures remain in service. Once a structure is removed from service it will no longer be inspected. The annual visual examination allows for early identification of maintenance issues and for a general assessment of the concrete. The inspections (visual and detailed) are typically conducted in the spring, unless operational requirements dictate otherwise. The inspection process is based on ACI 349.3R-02 [5], which recommends the inspection period not exceed five years. In this case, many of the concrete bunkers are older, with the oldest constructed in 1966[4] . Thus a more frequent, annual inspection schedule is warranted, with a more detailed inspection as required, based on the results of the annual inspections. The detailed inspection will also include all required elements of the annual visual inspection. Particulars on the inspection process are provided in Section 8.

6. LOCATION

6.1 Environment

The main WL site is located in southeastern Manitoba on the east bank of the Winnipeg River, approximately 100 km east northeast of Winnipeg. The site is 267 m above sea level in a broad zone where prairie grassland to the southwest mixes with boreal forest to the northeast [6]. It is on the western edge of the Canadian Shield. The WMA is a few kilometres to the northeast of the main WL site. The site experiences a mid-continental climate, with typically hot summers and cold winters. Results from a weather monitoring station active on the site between 1964 and 1998 indicate that mean temperatures remain below freezing from November to March [6], but some freeze-thaw cycling will occur in the months prior to and after this period. Typically, the near surface ground will begin to freeze in late October to early November; this area of southern Manitoba has approximately 110 frost-free days [7]. Using estimates of frost penetration into homogeneous soil [8], frost penetration would range from approximately 1 m (assuming 30 cm of snow cover) to approximately 2 m assuming no snow cover. Microclimates in sheltered areas, such as protected south facing walls of the bunker structures may experience localized freeze-thaw behaviour during the colder months. Snowfall accumulates during the winter months and will typically not melt until the spring. Measurements indicate precipitation is greatest in the spring and summer [6]. These conditions have historically limited the amount of freeze-thaw cycling occurring in a given year, but over longer time periods numerous freeze-thaw events will occur in the service life of the WMA bunkers. Additionally, the environmental conditions slow the rate of groundwater movement in the winter, as the supply of recharge water does not resume until spring melting.

6.2 Geology and Groundwater

A more detailed description of the WMA geology and groundwater condition is available in the fitness for service report [4]. WL and the WMA are located on terrain shaped by the last glacial period. The pH of the soils ranges from 5.4 to 8.0. This is considerably below the level of ordinary concrete (pH ~ 12), so some chemical interaction is expected where the concrete and soil are in contact, but it should not significantly impact the concrete.

Groundwater is locally recharged by precipitation through the Woodbridge sand unit, which is an exposed, slightly elevated region immediately to the east of the WMA. Precipitation migrates downward and laterally to recharge sand layers (Figure A-1) underlying the clay units. The WMA is generally considered to be in a groundwater discharge area (i.e., upward groundwater movement) as indicated in Figure A-1.

Sulphates in the soil can be dissolved and lead to Ca-Mg-Na-SO_4 type waters. The water table will vary depending on weather conditions and seasons, but is generally no lower than 2 m from the ground surface. Water movement through the clay is slower ($3x10^{-7}$ cm/s) than that through the basal sand, as a consequence most of the groundwater movement is in the basal sand layer.

6.3 Bunker Locations

All bunkers and SMAGS involved in this PIP are located within the boundaries of the WL WMA. The structures under consideration are ILW Bunkers 1 to 8, LLW Bunkers 1 to 6 and SMAGS (Figure A-2). MLW Bunkers 1 to 5 are essentially below the ground surface with the exception of their roof structures. MLW Bunkers 6 and 7 are partly below ground. LLW Bunkers 1 to 6 and ILW Bunker 8 are constructed surface bunkers. Sketches of the bunkers are provided in Figure A-3 to Figure A-9. SMAGS is pre-fabricated concrete slab type building located at the north end of the WMA.

7. SCHEDULE OF INSPECTION

Based on the WL WMA Bunkers' fitness for service report [4], the following inspections shall be made as part of the PIP:

- annual inspection (see Section 8.1); and
- detailed inspection as required (see Section 8.2).

It should be noted that the above schedule of examination does not exclude additional investigations to evaluate any unresolved issue with the performance of a bunker component or the overall bunker system. A detailed inspection will be performed as required.

8. INSPECTION METHOD

The American Concrete Institute document ACI 201.1R-08 [3] provides a checklist from which those items that are important or applicable for the inspection are selected. As mentioned in Section 7, additional investigations may be launched to evaluate any unresolved performance issues.

The general checklist includes the principal areas of review:

- description of structure;
- present condition of structure;
- nature of loading (e.g., snow load) and detrimental elements (e.g., chemical exposure, and sulphate rich groundwater);
- original condition of structure;
- materials of construction; and
- construction practices.

Each of these principal headings has subsections to guide the Inspector. For the WL WMA, much of the background information was gathered for the fitness for service report [4]. In some cases, details on the original condition of the structure and materials were no longer available.

8.1 Annual Inspection

In an annual inspection, the focus is to examine the bunkers for maintenance issues and to determine if visible changes have occurred since the previous survey. This includes conditions around the bunkers (e.g., standing surface water).

The inspection shall provide the following information:

- description of each structure (bunker/building type and number);
- photographs, general view and detailed close-up of condition of areas of interest as required;
- sketch map indicating orientation of bunkers and any areas of interest such as poorly drained areas or sufficient description to explain these conditions;
- present condition of structure;
- overall alignment with notes about any indications of structural movement (e.g., settling);
- areas showing distress;
- general surface condition (e.g., cracking and details of cracking, scaling, spalls, visible corrosion, cover remaining over rebar if spalling is noted, stains, exposed reinforcement,

previous patching, condition of visible waterproofing), note that not all these conditions may exist; and

- summary of weather conditions from the previous year.

For a typical inspection survey of a LLW bunker, the roof of each bunker is viewed from a ladder or mobile platform. The roof may also be accessed during these inspections. The survey methods will be adapted to account for anomalous conditions, problems or any other areas of interest.

Observation of the ground around the bunkers shall be conducted to ensure the ground remains sloped away from the structures and that low lying areas do not develop due to settling of graded material or that adjacent construction does not impact surface water movement.

Additionally, groundwater samples should be taken. Figure A-2 indicates the location of the monitoring wells used for taking samples from the WMA to measure groundwater chemistry. Sampling should be done once per year, typically around the time of the survey. The following chemical constituents are typically analyzed from the samples:

- Calcium: a baseline of calcium measurements should theoretically allow for calcium based leachate from a bunker to be detected, although the calcium could precipitate into the soil matrix, thus this is an indicator only;
- Magnesium: magnesium sulphates can be one of the more aggressive forms of sulphate which can attack concrete [4]; and
- Sulphate: sulphates can attack and weaken the structure of concrete.

Initially chlorides, which can cause corrosion of reinforcement, were tested for but the level was found to be very low [4]. This analysis may be repeated at a five-year interval to confirm the reading is still low.

The pH level of the groundwater was tested and found to be approximately 7. An increase in pH level is another indicator of an alkaline leachate from concrete structures. The pH should be tested annually.

Inspection work should include the condition of any roofing materials, gutters and structure-work (attached railings, ladders, etc.). Bituminous sealing compounds also have a finite lifespan, especially when exposed to the atmosphere and should be inspected to determine adherence to the concrete.

8.2 Detailed Inspection as Required

A detailed inspection shall be conducted if the annual inspections identify the need for a more in-depth inspection.

A more detailed examination of any cracks shall include measurements of crack extent and width if evidence from the annual inspection is indicating changes are occurring that require further investigation. The crack extent may be marked on the bunkers if the Inspector or Facility Manager believes an issue may be developing. The marks would be recorded by photos or mapping.

This may also include surveying the locations of the corners of the bunkers to determine if change has occurred. This can be accomplished by either traditional survey methods or by use of a sufficiently sensitive GPS device.

If sufficient degradation is noted, the concrete should be assessed by core sampling and analysis if evidence of degradation or alteration is noted in the routine inspections. A contractor skilled in the testing and analysis of concrete can be retained to provide assistance with sample coring, analysis and interpretation of results.

The locations of samples shall be determined in advance to provide representative samples from the following conditions:

- ILW bunkers at a depth where the groundwater table is present;
- ILW bunkers at a depth where the ground is seasonally dry; and
- ILW and LLW bunkers exposed to atmosphere.

It should be noted that 1) samples will not be collected from every location on every bunker, and 2) additional samples might be recovered from specific areas having anomalous conditions, problems or other issues.

As appropriate, the samples can be tested for:

- strength;
- density;
- alkali-aggregate or other reaction;
- bonding to aggregate;
- velocity;
- air content;
- chloride ion content;
- cover over reinforcing steel;
- reinforcement corrosion;
- corrosion of dissimilar metals;
- delamination;
- depth of carbonation;
- freezing and thawing attack;
- extent of deterioration; and

- aggregate portion and distribution.

Sample locations shall be patched and infilled with an appropriate cementitous compound and the surface sealed.

8.3 Abnormal/Environmental Conditions

In the event of abnormal or unusual conditions (e.g., a tornado in the immediate area of the WMA or vehicle collision with a bunker), an additional inspection may be requested by the Facility Authority or Facility Manager.

8.4 Issues from a Periodic Bunker Inspection

The Inspector shall report any issues identified from an inspection to the Facility Manager in a written document. At the request of the Facility Manager, the Inspector may return to inspect corrective work. E-mail communication from the Facility Manager or a completed work request in the site maintenance records system that the corrective work is complete shall be sufficient as a record of completed work.

Issues will be resolved by the Facility Manager with assistance from other personnel as required.

9. ACCEPTANCE CRITERIA

The results of the inspection will be subject to verification by providing them to a registered engineer assigned by the Facility Manager or Facility Authority. The assigned registered engineer will review the survey. In addition, any work requiring attention as indicated by the Inspector will be rated by importance and the reviewing engineer will verify the need for and order of the work to be done. Once this review is completed, the results of the inspection are deemed to be acceptable when agreed to by the Facility Manager. The memorandum or report produced (see Section 10) will be reviewed or approved by the Facility Manager and/or the Facility Authority. While the inspections are conducted to identify maintenance issues, overall the goal is to ensure that fitness for service requirements are met.

When considering the results of the inspections, in terms of fitness for service, the American Concrete Institute Service Life Prediction [9] recommends the definition of service life of concrete structures be based on a defined end-of-life which includes:

- unacceptable structural safety due to material degradation or exceeding the design load-carrying capacity;
- severe material degradation, such as corrosion of steel reinforcement initiated when diffusing chloride ions attain the threshold corrosion concentration at the reinforcement depth;
- maintenance requirements exceed available resource limits;
- aesthetics become unacceptable; and
- functional capacity of the structure is no longer sufficient for a demand.

It is important to note that all structures will have a finite lifespan and that the lifespan period requires periodic maintenance.

The fitness for service criteria for the bunkers in the WMA is their function of isolating the waste for an economic upkeep (repair) cost. If the structures are not performing that function then they cannot be considered fit for service.

10. REPORTING AND DOCUMENTATION

The inspections conducted following this PIP will generate communications, memorandums and reports. The results of inspections will be reported on CNL Memoranda and copied to the Facility Manager, Facility Authority and WL Licensing Manager. Inspection results will include conclusions to summarize the existing conditions and recommendations on how to correct issues as required by the findings.

A logbook will be maintained for inspections to record key details of the inspection; these details will be transferred to memorandums and reports as appropriate.

Key communications and e-mails shall be retained as records to indicate acceptance of inspection results, notification of issues and resolution of issues.

All communications, documents and records for this project shall be maintained according to the processes described under the WL Decommissioning Record Management and Retention procedure [10].

Licence: Renewed

Table of Contents

1.0 INTRODUCTION

1. Canadian Nuclear Laboratories Ltd. (CNL) has applied to the Canadian Nuclear Safety Commission[1] (CNSC) for the renewal of the Nuclear Research and Test Establishment Decommissioning Licence (NRTEDL) for its Whiteshell Laboratories (WL), located in Pinawa, Manitoba. The current licence, NRTEDL-W5-8.05/2019, which expires on December 31, 2019, allows CNL to operate and decommission WL. CNL requested a licence renewal for a period of 10 years.

2. The WL site encompasses an area of approximately 4,375 hectares and includes facilities such as the Whiteshell reactor (WR-1 reactor), shielded facilities, radioactive waste management facilities and structures, a concrete canister storage area and various research laboratories and support buildings. WL operated as a nuclear research facility for approximately 40 years. During this time, the WR-1 reactor operated for a period of 20 years.

3. In February 2019, up to $50,000 in funding to participate in this licensing process was made available to Indigenous groups, not-for-profit organizations and members of the public through the CNSC's Participant Funding Program (PFP). A Funding Review Committee, independent of the CNSC, recommended that up to $63,300 in participant funding be provided to five applicants. These applicants were required, by virtue of being awarded participant funding, to submit a written intervention and make an oral presentation at the public hearing commenting on CNL's application.

4. The Commission wishes to make clear that the scope of CNL's licence renewal application and of this public hearing was the renewal of the WL licence. This hearing did not consider the *in situ* decommissioning of the WR-1 reactor that has been proposed by CNL. The Commission understands that the proposed *in situ* decommissioning of the WR-1 reactor is an important concern for intervenors, as raised in several interventions. Those issues are outside the scope of these proceedings and the Commission will consider the concerns raised by Indigenous peoples, members of the public and other stakeholders regarding the proposed *in situ* decommissioning of the WR-1 reactor, as well as the EA for the proposed decommissioning method, through a future public Commission hearing, that will provide an opportunity for public participation.

<u>Issues</u>

5. In considering the application, the Commission was required to decide:

   a) what environmental assessment review process to apply in relation to this application;

---

[1] The *Canadian Nuclear Safety Commission* is referred to as the "CNSC" when referring to the organization and its staff in general, and as the "Commission" when referring to the tribunal component.

b) whether CNL is qualified to carry on the activity that the licence would authorize; and

c) whether, in carrying on that activity, CNL would make adequate provision for the protection of the environment, the health and safety of persons and the maintenance of national security and measures required to implement international obligations to which Canada has agreed.

Public Hearing

6. The Commission, in making its decision, considered information presented for a public hearing held on October 2-3, 2019 in Lac du Bonnet, Manitoba. The public hearing was conducted in accordance with the *Canadian Nuclear Safety Commission Rules of Procedure*[2] (the Rules). During the hearing, the Commission considered written submissions and heard oral presentations from CNL (CMD 19-H4.1, CMD 19-H4.1A, CMD 19-H4.1B and CMD 19-H4.1C) and CNSC staff (CMD 19-H4, CMD 19-H4.A, CMD 19-H4.B, CMD 19-H4.C and CMD 19-H4.D). The Commission also considered oral and written submissions from 11 intervenors (see Appendix A for a list of interventions). The hearing was webcast live via the CNSC website, and video archives are available on the CNSC's website.

Request for Ruling

7. On October 2, 2019, the Canadian Environmental Law Association (CELA) filed a ruling request[3] pursuant to Rule 20(1) of the Rules. The Commission acknowledged receipt of the request during the hearing and indicated that the Commission would consider the ruling request during its deliberations.

8. As stated in a previous decision,[4] the Commission has made its Rules and interprets them in light of the direction Parliament gave to the Commission in subsection 20(3) of the NSCA, that it deal with all proceedings "as informally and expeditiously as the circumstances and considerations of fairness permit." In this context, Rule 20 contemplates that a participant in a public hearing may request that the Commission rule on a particular issue. Such a request may be made at any time before the start of a public hearing or during a public hearing. The rule contemplates that the "relevant persons" – those whose interests might be affected by the ruling that is requested – have notice of a request and have an opportunity to present their views on it, before a ruling may be made.

---

[2] Statutory Orders and Regulations (SOR)/2000-211.
[3] CMD 19 H4.13, *Request for Ruling from the Canadian Environmental Law Association*, October 2, 2019.
[4] Canadian Nuclear Safety Commission Record of Decision, *Application to Renew the Nuclear Power Reactor Operating Licence for the Pickering Nuclear Generating Station*, issued December 2018.

9. The intervenor requested “that the Commission in its Record of Decision actively support, advance and implement the Winnipeg Nuclear Declaration 2018 in respect to the Right to Nuclear Peace and Freedom from Nuclear Fear.” The Commission determined that consultation with persons whose interests may be affected by the ruling requested was not required for this matter as it was determined that this request was outside the scope of this hearing.

10. Requests for ruling can contribute to the Commission ensuring that it conducts an expeditious and fair hearing. Such requests are always in the context of a particular hearing, and some requests for a ruling on a matter of substance or procedure can contribute to a fair hearing and should be dealt with specifically – a ruling on substance might narrow the scope of a hearing, for example, or might fully address a matter arising in a hearing, or might speak to the limiting of participation in a hearing, as contemplated in paragraph 2(b) of Rule 20. In such circumstances, the potential for specific rulings before or within a hearing is positive, and reliance on the rule, salutary. Requests for rulings are appropriate in respect of matters that either would not otherwise arise in a hearing and a participant feels a ruling would clarify or simplify a matter in some way, or would advance the Commission’s consideration of the subject-matter of the hearing in some way that merits separate treatment outside of or in addition to the flow of the hearing.

11. The Commission, as a quasi-judicial administrative tribunal, renders decisions that are within its legislated mandate and does not take a position on matters such as is contemplated by this ruling request. The Commission notes that Canada is a non-nuclear weapon country and that the Commission, in regulating the peaceful use of nuclear energy and materials, must be confident in its decision that licensees ensure maintenance of national security and measures required to implement international obligations to which Canada has agreed.

2.0 DECISION

12. Based on its consideration of the matter, as described in more detail in the following sections of this *Record of Decision*, the Commission concludes that CNL is qualified to carry on the activity that the licence will authorize. The Commission is of the opinion that, in carrying on that activity, CNL will make adequate provision for the protection of the environment, the health and safety of persons and the maintenance of national security and measures required to implement international obligations to which Canada has agreed. Therefore,

> the Commission, pursuant to section 24 of the *Nuclear Safety and Control Act*, renews the Nuclear Research and Test Establishment Decommissioning Licence issued to Canadian Nuclear Laboratories Ltd. for its Whiteshell Laboratories located in Pinawa, Manitoba. The renewed licence, NRTEDL-W5-8.00/2024, is valid from January 1, 2020 until December 31, 2024.

13. Although CNL requested a ten-year licence renewal, the Commission considers that a licence for a period of five-year is more appropriate considering all the important activities to be carried out at this specific site in the next couple of years and the concerns raised by some intervenors. The five-year licence period will provide enough time for CNL to submit the Environmental Impact Statement for the proposed *in situ* decommissioning of the WR-1 reactor, which the Commission understands will be available in 2020, and the Safety Analysis Report for the underground low-level waste (LLW) trenches, which the Commission understands will be available by the end of 2023. Indigenous peoples and members of the public are invited to review and comment CNL's performance as part of the regular Regulatory Oversight Report (ROR), as well as during future licensing hearings.

14. The Commission includes in the licence the conditions as recommended by CNSC staff in CMD 19-H4, CMD 19-H4.A, CMD 19-H4.B and CMD 19-H4.C, including licence condition 12.2. The Commission also delegates authority for the purposes of licence condition 3.2, as recommended by CNSC staff.

15. The Commission is satisfied that an environmental assessment (EA) under the *Canadian Environmental Assessment Act, 2012*[5] (CEAA 2012) was not required for the renewal and considers the environmental protection review that was conducted by CNSC staff to be acceptable and thorough.

16. With this decision, the Commission directs CNSC staff to report on the performance of CNL and WL as part of a ROR. CNSC staff shall present this report at a public proceeding of the Commission, where members of the public will be able to participate. The Commission encourages Indigenous groups and members of the public to participate.

17. The Commission notes that CNSC staff can bring any matter to the Commission as applicable. The Commission directs CNSC staff to inform the Commission of any changes made to the Licence Conditions Handbook (LCH) as a component of the ROR.

3.0 ENVIRONMENTAL ASSESSMENT

3.1 Application of the *Canadian Environmental Assessment Act, 2012* and the *Impact Assessment Act*

18. In coming to its decision, the Commission was first required to determine whether an EA under the CEAA 2012 was required.

19. CNL's application was made November 15, 2018. At that time, the CEAA 2012 and its regulations were the environmental assessment regime in place and specified the requirements for EA for nuclear projects. The licence renewal of a facility is not

[5] S.C. 2012, c. 19, s. 52

included on the Designated Project list for an EA, as renewing a licence is not an activity identified in the *Regulations Designating Physical Activities*.[6]

20. The application submitted by CNL is for a licence renewal and CNL is not requesting authorization to conduct new projects or new physical activities.[7] The Commission notes that a licence renewal is not a designated project under CEAA 2012. The Commission recognizes that the decommissioning of the WR-1 reactor triggered an EA under CEAA 2012 that is currently in process, with licensing for that project to be considered at a separate proceeding.

21. The *Impact Assessment Act*[8] (IAA) came into force on August 28, 2019. Under the IAA and the *Physical Activities Regulations*[9] made under it, impact assessments are to be conducted in respect of projects identified as having the greatest potential for adverse environmental effects in areas of federal jurisdiction. Since CNL's application was submitted to the CNSC prior to the coming into force of the IAA, the Commission is satisfied that the IAA does not apply to this licensing application.

22. Based on the information provided for this hearing, the Commission is satisfied that an EA under CEAA 2012 is not required in regard to this licence renewal.

3.2 CNSC Environmental Protection Review

23. The Commission considered the completeness and adequacy of the environmental protection review under the *Nuclear Safety and Control Act*,[10] (NSCA) and its regulations that CNSC staff conducted for this licence renewal. CNSC staff findings included that:

- CNL's environmental protection programs met CNSC regulatory requirements and results from CNL's and from other regional monitoring programs carried out by other levels of government confirmed that the environment and health of persons around the WL site remained protected.
- CNSC staff concluded that the potential risk from physical stressors and radiological and hazardous releases to the atmospheric, terrestrial, hydrogeological, aquatic and human environment are low to negligible. As required by the regulation, CNSC staff will verify that CNL conducts a site-wide ERA in accordance with REGDOC-2.9.1, E*nvironmental Principles, Assessments and Protection Measures* [11] and CSA N288.6-12, *Environmental*

---

[6] SOR/2012-147
[7] "Projects" as defined in section 66 of CEAA 2012.
[8] S.C. 2019, c. 28, s. 1
[9] SOR/2019-285
[10] Statutes of Canada (S.C.) 1997, chapter (c.) 9.
[11] CNSC Regulatory Document REGDOC-2.9.1, E*nvironmental Principles, Assessments and Protection Measures*, 2016.

Risk Assessment at Class I Nuclear Facilities and Uranium Mines and Mills[12] during the proposed licensing period.

- The 2017 sampling results from CNSC's Independent Environmental Monitoring Program (IEMP) confirmed that the environment and health of persons around the WL site were protected.

24. Based on the information provided on the record for this hearing, the Commission is satisfied that the environmental protection review conducted by CNSC staff for the WL licence renewal was acceptable and thorough. The Commission notes that the NSCA provides a strong regulatory framework for environmental protection, and the health and safety of persons. The Commission understands that an Environmental Risk Assessment (ERA) is currently underway and expects that the results from this ERA will form part of the information to be filed for the next licence renewal.

3.3 Conclusion on Environmental Assessment

25. Based on the information provided for this hearing, the Commission concludes that the licence renewal is not a designated project under CEAA 2012 and that an EA under CEAA 2012 is not required. Further, the Commission is satisfied that CNL has made, and will continue to make, adequate provision for the protection of the environment throughout the proposed renewed licence period.

26. Following its consideration of the information provided on the record for this hearing, the Commission concludes that an environmental protection review conducted under the NSCA and its regulations was appropriate for this licence renewal application.

4.0 ISSUES AND COMMISSION FINDINGS

27. In making its licensing decision, the Commission considered a number of issues and submissions relating to CNL's qualification to carry out the proposed licensed activities. The Commission also considered the adequacy of the proposed measures for protecting the environment, the health and safety of persons, national security and international obligations to which Canada has agreed.

28. CNL submitted a licence renewal application for WL on November 15, 2018. In its consideration of this matter, the Commission examined the completeness of the application and the adequacy of the information submitted by CNL, as required by the NSCA, the *General Nuclear Safety and Control Regulations*[13] (GNSCR) and other

---

[12] N288.6-12, *Environmental risk assessment at Class I nuclear facilities and uranium mines and mills,* CSA Group, 2012.

[13] SOR/2000-202.

applicable regulations made under the NSCA. The Commission also examined CNSC staff's assessment of CNL's performance in all 14 safety and control areas (SCAs) and in relation to several other matters of regulatory interest over the current licence period.[14]

4.1 Management System

29. The Commission examined CNL's management system which covers the framework that establishes the processes and programs required to ensure that WL achieve its safety objectives, continuously monitor its performance against these objectives, and foster a healthy safety culture. CNSC staff rated CNL's performance in this SCA as "satisfactory" throughout the current licence period.

30. The Commission assessed the information submitted by CNL and CNSC staff regarding the WL management system. CNSC staff submitted that CNL implemented CSA N286-12, *Management system requirements for nuclear facilities*[15] to all CNL sites in a CNL-wide management system program with Quality Assurance Plans to describe site-specific functions, responsibilities and authorities. CNSC staff also submitted that the WL Decommissioning Quality Assurance Plan met the expectations set in CSA N286-12.

31. The Commission reviewed the information submitted by CNL regarding its organizational structure at WL. CNL described the government owned-contractor operated (GoCo) model that has been in place since 2015. CNL submitted that the organizational structure at WL identified the high-level responsibilities and authorities of the positions associated with its operations, as detailed in its organizational chart.

32. CNSC staff reported that it had no concerns regarding CNL organizational structure and confirmed that it was of the view that CNL's organization was suitable to ensure continued safe operation and compliance with regulatory requirements. CNSC staff also reported that its reviews showed that CNL appropriately documented the roles, responsibilities, accountabilities and authorities in its documentation.

33. The Commission examined the information provided by CNL in regard to facility management at WL. CNL submitted that it operated under eleven corporate policies, providing direction and expectations to management and employees for all business activities performed at WL.

34. CNL submitted that it developed software to support the operating experience process and that the software contained a reporting component for workers to report issues and opportunities for improvement. CNSC staff indicated that CNSC staff routinely

[14] In this Record of Decision, when referring to the "current licence period", the Commission refers to the period including the current one-year licence issued on January 1, 2019, as well as the previous licence, which was valid from December 31, 2008 to December 31, 2018.
[15] N286-12, *Management system requirements for nuclear facilities,* CSA Group, 2012 (R2017).

reviewed the issues raised by CNL's employees and conducted field verifications of the completion of follow-up actions, where appropriate, during on-site inspection activities.

35. CNL provided the Commission with information on its change management program, noting that changes were made according to the Organizational Change Control process.

4.1.1 Safety Culture

36. The Commission assessed the adequacy of CNL's safety culture at WL. CNL reported that a detailed safety culture assessment was executed in the fall of 2012 and that results indicated that, at that time, additional effort was required to ensure that standards and expectations were established and clearly communicated to CNL employees. CNL also reported that it had implemented a corrective action plan to enhance safety culture and described the measures that had been taken, such as the 2013 alignment of CNL's Nuclear Safety Policy with the Institute of Nuclear Power Operators' *Traits of a Healthy Nuclear Safety Culture*.[16]

37. CNL submitted detailed information about its monitoring of safety culture through frequent surveys, including in 2017 and 2018. CNL stated that results from the 2017 and 2018 surveys continued to show that results on safety and security aspects ranked the highest.

38. CNL indicated that attendance at nuclear safety culture courses was required for all of CNL's employees and that the courses were delivered to all new employees during orientation training. CNL added that programs and processes were implemented and maintained to ensure the fostering of a strong safety culture at WL.

39. CNL submitted that it conducted a company-wide safety stand-down on May 30, 2019, after indication that its industrial safety metrics were declining. CNL explained that the safety stand-down was devoted to increased safety awareness, the strengthening of work practices, and identifying emergent safety issues where immediate action would produce quick gains, in addition to recognizing issues where improvements would take longer time. CNSC staff indicated that it assisted the safety stand-down and that it was satisfied with CNL's promotion of health and safety awareness at WL.

40. The Commission is satisfied that CNL had maintained and will continue to maintain a strong safety culture at WL.

[16] Institute of Nuclear Power Operators (INPO), INPO 12-012, *Traits of a Healthy Safety Culture* (Rev. 1), April 2013.

4.1.2 Conclusion on Management System

41. On the basis of the information provided on the record for this hearing, the Commission concludes that CNL has appropriate organization and management structures in place and that the operating performance at WL in the current licence period provides a positive indication of CNL's ability to adequately carry out the activities under the proposed licence.

4.2 Human Performance Management

42. The Commission assessed CNL's human performance management programs which encompass activities that enable effective human performance through the development and implementation of processes that ensure that the WL staff are sufficient in number in all relevant job areas and have the necessary knowledge, skills, procedures and tools in place to safely carry out their duties. During the current licence period, CNSC staff rated CNL's performance in this SCA as "satisfactory."

43. The Commission examined the information submitted by CNL regarding the WL human performance program and the improvements put in place by CNL during the current licence period to reduce human performance-related events and errors. CNL provided a list of improvement initiatives developed during the current licence period including the establishment of a Human Performance Steering Committee and the implementation of an Event Free Day Reset program at WL.

44. CNSC staff submitted that compliance inspections during the current licence period included verifications of the training records of employees in safety-related positions and a general verification of CNL's maintenance of a complement of competent and knowledgeable workforce at the WL. CNSC staff reported to the Commission that programs related to CNL's Human Performance Management activities at WL met the CNSC's regulatory requirements.

45. The Commission considered the information submitted by CNL about its personnel training programs. CNL informed the Commission that the application of the systematic approach to training (SAT) was mandatory for all personnel in direct operating positions in CNL nuclear facilities and that CNL's training procedures were aligned with REGDOC-2.2.2, *Personnel Training*, version 2.[17]

46. CNSC staff reported that CNL's program met specifications of REGDOC-2.2.2, version 2. CNSC staff submitted that its compliance verification activities determined that CNL had implemented and maintained appropriate training programs at WL.

47. The Commission assessed the information provided by CNL regarding the fitness for duty program at WL. CNL provided information elements of its fitness for duty program such as pre-employment medical screening for firefighters and drug and/or

[17] CNSC Regulatory Document REGDOC-2.2.2, *Personnel Training*, version 2, 2016.

alcohol testing for post-incident response and investigation.

48. Concerning the implementation of REGDOC-2.2.4, *Fitness for Duty: Managing Worker Fatigue*,[18] CNL indicated that it performed a gap analysis in 2017 and presented an implementation plan to CNSC staff. CNSC staff submitted that CNL had revised the scheduling requirements to meet REGDOC-2.2.4 by January 2020.

49. In regard to REGDOC-2.2.4, *Fitness for Duty, Volume II: Managing Alcohol and Drug Use*, version 2,[19] CNL informed the Commission that CNL was on track to comply with the specifications of REGDOC-2.2.4, Volume II. CNSC staff submitted that the CNSC's licensees had requested that their implementation dates for this REGDOC be delayed to allow for the discussion of industry-proposed amendments regarding the use of oral fluid testing. CNSC staff will monitor the implementation of REGDOC-2.2.4, Volume II by CNL during the proposed licence period.

50. Based on its consideration of the information presented on the record for this hearing, the Commission concludes that CNL has appropriate programs in place and that current efforts related to human performance management provide a positive indication of CNL's ability to adequately carry out the activities under the proposed licence.

51. The Commission is satisfied that CNL has appropriate training programs in place at WL and that these programs meet the objectives of REGDOC-2.2.2, version 2.

52. The Commission is satisfied that the factors for fitness for duty examined above were adequate and acknowledges the discussion of industry-proposed amendments for REGDOC-2.2.4, Volume II. The Commission expects REGDOC-2.2.4 and REGDOC-2.2.4, Volume II to be implemented in the renewed licence period as detailed in the submissions made for this hearing. The Commission expects updates in this regard via an ROR or other means, as appropriate.

4.3 Operating Performance

53. The Commission examined operating performance at WL, which includes an overall review of the conduct of the licensed activities and the activities that enable effective performance as well as improvement plans and significant future activities at WL. Throughout the current licence period, CNSC staff rated CNL's performance in the operating performance SCA as "satisfactory."

54. CNL submitted that WL were safely operated in accordance with the operating limits and conditions during the current licence period. CNL further reported that its safe operating practices were governed by its Conduct of Operations Program.

---

[18] CNSC Regulatory Document, REGDOC-2.2.4, *Fitness for Duty: Managing Worker Fatigue*, 2017.
[19] CNSC Regulatory Document REGDOC-2.2.4, *Fitness for Duty, Volume II: Managing Alcohol and Drug Use*, 2017, version 2.

55. CNSC staff submitted that CNSC compliance verification activities showed that WL were operated safely during the current licence period and that CNL's Conduct of Operations Program was in accordance with CNL's licence requirements for WL.

56. The Commission also reviewed CNL's operating experience (OPEX) program at WL. CNL provided details about its OPEX program, as well as the corrective action program, and noted that its processes included responding to external events and disseminating lessons learned. CNL also reported that, through the OPEX Program, CNL aimed to achieve higher levels of operational safety and performance, and to reduce the significance and occurrence of unplanned events.

57. Asked about the difference between the corrective action program and the OPEX program, the CNL representative explained that the OPEX program reviewed and tracked lessons learned internally or from other entities in the nuclear industry. The CNL representative further explained that the corrective action program was used to identify actions to put in place once issues were identified and to track those issues to closure.

58. Having examined the information submitted for this hearing, the Commission is satisfied that WL were operated and will continue to be operated safely during the proposed licence period.

59. The Commission assessed the information submitted by CNL and CNSC staff regarding CNL's adherence to the reporting requirements of unplanned situations or events at WL. CNL submitted that CNL's reporting procedure document was revised in 2016 to incorporate the additional requirements about reporting to a CNSC Duty Officer, as required by CNSC staff during the licence period.

60. CNSC staff reported that CNL complied with the requirements for reporting unplanned situations or events at the WL site to the CNSC during the current licence period. CNSC staff also reported that CNL would be expected to comply with REGDOC-3.1.2, *Reporting Requirements, Volume I: Non-Power Reactor Class I Nuclear Facilities and Uranium Mines and Mills*[20] during the proposed licence period and that this expectation would be added to CNL's LCH should the licence be renewed.

61. Based on the information provided, the Commission is satisfied that CNL met all reporting parameters for reporting unplanned situations or events at WL. The Commission expects CNL to implement REGDOC-3.1.2 in the renewed licence period as presented during this hearing and directs CNSC staff to report progress in future RORs or other means, as appropriate.

---

[20] CNSC Regulatory Document REGDOC-3.1.2, *Reporting Requirements, Volume I: Non-Power Reactor Class I Nuclear Facilities and Uranium Mines and Mills*, 2018.

62. The Commission considered the adequacy of CNL's documentation and procedures. CNSC staff submitted that CNL maintained a comprehensive suite of procedures across all programs and facilities at WL and had continually updated the facility-specific procedures as needed to support ongoing process improvements at WL. CNSC staff also confirmed that changes to procedures were made in accordance with CNL's change control process.

63. Based on the above information, the Commission concludes that the operating performance at WL during the current licence period provides a positive indication of CNL's ability to carry out the activities under the proposed licence. On the basis of its review of the above information, the Commission is satisfied that CNL will continue to ensure that appropriate operation performance-related programs are in place at WL to ensure the health and safety of persons and the protection of the environment.

4.4 Safety Analysis

64. The Commission assessed safety analysis at WL, which includes a systematic evaluation of the potential hazards associated with the conduct of the licensed activity or the operation of a facility, and considers the effectiveness of preventive measures and strategies in reducing the effects of such hazards. Safety analysis supports the overall safety case for WL. CNSC staff reported that, throughout the current licence period, WL were operated safely and within licence limits, with CNL's performance in this SCA rated as "satisfactory" by CNSC staff.

65. The Commission considered the information provided by CNL about the deterministic analyses that were performed for WL. CNL reported that the Safety Analysis Reports (SARs) demonstrated that the facilities at WL were appropriately designed to meet health, safety, security, environmental and regulatory requirements. CNL added that four facilities at WL had SARs: the Shielded Facilities, the Waste Management Area (WMA), the Concrete Canister Storage Facility (CCSF), and the Active Liquid Waste Treatment Centre.

66. CNSC staff reported that CNL updated the SARs over time as operational requirements changed and that the updates were reviewed by CNSC staff and carried out in accordance with the requirements of the licensing basis.

67. In regard to criticality safety, CNL informed the Commission of its procedures and guidance at WL providing oversight and direction in regard to all activities that involve fissionable materials. CNL reported that it updated its criticality safety documents on a risk-graded approach: upper subcritical limits were documented, criticality hazard identification studies were completed for all nuclear criticality controlled areas at WL and criticality accident mitigation measures were documented. CNL also reported that computer-based nuclear criticality safety awareness training was delivered to all staff as part of the required training.

68. CNSC staff submitted that the only remaining activities involving fissionable material at WL were the storage of used fuel in the CCSF and the WMA's Intermediate-Level Waste (ILW) standpipes, which CNSC staff reported to be of low risk. CNSC staff also reported that CNL implemented and maintained a nuclear criticality safety program compliant with RD-327, *Nuclear Criticality Safety*.[21]

69. On the basis of the information presented, the Commission concludes that the systematic evaluation of the potential hazards and the preparedness for reducing the effects of such hazards is adequate for the operation of the facility and the activities under the proposed licence. The Commission finds that CNL's safety analysis program for WL meets regulatory requirements and that CNL has adequate preventive measures and strategies in place at WL to ensure the protection of workers, members of the public and the environment and that the facilities at WL meet safety requirements. The Commission is also satisfied that CNL is maintaining appropriate programs to ensure criticality safety at WL.

4.5 Physical Design

70. The Commission considered the physical design of facilities at WL, including the activities to design the systems, structures and components to meet and maintain the design basis of the facility. The design basis is the range of conditions, according to established criteria, that the facility must withstand without exceeding authorized limits for the planned operation of safety systems. CNSC staff rated CNL's performance in this SCA as "satisfactory" throughout the current licence period.

71. The Commission examined the physical design and associated activities of the facilities at WL, which is managed by CNL under its Design Authority and Design Engineering Program. CNL submitted information about how its Design Engineering Program complied with CSA N286-12 and CSA N285.0, *General requirements for pressure retaining systems and components in CANDU nuclear power plants*,[22] noting that the program applied to all design activities at WL.

72. CNL submitted information regarding its Configuration Management Program which provides the framework to maintain and control the physical configuration of all structures, systems and components and which applies to all design, operation, decommissioning and maintenance activities at WL. CNL also provided the Commission with information regarding planned improvements and key initiatives for the proposed licence period such as performing a gap analysis for codes and standards and redistributing engineering functions to better leverage experience and knowledge in the workforce.

---

[21] CNSC Regulatory Document RD-327, *Nuclear Criticality Safety*, 2010.
[22] N285.0-08, *General requirements for pressure-retaining systems and components in CANDU nuclear power plants*, CSA Group, 2008.

73. CNL reported that the CNL chief nuclear engineer had the responsibility to ensure that staff executing design processes understood their accountabilities and that the chief nuclear engineer had authority over and provided oversight for the execution of the design program.

74. CNSC staff reviewed the design of new facilities, a Shielded Modular Above-Ground Storage Building and a Soil Storage Compound, constructed by CNL to support the on-going decommissioning activities at WL. CNSC staff determined that CNL met regulatory requirements related to the design of its facilities, and the operation of these new facilities remained within the design basis.

75. CNSC staff informed the Commission that, during the proposed licence period, CNL planned to design and construct facilities for the remediation of the 171 standpipes and ILW bunkers. CNSC staff added that the planned work included the removal, characterization, packaging, and shipment of the waste. CNSC staff indicated that CNSC staff will review the design of these facilities prior to their operation.

76. The Commission assessed the information provided by CNL and CNSC staff on the pressure boundary program at WL. CNL submitted that WL pressure boundary program provided assurance that pressure systems and components were in compliance with the applicable codes, standards, and regulatory requirements.

77. CNSC staff submitted that the WL pressure boundary program met regulatory requirements. CNSC staff indicated that CNL was required to update its pressure boundary procedure to include the decommissioning of pressure boundary systems and components. CNSC staff added that it will review the design of new facilities at WL to ensure that they meet pressure boundary requirements.

78. The Commission considered the adequacy of the Fire Protection Program design at WL. CNSC staff indicated that CNL's Fire Protection Program met the *National Building Code of Canada 2010*,[23] the *National Fire Code of Canada 2010*,[24] and CSA N293-12, *Fire protection for nuclear power plants*.[25] CNSC staff informed that, at its request, CNL performed a gap analysis in 2016 against the operational requirements of CSA-N393, *Fire Protection for Facilities that Process, Handle, or Store Nuclear Substances*,[26] and developed and implemented a corrective action plan to address the gaps identified. CNSC staff added that it reviewed the corrective action plan and will verify its implementation during upcoming inspections.

79. On the basis of the information presented, the Commission concludes that CNL continues to implement and maintain an effective design program at WL and that the design of WL is adequate for the operation period included in the proposed licence. The Commission is satisfied with CNSC staff's assessment of the adequacy of the

---

[23] IRC-10NBC, *National Building Code of Canada 2010*, National Research Council, 2010.
[24] IRC-10NBF, *National Fire Code of Canada 2010*, National Research Council, 2010.
[25] N293-12, *Fire protection for nuclear power plants*, CSA Group, 2012.
[26] N393-13, *Fire Protection for Facilities that Process, Handle, or Store Nuclear Substance,* CSA group, 2013.

physical design of WL.

4.6 Fitness for Service

80. Fitness for Service covers activities that are performed to ensure that the systems, structures and components (SSCs) at WL continue to effectively fulfill their intended purpose. CNSC staff rated the CNL's performance in this SCA as "satisfactory" throughout the current licence period.

81. The Commission considered the adequacy of CNL's maintenance programs. CNL provided the Commission with detailed information on preventative and corrective maintenance carried out at nuclear and non-nuclear facilities at WL. CNL reported that maintenance was carried out by qualified workers on safety systems as well as on those aspects of buildings, structures and grounds required to maintain personnel and structural safety, protection of site assets, protection of the environment and support of the closure mission.

82. CNSC staff reported that CNSC staff reviewed CNL's governing documents for the conduct of maintenance at WL and concluded that the program meets regulatory requirements and that SSCs verified during CNSC staff inspections were well maintained. CNSC staff also reported that CNL was compliant with CSA N286-12 in having processes in place for SSC maintenance.

83. CNL indicated that the concrete waste storage structures, the IWL bunkers, at WL were assessed under a Periodic Inspection Plan (PIP) and that the inspections were documented annually, with preventative maintenance and repairs occurring as needed. CNL added that the structural integrity of the CCSF was inspected quarterly, showing no significant cracking or spallation, and that preventative maintenance and repairs were performed as required. CNL also reported that maintenance plan updates would remain on a five-year review cycle in the proposed licence period.

84. CNSC staff reported that, based on its inspections and reviews of CNL's PIP and the CCSF inspection reports submitted by CNL, CNSC staff was of the view that CNL met and will continue to meet the regulatory requirements in regard to structural integrity at WL.

85. In response to a suggestion made in the intervention from the Local Government District of Pinawa regarding the hot cells in the shielded facility, the Commission asked whether it would be possible to retain the five fully functional hot cells at WL. The CNL representative explained that it could be possible to retain the hot cells but new work would be required to achieve this.

86. Based on the information provided on the record for this hearing, the Commission is satisfied with CNL's programs for the inspection and life-cycle management of key safety systems at WL. The Commission concludes that the equipment, as installed at

WL, is fit for service and that appropriate programs are in place to ensure that the equipment remains fit for service throughout the proposed licence period.

4.7 Radiation Protection

87. As part of its evaluation of the adequacy of the measures for protecting the health and safety of persons, the Commission considered the past performance of CNL in the area of radiation protection. The Commission also considered how the WL radiation protection program ensured that both radiation doses to persons and contamination were monitored, controlled and kept as low as reasonably achievable (ALARA), with social and economic factors taken into consideration. Throughout the current licence period, CNSC staff rated CNL's performance in this SCA as "satisfactory."

88. The Commission considered the information provided by CNL and CNSC staff to assess whether the WL radiation protection program satisfied the requirements of the *Radiation Protection Regulations*.[27] CNL informed the Commission that CNL updated its radiation protection program procedural documents in 2017 and 2018 to align with the new management system at CNL.

89. CNSC staff provided the Commission with information about the performance indicators used to monitor the radiation protection program at WL and submitted that CNL met CNSC expectations for the monitoring of the implementation and performance of the radiation protection program at WL. CNSC staff submitted that, throughout the current licence period, CNSC staff compliance inspection demonstrated that CNL had implemented an appropriate and effective radiation program at WL that satisfied regulatory requirements.

4.7.1 Application of ALARA

90. The Commission assessed the information submitted by CNL and CNSC staff regarding the application of ALARA at WL. CNL submitted that the ALARA principle was applied during the planning of radiological work at WL. CNL added that Health Physics and Radiation Protection employees were engaged in ALARA assessments, providing authoritative advice regarding radiation protection matters, preparing radiological safe work documents, providing oversight of the execution of radiation work and in the planning and conduct of radiological clearance surveys.

91. CNSC staff submitted that CNL had a documented ALARA program that identified the methods and processes in place at the WL site to control dose and minimize exposures based on current industry best practices and operating experience. CNSC staff added that its reviews of CNL's radiation protection program showed that CNL carried out ALARA planning for all radiological activities at WL, and that CNL's ALARA program met regulatory requirements.

---

[27] SOR/2000-203.

92. CNL provided details about the radiation protection improvement initiatives that were completed during the current licence period, such as documenting the contamination clearance levels used for decommissioning activities at WL. CNL also reported that the implementation of its radiation protection program at WL ensured operation in compliance with CNSC regulations, with no regulatory limits or action levels having being exceeded during the current licence period, and with individual and collective doses remaining ALARA. CNL also reported that weekly and quarterly radiation protection performance reviews were undertaken at WL to identify performance trends and track program corrective actions and improvement initiatives.

93. Based on the information considered for this hearing, the Commission is satisfied that the ALARA concept is adequately applied to all WL activities.

4.7.2 Worker Dose Control

94. The Commission considered information submitted by CNL and CNSC staff about CNL's worker dose control practices at WL, including detailed worker dose data for the current licence period. CNL submitted that all nuclear energy workers (NEWs) and non-NEWs, including site visitors and members of the public, received whole-body doses that were well below regulatory limits.[28] CNL submitted that the highest individual whole body annual dose for WL NEWs during the last 10 years was 1.65 mSv.

95. CNL submitted information about proposed improvements at WL that would further improve worker dose control, such as evaluation and employment of telescoping radiation detectors, high-range probes, and remote monitoring methods for the measurement radiation fields. CNL added that it would re-evaluate the radiological source term hazard in all buildings and facilities planned to be decommissioned to ensure that protection is optimized and exposures remain ALARA.

96. The Commission noted Northwatch's concern regarding an upward trend in doses in 2017 and 2018, but is satisfied that doses to workers remain low and that the small increase does not represent an increased risk to the health and safety of workers.

97. CNL submitted that CNL transferred the majority of WL Dosimetry service activities to the CNSC-licensed Chalk River Laboratories (CRL) dosimetry service. CNL added that WL procedures and processes were updated in 2018 to reflect the change of provider.

98. CNSC staff reported that CNL had effectively implemented its radiation protection program at WL to ensure that doses received by workers remained below regulatory limits. CNSC staff also informed the Commission that CNL operated a CNSC-

[28] The effective dose limits for a NEW is set at is set at 50 mSv in any one year and 100 mSv in five consecutive years, and for pregnant NEWs the dose limit is 4 mSv from the time the pregnancy is declared to the end of the term. The dose limits for non-NEWs, including members of the public, is set at 1 mSv per year.

licensed dosimetry service that was implemented through the radiation protection program and that the dosimetry service met regulatory requirements. CNSC staff added that effective and equivalent doses, along with the effective dose distribution data, demonstrated that CNL was maintaining effective control over worker exposures at WL.

99. CNSC staff informed the Commission that CNL was in the process of revising some of the radiation protection action levels used at WL. CNSC staff added that these new action levels will be subject to CNSC staff review and acceptance.

100. The Commission requested additional information on the type of personal and area dosimetry equipment used at WL. The CNL representative responded that CNL employees wore thermoluminescent dosimeters as well as electronic personal dosimeters. The CNL representative added that trained radiation detection staff also used remote radiation survey meters to monitor the dose rates at job sites. The Commission was satisfied with the information provided on this topic.

101. Based on the information provided for this hearing, the Commission is satisfied that doses to workers at WL are adequately controlled.

4.7.3 Dose to the Public Control and Radiological Hazard Control

102. The Commission considered the effectiveness of CNL's programs to prevent uncontrolled releases of radioactive materials to the public from the WL site. CNL submitted that weekly and quarterly radiation protection performance reviews were undertaken to identify performance trends and track program corrective actions and improvement initiatives. CNL added that radiation doses to the public did not exceed the annual dose limit of 1 mSv per year[29] for the most exposed member of the public.

103. The Commission also assessed CNL's identification and control of existing and potential radiological hazards during work activities at WL. CNL indicated that changes and improvements were planned for the proposed licence period, such as an enhanced air monitoring program for nuclear building demolition.

104. CNSC staff submitted that CNL had effectively controlled the radiological dose to the public. CNSC staff further reported that the maximum effective dose based on all radioactive releases from WL during the last five years was 0.0014 mSv per year in 2014. CNSC staff also submitted that CNL continued to maintain and implement radiation protection program requirements for contamination monitoring at WL such as contamination control, radiation dose rate control, and airborne monitoring and control.

---

[29] The regulatory dose limit for a member of the public is 1 mSv (1,000 µSv) per year and the natural background dose is estimated between 2 mSv – 5 mSv (2,000 µSv – 5,000 µSv) per year.

105. Based on the Commission's assessment of the information provided for this hearing, the Commission is satisfied that CNL is adequately controlling radiological doses to the public and will continue to adequately identify and control radiological hazards at WL.

4.7.4 Conclusion on Radiation Protection

106. Based on the information provided on the record for this hearing, the Commission concludes that, given the mitigation measures and safety programs that are in place and will be in place to control radiation hazards, CNL provides for, and will continue to provide for, the adequate protection of the health and safety of persons and the environment throughout the proposed licence period.

107. The Commission is satisfied that CNL's radiation protection program at the WL meets the requirements of the *Radiation Protection Regulations*.

108. The Commission notes the proposed improvements to CNL's radiation protection program for WL and anticipates that these will be carried out in the renewed licence period as presented in the materials submitted for this hearing.

4.8 Conventional Health and Safety

109. The Commission examined the implementation of a conventional health and safety program at WL, which covers the management of workplace safety hazards. The conventional health and safety program is mandated by provincial statutes for all employers and employees to minimize risk to the health and safety of workers posed by conventional (non-radiological) hazards in the workplace. This program includes compliance with applicable labour codes and conventional safety training. Throughout the current licence period, CNSC staff rated the CNL's performance in this SCA as "satisfactory."

110. CNL reported that the WL Site Safety and Health Committee was the principal forum for joint employee/management consultation and development of solutions for safety and health concerns. CNL added that the activities conducted by the committee included the inspection of all WL work locations and participation in incident investigations.

111. CNSC staff submitted that CNL's activities must comply with Part II of the *Canada Labour Code*,[30] its associated regulations,[31] and other applicable federal and provincial health and safety acts and regulations. CNSC staff added that CNSC staff verified CNL safety practices during compliance inspections and that CNSC staff was satisfied with CNL's performance at the WL site in the aspects related to conventional

[30] R.S.C, 1985, c. L-2
[31] SOR/86-304

health and safety.

112. CNL provided the Commission with detailed information regarding its Occupational Health and Safety (OHS) program at WL. CNL reported that contractors hired by CNL in Manitoba were subject to the *Manitoba Workplace Safety & Health Act and Regulation*[32] and that the CNL OHS program also provided oversight of contractors when they were on CNL property and that the contractors were governed by the CNL work permit process. CNL also provided the Commission with details regarding improvement initiatives that had been carried out in respect of the OHS program since 2009 such as a near-miss reporting initiative.

113. CNSC staff reported that CNL actively promoted conventional health and safety to its workforce through the provision of information, training, instructions, and supervision. CNSC staff also reported that CNL's employees were encouraged to report concerns, unsafe conditions, non-compliances or events in order to identify hazards and ensure measures were put in place to prevent injury and illness.

114. CNL reported to the Commission that there had been an overall improvement in the frequency of recordable lost-time injuries for WL site workers, as well as an improvement in the trend for the severity of lost-time accidents.

115. Based on the information presented, the Commission concludes that CNL's conventional health and safety program at WL satisfies regulatory requirements. The Commission also concludes that the health and safety of workers and the public was adequately protected during the operation of the facility for the current licence period and that the health and safety of persons will continue be adequately protected during throughout the proposed licence period.

4.9 Environmental Protection

116. The Commission examined CNL's environmental protection programs at WL, which are intended to identify, control and monitor all releases of radioactive and hazardous substances, and aim to minimize the effects on the environment which may result from the licensed activities. These programs include effluent and emissions control, environmental monitoring and estimated doses to the public. CNSC staff rated CNL's performance in this SCA as "satisfactory" throughout the current licence period.

117. The Commission considered whether the CNL's environmental protection programs adequately met the specifications of REGDOC-2.9.1.

---

[32] M.R. 217/2006

4.9.1 Effluent and Emissions Control (Releases)

118. The Commission considered CNL's programs to control the release of effluent and emissions from the WL site to the environment during the current licence period. CNL submitted that its program documentation was being updated to align with CSA N288.4-10, *Environmental monitoring programs at Class I nuclear facilities and uranium mines and mills,*[33] CSA N288.5-11, *Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills*,[34] CSA N288.7-15, *Groundwater Protection Programs at Class I Nuclear Facilities and Uranium Mines and Mills*[35] and CSA N288.8-17, *Establishing and Implementing Action Levels for Releases to the Environment from Nuclear Facilities.*[36] CNL also submitted information about radiological emissions from WL, including airborne emissions and liquid releases, noting that they were below derived release limits[37] (DRL) and regulatory limits. CNL also reported that the DRLs for WL had been updated in 2016 and that these were calculated in accordance with CSA N288.l-08, *Guidelines for calculating derived release limits for radioactive material in airborne and liquid effluents for normal operation of nuclear facilities*.[38]

119. CNSC staff indicated that it accepted CNL's plan and schedule for the implementation of these standards and that it was tracking and monitoring CNL's compliance with its commitments.

120. CNSC staff reported that CNL's environmental monitoring results presented in CNL's annual report demonstrated that radiological releases to the atmosphere and to the Winnipeg River were below their respective DRLs. CNSC staff added that, with the exception of chlorine, hazardous releases to the Winnipeg River were below release limits. CNSC staff explained that total residual chlorine released by WL was not a concern to the health of the Winnipeg River ecosystem because of the river's water flow rate.

121. CNL informed the Commission that federal requirements for the total residual chlorine in wastewater will come into force in 2021 for CNL's lagoon at WL. CNL added that WL will continue to adjust the site's chlorination practices to meet the new requirements.

---

[33] N288.4-10, *Environmental monitoring programs at class I nuclear facilities and uranium mines and mills*, CSA Group, 2010 (Reaffirmed 2015).
[34] N288.5-11, *Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills*, CSA Group, 2011 (Reaffirmed 2016).
[35] N288.7-15, *Groundwater Protection Programs at Class I Nuclear Facilities and Uranium Mines and Mills*, CSA Group, 2015.
[36] N288.8-17*, Establishing and Implementing Action Levels for Releases to the Environment from Nuclear Facilities,* CSA Group, 2017.
[37] The "derived release limit" (DRL) for a particular radionuclide is the release rate that would result in an annual committed effective radiation dose of 1 mSv to the most exposed group of the public (also known as the critical receptor) for that nuclear substance.
[38] N288.1-08, *Guidelines for calculating derived release limits for radioactive material in airborne and liquid effluents for normal operation of nuclear facilities*, CSA Group, 2008.

122. CNL submitted to the Commission detailed information regarding monitoring results and stated that the levels of radiation and radioactive contaminants in the environment outside the WL site remained low throughout the licence period. CNL added that liquid and airborne effluents were below the DRL and that all emissions of radioactive material from WL throughout the licence period were below CNL's Administrative Levels and Action Levels and well below regulatory limits.

123. CNSC staff reported to the Commission that CNL's monitoring results and CNL's Effluent Verification Monitoring Program, provided through the issuance of CNL's annual report, complied with the applicable regulations and continued to protect the public and the environment.

124. Noting the questions about the former experimental cesium pond raised in the intervention from the Concerned Citizens of Renfrew County and Area (CCRCA), the Commission asked for information. The CNL representative explained that this was a man-made pond injected with cesium-137 in order to study the effects of this radioisotope on microorganisms and to the natural environment. Asked about whether the pond contained any other radioisotopes, the CNL representative added that the pound strictly contained cesium-137. The Commission was satisfied with the information provided.

125. On the basis of the information provided for this hearing, the Commission is satisfied that the CNL has and will continue to have adequate programs in place for the control of effluent and emissions at WL to protect the environment and meet regulatory requirements.

4.9.2 Environmental Management System

126. The Commission assessed the information provided by CNL and CNSC staff about the WL Environmental Management System (EMS). CNL submitted that its EMS was ISO 14001:2015[39] certified and that annual EMS audits were performed to verify the effectiveness of the system and for the promotion of continuous improvement of CNL's environmental performance.

127. CNSC staff submitted that the WL EMS met the specifications of REGDOC-2.9.1 and added that CNL was updating its program to meet REGDOC-2.9.1, version 1.1[40] for implementation in the proposed licence period.

128. Based on the information provided, the Commission is satisfied that CNL has maintained, and will continue to maintain, an adequate EMS at WL.

---

[39] CAN/CSA-ISO 14001:2015, Environmental Management Systems – Requirements with Guidance for Use, CSA Group, 2015.

[40] CNSC Regulatory Document REGDOC-2.9.1, *Environmental Protection: Environmental Principles, Assessments and Protection Measures*, version 1.1, 2017.

4.9.3 Environmental Monitoring

129. The Commission considered information submitted by CNL about the CNL's environmental monitoring program that is designed to demonstrate that emissions from WL are properly controlled. CNL submitted that liquid effluents from WL were monitored for non-radioactive contaminants in order to measure conformance with CNL's internal guidelines for chemical substances in liquid effluents. CNL added that non-radiological monitoring results of liquid effluents and groundwater had been consistent over the licence period and levels of non-radiological contaminant releases from operations at the WL site did not negatively affect the quality of water on-site or on the local environment.

130. Further on CNL's environmental monitoring activities, CNL reported that it complied with the *Species at Risk Act*[41] and the *Migratory Bird Convention Act*[42] and that CNL performed identification of species at risk on the WL site over the current licence period, including acoustic songbird and bat recording studies as well as field sightings identification. CNL added that it completed an alternative habitat project in 2018 to provide barn swallows with an alternative nesting spot as buildings were removed on the WL site.

131. CNSC staff informed that CNSC staff review of CNL's environmental monitoring results for the licence period of 2009 to 2018 showed that monitoring of potential atmospheric effluent exposure pathways did not indicate any significant dose contributions from the operations of the WL site. CNSC staff also informed that the monitoring results indicated that radioactive contaminants in Winnipeg River water remained below allowable levels defined in the *Canadian Drinking Water Guidelines*[43] and that the groundwater monitoring program had demonstrated that there was no significant radioactive parameters (gross beta, gross alpha, tritium and uranium) migration from the waste management facilities.

132. Asked whether CNL adjusted the environmental monitoring frequency based on the onsite activities, the CNL representative explained that CNL performed routine environmental monitoring activities and also conducted enhanced monitoring when specific activities were occurring.

133. Based on the information provided, the Commission is satisfied that CNL has maintained, and will continue to maintain, adequate environmental monitoring at WL.

---

[41] SI/2004-48
[42] S.C. 1994, c. 22
[43] *Canadian Drinking Water Guidelines*, https://www.canada.ca/en/healthcanada/services/environmental-workplace-health/water-quality/drinkingwater/canadian-drinking-water-guidelines.html

Independent Environmental Monitoring Program (IEMP)

134. The Commission examined the information provided by CNSC staff in regard to the IEMP. CNSC staff provided detailed results from monitoring carried out in 2017 in publicly accessible areas outside the perimeter of the WL site of collected air, soil, sediment, vegetation, food and water samples. CNSC staff noted that the measured radioactivity in all samples were below CNSC reference levels.[44]

135. The Commission notes the interest of the Sagkeeng First Nation and the Manitoba Metis Federation (MMF) to participate more fully in the IEMP and encourage CNSC staff to consider the benefits of the increased participation.

136. CNSC staff submitted that the IEMP results confirmed that the public and the environment around WL were protected and that there should be no health impacts as a result of WL operations. Furthermore, CNSC staff reported that the IEMP results were consistent with the WL environmental monitoring results.

137. The Commission enquired about the seemingly elevated results of an IEMP sampling at location WL03, located 15 kilometers east of WL. CNSC staff noted that the results were below screening levels which are set well below levels that would be of regulatory concern and, although an outlier, CNSC staff did not investigate this result further. The CNL representative added that the gross alpha reading most likely arose from the natural uranium in the granite of the Canadian Shield.

138. Based on the information submitted by CNSC staff, the Commission is satisfied that that environmental monitoring both within and outside the perimeter of the WL site shows that CNL has and will continue to make adequate provision for the protection of the environment, workers and the public.

4.9.4 Environmental Risk Assessment

139. The Commission examined the information provided by CNSC staff in regard to the Environmental Risk Assessment (ERA) of WL. CNSC staff reported that an updated ERA for the lagoon and landfill areas on the WL site was currently underway for future decommissioning activities. CNSC staff added that, based on the available information from CNL's environmental monitoring results, safety reports submitted annually for the WL site and the CNSC IEMP results, CNSC staff is of the view that risk to human health and the environment at WL could be characterized as low, with an overall trend indicating stable performance.

140. CNSC staff reported that radioactive contaminants in the Winnipeg River were well below the Canadian drinking water guidelines and that dose to members of the public

[44] CNSC reference levels are established based on conservative assumptions about the exposure scenario and using CSA N288.1-14. On this basis, the reference level for a particular radionuclide in a particular medium represents the activity concentration that would result in a dose of 0.1 mSv per year.

from liquid effluents at WL was calculated to be low, at 0.048 μSv/yr. CNSC staff also reported that airborne emissions were negligible, with an estimated public dose of 0.002 μSv/yr.

141. CNSC staff informed the Commission that CNL will conduct a site wide ERA in accordance with REGDOC-2.9.1, version 1.1 and CSA N288.6-12 during the proposed licensing period.

142. Based on the information submitted by CNSC staff, the Commission is satisfied that that environmental monitoring both within and outside the perimeter of the WL site shows that CNL has and will continue to make adequate provision for the protection of the environment, workers and the public.

4.9.5 Protection of the Public

143. The Commission assessed CNL's programs to mitigate risk to members of the public from hazardous substances discharged from WL. CNL submitted that its monitoring activities included the monitoring of airborne and liquid effluent as well as groundwater. CNL informed the Commission that radiation monitoring results verified that the level of contamination outside the WL site due to its operations did not exceed the annual dose limit of 1 mSv per year for any member of the public. Regarding non-radiological contaminants, CNL submitted that monitoring results for those contaminants were consistent over the licence period and did not negatively affect the quality of water on-site or on the local environment.

144. CNL informed the Commission that non-radiological emissions to air dropped significantly, starting in 2013, with the conversion from centralized, fuel oil heating operations to localized electrical or propane heating and the continuing shut-down and demolition of site buildings.

145. Based on the information provided, the Commission is satisfied that CNL's programs to mitigate risk to members of the public from WL operations are adequate.

4.9.6 Conclusion on Environmental Protection

146. Based on the assessment of the application and the information provided on the record at the hearing, the Commission is satisfied that, given the mitigation measures and safety programs that are in place to control hazards, CNL will provide adequate protection to the health and safety of persons and the environment throughout the proposed licence period.

147. The Commission is satisfied that the CNL environmental protection programs adequately meet the specifications of REGDOC-2.9.1 and that CNL is expected to meet the specifications of REGDOC-2.9.1, version 1.1 in the proposed licence period.

148. The Commission notes the interest of the Sagkeeng First Nation and the Manitoba Metis Federation to participate more fully in the IEMP and direct CNSC staff to consider greater participation by interested Indigenous groups, where appropriate.

4.10 Emergency Management and Fire Protection

149. The Commission considered CNL's emergency management and fire protection programs which cover the measures for preparedness and response capabilities implemented by CNL in the event of emergencies and non-routine conditions at WL. This includes nuclear emergency management, conventional emergency response, and fire protection and response. Throughout the current licence period, CNSC staff rated CNL's performance in this SCA as "satisfactory."

150. CNL submitted that the WL Emergency Services Operations Branch fulfilled the Emergency Preparedness and Fire Protection requirements at WL, as well as the Security Program requirements.

4.10.1 Conventional Emergency Management

151. The Commission considered the adequacy of CNL's conventional (non-nuclear) emergency management programs at WL. CNL submitted that all required annual drills and exercises were completed as required during the current licence period with the exception of a major exercise scheduled for 2012 that was deferred to and completed in 2013. CNL added that all emergency preparedness plans and procedures had been updated during the current licence period. CNL further submitted that it was working with the Royal Canadian Mounted Police (RCMP) and that RCMP staff were going to the WL site for familiarisation tours and joint training exercises.

152. CNL reported that WL implemented a new organizational Emergency Operations Centre (EOC) and Incident Management Framework in 2015, adding that this framework was consistent with the industry standard Incident Command System (ICS).

153. CNSC staff informed the Commission that CNL maintained an effective conventional emergency response program and that emergency response personnel were available on site 24 hours a day to respond to any type of emergency. CNSC staff added that training and equipment were maintained for medical response, hazardous materials and other conventional hazards that may be present at WL.

154. Based on the information provided on the record for this hearing, the Commission is satisfied with CNL's programs to manage conventional emergencies at WL.

4.10.2 Nuclear Emergency Management

155. The Commission considered the information submitted by CNL and CNSC staff about nuclear emergency management at WL. CNL informed the Commission regarding nuclear emergency preparedness measures at WL. CNL also provided details regarding the performance of a gap analysis with REGDOC-2.10.1, *Nuclear Emergency Preparedness and Response*.[45] CNL added that the corrective actions were agreed upon by WL and the CNSC, and had been completed.

156. CNL reported that the WL Source Term Report had been revised, documenting the current radiological source terms of nuclear facilities at WL and the calculation of on-site and off-site radiation doses to individuals resulting from a hypothetical, accidental release of radioactive material. CNL added that the analysis documented in this report demonstrated that there was no longer a radiological requirement to have a site stay-in siren for the main WL campus and that this finding was accepted by CNSC staff.

157. CNSC staff informed that the WL Site Emergency Response Plan outlined the interfaces with the Manitoba Emergency Plan. CNSC staff evaluated CNL's emergency preparedness by assessing the emergency plan and preparedness program as well as the results of emergency exercises. CNSC staff submitted that CNL has sufficient provisions in place for emergency preparedness and response capabilities to mitigate the effects of accidental releases of nuclear and hazardous substances on the environment and the health and safety of persons.

158. CNL told the Commission that WL was provided a fully stocked Mobile Nuclear Laboratory on behalf of the federal Chemical, Biological, Radiological-Nuclear, and Explosives Research and Technology Initiative headed up by Health Canada. CNL added that the Mobile Nuclear Laboratory and its equipment were maintained in a state of readiness to respond to any off-site emergencies.

159. Asked about CNL's ability to manage medical emergencies at WL, the CNL representative reported that CNL has an onsite medical facility staffed by a registered nurse five days a week during normal shift hours. The CNL representative added that CNL works closely with the Pinawa Hospital during emergency drills and exercises. The CNL representative further added that the regional ambulance service provides transport for injured workers to the local Pinawa Hospital.

160. Further on this topic and in consideration of the interventions from the Local Government District of Pinawa and Northwatch, the Commission enquired whether the town of Pinawa was prepared to manage injuries to workers at WL involving radiological exposure or contamination. The Mayor of Pinawa explained that he had ongoing dialogue with CNL about the radiation protection of employees. The Mayor of Pinawa added that he was satisfied that CNL had the capability of managing radiation-related events. The CNL representative reported that CNL's emergency preparedness organization was working with the local hospitals and authorities to

---

[45] CNSC Regulatory Document REGDOC-2.10.1, *Emergency Preparedness and Response*, 2014.

ensure that they are aware of the radiation hazards.

161. Based on the information submitted for this hearing, the Commission is satisfied that CNL has appropriate emergency plans in place to protect the health and safety of persons and the environment in the event of a nuclear emergency at WL.

4.10.3 Fire Protection

162. The Commission examined the adequacy of the WL fire protection program. CNL submitted detailed information regarding fire response improvements and achievements that CNL had implemented since 2009 at WL. CNL reported that improvements included a gap analysis performed in 2016 against the operational requirements of CSA N393-13, *Fire protection for facilities that process, handle, or store nuclear substances*[46] followed by a corrective action plan that was developed and implemented to address the gaps identified. CNL added that third-party reviews were conducted on inspections, testing and maintenance operations and practices of WL facilities to ensure compliance with the *National Fire Code of Canada 2010* and CSA N393-13.

163. CNSC staff submitted that it would verify the implementation of the corrective action plan, resulting form the CSA N393-13 gap analysis, during upcoming inspections. CNSC staff added that CNL's fire response program at the WL site was still meeting regulatory requirements.

164. Based on the information provided, the Commission is satisfied that CNL has an adequate fire protection program in place at WL that meets regulatory requirements.

4.10.4 Conclusion on Emergency Management and Fire Protection

165. Based on the above information provided on the record for this hearing, the Commission concludes that WL nuclear and conventional emergency management preparedness programs and the fire protection measures in place, and that will be in place during the proposed licence period, are adequate to protect the health and safety of persons and the environment.

4.11 Waste Management

166. The Commission assessed CNL's WL site-wide Waste Management Program. Throughout the current licence period, CNSC staff assessed CNL's performance in this SCA, including waste minimization, segregation, characterization and storage programs, as "satisfactory."

[46] N293-13, *Fire protection for facilities that process, handle, or store nuclear substances*, CSA Group, 2013.

167. CNL reported that its waste management program ensured the continued availability of waste storage facilities and storage capacity for waste generated and stored temporarily at WL, and for the capability of the Chalk River Laboratories (CRL) to receive waste from WL.

168. CNL informed the Commission about the achievements and improvements made in the Waste Management Program during the current licence period such as the creation of the WL Waste Management Division and the operation of the Shielded Modular Above-Ground Storage (SMAGS) building to store LLW and ILW.

169. CNSC staff reported that wastes were generated at WL from operational activities and decommissioning projects and that radiologically contaminated waste was either decontaminated to meet clearance criteria where feasible or characterized and sent to the WMA for processing or storage. CNSC staff added that CNL was segregating, packaging, storing, reusing or recycling radioactive, hazardous and conventional wastes in accordance with its Waste Management Program.

170. CNSC staff reported that it evaluated CNL's compliance in the waste management SCA through oversight activities such as desktop reviews and compliance inspections and concluded that CNL's waste management SCA at the WL site met all applicable regulatory requirements.

171. In considering the intervention from CELA, the Commission asked about the characteristics and contents of the WMA standpipes. The CNL representative explained that the standpipes were of various ages of design with different dimensions. The CNL representative added that the 171 standpipes were all around five metres in length with a diameter ranging from a little less than half a metre to a metre. The CNL representative explained that the standpipes contained various materials including cut fuel elements, high efficiency particulate air (HEPA) filters or material coming from the hot cells. On the potential hazards from the standpipes, the CNL representative stated that there exists a potential for flammable gas generation and pyrophoric substances inside the standpipes and that remote-controlled operation of the remediation equipment had been proposed to mitigate these hazards.

172. The Commission asked whether any of the standpipes were under pressure and, if so, how was CNL containing or characterizing the radiological hazard when the standpipes were open. The CNL representative indicated that CNL had characterization data from previous years, as CNL had previously opened 20 of the standpipes and noted very little pressurization. The CNL representative added that a multi-part system with robotic arms was being designed to address possible hazards, including the worst-case hazard of a deflagration within one of the standpipes, and that the system would be designed to contain any releases without offsite impact.

173. In considering the intervention from the MMF, CELA and the CCRCA, the Commission enquired about space availability at CRL for the decommissioning waste coming from WL. CNSC staff submitted that CRL's operating licence allowed CRL

to accept waste from off-site clients providing that there was an identified storage or disposal facility in place.

174. The Commission asked for information on waste characterization and segregation at WL. CNSC staff stated that CNL had established clearance levels of waste in their program documents, aligned with the *Nuclear Substance and Radiation Devices Regulations*.[47] CNSC staff added that the waste was released as clean material if the characterization indicated that the material was below the screening levels.

175. Further on the waste characterization and segregation, the Commission asked for information concerning processes and how it was performed. The CNL representative explained that the waste characterization informed about the appropriate package to use depending on the quantity of radioactivity and other hazardous constituents. The CNL representative added that the quantity of radioactivity determined the level of inspections that happen with that particular package. The Commission was satisfied with the information provided.

176. The Commission enquired about the presence of enriched uranium at the CCSF. The CNL representative stated that most of the fuel at the CCSF was natural uranium, but added that a small quantity was enriched uranium. The CNL representative further stated that CNL performed criticality safety analysis before retrieving, moving, loading and shipping casks containing enriched uranium.

177. Commenting on the absence of a safety analysis report for the LLW trenches in CNL's and CNSC staff submissions, as noted in the interventions from CELA and the CCRCA, the Commission enquired about the reason for including the LLW trenches in the decision-making process when information to determine the adequacy of the safety case was not submitted. CNSC staff explained that *in situ* management for the LLW trenches, included in the safety analysis for the waste management area A, had been approved by the Commission in the 2002 licencing hearing[48] and that an updated safety analysis report needed to be presented to CNSC staff before any further work started on the LLW trenches. The CNL representative indicated that a safety assessment for the LLW trenches will be presented to CNSC staff for approval by 2023.

178. Further on the LLW trenches safety analysis report, the CNL representative stated that CNL would completely remove the contents of the trenches and transfer the content to CRL in the eventuality of CNSC staff not approving the LLW trenches safety analysis report.

---

[47] SOR/2000-207

[48] Record of Proceedings, Including Reasons for Decision, *Application for a licence to decommission Whiteshell Laboratories*, issued December 2002.

179. The Commission enquired about the possible implications of the new IAA's requirements when considering the *in situ* decommissioning of the LLW trenches. CNSC staff responded that the *in situ* decommissioning of the LLW trenches was not considered a new activity since it was presented to the Commission at the 2002 WL licence renewal hearing with an EA performed under CEAA 1992.[49] CNSC staff added that CNSC staff would review CNL's safety assessment for the LLW trenches during the proposed licence period and determine what type of environmental review, if needed, would be required.

180. Further on the *in situ* decommissioning of the LLW trenches, the Commission noted that the 2002 WL decommissioning licence application decision stated that the licensee was "*… proposing that some of the low-level radioactive waste currently stored in trenches in the WMF, and a limited area of radioactive contaminated sediment in the Winnipeg River, will remain in place after completion of Phase 3.*"

181. The Commission noted the concern raised by Northwatch about waste inventory and asked for clarification about the level of radioactive waste in the LLW trenches. The CNL representative reported that, as identified in the 2001 *Whiteshell Laboratories Decommissioning Project Comprehensive Study Report*[50] (Comprehensive Study Report), a number of trenches contained material not suitable for *in situ* decommissioning, including WR-1 reactor pressure tubes, and would need to be remediated.

182. Further on the LLW trenches safety analysis, the Commission enquired about whether CNL had a complete characterization of the content of the trenches. The CNL representative informed the Commission that CNL had detailed records of the contents of the trenches and that CNL was currently reviewing the data as part of the safety analysis to identify the trenches that required remediation or were not acceptable for *in situ* decommissioning. The Commission is satisfied that CNL is working on the completion of a safety analysis for the LLW trenches.

183. The Commission invited the Sagkeeng First Nation to describe how it had been engaged by CNL in regard to the LLW trenches decommissioning project. The Sagkeeng First Nation representative explained that the Sagkeeng First Nation had had general discussions with CNL on the *in situ* decommissioning of the LLW trenches and communicated to CNL that the Sagkeeng First Nation was opposed to having radioactive waste left in the ground on its territory. The Sagkeeng First Nation representative added that the Sagkeeng First Nation wanted to be involved in the preparation of the safety analysis for the LLW trenches and not only to review and comment it.

---

[49] S.C. 1992, c. 37 (repealed).
[50] AECL, *Draft Whiteshell Laboratories Decommissioning Project Comprehensive Study Report Volume 1: Main Report*, Revision 2, March 2001.

184. On the Indigenous engagement for the LLW trenches decommissioning, CNSC staff indicated that the LLW trenches safety analysis was the subject of engagement activities.

185. The Commission enquired about the possible impact the safety assessment for the LLW trenches could have on the proposed licence and the LCH. CNSC staff confirmed that the current licence would be adequate as long as the safety assessment for the LLW trenches determined that it remained within the licensing basis and that CNL would have to propose a new action course if the safety assessment for the LLW trenches was outside the licensing basis. CNSC staff added that CNSC staff will report to the Commission on changes to the LCH via a ROR, if there was a need for any changes.

186. Based on the above information and consideration of the hearing materials, the Commission is satisfied that CNL has appropriate programs in place to safely manage waste at WL. However, the Commission expects to receive more information concerning the safety analysis for the LLW trenches at the next licence renewal or through other means.

187. The Commission understands that following the submission by CNL of a safety analysis for *in situ* decommissioning of the LLW trenches, CNSC staff will review the documentation against applicable regulatory requirements and the licensing basis. It also understands that should the *in situ* decommissioning safety analysis demonstrates that it is outside the licensing basis, approval by the Commission of any other option would be required.

4.12 Security

188. The Commission examined CNL's security program at WL, which is required to implement and support the security requirements stipulated in the relevant regulations and the licence. This includes compliance with the applicable provisions of the *General Nuclear Safety and Control Regulations*[51] and the *Nuclear Security Regulations*.[52] During the current licence period, CNSC staff rated CNL's performance in this SCA as "satisfactory" for 2009 and 2010, "fully satisfactory" from 2011 to 2013, "satisfactory" from 2014 to 2017 and "below expectations" in 2018.

189. CNL provided the Commission with information on security exercises involving the RCMP carried out by the WL Emergency Services Operations as well as security improvements completed since 2009 such as vehicle denial barriers and card access-authentication at pedestrian access points. CNL added that Nuclear Security Officer

[51] SOR/2000-202.
[52] SOR/2000-209.

fitness-for-duty was managed in accordance with RD-363, *Nuclear Security Officer Medical, Physical and Psychological Fitness.*[53]

190. CNL informed the Commission about security improvements completed since 2009, such as upgrades to the physical security system and security lighting equipment and intrusion systems included in the expansion of the WMA protected area.

191. CNL presented security improvements to be implemented during the next licence period including upgrades to the WL Protected Areas to improve infrastructure and security posture, as well as improvement on communication and security culture.

192. The Commission enquired about the actions taken by CNL as a result of the 2018 "below expectations" rating. CNSC staff stated that it identified the issues to CNL and that CNL had responded appropriately by submitting a corrective action plan to CNSC staff. CNSC staff added that once CNL fully implements the corrective action plan, it will meet all of the regulatory requirements to ensure a satisfactory security program meeting the regulatory requirements.

193. CNSC staff submitted that, in 2018, it identified issues in the security arrangements at WL. CNSC staff added that these issues have been the subject of enforcement actions, including an order, and that CNSC staff accepted CNL proposed corrective actions which aligns with the requirements stated in the order. CNSC staff indicated that it continued to monitor the implementation of these corrective actions.

194. The Commission asked whether CNL would be able to implement the corrective action plan according to schedule. The CNL representative stated that CNL was confident that the security program at WL will achieve a satisfactory rating as anticipated by the corrective action plan. The CNL representative emphasized that the below expectation rating was not as a result of any breach of security at the WL site, nor a result of an attempted breach of security.

195. CNSC staff recommended the addition of a licence condition to the WL licence to strengthen regulatory compliance in the security SCA and to ensure a timely implementation of the security corrective action plan. CNSC staff proposed the following licence condition 12.2: "*The licensee shall complete the implementation of all security arrangements as outlined in the corrective action plan Implementation Plan: Tiered Response Force (TRF) 119-508710-PLA-010, no later than May 1, 2020.*"

196. Asked for how a design basis threat could be defined, the CNL representative explained that design basis threats were the definitions of the different threat profiles that a nuclear facility may encounter. CNSC staff indicated that the definition in the *Nuclear Security Regulations* for a design basis threat was "the characteristics of a potential adversary in respect of which countermeasures are incorporated into the

[53] Canadian Nuclear Safety Commission, Nuclear Security Officer Medical, Physical, and Psychological Fitness, RD-363, 2008.

design and evaluation of a physical protection system."

197. Upon enquiry on the inspection frequency related to security, CNSC staff responded that high-security sites, such as WL, were required to conduct a security exercise every two years to test the contingency plan, which is intended to demonstrate the plan's effectiveness to counter the design basis threat. CNSC staff added that the next scheduled security exercise was scheduled to take place on November 28, 2019.

198. Based on the information provided for this hearing, together with the specific licence condition, the Commission is satisfied that CNL will provide for the implementation of adequate measures in the area of security at WL.

4.13 Safeguards and Non-Proliferation

199. The Commission examined the adequacy of CNL's safeguards program at WL. The CNSC's regulatory mandate includes ensuring conformity with measures required to implement Canada's international obligations under the *Treaty on the Non-Proliferation of Nuclear Weapons* [54] (NPT). Pursuant to the NPT, Canada has entered into a Comprehensive Safeguards Agreement and an Additional Protocol (safeguards agreements) with the International Atomic Energy Agency (IAEA). The objective of these agreements is for the IAEA to provide credible assurance on an annual basis to Canada and to the international community that all declared nuclear material is in peaceful, non-explosive uses and that there is no undeclared nuclear material or activities in this country. CNSC staff rated CNL's performance in this SCA as "satisfactory" throughout the current licence period.

200. CNL provided the Commission with information about its Nuclear Materials and Safeguards Management (NM&SM) program, which was designed to meet the specifications of REGDOC- 2.13.1, *Safeguards and Nuclear Material Accountancy*[55] and to be applied to all nuclear material and safeguards management activities performed at CNL facilities. CNL also informed the Commission that classified confidential inventory of nuclear material was placed on a stand-alone server to provide the adequate care and control of information associated with nuclear material inventories. CNL further provided details on how it had implemented Nuclear Materials Accountancy Reporting (NMAR) at WL and how it was submitting reports through the NMAR portal to ensure accurate and efficient nuclear materials reporting and security verification.

201. CNL informed the Commission that it was using a new reporting tool introduced by the IAEA and added that the current plan to retrieve all irradiated fissionable materials from the CCSF and the WMA standpipes and to transfer the materials to CRL for storage will increase the NM&SM workload at WL over the next licensing period.

---

[54] *Treaty on the Non-Proliferation of Nuclear Weapons* (1968), IAEA Doc. INFCIRC/140, 729 UNTS 169, entered into force 5 March 1970 (NPT).

[55] CNSC Regulatory Document REGDOC-2.13.1, *Safeguards and Nuclear Material Accountancy*, 2018.

202. CNSC staff reported that CNL had an effective safeguards program that conformed to measures required by the CNSC to meet Canada's international safeguards obligations as well as other measures arising from the NPT. CNSC staff also reported that nuclear material accountancy information submitted by CNL met regulatory requirements and that CNL continued to grant access and assistance to the IAEA for inspection activities at WL.

203. Based on the above information, the Commission is satisfied that CNL has provided for, and will continue to implement adequate measures in the areas of safeguards and non-proliferation at WL that are necessary for maintaining national security and measures necessary for implementing international agreements to which Canada has agreed.

4.14 Packaging and Transport

204. The Commission examined CNL's packaging and transport program at WL. Packaging and transport covers the safe packaging and transport of nuclear substances and radiation devices to and from the licensed facility. The licensee must adhere to the *Packaging and Transport of Nuclear Substances Regulations, 2015*[56] and Transport Canada's *Transportation of Dangerous Goods Regulations*[57] (TDG Regulations) for all shipments. During the current licence period, CNSC staff rated CNL's performance in this SCA as "satisfactory."

205. CNL provided information about its Transportation of Dangerous Goods (TDG) program and reported that this program provided an operational framework for the safe transport of all nine classes of dangerous goods in conformance with all applicable legislations, CNL procedures and international standards. CNL added that CNL will implement the new edition of the IAEA safety standard, *Regulations for the Safe Transport of Radioactive Material*,[58] that was released in 2018 and that CNL also planned to implement the new edition of the TDG Regulations expected to be released in the near future by Transport Canada.

206. CNL informed the Commission about recent activities such as the procurement of certified transportation/storage packages, waste handling equipment and associated equipment to facilitate LLW transfer operations and the large-scale waste shipping campaign, resulting in the transportation of approximately 1,500 m^3 of contaminated soil to CRL in 2017, and the remaining 866 m^3 in 2018. CNL also provided information about the continued collaboration with the Nuclear Waste Management Organization for the use of the used fuel transportation package to facilitate high-level waste transportation operations.

---

[56] SOR/2015-145.
[57] SOR/2001-286.
[58] International Atomic Energy Agency, SSR-6, *Regulations for the Safe Transport of Radioactive Material*, 2018.

207. CNSC staff submitted that CNSC inspections had shown that CNL's TDG program was effectively implemented and that the transport of nuclear substances to CRL was regularly performed in a safe manner and met regulatory requirements. CNSC staff also noted that CNSC inspectors verified that CNL's personnel involved in transport held valid training certificates.

208. In relation to the intervention from Northwatch, the Commission enquired whether the transportation of nuclear substances was part of the scope of CNSC staff's environmental protection review report. CNSC staff answered that the transportation of radioactive material was not in the scope of the environmental protection review but was reviewed as part of the Comprehensive Study Report conducted in 2001 and in the Packaging and Transport SCA section of CMD 19-H4. CNSC staff added that the Comprehensive Study Report reviewed the transportation of radioactive material in terms of accidents and malfunctions and concluded that they would not result in any significant adverse environmental effects.

209. Upon request for comment about the CCRCA's assertion on radioactive waste shipments made "with no formal governmental approval or consultation", the Atomic Energy of Canada Limited (AECL) representative reported that CNL's decommissioning plans have been reviewed by AECL and accepted by AECL, a crown corporation.

210. In considering the intervention from Northwatch regarding the monitoring activities of the transport of radioactive material, CNSC staff explained that the fundamental concept of safety in the transportation of radioactive material lied within the packaging, and added that the requirements for the performance and the robustness of the package increased with the levels of risk posed by the nuclear substances being transported. CNSC staff also explained that the packaging required certification from the CNSC for the highest level of risk of material being transported.

211. In regard to the intervention from Northwatch, the Commission enquired about statistics on the number of accidents in relation to the transport of nuclear substances. CNSC staff informed that the regulations required to report any dangerous occurrence to the CNSC related to transportation of radioactive material. CNSC staff added that the events were listed in the ROR on the use of nuclear substances and that the number of reportable events was in the tens per year but that packages were not damaged. As an example, CNSC staff stated that it previously happened that a truck carrying a high-risk source caught on fire and the truck melted, however there was no safety-significant impact on the package or to the source.

212. The Commission enquired about how CNSC staff was being informed of road infractions committed by nuclear substance carriers. CNSC staff reported that it had mechanisms in place to discuss issues with regards to transport with provincial authorities. CNSC staff added that CNSC staff was part of a working group committee along with Transport Canada and provincial and territorial transportation committees, which met twice a year to discuss transportation issues. CNSC staff further added that

the citations issued for trucks that were transporting Class 7 material, mentioned in the intervention from Northwatch, had been reviewed by CNSC staff and that after following up with the Ontario's Ministry of Transportation, CNSC staff was of the view that they did not represent a risk to the environment or the health and safety of persons.

213. Asked about the safety and risk analysis based on the mode of transportation, the CNL representative provided that the usability of rail was assessed by CNL but was deemed not financially feasible compared to road transportation.

214. Further on risk assessment analysis of transportation activities, the Commission enquired about whether the proposed accelerated decommissioning timeline, compared to the original decommissioning plan assessed in the Comprehensive Study Report, would increase health and safety risks of radioactive waste transportation compared to the original decommissioning plan. The CNL representative indicated that risk analysis was part of CNL's operating procedures and that the risk for the proposed accelerated decommissioning plan on transportation was determined to be minimal. CNSC staff explained that the *Radiation Protection Regulations* had to be followed regardless of the radioactivity of the material being shipped, and that the dose limits still had to be respected.

215. In relation to a concern raised by Northwatch about driver training and vehicle maintenance, the CNL representative submitted that CNL was using subcontractors for transportation and that CNL assessed transport carriers' safety record as part of CNL's procurement process. The CNL representative added that CNL inspects every trucks and packages before they leave WL and that a more rigorous inspection corresponding with the radiological hazard would be performed on the vehicles before they leave.

216. From a concern raised in the intervention from CCRCA, the Commission enquired about whether it was possible to publicly release information about radioactive shipments made by CNL, taking security considerations into account. The CNL representative stated that CNL had to consider some documents on a case-by-case basis and that CNL was actively trying to add more documents to its external web site

217. In relation to the intervention from Northwatch, the Commission asked about the public's involvement in the certification of packages. CNSC staff indicated that certification decisions were carried out by designated officers with no public participation. CNSC staff added that the IAEA provided the CNSC with an independent review of the packaging design.

218. Asked about whether any intermediate-level liquid waste was to be shipped from WL, the CNL representative answered that CNL did not anticipate any intermediate-level liquid waste shipment. The CNL representative added that CNL intended to stabilize and solidify, in a concrete-like matrix, any liquid waste that would be generated before shipment. The Commission was satisfied with the information provided.

219. The Commission asked about whether CNL would be shipping radioactive waste to facilities other than CRL. The CNL representative stated that CNL used several commercial facilities, both in Canada and the U.S., for the treatment of its waste, adding that those facilities were generally restricted to mixed waste such as organic volatile, organic compounds mixed with tritium or other types of LLW. The CNL representative also stated that the waste were either incinerated, stabilized or macro-encapsulated before being sent back to CNL. The CNL representative further added that the resultant treated waste would be certified to meet Ontario Regulation 347 *General - Waste Management*[59] which allows for shallow land disposal. The Commission was satisfied with the information provided on this matter.

220. Based on the information presented on the record for this hearing, the Commission is satisfied that CNL is meeting, and will continue to meet, regulatory requirements regarding packaging and transport.

4.15 Indigenous Engagement and Public Information

4.15.1 Participant Funding Program

221. The Commission assessed the information provided by CNSC staff regarding public engagement in the licensing process as enhanced by the CNSC's Participant Funding Program (PFP). CNSC staff submitted that, in February 2019, up to $50,000 in funding to participate in this licensing process was made available to Indigenous groups, members of the public and other stakeholders to review CNL's licence renewal application and associated documents, and to provide the Commission with value-added information through topic-specific interventions.

222. A Funding Review Committee, independent of the CNSC, recommended that 5 applicants be provided with up to $63,300 in participant funding. These applicants were required, by virtue of being awarded participant funding, to submit a written intervention and make an oral presentation at the public hearing commenting on CNL's licence renewal application. As such, participant funding was awarded to the following recipients:

- Canadian Environmental Law Association
- Concerned Citizens of Renfrew County and Area
- Manitoba Metis Federation
- Northwatch
- Sagkeeng First Nation

---

[59] R.R.O. 1990, Reg. 347: *General - Waste Management.*

223. Based on the information submitted for this hearing, the Commission is satisfied that Indigenous peoples, members of the public and other stakeholders were properly notified of CNL's application and were provided with sufficient information on how to participate in this licence amendment process.

4.15.2 Indigenous Engagement

224. The common law duty to consult with Indigenous peoples applies when the Crown contemplates action that may adversely affect established or potential Indigenous and/or treaty rights. The CNSC, as an agent of the Crown and as Canada's nuclear regulator, recognizes and understands the importance of building relationships and engaging with Canada's Indigenous peoples. The CNSC ensures that its licensing decisions under the NSCA uphold the honour of the Crown and considers Indigenous peoples' potential or established Indigenous and/or treaty rights pursuant to section 35 of the *Constitution Act, 1982*.[60] The Crown has discretion as to how it structures consultation, and must prioritize fairness. It is the CNSC's practice to use both the work by CNSC staff and the Commission hearing to fulfil the requirements of the duty to consult.

225. CNL described its ongoing engagement with local Indigenous communities in accordance with REGDOC-3.2.2, *Indigenous Engagement*,[61] noting that CNL was seeking feedback from communities regarding traditional and current uses of the lands surrounding the WL site.

226. CNSC staff provided the Commission with information about ten Indigenous groups that were identified as having a potential interest in WL licence renewal and the CNSC engagement activities that were carried out with the identified groups. CNSC staff submitted that it encouraged communities' participation in this hearing process and also noted that CNL continued to engage with interested Indigenous communities on the licence application and ongoing activities of interest to the communities.

227. CNSC staff submitted that, since the proposed licence renewal did not include any significant modifications to WL, this renewal would not cause adverse impacts to any potential or established Indigenous and/or treaty rights. While CNSC staff expressed the view that no formal duty to consult was engaged by the licence renewal, CNSC staff further submitted that continued engagement with interested Indigenous groups was, and would continue to be a priority for CNSC staff and would be continued throughout the proposed licence period to ensure that the groups received all information requested and to establish, maintain and enhance relationships with the groups.

228. The Commission asked whether CNL and CNSC staff were actively tracking the

[60] *Constitution Act, 1982*, Schedule B to the *Canada Act 1982*, 1982, c. 11 (U.K.).
[61] CNSC Regulatory Document REGDOC-3.2.2, *Indigenous Engagement*, 2016.

engagement activities with the Sagkeeng First Nation, the MMF and other Indigenous peoples. The CNL representative stated that CNL was tracking and reporting annually to the CNSC on its engagement activities, such as First Nations and Métis engagement, public inquiries and website traffic, in order to improve CNL's communications and future engagements. CNSC staff answered that CNSC staff tracked all interactions with Indigenous and Métis communities.

Sagkeeng First Nation

229. The Commission expressed appreciation for the information provided by the Sagkeeng First Nation, and asked about how the Sagkeeng First Nation saw its role and responsibility as a steward of the lands. The Sagkeeng First Nation representative explained that stewards of the land needed to protect the land, the ground and also the water, for hunters to be able to live off the land. The Sagkeeng First Nation representative added that the obligation to be stewards of the land and to protect the land was reflected in their law, their Onakonigawin.

230. The Commission noted that in reading the submission from the Sagkeeng First Nation, the Commission sensed frustration in the engagement process and enquired about how the Sagkeeng First Nation saw engagement occurring for the WL decommissioning. The Sagkeeng First Nation representative explained that the Sagkeeng First Nation would like to be meaningfully engaged in the planning process for activities related to the decommissioning project, in the environmental monitoring during the institutional control period of 200 years or the end-states of the land, as the Sagkeeng First Nation will be using the site after its release.

231. Asked to provide additional information on how CNL engages and plans to engage the Sagkeeng First Nation in the WL decommissioning project and beyond, the CNL representative stated that different opportunities for further engagement would be available for CNL to interact with Indigenous groups during the development of specific execution plans to perform the activities described in the WL detailed decommissioning plan. The CNL representative added that this further engagement would enable CNL to understand and interact with the Indigenous groups and to look for a solution to influence the final implementation of the detailed decommissioning plan (DDP) to alleviate concerns. CNSC staff communicated that regulatory requirements were in place to require CNL to consult during the implementation of the DDP.

232. The Commission considered the recommendations submitted by the Sagkeeng First Nation in its intervention and enquired about whether CNL would engage with the Sagkeeng First Nation in regard to these recommendations. The CNL representative indicated that, prior to this Commission hearing, CNL sent a letter to the Sagkeeng First Nation to proactively address some of its concerns and added that CNL would continue to work with the Sagkeeng First Nation, as needed, to address all of its concerns.

233. Upon request for comment on the Sagkeeng First Nation's assertion about the practice of leaving LLW on-site being inconsistent with international standards, the Sagkeeng First Nation representative stated that leaving irradiated materials of any sorts on the WL site could not be the preferred option when the option of safely transporting the radioactive materials to a purpose-built facility was available. The Sagkeeng First Nation representative added that removal of the radioactive material could be performed safely and that the waste should go to a storage area designed for that purpose, whether in the interim or the long term.

234. In its closing remarks, the Sagkeeng First Nation representative noted that the engagement done by CNL and CNSC staff for this hearing was satisfactory. The Sagkeeng First Nation representative added that CNL and CNSC staff visited the community at numerous occasions as it should have been done in the past. The Commission thanked the Sagkeeng First Nation for their participation at this public hearing.

Manitoba Metis Federation

235. The Commission enquired about the MMF's current involvement in the monitoring of air, land, food and wildlife at WL as well as the MMF's recommendation on the creation of a working group to assist with the design and oversight of a monitoring plan. The MMF representative explained that, through an arrangement with CNL, the MMF had the opportunity to have a Métis monitor on the WL site undertaking work in cooperation with CNL. The MMF representative added that MMF recommended the creation of a Métis technical working group, where the MMF could assist with the design and oversight of the monitoring plan, to increase the MMF's involvement.

236. On the MMF's inclusion in the environmental monitoring process, CNSC staff recognized that the CNSC did not have a structured program for the inclusion of Indigenous groups in its inspections. CNSC staff added that it will look at the feasibility and how to implement a program across all regulated facilities. The CNL representative stated that CNL was currently working on aligning and implementing CSA N288.4, which requires the licensee to consult with and get input from impacted Indigenous groups into its environmental monitoring program.

237. Asked about the MMF's vision of the end-state of WL, the MMF representative told the Commission that the land should allow Métis citizens to eat unlimited amount of non-contaminated food. The MMF representative added that Métis citizens should be able to freely practice traditional harvesting activities in the WL area without fear of contamination, including hunting, fishing and gathering.

238. In its closing remarks, the MMF representative noted that the MMF was concerned about contamination spreading outside WL, due to its location beside the Winnipeg River. The MMF representative also encouraged the Commission to consider the recommendations made by the MMF in its submissions.

239. The Commission wishes to thank MMF for participating in this hearing and for submitting information.

Assessment of Indigenous Engagement

240. The Commission notes that CNL committed to dialogue with all Indigenous groups and was looking forward to sitting down with them face to face and further addressing their concerns and developing a plan and a path forward. The Commission expects CNL to engage with Indigenous groups on the end-state of WL. The Commission also requests that CNSC staff continue to engage and develop relationships with Sagkeeng First Nation, the MMF and other Indigenous groups in Manitoba, and report on progress in the context of the ROR or through other means. The Commission noted that Indigenous traditional knowledge is a type of science and should be taken into consideration to help reduce the fear surrounding the WL decommissioning.

241. Based on the information provided for this hearing, the Commission is satisfied that Indigenous engagement activities carried out for the renewal of the existing licence were adequate.

4.15.3 Public Information

242. The Commission assessed CNL's public information and disclosure program (PIDP) for WL. A public information program is a regulatory requirement for licence applicants and licensed operators of Class I nuclear facilities. Paragraph 3(j) of the *Class I Nuclear Facilities Regulations*[62] requires that licence applications include

> "the proposed program to inform persons living in the vicinity of the site of the general nature and characteristics of the anticipated effects on the environment and the health and safety of persons that may result from the activity to be licensed."

243. The Commission assessed how CNL's PIDP met the specifications of RD/GD-99.3, *Public Information and Disclosure*.[63] CNL provided the Commission with information regarding its Whiteshell Public Liaison Committee and the WL Economic Regeneration Partnership, formed in 2015. CNSC staff submitted that its review of CNL's PIDP found that it met regulatory requirements. CNSC staff also submitted that CNL was encouraged to refine and update its PIDP on a regular basis to meet the changing information needs of CNL's target audiences.

244. In considering the interventions from the Sagkeeng First Nation, the MMF and the CCRCA, the Commission recognized that there was a significant level of concern about the risk from the WL site and the waste generated. The Commission requested

[62] SOR/2000-204.
[63] CNSC Regulatory/Guidance Document RD/GD-99.3, *Public Information and Disclosure*, 2012.

details from CNL on how it was communicating with Indigenous groups and stakeholders about this risk. The CNL representative told the Commission that the first step was to listen and understand the perspective from the Indigenous groups and that this was followed by explaining in simple terms the clean-up program and the benefits for future generations.

245. On the subject of risk perception and the psychosocial issues for the persons living around WL, CNSC staff explained that, under the NSCA, subsection 9(b), the CNSC had to disseminate objective scientific and regulatory information to the public. CNSC staff added that typical engagement activities focussed on understanding what radiation and background radiation were and the effects of the licensee activities. CNSC staff further added that CNL was required to establish communications with its community and address those needs.

246. The Commission asked whether a psychosocial impact assessment had been completed or was contemplated by CNL for the decommissioning of WL. CNSC staff stated that psychosocial impacts of the WL decommissioning project was to be further explored as part of the environmental assessment for the WR-1reactor *in situ* decommissioning project. The Commission suggests that the psychosocial impact assessment of the WL decommissioning project includes the whole WL site and not be limited to the WR-1 reactor.

247. Based on the information presented for this hearing, the Commission is satisfied that CNL, through the PIDP and engagement activities, has adequately communicated and will continue to communicate to the public information about the health, safety and security of persons and the environment and other issues related to WL.

4.15.4 Conclusion on Indigenous Engagement and Public Information

248. Based on the information presented, the Commission is satisfied that, overall, CNL's PIDP meets regulatory requirements and commitments made by CNL will increase the effectiveness of its program and engagement activities in keeping Indigenous groups and the public informed of WL operations. The Commission acknowledges the many best practices already implemented by CNL and encourages its efforts in creating, maintaining and improving its dialogue with the neighbouring communities.

249. The Commission acknowledges the current efforts and commitments made by CNL in relation to Indigenous engagement and CNSC staff's efforts in this regard on behalf of the Commission that go beyond the context of the licence renewal proceeding. Based on the information presented on the record for this hearing, the Commission is satisfied that this licence renewal will not result in changes to WL operations that would cause adverse or new impacts to any potential or established Indigenous and/or treaty rights. The Commission is also of the opinion that the engagement activities taken for the review of the WL licence renewal application have been adequate.[64]

---

[64] *Rio Tinto Alcan v. Carrier Sekani Tribal Council,* 2010 SCC 43[2010] 2 S.C.R. 650 at paras 45 and 49.

250. The Commission notes that CNL committed to dialogue with all Indigenous groups and was looking forward to sitting down with them face to face and understanding their concerns and developing a plan and a path forward. Therefore, the Commission expects CNL to engage accordingly with First Nations and Métis groups on the end-state of WL.

251. The Commission request that CNSC staff report on progress made in its engagement activities in Manitoba in the context of future RORs or through other means. The Commission also suggests that the upcoming psychosocial impact assessment of the WL decommissioning project includes the whole WL site and not be limited to the WR-1 reactor.

4.16 Decommissioning Plans and Financial Guarantee

252. The Commission requires that CNL has operational plans for the decommissioning and long-term management of waste produced during the lifespan of WL. In order to ensure that adequate resources are available for safe and secure future decommissioning of the WL site, the Commission requires that an adequate financial guarantee for realization of the planned activities is put in place and maintained in a form acceptable to the Commission throughout the licence period.

253. CNSC staff indicated that CNL's DDP was to contain 12 volumes and that CNL was updating their Volume 1, Program Overview DDP to align with CSA N294-09, *Decommissioning of Facilities Containing Nuclear Substances*[65] and G-219, *Decommissioning Planning for Licensed Activities*.[66]

254. The Commission enquired about how many of the 12 volumes of DDP had already been developed. The CNL representative described the outstanding DDPs, such as one volume for Building 402 and the three parts of the WMA volume. The CNL representative added that CNL submitted one of those volumes to the CNSC for review and was currently working on comment disposition. The CNL representative also mentioned that the two volumes related to the standpipes and the ILW waste needed the design of the remediation equipment and the safety analysis in order to be complete.

255. The Commission enquired about a concern raised by CELA about whether the DDP could be made readily available to members of the public. The CNL representative stated that the document could be provided to the public, if requested, adding that commercially sensitive information would have to be redacted. The Commission noted CELA's recommendation of a public repository of documents to allow public access to documents without having to request them.

---

[65] N294-09 (Reaffirmed 2014), *Decommissioning of Facilities Containing Nuclear Substances, Update No.1*, CSA Group, 2014.
[66] CNSC Regulatory Document, G-219, *Decommissioning Planning for Licensed Activities,* Guidance Document, 2000.

256. In relation to the CCRCA's intervention, the Commission enquired about the reasons to proceed with the proposed accelerated decommissioning compared to the original decommissioning plan assessed in the Comprehensive Study Report. The CNL representative explained that lessons learned from the decommissioning industry around the world demonstrated that it was beneficial to take some action in the near term, which can all be achieved safely within the arrangements in place. The CNL representative added that radioactive waste can be retrieved from its less optimal current storage and then sorted, characterized and repackaged. The CNL representative further added that having the radioactive waste concentrated in one location allowed for a concentration of trained personnel in radioactive waste handling.

257. Further on the accelerated decommissioning of WL, CNSC staff stated that the reduced deferment period was still in line with the decommissioning strategy that CNL outlined in their DDP. Concerning the double handling of the radioactive waste required to transfer the waste to a permanent repository once one available, CNSC staff indicated that it was CNSC staff's view that CNL applied ALARA measures for any handling of radioactive waste in a robust manner.

258. The Commission enquired about the safety implications of an accelerated decommissioning compared to the deferred decommissioning assessed in the original Comprehensive Study Report. CNSC staff explained that the irradiated WR-1 reactor components had been placed in the waste areas 30 years ago, reducing the external dose rates from short-lived isotopes by several half-lives. CNSC staff added that a delay of 5 to 10 additional years would not have a significant impact on those dose rates.

259. Further on the risk assessment of the accelerated decommissioning, CNSC staff submitted that in addition to the site-wide decommissioning plan, CNL was required to produce a DDP for each individual building or facility detailing the end-state objectives, an assessment of the doses to workers, as well as assessment of any hazard present on that site. CNSC staff added that CNSC staff reviewed and assessed every DDP before giving an approval.

260. To better understand the effects of the accelerated decommissioning, the Commission requests that CNSC staff provide a systematic assessment of the potential effects on the collective occupational dose of the proposed accelerated decommissioning compared to the deferred decommissioning assessed in the original Comprehensive Study Report. The assessment could be provided during a future ROR or other means.

261. Asked about the scenario where CNL did not decommission the WR-1 reactor within the next 10 years and a proposed licence not allowing decommissioning, CNSC staff indicated that the current licensing basis authorizes the dismantlement and complete decommissioning of the WL site and that it is the *in situ* decommissioning of WR-1 reactor that is not authorized in the proposed licence. CNSC staff added that the responsibility for managing the activities related to decommissioning was on the

licensee and that CNL would have to come to the Commission to propose a different plan.

262. The Commission asked for information about the kind of Institutional Control Program that is or would be in place for the WL site. The CNL representative explained that the program was administered by CNL and not by the province of Manitoba.

263. The Commission considered whether the financial guarantees maintained by CNL for WL were in accordance with G-219 and G-206, *Financial Guarantees for Decommissioning of Licensed Activities*.[67] CNSC staff informed that the CNSC received from the Federal Minister of Natural Resources an expressed commitment stating that AECL will retain ownership of the lands, assets and liabilities associated with CNL's licences, including the WL Licence, and stated that the liabilities of AECL were the liabilities of Her Majesty in Right of Canada.

264. Based on the information considered at this hearing, the Commission concludes that the detailed decommissioning plan and related financial guarantee for WL are acceptable for the purpose of the current application for licence renewal.

4.17 Cost Recovery

265. The Commission examined CNL's standing under the *Cost Recovery Fees Regulations*[68] (CRFR) requirements for WL. Paragraph 24(2)(c) of the NSCA requires that a licence application is accompanied by the prescribed fee, as set out by the CRFR and based on the activities to be licensed.

266. CNL informed the Commission that it was in good standing with regards to the provision of CNSC licensing fees and would continue to pay all fees, as required. CNSC staff reported that after conducting a thorough review of CNL records, CNSC staff had verified that CNL was in good standing with respect to the CRFR requirements, and had paid their cost recovery fees in full.

267. Based on the information submitted by CNL and CNSC staff, the Commission is satisfied that CNL has satisfied the requirements of the CRFR for the purpose of this licence renewal.

---

[67] Canadian Nuclear Safety Commission, Regulatory Guide G-206, Financial Guarantees for Decommissioning of Licensed Activities, 2000.

[68] SOR/2003-212.

4.18 Nuclear Liability Insurance

268. The Commission notes that CNL is required to maintain nuclear liability insurance for WL. CNCS staff submitted that CNL maintained nuclear liability insurance in accordance with the *Nuclear Liability Act*[69] (NLA) during the current licence period until December 31, 2016 and since then, under the *Nuclear Liability and Compensation Act*[70] (NLCA) that came into force on January 1, 2017. CNSC staff reported to the Commission that Natural Resources Canada, the federal department responsible for the administration of the NLCA, had confirmed that CNL had satisfied and should continue to satisfy its obligation under the NLCA during the balance of the current licence period and throughout the proposed licence period.

269. Based on the information provided on the record for this hearing, the Commission is satisfied that CNL has satisfied, and will continue to satisfy, the requirements for the maintenance of nuclear liability insurance under the NLCA. The Commission expects annual updates on CNL's status in regard to its requirements under the NLCA in the context of an annual ROR.

4.19 Licence Length and Conditions

270. The Commission considered CNL's application for the renewal of the current WL licence for a period of 10 years. CNSC staff recommended the renewal of the licence for a period of 10 years, until December 31, 2029, submitting that CNL is qualified to carry on the licensed activities authorized by the licence. Several intervenors recommended shorter licence periods, as low as a one-year term.

271. The Commission asked about the rationale for recommending a 10-year licence, compared to the 1-year licence extension granted a year ago and also what had changed during the last year to justify a 10-year licence. The CNL representative explained that, at the time of the last licence renewal, CNL wanted to keep the WR-1 reactor *in situ* decommissioning linked with the licence renewal for efficiency purposes and that CNL believed, at that time, that CNL could disposition CNSC staff's comments on the Environmental Impact Statement for the WR-1 reactor *in situ* decommissioning in a short period of time justifying a one-year renewal. The CNL representative added that as the timeline had been longer than expected, CNL decided to proceed with a 10-year licence renewal request and would seek a licence amendment for the WR-1 reactor *in situ* decommissioning.

272. Further on the rationale for recommending a 10-year licence, CNSC staff indicated that, should a licence amendment for the WR-1 reactor *in situ* decommissioning be granted, CNSC staff would review the Licence Conditions Handbook to look at all the processes and procedures that need to be changed in order to allow for that activity to be conducted safely. CNSC staff added that a licence amendment would be required in

---

[69] R.S.C., 1985, c. N-28 (repealed).
[70] S.C. 2015, c. 4, s. 120.

the case of a deviation from what had been approved by the Commission under the licensing basis and the safety case. The Commission noted that several intervenors had concerns about granting a 10-year licence to CNL.

273. In considering the licence period, the Commission enquired about the planned submission date of the Environmental Impact Statement for the *in situ* decommissioning of WR-1 reactor. The CNL representative stated that CNL was in the final stages of preparing the Environmental Impact Statement, responding to information requests, and that CNL anticipated a formal submission to the CNSC around March of 2020.

274. The Commission enquired whether the environmental assessment for the WR-1 reactor *in situ* decommissioning would have an impact on the licence and the Licence Conditions Handbook. CNSC staff stated that the first step would be for the Commission to make decisions under subsection 52(1) of CEAA 2012. CNSC staff added that, should the Commission issue a positive decision allowing the project to move forward, a licence amendment would be required to include the *in situ* decommissioning of WR-1 reactor in the licensing basis. CNSC staff further added that the Licence Conditions Handbook would then be updated to include a section on the *in situ* decommissioning of WR-1 reactor, including compliance verification criteria.

275. In order to provide adequate regulatory oversight of changes that are administrative in nature or less significant and do not require a licence amendment nor Commission approval, CNSC staff recommended that the Commission delegate authority for certain approval or consent, as contemplated in licence condition 3.2, to the following CNSC staff:

- Director, Canadian Nuclear Laboratories Regulatory Program Division
- Director General, Directorate of Nuclear Cycle and Facilities Regulation
- Executive Vice-President and Chief Regulatory Operations Officer, Regulatory Operations Branch

276. Based on the information examined by the Commission during the course of this hearing, the Commission considers that a 5-year licence is more appropriate for WL. Unavailable information on decommissioning approach is to be completed and submitted in the next few years and therefore, the Commission considers that a 5-year licence is justified on the basis of CNL's past performance, the time required to complete the Environmental Impact Statement for the *in situ* decommissioning of the WR-1 reactor, the need for CNSC staff to review the Safety Analysis Report for the underground LLW trenches, and opportunities for Indigenous groups and the public to be involved during the renewed 5-year licence period through RORs or other means.

277. The Commission accepts the licence conditions as recommended by CNSC staff. The Commission also accepts CNSC staff's recommendation regarding the delegation of authority, and notes that it can bring any matter to the Commission as required.

5.0 CONCLUSION

278. The Commission has considered the licence renewal application submitted by the CNL. Based on its consideration of the information submitted, the Commission is satisfied that the application submitted by CNL meets the requirements of the NSCA, the GNSCR and other applicable regulations made under the NSCA.

279. The Commission has also considered the information and submissions of the applicant, CNSC staff and all participants as set out in the material available for reference on the record, as well as the oral and written interventions provided or made by the participants at the hearing.

280. The Commission is satisfied that CNL meets the test set out in subsection 24(4) of the *Nuclear Safety and Control Act*. That is, the Commission is of the opinion that CNL is qualified to carry on the activity that the proposed licence will authorize and that it will make adequate provision for the protection of the environment, the health and safety of persons and the maintenance of national security and measures required to implement international obligations to which Canada has agreed.

281. Therefore, the Commission, pursuant to section 24 of the *Nuclear Safety and Control Act*, renews the Nuclear Research and Test Establishment Licence issued to Canadian Nuclear Laboratories for its Whiteshell Laboratories located in Pinawa, Manitoba. The renewed licence, NRTEL-W5-8.00/2024, is valid from January 1, 2020 until December 31, 2024.

282. The Commission includes in the licence the conditions as recommended by CNSC staff in CMD 19-H4, CMD 19-H4.A, CMD 19-H4.B, CMD 19-H4.C and CMD 19-H4.D, including licence condition 12.2. The Commission also delegates authority for the purposes of licence conditions 3.2, as recommended by CNSC staff.

283. The Commission considers the environmental protection review that was conducted by CNSC staff to be acceptable and thorough. The Commission is satisfied that an EA under CEAA 2012 was not required for the WL licence renewal application and notes that the NSCA provides a strong regulatory framework for environmental protection. Further, the Commission is satisfied that CNL has made, and will continue to make, adequate provision for the protection of the environment and the health of persons throughout the proposed licence period.

284. The Commission wishes to make clear that the proposed licence does not provide for the *in situ* decommissioning of the WR-1 reactor. The Commission states that the concerns raised by Indigenous peoples, members of the public and other government regulators regarding the decommissioning of the WR-1 reactor, as well as the EA for the proposed decommissioning method, will be considered by the Commission at a future public Commission hearing(s).

285. To better understand the effects of the accelerated decommissioning, the Commission request CNSC staff to provide a systematic assessment of the potential effects on the collective occupational dose of the proposed accelerated decommissioning compared to the deferred decommissioning assessed in the original Comprehensive Study Report. The assessment could be provided during a ROR or through other means.

286. The Commission requests that CNSC staff report on progress made in its engagement activities in Manitoba in the context of future RORs or through other means. The Commission also suggests that the psychosocial impact assessment of the WL decommissioning project includes the whole WL site and not be limited to the WR-1 reactor.

287. The Commission notes that CNL committed to dialogue with all Indigenous groups and was looking forward to sitting down with them face to face and understanding their concerns and developing a plan and a path forward. Therefore, the Commission expects CNL to engage with Indigenous groups on the end-state of WL. The Commission also requests that CNSC staff continue to engage and develop relationships with Sagkeeng First Nation, the MMF and other Indigenous groups in Manitoba, and report on progress in the context of the ROR or through other means.

288. The Commission notes that CNSC staff can bring any matter to the Commission that merits its attention. The Commission directs CNSC staff to inform the Commission on an annual basis of any changes made to the Licence Conditions Handbook (LCH).

289. With this decision, the Commission directs CNSC staff to report on the performance of CNL and WL, as part of a ROR. CNSC staff shall present this report at a public proceeding of the Commission, where members of the public will be able to participate.

EXECUTIVE SUMMARY

BACKGROUND

Purpose and Need

Whiteshell Laboratories has provided research facilities for the Canadian nuclear industry since the early 1960's. As a result of the financial impact of the federal government's program review process, Atomic Energy of Canada Limited (AECL) made a business decision in 1997 to discontinue research programs and operations at Whiteshell Laboratories. Because no private sector sponsor was found to assume financial responsibility for the facility, in 1998, the federal government concurred with AECL's decision to decommission the Whiteshell Laboratories. The decommissioning project may proceed only with the prior licensing approval of the Canadian Nuclear Safety Commission (CNSC). Furthermore, and depending on the final conclusions made with respect to the effects on the Winnipeg River, aspects of the project may also be contingent on approvals issued pursuant to the *Fisheries Act***.** In 1999, AECL began to prepare plans for the safe and effective decommissioning of the Whiteshell Laboratories, that would meet the regulatory requirements.

The Canadian Environmental Assessment Act; Responsible Authorities, Procedures and Schedule

Before the responsible federal authorities can permit the Whiteshell Laboratories Decommissioning Project to proceed, a decision must be made on the results of an environmental assessment prepared pursuant to the *Canadian Environmental Assessment Act* (CEAA). Under the Act, the CNSC and the Department of Fisheries and Oceans (DFO) are the Responsible Authorities. The Responsible Authorities determined that a *comprehensive study* under the CEAA was required. A document outlining the scope of the project and assessment was issued in December 1999 following consultation with the public and other federal and provincial government departments. The other expert federal authorities with an interest in the project include Environment Canada, Health Canada, Natural Resources Canada and Western Economic Diversification Canada. A number of departments and agencies of the Province of Manitoba participate through a special Technical Advisory Committee.

As required by the CEAA, a Public Registry was established for the Whiteshell Laboratories Decommissioning Project. This involves the registration of the project on the *Federal Environmental Assessment Index* (FEAI ref. No. 18737) and maintaining public access to all documents related to the environmental assessment. The FEAI can be accessed through the Canadian Environmental Assessment Agency and the CNSC and AECL web sites. The document list, copies of the documents, can be obtained by contacting the CNSC. Manitoba Conservation also established a public registry for the project (File no. 4479.00) with registry locations at the Pinawa Library, Winnipeg Centennial Library and Manitoba Conservation Resource Centre in Winnipeg.

A draft CSR (Rev.1) was submitted to the CNSC in April of 2000. The draft was also made available to the public and distributed to expert federal departments. The comments from the expert departments and responses to these comments are included in Appendix F of the CSR. During the summer and fall of 2000, additional studies were carried out in the Winnipeg River and in the Waste Management Area (WMA) to confirm the appropriateness of the decommissioning proposals for those areas. These studies are presented in Appendices B and C. respectively.

This document (Rev. 2) is now being submitted by the RAs to the public for comment. Following a review of the comments, the RAs will submit the CSR with appropriate addenda and recommendations to the Canadian Environmental Assessment Agency for review and then a decision by the federal Minister of the Environment as to whether the project should be referred back to the responsible authorities for action, or requires further environmental assessment by a mediator or review panel.

SCOPE OF PROJECT

What is included?

The Whiteshell Laboratories Decommissioning Project encompasses all of the site facilities, buildings, infrastructure and land defined as the area affected by nuclear development and operation. Figure ES.1 shows the Licensed Study Area and the Unaffected Lands.

What is not included?

The total area that is under CNSC licence is approximately 4,375 hectares or 10,800 acres. Approximately 3,000 hectares (7,400 acres) of the licensed area is identified as land which was not used for or impacted by nuclear development or operations, and is excluded from the assessment scope.

The Underground Research Laboratory (not licensed by CNSC) and the Whiteshell Irradiator (which is under an CNSC licence held by ACSION) are also excluded.

CONSTRAINT

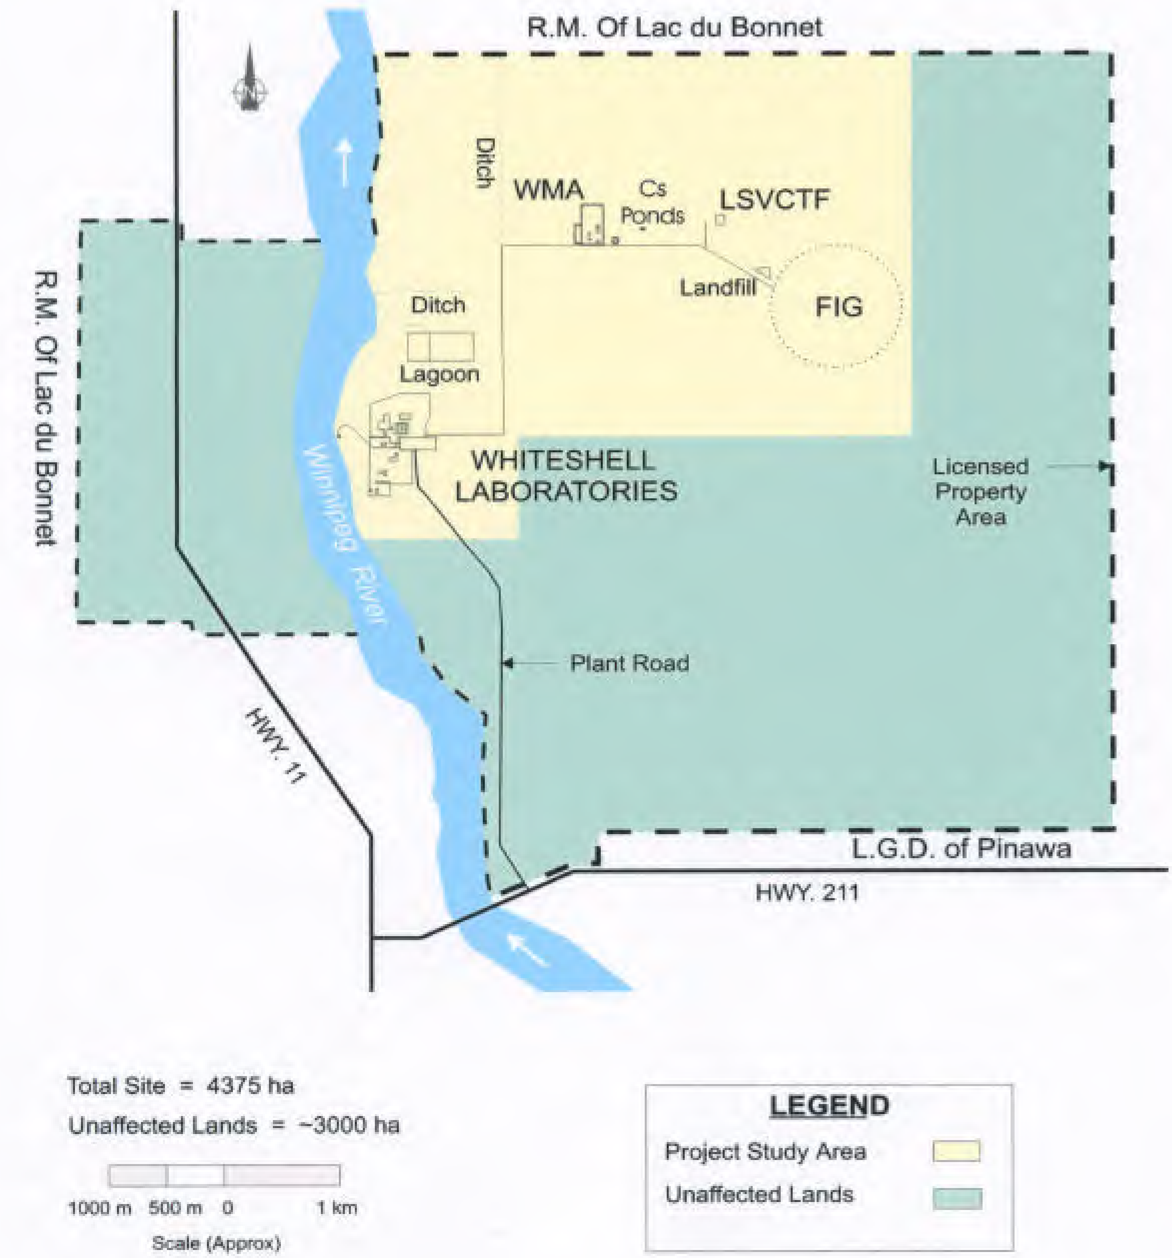
The long-term management of nuclear wastes is contingent upon finding a nationally acceptable solution consistent with federal policy on waste management. At present, no options or sites have been defined or approved that will provide such a solution. The availability of off-site national disposal facilities is essential to completing the decommissioning of the Whiteshell Laboratories' site. Provision of national waste disposal facilities is not within the Whiteshell Laboratories Decommissioning Project scope. Until a national facility is available, the wastes arising from the decommissioning project will remain in other secure interim waste management facilities licensed by the CNSC.

SCOPE OF ASSESSMENT

The environmental assessment of the proposed project includes a consideration of factors detailed in CNSC's Scope of Assessment document and of the following factors identified in the *Canadian Environmental Assessment Act*:

- purpose of the project (Section 1.0);
- alternative means of carrying out the project that are technically and economically feasible (Section 3.0);
- environmental effects of the project, including the environmental effects of malfunctions or accidents that may occur in connection with the project and any cumulative

FIGURE ES.1
PROJECT STUDY AREA



AECL EACL

WHITESHELL LABORATORIES DECOMMISSIONING
ENVIRONMENTAL ASSESSMENT

environmental effects that are likely to result from the project in combination with other projects or activities that have been or will be carried out (Section 6.0);

- socio-economic effects caused by a change in the environment due to the project (Section 6.0);
- sustainability of renewable resources (Section 6.0);

- mitigation measures that are technically and economically feasible (Section 6.0);
- significance of the effects (Section 7.0);
- cumulative effects (Section 8.0);
- requirements of a follow-up program (Section 9.0); and
- comments received from the public (Section 10.0).

ALTERNATIVES

CEAA requires that the CSR address alternative means to achieve the decommissioning program. Our review of alternative means indicated that the main difference would be the time period required to complete the decommisssioning program. That is, the same steps and the same activities have to be carried out to achieve decommissioning. It was recognized from the beginning that the public would prefer decommissioning to be carried out in as short a period as possible. The minimum period given the time frame to deliver the decommissioning program and the availability of waste disposal was determined to be 20 years. Three alternatives were analyzed:

- Alternative 1 - End state in a Short time period (20 years).
- Alternative 2 - End state in a Long Time Period (100 years).
- Alternative 3 - End state in a Moderate Time Period (60 years).

Alternative 1 is based on the assumption that an off-site radioactive waste disposal repository would be available within 10 years. This would give time for evaluating wastes and preparing detailed decommissioning programs. Wastes would be removed to disposal throughout the subsequent 10-year time period. Alternative 2 is based on the assumption that the longest time the process necessary to implement a national waste disposal policy could take would be 100 years. Alternative 3 proposes that Whiteshell Laboratories would be decommissioned over an intermediate time frame (approximately 60 years). This time frame is based on the concept that safety and costs can be optimized by taking advantage of natural radioactive decay and by decommissioning buildings as they come to the end of their economic and structural life. It is also based on the assumption that national waste disposal facilities would be available for low-level waste by the year 2025 and high-level waste by 2050.

While it is understood that public preference is for an early decommissioning process, that is, Alternative 1, this approach has two limitations, namely occupational health and safety and costs. The safety issue arises from early handling of highly activated material from WR-1 which currently produces high radiation fields. Working in these fields requires the highest level of local shielded handling facilities as well as expensive and highly automated remote handling. Since an off-site disposal facility is not likely to be available within the 20-year time frame, the highly radioactive wastes from the disassembly of the reactor, and the low and intermediate-level wastes from the other site nuclear facilities would also have to be accommodated in interim storage facilities. This means additional safety risks to workers (double the amount of handling) and associated cost increases of between $50M and $130M.

Alternatives 2 and 3 avoid some of these problems. The likelihood that a national waste disposal facility is established is greatly improved. Postponing the dismantling of WR-1 for fifty years following shut-down provides a thousand-fold decrease in radiation fields. The risk of environmental problems developing over the deferment period is minimized since the site will remain under CNSC license and a follow up/monitoring program will be in place throughout the implementation period.

Alternative 2 is inferior to Alternative 3 providing that national waste facilities become available within the planning time frames of Alternative 3. The decrease in radioactivity resulting from a longer period of natural radioactivity decay in Alternative 2 does not significantly enhance worker safety. In addition, most of the buildings housing nuclear facilities will have gone beyond their economic and structural lives and will have to undergo extensive replacement increasing the costs of Alternative 2. Alternative 3 also reduces the amount of waste ultimately requiring disposal and produces more benign environmental effects than Alternative 2. Table ES.1 summarizes the incremental costs of Alternatives 1 and 2 as compared with the Alternative 3. The table shows that Alternative 3 is the least cost option - $50 to $130 million less expensive than Alternative 1 and $108 million less expensive than Alternative 2. Alternative 3 therefore is chosen as the reference alternative.

Table ES.1
Comparison of Costs for Decommissioning Alternatives

Alternative	**Time Frame (Years)**	**Base Cost ($M)**	**$M Reductions Provided by Option**	**$M Additional Costs of Option**	**$M Total Incremental Cost of Option**
1	20	reference project cost	-40	90 – 170	50 to 130
2	100	reference project cost	0	108	108
3	60	reference project cost	0	0	0

The basic rationale for decommissioning Whiteshell Laboratories is to move site waste only when off-site disposal is available or when the safety of managing wastes in existing facilities is compromised. For analytical purposes, based on technical, economic, public and environmental considerations, Alternative 3 was identified as the preferred alternative. It should be noted that if off-site waste disposal becomes available earlier, all site facilities except those which provide radioactivity decay benefits (e.g. WR-1 and some WMA wastes) could be decommissioned earlier. On the other hand, should off-site waste disposal availability take longer than assumed, the contingency would be to revert to Alternative 2.

Decommissioning Options within the Preferred Alternative

The general strategy is to remove facilities entirely from the site. For two project components, it was determined that the most environmentally sound and cost-effective solution was in-situ disposal, in other words, managing the wastes in the existing location. These two cases were the river sediments and Low Level Waste (LLW) in trenches in the Waste Management Area. In the case of the river sediments, after extensive sediment surveys, it was shown that even if the contaminants detected near the outfall to the Winnipeg River were somehow exposed or resuspended there was no risk to human or ecological health (see Appendix B). Analyses were also carried out for the waste in the trenches (see Appendix C). These analyses indicated that there has been no significant transport of contaminants beyond the trench boundaries. The analysis concluded that there was no likelihood that contaminants could move beyond the boundary of the Waste Management Area before the period of institutional control (now estimated at 200 years) is complete. These conclusions are based on the following observations:

1. The trenches were deliberately located in a water discharge area. This means that water moves upward preventing contaminants from migrating down into the sand aquifer overlying the bedrock and eventually reaching the Winnipeg River.
2. The clay soils around the trenches dramatically inhibit the movement of contaminants.
3. Under the most conservative assumptions the decay period for the dominant radionuclides (^{90}Sr and ^{137}Cs) in the trenches is shorter than the time it would take to migrate to the boundary of the WMA.

During the course of the decommissioning program, there will be additional monitoring and analysis to verify these findings. During Phase 3, a supplementary environmental assessment and safety analysis will be conducted to support the final in-situ end state.

PROJECT DESCRIPTION

Facilities

The following facilities will be decommissioned.

Table ES.2
Facilities to be Decommissioned

Nuclear Facilities	Radioisotope Facilities	General Infrastructure
• Shielded Facilities • Van de Graaff Accelerator • Neutron Generator • Active Liquid Waste Treatment Centre • Whiteshell Reactor -1 • Concrete Canister Storage Facility • Waste Management Area	• Building 300 • Decontamination Centre • Building 402	• Non-nuclear Buildings • Landfill • Sewage Lagoon • Buried Services • Contaminated Lands ("Affected Lands")

Phasing

The proposed Whiteshell Laboratories Decommissioning Project will be implemented through a phased approach (See Figure ES.2) preceded by operational shut down work. The activities planned in each phase are:

- ***Phase 1*** *(approximately 5 years)* – activities directed toward nuclear and radioisotope buildings and facilities to place them in a safe, secure, interim end state. The Van de Graaff Accelerator and the Neutron Generator will be completely decommissioned.

- ***Phase 2*** *(approximately 10 years)* – regular monitoring and surveillance of all buildings and facilities. Most project activity will be focussed on the Waste Management Area. Most waste management facilities will be placed in a passive operational state and interim processing, handling and storage facilities, required during monitoring and surveillance and decommissioning project activities, will be established.

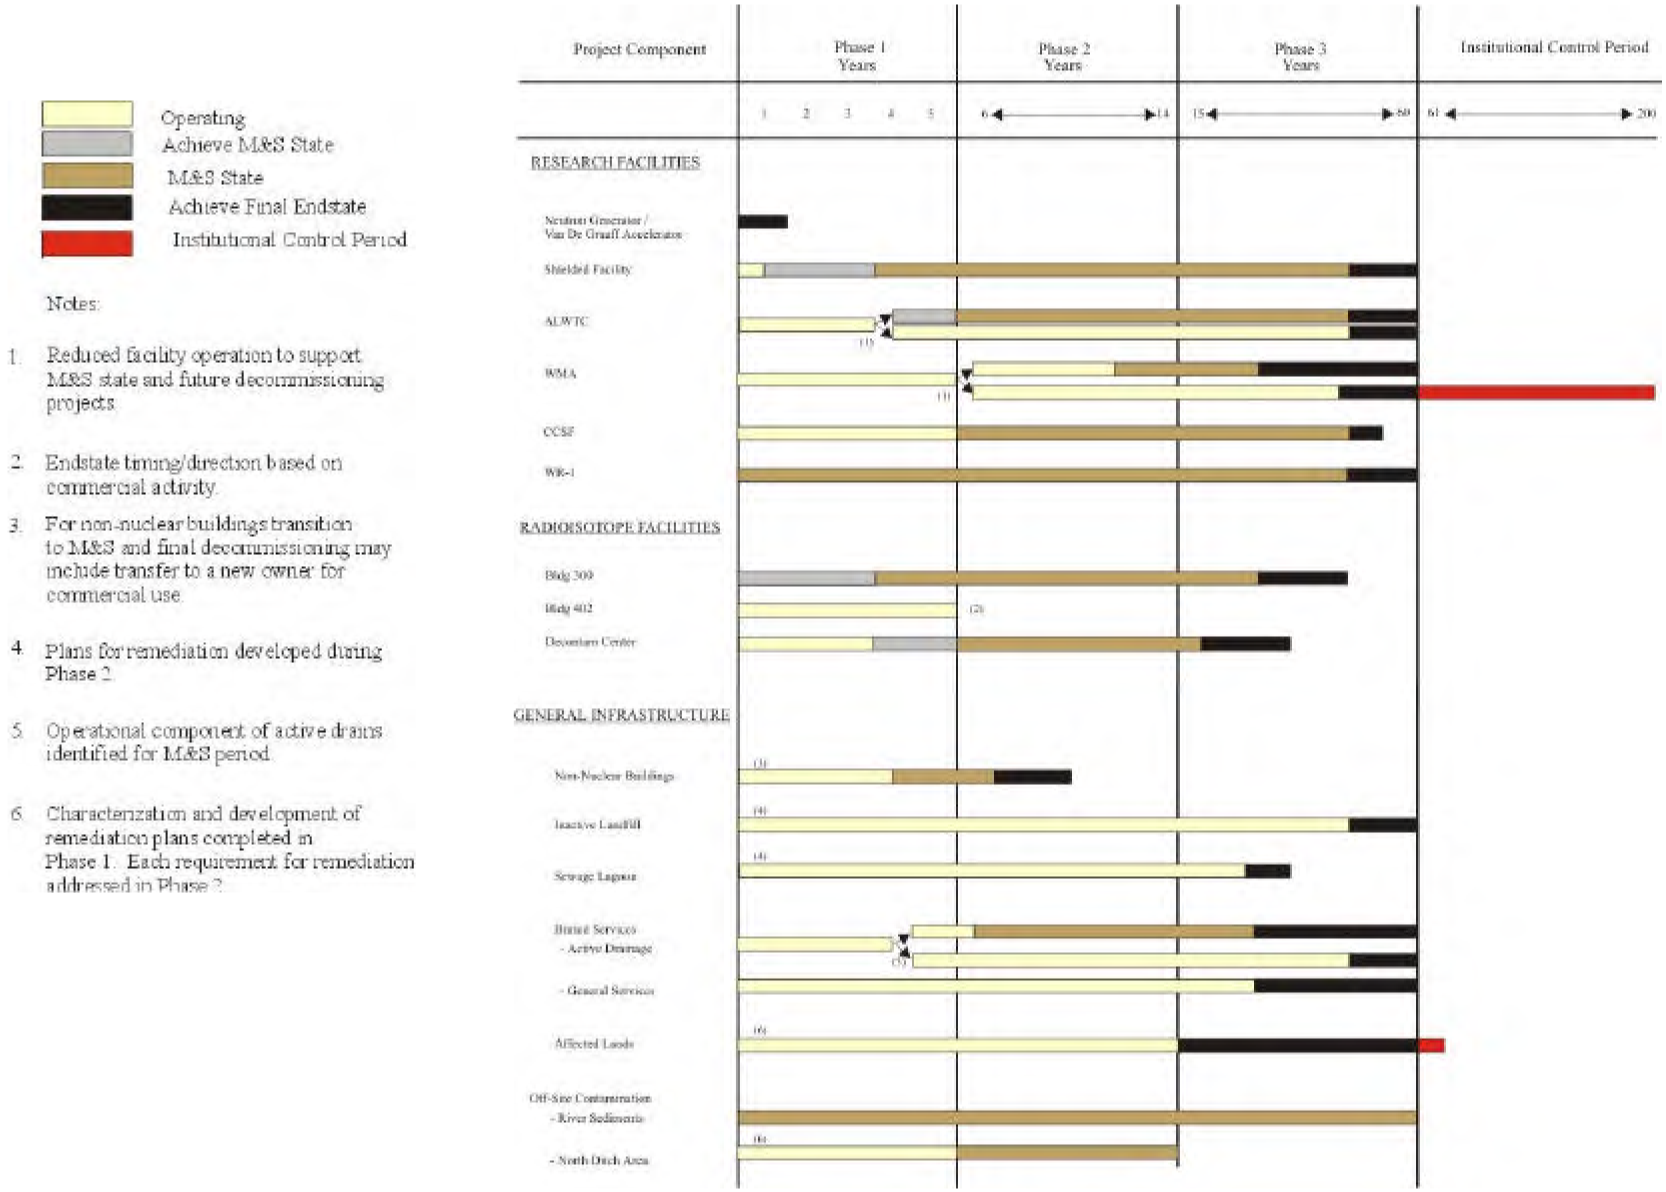
- ***Phase 3*** *(approximately 45 years)* – activities directed to bringing the site to a final end state that will fulfil all pertinent regulatory and national policy requirements. The timing and sequence of decommissioning activities will be determined largely by the availability of disposal facilities and by the age and condition of engineered structures and buildings.

Following the completion of Phase 3, part of the site, namely, the Waste Management Area, will remain under institutional control for an additional 200 year period.

Management of Waste

The decommissioning program essentially is a process of managing the Whiteshell Laboratories' site waste. The inventory of stored waste from Whiteshell Laboratories includes approximately 21,000 m^3 of low-level radioactive waste, approximately 1,400 m^3 of medium level radioactive waste and approximately 28 metric tonnes of irradiated reactor fuel. The decommissioning program will produce an additional approximately 12,000 m^3 of low-level radioactive waste, approximately 1,400 m^3 of medium level radioactive waste and approximately 50,000 m^3 of deminimis (below regulatory concern) waste. TFRE / Amine radioactive liquid waste stored at the site will be processed to a solid waste form. The result of the decommissioning program will be an end state where all wastes are dispositioned to off site disposal facilities or, in the case of river sediments and the LLW trenches, to management in-situ.

Figure ES.2
Whiteshell Laboratories Decommissioning Project Component Timelines



THE ENVIRONMENT

The Site

The Whiteshell Laboratories' site is located on the east bank of the Winnipeg River approximately 100 km east northeast of Winnipeg. The site lies approximately 267 m above sea level within a broad zone where prairie grassland to the southwest merges with boreal forest to the northeast. It is on the western edge of the Precambrian Shield and is surrounded by cleared land, which supports agriculture, interspersed with peat bog. Forty-three percent of the site is forested or leased farmland.

Environmental Indicators and how effects can be transmitted at Whiteshell Laboratories

The following are some key characteristics of the site:

- ***Radioactive Emissions:*** The estimated dose to the most exposed members of the public (assumed to be living at the site boundary) is a negligible percentage of the typical background radiation dose in Canada.

- ***Air Quality:*** Indicators of air quality in the area range from 0 to 17% of provincial and/or federal standards for non-radiological contaminants. Air in the area may be described as "very clean".

- ***Soils and Groundwater:*** Groundwater in the area is generally regarded as "potable". The water tends to move toward the Winnipeg River except at the Waste Management Area which is a water discharge zone where water tends to flow upward to the surface. The site consists of overburden soils (derived from glacial deposits) overlying Precambrian bedrock. Silt, silty clay, fine sand and clay till dominate the Local and Project Study Areas.

- ***Surface Water and the Winnipeg River:*** In general, most surface water from the site flows to the Winnipeg River. Water quality in the Winnipeg River is good and radioactivity is well within the Maximum Acceptable Concentrations for radioactivity in drinking water in Canada, as specified by Health Canada. Appendix B shows that concentrations of radioactivity in the sediments near the outfall present no risk to human or ecological health.

- ***Terrestrial Biota:*** There are many types of vegetation, some of which are rare in the area but common elsewhere in Manitoba. There may be more than 50 species of mammals living on the site but none of them are considered "rare or endangered." The white tailed deer is quite common. The local study area ***may*** support several endangered birds including peregrine falcon, burrowing owl, piping plover and loggerhead shrike. ***Vulnerable*** species in the area may include the least bittern, short-eared Owl, Caspian tern and red-headed Woodpecker.

- ***Aquatic Biota:*** The Winnipeg River has a wide variety of fish species including walleye, pike, red and white sucker, whitefish and the "at risk" and protected sturgeon. There is no significant aquatic vegetation on the site.

- ***Socio-Economics:*** The area around Whiteshell Laboratories has a population of about 18,000. Although Whiteshell Laboratories employed as many as 1,100 people at its peak, it currently employs about 350. When shut down is complete employment will decrease to approximately 30. Other industries now provide the bulk of employment in the area. Traditional employers are mining and forest products but the percentage of employment in the retail trade and tourism is growing.

- ***Land and Resource Use:*** The area supports farming, hunting and fishing and a growing recreational industry based on these activities, as well as swimming and a growing cottage community. The Winnipeg River is particularly important to all these activities.

Valued Ecological and Social Components

Valued Ecological Components (VECs) and Valued Social Components (VSCs) are a way of focussing on potential environmental effects. These components are protected by law or regulation; recognized by the scientific communities as important within the ecosystem; and/or recognized by the public as being important due to their social importance, commercial economic value or role in maintaining quality of life within the community. The following VECs and VSCs were identified in the assessment:

- The Winnipeg River and its Shoreline.
- Sturgeon, Walleye, Northern Pike and Mooneye.
- Whitetail Deer and Moose.
- Gullies and Ravines.
- Coniferous Forest.
- Habitat Diversity.
- The Sport Fishery.
- Provincial Park and Natural Forest Areas.
- The Model Forest.
- The Field Irradiator Gamma (FIG).

EFFECTS OF THE PROJECT ON THE ENVIRONMENT

Approach

Residual effects were determined through a review of decommissioning activities and interactions with environmental components.

Contaminant migration pathways were evaluated and possible receptors along the pathways identified. Where mitigation measures were required they were applied to determine the net residual effect. Special attention was paid to the geographical extent of the effect e.g. the area around the activity, the Project Study Area or the Local or Regional Study Areas (see Figure ES.3).

Residual Effects

In general, there will be an improvement to the environment as a result of the decommissioning program. This is because:

- the achievement of operational shutdown will continue to reduce emissions, ultimately emissions will fall to zero;
- decay of any material on the site will continue;
- there will be no new sources of contaminants; and
- the site will ultimately be restored to a natural condition.

Accordingly, there will be some effects although they will be generally small and in many cases, undetectable. In that regard it should be noted that releases to the environment are not continuous and they are controlled (so that effects are minimal from the start). It should also be noted that the site will remain under license which means that monitoring subject to CNSC review will continue for the entire program. Certain parts of the site will be under institutional control for as long as 200 years.

The following is a summary of residual, but not necessarily significant effects that may be associated with the program.

Air Quality and Noise

Air quality issues were related to most decommissioning activities including decontamination, building demolition and site remediation. Air quality effects ranged from the release of very small amounts of radioactive airborne particulates to nuisance dust and noise. Several observations may be made:

- airborne radioactive emissions are controlled to be below permissible Derived Release Limits (DRL). The target for total emissions is a small fraction of the DRL. HEPA filters effectively control radioactive particulates. Where greater control is required, additional HEPA filters can be added. The result is that the release of radioactive particulates is negligible;

FIGURE ES.3

AECL EACL

WHITESHELL LABORATORIES DECOMMISSIONING
ENVIRONMENTAL ASSESSMENT

- radioactive materials will be removed from all structures through a decontamination process. HEPA filters used during decontamination will remove a high level of radioactively contaminated dust (99.97%). As a result virtually no radioactivity will be released during the decontamination process;
- experience at other sites suggests that from time to time nuisance dust will be generated. Recent work (Watson and Chow 1999) suggests that the fine fraction (PM_{10}) of fugitive dust, generated by construction-type activities, will remain in the lowest 2 m of the atmosphere and that the local deposition losses and impaction losses (trees) will reduce the amount transported beyond 50 metres by over 90%;
- under extremely windy conditions, when there is a possibility that emissions may leave the site, decommissioning activities will be curtailed; and
- the preservation of the dense tree coverage across the site provides a natural noise barrier between site activities and potential noise receptors within the Project Study Area. Vibration effects would likely only be of concern within the Project Study Area to adjacent buildings and structures.

The assessment has concluded that the spatial extent of the residual effects from emissions to the air and noise will be limited to the Project Study Area.

Surface Water (Hydrology)

Residual effects on surface water, particularly the Winnipeg River, were identified from discharges from the Active Liquid Waste Treatment Centre and the sewage lagoon. These discharges, currently well below applicable standards, will gradually diminish to almost zero by the time decommissioning is complete. The discharges that will occur will be controlled so that there will be some, but very small, residual effects on the River.

Soil and Groundwater (Geology and Hydrology)

Small amounts of contamination may remain in the soils where leaks have occurred around buried services and where active buildings or facilities, such as the Shielded Facilities have been removed. Very small amounts of leachate from these sources as well from the Inactive landfill may migrate into the groundwater. The main area of concern was the LLW to be managed in-situ in the Waste Management Area. As noted in the discussion in alternative methods, it was determined that the likelihood of contaminant transport beyond the Waste Management Area was extremely low and no effects on groundwater were anticipated from in-situ disposal of the trenches. Monitoring of this area will continue well beyond the decommissioning program until the beginning of the 23rd century. The analysis concluded that effects on groundwater would be limited to the Waste Management Area.

Terrestrial Biota

No effects were identified on terrestrial biota and it is expected that natural vegetation will re-establish itself.

Aquatic Biota

The only potential effects were related to the possibility of exposure of aquatic biota to the Winnipeg River contaminated sediments. An ecological risk assessment (Appendix B) indicated that even under the most unfavourable assumptions, there would be no effect on aquatic biota.

Worker Health and Safety

Workers are exposed to radiation during many of the decommissioning activities. Adherence to AECL's radiation protection and occupational health and safety programs will ensure that exposures are controlled and kept within regulated limits. Furthermore, the application of the radiation protection program ensures that exposures are justified and kept as low as reasonably achievable (ALARA), social and economic factors taken into account. No residual effects on worker health and safety are anticipated.

Public Health

No residual effects on public health are expected. The main risk is associated with possible contamination of the Winnipeg River as a water supply. This risk is minimized through control of releases to ensure that there is no effect. The risk analysis described in Appendix B has indicated that there is no risk to human health from contaminated sediments. There is a possibility of radiation exposure from accidents associated with the transport of radioactive waste off-site. Approaches to ensuring the safety of radioactive transport have been developed and include contingencies for accidents and spills.

Physical and Cultural Heritage / Archaeology

Physical and cultural heritage refers to use by First Nations and others of the land over time. In particular, these groups have used the area and especially the Winnipeg River for hunting, fishing and many other traditional activities. The concern is the possible loss of buried artifacts. To avoid such losses, archaeologists will be present during any significant shoreline excavations. Effects can therefore be prevented.

Land and Resource Use

A residual effect is the long-term restriction on land use. The amount of land likely to be involved is very small, relative to the large area of the site.

Socio-Economics

Because there are not likely to be any effects on the biophysical environment, effects on the area's socio-economic conditions are unlikely.

Aboriginal Interests

Activities of specific interest to aboriginal communities are associated with historical and current uses of the Winnipeg River, the disturbance of sacred lands and artifacts. No particularly valuable historical site has been identified in the Project Study Area and First Nations will be kept apprised of any findings during excavations as well as being kept abreast of the decommissioning activities as the project proceeds. This process will ensure that aboriginal interests are not affected.

EFFECTS OF THE ENVIRONMENT ON THE PROJECT

The assessment reviewed the effects of non-routine events including floods, tornadoes, earthquakes and fire. The assessment concluded that if such events were to occur, AECL's existing contingency plans and emergency preparedness plans will be implemented and the effect on the project will be adequately controlled.

ACCIDENTS AND MALFUNCTIONS

These events include equipment failure, fire, explosion, spills and leaks, loss of services and off-site transportation accidents. The assessment confirmed that all of the accidents and malfunctions reviewed have avoidance and contingency plans in order to mitigate potential environmental effects. Mitigation measures to reduce the potential hazards during decommissioning will be developed in the decommissioning plans for individual facilities. Accident mitigation is based on prevention, early detection, remediation and accommodation. AECL is committed to having the necessary trained staff available for these purposes.

ASSESSMENT OF SIGNIFICANCE

The significance of residual effects was assessed using a two-step approach. Step one involved a comparison with specific criteria such as contravening a standard; displacing or endangering a designated environmental feature; or adversely affecting an established treaty and/or aboriginal right. For those effects that met the criteria of the first step, their significance was determined in a second step using a scoring system addressing factors such as magnitude, duration, occurrence, geographical extent and reversibility. No effect was considered significant using either level of evaluation and the analysis determined that the Whiteshell Laboratories Decommissioning Project was not likely to cause significant adverse environmental effects.

CUMULATIVE EFFECTS

Cumulative effects are changes to the environment that are caused by an action (this project) in combination with other past, present and future human actions (other projects or activities in the area).

A total of 30 actions/physical works were identified of which 10 were considered to have the potential to interact with the project.

The effects analysis indicated that the only VEC that could be affected was the Winnipeg River. In all cases, either small amounts of effluent were involved or the discharge points were remote from the stretch of the Winnipeg River affected by the Decommissioning Project. Hence, no cumulative effects were identified.

FOLLOW-UP

The purpose of follow-up is to:

- optimize the monitoring and surveillance program;
- confirm that appropriate mitigation measures are implemented;
- develop appropriate responses to unforeseen effects; and
- identify effects of the project that may not have been predicted.

Follow-up activities include monitoring, surveillance, inspection, data collection, analysis, evaluation, and reporting.

Components of the follow-up program include:

- the preparation of detailed decommissioning plans for each nuclear facility. Each plan addresses environmental control issues and describes control procedures;
- the maintenance of existing site and effluent verification monitoring programs throughout the decommissioning program;
- program updates to meet new requirements identified from implementing the monitoring and surveillance program;
- additional wells and monitoring around the WMA, sewage lagoon and inactive landfill
- the maintenance of regular reporting procedures; and
- support for and co-operation with any independent Public Advisory Committee that may be created to assist the Whiteshell Laboratories Decommissioning Project.

In addition to the above, independent audits can be conducted by the AECL Safety Review Committee and by the CNSC.

PUBLIC CONSULTATION

A public consultation program was designed and implemented to solicit public comments on the Whiteshell Laboratories Decommissioning Project. The program sought the involvement of the stakeholders, First Nations, and interested members of the public that would endure throughout and beyond the entire decommissioning program. Public consultation activities undertaken are shown below:

Activities	1999	2000
Key-person Interviews	July – September	
Interviews (VECs/VSCs)	July – August	
Newsletter	October	June
Letter to Contact List	October	June
Open House	October	
Information Sessions	October	June
Follow-Up Presentation	November	

This approach reached a large a number of people in the area. For example:

- the newsletter was sent out to 7,627 post boxes in the Regional Study Area;
- 121 people attended the open house at Whiteshell;
- another 43 people attended information sessions;
- contacts have been made with the Sagkeeng First Nation, Brokenhead Ojibway First Nation, Treaty 3 First Nations and the Manitoba Metis Federation;
- a communication protocol has been established with the Sagkeeng First Nation, and
- presentations were made to interest groups, local Councils, the Community Leaders Group, the TAC and others.

A number of issues were raised with respect to the project. All of these issues have been addressed in the Comprehensive Study Report.

COMMITMENT

AECL, as holder of the Whiteshell Laboratories' site licence, is committed to:

- conducting all decommissioning activities to ensure health and safety of workers, the public and protection of the environment;
- ensuring that the funding to meet the Whiteshell Laboratories decommissioning requirements is identified as a component of the segregated appropriation for decommissioning from the Treasury Board;
- meeting all applicable regulatory, safety and environmental requirements throughout the decommissioning process;
- retaining key individuals to develop and initiate its decommissioning program. AECL is committed to maintaining required resources on its decommissioning team;
- maintaining fully trained and qualified staff to meet security requirements;
- maintaining an environmental monitoring program for as long as wastes requiring management remain at the site;
- the involvement of local communities in the environmental monitoring program;
- implementing mitigation measures for project activities where an evaluation of decommissioning activities has determined the need for mitigation;
- maintaining monitoring and surveillance programs for all nuclear facilities and affected lands until the final end state is achieved; and

- an ongoing communication program with area communities and other stakeholders and supports the establishment of a Public Advisory Committee during the decommissioning program.

CONCLUSIONS

The following conclusions may be drawn from the Comprehensive Study Report:

- the Whiteshell Laboratories Decommissioning Project is not likely to cause significant adverse environmental effects taking into account the mitigation measures recommended in the report;
- the cumulative effects analysis indicates that there are not likely to be any cumulative effects associated with the project; and
- public concerns raised to date about the project have been addressed in the CSR (Section 10.0).

TABLE OF CONTENTS

Page No.

LIST OF TABLES

Page No.

LIST OF FIGURES

Page No.

GLOSSARY

Active

Active signifies radioactive. It does not indicate whether the facility is operational.

Active Area

The Whiteshell Laboratories (WL) active area (Figure 2.2) includes all WL nuclear and radioisotope facilities. The CCSF and WMA are included as a part of the active area.

Active Drain Lines

Active drain lines are pipes which transfer contaminated liquids from laboratories, hot cells and buildings to the ALWTC collection tanks. A typical drain configuration consists of a drain in a fumehood or sink, a drainage pipe, a tank, a pump and a double pipeline (pipe within a pipe) to the ALWTC.

Active Ventilation

Active ventilation is the exhaust system used to remove air which may contain radioactive particles from a structure such as a laboratory, hot cells, or vented enclosures. A typical configuration in a radioisotope or nuclear facility consists of a lab fume hood, ductwork, a HEPA filter bank, an exhaust fan and an exhaust stack.

AECL

Atomic Energy of Canada Limited, a Crown corporation set up by the Canadian government in 1952 to develop peaceful uses of nuclear energy. AECL develops, markets, sells and builds CANDU power reactors and research reactors and provides engineering and other technical services to nuclear utilities.

Affected Lands

The Affected Lands (Figure 2.1) is defined as the lands where nuclear development, or operations, or supporting activities were conducted. As well, lands potentially impacted by such activities are included as being “Affected”.

Air Kerma

Air kerma is an approximation of dose from gamma radiation.

Alpha Radiation

The least penetrating but most strongly ionizing of the three principal forms of radiation from radioactive materials. It is halted by the outer layer of skin cells in human skin.

ALARA

As Low As Reasonably Achievable. ALARA refers to radiation exposures that are kept as far below regulatory limits as possible, taking into account current technology and the costs of improvement related to three areas: the benefits and risks to the environment and public health and safety; societal and socio-economic factors; and the use of radioactive materials for public benefit, such as in research, medical diagnosis and the production of electricity by nuclear power.

Amine Tank

A tank in the WMA containing radioactive liquid waste from an experiment in which an irradiated CANDU natural uranium fuel bundle was dissolved.

Background Radiation

Radiation that occurs in the natural environment, including cosmic rays and radiation from naturally occurring radioactive elements.

Bequerel (Bq)

The standard international unit of radioactivity equal to 1 radioactive disintegration per second. 37 billion becquerels is equal to 1 curie (Ci).

CANDU

A nuclear power reactor developed in Canada. The term stands for Canadian Deuterium Uranium. The moderator is deuterium or heavy water and the fuel source is natural uranium.

Canister

A steel-lined concrete structure used to store spent nuclear fuel.

Characterization Survey

A radiological survey carried out to characterize radiation hazards and estimate the level of radiation. See interim end state survey definitions.

CEAA

The *Canadian Environmental Assessment Act (CEAA)* sets out responsibilities and procedures for the environmental assessment of projects involving the federal government. The Act applies to projects for which the federal government holds decision-making authority whether as proponent, land administrator, source of funding, or regulator. It was proclaimed on January 19, 1995. The Canadian Environmental Assessment Agency administers the *Act*.

CNSC

The Canadian Nuclear Safety Commission (CNSC) is the federal regulatory body which regulates the use of nuclear energy and nuclear substances to protect health, safety and security and the environment and to respect Canada's international commitments on the peaceful use of nuclear energy. Parliament passed the Nuclear Safety and Control Act in 1997, updating the older Atomic Energy Control Act (1946) and paving the way for the former Atomic Energy Control Board (AECB) to become the CNSC on May 31, 2000.

Comprehensive Study Report (CSR)

An environmental assessment report prepared under the *Canadian Environmental Assessment Act*. A comprehensive study is required for projects listed in the Comprehensive Studies Regulations under the *Act*.

Controlled Area

An area controlled in accordance with Radiation Protection practices. The controlled area is often referred to as the active area.

Critical Group

For a given radionuclide and source, a uniform or generic group of people whose location, age, habits, diet etc cause them to receive doses higher than the average received by people in all other groups in the exposed population.

Curie (Ci)

A unit used to measure the level of radioactive decay. One curie equals 37 billion disintegrations per second, or approximately the radioactivity of one gram of radium.

Deferment Period

A period of monitoring and surveillance when no significant decommissioning work is in progress.

Deminimis Waste

Waste which has activity levels below regulatory requirements for unrestricted release. This material is releasable to an off-site landfill or is recyclable.

Detailed Decommissioning Plans (DDP)

A plan to decontaminate/remediate redundant nuclear facilities to a condition which establishes a final end state that fulfills all pertinent regulatory and national policy requirements.

Duration

The time period over an environmental effect will last.

Environmental Effect

A change in the natural and / or social environment that occurs as a result of project activities.

Final End State

The target final condition of the decommissioned site. Normally this is the state achieved when release from regulatory control or establishment of continuing controls is approved.

Fission

The break-up of the nucleus of an atom into two major fragments, plus smaller fragments and free neutrons, when the nucleus is struck by a slow-moving free neutron.

Fixation (Fixing)

The process of stabilizing contamination through methods such as the application of spray or brushed-on paint or paint-like products. Fixation is done to ensure that any loose surface contamination is stabilized for a long period.

Flask

A CNSC approved containment system for transfer of radioactive materials. It is commonly used for transport of radioactive material from one licensed facility to another licensed facility.

Fuel (Nuclear)

Fissionable material used to power a nuclear reactor.

Gamma radiation

Radiation with the greatest penetrating power but least ionizing of the three principal forms of radiation. Gamma radiation can completely penetrate and damage all body organs.

Geographical Extent

The area over, or throughout which, the environmental effects are likely to occur.

Gray (Gy)

Standard International unit for absorbed radiation dose, equal to the absorption of one joule of radiation energy per kilogram of material.

Hazard

A source of danger to worker health and safety or the environment. Typical conventional industrial hazards include PCB's, asbestos, dust, propane and lead-based coatings. Typical radiological hazards include radiation sources, samples, contaminated materials and irradiated fuel.

HEPA Filters

High Efficiency Particulate Air filters used to filter radioactive dusts from the air.

HLW

High Level Waste comprises irradiated reactor fuel and metals from nuclear reactor core components.

HVAC

This refers to the Heating, Ventilation and Air Conditioning systems. At Whiteshell the heating system includes the powerhouse, district heating distribution system and building heating coils. Typical ventilation for most buildings includes supply and exhaust air duct work and ventilation fans. Air conditioning includes the B100 chiller, distribution lines and the building coils.

Hydrocarbon

An organic compound containing carbon and hydrogen.

Inactive

Not radioactive: as with "active" this does not mean that the facility is non-operational.

Inactive (Supervised) Area

The inactive area boundary is shown in Figure 2.1. The inactive area is generally the support infrastructure that has not been directly impacted by nuclear operations and is considered free of radioactive contamination.

In-Situ

A term referring to the management of radioactive material, waste or a facility in its existing location.

Interim End State

A temporary end state achieved to place a facility in safe monitoring and surveillance until final decommissioning is implemented.

Interim End State Survey

Radiological characterization done to identify hazards and estimate the level of radiation. This would be a documented detailed survey. It would include a review of historic information, gridded surveying, swipe sampling and photographic documentation.

Institutional Control

Institutional controls are requirements placed on AECL by the CNSC to ensure long-term safety from residual contamination of a decommissioned facility.

Isopleth

Line drawn on a diagram, delineating areas with similar ranges of numerical value for a parameter of interest.

Leachate

The water that percolates through a porous medium such as soil and transports any salts or other dissolvable materials which may be found in the soil.

LLW

Low-level (radioactive) Waste is generated from laboratories and the nuclear fuel cycle as well as the nuclear fuel cycle. It comprises paper, rags, tools, clothing, filters etc. which contain small amounts of mostly short-lived radioactivity. It is not dangerous to handle, but must be disposed of more carefully than normal garbage.

Loss of Function

Inability to use the environmental component in a way that serves its ecological role.

Magnitude

Size or degree of the impact compared to existing environmental conditions.

Mitigation

Measures applied to prevent or minimize harm that would otherwise occur to the environment or workers or the public. For example, the use of respirators by workers to eliminate ingestion of airborne contamination is mitigation.

MLW

Medium (or intermediate) level Waste contains higher amounts of radioactivity and may require special shielding. It typically comprises resins, chemical sludges and reactor components, as well as contaminated materials from reactor decommissioning.

Moderator

Moderators are used to lower ("moderate") the energies of the neutrons emitted by fissioning uranium atoms, to increase their probability of hitting another uranium atom to cause further fissioning. Graphite and light water are frequently used as moderators. CANDU reactors use heavy water as the moderator.

Monitoring and Surveillance

Monitoring and surveillance (M&S) is applied to a facility that has been decommissioned to an interim end state but has not been demolished. M&S includes radiological surveying, and inspection and maintenance of building and facility systems.

Natural End State

A state in which lands are released for unconditional public use by the CNSC and where radiation levels approximate background levels in the area.

Occurrence

The rate of recurrence of the environmental effect.

Operational Shutdown

Shutdown operations involve the closing of operations and the removal of unfixed items including furniture, chemicals and laboratory apparatus otherwise necessary to the normal operation of the facility.

Outer (Uncontrolled) Area

The outer area at Whiteshell Laboratories consists of the balance of the property outside the active and inactive areas. There should be no radiation hazards within the outer area, except while material or waste is being transported to the WMA or off-site.

Passive Operating State

This condition is instituted when a facility or system is placed in an operating state where the inventory of radiological or other hazards is managed and controlled, but no new operations are carried out involving additional inventory.

Phase

For the purposes of the Whiteshell decommissioning program, phases are time periods. For Whiteshell Laboratories, there are three proposed phases spanning a time period of sixty years and at the end of the third phase, decommissioning will be complete.

Public Registry

The public registry is a physical and electronic repository of all public information on the CSR. The maintenance of the public registry is the responsibility of the Responsible Authorities (RAs).

Radiation

Radiation refers to energy that is given off by atoms when they move or change state. It can take the form of electromagnetic waves, such as heat, light, x-rays or gamma rays and streams of particles such as alpha particles, beta particles, neutrons and protons.

Radioactive

The condition of a material exhibiting the spontaneous decay of an unstable atomic nucleus into a stable or unstable nucleus.

Radioisotopes

Atoms of chemical elements may have many isotopes (different forms) with different atomic numbers and different atomic weights. If an isotope is radioactive, it is sometimes referred to as a radioisotope.

Refurbishment

Refurbishment involves repairs and replacement of building system components integral to maintenance of a building envelope and the maintenance of its original use.

Rem

A unit of dose equivalent and effective dose equivalent. It is the non-SI unit that has been superseded by sievert. It is equal to 0.01 Sv.

Remediation

Corrective measures that are applied to reduce or eliminate an effect after an incident has occurred. For example, containing and cleaning up a spill is remediation. Remediation techniques are also used to return an uncontaminated site to a natural state.

Renewable Resources

Resources that can naturally regenerate such as forests or fisheries. With effective use and management, these resources can be harvested today while maintaining viability for continued use in the future.

Responsible Authority (RA)

The federal agency or department that is responsible under the *Canadian Environmental Assessment Act* for ensuring that the environmental assessment is conducted in accordance with the requirements of the *Act*.

Reversibility

The degree to which the effect can or will be reversed (usually measured in time it will take to restore the environment).

Roentgen (R)

A unit of exposure equal to 2.58 x 10-4 Ci/kg.

Sediment

Particulate matter that has been transported by wind, water or ice and subsequently deposited.

Scoping Survey

A radiological survey carried out to identify hazards and to estimate the level of radiation to establish safe work practices. Only a moderate amount of detail and effort are required for a scoping survey.

Scope of Environmental Assessment

The subjects identified by the RA to be addressed in the CSR.

Shutdown Operations

See Operational Shutdown.

Sievert (Sv)

A Standard International unit of measurement that is used to describe the absorption of radiation by the human body.

Site Remediation

Refers to cleaning and removal of contaminants from the soil. A remediated site has no contaminants above specified release levels.

Site Restoration

Involves returning a site insofar as is possible to its unperturbed or pre-development condition and may include re-vegetation.

Stabilization

Stabilization is a part of the remediation process. It typically refers to placement of a piece of ground into a state where it will not be affected by erosion or other physical influences.

Standpipe

Standpipes consist of vertically reinforced concrete containers lined with carbon steel pipe and covered with a concrete shielding plug. Smaller standpipe units are 0.6 m I.D. and 1.0 m O.D. with 0.5 m extension above the ground surface. Larger units are about 0.9 m I.D. and 1.3 m I.D. Older units have no steel liners. Standpipes are used to store fuel, MLW and HEPA filters.

Storm Drain System

This network of catch basins, pipes and an outfall is used to drain surface water from the site into the Winnipeg River.

Sump

A pit, depression or other structure in which water collects before being bailed or pumped out.

TLD - Thermoluminescence Dosimeter

A crystalline material, which, when heated after being exposed to radiation, emits light in proportion to the radiation dose previously received. TLD's are used to measure direct dose received by workers.

Trench

Holes of varying lengths and widths, typically 4 m in depth excavated in the WMA until about 1985 and used for storage of low-level radioactive waste.

Tritium

A radioactive isotope of hydrogen with two neutrons and one proton in the nucleus. It is both naturally occurring and produced in nuclear reactors. As well, significant amounts were generated by nuclear weapons testing in the 1950's and 60's. Its uses include biomedical research and self-illuminating devices. It has a radioactive half-life of 12.33 years.

Unaffected Land

The Unaffected Land (Figure 2.1) is the portion of the site that was not used for or impacted by nuclear operations.

Unrestricted Release

A term used to apply to buildings or real estate which the CNSC has certified as no longer requiring radiological controls.

WR-1	Whiteshell Reactor-1 (organically-cooled)
ZEUS	Zoological Environment Under Stress

1.0 INTRODUCTION

1.1 BACKGROUND

Atomic Energy of Canada Limited (AECL) was established in 1952 by the Canadian government for the purposes of developing peaceful uses of nuclear energy. AECL has a staff of more than 3500 and has its head office and design and engineering centre in Mississauga, Ontario and major research laboratories in Chalk River, Ontario along with branch offices worldwide. It also has facilities at the Whiteshell Laboratories near Pinawa, Manitoba, in Montreal, Quebec and an office in Ottawa, Ontario.

Whiteshell Laboratories was established at Pinawa, Manitoba (Figure 1.1) in the early 1960s to carry out nuclear research and development activities for higher temperature versions of the Canada Deuterium Uranium (CANDU) reactor. The initial focus of research was the Whiteshell Reactor-1 (WR-1) and Organic Cooled Reactor (OCR), which began operation in 1965. The OCR program was discontinued in the early 1970s in favour of the heavy-water-cooled CANDU system. WR-1 continued to operate until 1985 in support of AECL research programs. Other programs carried out at Whiteshell Laboratories included the Nuclear Fuel Waste Management Program, SLOWPOKE Demonstration Reactor Project and various accelerator activities. Whiteshell Laboratories has a range of nuclear facilities that provided support for these and other research and development programs.

As a result of the financial impact of the federal government's program review process, AECL made a business decision in 1997 to discontinue research programs and operations at Whiteshell Laboratories. AECL and the federal government attempted unsuccessfully to find an alternative private sector sponsor that would assume the financial responsibility for site operations, facilities and programs. Subsequently, AECL received government concurrence in 1998 to proceed with actions to achieve closure of Whiteshell Laboratories. Planning is now in progress to achieve the transition from an operational state at Whiteshell Laboratories, in support of AECL's business, to a shutdown and decommissioned state that meets regulatory requirements for a licensed nuclear site.

1.2 PROJECT OVERVIEW

The Whiteshell Laboratories' decommissioning program encompasses all of the site buildings and facilities except for unaffected lands (land not used for or impacted by nuclear development or operations), where early release may be requested to meet commercialization or privatization objectives. The first task is to achieve operational shutdown of redundant nuclear research facilities. This shutdown has been initiated and will include operational cleanup and safe shutdown of redundant facilities, preparation and submission to the Canadian Nuclear Safety Commission (CNSC) of Detailed Decommissioning Plans (DDP) for approval, and preparation and submission of an environmental assessment report (i.e. this report). The Active Liquid Waste Treatment Centre (ALWTC) as well as the Waste Management Facilities, Concrete Canister Storage Facility (CCSF) and Waste Management Area (WMA), will remain in operation throughout the operational shutdown period and for the first phase of decommissioning.

The primary objective of the decommissioning program is to leave the site in a safe and environmentally sound manner. The implementation plan for the decommissioning program is highly dependent upon a number of factors. The most important is the availability of disposal facilities which dictates the time frame within which the Whiteshell Laboratories decommissioning program can be carried out to achieve a final end state (see Section 2.3.2).

1.3 PROJECT NEED AND PURPOSE

1.3.1 Need

As a result of the federal government's program review process that significantly reduced funding to nuclear research in Canada, AECL subsequently made a business decision to discontinue research programs and operations at the Whiteshell Laboratories. This closure requires a change in the nature of the licence by the CNSC to reflect the transition from Site Operations to Site Decommissioning.

1.3.2 Purpose

The purpose of the project is to safely and effectively transform the Whiteshell Laboratories from an operational state that supports AECL's business, to a shutdown and decommissioned state that meets regulatory requirements for the unrestricted release of a decommissioned nuclear site.

1.4 REGULATORY REQUIREMENTS

Whiteshell Laboratories Decommissioning Project will be required to comply with applicable federal and provincial environmental legislation and adhere to relevant environmental policies, guidelines and standards.

1.4.1 Federal Government

The Whiteshell Laboratories is owned and operated by the Crown (AECL) and is therefore subject to federal environmental legislation. The three most applicable Acts and regulations are as follows:

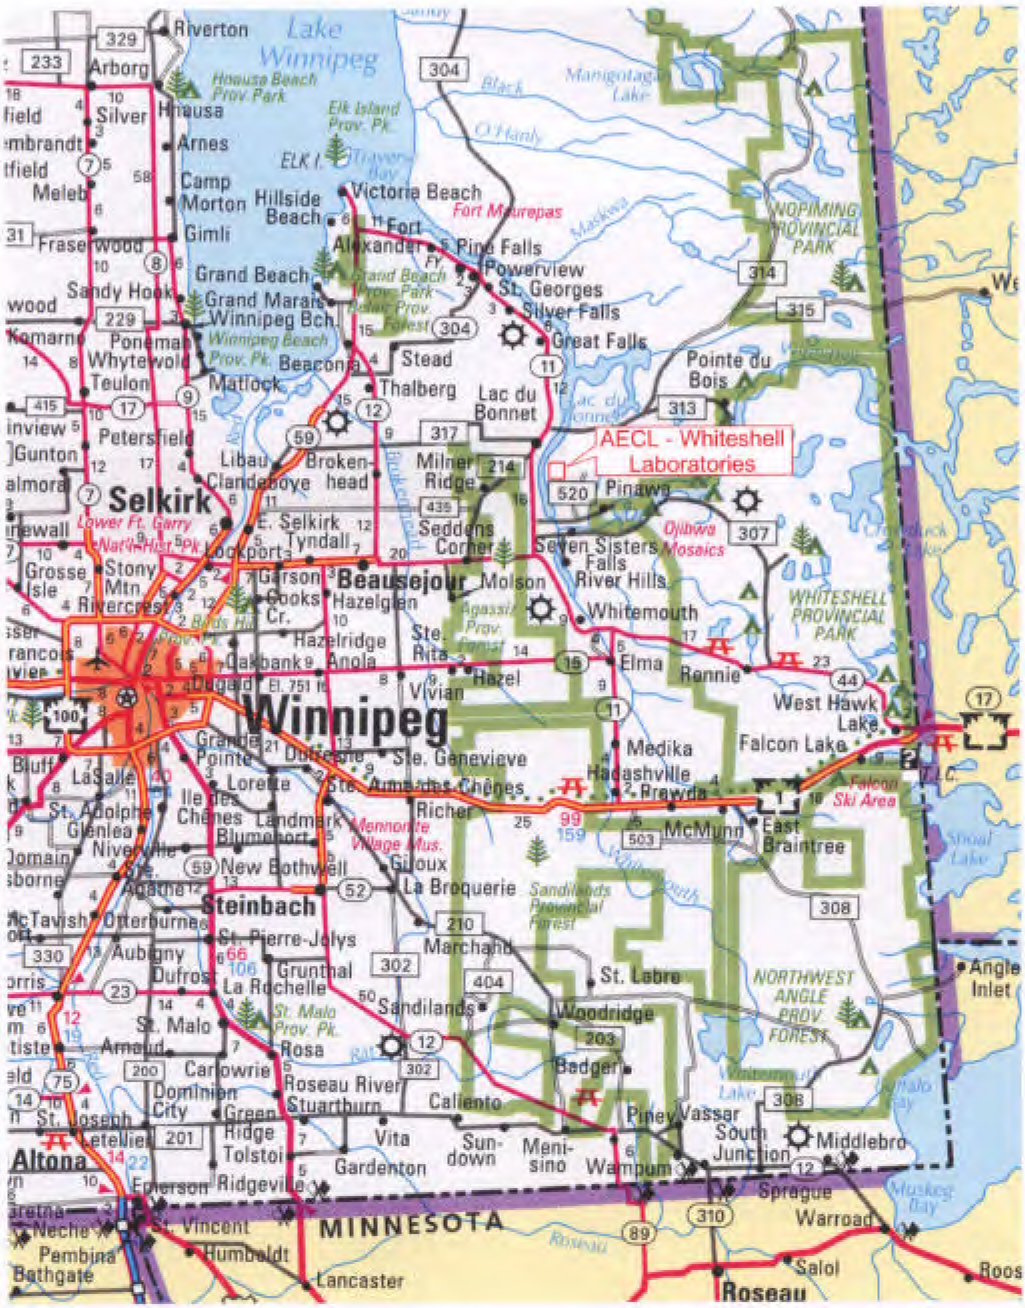
1.4.1.1 Nuclear Safety Control Act

The *Nuclear Safety and Control Act (NSCA)* took effect on May 31, 2000 and replaced the *Atomic Energy Control Act*. The CNSC regulates the use of nuclear energy and materials in Canada to protect human health, safety, security and the environment, and to respect Canada's international commitments on the peaceful uses of nuclear energy. The mandate of the CNSC has evolved from national security concerns to the control of the health, safety and environmental consequences of nuclear activities.

With the *Nuclear Safety and Control Act* taking effect, the Atomic Energy Control Board became the Canadian Nuclear Safety Commission. Relevant regulations under the *Nuclear Safety and Control Act* include:

FIGURE 1.1

LOCATION OF AECL - WHITESHELL LABORATORIES



- General Nuclear Safety and Control Regulations.
- Radiation Protection Regulations.
- Class I Nuclear Facilities Regulations.
- Nuclear Substances and Radiation Devices Regulations.
- Packaging and Transport of Nuclear Substance Regulations.
- Nuclear Security Regulations.

The document *Decommissioning Planning for Licensed Activities*, Regulatory Guide G-219, describes the CNSC's requirements concerning the planning of decommissioning activities.

1.4.1.2 Canadian Environmental Assessment Act

The *Canadian Environmental Assessment Act (CEAA)* establishes the process to assess the environmental effects of projects requiring federal actions or decisions. *CEAA* is designed to ensure that the environmental effects of projects are considered as early as possible in a project's planning stage. Application of *CEAA* to the Whiteshell Laboratories Decommissioning Project is discussed below.

Whiteshell Laboratories Decommissioning Project

Decommissioning of the Whiteshell Laboratories is an activity in relation to a physical work (i.e. a project) under *CEAA* and is subject to environmental assessment requirements of the *CEAA*. Where *CEAA* applies, the responsible authority must make a decision on the results of an environmental assessment before it can exercise a power, function or duty of a type set out in section 5 of the *CEAA*, such as issuing a prescribed regulatory approval, or providing federal funds or lands that would allow the project to proceed.

Proponent

The proponent of the Whiteshell Laboratories Decommissioning Project is AECL.

Section 5 Trigger

The amendment to the Whiteshell Laboratories licence to allow for decommissioning of the Whiteshell Laboratories will be made under subsection 24(2) of the *NCSA*.

With the advent of the NSCA, consequential amendments to the regulations under the *CEAA* will be needed to replace references to the *Atomic Energy Control Act* and its regulations by appropriate references to the provisions of the NSCA. Until these amendments are put in place, Section 44 of the Interpretation Act deems references to the former legislation to be references to the analogous provisions of the NSCA.

In this case, the former provision authorizing the licence amendment was subsection 27(1) of the Atomic Energy Control Regulations, which was listed as a *CEAA* trigger under the Law List Regulations. Reading the NSCA in analogous fashion, the present renewal is a trigger for the *CEAA* under the Law List Regulations.

Furthermore, should the assessment determine that the project is likely to harmfully alter, disrupt or destroy fish habitat, an authorization under section 35(2) of the *Fisheries Act* may be required. The granting of such an approval is also prescribed in the *CEAA* Law List Regulations as a trigger for an environmental assessment.

Responsible Authority

The Responsible Authorities (RAs) for the Whiteshell Laboratories Decommissioning Project are the CNSC and the Department of Fisheries and Oceans (DFO). The Canadian nuclear industry is monitored and regulated by the CNSC, a federal nuclear control agency, answerable to the Canadian Parliament. DFO's interest lies in possible effects on the Winnipeg River. There are no other RAs for the project.

Environmental Assessment Track

Decommissioning of the Whiteshell Laboratories has been determined by the CNSC to require a Comprehensive Study environmental assessment under *CEAA*. Decommissioning of the WR-1 nuclear reactor, which is included in the project scope, is referenced under Part VI, Section 19, Subsection (d) of the Comprehensive Study List Regulations of *CEAA*. The environmental assessment is required to address Section 16 (1) and (2) factors under the *Act*.

Expert Federal Authorities

Pursuant to the Federal Co-ordination Regulations under the *CEAA*, the following expert federal authorities likely to have an interest in the decommissioning project include:

- Environment Canada.
- Health Canada.
- Natural Resources Canada.
- Western Economic Diversification Canada.

Public Registries

The CNSC, as the lead RA, established and maintains a public registry for the Whiteshell Laboratories Decommissioning Project in accordance with *CEAA* requirements. This involves the registration of the project on the Federal Environmental Assessment Index (FEAI reference no. 18737) and maintaining public access to all documents related to the environmental assessment. The FEAI can be accessed through the *CEAA*, CNSC and AECL web sites. Manitoba Conservation also established a public registry for the project (File no. 4479.00) with registry locations at the Pinawa Library, Winnipeg Centennial Library and Manitoba Conservation Resource Centre in Winnipeg.

1.4.1.3 Fisheries Act

The *Fisheries Act* is administered by the Ministers of Fisheries and Oceans. The *Fisheries Act* regulates the protection of fishes and fish habitat and prohibits deposition of deleterious substances into waters frequented by fish. Disturbance to or alteration of fish habitat in the Winnipeg River may require issuance of an authorization under the *Fisheries Act*.

1.4.2 Provincial Government

The Manitoba Conservation Department has been notified of the federal environmental assessment to be conducted for this project. Decommissioning of the Whiteshell Laboratories is not considered by Manitoba Conservation to be a development under the *Manitoba Environment Act*. However, under the Canada-Manitoba Agreement for Environmental Assessment Harmonization, information on the decommissioning project has been provided to Manitoba Conservation by the Canadian Environmental Assessment Agency, and provincial technical staff have been invited to participate in the technical review of the assessment. Manitoba Conservation has formed a Technical Advisory Committee (TAC) to maintain awareness of the environmental and socio-economic implications of the decommissioning activities and to provide advice to the Director and the Minister of Manitoba Conservation.

There are some restrictions on the storage of radioactive waste in Manitoba. *The Manitoba High Level Radiation Waste Act* limits the interim or permanent storage of radioactive wastes to those produced from research conducted in Manitoba.

Decommissioned lands released for unrestricted use will be transferred to the Manitoba provincial government and will be subject to provincial legislation. Developments proposed for these lands that are listed in the Classes of Development Regulations under the *Manitoba Environment Act* require licensing under that *Act*. Environmental assessments will be required for listed developments.

1.5 AECL COMMITMENTS

AECL, as holder of the Whiteshell Laboratories site licence, has made the following commitments:

- AECL is committed to conducting all decommissioning activities to ensure health and safety of workers, the public and protection of the environment.
- AECL is committed to ensuring that the funding to meet the Whiteshell Laboratories decommissioning requirements is identified as a component of the segregated appropriation for decommissioning from the Treasury Board.
- AECL is committed to meeting all applicable regulatory, safety and environmental requirements throughout the decommissioning process.
- AECL has retained key individuals to develop and initiate its decommissioning program. AECL is committed to maintaining required resources on its decommissioning team.
- AECL is committed to maintaining fully trained and qualified staff to meet security requirements.
- AECL is committed to maintaining an environmental monitoring program for as long as wastes requiring management remain at the site.

- AECL is committed to the involvement of local communities in the environmental monitoring program.
- AECL will implement mitigation measures for project activities where an evaluation of decommissioning activities has determined the need for mitigation.
- AECL is committed to maintaining monitoring and surveillance programs for all nuclear facilities and affected lands until the final end state is achieved.
- AECL is committed to an ongoing communication program with area communities and other stakeholders and supports the establishment of a Public Advisory Committee during the decommissioning program.

1.6 SCHEDULE

1.6.1 Comprehensive Study Report

The technical work supporting the preparation of the draft Comprehensive Study Report (CSR) was completed in December 1999. From January through March 2000 the document underwent project team review and review by the AECL Safety Review Committee. Following a technical review of the draft report by the CNSC, Federal Authorities and Manitoba Conservation, the CSR was revised to address technical comments. Written comments from the public were requested and incorporated into the draft report as appropriate. The final Comprehensive Study Report is then submitted to the Canadian Environmental Assessment Agency for further public review. In turn, the Agency makes a recommendation regarding approval of the CSR to the Minister of the Environment.

1.6.2 Decommissioning

The initial requirement for Whiteshell Laboratories is to achieve operational shutdown of redundant research facilities, prepare a submission of detailed decommissioning plans to the CNSC for approval and prepare the comprehensive study environmental assessment report. On completion of operational shutdown, AECL will need to have resolved any revisions to the licensing structure for the site and have received approval of the detailed decommissioning plans taking into account mitigation measures and follow-up requirements of the environmental assessment.

1.7 LICENSING

The Whiteshell Laboratories are currently regulated under CNSC Operating Licence NRTEOL-2.00-2002. This licence contains conditions for operation of nuclear and other related facilities. Decommissioning of any facilities at the Whiteshell Laboratories will require the prior approval of the CNSC. The future licensing strategy includes revocation of the current Operating Licence and the issuance of a Decommissioning Licence that will allow decommissioning and designated operating activities to proceed.

1.8 PLANNING RESPONSIBILITIES (AECL)

Detailed planning and execution of the decommissioning program is carried out by AECL's Facilities and Nuclear Operations Unit. The organization implementing the decommissioning plan consists of a Program Manager, Licensing Manager, Decommissioning Operations Manager, Project Team Leaders and representatives from key AECL support functions. Once decommissioning of a facility is implemented, responsibility for safety of that facility is transferred from the Facility Authority to the Decommissioning Authority.

1.9 REPORT ORGANIZATION

The Comprehensive Study Report is organized into the following sections:

1.0 – Introduction: Provides an overview of the Whiteshell Laboratories Decommissioning Project, describes the need and purpose for the project, outlines regulatory requirements and AECL's commitments, presents the schedule for the Comprehensive Study Report and for decommissioning licensing requirements and responsibilities.

2.0 – Scope of Assessment: Discusses the scope of the project and assessment, identifies issues to be addressed in the Comprehensive Study Report and describes spatial and temporal boundaries for the environmental assessment.

3.0 – Alternatives: Discusses alternative means of carrying out the project and presents a preferred alternative.

4.0 – Project Description: Describes Whiteshell Laboratories' site and associated buildings and facilities, describes the proposed decommissioning project, and presents the approach for decommissioning.

5.0 – Description of Existing Environment: Describes the biophysical and socio-economic environment in which the decommissioning project will be carried out and identifies Valued Ecosystem Components and Social Components to be assessed.

6.0 – Assessment of Environmental Effects and Mitigation: Evaluates environmental and socio-economic effects by environmental component for the preferred alternative including effects of accidents and malfunctions and effects of the environment on the project. Mitigation measures to address any adverse environmental effects are outlined and a statement of residual effects is presented.

7.0 – Significance of Residual Effects: Analyzes significance of residual environmental effects for the Whiteshell Laboratories Decommissioning Project.

8.0 – Cumulative Environmental Effects: Assesses environmental effects of decommissioning project in conjunction with effects from other activities in the area.

9.0 – Follow-up Program: Describes the follow-up program for the decommissioning project including monitoring, surveillance and inspection, as well as responsibilities for implementation and reporting.

10.0 – Public Consultation: Outlines the public consultation program developed for the Whiteshell Laboratories Decommissioning Project, describes public and First Nation consultations carried out and discusses issues raised and responses provided.

11.0 – Conclusions: Discusses the acceptability of residual environmental effects, identifies outstanding issues and proposes actions to address them.

2.0 SCOPE OF PROJECT AND ASSESSMENT

The scope of the project, and scope of the assessment were defined by the CNSC in accordance with Sections 15 and 16 of *CEAA* (Appendix A).

2.1 SCOPE OF THE PROJECT

The scope of the project refers to the various components of the proposed undertaking that will be considered as the project for the purposes of the environmental assessment. The project is the decommissioning of the Whiteshell Laboratories, which includes the following nuclear facilities (listed in Appendices A and C of the site licence NRTEOL-2.00-2002):

- Shielded Facility.
- Concrete Canister Storage Facility.
- Waste Management Area.
- Active Liquid Waste Treatment Centre.
- Van de Graaff Accelerator.
- Neutron Generator.
- Whiteshell Reactor (WR-1).

All buildings and infrastructure on the site are included in the project.

Land under CNSC licence, identified as being affected or potentially affected by nuclear development and/or operations, is also included in the project scope. Land which is not connected or associated with any nuclear development or operations and which is not linked to the decommissioning project is not within the scope of the project. This includes a large portion of land currently under the CNSC licence. The approximately 4375 ha (10,800 acres) currently under CNSC licence, was originally selected to provide an appropriate exclusion zone when the WR-1 reactor and site facilities were in full operation. The use of this area for that purpose is no longer required. The Project Study Area map (Figure 2.1) defines the boundaries between the decommissioning project and the licensed project study areas.

Decommissioning activities consist of the dismantling and/or decontamination and refurbishment of all structures, infrastructure and services and the remediation of all lands in the project area, except for 8 ha where continued management of radioactive waste under CNSC licence is proposed to continue in the future. Decommissioning is intended to render the aforementioned facilities, buildings and lands to a condition acceptable for release from CNSC licensed control. The project also includes on-site sorting, segregation, decontamination and interim storage of all materials either currently in storage, or arising from decommissioning activities. Areas where waste management activities are proposed to continue will remain under a CNSC licence and will not be released for unrestricted use.

The project does not include the Underground Research Laboratory (not licensed by CNSC), nor does it include the Whiteshell Irradiator (which is under a CNSC licence held by ACSION).

The CSR does not include the analysis of environmental effects from investigations to identify, delineate or evaluate potential existing contamination that is required to maintain site safety and conduct the environmental assessment. It also does not include the various operations, monitoring and surveillance activities currently authorized under the operating licence.

The long-term management of nuclear wastes is contingent upon finding a nationally acceptable solution consistent with federal policy on waste management. No options or sites have been defined or approved that will provide such a solution. Consequently, it is not possible to examine long-term waste management alternatives as part of the scope of the Whiteshell Laboratories Decommissioning Project.

2.2 SCOPE OF THE ASSESSMENT

The environmental assessment of the proposed project includes a consideration of factors detailed in the CNSC's Scope of Assessment document (CNSC 1999) and of the following factors identified in paragraphs 16(1)(a) to (d) and 16(2)(a) to (d) of *CEAA*:

- purpose of the project;
- alternative means of carrying out the project that are technically and economically feasible and the environmental effects of any such alternatives;
- environmental effects of the project, including the environmental effects of malfunctions or accidents that may occur in connection with the project and any cumulative environmental effects that are likely to result from the project in combination with other projects or activities that have been or will be carried out;
- socio-economic effects caused by a change in the environment due to the project;
- significance of the effects;
- comments from the public that are received in accordance with *CEAA* and its regulations, during the scoping, conduct and review of the environmental assessment;
- measures that are technically and economically feasible and that would mitigate any significant adverse environmental effects of the project;
- requirements of a follow-up program in respect of the project; and
- sustainability of renewable resources, including effects on the capacity of renewable resources that are likely to be affected by the project.

In accordance with subsection 16(1)(e) of the *CEAA*, the assessment also includes a consideration of the following matters considered relevant by the CNSC:

- description of the decommissioning project;
- description of the existing environment which may reasonably be expected to be affected by the project; and
- program for consultation with the community and other stakeholders on the project, and for addressing issues raised by the public that are within the scope of this assessment.

2.3 BOUNDARIES

2.3.1 Spatial

The environmental assessment of the proposed Whiteshell Laboratories Decommissioning Project was conducted based on four geographic study areas as follows.

2.3.1.1 Project Study Area

The Project Study Area encompasses all facilities, buildings and infrastructure, including lands, that are directly connected or associated with the decommissioning project as described under the scope of the project (Figure 2.1). This area includes the active and controlled areas as well as the Waste Management Area and Concrete Canister Storage Facility.

2.3.1.2 AECL Licensed Study Area

The Licensed Study Area is the area within the property boundaries of Whiteshell Laboratories (Figure 2.2). The property is located approximately 10 km west of Pinawa and north of Highway 211, and includes lands on both the east and west side of the Winnipeg River. The property covers 4375 ha. The eastern area's southern boundary starts just north of Highway 211 and the property line extends north for about 7.1 km. Across the river, Highway 11 passes through the centre of the western area, which is directly across from the hub of the facility's buildings and stretches 3.5 km along the riverbank. The majority of the Whiteshell Laboratories facilities fall within a 40 ha area, adjacent to the east shore of the Winnipeg River. The lagoon is 300 m north of the main laboratory. The Waste Management Area (WMA), Large Scale Vented Combustion Test Facility (LSVCTF), landfill, and Field Irradiator Gamma (FIG) areas fall between 1 and 3 km north-east of the main area of buildings.

2.3.1.3 Local Study Area

The Local Study Area includes the Rural Municipality of Lac du Bonnet, the Local Government District of Pinawa and the north part of the Rural Municipality of Whitemouth (Figure 2.2). The area includes the communities of Pinawa, Seven Sisters Falls, River Hills, McArthur Falls, and Lac du Bonnet. It includes a north-south reach of the Winnipeg River, the Pinawa Channel and the Underground Research Laboratory.

2.3.1.4 Regional Study Area

The Regional Study Area is the area approximately bounded by the east-west extension of Highway 15 in the south, Traverse Bay of Lake Winnipeg in the north, Highway 12 north of Anola to Grand Beach in the west and north of Rennie to Pointe du Bois in the east (Figure 2.3). The area includes the Local Study Area communities, as well as Beausejour, Pine Falls, Great Falls and Whitemouth, and Sagkeeng and Brokenhead First Nations. It includes parts of Whiteshell and Nopiming Provincial Park, Grand Beach Provincial Park, and a portion of the Winnipeg River watershed.

2.3.2 Temporal

The time frame for the environmental assessment is dependent on the duration of the decommissioning program, as well as the subsequent period of control over the wastes and facilities proposed to remain on site prior to transfer to a permanent disposal facility or other nationally acceptable long-term solution to the management of radioactive wastes.

The implementation plan for the decommissioning program is highly dependent on a number of key factors, namely:

- identification, characterization and safety assessments for site hazards;
- development of detailed plans and procedures;
- waste management policy and structure which allows definition of a suitable end-state; specifically, availability of waste disposal or suitable storage alternatives;
- satisfactory completion of the regulatory approvals process, including an environmental assessment; and
- implementation and control of the decommissioning process.

These factors dictate the time frame within which the decommissioning program can be carried out to achieve a final end-state. Many project components must be addressed in a sequential manner since support facilities (waste management areas, decontamination facilities, site service infrastructure) are required to remain in operation to support the initial decommissioning activities. This requires optimization of resources/project teams to develop the hazards characterizations, plans and approvals necessary to implement the project in a sequential manner. Since disposal is not available, the remaining life cycle of the existing buildings and infrastructure is taken into account to control liabilities/hazards for an interim period.

Depending on the alternative selected for decommissioning, the time frame for the project ranges from 20 years to 100 years.

In addition to the time frame of the project as described above, the temporal boundaries of the assessment were considered to be flexible to ensure that the duration of any significant effects beyond the project time frame would be fully characterized.

3.0 ALTERNATIVES

3.1 INTRODUCTION

CEAA identifies two types of alternatives which can be considered in an environmental assessment; these are "alternatives to" the project and "alternative means" of carrying out the project. Alternatives to the project are functionally different ways to meet the need and achieve the project purpose. "Alternative means" of carrying out the project are methods of a similar technical character or methods that are functionally the same. They illustrate the variety of ways a project can be undertaken and refer to such factors as location, technologies, designs, and economic feasibility.

Since shutdown facilities cannot remain in a monitoring state indefinitely, their ultimate decommissioning is unavoidable. Moreover, the CNSC's regulatory policy on decommissioning imposes obligations on the licensee to retire facilities permanently in the interest of health, safety, security and protection of the environment. Therefore, decommissioning of the Whiteshell Laboratories is necessary and there is no alternative to that undertaking. Thus, only alternative means of carrying out the project have been assessed in this study. The primary difference between alternative means is the implementation time for individual phases. The only difference in delivery is in the optimization of individual project components which are described in Section 4.0.

3.2 ALTERNATIVE MEANS OF CARRYING OUT THE PROJECT

Public input in the local area indicated interest in a rapid (5 years or less) decommissioning program for Whiteshell Laboratories. This approach was not considered for further assessment, since it was deemed to be unrealistic in terms of the time frame to deliver the decommissioning program, optimization of resources and the availability of waste disposal (Helbrecht 1999). Consequently three alternative means were established and evaluated for economic and technical feasibility, public concern and environmental effects.

- Alternative 1 - End state in a Short time period (20 years).
- Alternative 2 - End State in a Long Time Period (100 years).
- Alternative 3 - End-state in a Moderate Time Period (60 years).

All alternatives include a period of waste storage on site with transfer to an off-site waste disposal facility when it becomes available. The establishment of an off-site waste disposal facility is not within the scope of this project. Table 3.1 provides criteria for assessing alternatives.

Table 3.1
Criteria for Assessing Alternatives

Criteria	Definitions
Economic Feasibility	How does each alternative compare in relation to the cost of the project activity? Economic Feasibility Good, Moderate, or Poor
Technical Feasibility	Are off-site waste disposal facilities available? Are there different occupational safety risks associated with each alternative? Technical Feasibility – Yes, No or Undetermined
Public Concern	Is there public concern for each alternative? Public Concern – High, Medium or Low
Environmental Effects	What are the likely environmental effects associated with each alternative? Include the time for which the alternative to the project will satisfy the need and purpose of the project. Environmental Effects – Adverse, Beneficial or Undetermined

Source: Canadian Environmental Assessment Agency 1998.

An outline of each of the alternative means is provided in Sections 3.2.1 to 3.2.3.

3.2.1 Alternative 1 - End State in a Short Time Period

This alternative proposes that Whiteshell Laboratories be decommissioned over a relatively short time period (approximately 20 years). The time frame provides sufficient time to meet characterization, safety assessment and planning/approval requirements needed to implement the project work. Twenty years would allow time to assess wastes and to differentiate the wastes that can be managed in-situ at the site from those that will require removal to disposal or alternate storage.

The approach assumes that a radioactive waste disposal repository would be available within 10 years. The Whiteshell Laboratories' facilities would initially be decommissioned to a safe monitoring and surveillance state. Once waste disposal facilities are available, the final decommissioning phase would be completed. The waste would be removed to disposal throughout the subsequent 10-year time period.

This alternative presents substantial risks in that waste disposal facilities which are outside the control of the Whiteshell Laboratories management program, may not be available.

3.2.2 Alternative 2 – End State in a Long Time Period

This alternative proposes decommissioning of Whiteshell Laboratories over as long a period as necessary to implement national waste disposal policies. The assumption is that the longest this process would take is 100 years. As in Alternative 1, the initial work would involve placing site facilities in a secure monitoring and surveillance state. It is likely that all waste disposal requirements could be optimized as part of the national program. Implementation would occur in three phases followed by an institutional control period:

Phase 1 – Activities directed toward nuclear and radioisotope buildings and facilities in order to place them in a safe, secure, interim end state. The Van de Graaff Accelerator and the Neutron Generator would be completely decommissioned. Phase 1 would be completed in approximately six years.

Phase 2 – Regular monitoring and surveillance of all buildings and facilities project activity would be focussed on the Waste Management Area (WMA). Most waste management facilities would be placed in a passive operational state and interim processing, handling and storage facilities, required during monitoring and surveillance and decommissioning project activities, would be established. Phase 2 would be followed by a deferment period of approximately 45 years during which site monitoring and surveillance would be maintained.

Phase 3 – Activities directed to bringing the site to a final end state that would fulfil all pertinent regulatory and national policy requirements. Phase 3 would involve decommissioning to a final end-state within 100 years. The site would be decommissioned to an unrestricted release state except for some parts of the Waste Management Area which would be disposed of in-situ. Some infrastructure refurbishment and rebuilding may be required to maintain the facilities under monitoring and surveillance for the 45 year deferment period and beyond, resulting in increased volumes of rubble during the final decommissioning.

Institutional Control Period – The three phases of decommissioning activities will be followed by a period of institutional control where the performance of the remaining in-situ disposal components (low-level waste trenches) are monitored and controlled. The institutional control activities are designed to demonstrate that the in-situ components perform in the manner predicted in the related safety assessments and to ensure that there is no development or intrusion into affected areas until the hazards have been reduced to acceptable levels. For Whiteshell Laboratories, this period is expected to extend for approximately 200 years beyond the physical project work.

3.2.3 Alternative 3 - End State in a Moderate Time Period

This alternative proposes that Whiteshell Laboratories be decommissioned over an intermediate time frame (approximately 60 years). The time frame is based on the concept that safety and costs can be optimized by taking advantage of natural radioactive decay and by decommissioning buildings as they come to the end of their economic and structural life. It is also based on the assumption that national waste disposal facilities would be available for low-level waste by 2025 and high level waste by 2050. Decommissioning would be carried out in three phases.

The phasing for Alternative 3 is identical to that for Alternative 2 with the following exceptions:

- the deferment period following Phase 2 would be eliminated;
- Phase 3 decommissioning would be carried out over the period 2015 to 2060; and
- the timing and sequence of decommissioning activities would be determined largely by the availability of disposal facilities and by the age and condition of engineered structures and buildings.

This alternative has the advantage of presenting a feasible approach that is planned in accordance with assumptions for disposal space for Whiteshell Laboratories waste. The approach also achieves maximum cost-efficiency since it capitalizes on existing engineered services and building envelopes to (i) monitor liabilities in the interim, and (ii) schedule final decommissioning for individual facilities based on the expected life span of structures. It also minimizes the production of new waste from refurbishment or construction required to maintain facilities over a lengthy deferment period.

If off-site waste disposal becomes available earlier, all site facilities except those which provide radioactivity decay benefits (e.g. WR-1 and some WMA wastes) could be decommissioned earlier. On the other hand, should offsite waste disposal availability take longer than assumed, the contingency would be to revert to Alternative 2.

3.3 COMPARISON OF ALTERNATIVES

Results of a comparative evaluation of economic feasibility, technical feasibility and public concern are summarized in Table 3.2. The qualitative terms "high", "medium" and "low" are applied to public concerns; "good", "moderate", and "poor" are applied to economic feasibility. Technical feasibility is expressed as either feasible (Yes) or not feasible (No). The relative environmental effects of the three alternatives are evaluated and compared in Section 3.4.2.

Table 3.2
Comparison of Alternative Means of Carrying Out the Project

Alternatives	**Criteria**		
	Economic Feasibility	**Technical Feasibility**	**Public Concern**
Alternative 1 **End-State in a Short Time Period**	***Poor*** Very high decommissioning costs Property maintenance costs low.	***No*** Off-site disposal facility unlikely to be available. Shorter time for radioactivity decay results in high occupational safety risk.	***Low*** Meets public request to clean-up site as soon as possible. Maximizes availability of land for re-development.
Alternative 2 **End-State in a Long Time Period**	***Moderate*** Reduced decommissioning costs High site maintenance costs Increased waste handling costs.	***Yes*** Off-site waste disposal most likely to be available. Longest time for radioactive decay. Lowest occupational safety risk.	***High*** Wastes remain on site for long period - Perceived safety issues. Delays availability of some site land of redevelopment.
Alternative 3 **End-State in a Moderate Time Period**	***Good*** Lowest decommissioning costs Moderate site maintenance costs Lowest waste handling costs.	***Yes*** Off-site waste disposal likely to be available Sufficient time for radioactive decay Low occupational safety risk.	***High*** Wastes remain on site for long period - Perceived safety issues Delays availability of some site land for redevelopment

The main difference between the three alternative means of decommissioning the Whiteshell Laboratories is the time involved. The steps to completing decommissioning of the site and the proposed end-state are virtually the same for the three alternatives considered. It is understood that the public preference is for an early and complete decommissioning, that is, Alternative 1. That approach appears to have two limitations. One relates to the short period for deriving benefits from natural radioactive decay; the other to the unavailability of a site or facilities for disposal of radioactive wastes. Alternatives 2 and 3 offer longer time frames to complete the project, allowing optimization of radioactivity decay and the avoidance of double handling by moving wastes directly to disposal facilities.

It should be noted that although WR-1 is used as the example for the safety and cost discussion relative to project implementation, the same argument can be made for intermediate-level wastes stored in engineered facilities at the Waste Management Area and for decommissioning waste arising from other nuclear facilities. This constitutes an additional volume of ~ 2800 m^3 of waste which was produced through the WR-1 experimental program. This waste has the same characteristics as the WR-1 decommissioning waste and presents similar benefits from optimization of radioactivity decay.

At shutdown in 1985, radiation fields of reactor vault components in WR-1 were approximately 500 Gy/h (50,000 R/h). The radiation levels were estimated by activation calculations based on the irradiation history of the reactor and were verified through direct measurements taken in representative fuel channel locations (McIlwain 1992). The radiation fields resulted from the activation of the main reactor core materials, the stainless steel calandria, the mild steel of the reactor thermal shield and from the stainless steel ozhenite and zirconium-niobium fuel channels.

There are varying degrees of benefit from natural radioactivity decay dependent on the proposed handling and disposition of individual component materials. For example, the most significant decay from fuel channels has already been achieved during the first 15 years following shutdown. On average, the radioactivity decays by a factor of over 1,000 commencing at shutdown through a deferment period of ~ 50 years. Approximately one-tenth of that decay has already been achieved. However, the reactor thermal shield and the stainless steel calandria vessel radiation levels will decrease by an additional factor of about 100 by 2050. These two components are particularly important from a decay benefit perspective since handling these materials to disposal is extremely labour intensive. The material must be segmented to remove it from the core. Therefore, the radiation levels at the time the work is implemented are critical in controlling the project cost and in managing worker doses. The availability of disposal facilities is also a critical factor to consider. Without a disposal facility double handling occurs resulting in additional dose to workers since materials are initially transferred to storage facilities and ultimately to disposal.

Figures 3.1, 3.2 and 3.3 show the decay curves for the core component materials. The reference material (McIlwain 1992) provides additional detail on the radioactivity decay characteristics.

The main benefit of a radioactivity decay period is provided through the decay of the shorter half-life radioisotopes ^{60}Co, ^{55}Fe, ^{54}Mn, ^{125}Sn, and ^{125m}Te. After about 50 years, the radiation fields in the reactor vault are dominated by the long-lived radioisotopes, ^{94}Nb, ^{63}Ni, ^{14}C and there is limited benefit to further deferment.

It is important to note that the reactor vault is a highly shielded structure which provides a high integrity storage location for the activated components until waste disposal is developed in Canada. In fact there are currently no available storage structures in Canada which can accommodate the activated WR-1 vault components. Consequently the best storage location for the fuel channels is the reactor vault until optimum decay is achieved for the entire activated inventory. Radiation fields outside the reactor vault are generally low (< 10 mrem/hr) and are easily manageable during the monitoring and surveillance period.

Handling of the highly radioactive materials places economic and safety limitations on the implementation of the decommissioning program. Although doable, removal of highly radioactive material prior to optimizing radioactive decay, dramatically increases the cost to maintain worker safety. The additional shielding and remote handling required is estimated to add between $40M and $80M to the reference project cost.

Similarly, the unavailability of disposal facilities impacts cost and worker safety. To provide interim storage space requires the construction of high integrity shielded facilities estimated to add between $20M and $40 M to the reference cost of the decommissioning project. The double handling to move materials to disposal adds an additional $10M to $20M to the reference cost of the project and contributes to significant additional dose to workers.

Figure 3.1

(Reactor shutdown in 1985)

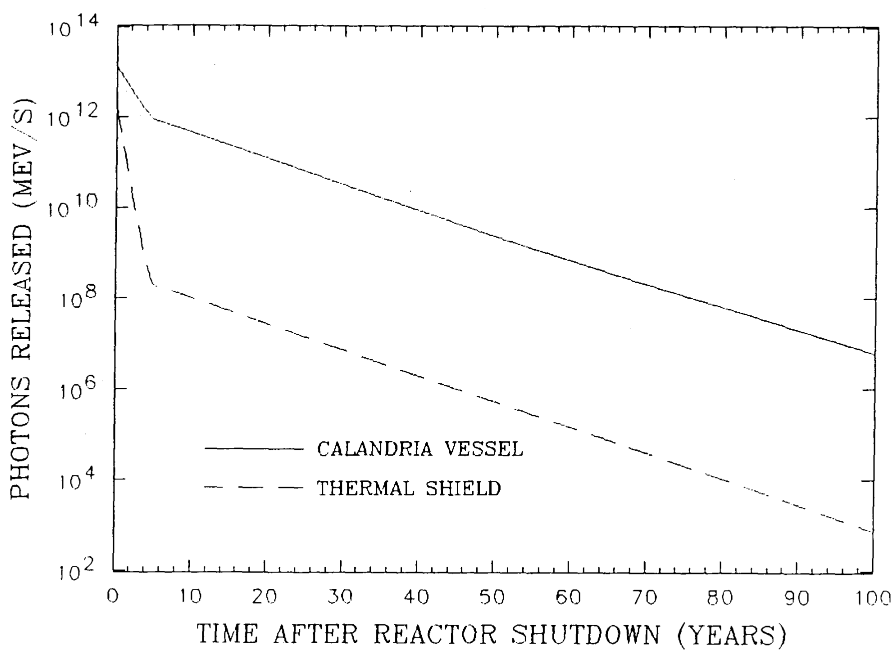

Figure 3.2
Decay Curves for the Steel Fuel Channels and the Steel Calandria Vessel (per kilogram)
(Reactor shutdown in 1985)

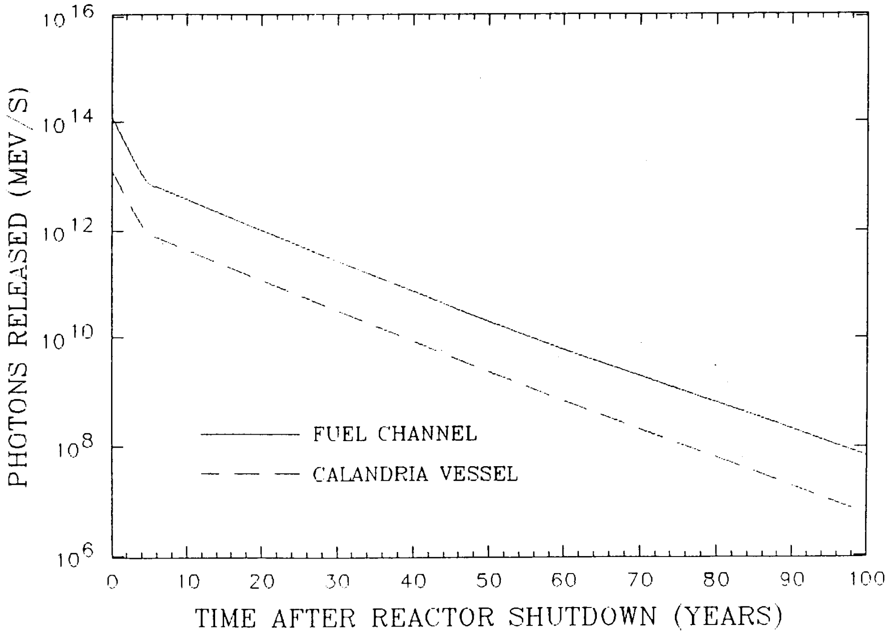

Figure 3.3
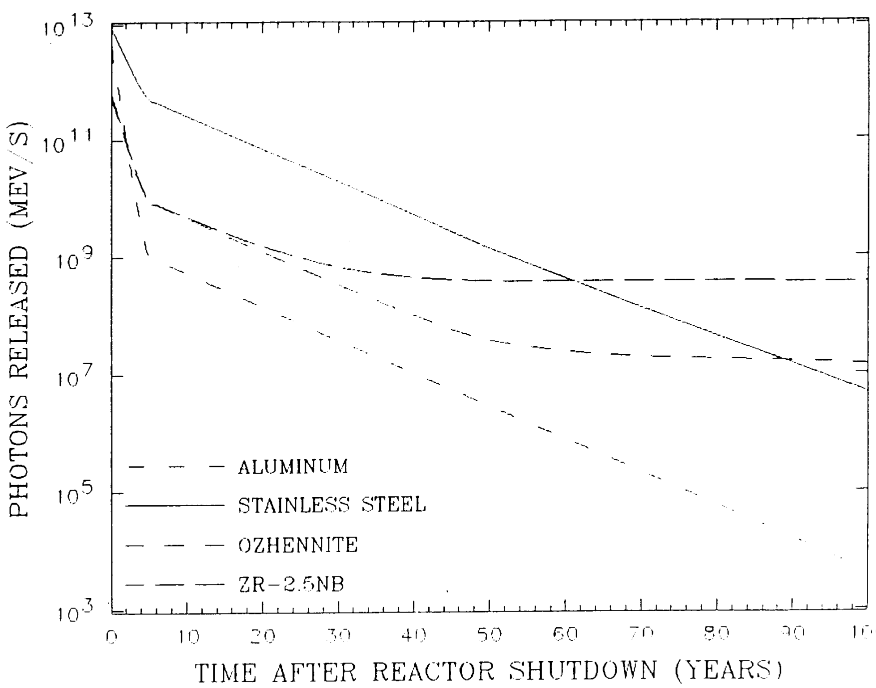
Decay Curves for the Fuel Channel and Calandria Tubes (per centimetre height)
(Reactor shutdown in 1985)



The management of the irradiated fuel inventory currently stored in concrete canisters at Whiteshell Laboratories until disposal facilities become available also provides an economic benefit. The canister life safely extends to at least 2050. Although, handling equipment does exist to allow transfer to another location, the construction of replacement interim storage and the associated double handling would add approximately $20M to $30M to the reference project cost.

Alternative 3, (60 years) is the reference option and represents the baseline project cost. Alternative 1 (20 years) would incur the highest overall additional cost to complete the project. Although the M & S cost (approximately $2M/a) would be lower by ~ $40M, the remote handling and interim storage costs would increase the reference project cost in the range of $90M to $170M for an overall increase of between $50M and $130M.

Alternative 2 (100 years), would incur no additional cost for interim storage or remote handling beyond those already estimated in the reference option because there is limited benefit from additional radioactivity decay. However, the M & S costs (approximately $2M/a) would be higher by ~ $80M because of the increased project time frame. As well, most buildings housing nuclear facilities on the site would have exceeded their economic and structural life span and would require extensive replacement. This would add ~ $28M to overall project cost (estimated at about $2000/m^2 for the basic building footprint space of 14,000 m^2 occupied by nuclear facilities). The rebuilding would also increase the amount of waste which ultimately requires disposal. The cost of Alternative 2 is higher than the reference alternative by at least $108M. A cost comparison for the three alternatives is presented in Table 3.3.

The three alternatives involve virtually identical decommissioning steps. As a result, the main differences relate to overall project cost and the greater risk to worker health and safety associated with the dismantling of WR-1 before radioactivity levels have been lowered naturally over time.

Table 3.3

Comparison of Costs for Decommissioning Alternatives

Alternative	Time Frame (Years)	Base Cost ($M)	$M Reductions Provided by Option	$M Additional Costs of Option	$M Total Incremental Cost of Option
1	20	reference project cost	-40	90 – 170	50 to 130
2	100	reference project cost	0	108	108
3	60	reference project cost	0	0	0

The foregoing discussion indicates that Alternative 3 provides the best worker dose optimization and is the lowest cost approach. This approach is summarized as follows:

1. The achievement of a monitoring and surveillance state for the site nuclear facilities within 6 years of project implementation.
2. Monitoring and surveillance of the nuclear facilities with decommissioning activities scheduled to coincide with the end of building structural life and the expected availability of national disposal facilities.

3. Movement of wastes only when off-site disposal is available or when safety in existing structures is compromised.
4. In-situ management for selected low-level waste trenches in the Waste Management Area.

3.4 COMPARATIVE EVALUATION OF ENVIRONMENTAL EFFECTS OF ALTERNATIVES

3.4.1 Overview of Environmental Effects of the Three Alternatives

The focus on environmental effects addresses the likely differences between alternatives. The effects analysis of the preferred alternative is given in Section 6.0. In general, the same activities occur for all three alternatives so any difference would relate either to:

- changes in the intensity of the activity; or
- the risk of leaving a potential contaminant in-situ.

Two comments can be made:

- Notwithstanding the different time frames of the three alternatives, decommissioning still occurs over a lengthy period – at least 20 years. As a result, the intensity of any activity is not likely to be much different between alternatives. Overlap of activities is unlikely.
- Institutional control remains in effect throughout the decommissioning period – whatever alternative is chosen and will include monitoring activities (see Section 9.5). As a result, risk of undetected contaminant migration from the Study Area will be very low for all alternatives.

The following provides a qualitative comparison of the environmental effects of the three alternatives:

Air Quality and Noise

No differences in air quality effects are anticipated for the three alternatives.

Groundwater

The potential for groundwater contamination relates to in-situ disposal. Any permanent in-situ disposal must be safe for all time. In that context, the time differences between alternatives are insignificant and the differences in environmental effects probably not measurable. The potential for groundwater impact is discussed in Appendix C.1. The conclusion, at least for the decommissioning period, was that there is little likelihood of contaminant migration. As a result, there will be no difference between alternatives.

Surface Water

Effects from all three alternatives should be essentially the same. Alternative 1 may result in slightly higher effluent emissions to the river due to the short project duration. However, for all three alternatives, effluent emissions are expected to be lower than in the past when Whiteshell Laboratories was operating.

Aquatic Biota

The effect from all three alternatives should be essentially the same. The risk to aquatic biota is related to the release of contaminants to the Winnipeg River. Alternative 1 may result in the higher effluent emissions. However, for all three alternatives, effluent emissions are expected to be lower than in the past when Whiteshell Laboratories was operating.

Socio-Economics

There has been public pressure to have the site released for other uses as soon as possible. Alternative 1 will achieve this sooner than Alternative 3 while Alternative 2 takes the longest time.

Worker Health and Safety

The prime worker health and safety concern is the decommissioning of WR-1. Alternative 3 allows sufficient time for radioactive decay to occur for the safe handling of radioactive material. Alternative 1 subjects workers to much higher radiation fields. Alternative 2 results in slightly lower radiation fields than Alternative 3 in decommissioning WR-1, but contributes additional radioactivity dose through the refurbishment of facilities and the relocation of wastes to interim storage to manage the project over such a long period.

Public Health

The operation of Whiteshell Laboratories has had no measurable effect on public health. Clearly the longer radioactive decay is allowed, the lower will be the risk of an accident when handling high level waste. Thus although small, Alternative 1 has the potential for creating more significant public health effects because of the risk associated with the early off-site transportation of more highly radioactive wastes. Alternatives 2 and 3 benefit from additional radioactive decay and do not result in the same concerns over off-site transportation.

Physical and Cultural Heritage; Land and Resource Use; Archaeology; and Aboriginal Interests

The effects from all Alternatives would be essentially the same.

3.4.2 Comparison of Alternatives

The Canadian Environmental Assessment Agency (1998) describes four criteria for comparing alternatives: economic feasibility, technical feasibility, public concerns and environmental effects. Table 3.2 provides a preliminary comparison of the alternatives using the first three of these criteria. Based on the environmental effects analysis described above, the fourth criteria can now be added as presented in Table 3.4.

Table 3.4
Comparison of Alternatives

Criteria / Alternatives	Economic Feasibility [1]	Technical Feasibility [1]	Public Concerns [1]	Environmental Effects
Alternative 1 **End-State in a Short Time Period**	Poor	No	Low	Beneficial Best on socio-economics, highest risk to worker health and safety
Alternative 2 **End-State in a Long Time Period**	Moderate	Yes	High	Beneficial Worst on socio-economics
Alternative 3 **End-State in a Moderate Time Period**	Good	Yes	High	Beneficial Best on worker health and safety

(1) More details are given in Table 3.2

All three alternatives were found to benefit the environment since the property is decommissioned to a clean condition compared to its current state.

Environmental effects from each alternative are expected to be similar with the exception of higher risk to Worker Health and Safety for Alternative 1 than for Alternatives 2 and 3.

Of the three alternatives, Alternative 3 is the preferred option. Alternative 1 was dismissed because of the poor economic feasibility and the higher risk to worker health and safety. Alternative 3 was preferred over Alternative 2 because of:

- Socio-economics – The public would like to see the site released as soon as possible making Alternative 3 preferable over Alternative 2.
- Economic feasibility – Decommissioning costs for Alternative 3 are expected to be lower than for Alternative 2.

3.5 DECOMMISSIONING ALTERNATIVES WITHIN THE PREFERRED TIME PERIOD

Within the preferred option, Alternative 3, it is recognized that various strategies, approaches and technologies will be available to achieve the end-state. It is expected that an optimization exercise will be conducted for each facility and the results will form the basis for the individual detailed decommissioning plans. Because of the technical developments that will be achieved over the lifetime of the project, it is not possible to speculate on what new processes or techniques will be available to those implementing the decommissioning plans. When the detailed decommissioning plans are developed in the future, the regulator will be able to verify that the optimization process took place and that the applicable standards will be met.

That said, there exist two fundamental alternatives that apply to project components or facilities. One such option is complete removal. It applies to most of the facilities at Whiteshell Laboratories. When complete removal is achieved, the land will become available to other uses.

However, for some other components or facilities, the advantages of complete removal are not easily demonstrated. For those components, in-situ management is an option that warrants consideration. Therefore, a decision has to be made on whether a facility or component can be managed in-situ or if it merits full removal. A number of criteria need to be established to make that decision. These may include:

- Nature and level of contaminants still present.
- Exposure pathways (workers and public).
- Potential environmental effects.
- Technical feasibility of remediation.
- Economic feasibility of remediation.
- Level of public concern.

The two areas involving possible in-situ disposal include the river sediments downstream of the outfall and the low-level radioactive waste (LLW) trenches at the Waste Management Area. The option for permanent disposal is discussed in 4.3.1 and will be subject to regulatory review and approval. Descriptions of the river sediments and of the Waste Management Area are provided in Sections 4.3.3 and 4.3.1 respectively.

During the assessment, it was established that additional fieldwork was necessary to gain enough information to make that decision.

The investigation work for the river sediments is provided in Appendix B and sediment quality data is provided in Section 5.4.7. Appendix C contains the information on the LLW trenches investigation. Key information on the groundwater flow regime in the vicinity of the WMA is provided in Section 5.4.4.

The results of the assessment for those two components are summarized in Section 6.3. It was demonstrated that safe in-situ abandonment of the sediments is feasible. Safe in-situ management of the Waste Management Area is considered feasible. However, as mentioned above, the final safety case for in-situ disposal of WMA waste must be prepared to support the final decision on in-situ disposal.

Table 3.5 provides an overview of factors considered in deciding whether to manage the LLW trench contaminants in-situ or to fully remove them.

Table 3.5
Comparison of Alternative Methods

Criteria	River Sediments	LLW Trenches
Contamination	1.3 GBq in a small area immediately downstream of outfall	Limited to trench area. No evidence of upward or lateral migration
Technical feasibility of removal	Feasible	Feasible
Economical feasibility	Feasible	Prohibitive cost associated with retrieval, interim storage facilities and final disposal of site.
Main environmental impacts – In-situ	Insignificant	Not significant due to low inventory, favorable groundwater flow regime and controls
Main environmental impacts – Removal	Re-suspension of contaminants. Need for site to store dredgate.	Doses to workers, interim storage facility and transport to off-site disposal.
Public Concern	Protection of water quality and fish resources is important	Complete removal preferred

Based on the available information, AECL selected in-situ abandonment of the river sediments. There is currently a very small area of contamination immediately downstream of the outfall and the inventory in the sediments is quite small (1.3 GBq). Given that the estimated doses to humans and non-human biota is extremely low, remediation poses a greater risk through re-suspension of the contaminated sediments and cannot be justified.

AECL also believes that the LLW currently stored in the waste management area can be managed in-situ and that this approach represent no significant risk to workers or members of the public. This conclusion is based on the relatively small contaminant inventory, a favorable groundwater flow regime and the absence of pathways that could lead to significant exposure to hazardous levels of contaminants. There is no merit in recovering the LLW and moving it to another storage facility. The removal would unnecessarily expose workers handling the waste. The waste management area will continue to be monitored closely for any change in the current conditions.

4.0 PROJECT DESCRIPTION

4.1 INTRODUCTION AND OVERVIEW

The Whiteshell Laboratories is a nuclear research facility located approximately 100 km northeast of Winnipeg near Pinawa, Manitoba. The site occupies approximately 4375 ha of land owned by AECL, adjacent to the Winnipeg River. Whiteshell Laboratories consists of ten major buildings and a number of smaller support facilities. The Waste Management Area (WMA), the Concrete Canister Storage Facilities (CCSF) and the Large Scale Vented Combustion Test Facility (LSVCTF) are located approximately 1 km northeast of the main laboratory site. The main laboratory site layout is shown schematically in Figure 4.1.

4.1.1 History

The Whiteshell Laboratories site was established by AECL to carry out research and development of higher temperature versions of the CANDU reactor during the early 1960s. The site originally included Whiteshell Reactor-1 (WR-1) an Organic Cooled Reactor (OCR), which was brought on-line in 1965. The OCR program was eliminated in the early 1970s to focus on the heavy water-cooled CANDU reactor system. Development of programs including the Nuclear Fuel Waste Management Program, SLOWPOKE Demonstration Reactor, CANDU Reactor Safety research projects and accelerator projects maintained Whiteshell Laboratories as a diverse centre for research. Many other support facilities were required over the years to support the research programs. These included the WMA, CCSF and Active Liquid Waste Treatment Centre (ALWTC) in 1963, Hot Cell Facilities (HCF) in 1965, the Immobilized Fuel Test Facility (IFTF) in 1984, the Van de Graaff Accelerator in 1970 (upgraded in 1979) and the Neutron Generator Facility in 1975.

AECL decided to discontinue research programs at Whiteshell Laboratories as a result of the federal program review process that significantly reduced funding to nuclear research. The federal government examined various alternatives for the site and recommended privatization. Subsequent attempts to attract a private owner to take over the facility were unsuccessful. Subsequently, AECL made the business decision in 1998 to close Whiteshell Laboratories and to decommission the facilities to meet regulatory requirements. Certain operations at the site are presently in various stages of operational shutdown. Experimental work except for processing of active liquid wastes (TFRE/Amine) was concluded in the Shielded Facilities (SF) Cleanup and removal of research equipment has also been completed. Both the Neutron Generator Facility and the Van de Graaff Accelerator have been shutdown and detailed decommissioning plans have been prepared. The WR-1 reactor was permanently shutdown in 1985 and Phase 1 decommissioning, which started in 1989, was completed in 1995. This shutdown involved removal of sources and readily-removable radioactive materials, such as irradiated reactor fuel, from the facility and loose contamination from the main floor (600 level) and first sub-level (500 level) space. The completion of Phase 1 prepared WR-1 for a long deferment period during which radioactivity levels will be reduced significantly through natural decay prior to implementing further decommissioning work. At present, WR-1 is under a monitoring and surveillance program.

4.1.2 Project Components

To define the scope of the Whiteshell Laboratories Decommissioning Project, the site has been segregated into affected and unaffected lands. The affected lands are defined as the lands where nuclear development, operations or supporting activities are conducted and also includes land potentially affected by such activities. The unaffected lands are the balance of the site which have not been associated with AECL nuclear operations, and are not linked to or required for the decommissioning project.

The Whiteshell Laboratories decommissioning program encompasses all of the site facilities, buildings and land within the affected lands. Project components were identified from an examination of the Whiteshell Laboratories Detailed Decommissioning Plan, discussions with decommissioning project staff, and review of Whiteshell Laboratories' reports. Project components were finalized at a workshop in August 1999 attended by AECL and consultant team representatives, and were determined to be as outlined in Table 4.1.

Table 4.1
Project Components

Nuclear Facilities	Radioisotope Facilities	General Infrastructure
Shielded Facilities Van de Graaff Accelerator Neutron Generator Active Liquid Waste Treatment Centre Whiteshell Reactor -1 Concrete Canister Storage Facility Waste Management Area	B300 Decontamination Centre B402	Non-nuclear Buildings Landfill Sewage Lagoon Buried Services Contaminated Lands ("Affected Lands") Off-site Contamination including River Sediments

Project activities for each of the project components were identified for the three phases of the decommissioning project at the workshop in August 1999. Subsequently, project component activities were documented for Alternative 3, the Preferred Alternative, by Whiteshell Laboratories decommissioning program staff. The source documents are Whiteshell Laboratories Detailed Decommissioning Plan Volume 1: Program Overview (Helbrecht 1999) and The Whiteshell Laboratories Decommissioning Project Descriptions for the Comprehensive Study Report (Ridgway 1999).

4.2 DECOMMISSIONING PROJECT

4.2.1 Decommissioning Strategy

Plans are being developed to transform Whiteshell Laboratories safely and effectively from an operational state to a shutdown and decommissioned state. The shutdown and decommissioning of Whiteshell Laboratories address business objectives, and operational and decommissioning constraints as follows.

Business Objectives

- Ensure an orderly consolidation of remaining CANDU programs so as not to jeopardize CANDU business.
- Continue to fulfil management responsibilities for the Nuclear Fuel Waste Management Program until privatization or termination of the program occurs.
- Minimize the operational costs for Whiteshell Laboratories by aligning site operational activities with the level of activity in the remaining programs.
- Fulfil management responsibilities for the decommissioning program and provide operational support to the decommissioning program.

Operational Constraints

- AECL's Reactor Safety Research Program will continue to operate at Whiteshell Laboratories until December 2003 and will require continued operations in three active area buildings.
- The Nuclear Fuel Waste Management Program will continue to operate out of Whiteshell Laboratories and/or the Underground Research Laboratory until an as yet undefined date and will require continued operations in one active area facility (B300).
- The Whiteshell Laboratories Waste Management Area will need to continue as an operational facility for the initial decommissioning work to support continuing AECL programs and decommissioning of buildings no longer required by AECL.
- AECL assets not required for continuing CANDU programs will be made available for commercialization purposes.

Decommissioning Constraint

- Currently there is no nuclear waste disposal facility in Canada, thus limiting the decommissioning activities to achieving and maintaining a secure monitoring and surveillance state for the nuclear facilities until such a facility is available.

4.2.2 Overview of the Decommissioning Program

The decommissioning program proposed for Alternative 3, AECL's preferred alternative for Whiteshell Laboratories, is described in the document by Helbrecht (1999) and is part of a series of planning actions now in progress. With the exception of radioisotope facilities that will have shutdown plans, there is, or will be, a separate detailed decommissioning plan for each major component or facility. The detailed decommissioning plans will meet the requirements of the Canadian Nuclear Safety Commission's *Decommissioning Planning for Licensed Activities* (CNSC 2000a). A generic outline of a Detailed Decommissioning Plan (DDP) is provided in Table 4.2.

Table 4.2
Elements of a Detailed Decommissioning Plan

Brief description of the components and structure to be decommissioned
History of operation
Statement of the final end-state objectives
Description of specific requirements for institutional control
Result of radiological and hazardous chemical survey
Overview of decommissioning strategy
Description of each work package
Schedule
Description of waste management plan
Assessment of potential environmental effects (this document)
Conservative cost estimate
Description of public consultation (included in this document)
Description of project management structure
Quality Assurance plan
Emergency response plan
Site security program
Radiation protection program
Environmental protection and monitoring program
Personnel training program
Human factors program
Summary of health and safety issues and plan to address them
Listing of governmental agencies involved in the decommissioning program
Listing of operational and decommissioning record

It is fully expected that the level of detail to be included in the DDP will reflect the characteristics of the facility to be decommissioned. The DDP will also provide a mechanism to address uncertainties where decommissioning is deferred well into the future.

The proposed Whiteshell Laboratories decommissioning program will be implemented through a phased approach preceded by operational shutdown work. Actual decommissioning cannot proceed until the Comprehensive Study Report (CSR) is approved. The operational shutdown work which can be conducted in parallel with the preparation of the CSR will require a period of approximately 15 months. Preparatory work for the initial phase of decommissioning will be completed as follows:

- prepare and submit facility-detailed decommissioning plans for approval;
- secure transfer of the listed facilities addressed in Phase 1 to a site licence structure recognizing the decommissioning on acceptance of the CSR and approval of detailed decommissioning plans; and

- establish the licensing requirements for the remainder of site facilities.

Shutdown operations for the research facilities at Whiteshell Laboratories are in progress and occur in parallel with decommissioning planning. Operational shutdown work for the ALWTC and the Decontamination Centre will commence following shutdown of those facilities.

There is a logical series of steps needed to decommission a nuclear, radioisotope, or general infrastructure facility. Decommissioning work includes the following activities:

- assessing and characterizing hazards;
- decontaminating/remediating contaminants;
- packaging/dispositioning of waste (radiological, industrial, chemical and clean);
- surveying to document interim end-state or final surveying for unrestricted use;
- monitoring and surveillance during a deferment period;
- dispositioning of structures (i.e. for demolition or reuse); and
- surveying, characterizing and monitoring at the final end-state.

Some of the steps outlined above may be skipped or duplicated, depending on the facility. As an example of skipping a step, final decommissioning of the Neutron Generator and the Van de Graaff Accelerator will be carried out shortly after the conclusion of this environmental assessment and issuance of a decommissioning licence by the CNSC. There will be no need for documentation of an interim end state or for monitoring and surveillance because the final end-state is achieved in Phase 1.

Conversely, there may be the need to repeat decontamination steps in some radioisotope facilities. Decontamination and remediation of contaminants will be carried out shortly after assessment of hazards. Later on, duct work and active drain lines will be disconnected and capped. During this process, pieces of duct work and drain lines will be removed, potentially causing recontamination. Therefore, additional decontamination work may be needed.

Phased Approach

The decommissioning project proposes a phased approach over a sixty-year time period. Within each phase, and, therefore, over the entire program, the decommissioning activities are of a discontinuous nature (i.e. flow from the ALWTC will not be continuous, air emissions from decontamination and demolition activities will be intermittent and there are considerable periods of monitoring and surveillance).

Decommissioning is planned in three phases followed by an institutional control period:

Phase 1 – Activities will be directed toward nuclear and radioisotope buildings and facilities to place them in a safe, secure interim end state. The Van de Graaff Accelerator and the Neutron Generator will be completely decommissioned (approximately 5 years).

Phase 2 – Regular monitoring and surveillance of all buildings and facilities. Most of project activity is focussed on the WMA. Most waste management facilities will be placed in a passive operational state meaning that no further waste can be added but facility monitoring is maintained. Interim processing, handling and storage facilities, required during monitoring and surveillance and decommissioning project activities, will be established (approximately 10 years).

Phase 3 – Activities directed to bringing the site to a final end state will fulfil all pertinent regulatory and national policy requirements. The timing and sequence of decommissioning activities will be determined largely by the availability of disposal facilities and by the age and condition of engineered structures and buildings (approximately 45 years).

Institutional Control Period – The three phases of decommissioning activities will be followed by a period of institutional control where the performance of the remaining in-situ disposal components (low-level waste trenches) is monitored and controlled. The institutional control activities are designed to demonstrate that the in-situ components perform in the manner predicted in the related safety assessments and to ensure that there is no development or intrusion into affected areas until the hazards have been reduced to acceptable levels. For Whiteshell Laboratories this period is expected to extend for approximately 200 years beyond the physical project work.

Contingency Long-Term Waste Storage

The decommissioning program described above is based on an assumption that Canadian nuclear waste disposal facilities will be available for low-level waste by 2025 and for high-level waste by 2050. Given the uncertainty of when those facilities will actually be available, the decommissioning program includes contingency provisions for longer-term waste storage on the site and/or at other interim locations until the permanent disposal facilities are available. Any such interim waste storage facilities will be designed, constructed, operated and monitored using proven technologies for protecting people and the environment. All long-term storage facilities will remain under CNSC licensing controls for as long as is necessary to protect people and the environment.

4.3 DESCRIPTION OF FACILITIES

The following sections provide descriptions of the project components listed in Table 4.1, as well as a brief discussion of the decommissioning approach for each component. Details regarding decommissioning activities for each of the three phases for each component are provided in Helbrecht (1999) and Ridgway (1999).

4.3.1 Nuclear Facilities

The decommissioning approach is similar for nuclear facilities and radioisotope facilities, and has been summarized below. A description of each project component under the category of "Nuclear Facilities" follows.

In Phase 1, nuclear facilities and radioisotope facilities, with the exception of the waste management facilities and part of the ALWTC, will be placed in a safe, secure interim end state. Decommissioning operations will ultimately be conducted from the B100 supervised area. Heating, ventilation and air conditioning of this facility will remain at the current level and will be reduced in all remaining buildings and facilities. By the end of Phase 1, all of the remaining buildings will have been prepared for monitoring and surveillance. Phase 1 decommissioning activities will be completed and the buildings will be shutdown. All buildings and facilities will be advanced to an interim end state. The laboratory site nuclear and radioisotope facilities will be administered under a decommissioning licence structure.

In Phase 2, there will be regular monitoring and surveillance of all buildings and facilities. Most of the project activity will be focused on the WMA. This work will include decommissioning the incinerator, relocating irradiated fuel waste from standpipes and high-level waste from trench 6 and placing most of the WMA bunkers and buildings in a monitoring and surveillance state. A new facility will be constructed to accommodate radioactive solid waste arising from TFRE/Amine waste processing and decommissioning operations in Phase 2 and Phase 3. By the end of this phase, there will only be a small operating area for processing packaging and storage of waste. This work is scheduled to be completed in about 10 years. However, part of the ALWTC aqueous waste processing facility will be retained until the end of Phase 3.

In Phase 3, the site will be brought to a final end state. This will occur over a time frame of approximately 45 years. Work will begin in the WMA, then continue in the nuclear and radioisotope facilities and for the Active Drainage system. The Building Decontamination Centre will be relocated to B100 and interim domestic sewage facilities will be installed to replace the sewage lagoon. The Shielded Facility, WR-1, and the CCSF will be the last to be decommissioned. Some low-level waste in the WMA will be disposed of in-situ. There will be the need for a period of institutional control for the WMA.

Shielded Facilities

a) Description

The Shielded Facilities (SF) includes the Hot Cell Facility (HCF) and the Immobilized Fuel Test Facility (IFTF), both of which form the west extension of the Research and Development Building (B300).

The HCF began operation in 1965, and was used to provide shielded, remote handling facilities in support of the CANDU reactor safety research programs including post-irradiation examination of fuels and reactor core components, post-experimental examination of radioactive materials used in waste management studies and services for other AECL programs or industrial work involving radioactive materials.

The HCF is a single-storey structure with a main floor area of about 1200 m^2 and a ceiling height of 9.5 m. A 1-2 m deep crawl space is located beneath the main floor Operating Area and a full basement is located beneath the balance of the HCF.

The main floor of the HCF consists of the Cells, the Decontamination Area, the Horizontal and Vertical Storage Blocks, the Manipulator Decontamination and Repair Facility, the Operating Area, a Scanning Microscope facility, a workshop, a photographic laboratory, office areas, hallway, a change room and a shipping room. The Cells consist of 11 steel-lined, ilmenite-concrete shielded cells (Cells 1-11) and one steel-lined lead-shielded cell (Cell 12). All cells are equipped with remote manipulators and lead-glass shielding windows.

The IFTF began operation in 1984 and was used to provide space and facilities for a wide range of experiments using radioactive materials in support of the Canadian Nuclear Fuel Waste Management and CANDU Reactor Safety research programs.

The IFTF is a building extension located at the northwest corner of the HCF. It is a single-storey structure and has a main floor area of about 1300 m^2, with a high-ceiling area 9.5 m high and a low-ceiling area 3.5 m high. A 3 m deep crawlspace is located beneath the high-ceiling area and a full basement is located beneath the low-ceiling area.

The main floor of the IFTF consists of six Cells, the Decontamination Vestibule, the Operating Area, the Canister Storage Area, the Mock-Up and Mechanical Maintenance Area, five laboratories, change rooms and several offices.

b) Decommissioning Approach

Operational Shutdown

Experimental work has been terminated in both facilities and operational cleanup of Cells and work areas to remove research program equipment, materials and wastes is in progress as part of operational shutdown. The operational shutdown work also focuses initially on the processing of two active-liquid waste volumes stored at the site. 270 L of Thorium Fuel Reprocessing Experiment (TFRE) waste, stored in a tank in the HCF and 180 L of Amine Experiment waste (Amine), stored at the WMA will be processed to a solid waste form for interim storage at Whiteshell Laboratories. This work will emphasize identification, design, construction and operation of a processing facility in the HCF to solidify these wastes in an acceptable form for interim storage. The work includes the transfer of the amine wastes to the HCF. Processing of these wastes requires the continued operation of the HCF remote handling and safety systems (Cells 1, 2 and 3) identical to the requirements during the routine operating period. Therefore, this work is planned to be conducted under the existing Facility Authorization under SF operating licence. However, some decommissioning work activities, in other areas of the SF, may be implemented in parallel with the waste processing.

Decommissioning

Phase 1 decommissioning work will address decontamination and/or fixation of contamination, sealing of the shielded cells and operating areas. Minimum building heating and ventilation, to maintain building structural integrity meeting safety needs, will be established and the facility will be placed in a monitoring and surveillance state.

The SF will remain under monitoring and surveillance throughout Phase 2 and well into Phase 3. Final decommissioning to achieve a cleanup level suitable for releasing the facility from regulatory control will commence in about 2040.

Van de Graaff Accelerator

a) Description

The Van de Graaff Accelerator operated from 1970 to 1997, initially in the electron-beam mode and following an upgrade in 1979 exclusively in a proton continuous-beam mode. The facility is contained in four laboratories in B300 with the accelerator in two rooms separate from the target room and the control room. The facility occupies approximately 170 m^2 of space.

b) Decommissioning Approach

The facility is permanently shutdown and a Detailed Decommissioning Plan has been prepared. A scoping survey of the facility indicates very low radiation fields. No radioactive contamination is indicated in the accelerator work areas.

The equipment in this facility will be fully decommissioned in Phase 1. Decommissioning includes dismantling and removal of the system components and the associated support systems. All that will remain at the end of Phase 1 are the bare walls. Rooms will be decontaminated and released for monitoring and surveillance. In Phase 2, monitoring and surveillance work will be integrated with monitoring and surveillance operations for B300.

Subsequent demolition of the space occupied by these facilities will be part of B300 Final Demolition Plan.

Neutron Generator

a) Description

The 14 MeV Neutron Generator Facility is located in the Research and Development Complex (B300) rooms B-152/153. The facility was built in 1975 and was used in the development of methods for the assay of fissile and fertile materials in reactor fuels and components. Usage eventually shifted to fast neutron activation analysis.

The facility shutdown in 1988 and a Detailed Decommissioning Plan has been prepared. The tritium target was replaced with a blank target and all vacuum pumps were shutdown.

b) Decommissioning Approach

The equipment comprising this facility will be fully decommissioned in Phase 1. Decommissioning includes dismantling and removal of the system components and the associated support systems. All that will remain at the end of Phase 1 are the bare walls. Rooms will be decontaminated and released for monitoring and surveillance. In Phase 2, monitoring and surveillance work will be integrated with monitoring and surveillance operations that are planned to be carried out in the SF.

Subsequent demolition of the space occupied by these facilities will be part of the SF Final Decommissioning Plans.

Active Liquid Waste Treatment Centre

a) Description

The ALWTC, which is located in B200, began operation in 1963, receiving low-level liquid waste effluent from operating nuclear facilities (WR-1, SF, B300 Research Laboratories, Laundry/ Decontamination). The liquid effluents are transferred via underground piping connecting existing facilities to the ALWTC.

The ALWTC includes a medium-level liquid waste processing system which concentrates the waste stream originating from the SF. The resulting concentrate is solidified and stored at the WMA.

The ALWTC is a two-storey building, with external dimensions of 24.7 m by 12.8 m and a height of 7.6 m. Exterior walls from grade to 3.0 m above grade are constructed of 0.30 m thick reinforced concrete on the inside, followed by 25 mm of rigid insulation and 0.10 m thick brick facing. A thicker wall (0.46 m reinforced concrete) is used in Room 1-07. The upper part of the building is similar except that 0.20 m thick hollow concrete blocks are used rather than reinforced concrete. Two-storey shielded process cells run along both sides of the ground-floor pump gallery and second-floor operating gallery. The process cells contain holding tanks which are provided to store liquid wastes as follows:

Room 1-04	Laundry Tanks Cell
Room 1-05	Decontamination Tanks Cell
Room 1-07	Evaporator Cell
Room 1-08	B300 Tanks Cell
Room 1-09	B100 Tanks Cell

The evaporator cell (Room 1-07) and the adjacent areas of the building house the medium-level waste concentration and solidification system.

The decommissioning of the aqueous waste collection system connecting WR-1, B300 and the Decontamination Centre to the ALWTC is addressed as part of that plan. The in-ground collection system is a double containment system consisting of small diameter polyethylene piping inside a larger diameter polyurethane pipe. The system is equipped with leakage detection wells.

b) Decommissioning Approach

For the first part of Phase 1, the ALWTC will remain fully operational. By the end of Phase 1, most of the facility will be decommissioned to an interim end state. The process systems required for managing the reduced amount of aqueous Low-Level Waste from building sumps and small amounts of aqueous Medium-Level Waste generated from monitoring and surveillance and site decommissioning operations will be retained in an operational state beyond Phase 1 as follows:

- seven existing waste collection tanks will be consolidated into two tanks to collect building sump wastes during the monitoring and surveillance period; and
- a replacement waste concentration system will be designed and constructed to process medium level aqueous waste arising from WMA waste processing operations (e.g. standpipe waste retrieval). The existing method of treatment using an evaporator is worker radiation dose intensive and was eliminated as an option.

Phase 1 decommissioning of the unused portion of the ALWTC will include sealing active systems and active drainage. For example, drainage and ventilation systems will be removed or modified. Any systems remaining in place, which are not being used, will be capped off. Rooms will be decontaminated, hazards assessed and remediation applied where needed. In some areas contamination may be sealed/fixed in place until the final decommissioning in Phase 3. Radiological surveying will be carried out to document the facility condition for the interim end state.

In Phase 2, the unused portion of the ALWTC will remain in a monitoring and surveillance state. Liquid waste processing operations will be continued in a portion of the building. The design and operation of the remaining facility will be controlled to ensure the impact of operation is well within regulatory requirements.

The ALWTC will be decommissioned to an unrestricted use level in Phase 3. However, the decommissioning will not be completed until all decommissioning work is done for WR-1 and the WMA.

Whiteshell Reactor 1

a) Description

The WR-1 reactor was placed in service in 1965 to demonstrate the organic-cooled reactor concept using heavy water as the moderator. The system also provided a facility for engineering tests on alternative fuels, fuel channels and reactor coolants.

WR-1 operated from 1965 to 1985, accumulating 120,000 operating hours during its lifetime. The reactor was permanently shutdown in 1985 and placed in a secure shutdown state in preparation for decommissioning. The shutdown activities included defueling the reactor, placing the irradiated fuel in the storage bays and removing bulk heavy water to storage. Bulk organic coolant was removed from the reactor cooling circuits and transferred to the WMA for incineration. Reactor control systems were isolated. All building services required for decommissioning were maintained in an operating mode.

b) Decommissioning Approach

The initial decommissioning work for WR-1 commenced in 1989 and was completed in 1995. This work addressed the removal of easily mobilized radioactivity (fuel, fluids, etc.) from the facility and decontamination of the main floor (600 level) and first sub-level (500 level) space with potential for reuse by Whiteshell Laboratories. Phase 1 work substantially decreased potential hazards from the facility and reduced the monitoring and surveillance requirements for the deferment period. The Phase 1 end state prepared WR-1 for a deferment period during which significant radioactivity decay will reduce the postulated dose commitment associated with future decommissioning work.

- WR-1 will remain under monitoring and surveillance throughout Phases 1 and 2. Final decommissioning will be implemented as part of Phase 3 in about 2050.

The approach for WR-1 is to fully remove and package all activated and contaminated components for disposal in offsite facilities, to decontaminate the facility structure and then to demolish the building to achieve unrestricted release criteria. The dismantling and remediation activities include:

- removal of reactor vault components;
- removal of process piping and equipment;
- transfer of radioactive waste to off-site facilities;
- decontamination of building structure;
- demolition of the building structure; and
- remediation of the site to a “natural” state.

Concrete Canister Storage Facility

a) Description

The Concrete Canister Fuel Storage Program was developed at Whiteshell Laboratories to demonstrate that dry storage is a feasible alternative to water pool storage for irradiated reactor fuel. Because of the success of the demonstration program, concrete canisters have been used to store all remaining WR-1 used fuel. The CCSF is composed of two storage areas: (1) the main canister site adjacent to the WMA; and (2) the demonstration canister site within the site laboratory area.

The main canister site is located on a prepared site about 1000 m to the northeast of the plant site. The site was excavated to a depth 0.6 m and then backfilled with gravel to the original elevation. The centre-to-centre canister spacing is 7.5 m within a row and the canister rows are 9 m centre-to-centre apart. Each canister is located on a pad of reinforced concrete 3.66 m square and 0.2 m thick.

The main canister site is surrounded by a heavy duty galvanized chain link fence 2.5 m high, with three strands of barbed wire on top. Locked gates restrict access to the canisters. Control B425, located within the CCSF, houses the necessary instrumentation, electrical, monitoring, sampling and alarm equipment for the canisters.

The demonstration canister site is located within the present Whiteshell Laboratories site active area approximately 140 m east of B100 and 85 m southeast of the central powerhouse. There are two canisters, located in a north - south row immediately adjacent to an existing access road running along the east boundary of the plant active area. The demonstration canister site is surrounded by a 2.4 m fence topped with three strands of barbed wire. The canisters are placed on 3.048 m square reinforced concrete pads, 0.2 m thick. These pads rest on 46 cm of compacted granular fill (replacing the excavated topsoil) over undisturbed native soil. Fuel from these canisters has already been transferred into the main canister facility and both demonstration canisters are empty.

b) Decommissioning Approach

The CCSF will remain in operation throughout Phase 1 under the current facility authorization.

In Phase 2 the continuing operational requirements will be assessed and the CCSF will be placed in a passive operational state. The design life of the canisters will be confirmed as part of the Phase 2 assessments.

Monitoring and surveillance will be carried out during most of Phase 3. Once a disposal facility has been established for the fuel inventory, the fuel will be transferred (planned for 2050). All canisters then will be decontaminated and demolished. The canister rubble will be disposed of or recycled and the CCSF sites will be rehabilitated to unrestricted release.

Waste Management Area

a) Description

The WMA is located approximately 1 km northeast of the Whiteshell Laboratories site. The area is approximately 148 m by 312 m. The WMA has been in operation since 1963, providing storage for low- and medium-level radioactive wastes. Other materials also stored here include irradiated fuel waste placed in standpipes, high level wastes in trench no. 6, high level liquid waste in a dedicated storage tank and hazardous chemicals in bunker no. 4.

The WMA is surrounded by a 2.5 m-high wire mesh fence. Personnel access is through B423, and road access is through a normally locked gate west of B423.

The following facilities are located within the WMA:

1. the main access building, (B423);
2. the organic incinerator (B514);
3. the organic drum storage building (B430);
4. the LLW processing building (B421);
5. the LLW storage bunkers (LLW #1,2,3,4);
6. LLW storage buildings (B431, B432, B433);
7. LLW unlined earth trenches (#1-23);
8. MLW in-ground concrete bunkers (101-01 to 20);
9. MLW storage bunkers (ILW #6,7);
10. HLW/MLW in-ground concrete standpipes; and
11. Amine storage tanks (B417).

The location of these facilities is illustrated schematically in Figure 4.2.

FIGURE 4.2

WASTE MANAGEMENT AREA LAYOUT SCHEMATIC

AECL EACL

WHITESHELL LABORATORIES DECOMMISSIONING
ENVIRONMENTAL ASSESSMENT

b) Decommissioning Approach

The WMA will remain fully operational during Phase 1. Surveying/assessment will be carried out in the latter part of this phase. This work will be used to characterize the waste inventory and determine if there are any associated contaminant plumes.

In-situ disposal is proposed to manage low-level wastes stored in earthen clay trenches in the WMA. The case for in-situ disposal is presented in Appendix C.

Phase 1 work will include the design and implementation of an enhanced hydrogeological and environmental monitoring program to collect additional site data to support a final decision on in-situ disposal. Throughout Phase 1, 2 and much of Phase 3 the wastes will continue to be managed under CNSC licensing conditions which provide an audit and review mechanism to ensure that any additional monitoring or environmental assessment required to support a final decision is conducted.

Phase 1 activities are:

- Acceptance of low-, medium- and high-level radioactive waste generated from decontamination of the site research facilities (e.g. Shielded facility, B300). Waste includes:
    - solidified TFRE/Amine active liquid waste;
    - decontamination waste;
    - contaminated laboratory equipment; and
    - contaminated building service system components.
- Construction of additional bunker storage space to meet capacity requirements for Phase 1 decommissioning waste.
- Maintenance of the WMA facilities and grounds.
- Design and implementation of an enhanced monitoring system for the LLW trenches to collect data in support of the final in-situ disposal decision.

In Phase 2, waste processing operations will be implemented to address wastes which cannot remain in existing storage structures until waste disposal becomes available. This work will specifically address irradiated fuel waste in standpipes and high level waste in trench 6. The key activities to be carried out are:

- Establishing the remaining operating area required to process, package and provide interim storage throughout Phases 2 and 3. New facilities will be constructed to meet regulatory requirements and will include retrieval, processing, segregation and interim storage for waste which cannot be managed in existing facilities until waste disposal facilities become available.
- Placing the WMA facilities, no longer receiving or processing waste, into a passive operational state. This may include modification to facilities and some relocation of waste within facilities.
- Recovering and processing the fuel waste from the standpipes and the irradiated reactor components from Trench 6.

- Constructing facilities in the remaining operating area to meet Whiteshell Laboratories' requirements for managing waste from decommissioning activities.
- Carrying out enhanced monitoring in support of trench in-situ disposal.

Several new facilities will be designed and constructed in the newly defined operating area located within the existing WMA boundary. New facilities comprise:

- interim storage bunker for solidified TFRE / Amine active liquid waste;
- interim bunker storage for routine monitoring and surveillance waste;
- interim storage for processed waste arising from WMA retrieval operations and from any site decommissioning work required prior to the availability of off-site disposal;
- a deminimis segregated facility to process waste into appropriate handling categories for off-site disposal; and
- transport equipment (shielded tanker) to accommodate transfer of aqueous waste to the ALWTC.

WMA storage facilities which are not required for Phase 2 activities will be transitioned to a passive operational state.

In Phase 3, the waste processing operations for wastes being generated from the remainder of the site will focus on preparation and packaging of waste for immediate transfer to disposal facilities, since the major site decommissioning activities are planned in accordance with assumptions on waste disposal facility availability. Monitoring and surveillance will be carried out in the passive operational area until the wastes are removed to disposal facilities or in-situ management controls are in place.

Low-Level Trenches

The final safety case for in-situ disposal of trench wastes must be prepared to support the final decision on in-situ disposal. The final safety case will consider any enhancements or additional actions which may be required to manage these wastes in-situ. Optimization of the disposal plan will consider:

- removal / remediation of trench waste unsuitable for in-situ disposal;
- engineered barriers;
- surface drainage patterns;
- additional monitoring locations; and
- institutional controls following Phase 3.

Remaining activities for Phase 3 are:

- processing final decommissioning project wastes as required to accommodate transport to disposal facilities (e.g. segregation of contaminated waste from clean waste, packaging, loading shipping containers);
- retrieving and transfer all WMA waste that cannot be managed in-situ at the site to final disposal;
- stabilizing/capping/securing the low-level trench area to manage waste in-situ and establish institutional controls; and
- remediating the balance of the WMA to a more "natural" condition.

4.3.2 Radioisotope Facilities

The decommissioning approach for radioisotope facilities was discussed in Section 4.3.1. A description of these facilities is provided below.

Building 300 (B300)

a) Description

B300 is the primary research laboratory for the Whiteshell Laboratories site, which provided support to the full range of nuclear research and development programs conducted at Whiteshell Laboratories during the operating period. The building comprises an area of approximately 17,000 m^2 and was built in six stages over the period of 1964 to 1982. Most of the building was used to provide general laboratory work areas and contains 68 laboratories designed to handle various levels of radioactivity. The south end of the building is a high bay area which supported experimental activities requiring large room areas and significant head room. The RD-14M experimental loop is located in the south high bay. Although the SF is part of the B300 complex, it is addressed separately as a listed facility. Two other facilities in the building, the Van de Graaff Accelerator and the Neutron Generator, are similarly addressed as individual listed facilities.

Research program work remains in progress in two significant areas of B300, the north extension utilized by the Nuclear Fuel Waste Management Program and the south high bay utilized by the Reactor Safety Research Program.

b) Decommissioning Approach

All research activities are currently being consolidated into the two operating areas noted above to allow progress on operational shutdown and decontamination of the building between the south high bay and the north extension. Building service systems (ventilation, heating) for this area can be isolated from the balance of the building to minimize impacts of decontamination on the continuing operational research programs. Since the emphasis of continuing research program work is on non-radioactive work, no increase in radioactive inventory is anticipated for the continued operation areas. Phase 1 decommissioning of the continued operation area of B300 is planned for year four of the project.

The Phase 1 work for B300 includes decontamination and/or fixation of contamination throughout the facility. Fumehoods will be isolated from the exhaust ventilation system and active drainage lines will be drained and capped. Active drainage system connections to the ALWTC will be maintained to manage building sump waste water. Minimum heating and ventilation will be established and the facility will be placed under Monitoring and Surveillance.

Monitoring and surveillance will be maintained throughout Phase 2 and in Phase 3 the facility will undergo final decommissioning to an unrestricted release state commencing in about 2030.

Decontamination Centre

a) Description

The Decontamination Centre (B411) provides a decontamination service for maintaining research and development experimental rigs, equipment and tools in a safe useable state. It also provides a laundry service for radioactively contaminated clothing. The building comprises an area of approximately 850 m^2. The decontamination area contains eight fumehoods and the work area is designed to accommodate a broad range of contaminated equipment cleanup. The laundry contains four fumehoods to accommodate sorting of contaminated clothing, and laundry equipment consists of six industrial washing machines and four dryers.

b) Decommissioning Approach

This facility will be retained in service to support the first phase of decommissioning, as well as shutdown and decontamination activities in B300. Shutdown and decontamination activities for the Decontamination Centre will be conducted in the final two years of Phase 1 of the decommissioning program. The facility will be placed in Monitoring and Surveillance at the end of Phase 1. Decontamination processes required to meet monitoring and surveillance and future decommissioning operations will be established in B100. These comprise a small laundry operation and respirator decontamination equipment.

Final decommissioning of the Building Decontamination Centre to an unrestricted release state is planned for 2025.

Building 402 (B402)

B402 will operate throughout Phase 1 to provide dosimetry services to AECL and to accommodate commercialization activities such as ACSION. Space within this building is currently being marketed to privatization interests. B402 is suitable for low-level radioactive work. It is designated as zone 1 (considered a "clean zone", dose levels do not exceed 1 mSv/a) suitable for use as routine laboratory space.

The decommissioning approach for the building is dependent on the extent of continued commercial use beyond Phase 1. The options include:

- characterization and environmental audit to provide for turnover of the facility to a new owner; or
- characterization and decontamination activity similar to the Decontamination Centre to prepare the building initially for monitoring and surveillance and ultimately for decommissioning to an unrestricted release level.

If commercialization activity is discontinued, B402 could undergo final decommissioning as early as the first part of Phase 2.

4.3.3 General Infrastructure

The other buildings and infrastructure at Whiteshell Laboratories are administered under the general terms of the site licence and include a total of nearly 40 buildings or structures that were used for a variety of purposes. Such uses have included:

- general and administrative offices;
- cafeteria and coffee areas;
- laboratories;
- storage;
- workshops;
- receiving docks; and
- other service buildings.

In general, the only work that will be done in Phase 1 is characterization of the building spaces to ensure safety during the deferment period. Very little decontamination work is expected to be needed. Heating and ventilation will be retained, as required, in some buildings.

The demolition of the other buildings and infrastructure will begin in Phase 3, targeted for completion by 2020. If commercialization is unsuccessful, demolition of some buildings may occur much sooner (e.g. 2005 and onward). Prior to demolition, the buildings will be surveyed and remediated to unrestricted release requirements. Finally, once a building has been demolished, the building footprint area will be returned to green state conditions. As well, B405 and connectors between B100 and B300 will be retained until B300 laboratories are fully decommissioned.

Alternatively, certain buildings may be transferred to private ownership. The long-term use of non-nuclear buildings is entirely dependent on economic development activity at the site. Planning to develop an industrial park to utilize the buildings outside the controlled active area of the laboratory site is in progress. It is anticipated that redundant buildings which are not commercialized within a timeframe of 5 to 10 years will be demolished.

Non-Nuclear Buildings

a) Description

The most significant buildings and services that are part of the non-nuclear buildings and infrastructure of the supervised and controlled area are:

- Gas Dynamics Research Laboratory (B303).
- Gas Dynamics Research Laboratory (B304).
- Engineering and Administration (B400).
- Security and Reception (B401).
- Technical Information Centre (B405).
- Cafeteria (B406).
- Material Handling (B408).
- Active Area Storage (B409).
- Machine Shop (B412).
- Material Warehouse (B415).
- Pumphouse (B902).
- Large Scale Vented Combustion Test Facility (B308, B309, B310).

There are a number of additional smaller buildings of various classifications. Table 4.3 lists non-nuclear buildings and provides a brief description of their function.

Table 4.3
Description of Non-Nuclear Buildings

Building (B) Number	**Description**	**Building (B) Number**	**Description**
300	Thermal hydraulics Annex	427	Mechanical Shop Storage No. 1
301	FIG Control	428	Mechanical Shop Storage No. 2
302	ZEUS Control	429	Civil Materials Storage
303	Containment Test Facility (CTF)	500	Internal Friction Lab
304	Gas Dynamics Research Labs	501	Aquatic Toxicity Lab
306	Gas Dynamics Research Lab	503	Ecology Lab
307	Diffusion Flame Facility	504	Inactive Lab/Offices
308	Large Scale Vented Combustion Test Facility	505	Soils Research Lab
309	LSVCTF-Local Services	509	Civil Materials Storage
310	LSVCTF-Remote Control	515	Drill Site Office
311	LSVCTF-Hydrogen Storage	518	B300 Coffee Room
312	Steam Generator Storage	523	Controlled Environment Building

Building (B) Number	Description	Building (B) Number	Description
400	Engineering and Administration	526	Borehole Instrumentation
401	Security and Reception	527	Flammable Liquid Storage Shed
403	Vehicle Gate House	530	Internal Friction Lab Annex
404	Meteorological Tower	902	Pumphouse
405	Technical Information Centre	903	Water Filtration
406	Cafeteria	904	Fire Protection Water System
408	Stores Workshop and Garage	905	Process Water System
409	Active Area Storage	906	Storm Drainage System
410	Cafeteria Garbage Storage	907	Sewage Lift Station and Lagoons
412	Engineering Products and Services	911	Powerhouse

414	Controlled Area to Entrance	914	Main Power Distribution
415	Unheated Storage	916	Communications System
416	Storage	917	Supervisory Control and Alarm
420	Mobile Equipment Storage	918	Clarified Water System
426	Civil Material Storage	921	Pedestrian Links Between Buildings

(Adapted from Helbrecht 1999)

Although not among buildings listed as nuclear, B503 has laboratories where radioactive and bio-hazardous materials were previously used. Cleanup of this contamination may be undertaken as part of the operational cleanup. Other buildings will only have incidental contamination, if any, resulting from their proximity to the nuclear facilities.

b) Decommissioning Approach

During the operational shutdown period, non-nuclear buildings will be prepared for demolition or for transfer to other (commercial) owners.

The general site buildings are maintained in an operational state to support continuing research programs (e.g. B303, B304), the decommissioning program, commercialization opportunities (e.g. B400, B408, B401,) or to support the site operation generally (e.g. Powerhouse B911, Pumphouse B902). An assessment will be made of the timing of the decommissioning of the general site service facilities by the end of Phase 1.

The Whiteshell Laboratories' Irradiator in B305 is excluded from the Shutdown and Decontamination Plan because it is administered by the CNSC under a separate licence with ACSION, a private business operation at the site.

Inactive Landfill

a) Description

The inactive (i.e. non-radioactive) landfill was placed in operation when the Whiteshell Laboratories site was established to contain non-radioactive and non-hazardous wastes, excluding food waste. It is located at a high point in the local terrain approximately 2 km east of the main site at the end of a service road and next to the entrance gate to the Field Irradiator Gamma (FIG) facility. The surficial geology in this area is mainly sand and gravel. The area is a recharge zone, and groundwater will move either toward the river or northeast toward a large black spruce and sphagnum bog.

The landfill is less then 10 m in height and less then 1 ha in area. Typical materials placed in the landfill include plastic, paper, wood, cardboard, glass, and building materials. Standard activities include dumping, ditching, and capping with sand and gravel from surrounding borrow pits.

b) Decommissioning Approach

The inactive landfill will remain fully operational for Phases 1 and 2. Waste processing operations and maintenance will be consistent with that done prior to decommissioning. A plan for remediation of the landfill will be developed during Phase 2. Environmental, radiological and geotechnical evaluations will be carried out to provide inputs to the plan.

The landfill will be decommissioned to a final end state toward the end of Phase 3. The landfill will be capped and the surface restored to a more "natural" condition. Subsequent to closure, monitoring will be carried out to confirm that the landfill is fully stabilized.

The operation and decommissioning of the inactive landfill falls under federal jurisdiction. *Manitoba Environment Act* Regulation 150/91 on closure of landfills will be considered in developing the remediation plan for this facility.

Sewage Lagoon

a) Description

The lagoon system, placed in operation when the Whiteshell Laboratories site was established, is located north of the main plant site. It comprises a primary settling pond, a secondary pond, an outlet and the sewage lift station (B907). The lagoon receives liquid wastes from lavatories, showers and non-active drains. The lagoon water is retained for approximately six months to allow for settling and biodegradation. It is analyzed for fecal coliform and biochemical oxygen demand and if within limits may be released in May and October each year to the Winnipeg River.

The lagoon was constructed of low permeability clay embankments placed on a prepared clay surface, with no additional lining. The primary and secondary ponds are connected to each other via a culvert.

There are levees around each lagoon, with a roadbed at the top. At various times of the year the water level in the lagoons is higher than the surrounding land surface. Emergent macrophytes (primarily cattail) vegetate the water's edge. Water is released from the pond every spring and fall and flows from the lagoon to the Winnipeg River through a drainage way that is about 400 to 500 m in length.

b) Decommissioning Approach

The sewage lagoons will remain fully operational for Phase 1. Waste processing operations and maintenance will be consistent with that done prior to decommissioning. A plan for remediation of the lagoon system will be developed in the early part of Phase 2. Environmental, radiological and geotechnical evaluations will be carried out to provide inputs to the plan.

In Phase 3, the lagoon system will be decommissioned to a final end state by 2020. The lagoon will be backfilled and restored to a more "natural" condition. Subsequent to closure, monitoring will be carried out to confirm the lagoon is fully stabilized. Interim domestic sewage facilities (e.g. septic tanks) will be required to meet Phase 3 operations needs.

The operation and decommissioning of the lagoon falls under federal jurisdiction. *Manitoba Environment Act* Regulation 163/88 will be taken into consideration in developing remediation plans for this facility.

Buried Services

a) Description

Buried services run through the entire site and include:

- drainage systems;
- district heating;
- electrical;
- fire (250 mm diameter pipe) and process water (600 mm diameter pipe); and
- domestic water (200 mm diameter pipe).

The most significant buried services from a decommissioning perspective are the three types of drainage systems:

- *Sanitary drains* (250 mm diameter pipe): collect waste water from toilets, showers, sinks etc., and discharge it to the site sewage lagoon.
- *Aqueous radioactive waste collection drains* (38 mm diameter pipe enclosed in 200 to 300 mm diameter pipe): collect wastewater containing radioactive (and chemical) contaminants. The waste is pumped through double walled pipes to tanks in the ALWTC. The low-level tank waste is sampled and if radioactivity levels are acceptably low, the waste is pumped to the process drain/storm sewer at a maximum rate of 8 L/s. Medium radioactivity level aqueous wastes are concentrated and solidified for storage at the WMA. Any leaks in the active lines would be contained within the outer wall of the transfer pipes and flow to leak collection points (man-holes or sumps) located at low

points along the route. No leaks have been detected since the system was placed in operation.

- *Storm drains* (process drains, 1200 mm diameter pipe): collect cooling water from experimental facilities, site runoff water, low-level radioactive liquid waste from the ALWTC following sampling and monitoring, inactive effluent from non-active building sump floor drains and laboratory sinks, and process water that is used to maintain a minimum flow (50 L/s) at the outfall for a flow measurement. The storm drain water is discharged via the outfall to the Winnipeg River.

The aqueous radioactive waste collection system was replaced by the existing double pipe system in the mid-1980s. The old system had failed and leakage from some lines adjacent to the ALWTC had occurred. The area was partially remediated through removal of excavated soil; however, in subsequent years, the vegetation in the spill area was found to have elevated levels of beta and gamma emitting radioactivity, in particular ^{137}Cs and ^{90}Sr. Routine monitoring of the area is maintained to provide an indication of mobility which would require early remediation.

b) Decommissioning Approach

The buried services will remain fully operational for the first part of Phase 1. In the latter part of Phase 1, drains will be assessed, remediated and capped. In Phase 2, monitoring and surveillance and maintenance will be conducted as required. Most systems, other than parts of the active drainage, will remain functional during Phase 2. The active drain lines required to collect monitoring and surveillance building sump wastes for transfer to the ALWTC will be identified and retained.

The buried services and soil contamination associated with the old active drainage system leakage will be remediated in Phase 3. Removals will be staged because certain parts of the system (e.g. fire water) will be needed until WR-1, the last major project component, is fully decommissioned.

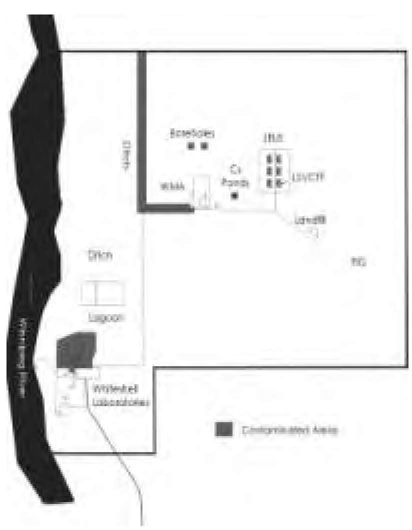
"Affected" Lands

a) Description

The affected lands are those lands within the Whiteshell Laboratories' site (the Licensed Property Study Area) that are contaminated, potentially contaminated or affected by nuclear operation and are more than 1 m away from buildings. Decommissioning of land within 1 m of the buildings is considered part of the decommissioning of the building.

The affected lands may contain contamination because of proximity to facilities and unusual occurrences. Known contamination areas identified in the affected lands are shown in Figure 4.3:

Figure 4.3
Affected Lands



Active Area Soil Contamination

Surface contamination attributed to releases from the HCF exhaust stack was detected in 1971 and 1972. The releases were at very low-levels and there is no detectable contamination remaining in these areas.

Leakage to topsoil has occurred as a result of active drain line failures, particularly in the ALWTC area, where 3 incidents released about 65 GBq of mixed fission product contamination. About 9 GBq of ^{137}Cs and ^{90}Sr are estimated to remain in the ground and the area is routinely monitored. There is no indication of contamination movement from the area.

Cesium Ponds

This area is located directly east of the WMA. The ponds were developed to study the distribution of dose received by organisms living at the water-mud interface. 0.5 Ci of ^{137}Cs were injected into the pond in the 1960's. This has decayed to approximately half of the original injection and elevated levels of ^{137}Cs remain detectable but limited to the pond area.

Field Irradiator Gamma (FIG)

This project was conducted in the late 1970s to early 1980s to study the ecological effects on a mixed boreal forest ecosystem from continuous exposure to gamma radiation. Only sealed sources were used. These have been removed and there is no radioactive contamination in the FIG area.

Zoological Environment Under Stress (ZEUS)

The ZEUS project studied the effects of ionizing radiation on small mammals. Only sealed sources were used. These have been removed and there is no radioactive contamination in the area.

Deep Borehole Site

The borehole site is located north of the CCSF. Small amounts of short half-life tracers were injected into three wells to study radionuclide transport in bedrock. The radioactivity has decayed to background.

A summary of release quantities and current radiological status is given in Section 5.3.3.

b) Decommissioning Approach

The approach to decommissioning will be the same generally for each of the known affected areas. In Phase 1, the emphasis will be on surveying, assessing and developing remediation plans. Any identified need for early remediation or stabilization will be completed late in Phase 1 or early in Phase 2. Stabilization/remediation is the first step in addressing each incident or the termination of an experiment. Therefore, only limited work is expected for these areas as an interim measure. Final remediation in Phase 3 will be focused on the active areas soil contamination and on the cesium ponds contamination.

In Phase 3, remediation will be completed to a level where any remaining contamination is within acceptable levels for unrestricted release. In some areas, institutional controls may be required after Phase 3 has been completed.

Off-Site Contamination

Off-site contamination resulting from the operation of the Whiteshell Laboratories has occurred in two areas. Routine releases (well within regulatory limits) and some spill incidents have resulted in contamination of river sediments. The north property ditch and the natural drainage creek northwest of the AECL site boundary was contaminated as the result of a spill in the WMA. These off-site contamination areas are described below.

River Sediments

a) Description

The Whiteshell Laboratories is situated on the east bank of the Winnipeg River. The river in this area is wide and flows rapidly several metres below the level of the surrounding land. The average flow is approximately 950 m^3/s, although this is controlled by Manitoba Hydro control stations, and may vary from time to time according to Manitoba Hydro policies.

Liquid effluent from the ALWTC is discharged to the Winnipeg River via the process sewer at the sewer outfall located about 8 m offshore in 5 m of water. The ^{137}Cs (the dominant radionuclide) concentration in downstream river water is 0.005 Bq/L, which is well within the 10 Bq/L Canadian Drinking Water Quality Guidelines (Canadian Council of Ministers of the Environment 1999a).

A reduction in the effluent particulate load was accomplished in 1998-99 by the installation of filter stations to collect the larger particulate for the most critical waste streams. The effluent from the WMA sumps is routinely filtered through 5 micron filters before being transferred by tanker to the ALWTC. In 1995, a decision was made to reduce the concentration control point for ALWTC waste by reducing the Administrative Level from 1 GBq/m^3 to 0.1 GBq/m^3. By these means the overall level of releases was reduced and a significant fraction of the larger particulate (settable solids) was collected, and therefore prevented from being released to the river.

Elevated sediment contamination has been measured in the local outfall area (an area 20m wide by 80m downstream). The total inventory is very low, approximately 1.3 GBq. A detailed evaluation of the sediment contamination is presented in Appendix B.1. The assessment concludes that using the most conservative dose estimation methods, doses to non-human biota and humans are below accepted guidelines.

b) Decommissioning Approach

Based on the evaluation in Appendix B.1, the decommissioning approach is to abandon the contaminated sediments in-situ.

Environmental monitoring of sediments will take place throughout Phase 2 and most of Phase 3 to determine if contaminants deposited as a result of the decommissioning project require remediation to achieve the final end-state objectives.

North Ditch/Creek

a) Description

A spill incident at the WMA in 1979 led to fission product contamination of a 2 km ditch system, (including the west ditch, the north ditch, and a small creek). The creek is located in the public domain north of Whiteshell Laboratories, and discharges into the Winnipeg River. A follow-up ditch sampling program indicated radioactivity was deposited throughout the 5 to 10 cm of clay-silt soil in the ditch system near the WMA. Surface water was present in the ditches at the time, and contamination of the water flowing down the drainage system exceeded the maximum permissible concentration in drinking water for continuous consumption.

The ditch flowing west from the WMA was excavated to remove contaminated soil. The entire ditch/creek system was surveyed to determine the immediate remediation required. Routine monitoring continues to be carried out in this ditch/creek system.

b) Decommissioning Approach

A full assessment of environmental monitoring data and of the original spill documentation will be conducted to confirm that the initial remediation following the incident was satisfactory and that no additional remediation is required.

4.3.4 Timing for Decommissioning Activities

The general decommissioning approach for the various facilities and components was outlined in the preceding sections. The timing of the decommissioning activities are summarized in Table 4.4 and illustrated in Figure 4.4.

There is a logical flow of decommissioning work commencing with nuclear facilities and nuclear support facilities to handle the most significant hazards while maintaining the site infrastructure. Service systems are addressed subsequent to nuclear facilities decommissioning. This also tends to avoid overlapping or conflicting effects between individual project components.

The decommissioning work is concentrated in Phase 1 and the latter half of Phase 3. For the interim period, most of the facilities will be under monitoring and surveillance. The figure also shows the remaining operating period for the site infrastructure and support facilities required during the decommissioning activities.

Table 4.4
Whiteshell Laboratories Decommissioning Schedule

Facility	Decommissioning Activity / State	Phase
Shielded Facilities	Operational - processing of high level liquid waste	Phase 1
	Decontamination	Phase 1
	Monitoring and surveillance	Phases 2 and 3
	Final Decommissioning	Phase 3
Van De Graaf Accelerator	Final Decommissioning	Phase 1
Neutron Generator	Final Decommissioning	Phase 1
Active Liquid Waste (ALWTC)	Part of facility remains operational through to Phase 3	Phase 1, 2 and 3
	Decommissioning of unused portion	Phase 1
	Monitoring and Surveillance	Phase 2
	Final Decommissioning	Phase 3
Concrete Canister Storage Fac.	Operational	Phase 1
	Placed in a Passive Operational State	Phase 2
	Monitoring and Surveillance	Phase 2 and 3
	Final Decommissioning	Phase 3
WMA	Operational	Phase 1
	Define and operate remaining facility	Phase 2 and 3
	Storage of monitoring and surveillance wastes	Phase 2 and 3
	Recover and process stored waste from facilities requiring upgrading	Phase 2
	Placing retrieved waste into new upgraded facilities	Phase 2
	Transfer WMA storage facilities not required for Phase 2 activities to a passive operational state	Phase 2
	Monitoring and Surveillance in the Passive Operational State until wastes are removed to disposal facilities.	Phase 3
	Maintain institutional controls until in-situ waste is acceptable for unconditional release	Institutional control period
	Preparation and transfer of waste to disposal facilities	Phase 3
Building 300	Decontamination and or Fixation of Decontamination	Phase 1
	Monitoring and Surveillance	Phase 2 and 3
	Final Decommissioning to an unrestricted release state	Phase 3
Decontamination Centre	Shutdown and decontamination in the final 2 years of Phase 1	Phase 1
	Monitoring and surveillance	Phase 2 and 3
	Final Decommissioning to an unrestricted release state	Phase 3
B402	Operational throughout Phase 1 Decommissioning. Approach is dependent on the extent of continued commercial use of B402 beyond Phase 1	Phase 1
	Final decommissioning as early as the first part of Phase 2 (if commercialization is discontinued)	Phase 2
Non-Nuclear Bldgs	An assessment will be made of the decommissioning of the general site service facilities by the end of Phase 1	Phase 1
	Final decommissioning	Phase 2 and 3

Facility	Decommissioning Activity / State	Phase
Inactive Landfill	Operational throughout Phases 1 and 2	Phase 1and 2
	Development of a remediation plan	Phase 2
	Final Decommissioning	Towards the end of Phase 3
Sewage Lagoon	Operational throughout Phase 1and 2	Phase 1 and 2
	Development of a remediation plan	Phase 2
	Final Decommissioning	Phase 3
Buried Services	Operational	First part of Phase 1
	Drains will be assessed, remediated and capped	Phase 1
	Monitoring and Surveillance	Phase 2
	Most systems, other than parts of the active drainage, will remain functional during Phase 2 Remediation of buried services and soil contamination associated with the active drainage system	Phase 2 and 3
Affected Lands	Surveying, assessing and developing remediation plans	Phase 1
	Monitoring and surveillance	Phase 2 and 3
	Remediation to levels acceptable for unrestricted release	Phase 3
River Sediments	Monitoring and surveillance	Phase 1, 2 and 3
	Re-evaluation to confirm final in-situ end state	Phase 3
North Ditch	Identification of contamination above levels acceptable for unconditional release.	Phase 1
	Preparation of a remediation plan	Phase 1
	Remediation if necessary	Early in Phase 2

Figure 4.4

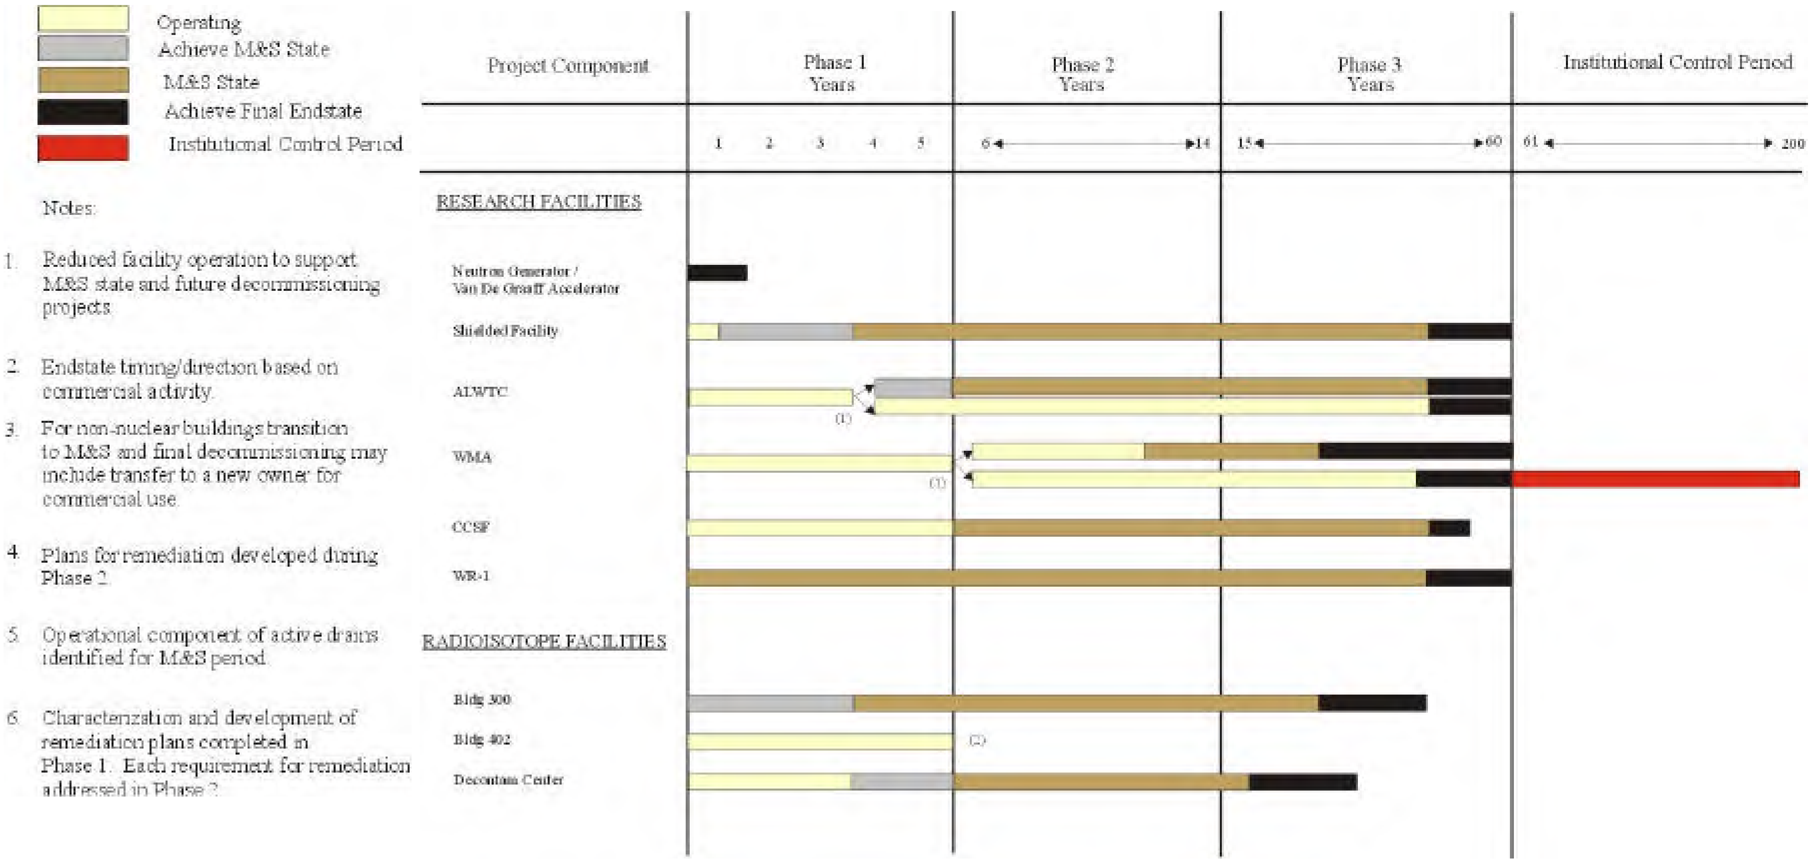

Figure 4.4 (continued)

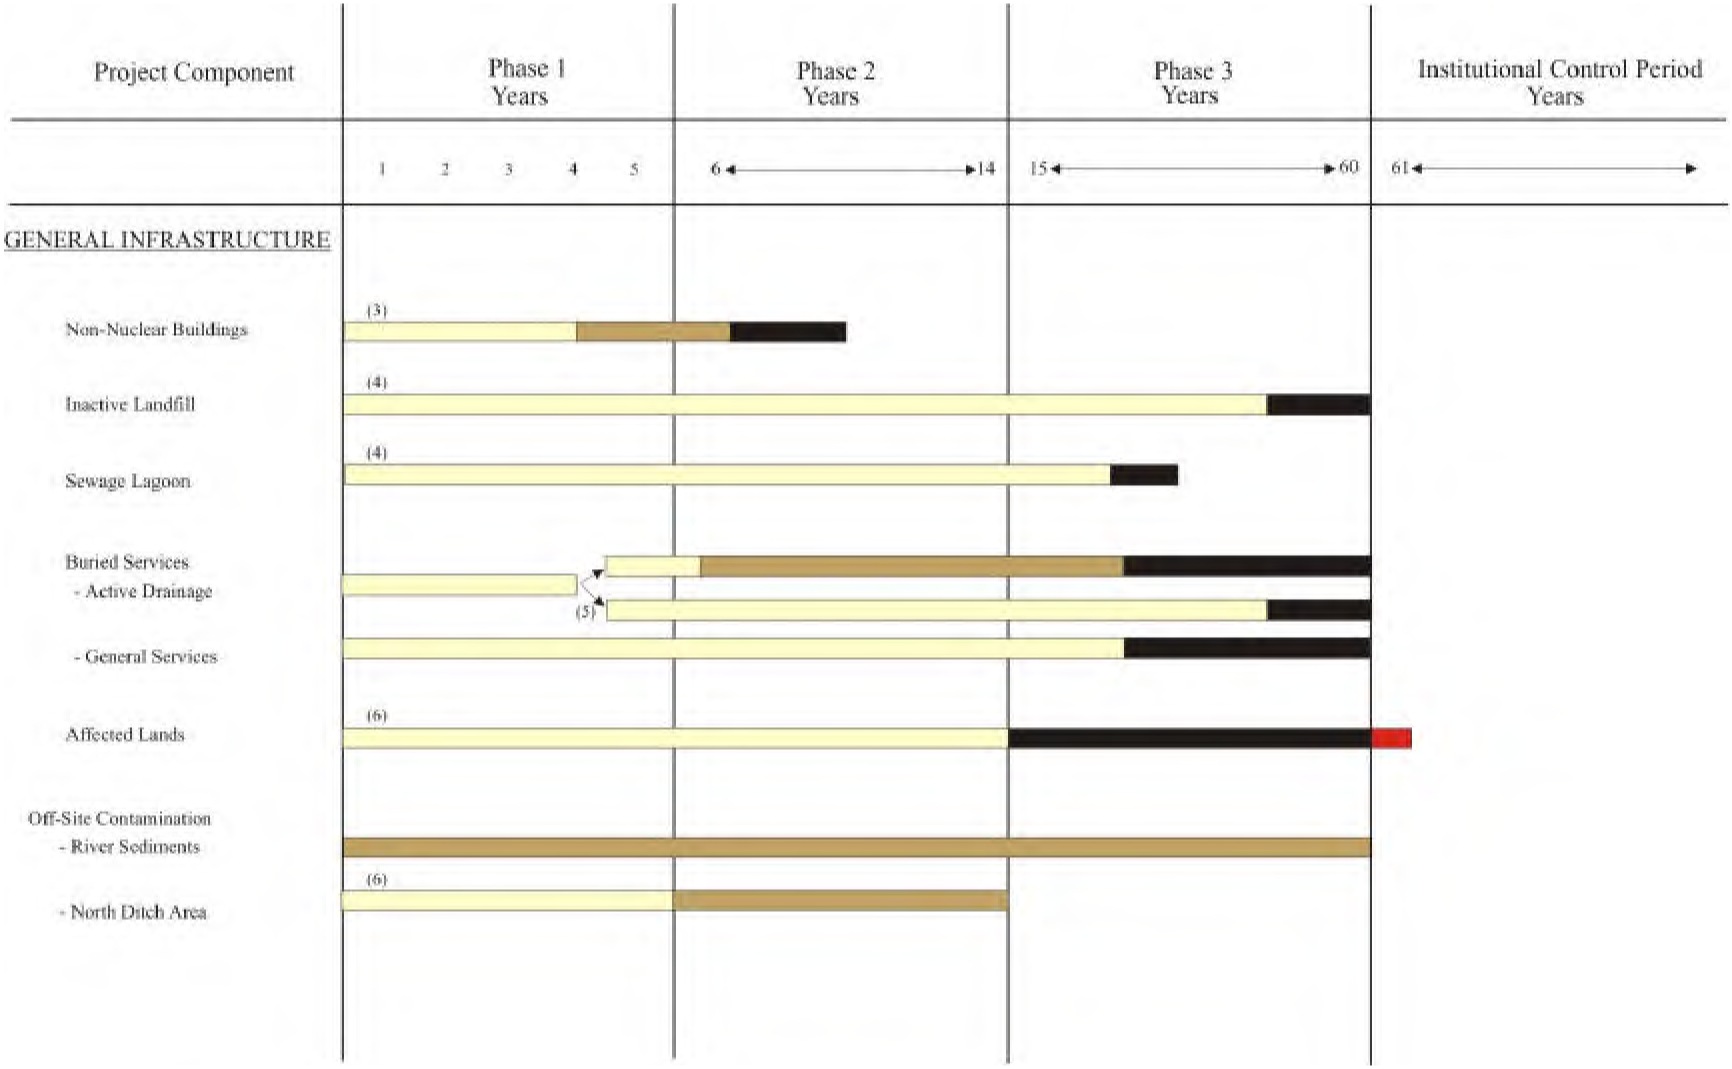
Whiteshell Laboratories Decommissioning Project Component Timelilnes



4.4 KEY DECOMMISSIONING ACTIVITIES

The specific decommissioning activities related to each facility, as detailed in Ridgway (1999), were used in the assessment of potential environmental effects. Several of these activities which are common to many of the facilities, have the potential to result in environmental effects. Brief descriptions of these key decommissioning activities are provided below.

4.4.1 Decontaminating

Interior

Decontamination will be used to remove radioactive contamination from contaminated surfaces or materials. Removal of chemical hazards (e.g. asbestos, PCBs) will be undertaken prior to or in parallel to decontamination activities. Typical decontamination activities include vacuuming, cleaning, washing, washing with high pressure, swabbing, scabbling, chemical treatment and CO_2 blasting (Table 4.5). This will be carried out for individual rooms and on areas of the walls, ceiling and floors to remove loose contamination.

Table 4.5
Decontamination Activities

ACTIVITY	DESCRIPTION
1. Washing	Washing is an important method for removal of loose contamination. For floors, a cotton mop is typically used with a decontamination cleaner.
2. Cleaning	Aggressive cleaning is used to remove embedded contaminants.
3. High Pressure Washing	High pressure washing is used to remove embedded contaminants. A jet spray (1000 - 1200 psi) is used with detergent and a cleaner.
4. Jack Hammer	An air-powered jack hammer (1000 psi) is used to remove deeply embedded contaminants (e.g. those embedded in concrete).
5. Scabbling	An air-powered (80 – 90 psi) hammering system is used for light percussive work (e.g. cracks or pores in concrete). The three main tools are hand-held, a corner tool and a floor tool. The system includes a HEPA vacuum that sucks the debris and dust created by scabbling action.
6. Swabbing	Mopping floors for removal of contamination (see washing).
7. Vacuuming	A high-capacity air-operated industrial vacuum, complete with a HEPA filtration system, is used for heavy duty vacuuming. This includes removal of concrete, plaster dust and other rubble.
8. Carbon Dioxide Blasting	Pressurized CO_2 is used with a variety of tools for percussive work.

Note: Wherever possible, the use of water is avoided. This reduces formation of secondary waste.

Minor decontamination activities may be required when building services are handled and removed. Work will be directed to the active ventilation and drainage systems. For example, the process for removal of ventilation ductwork will likely follow these steps:

- opening a sealed section of ductwork;
- decontaminating ductwork to a level that is safe for handling;

- disassembling the piece of ductwork that has been decontaminated;
- further decontaminating the piece of ductwork;
- packaging the piece of ductwork, and
- sending the ductwork to the WMA for storage.

If a portion of a machine cannot be easily decontaminated, the machine may be disassembled and the contaminated portion sent for storage in the WMA. The remaining uncontaminated portion of the equipment will be sent for reuse or recycle following surveying in the deminimis segregation facility to be located in the WMA.

Exterior

Most contamination originates inside the building and occasionally works its way through to the exterior walls. The normal decontamination process is to work from the inside out removing material until release levels are achieved. This means that the internal control systems to prevent loss of material remain in effect even when the work affects outside surfaces. Exterior contamination can also occasionally be found around vents and exhausts and on roofs. Cleaning of these surfaces is conducted under enhanced local contamination controls.

4.4.2 Removing Fixed Surplus Equipment (Interior)

Any remaining fixed equipment will be removed from the various rooms, facilities or laboratories. Typical fixed equipment includes:

- machinery;
- equipment;
- benches and tables;
- ovens and dryers;
- experimental apparatus;
- electrical components;
- grinders; and
- hoists.

Unfixed surplus items such as furniture, chemicals, laboratory apparatus and computers would already have been removed as part of the shutdown operations.

Work related to removal of equipment includes:

- removing and capping water supply and drain lines;
- disconnecting, isolating and sealing power to these units; and
- removing and sealing any other mechanical services.

4.4.3 Fixing in Place (Interior)

Fixing is the process of stabilizing contamination through methods such as the application of spray or brushed-on paint or paint-like products. Fixing is done to ensure that any loose, surface contamination is stabilized for any planned deferment period.

4.4.4 Demolishing

Buildings and structures will be dismantled and demolished in an orderly manner. For example, a building would likely be stripped to the bare shell, with all of the wood, plaster and room dividers removed. The metal roof would then be removed, leaving the concrete structure available for final demolition. If feasible, the building material and structure will be reused or recycled.

4.4.5 Remediating the Building Sites

Building sites will be remediated, stabilized and rehabilitated. This work will include:

- removing the building foundations; and
- excavating any remaining contaminated soil with concentrations above applicable guidelines.

4.4.6 Rehabilitating

Rehabilitation is aimed at returning the building sites to a more "natural" condition. Work activities will include:

- backfilling the building area with clean soil or fill;
- re-grading the area to "natural" condition;
- establishing an appropriate drainage arrangement (e.g. ditching, berm construction); and
- re-vegetating the building site and the area.

4.4.7 Transporting Radioactive Waste Off-Site

The transport of radioactive waste is regulated under the *Packaging and Transport of Nuclear Substances Regulations* (CNSC 2000c). Transported waste includes High-Level Waste (fuel, solidified active liquid waste and irradiated reactor components) as well as Medium and Low-Level waste. Key activities consist of:

- loading the waste into an approved shipping container;
- loading the container onto the vehicle;
- monitoring the vehicle for contamination and cleaning it if necessary; and
- driving the transport vehicle to an approved facility.

4.5 WASTE MANAGEMENT PRACTICES

In essence, the decommissioning program is a process of managing the Whiteshell Laboratories' site waste streams to secure an end state where all wastes are dispositioned to off-site disposal facilities or to in-situ management. The following sections describe the proposed approach to waste management for the decommissioning project.

4.5.1 Inventory of Stored Wastes

Radioactive laboratories and waste storage occupy approximately 1% of the site land (approximately 40 ha). The active area totals approximately 4 ha (0.1% of the site). Radioactive wastes are stored in waste management facilities. These wastes are categorized in three levels according to AECL procedures defined in Barnard et al. (1985) and as approved by the CNSC.

1. Low-level waste (LLW), which consists of used lab-ware, rubber gloves, shoe covers, wipe paper, and mops. The total accumulation of LLW is approximately 21,000 m^3 and is located in trenches (40 TBq as an upper limit), bunkers and storage buildings;

2. Medium-level waste (MLW), which is typically composed of scrap metal materials from experiments, filters, and radioactive liquid waste that has been solidified. This waste is stored in the standpipes and bunkers in the WMA. The total accumulation of MLW in the WMA is approximately 1,400 m^3; and

3. High-level waste (HLW), comprises of irradiated reactor fuel and metals from nuclear reactor core components. The Concrete Canister Storage Facility (CCSF) provides storage for 25 metric tonnes of irradiated reactor fuel. Some fuel wastes (approximately 3 metric tonnes) from operations prior to 1975 are stored in standpipes in the WMA.

Two other categories of stored waste are:

- 450L of active liquid waste processed to a solid form as part of shutdown operations; and
- a small volume of PCBs (16.6 L) is stored in B413 located at the main laboratory site.

4.5.1.1 Inventory of Decommissioning Wastes

The decommissioning project will handle waste from five broad categories. Preliminary estimates of the waste generation are summarized as follows:

1. Nuclear facilities and radioisotope facilities will produce the largest component of radioactively contaminated waste estimated at approximately 10,400 m^3 of LLW and approximately 1,400 m^3 of MLW. Deminimis waste from these facilities is estimated at approximately 20,000 m^3 and about 10-15% is expected to be recyclable.

2. Non-nuclear buildings and services will produce approximately 30,000 m^3 of deminimis waste and approximately 2,000 m^3 of suspect LLW.

3. Contaminated soil waste will be produced from remediation of individual building sites and from remediation of affected lands (spill incident areas, active drain lines etc.). This category cannot be estimated until additional assessments are carried out during Phase 1 to delineate the extent of contamination.

4. Another category of waste is hazardous chemicals. Some PCB-filled electrical components remain in operation at the site and many nuclear facilities contain asbestos insulation on process piping systems. Most building floor and ceiling tiles contain some asbestos. Estimates for asbestos waste volumes will be prepared as part of detailed decommissioning planning. Some laboratory chemicals may be encountered; this is expected to be negligible because Whiteshell Laboratories has continuously disposed of redundant or waste chemicals through contract firms. Also, laboratory chemicals remaining on shutdown have been disposed of in that manner as part of shutdown operations.

Table 4.6 summarizes the site waste inventory.

Table 4.6
Whiteshell Laboratories Total Waste Inventory (Preliminary Estimate)

Facility/Storage	ALW (L)	HLW (metric tonnes)	MLW (m^3)	LLW (m^3)	DEMINIMIS[1] (m^3)	Hazardous Chemicals
Stored Inventory						
WMA	180	3 25	1,400 -	21,000 -	- -	• 3000 lbs. of arsenic • 1800 lbs. of lead • DDT, glycol, solvents • Small Volume of Carcinogens[2]
CCSF B413		-	-	-	-	- • -16.6 L of PCB's
Decommissioning Waste						
Nuclear/Radioisotope Facilities - AD-TK3	270	-	1,400	10,400	20,000	• Asbestos[3] • Insulation • Lead Shielding[4]
Non-nuclear Buildings/ Infrastructure		-	-	2,000[5]	30,000	• Asbestos[3] • Floor and Ceiling Tiles
Chemical Wastes from in-Service Facilities						
PCB's Freon [7]						332 L 3,014 kg
Total Waste Inventory	**450**	**28**	**2,800**	**33,400**	**50,000**	**348.6L PCB's[6]** **3,014 kg Freon** [7]

(1) Approximately 10-15% of deminimis waste is expected to be recyclable.
(2) Small volumes of carcinogenic chemicals are stored in dedicated quadrant of Bunker B-4.
(3) Asbestos insulation was used on much of the WR-1 process systems and on some building service systems (High Temperature Hot Water Lines). Also building ceiling and floor tiles contain asbestos. Waste estimates will be prepared as part of detailed decommissioning planning.
(4) Lead shielding exists on many experimental/lab work areas. Estimates are being produced as part of detailed decommissioning planning.
(5) Suspect LLW which may be cleared for inactive landfill disposal.
(6) Storage of PCB materials is managed with in accordance with the Federal "Storage of PCB Materials Regulations".
(7) Ozone-depleting substances consist of Halons, CFCs, HCFCs and HFCs.

4.5.2 Waste Streams and Disposal Pathways

Figure 4.5 indicates the various decommissioning waste streams, disposal pathways and additional/new facilities which will be required to manage wastes arising from monitoring and surveillance activities and from decommissioning work at the site, until national waste disposal facilities become available. The waste sources (i.e. the various existing site facilities) are indicated in the left column. The interim processing and storage facilities are in the centre column and final disposal location or facility is indicated on the right. The primary waste sources requiring interim treatment and handling are:

- aqueous waste collected from sumps in monitoring and surveillance buildings;
- processing of site TFRE/Amine active liquid waste to a solid form;
- MLW and LLW retrieved from existing waste management facilities where enhanced packaging and storage is required prior to the availability of a waste disposal facility;
- wastes produced from carrying out monitoring and surveillance activities; and
- wastes produced from decommissioning activities prior to the availability of disposal facilities.

Figures 4.6 and 4.7 indicate the timing for shutdown and decommissioning of existing waste management facilities and the replacement facilities required to manage liquid and solid waste, respectively, produced from monitoring, surveillance and decommissioning project activities.

The upper half of the figures indicate which waste management facilities will be available over the duration of the project, whereas the lower half shows the nature of the wastes arising from decommissioning activities as well as the period when they are to be generated. The same colour codes are used in the upper and lower halves and show the destinations of the wastes.

4.5.2.1 Active Liquid Waste Processing

As indicated previously, 450 L of TFRE/Amine active liquid waste are stored at Whiteshell Laboratories. As part of operational shutdown, these wastes will be immobilized in steel containers in the Shielded Facilities, and placed into steel baskets which will be stored in a new interim storage bunker located in the WMA. These wastes will be transferred to off-site waste disposal facilities when such facilities are available.

4.5.3 Waste Processing Facilities

As indicated by the boxes in the centre column of Figure 4.5, modification of existing facilities and several new facilities are needed to process waste and provide interim storage until final disposal facilities are available. The anticipated interim processing and storage facilities required are described briefly as follows:

- Deminimis Segregation Facility

  This facility will be used to monitor wastes that are identified for off-site disposal. Wastes having radioactivity levels above free-release requirements will be segregated and placed in interim storage until disposal facilities are available. Materials below free-release levels will be transported off-site for recycling or disposal.

- Reduced Active Liquid Waste Treatment Centre

  By about year 4 of Phase 1, most of the ALWTC will be decommissioned to an interim end state. A small portion of the facility will be retained in an operational state to process aqueous LLW collected from the building sumps and small amounts of aqueous LLW and MLW originating from WMA retrieval, processing and interim storage operations.

- WMA Retrieval, Reprocessing and Repackaging Facility

  A retrieval, reprocessing and repackaging facility will be required to process waste generated from monitoring and surveillance activities and from decommissioning project work implemented prior to the availability of disposal facilities.

  Retrieval of wastes which cannot be accommodated in existing storage facilities until disposal becomes available (e.g. fuel waste in standpipes and trench 6 MLW) will require portable shielded processing facilities.

- New WMA Interim Storage Facilities

  New interim storage facilities will be required for interim storage of LLW and MLW until disposal becomes available. This will likely be composed of a segregated storage area within the WMA and include or be adjacent to the reprocessing facilities. The wastes expected to require new interim storage are:

  - solidification waste from the processing of HLW and aqueous wastes arising from WMA retrieval and processing operations;
  - monitoring and surveillance waste;
  - contaminated building maintenance materials; and
  - retrieved, processed and repackaged (WMA) waste.

Construction of new storage facilities will be subject to review and approval by AECL Safety Review Committee and the CNSC.

4.5.4 Final Waste Disposal

The final waste disposal paths are shown on the far right of Figure 4.5. There are five main disposal paths for the site decommissioning waste. These are described briefly as follows:

- In-Situ Disposal

  Waste items may be left in place for permanent disposal. In-situ disposal is proposed as the reference option for most of the LLW trenches in the WMA and for contaminated sediments at the outfall.

- Chemical Safe Storage / Disposal

  These are engineered off-site facilities expected to be available in Canada for disposal or safe storage of hazardous chemical wastes.

- Off-Site Landfill

  These are engineered sanitary landfills expected to be available within the Regional Study Area. It would likely be an off-site facility capable of handling building rubble.

- River

  Liquids are batch processed at the ALWTC to remove contamination and only released to the Winnipeg River if they meet release criteria. All releases to the environment will be controlled within administrative levels set well below the site Derived Release Limits (DRLs) (Soonawala 1998). Aqueous wastes above these levels are processed and stored as a solid product at the WMA. It is expected that liquid releases will be gradually reduced approaching the deferment period (end of Phase 1), and will remain at low levels throughout the deferment period.

- National Waste Disposal Facility

  A national waste disposal facility or series of facilities is required for all of the radioactive waste materials at Whiteshell Laboratories, except for the WMA low-level wastes which may be managed in-situ. Separate facilities may be required for the three main categories of solid waste. These categories are low-level, medium-level and high-level radioactive waste.

FIGURE 4.6

TIMING FOR MANAGEMENT OF RADIOACTIVE LIQUID WASTE

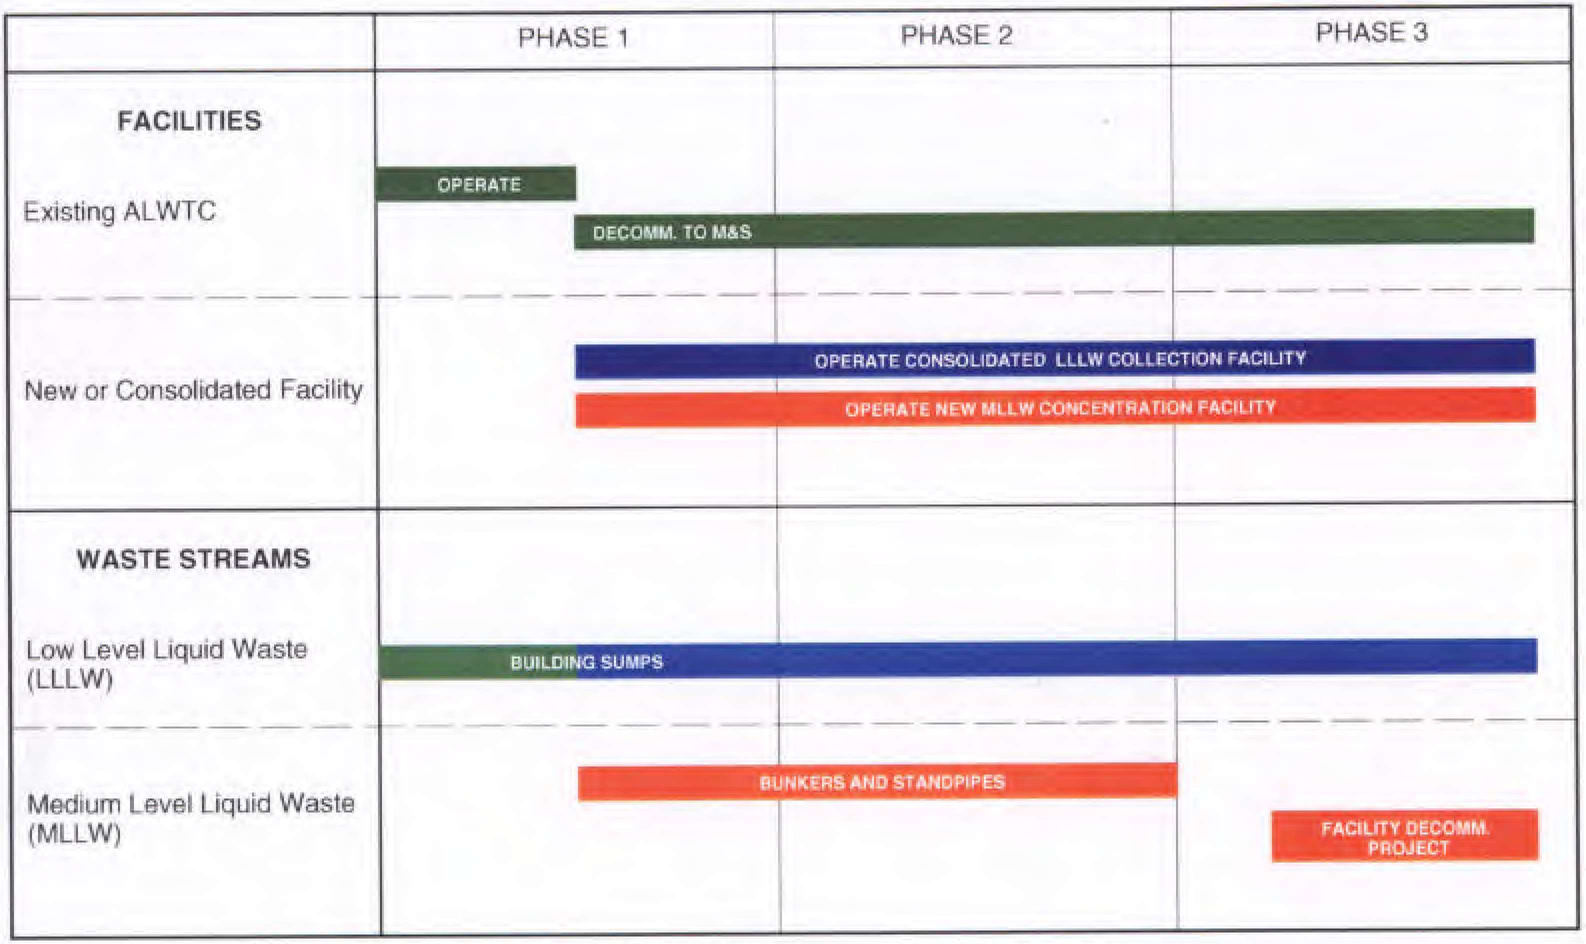

FIGURE 4.7

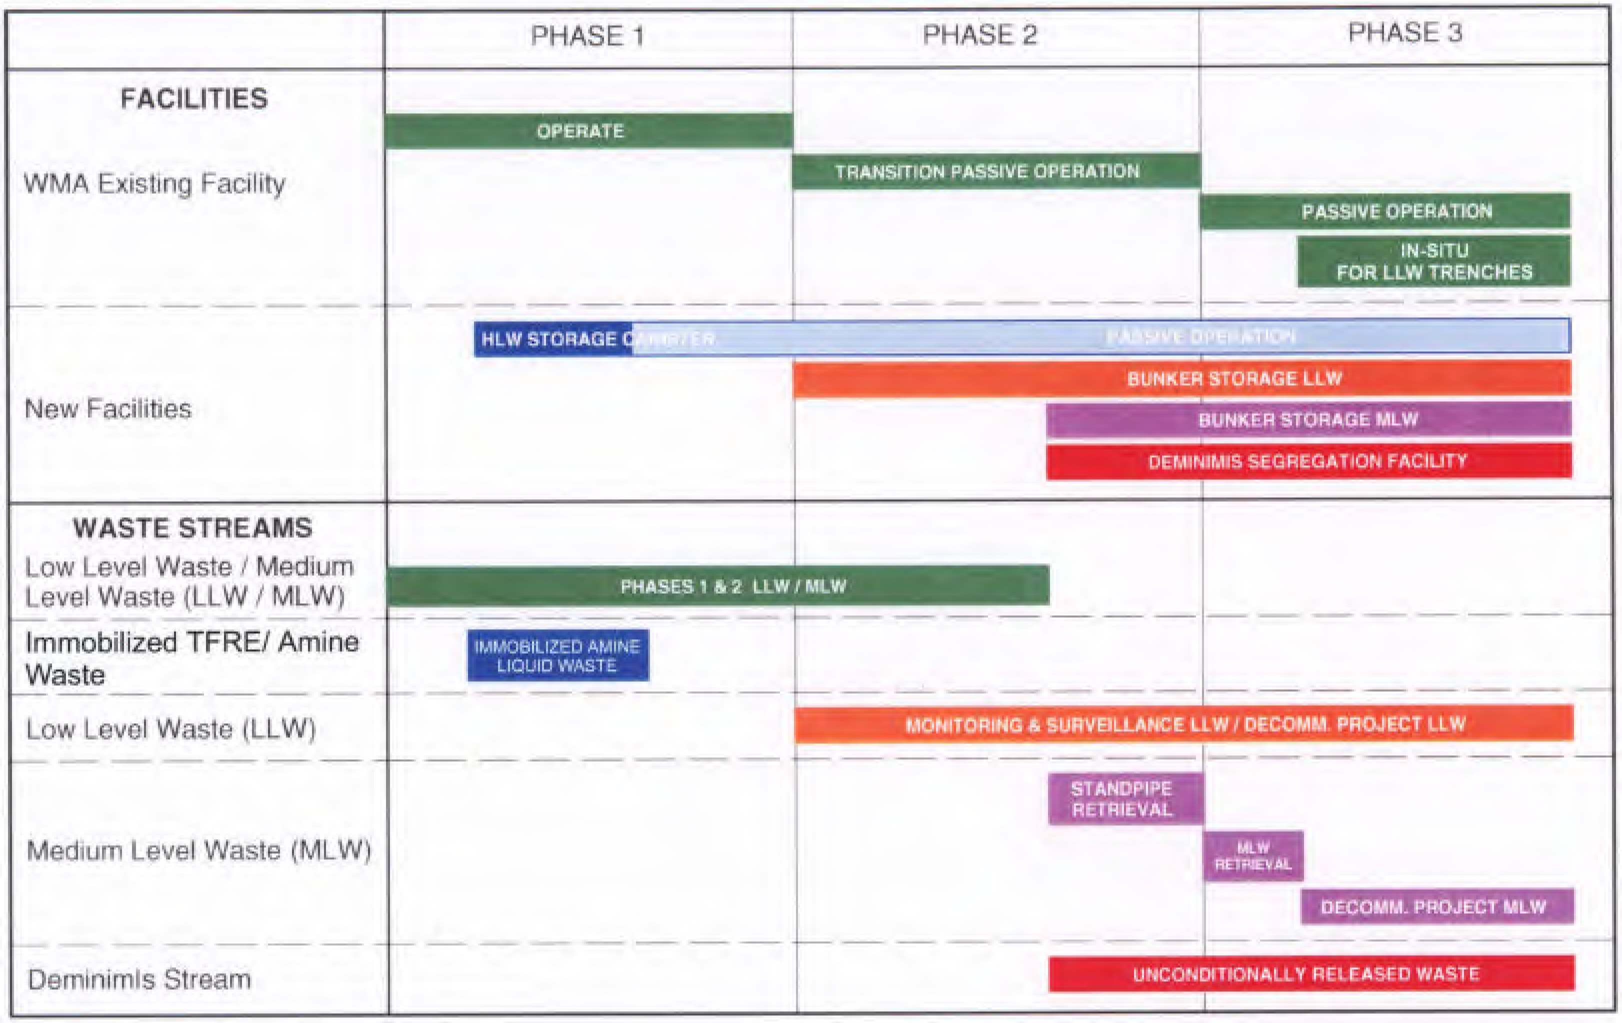
TIMING FOR MANAGEMENT OF RADIOACTIVE SOLID WASTE



5.0 DESCRIPTION OF THE EXISTING ENVIRONMENT

5.1 LOCATION

5.1.1 Geographic Setting

The Whiteshell Laboratories site is located on the east bank of the Winnipeg River (50º 11'N; 96º 03'W), approximately 100 km northeast of Winnipeg, approximately 10 km west of Pinawa and 9 km upstream of the Village of Lac du Bonnet (Figure 1.1). The site lies approximately 267 m above sea level (Reimer 1966), within a broad zone where prairie grassland to the southwest merges with boreal forest to the northeast. It is on the western edge of the Precambrian Shield and is surrounded by cleared land, which supports agriculture, interspersed with peat bog (Canada Land Inventory 1968, 1975).

Forty-three percent of the site is forested and leased farmland, 46% is occupied by buildings, facilities and developed lands, and the remaining 11% is a fenced area for nuclear and non-nuclear buildings and facilities. The fenced area contains ten major buildings, and a number of small support facilities.

5.1.2 Study Areas

Regional Study Area

The Regional Study Area (Figure 2.3) is partially a Canadian Shield landscape. A large number of shield lakes (approximately 25 lakes) and connecting rivers are found in the area. The Winnipeg River, which has its outlet in Traverse Bay at the southern end of Lake Winnipeg, is among these rivers. The area includes approximately 60 km of Lake Winnipeg's shoreline, and a small portion of the lake, consisting mostly of Traverse Bay and Elk Island Heritage Park. There are a number of provincial parks in the region: Whiteshell Provincial Park (approximately one quarter of the eastern edge), Nopoming Provincial Park (the south-eastern tip), and Grand Beach Provincial Park. Also falling within the study area are the Agassiz, Whiteshell, Brightstone Sand Hills, and Belair Provincial Forests (Manitoba Highways and Transportation 1999).

Local Study Area

The Local Study Area (Figure 2.2) falls primarily within the Canadian Shield. The area includes a public airport just north of Lac du Bonnet, a hospital at Pinawa, the Seven Sisters Dam, two government picnic grounds, and a government campsite. The La Verendre Trail, connecting a number of communities in Eastern Manitoba near Whiteshell Provincial Park, passes through the centre of the Local Study Area (Manitoba Highways and Transportation 1996).

Licensed Property Study Area

The licensed Property Study Area (Figure 2.2) of Whiteshell Laboratories consists of land on both sides of the Winnipeg River. The developed and larger portion is on the east-side of the river, roughly 10 km from the Town of Pinawa. This east side of the licensed area is composed of all Whiteshell Laboratories facilities and the Field Irradiator Gamma (FIG) area. However, the vast majority of the east side is undeveloped and comprises bush land, swamp and undeveloped river frontage. All land on the west side of the river is leased to farmers for agricultural purposes.

Project Study Area

The Project Study Area consists of approximately 1340 ha of the licensed Property Study Area which has been used and/or affected by AECL nuclear development and operations.

The majority of the Whiteshell Laboratories facilities fall within a 40 ha area, adjacent to the east shore of the Winnipeg River. The Project Study Area is identified in Figure 2.1.

5.2 EXISTING CONDITIONS FOR THE CURRENT OPERATION OF THE WHITESHELL LABORATORIES FACILITY

Extensive data is collected for radiological and non-radiological conditions in and around Whiteshell Laboratories. The most recent emissions monitoring data describing the current operation of the Whiteshell Laboratories facility is presented in the 1998 Annual Report of Radiological Monitoring - Volume 2 (Niemi and Soonawala 1999a). This report summarizes radioactive emissions from Whiteshell Laboratories and compares effluent release data to the Derived Release Limit (DRL). A DRL is derived from regulatory dose limits by analytical modelling of all significant pathways to an individual in the most exposed group (the critical group). A DRL is, therefore, the upper limit of a single radionuclide for a facility in airborne and/or liquid effluents. Continued release of any radionuclide at a rate equal to the DRL would, in theory, result in an annual radiation dose equal to the regulatory limit. The operation of Whiteshell Laboratories has consistently maintained releases well below the DRL and has never resulted in adverse effects on the environment or human health.

The 1999 operations have resulted in lower emissions due to shutdown of a majority of the facilities.

Standards for Radiological and Non-Radiological Effluents

(a) *Radiological Effluents*

Standards followed for radiological effluents are based on dose limits for members of the general population prescribed by the CNSC, which in turn are based on ICRP recommendations. The current dose limit is 1 mSv per annum (CNSC 2000b). These dose limits are used to back-calculate the DRLs for every source of radiological effluents, liquid or gaseous, and for every radionuclide, released on a site. DRLs, in units of Bequerels per week or month, are approved by the CNSC and subsequently published by AECL. Critical groups and contaminant transfer pathways are important components of models used to calculate DRLs. Dose limits are shown in Table 5.1.

Table 5.1
Recommended Dose Limits

Application	Annual Dose Limits *	
	Atomic Radiation Worker	Public
Effective Dose: Current Limits	20 mSv (averaged over 5 years)	1 mSv

* This limit is the same as the current Administrative Control Limit effective dose per year.

In addition, the facility is operated in accordance with administrative controls as specified in AECL RC-2000-633-1. This document in part addresses the responsibilities and procedures for monitoring employee dose accumulation and restricting exposure to ionizing radiation. It sets out the Administrative Control Limits which are below the levels set by ICRP and the CNSC (See Table 5.2).

Table 5.2
Current Administrative Control Levels mSv (rem) for Atomic Radiation Workers

Organ or Tissue	Per 4 Weeks or Longer Monitoring Period	Per Year
Effective Dose	4 (0.4)*	20 (2)
Shallow Dose	50 (5)	200 (20)
Extremity Dose	50 (5)	----------

* Administrative Control Limits for workers who have declared pregnancy shall be 0.3 mSv. (0.03 rem) per two weeks and 5 mSv (0.5 rems) to the abdomen for the remainder of the pregnancy.

(b) *Non-Radiological Effluents*

Guidelines are followed for determining acceptable concentrations of various elements and pH in non-radiological effluents from AECL sites. These guidelines are listed in the AECL Environmental Protection Manual (RC 2000-021-00). Guidelines are for daily releases and monthly releases, the latter being the more restrictive of the two. The guidelines were obtained or derived from the following existing federal and Ontario guidelines:

- Environment Canada - Guidelines for Effluent Quality and Wastewater Treatment at Federal Facilities: EPS 1-EC-76-1, 1976 April.
- Environment Canada - Environmental Codes of Practice for Steam Power Generation: Design Phase and Operation Phase. EPS 1/PG/1 (1985 March) and EPS 1/PG/5 (1992 November).

Non-radiological monitoring data for Whiteshell Laboratories is documented in Atomic Energy of Canada Limited (1998).

5.2.1 Whiteshell Laboratories Airborne Effluents

The major sources of airborne radioactive effluents from Whiteshell Laboratories in 1998 were:

- the reactor building (B100) stack;
- the Active Liquid Waste Treatment Centre (B200);
- the Hot Cell Facility;
- the Immobilized Fuel Test Facility;
- Laboratory 2-136 in B300; and
- the Incinerator and the Compactor/Baler in the Waste Management Area.

A summary of air effluent monitoring results for Whiteshell Laboratories are provided in Table 5.3. Results for 1998 and the three previous years are also shown.

DRL * for members of the public at the Whiteshell Laboratories boundary.

** The DRL for ^{90}Sr is applied to beta activity.

Average emissions, in Becquerels per week and as a percentage of DRLs and the maximum weekly emissions as a percentage of DRL are shown for tritium, gross beta and ^{131}I for facilities in B300, B200 and B100. The releases from the various sources at Whiteshell Laboratories for various radionuclides, expressed in percentages of DRLs, are added to provide an indicator of the overall performance of the site. The highest such sum is 0.0057% for 1996, whereas the corresponding sum for 1998 is 0.0015%. The conclusion is that releases are very small, well below one thousandth of the DRL, and that this situation has been stable over several years. The year to year variations within these extremely small numbers are of no consequence.

5.2.2 Whiteshell Laboratories Liquid Effluents

The primary source of liquid radioactive effluents at Whiteshell Laboratories is the process water outfall (Outfall) which discharges continuously to the Winnipeg River. The discharge from the outfall is composed of tank discharges (including discontinuous discharges from the Active Liquid Waste Treatment Centre), storm water run-off, and miscellaneous cooling water. The secondary source of liquid effluents is the sewage lagoon which is discharged twice a year (usually June and October) to the Winnipeg River. The sewage lagoon collects sanitary sewage and wastewater from most buildings on the site.

Some drainage ditches also discharge to the Winnipeg River, but their contribution to the radioactivity in the effluent from the site is insignificant compared to the outfall and the lagoon.

Table 5.4 provides a summary of radioactive contaminants in liquid releases from Whiteshell Laboratories for the years 1995 to 1998. The average monthly releases, expressed as a percent of DRLs, are added for the various sources on site to provide a quantitative indicator of the performance of the site. In all cases, the releases were well below one thousandth of the DRL.

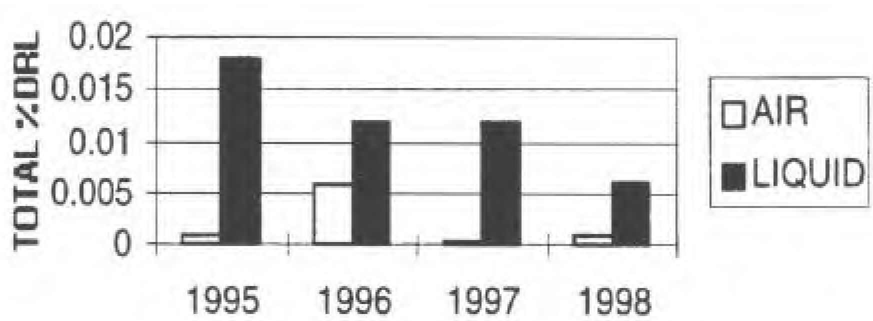
Notes:
1. Averages shown for sewage lagoon equal the total of 2 releases divided by 12.
2. DRL for ^{241}Am is applied to alpha. In previous reports DRL for ^{239}Pu was applied to alpha. Percent DRL values for 1995 to 1997 have been recalculated.
3. DRLs are for members of public at the site boundary.

In summary, expressed as DRLs, the airborne and liquid emissions from Whiteshell Laboratories have been low in 1998 and previous years. It can be noted that over this time period, the highest sum of the site-wide DRL, is about 0.02% of the cumulative DRL (liquid emissions in 1995).

Figure 5.1 summarizes annual monitoring results for airborne and liquid effluents from the Whiteshell Laboratories site from 1995 to 1998, as percent of DRL.

Figure 5.1
Radioactive Emissions from Whiteshell Laboratories 1995-1998



Non- radiological Contaminants in Liquid Effluents

A table from AECL-MISC-390-99 presented below, show the trends for 1995 to 1999 for average annual concentrations, conformance with daily emission limits, conformance with monthly emission limits and loadings. Data are presented for the two effluent release points from the site, the lagoon and the outfall. The monthly and daily emission limits adopted by AECL are also shown.

5.2.3 Estimated Dose from Whiteshell Laboratories Effluent Emissions

Environmental monitoring data (Niemi et al. 2000) have been used to estimate the incremental dose that could be caused to members of critical groups by operations at Whiteshell Laboratories. The estimates take into account water, fish and vegetable ingestion and beach exposure. Immersion in air and ingestion of wildlife (game) are not considered because of the extremely low radioactivities associated with those two sources.

Table 5.6 shows the reported dose estimates for 1997 to 1999.

Table 5.6
Estimated dose from Whiteshell Laboratories Liquid Effluents

	ADULT (mSv/a)			**INFANT (mSv/a)**		
Pathway	1997	1998	1999	1997	1998	1999
Water Ingestion	2.1E-04	3.19E-04	2.10E-04	5.6E-05	2.82E-04	1.82E-04
Fish Ingestion	1.0E-04	1.46E-04	8.32E-05	5.0E-06	7.28E-06	3.84E-06
Vegetable Ingestion	NA	5.95E-05	1.18E-04	NA	3.0E-04	2.12E-05
Beach Exposure	4.6E-05	3.69E-05	2.42E-05	7.1E-05	5.57E-05	3.63E-05
Total	3.6E-04	5.61E-04	4.35E-04	1.3E-04	6.45E-04	2.43E-04

NA: not analyzed

For comparison, typical radiation doses to adults from major natural sources and from medical diagnostic procedures amount to about 3.2 mSv/a. Actual background doses vary as a function of various factors such as elevation, local geology and housing material.

5.3 GENERAL RADIATION ENVIRONMENT

The following section provides an overview of the general radiation environment in the Pinawa area. The radiation data presented consists of routine ambient gamma radiation measurements made at 12 ambient air monitoring stations, gamma radiation survey data for various locations in the area and gross alpha/beta data for surface water, sediment and vegetation. Specific radionuclide data are presented in Section 5.3, Biophysical Conditions. The data in this section is drawn from the 1998 Annual Report of Radiological Monitoring – Volume 3 (Niemi and Soonawala 1999b). In most cases, the 1998 results of gross radiological parameter monitoring are presented along with 1994 – 1998 data in order to identify any trends.

5.3.1 Ambient Gamma Radiation Level

In 1998, ambient gamma radiation in air was monitored by means of thermoluminescent dosimeters (TLDs) at 12 locations in the three following general areas:

- at 5 locations near the perimeter of the Whiteshell Laboratories site;
- at the Pinawa hospital, Pinawa Resort (Kelsey House), Pinawa town yard; and
- at 4 locations on the Controlled Area fence.

The annual TLD readings for years 1994 to 1998 for each of the 12 TLD monitoring locations are shown in Table 5.7 in units of milligray per year (mGy/a). Figure 5.2 shows the mean of the readings from the TLDs at the site perimeter, Pinawa and Whiteshell Laboratories site Controlled Area fence areas, respectively, for the years 1994 to 1998. The reported readings include the gamma background exposure.

Data in Table 5.7 and Figure 5.2 show that ambient gamma radiation at all locations has remained stable over the period 1994 to 1998. The 1998 levels are marginally lower than the 1997 levels, but such small variations are of no particular significance.

Table 5.7
Ambient Gamma Radiation

Location	Total Gamma Dose (mGy/a)

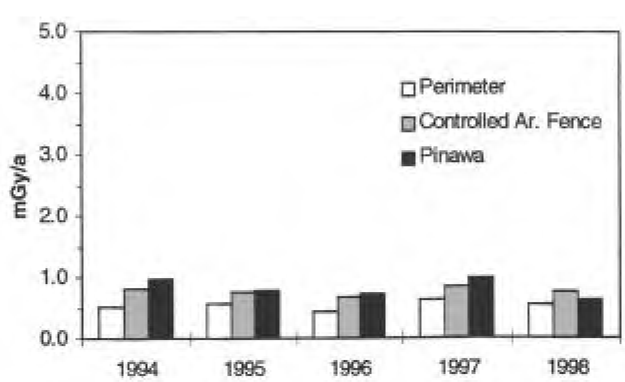
N/A Data not available because of vandalism of TLDs.
* Sum of 3rd and 4th quarter readings multiplied by two.
Natural background, caused by cosmic and terrestrial sources, is included in the TLD readings.

Figure 5.2
Ambient Gamma Radiation 1994-1998



5.3.2 Gamma Radiation Survey Data

The dose rate due to ambient gamma radiation was measured once during 1998 at control points on road routes along a 16 km radius surrounding the Whiteshell Laboratories site. Results for 13 points in the off-site public area and 10 points within the Whiteshell Laboratories site are shown in Table 5.8 for the years 1994 to 1998. The results for 1998 are similar to those for previous years.

5.3.3 Affected Lands

Information on the nature and extent of potential contamination on the affected lands, resulting from some of the more significant unplanned events as well as planned tests and experiments, is presented in Table 5.9.

Table 5.9
Contamination in Affected Lands at Whiteshell Laboratories

Date	Event	Purpose/Scope	Release Quantity	Current Status	Reference
67 May	Cesium Pond experiment	Study of dose distribution in a pond containing Cs	18.5 GBq (0.5 Ci)	Elevated levels of Cs-137	Guthrie & Scott, 1969
71 May	Contamination of lawns near B300, and north side of B402 due to fission product release from Hot Cells stacks.	N/A	Max I-131 concentration in grass was 2.07E4 dpm/m^2	No detectable contamination	Acres, 1971
72 May	Contamination of grass north of B300, due to fission product release from Hot Cells stacks	N/A	92.5 MBq (25 mCi) of old fission products	No detectable contamination	Plunkett, C.H., 1972
73 March	Field Irradiator Gamma (FIG) facility	Study of ecological effects of gamma exposure on boreal forest ecosystem.	No activity released. Sealed source of 370 TBq Cs-137	No radioactivity above background	Guthrie and Dugle, 1983
1976	Zoological Environment Under Stress (ZEUS) facility	Study effects of ionizing radiation on small mammals	No activity released. Sealed source of 0.22 PBq (6000 Ci) Cs-137	No radioactivity above background	Turner and Iverson, 1976
79 May	Water containing fission products dumped at WMA into the North Ditch that discharges into the Winnipeg River.	N/A	7 GBq of fission products	Elevated levels of gross beta, about 1.25 to 2.5 times activity in West Ditch	Guthrie and Acres, 1980
80 Aug	Contamination of ground and roadway south of B200 caused by pumping of ALWTC Tank 801 into a leaking line.	N/A	65 GBq (total of 3 incidents)	About 9 GBq of Cs-137 and Sr-90 remain in ground	Ridgway et al., 1997
91 Feb and Mar	Tracer Experiment in deep boreholes, Whiteshell Laboratories borehole site	Study of radionuclide transport in rock.	1.4 GBq (37.6 mCi) of Br-82, I-131, Sr-85 and Cs-134.	Negligible activity-- short half-lives.	Frost, L.H. et al. 1995

Note: Units of radioactivity used in references have been retained. 1 Ci = 37 GBq.

An airborne gamma survey was performed to assist with site wide characterization of ground-level radiation and to verify that any significant manmade contamination was restricted to the Whiteshell Laboratories site (Gamma Bob and Sander Geophysics Ltd. 2000). Airborne gamma ray maps of the Project Study Area were produced (Figures 5.3, 5.4 and 5.5) and show ^{137}Cs and ^{60}Co gamma radiation and the total due to all sources of gamma radiation (nGy/h).

Four localized sources of ^{137}Cs were detected within the affected lands. Three of these areas are associated with the Whiteshell Laboratories nuclear facilities and the remaining area is the site of the cesium pond experiment. One of the sources associated with the Whiteshell Laboratories nuclear facilities also showed the presence of ^{60}Co and ^{232}Th. ^{137}Cs was also detected throughout the affected lands and was attributed to atomic weapons testing carried out in the 1950s and early 1960s. The ^{137}Cs activities ranged from 0 to 15 Bq/kg and are typical of those found in southeast Manitoba. No other areas with elevated levels of manmade radiation were detected within the affected lands.

It is important to note that the ^{60}Co map reveals concentrations in the WMA and not in WR-1, although there are much higher levels of ^{60}Co in WR-1. The reason for this is the integrity of the WR-1 reactor shielding structure, which attenuates the gamma radiation from ^{60}Co. This supports the argument presented in Section 3.3 that the best storage location for the WR-1 components is the reactor vault until radioactivity decay is optimized.

5.3.4 Unaffected Lands

Environmental monitoring data, (i.e. ambient gamma radiation and vegetation monitoring) referenced in Atomic Energy of Canada Limited (2000) indicate that the unaffected lands at the Whiteshell Laboratories have not been utilized, impacted or affected by Whiteshell Laboratories' operations. This was verified through a detail radiological survey in the summer of 2000 (Gamma Bob and Sander Geophysics Ltd. 2000). Until the release of unaffected lands is authorized by the CNSC, the lands will remain under CNSC licenced control.

5.4 BASELINE CONDITIONS: BIOPHYSICAL

Biophysical conditions are described for climate and meteorology, air quality, geology, hydrogeology, hydrology, terrestrial biota and habitats, aquatic biota and habitats, regional land and resource use, and valued ecosystem components.

5.4.1 Climate and Meteorology

Site

Meteorological measurements were made at the Whiteshell Laboratories' climate station located on a 50 m x 50 m grass field located about 200 m west of the Whiteshell Laboratories' plant site and 200 m east of the Winnipeg River, which runs approximately north-south of the site. The field is located within a 2 ha clearing with the nearest trees or buildings at least 100 m distant. The Whiteshell Laboratories' climate station consisted of a louvered shelter used to house two liquids in glass thermometers, as well as two precipitation gauges. The Whiteshell Laboratories station was closed in 1998. Also on the field are a 61 m tower operated by Whiteshell Laboratories and a 10 m tower operated by Environment Canada. The 61 m tower is instrumented at the 61, 25, 6 and 1.5 m levels with wind and air temperature sensors. Environment Canada monitors instruments mounted on or near a 10 m tower to measure air temperature, wind, rainfall, snow cover on the ground, dewpoint temperature and barometric pressure.

<u>*Period of Record*</u>

The climate station has data covering the 34 year period from 1964 to 1997 inclusive for temperature and precipitation. Wind data are available for 21 years from 1978 to 1997. Summary data in Table 5.10 covers 32 years from 1964 - 1995.

Temperature

The near surface temperature affects the reaction rates of contaminants as well as atmospheric stability.

Table 5.11 presents the temperature variations by month over the 32 year period of record. The daily minimum ranges from a high of 12.9°C in July to a low of –23.8°C in January, while the daily maximum ranges from a high of 24.7°C in July to a low of –13.0°C in January. The daily mean temperature varies from a low of –18.4°C in January to a high of 18.8°C in July.

Over the 32 year period of record, the extreme maximum temperature was 37.5°C recorded on 17 June 1995 and the extreme minimum was –47.8°C recorded on 19 February 1966.

Precipitation

Contaminants in the atmosphere can be deposited to the Earth's surface by precipitation. This can contribute to contaminant levels in soil and groundwater.

Table 5.11 shows that Whiteshell Laboratories receives an average of 562 mm of precipitation per year, including an average of 127.1 cm of snowfall. The mean maximum monthly rainfall is 91.3 mm in June. Both July and August also have relatively high rainfall of 77.8 mm and 72.5 mm, respectively.

ENVIRONMENTAL ASSESSMENT

The maximum 24-hour accumulation of rainfall occurred on 15 June 1973 when 168.4 mm was measured. The maximum snowfall in one day was 36.8 cm on 31 October 1971.

Measurable precipitation occurs on an average of 128 days per year based on the Environment Canada Whiteshell Station over the period 1961 to 1990 (Environment Canada 1993).

Wind Speed

Figure 5.6 presents the average wind speed and shows that at Whiteshell Laboratories, the wind speed varies from 8 to 9 km/h near the surface (6 m) to 17 to 20 km/h at a height of 61 m. The annual average wind speed at the reference 10 m height is 14 km/h (Environment Canada 1982).

Dilution of airborne emissions increases with wind speed.

Figure 5.6
Average Wind Speed vs Height for the Period 1978 to 1995

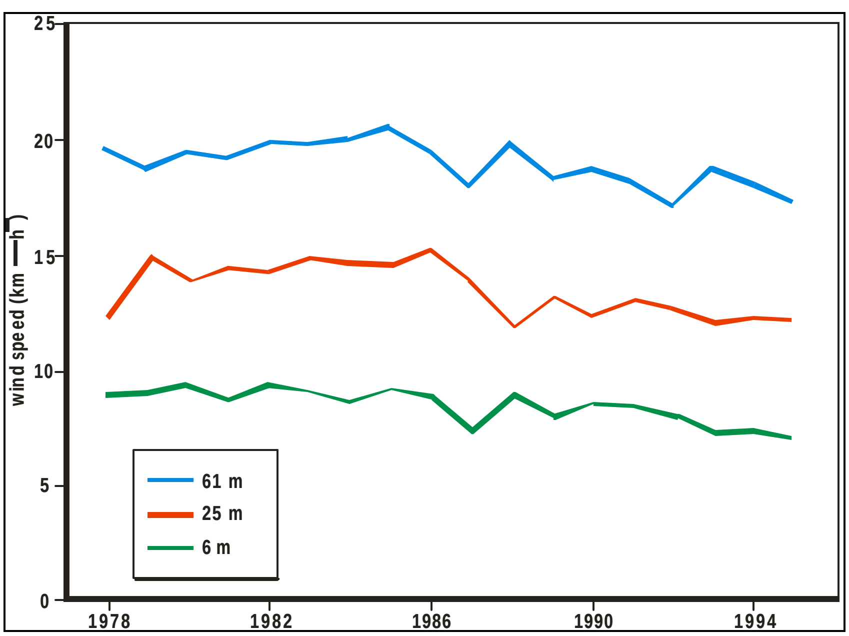

Table 5.12 presents the percentage frequencies of various wind speed categories as a function of wind direction. Wind speed data were divided into four classes: calm, 1.5 to 12, greater than 12 to 20, and greater than 20 km/h. Calm was defined as any wind speed less than 1.5 km/h.

Table 5.12

Source: Johnston 1996.

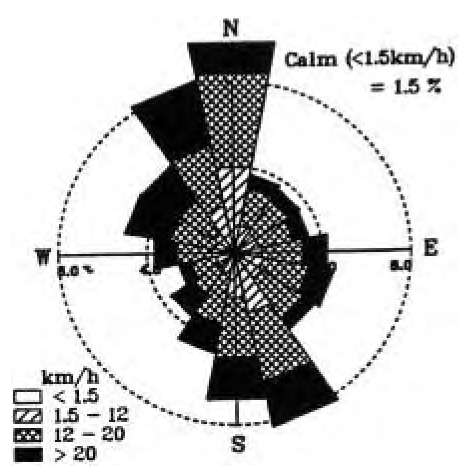
Table 5.12 shows that only about 5% of the wind speeds are above 20 km/h which is the wind erosion threshold speed. This indicates that there is a very low potential that fugitive dust resulting from decommissioning will be resuspended and carried off-site.

Wind Direction

Wind direction is reported as the direction from which the wind blows. In general terms, if the wind does not blow toward a receptor, there is no air quality problem. However, at most locations the wind blows in all directions with varying frequencies. Certain directions occur more frequently than others, and these are known as the prevailing winds.

Table 5.12 presents the wind rose data for the 6 m level at Whiteshell Laboratories. It shows that the prevailing wind directions are SSE, S and NNW. This bi-directional prevailing wind characteristic is caused by a channelling of the wind by the local topography (the river valley).

Figure 5.7
Whiteshell Laboratories Windrose, 1998 for 61 m Height



Recent Wind Data

The 1998 data from the Whiteshell Laboratories' observing station shows a similar pattern to the 17 year summary presented in Table 5.12. The data presented in Figures 5.7, 5.8, 5.9 and 5.10 show an increasing percentage of calms and a shift to lower windspeeds as the surface is approached. This is consistent with theory. The high level of calms near the surface (20.5%) means that any dusts generated tend to stay on or near the site.

Figures 5.7, 5.8, 5.9 and 5.10 also show a shift in the predominant wind directions from SSE-NNW near the surface (6 m) to N-S aloft (61 m). Again, this is consistent with boundary layer physics with a clockwise rotation due to the coriolis forces as one moves away from the earth's surface.

Figure 5.10 presents the 1998 wind rose data from the Environment Canada tower. It is very consistent with the Whiteshell Laboratories' data except that it shows lower wind speeds and a high frequency of occurrence of winds from the NW and SE sectors.

<u>Introduction</u>

The existing air quality is being documented to provide a baseline against which the effects of the decommissioning of Whiteshell Laboratories can be assessed. The decommissioning will generate dust (particulate matter) with varying particle sizes. These are generally categorized into three forms:

- PM_{10} is the fraction of the particulate matter that is less than 10 µm in diameter. PM_{10} will remain in the atmosphere longer since the particles are smaller. Particles of this size have been linked with increased cardiopulmonary effects in humans.
- $PM_{2.5}$ is the fraction of particulate matter that is less than 2.5 µm in diameter. This size of particle can be breathed deep into the lungs and behaves like a gas, remaining in the atmosphere for days to weeks before being deposited.
- Dustfall which is made up primarily of larger dust particles that can collect on flat surfaces.

<u>Regional Study Area</u>

There is no air quality monitoring in the region (Van Dusen 2000). The closest data available are from the following stations:

- Stations 9118 and 9119 in Winnipeg, MB.
- Stations 62030, 62032 and 62035 in Fort Frances, ON.
- Stations 63200, 63046, 63120 and 63121 in Thunder Bay, ON.

These stations have been set up primarily as significant local source monitors and as such will not be representative of conditions in the Regional Study Area. The lowest 10th percentile of the observations will, however, represent background air quality. These data can be used to estimate the background air quality at the study area as this level is fairly constant from site to site. Data from the above stations for 1995 were reviewed and the 10th percentile values are presented in Table 5.13.

Table 5.13

Table 5.14 shows regional air quality background concentration levels in the following range:

Table 5.14
Air Quality Background Concentration Levels

Parameter		Concentration Range (various units)	Concentration Range ($\mu g/m^3$)	Air Quality Standard ($\mu g/m^3$)	Range (%)
CO	(1 hour average)	0 – 0.4 ppm	0 – 466	36200	0 – 1.2
NO_2	(1 hour average)	0 – 0.7 pphm	0 – 13	400	0- 3.3
NO	(1 hour average)	0 pphm	0	ns	-
NO_x	(1 hour average)	0 – 0.8 pphm	0 – 15	400	0 – 3.4
O_3	(1 hour average)	2 – 13 ppb	4 – 26	160	2.5 – 16.3
SO_2	(1 hour average)	0 ppm	0	690	0
TRS	(1 hour average)	0.00 ppb	0	40	0
PM_{10}	(24 hour average)		6 – 8	50	12 – 16
TSP	(24 hour average)		10 – 21	120	8.3 – 17.5
Pb	(24 hour average)		0.01	2	0.5
$SO_4^{=}$	(24 hour average)		0.85 – 1.48	ns	-
NO_3^-	(24 hour average)		0.08 – 0.14	ns	-

In summary, the regional air quality ranges from 0 to 17% of the relevant provincial and/or federal standards. Therefore, this area is classified as “very clean”.

Local Study Area (Including the Licensed Study Area)

The 1998 Annual Report of Radiological Monitoring - Volume 3 (Niemi and Soonawala 1999b) was used to develop the baseline air quality for the Whiteshell Laboratories site. Levels of non-radiological pollutants including dust (Particulate Matter less than 10 µm in diameter (PM_{10}), Particulate Matter less than 2.5µm in diameter ($PM_{2.5}$), Sulphur dioxide (SO_2), Nitrogen oxides (NO_x) and Volatile Organic Compounds (VOCs), in the Project Study Area are not expected to differ from the regional levels.

Radioactivity and Air Quality

The monitoring data collected for the above mentioned 1998 report shows consistently low levels of radioactivity at all monitoring stations both within the Project Study Area and in the Local Study Area (Niemi and Soonawala 1999b). It concludes that "*…monitoring of potential atmospheric effluent exposure pathways did not indicate any measurable contribution in excess of natural background levels from Whiteshell Laboratories operations. This is consistent with effluent monitoring results which indicated that airborne emissions were very small.*"

The estimated dose to the most heavily exposed members of the public (assumed to be living at the site boundary) was a negligible percentage of the typical background radiation dose in Canada.

5.4.3 Geology

Bedrock Geology

Regional Study Area

In the eastern portion of the Regional Study Area, the chief rock types consist of predominately acidic to intermediate gneisses that have been extensively intruded by granitic to granodioritic rocks. In the western region, Precambrian rocks are overlain by gently dipping (to the west) Paleozoic sediments forming the eastern margin of the Western Canadian Sedimentary Basin. The basal unit of this formation is the Winnipeg Formation, comprising inter-bedded shales and sandstones, which lie unconformably on the Precambrian surface. Overlying the Winnipeg Formation is the Red River Formation, comprising limestones and dolomites. To the northeast lies a series of Archean sedimentary, volcanic and intrusive rocks, which include the large Bernic Lake pegmatite (Guthrie and Scott 1988).

Local Study Area

In the vicinity of the Whiteshell Laboratories (Figure 5.11), the Lac du Bonnet batholith is the dominant igneous body in the area, and forms part of the English River Subprovince of the Superior Province of the Precambrian Shield. The Lac du Bonnet batholith is a large, flat, sheet-like body with steeply dipping walls (Guthrie and Scott 1988), and where outcrops occur (mostly on the east side of the Winnipeg River), jointing is evident. The northern and southern contacts of the Lac du Bonnet batholith consist of granodioritic gneisses and undifferentiated grantitic rocks, respectively.

Surficial Geology

Regional Study Area

The regional surficial geology comprises widespread deposits of till and glacio-fluvial and glacio-lacustrine materials. Tills of predominantly sandy and/or clayey composition are widespread in the western portions of the region, but are less widespread in the central and eastern portion, where they are generally confined to bedrock depressions between bedrock outcrops. End-moraine and outwash complexes (comprising mostly sand and gravel) are evident just west of the Winnipeg River. Extensive deposits of lacustrine clay, mud and silt, are found over the existing glacial deposits in the western portion of the region, but are less widespread in the central and eastern areas (Betcher et al. 1988). In general, the Winnipeg River divides the area into two basic subregions with regard to surficial geology: (i) calcareous tills to the west, and (ii) sandy tills and glacio-fluvial deposits to the east (Guthrie and Scott 1988). Finer glacio-lacustrine deposits are evident along the drainage depressions of the Winnipeg River and Pinawa Channel (Lee River).

Local Study Area

On either side of the Winnipeg River, extending for 2 to 3 km, a continuous surficial unit of clay is present, broken in only a few places by occasional bedrock outcroppings and slightly elevated and coarser materials overlying the clay unit (Figure 5.12). Further east of the Winnipeg River, the overburden soils become thinner, and the bedrock outcrops more numerous (Shawinigan Engineering Company 1960).

Project Study Area

In the immediate vicinity of the Whiteshell Laboratories, there are approximately 10 to 20 m of surficial overburden soils overlying the Precambrian bedrock. These overburden soils include glacial, glaciofluvial and alluvial deposits. A low alluvial terrace exists along the banks of the Winnipeg River comprising mostly silt material.

Two major silty clay horizons overlying clay till were noted in test boreholes undertaken at the site in the late 1950s (prior to development of the site). The upper silty clay horizon has been described as hard, while the lower silty clay horizon was noted to be stiffer and containing less silt. The upper silty clay sequence is approximately 4 to 6 m thick at the eastern portion of the site, but was noted to be thinner to the west, towards the Winnipeg River. There were also instances of fine sand lenses encountered in some test holes (Shawinigan Engineering Company 1960).

At the Waste Management Area (WMA) of the Whiteshell Laboratories, and where extensive test hole drilling has taken place prior to, and since site development, the overburden soils were found to comprise 0.5 m of organic-rich soil horizon overlying 1.5 m of silt, 2.5 m of clay, 5 m of clayey till, and 3 to 5 m of stratified sand (Cherry and Robertson 1988). The upper silt, clay and clayey till units are noted to thicken in an eastward direction. The upper silt, clay and clayey till units were also noted to be vertically fractured throughout, possibly due to both historically drier climates and lower water tables, and subsurface geochemical processes causing shrinking and swelling of clay minerals in the till. The surficial geology in the immediate vicinity of the WMA is shown in Figure 5.12 and

Figure 5.13 Stratigraphic cross-sections of the overburden geology at the WMA are presented in Figures 5.14.

Soil Characterization

The two major factors that influence soil formation are drainage and parent material. The surficial soil types in the Local Study Area are presented in Figure 5.15. In general, the surficial soil distribution in the low-lying areas to the northwest and west, and away from major streams, comprise peats in areas of poor drainage. Improved drainage conditions in these areas leads to the development of humic gleysols and brunisols, while underlying outwash sands and gravels lead to the development of brunisols. Soil development near the Winnipeg River includes peaty humic gleysols on lacustrine silts and clays, but the inherently more effective surface drainage at these locations generally retards peat development. Precambrian bedrock outcrops generally have only partial lichen and moss cover, although peat soil is common in depressions (Guthrie and Scott 1988).

5.4.4 Hydrogeology

Bedrock Aquifers

The Winnipeg and Red River Formations form important and extensive bedrock aquifers in the western part of the region, while Precambrian rocks form the main bedrock aquifer east of the Winnipeg and Whitemouth Rivers, where surficial deposits are generally thin and scattered (Betcher et al. 1988). The limestone and dolomites of the Red River Formation are generally well fractured and provide moderate to high well yields (up to 50 L/sec), while the sandstone sequences of the Winnipeg Formation will typically yield somewhat less. These two aquifers are effectively separated by shale sequences comprising the upper portion of the Winnipeg Formation. Groundwater in the Precambrian bedrock aquifer is obtained primarily from fracture zones in otherwise competent rock of very low permeability. Yields are highly variable, from effectively no groundwater at all, up to 5 L/sec (Betcher et al. 1988).

Shallow and Perched Aquifers

Regional Study Area

Carbonate-rich sand and gravel aquifers overlying Pre-Cambrian bedrock are widespread near the Milner Ridge moraine, at the centre of the Regional Study Area, and represent a major recharge area for the sedimentary bedrock aquifers underlying the western portion of the Regional Study Area. Elsewhere in the Local Study Area, localized sand and gravel aquifers are found (at the Waste Management Area, for example), but are generally interstratified with finer grained deposits within till sheets or at the bedrock-till contact. The till aquifers generally have low water-bearing capacities, although some sandy till zones are exploited through the installation of specially designed, large-diameter wells (Guthrie and Scott 1988).

Whiteshell Laboratories – Project Study Area

The focus of the hydrogeological studies in the Project Study Area has been the Waste Management Area, the main storage area for the radioactive and hazardous waste at Whiteshell Laboratories. The area has been the site of intensive hydrogeological studies initiated in 1968. The area investigated is a strip of terrain 5 km by 2 km that extends from the FIG Site (Figure 5.13) to the Winnipeg River. Investigations included:

- Extensive test drilling and piezometer installation for delineation of the stratigraphy, groundwater flow conditions and hydrogeochemistry.
- Extensive monitoring of water levels (over 20,000 water level measurements were compiled).
- Estimation of hydraulic properties of the overburden deposits from several different methods including pumping tests, sediment grain size analysis, mass balance calculations and environmental tracer migration.
- 2-D and 3-D groundwater flow modelling to understand flow conditions at the site.
- Use of environmental isotope and geochemical data to investigate groundwater migration processes.

A comprehensive summary of the results from studies performed over the 17-year period 1968 to 1985 is given in Robertson and Cherry (1985). A brief summary of key results is provided here along with results from additional analysis performed in support of the CSR.

Hydraulic Parameters of the Stratigraphic Units

Groundwater flow rates and velocities are a function of the hydraulic conductivity and porosity of the stratigraphic units comprising the overburden. The stratigraphic units at the WMA from surface to bedrock as described in Section 5.4.3 comprise of approximately:

- 0.5 m of organic rich soil horizon;
- 1.5 m of lacustrine silt;
- 2.5 m of lacustrine clay;
- 5 m of clayey glacial till referred to as 'clay-till'; and
- 3-5 m of a relatively permeable sand aquifer referred to as 'basal sand' or 'basal sandy drift'.

The basal sands overlay the bedrock surface on top of the bedrock surface throughout the study area and have a maximum thickness of approximately 16 m (Figure 5.16).

The watertable in the WMA normally exists in the silt unit and fluctuates seasonally within a depth range of 0 to 3 m of ground surface. Hydraulic parameter estimation has focussed on the stratigraphic units in the saturated zone below the watertable. These are the lacustrine clay, clay-till and basal sand units. Recommended hydraulic parameter values for these units are summarized in Table 5.15. These values are best estimates and represent average values for the stratigraphic units.

Table 5.15
Hydraulic Parameters of the Stratigraphic Units

Stratigraphic Unit	Horizontal Hydraulic Conductivity K_x $cm\text{-}s^{-1}$	Vertical Hydraulic Conductivity K_z $cm\text{-}s^{-1}$	Porosity
Basal Sandy Drift in the vicinity of the WMA	[a]8E-04	[f]2E-05	[d]0.3
Basal Sand – Upland Recharge Area	[b]3E-03	[f]7.5E-05	[d]0.3
Lacustrine Clay And Clay Till	[g]<3E-07	[c]< 3E-07	[e]7E-04

a) Estimated from Pumping Tests.
b) Estimated from Mass Balance Calculations.
c) Estimated from Mass Balance Calculations and Flow Modeling.
d) Chosen Value (Robertson and Cherry 1985). Porosity of sands typically range from 0.25 to 0.5 (Freeze and Cherry 1979).
e) Estimated from average vertical fracture spacing of 6 cm and fracture aperture of 40 microns.
f) Based on ratio of horizontal to vertical conductivity of 40 (Robertson and Cherry 1985).
g) No continuous horizontal fractures were noted in the clays. Horizontal hydraulic conductivity is expected to be no greater than vertical conductivity.

Lacustrine Clay and Clay-Till: Consolidation tests indicate that the intergranular hydraulic conductivity (K) of the lacustrine clay unit is in the range of 5E-10 cm s^{-1} to 3E-08 cm s^{-1}. Intergranular K of the clay-till is probably similarly low. However there is abundant evidence to indicate that these units are fractured and that the fractures impart a bulk permeability to this material much greater than the intergranular permeability. Because vertical fractures have been observed to cross the stratigraphic boundary between the lacustrine clay and clay-till these two materials may be considered to have similar hydraulic conductivities. The vertical hydraulic conductivity of these units is estimated to be greater than the intergranular permeability but less than 3E-07 cm-s^{-1}. The horizontal hydraulic conductivity is probably of similar magnitude.

Groundwater flow through the lacustrine clay and clay-till will occur primarily through the fractures as opposed to through the intergranular pore space. Fracture porosity is estimated from an average fracture spacing of 6 cm and fracture aperture of 40 microns and is approximately 7.0E-04.

Basal Sandy Drift: The horizontal hydraulic conductivity of the basal sands varies from approximately 1E-2 to 1E-4 cm-s^{-1}, Figure 5.17. The hydraulic conductivity in the periphery of the WMA is approximately 8E-04 cm-s^{-1} and increases to 3E-03 cm-s^{-1} as one moves eastward from the WMA to the upland recharge area located approximately 1.5 km east of the WMA. Vertical hydraulic conductivity of the basal sands is estimated to be at least a factor of 40 lower than horizontal conductivity. The porosity of the basal sands is between 0.25 and 0.5.

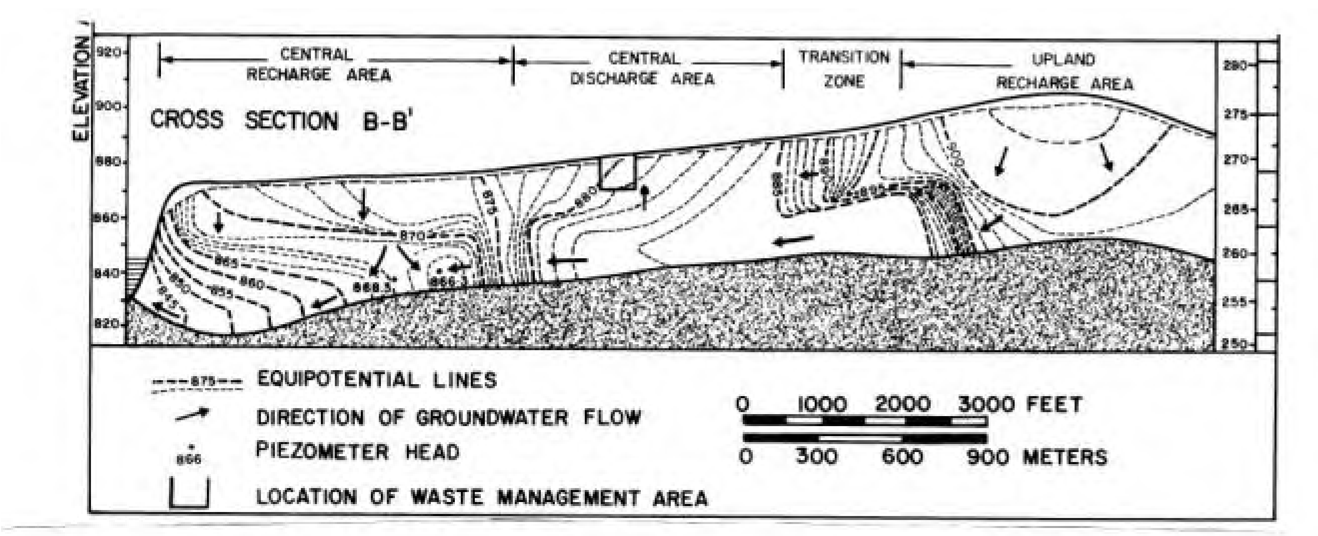
<u>*Groundwater Flow, Recharge and Discharge*</u>

Groundwater in the overburden is derived from rain and snow melt that infiltrates downward into the basal sands in a slight upland area of sand situated about 1 to 1.5 km east of the WMA. Recharge is estimated to be about 14% of the average annual precipitation of 57 cm (Robertson and Cherry 1985).

Water level measurements from monitoring wells in the study area provide a basis for understanding the groundwater flow patterns. Groundwater flows in the direction of decreasing water levels. Wells that are situated close to surface indicate the level of the water table. Water levels in deeper wells indicate whether there is upward or downward movement of water. If water levels in deeper wells are greater than in shallow wells there is upward movement. Conversely, if water levels in deeper wells are less than in the shallow wells, there is downward movement of water.

Figure 5.18 shows representative groundwater flow patterns along the vertical cross-section B-B'. Three distinct zones within the flow system are evident. These are from east to west an upland recharge area where groundwater moves downward from the water table into the basal sand aquifer; a central discharge area where water moves upward from the basal aquifer through the overlying clay-till and clay to the water table, and a central recharge area where groundwater migrates downward through the clay and clay-till units to the basal sandy aquifer. The boundaries between recharge and discharge zones are transient, primarily in response to water table fluctuations. Figure 5.19 shows the percentage of time recharge and discharge conditions to the basal sandy aquifer occur over the period 1968 to 1983 and the width of the transition zones between the discharge and recharge zones. To the west the width of the transition zone is approximately 300 m, to the east it is approximately 500 m.

Figure 5.18
Sketch of Hydrology and Water Flow Pattern



The WMA is located in the middle of the central discharge area. Groundwater flow in the silt, clay and clay-till units has been upward on almost all occasions during the monitoring period 1968 to 1983. These units are sufficiently fractured that flow occurs through them. The clay-till and clay units are an integral part of the flow system.

The fact that the WMA is located in a groundwater discharge zone has positive benefits. Chemical or isotopic constituents solubilized from any waste materials released at the WMA site do not move downward to the sandy zone, and thus this zone does not act as a transmission zone for contaminants from the WMA into the Winnipeg River.

To provide more recent data on the hydrological conditions at the WMA and to confirm that hydrological conditions have not changed, groundwater monitoring data from two well nests in the WMA for the period 1984 to 2000 were analyzed; well nest RW5 located on the western boundary of the WMA and well nest RW1 located in the centre of the WMA. The analysis is reported in Appendix C.5. Records for the RW5 well nest showed a distinct upward gradient, representative of discharge conditions and in compliance with findings of earlier studies. Data for well nest RW1 were inconclusive, showing no gradient. Water elevations in the clay unit were the same as in the underlying basal sands.

The similar water level elevations in the sand and clay units for well nest RW1 is probably due to leakage between the two stratigraphic units due to poor well construction rather than to a change in hydrological conditions at the site. Both RW1 and RW5 are in a region where upward hydraulic conditions existed for more than 95% of the time over the period 1968 to 1983. The two well nests are separated by only 100 m and it is unlikely that hydrological conditions have changed such that discharge conditions exist in one well and recharge in the other. In fact, of the two well nests, RW5, for which upward hydraulic gradients were observed, is located closest to the central recharge zone.

The hydraulic head distribution and groundwater flow directions in the basal sands are shown in Figure 5.20. Groundwater flow is to the west over most of the study area and discharges to the Winnipeg River. However, a flow divide does exist in the general vicinity of the topographic high in the upland recharge area located approximately 1.5 km east of the WMA. Flow originating west of the divide migrates westward via the sand aquifer toward the Winnipeg River. Flow originating east of the divide travels eastward towards the Pinawa Channel. All nuclear facilities are located to the west of the divide. The only facilities in the immediate vicinity of the divide are the inactive landfill, the FIG site and the ZEUS site.

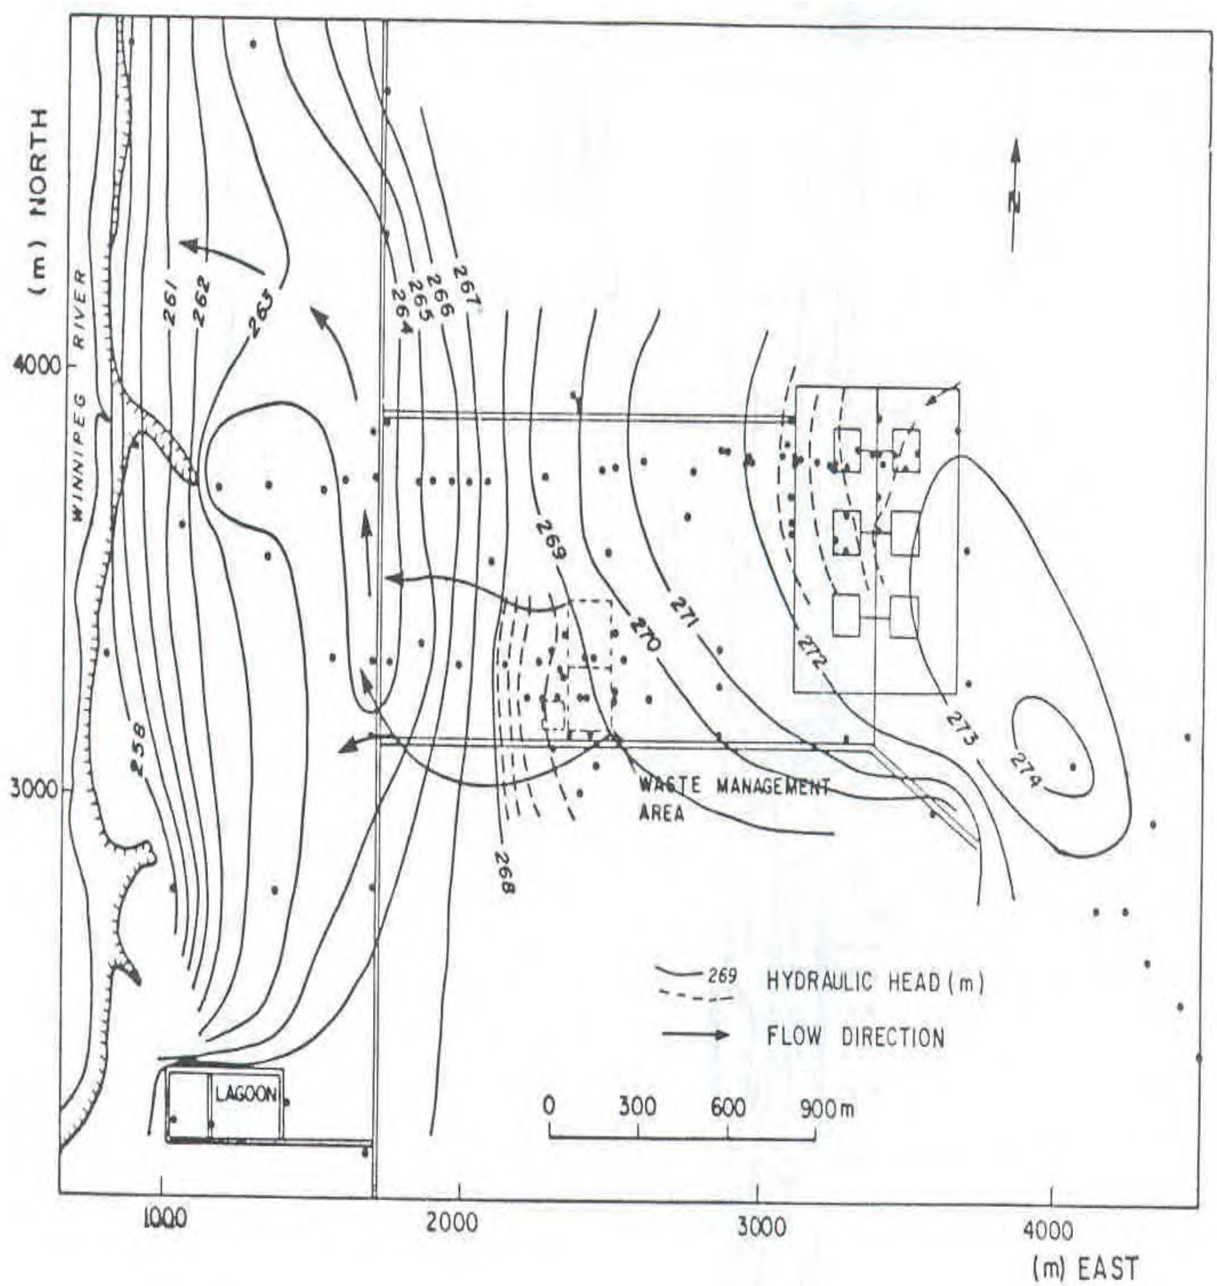
SOURCE: ROBERTSON and CHERRY, 1985

AECL EACL

Figure 5.20
Potentiometric Surface and Approximate Groundwater Flow Directions in the Sandy Zone



There is the potential for lateral flow in the vicinity silt, clay and clay-till units. Lateral flow in the vicinity of the WMA is influenced by permeability of the soil zone, drainage ditches, and local scale effects from waste trenches. As a result, there may be significant lateral components to flow in the clay, clay till and silt zones in the vicinity of the WMA.

Groundwater Velocities, Flow Rates and Transit Times

Groundwater velocities represent the rate at which non-reactive contaminants move through the flow system. The estimates are derived from application of Darcy's Law and make use of the representative hydraulic conductivity and porosity values and measured hydraulic gradients. Flow rates represent the volume of water discharge per unit aquifer area.

Average horizontal groundwater velocities in the basal sand in the WMA are estimated to be 1.6 m a^{-1}. These are derived from an average horizontal hydraulic gradient of approximately 0.002, an effective porosity of 0.3 and hydraulic conductivity of 8.0E-04 cm s^{-1}. Velocities in the basal sands are highly variable due to the heterogeneous nature of the unit. Velocities to the east of the WMA where sands are more permeable are probably an order of magnitude greater than at the WMA. The flow rate through the basal sand aquifer in the vicinity of the WMA is estimated to range from 3000 to 50,000 L per year per meter of aquifer width. The groundwater transit time for water recharging in the upland recharge area to the WMA is of the order of 100 to 1000 years.

Groundwater flow in the clay and clay-till unit is predominantly through the fractures in these units. The average vertical hydraulic gradient across the clay and clay till unit is 0.2 which occurs commonly in discharge and recharge areas. Assuming vertical hydraulic conductivity of 3E-07 cm s^{-1}, and porosity of 7E-04 gives vertical groundwater velocities of several meters per year. The groundwater flow rate through the clay and clay till units are very low owing to the low hydraulic conductivity of these units. The vertical flow rate is in the range of a few cm per year (few hundred m^3-ha^{-1} per year). Water seeping to surface is lost by evaporation from the soil and transpiration from plants. The transit time for upward flow from the base of the clay till unit to surface is of the order of a few months to a few years.

Groundwater Quality

Local Study Area

The groundwater quality in the Local Study Area varies considerably, but in general is considered potable (Rutulis 1982). This includes groundwater from both overburden and bedrock aquifers. The quality of groundwater appears to be slightly better, with respect to hardness and total dissolved solids, in or near the main recharge areas of the western portion of the Local Study Area, namely the Milner Ridge area. With respect to domestic purposes, groundwater quality generally degrades east of the Winnipeg River.

Several groundwater sampling and laboratory analyses programs have been initiated by AECL prior to, and since facility start-up. In general, the laboratory, engineering and statistical analyses indicates groundwater in the bedrock and overburden aquifers to be within the statistical norms for groundwater quality. Although anomalous (elevated) concentrations of uranium were detected in groundwater samples collected from primarily the Pre-Cambrian bedrock aquifer, the concentrations were comparable to other anomalous samples measured world-wide. These elevated concentrations in the bedrock aquifer are attributed to leakage from uraniferious groundwater from overlying clays (Betcher et al. 1988).

It has been determined that the potential for on-site or off-site groundwater resources to be contaminated, including those that may be tapped for livestock watering or domestic use adjacent to the site, is negligible. The location of wells off-site is not relevant to the discussion since the groundwater flow direction as determined by Cherry and Robertson (1988) precludes them from being affected.

Project Study Area - WMA

Radioactivity of deep wells and water-table wells at the Waste Management Area (WMA), is routinely monitored. Measurements are taken once a month between March and October. Results of total-beta analyses for 1999 for the water table and deep wells shown in Table 5.16.

Table 5.16
Total Beta Activity in Wells at the WMA, 1999

	Maximum	**Minimum**	**Average**
	Beta, Bq/L		
Water-Table Wells	0.7	0.13	0.34
Deep Wells	0.73	0.04	0.26

The average values for 1995 to 1999 for total beta activity in water-table wells and deep wells are shown in Table 5.17. Based on the conservative assumption that the total-beta activity is caused entirely by the most restrictive radionuclide (^{90}Sr, for which the Maximum Acceptable Concentration (MAC) in drinking water is 5 Bq/L), the data presented shows that the average concentrations were below MAC in all wells. Table 5.17 confirms for the low average concentration for the period 1995 to 1999.

Table 5.17
Average Total Beta Activity in Waters at the WMA

	1995	**1996**	**1997**	**1998**	**1999**
	Beta, Bq/L				
Water-Table Wells	0.5	0.43	0.35	0.41	0.34
Deep Wells	0.28	0.24	0.38	0.2	0.26

Inactive Landfill

Operating protocols for the landfill site exclude the disposal of radioactive wastes and all wastes are monitored prior to emplacement. There was one recorded incident of an inadvertent placement of low-level radioactive waste in the landfill. The material was subsequently removed and the area surveyed to ensure there was no residual contamination remaining. The area is routinely monitored for gamma radiation to ensure that storage practices are effective in ensuring that only non-radioactive wastes are emplaced.

A groundwater monitoring program at the landfill has been in operation since 1993. Annually, groundwater is collected from several points at the landfill and a control point 300 m to the north. The groundwater is analyzed for gross alpha and gross beta activity. The analysis results for 1999, which are representative of other years, are presented in the following table.

Table 5.18
Gross Alpha & Beta Activity for Landfill Groundwater

ILS Pond Sample Location	Sample Date	Gross Alpha Bq/L		(2s)	Gross Beta Bq/L		(2s)
=======	========	=======		=======	=======		=======
5	04-May-99	0.03	+/-	0.03	0.11	+/-	0.02
11	04-May-99	0.21	+/-	0.07	0.41	+/-	0.03
14	04-May-99		< 0.08		0.35	+/-	0.04
15	04-May-99	0.07	+/-	0.06	0.29	+/-	0.04
21	04-May-99	0.14	+/-	0.07	0.30	+/-	0.04
22	04-May-99		< 0.11		0.22	+/-	0.04

For comparison, the Maximum Acceptable Concentration (MAC) for gross beta (assumed to be due to ^{90}Sr) in drinking water is 5 Bq/L.

Sewage Lagoons

Radioactive contamination is present in the lagoon sludge with a higher concentration in the primary pond than in the secondary pond. The activity appears to increase with depth at the inlet to the secondary lagoon, while it is level or decreases with depth in the surrounding areas.

Lagoon sediment sampling indicates very low levels of contamination, less than 3 Bq/g for ^{137}Cs and trace quantities of ^{60}Co, and shows no evidence of migration into the underlying clays.

5.4.5 Hydrology

Drainage Patterns

Regional Study Area

The regional hydrology or surface water drainage regime is primarily determined by the slope, thickness and texture of surficial deposits, and the proximity and permeability of bedrock (Guthrie and Scott 1988). Three regional drainage categories include: (i) thick glacial ridge-depression areas to the west of the Winnipeg River, (ii) bedrock outcrops and thin glacial deposits over impervious Precambrian bedrock to the east, and (iii) low-lying but drainable lacustrine deposits along the Whitemouth and Winnipeg Rivers and along parts of the Pinawa Channel. Drainage and surface water flow patterns have been extensively modified within southern Manitoba over the past hundred years through the development of hydroelectric dams on the Winnipeg River as well as the draining of marshes and swamps to improve or develop agricultural land.

The Regional Study Area comprises 5% of the Lake Winnipeg Drainage basin, and 50% of the Winnipeg River Drainage basin. These basins drain areas 1,000,000 km^2 and 150,000 km^2, respectively (Betcher et al. 1995).

Winnipeg River

The Winnipeg River is classified as a medium-sized lowland river. The total drainage basin of the Winnipeg River is approximately 150,000 km^2, although only about 4,000 km^2 are below the junction of the English River in the Province of Manitoba proper. A descent in ground elevation of 83 m from the Manitoba-Ontario border to Lake Winnipeg through a series of falls and rapids has resulted in extensive hydroelectric exploitation of this river. Six electric generating stations are present on the Winnipeg River, whose discharge rate is now largely controlled by these hydroelectric dams, which precludes any short-term correlation between precipitation and river flow.

At the Whiteshell Laboratories site, the river is approximately 0.3 km wide, 7 m deep and flows in a northerly direction at a velocity of approximately 0.3 m/s. Flow rates as high as 2,000 m^3/s have been measured during flood conditions (Guthrie 1964). At the Whiteshell Laboratories site, flow velocities measured in the Winnipeg River were noted to be greater on the west bank, with no backwater noted. Additional data on currents and flow volume at the Whiteshell Laboratories outfall are found in Ireland et al. (1973).

Lake Winnipeg

Lake Winnipeg is one of the largest freshwater lakes in the world, with a direct drainage basin that includes much of the central-eastern portion of the province. Indirectly, drainage into Lake Winnipeg includes the Lake Manitoba and Saskatchewan River basin to the west, the Assiniboine and Red River Basin drainage basins to the south and southwest, and the Winnipeg River basin to the southeast. Drainage from Lake Winnipeg is into the Nelson River system, which discharges into Hudson Bay and ultimately the Arctic Ocean.

Local Study Area

In the western portion of the Local Study Area, surface drainage is discouraged in the Milner Ridge area due to rapid entry through coarse-textured ridge materials, and/or slowly through finer sediments in local depressions. Therefore, few streams are found in this area. Except for bogs in low-lying areas, there are few lakes (Guthrie and Scott 1988). To the east, surface drainage is encouraged due to Precambrian outcrops with their thinner glacial deposits. Here, drainage is primarily by surface streams, which flow into the Pinawa Channel and the Winnipeg River. To the south, the Whitemouth river basin drains into the Winnipeg River at Seven Sisters Falls/Natalie Lake. The Whitemouth and Winnipeg Rivers flow through the glaciolacustrine deposits in the centre of the region. Although these fine-textured deposits exhibit little variation in relief, they are of sufficient thickness that postglacial incision by these major rivers encourages east-west drainage towards them.

Project Study Area

Surface water run-off at the Whiteshell Laboratories site drains into the Winnipeg River (Figure 5.21). Water quality is discussed in the next section.

5.4.6 Water Quality

Sampling and laboratory analyses of water from the Winnipeg River near the Whiteshell Laboratories has been undertaken by AECL. In general, the studies conclude no significant anomalous concentrations of various parameters analyzed, including radionuclides. The primary source of liquid radioactive effluents at the Whiteshell site is the process water outfall. Discharges include storm run-off, miscellaneous cooling water, and holding tank discharges from the Active Liquid Waste Treatment Centre. These discharges are designed to remain within regulatory guidelines and the DRLs, however there has been some accumulation of radionuclides in sediments near the outfall that is discussed later in this section.

The on-site sewage lagoon also discharges into the Winnipeg River. Studies conducted by Manitoba Environment to assess water quality in the vicinity of Lac du Bonnet from 1997 to 1998, did not indicate any water quality problems in terms of nutrient loading from upstream sources. Thus it is believed that the lagoon discharges have not had a negative impact on the river water quality in terms of nutrient loading. (Ralley 1999).[1]

The Winnipeg River Task Force (1995) looked at potential sources of Winnipeg River water quality degradation near the community of Sagkeeng. The Task Force found that Whiteshell Laboratories has not had an adverse effect on water quality in the Winnipeg River for downstream communities.

Similar sampling and analyses has been undertaken for water samples collected from Lake Winnipeg. In general, the laboratory analyses and interpretation indicates no anomalous concentrations of routine water quality parameters.

[1] Sampling locations include three sites near the town of Lac du Bonnet on the Winnipeg River, roughly 10km downstream of AECL's Whiteshell Laboratories, and a number in the lake of Lac du Bonnet. Locations were sampled for ammonia, nitrate/nitrite, nitrogen, phosphorus, fecal coliform and chlorophyll. Concentration of nutrients in the Winnipeg River were found to be within normal ranges for waterbodies in eastern Manitoba and generally below water quality guidelines.

FIGURE 5.21

TOPOGRAPHY AND DRAINAGE IN LOCAL STUDY AREA

SOURCE: GUTHRIE AND SCOTT, 1988

Radioactivity in the Winnipeg River

As outlined in Niemi and Soonawala (1999b), five radiological parameters (including three radionuclides) are currently monitored in the Winnipeg River at the Whiteshell Laboratories site by AECL. Monthly composite samples of Winnipeg River water are collected from four locations: about 17 km upstream of the process outfall (at Pinawa); 2 km downstream at the Whiteshell Laboratories boundary; 10 km downstream at the Lac du Bonnet water intake; and, 28 km downstream at the Great Falls generating station. Monitoring of downstream concentrations to date have not been found to vary significantly from upstream sampling. For example, between 1962 and 1972 the average annual concentrations of ^{137}Cs in river water downstream (28 km) were similar to upstream concentrations. It is believed that the major contributor of ^{137}Cs was atmospheric nuclear weapons testing occurring during that time. After 1972, nuclide concentrations found in the river were thought to be most affected by Whiteshell Laboratories (Dunford et al. 1983). Recent (1994-1998) concentrations of nuclides found in the Winnipeg River are given in Table 5.19. Concentrations in 1998 were comparable to those in previous years. The measured concentrations were very small fractions of the Maximum Acceptable Concentrations (MACs) for radioactivity in drinking water in Canada, specified by Health Canada. The 1998 concentrations at the sampling points downstream of Whiteshell Laboratories were not much different from the concentrations at the upstream sampling point.

Table 5.19
Radioactivity in Winnipeg River Water

Location	**Mean Concentration (Bq/L)**

Within the Whiteshell Laboratories Site

Radioactivity was monitored in surface waters of two ditches (one flowing west to the Winnipeg River and the other flowing north) located near the Waste Management Area (WMA). Water from the recharge area east of the WMA is diverted around the WMA to the west-flowing ditch and into the Winnipeg River. The other ditch, running north to the Whiteshell Laboratories boundary, drains the land north of the WMA up to the site boundary.

The results for both ditches, for years 1994 to 1998, are shown in Table 5.20 and in Figures 5.22 and 5.23. Data show a slight increase in the gross beta activity in the north ditch, otherwise, the activity is stable over the five-year period.

The radioactivity results from an accidental spill in the late 1980s and is not indicative of routine releases from the area. Very low levels of contamination can be detected in the ditch system (about 0.13 GBq of radioactivity was estimated to be deposited in the drainage system in the public domain) and analysis of the condition following initial remediation indicated negligible effect of leaving the contamination in place.

Table 5.20
Annual Mean Gross Beta and Gross Alpha Radioactivity in Ditches Near WMA, 1998

5.4.7 Sediment Quality

Lacustrine clay is the predominant component of both water-borne and deposited sediments in the Winnipeg River and Lake Winnipeg. Coarser-grain materials are present in the Winnipeg River bed sediments, including gravel, sand and silt, although less gravel was observed upstream than downstream of the Whiteshell Laboratories site (Guthrie and Scott 1988).

Sampling and laboratory analyses of riverbed sediments along the Winnipeg River near the Whiteshell Laboratories have been undertaken. Similar sampling and analyses has been undertaken for the lakebed sediments of Lake Winnipeg, including Traverse Bay, the location of the Winnipeg River discharge into the lake. In general, the data indicate that the chemical history of the lakebed sediments correlates well with parameter maxima in other North American lakebed sediments since European settlement (Lockhart et al. 1994).

Radioactivity in Sediments

Sediment contamination has been examined through several studies from the early 1960s until more recently. It extends from the Whiteshell Laboratories outfall to Lake Winnipeg. Peak activity for ^{137}Cs occurred during the 1960s and was accredited to peak nuclear bomb testing activity during the time. The source of elevated levels in the 1970s and 80s is less clear. A study of deeper sediment samples (Soonawala 2000) concluded that Whiteshell Laboratories could not have contributed to the ^{137}Cs deeper in the sediment column. These elevated levels are, in fact, attributed to the residual effect of global fallout. Regardless, evidence exists through monitoring that ^{137}Cs concentrations in the Winnipeg River surface sediments are elevated downstream of Whiteshell Laboratories, compared to upstream values. This radionuclide is present as a result of the accumulation of solids which could settle from the ALWTC discharges (and possibly leaks from WR-1). The International Atomic Energy Agency (IAEA) clearance levels for unconditional clearance levels of mildly contaminated solids to the public domain is 300 Bq/kg for ^{137}Cs. Table 5.21 shows radioactivity found in the first centimetre of Winnipeg River sediment at various locations up and downstream from Whiteshell Laboratories.

Table 5.21

(Adapted from Niemi and Soonawala 1999b)

River-bottom sediments were collected from 12 locations along the Winnipeg River, ranging from 0.76 km upstream to 13.06 km downstream of the process outfall.

Table 5.22 shows the gross beta and gross alpha activities (in Bq/kg dry weight) of the river-bottom sediments from the 12 locations along the Winnipeg River for the years 1994 to 1998.

(1) The gross alpha data for 1998 are based on a revised efficiency factor. Previous years values would have been higher if the revised efficiency factor had been applied two those years.
(2) Less than Lower Limit of Detection.

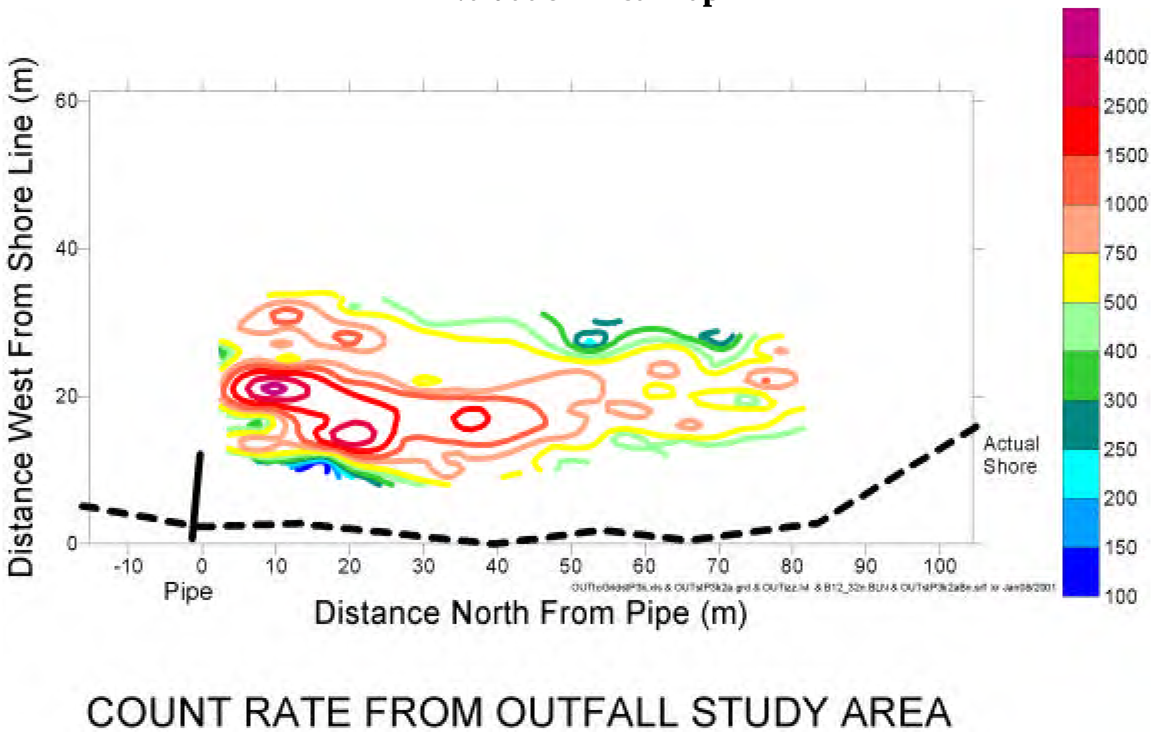
<u>*Sediment Contaminant Levels at the Outfall*</u>

To evaluate the impact of contaminated sediments at the outfall, a detailed assessment of the contaminated inventory was taken to support in-situ abandonment of the contaminated outfall area. A detailed field study to assess the potential impact of the sediment contamination on aquatic biota and humans was completed in the summer of 2000 and is documented in Appendix B. The study included:

- A detailed gamma survey of the riverbed in the contaminated area having sediment activities 5-fold above background.
- Measurement of contaminant levels in sediment cores and grab samples collected from the riverbed.

A 2-D contour plot of the gamma activity is shown in Figure 5.24. The gamma survey showed a region of elevated activity (10 times greater than background) extending a distance 80 m downstream of the outfall and 20 m in width.

Figure 5.24
Evaluation Area Map



The gamma survey results were plotted with software that allows definition of isopleths. These were used to compute an inventory of contaminant in the sediment of the evaluation area (Table 5.23). The observed activity at the isopleth line (counts per second or cps) was corrected for background, converted to dose rate (nGy/h) using the calibration developed for the sediment survey, and converted to concentration of ^{137}Cs Bq/g. Assuming a sediment density of 1500 kg/m^3, consistent with the dense clay observed, and a contamination depth of 5 cm, the contamination per unit area was computed. This multiplied by the corresponding area between this isopleth and the next gives an amount as Bq (Further details are given in Appendix B.1).

These values were summed for all the isopleths, resulting in an estimate of total inventory of 1.3 GBq. It is relevant to note that this is substantially less than the annual releases of ^{137}Cs prior to 1985 when the reactor was operating.

5.4.8 Aquatic Habitat and Biota

Local Study Area

The primary aquatic habitat found in the Local Study Area is the Winnipeg River, which passes directly through the licensed property area. In addition to this, there are several small isolated ponds on the Whiteshell Laboratories' site that are fed by local runoff and intermittent streams that run primarily during the spring. The streams are associated with gullies that dissect the clay plains along the banks of the Winnipeg River. They provide ideal beaver habitat, and as a result, beaver ponds are a common feature on the site. Ponds formed by beaver dams are seldom more than a few years old before they are drained and thus are not considered good aquatic habitat. There are also two sewage lagoons that are over 20 years old and that harbour a number of aquatic plants and animals. Man-made ditches carry water during spring runoff, but are generally dry in summer. Some become saline seeps in summer, as groundwater discharges into the dry ditches and the salts accumulate.

Fish

Of the 177 endemic fish species present in Canada, 94 species are found in the Hudson Bay Drainage System, which includes the Winnipeg River, and 79 species are present in Manitoba (Scott and Crossman 1973). Most of these species are forage fish such as carp and other minnow species. Predator fish in the area include walleye, northern pike, smallmouth bass, mooneye and lake trout. Populations of the fish, with the exception of sturgeon are considered stable.

Lake Sturgeon considered a species at risk due, in part, to over fishing during the first half of the century, is also found in the Winnipeg River. It is being studied because of concerns that the population may be declining as a result of the extensive hydroelectric developments on the river. The sturgeon is known for living upwards of 70 years, attaining weights of over 100 kg and reaching maturity at 20 years of age. Sturgeon feed on insect larvae, molluscs and crayfish. It has been suggested by locals that an area favoured by sturgeon is located at the outfall of the Whiteshell Laboratories.

Radioactivity in the Winnipeg River Fish

Fish consumption is the dominant exposure pathway of ^{137}Cs for people in the local area. Within the Winnipeg River, dominant fish species are walleye, pike, red sucker, white sucker and whitefish. In the past, variations in ^{137}Cs in fish flesh was not statistically significant between the fish downstream and upstream during the decade from 1962 to 1972; however marked increases of ^{137}Cs were observed in fish downstream between 1976 and 1982. These levels decreased to those observed between 1962 to 1972 after construction of the ALWTC in 1982 (Dunford et al. 1983). Table 5.24 to 5.26 gives a summary of the ^{137}Cs, potassium-40 and gross beta activity found in fish flesh at three locations on the Winnipeg River, from 1992 to 1998.

It is evident from data collected between 1992 to 1998 that fish in the downstream locations generally have higher concentrations of ^{137}Cs. Pickerel, common sucker and pike showed elevated concentrations in 1996 at 0.5 km downstream of the outfall. Otherwise, concentrations are uniform over the seven years except for a slight decline in 1997 and 1998 (Niemi and Soonawala 1999b).

Invertebrates

Studies on benthic species have been undertaken on the Winnipeg River by Guthrie and Iverson (1970) and Ireland et al. (1973). More recent studies have been undertaken by Wong et al. (1996) downstream near Pine Falls and in Whiteshell Provincial Park (McKillop 1996).

Among the many species of zooplankton in Winnipeg River, rotifers, cladocera and copepoda are usually dominant. The benthic fauna include protozoa, ostracods, nematodes, oligochaetes, leeches, mysids (the opossum shrimp), crayfish, amphipods, mollusks (snails), bivalve clams (e.g. mussels) and aquatic insects. The latter include Diptera larvae such as Chironomid and Chaoborus larvae, dragonflies, mayflies (e.g. Hexagenia) caddisflies, true bugs and aquatic beetles (Guthrie and Iverson 1970).

Diversity and production of the benthos is generally greater in the littoral (shallow) area than in the profundal (deep water) area. However, production in profundal areas may be high as attested by the large emergence of mayflies from Lac du Bonnet each summer. Blackfly larvae are present in fast water reaches of connecting channels. Chironomidae and tubificids were particularly numerous in the early operational survey carried out by Ireland et al. (1973). These authors provide benthic abundance data for the Winnipeg River upstream and downstream of the Whiteshell Laboratories liquid effluent outfall. The benthic fauna has been investigated in more detail downstream in the Winnipeg River near Pine Falls (Wong et al. 1996). The distribution of aquatic snails and their association with aquatic plants in nearby Whiteshell Provincial Park has been documented (Pip 1978; Pip 1979; McKillop 1996).

In the summer 2000 study, ^{137}Cs levels in clamshells and tissue were found to be slightly elevated. There was considerable variation in levels with slight trends to higher tissue concentrations close to the outfall and higher concentrations in larger (older) clams. Additional details are provided in Appendix B.1.

Macrophytes (Aquatic Vegetation) and Phytoplanton (Algae)

Emergent macrophytes such as bullrushes, cattails and wild rice are found to a depth of about 1 m along the shores of the Winnipeg River. Phytoplankton of the Winnipeg River consists of a diverse assemblage of nearly all major algal taxonomic groups. Wild rice is harvested in the region, with harvesters reporting individual takes in the order of 5,000 kg. Almost all of this is concentrated on smaller water bodies than the Winnipeg River, including some seeded lakes. There are no water bodies suitable for wild rice on the Whiteshell Laboratories site.

5.4.9 Terrestrial Biota and Habitat

Regional Study Area

The Regional Study Area falls almost entirely within the Boreal Shield Ecozone, existing in Ecoregion 90 and Ecoregion 91, specifically the Lac Seul Upland and Lake of the Woods area, respectively. A very small portion of the Boreal Plains Ecozone, represented by a portion of Ecoregion 155 or the Interlake Plain, is also within the Regional Study Area (Environment Canada 1999). Lac Seul Upland makes up approximately 38% of the Regional Study Area, Lake of the Woods makes up approximately 56% of the area, and the Interlake Plain makes up approximately 6% (Manitoba Conservation Data Centre 1998).

The Regional Study Area is on the interface between aspen parkland and boreal forest. The local relative dominance of tree species depends largely on the underlying soils. The calcareous poorly drained clay soils, if not covered by organic deposits, support aspen parkland, whereas sandy soils and organic soils tend to support species typical of boreal forest (e.g. black spruce, white spruce, tamarack, jack pine, balsam fir). The confluence of these two major habitat types results in complex local associations. The region is also the eastern boundary of the range of many western species, and the western boundary of the range of many eastern species. The river has an additional influence on this combination of habitats. The riparian zones along the shore of the Winnipeg River are first footholds for species not normally found in the area. For example, the ironwood tree is at the northern boundary of its range, and occurs in the region almost exclusively along the riverbanks.

Of the listed species of concern outlined by the Manitoba Conservation Data Centre, the Lake of the Woods ecoregion maintains vegetation that is widespread throughout North America; however, 20% of species are ranked as being very rare within Manitoba. In Lac Seul Upland, 19% of the species of vegetation listed are very rare throughout their range in the province, but are common elsewhere. In the Interlake Plain, 30% of the listed vegetation is rare within the province. Within this ecoregion, the Western Prairie Fringed Orchid and the Western Silvery Aster are listed as endangered and threatened, respectively (Manitoba Conservation Data Centre 1998).

Local Study Area

Figure 5.25 shows vegetation cover in the local area. The aspen and balsam poplar forest on the clay plains has associations of willow, rose, alder, currant and dogwood. The mixed deciduous forest and the river forest include ash, aspen, birch, oak and fir, with associations of cranberry, willow, rose and strawberry. The black spruce in the bogs to the east is associated with Labrador tea, moss, tamarack, horsetail, blueberry and willow. The upland mixed conifers on the sandy soils include jack pine and poplar stands, with spruce, fir and birch and associations of Labrador tea, hazelnut, plum and blueberry. The wetlands contain manna-grass, cattail, sedge, and bullrush. The old-field areas and other areas where vegetation is controlled contain types of grass, bluegrass, sedge, strawberry, clover and aster.

Project Study Area

The terrestrial habitat in the Project Study Area is diverse over short distances. Large tracts of wetland cover the easterly portions of the site, with black spruce common. Within this area is a ridge of well-drained sandy soils with jack pine as the notable species. Further to the west are poorly drained clay plains, some forested with species such as ash and poplar, and some as abandoned farm fields vegetated with grasses and shrubs. Near the FIG (Field Irradiator Gamma) site are upland mixed conifers including jack pine and poplar stands, with spruce, fir and birch and associations of Labrador tea, hazelnut, plum and blueberry. This is shown in Figure 5.26. Close to the Winnipeg River are gullies or ravines where beaver dams are common. The gullies and the riparian environments along the Winnipeg River occasionally harbour species not common to the region.

Mammals

Over 50 species of mammals can be expected to occur around the Whiteshell Laboratories site (Banfield and Brooks 1974). More detailed regional data are available from Manitoba Natural Resources through hunting and trapping statistics. Many of the mammals, such as the snowshoe hare, American red squirrel, meadow vole, red fox and white-tailed deer, are common and widespread. Others, such as the American water shrew, Franklin's ground squirrel, southern bog lemming, fisher and moose are only locally common where suitable habitat is available. Still others, such as the grey fox, wolverine and mountain lion are rare.

The Committee on the Status of Endangered Wildlife in Canada produced an annual Canada wide list of species designated at risk (e.g. extinct, extirpated, endangered, threatened and vulnerable) for 1997. No mammals species in the area were listed as endangered while the grey fox and the wolverine were listed as vulnerable.

White-tailed deer successfully colonized Manitoba at the turn of the century with the settlement of the province. These deer have become an important ecological component and are considered important for aboriginal peoples, as well as a game species. Deer inhabit the Whiteshell Laboratories site and have established wintering areas on the site. A capability map for ungulates (which include deer) is provided in Figure 5.27.

Mammals common to the Whiteshell Laboratories area, generally have a range that extends well beyond the facility. This range is of similar habitat to the Whiteshell Laboratories site.

Radioactivity in the Flesh of Wildlife

Niemi et al. 2000 presents data on radioactivity in flesh of roadkills from the vicinity of Whiteshell Laboratories and trapped animals from Crowduck Lake, about 60 km northeast of Whiteshell Laboratories on the Winnipeg River system. The data are presented in Table 5.27. The trend for years 1995 to 1999 for ^{137}Cs concentration in deer flesh from the vicinity of Whiteshell Laboratories is shown in Figure 5.28.

Table 5.27
Radioactivity in Flesh of Roadkills

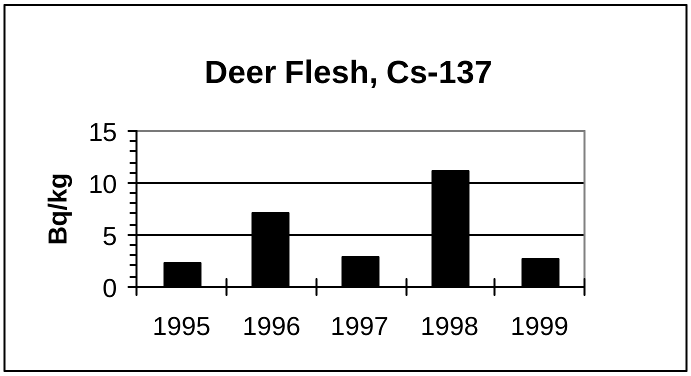
Radioactivity in Flesh of Deer
(Bq/kg, fresh weight)



Radioactivity in Vegetation

Radioactivity in native vegetation, in units of Bq/kg fresh weight, is reported from 6 locations at Whiteshell Laboratories in Table 5.28.

Table 5.28
Radioactivity in Native Vegetation at
Whiteshell Laboratories – 1998
(Bq/kg Fresh Weight)

Location	**Gross Beta[(1)] (Bq/kg)**
ARMS 1, North	87
ARMS 3, South-southeast	209
ARMS 4 West	150
ARMS 5, Northwest	152
West of WMA (standpipe 83 spill area)	450[(2)]
North of Canisters	234[(2)]

[(1)] ARMS locations are yearly averages.
[(2)] Stations sampled once (during spring) known to yield elevated results.

Birds

A large variety of bird species can be expected to occur in the vicinity of the Whiteshell Laboratories site based on general distribution data (Godfrey 1986). The birds of the region have been studied in detail by Taylor (1983) and Seabloom (1975). Taylor's surveys continue and data for the area includes breeding bird and owl surveys as well as Christmas bird counts. Zach (1982) has studied the breeding biology of house wrens and tree swallows on the site itself, so data exists on parameters such as brood size, hatching success and growth rates (Zach 1982; Zach and Mayoh 1982a, 1982b, 1986).

There are important bird migration staging areas on or near the site. The most important physical feature related to migration routes of birds is the Winnipeg River. It represents a migratory corridor for several species that move into central Manitoba and beyond from the Great Lakes and/or the Mississippi River in spring and back in the fall. The most important species include the common loon, red-necked grebe, horned grebe, double-crested cormorant, American white pelican, Bonaparte's gull, common tern, Caspian tern, lesser scaup, greater scaup and bald eagle. The Winnipeg River can become an important staging area for a variety of waterbirds each spring (e.g. common loon and red-necked grebe).

The Committee on the Status of Endangered Wildlife in Canada annual Canada-wide list of species designated at risk for 1997 indicates that the area may support several endangered species including: peregrine falcon, burrowing owl, piping plover and loggerhead shrike. Vulnerable species in the area may include the least bittern, short-eared Owl, Caspian tern and red-headed Woodpecker.

Amphibians and Reptiles

A wide diversity of amphibians is present in the vicinity of the Whiteshell Laboratories site, despite the generally harsh winter conditions. About 10 species of amphibians can be found (Froom 1982; Cook 1984). Most are frogs such as the spring peeper, grey tree frog, striped chorus frog, wood frog and northern leopard frog are common and widespread. However, some species, such as the green frog and the mink frog are less common and widespread (Taylor 1990).

Only four reptile species can be found on-site; two turtle and two snake species (Preston 1982; Cook 1984). Both are common and widespread. The common garter snake is widely distributed and prevalent in the region, but little is known about the exact status of the redbelly snake found in the area. All the reptile species hibernate to survive the harsh winters and hibernacula are a potentially important ecological feature in the Whiteshell region. None are known to exist on the Whiteshell Laboratories site. In spring, the reptiles become active and enter their breeding cycle, which may involve special areas for egg-laying; none are known to be located in the Whiteshell Laboratories' controlled area.

5.4.10 Regional Land and Resource Use

Agriculture

In the regional area, some of the best farmland is along waterways and on upland lighter-textured soils (Canada Land Inventory 1968, 1975). Consistent with the regional area, in the local area better farm land is found along the Winnipeg River. The land capability map (Figure 5.29) identifies classes of crop land for the local area. Agricultural operations in the region include cereal production, hay, flax, canola and alfalfa crops, and dairy and livestock production. Alfalfa seed production and the attendant leaf-cutter bees is a specialty in the area. Early data for comparison to present-day production, cultivation and harvest is available for cereal, flax, alfalfa and hay (Guthrie and Scott 1988). These data are broken out by township and farm size. The early census data show that less than half of the cattle in the area are dairy animals. Poultry, eggs and swine are also produced. Specialty operations in the area include goat herding, emu and ostrich farming, and leaf cutter bee operations. Farmers lease land from AECL on the west side of the Winnipeg River, in the area catagorized as unaffected.

Forestry

Forestry is a strong industry in the regional area, although little if any forestry has occurred in the local area. Aspen, black spruce and jack pine are the dominating natural stands of timber in the region (Dugle et al. 1974; Canada Land Inventory 1974). There are extensive and potentially productive softwood and hardwood forests close to Whiteshell Laboratories (Guthrie and Scott 1988). The Province's Agassiz Forest Reserve is just to the west of the Whiteshell site. Considerable softwood stands (black and white spruce, balsam fir and jack pine) in the region have been and are presently being logged to supply pulp to Pine Falls Pulp and Paper Co. newsprint operation at Pine Falls. Guthrie and Scott (1988) give regional commercial forestry harvest statistics for the 1960s. However, maps from Canada Land Inventory (1974) indicate that the area in the immediate proximity of the Whiteshell Laboratories site shows moderate to moderately severe limitations to commercial forestry and the land due east of the plant site (primarily bog) has either severe limitations or commercial forest growth is completely precluded. The site is within the Manitoba Model Forest boundary presenting some restrictions or oversight to large-scale forestry operations at present.

Recreation

Recreation is a major land and water use. The Whiteshell Laboratories' site is located just a few kilometres northwest of the Whiteshell Provincial Park boundary and southwest of the Nopiming Provincial Park, both of which are prime outdoor recreation areas in eastern Manitoba. The Trans-Canada Trail follows the dyke along Natalie Lake just south of Highway 211 and the Whiteshell Laboratories' controlled area. Home and cottage development along the west side of the Winnipeg River indicates that waterways, scenery, trails and wildlife of the region are attracting vacationers and weekend campers. The area to the north affords great vistas and interesting hiking terrain as well as heritage and cultural points of interest (such as the Bannock Point petroforms, the Old Pinawa Dam, voyageur routes along the Winnipeg River). Explore Magazine and Going Places, the magazine of the Canadian Automobile Association (CAA), recently featured Pinawa as one of the birding meccas of Manitoba, with some 20 km of maintained hiking trails in summer. This area also has considerable recreational resource use in winter with 30 km of groomed cross-country ski trails and access to hundreds of kilometres of snowmobile trails (directly linked to the U.S.).

Hunting and Trapping

Hunting and trapping is popular in the region (Canada Land Inventory 1971, 1972a, 1972b). The principle game animals are deer and moose, although bear hunting is becoming more popular. Wolf, coyote, fox, beaver, muskrat, mink, weasel, otter, fisher, martin and squirrel are the most commonly trapped species on the twenty to thirty traplines in the Whiteshell game hunting area. Both open areas and registered traplines exist and Manitoba Natural Resources maintain records of game and fur-bearing species harvested. No registered traplines are within the controlled area of the Whiteshell Laboratories site (it is designated restricted). However, trapline number 23 is located along the southern and eastern boundary of the controlled area (Lac du Bonnet Natural Resources Officer 1999).

SOURCE: GUTHRIE AND SCOTT, 1988

Water Use

The primary use of water from the Winnipeg River is for domestic purposes. The Winnipeg River serves as the drinking water source for the downstream towns of Lac du Bonnet, Great Falls, St. George and Pine Falls. Water treatment varies for each municipality and includes a range from chlorination only, to chlorination, filtration, sedimentation and coagulation (Pine Falls).

Some irrigation water is also taken and the province keeps records of irrigation permits. The entire length of the Winnipeg River is used for boating and water skiing. Owners of private property with river frontage have docks and use the river for swimming. The closest beach for public swimming is on the west shore of Lac du Bonnet in the town's centre.

Fishing

No commercial fishing is carried out on the Winnipeg River. Commercial fishing takes place at the mouth of the river in Traverse Bay at the south end of Lake Winnipeg. The major species are northern pike, walleye, lake sturgeon, smallmouth bass, burbot and yellow perch.

Sport fishing, however, is very popular in the Winnipeg River. In this respect, the Whiteshell Laboratories site is in management area No.3 (Guthrie and Scott 1988). Major sports fish in the area are walleye, northern pike, smallmouth bass, mooneye, and lake trout. Mooneye is a relatively small fish prized for consumption when pickled and smoked. The aforementioned species are common in the region and although they are thought to have stable populations, capture limits have been designated by Manitoba Conservation. Local knowledge suggests an area favoured by sturgeon is located near the outfall of the Whiteshell Laboratories. Sturgeon is a protected species that must be released if caught.

5.5 BASELINE CONDITIONS: SOCIO-ECONOMIC

5.5.1 Population

Whiteshell Laboratories is part of the Pinawa LGD. In 1996, the population of the communities around Whiteshell Laboratories was approximately 18,700, up about 400 from 1991 (Table 5.29). According to the Community/Provincial Leaders Committee on the Closure of Whiteshell Laboratories, approximately half of the workforce at Whiteshell Laboratories has tended to live in the Pinawa-Whitemouth Region. In 1996, the two communities (Pinawa LGD and Whitemouth RM) had a combined population of 3,311, down from 3,520 in 1991 and 3,847 in 1981. The population of Pinawa where the Whiteshell facility is located was down from 2011 in 1981 to 1672 in 1996.

Table 5.29

5.5.2 Employment and Economic Base

General

Employers such as government, schools, shops and some new services and industries have evolved since downsizing of the Whiteshell Laboratories began. Historically, however, the Whiteshell facility has been the dominant employer in the area (Table 5.30). Estimates prepared for the Community/Provincial Leaders Committee's report indicate that the workforce at Whiteshell Laboratories peaked at about 1168 in the fall of 1984, and was fairly constant at around 1100 until June 1992. Thereafter, employment fell off to 802 in February 1998 and, following the layoffs of March 1998, has fallen to 349. The decommissioning workforce will be about 150. Ultimately, once the first phase of decommissioning is complete, total employment at the site will be approximately 30 people. The number of staff in addition to those involved in the decommissioning is not clear. AECL records indicate that at present, approximately 50% of the employees who have been laid off from Whiteshell continue to live in Pinawa.

Table 5.30
Employment by Sector

Sector	Manitoba	Lac du Bonnet (Rural Municipality)	Alexander	Pine Falls	Pinawa	Lac du Bonnet (Village)	Powerview	Fort Alexander

Sources: Statistics Canada, 1996 census.
Interviews with Manitoba Industry, 1997 data.

In the past, this employment brought significant amounts of income into Pinawa and the area. AECL's 1991 Whiteshell Laboratories' payroll was approximately $54 million. Half of that amount went to employees living in Pinawa. Downsizing has reduced AECL's income contribution. The current (early 1999) payroll is about $18 million and the average annual salary is now $51,576 down from the 1991 level of $53,138, (not counting inflation).

Other Activities

Mining

Mining activity in the eastern region includes tantalum mining in the Lac du Bonnet area. The Tanco mine produces high grade spodumene for ceramic and specialty glass industries. Mining operations restarted in 1995. There are also quarry leases for granite in the area. In addition, silicon sand leases are pending in the area.

Forestry

Forestry is an important industry in the area. There are extensive and potentially productive softwood and hardwood forests close to Whiteshell Laboratories. Several of the softwood stands in the region are logged to supply pulp to Pine Falls Pulp and Paper Co. newsprint operation at Pine Falls.

A Federal/Provincial Program designed to create a sustainable forest environment is now underway in the area. The model forest is a large-scale working model of sustainable forest management. The Manitoba Model Forest covers a large area, which extends just south of Pinawa northward, including the southern portion of Atikaki Provincial Wilderness Park, east to the Manitoba-Ontario border and west to Lake Winnipeg.

Agriculture

As discussed in Section 5.4.10, cereal, flax, alfalfa and hay are grown in the Whiteshell area. Specialty operations in the area include goat herding; emu and ostrich farming; and alfalfa seed production and leaf cutter bee operations.

Gross farm receipts by municipality in the regional area are provided in Table 5.31.

Table 5.31
Agriculture Gross Farm Receipts

Rural Municipality	# of Farms	Total Gross Farm Receipts	Receipts per Farm	$50,000+ Reporting	Under $50,000 Reporting
Lac du Bonnet	126	$9,537,662	$75,696	49	94
Whitemouth	155	18,161,139	117,169	126	87
Alexander	83	2,554,093	30,772	17	71
Brokenhead	362	19,760,520	54,587	187	245
Manitoba Total	**24,383**	**2,970,070,722**	**121,809**	**20204**	**12205**

Note: These figures do not include expenses, but are strictly gross receipts for farm operations in these rural municipalities. They are given as indication of the economic activity associated with farming in the area.

Source: Statistics Canada, 1996 Census.

Tourism

Tourism in the south east area of Manitoba is a significant industry (Table 5.32). According to a 1998 survey, 12% of American visitors to Manitoba visited the south east area of the province. This area extends north to just past Victoria Beach, east to the Manitoba – Ontario border and south to the American border and includes approximately the eastside of the Red River. Expenditures by American tourists average $188 per visit for the province and for the south east region the expenditures are over $200 per visit.

Table 5.32
Tourism Activity in South East Manitoba

Visits	Manitoba	South East Region	Percent of Manitoba Total
Total American Visits	824500	96500	12%
Total Domestic Visits	6306	1097	17%
American Visitors' Expenditures			
Average Reported Spending per Visit	$187.77	$86.97	
Average Reported Spending per Night	$132.84	$138.46	

Housing (Cottages)

Home and cottage development along the west side of the Winnipeg River indicates that waterways, scenery, trails and wildlife of the region are attracting vacationers and weekend campers.

Cottages and cottage lots have shown a steady demand over the last few years. The current price for river lots ranges from $35,000 to $50,000 depending on the location. Cottage lots on the Winnipeg River are in demand with the increase of retirees in southern Manitoba.

Sport Fishing

As discussed in Section 5.4.10, there is no commercial fishing in the Winnipeg River. However, sport fishing is popular.

The Whiteshell/Nopiming area represents about 20% of the total sport fishing activity in Manitoba, based on figures from sport surveys undertaken by Fisheries Branch, Province of Manitoba.

Table 5.33 is a summary of some indicators that establish the relative importance of sport fishing in Manitoba. Twenty percent of the sport fishing activity of the province takes place in the Whiteshell/Nopiming area. On a provincial basis, expenditures directly attributable to sport fishing totalled $28,755,591 for non-residents and $49,191,732 for Manitoba residents in 1995. This indicates the substantial impact sport fishing has the general area which includes the study area.

Table 5.33
Sport Fishing in Manitoba

Sport Fishing Indicator		1985	1990	1995
Whiteshell/Nopiming				
Percentage of Provincial Angler Days Expended by Anglers		18.7%	19.8%	20.4%
Non-resident		7.2%	8.8%	6.4%
Resident		20.0%	21.1%	22.4%
Total Province				
Non-residents	Average days per angler		7	7
	Trips – all reasons	159,880	176,212	180,997
	Fishing trips	64,759	96,748	105,031
	Days spent fishing	291,193	251,536	267,493
Non-residents (Continued)	Expenditures directly attributed to sport fishing- Manitoba		$23,503,144	$28,755,591
	Expenditures relating in hole or to sport fishing- Manitoba		$1,377,433	$3,661,591
Residents	Average days per angler		16	16
	Expenditures directly attributed to sport fishing –Manitoba		$68,046,453	$49,191,732
	Expenditure relating in whole or part to sport fishing – Manitoba		$115,883,175	$123,907,154
Daily Average – Resident and Non-Resident Licence				
Expenditure directly attributed to sport fishing per day			$38.60	$35.48

Notes: * Includes food, lodging, travel cost, fishing supplies, household-owned boat costs, other costs and packages.
** Includes fishing equipment, boats and related equipment, camping equipment, special vehicles, land/buildings, and other expenditures.

Trapping and Hunting

The value of the traplines in the local area is unknown, but a general trend across Canada has been a reduction in the economic value of trapping in recent years, due to the falling price of furs. Hunting remains a popular activity in the area, but the economic impact is unknown.

5.5.3 Infrastructure

Roads

The primary access to Whiteshell Laboratories from Winnipeg is via Highway 44 east, Highway 11 north, and Highway 211 east. The road between Winnipeg and Beausejour (46 km) is a four lane divided highway. Highway 11 connects the area to Lake Winnipeg to the north and the Trans-Canada Highway to the south. The remaining 90 kilometres are two lane, paved roads. There are several unpaved through roads – Highway 520 between Pinawa and Lac de Bonnet via Highway 307 and Highway 406 south of Seven Sisters connecting to Highway 11. Municipal roads in towns are paved. There are numerous unpaved interior access roads. Within the Whiteshell Laboratories' site, the main access roads to the facility are paved, although roads accessing facilities outside of the main complex, for example the waste management facility, are generally unpaved.

During most of the year, there are no load restrictions on any of the paved roads in the area. There are some load restrictions in the spring, particularly on unpaved roads. The bridge over the Winnipeg River at Highway 211 just of Highway 11, has no load restrictions.

In addition to serving the area's local permanent population, the roads to the Whiteshell area serve a large number of cottagers in and around Whiteshell Provincial Park.

Water Supply and Sewers

The Winnipeg River is the source of water for most of the people living in the area. The Town of Lac de Bonnet and the LGD of Pinawa draw water from the river and treat it at their water treatment plants. Water co-ops (there are five in the RM of Lac de Bonnet alone) also draw water from the river and provide it directly through local piped systems or haul it to individual homes or systems away from the river.

Sewer systems exist in several communities, including the Town of Lac de Bonnet and the LGD of Pinawa, and include treatment at lagoons. The RM of Lac de Bonnet has no sewerage system but has a lagoon in which local septic tank maintenance contractors as well as travellers using RV's can dispose of their wastes.

5.5.4 Community Services

Apart from the availability of a considerable variety of outdoor recreational opportunities (see Section 5.4.10), most notably the Winnipeg River and the Nopiming and Whiteshell Provincial Parks, the area is well served with recreation and community services, Pinawa is particularly well serviced. It has both a high school and a public school. It has a 17-bed hospital, a community hall, and numerous other facilities including baseball and soccer fields, tennis courts, artificial ice arena as well as a popular golf course. These facilities are in part an outcome of the relatively high per capita expenditures on recreation. The Community/Provincial Leaders Committee on the Closure of Whiteshell Laboratories noted that, on a per capita basis, recreation and cultural expenditures were twice the Manitoba average even excluding the $250 annual costs of cable television.

5.5.5 Municipal Finance

Notwithstanding the high level of services available to residents of Pinawa, taxes on a standard bungalow (defined as 102 m^2, built around 1975) are on a par with communities elsewhere in the area but substantially lower than in Winnipeg (Table 5.34).

Table 5.34
Property Taxes in Manitoba Communities

Community	1997	1999
Pinawa	$1922	$1779
Beausejour	$1718	$1680
Lac du Bonnet	$1791	$1690
Winnipeg St. James	$2523	$2783

Note: Data adjusted to reflect different charges (cable TV, water and sewer).

Source: The Whiteshell Laboratories, Community/Provincial Leaders Committee (April 30, 1999).

The provision of a high level of community services in conjunction with relatively low property taxes was planned by AECL for Pinawa. The grant-in-lieu of taxes paid by AECL to Pinawa was designed to ensure that the Town had services at least comparable to those elsewhere, if not better. The grant-in-lieu has recently been in excess of $1.9 million and has effectively amounted to half the revenue spent on schools and municipal services. Without the grant, the Leaders Committee estimated that the owner of a typical bungalow would have to pay $4,569 in property taxes, assuming that the Provincial policy of not providing the same educational funding assistance that it provides to other municipalities in Manitoba continues.

5.5.6 Historical and Archaeological Features

A comprehensive archaeological and historical record for the Licensed Property Study Area is not available. The lack of archaeological data for this area is not an indication of low potential for archaeological site, but rather is due to the fact that no formal archaeological field investigations have occurred within this study area. Only two archaeological sites within the area are presently recorded in the Provincial Archaeological Site Inventory: EaLa-6, the Sweet Creek Petroform Site, and EaLa-7, the Boat Launch Site (Figure 5.30). The first site was an ancient ceremonial site, which was destroyed during agricultural activities. The second is a pre-European-contact campsite. The present condition of this site is not known.

Two archaeological studies were conducted during the 1970s, one on each side of the reach of river where AECL property is located. These studies revealed high concentrations of pre-European-contact and fur trade sites. Of particular importance were the sites at the confluence of the Whitemouth and Winnipeg Rivers, where large settlements and burial mounds were recorded. These sites occur several kilometres south of the Licensed Property Study Area.

Archaeological Sites

Throughout history, rivers have played a vital role in the lives of people around the world. Aside from being a source of food and water, rivers are also important in transportation, communication, commerce and religion. The Winnipeg River is no exception, and has been used as an artery in east-west movements from as early as 5000 BC (Steinbring 1980).

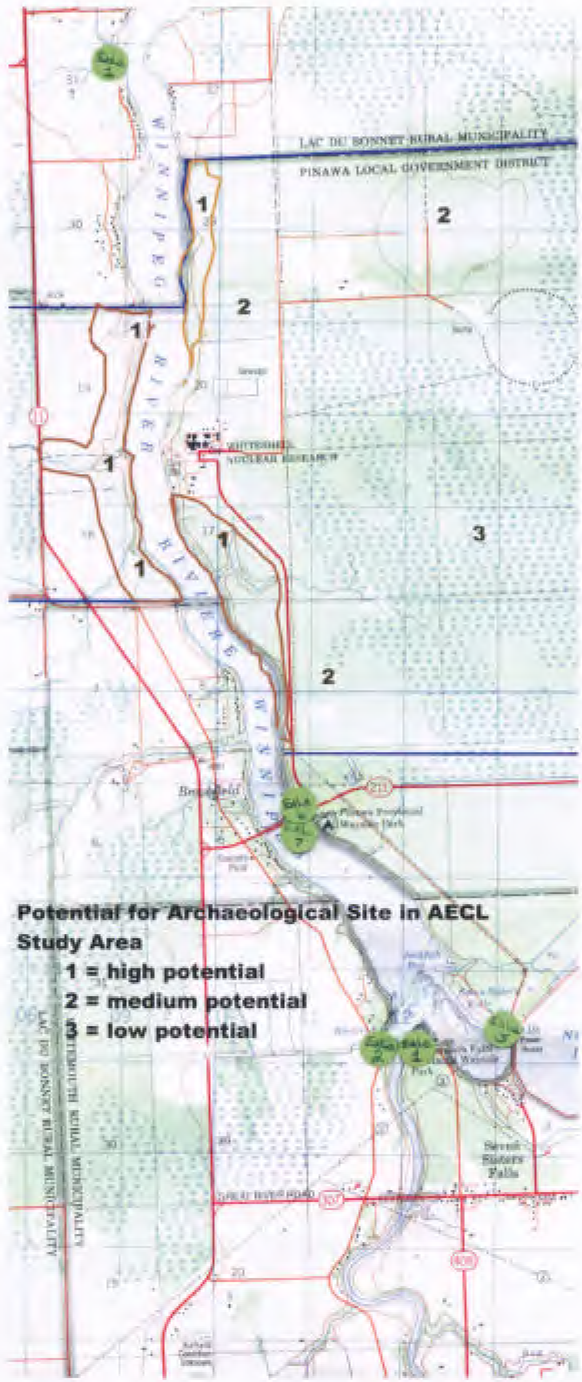
The Winnipeg River has a rich and varied history ranging from the earliest Transitional (Shield-Archaic) populations to the Laurel peoples and the Blackduck, Selkirk and other pre-European-contact cultural groups terminating with the introduction of European fur traders and, eventually, white settlers. Evidence of early human occupation along the Winnipeg River has been found in a large number of archaeological sites located along the length of the waterway. Many of these sites were identified during the Winnipeg River Archaeological Project (1980-1982). This project was undertaken when Manitoba Hydro announced in 1979 that repairs to the Great Falls and Seven Sisters Dams would lead to the lowering of water levels in their forebays for three years. This project focused on two areas: from Great Falls to McArthur Falls and from Seven Sisters Falls to Sturgeon Falls (Buchner 1982).

The Regional Study Area is characterized by a concentration of archaeological sites along the banks of the Winnipeg, Whitemouth and Brokenhead Rivers. No sites are registered for the Project Study Area. However, because no sites are currently registered does not mean that there are no sites present in this area.

The Regional Study Area contains 638 known archaeological sites, and encompasses a vast area. The Local Study area contains 97 of the above numbered sites, and most are located between Otter Falls and Seven Sisters Falls. The locations of the two sites, which are found within the Project Study Area, are not precise due to poor data.

FIGURE 5.30

POTENTIAL ARCHAEOLOGICAL SITES IN THE AECL STUDY AREA



AECL EACL

Local Study Area

While the section of the river represented as the Local Study Area was left out of the early assessment, some sites are known, including some of the most prolific sites in Manitoba. The Whitemouth Falls (EaLa-1) and Bjorklund (EaLa-3) sites located at the confluence of the Whitemouth and Winnipeg Rivers, for example, show evidence of occupation spanning several millennia. In addition to the large number of artifacts found, the sites in this area are also notable for their rare finds of considerable cultural significance.

Petroform sites are abundant in the Winnipeg River area, compared to the rest of Canada and may represent a localized cultural phenomenon. These sites consist of boulders that have been aligned in a particular fashion to produce various figures. Ranging from lines and ellipses to easily recognizable zoomorphic figures, these sites are considered very important by both archaeologists and the descendants of their creators. The Anishinabe inhabitants of the area consider "*the teachings inherent in the petroforms. … necessary for [their] present and future physical, emotional, and spiritual well-being*" (Pettipas 1990). One such site has been located in the Local Study Area, on the east-side of the Winnipeg River. The Sweet Creek Petroform site consisted of a linear feature, a circle and a snake before plowing destroyed the alignments.

Another significant find in the Local Study Area consists of a large burial mound located near the Bjorklund site. Such large mounds are characteristic of the Laurel Culture whose people may have immigrated into the Winnipeg River area from the east nearly two thousand years ago (Steinbring 1980). The mound cult developed in large centres in Ontario and the midwestern United States and terminated, with this exception near Seven Sisters, on the Rainy River (Steinbring 1980). This lone mound on the Winnipeg River, known as the Porth Mound, measures approximately 10 m long, 5 m wide and 3.5 m high (Steinbring 1980).

Historical Sites

Within the Regional Study Area, only one provincially recognized site, the Pinawa Dam Provincial Heritage Park, is found. This park is under the management of Manitoba Conservation (former Natural Resources). During the construction of the amphitheatre Historic Resources Branch staff conducted some archaeological investigations, and a cultural component related to the dam construction was identified. The site was assigned an archaeological Borden Number EbKx-5.

5.5.7 First Nation and Aboriginal Interests

The Regional Study Area includes lands covered by the terms of both Treaty 1 and Treaty 3. The Treaty 1 Ojibway communities of Sagkeeng First Nation (also known as Fort Alexander, Manitoba) and Brokenhead Ojibway Nation (also known as Scanterbury, Manitoba) are located within the Regional Study Area.

Lands within the Regional Study Area are part of the historic traditional territories of both Sagkeeng Fist Nation and Brokenhead Ojibway Nation. The Regional Study Area is also located within the historic traditional territory of the Wabaseemoong Independent Nation which is a Treaty 3 First Nation whose Reserve is located in Ontario.

Consultations with the First Nations have confirmed that First Nations participate in traditional activities within the Regional Study Area. The Sagkeeng First Nation participates in traditional activities of wild rice harvesting, sturgeon fishing, berry picking and gathering of plants and medicines. The Brokenhead First Nation has not identified specific activities. However, it has a Treaty Land Entitlement and is in discussions with the Province regarding a petroform site in Whiteshell Provincial Park located east and south of Pinawa. Contact with 7 Treaty 3 First Nations confirmed that the Wabaseemoong Independent Nation has interests in the Regional Study Area and cultural activity occurs frequently and regularly. Two of the First Nations contacted indicated that they had no concerns with the decommissioning program and did not have traditional lands or aboriginal interests in the Regional Study Area. Four First Nations contacted did not provide confirmation of their interests.

The Sagkeeng First Nation also uses the Winnipeg River as its water supply and considers the river to be a valued social component.

5.6 SUMMARY OF VECS AND VSCS

5.6.1 Definition

Valued ecosystem components (VECs) are features of the environment selected to be a focus of an environmental assessment because of their ecological value and their potential vulnerability to the effects of the project. Project components are assessed with respect to their interaction with the natural and social environment and based on this assessment, a determination is made of residual environmental effects and the impact on the VECs. VECs are considered to be valuable because they are:

- legally recognized and afforded specific protection by law, policy or regulation; and/or
- recognized by the scientific or professional communities as important due to their abundance, scarcity, endangered status or role in the ecosystem.

Attributes that may be selected as VECs include: habitats, species, populations, communities, organisms, significant sites etc.

Valued social components VSCs are a subset of VECs and generally refer to those items recognized by the public as being important because of their social importance, commercial or economic value, or their role in maintaining quality of life within the community. They are generally environmental components, such as a river or a sport fishery but they may also be cultural or heritage components such as archaeological or traditional First Nations sites.

5.6.2 Assessment of VECs

VECs were selected by various means:

- expert professional opinion (e.g. ecologists, biologists, naturalists, etc.);
- interviews with knowledgeable lay persons (e.g. trappers, bird watchers, hikers, local residents);
- consultation with appropriate government staff (e.g. Manitoba Natural Resources);

- input from public consultation program; and
- lists of endangered, threatened and vulnerable species (e.g. Committee on the Status of Endangered Wildlife in Canada).

Using information collected from the sources above, the VECs and VSCs were assessed according to their ecological and social importance, spatial extent and species abundance. None of the wildlife species selected as VECs were considered to be endangered. While all VECs and VSCs were weighted equally, the assessment concluded that the Winnipeg River and the aquatic features of the waterway were the area's most important VEC and VSC.

The Winnipeg River and its Shoreline

The Winnipeg River provides drinking water to the area either through municipal systems or co-ops. Its waters are the basis of a sports fishery, which in turn is a major component of the tourist industry as well as the growing retirement home and cottage communities. It is highly valued, and is susceptible to effects related to contamination, sediment loading and sediment and shoreline disturbance. It also serves as a migratory route for many birds and as such, is susceptible to disturbance, due to human presence on the water and along the shores. Because the river is large and flows throughout the region, effects on the river have regional implications.

The shorelines of the Winnipeg River have provided locations for the homes or cottages of aboriginal and European peoples for centuries. The shorelines are traditional first nations lands and may contain important archaeological sites and artefacts. Their location next to the water make them desirable locations for year-around homes, cottages and tourism facilities. The access to water also makes the lands of the Winnipeg River desirable locations for industries requiring large amounts of water (e.g. Pine Falls). Finally, the shorelines are adjacent to some of the best farmland in the region.

Other VECs and VSCs considered during the project include:

Sturgeon, Walleye, Northern Pike and Mooneye

Sturgeon, walleye, pike and mooneye are valued fish species in the Winnipeg River. Sturgeon, a protected species, must be released if caught. As an illustration of their valued status, they are used in advertising campaigns for the downstream community of Lac du Bonnet. As a very long-lived bottom feeder, they are particularly susceptible to contaminated sediments and bone-seeking radionuclides such as ^{90}Sr. Anecdotal evidence suggests sturgeon continue to be common near the Whiteshell Laboratories' outfall. They were netted in the area prior to the start-up of the Whiteshell site, and two small ones were captured in the fall 1999 AECL fish monitoring campaign. Walleye, northern pike and mooneye are preferred sportfishing species; walleye and northern pike are top predators and mooneye feed heavily on invertebrates. They are common in the region and although they are thought to have stable populations, capture limits are applied to the sport fishery.

Whitetail Deer and Moose

Whitetail deer and moose are valued by both subsistence hunters and sport hunters and by the general public as interesting and visible signs of the natural environment. Whitetail deer are very common throughout the region, supporting a large hunting effort and populations of wolves and perhaps mountain lions. They aggressively invade and feed in disturbed areas, and will graze contaminated vegetation even where access is physically restricted. They also consume soil in the saline-seep ditches common near the site, which makes them susceptible to groundwater discharges of contamination. Moose are present but not common. They require large tracts of undisturbed lands with a predominance of wetlands and small water bodies.

Gullies and Ravines

The gullies and ravines along the river offer a unique habitat. They provide habitat to locally rare species such as the woodland jumping mouse. As riparian features with specific microclimates, the gullies provide habitat for species not endemic to the region. Beavers frequently build dams in the gullies, and this introduces new habitat for other organisms. Beaver activity on the site is restricted to the gullies. The gullies are susceptible to contamination because any overland runoff or groundwater flows from inland areas travel through the gullies toward the Winnipeg River.

Coniferous Forest

The coniferous forest on the site includes both wetland areas dominated by black spruce, and well-drained areas populated by jack pine. Both types of trees are found in the FIG (Field Irradiator Gamma) research area (Figure 5.26). Black spruce in particular is very slow growing, and stands on the site may be over 100 years old. The conifers provide cover for a large number of undergrowth plant species as well as for birds and mammals listed as potential VECs. The FIG area was intensively studied for over 10 years, and has the potential to serve as a benchmark site for conifers and boreal environments in Canada.

Habitat Diversity

The diversity of habitats is an important attribute of the site. Upland sandy soils, clay plains, peat-filled wetlands, beaver ponds and a major river contribute to the diversity on the site. The confluence of aspen parkland and boreal forest ecosystem types and the overlap of the ranges of eastern and western species result in interesting combinations in the region. Agricultural and forestry practices also merge with large undisturbed areas in the region.

The Sport Fishery

The Sport Fishery is a major component of the local economy. Nopiming and Whiteshell Provincial Parks provide 20% of the total annual sport fishing days in Manitoba.

Provincial Park and Natural Forest Areas

Natural recreational areas include the Nopiming and Whiteshell Provincial Parks and the Agassiz, Whiteshell and Sandilands Provincial Forests. These areas attract both local residents and tourists and include a full range of recreational potential and activities such as cottaging, canoeing, hiking, hunting, fishing, and snowmobiling.

The Model Forest

Forestry is a major industry to the north of the area. A Federal/Provincial Program designed to create a sustainable forest environment is now underway in the area.

The FIG

There is an area within the Whiteshell boundaries known as the Field Irradiated Gamma (FIG). This facility, intentionally irradiated over an approximately fifteen-year period, represents a historical research area that has attracted researchers worldwide.

6.0 ASSESSMENT OF ENVIRONMENTAL EFFECTS

6.1 OVERVIEW AND APPROACH

6.1.1 Overview

This section discusses potential effects on the environment from activities associated with the decommissioning of the Whiteshell Laboratories. The objective of this section is to identify residual effects (after mitigation) as a basis for the later determination of the *CEAA* environmental assessment requirement of whether or not the project has any significant adverse effects on the environment (Section 7.0). The baseline condition is that of autumn 2000, a point in time in which substantial portions of the facility have already been placed in operational shutdown state.

The analysis addresses the effects of decommissioning activities on the environment throughout the decommissioning project. It only incidentally considers the overall effect of decommissioning itself, which will in all likelihood generate substantial positive benefits. Thus:

- Decommissioning will lead to improvements to the environment as the overall risk posed by the facilities is progressively reduced.
- The achievement of operational shutdown will dramatically reduce any current discharges.
- Natural radioactive decay will reduce radioactivity on site.
- There will be no new sources of contamination.
- As the decommissioning of each facility is completed, the land on which it is located will be restored to a more "natural" condition, that is, the land will be seeded with natural grasses and left to develop as nature allows.

6.1.2 Approach

The analysis of effects is organized into an analysis of the effects of:

- Air Quality.
- Noise.
- Surface Water.
- Groundwater and Soils.
- Terrestrial Biota.
- Aquatic Biota including biota living or feeding in sediments.
- Worker Health and Safety.
- Public Health.
- Socio-Economic Effects:
    - Cultural and Physical Heritage;
    - Archaeological Features;
    - Land and Resource Use; and
    - Aboriginal Interests.
- Accidents and Malfunctions.

- How the Environment itself might affect Decommissioning.
- Sustainable Use of Renewable Resources.
- VECs and VSCs.

The effects were determined by:

1. reviewing decommissioning activities on a facility by facility basis and assessing the sources and amounts of emissions;
2. indicating the primary pathways for these emissions (air, soils, biota, surface water and groundwater);
3. identifying the receptors (especially VECs and VSCs) that could be affected along the pathways;
4. assessing whether there could be any environmental effects;
5. determining whether or not mitigation is required;
6. applying appropriate mitigative measures; and
7. assessing the possibility of residual effects.

The actual analysis involved the following steps.

Consultation with Experts and the Public

There were two types of consultation to obtain information relevant to the decommissioning project. The first was a formal and on-going program of consultation with the community. The second part was an interchange of ideas between the consultants and expert and interested groups and individuals on a less formal basis. This involved discussions on particular issues, such as the identification of VECs. A full discussion of the public consultation program is given in Section 10.0.

Effects Workshop and Initial Screening

A technical workshop attended by the consulting team and the AECL decommissioning team was held to identify potential effects from decommissioning activities associated with particular facilities that warranted further review and analysis. At the workshop, environmental screening tables were developed to show how different activities associated with the project might affect environmental components such as air, surface water, etc. All facilities were discussed at the workshop although tables were not prepared for all of them. The screening tables were used as the starting point, not the end point, of the analysis. Appendix E presents the initial screening tables prepared for each facility.

Review of Literature and Data

The literature and data were reviewed to determine if there was adequate support for the analysis.

Data Supplements

Because Whiteshell Laboratories is a highly regulated facility, there is substantial data for baseline conditions for most environmental components. In some areas, however, specifically, with respect to the river sediments and the low-level waste trenches, more data was collected.

Environmental Interaction Analysis

Interactions with environmental components were determined and environmental effects estimated using various analytical tools, models, and professional judgement.

Application of Mitigation Measures

Mitigation measures were applied to reduce the level of environmental effect as appropriate. Many of these measures are applied during the normal course of operation to meet licensing requirements. Other measures, not necessarily related to AECL's current policies are applied in accordance with good environmental practice.

Estimation of Residual Environmental Effects -VECs

Once mitigation has been applied the residual effects on the VECs and VSCs outlined in Section 5.0 could be estimated. These effects form the basis for the analysis of significance (Section 7.0) and cumulative effects (Section 8.0).

6.1.3 Organization of Section 6

The remainder of this chapter is organized into six main sections:

1. Environmental Mitigation Measures currently applied at Whiteshell.
2. The assessment of Potential Environmental Effects by Environmental Component.
3. Effects of Accidents and Malfunctions.
4. Effects of the environment on Decommissioning.
5. Effects on the Sustainable Use of Renewable Resources.
6. Summary of Effects on VECs and VSCs.

6.2 MITIGATION MEASURES

6.2.1 Compliance Programs

A number of compliance programs are in place that translate legal and related requirements into processes or program requirements appropriate for AECL. The compliance programs establish a common set of work practices and procedures to ensure work is performed consistently across all AECL sites. At Whiteshell Laboratories, these programs were initially designed for an operating nuclear facility with control systems to handle a much larger (several orders of magnitude) radioactive inventory than are expected from the decommissioning program. Equivalent programs and control systems will remain during the entire decommissioning project and will be augmented as necessary according to the Detailed Decommissioning Plans (DDPs) to ensure that any effects from decommissioning activities would be handled in a controlled and effective manner.

6.2.1.1 Radiation Protection

The AECL Radiation Protection Requirements Implementation Plan outlines the requirements for radiation protection. These requirements are implemented through the Radiation Protection Manual. Alternate protocols are provided where a specific procedure has not been outlined in the manual.

All decommissioning work will be conducted in accordance with requirements of the AECL Radiation Protection Program using approved procedures and work plans, ALARA reviews and pre-job briefings to minimize the exposure to personnel and ensure that regulatory and site limits are not exceeded. If a specific job presents hazard potential, an ALARA review that includes a dose assessment will be performed and engineering controls will be implemented to minimize the dose to personnel (e.g. incorporate shielding, limit exposure time, rotate personnel).

6.2.1.2 Occupational Health and Safety

AECL's Occupational Safety and Health Program is defined by the requirements contained in AECL's Occupational Safety and Health Program Manual and AECL's Work Permit System.

The decommissioning work will be conducted in accordance with the manual's requirements using approved procedures and work plans and/or implementation of AECL's Work Permit System. The primary safeguard against industrial hazards is the use of qualified staff following approved procedures. This includes the Work Permit System, which provides a systematic approach to identifying hazards and ensures that staff are properly qualified and equipped for the workplace.

6.2.1.3 Environmental Protection

The Environmental Protection Program at Whiteshell Laboratories is designed to ensure protection of the environment and the public with respect to environmental aspects that result from operation of AECL's facilities. Requirements are outlined in AECL's Environmental Protection Program Manual.

Decommissioning work will be conducted in accordance with the requirements of AECL's Environmental Protection Program. The Whiteshell Laboratories Monitoring Program will be maintained throughout the decommissioning project to monitor the effect of decommissioning activities and verify that the requirements and objectives of the Environmental Protection Program are met.

6.2.1.4 Emergency Preparedness

Whiteshell Laboratories site and facility-specific emergency plans are a contingency measure designed to address an accident or malfunction scenario. The requirements are contained in an Emergency Preparedness Program Requirements Manual and Whiteshell Laboratories Emergency Plan.

Decommissioning work will be carried out in accordance with these plans and the plans will remain in effect until the hazards associated with each activity are removed or mitigated. These plans deal with accidents, malfunctions or other non-routine events, such as a spill of a hazardous substance.

6.2.1.5 Security Program

A company-wide Security Program is described in the Physical Security Program Manual. A site-specific plan is also in place at the Whiteshell Laboratories.

The Security Force provides access control, visual monitoring and patrolling, and operates an extensive surveillance system to detect and deter unauthorized entry to the Laboratories and/or any diversion of materials and equipment. A progressive system of zones is used to provide increasing levels of security to specified areas of the Laboratories, in accordance with the *Nuclear Security Regulations* issued pursuant to the *Nuclear Safety and Control Act*.

The security program will continue to apply throughout the decommissioning program.

6.2.1.6 Quality Assurance

The Quality Assurance (QA) programs at AECL apply to all staff and external contractors who participate in, or support, projects and activities at AECL sites.

The AECL Management Manual (AECL 1999) describes how AECL manages its business and how it attains quality. It provides employees with direction on the business and management systems. Quality programs and procedures within AECL must meet the requirements, principles and practices described in the Management Manual.

For nuclear safety-related activities, the QA programs and supporting procedures meet the requirements and practices described in the Canadian Standards Association CAN/CSA-N286 series of standards. All activities defined as nuclear safety-related are carried out under quality assurance programs meeting the requirements of the standards.

6.2.1.7 Other Applicable Compliance Programs

In addition to the programs described in the preceding sections, other compliance programs applicable to the decommissioning activities include:

- Operational Experience.
- Nuclear Materials Management.
- Transportation of Radioactive Materials.
- Nuclear Operations.

Internal assessments and audits are conducted to assess the adequacy and effectiveness of the compliance programs. Independent reviews of proposed activities at AECL sites are also carried out by the Safety Review Committee on behalf of the President and CEO of AECL.

6.2.2 Application of Policies and Guidelines

As noted in Section 6.2.1, since Whiteshell Laboratories is an existing licensed facility, there are many key support programs in place to deal with radiation protection, occupational health and safety, environmental protection and emergency preparedness. There are also numerous policies, and guidelines that are adhered to at the facility (examples are given in Table 6.1). All of these programs and policies help to ensure that effects on health, safety and the environment are controlled at source and thus effectively mitigate against environmental effects. In addition, Detailed Decommissioning Plans (DDPs) are being developed for each facility and will provide detailed measures to mitigate environmental effects. These mitigative measures will be consistent with AECL policies, procedures and programs. The DDPs will be subject to review and approval by the CNSC. An important part of the mitigation program is the maintenance of detailed records on the progress of the decommissioning. Such records support later analysis and the identification of required follow-up procedures.

Table 6.1

Policies or Guidelines Related to Mitigation

Policy or Guideline	Title/Topic	Comment
AECB-R-85	Radiation Protection Requisites for the Exemption of Certain Radioactive Material from Further Licencing Upon Transferral for Disposal.	Provides guidance to determine which material can be exempted from regulatory control based on a deminimis risk.
CNSC R-104	Long-Term Radioactive Waste Disposal	Regulatory basis for judging the acceptability of waste disposal facilities.
CNSC G-219	Decommissioning Planning Guideline for Licensed Activities	Provides guidance for the preparation of decommissioning plans.
CNSC 1049, Rev. 2	Accountability Procedures	Accountability records necessary for the Non-Proliferation Treaty and the NSCA.
CNSC Licence NRTEOL-2.00-2002	Whiteshell Laboratories Site Licence	
CAN/CSA-N286	Quality Assurance	Standard for the nuclear life cycle. Quality assurance of work done for decommissioning.
CAN-Z299	Procurement Standards	Non-nuclear standard covering manufacturing, procurement and supply of services.
IAEA Tech Doc 716	Decontamination and decommissioning of nuclear facilities	
IAEA Safety Standard Series WS-G-2.2	Decontamination of medical, industrial and research facilities	
RC-2000-633-0	AECL Research's Radiation Protection Requirements and Implementation Plan	Radiation protection methodology within AECL.
W-SPP-#1.1 to 11.1	AECL Policies and Procedures	Basic structure for management of AECL activities and personnel, including: safety, dosimetry, radioactive waste management and security.
AECL 40101	Corporate Management Policy Manual: Health Safety and Environmental Review	Elements of the health, safety and environmental review program, including Safety Review Committee.

Policy or Guideline	Title/Topic	Comment
AECL 40501	Corporate Management Policy Manual: Protection of Environment	Key elements of the environmental protection policy.
RC-2000-060-500	Whiteshell Laboratories Emergency Plan	Emergency response plan which provides a mechanism to minimize the effect of an emergency on AECL employees, the public, the site and the environment.
RC-2000-060-000	Emergency Preparedness Program Requirements	
RC-2000-633-1	AECL Radiation Protection Manual (Draft)	
SRC-R-4/00-832	AECL Requirements for Independent Review of the Decommissioning of Buildings Facilities and Sites	
RC-2000-021-0	Environmental Protection Program Manual	Provides in-depth description of the key elements of AECL's environmental protection program.
RC-2000-101-01-0810	Working Draft AECL's Work Permit System Procedure	A work permit is a mechanism for controlling and co-ordinating work to protect workers. A work permit informs a person of hazards and safety measures, so the work can be done safely.
Emergency Procedures	Emergency Procedures Whiteshell Laboratories	An on-line document covering basics of Whiteshell Laboratories emergency signals and the required sections by staff.
Policy 00-003 Rev 0	Security	Policy covering personnel security, protection of information systems and data, and physical security.
WNRE-659	Radiation Protection Manual	

All decommissioning work will be conducted in accordance with AECL's approved policies, programs and procedures to ensure the safety of workers, the public and the environment. For this reason, it is expected that most of the possible environmental effects from the decommissioning project can be mitigated through adherence to the AECL's programs. Few additional mitigative measures will be required.

Due to the fact that the decommissioning program is essentially a process of managing waste streams, a comprehensive program for the management of wastes arising from decommissioning work at the site is being developed by AECL. As detailed in Section 4.5, existing waste facilities will be modified and new facilities will be constructed to process and manage wastes which cannot remain in existing storage structures until waste disposal becomes available. This enables the decommissioning process to handle all waste streams on site, thereby providing a key mitigative measure. These facilities will remain operational until no longer required and will then be decommissioned.

The Whiteshell Laboratories was originally designed with protection systems to handle a much larger (several orders of magnitude) radioactive inventory than exists now. These protection systems will remain in effect entirely during the first phase of decommissioning, and similar measures will routinely be applied to subsequent phases to ensure that any process streams or malfunctions from decommissioning activities would be handled in a controlled and effective manner.

Where measures outlined above were not deemed adequate to mitigate potential environmental effects, additional measures were proposed. Following the application of these measures, an assessment was made to determine whether or not an effect would remain. If an effect could not be fully mitigated, it was considered a residual effect. Note that the classification of an effect as "residual" is not a statement of the significance of the effect. That analysis is carried out in Section 7.0.

6.3 ASSESSMENT OF POTENTIAL ENVIRONMENTAL EFFECTS

6.3.1 Air Quality

Air quality refers to the quality of atmospheric air. It is typically assessed at a site's property boundary. For the Whiteshell Laboratories site, this would normally be the licensed property area. However, to accommodate the potential for the early release of certain lands within the licensed property area, air quality effects are evaluated at the boundary of the Project Study Area.

Air quality effects have been categorized as:

(a) airborne radioactive emissions - particulate bound emissions which are distinct from conventional airborne emissions;
(b) airborne non-radioactive emissions - particulate emissions which are not radioactive (e.g. solvents, mercury, lead and asbestos);
(c) nuisance dust - this is typically represented by TSP (total suspended particulate) and is an indicator of soiling, visibility, and in high enough concentrations, health effects; and
(d) fine particulate - this is typically represented by PM_{10} (particulate matter less than 10 microns in diameter) and is an indicator of health effects associated with respirable particulates (e.g. asthma).

In a typical air quality assessment, concentrations at a particular point (usually the property boundary or a sensitive receptor) are either measured or estimated and compared against existing provincial or federal air quality guidelines or standards. These standards are usually reflective of the most stringent effect whether it be on human, terrestrial or aquatic species.

Although it is theoretically possible to develop predictive models for concentrations of emissions at the boundary, the episodic nature of the activities that would generate the emissions as well as the distance of the activity from the boundary make modelling highly speculative. As a result, there is reliance on professional judgement. Note that in Section 9.0, a monitoring program calling for studies of air emissions from various activities which are expected to confirm our professional judgement, has been outlined. The approach considers:

- the potential for emissions to enter the atmosphere;
- the type of emissions (as defined above);
- the potential magnitude (concentration) of emissions;
- the potential lareal extent of the emissions;
- the frequency and duration of emissions; and
- the predominant meteorological conditions (particularly wind direction).

6.3.1.1 Potential Project/Environment Interactions

Physical works/activities resulting in 1) the release of airborne radioactive emissions 2) airborne non-radioactive emissions and 3) nuisance dust, are summarized below.

Physical works/activities leading to the release of airborne radioactive emissions:

- operation of the WMA, including operation of the baler during compaction of wastes, constructing new storage space, retrieval and repackaging of waste from existing storage facilities and decontamination activities and site restoration;
- operation of building ventilation systems for nuclear facilities (B300, Decontamination Centre, ALWTC, B100);
- retrieval and recovery of fuels from the CCSF and exterior decontamination of the canisters. The risk is associated with the possible release of airborne radioactive particles during canister demolition;
- decontamination of nuclear/radioisotope facilities (Shielded Facilities, Active Liquid Waste Treatment Centre, WR-1, B300, Decontamination Centre);
- disconnecting of nuclear facility services; and
- remediation of contaminated soils/sediments (buried services, affected lands and sewage lagoons).

Physical works/activities leading to the release of airborne non-radioactive emissions include:

- disconnecting of nuclear facility services and maintenance of buildings;
- removal of hazardous materials from facilities; and
- methane pollution from organic material that may be in the inactive landfill.

Physical works/activities leading to nuisance dust and fine particulates include:

- retrieval and repackaging of waste from existing storage facilities and construction of new storage area;
- demolition of facilities and disposal of rubble as clean fill; and
- site restoration.

6.3.1.2 Likely Environmental Effects

Air quality effects range from the release of very small amounts of radioactive airborne particulates to nuisance dust. Several observations may be made about likely environmental effects from the project:

1. The nature of the decommissioning process means air emissions are likely to be limited to intermittent releases. Thus, air quality standards could be exceeded over short averaging periods such as twenty-four hours, but are very unlikely to exceed weekly DRLs.

2. Airborne radioactive emissions are controlled to be below DRL's and are kept As Low As Reasonably Achievable (ALARA) through the use of mitigation measures.

3. The area affected by nuisance dust is expected to be small. Recent work (Watson and Chow 1999) suggests that most fugitive PM_{10} dust (for example, dust generated by construction-type activities) will remain in the lowest 2 m of the atmosphere and that the local deposition losses and impaction losses (trees) will reduce the amount transported beyond a few hundred metres by over 50%.

4. The bi-directional character of the prevailing wind pattern in a south-southeast north-northwest direction and predominantly low wind speeds (on average less than 14 km/hour over the year), would normally limit the geographical extent of any air quality effects to within the boundaries of the Project Study Area. Only on particularly windy days, would air quality effects be observed beyond the Study Area.

5. Deposition of radioactive particulates to ground surface could occur in areas identified as VECs (gullies, ravines and coniferous forest). However, since emissions are expected to be well below applicable limits, no effect on these areas is expected.

6.3.1.3 Identified Mitigation Measures

Mitigation measures to minimize air quality effects from the project fall into the following categories:

- Use of enclosures and HEPA filters to control airborne radioactive emissions. HEPA filters used during decontamination will remove a high level of radioactively contaminated dust (99.7%).
- Use of dust control measures (e.g. containment and suppression) to control generation of non-radioactive airborne emissions and nuisance dust.
- Curtailment of activities during periods of adverse meteorological conditions (e.g. during periods of very high winds).
- Maintenance of on site access routes.

Special enclosures to cover large areas may be required to contain airborne emissions from decommissioning activities in some cases (for example decommissioning of the WMA, Buried services and larger buildings on site). Enclosures covering large areas are available. Portable enclosures can and are being used to control dust in road repair and removal and cover areas of up to 800 square feet. The need for such enclosures will be identified in the DDPs.

6.3.1.4 Residual Effects

The expected residual effects are:

- Release of airborne radioactive particulates from the following project activities:
  - disconnecting services;
  - decontamination of facilities;
  - retrieval and repackaging of materials; and
  - remediation of WMA's, buried services and affected lands.
- Nuisance dust and fine particulates from building demolition and site restoration and rehabilitation.
- Production of methane gas from the inactive landfill.

The spatial extent of residual effects is expected to be limited to the Project Study Area.

6.3.2 Noise and Vibration Assessment

In a typical noise vibration assessment, sound levels from the source are either measured or estimated and compared against the existing sound levels at the closest residence or other sensitive receptor (e.g. campground, school or church). In this assessment, specific recent and relevant noise level data at the closest residence or sensitive receptor is not available. Excessive noise has been documented to have a negative influence on wildlife breeding, migration and feeding patterns (Canter 1996). During decommissioning activities, noise is expected to be short-term and sporadic and will be confined to daytime activities. Those wildlife species identified as VECs (deer and moose) have a range that extends beyond the site and can temporarily relocate to other suitable habitats nearby if the noise is too disruptive.

Potential noise effects prior to mitigation are evaluated based on professional judgement. This approach considers, as a minimum, for each activity:

- the origin and type of noise emissions and vibrations;
- the potential magnitude of noise and vibration emissions;
- the potential areal extent of the noise emissions;
- the frequency, duration, and time-of-day of the noise emissions;
- the distance to the nearest residence and/or sensitive receptor; and
- the presence of existing (e.g. building envelope) and/or natural (e.g. trees) sound barriers.

6.3.2.1 Project/Environment Interactions

Project physical works and activities likely to generate noise and vibrations are building demolition, site remediation and restoration activities. Decommissioning activities will include little or no blasting.

6.3.2.2 Likely Environmental Effects

The noise generated may have significant magnitude, but is expected to be short-term and sporadic and will be confined to daytime activities. The preservation of the dense tree coverage across the site will provide a natural noise barrier between site activities and potential noise receptors within the Project Study Area. Furthermore, because of the natural dissipation of noise energy with distance, the impact of noise on offsite residences will be limited. Vibration effects would likely only be of concern within the Project Study Area to adjacent buildings and structures.

Wildlife living near the site boundaries may be exposed to the noise generated by decommissioning. However, due to the nature of the decommissioning generated noises (dismantling, using little if any blasting) none of the wildlife species affected will experience habitat loss as a result.

No residual effects from noise and vibration are expected.

6.3.2.3 Identified Mitigation Measures

No mitigation measures for noise and vibration will be required.

6.3.3 Hydrology

Surface water flows include all surface water flow on site (streams, surface water runoff and flow through storm sewers) and the Winnipeg River – the ultimate destination of surface water discharges from the site and the most important surface water body in the area.

Surface water quality effects have been categorized as:

a) Effluent discharges to the Winnipeg River.
b) Effluent discharges to ground-surface which have the potential to migrate via surface runoff to the Winnipeg River.
c) Contaminated groundwater discharges to the Winnipeg River.

Surface water quality is generally assessed at locations where surface water leaves the site's boundary and in water-bodies affected by discharges. Concentrations of radiological and non-radiological parameters are measured and compared against existing provincial or federal surface water quality guidelines or standards. These standards are usually reflective of the most stringent effect, whether it be on human, terrestrial or aquatic species.

The potential for surface water quality effects prior to mitigation is evaluated using existing data, data collected specifically for the CSR (See Appendix B and C) and professional judgement. The approach considers:

- The potential for effluent discharges.
- The receptors potentially affected by the discharges.

6.3.3.1 Likely Project/Environment Interactions

Physical works/activities with the potential to affect surface water quality are listed according to each effect category.

Physical works/activities resulting in discharges to the Winnipeg River are:

- Operation of the Active Liquid Waste Treatment Centre (ALWTC). Effluents from the ALWTC are discharged to the process sewer which in turn discharges to the Winnipeg River via the outfall. Releases will continue to be controlled within compliance guidelines through Phases 1 to 3.
- Bi-annual operational releases are expected to continue through Phases 1 to 3 from the sewage lagoons.
- Surface water runoff from the site collected by storm sewers and drained via the Process Sewer.
- Intermittent discharges from ditches draining the WMA (Phase 1 to 3 and beyond).

Physical works/activities with the potential for discharges to ground-surface and migration via surface runoff to the Winnipeg River are:

- Operation and Passive Operation of the WMA (Phase 1 to 3) and In-situ Disposal of LLW at the WMA (Phase 3 and beyond).
- Remediation of buried services and affected lands (Phase 1 and 3).

Physical works/activities with the potential for leachate migration to groundwater and discharge to the Winnipeg River are:

- Operation and passive operation of WMA in-situ trenches (Phase 1 to 3).
- In-situ disposal of LLW in WMA (Phase 3 and beyond).
- Operation of the inactive landfill and sewage lagoon (Phase 1 to 3).

6.3.3.2 Likely Environmental Effects

General comments about likely effects from decommissioning on water quality of the Winnipeg River, the ultimate discharge location for all effluent from the site are listed below:

- The water quality of the Winnipeg River has met drinking water standards throughout the operation of Whiteshell Laboratories. Effluent emissions during decommissioning will decline from operational levels and no adverse effect on water quality is expected.

- Residual contamination on river sediments from past operations is not expected to affect water quality. The radionuclide inventory in the most contaminated region of the sediments is 1.3 GBq, a small fraction of total releases to the Winnipeg River

(See Appendix B). Even if the complete sediment radionuclide inventory was released to water by de-sorption and re-suspension in a short period of time (for example, one year) the increase in concentrations would only be 6.5 E-05 Bq/L. This value is derived from the estimated sediment inventory of 1.3 GBq divided by the average annual flow rate of 19.9 E+09 m^3/a. The increase in the radionuclide concentration is a small fraction of the maximum acceptable concentration (10 Bq/L) for ^{137}Cs (the most abundant radionuclide in the sediments) in drinking water (Canadian Council of Ministers of the Environment 1999a).

- Discharges to the Winnipeg River from the ALWTC and sewage lagoon will be intermittent and controlled. The discharges are currently well below accepted standards (Niemi, Soonawala and Ross 2000) and will gradually diminish to zero by the time decommissioning is complete;

- Radioactivity levels in ALWTC effluent discharges are monitored to ensure compliance with release criteria. Liquid waste above release criteria is processed to a solid form for storage at the WMA's. The sewage lagoon water is monitored during release periods (Niemi, Soonawala and Ross 2000);

- Non-radiological contaminants are monitored at the Process Sewer outfall and sewage lagoon outlets and documented in AECL MISC-390 series. AECL guidelines have not been exceeded at the outfall or sewage lagoon outlets. Current operational control levels will be maintained throughout the decommissioning program and because operations will decline, even lower emissions will result;

- The largest potential source for groundwater leachate is the WMA. The WMA is situated in a groundwater discharge zone which effectively limits contaminant migration from the WMA to the river (Section 5.4.4 and 6.3.4); and

- The travel time from the WMA to the Winnipeg River through the most permeable hydrogeologic unit for the most hazardous radionuclides, ^{90}Sr and ^{137}Cs, is probably several hundred years (Cherry, Grisak and Clister 1973). This is sufficient time for the ^{90}Sr and ^{137}Cs to decay to background. Therefore, even if leachate from the WMA's entered the permeable sands, the impact on the Winnipeg River would be small.

6.3.3.3 Identified Mitigation Measures

Mitigation measures to minimize water quality effects from the project fall into the following categories:

- Continued compliance with release limits at the ALWTC and sewage lagoon.
- Groundwater monitoring at the WMA, sewage lagoons and inactive landfill to indicate potential contaminant migration from these facilities to the river.
- Construction of containment barriers where necessary to ensure collection, control of and treatment of contaminated water (for example at the WMA).

- Use of effluent containment procedures including use of rain barriers (berms and coverings) to minimize surface water runoff during remediation of buried services and affected lands.

6.3.3.4 Residual Effects

Effluent emissions from decommissioning are not expected to result in an increase in conventional or radionuclide concentrations in the Winnipeg River as effluent emissions during decommissioning are expected to decrease from current operational levels. However, as noted above, some discharges to the River will occur. Residual effects on the Winnipeg River and surface water from decommissioning include:

- Discharges of treated flows to the Winnipeg River from the ALWTC and the sewage lagoon.
- Surface water contamination in the Project Study Area and potential migration to the Winnipeg River from the WMA, buried services and affected lands.
- Potential for groundwater contaminant migration to the Winnipeg River from the WMA, sewage lagoons and the inactive landfill.

Effects on surface water are expected to be limited to the Project Study Area and the Winnipeg River. Selected fish species in the river and Sport Fishing have been identified as VECs/VSCs (Section 5.6).

6.3.4 Geology and Hydrogeology

The analysis of the potential for soil and groundwater contamination was based on an understanding of the site geological and hydrogeological conditions described in Section 5.0. The nature and amount of possible contamination was considered. Containment methods were reviewed and special note taken of any previous incidents and the experience gained from them. The effect of project activities on the groundwater flow regime was also assessed.

Groundwater quality is assessed by collecting groundwater samples from monitoring wells and measuring concentrations of radiological and non-radiological parameters. The measured concentrations are compared against existing provincial or federal water quality guidelines or standards.

6.3.4.1 Project/Environment Interactions

Physical works/activities with the potential to cause groundwater contamination are:

- Continued operation and passive operation of the WMA (Phases 1 through 3).
- In-situ disposal of LLW waste at WMA (Phase 3 and beyond).
- Operation of the inactive landfill (Phase 1 through 3).
- Operation of the sewage lagoons (Phase 1 through 3).
- Buried services and affected lands (Phases 1 to 3).

Physical works/activities with the potential to affect the groundwater flow regime are:

- Stabilization and closure of the inactive landfill and sewage lagoon: reduced infiltration of surface water as a result of covering, capping these facilities and site re-establishment including grading and ditching around the facilities has the potential to affect groundwater flow (Phase 3).

6.3.4.2 Likely Environmental Effects

Groundwater contamination effects are related to the operation and decommissioning of five facilities/areas:

1. WMA;
2. inactive landfill;
3. sewage lagoons;
4. buried services; and
5. affected lands.

The WMA is the main waste management facility on site and contains low, intermediate and high level waste (Section 4.5). Contaminant migration from this facility is the main hydrogeological issue and is the focus of this section.

The alteration of groundwater flow regimes from the decommissioning activities is not expected to be significant and will not affect the VECs. No mitigation measures are required. Alteration of groundwater flow regimes will not be discussed further.

WMA

There is the potential for groundwater contamination during operation of the WMA and from in-situ disposal of LLW at the site. The potential impact of the WMA on groundwater during continued operation of the WMA is limited by:

- Existing engineered barriers.
- Short half-life of active waste in WMA trenches.
- Groundwater flow regime at the WMA.

These are discussed followed by comments on likely effects from in-situ disposal of LLW at the WMA.

WMA - Engineered Barriers

All high and intermediate level waste, with the exception of high-level waste in trench 6 is stored in engineered structures (concrete standpipes, concrete bunkers, storage tanks). These structures provide a barrier between the waste and the natural environment until these wastes are transferred to disposal facilities in Phase 3.

Other waste which cannot stay in existing storage structures, for example, irradiated fuel waste in standpipes, will be moved to new interim engineered storage facilities in Phase 2.

WMA – In-Situ Disposal of Trench Waste

Low-level radioactive waste and some conventional waste will be managed in-situ. The final safety case for the in-situ end state will be made near the end of Phase 3. For the project period (60 years), the WMA remains under regulatory control. This provides a mechanism to respond to any changes detected in the storage environment that could affect contaminant migration. Also, this period will be utilized to develop fully the safety case leading to a confirmation and approval of in-situ disposal as a final end state. The opportunity for additional environmental assessment is also retained.

The nature of groundwater flow in the area around the WMA limits contaminant migration away from the WMA. The WMA is located in a groundwater discharge zone. Groundwater flow is upward through the sands and continues upward through fractures in the overlying silts and clays. The groundwater then exits the groundwater zone by evaporation and evapotranspiration. There is no downward movement of groundwater flow from the WMA to the underlying permeable sandy zone which has the potential to act as a transmission zone to the Winnipeg River (Cherry and Robertson 1988).

The waste contained in trenches, is located to a depth of 4 m below ground-surface and 1 to 2 m below the watertable. The upward groundwater flow will cause some upward migration of constituents toward the biosphere. It is expected that many of the solubilized constituents will be rendered relatively immobile due to sorption on clay minerals and organic materials (Cherry and Robertson 1988). However, there is the potential for some contaminant migration through the clay fractures because there is a long-term accumulation of sulfate salts on the fractures that may reduce sorption tendencies. Once the water table zone is reached the constituents could migrate laterally towards the periphery of the WMA and ultimately to the Winnipeg River (Cherry and Robertson 1988).

A review of hydrological data collected over the past 20 years has confirmed our understanding of the groundwater flow regime at the WMA (See Appendix C.5).

A detailed evaluation to support the in-situ disposal approach was conducted in the autumn of 2000 and is detailed in Appendix C.1. The evaluation was based on:

- a review of the trench inventory;
- existing environmental monitoring and ground water well data;
- sampling of trench cover material and soil adjacent to the trenches;
- confirmation of the ground water flow model; and
- modelling of contaminant transport mechanisms.

The evaluation found that:

- The WMA remains a water discharge zone consistent with the original hydrogeological model.
- The clay soils around the trenches provide a natural attenuation (retards contaminant transport).
- The upper bound of the radionuclide inventory is 40 TBq of initial radioactivity. The majority of radionuclides in the inventory have relatively short half-lives. There are non-radiological contaminants of concern which will likely require selective remediation.
- There is no indication of significant upward or lateral migration in the near trench zone.
- Migration of radioactive contaminants occurs at a rate slower than radioactive decay.
- Trenches 1, 6, 10 and 16 were determined to be unsuitable for in-situ disposal.
- Institutional control will be required beyond the project period to confirm the performance of the disposal environment.

In-situ disposal of LLW is subject to regulatory review and approval and must address all the basic requirements applicable to the long-term aspects of radioactive waste disposal. Those aspects are currently documented in CNSC Regulatory Policy R-104. The basic requirements emphasize minimizing the burden on future generations and protecting the environment and human health. The maximum acceptable risk is 10^{-6} fatal cancers and serious genetic effects in a year over a period of up to 200 years (the period required for ^{90}Sr and ^{137}Cs to decay to background). AECL will develop a safety case to demonstrate compliance with those requirements to confirm in-situ disposal of LLW as a final end state.

Inactive Landfill

There is the potential for contaminant migration to groundwater from the landfill (Phases 1 to 3). Operating procedures for the landfill have been in place to ensure only non-radiological and non-hazardous waste were placed in the landfill (Barnard et al. 1985). Therefore contaminant levels in leachate from the landfill are expected to be low. This will be verified through the implementation of an enhanced monitoring program (See Section 9.5.3).

Sewage Lagoon

There is a potential for contaminant migration to groundwater during operation of the lagoon. The lagoons are constructed of low permeability clay embankments placed on a prepared clay surface, with no additional lining (Section 4.3.3). The clay embankments and underlying clay are barriers to groundwater flow and it is unlikely that there has been any release of contaminants to groundwater. This will be verified through the implementation of an enhanced monitoring program (See Section 9.5.4).

Buried Services

Ultimately, the effects of shutdown and decommissioning of the buried services is minimized by first flushing the pipes and by removing the internal contaminated piping before removal of external piping. Removing and remediating the lines will reduce the contaminating potential of the drain lines and consequently soil and groundwater composition is improved.

There is the potential of soil contamination from past leaks and from migration of contaminants to groundwater. The extent of any groundwater contamination is expected to be limited to the Project Study Area.

Affected Lands

There is a potential for groundwater contamination from contaminated soils within the affected lands project component. Ultimately, remediating affected land will reduce the contamination potential of the area and consequently soil and groundwater composition is improved. The only areas with the potential for ground water contamination are the cesium ponds and laboratory site contaminated areas (ALWTC).

6.3.4.3 Mitigation Measures

Remediation plans and mitigation measures will be developed for the affected land areas discussed in this section. Mitigation measures which will be used to control groundwater contamination are:

- Ground-surface radiation surveys to monitor potential surface contamination for cesium ponds and active area soil contamination.
- Effluent containment procedures including the use of rain barriers (berms and coverings) to minimize the spread of contamination during remediation of cesium ponds and active area contaminated soils.
- Continued control of wastes deposited in the inactive landfill.

6.3.4.4 Residual Effects

Groundwater flow in the Project Study Area is towards the Winnipeg River. Potential groundwater contamination from the affected lands is therefore expected to be limited to the Project Study Area.

VECs which may be effected by contaminated groundwater discharges to surface and soil contamination are:

- Winnipeg River and selected fish species (Sturgeon, Walleye, Pike and Mooneye).
- Winnipeg River Shoreline and Gullies and Ravines on site.
- Deer and moose – the risk is that these may graze in areas affected by groundwater contamination.
- Coniferous Forest on site.

6.3.5 Terrestrial Biota

The following discussion provides a qualitative assessment of likely effects on vegetation and mammals in the Project Study Area.

6.3.5.1 Likely Project/Environment Interactions

Physical works/activities affecting air, soils, groundwater and surface water have the potential to affect terrestrial biota. These physical works/activities were discussed in the preceding sections (6.3.1, 6.3.3 and 6.3.4).

6.3.5.2 Likely Effects on the Environment

Vegetation

Vegetation in the area includes forested areas and fields vegetated with shrubs and grasslands. Coniferous forest in the area has been identified as a VEC. No vegetation species in the Project Study Area is identified as a rare or protected species.

Contaminant exposure pathways for vegetation are by contaminants in air, contaminated soil, groundwater and surface water. Airborne emissions from decommissioning activities are likely to be less than in the past and no effect from this exposure pathway is expected.

There is the potential for exposure from contaminated soils, contaminated groundwater and surface water within the Project Study Area, in particular near WMA. However, any effects are expected to be limited to the Project Study Area.

It is expected that the natural vegetation will re-establish itself in released areas.

Mammals

Over 50 species of mammals can be expected to occur around the Whiteshell Laboratories site. These include squirrels, the meadow vole, fox and larger mammals such as deer and moose. No mammal species in the area is an endangered species however the grey fox and wolverine are listed as vulnerable. Mammals selected as VECs are deer and moose. It should be noted that they are valued because of their value to subsistence and sport hunters and the general public. They are neither endangered nor vulnerable species.

Contaminant exposure pathways for mammals are by contaminants in air, soil, surface water and vegetation. Airborne emissions from decommissioning activities are likely to be less than in the past and no effect from this exposure pathway is expected. There is the potential for exposure from contaminated soils and surface water, in particular near WMA. No effect on the population of mammals is expected because:

- The geographical extent of areas affected by residual contamination is expected to be limited to the Project Study Area.
- Mammals are mobile and will also feed and graze outside contaminated areas.

No effects from noise on wildlife are expected (Section 6.3.2).

6.3.5.3 Identified Mitigation Measures

No mitigation measures are warranted to protect terrestrial biota.

6.3.5.4 Residual Effects

No residual effects on terrestrial biota are expected.

6.3.6 Aquatic Biota

Aquatic biota considered include fish and benthic organisms in the Winnipeg River. This section provides a discussion on the maximum dose aquatic biota might receive from decommissioning activities and contaminated river sediments. The discussion is based on the detailed evaluation on contaminated river sediment impacts is presented in Appendix B.1.

6.3.6.1 Likely Project/Environment Interactions

Physical works/activities affecting aquatic biota are effluent emissions to the Winnipeg River, potential contaminated surface runoff and groundwater discharges to the river and contaminated river sediments. These emissions were discussed in detail in Section 6.3.3.

6.3.6.2 Likely Effects on the Environment

Exposure pathways to aquatic biota include radiation from nuclides in the water and sediment and from radionuclides accumulated in the body. Decommissioning activities have the potential to affect radionuclide levels in water and sediment and the discussion is limited to these exposure pathways. The radio-sensitivity of aquatic organisms was reviewed by the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR 1996). UNSCEAR concluded that the reproductive viability of aquatic populations would not affected at dose rates below 10 mGy/d.

Exposure from nuclides in water is not expected to affect aquatic biota. No decrease in water quality is expected from the project as effluent emissions to the river are expected to decline from present levels (Section 6.3.3). Re-suspension of contamination in sediments was discussed in Section 6.3.3.2 and is also not expected to lead to a decrease in water quality.

The effect of exposure from radionuclides in sediments on aquatic biota was estimated by Sheppard (See Appendix B.1) and is briefly summarized here. Many organisms may interact with the contaminated sediments, despite the fact they are in a 3 to 4m depth of water. Clams are an obvious endpoint for the calculation of likely effects from the sediments because they are present, long-lived and relatively sessile, and they dwell in or on the sediment. Benthic invertebrates may be important, but are short-lived and emergent species and are only seasonally present.

Exposures to predators of the clams were not estimated because:

- the possible predictors are quite mobile and will feed outside the contaminated area, thus diluting their ingestion of contamination by some unknown amount; and
- most radionuclides do not biomagnify, and are at their highest concentration in biota most closely associated with the contaminated media.

The scenarios to assess the dose to clams from sediments assume the clams are located in an area where concentrations are greater than 99th and 99.9th percentile values of the sediment concentrations one might observe in the most contaminated region. It should be noted that these concentrations were not observed in the sediment survey.

The doses for the 99th and 99.9th percentile scenarios were 1.06E-04mGy/d and 4.65E-02 mGy/d, a small fraction of the UNSCEAR limit of 10 mGy/d and the limit at which no effect on aquatic populations is expected.

In conclusion, no effect on aquatic species is expected from decommissioning activities or the contaminated sediments. Therefore, likely radiation effects on aquatic biota do not warrant further attention.

6.3.6.3 Identified Mitigation Measures

No mitigation measures are required.

6.3.6.4 Residual Effects

No residual effects on aquatic biota are expected.

6.3.7 Worker Health and Safety

As operator of the facility, AECL is responsible for ensuring the health and safety of its employees. AECL's health objective is that no worker shall be subjected to exposure to ionizing radiation beyond the prescribed limits and exposures shall be kept As Low As Reasonably Achievable (ALARA) within the restrictions of social and economic factors. This is to be achieved through the operation of the facility and decommissioning activities in compliance with the regulations set out by the CNSC and the AECL Radiation Protection Program.

The current annual dose limit to atomic radiation workers is 20 mSv per year averaged over 5 years (CNSC 2000b).

6.3.7.1 Likely Project/Environment Interactions

The potential for exposure to radiation and hazardous materials from Physical activities/works will be evaluated and documented in Detailed Decommissioning Plans. These will be prepared for each facility.

The following is a list of generic activities expected to result in radiation exposure to workers during decommissioning:

- Decontamination of facilities.
- Dismantling and demolition of facilities.
- Processing, handling and transporting radioactive and hazardous materials on-site.
- Facility maintenance.

6.3.7.2 Likely Environmental Effects

Preliminary radiological dose estimates for Phase 1 of the Whiteshell Laboratories Decommissioning Project have been prepared. The estimates were provided as an initial project hazard assessment to assist with the further development and refinement of facility decommissioning plans.

The estimates do not address Phase 2 and 3 of the project because detailed evaluation, engineering and design of specific project components for these phases has not been completed. Dose estimates for these phases will be done in accordance with AECL's Radiation Protection Protocols and all regulatory requirements and will be documented in the Detailed Decommissioning Plan for each facility.

The Phase 1 radiological dose estimate is for the following facilities:

- Active Liquid Waste Treatment Centre.
- Shielded Facilities.
- Building 300.
- Building 411.
- Site General.
- Waste Management Area.
- Concrete Canister Storage Facilities.

The total estimated dose for Phase 1 is 0.27 person-Sv (27.37 person-rem). Approximately 90% of the dose is expected from the Shielded Facility and Active Liquid Waste Treatment Centre.

The radiation dose to workers will be kept within regulatory limits. This is to be achieved through the operation of the facility and decommissioning activities in compliance with the regulations set out by the CNSC and the AECL Radiation Protection Program.

6.3.7.3 Identified Mitigation Measures

No additional mitigation measures are warranted or recommended.

6.3.7.4 Residual Effects

No residual effects on worker health are expected.

6.3.8 Public Health

For an effect on public health to occur, there must first be a significant effect on one or more of the environmental components linked directly or indirectly to a human receptor. Public health effects were reviewed to determine if it was possible for contaminants to reach offsite human receptors via the air, water, or food chain. If such a process was possible, further analysis, such as estimation of radiation dose and other measures of exposure, was carried out to determine the nature of the effect. Of interest to this assessment are:

- air quality;
- drinking water quality (groundwater and surface water);
- water quality of the Winnipeg River for recreational activities; and
- the dose from exposure to radiation.

As operator of the facility, AECL is responsible for ensuring the health and safety of its employees and the public, and for the protection of the environment. AECL's health objective is that no member of the public or the environment shall be subjected to exposure to ionizing radiation beyond the prescribed limits and exposures shall be kept As Low As Reasonably Achievable (ALARA) within the restrictions of social and economic factors. This is to be achieved through the operation of the facility and decommissioning activities in compliance with the regulations set out by the CNSC and the AECL Radiation Protection Program.

6.3.8.1 Likely Project/Environment Interactions

The physical works/activities with the potential to affect human health are the physical works/activities affecting environmental compartments linked indirectly or directly to a human receptor. These compartments include air, surface water, groundwater and aquatic and terrestrial biota. Physical works/activities affecting these compartments were discussed in the respective sections on environmental effects.

6.3.8.2 Likely Environmental Effects

Potential effects on the public can be assessed by estimating the expected annual dose to members of the critical group in the vicinity of the Project Study Area. A critical group is considered to be the group of individuals who would be expected to receive the highest doses due to their location, age, diet and other characteristics. The current regulatory limit for the public is 1000 µSv/a (CNSC 2000b).

Decommissioning activities are not expected to lead to increased emissions to air and surface water (Section 6.3.1 and 6.3.3). In fact, emissions are expected to decrease. There is the potential for groundwater contamination from the project but any contamination is expected to remain within the Project Study Area. For these reasons, decommissioning activities are not expected to affect public health. No decline in the quality of the air, offsite surface water (Winnipeg River) or offsite groundwater is expected.

Because emissions are expected to decrease, the incremental dose from the project on the public is expected to be less than the incremental dose estimated from current operations reported in Section 5.2.3. Total incremental dose to adults and infants in 1999 were 4.35 E-04 and 2.43 E-04 mSv/a, respectively. These values are significantly less than typical radiation doses to adults from major natural sources and medical diagnostic procedures (3.2 mSv/a). The estimate takes into account water, fish and vegetable ingestion and beach exposure. Immersion in air and ingestion of wildlife (game) are not considered because of the very low radioactivity associated with those two source terms.

A review was also made of the effects of radiation from contaminated river sediments on human health (See Appendix B.1). The hypothesis was that somehow the flow of water in the Winnipeg River was blocked allowing a person to stand on an area of active sediments. This was in itself considered a highly unlikely scenario. This produced a dose from beach exposure of 4.0 E-02 mSv/a for an adult; a value higher than the exposure dose of 2.42 E-05 mSv/a reported by Niemi et al. (2000). Thus the incremental dose remains 2 orders of magnitude lower than the typical dose received by an adult.

6.3.8.3 Identified Mitigation Measures

No further mitigation measures are required to protect the public.

6.3.8.4 Residual Effects

No residual effects on public health are expected.

6.3.9 Socio-Economic Impacts

The *Canadian Environmental Assessment Act* considers socio-economic impacts only when a biophysical effect is identified. In general, few biophysical effects have been indicated and therefore, no socio-economic impacts are anticipated.

6.3.9.1 Impact of Cultural Heritage and Archeological Features

A society's cultural heritage is composed of many elements including history, traditions, arts, architecture, religious beliefs, sciences, education and other distinct traits. Archeological features are particularly important because they are non-renewable. Cultural heritage and archaeological features include:

- Architectural sites.
- Sites or objects formally recognized at the international, national, provincial or municipal level.
- Sites or objects whose cultural value may be greater than the site's physical components.
- Sites or objects of unique cultural value to aboriginal peoples.

Of particular interest are archaeological features that may be present in the study areas.

A review of historical and archaeological information relating to the area was undertaken to determine if there were any particular aspects of the study areas that required attention. The findings are summarized in Section 5.5.6.

Project/Environment Interactions

Any restoration activities undertaken along the Winnipeg River may impact on archaeological features along the shoreline and vicinity.

Likely Environment Effect

The shorelines of the Winnipeg River have been utilized for many centuries. As mentioned in Section 5.5.6, no archaeological studies were carried out on the licensed Property Study Area, however, the abundance of sites in the regional study area would indicate that sites might exist on the property.

Restoration and remediation activities conducted along the Winnipeg River and sewage lagoons have the potential for disturbing or destroying historical or archaeological artifacts.

Identified Mitigation Measures

An archaeologist will be available to assess the significance of any finds during excavation of restoration work conducted along the Winnipeg River area.

Residual Effect/Comment

Other archaeological sites in the region are notable for their rare finds of considerable cultural importance. It is therefore important to have experts on hand to prevent or minimize the loss of artifacts.

6.3.9.2 Impact on Land and Resource Use

The CSR addressed the question of how sustainability of a resource could be potentially affected by the project. For a resource to be affected adversely, a residual environmental effect must decrease the ability of a resource to be used at least at its current level. This could occur, for example, if contamination affected the ability of fish, such as the Winnipeg River sturgeon, to reproduce.

Project/Environment Interaction

Activities that can impact on the land and resource use during and after the decommissioning project include:

- low-level waste in trenches in the Waste Management Area;
- closure of the inactive landfill; and
- closure of the sewage lagoons.

Likely Environment Effect

During decommissioning and the institutional control period, the use of some lands will be restricted.

Identified Mitigation Measures

- Limit areas of restricted use as much as possible.
- Monitor the river sediments, shorelines and river water quality as part of the follow-up program.
- Monitor the inactive landfill and sewage lagoons to provide input for the development of suitable closure plans. The *Manitoba Environment Act* (Regulation 163/88 and Regulation 150/91 for the sewage lagoon and landfill site, respectively) will also be considered in developing the closure plans. This will minimize restrictions for the use of the landfill and sewage lagoons areas.

Residual Effect /Comment

AECL has already taken steps to release a large portion of its property that has remained unaffected by its operations. The unaffected land represents approximately 3,000 hectares of the 4,375 hectares of the licensed site. As the facilities are decommissioned, additional areas will likely be released. Thus, the 'footprint' of AECL property will diminish with time. Towards the end of the decommissioning project, it is expected that the licensed activities will be centred on the Waste Management Area. For the period of institutional control, only a few tens of hectares may be restricted.

6.3.9.3 Economic Impact

As mentioned above, the economic impacts to be assessed in the context of the federal environmental assessment regime are limited to impacts resulting from a change in the bio-physical conditions. Therefore, the socio-economic effects resulting from the closure of Whiteshell Laboratories are not considered here.

Potential Project/Environment Interactions

Project activities that may have an economic impact include:

- Any remediation or restoration activities in or along the Winnipeg River.
- Release of contaminants to surface waters as a result of decommissioning activities.
- Release of contaminants into the groundwater as a result of in-situ management of low-level waste or other sources of contaminants on-site.

Likely Environment Effects

The users of the Winnipeg River and/or the landowners along the river could feel the effects of the aforementioned activities. Those effects, real or perceived, may include:

- Reduction of the Sport Fishery if fish caught are believed to be unsafe for human consumption.
- Reduction in value of cottage properties due to water believed to be of inadequate quality.
- Alternate sources of drinking water if groundwater contamination occurs. This would result in additional costs to property owners.

Identified Mitigation Measures

The mitigation measures that will be implemented are essentially the same as those used to minimize or prevent the deterioration of surface water and groundwater quality (Sections 6.3.3 and 6.3.4). The results of the monitoring activities will be communicated to the public.

AECL also supports the establishment of a Public Advisory Committee that would make recommendations on the monitoring activities. The Committee may also make recommendations on additional mitigation or compensation measures based on the follow-up activities, if and where necessary.

Residual Effects/Comment

Because effects on the bio-physical environment are highly unlikely, any residual economic effects emanating from the project are also unlikely.

6.3.9.4 Impact on Aboriginal Interests

A comprehensive public consultation program was set up which included specific consultation with aboriginal communities. Feedback from these communities was used to determine effects from decommissioning activities as they relate to aboriginal interests. A summary of those interests is presented in Section 5.5.7.

Potential Project/Environment Interactions

The interactions that may impact on Aboriginal interests are as follows:

- Any remediation or restoration activities in or along the Winnipeg River or in the vicinity of the sewage lagoons.
- Release of contaminants to surface waters as a result of decommissioning activities.

Likely Environment Effects

Aboriginal people have acquired an ecological knowledge based on experience and teachings passed from generation to generation. That knowledge brings a holistic view where the environment cannot be separated from the people that live in it. Aboriginal people understand the complexity of ecosystems and can foresee long-term and cumulative impacts resulting from individual activities. The following effects are believed to have some importance:

- Reduction of the Sport Fishery if fish caught are believed to be unsafe for human consumption.
- Land use restrictions particularly along the shores of the Winnipeg River may impact on the traditional use of the land for fishing, hunting, wild rice harvesting and the gathering of medicinal plants.
- Loss of cultural features such as burial sites/mounds, historic campsites, spiritual and ceremonial sites.
- Deterioration of water quality or other environmental features.

Identified Mitigation Measures

Mitigation measures proposed for surface waters (Section 6.3.3.3) will be implemented. Also, the results of the monitoring activities will be communicated to Sagkeeng and other Aboriginal communities potentially affected by the decommissioning.

AECL supports the establishment of a Public Advisory Committee on which representatives from the communities can sit. The Committee would have the ability to make recommendations on the monitoring activities. The Committee may also make recommendations on additional mitigation or compensation measures based on the follow-up activities, if and where necessary.

As mentioned above, an archaeologist will be available to assess the significance of any finds during excavation or restoration work conducted along the Winnipeg River area. Although no cultural features have been identified in the Project Study Area, particular care will be taken during any restoration work performed along the riverbanks to prevent the loss of valuable artifacts if any are identified.

6.3.9.5 Residual Effects/Comment

No land use restrictions are anticipated for the river shoreline; therefore, no effects are anticipated on the traditional use of the shoreline aboriginal people. Potential residual effects include reduction of the sport fishery as a result the contamination of the river water or fish and the possible loss of cultural features during restoration work.

6.4 EFFECTS OF ACCIDENTS AND MALFUNCTIONS

Accidents and Malfunction Events

This section addresses accidents and malfunctions related to on-site events and offsite transportation of radioactive materials which are not part of normal operations, and which may result in potential emergency situations. These events include equipment failure, fire, explosion, spills and leaks loss of services and off-site transportation accidents. These events are briefly described below.

Equipment Failure

Equipment failure may result from equipment malfunction, power loss, fire, explosion, extreme environmental conditions and human intrusion (vandalism) or error. Examples include:

- failure or malfunction of the aqueous waste collection and associated drainage systems;
- failure or malfunction of air emission control equipment associated with decontaminating, repackaging and containment systems;
- failure or malfunction of surface water containment systems;
- failure of product containment systems (storage buildings and tanks);
- failure or malfunction of alarm and monitoring systems; and
- failure of shielding systems.

Fire

Fire may result from equipment malfunction, electrical faults, extreme environmental conditions, and human intrusion (vandalism) or error. Fire hazards include solvents, fuels, and flammable building materials.

Explosion

Explosion may result from equipment malfunction, fire (particularly related to fine particulates, solvents and fuels), building demolition, and human intrusion (vandalism) or error.

Spills and Leaks

Spills and leaks may result from breaks or cracks in piping, storage tanks, holding tanks, drums, transformers and sumps; dripping valves; repackaging operations; loading, transfer and unloading operations; pumping operations; decommissioning and transport equipment; extreme environmental conditions; power loss; fire; explosion; and human intrusion (vandalism) or error (overfilling or improper storage).

Loss of Service to Buildings

Loss of service pertains primarily to power failure which can lead to all of the above accident and malfunction scenarios.

Off-site Transportation Accidents

The movement of hazardous and radioactive materials off-site is governed by the *Packaging and Transport of Nuclear Substances Regulations* (CNSC 2000c). The containers are designed to prevent the release of contaminants in the event of a severe accident and must be approved by the CNSC. In the event of an accident, AECL has procedures for corrective action.

Effects and Mitigation of Accident and Malfunction Events

The effects and mitigation measures of each of the aforementioned events are presented in Table 6.2. As indicated in Section 6.2.1.4., Whiteshell Laboratories already has site wide and facility-specific emergency preparedness plans to address accident and malfunction events. Hazard analyses have been performed on all the major facilities at the Whiteshell Laboratories site and are documented in the Safety Analysis Reports which identify the potential worst-case hazards for each facility. The main focus is on potential radiological hazards but non-radiological hazards are addressed where appropriate. Procedures to respond to the potential hazards are identified in the Safety Analysis Reports or in the facility-specific plan. The decommissioning work will be carried out in accordance with these plans and the plans will remain in effect until the hazards associated with each facility and/or activity are removed or mitigated.

Important aspects of these plans include:

(a) Fire and Explosion:

An incident such as a fire or explosion that could result in a high radiation field or the release of hazardous quantities of radioactive or other toxic substances would initiate a Stay-in or Evacuation. The actions to be taken on discovering such an emergency are:

- ensure no one is in immediate danger;
- pull the nearest fire alarm, if there is a fire;
- call Protective Services and report the location and nature of the emergency;
- request a Stay-in, if warranted; and
- close all doors, windows and fumehoods before vacating the area.

The initiation of a Stay-in will result in the formation of the Emergency Operations Centre (EOC). All information from the scene of the incident will be transmitted to the EOC which will then deploy the required personnel to deal with the incident.

(b) Spills:

For a radiological spill requiring a Stay-in, the same procedures as described for fire and explosion will be followed. If it is a spill of radiological or hazardous material not requiring a Stay-in, the Safety Supervisor will assign a Health Surveyor to the area to determine the extent of the contamination and the remedial measures that are required.

In addition, a number of buildings and infrastructure facilities (e.g. ALWTC; the aqueous waste collection system associated with B300; the Decontamination Centre; WM storage; and processing facilities) will not be shutdown until the latter stages of decommissioning and events associated with equipment failure could occur over the entire period of the decommissioning program.

The movement of hazardous and radioactive materials off-site is governed by the *Packaging and Transport of Nuclear Substances Regulations* (CNSC 2000c). The containers are designed to prevent the release of contaminants in the event of a severe accident and must be approved by the CNSC. In the event of an accident, AECL has procedures for corrective action.

Table 6.2
Summary of Potential Effects of Accidents and Malfunctions on Decommissioning Activities

Accident and Malfunctions	Potential Effects / Mitigation Measures
Equipment Failure	*Effects* • Release of airborne emissions to the atmosphere where they may be subsequently transported and deposited at various distances from the source • Release of liquid contaminants which could contaminate soil, groundwater, surface water and air • Worker health and safety issues *Mitigation* • Where possible equipment will be designed and operated in a fail-safe mode • Secondary containment is already provided for most existing equipment and systems; new equipment and systems will provide for secondary containment where necessary • Contingency plans and emergency preparedness plans already exist for the Whiteshell facility. In the unlikely event of significant contaminant release, any migration will be curtailed and immediate clean-up will be implemented
Fire	*Effects* • Release of airborne emissions (existing contaminants and those generated from the fire) to the atmosphere where they may be subsequently transported and deposited at various distances from the source • Release of liquid contaminants which could contaminate soil, groundwater, surface water and air • Explosion and propagation to off-site (creation of a large-scale forest fire with wider reaching environmental effects) • Worker health and safety issues *Mitigation* • Whiteshell has fire fighting procedures for dealing with fires • Whiteshell expects to enter into an agreement with local communities with respect to fire protection

Accident and Malfunctions	Potential Effects / Mitigation Measures
	• In the unlikely event of any contaminant release as a result of fire, any migration will be curtailed and immediate clean-up will be implemented
Explosion	*Effects* • Release of airborne emissions to the atmosphere where they may be subsequently transported and deposited at various distances from the source • Release of liquid contaminants which could contaminate soil, groundwater, surface water and air • Fire and associated effects • Worker health and safety issues • Expulsion of projectiles resulting in widespread debris *Mitigation* • Whiteshell has fire fighting procedures for dealing with fires caused by explosions • In the unlikely event of any contaminant release as a result from explosion, any migration will be curtailed and immediate clean-up will be implemented
Spills and Leaks	*Effects* • Release of volatile contaminants to the atmosphere where they may be subsequently transported and deposited at various distances from the origin. • Release of liquid contaminants which could contaminate soil, groundwater, surface water and air • Fire and associated effects • Worker health and safety issues *Mitigation* • Secondary containment is already provided for most existing equipment and systems; new equipment and systems will provide for secondary containment where necessary • Contingency plans and emergency preparedness plans already exist for the Whiteshell facility. In the unlikely event of significant contaminant release, any migration will be curtailed and immediate clean-up will be implemented
Loss of service (power)	• Failure of lighting, air and water systems (including fans and pumps) which may result in worker health and safety effects • Failure of alarm and monitoring systems which could result in the release of airborne and liquid effluents to the environment and worker health and safety issues *Mitigation* • Where possible equipment and systems will be designed to shutdown in a fail-safe mode in the event of a power loss • Secondary containment is already provided for most existing equipment and systems; new equipment and systems will provide for secondary containment

Accident and Malfunctions	Potential Effects / Mitigation Measures
	where necessary • Contingency plans and emergency preparedness plans already exist for the Whiteshell facility. In the unlikely event of significant contaminant release, any migration will be curtailed and immediate clean-up will be implemented
Off-Site Transportation Accidents	*Effects* • A transportation accident releasing contaminants to the environment exposing workers and the public to radiation fields and radioactive contamination *Mitigation* • The movement of radioactive materials is governed by the *Packaging and Transport of Nuclear Substances Regulations* (CNSC 2000c) • The containers are designed to prevent the release of contaminants in the event of a severe accident and must be approved by the CNSC. Contingency plans and emergency preparedness plans already exist for Whiteshell Laboratories • In the unlikely event of significant contaminant release, any migration will be curtailed and immediate clean-up will be implemented

Conclusions

The accidents and malfunctions listed in Table 6.2, have avoidance and contingency plans applicable to each, in order to mitigate the potential environmental effects. Mitigation measures to reduce the potential hazards during decommissioning will be developed in individual decommissioning plans for individual facilities. Accident mitigation is based on prevention, early detection, remediation and accommodation.

6.5 THE EFFECT OF THE ENVIRONMENT ON DECOMMISSIONING ACTIVITIES (NON-ROUTINE EVENTS)

Non-routine environmental events are defined as naturally occurring events that can produce extreme conditions affecting the performance of decommissioning activities. These events include extreme rainfall and flooding, earthquakes, tornadoes, and forest/grass fires. Plans exist for handling such events on-site. They have been submitted and approved by the regulatory authorities and their risks are assessed in the Safety Reports.

These non-routine events are described below and potential effects from them are presented in Table 6.5.

Extreme Rainfall and Flooding

Extreme rainfall statistics are presented in Table 6.3. These statistics integrate return periods and the length of the rainfall event with the amount of rainfall.

Table 6.3
Extreme Rainfall Statistics for Winnipeg, Manitoba

Return Period (Years)	Rainfall in mm								
	5min	**10min**	**15min**	**30min**	**1-hr**	**2-hr**	**6-hr**	**12-hr**	**24-hr**
2	8.34	13.18	15.85	22.36	28.36	32.70	37.38	47.21	52.38
5	11.88	17.60	22.03	31.19	37.19	45.07	51.50	62.22	66.50
10	14.22	20.53	26.14	37.05	43.05	53.27	60.88	72.19	75.88
15	15.54	22.18	28.45	40.35	46.35	57.89	66.16	77.80	81.16
20	16.46	23.33	30.06	42.66	48.66	61.12	69.86	81.72	84.86
25	17.18	24.22	31.31	44.44	50.44	63.62	72.70	84.75	87.70
50	19.37	26.96	35.14	49.92	55.92	71.29	81.47	94.06	96.47
100	21.55	29.69	38.96	55.37	61.37	78.92	90.19	103.33	105.19

Source: W.D. Hogg and D.A. Carr, 1985.

No rainfall event has affected the operation of Whiteshell Laboratories. Therefore, the only potential effect on the decommissioning project will be to curtail activities during a rainfall event.

Overflow of the Winnipeg River

Flooding of the Winnipeg River may result from extreme rainfall conditions and/or as a result of failure of the Seven Sisters Dam which is located southeast of the Whiteshell Laboratories area.

With particular regard to the Seven Sisters Dam, literature indicates that there has never been a failure of any hydroelectric dam in Canada. Further, Manitoba Hydro has contingency plans for comprehensive notification, warning, and response systems in case an emergency condition is detected. It is estimated that it would take 1.5 hours to reach a peak flood level of 7 m above normal conditions 7.8 km downstream of the breach, on AECL property. Table 6.4 provides an estimate of the propagation of flood wave characteristics.

A dam break may affect the shoreline but will not flood the site. The only effects therefore would be on the outfall. Any rupture would not affect the amount of flow into the river. An overflow of the river is deemed highly unlikely and the effects on the decommissioning project would be negligible.

Table 6.4
Propagation of Flood Wave Resulting from Dam Breach at Seven Sisters

Location	Distance Downstream of Breach (km)	Time from Start of Flow Through Breach (hours)		Estimated Duration of Flooding (hours)	Estimated Increase in River Level from Normal Condition	
		First Arrival of Flood Water	Peak Flood Level		(ft)	(m)
AECL Property	7.8	0.7	1.5	6.3	23	7
AECL Property	10.0	0.7	1.6	6.5	23	7

Earthquake

The province of Manitoba is the least earthquake-prone area in Canada. Seismic activity in the prairie region south of 60°N is predominantly confined to southern Saskatchewan in a zone that continues into Montana (Anglin et al. 1990).

The Canadian nuclear fuel waste management program studying seismic stability in Northwest Ontario and Eastern Manitoba has found, based on a detection level of 2.5 on the Richter scale, that the Whiteshell Laboratories area and the southern two-thirds of Manitoba are aseismic (Wetmiller et al. 1996).

Tornado

Between 1868 and 1990 at least 75 tornadoes or tornado groups have occurred in Manitoba with two of these tornadoes passing near Whiteshell Laboratories in 1978. It has been estimated that the probability of a tornado strike in a given 1 km^2 area within the most southerly 190 km of Manitoba is about 4.8×10^{-4}/year; that is, there is a moderate probability of a tornado affecting the Whiteshell Laboratories' site. If a tornado did strike, it would affect many site buildings. It would not, however, affect the reactor or the concrete canisters which are designed to withstand very high winds.

Forest/Grass Fires External to the Facility

Natural grasslands and hardwood forests are located close to the Whiteshell Laboratories site (Guthrie and Scott 1988). Forest/grass fires may result from extremely dry conditions or lightning strikes. Whiteshell Laboratories has procedures for dealing with fires. Fire fighting capability will be supplemented with arrangements with surrounding communities.

Table 6.5

Summary of Effects of Environment (Non-Routine Events) on Decommissioning Activities

Environmental Event	Potential Effects / Mitigation Measures
Extreme Rainfall and Flooding	*Effects* • Increased soil erosion • Significant increase in surface water run-off • Increased worker safety issues (slippery surfaces for both workers and equipment, reduced visibility; increased electrical hazards, etc.) • Delays in the decommissioning schedule *Mitigation* • The suspension of outdoor decommissioning/remediation activities that could lead to contamination of run-off • WR-1 and the concrete canisters, in particular, have been designed to withstand extreme environmental events; new storage facilities constructed during decommissioning will also be designed to withstand extreme environmental events • Maintain adequate storm drainage facilities • In the unlikely event of significant contaminant release, clean-up will be implemented
Overflow of the River	*Effects* • No effect *Mitigation* • No mitigation required *Comments* • A breach of the Seven Sisters Dam is highly unlikely to occur • In the unlikely event of a breach of the dam, flooding would be expected to occur south of Whiteshell Laboratories and further north by Lac Du Bonnet • Notwithstanding, such extreme conditions could affect the AECL Bridge which could result in delays in decommissioning activities involving off-site transportation
Earthquake	*Effects* • Damage to decommissioning containment enclosures • Damage to active drains and stormwater drains • Destabilization of excavation slopes and stockpiles • Worker health and safety effects • Delays in the decommissioning schedule *Mitigation* • WR-1 and the concrete canisters, in particular, have been designed to withstand extreme environmental events; new storage facilities constructed during decommissioning will also be designed to withstand extreme environmental events

Environmental Event	Potential Effects / Mitigation Measures
	• Contingency plans and emergency preparedness plans already exist for the Whiteshell facility. In the unlikely event of significant contaminant release, any migration will be curtailed and immediate clean-up will be implemented *Comments* • Low probability • Area is aseismic
Tornadoes	*Effects* • Damage to existing above-ground facilities • Damage to decommissioning containment enclosures • Destabilization of excavation slopes and stockpiles • Worker health and safety effects • Delays in the decommissioning schedule *Mitigation* • WR-1 and the concrete canisters, in particular, have been designed to withstand extreme environmental events; new storage facilities constructed during decommissioning will also be designed to withstand extreme environmental events • Contingency plans and emergency preparedness plans already exist for the Whiteshell facility. In the unlikely event of significant contaminant release, any migration will be curtailed and immediate clean-up will be implemented *Comments* • Effects likely very localized within Whiteshell Laboratories • Moderate probability
Forest/Grass Fires	*Effects* • Temporary cessation of decommissioning activities • Evacuation due to fire and smoke *Mitigation* • The area around the facility will remain cleared to reduce the potential for the spread of fire onto the facility • In the unlikely event of a contaminant release resulting from fire, clean-up will be implemented *Comments* • Fire fighting capability will be supplemented with arrangements with surrounding communities

<u>*Conclusions*</u>

If a non-routine event were to occur, AECL's existing contingency plans and emergency preparedness plans would be implemented. If required, remediation of any new contamination would be undertaken.

6.6 EFFECTS ON SUSTAINABLE USE OF RENEWABLE RESOURCES

The *Canadian Environmental Assessment Act* requires that a Comprehensive Study Report consider the capacity of renewable resources that may be affected by the project. The capacity of sustainable use is based on a range of ecological considerations such as integrity of the ecosystem, productive capacity of the resource, carrying capacity of the ecosystem, and assimilative capacity of the ecosystem.

Renewable resources are those resources that can be naturally regenerated, such as forests or fisheries. The sustainable use of renewable resources refers to the ability to utilize these resources today without adversely affecting prospects for their use by future generations.

The decommissioning of Whiteshell Laboratories will have a positive effect on renewable resources in the biophysical environment both directly or indirectly. For example, the remediation and reestablishment of habitat for wildlife within the area is proposed after decommissioning and demolition. The decommissioning of facilities such as the ALWTC should also result in positive effects to the Winnipeg River. The release of new contaminants will be curtailed and eventually stopped. Subsequently, a review will be made of the contamination in the river sediments to confirm in-situ abandonment as the final end state.

In the case of Whiteshell Laboratories decommissioning, water quality is a renewable resource that will be improved as a result of the project. Other resource improvements would include fisheries, aquatic and terrestrial biota and terrestrial vegetation and wildlife.

Within the Project Study Area, it is expected that the effects of decommissioning on renewable resources should be mostly positive in nature. It is estimated that all but 1,415 ha of the site would be available for new business ventures by 2001. Release of maintained land would result in a larger area for hunting and other recreational activities. Table 6.6 summarizes the effects on renewable resources.

Table 6.6
Renewable Resources

	EFFECT
Forest	Positive – forested area may increase
Winnipeg River	Positive – flow of contaminants is already reduced and will eventually cease
Wildlife	Positive – habitat area will increase
Fisheries	Positive – water quality (which is currently high) will continue improve. This is conducive to the maintenance of fish habitats.

6.7 SUMMARY OF RESIDUAL EFFECTS ON VECS / VSCS

VECs and VSCs were identified in Section 5.6. The Winnipeg River and the aquatic features of the waterway are the area's most important VECs. Additional VECs/VSCs include wildlife in the area, the Sport Fishery and provincial parks and natural forests areas which are valued for their recreational uses.

This section provides an assessment of effects of the project on VECs/VSCs. Examples of possible adverse effects are a reduction in the water quality of a lake or river, a reduction in the population of fish or wildlife, loss of habitat and changes in breeding patterns.

6.7.1 Project/Environment Interactions (VECs/VSCs)

The VECs/VSCs are primarily related to the aquatic and terrestrial environmental components. Physical works/activities affecting air, surface water, soil and groundwater quality have the potential to affect the VECs/VSCs. Those interactions were assessed in Sections 6.3.1, 6.3.3 and 6.3.4.

6.7.1.1 Likely Environmental Effects

Likely effects on VECs/VSCs are as follows:

Winnipeg River and its Shoreline

Environmental effects of the project on the Winnipeg River were discussed in Section 6.3.3 (Hydrology). No adverse effects on the river are expected. Effluent emissions from decommissioning activities are expected to decline from current levels and no effect from contaminated sediments is anticipated (Appendix B.1).

There is the potential for contamination of the shoreline from contaminated surface water runoff and groundwater discharges. The geographical extent of any contamination would be limited to the shoreline on the Whiteshell Laboratories site.

Contaminated river sediments are not expected to affect the shoreline. The contamination levels of the sediments are low and do not represent a risk to public health or aquatic biota (Appendix B.1).

Gullies and Ravines along the Winnipeg River

Gullies and Ravines along the river were chosen as a VEC because they offer a unique habitat to wildlife. There is the potential for contamination from contaminated surface water runoff and contaminated groundwater discharges. The geographical extent of contamination is expected to be limited to the Project Study Area.

Fish Species in the Winnipeg River (Sturgeon, Walleye, Northern Pike and Mooneye) and the Sport Fishery

Effects on aquatic biota including fish species were discussed in Section 6.3.6. No effects on the population of fish species or the Sport Fishery are expected. Sport fishermen have been known to fish in the vicinity of Whiteshell Laboratories and it is expected that they will continue to do so.

Whitetail Deer and Moose

The effect of the project on White Tail Deer and Moose was addressed in the discussion of effects on terrestrial biota (Section 6.3.5). There is the potential for exposure from contaminated soils and surface water, in particular near Waste Management Area. However, no effect on the population of mammals is expected because the:

- contamination is extremely low and vegetation uptake is limited;
- geographical extent of areas affected by residual contamination is expected to be limited to the Project Study Area; and
- deer and moose are mobile and will also feed and graze outside contaminated areas, diluting any uptake.

Habitat Diversity, Coniferous Forest at Whiteshell and the FIG

There is the potential for localized soil, groundwater and surface-water contamination within the Whiteshell Laboratories site, particularly at the WMA (Sections 6.3.3 and 6.3.4). Any effects such as contamination of vegetation are expected to be localized and will not effect habitat diversity, the coniferous forest or other vegetation on the site as a whole.

FIG, the Field Irradiated Gamma research area, is not likely to be affected by decommissioning. It is located approximately 1.5 km from the WMA and 3 km from the laboratory facilities. Surface water and groundwater contamination from the WMA and Laboratories are not expected to reach this area.

Provincial Park, Natural Forest Areas, the Model Forest

These VSCs lie outside of the Whiteshell Laboratories site. No likely environmental effects are expected outside the Whiteshell Laboratories site and therefore no effects on these VSCs are expected.

6.7.1.2 Identified Mitigation Measures

No mitigation measures are warranted or recommended.

6.7.1.3 Residual Effects

There is the potential for contamination of Gullies and Ravines and the Winnipeg River shoreline by contaminated surface runoff and contaminated groundwater discharges.

7.0 EVALUATION OF SIGNIFICANCE

7.1 RESIDUAL EFFECTS

Section 6.0 identified residual effects emanating from the Whiteshell Laboratories Decommissioning Project. Residual effects are defined as any effect, no matter how small, arising from the project after mitigation. *CEAA* requires that an assessment be carried out to determine if any of the residual effects can cause a significant adverse environmental effect. The assessment of significance begins with residual effects. These are summarized in Table 7.1. The column, spatial effect, indicates if it is anticipated that the effect will go beyond the property boundary, that is, offsite.

Table 7.1
Summary of Residual Effects

Category	Description of Residual Effect	Potential Spatial Effect	Facility / Source
Air Quality and Noise	Release of airborne radioactive particulates during disconnecting of services, decontamination retrieval and repackaging of materials and remediation	On-site	ALWTC, WR-1, B300, Decontamination Centre, B402, WMA, Buried Services, Affected Lands, North Ditch, River Sediments
	Release of airborne radioactive particulates during demolition of canisters	On-site	Concrete canisters
	Nuisance dust and fine particulates from building demolition, and site restoration and rehabilitation	On-site	All except Van de Graaff Accelerator and Neutron Generator
	Production of methane gases from landfill	On-site	Inactive landfill
	Noise during demolition and site restoration	On-site	All facilities
Surface water (hydrology)	Surface water contamination associated with migration of decontamination process water, the removal of drains and other buried services and remediation	Off-site Winnipeg River	Buried Services, WMA, Affected Lands, North Ditch
	Discharge of treated water flows into Winnipeg River (active and inactive)	Off-site Winnipeg River	ALWTC, Sewage Lagoons
	Leaks into surface water from in-situ trenches	Off-site Winnipeg River	WMA
Soil and groundwater (geology and hydrology)	Soil and Groundwater contamination during operations	Off-site Winnipeg River	WMA, Sewage Lagoons
	Contamination from leaks around existing facilities or contamination during remediation	Off-site Winnipeg River	Off-site Contaminated Lands, Sewage Lagoons, Buried Services, Affected Lands, North Ditch
	Leachate from in-situ trenches	Off-site Winnipeg River	WMA
	Leachate from remediated facilities	Off-site Winnipeg River	Inactive landfill
Terrestrial Biota	No effects identified		
Aquatic Biota	No effects identified		
Worker Health and Safety	No effects identified		

Category	Description of Residual Effect	Potential Spatial Effect	Facility / Source
Socio-economics	No effects identified		
Public Health	No effects identified		
Physical and Cultural Heritage	Potential to disrupt traditional uses of the Winnipeg River	Off-site Winnipeg River shoreline	Shoreline
Land and Resource Use	Land-use restriction associated with in-situ disposal of radioactive waste	On-site	WMA
	Land-use restrictions associated with in-situ disposal of non-radioactive waste	On-site	Inactive landfill
Archaeology	Artifact loss during excavations near shores of the Winnipeg River	On-site Shoreline	Sewage lagoon, shoreline
Aboriginal Interests	General interest in the project especially as it affects the Winnipeg River. Artifact loss during excavations near shores of the Winnipeg River	On-site Shoreline	Sewage lagoon, shoreline

There are four overall comments that should be made with respect to all releases:

- Releases during decommissioning will not be continuous. The decommissioning process is spread over many years and activities will occur sporadically.
- Radioactive releases are controlled. For example, discharges from the ALWTC are regulated and releases above prescribed limits are not permitted.
- A Detailed Decommissioning Plan (DDP) will be prepared for every nuclear facility to be decommissioned. The DDPs will address environmental control issues, describe control procedures and form the basis for regulatory approval of individual decommissioning projects.
- Monitoring will be continuous. It will not be possible for an emission which exceed regulatory limits to go undetected. In most cases, the detection is less than a day.

The following is a brief description of the residual environmental effects for each of the categories in Table 7.1.

Air Quality and Noise

Air quality issues were related to most decommissioning activities including decontamination, building demolition and site remediation. Air quality effects ranged from the release of very small amounts of radioactive air borne particulates to nuisance dust and noise. Several observations may be made:

- airborne radioactive emissions are controlled to be below the DRL and kept as low as reasonably achievable (ALARA). The target for total emissions is a small fraction of the DRL. HEPA filters effectively control radioactive particulates. Where greater control is required, additional HEPA filters can be added. The result is that the release of radioactive particulates is negligible;

- radioactive materials will be removed from all structures through a decontamination process. HEPA filters used during decontamination will remove a high level of radioactively contaminated dust (99.97%). As a result virtually no radioactivity will be released during the demolition process;
- experience at other sites suggests that from time to time nuisance dust will be generated. Recent work (Watson and Chow 1999) suggests that the fine fraction (PM_{10}) of fugitive dust, generated by construction-type activities, will tend to remain in the lowest 2 m of the atmosphere and that the local deposition losses and impaction losses (vegetation and especially trees) will reduce the amount transported beyond 50 metres by over 90%;
- under extremely windy conditions, when there is a possibility that emissions may leave the site, activities will be curtailed; and
- the nature of the decommissioning activities will limit the generation of noise. The preservation of the dense tree coverage across the site will provide a natural noise barrier between site activities and potential noise receptors within the Project Study Area. Vibration effects would likely only be of concern within the Project Study Area to adjacent buildings and structures.

Soil and Groundwater

Small amounts of active contamination may remain in the soils where leaks have occurred around buried services and where active buildings or facilities, such as Shielded Facilities, have been removed. A small amount of leachate from these contaminated soils and from the inactive landfill may migrate into the groundwater. The evaluation of contaminant migration from the WMA trenches (Appendix C) concluded that there is no contaminant migration beyond the WMA boundaries. These amounts will be extremely small and below release limits. The approaches to their treatment will be addressed in the DDPs.

Surface Water

Residual effects on surface water, particularly the Winnipeg River, were identified from ALWTC discharges and the sewage lagoon. These discharges are currently lower than accepted release levels and will gradually diminish to virtually zero by the time the decommissioning is complete. Contaminated river sediments will not affect surface water quality (Section 6.3.3).

Terrestrial Biota

No effects were identified on terrestrial biota. The only potential effect of the project on terrestrial wildlife might be intermittent noise. However deer and moose have ranges much larger than the property and, if disturbed by noise, can go to other areas.

Aquatic Biota

The only effect on aquatic biota is related to the Winnipeg River. The river will only be affected if there is a substantial leak. Contaminated river sediments will not affect aquatic biota (Section 6.3.6).

Socio-Economic

Socio-economic effects were related to contamination of the Winnipeg River in amounts sufficient to affect aquatic life, drinking water quality and in general the economic activities associated with the river. No such contamination levels were identified and no effects are anticipated.

Worker Health and Safety

Workers will be exposed to radiation in many of the decommissioning activities. Adherence to AECL's radiation protection and occupational health and safety programs will ensure that doses are controlled and incorporate ALARA principals. Decommissioning activities will build upon past experience with nuclear facility decommissioning. Other worker health and safety risks are limited to the kinds of risk associated with normal building demolition.

Physical and Cultural Heritage

Physical and cultural heritage refers to the use of the land by First Nations and others over time. In particular, First Nations groups have used the area and especially the Winnipeg River for hunting, fishing and many other traditional activities. Other archaeological sites in the region are notable for their rare finds of considerable cultural importance.

Land and Resource Use

A potential residual effect identified is long-term restriction on land use. The use of certain areas (the WMA) will be restricted during the institutional control period. There may also be some restrictions on use of the area around the inactive landfill site. The amount of land associated with all of these areas is very small relative to the 4375 ha area of the Whiteshell Laboratories site.

Public Health

Currently there are no public health threats from the Whiteshell Laboratories Decommissioning Project. Releases are well within limits. Regular monitoring ensures that any aberrations are detected immediately. There is the possibility of an accident associated with the transport of radioactive wastes offsite. Approaches to ensuring the safety of radioactive materials transport have been developed and include contingency plans for accidental spills.

Archaeology

Residual effects in this area may be associated with the decommissioning of the sewage lagoon and any remediation activities along the Winnipeg River. Small areas adjacent to the Winnipeg River have been previously excavated to create the existing facilities. An archaeologist will be available during excavations to ensure that no artifacts are lost. The end state of the project will return the area to a "natural" state.

<u>*Aboriginal Interests*</u>

Activities of specific interest to aboriginal communities are associated with historical and current uses of the Winnipeg River, the disturbance of sacred lands and artifacts as well as other aspects of interest to other groups. No particular valuable historical site has been identified and First Nations will kept apprised of any findings during excavations as well as being kept abreast of the progress of the project in general. The quality of the Winnipeg River will be maintained as described in previous sections.

7.2 APPROACH TO ASSESSING SIGNIFICANCE

A two-step procedure was used to determine the significance of these effects. The first step was to identify effects that were considered significant based on existing legal and social standards that would be applied to any project or activity. A residual environmental effect was automatically determined to be significant if it:

- contravenes an applicable federal, provincial or municipal standard such as water quality or CNSC regulations;
- displaces or endangers a designated or protected environmental feature or population;
- adversely affects established treaty and/or aboriginal rights;
- displaces a human community; or
- causes a proven chronic effect on human health.

The second step, which was applied to those effects that did not contravene the Step 1 criteria, involved evaluating significance within a framework developed specifically for this project. The object was to determine the degree to which VECs or VSCs were affected. The framework was developed following a review of procedures described in Natural Resources Canada (1996), Canadian Environmental Assessment Agency (1997) and Canadian Standards Association (in preparation).

Significance was determined by the degree of change from existing conditions and the value of the environmental components being affected. The measures of significance used include:

- the anticipated magnitude of disturbance in relation to existing conditions;
- the duration of the effect, is the time period over which the event will last;
- the occurrence of the effect, percent of entire decommissioning period when effects occur;
- the geographical area covered, specifically whether it went beyond the Project Study Area; and
- the reversibility of the environment affected, specifically whether the environment affected can be reversed within a reasonable time period.

The specific evaluation criteria used are presented in Table 7.2. Definitions of the terms are also provided in the glossary.

Table 7.2
Evaluation Criteria Used to Assess Significance of Residual Environmental Effects

Criteria	Rating*	Definition
Magnitude: extent of predicted disturbance compared to existing conditions	L M H	No measurable disturbance Measurable disturbance but no loss of function Measurable disturbance but with some loss of function
Duration: the time period over which the event will last	L M H	Short-term (less than a week) Moderate (less than a month) Long-term (continuous over at least a one year period)
Occurrence: percent of entire decommissioning period when effects occur	L M H	Less than 1% of the time Less than 30% of the time Greater than 30% of the time
Geographic extent: area over which the effect will occur	L M H	Project Study Area Local Study Area Regional Study Area
Reversibility: the ability of the environment affected to return to the state before the effect occurred	L M H	Effect naturally reversible within one year Effect reversible within one year but only with human intervention Effect not reversible within one year

* L = Low; M = Medium; H = High.

Note: These are generally qualitative judgements. In some cases, especially for duration and occurrence, different definitions related to human health and ecological risks would apply.

In carrying out the assessment, it became apparent that the most important criteria affecting the significance of the effect was magnitude. The nature of the project calls for sporadic activities carried out over a long period of time, with more intense level of activities at the beginning and at the end of the decommissioning project. Thus, the temporal aspect would not appear to be a dominant factor. Likewise, it was shown that, for most of the effects identified, the area affected would be relatively small in the regional context. Finally, the ability of an environmental component to recover from a stress – the reversibility of an effect – is largely linked to the severity or magnitude of an effect. Accordingly, the following rules were set:

Magnitude Rating	Requirements for Effect to be Significant
"H"	One additional criterion rated "H" and two other criteria that rated e
"M"	Two additional criteria rated "H" and two other criteria that rated either "H" or "M"
"L"	Four additional criteria rated "H"

Note: These rankings when applied individually do not imply that there is a significant effect.

7.3 SIGNIFICANCE ANALYSIS

Step 1

All activities met the criteria outlined in Step 1 and no violations were found.

Step 2

Application of the criteria outlined in Table 7.2 led to the results shown in Table 7.3.

Table 7.3
Significance Analysis

Component	Description of Residual Effect	*M*	*D*	*O*	*G*	*R*	Comment / Conclusion
Air Quality and Noise	Release of airborne radioactive particulates during operating and maintenance of the facility	**L**	**M**	**L**	**L**	**L**	***Not significant:*** *Radioactive emissions are regulated and controlled in accordance with derived release limits. The target for total emissions is a small percentage of the DRL. HEPA filters effectively control radioactive dust and where greater filtration is required, more filters can be added. The result is that the release of radioactive emissions is negligible.*
	Release of airborne radioactive particulates during disconnecting of services, decontamination retrieval and repackaging of materials and remediation	**L**	**L**	**M**	**L**	**L**	
	Release of airborne radioactive particulates during break-up of concrete canisters	**L**	**L**	**L**	**L**	**L**	
	Nuisance Dust and fine particulates from building demolition, and site restoration and rehabilitation	**L**	**M**	**L**	**L**	**L**	***Not significant:*** *A number of factors will limit the transport of nuisance dust to the licensed property area.*
	Production of methane gases from Landfill	**L**	**H**	**H**	**L**	**L**	***Not significant:*** *Effect is easily mitigated as venting is widely used technology for controlling methane gas build-up.*
	Noise during demolition and site restoration	**L**	**L**	**L**	**L**	**L**	***Not significant:*** *The preservation of the dense tree cover across the site will provide a natural noise barrier between site activities and potential noise receptors within the Project Study Area. Vibration effects would likely only be of concern within the Project Study Area to adjacent buildings and structures.*

Table 7.3 (continued)
Significance Analysis

Component	Description of Residual Effect	*M*	*D*	*O*	*G*	*R*	Comment / Conclusion
Surface Water Quality (hydrology)	Surface water contamination associated with migration of decontamination process water, the remediation of affected lands and buried services	**L**	**M**	**M**	**L**	**M**	***Not significant:*** *Decontamination process water will be sent to the ALWTC for treatment. Decontamination is normally done indoors and there is no opportunity for water to go anywhere except to the ALWTC drains.*
	Discharge of treated water flows into Winnipeg River (active and inactive)	**L**	**L**	**L**	**M**	**L**	***Not significant:*** *Releases controlled so that effluents remain below acceptable standards.*
	Leaks into surface water from in-situ trenches	**L**	**M**	**L**	**M**	**L**	***Not significant:*** *No migration of radioactive contaminants to surface water.*
Soil and Groundwater Contamination (geology and hydrogeology)	Contamination from leaks around existing facilities	**L**	**M**	**L**	**L**	**M**	***Not significant:*** *Contamination will be removed and only small amounts at levels to allow unrestricted use will remain. Amounts too small affect groundwater.*
	Soil and Groundwater contamination during operations	**L**	**M**	**L**	**L**	**M**	***Not significant:*** *Routine monitoring to ensure integ rity of facility.*
	Soil and Groundwater contamination during remediation	**L**	**L**	**L**	**L**	**M**	***Not significant:*** *Use of rain barriers, berms, to keep water from flowing away from site being remediated containment barriers to direct water to drains.*
	Leachate from WMA trenches	**L**	**M**	**M**	**L**	**M**	***Not significant:*** *The hydrogeological conditions at the WMA are favourable for in-situ management of the waste. There is no evidence of upward or lateral migration to date and scooping calculations suggest no significant migration from the WMA will occur (Appendix C). Monitoring performed as part of the follow-up will ensure no undetected migration from the WMA.*
	Leachate from remediated facilities	**L**	**M**	**M**	**L**	**M**	***Not significant:*** *Remediation plan measures will limit leachate to below acceptable standards.*
Terrestrial Biota	No effects identified						
Aquatic Biota	No effects identified						
Worker Health and Safety	No effects identified						
Public Health	No effects identified						
Socio-Economic	No effects identified						

Table 7.3 (continued)
Significance Analysis

Component	Description of Residual Effect	*M*	*D*	*O*	*G*	*R*	Comment / Conclusion
Physical and Cultural Heritage	Loss of resource use of Winnipeg River associated with sediment removal option	**L**	**L**	**L**	**M**	**L**	***Not significant:*** *Remediation will only be undertaken if there are no significant environmental effects.*
Land and Resource Use	Land-use restriction associated with in-situ disposal of radioactive waste	**L**	**H**	**L**	**L**	**H**	***Not significant:*** *Areas involved very small; especially relative to the total amount of land being released on site.*
	Land-use restrictions associated with in-situ disposal of non-radioactive waste	**L**	**H**	**L**	**L**	**H**	***Not significant:*** *Areas involved very small; land still useable for many purposes.*
Archaeology	Artifact loss during excavations near shores of Winnipeg River	**L**	**L**	**L**	**M**	**H**	***Not significant:*** *The Presence of an Archaeologist during excavations will ensure that artifacts are not destroyed or lost.*
Aboriginal Interests	General interest in the project especially as it affects the Winnipeg River. Special interest in artifact loss during excavations near shores of Winnipeg River	**L**	**L**	**L**	**M**	**H**	***Not Significant*** *Concerns about specific artifacts have been addressed under physical heritage and archaeological aspects. There will no significant effects on the wider concerns of First Nations' people with respect to the protection of the Winnipeg River.*

* L = Low; M = Medium; H = High.

7.4 CONCLUSION

It is concluded that the Whiteshell Laboratories Decommissioning Project, taking into account the appropriate mitigation measures, is not likely to cause significant adverse environmental effects.

8.0 CUMULATIVE EFFECTS

Section 16(1) of the *Canadian Environmental Assessment Act* requires that the environmental assessment include a consideration of cumulative environmental effects. Cumulative environmental effects are defined in the Agency's Practitioner's Guide (1999) as "changes in the environment that are caused by an action in combination with other past, present and future human actions". The following steps are used in determining the cumulative effects of the Whiteshell Laboratories Decommissioning Project:

- the identification of actions or works that in some way might interact with the project;
- the characterization of those actions or works in terms of the effects that might interact with those effects from the decommissioning project;
- the assessment of the interactions;
- the identification of any additional mitigation measures;
- the assessing of the significances; and
- follow-up measures.

8.1 IDENTIFICATION OF ACTIONS / PHYSICAL WORKS

A total of 30 actions/physical works were identified through consultation with people knowledgeable of the Local and Regional Study Areas and potential development. These actions/physical works are located either within the Local or Regional Study Areas defined for this assessment. The status of these actions/physical works have been determined according to three categories:

- past or ongoing;
- certain or reasonably foreseeable (i.e. are identified in an approved development plan); and
- hypothetical (i.e. no definitive information on proceeding is available).

A listing of the actions/physical works, their location with respect to the study areas and their current status is given in Table 8.1.

Table 8.1
Proposed Actions/Physical Works

Actions/Physical Works	Relevant Study Area	Current Status
Awanipark Residential Development	Local	Ongoing
Manitoba Hydro-Pointe du Bois Expansion	Regional	Ongoing
Pinawa, existing Sewage Treatment facility	Local	Ongoing
Pinawa Landfill	Local	Ongoing
Pine Falls Paper Company mill	Regional	Ongoing
Powerland Centre	Local	Ongoing
Rural Municipality of Lac du Bonnet (includes towns)	Local	Ongoing
Rural Municipality Whitemouth (includes towns)	Local	Ongoing
Technology Firms - ACSION (Whiteshell Irradiator), Channel, ECOMatters	Local	Ongoing
Underground Research Laboratory	Local	Ongoing
AECL's WM Privatization	Local	Hypothetical
Agricultural Expansion	Local	Hypothetical
Alternative Forest Products	Local	Hypothetical
Aqueduct Project	Local	Hypothetical
Call Centre	Local	Hypothetical
Education/Training Centre	Local	Hypothetical
Fish Farming, Hatcheries, etc	Local	Hypothetical
High Tech Centre	Local	Hypothetical
Market Gardening	Local	Hypothetical
National Wildlife Area	Local	Hypothetical
Natural Gas Co-operative	Local	Hypothetical
NEON project	Local	Hypothetical
Pinawa Industrial Park	Local	Hypothetical
Pinawa Residential/Commercial Expansion	Local	Hypothetical
Seven Sisters Falls Development	Local	Hypothetical
SunGro Peat Expansion	Local	Hypothetical
Tanco Expansion	Local	Hypothetical
Technology Firms - ASD opportunities B402	Local	Hypothetical
Tourism Expansion - TCT, adventure trips, river cruises	Local	Hypothetical
Wild Rice Production Increase	Local	Hypothetical

As recommended in the Agency's Practitioner's Guide, the scope of the cumulative effects assessment includes those past, ongoing and likely future actions/physical works that are certain and reasonably foreseeable. Ten actions in Table 8.1 were listed as “Ongoing”. None were deemed certain.

The effect of relevant *past* projects and activities, such as the past construction and operation of the Whiteshell Laboratories, nuclear bomb testing in the 1950s and 1960s, etc. are documented in the description of the existing environment in Section 5.0 (e.g. existing residual ^{137}Cs concentrations in sediments and soils). The cumulative effects of those past activities with the effects of the decommissioning project are therefore implicitly taken into account in the assessment of the project effects in Section 6.0. To complete the assessment of cumulative effects, therefore, the cumulative effects of the project with *ongoing* and foreseeable *future* projects are considered in this section.

8.2 CHARACTERIZATION OF RELEVANT ACTIONS / PHYSICAL WORKS

On the basis of the interviews conducted and a review of the actions and physical works, ten actions/physical works selected for further review were characterized in terms of their likely environmental effects on the VECs/VSCs considered in the environmental assessment. The VECs and VSCs were summarized in Section 5.6. Table 8.2 summarizes the potential environmental effects of each action/physical work and the respective VECs/VSCs that would be affected.

Table 8.2
Review of Potential Effects of Ongoing Actions/Physical Works on VECs

Name	Location	Possible *VEC* Effect	Comment
Awanipark Residential Development	2.5 km Upstream of Whiteshell Laboratories	Seepage from Septic Tanks to the *Winnipeg River*	Septic tank systems are designed so that the flow from the tanks will be adequately diluted by the tile beds and that no contaminants can reach the river. This and the distance from the outfall and consequent dilution of any contaminant that may leak into the river mitigate against any combination of effects from drainage from the Whiteshell Laboratories sewage lagoon.
Manitoba Hydro Point du Bois Power Station recent Expansion	25 km Upstream of Whiteshell Laboratories	Potential for higher flows resulting from increased power production to cause greater erosion of river bottom and re-suspend sediments and contaminate the *Winnipeg River*	The sediment review (see Appendix B) has indicated that the sediment contamination in the river adjacent to the outfall is at level which, under the most conservative assumptions, presents no threat to human health or the environment. In addition the amounts of contamination are small (1.3 GBq). It would appear that even if the sediments were re-suspended, there would be no effect on water quality. The greater flows associated with any possible and unlikely displacement would augment the already substantial dilution effect.
Pinawa, Existing Sewage Treatment Facility	10 km upstream	Flows from lagoon into the *Winnipeg River*	Discharges from sewage lagoons are designed to minimize effects on the receiving water body. The result is that contamination from the lagoon is likely to be minimal and have little effect on water quality. By the time the contaminant reaches Whiteshell Laboratories, 10 km downstream, dilution is likely to render this already small amount of contamination not only negligible but essentially undetectable.
Pinawa Landfill	East of Whiteshell Laboratories	Leachate into the *Winnipeg River*	The landfill ultimately drains into the Winnipeg River via the Pinawa Channel and Lac Du Bonnet, a distance of 30 kilometres. The landfill which is subject to Provincial jurisdiction is designed to have minimal effects on surface and groundwater and, by the time it reaches the Winnipeg River, dilution is likely to render this already small amount of contamination not only negligible but essentially undetectable. Given that small amounts of contaminants are released from Whiteshell, the likelihood of any significant for interaction between those two sources is very small.
Pine Falls Paper Company Mill – waste treatment facility	At mouth of Lake Winnipeg 50 km downstream	Flow from Treatment facility into the *Winnipeg River*	Whiteshell discharges are extremely small and the dilution effect over the distance involved is such that the small amount of contamination released at Whiteshell is likely to be not only negligible but essentially undetectable by the time it reaches the paper mill outfall.
Powerland Centre - Commercial Development	Downtown Pinawa	No effect identified	Interactions with environmental components are unlikely
Rural Municipality of Lac du Bonnet (including. town of Lac du Bonnet) Sewage Treatment Facility	10 km downstream	Flows from lagoon into the *Winnipeg River*	Discharges from sewage lagoons are designed to minimize effects on the receiving water body. The result is that contamination from the lagoon is likely to be minimal and have little effect on water quality. Very little contamination is expected from Whiteshell, and by the time the contaminants reach Lac du Bonnet, 10 km downstream, dilution is likely to render this already small amount of contamination not only negligible but essentially undetectable.
Rural Municipality of Whitemouth (including town of Whitemouth)	Below Seven Sisters, 4 kms upstream	Flows from lagoon into the *Winnipeg River*	Discharges from sewage lagoons are designed to minimize effects on the receiving water body. The result is that contamination from the lagoon is likely to be minimal and have little effect on water quality. By the time any contaminants reach Whiteshell Laboratories, 4 km downstream, dilution is likely to render this already small amount of contamination not only negligible but also essentially undetectable.

Name	Location	Possible *VEC* Effect	Comment
Technology Firms	At Whiteshell Laboratories site	No effect identified	Interactions with environmental components are unlikely
Underground Research Laboratory		Flows from tailing ponds into the *Winnipeg River*	Liquid emissions from the mine water settling pond and mined rock storage area reach the Winnipeg River through a convoluted path (first a small surface stream, then the Lee River, Lac du Bonnet and finally, the Winnipeg River.) The surface stream is dry most of the year and no discharges from URL reach the Lee River unless the conditions are quite wet -spring and fall). Very small amounts of contaminants will be discharged from Whiteshell Laboratories. Therefore, there is little chance of any additive effects.

8.3 INTERACTIONS WITH THE DECOMMISSIONING PROJECT

This cumulative effects assessment must build upon the results of the analysis presented in previous sections of this report. Table 7.1 provides a summary of the residual effects from the project. The cumulative effect assessment focuses on the VECs and VSCs. The only VEC that the proposed actions/physical works outlined in Table 8.2 can affect is the Winnipeg River and by extension, the Sport Fishery.

The assessment also shows that the likelihood of interaction with between residual effects from the Whiteshell Laboratories Decommissioning Project and effects from the ten proposed actions/physical works is very small owing to the limited amount of contaminants released into the Winnipeg River from those actions and physical works. This is because:

- The design of the effluent control systems (septic systems are designed to produce acceptable effluents that will not adversely affect ground or surface water).
- The points of discharge or influence are so far away from the River that no significant levels of contaminants are likely to reach the river (e.g. the leachate from the Pinawa Landfill).
- Some actions/physical works affect a stretch of the Winnipeg River well downstream of the decommissioning project (e.g. URL). Others simply do not have any significant environmental effects (e.g. Powerland and Technology Firms).

8.4 CONCLUSIONS

A review of proposed and existing actions and physical works in areas surrounding the Whiteshell Laboratories site reveals that there is no measurable interactions between the effects of the ten projects and those of the Whiteshell Laboratories Decommissioning Project. It follows that there is no need for mitigation beyond the proposed decommissioning project and no significant cumulative effects are expected. As such, the only follow-up programs necessary are those related to the project as a whole. These are outlined in Section 9.0. The extent of the proposed follow-up actions including monitoring activities will allow for the identification of any unlikely cumulative effects.

9.0 FOLLOW-UP PROGRAM

In this section, the goals and description of the proposed follow-up program are provided for the operational shutdown of the facilities and the three phases of the decommissioning program. The monitoring program in effect during operations of the Whiteshell Laboratories will be used as a basis for the proposed program. However, the existing monitoring program will be subject to change as a result of discussions with regulatory agencies, information obtained, periodic review of the data, response to public concerns and actual performance of the decommissioned facilities.

9.1 GOALS AND OBJECTIVES

The purpose of follow-up is to:

- optimize the monitoring and surveillance program;
- confirm that appropriate mitigation measures are implemented;
- develop appropriate responses to unforeseen effects; and
- identify effects of the project that may not have been predicted.

Follow-up activities include monitoring, surveillance and inspection, all of which may require data collection, analysis, evaluation and reporting. Additional mitigation measures may be implemented as a result of follow-up.

9.2 DETAILED DECOMMISSIONING PLANS

Detailed Decommissioning Plans (DDP) document health, safety and environmental considerations for implementation of decommissioning work. DDPs will be prepared for each nuclear facility, outlining the proposed mitigation measures that will be in place to reduce or eliminate hazards associated with decommissioning. Individual DDPs form the basis for approval of decommissioning by the CNSC.

DDPs for activities in Phase 2 and Phase 3 will be modified as required, based on the monitoring and surveillance activities in the earlier phase(s). As such, it is not possible to present specific changes to the existing monitoring program for activities in later phases until the surveying and monitoring activities proposed for the majority of facilities have been undertaken.

9.3 ENVIRONMENTAL MONITORING PROGRAM

AECL maintains a comprehensive Site Environmental Monitoring Program for Whiteshell Laboratories to ensure that radiation doses as a result of releases of radioactive material remain well below the annual dose limits for members of the public. These annual doses are specified in the *Nuclear Safety and Control Act* and are as low as reasonably achievable (ALARA), taking into account economic and social factors. The primary objectives of the Environmental Monitoring Program are:

- to provide a quantitative record of radioactive contaminants in the environment resulting from operation of the site, which will permit assessment of actual or potential radiation doses to critical groups and populations;
- to provide data to confirm compliance with regulatory limits and other guidelines and to provide public assurance of compliance;
- to provide verification of the effectiveness of facility operation and control of emissions and the adequacy of effluent monitoring; and
- to provide data to verify or refine the assumptions and models used in DRL calculations for the site, where applicable.

The following secondary objectives are also considered in the design of the site Environmental Monitoring Program:

- to provide data for trend analysis;
- to provide baseline data and capability for monitoring and assessment in the event of emergency conditions; and
- to provide information and assurance to the public about radiological and non-radiological hazards involved in site operations.

AECL maintains a comprehensive Site Verification Monitoring Program for Whiteshell Laboratories. Monitoring locations on airborne and liquid effluent streams are representative of the final discharge to the off-site environment and may include the combined discharge from a number of facilities. Where necessary, additional monitoring points are maintained at upstream locations as an aid in identifying the specific sources of emissions. Sampling system design ensures that samples are representative of the total content of the stream at that location. An overview of environmental monitoring activities at Whiteshell Laboratories is shown in Table 9.1.

Table 9.1
Summary of Environmental Monitoring Activities at the Whiteshell Laboratories

Environmental Component	Sampling Location	Parameters	Sampling Frequency
Air	Whiteshell Laboratories perimeter, WMA, off-site	ã (TLDs)	A

Land Surveys	On-site, off-site	ã-spec	A

D: Daily   M: Monthly   S/A: Semi-annually
W: Weekly   A: Annually   A/R: As required

Effluent streams are monitored for all radionuclides or groups of radionuclides that are known to be, or are likely to be, present in the effluent, and that are likely to be a significant component of emissions via the monitored effluent stream. Monitoring is conducted by direct measurement or by sampling and analysis.

An outline of the existing monitoring programs and schedules at Whiteshell Laboratories is provided below. Details of these programs may be found in specific documents issued under AECL's Environmental Protection Program.

- Radiological Environmental Program – this program provides details concerning radiological environmental monitoring of the following parameters:

- air;
- surface water;
- fish from Winnipeg River;
- sediments in the Winnipeg River;
- groundwater;
- perimeter vegetation;
- land gamma surveys of roads; and
- off-site deposition.

Details of monitoring location, frequency of sample collection and analytical methods and parameters are provided in Tables 9.2 to 9.9.

- Non-Radiological Environmental Program – this program provides details concerning non-radiological monitoring for the following parameters:

  - BOD
  - fecal coliform
  - pH
  - total phosphorus
  - conductivity
  - total suspended solids
  - phenolics
  - oil / grease
  - chromium
  - copper
  - iron
  - lead
  - nickel
  - zinc
  - mercury

These parameters are monitored in the ALWTC tanks, sewage lagoon discharges and outfall effluent. The current sampling schedule for non-radiological liquid effluent sampling is provided in Table 9.10.

Table 9.10
Whiteshell Laboratories Non-Radiological Liquid Effluent Sampling Schedule

Parameter	Building 200 Laundry	(ALWTC) Decontam	Tanks R&D	WR-1	Site Outfall	Lagoon

Legend:

Dis	Per discharge:	Approximately 15 times a month for laundry tanks. Approximately 2 times a month for decontam tanks. Approximately 2 times a month for R&D tanks. Approximately 2 times a month for WR-1 tanks. 2 times a year for sewage lagoon (average of 3 samples each discharge).
M	Monthly grab sample:	Normally taken 1st week of the month, or 1st discharge of the month in case of batch discharges.
Mcw	Monthly composite of weekly grab samples.	
W	Weekly grab sample:	Normally taken 1st discharge of week in case of batch discharges.
Wcd	Weekly composite of daily samples or samples taken at each discharge.	
*	Analysis of BOD and Fecal Cloakroom is by the Provincial Laboratory.	

9.4 SITE EFFLUENT VERIFICATION MONITORING PROGRAMS

AECL maintains comprehensive Site Effluent Verification Monitoring Programs for the Whiteshell Laboratories site to ensure that radiation exposures as a result of any releases of radioactive material remain well below the annual dose limits. These doses are specified in the *Nuclear Safety and Control Act*, and as low as reasonably achievable (ALARA), taking into account economic and social factors. The primary objectives of the Site Effluent Verification Monitoring Program are:

- to verify compliance with regulatory emission limits and conformance with AECL's internal emission levels and guidelines;
- to provide a quantitative record of radioactive emissions to the environment that will permit assessment of potential radiological effects on people and the environment as a result of site operations;
- to provide independent verification of site and facility operational performance with respect to radioactive emissions; and
- to provide warning of abnormal emissions that may require investigation or corrective action.

- Radiological Air Effluent Verification Monitoring – details of this program are provided in Table 9.11. For each monitored stream, routine reports provide information on:

    - the period monitored;
    - total weekly effluent volume (m^3) discharged;
    - total release (loading) in Bq of each monitored parameter for the week; and
    - a summary of any failures or unavailability of measurements or equipment.

Table 9.11
Whiteshell Laboratories Air Effluent Sampling and Analysis Schedule – Effluent Verification Monitoring

WMA Incinerator		A/R	GFA Filter	A/R	A/R		A/R

Legend:
Cont - The air effluent is measured by passing a continuous sample of the exhaust through a filter. The GFA filter is normally used for beta-gamma, the Millipore normally for alpha, and charcoal or silver zeolite for radioiodine, and a water bubbler for tritium.
D5 - Daily during normal workdays.
W - Weekly.
A/R - As required, continuous sample when facility is operating.

- Radiological Liquid Effluent Verification Monitoring – details of this program are provided in Tables 9.12 and 9.13. For each monitored stream, the following information is given in routine reports:

    - the period monitored;
    - total monthly (if applicable) weekly effluent volume (litres) discharged;
    - total release (loading) in Bq of each monitored parameter for the period;
    - the average concentration (Bq/L) of each monitored parameter; and
    - a summary of any failures or unavailability of measurements or equipment.

Legend:
D5 - Daily on normal weekdays.
Disch - Per discharge, twice a year for the sewage lagoon, as required for building 200.
Wc - Weekly composite, composite of samples collected during the week.
Mc - Monthly composite, composite of samples collected during the month.
Me - Monthly, when ditches have water, usually after a rain or snow melt.

- Personnel Radiation Dosimetry – this program provides data on occupational radiation doses and is part of AECL's Radiation Protection Policy #40301. The health and safety of AECL employees and the public, as a result of AECL operations, are governed by federal legislation under the *Nuclear Safety and Control Act* and Regulations. Administration of the *Act* and Regulations is performed by the CNSC.

9.5 MONITORING AND SURVEILLANCE FOR DECOMMISSIONING

Drivers

- For the decommissioning period, the monitoring program will be modified to reflect any new potential release pathways (both radioactive and non-radioactive).
- Fiscal responsibility (develop the best monitoring program possible for the resources invested).
- Environmental responsibility (monitor all parameters that are currently thought to be important).
- Temporal responsibility (the program will continue for about 60 years and knowledge will change over that period).

Environmental monitoring during the decommissioning period will be conducted in accordance with AECL's Environmental Protection Program, part of which has been outlined in Section 9.3. Monitoring and/or resurveying is built into each of the three phases of decommissioning. For monitoring requirements arising from decommissioning but not covered in the Environmental Protection Program, appropriate procedures will be developed that will meet or exceed federal and provincial regulatory requirements. Whiteshell Laboratories procedures and protocols for Emergency Preparedness will be updated to include decommissioning activities.

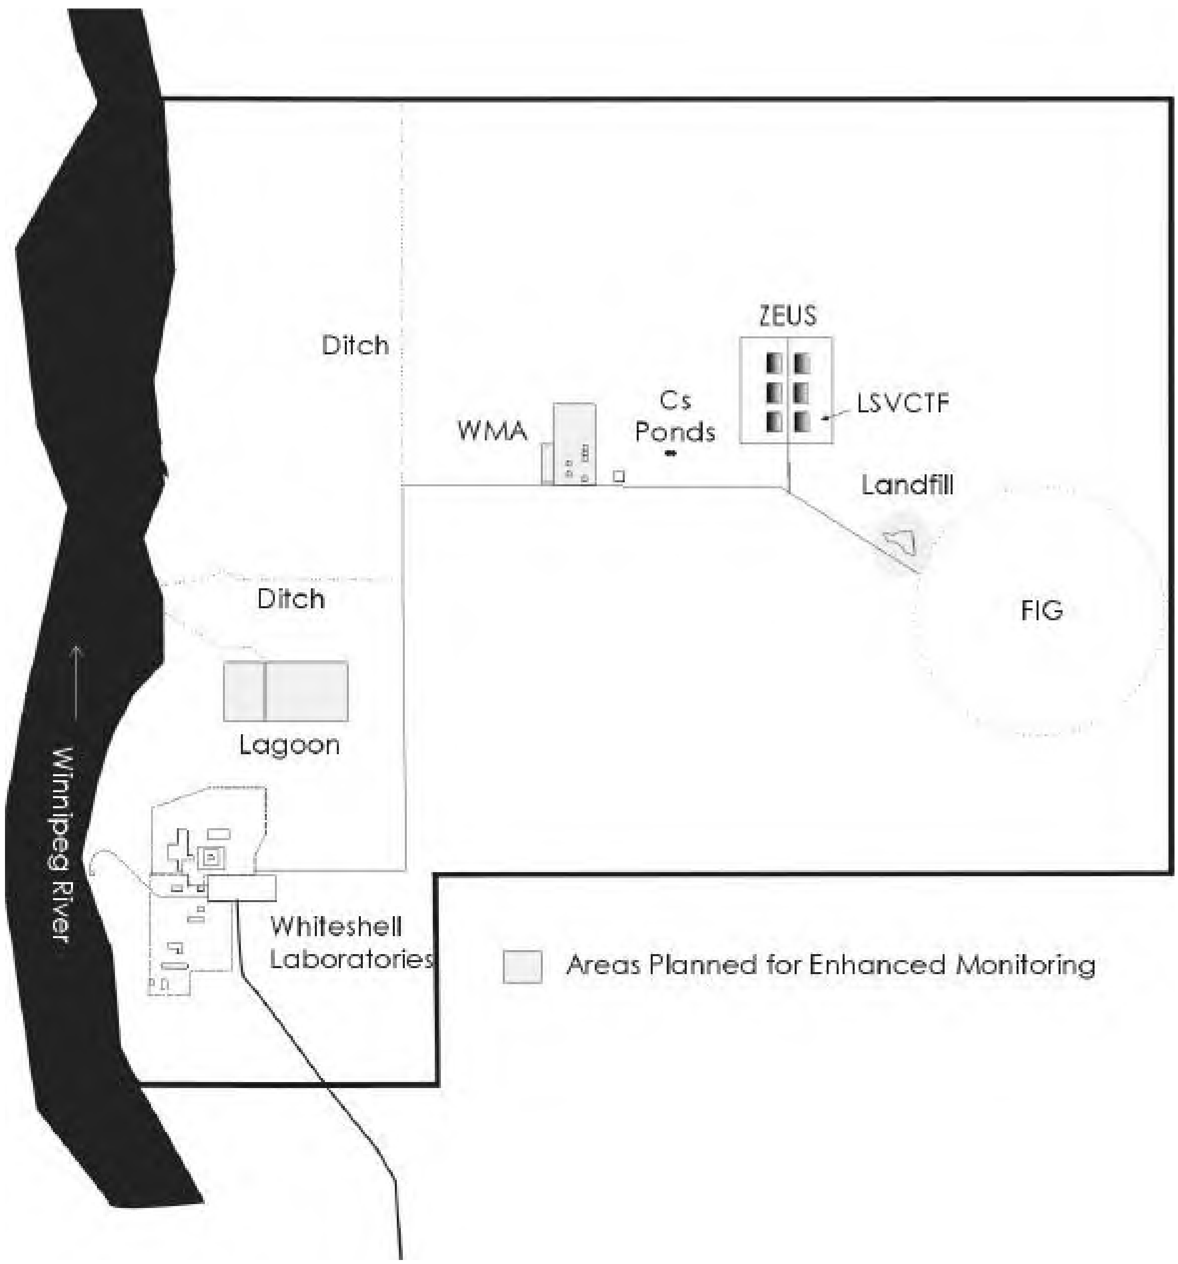
A post-decommissioning monitoring program will be established for those areas where a potential need is identified, such as in remediated sites, or in areas such as the Waste Management Area where low-level radioactive materials remain in-situ. The degree of monitoring and surveillance established for each area will be commensurate with radiological hazards or other hazards.

While baseline information is available with respect to most of the decommissioning activities to be undertaken, in some circumstances, baseline information may need to be gathered in order to define and carry out follow-up activities. One such example is the Winnipeg River, where an investigation of the river around and downstream of the outfall has been carried out as part of the CSR (See Appendix B.1).

A further area where some baseline work will be necessary during decommissioning is for air quality parameters affected by decommissioning activities. Airborne dust is the principal issue here; however, in order to properly interpret the data, meteorological data will also be needed. This aspect is discussed in the next section.

In addition, there are three further areas where additional follow-up monitoring can be envisaged at this time. The first is the waste management area where a special investigation to characterize the potential pathways for movement to the surface or laterally was carried out in the fall of 2000. (See Section 4.3.1 for a brief description of the program and the results to date) Although they are not considered to represent a hazard, for precautionary reasons, some follow-up monitoring is also proposed for the inactive landfill and the sewage lagoon. Each of these three areas is shown on Figure 9.1.

Figure 9.1
Affected Lands – Follow-Up Monitoring Program Map



The key disciplines required to carryout the Monitoring and Surveillance activities at the site are security, radiation protection, environmental monitoring and building/infrastructure maintenance staff. Fire fighting is also required but will likely be provided on a local community sharing basis. AECL will maintain adequately trained resources in each of these areas consistent with carrying out the elements of the Monitoring and Surveillance plans defined for the facility interim end states and the remaining operational support facilities.

9.5.1 Follow-Up Monitoring for Air and Meteorology

The strategy for air quality monitoring is premised on the concept that there are two monitoring states namely:

"Dormant", "Stand-by" or "Waiting" State

- This state occurs during a monitoring and surveillance period when decommissioning activities are limited.

"Active" State

- This state occurs during a period of decontamination or decommissioning. Activities likely to occur during this state include digging of soil, sandblasting buildings and demolishing buildings.

During the "dormant" state, the following is proposed:

- monitor once per season for air quality parameters of concern (dust, PM_{10}, radionuclides);
- monitor continuously for meteorological parameters (wind speed, wind direction, temperature, rainfall); and
- monitor at current locations (i.e. where there are existing state monitoring stations only).

During the "active" state, it is proposed to monitor:

- air quality parameters of concern (program to suit the activity involved);
  - dust, PM_{10}, radioactivity – 24 hour averages;
  - odour – trained nose on-site during the process;
- monitor continuously for meteorological parameters (wind speed, wind direction, temperature, rainfall); and
- monitor around the active area at upwind (one monitor) and downwind (3 monitors at various distances) locations.

It is also suggested that there be a review or audit after the first demolition projects. This audit would:

- review and analyze all monitoring data from the previous year;
- review all monitoring activity and add/subtract monitoring tasks for future monitoring as appropriate;
- review the methodology being used and adjust for future monitoring if necessary; and
- review parameters being monitored against the issues-of-the-day and adjust future monitoring requirement as necessary to address any new issues.

The reports would be prepared annually and/or after each "active" cycle, whichever comes first.

9.5.2 Follow-Up Monitoring Waste Management Area

In the fall of 2000, a program of trench cover sampling and coring adjacent to the trenches was carried out to confirm the hypothesis that there is no (significant) upward or lateral migration from the trenches. As noted earlier, a detailed description of this program and its results can be found in Appendix C.

A part of this investigation was the evaluation of hydrographs from the WMA area to confirm that the area is, for the majority of the time, a water discharge zone as originally concluded by investigators from the University of Waterloo. Part of the follow-up program will be the annual evaluation of the key hydrographs and evaluation of any potential changes to the flow pattern.

A further element of the follow-up program will be the installation of a few groundwater quality wells which will be established in key locations close to the waste trenches. The bcations and monitoring details for these wells will be established following a data quality objectives protocol and discussions with the CNSC. Information from the ongoing environmental monitoring programs noted in Section 9.3 and the results of the recent investigations (Appendix C) in the trench area will be considered in developing the details of this program.

As discussed elsewhere in this document (Section 4.3.1), selective removal of certain trenches or elements of certain trenches is contemplated. In anticipation of at least some partial relocation, a plan will be developed to characterize the wastes at the time of relocation in order to strengthen the understanding of the basis for the waste inventory which has been developed from historic records. This sampling/characterization plan will be developed as part of the planning for selective trench relocation through a data quality objectives protocol and reviewed with the CNSC prior to implementation.

Confirmation of in-situ disposal of LLW as the final end state will be subject to regulatory review and approval. The safety case will be prepared to address all the basic requirements applicable to the long-term aspects of radioactive waste disposal. Those aspects are currently documented in CNSC Regulatory Policy R-104. The basic requirement is to minimize the burden on future generations and to protect the environment and human health. The maximum acceptable risk is 10^{-6} fatal cancers and serious genetic effects in a year. For the WMA trench environment a control period of up to 200 years (the period required for ^{90}Sr and ^{137}Cs to decay to background) is required. The data required to support the safety case for the final end state will be collected through the updated follow-up monitoring program. The safety case will be supported by an environmental assessment.

9.5.3 Follow-Up Monitoring for Inactive (Non-Radioactive) Landfill

The inactive (non-radioactive) landfill was placed into operation to manage non-radioactive and non-hazardous wastes, excluding food wastes. The landfill is less than 10 m in height and covers an area of less than 1 ha.

The landfill is located at a high point in the local terrain approximately 2 km east of the main site immediately north-west of the FIG (Figure 9.1). The surficial geology in this area is mainly sand and gravel which is underlain by the following units: lacustrine clay; clayey-silty-sand till; bouldery gravel; and bedrock. The surficial geology is illustrated in Figure 5.13 and in cross-section in Figure 5.14.

The landfill is located in a recharge zone and water from the landfill moves either toward the Winnipeg River (located 2.3 km to the west) or northeast towards a large black spruce and sphagnum bog.

Typical materials managed in the landfill include plastic, paper, wood, cardboard, glass and building materials. There is some possibility, however, that the landfill site may still have some radioactivity associated with instances of inadvertent placement of radioactive materials associated with industrial waste deposited in the area, although radioactive materials have been removed from the landfill and any resultant contamination has been remediated. Gross alpha and beta activity has been monitored at the periphery of the landfill for several years to ensure these actions are effective and will continue as required.

The landfill will remain fully operational for Phases 1 and 2. A plan for remediation of the landfill will be developed during Phase 2 and an environmental evaluation will be carried out to provide input to the remediation plan.

During Phase 1, monitoring of gross alpha and beta activity will continue. Monitoring will be conducted both at the periphery of the landfill and on the materials to be placed in the landfill, to ensure no further inadvertent contamination of the landfill with radioactive or hazardous materials occurs.

Due to the relatively permeable nature of the surficial sediments on which the landfill is located, and the fact that the landfill is located in a groundwater recharge area, there may be a need to monitor groundwater up and downgradient of the landfill to ensure the groundwater is not impaired such that loadings to the receiving environment are unacceptable. The details of such a plan will be developed as part of the Phase 2 remediation plan. Determination of monitoring well locations to ensure adequate monitoring and characterization of potential contamination from the site will likely involve a phased hydrogeological investigation. Any groundwater that is sampled should be analyzed for selected key radiological and non-radiological parameters similar to those being monitored in the groundwater around the WMA, in addition to standard parameters of interest with respect to a non-hazardous landfill.

9.5.4 Follow-up Monitoring for Sewage Lagoon

The sewage lagoon system consists of a primary and a secondary lagoon located 150 metres east of the Winnipeg River. The lagoons are constructed from low permeability clay embankments, which have been placed on a prepared clay surface. Underlying natural glacial deposits in the area consist of relatively low permeability silt, lacustrine clay, and clay-till deposits overlying a thin sandy layer which is itself underlain by bedrock, as illustrated in Figure 5.13 (Section 5.4.3).

Currently water is released from the facility every spring and fall to the Winnipeg River through a drainage channel from the secondary lagoon. Discharged water is monitored for the following non-radiological parameters: BOD_5, fecal coliform, pH, total phosphorus, conductivity, total suspended solids, phenolics, oil/grease, chromium, copper, iron, lead, nickel, zinc and mercury. Discharged water is also monitored for the following radiological parameters: gross beta, gross alpha, gamma spec liquid, gamma spec dry and ^{90}Sr. The monitoring is conducted to confirm compliance with regulatory limits guidelines, to provide verification of the facility operation and to provide public assurance of compliance.

During Phase 1 and early Phase 2, the sewage lagoon will remain fully operational and the existing effluent discharge monitoring program will continue unchanged. In preparation for remediation of the lagoon system, an environmental evaluation will be conducted to determine the effects of the system, if any, on local groundwater and the Winnipeg River. This evaluation will initially require the installation of several (3 to 4) groundwater monitoring well nests, one of which will be located upgradient (to the east) of the lagoon system in order to determine groundwater quality prior to any effects from the lagoon system. The remaining monitoring well nests will likely be installed immediately downgradient of the site (to the west) between the lagoons and the Winnipeg River. Further monitoring programs for the decommissioning and post-decommissioning periods will be developed as required based on the proposed investigations and the remediation plan to be developed for the site.

9.6 FACTORS AFFECTING SCOPE OF MONITORING

Monitoring requirements will change in terms of frequency, duration and type over the course of decommissioning and following the completion of decommissioning. These changes will reflect not only changes in regulatory requirements and technological advancements but also the characteristics of the effects being monitored. Air quality monitoring, for example, will have only relatively short-term monitoring requirements because air quality generally is only affected during construction/ demolition related activities. In addition, the type of air quality monitoring will depend on the specific activity being undertaken; remediating contaminated interior spaces requires a different type and scale of air quality monitoring than that required during demolition.

The frequency and type of monitoring will continue to be evaluated over time. Monitoring will be adjusted to reflect findings from the monitoring activities. Cessation of a monitoring activity will occur once it can be shown that an effect has stabilized or has been reduced to a level where it is no longer considered significant by regulatory or other standards such as community concerns. Any modifications to the monitoring program will be communicated to the CNSC.

In the event that an unanticipated effect develops from the decommissioning activities, special surveys would be developed to assess and monitor the effect. Appropriate mitigation measures would evolve from the monitoring and surveying activities.

9.7 REPORTING

The Whiteshell Laboratories' licence requires that AECL submit to the CNSC an annual report for each calendar year summarizing the results of monitoring of radiation exposures to personnel at the site, the results of monitoring of radioactive materials in airborne and liquid effluents from the site and the results of environmental monitoring at and around the sites.

Reporting measures during decommissioning activities will follow the requirements of the regulatory bodies in addition to AECL's policy on reporting. Regular record keeping will be undertaken and include maintenance of hard copies of all monitoring reports, manuals and procedures for care and maintenance and contingency plans. A complete set of historical documents will also be maintained by AECL or other agency, as appropriate. Records may include all or some of the following:

- annual reports;
- transition monitoring-transition assessments; and/or
- background and reference studies.

9.8 AUDITING

Auditing is an independent verification of AECL's environmental monitoring programs. Auditing at Whiteshell Laboratories takes place at AECL's Safety Review Committee's discretion and/or at the CNSC's discretion. Options for auditing include:

- self auditing;
- public environmental review committee to oversee the long-term follow-up activities for the site; and
- reporting of an independent auditor to the CNSC.

Actual responsibility for ensuring that appropriate follow-up activities are undertaken will lie with the CNSC or other designated agencies.

9.9 PUBLIC ADVISORY COMMITTEE

AECL supports the idea of a Public Advisory Committee which could include members of the public, First Nations, appropriate government agencies and other stakeholders. This committee could make recommendations on the type, extent and frequency of monitoring activities on an on-going basis. It could also review monitoring results, and make recommendations on modifications to the decommissioning program and to mitigation measures, where necessary. Terms of reference for formation of the Public Advisory Committee require consultation with the local community and will be undertaken early in Phase 1.

9.10 MONITORING RESPONSIBILITY

AECL is responsible for the decommissioning activities and on-going monitoring of the project. AECL is committed to ensuring that the funding to meet the Whiteshell Laboratories decommissioning requirements is identified as a component of the segregated appropriation for decommissioning treasury board.

10.0 PUBLIC CONSULTATION

10.1 OVERVIEW

A public consultation plan was designed to fully satisfy the *Canadian Environmental Assessment Act's (CEAA)* requirements by providing opportunities for people interested in the proposed decommissioning program to learn about it and comment on it. It was also designed to establish long-term relationships with stakeholders, First Nations and interested members of the public that would endure beyond this environmental assessment phase and extend throughout the entire decommissioning program. A number of the initial communication and consultation activities were designed to communicate information about the proposed decommissioning program and environmental assessment process and to seek input into the proposed program. The consultation program was designed to meet the different informational needs of the public, stakeholders and First Nations.

The public consultation plan and program are described in detail in Sections 10.2 and 10.3. Issues raised throughout the process are presented in Section 10.4. The First Nation consultation program and issues raised in the program are described in Section 10.5. Background material is contained in Appendix E. Appendix E.1 contains a record of AECL's ongoing communications program with stakeholders. Appendix E.2 contains a record of public consultation on the Comprehensive Study Report (CSR) including a summary table of all contacts and Appendix E.3 contains copies of all public information material. Appendix E.8 contains a record of the First Nation consultation program including a table of all contacts. All issues and questions have been responded to in one of three ways: addressed in the CSR, addressed with a response from AECL or to be addressed through a follow-up program.

10.2 PUBLIC CONSULTATION PLAN

10.2.1 *CEAA* Requirements

The specific requirements of *CEAA* regarding public participation in a CSR include consideration of public comments by the Responsible Authority, public notification and consideration of public comments by the Canadian Environmental Assessment Agency and public notification concerning follow-up programs. There is no specific requirement of *CEAA* to consult with the public during an environmental assessment at the self-assessment stage; however, *CEAA* clearly supports the principle of an early and meaningful public consultation. The intent of the following public consultation plan is to comply with and where possible exceed the requirements of *CEAA*.

10.2.2 Objectives

The objectives of the public consultation plan relating to the *CEAA* component were to:

- inform stakeholders, potentially interested parties, First Nations and the public about the proposed decommissioning program and the environmental assessment process;
- introduce the decommissioning team and the environmental assessment team to stakeholders, interested parties, First Nations and the public;

- develop on-going relationships that would be important throughout the environmental assessment process, closure and decommissioning phases;
- identify issues and concerns early in the environmental assessment process and address them;
- provide input to the environmental assessment team on VECs and VSCs;
- gauge interest and level of concern; and
- assist in defining mitigation measures and follow-up programs.

10.2.3 General Strategy and Approach

The Whiteshell Laboratories operation has developed an ongoing broad communication strategy to ensure that the general public has access to information on the proposed decommissioning program. More focused consultation efforts were directed at stakeholders, First Nations and potentially interested parties. AECL recognized that relationship building was an important aspect of the consultation program and that different groups and interests would require different consultation approaches. AECL also refined its ongoing communication program.

AECL recognized that many issues surrounding the closure of Whiteshell Laboratories were of a socio-economic nature and were being addressed through other processes, whereas the CSR dealt with the decommissioning activities which result from the permanent shutdown of nuclear facilities and other associated facilities and lands. For clarity, AECL sought the Canadian Environmental Assessment Agency's comment on the exclusion of socio-economic aspects of the closure of Whiteshell Laboratories from the scope of the CSR. The Agency confirmed that these aspects could be excluded from the CSR. Communication materials were developed accordingly. Nevertheless, issues that were raised throughout the consultation process and fell outside the scope of the CSR were duly recorded.

The following discussions are related primarily to the *CEAA*-related environmental assessment public consultation plan which is an add-on and complementary to the on-going Whiteshell Laboratories' broad communication program.

10.2.4 Identification of Interests

One of the first tasks in designing the *CEAA*-related public consultation program was to identify the potential interests in the proposed project. The following interests were identified as potentially affected or interested parties:

- municipal governments
- elected federal and provincial officials
- First Nations/First Nation organizations
- aboriginal associations
- cottage associations
- tourism organizations
- area businesses
- community organizations
- environmental organizations
- nature/wilderness organizations
- conservation associations
- birders
- current AECL employees
- tenants at Whiteshell Laboratories
- land development group
- industry associations

- community associations
- economic development organizations
- area residents
- cottagers
- regional resource industries
- provincial government officials
- federal government officials
- health/education associations
- fishers, hunters, trappers, wild rice harvesters

Based on this list of interests, organizations were identified to be targeted in the communication and consultation program. The general public was recognized as a broad group with no specific interest in the proposed program but who may wish to become involved.

10.3 *CEAA*-RELATED PUBLIC CONSULTATION PROGRAM

10.3.1 Overview of Activities and Timing

Techniques that were selected for communicating information and obtaining feedback and input included newsletters, open houses, presentations, key-person interviews, meetings and information sessions. Throughout the public consultation process, identification and comments on valued ecosystem (VECs) and social components (VSCs) were also sought. An interview process was also established to identify public opinions on VECs and VSCs for input to the project team. AECL recognized that public involvement is a dynamic process and undertook an evaluation of interest and activities as the consultation program progressed.

An overview of activities carried out during the *CEAA*-related public consultation and the timing of these activities is presented in Table 10.1.

Table 10.1
Public Consultation Activities

Activities	1999	2000
Key-person Interviews	July-September	
Interviews (VECs/VSCs)	July-August	
Newsletter	October	June
Letters to Contact List	October	June
Open House	October	
Information Sessions	October	June
Follow-up Presentations	November	April

10.3.2 Presentations to Municipal Councils

AECL conducted a series of briefings for local municipal officials in winter of 1998/1999 to inform them of closure and decommissioning activities. These briefings were undertaken to advise area municipalities of AECL's notification to the Canadian Nuclear Safety Commission (CNSC) of AECL's intention to decommission the Whiteshell Laboratories site and to outline the proposed strategy and regulatory framework. An update was provided in June 1999 to the same municipalities except the L.G.D. of Pinawa which indicated that it did not require a briefing at that time. These briefings are part of AECL's routine communications and will continue throughout the decommissioning program.

10.3.3 Presentations to Interested Organizations and Individuals

Briefings for elected federal and provincial officials, Manitoba Conservation (formerly Manitoba Environment) and the media were undertaken in the winter of 1998/1999. These briefings were undertaken to advise interested parties of AECL's notification to the CNSC of AECL's intention to decommission the Whiteshell Laboratories site and to outline the proposed strategy and regulatory framework. An update was provided to Manitoba Conservation and other provincial departments in July 1999. There was also a briefing by AECL at Whiteshell Laboratories to the provincial Minister of Industry, Trade and Mines in November 1999 as part of AECL's on-going briefings. AECL will provide additional briefings at appropriate junctures in the environmental assessment process and throughout the decommissioning program.

10.3.4 Key-Person Interviews

Key-person interviews are a useful consultation tool for soliciting background information from key people about their communities and their concerns respecting a proposed undertaking. Interviews were conducted with the following people: Administrator, L.G.D. Pinawa; Mayor, L.G.D. Pinawa; President, Pinawa Community Development Corporation; Co-ordinator, Pinawa Implementation Committee; and Reeve, R.M. Lac du Bonnet.

10.3.5 Newsletter

A newsletter (No. 1 October 1999) was prepared to facilitate understanding of the proposed decommissioning program and environmental assessment process and to invite people to participate in the environmental assessment process. This newsletter was distributed on October 5 and October 6, 1999 to 7,627 post boxes in the Regional Study Area. The newsletter announced the date for an open house at Whiteshell Laboratories and provided contact information. Copies of the newsletter were also placed in Manitoba Conservation's Resource Centre in Winnipeg. A copy of the newsletter is provided in Appendix E.3.

A follow-up newsletter (No. 2 June 2000) was prepared to provide a status update on the planning of the Whiteshell Laboratories Decommissioning Project. This newsletter was distributed June 5 and June 6, 2000 to 7,627 post boxes in the region. The newsletter provided responses to issues and questions raised during the consultation process. It also invited people to discuss the project at information sessions in area communities. Copies of the newsletter were also placed in Manitoba Conservation's Resource Centre in Winnipeg. A copy of the newsletter is provided in Appendix E.3.

10.3.6 Letters to Potentially Interested Organizations/Persons

A contact list was developed based on the initial identification of potentially interested organizations and persons. The list was used to notify organizations by letter of the consultation process that was underway in 1999 and to invite them to an open house. Further, organizations that were not involved in regular briefings were asked if they would like to have a presentation made to them on the proposed decommissioning program and environmental assessment process. Copies of the newsletter were also distributed to this contact list. One organization responded with a request for a presentation. The contact list is presented in Table 10.2. A copy of the letters is provided in Appendix E.4.

Organizations were contacted in June 2000 to advise them of the status of the decommissioning project and to invite them to attend drop-in information sessions in area communities. A copy of the second newsletter was also provided. A copy of the letters is presented in Appendix E.4.

Industry Associations
- Canadian Nuclear Association

10.3.7 Open House

The major consultation event related to *CEAA* was an open house that was hosted by AECL at Whiteshell Laboratories on Saturday, October 16 1999 from 10 a.m. to 4 p.m. This session provided an opportunity for interested persons to engage in discussions with the decommissioning team and the environmental assessment team. Tours of some of the facilities to be decommissioned including the Waste Management Area and Concrete Canister Storage Area were organized for those who wished to take them. Notification of the open house occurred via newsletters and ads in the regional newspapers.

AECL EACL

We invite you to attend the
Whiteshell Laboratories Open House
October 16, 1999
10 a.m to 4 p.m

Location: Whiteshell Laboratories off Highway 211
(accessed via Highway 11)

Atomic Energy of Canada's Whiteshell Laboratories is being shut down and will be decommissioned. The decommissioning plan is undergoing an environmental assessment. Public input is important for the environmental assessment.

Discuss the plan with the decommissioning and environmental assessment team. View displays, take tours and provide us with your feedback.

For more information, please call (204) 753-2311 ext. 2294

Storyboards were displayed on multi-screen displays in the Whiteshell Laboratories' cafeteria. The storyboards discussed the following topics:

- Purpose of the Open House.
- Whiteshell Laboratories-Historical Highlights.
- Regulatory Framework.
- Future Availability of Land.
- What is Decommissioning?
- Decommissioning Alternatives.
- Decommissioning Strategy.
- Decommissioning Scope.
- Decommissioning Activities.
- Waste Management.
- Environmental Protection.
- Health and Safety Programs.
- Regional and Local Setting.
- Valued Ecosystem and Social Components.
- Study Areas.
- Environmental Assessment Process.
- Next Steps in the Environmental Assessment Process.
- AECL's Commitments.

Members of AECL's decommissioning team and the environmental assessment consulting team were stationed at the various displays to respond to questions and assist with understanding the decommissioning program. Comment sheets were available to be completed at the open house or mailed or faxed back. A total of 10 comment sheets were returned. Questions raised at the displays or on tours were recorded.

Attendance at the open house was 121. Ten tours were conducted and 80 people took the tour. Table 10.3 shows the distribution of people who attended the open house and communities they live in.

Table 10.3
Breakdown of Attendance at Open House Whiteshell Laboratories
16 October 1999

Location	No.	Location	No.
Pinawa	57	Beausejour	6
Seven Sisters	9	Pine Falls	1
Lac du Bonnet	23	Whitemouth	2
Winnipeg	15	Elma	3
Garson	4	Sagkeeng First Nation	1

10.3.8 Information Sessions

Information sessions were held in October 1999 following the open house as an opportunity for individuals who may not have been able to attend the open house. Some of the display panels were selected for display at these information sessions. They were staffed by three AECL decommissioning team members and one or two environmental assessment team members. Communities were notified with an ad in regional newspapers, posters in communities and a phone call to the municipal administrators. The information sessions were held from 4 p.m. to 6 p.m. in Beausejour, Pinawa, Whitemouth and Lac du Bonnet. In total, 19 people attended these information sessions. No comment sheets were completed.

AECL EACL

A display on the Whiteshell Laboratories decommissioning program will be set up in the following communities.

You are invited to drop in between 4p.m. and 6p.m.

Oct 21	**Beausejour**	**Town Office , 639 Park**
Oct 25	**Pinawa**	**Whiteshell Centre**
Oct 26	**Whitemouth**	**Community Hall**
Oct 28	**Lac du Bonnet**	**Community Center**

Members of the Whiteshell Decommissioning and Environmental Assessment teams will be on hand to answer your questions and obtain feedback.

For more information,
please call (204) 753-2311 ext 2294 or 1-800-665-0436

A second round of information sessions was held in June 2000 in the same communities. These information sessions were held to provide an opportunity for people to discuss responses to issues and questions raised during the first round of consultations. New display material was developed to update the public and respond to issues raised. Communities were notified with ads placed in regional newspapers, posters sent with letters and information in the newsletter. In total, 24 people attended the information sessions. No comment sheets were completed.

10.3.9 Scoping of Valued Ecosystem and Social Components

An interview process was one of the tools used to develop a list of what members of the public considered to be valued ecosystem components. Four experts and three lay people were interviewed. In addition to the interview process, the open house, key-person interviews, information sessions and First Nation consultation process were used to obtain opinions of what individuals considered to be valued ecosystem and social components.

10.3.10 Information Availability

A handout of the display panels was made available at the open house and the October 1999 information sessions and placed on the public registry. A copy of the handout is provided in Appendix E.3. The report Whiteshell Laboratories Detailed Decommissioning Plan, Volume 1-Program Overview (Helbrecht 1999) was made available to interested persons at the open house and information sessions. A draft of the scope of assessment document written by the CNSC was made available to the public for comment in early November 1999. The reports were also made available by request through AECL. The draft CSR Revision 1 was distributed by the CNSC for technical review to federal and provincial departments and agencies in April 2000. At that time, AECL provided a copy as a courtesy to 7 municipal councils, the Whiteshell Laboratories/Provincial Leaders Committee and the Sagkeeng and Brokenhead First Nations. A copy of the transmittal letters is provided in Appendix E.4. The draft CSR will be made available to the public by the CNSC. When completed, the CSR will be released as a final report and placed on the Public Registry by the Responsible Authority for public review.

10.3.11 Web Site and Toll-Free Number

AECL's web site, e-mail address, local telephone number and toll-free number were advertised in both newsletters. A public affairs staff person at Whiteshell Laboratories managed the local information requests. As of December 2000, AECL had received nine telephone calls, four e-mails, one information pick-up and one letter. Seven of these were requests for a copy of the Decommissioning Plan.

10.3.12 Public Registry

The Canadian Environmental Assessment Agency operates a public registry and the *CEAA* requires that the Responsible Authority, in this case, the CNSC, set up a file and maintain it on the registry for all federal comprehensive study projects. The CNSC registered the Whiteshell Laboratories Decommissioning Project on the *CEAA* public registry and also made available information on its own web site. Manitoba Conservation established a public registry at the Pinawa Library, the Winnipeg Centennial Library and at its Winnipeg Regional Offices at 123 Main Street.

10.3.13 Government Contacts

A provincial Technical Advisory Committee (TAC) for the Whiteshell Laboratories Decommissioning Project was formed to undertake a technical review of the decommissioning program. The TAC is an advisory body to the Director and the Minister of Conservation and includes experts from within government as well as external agencies. The TAC is chaired by

Manitoba Conservation. The regional Canadian Environmental Assessment Agency office is represented on the TAC. TAC meetings were held in June and October 1999. The CNSC made a presentation at the June and October meetings and AECL made a presentation at the October meeting. Other briefings of provincial officials occurred in July with the Chair of the TAC and the Assistant Deputy Minister of Manitoba Conservation. The TAC reviewed the draft CSR Revision 1 and forwarded comments to the CNSC.

10.3.14 Community/Provincial Leaders Committee

Another forum for addressing issues related to dosure and decommissioning is the Whiteshell Laboratories Community/Provincial Leaders Committee that was established in December 1998. The purpose of the Committee is to develop a strategy for addressing the regional effects of the closure of Whiteshell Laboratories. The Committee is co-chaired by the MLA for Lac du Bonnet and the Mayor of the L.G.D. of Pinawa. The Committee membership consists of the School District of Whiteshell; the Rural Municipalities of Lac du Bonnet, Whitemouth, Brokenhead; the Towns of Lac du Bonnet and Beausejour; the Economic Development Authority of Whiteshell; the Departments of Industry Trade and Tourism, Rural Development and Conservation; and the MLA for La Verendrye.

The Committee's April 30, 1999 report identified four main issues with respect to the regional and provincial impacts of the closure of the Whiteshell Laboratories. Three of these issues fall outside AECL's mandate or the scope of the CSR and the fourth issue relates to decommissioning. The Committee also developed a set of 20 recommendations for the decommissioning program. AECL has responded to these recommendations as outlined in Table 1 in Appendix E.5. AECL contacted the Committee by letter in November 1999 to determine if it would like a briefing with the decommissioning team and environmental assessment team. A letter was sent on January 31, 2000 advising the Committee that responses to its 20 recommendations had been prepared and included in Appendix E.5. AECL offered the Committee an opportunity to discuss these responses at a meeting. A meeting was held on April 8, 2000.

10.4 RESULTS OF PUBLIC CONSULTATION

A number of issues were raised in the public consultation process. These issues were recorded from interviews, open house comments, briefings and responses to the CNSC scoping document. As well, comments were provided on the draft CSR Revision 1 by the Community/Provincial Leaders Committee. For organizational and analytic purposes, the issues have been categorized and organized into tables.

Issues that were raised that are within the scope of the CSR are discussed below and presented in Table 10.4. Other issues that fall outside the scope of the CSR have been noted and responded to in Table 1 in Appendix E.6. AECL understands these to be important community issues and notes instances where other processes are responding to them. Questions and comments that were raised at the Open House that are not otherwise recorded as issues are noted in Table 1 of Appendix E.7. Responses to these were given by AECL and environmental assessment consultants at the Open House.

Issues that were raised that are within the scope of the CSR have been categorized in the following manner:

1. Scope of decommissioning program.
2. Time frame.
3. Environmental effects.
4. Terrestrial biota / wildlife effects.
5. Aquatic biota / fish effects.
6. Land / resource use.
7. Health and safety.
8. Environmental monitoring.
9. External events.
10. Security.
11. Future staffing requirements.
12. Site characterization.
13. Storage.
14. Long-term communications.
15. Financial assurances.
16. Planning considerations.
17. Acceptability of plan.

Table 10.4

Issues / Comments Raised in the Public Consultation within the Scope of the CSR

ISSUES / COMMENTS	STATUS
Scope of Decommissioning Program	
Why not mothball the Hot Cells and the IFTF complex and not decommission them, both as a national asset and until the question of the Canadian Neutron Facility can be debated?	**Addressed in CSR:** The business decision to discontinue research at Whiteshell Laboratories creates the requirement to decommission the nuclear facilities and the site to: Produce a safe monitoring and surveillance state until all wastes can be removed to disposal facilities; Reduce the cost of maintaining the site; and Meet all regulatory requirements for shutdown of nuclear facilities. Furthermore, mothballing of facilities to the above requirements generally precludes any further use. **Outstanding Issues:** None.
Why not consider keeping the WR-1 building and Building 300 for future use?	Same as above.
It is not acceptable to the community to not demolish the Hot Cell Facility and Building 300 until a disposal facility is available.	**Addressed in CSR:** AECL notes that conflicting community views have been expressed on the timing for demolition of these buildings. AECL plans to achieve and maintain a safe monitoring and surveillance state until disposal becomes available. The safest way to manage non-mobile hazards in these facilities is with the current facility and building structures until disposal options become available. All potentially mobile hazards will be addressed prior to placing the facilities in a safe monitoring and surveillance condition. **Outstanding Issues:** None.
We insist that the hot cells should remain serviceable until after all of the repackaging and storage of high and intermediate-level decommissioning wastes is complete.	**Addressed in CSR:** Hot cells will be in service until no longer needed. Packaging / handling of high level wastes may require local shielded equipment in the WMA. AECL's analysis of the decommissioning requirements indicate that the SF is required only to process active liquid wastes currently stored in the WMA and the SF. The facility will be decommissioned after that need has been met and local shielded structures will be used for repackaging WMA wastes where required. Transfer of wastes to the Shielded Facility is not economic nor an efficient processing option. **Outstanding Issues:** None.

ISSUES/COMMENTS	STATUS
There is a concern about future uses of the site being outside the scope of the environmental assessment.	**Addressed in CSR:** Any new site business uses or activities are expected to be subject to the environmental assessment requirements for the proposed activity. Section 8.0 of the CSR which deals with cumulative effects, addresses this issue. **Outstanding Issues:** None.
Time Frame	
The Whiteshell site must be fully decommissioned in less than 20 years and not defer costs to future generations.	**Addressed in CSR:** AECL believes the preferred alternative of a final end-state by 2060 is advantageous for a variety of reasons. Although there is a national policy for disposal of nuclear waste, permanent disposal space for Whiteshell Laboratories waste is not expected to be available until 2025 for LLW and 2050 for HLW. The proposed plan optimizes the use of existing engineered structures and building envelopes to control nuclear liabilities. The plan takes advantage of the reduction in activity of key radionuclides. This minimizes the exposure to workers/the environment, and the cost for protection of workers/the environment. The issue of double handling is avoided. For example, if a waste storage facility were currently available for HLW, it would have to be handled twice. First, it needs to be handled at Whiteshell Laboratories when being sent to the storage location. Then, it would need to be handled for a second time, when a permanent disposal location becomes available. The cost efficiency of this approach will be assessed and compared to other alternatives. **Outstanding Issues:** None.
The 60-year timeframe for decommissioning is unacceptable to communities.	**Addressed in CSR:** AECL understands the concern of communities and acknowledges different points of view. The proposed phased approach optimizes the timeframe relative to the existing life of buildings and storage structures, radioactivity decay and the availability of disposal facilities. **Outstanding Issues:** None.
The average person doesn't understand why a long time frame is contemplated and the argument needs to be made in terms that they understand.	**Addressed in CSR:** AECL acknowledges that the rationale for the long time frame may not be understandable to the average person and it will endeavour to communicate this in lay terms. **Outstanding Issues:** None.
There are a number of outstanding public issues, the principal one being AECL's intention to close up the site and not do any real decommissioning and decontamination until decades in the future.	**Addressed in CSR:** The amount of decommissioning that will occur during the first 10 years is substantial. While it is true that WR-1 will not be decommissioned for 50 years to allow for radioactive decay and to enhance safety, the decommissioning of other facilities will begin as soon as approval is given. Figure 4.4 summarizes plans for the management of liquid and solid waste and indicates that decommissioning including decontamination will begin as early as 2002. **Outstanding Issues:** None.
Long-term storage is unacceptable to communities.	**Addressed in CSR:** Groundwater monitoring around the WMA indicates no movement of radionuclides during the 35 years of operation. A safety assessment has been conducted to determine the long-term environmental acceptability of in-situ management of low-level waste. (Appendix C) **Outstanding Issues:** None.
Very little needs to be postponed for safety reasons.	**Addressed in CSR:** It is true that only WR-1 and some intermediate-level waste in the WMA benefit from radioactive decay over a deferment period. However, other safety considerations include minimizing overall radiation doses to decontamination staff by avoiding double handling of material. Whiteshell Laboratories' waste is currently in safe storage and will only be moved when national disposal facilities are available. **Outstanding Issues:** None.
AECL has also ignored the additional risks of leaving the radioactive materials in their present location for long periods.	**Addressed in CSR:** Additional information on the waste inventory, the trenches and the river sediments etc. and the associated risks has been provided in Section 5 and 6. In the case of WR-1, early decommissioning such as a 20-year time frame increases safety risks and is extremely costly especially given the unavailability of a national waste disposal facility. The risks of early decommissioning of WR-1 are outlined in Section 3.0. Regardless of how long the project takes, the site will remain under CNSC licence control and will be subject to appropriate monitoring to ensure people and the environment are adequately protected. **Outstanding Issues:** None.

ISSUES/COMMENTS	STATUS
We expect AECL to fully decommission the site in a continuous process in less than twenty years. A project with a sixty-year completion date can never be guaranteed.	**Addressed in CSR:** The CNSC will maintain full licensed control of the decommissioning project for as long as is necessary to ensure there are no unreasonable risks to people and the environment. The assessment has determined that a phased decommissioning approach over several decades will pose the least risk to people and the environment. **Outstanding Issues:** None.
AECL's strategy of deferring decommissioning is out of step with practices and safety considerations applied in other OECD countries.	**Addressed in CSR:** The policies for national waste disposal are set at the national level in all countries. Canadian policies and laws are being followed. Deferred decommissioning is practiced in virtually every OECD country. Even where waste disposal is already available, health, safety and environment priorities and funding priorities determine the immediate or early decommissioning requirements. When public and environmental safety is not a critical issue, deferment is routinely applied as an interim decommissioning step. **Outstanding Issues:** None.
The morality of deferring the immense costs of decommissioning the Whiteshell site to our grandchildren who had no benefit of AECL's existence is reprehensible.	**Addressed in CSR:** Many of the costs are being borne by this generation. Note also, that the benefits of the Whiteshell Laboratories research projects apply to more than one generation. **Outstanding Issues:** None.
The integrity of concrete canisters over the long term is questioned as is potential for radioactivity leaking out of the canisters.	**Addressed in CSR:** The life of the concrete canisters is expected to be at least 50 to 100 years. Twenty-five years of experience indicates no deterioration and AECL expects the actual life to be adequate until final disposal is available. The integrity of the canisters will be routinely assessed during the decommissioning program. Deterioration prior to fuel transfer would require construction of replacement canisters. **Outstanding Issues:** None.
Environmental Effects	
There is concern about potential contamination of the environment in general during decommissioning and over the longer term.	**Addressed in CSR:** The purpose of decommissioning is to mitigate, remove or reduce hazards. All work is conducted according to this principle. The general approach to assessing potential environmental effects is to investigate them through the site characterization activities, which are a component of the decommissioning program. Decommissioning activities related to all project tasks are evaluated in the CSR and where necessary, mitigation plans are developed or proposed. AECL will maintain environmental monitoring for the site for as long as wastes requiring management remain at the site. **Outstanding Issues:** None.
There is concern about downstream water quality.	**Addressed in CSR:** Residual contamination in river sediments was found to be small. In the most contaminated area, near the outfall, the inventory is a small fraction of the annual releases prior to 1985. Even if the entire inventory was released into the river, the incremental Cs-137 concentration would be negligible. **Outstanding Issues:** None.
There is concern about surface water contamination.	**Addressed in CSR:** AECL will maintain a comprehensive environmental monitoring program during the decommissioning program that will include surface water. Any indication of releases will be followed up immediately and corrective action undertaken. **Outstanding Issues:** None.
Terrestrial Biota/Wildlife Effects	
What are the potential impacts of decommissioning activities on wildlife?	**Addressed in CSR:** The environmental monitoring program includes analysis of road kill. Results indicate that the effect to wildlife from past operations has been negligible and no additional effects are expected from decommissioning activities. Remediation of contaminated land may disturb wildlife habitat but it would be very localized and of short duration. These areas are previously disturbed areas. Potential effects would be no different than if new development occurred on previously used site lands. **Outstanding Issues:** None.

ISSUES/COMMENTS	STATUS
There is potential for increased contamination during removal of waste from bunkers and tile holes in Phases 1 and 3.	**Addressed in CSR:** All work that includes the remediation of radioactive or industrial materials and hazards has the potential to spread contamination to the environment. AECL operates established and approved Radiation Protection, Occupational Safety & Health, and Environmental Protection programs that are designed to ensure the safety of workers, the public and the environment. These programs are in compliance with federal and provincial regulations, incorporate international standards and practices and are approved by the CNSC. Careful work planning is carried out using these program requirements and implemented using AECL's work permit system and pre-job briefings. During decommissioning, these programs will continue to be implemented and will be enhanced where uncommon or unique situations are addressed. This includes the use of engineering controls such as specially built enclosures to contain hazards during remediation and the use of specialized equipment designed to address these types of hazards (e.g. HEPA ventilated vacuum systems). **Outstanding Issues:** None.
There is the potential for disturbance of wildlife, increased contamination and destruction of habitat during Phases 2 and 3 remediation of contaminated lands.	Same as above.
Land/Resource Use	
There is the potential for increased contamination and sediment load during Phase 3 removal of active drain lines.	Same as above.
Aquatic Biota/Fish Effects	
There is the potential for increased contamination and sediment load during Phase 3 removal of active drain lines.	**Addressed in CSR:** All work that includes the remediation of radioactive or industrial materials and hazards has the potential to spread contamination to the environment. AECL operates established and approved Radiation Protection, Occupational Safety & Health, and Environmental Protection programs that are designed to ensure the safety of workers, the public and the environment. These programs are in compliance with federal and provincial regulations, incorporate international standards and practices and are approved by the CNSC. Careful work planning is carried out using these program requirements and implemented using AECL's work permit system and pre-job briefings. During decommissioning, these programs will continue to be implemented and will be enhanced where uncommon or unique situations are addressed. This includes the use of engineering controls such as specially built enclosures to contain hazards during remediation and the use of specialized equipment designed to address these types of hazards (e.g. HEPA ventilated vacuum systems). **Outstanding Issues:** None.
There is the potential for increased contamination, sediment load and habitat destruction during Phases 1 and 3 removal of river sediment.	**Addressed in CSR:** Residual contamination in river sediments was found to be small. In the most contaminated area, near the outfall, the inventory is a small fraction of the annual releases prior to 1985. Even if the entire inventory was released into the river, the incremental Cs-137 concentration would be negligible. **Outstanding Issues:** None.

ISSUES/COMMENTS	STATUS
Land/Resource Use	
There is the potential for increased contamination and sediment load during Phase 3 removal of active drain lines.	**Addressed in CSR:** All work that includes the remediation of radioactive or industrial materials and hazards has the potential to spread contamination to the environment. AECL operates established and approved Radiation Protection, Occupational Safety & Health, and Environmental Protection programs that are designed to ensure the safety of workers, the public and the environment. These programs are in compliance with federal and provincial regulations, incorporate international standards and practices and are approved by the CNSC. Careful work planning is carried out using these program requirements and implemented using AECL's work permit system and pre-job briefings. During decommissioning, these programs will continue to be implemented and will be enhanced where uncommon or unique situations are addressed. This includes the use of engineering controls such as specially built enclosures to contain hazards during remediation and the use of specialized equipment designed to address these types of hazards (e.g. HEPA ventilated vacuum systems). **Outstanding Issues:** None.
Health and Safety	
Some members of community lack confidence in future safety measures.	**Addressed in CSR:** AECL's health and safety programs are reviewed by the CNSC and will continue to be implemented during the decommissioning project. AECL will retain the responsibility for maintenance of the licence. AECL is committed to an ongoing communication program with area communities and stakeholders and will report on its health and safety program. **Outstanding Issues:** None.
There is a concern that a loss of hands-on knowledge is a risk to future worker and community safety.	**Addressed in CSR:** AECL has retained key individuals to develop and initiate its decommissioning program. AECL is committed to maintaining key people in its decommissioning team. Currently, AECL is recalling some former staff on a contract basis. There are standards and procedures that will be followed and future staff will be required to adhere to these standards and procedures. **Outstanding Issues:** None.
Will there be adequate fire fighting services?	**Addressed in CSR:** Yes. AECL's fire fighting capability is reviewed annually by the AECB and is subject to the Federal Fire Regulations and the National Fire and Building Code. Fire fighting capability at Whiteshell Laboratories will be maintained consistent with these regulations. **Outstanding Issues:** None.
What are the potential health effects from decommissioning?	**Addressed in CSR:** Decommissioning involves less activity than the operations phase of Whiteshell Laboratories. During operations, the estimated annual doses to the public have been, and continue to be, well within regulatory limits established by the CNSC. All releases and doses to the public will continue to be reported annually. **Outstanding Issues:** None.
How can people be assured that health and safety are protected?	**Addressed in CSR:** AECL is committed to an ongoing communication program with area residents to ensure they are informed of site activities and to respond to concerns that residents may have. **Outstanding Issues:** None.
Plan is clearly at odds with basic safety principles applied in other countries.	**Addressed in CSR:** The CNSC will not authorize the project to proceed until it is satisfied that it meets all of the relevant regulatory requirements. **Outstanding Issues:** None.
Environmental Monitoring	
There should be local input to the design of monitoring program.	**Addressed in CSR:** AECL supports the idea of a Public Advisory Committee. Local input into the design of the monitoring program could be accommodated through this mechanism. **Outstanding Issues:** A Public Advisory Committee will be considered in parallel with implementation of the decommissioning program.
Regular reporting of information to neighbouring communities would help alleviate concerns.	**Addressed in CSR:** AECL is committed to an ongoing communication program with neighbouring communities. **Outstanding Issues:** None.
The fact that there is off-site monitoring would imply that there are releases of concern to the environment.	**Addressed in CSR:** Off-site monitoring is undertaken to confirm that there are no releases above regulatory limits and to measure any effect of site operations. **Outstanding Issues:** None.

ISSUES/COMMENTS	STATUS
Independent monitoring would give people more confidence.	**Addressed in CSR:** Independent monitoring has been done in the past (e.g. Fisheries and Oceans Canada and Health Canada). Health Canada continues to monitor at stations downstream of Whiteshell Laboratories. **Outstanding Issues:** None.
External Events	
Significant external events like forest fires could impact on security.	**Addressed in CSR:** External events have been considered in the Safety Analysis Reports for the various nuclear facilities at Whiteshell Laboratories. **Outstanding Issues:** None.
There is a need to undertake a probabilistic risk assessment of external events.	**Addressed in CSR:** Safety Analysis Reports have considered external events. Future safety analysis to support interim end-state and monitoring and surveillance plans will also consider external events. **Outstanding Issues:** None.
Has the effect of flooding of the Winnipeg River on stored waste materials been considered?	**Addressed in CSR:** Flooding was assessed by Manitoba Hydro on the basis of a dam failure at Seven Sisters. The assessment determined the Whiteshell Laboratories site including the WMA would be unaffected. **Outstanding Issues:** None.
Security	
24-hour monitoring of Waste Management Area should be considered.	**Addressed in CSR:** There will be 24-hour camera surveillance of the WMA during decommissioning. Any incidents can be responded to within a reasonable timeframe (approximately one-half hour). This represents an enhancement in routine monitoring and surveillance from the level in place throughout the site operating period. **Outstanding Issues:** None.
There is the perception that AECL is abandoning the site and leaving it to a security company with low-paid employees.	**Addressed in CSR:** AECL is committed to maintaining fully trained and qualified staff on site to carry out the site monitoring and surveillance activities As well, AECL's management system clearly identifies responsibilities for radiation protection, environmental protection and monitoring, and health and safety. **Outstanding Issues:** None.
Future Staffing Requirements	
The loss of technical resources in region will impact on future availability of qualified staff.	**Addressed in CSR:** Key people have been retained and will be retained to maintain all site management requirements. **Outstanding Issues:** None.
Loss of corporate memory is reducing peoples' confidence in ability of future staff to manage problems.	**Addressed in CSR:** There are a variety of methods AECL uses to protect against the loss of corporate memory. These include: A management system that defines responsibilities, sets goals and uses standards for operating the Company and its staff; Internal and external training programs (e.g. radiation protection training); Maintaining a complement of key staff; Contracting back former staff to help address operational or decommissioning issues; Operating procedures for the various buildings and systems; Centralized records and reports systems; On-line information available through the Intranet; Retention of internal and external consultants to assist in the identification and assessment of historical information and data. **Outstanding Issues:** None.
There is a concern about whether training will be adequate for staff and what their qualification requirements will be.	**Addressed in CSR:** A training program will be maintained as required by the CNSC to meet all site monitoring and surveillance requirements. AECL can also call on its resources at Chalk River to provide support for training if it is not available at Whiteshell Laboratories. The program is audited by the CNSC. **Outstanding Issues:** None.

ISSUES/COMMENTS	STATUS
When decommissioning, using personnel familiar with the operations of a facility and the location and nature of the contamination poses less risk to the employees.	**Addressed in CSR: It** is desirable to take advantage of the knowledge of people who are on the site. The DDP's will be developed using information from all available sources. Generally, these plans will be completed during the next five years. However it should be pointed out that virtually all of the people who have worked on Whiteshell will have reached retirement age within the next ten years. They simply won't be available to participate in the actual decommissioning process regardless of the alternative selected. That said, the DDP's will provide a detailed disciplined step-by-step description of the decommissioning process in accordance with CNSC Regulatory Document G-219. This will ensure that the process is not dependent on human memory alone. It should also be noted that "corporate memory" is most important in the achievement of facility shutdown. Once shutdown is complete, there is a transition to a team expert in monitoring, dismantling, demolishing, and remediating. **Outstanding Issues:** None.
To leave a site virtually unattended without the necessary staff to provide full protection is unprecedented. The CSR does not even give an indication of the structure and competence of the caretaker operation.	**Addressed in CSR:** AECL has clearly committed to maintaining the resources required to carry out the monitoring and surveillance activities to the end of the decommissioning program including security, fire fighting, environmental monitoring, radiation protection and buildings maintenance. A new Section (9.5.1) describing the disciplines required has been added. The site will remain under CNSC licence as appropriate to ensure there will be no unreasonable risk to people or the environment. **Outstanding Issues:** None.
AECL has been putting pressure on the L.G.D. of Pinawa to agree to provide fire protection to the active area of the site. AECL must maintain their own fully trained fire protection staff as long as there are contaminated facilities on the site.	**Addressed in CSR:** As noted in the above response, AECL commits to meeting fire protection requirements for the licensed site and facilities. The provision of such services can include the use of shared community resources. The CNSC will also ensure, through its licensing and compliance process, that adequate emergency response is in place. **Outstanding Issues:** None.
Start immediately to fully decommission the Whiteshell site in a continuous way according to the twenty-year time frame. This would allow full advantage to be taken of local knowledge and provide continuous employment for a decommissioning team and a level of economic activity that would go some way to alleviating the impact of the withdrawal of AECL's R&D activities.	**Addressed in CSR:** See response to 4th comment above. Note also that, with respect to economic effects, the scope of the assessment includes only those effects that are directly the result of changes that the project is likely to cause to the biophysical environment. **Outstanding Issues:** None.
An intermittent decommissioning process will have huge problems in assembling the human resources each time there is an incremental activity.	**Addressed in CSR:** With the exception of the WMA and WR-1, a large portion of the decommissioning will occur during the first 20 years. The safety and environmental rationales for the proposed phasing of the decommissioning program are set out in the draft CSR. A summary table and figures outlining the scheduling of key decommissioning activities is included in Section 4.0. Given the lead times available for the detailed planning and preparation of the various decommissioning phases, and the anticipated requirements for the provision of financial guarantees, the assembly of the necessary resources to carry out the decommissioning stages is not anticipated to be a problem. **Outstanding Issues:** None.
Site Characterization	
Does AECL know everything about the site?	**Addressed in CSR:** AECL has adequate knowledge about the site to ensure maintenance of health and safety and environmental protection. Decommissioning involves activities to characterize the hazards and minimize potential effects on workers, the public and environment. **Outstanding Issues:** None.
There is the perception that records on where materials are stored at the WMA are not good.	**Addressed in CSR:** This is a false perception. Records are good and the locations of where waste is stored at the WMA are well documented. As well, records will be maintained in a secure, centralized location. **Outstanding Issues:** None.

ISSUES/COMMENTS	STATUS
There is a lack of detail as to the nature of the contamination in the facilities and the quantities and location of the various waste forms.	**Addressed in CSR:** Full information on the waste streams involved for each site awaits the completion of the DDP's. Additional information on the characterization of the river sediments and the Waste Management Area is provided in the appropriate sections of Section 4.0. AECL believes that the amount of information necessary to demonstrate that the decommissioning can be carried out without significant effects on the environment, as required under *CEAA*, has been provided. **Outstanding Issues:** None.
Much more detail on the condition of the facilities (nature, location and amounts of contamination) is required before AECL can be allowed to proceed with decommissioning.	**Addressed in CSR:** The responsible authority(ies) will consider in the CSR the information necessary to decide if the project is likely to cause significant adverse environmental effects, taking into account the appropriate mitigation measures. This will require a certain amount of detail on the conditions and characteristics of the facilities and the ranges of contamination present. It is normally not necessary to have all of the detailed information to make an EA decision on the overall likelihood and significance of effects. The revised CSR now contains the information appropriate for arriving at environmental assessment-level decisions with a reasonable level of certainty. Further detailed information will be required for licensing purposes, such as prior to the authorization of specific decommissioning tasks to be specified in Detailed Decommissioning Plans for each facility. Furthermore, the proposed follow-up and monitoring program will be designed to gather more specific information during the actual decommissioning process. That information will be used to verify the predicted effects and ensure effectiveness of the mitigation measures. **Outstanding Issues:** None.
There is no analysis in the report to support the conclusions. AECL is controlling the access to information about the condition of the facilities and the quantities, types and disposition of the radionuclides, making it impossible to undertake independent safety assessments.	**Addressed in CSR:** All of the information necessary to support the conclusions of the environmental assessment has now been added to the CSR. If the project proceeds from the environmental assessment stage, further detailed information will be included at the time that the Detailed Decommissioning Plans for each component of the facility will be prepared under the CNSC licensing process. All information used in the environmental assessment is available to the public in either the CSR itself, or from the related documents listed in the Public Registry. Information related to the licensing will also be available to the public from the CNSC. **Outstanding Issues:** None.
Storage	
Waste currently stored in trenches or below ground should be moved to above ground storage bunkers or series of bunkers.	**Addressed in CSR:** Current environmental monitoring demonstrates that waste is safely stored. Except for one trench with fuel channels and some standpipe waste, waste will continue to be stored in this manner. Current safety assessments show there is no risk to human health. **Outstanding Issues:** None.
The decommissioning plan should not anticipate the availability of a repository but should focus on getting all of the high-level waste into safe storage now.	**Addressed in CSR:** All waste will be stored in CNSC-approved storage facilities throughout the decommissioning process. As buildings approach the limits of their useable and safe life they will be decommissioned. WR-1 currently meets all safety requirements and it is safer to manage components of WR-1 in the facilities until a national waste disposal site becomes available than to move it. The alternative would require the construction of an interim storage facility with shielding equal to that currently provided by WR-1. **Outstanding Issues:** None.
They must not use the lack of a repository as an excuse for not building engineered storage facilities now.	**Addressed in CSR:** Any storage of existing wastes, or those that may arise from the decommissioning project, will remain in waste management facilities, licensed by the CNSC until such time as other alternative, licensed facilities are made available. **Outstanding Issues:** None.
Long-Term Communications	
There is a need for ongoing communications to provide information on decommissioning program.	**Addressed in CSR:** AECL is committed to an ongoing communication program with area communities and stakeholders. **Outstanding Issues:** None.
There is a need to inform and involve the community in a communications plan during the decommissioning years (i.e. role in monitoring, notification protocol for work in progress, accidental releases into the environment, etc.)	**Addressed in CSR:** AECL supports the idea of a Public Advisory Committee. These are the kinds of activities that the local community could be involved with through a Public Advisory Committee. **Outstanding Issues:** A Public Advisory Committee will be considered in parallel with implementation of the decommissioning program.

ISSUES/COMMENTS	STATUS
Financial Assurances	
Will AECL be able to acquire the necessary resources for decommissioning particularly when it is looking for new money for Chalk River?	**Addressed in CSR:** AECL's decommissioning budget is a separate appropriation from Treasury Board. This money is separate from any operations/refurbishment budget needed for Chalk River. **Outstanding Issues:** None.
What guarantees are there that resources will be available for long-term monitoring?	**Addressed in CSR:** Decommissioning is covered under a direct appropriation from the Treasury Board to ensure that adequate funding is available to meet commitments. AECL has a responsibility to maintain compliance for a licensed site which includes long-term monitoring. **Outstanding Issues:** None.
What assurances does the public have that AECL won't take shortcuts?	**Addressed in CSR:** AECL has a historical track record of responsibly managing nuclear sites and operations. AECL prides itself on that reputation and intends to maintain it. The CNSC also provides a routine check on the ongoing performance of AECL and the administration of nuclear sites. As well, AECL will be required to operate within guidelines laid down by other federal and provincial agencies. **Outstanding Issues:** None.
Whatever decommissioning plan is finally accepted, there must be guaranteed funding in place to carry it out.	**Addressed in CSR:** The CNSC will require that financial guarantees are in place to ensure successful completion of the decommissioning project. **Outstanding Issues:** None.
AECL and the federal government must stop passing the buck on the financial liability and all future commitments for decommissioning should be presented and guaranteed jointly. We understand that the new CNSC regulations require that financial provisions be made before decommissioning plans can be implemented.	**Addressed in CSR:** The CNSC will require that financial guarantees are in place to ensure successful completion of the decommissioning project. **Outstanding Issues:** None.
Once a decommissioning plan is accepted and approved, firm financial guarantees from the federal government must be put in place, with penalties for missing major targets.	**Addressed in CSR:** The CNSC will require that financial guarantees are in place to ensure successful completion of the decommissioning project. **Outstanding Issues:** None.
Planning Considerations	
Table 3.2, in which the rationale for choosing the 60-year plan is presented, contains many unsupported conclusions.	**Addressed in CSR:** In general, conservative estimates have been used for costs and radioactivity. These estimates are entirely suitable for planning purposes. **Outstanding Issues:** None.
This decommissioning plan is clearly driven by fiscal considerations and not by considerations of safety, economics or public morality. Some references in the report to economic choices are not supported by analysis.	**Addressed in CSR:** The major factors controlling the timing of the decommissioning are the availability of an off-site disposal facility and the safety of the workers. That said, a costly solution such as early decommissioning of WR-1 that achieves no safety goals is not prudent. Maintaining facilities over the proposed long decommissioning time frame is also costly. **Outstanding Issues:** None.
We expect AECL to contract immediately for the necessary decommissioning facilities so that the project can move forward.	**Addressed in CSR:** The decommissioning project may not proceed until the environmental assessment requirements are complete and a decommissioning licence has been issued by the CNSC. **Outstanding Issues:** None.
Remediation of the tile hole situation should proceed with the highest priority and not wait 10 years to proceed.	**Addressed in CSR:** Addressing fuel waste stored in standpipes at Whiteshell Laboratories will capitalize on remediation planning for similar materials at Chalk River Laboratories. Engineering specifications are currently being developed for retrieval, processing and re-packaging facilities at Chalk River to safely handle the wastes. This project is aggressively in progress at Chalk River Laboratories and the realistic timeframe for implementation is 10 years. **Outstanding Issues:** None.

ISSUES/COMMENTS	STATUS
There is concern that attention will soon become focussed on decommissioning liabilities at Chalk River and that the Whiteshell liabilities will drop in priority.	**Addressed in CSR:** The priority of the Whiteshell Laboratories Decommissioning Project is adequately recognized to proceed with activities outlined in the reference document. Initiation of the decommissioning planning process with the regulator has begun and AECL is committed to this process.
Acceptability of Plan	
The CSR ignores the concerns of the Community Leaders and falsely concludes that there are no concerns in the community about the decommissioning plan.	**Addressed in CSR:** All relevant concerns expressed by the public will be carefully documented and considered in the completion of the environmental assessment. The CSR addresses recommendations made by the Community Leaders Committee in Appendix E.5. Also, a meeting was held with the Committee April 8, 2000 to respond to its recommendations. Other concerns that the Committee has that are of an economic nature are outside the scope of the CSR and are being addressed through other processes. **Outstanding Issues:** None.
Urge that the CNSC reject this decommissioning plan and instruct AECL to seek the necessary resources to properly decommission the Whiteshell Laboratories in accordance with the expectations of the communities in Eastern Manitoba and the Government of Manitoba.	**Addressed in CSR:** The CNSC will not authorise the decommissioning project until it is satisfied that it will meet all of the applicable regulatory requirements, including those for the protection of people and the environment, and for ensuring that the exposure of workers and the public to radiation is as low as reasonably achievable, social and economic factors taken into account. **Outstanding Issues:** None.
The decommissioning plan as outlined is totally unacceptable to the L.G.D. of Pinawa, also to the Mayors and Reeves of the surrounding communities, an important fact that the report neglects to mention.	**Addressed in CSR:** A draft CSR, including a description of the proposed decommissioning project, will be circulated for public review and comment before it is finalized and submitted to the Canadian Environmental Assessment Agency for a further public review. That future draft and final CSR will contain the views expressed by the public on the project and how they were considered in the environmental assessment. **Outstanding Issues:** None.
AECL's concept of community consultation is to ignore them and move on with their plan as originally conceived.	**Addressed in CSR: The** scope of the assessment offers several opportunities for public input. All relevant comments received from stakeholders will be carefully considered in the completion of the assessment. **Outstanding Issues:** None.

In general terms, the time frame to decommission is not viewed favourably by the public. However, the associated issue of availability of national disposal facilities is recognized as a constraint to the Whiteshell Laboratories decommissioning program. The CNSC has indicated that these matters fall outside the scope of the Whiteshell Laboratories decommissioning program and environmental assessment process. The long-term in-situ waste management of low-level radioactive wastes is also a concern. The environmental monitoring program confirms that these wastes are being safely managed. A risk assessment has been conducted to evaluate the feasibility of in-situ waste disposal. Results are documented in Appendix C.

The main concerns revolve around the time frame to decommission and the associated issues related to overall site management, staffing and security requirements; health and safety; environmental protection; containment of waste; long-term involvement of local communities; and financial assurances.

The public is seeking assurances from AECL that appropriate levels of financial and human resources are committed to the Whiteshell Laboratories decommissioning program. The public is seeking assurances that AECL will put in place appropriate procedures and staffing requirements to ensure that public safety and security are protected. There is concern that a loss of corporate technical knowledge through staff reductions at Whiteshell Laboratories could have an impact on the ability of AECL to adequately characterize hazards and minimize effects.

Potential environmental effects are also a concern. Much of the public has not been aware of the routine releases to the environment during Whiteshell Laboratories operations and of the comprehensive environmental monitoring program in place. A heightened awareness has occurred through the public consultation program and the public is seeking opportunities to become informed about the environmental monitoring program and to provide their input. The public is also concerned about the integrity of the concrete canisters over the long term and wants assurances that radioactivity will not leak out.

The public has consistently noted the need for a long-term communications and consultation program. AECL also notes that conflicting points of view on the proposed decommissioning plan have been raised during the consultation process. AECL acknowledges these points of view and encourages ongoing participation during the decommissioning program.

10.5 FIRST NATION CONSULTATION

10.5.1 Overview

As part of the *CEAA*-related consultation program, a process was designed to consider the informational needs and consultation preferences of First Nations whose communities and/or traditional territories are within the Regional Study Area. Areas considered in the CSR include lands covered by the terms of Treaty 1 and Treaty 3. The Treaty 1 Ojibway communities of Sagkeeng First Nation (also known as Fort Alexander, Manitoba) and Brokenhead Ojibway Nation (also known as Scanterbury, Manitoba) are located within the Regional Study Area. Lands within the Regional Study Area and Local Study Area are part of the traditional territories of Sagkeeng First Nation and Treaty 3 First Nations located in Ontario. Finally, Brokenhead Ojibway Nation has recently identified lands approximately 25 km east and south of Pinawa as part of its Treaty Land Entitlement.

Given the different contexts of each First Nation community and its potential interest in the Whiteshell Laboratories' decommissioning program, AECL developed a different initial consultation strategy with the two First Nations located in the Regional Study Area and the Treaty 3 communities located outside the study area. A description of the approach follows in Sections 10.5.2 to 10.5.4. Copies of correspondence, project description, communication protocol with Sagkeeng First Nation and a summary of contacts is provided in Appendix E.8.

10.5.2 Sagkeeng First Nation

AECL has had some previous interaction with the Sagkeeng First Nation through its participation on the Winnipeg River Roundtable on Environment and Economy. The Round Table has taken an interest in the Winnipeg River and has a number of objectives including providing recommendations on environmental sustainability with respect to specific issues and encouraging a bioregional perspective.

The initial consultation with Sagkeeng First Nation on the proposed Whiteshell Laboratories' decommissioning program involved a meeting with staff of Sagkeeng's Environment Department and AECL's consultant in August 1999. This provided an initial understanding of potential interest in the Whiteshell Laboratories' decommissioning program. A follow-up letter was sent to Chief and Council outlining the proposed decommissioning program and environmental assessment process and providing a project description with maps of the Local and Regional Study Areas. AECL also suggested that a meeting be held at Whiteshell Laboratories. A meeting was held at Whiteshell Laboratories in October 1999, that also included a tour of the facilities. Newsletters were forwarded to the Band office and staff and Chief and Council were notified of the Open House. A meeting was held in November 1999 with the Elders Council at Sagkeeng.

Sagkeeng First Nation secured external resources to retain a consultant to assist with the development and implementation of a communication protocol. A meeting was held with Sagkeeng and its consultants in November 1999 to discuss a joint communication process. The *Consultation and Communication Process for the Participation of the Sagkeeng First Nation* was jointly developed by AECL and Sagkeeng First Nation in November 1999 and set out the process for AECL and Sagkeeng First Nation to follow in reviewing and discussing issues of concern to Sagkeeng First Nation (Appendix E.8). A Core Group has been established to undertake this process.

At the request of Sagkeeng First Nation, AECL provided copies of reports for review for its assessment of potential issues of concern. Two copies of the environmental monitoring display panels indicating environmental monitoring locations were also provided.

10.5.3 Brokenhead Ojibway Nation

Initial contact was made with Brokenhead Ojibway Nation in September 1999 by AECL's consultant to notify it of the proposed decommissioning program and to determine if Brokenhead was interested in participating in the process. A follow-up letter with the attached project description and Regional and Local Study Area maps was forwarded with a suggestion that a meeting be held. A meeting was held at the Brokenhead Ojibway Nation's offices in November 1999, with Chief and Council and AECL. Copies of the newsletter were provided at an earlier date. As a follow-up to the meeting, copies of 15 years of environmental monitoring reports were forwarded for their review.

10.5.4 Treaty 3 First Nations

Initial contact was made with seven First Nations in the Treaty 3 region of Ontario in September 1999, by AECL's consultant to advise them of the proposed decommissioning program and to determine if they had an interest in the project. A follow-up letter in September 1999 provided a project description and Regional and Local Study Area maps. AECL indicated that it was interested in knowing if the First Nations currently use the local area as identified in the local area map for traditional activities. The First Nations that were contacted included: Shoal Lake 40 First Nation, Iskatewizaagegan #39 Independent Nation, Anishinabe of Wauzhushk Onigum, Ochiichagwe'babigo'ining First Nation, Lac Seul First Nation, Wabaseemoong Independent Nations and Grassy Narrows First Nation. A letter was sent in November 1999 to the Grand Chief of Treaty 3 to advise him of the contacts that had been made with the individual First Nations.

10.6 RESULTS OF CONSULTATION

10.6.1 Sagkeeng First Nation

The Sagkeeng First Nation forwarded its issues of concern in February 2000 in a document entitled "*Identified Issues for Atomic Energy of Canada for the Preparation of a Comprehensive Study Report for the Whiteshell Laboratories Decommissioning Program.*" This document is provided in Appendix E. A summary of the issues raised along with responses is presented in Table 10.5. A meeting to discuss issues and responses with representatives of the Sagkeeng First Nation was held on April 11, 2000. Further to that meeting, AECL forwarded a copy of "Whiteshell Laboratories Emergency Plan" and a copy of the draft CSR Revision 1 in April 2000. Sagkeeng was advised of the information sessions in area municipalities and were forwarded copies of the June 2000 newsletter. Copies of transmittal letters are provided in Appendix E.8. Further communication with Sagkeeng occurred at a meeting held on August 28, 2000 to provide a status update of the CSR technical review and to discuss Sagkeeng's potential involvement in the environmental monitoring program and its training requirements. As a result of discussions in November 2000, it was agreed that further meetings would be held on completion of the technical review of the draft CSR.

Table 10.5
Issues Raised by Sagkeeng First Nation

ISSUES/COMMENTS	STATUS
Impacts to Flora and Fauna	
CSR should address possible impacts on flora and fauna from historical activities as well as proposed decommissioning activities. Study should also address impacts to migratory species.	**Addressed in CSR:** Results of the environmental monitoring program indicate that the effects on flora and fauna, including migratory species, from past operations have been negligible. Proposed remediation of contaminated land may disturb wildlife habitat but it would be very localized and of short duration.
Specific concern about impacts to wildlife as they move in and out of Waste Management Area.	Since the WMA is fenced, large animals cannot enter the area. Although smaller species and birds enter and leave the site, monitoring data which includes animal carcasses identified no previous impacts. **Outstanding issues:** None.
Risks Associated with the Waste Management Area	
Concern about how accidental releases will be mitigated and monitored and what sort of institutional controls will be provided.	**Addressed in CSR:** The fact that the WMA is situated in clay soils and in a ground water discharge zone has positive benefits. Contaminants stored within the WMA will not move downward to the sandy zone, and this zone will not act as a transmission zone for contaminants from the WMA into the Winnipeg River. Contaminants will be rendered relatively immobile due to sorption on clay soils. Mitigation measures that will be put in place include construction of containment barriers where necessary to ensure collection and control of decontamination process water and routine site inspections to ensure the integrity of the facility. Table 6.12.2 describes the proposed mitigation measures for the continued operation and decommissioning of the WMA. Monitoring locations in the vicinity of the WMA will be maintained for as long as wastes requiring management remain at the WMA. Monitoring results will be reported annually to the regulator and will be publicly available.
Clarification sought on how intentional intrusion into the WMA will be mitigated.	Site security will be maintained as a component of monitoring and surveillance.

ISSUES/COMMENTS	STATUS
Request that a risk assessment report be prepared for the WMA that quantifies risks to the environment and human health from material stored in the WMA and material ultimately slated for disposal in the WMA that currently lies in the trench facility.	A risk assessment for the in-situ disposal of low-level wastes at the WMA has been prepared. (see Appendix C). **Outstanding Issues:** None.
Impacts to Sediment and Water Quality	
AECL asked to describe background conditions prior to Whiteshell Laboratories operations and nature and extent of impacts from releases.	**Addressed in CSR:** Background conditions for the site are documented in Guthrie and Scott 1988 "Pre-operational Environmental Survey Report of the Whiteshell Nuclear Research establishment Area" WNRE-756. AECL has an extensive program for monitoring the environment the site including the Winnipeg River. Results are documented in annual environmental monitoring reports. The 1995 Winnipeg River Task Force report concluded that it is unlikely that Whiteshell Laboratories has ever posed a significant threat to the health of downstream residents. With respect to fishery impacts, radioactivity levels in fish in the Winnipeg River are typical of values obtained across Canada, including regions very remote from nuclear facilities. These levels are well below Health Canada's guidelines.
Concern about contaminated sediment and water downstream of Whiteshell Laboratories and impacts on fish species from AECL activities and potential for impacts from decommissioning.	The Winnipeg River and associated fishery will only be affected if there is a substantial leak. AECL records show that routine discharges are currently maintained within acceptable standards and discharges will gradually diminish to virtually zero by the time decommissioning is complete. The likelihood of a major leak is low because all site and facilities protection systems and work controls are maintained during the decommissioning project. The decision on the in-situ abandonment of river sediments was dependent on completion of the assessment outlined in Appendix B. The study carried out in the fall of 2000 revealed a small inventory of contaminants immediately downstream of the outfall. It was determined that if the entire inventory was resuspended in the river, the increase in Cs-137 concentration in the river would be negligible. An assessment indicated that the dose to human or non-human biota would be well below applicable limits. No remediation is contemplated in light of those results. **Outstanding Issues:** None.
Accidents	
Concern about potential accidents during the decommissioning process and potential impacts to human health and land and water resources. AECL asked to describe safeguards that will be implemented and contingency plan in case of an accident.	**Addressed in CSR:** Potential accidents and malfunctions have avoidance and contingency plans applicable to each in order to mitigate potential environmental effects. Table 6.26 describes safeguards that will be put in place. Contingency plans and emergency preparedness plans already exist for the Whiteshell Laboratories facility. In the unlikely event of significant contaminant release, any migration will be curtailed and immediate clean-up will be implemented.
Sagkeeng request a communication program to notify Sagkeeng in the event of an incident.	Consistent with the November 1999 communications protocol between AECL and the Sagkeeng First Nation, AECL will ensure that the Sagkeeng First Nation is notified of any accident that has the potential to impact the resources within its Traditional Land Use Area. **Outstanding Issues**: None.
Reporting	
Sagkeeng request that decommissioning status reports be prepared for each phase and that reports be placed in a public registry.	**AECL Response:** AECL will prepare publicly available decommissioning status reports for submission to the CNSC. Such reports are available to any interested party. Status reporting will also be maintained as part of the ongoing communications program with the Sagkeeng. **Outstanding Issues:** A formal mechanism for public registries during decommissioning project implementation has not been established**.**

ISSUES/COMMENTS	STATUS
Involvement in Monitoring	
Sagkeeng request that they be involved in the development of a long-term monitoring program and that the people of Sagkeeng be trained and employed in the collection of monitoring data. Sagkeeng would like to partner with AECL in the monitoring of resources within the regional study area.	**AECL Response:** AECL is committed to the involvement of the Sagkeeng First Nation in the development of the long-term monitoring program. AECL is prepared to provide training and some employment in the collection of monitoring data. Discussions on Sagkeeng's involvement were initiated in August 2000 with representatives of AECL and Sagkeeng First Nation. Involvement could begin when the project commences. **Outstanding Issues:** None.

10.6.2 Brokenhead Ojibway Nation

At the initial consultation meeting with Chief and Council of the Brokenhead Ojibway Nation, AECL provided an overview of the decommissioning program and made the offer to host a tour at Whiteshell Laboratories. A number of questions were raised. In summary, concerns were expressed on the following issues:

- impacts to surface water, ground water and any effects on the Brokenhead River;
- airborne effects;
- assessment of potential contamination of lands that may be turned into a wildlife management area;
- potential impacts to wildlife; and
- potential impacts to bison herd at Brokenhead.

AECL explained that the environmental monitoring program has demonstrated that there have been no adverse environmental effects off-site. Also, the Brokenhead River is not within the same watershed.

The Brokenhead Ojibway Nation advised AECL in a letter in January 2000 that the Chief and Council wished to remain informed about the decommissioning project and further reiterated its concerns. AECL advised Brokenhead in a follow-up letter that its concerns were being addressed in the CSR and that AECL would continue to keep Chief and Council informed. Further communications included a copy of the draft CSR Revision 1 in April 2000 and copies of the June 2000 newsletter. Copies of correspondence are presented in Appendix E.8.

10.6.3 Treaty 3 First Nations

Based on information reviewed by Chief and Council, the Iskatewizaagenean Independent Nation and Shoal Lake #40 First Nation have both confirmed that they have no immediate concerns regarding the proposed decommissioning program. However, if anything new were to come up, both First Nations requested that they be contacted again. The Anishinabe of Wauzhushk Onigum confirmed receipt of AECL's letter and information. However, they have indicated that other matters were more pressing in their community and they have not yet had the opportunity to respond.

The Wabaseemoong Independent Nations indicated that they have extensive interest in the Regional Study Area, but have not responded with an identification of interests or concerns. No response was received from the Grassy Narrows First Nation, the Ochchagwe'babigo'ining First Nation or the Lac Seul First Nation.

The Treaty 3 First Nations and the Grand Chief of the Grand Council Treaty #3 were advised by letter in January 2000 that under the *CEAA* guidelines there were further opportunities for them to submit their interests during the review process. They were forwarded copies of the June 2000 newsletter to update them on the status of the CSR. Copies of correspondence is in Appendix E.8.

10.7 ONGOING CONSULTATION

AECL is committed to an ongoing communication and consultation program after the environmental assessment process is complete. Ongoing communications with area municipalities and elected officials will be undertaken. AECL supports the idea of a Public Advisory Committee and will give this consideration in parallel with implementation of the decommissioning program.
A process for a long-term relationship between AECL and Sagkeeng First Nation that ensures Sagkeeng's ongoing involvement in its areas of interest in the decommissioning program (e.g. environmental monitoring) will be established. In the spirit of partnership and capacity-building, AECL will endeavour to provide opportunities for the Sagkeeng First Nation to build on skills at the community level.

10.8 SUMMARY OF PUBLIC AND FIRST NATION CONSULTATION

The consultation program that has been undertaken by AECL has included a number of different mechanisms for providing information and receiving input on the proposed decommissioning program. These mechanisms included:

- Presentations
- Open Houses
- Information sessions
- Interviews
- Newsletters
- Reports and documents
- Meetings with stakeholders
- Public tours
- Public notices
- On-going communication via telephone, e-mail, letters.

The questions and concerns raised through the consultation process were responded to in a number of different ways:

- Verbal response at a meeting, presentation, or open house;
- Written response by letter;
- Development of a communications protocol;
- Incorporation of input into appropriate sections of the Comprehensive Study Report;
- Responses in issues tables in the Comprehensive Study Report and its appendices; and
- Follow-up programs.

AECL's commitments to an ongoing communication and consultation program will ensure that information on the decommissioning program will be made available during the implementation phases and opportunities will be available for further input. Further, AECL supports the establishment of a Public Liaison Committee in parallel with the implementation of the decommissioning program.

10.9 CONCLUSIONS

Through its consultation program, AECL is confident that it has provided appropriate opportunities for interested parties, First Nations and members of the public to become informed about the proposed decommissioning program and to raise issues of concern. These issues have been addressed in the Comprehensive Study Report. AECL is committed to an ongoing communication and consultation program to provide opportunities for public involvement during the implementation phases. It appears that the public has had and will continue to have adequate information to assess the effects of the project. No outstanding concerns associated with the decommissioning activities have been indicated.

11.0 CONCLUSIONS OF THE ASSESSMENT

This report describes the Whiteshell Laboratories Decommissioning Project and provides the results of an assessment of the likely effects of the project including an assessment of the cumulative effects of the project with other existing and proposed projects. Where appropriate, it describes mitigation measures and identifies any adverse environmental effects. The report provides the results of an assessment, which used standard and accepted methodologies, of the significance of all residual effects. Finally, the report describes the extensive and ongoing public consultation program associated with this assessment. This program includes a process developed in consultation with First Nations to keep them informed of the progress of the decommissioning program and to allow them to participate in the project in a meaningful way.

The Decommissioning Project covers a very long time frame – estimated at 60 years for the reference alternative, Alternative 3. To address the inevitable uncertainties associated with a time frame of this length, the report proposes an ongoing follow-up and monitoring program designed to keep track of environmental indicators and to allow for any necessary changes to be made. Two parts of that program are of particular interest. One is the preparation of DDPs for each nuclear facility; the other is support for a Public Advisory Committee that could assist AECL in issues related to the decommissioning.

The following conclusions may be drawn from the Comprehensive Study Report:

- the Whiteshell Laboratories Decommissioning Project is not likely to cause significant adverse environmental effects taking into account the mitigation measures recommended in the report;
- the cumulative effects analysis indicates that there are not likely to be any cumulative effects associated with the Project; and
- the public has had appropriate opportunities to become informed and to raise issues of concern. Responses have been provided for all concerns related to the proposed Decommissioning Project.

Summary

This Commission member document (CMD) concerns the Regulatory Oversight Report for sites operated by Canadian Nuclear Laboratories (CNL) for the 2019 calendar year. CNL is the licensee for each of these sites.

No actions are required of the Commission. This CMD is for information only.

Résumé

Le présent document à l’intention des commissaires (CMD) porte sur le Rapport de surveillance réglementaire pour les sites exploités par les Laboratoires Nucléaires Canadiens (LNC) durant l’année civile 2019. Les LNC sont le titulaire de permis pour chacun de ces sites.

Aucune mesure n’est requise de la part de la Commission. Ce CMD est fourni à titre d’information seulement.

TABLE OF CONTENTS

EXECUTIVE SUMMARY

The *Regulatory Oversight Report for Canadian Nuclear Laboratories Sites: 2019* is a Commission member document (CMD) which presents the Canadian Nuclear Safety Commission (CNSC) staff's assessment of licensee performance at sites that are licensed to Canadian Nuclear Laboratories (CNL) for the 2019 calendar year. This report also provides an update on CNSC staff's activities related to public information, community engagement and relevant aspects of the CNSC's Independent Environmental Monitoring Program.

CNSC staff use the safety and control area framework to evaluate the performance of each licensee. This report provides performance ratings for all 14 safety and control areas (SCAs). It focuses on radiation protection, environmental protection and conventional health and safety, in particular. Taken together, these SCAs provide a meaningful overview of the safety performance of the facilities addressed in this report.

The report also includes information on the licensee's public information programs, its engagement with Indigenous groups and communities, reportable events, and areas of increased regulatory focus, where applicable to the sites. It also provides updates to matters discussed at the Whiteshell Laboratories' licence renewal Commission Hearing held in October 2019; namely an update on the security SCA and preliminary information on the potential effects on the collective occupational dose from the proposed accelerated decommissioning.

In order to assess the safety performance of licensees, the CNSC conducts regulatory oversight activities consisting of onsite inspections, technical assessments, reviews of reports submitted by licensees, reviews of events and incidents, general communication with licensees, and exchanges of information with them. While licensee performance across all SCAs is not explicitly documented in this report, CNSC staff's regulatory oversight activities extend to all SCAs.

CNSC staff have rated CNL's performance at its sites[1] in 2019 in each SCA as either "satisfactory" (SA) or "below expectations" (BE), as shown in the following table:

[1] CRL: Chalk River Laboratories; WL: Whiteshell Laboratories; PHP: Port Hope Project; PGP: Port Granby Project; DP: Douglas Point; G-1: Gentilly-1; NPD: Nuclear Power Demonstration.

SCA	CRL	WL	PHP	PGP	DP	G-1	NPD
Management system	SA	SA	SA	SA	SA	SA	SA
Human performance management	SA	SA	SA	SA	SA	SA	SA
Operating performance	SA	SA	SA	SA	SA	SA	SA
Safety analysis	SA	SA	SA	SA	SA	SA	SA
Physical design	SA	SA	SA	SA	SA	SA	SA
Fitness for service	SA	SA	SA	SA	SA	SA	SA
Radiation protection	SA	SA	SA	SA	SA	SA	SA
Conventional health and safety	SA	SA	SA	SA	SA	SA	SA
Environmental protection	SA	SA	SA	SA	SA	SA	SA
Emergency management and fire protection	SA	SA	SA	SA	SA	SA	SA
Waste management	SA	SA	SA	SA	SA	SA	SA
Security	SA	BE	SA	SA	SA	SA	SA
Safeguards and non-proliferation	SA	SA	SA	SA	SA	SA	SA
Packaging and transport	SA	SA	SA	SA	SA	SA	SA

CNSC staff confirm that in 2019, CNL sites continued to perform licensed activities safely. For this reporting year, CNSC staff rated all SCAs as “satisfactory” with the exception of the security SCA at Whiteshell Laboratories which was rated as “below expectations”, the same rating as 2018.

Overall, CNSC staff’s compliance activities determined that:

- radiation protection programs at all sites adequately controlled radiation exposures, keeping doses as low as reasonably achievable (ALARA)
- environmental protection programs at all sites were effective at protecting people and the environment
- conventional health and safety programs at all sites continued to protect workers

Therefore, CNSC staff conclude that in 2019, the CNL sites covered by this regulatory oversight report made adequate provisions for the health and safety of workers, the protection of the public and the environment, and Canada’s international obligations.

1 INTRODUCTION

For the purposes of the *Nuclear Safety and Control Act* (NSCA), and its associated Regulations, the Canadian Nuclear Safety Commission (CNSC) regulates Canada's nuclear industry to protect the health, safety, security and the environment; to implement Canada's international commitments on the peaceful use of nuclear energy; and to disseminate objective scientific, technical and regulatory information to the public. Licensees are responsible for operating their facilities safely, and are required to implement programs that make adequate provision for meeting legislative and regulatory requirements.

The Commission has directed CNSC staff to report to the Commission annually on the safety performance of sites operated by Canadian Nuclear Laboratories (CNL) in the form of a regulatory oversight report (ROR). This ROR provides an overview of CNSC regulatory efforts and staff's assessment of licensee performance at sites operated by CNL for the 2019 calendar year.

The CNL sites covered by this report are:

- Chalk River Laboratories (CRL)
- Whiteshell Laboratories (WL)
- Port Hope Area Initiative (PHAI)
    - Port Hope Project (PHP)
    - Port Granby Project (PGP)
    - Port Hope Pine Street Extension Temporary Storage Site
    - Port Hope Radioactive Waste Management Facility
- Douglas Point (DP) Waste Facility
- Gentilly-1 (G-1) Waste Facility
- Nuclear Power Demonstration (NPD) Waste Facility

This report focuses on radiation protection, environmental protection, and conventional health and safety, as they provide a good overview of safety performance at CNL sites. The report also provides an overview of licensee operations, licence changes, major developments at licensed facilities and sites, and reportable events. In addition, the report includes information on CNL's public information programs, engagement with Indigenous groups and communities, Waste and Decommissioning and the CNSC's Independent Environmental Monitoring Program (IEMP). It also provides updates to matters discussed at the WL licence renewal Commission Hearing held in October 2019, namely an update on the Security SCA and information on the potential effects on the collective occupational dose from the proposed accelerated decommissioning. The information in this document is complementary to the information provided in the PowerPoint presentation titled *Regulatory Oversight Report for Canadian Nuclear Laboratories Sites: 2019* CMD 20-M22.A.

2 CANADIAN NUCLEAR LABORATORIES

CNL is responsible for the operation and management of nuclear sites owned by Atomic Energy of Canada Limited (AECL) under a Government-Owned, Contractor-Operated model.

A brief overview of each CNL site is provided below, with a link to the CNSC web page that contains more details such as facility information, announcements, regulatory reporting and other key topics.

2.1 Chalk River Laboratories

Chalk River Laboratories (CRL) is located in the province of Ontario, 160 kilometers (km) northwest of Ottawa. CRL operates under a single licence that includes Class I and Class II nuclear facilities, waste management areas, radioisotope laboratories, support facilities and offices. The CRL site continues to undergo a period of change. Where permitted by the current licensing basis, CNL is shutting down and decommissioning legacy facilities, and constructing and commissioning replacement facilities throughout the site. Further information on CRL is available on the CNSC's Website at: http://nuclearsafety.gc.ca/eng/reactors/research-reactors/nuclear-facilities/chalk-river/index.cfm

CNL continues work on the proposal to construct and operate a Near-Surface Disposal Facility (NSDF) at the CRL site. This project is currently under review by CNSC staff, is subject to an environmental assessment pursuant to the *Canadian Environmental Assessment Act, 2012*, and will require authorizations from the Commission. Additionally, Global First Power is proposing a small modular reactor at the CRL site. This project is also undergoing an environmental assessment with Global First Power as the proponent. Because there will be separate Commission decisions on these projects, they are not specifically discussed in further detail in this ROR.

2.2 Whiteshell Laboratories

Whiteshell Laboratories (WL) is a former nuclear research and test facility located near Pinawa, Manitoba that was established in the early 1960s. The site hosts the 60 megawatt thermal (MWth) Whiteshell Reactor No. 1 (WR-1), a SLOWPOKE demonstration reactor, other research and support facilities, and a waste management area that contains low-level waste (LLW), intermediate-level waste and high-level radioactive waste. The WR-1 and SLOWPOKE reactors were permanently shut down in 1985 and 1990 respectively. Decommissioning activities at WL commenced in 2003. Further information on WL is available on the CNSC's Website at: http://nuclearsafety.gc.ca/eng/reactors/research-reactors/other-reactor-facilities/whiteshell-laboratories.cfm.

In 2016, the CNSC received an application by CNL to change the decommissioning approach for WR-1 from full dismantlement to in situ decommissioning. This proposed approach is currently under review by CNSC staff, is subject to an environmental assessment pursuant to the *Canadian Environmental Assessment Act, 2012*, and will require authorization from the Commission. As there will be separate Commission decisions on this project, it is not specifically discussed further in this ROR.

2.3 Port Hope Area Initiative

The Port Hope Area Initiative (PHAI) consists of the Port Hope Project (PHP) and the Port Granby Project (PGP). The scope of the PHAI is defined by a legal agreement between the Municipalities of Port Hope and Clarington and the Government of Canada, originally signed in 2001. These projects involve the clean-up of historic low-level radioactive waste contamination found in Port Hope and Port Granby, and its emplacement in new long-term waste management facilities (LTWMFs) located in each community.

The Port Hope Pine Street Extension Temporary Storage Site and the Port Hope Radioactive Waste Management Facility are small temporary storage sites for low level waste that are being remediated as part of the PHP. As such, they are included under the PHP in this report.

Further information on the PHAI is available on the CNSC's Website at: http://nuclearsafety.gc.ca/eng/waste/historic-nuclear-waste/port-hope-area-initiative/index.cfm.

2.4 Prototype Power Reactors

The Douglas Point (DP), Gentilly-1 (G-1), and Nuclear Power Demonstration (NPD) waste facilities are three prototype power reactors that are currently safely shut down and undergoing decommissioning activities of hazard reduction and waste characterization, in line with plans reviewed and accepted by CNSC staff. These prototype reactors are required to implement and maintain programs such as radiation protection, occupational health and safety, security and fire protection.

2.4.1 Douglas Point Waste Facility

DP, located in Tiverton, Ontario on the Bruce nuclear site is a partially decommissioned prototype power reactor. The 200-megawatt electric (MWe) prototype Canada deuterium uranium (CANDU) power reactor was put into service in 1968 and permanently shut down in 1984. CNL safely manages low- and intermediate-level radioactive wastes, as well as used nuclear fuel stored in concrete dry storage canisters at the site. CNL is also undertaking decommissioning planning activities. Further information on DP is available on the CNSC's Website at: http://nuclearsafety.gc.ca/eng/reactors/research-reactors/other-reactor-facilities/douglas-point-waste-facility.cfm.

In July of 2019, CNL submitted to the CNSC an application for a licence amendment to allow CNL to begin dismantlement work at DP. This work includes a discrete set of proposed decommissioning activities that form part of a proposed multi-stage, 50-year decommissioning project. The scope of this amendment request does not include decommissioning of the Spent Fuel Canister Area or the Reactor Building. CNSC staff's assessment of the DP application can be found in CMD 20-H4. This request is subject to a separate Commission Hearing scheduled for November 2020.[2]

2.4.2 Gentilly-1 Waste Facility

G-1, located in Bécancour, Québec within Hydro-Québec's Gentilly-2 site, is a partially decommissioned prototype power reactor. The 250 MWe boiling water reactor was put into service in 1972 and shut down in 1984. At G-1, CNL safely manages low- and intermediate-level radioactive wastes, as well as used nuclear fuel in concrete dry storage canisters. Additionally, CNL is undertaking decommissioning planning activities. Further information on G-1 is available on the CNSC's Website at: http://nuclearsafety.gc.ca/eng/reactors/research-reactors/other-reactor-facilities/gentilly-1-facility.cfm.

2.4.3 Nuclear Power Demonstration Waste Facility

NPD, located in Rolphton, Ontario, is a partially decommissioned prototype power reactor. The 20 MWe prototype CANDU power reactor was placed into service in 1962 and operated until 1987. At NPD, CNL safely manages low- and intermediate-level radioactive wastes. Additionally, CNL is undertaking decommissioning planning activities. Further information on NPD is available on the CNSC's Website at: http://nuclearsafety.gc.ca/eng/reactors/research-reactors/other-reactor-facilities/nuclear-power-demonstration.cfm.

In 2016, CNL submitted an application to the CNSC to modify the decommissioning approach for NPD from full dismantling to in situ decommissioning, which could accelerate the decommissioning process. This application is under review by CNSC staff, is subject to an environmental assessment pursuant to the *Canadian Environmental Assessment Act 2012*, and will require authorization from the Commission. Because there will be a separate Commission decision on this project, it is not specifically discussed further in this ROR.

[2] Further information on the DP licence amendment hearing can be found on the CNSC's Website at: https://www.nuclearsafety.gc.ca/eng/the-commission/hearings/documents_browse/results.cfm?dt=26-Nov-2020&yr=2020

3 THE CNSC'S REGULATORY OVERSIGHT OF CNL

The CNSC performs regulatory oversight of licensed facilities to verify compliance with the requirements of the NSCA and associated Regulations made under the NSCA, each site's licence and licence conditions handbook (LCH), and any other applicable standards and regulatory documents.

CNSC staff use the Safety and Control Area (SCA) framework to assess, evaluate, review, verify and report on licensee performance. The SCA framework includes 14 SCAs, which are subdivided into specific areas that define its key components. Further information on the CNSC's SCA framework can be found on the CNSC's Website at: http://www.nuclearsafety.gc.ca/eng/resources/publications/reports/powerindustry/safety-and-control-areas.cfm.

3.1 Regulatory Activities

CNSC staff spent over 33,500 hours in 2019 working on licensing and compliance activities for CNL sites. This included effort from CNSC staff in 36 different divisions spread over 9 directorates.

Compliance

The CNSC ensures licensee compliance through verification, enforcement and reporting activities. CNSC staff implement compliance plans for each site by conducting regulatory activities including on-site inspections, desktop reviews and technical assessments of licensee programs, processes and reports.

In 2019, CNSC staff spent over 17,400 hours on compliance activities, including 14,500 hours performing desktop reviews and technical assessments of licensee documents and 2,900 hours conducting inspections. Appendix A contains a list of CNSC inspections carried out at each CNL site in 2019. All findings in these inspections were considered low-risk and did not have an impact on safety at CNL sites.

Licensing

In 2019, CNSC staff spent over 16,100 hours on licensing activities, which includes drafting new licences, preparing Commission member documents, and drafting or revising LCHs. A summary of licensing activities is below:

Site, Facility or Project	Licence Changes	LCH Changes
Chalk River Laboratories	None	Revised LCH issued February 2019
Whiteshell Laboratories	5-year licence issued December 2019 • CMD 19-H4 • Record of Decision	New LCH issued January 2020
Port Granby Project	Licence amendment with new release limits, April 2019 • CMD 19-H101 • Record of Decision	New LCH issued April 2019
Douglas Point, Gentilly-1 & Nuclear Power Demonstration waste facilities	Separation of single licence into individual licences for each site, February 2019 • CMD 18-H107 • Record of Decision	New LCHs issued, one applicable to each site: • NPD issued April 2019 • DP issued June 2019 • G-1 issued July 2019

As CNSC regulatory documents are published, CNSC staff update the LCHs as applicable for each site, taking into consideration the licensee's implementation plans. CNSC staff verify the implementation as part of ongoing compliance verification activities. Appendix B provides a list of CNSC regulatory documents implemented at CNL sites and used by CNSC staff for compliance verification.

International Atomic Energy Agency (IAEA) Safeguards Activities

Under the terms of the Canada-IAEA safeguards agreements, the IAEA has the right to perform independent verification activities at various types of sites in Canada. The PGP is the only site covered by this ROR which is not under IAEA safeguards, as the PGP site does not possess safeguarded materials. IAEA activities are not CNSC compliance inspections, but CNSC staff accompany the IAEA in roughly 75% of their activities.

In 2019, the IAEA carried out activities at CRL, WL, PHP, DP, and G-1 to verify nuclear material inventories and assure the absence of undeclared nuclear material and activities. No significant issues were identified.

3.2 Performance Ratings 2019

Performance ratings result from regulatory oversight activities. CNSC staff have rated CNL's performance in each SCA as either "satisfactory" (SA) or "below expectations" (BE).

SCA	CRL	WL	PHP	PGP	DP	G-1	NPD
Management system	SA	SA	SA	SA	SA	SA	SA
Human performance management	SA	SA	SA	SA	SA	SA	SA
Operating performance	SA	SA	SA	SA	SA	SA	SA
Safety analysis	SA	SA	SA	SA	SA	SA	SA
Physical design	SA	SA	SA	SA	SA	SA	SA
Fitness for service	SA	SA	SA	SA	SA	SA	SA
Radiation protection	SA	SA	SA	SA	SA	SA	SA
Conventional health and safety	SA	SA	SA	SA	SA	SA	SA
Environmental protection	SA	SA	SA	SA	SA	SA	SA
Emergency management and fire protection	SA	SA	SA	SA	SA	SA	SA
Waste management	SA	SA	SA	SA	SA	SA	SA
Security	SA	BE	SA	SA	SA	SA	SA
Safeguards and non-proliferation	SA	SA	SA	SA	SA	SA	SA
Packaging and transport	SA	SA	SA	SA	SA	SA	SA

Appendix C provides SCA ratings for each site from 2015 to 2019.

For 2019, CNSC staff rated all SCAs for all CNL sites as "satisfactory", with the exception that CNSC staff have evaluated the Security SCA at WL as 'below expectations'.

Update on Repatriation of Highly Enriched Uranium (HEU)

Under the joint regulatory oversight of the CNSC and the United States Nuclear Regulatory Commission (USNRC), CNL has been safely returning materials which contain HEU to the United States. The HEU originates from materials imported to Canada for research and medical isotope production at CRL. The movement of HEU is also monitored by the IAEA. In 2019, CNL continued fuel and liquid HEU repatriation activities, with six shipments completed. CNSC staff have assessed CNL's repatriation work and concluded that it continues safely.

Update on Security SCA at WL

CNSC staff have evaluated CNL's 2019 performance at the WL site for the Security SCA as "below expectations", the same rating as 2018. In 2018, CNSC staff raised concerns regarding CNL's security program at Whiteshell Laboratories. These concerns led to the CNSC issuing an Order to CNL to implement changes to CNL's security posture at the site. In September of 2019, CNL submitted a corrective action plan to the CNSC to address identified deficiencies, while implementing interim compensatory measures that were reviewed and accepted by CNSC staff. CNL is providing regular progress updates on the status of the actions identified in the corrective action plan.

Closure of the CNSC Order is contingent on CNL completing the implementation of the corrective action plan. CNL has made significant progress, and CNSC staff expect that CNL will complete all actions identified in the corrective action plan, as well as additional response force training and procurement, by the end of September 2020.

4 THE CNSC'S ASSESSMENT OF SAFETY AT CNL SITES

The CNSC regulates all aspects of safety at nuclear sites in Canada, including risks to workers, the public and the environment. Information related to the SCAs of radiation protection, environmental protection and conventional health and safety are most representative of CNL's overall safety performance. In particular, the SCAs of radiation protection and conventional health and safety are a good measure of the safety of workers at CNL sites, while the SCA of environmental protection is a good measure of the safety of the public and the environment.

For both the radiation protection and environmental protection SCAs, the concept of Action Levels (ALs) is used. ALs are a specific dose of radiation or other parameter that serve as an early warning to safeguard against exceedances of radiation dose limits and environmental release limits. Action level exceedances are reportable to the CNSC.

4.1 Environmental Protection

Protection of the environment and the public are linked in the SCA of environmental protection. This SCA covers programs that identify, control and monitor all releases of radioactive and hazardous substances, and the effects on the environment from facilities or as a result of licensed activities.

Currently, all CNL sites covered by this ROR have acceptable environmental protection programs in place to ensure the protection of the public and the environment. For 2019, CNSC staff rated the environmental protection SCA at all CNL licensed sites as “satisfactory”.

Appendix D provides the total annual releases of radionuclides for each CNL site from 2015 to 2019. Appendix E contains data on dose to the public for each CNL site from 2015 to 2019.

Effluent and Emissions Control at CNL sites

CNL implements effluent and environmental monitoring programs at all sites covered by this ROR.

Emissions: CNL reported three action level exceedances at CRL for releases of radioactive substances to air. Two of the exceedances were in adjacent weeks at the Waste Management facilities and were related to the transfer of waste bags with higher than normal quantities of tritium. The third was related to work in the Universal Cells facility due to internal cross contamination from a higher activity cell to a lower activity cell. CNSC staff have assessed that the risk to the public and the environment from these exceedances is negligible.

Effluents: There was one exceedance of the *Wastewater Systems Effluent Regulations* (WSER) limits at CRL in 2019. This was an exceedance of total suspended solids applicable to the B1425 Sanitary Sewage Treatment Facility effluent. CNL reported one action level exceedance at PGP for arsenic, uranium, molybdenum and radium-226 in effluent due to higher influent feed water concentration and temperature. CNL also reported a release of untreated water from the PGP to Lake Ontario and the Port Granby Creek following a heavy rain event in July 2019.

At all CNL sites, airborne and waterborne releases of radioactive and hazardous substances remained below their respective regulatory limits in 2019. CNSC staff conclude that the effluent verification monitoring programs in place for CNL facilities protect the environment and the public.

CNL’s Environmental Management System

The CNSC requires that licensees develop and maintain an Environmental Management System (EMS) in order to provide a documented framework for integrated activities related to environmental protection. CNL has established a corporate EMS which applies to all CNL sites in Canada. Through regular compliance verification activities, CNSC staff confirmed that CNL’s corporate EMS conforms to International Standards Organization (ISO) 14001: *Environmental Management Systems*, and the EMSs for CRL and WL are registered to ISO 14001:2015.

Assessment and monitoring

CNL has implemented an Environmental Monitoring Program (EMP) at its facilities, which complies with the CSA N288.4: *Environmental Monitoring Program at Class I Nuclear Facilities and Uranium Mines and Mills*.

Through compliance activities conducted during 2019, CNSC staff concluded that environmental monitoring conducted at CNL sites and the discharge of treated effluent from CNL sites met regulatory requirements. CNSC staff assessment of CNL's EMP annual report results for the year 2019 confirm that the EMP in place for CNL facilities protects the environment and the public.

Environmental Risk Assessment

The Environmental Risk Assessment (ERA) is a systematic process used to identify, quantify and characterize the risk posed by contaminants and physical stressors in the environment to human and non-human (biological) receptors.

In 2019, CNL submitted an ERA for DP and an updated ERA for CRL. CNSC staff determined that the ERAs are compliant with the CSA Standard N288.6-12: *Environmental Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills*. CNSC staff's assessment of the DP ERA can be found in CMD 20-H4, related to the DP licence amendment request.

A Safety Analysis Report (SAR) was submitted for G-1 in 2019 that included information demonstrating that operations do not pose an unreasonable risk to human health and the environment.

Protection of the Public

CNL is required to demonstrate that the health and safety of the public are protected from exposures to hazardous substances released from its licensed operations. The effluent and environmental monitoring programs are used to verify that releases of hazardous substances do not result in environmental concentrations that may affect public health.

The CNSC receives reports of discharges to the environment through the reporting requirements outlined in CNL's licences and LCHs. CNSC staff assessment of CNL's Environmental Monitoring Program annual report results for non-radiological (hazardous substances) at CNL facilities for the year 2019, conclude that CNL met regulatory requirements.

Estimated dose to the public

As part of annual reporting to the CNSC, CNL provides data on dose to a hypothetical member of the public that is representative of someone who spends considerable time in proximity to the licensed site.

In all cases, CNL's data indicates that doses to the public resulting from CNL's operations are well below the 1 mSv limit prescribed in the *Radiation Protection Regulations*. At no point during 2019 did the emissions from the CRL site exceed the constraint for dose to the public of 0.30 mSv/year (y) indicated in the CRL LCH. Additionally, the maximum estimated doses to the public from CNL sites were from the PGP at 0.0396 mSv and the PHP at 0.0360 mSv, which are both less than 4% of the regulatory annual dose limit of 1 mSv.

4.2 Radiation Protection

The Radiation Protection SCA covers the implementation of a radiation protection program in accordance with the *Radiation Protection Regulations*. CNL sites are required to implement and maintain a radiation protection program to ensure that contamination levels and radiation doses received by individuals are monitored, controlled and maintained as low as reasonably achievable (ALARA).

For 2019, CNSC staff rated the radiation protection SCA at all CNL licensed sites as "satisfactory".

Appendix F contains data on dose to workers for each CNL site from 2015 to 2019.

Application of ALARA

CNL's application of ALARA within the radiation protection program includes management commitment and oversight, personnel qualification and training, design analyses of facilities and systems, provision of protective equipment and ALARA assessments/reviews of radiological activities.

In 2019, CNL continued to effectively implement the ALARA program at its sites. This program integrates ALARA into design, planning, management and control of radiological activities, and is based on current industry best practices and operating experience. Of note in 2019, CNL introduced a new Radiological Work Permit form that identifies radiological hazards and radiation protection controls in a consistent manner, which in turn increases the effectiveness of pre-job briefings.

WL Decommissioning ALARA Assessment

In the Record of Decision from the October 2019 WL licence renewal Commission Hearing, the Commission requested that CNSC staff provide a systematic assessment of the potential effects on the collective occupational dose from the proposed accelerated decommissioning. In order to provide this information to the Commission, CNSC staff requested that CNL perform an ALARA assessment addressing the impacts of accelerated decommissioning. CNL submitted this assessment to the CNSC on July 30, 2020. This assessment included the potential impact of accelerated decommissioning on both collective and individual doses.

The total collective dose for the accelerated decommissioning approach is estimated to be 520 person-millisieverts[3] (p-mSv), compared to a total collective dose estimate of 205 p-mSv for the alternative selected in the 2002 Comprehensive Study Report (end-state achieved in a 60 year period). This 520 p-mSv collective dose estimate includes workers at both WL and CRL and assumes in situ decommissioning of the WR-1 Reactor and low-level waste management trenches, with the activities concluding in the year 2027.

CNSC staff's preliminary conclusion is that the current suite of action levels (which includes a maximum annual dose of 6 mSv) are appropriate to provide assurance that worker exposures will be managed and controlled during the proposed period of accelerated decommissioning. CNSC staff will provide another update to the Commission after CNSC staff have completed their analysis of CNL's ALARA assessment.

Worker dose control

Workers, including employees and contractors, conducting work activities which present a reasonable probability that the worker may receive an occupational dose greater than 1 mSv/y, are identified as Nuclear Energy Workers (NEWs). Workers, whose job function do not present a reasonable probability of receiving an occupational dose greater than 1 mSv/y are considered non-NEWs.

In 2019, no worker received a radiation dose in excess of the CNSC regulatory dose limits. The maximum dose received by a NEW at CNL sites was at CRL, with a dose of 8.23 mSv, which is approximately 16 percent of the regulatory limit for effective dose of 50 mSv in a one-year dosimetry period.

Radiation protection program performance

Radiation protection program performance at CNL sites was assessed in 2019 through CNSC staff compliance activities.

CNSC staff approved revisions to the PHAI RP Plan for the PHP and PGP in February 2019, which included updates to the action levels for radiological exposures to be more aligned with current work activities. CNL revised the action levels at DP and G-1 based on reviews of historical dosimetry results and planned activities. The revised actions levels for both sites were submitted to the CNSC in December 2019 and accepted by CNSC staff in March 2020.

In 2019, no radiation protection action levels were exceeded.

Radiological hazard control

Radiation and contamination monitoring programs continued to be implemented at CNL's sites in 2019, to control and minimize radiological hazards and the spread of radioactive contamination. Dose rate measurements and, where appropriate, in-plant air monitoring are routinely performed to confirm that radiation exposures are kept ALARA.

[3] Person-millisieverts is a unit of measurement for the annual collective dose for workers (the sum of the effective doses received by all the workers at a facility in a year)

The radiological hazard surveys conducted in 2019 by CNL's staff did not identify any adverse trends, and were consistent with expected radiological conditions.

In April 2019, CNL had 4 skin contamination events occur within a 1 week period associated with the removal of contaminated piping at WL. While the respiratory protection specified provided adequate protection against inhalation intakes, CNL determined that improvements in protective clothing were necessary to prevent worker body contamination. Based on this operating experience, CNL suspended work, changed the suits used during these activities, and provided further training to staff on dress/undress procedures to ensure all proper protocols were being followed. Work resumed in September 2019, and no further skin contaminations were reported. CNSC staff is satisfied with CNL's corrective actions. None of these skin contamination events resulted in an action level exceedance.

4.3 Conventional Health and Safety

The conventional health and safety SCA covers the implementation of a program to manage workplace safety hazards and protect workers. CNL licenced sites must develop, implement and maintain effective safety programs to promote safe and healthy workplaces and minimize incidences of occupational injuries and illnesses.

For 2019, CNSC staff rated the conventional health and safety SCA at all CNL licenced sites as "satisfactory".

Appendix G contains health and safety information for each CNL site from 2015 to 2019.

Practices

During 2019, CNSC staff verified CNL safety practices during compliance inspections and site walk-downs, as well as during desktop reviews and technical assessments.

CNL conducted a company-wide safety stand down on May 30, with that day dedicated to raising safety awareness and strengthening work practices.

Performance

The key performance indicators for conventional health and safety are the number of recordable lost-time injuries (RLTI) that occur per year, RLTI severity and RLTI frequency. An RLTI is defined as a workplace injury that results in the worker being unable to return to work for a period of time.

In 2019, there was 1 RLTI at CRL, 2 at PHP, and 1 at PGP. The RLTI at PGP involved a worker who was injured by the unloading mechanism of a roll-off bin truck and was airlifted to a hospital in Toronto for medical treatment. This event was presented to the Commission in CMD 19-M9, and is discussed further in Section 5.1 of this report.

There were no RLTIs at WL, NPD, G-1, and DP in 2019.

5 EVENTS AND OTHER MATTERS OF REGULATORY INTEREST

5.1 Reportable Events

Detailed requirements for reporting unplanned situations or events at CNL licensed sites to the CNSC are included in the applicable LCH. CNSC Regulatory Document 3.1.2 Reporting Requirements for Non-Power Reactor Class I Facilities and Uranium Mines and Mills came into force for applicable CNL sites in January 2019. Over the period covered by this report, CNL has complied with the requirements for submission of these reports.

For reportable events which occurred in 2019, CNSC staff are satisfied with CNL's corrective actions.

Events which CNSC staff assess as meeting specific risk criteria are the subject of "Event Initial Reports" from CNSC staff to the Commission. In 2019, there were two Event Initial Reports which were both presented to the Commission on February 20, 2019:

1. Worker injured on January 9, 2019 at Port Granby Project, in which a contractor was pinned by the unloading mechanism of a roll-off bin truck, presented to the Commission in CMD 19-M9. Immediately following the event, CNL suspended the use of trucks with roll-off bins at all of its operations in Canada while it conducted an investigation and developed corrective actions to prevent recurrence. Corrective actions included bulletins regarding safety around remotely operated mechanisms at all sites, and training for persons operating such mechanisms. CNSC staff subsequently verified implementation of these corrective actions during an inspection.
2. Power Outage on February 3, 2019 at Chalk River Laboratories, presented to the Commission in CMD 19-M10. CNL determined that the power outage was the result of an electrical malfunction of a 2400V distribution cable. CNSC staff reviewed CNL's Root Cause Analysis for this event and found it to be a thorough assessment of the root causes of the event, which relate to aging infrastructure at the CRL site. CNSC staff also assessed that CNL's corrective and remedial actions will reduce the risk of a similar event in the future, and the consequences of such an event should one occur. CNSC staff performed an inspection at CRL in March 2020 that followed up on the site-wide power outage that confirmed the implementation of CNL's corrective actions.

CNSC staff are satisfied that CNL responded appropriately to these incidents and implemented appropriate corrective actions in response to each event.

5.2 Public Engagement

The area of public engagement has two aspects, those of activities carried out directly by CNSC staff, and of activities carried out by CNL.

5.2.1 CNSC

The NSCA mandates the CNSC to disseminate objective scientific, technical and regulatory information to the public concerning its activities and the activities it regulates. CNSC staff fulfill this mandate in a variety of ways, including hosting in-person and virtual information sessions and through annual regulatory reports. CNSC staff also participate in local community events as well as CNL led public meetings. CNSC staff also seek out other opportunities to engage with the public and Indigenous groups, often participating in meetings or events in communities with interest in nuclear sites. These allow CNSC staff to answer questions about the CNSC's mandate and role in regulating the nuclear industry, including CNL's sites.

CNSC staff carried out over a dozen outreach activities in 2019, which were targeted at, or otherwise relevant to, CNL sites. Some of these activities were targeted to specific regulatory review processes underway, including the WL licence renewal, DP licence amendment, CNL ROR, NSDF and the WL and NPD in situ decommissioning projects. CNSC staff hosted webinars and attended open houses, trade fairs, public markets, municipal Fairs, environmental stewardship meetings such as:

- Lac du Bonnet Trade Fair
- WL Open House (at WL site)
- Pinawa Birthday Celebrations Town Market
- Manitoba Metis Federation Annual General Assembly
- Petawawa Showcase weekend
- Renfrew fair
- Port Hope Fall Fair
- CNSC WL licence renewal webinar
- CNSC ROR webinar

These outreach activities are separate from CNSC staff's Indigenous engagement activities.

CNSC awarded over $41,000 in participant funding to assist Indigenous peoples, members of the public and stakeholders in reviewing this ROR and submitting comments to the Commission, as detailed in Appendix H. CNSC staff is also hosting public webinars to provide information on this ROR and the CNSC.

5.2.2 Canadian Nuclear Laboratories

To ensure open and transparent information about nuclear facilities is available to the public, the CNSC requires licensees to implement and maintain a public information program and disclosure protocol (PIDP).

CNSC staff monitor CNL's implementation of its public information and disclosure programs to verify CNL communicates regularly with its audiences in a way that is meaningful to them. CNSC staff review yearly program updates to verify CNL is taking audience feedback into consideration and taking steps to implement program adjustments to meet the evolving needs of its audiences.

Of note in 2019, CNSC staff performed an in-depth inspection of CNL's public information program for the PHAI. This inspection ran over a two-month period. During this period, CNSC staff assessed the information provided to the public by CNL for the PHP and the PGP for accessibility and content. CNSC staff observed CNL's interactions with the public by attending multiple community engagement activities performed by CNL. This inspection concluded that CNL effectively implements public information program requirements for the PHAI.

5.3 Indigenous Consultation and Engagement

5.3.1 CNSC

As an agent of the Government of Canada and as Canada's nuclear regulator, the CNSC recognizes and understands the importance of consulting and building relationships with Indigenous peoples in Canada. CNSC staff are committed to building long-term relationships with Indigenous groups who have interest in CNSC-regulated facilities within their traditional and/or treaty territories. By pursuing informative and collaborative ongoing interactions, the CNSC's goal is to build partnerships and trust. The CNSC's Indigenous engagement practices, which include information sharing and funding support (through the CNSC's Participant Funding Program) for Indigenous peoples to meaningfully participate in Commission proceedings and ongoing regulatory activities, are consistent with the principles of upholding the honour of the Crown and reconciliation.

CNL sites fall within the traditional and treaty territories of many Indigenous communities, as listed in Appendix I. CNSC staff efforts in 2019 supported the CNSC's ongoing commitment to meeting its consultation obligations and building relationships with Indigenous peoples. In particular, CNSC staff continued to work to meet its Duty to Consult obligations with regards to CNL's proposed projects undergoing environmental assessments and licence amendments or renewals. CNSC staff also continued to identify opportunities for formalized and regular engagement throughout the lifecycle of CNL sites, including meetings and workshops upon request. Through this engagement, CNSC staff welcomed the opportunity to discuss and address all topics of interest and concern to the Indigenous communities.

5.3.2 Canadian Nuclear Laboratories

CNSC staff note that CNL has a dedicated Indigenous engagement program that covers CNL's operations and activities. CNL met and shared information with interested Indigenous communities and organizations throughout 2019.

CNSC staff continue to be satisfied with the level and quality of Indigenous engagement conducted by CNL with regards to its operations and proposed projects at its different sites. CNSC staff encourages CNL to continue to remain flexible and responsive to the requests and needs of the communities that have an interest in its sites, facilities and proposed projects.

5.4 Waste and Decommissioning

CNL's activities at each of the sites covered by this report involve the generation, storage and management of radioactive wastes. CNL has pursued accelerated decommissioning strategies at many of its sites, resulting in an actual or planned increase in the rate of generation of radioactive wastes.

Radioactive wastes stored on the sites covered by this report consist of high, intermediate and low-level radioactive waste. The inventory of wastes stored at CNL sites is included in the sixth *Canadian National Report for the Joint Convention on the Safety of Spent Fuel Management and on the Safety of Radioactive Waste Management (October 2017)*. The report can be found on the CNSC's website. The next meeting of the Joint Convention on the Safety of Spent Fuel Management and on the Safety of Radioactive Waste Management will take place in May 2021. Canada's Seventh National Report will be released in the spring of 2021 and will be available on the CNSC's website.

During the reporting period, CNL enhanced its decommissioning program with the release of the Environmental Remediation Process, which is initiated when an environmental remediation is required or a CNL site requires investigation. In terms of reducing its legacy liability, throughout 2019 CNL continued to execute decommissioning and remediation activities at all of its sites.

CNSC staff maintain oversight of CNL's current and future management of radioactive wastes via inspections, desktop reviews, and technical assessments. During 2019, CNL employed effective programs to safely manage radioactive and hazardous wastes from CNL's licensed activities and decommissioning of its facilities as authorized by the Commission.

5.5 Independent Environmental Monitoring Program (IEMP)

In addition to licensees carrying out required monitoring of their operations, the CNSC carries out its IEMP to verify and confirm that the public and the environment around licensed nuclear facilities remain safe. Further information on the CNSC's IEMP, including sampling results and associated standards, can be found on the CNSC's Website at: http://www.nuclearsafety.gc.ca/eng/resources/maps-of-nuclear-facilities/iemp/index-iemp.cfm.

In 2019, CNSC staff conducted independent environmental monitoring around the CRL, DP, PHP and PGP sites. IEMP results for the areas surrounding these sites indicate that the public and the environment in the vicinity of these sites are protected.

6 OVERALL CONCLUSIONS

CNSC staff conclude that the CRL, WL, PHAI, DP, G-1 and NPD sites operated safely in 2019. This conclusion is based on CNSC staff's assessments of licensee activities that included site inspections, reviews of reports submitted by licensees, and event and incident reviews, supported by follow-up and general communication with the licensee.

For 2019, the performance in all 14 SCAs was rated as "satisfactory" with the exception of the Security SCA at WL, which was rated "below expectations".

CNSC staff's compliance activities confirmed that:

- Environmental protection programs at all CNL sites were effective in protecting the environment;
- Radiation protection programs at all CNL sites adequately controlled radiation exposures, keeping doses ALARA; and
- Conventional health and safety programs at all CNL sites continue to protect workers.

CNSC staff will continue to provide regulatory oversight at all CNL sites, to ensure that CNL continues to make adequate provision to protect the health, safety and security of workers, Canadians and the environment, and continues to implement Canada's international obligations on the peaceful use of nuclear energy.

ACRONYMS

AECL	Atomic Energy of Canada Limited
AL	Action Level
ALARA	As Low As Reasonably Achievable
BE	Below Expectations
Bq	Becquerel
CANDU	Canada Deuterium Uranium
CMD	Commission Member Document
CNL	Canadian Nuclear Laboratories
CNSC	Canadian Nuclear Safety Commission
CRL	Chalk River Laboratories
CSA	Canadian Standards Association
DP	Douglas Point
DRL	Derived Release Limits
EMP	Environmental Monitoring Program
EMS	Environmental Management System
EPD	Electronic Personal Dosimeters
ERA	Environmental Risk Assessment
G-1	Gentilly-1
HEU	Highly Enriched Uranium
Hrs	Hours
HTO	Hydrogenated tritium oxide; also called tritiated water
IAEA	International Atomic Energy Agency
IEMP	Independent Environmental Monitoring Program
ISO	International Standards Organization
Kg	Kilogram
Km	Kilometers
LCH	Licence Conditions Handbook
LLW	Low-Level Waste
LTWMF	Long-Term Waste Management Facility
MBq	Megabecquerel

MeV	Megaelectron Volt
mSv	Millisievert
MWe	Megawatt Electric
MWth	Megawatt Thermal
NEW	Nuclear Energy Worker
NPD	Nuclear Power Demonstration
NSDF	Near-Surface Disposal Facility
NSCA	Nuclear Safety and Control Act
NRU	Nuclear Reactor Universal
PGP	Port Granby Project
PHAI	Port Hope Area Initiative
PHP	Port Hope Project
p-mSv	Person-Millisieverts
PIDP	Public Information and Disclosure Program
RLTI	Recordable Lost-Time Injuries
ROR	Regulatory Oversight Report
SA	Satisfactory
SAR	Safety Analysis Report
SCA	Safety and Control Area
SWS	Storage with Surveillance
USNRC	United States Nuclear Regulatory Commission
WL	Whiteshell Laboratories
WR-1	Whiteshell Reactor No. 1
WSER	Wastewater Systems Effluent Regulations
Y	Year

A. LIST OF INSPECTIONS AT CNL SITES IN 2019

Table A-1: List of inspections at Chalk River Laboratories

Inspection	Dates	SCAs Covered
CNL-CRL-2019-01: Transportation of Dangerous Goods	March 21 - 22, 2019	• Packaging and Transport
CNL-CRL-2019-02: ZED 2	September 4 - 5, 2019	• Fitness for Service • Operating Performance • Radiation Protection • Waste Management • Management System • Security • Conventional Health and Safety
Security Field Inspection	May 16, 2019	• Security
Security Field Inspection	May 17, 2019	• Security
CNL-CRL-2019-03: Waste and Decommissioning	September 4 - 5, 2019	• Operating Performance • Radiation Protection • Waste Management
Security Field Inspection	September 18, 2019	• Security
CNL-CRL-2019-04: Emergency Transport Exercise	October 9, 2019	• Emergency Management and Fire Protection • Radiation Protection • Management System

Table A-2: List of inspections at Whiteshell Laboratories

Inspection	Dates	SCAs Covered
CNL-WL-2019-01: Packaging and Transport	June 6 - 7, 2019	• Management System • Operating Performance • Radiation Protection • Conventional Health and Safety • Human Performance Management • Waste Management • Packaging and Transport
CNL-WL-2019-02: Fire Protection	August 6 - 8, 2019	• Fitness for Service • Operating Performance • Radiation Protection • Human Performance Management • Emergency Management and Fire Protection • Security • Conventional Health and Safety • Waste Management
Security Field Inspection	August 26 - 28, 2019	• Security
Security Exercise	November 28, 2019	• Security

Table A-3: List of inspections at the Port Hope Project

Inspection	Dates	SCAs Covered
CNL-PHAI-PHP-2019-01: Waste Water Treatment Plant	January 23 - 25, 2019	• Environmental Protection
CNL-PHAI-PHP-2019-02: Training	March 11 - 13, 2019	• Environmental Protection • Radiation Protection • Conventional Health and Safety • Human Performance Management
CNL-PHAI-PHP-2019-03 and CNL-PHAI-PHP-2019-04: Waste Movement RP Transport	March 26 - 27, 2019	• Radiation Protection • Packaging and Transport
CNL-PHAI-PHP-2019-05: General Inspection	August 15 - 16 2019	• Environmental Protection • Radiation Protection • Conventional Health and Safety
CNL-PHAI-PHP-2019-06: Public Information Program	September 30 - November 29, 2019	• Public Information Program
CNL-PHAI-PHP-2019-07: Small Scale Site Remediation Verification	October 1 - 2, 2019	• Environmental Protection • Radiation Protection • Conventional Health and Safety
CNL-PHAI-PHP-2019-08: Cell Integrity	November 14 - 15, 2019	• Physical Design

Table A-4: List of inspections at the Port Granby Project

Inspection	Dates	SCAs Covered
CNL-PHAI-PGP-2019-01: Waste Water Treatment Plant	January 23 - 25, 2019	• Environmental Protection
CNL-PHAI-PGP-2019-02: Cell Capping	May 29 - 30, 2019	• Physical Design
CNL-PHAI-PGP-2019 -03: Slope Stability	May 29 - 30, 2019	• Physical Design
CNL-PHAI-PGP-2019-04: Public Information Program	September 30 - November 29, 2019	• Public Information Program
CNL-PHAI-PGP-2019-05: Remediation Verification	October 2 - 4, 2019	• Environmental Protection
CNL-PHAI-PGP-2019-06: Radiation Protection	October 2 - 4, 2019	• Radiation Protection
CNL-PHAI-PGP-2019-07: Cell Capping	November 13 - 14, 2019	• Physical Design

Inspection	Dates	SCAs Covered
Security Field Inspection	May 30, 2019	• Security

B. REGDOC IMPLEMENTATION

Table B-1: Regulatory Documents - CRL

Document Number	Document Title	Version	Status
REGDOC-2.1.2	Management System: Safety Culture	2018	Implemented
REGDOC-2.2.4	Fitness for Duty: Managing Worker Fatigue	2017	Implemented
REGDOC-2.2.4	Fitness for Duty, Volume II: Managing Alcohol and Drug Use, version 2	2017	Implemented
REGDOC-2.2.4	Fitness for Duty, Volume III: Nuclear Security Officer Medical, Physical, and Psychological Fitness	2018	Implemented
REGDOC-2.4.1	Deterministic Safety Analysis	2014	Implemented
REGDOC-2.5.7	Design, Testing and Performance of Exposure Devices	2017	Implemented
REGDOC-2.6.3	Aging Management	2014	Implemented
REGDOC-2.9.1	Environmental Principles, Assessments and Protection Measures, version 1.1	2017	Gap analysis due December 2020
REGDOC-2.10.1	Nuclear Emergency Preparedness and Response, Version 2	2016	Implemented
REGDOC-2.12.1 (prescribed information)	High-Security Sites, Volume I: Nuclear Response Force	2013	Implemented
REGDOC-2.12.1 (prescribed information)	High-Security Facilities, Volume II: Criteria for Nuclear Security Systems and Devices	2018	Implemented
REGDOC-2.12.2	Site Access Security Clearance	2013	Implemented
REGDOC-2.12.3	Security of Nuclear Substances: Sealed Sources	2013	Implemented
REGDOC-2.13.1	Safeguards and Nuclear Material Accountancy	2018	Implemented
REGDOC-3.1.2	Reporting Requirements, Volume I: Non-Power Reactor Class I Nuclear Facilities and Uranium Mines and Mills	2018	Implemented
REGDOC-3.2.1	Public Information and Disclosure	2018	Gap analysis due December 2020

Table B-2: Regulatory Documents - WL

Document Number	Document Title	Version	Status
REGDOC-2.1.2	Management System: Safety Culture	2018	Implemented
REGDOC-2.2.2	Personnel Training, version 2	2016	Effective January 1, 2020
REGDOC-2.2.4	Fitness for Duty: Managing Worker Fatigue	2017	Effective January 1, 2020
REGDOC-2.2.4	Fitness for Duty, Volume II: Managing Alcohol and Drug Use, version 2	2017	TBD
REGDOC-2.2.4	Fitness for Duty, Volume III: Nuclear Security Officer Medical, Physical, and Psychological Fitness	2018	Effective October 2020
REGDOC 2.4.3	Nuclear Criticality Safety	2018	Effective January 1, 2020
REGDOC-2.9.1	Environmental Principles, Assessments and Protection Measures, version 1.1	2017	Gap analysis due December 2020
REGDOC-2.10.1	Nuclear Emergency Preparedness and Response, Version 2	2016	Effective January 1, 2020
REGDOC-2.12.1 (prescribed information)	High-Security Sites, Volume I: Nuclear Response Force	2013	Effective January 1, 2020
REGDOC-2.12.1 (prescribed information)	High-Security Facilities, Volume II: Criteria for Nuclear Security Systems and Devices	2018	Effective January 1, 2020
REGDOC-2.12.2	Site Access Security Clearance	2013	Effective January 1, 2020
REGDOC-2.12.3	Security of Nuclear Substances: Sealed Sources	2013	Effective January 1, 2020
REGDOC-2.13.1	Safeguards and Nuclear Material Accountancy	2018	Effective January 1, 2020
REGDOC-3.1.2	Reporting Requirements, Volume I: Non-Power Reactor Class I Nuclear Facilities and Uranium Mines and Mills	2018	Implemented
REGDOC-3.2.1	Public Information and Disclosure	2018	Gap analysis due December 2020

Table B-3: Regulatory Documents - PHP

Document Number	Document Title	Version	Status
REGDOC-2.2.2	Personnel Training, version 2	2016	Effective October 2021
REGDOC-2.9.1	Environmental Principles, Assessments and Protection Measures, version 1.1	2017	Gap analysis due December 2020

Table B-4: Regulatory Documents - PGP

Document Number	Document Title	Version	Status
REGDOC-2.2.2	Personnel Training, version 2	2016	Effective October 2021
REGDOC-2.9.1	Environmental Principles, Assessments and Protection Measures, version 1.1	2017	Gap analysis due December 2020

Table B-5: Regulatory Documents - DP, G-1 and NPD

Document Number	Document Title	Version	Status
REGDOC-2.1.2	Management System: Safety Culture	2018	Implemented
REGDOC-2.2.2	Personnel Training, Version 2	2016	Effective June 1, 2020
REGDOC-2.6.3	Aging Management	2014	Implemented
REGDOC-2.9.1	Environmental Protection: Environmental Protection Policies, Programs and Procedures (2013)	2013	Implemented
REGDOC-2.9.1	Environmental Protection: Environmental Principles, Assessments and Protection Measures, version 1.1	2017	Gap analysis due December 2020 Effective December 2021
REGDOC-2.10.1	Nuclear Emergency Preparedness and Response, Version 2	2016	Effective July 1, 2020
REGDOC-2.13.1	Safeguards and Nuclear Material Accountancy	2018	Implemented

D. TOTAL ANNUAL RELEASE OF RADIONUCLIDES

Licensees are required to demonstrate that their releases are below their Derived Release Limits (DRL) and that the sum of their release are below 1 mSv/y, which is the public regulatory dose limit. To ensure these limits are respected, licensees also are required to develop action levels significantly below their DRLs as a means of detecting elevated releases meriting follow-up investigations and actions to ensure releases are adequately controlled.

The following tables provide the annual load of key radionuclides directly released to atmosphere or to surface waters from licensed facilities operated by CNL for the reporting period of 2015-2019. Applicable DRLs are also presented where they exist. There are no comparisons to limits and guidelines for the PHP or PGP as the limits in licences are based on either monthly mean, weekly mean, or grab samples.

Over this reporting period, there have been no licence limit exceedances.

As CNL is the licence holder for the G-1 waste facility, releases would be reported in this ROR. However, an effluent monitoring plan assessment conducted in 2016 confirmed that there is minimal or no source of airborne radioactivity at G-1. Therefore, airborne emissions are no longer monitored. Furthermore, all liquids from facility sumps were transferred to the Gentilly-2 facility effluent system to be managed and discharged by Hydro-Quebec.

CNSC staff have commenced publishing annual releases of radionuclides to the environment from nuclear facilities on the CNSC Open Government Portal: https://open.canada.ca/data/en/dataset/6ed50cd9-0d8c-471b-a5f6-26088298870e.

Chalk River Laboratories

Table D-1: Chalk River Laboratories annual radionuclide releases to atmosphere for 2015 - 2019

Year	Elemental Tritium (Bq)	Tritium: (HTO: Bq)	Carbon-14 (Bq)	Iodine-131 (Bq)	Noble Gas (Bq-MeV)	Argon-41 (Bq)	Xenon-133 (Bq)
DRL	**3.84E+17**	**1.25E+16**	**2.14E+15**	**3.96E+12**	**4.96E+16**	**6.50E+16**	**8.35E+17**
2019	5.51E+12	1.98E+14	3.44E+10	2.14E+07	N/A [a]	N/A [b]	N/A [c]
2018	6.86E+12	2.29E+14	2.54E+11	1.02E+08	6.50E+12	2.59E+15	N/A [c]
2017	4.64E+12	2.50E+14	4.90E+11	3.82E+08	6.50E+12	1.16E+16	N/A [c]
2016	2.55E+12	2.30E+14	4.84E+11	5.17E+10	8.50E+14	1.07E+16	3.12E+15
2015	4.77E+12	2.77E+14	3.77E+11	1.03E+11	1.20E+15	1.29E+16	4.89E+15

a After the safe shutdown of the Molybdenum Production Facility, there are no airborne releases of noble gases

b After the safe shutdown of the Nuclear Reactor Universal (NRU) reactor, there are no airborne releases of Argon-41

c After the safe shutdown of the Molybdenum Production Facility, there are no airborne releases of Xenon-133

Table D-2: Chalk River Laboratories annual radionuclide releases to surface water for 2015 - 2019

Year	Tritium: (HTO: Bq)	Gross Alpha (Bq)	Gross Beta (Bq)
DRL	**1.03E+17**	**1.32E+12**	**2.70E+13**
2019	1.37E+13	4.62E+08	2.75E+10
2018	1.93E+13	6.88E+08	2.84E+10
2017	3.81E+13	7.66E+08	4.17E+10
2016	3.50E+13	6.60E+08	3.22E+10
2015	3.94E+13	6.94E+08	3.96E+10

<u>Whiteshell Laboratories</u>

Table D-3: Whiteshell Laboratories annual radionuclide releases to atmosphere for 2015 - 2019

Year	Tritium: (HTO: Bq)	Gross Alpha (Bq)	Gross Beta (Bq)
DRL	**8.58E+16**	**9.00E+10**	**3.60E+11**
2019	3.34E+10	9.31E+04	3.27E+05
2018	1.31E+10	9.13E+04	1.70E+05
2017	5.03E+10	9.34E+04	2.24E+05
2016	3.24E+10	9.46E+04	2.12E+05
2015	9.88E+10	9.79E+04	2.26E+05

Table D-4: Whiteshell Laboratories annual radionuclide releases to surface water for 2015 - 2019

Year	Gross Alpha (Bq)	Uranium-total (Bq)	Plutonium -239/240 (Bq)	Plutonium -238 (Bq)	Americium-241 (Bq)	Gross Beta (Bq)	Strontium -90 (Bq)	Cesium-137 (Bq)
DRL	**1.33E+10**	**1.50E+11**	**1.33E+10**	**1.39E+10**	**1.25E+10**	**a**	**1.56E+11**	**1.39E+11**
2019	5.82E+07	1.49E+07	4.70E+07	4.86E+07	2.01E+07	3.43E+08	5.95E+07	2.11E+07
2018	3.90E+07	1.16E+07	2.32E+07	1.84E+07	4.21E+06	1.94E+08	3.21E+07	1.51E+07
2017	3.88E+07	1.69E+07	1.20E+07	8.69E+06	5.10E+06	2.97E+08	6.67E+07	1.89E+07
2016	4.59E+07	N/A[b]	N/A[b]	N/A[b]	N/A[b]	2.83E+08	6.08E+07	1.28E+07
2015	4.08E+07	N/A[b]	N/A[b]	N/A[b]	N/A[b]	2.23E+08	3.96E+07	1.65E+07

a There is no DRL for gross beta because there is a DRL for the regulated components of gross beta (cesium-137 and strontium-90)
b Monitoring of uranium-total, Plutonium-239/240, Plutonium-238, and Americium-241 began in 2017

Port Hope Area Initiative

Table D-5 shows releases from the Port Granby Project and Table D-6 shows releases from the Port Hope Project. For both projects, the loadings were calculated by multiplying the monthly total volume released by the monthly average concentrations. The total annual loadings are a sum of the monthly loads. There were no exceedances of regulatory limits.

Port Granby Project

CNL began using the new Waste Water Treatment Plant in 2016 to treat contaminated water at the PGP.

Table D-5: Port Granby Project annual radionuclide releases to surface water for 2015 - 2019

Year	Radium-226 (MBq)	Uranium (kg)
2019	2.2	2.7
2018	1.0	1.3
2017	1.0	1.4
2016	2.4	15.6
2015	4.6	29.0

Port Hope Project

CNL began using the new Waste Water Treatment Plant in 2017 to treat contaminated water, in place of the old Water Treatment Building. During heavy rainfall events in 2017, 2018, and 2019, CNL restarted the old Water Treatment Building to treat excess contaminated water, in accordance with their water contingency plan, in order to avoid a release of untreated water to the environment.

Table D-6: Port Hope Project annual radionuclide releases to surface water for 2015 - 2019

Year	Radium-226 (MBq)	Uranium (kg)
2019	13.6	6.9
2018	6.2	14.3
2017	16.6	110.2
2016	3.3	19.3
2015	4.5	20.7

Douglas Point

Table D-7: Douglas Point annual radionuclide releases to atmosphere for 2015 - 2019

Year	Tritium: (HTO: Bq)	Gross Alpha (Bq)	Gross Beta (Bq)	Carbon-14 (Bq)
DRL	**5.46E+17**	**N/A**	**3.69E+12**	**3.22E+15**
2019	2.41E+11	4.90E+03	3.90E+04	N/A[c]
2018	7.96E+11	3.07E+03	4.55E+04	1.51E+09
2017	1.12E+11	1.64E+03	2.29E+04	N/A[b]
2016	1.59E+11	1.68E+03	1.91E+04	N/A[b]
2015	1.33E+10	N/A[a]	N/A[a]	N/A[b]

a Monitoring of gross alpha and gross beta began in 2016

b Monitoring of Carbon-14 was completed in 2018 for activities that had potential for a measurable release of C-14

c C-14 was not measured in 2019 because there were no projects identified that had the potential to generate C-14 emissions

Table D-8: Douglas Point annual radionuclide releases to surface water for 2015 - 2019

Year	Tritium: (HTO: Bq)	Gross Alpha (Bq)	Gross Beta (Bq)
DRL	**2.04E+17**	**N/A**	**3.43E+13**

E. ESTIMATED DOSE TO THE PUBLIC

This appendix contains information on the estimated dose to the public around CNL sites. Regulatory release limits known as derived release limits or DRLs are site-specific calculated releases that could, if exceeded, expose a member of the public of the most highly exposed group to a committed dose equal to the regulatory annual dose limit of 1 mSv/y. DRLs are calculated using CSA standard N288.1-14, *Guidelines for calculating derived release limits for radioactive materials in airborne and liquid effluents for normal operation of nuclear facilities*.

As per the *Radiation Protection Regulations* subsection 1(3), and considering the fact that the radiological releases from all the sites covered by this ROR have remained small fractions of the DRLs applicable to those sites, the contribution to the dose to the public from these releases remains a very small fraction of the prescribed limit for the general public.

Chalk River Laboratories

The maximum dose in each year since 2015 has been well below the dose limit of 1 mSv/y. Furthermore, at no point during this period have the emissions from the CRL site exceeded the constraint for dose to the public of 0.30 mSv/y.

Table E-1: CRL maximum effective dose to a member of the public from 2015 - 2019

Dose Data	2015	2016	2017	2018	2019	Regulatory Limit
Maximum Effective Dose (mSv)	0.0820	0.0780	0.0870	0.0360	0.0039	1 mSv/y

Whiteshell Laboratories

The dose to critical groups from releases from CNL-WL in 2019 was 0.00009 mSv, which is well below the regulatory dose limit of 1 mSv/y.

Table E-2: WL maximum effective dose to a member of the public from 2015 - 2019

Dose Data	2015	2016	2017	2018	2019	Regulatory Limit
Maximum effective dose (mSv)	0.00004	0.00007	0.00005	0.00004	0.00009	1 mSv/y

Port Hope Area Initiative

A modified approach for calculating estimated dose to the public was performed by CNL for PHAI sites in 2019, and included both radon monitoring and fence line dosimeter measurements at both PHP and PGP sites.

The annual estimated doses to the public in 2019 were 0.0396 mSv/y at PGP and 0.036 mSv/y at PHP, which are well below the annual regulatory dose limit of 1 mSv.

Table E-3: PGP maximum effective dose to a member of the public from 2015 - 2019

Dose data	2015	2016	2017	2018	2019	Regulatory limit
Maximum effective dose (mSv)	0.0084	0.0054	0.0057	0.0200	0.0396	1 mSv/y

Table E-4: PHP maximum effective dose to a member of the public from 2015 - 2019

Dose data	2015	2016	2017	2018	2019	Regulatory limit
Maximum effective dose (mSv)	0.0935	0.0120	0.0045	0.0275	0.0360	1 mSv/y

Douglas Point Waste Facility

In 2016, CNL conducted a gap analysis against CSA N288.4, *Environmental monitoring programs at Class I nuclear facilities and uranium mines and mills*, and determined that given the very low levels of contaminants in airborne and waterborne effluents, there was no regulatory requirement for an Environmental Monitoring Program at DP. CNSC staff reviewed and accepted this gap analysis. All releases of radioactive material in DP effluents are a small fraction of their respective DRLs and thus, continue to indicate minimal impact on the public or the environment.

Gentilly-1 Waste Facility

The effluent monitoring plan assessment conducted in 2016 by CNL determined that there is minimal or no source of airborne radioactivity from routine operations at G-1. In addition, all liquid releases were discharged through Gentilly-2 effluent system, operated by Hydro-Québec, and represent a small fraction of the total releases from the larger Gentilly site. The Hydro-Québec’s Gentilly-2 environmental monitoring program captures any environmental impacts from the small contribution from G-1. The dose to the public from the Gentilly-2 nuclear site, including contributions from G-1, remain below 0.01 mSv/y.

Nuclear Power Demonstration Waste Facility

NPD is no longer discharging liquid effluents from the facility sumps to the Ottawa River, and there were no such releases during the 2019 reporting period. All other releases of radioactive material in NPD effluents are a small fraction of their respective DRLs and thus, continue to indicate minimal impact on the public or the environment. CNL’s environmental monitoring at CRL will regionally overlap with the NPD waste facility, so information from CRL’s off-site environmental monitoring program could also be considered. CNSC staff have determined that the public dose from NPD remains at a very small fraction of the public dose limit.

F. DOSES TO NUCLEAR ENERGY WORKERS AND NON-NUCLEAR ENERGY WORKERS AT CNL SITES

This appendix presents information on doses to Nuclear Energy Workers (NEWs) and non-NEWs at CNL sites.

Chalk River Laboratories

Figure F-1 provides the average effective doses and the maximum effective doses to NEWs at CRL from 2015 to 2019. In 2019, the maximum effective dose received by a NEW at CRL was 8.23 mSv; approximately 16 percent of the regulatory limit for effective dose of 50 mSv in a one-year dosimetry period.

The dose fluctuations from year to year are attributed to the scope and duration of the radiological work conducted, along with the dose rates associated with the work. No adverse trends were identified in 2019.

Figure F-1: Average and maximum effective doses to NEWs at CRL from 2015 - 2019

	2015	2016	2017	2018	2019
Average Effective Dose (mSv)	0.45	0.49	0.44	0.34	0.27
Maximum Effective Dose (mSv)	10.72	12.24	13.13	12.48	8.23
Number of Persons Monitored	4410	4387	4515	4227	4071

As shown in tables F-1a and F-1b, equivalent doses (skin and extremity) at the CRL site were below the CNSC regulatory equivalent dose limits for a NEW of 500 mSv/y. The maximum equivalent (skin) dose received by a NEW in 2019 was 9.65 mSv; approximately 2 percent of the regulatory limit for equivalent dose to the skin of 500 mSv in a one-year dosimetry period. The maximum equivalent (extremity) dose received by a NEW in 2019 was 21.38 mSv; approximately 4 percent of the regulatory limit for equivalent dose to the hands and feet of 500 mSv in a one-year dosimetry period.

Table F-1a: Equivalent (skin) doses to NEWs at CRL from 2015 - 2019

Dose Data	2015	2016	2017	2018	2019	Regulatory Limit
Average skin dose (mSv)	0.55	0.60	0.53	0.40	0.29	n/a
Maximum skin dose (mSv)	15.75	16.54	19.95	15.84	9.65	500 mSv/y

Table F-1b: Equivalent (extremity) doses to NEWs at CRL from 2015 - 2019

Dose Data	2015	2016	2017	2018	2019	Regulatory Limit
Average extremity dose (mSv)	2.84	3.71	6.10	4.85	2.21	n/a
Maximum extremity dose (mSv)	29.32	41.59	85.06	44.83	21.38	500 mSv/y

Non-NEWs at CRL

In 2019, the maximum annual effective dose received by a non-NEW was 0.3 mSv; 30 percent of the regulatory limit for effective dose of 1 mSv in a one-year dosimetry period.

Whiteshell Laboratories

Figure F-2 provides the average effective doses and the maximum effective doses received by NEWs at WL from 2015 to 2019. In 2019, the maximum effective dose received by a NEW at WL was 3.09 mSv; approximately 6 percent of the regulatory limit for effective dose of 50 mSv in a one-year dosimetry period.

The dose fluctuations from year to year are attributed to the scope and duration of the radiological work conducted, along with the dose rates associated with the work. No adverse trends were identified in 2019.

Figure F-2: Average and maximum effective doses to NEWs at WL from 2015 - 2019

	2015	2016	2017	2018	2019
Average Effective Dose (mSv)	0.04	0.02	0.03	0.07	0.10
Maximum Effective Dose (mSv)	0.42	0.36	1.41	1.65	3.09
Number of NEWs Monitored	753	659	607	595	489

As shown in tables F-2a and F-2b, equivalent doses (skin and extremity) at the WL site were below the CNSC regulatory equivalent dose limits for a NEW of 500 mSv/y. The maximum equivalent (skin) dose received by a NEW in 2019 was 7.47 mSv; approximately 1.5 percent of the regulatory limit for equivalent dose to the skin of 500 mSv in a one-year dosimetry period. The maximum equivalent (extremity) dose received by a NEW in 2019 was 37.77 mSv; approximately 7.5 percent of the regulatory limit for equivalent dose to the hands and feet of 500 mSv in a one-year dosimetry period.

Table F-2a: Equivalent (skin) doses to NEWs at WL from 2015 - 2019

Dose Data	2015	2016	2017	2018	2019	Regulatory Limit
Average skin dose (mSv)	0.04	0.02	0.05	0.12	0.20	n/a
Maximum skin dose (mSv)	0.65	0.36	2.90	3.72	7.47	500 mSv/y

Table F-2b: Equivalent (extremity) doses to NEWs at WL from 2015 - 2019

Dose Data	2015	2016	2017	2018	2019	Regulatory Limit
Average extremity dose (mSv)	0.09	0.05	1.51	5.02	4.80	n/a
Maximum extremity dose (mSv)	0.72	0.11	11.35	36.71	37.77	500 mSv/y

Non-NEWs at WL

In 2019, external dosimeters issued to non-NEWs at WL did not record any measureable doses.

Port Hope Area Initiative

<u>Port Granby</u>

Figure F-3 provides the average effective doses and the maximum effective doses for NEWs at the PGP from 2015 to 2019. In 2019, the maximum effective dose received by a NEW at the PGP was 0.79 mSv, which is well below the CNSC's annual regulatory effective dose limit of 50 mSv. The total number of NEWs includes all contractors involved in work at the PGP as well as CNL staff.

Effective doses were trending down in 2019 due to work activities at the PGP nearing completion of excavation activities, and with the focus turning to capping of the Long-Term Waste Management Facility (LTWMF).

Figure F-3: Average and maximum effective doses to NEWs at PGP from 2015 - 2019

	2015	2016	2017	2018	2019
Average Effective Dose (mSv)	0.01	0.01	0.03	0.06	0.05
Maximum Effective Dose (mSv)	0.16	0.30	0.39	3.13	0.79
Number of NEWs Monitored	118	309	430	489	560

As shown in Table F-3, skin doses at the PGP were well below the CNSC regulatory equivalent dose limit for a NEW of 500 mSv/y. The maximum skin dose for a NEW at the PGP in 2019 was 0.79 mSv, and the average skin dose for all NEWs was 0.05 mSv.

Table F-3: Equivalent (skin) doses to NEWs at PGP from 2015 - 2019

Dose Data	2015	2016	2017	2018	2019	Regulatory Limit
Average skin dose (mSv)	0.01	0.01	0.04	0.05	0.05	n/a
Maximum skin dose (mSv)	0.16	0.30	0.34	2.44	0.79	500 mSv/y

Port Hope

Figure F-4 provides the average effective doses and the maximum effective doses for NEWs at the PHP from 2015 to 2019. In 2019, the maximum effective dose received by a NEW at the PHP was 0.38 mSv, which is well below the CNSC's annual regulatory effective dose limit of 50 mSv. The total number of NEWs includes all contractors involved in work at the PHP as well as CNL staff.

Effective doses remained low in 2019 as there were no significant changes in the scope of work activities at the PHP.

Figure F-4: Average and maximum effective doses to NEWs at PHP from 2015 - 2019

	2015	2016	2017	2018	2019
Average Effective Dose (mSv)	0.01	0.01	0.03	0.04	0.04
Maximum Effective Dose (mSv)	0.16	0.30	0.34	0.59	0.38
Number of NEWs Monitored	118	309	343	656	932

As shown in Table F-4, skin doses at the PHP were also well below the CNSC regulatory equivalent dose limit for a NEW of 500 mSv/y. The maximum skin dose for a NEW at the PHP in 2019 was 0.60 mSv, and the average skin dose for all NEWs was 0.04 mSv.

Table F-4: Equivalent (skin) doses to NEWs at PHP from 2015 - 2019

Dose Data	2015	2016	2017	2018	2019	Regulatory Limit
Average skin dose (mSv)	0.01	0.01	0.04	0.04	0.04	n/a
Maximum skin dose (mSv)	0.16	0.30	0.34	0.33	0.60	500 mSv/y

Non-NEWs at Port Hope Area Initiative

Doses to non-NEWs at the Port Hope Area Intitiative are either estimated based on radiological conditions of areas visited, or directly monitored by using electronic personal dosimeters (EPDs).

In 2019, the maximum annual effective doses received by non-NEWs were 0.02 mSv at the PGP, and 0.04 mSv at the PHP. These doses are well below the annual regulatory dose limit of 1 mSv in a one-year dosimetry period.

DP, G-1 and NPD Waste Facilities

Douglas Point Waste Facility

Figure F-5 provides the average effective doses and the maximum effective doses for NEWs at DP from 2015 to 2019. In 2019, the maximum effective dose received by a NEW at DP was 0.24 mSv, which is well below the CNSC's annual regulatory effective dose limit of 50 mSv.

There has been an increase in the number of workers since 2015 at DP, mainly attributed to an increase in the execution of planned hazard reduction work activities such as the Spent Resin Removal Project and dry active waste removal campaigns. These work activities resulted in slight increases in the maximum effective doses observed in 2017 and 2018.

Figure F-5: Average and maximum effective doses to NEWs at DP from 2015 - 2019

	2015	2016	2017	2018	2019
Average Effective Dose (mSv)	0.00	0.01	0.01	0.01	0.02
Maximum Effective Dose (mSv)	0.06	0.11	0.37	0.43	0.24
Number of NEWs Monitored	64	80	92	123	74

Annual average and maximum equivalent (skin) dose results for NEWs at DP from 2015 to 2019 are provided in Table F-5. In 2019, the maximum skin dose received by a NEW at DP was 0.24 mSv, which is well below the CNSC's annual regulatory equivalent dose limit of 500 mSv/y.

Table F-5: Equivalent (skin) doses to NEWs at DP from 2015 - 2019

Dose Data	2015	2016	2017	2018	2019	Regulatory Limit
Average skin dose (mSv)	0.00	0.01	0.01	0.01	0.02	n/a
Maximum skin dose (mSv)	0.06	0.11	0.37	0.43	0.24	500 mSv/y

Non-NEWs at DP

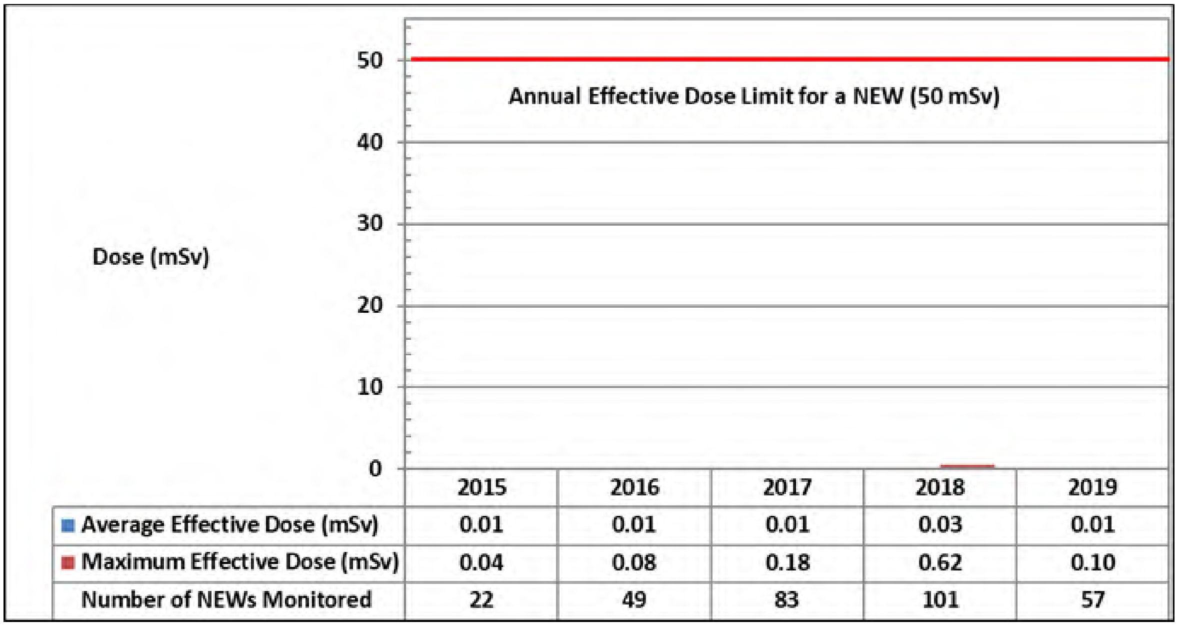
In 2019, external dosimeters issued to non-NEWs at DP did not record any measureable doses.

Gentilly-1 Waste Facility

Figure F-6 provides the average effective doses and the maximum effective doses for NEWs at Gentilly-1 from 2015 to 2019. In 2019, the maximum effective dose received by a NEW at Gentilly-1 was 0.10 mSv, which is well below the CNSC's annual regulatory effective dose limit of 50 mSv.

Since 2015, there has been an increase in the number of workers on site at G-1, along with slight increases in radiation doses for NEWs, due to an increase in planned work activities (both maintenance tasks and project activities), including the Spent Resin Removal Project in 2018.

Figure F-6: Average and maximum effective doses to NEWs at G-1 from 2015 - 2019



Annual average and maximum equivalent (skin) dose results for NEWs at G-1 from 2015 to 2019 are provided in Table F-6. In 2019, the maximum skin dose received by a NEW at G-1 was 0.16 mSv, which is well below the CNSC's annual regulatory equivalent dose limit of 500 mSv.

Table F-6: Equivalent (skin) doses to NEWs at G-1 from 2015 - 2019

Dose Data	2015	2016	2017	2018	2019	Regulatory Limit
Average skin dose (mSv)	0.01	0.01	0.01	0.03	0.01	n/a
Maximum skin dose (mSv)	0.04	0.08	0.18	0.62	0.16	500 mSv/y

Non-NEWs at Gentilly-1

In 2019, external dosimeters issued to non-NEWs at G-1 did not record any measureable doses.

Nuclear Power Demonstration Waste Facility

Figure F-7 provides the average effective doses and the maximum effective doses for NEWs at NPD from 2015 to 2019. In 2019, the maximum effective dose received by a NEW at NPD was 0.05 mSv, which is well below the CNSC's annual regulatory effective dose limit of 50 mSv.

Effective doses during the years 2015 and 2016 were consistently low and reflect storage with surveillance (SWS) activities such as routine inspection and maintenance, as well as some hazard reduction activities. Doses in 2017 saw a sharp increase due to planned work activities involving engineering assessments, thorough facility characterization and large scale hazard reduction activities (asbestos abatement). Following the 2017 increase, doses in 2018 and 2019 have returned to levels seen previously during SWS activities, while remaining characterization and engineering activities occurred.

Figure F-7: Average and maximum effective doses to NEWs at NPD from 2015 - 2019

	2015	2016	2017	2018	2019
Average Effective Dose (mSv)	0.00	0.00	0.05	0.00	0.03
Maximum Effective Dose (mSv)	0.12	0.05	3.02	0.09	0.05
Number of NEWs Monitored	211	212	265	186	167

Annual average and maximum equivalent (skin) dose results for NEWs at NPD, from 2015 to 2019, are provided in Table F-7. In 2019, the maximum skin dose received by a NEW at NPD was 0.05 mSv, which is well below the CNSC's annual regulatory equivalent dose limit of 500 mSv.

Table F-7: Equivalent (skin) doses to NEWs at NPD from 2015 - 2019

Dose Data	2015	2016	2017	2018	2019	Regulatory Limit
Average skin dose (mSv)	0.00	0.00	0.04	0.00	0.03	n/a
Maximum skin dose (mSv)	0.12	0.05	3.03	0.09	0.05	500 mSv/y

Non-NEWs at NPD

In 2019, external dosimeters issued to non-NEWs at NPD did not record any measureable doses.

G. LOST-TIME INJURY INFORMATION

This appendix contains information on the number, frequency and severity of recordable lost-time injuries at the CNL sites covered by this ROR, with information presented separately for CNL employees and contractors.

CNL Employees

Frequency and severity are calculated per 100 full-time workers (equivalent to 200,000 worker-hours per year) using the following formulas:

Frequency rate = (# of Lost-Time Injuries) x (200 000 hrs of exposure) / (person hours worked)

Severity rate = (# of Working Days Lost) x (200 000 hrs of exposure) / (person hours worked)

Table G-1: Summary of CRL's recordable lost time injuries (RLTI), frequency and severity *(Source: CNL)*

Year	2015	2016	2017	2018	2019
Person Hours Worked (all CNL)	6 294 295	6 405 670	-	-	-
Person Hours Worked	-	-	5 597 015	5 396 450	5 729 010
Lost-Time Injuries	2	6	4	5	1
Working Days Lost	7	47	10	69	75
Frequency	0.06	0.19	0.14	0.19	0.03
Severity	0.22	1.47	0.36	2.56	2.62
Note that prior to 2017, CNL did not provide data for person-hours worked on CRL site alone, therefore total CNL hours worked are used in place of that data. This skews frequency and severity data for the CRL site for the 2014-2016 years, and makes comparison between pre- and post-2017 data for CRL difficult.					

For 2019, 75 working days were lost at CRL, the most since 2015. The majority of these days are attributable to one CNL employee who sustained a shoulder injury that required subsequent surgery.

Table G-2: Summary of WL's recordable lost time injuries (RLTI), frequency and severity *(Source: CNL)*

CNL employees at WL did not have any recordable lost-time injuries in 2019

Year	2015	2016	2017	2018	2019
Person Hours Worked	741 000	684 450	706 000	688 000	642 000
Lost-Time Injuries	0	1	3	1	0
Working Days Lost	0	5	27	5	0
Frequency	0	0.29	0.85	0.28	0
Severity	0	1.46	7.67	1.45	0

Table G-3: Summary of PHPs recordable lost time injuries (RLTI), frequency and severity *(Source: CNL)*

Year	2015	2016	2017	2018	2019
Person Hours Worked	N/A	N/A	N/A	N/A	340 000
Lost-Time Injuries	0	0	0	0	1
Working Days Lost	0	0	0	0	33
Frequency	0	0	0	0	0.68
Severity	0	0	0	0	22.57

CNL staff at the DP, G-1 PGP, and NPD sites have not recorded a lost-time injury since 2015.

Contractors at CNL sites

The number of contractor recordable lost-time incidents reported to CNL in 2019 is shown in Table G-4.

CNL records the number of lost time incidents reported to CNL by their contractors. However, contractor employee hours worked is considered sensitive information and the contractors do not divulge the specific number of hours worked to CNL as their client. Therefore, CNL does not provide frequency and severity rates for contractors since these calculations require hours worked.

Table G-4: Contractor lost time incidents in 2019 *(Source: CNL)*

Site	CRL	WL	NPD	G-1	DP	PHP	PGP
Lost -Time Injuries	0	0	0	0	0	1	1

H. PARTICIPANT FUNDING AWARDED FOR THE 2019 CNL REGULATORY OVERSIGHT REPORT

Recipient	Amount (up to)
Algonquins of Ontario	$11,700
Canadian Environmental Law Association	$5,880
Grand Council Treaty #3	$4,000
Manitoba Métis Federation	$11,700
Concerned Citizens of Renfrew County	$2,500
Curve Lake First Nation	$5,676

I. INDIGENOUS COMMUNITIES AND GROUPS WHOSE TRADITIONAL AND/OR TREATY TERRITORIES ARE IN PROXIMITY TO CNL SITES

Chalk River Laboratories and Nuclear Power Demonstration

- Algonquins of Ontario
- Algonquins of Pikwàkanagàn
- Métis Nation of Ontario
- Algonquin Anishinabeg Nation Tribal Council
- Kebaowek First Nation
- Kitigan Zibi Anishinabeg First Nation
- Anishinabek Nation
- the Algonquin Nation Secretariat
- Williams Treaties First Nations:
  - Alderville First Nation
  - Beausoleil First Nation
  - the Chippewas of Georgina Island First Nation
  - Chippewas of Rama First Nation
  - Curve Lake First Nation
  - Hiawatha First Nation
  - Mississaugas of Scugog Island First Nation

e-Doc 7067398 (PDF)

Summary

This Commission member document (CMD) concerns the regulatory oversight report for sites operated by Canadian Nuclear Laboratories (CNL) for the 2022 calendar year. CNL is the licensee for each of these sites.

No actions are required of the Commission. This CMD is for information only.

Résumé

Le présent document à l’intention des commissaires (CMD) porte sur le Rapport de surveillance réglementaire pour les sites exploités par les Laboratoires Nucléaires Canadiens (LNC) durant l’année civile 2022. Les LNC sont le titulaire de permis pour chacun de ces sites.

Aucune mesure n’est requise de la part de la Commission. Ce CMD est fourni à titre d’information seulement.

TABLE OF CONTENTS

PLAIN LANGUAGE SUMMARY

The *Regulatory Oversight Report for Canadian Nuclear Laboratories Sites: 2022* describes the safety performance of the sites that are licensed to Canadian Nuclear Laboratories (CNL) by the Canadian Nuclear Safety Commission (CNSC). It also provides details on CNSC staff's work to ensure the safety and protection of the people and the environment around the sites.

CNSC staff evaluated CNL's performance across the CNSC's standard set of 14 safety and control areas (SCAs). This report provides the resulting performance ratings for the following sites for the 2022 calendar year:

- Chalk River Laboratories (CRL) – an operating nuclear research laboratory
- Whiteshell Laboratories (WL) – a nuclear research laboratory undergoing decommissioning
- Port Hope Area Initiative
    - Port Hope Project (PHP) – a long-term low-level radioactive waste remediation project
    - Port Granby Project (PGP) – a long-term low-level radioactive waste remediation project
    - Port Hope Pine Street Extension Temporary Storage Site – a temporary storage site for low-level radioactive waste
    - Port Hope Radioactive Waste Management Facility – a temporary storage facility for low-level radioactive waste
- Douglas Point Waste Facility – a shutdown prototype power reactor
- Gentilly-1 Waste Facility – a shutdown prototype power reactor
- Nuclear Power Demonstration Waste Facility – a shutdown prototype power reactor

The CNL sites continued to operate safely in 2022, and monitoring data demonstrates that both the water and any food grown in proximity to these sites are safe to consume. There were no releases that could have harmed the health or safety of people or the environment.

Each year, CNSC inspectors conduct inspections at CNL sites. The number of inspections and their focus depend on the individual site and its performance. The CNSC uses a risk-informed approach when planning inspections. In 2022, CNSC staff performed a total of 21 inspections at the CNL sites; those inspections are covered in this report. The inspections resulted in the issuance of 73 notices of non-compliance (NNCs), which all related to issues identified as being of low safety significance. All NNCs have been closed or have an appropriate corrective action plan in place to prevent recurrence.

The CNSC assesses the safety performance of licensees by conducting regulatory oversight activities, including inspections, technical assessments of licensee reports, reviews of events and incidents, and general communication and exchanges of information with licensees. While the CNSC evaluates licensees across all 14 SCAs, the main focus of this report is the following 3 SCAs, as these provide a good overview of safety performance at CNL sites:

- **Radiation protection:** In 2022, the maximum individual effective radiation dose to a worker at any of the CNL sites occurred at the CRL site and was 5.48 mSv, which is 11% of the CNSC's regulatory limit for effective dose of 50 mSv in a 1-year dosimetry period. The maximum estimated dose to the public from a CNL site was from the PGP, at 0.033 mSv/year (3.3% of the 1 mSv/year prescribed dose limit).
- **Conventional health and safety:** All CNL sites must report any workplace-related lost-time injuries to the CNSC and to federal/provincial agencies. In 2022, there were a total of 4 lost-time injuries reported, 1 less than in the previous year and well below the frequency in comparable industries.
- **Environmental protection:** CNSC licensees are required to report to the CNSC and other regulatory authorities any unauthorized releases of hazardous substances or nuclear materials to the environment. In 2022, in the composite effluent sample from the PHP waste water treatment plant, there was 1 exceedance of the weekly release limit for copper, 1 exceedance of the weekly action level limit for zinc, and 1 exceedance of the weekly action level limit for arsenic. These exceedances did not pose a risk to human health or the environment. Airborne and waterborne releases of radioactive and hazardous substances at all other CNL sites remained below their respective regulatory limits and action levels in 2022. In compliance with applicable regulatory requirements, CNL has implemented environmental protection programs at its licensed facilities in Canada that are protective of the environment and the public.

Indigenous Nations and community engagement

CNL sites are located on the traditional and/or treaty territories of many Indigenous peoples. The CNSC is committed to building relationships and trust with Indigenous Nations and communities interested in CNSC-regulated facilities. In 2022, CNSC staff undertook ongoing and meaningful engagement activities with Indigenous Nations and communities in relation to the facilities covered by this regulatory oversight report. These engagement activities support the CNSC's commitment to meeting its consultation responsibilities and to continuing to build and strengthen positive relationships with Indigenous Nations and communities and respond to their issues and concerns. The CNSC is also making efforts to follow up with public stakeholders and previous intervenors to explore how to address issues raised.

Summary

For this reporting year, CNSC staff rated all SCAs as “satisfactory”, with the exception of the emergency management and fire protection SCA at WL and the security SCA at CRL (these were rated as “below expectations”). Details on these ratings can be found in sections 4.10.3 and 4.12.2, respectively.

Despite the 2 ratings of below expectations, CNSC staff conclude that the CNL sites continued to perform licensed activities safely in 2022. This conclusion was supported by safety performance measures and observations, including the fact that CNL:

- operated within the bounds of its operating policies and principles
- followed approved procedures and took adequate corrective actions for all events reported to the CNSC

And CNL confirmation that:

- the health and safety of Indigenous Nations and communities and the public near the CNL sites, as well as the surrounding environment, continue to be protected
- workers at each CNL site have conducted the licensed activities safely and are properly protected
- there were no releases from CNL sites that could have harmed the environment or the health and safety of people

The referenced documents in this Commission member document are available to the public upon request, subject to confidentiality considerations.

1 INTRODUCTION

In accordance with the *Nuclear Safety and Control Act* [1], and its associated regulations, the Canadian Nuclear Safety Commission (CNSC) regulates Canada's nuclear industry to protect the health, safety of the people, security and the environment; to implement Canada's international commitments on the peaceful use of nuclear energy; and to disseminate objective scientific, technical and regulatory information to the public. Licensees are responsible for operating their facilities safely and are required to implement programs that make adequate provision for meeting legislative and regulatory requirements.

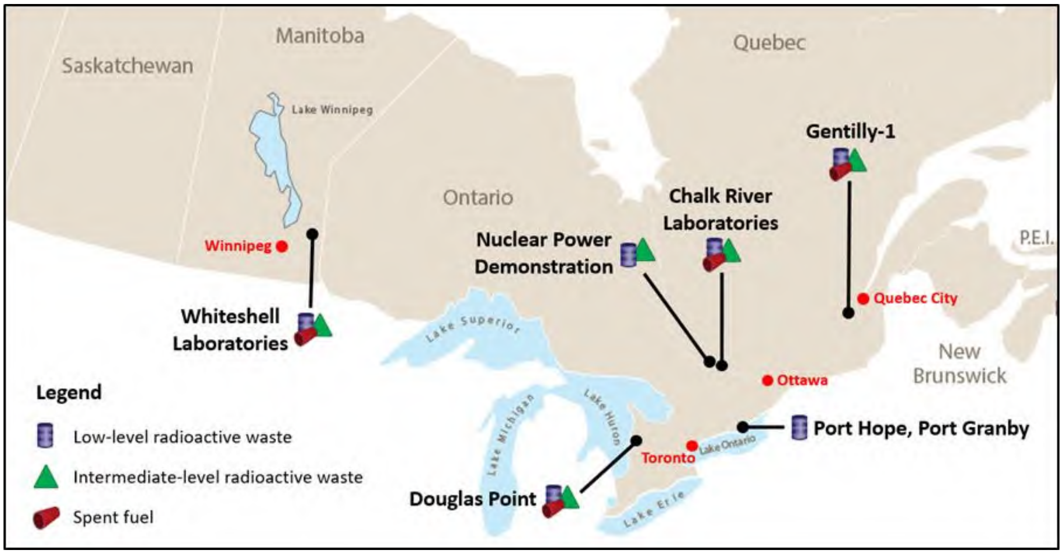
The Commission has directed CNSC staff to report to the Commission annually on the safety performance of sites operated by Canadian Nuclear Laboratories (CNL) in the form of a regulatory oversight report (ROR). This ROR provides an overview of CNSC regulatory effort and staff's assessment of licensee performance at sites operated by CNL for the 2022 calendar year.

The CNL sites covered by this report are located in many different parts of the country (Figure 1). CNSC staff would like to acknowledge the Indigenous Nations and communities (Appendix A) whose traditional and/or treaty territories are within proximity to the CNL sites covered by this report.

These CNL sites include:

- Chalk River Laboratories (CRL)
- Whiteshell Laboratories (WL)
- Port Hope Area Initiative (PHAI)
    - Port Hope Project (PHP)
    - Port Granby Project (PGP)
    - Port Hope Pine Street Extension Temporary Storage Site
    - Port Hope Radioactive Waste Management Facility
- Douglas Point Waste Facility (DPWF)
- Gentilly-1 Waste Facility (G1WF)
- Nuclear Power Demonstration Waste Facility (NPDWF)

Figure 1: Sites covered by this report



This ROR discusses all safety and control areas (SCAs), but focuses on radiation protection, conventional health and safety and environmental protection. The report also provides an overview of licensee operations, licence changes, major developments at licensed facilities and sites, and reportable events. In addition, the report includes information on the CNSC's and CNL's engagement with Indigenous Nations and communities, and the public.

2 CANADIAN NUCLEAR LABORATORIES

CNL is responsible for the operation and management of nuclear sites owned by Atomic Energy of Canada Limited (AECL) under a Government-Owned, Contractor-Operated model. While AECL owns the sites and nuclear substances, CNL is the CNSC licensee for activities at those sites.

A brief overview of each CNL site is provided below, with a link to the CNSC web page that contains more details such as facility information, announcements, regulatory reporting and other key topics.

2.1 Chalk River Laboratories

Chalk River Laboratories (CRL) is located in Chalk River, Ontario, 160 kilometers northwest of Ottawa (Figure 2), on the traditional unceded territory of the Algonquin Anishinabeg People. CRL operates under a single licence that includes Class I and Class II nuclear facilities, waste management areas, radioisotope laboratories, support facilities and offices. CNL safely manages low-, intermediate- and high-level radioactive waste at the site. The CRL site continues to undergo a period of change. Where permitted by the current licensing basis, CNL is continuing to shut down and decommission legacy facilities and constructing and commissioning replacement facilities throughout the site. Further information on CRL is available on the CNSC's website at: http://nuclearsafety.gc.ca/eng/reactors/research-reactors/nuclear-facilities/chalk-river/index.cfm.

Figure 2: View of the CRL built-up area *(Source: CNL)*

2.1.1 Major Activities at CRL

The National Research Universal (NRU) reactor ceased operating on March 31, 2018, and remains in a permanently shut down, defueled and dewatered state in 2022. CNL continues its work in the NRU reactor and its associated systems to place the facility in a permanently safe shut down state. CNL performed a total of 63 work packages since 2018, however no additional work packages were completed in 2022 due to ongoing electrical and ventilation projects needed to support the shutdown. Further activities will continue until the NRU reactor and facility can be placed in a state of storage with surveillance.

In September 2022, construction officially began on the Advanced Nuclear Materials Research Centre (ANMRC) and included mass excavation and shoring work. The detailed design for ANMRC is ongoing and construction of the main building elements has commenced. The ANMRC will consolidate existing laboratories and hot cells located at CRL and is anticipated to be one of the largest active research laboratories in Canada.

CNL continued work on the proposal to construct a Near Surface Disposal Facility (NSDF) at the CRL site. This project underwent a review by CNSC staff and was subject to an Environmental Assessment (EA) [2] pursuant to the *Canadian Environmental Assessment Act, 2012* (CEAA, 2012) [3]. CNSC accepted the Final Environmental Impact Statement [4], leading to a two-part public hearing to consider CNL's application to authorize the construction of the proposed NSDF. The public hearings occurred on February 22, 2022 (Part I) and May 30 to June 3, 2022 (Part II). On July 5, 2022, the Commission announced its direction to leave the NSDF hearing record open to allow more time for engagement and consultation with Kebaowek First Nation (KFN) and the Kitigan Zibi Anishinabeg (KZA), and for the filing of additional information about these consultative efforts. In response to requests from KFN [5] and the KZA [6] in December 2022, the Commission extended the deadline for filing submissions to May 1, 2023 and final submissions will be considered during an oral public hearing. On May 17, 2023, the Commission announced that it reviewed the additional submissions from KFN, KZA, AECL, CNL and CNSC staff and is satisfied with the information received and does not require any additional information. The Commission announced that it is ready to receive final written submissions from intervenors and CNL by June 6 and June 21, 2023, respectively, with an oral public hearing scheduled for August 10, 2023.

2.2 Whiteshell Laboratories

Whiteshell Laboratories (WL) is a former nuclear research and test facility located near Pinawa, Manitoba that was established in the early 1960s (Figure 3). It is located in the homeland of the Red River Métis, Treaty 1 and Treaty 3 territories, and the traditional territory of Anishinaabe and Ojibway Peoples. The WL site is also located in the vicinity of Treaty 5 territory. The site hosts the 60-megawatt thermal (MWth) Whiteshell Reactor No. 1 (WR-1), a SLOWPOKE demonstration reactor, other research and support facilities, and a waste management area that contains low-, intermediate- and high-level radioactive waste. The WR-1 and

SLOWPOKE reactors were permanently shut down in 1985 and 1990, respectively. Decommissioning activities at WL commenced in 2003. Further information on WL is available on the CNSC's website at: http://nuclearsafety.gc.ca/eng/reactors/research-reactors/other-reactor-facilities/whiteshell-laboratories.cfm.

Figure 3: Whiteshell Laboratories main campus *(Source: CNL)*

2.2.1 Major Activities at WL

Demolition of the Active Liquid Waste Treatment Centre and the Health and Safety Facilities began in 2021 and was completed in early 2022. The Shielded Modular Above Ground Storage facility is being converted to the Cask Loading Facility. The Cask Loading Facility will be used to handle, stage and load waste into appropriate shipping packages for transportation off-site. The removal, characterization and packaging of low-level radioactive waste packages from storage facilities in the waste management area continues.

CNL also prepared a Recoverable Surface Storage and Staging Area (RSSSA) consisting of an outdoor, above ground storage pad to enable the storage and loading of solid low-level waste in sea land containers and storage of oversized low-level waste items awaiting further processing, characterization and/or packaging prior to off-site disposition. The RSSSA was placed into service in early 2022.

A safety-stand down was performed at the WL site following a near-miss in which equipment was not properly electrically isolated prior to work. The safety-stand down. began on June 13, 2022. Activities at the site resumed in a phased manner, with the stand-down officially ending on December 9, 2022.

In April 2023, CNL performed a planned self-assessment of the WL fire protection program, which included the review of fire protection records for calendar years 2020, 2021 and 2022. Through the self-assessment, CNL identified a number of non-compliances and reported this to the CNSC. CNL immediately placed the WL site into a safe shutdown state, where only essential compliance and maintenance work could be conducted. As a result of this event, CNL has received a below expectations rating for the emergency management and fire protection SCA. Further details on this can be found in section 4.10.3 of this report.

CNL continues to work on the proposal to change the decommissioning approach for WR-1 from full dismantlement to in-situ decommissioning. This proposed approach is currently under review by CNSC staff, and is subject to an EA [7] pursuant to CEAA, 2012 [3], which will require authorization from the Commission. As these are not currently CNSC-licensed activities and will be the subject of separate Commission decisions, they are not specifically discussed further in this report.

2.3 Port Hope Area Initiative

The Port Hope Area Initiative (PHAI) is a federal government initiative based on a community proposal, which includes the Port Hope Long-Term Low-Level Waste Management Project (Port Hope Project) and Port Granby Long-Term Low-Level Waste Management Project (Port Granby Project) (Figure 4 and Figure 5). The Government of Canada, through Natural Resources Canada, has committed to clean up low-level radioactive waste in the Port Hope area and provide long-term safe management of the historic low-level radioactive wastes in the Port Hope area. These wastes arose from the activities of a former federal Crown Corporation (Eldorado Nuclear) and its private sector predecessors. The PHAI is on the traditional territory of the Michi Saagig Anishinaabe People. These lands are covered by the Williams Treaty between Canada and the Mississauga and Chippewa Nations.

Through its Historic Waste Program Management Office, CNL is implementing the PHAI on behalf of AECL.

For the 2022 reporting period CNL had 4 licences associated with the PHAI. The 4 licences include:

- WNSL-W1-2310.02/2022 for the Port Hope Project (PHP)
- WNSL-W1-2311.00/2022 for the Port Granby Project (PGP)
- WNSL-W1-182.0/2022 for the Port Hope Pine Street Extension Temporary Storage Site
- WNSL-W1-344-1.8/ind. for the Port Hope Radioactive Waste Management Facility

Following a one-day hearing on November 22, 2022, the Commission announced its decision, which can be found in DEC 22-H13 [8], to renew the PHP licence, for a 10-year period beginning January 1, 2023. As part of the decision, a single licence that consolidates the licensed activities previously authorized under CNL's 4 waste nuclear substance licences was issued. The new licence, Port Hope Area Initiative Waste Management Project, WNSL-W1-2310.00/2032 is valid from January 1, 2023 until December 31, 2032.

Further information on the PHAI is available on the CNSC's Website at: http://nuclearsafety.gc.ca/eng/waste/historic-nuclear-waste/port-hope-area-initiative/index.cfm.

Figure 4: Work in Port Hope - Waterfront Sites *(Source: CNL)*

Figure 5: Port Granby – Remediation Completed *(Source: CNL)*

2.3.1 Major Activities at PHAI

In 2022, the PHP and PGP Long-Term Waste Management Facilities (LTWMF) and associated Waste Water Treatment Plants (WWTP) continued their operations safely and as required by their respective licences.

In 2022, the PHP LTWMF remained open to receive offsite shipments of PHAI related low-level radioactive waste (LLRW). This included LLRW from residential properties, municipal road allowances, temporary storage sites, waterfront sites, industrial sites and locations within the municipality known to have LLRW from historical records.

CNL announced in May 2022 that the PGP is now in long-term maintenance and monitoring following the emplacement of 1.3 million tonnes of LLRW into the LTWMF that was capped and closed in late 2021. Final grading, erosion control measures and the construction of the east gorge groundwater collection system were completed in the fall of 2022. CNSC staff continue its regulatory oversight of the PGP to ensure the protection of the public and environment.

2.4 Prototype Power Reactors

The Douglas Point Waste Facility (DPWF), Gentilly-1 Waste Facility (G1WF) and Nuclear Power Demonstration Waste Facility (NPDWF) are 3 prototype power reactors. They are currently in a safe shutdown state and undergoing decommissioning activities. G1WF and NPDWF are in storage with surveillance, which includes hazard reduction and waste characterization. DPWF has started active decommissioning of the non-nuclear structures, in line with plans reviewed and accepted by CNSC staff. For these prototype reactors, CNL continues to implement and maintain programs such as radiation protection, conventional health and safety, security and emergency management and fire protection.

2.4.1 Douglas Point Waste Facility

Douglas Point Waste Facility (DPWF) located in Tiverton, Ontario on the Bruce nuclear site is a partially decommissioned prototype power reactor (Figure 6). The DPWF is located within the traditional territory of the Saugeen Ojibway Nation (SON), and the harvesting areas of the Georgian Bay Métis Nation of Ontario (MNO) and the Historic Saugeen Métis (HSM) Peoples. The 200-megawatt electric (MWe) prototype Canada deuterium uranium (CANDU) power reactor was put into service in 1968 and permanently shut down in 1984. CNL safely manages low- and intermediate-level radioactive wastes, as well as spent nuclear fuel stored in concrete dry storage canisters at the DPWF site. CNL is also undertaking decommissioning activities. Further information on DPWF is available on the CNSC's website at: http://nuclearsafety.gc.ca/eng/reactors/research-reactors/other-reactor-facilities/douglas-point-waste-facility.cfm.

In its Record of Decision DEC 20-H4, *Application to amend the Waste Facility Decommissioning Licence for the Douglas Point Waste Facility to include phase 3 decommissioning activities* [9], the Commission granted a licence amendment effective March 12, 2021 authorizing the phase 3 decommissioning activities, including the decommissioning and dismantlement of certain facilities and structures at the DPWF site. Decommissioning work is ongoing on the non-nuclear buildings to facilitate the safe dismantling and demolition of the buildings.

Figure 6: Douglas Point Waste Facility *(Source: CNL)*

2.4.2 Gentilly-1 Waste Facility

Gentilly-1 (G1WF), located in Bécancour, Québec within Hydro-Québec's Gentilly-2 site, is a partially decommissioned prototype power reactor (Figure 7). The site is located on the traditional and unceded territory of the Abenaki People and the Wabanaki Confederacy and the traditional land of the Huron-Wendat. The 250 MWe boiling water reactor was put into service in 1972 and shut down in 1984. At G1WF, CNL safely manages low- and intermediate-level radioactive wastes, as well as spent nuclear fuel in concrete dry storage canisters. Additionally, CNL is undertaking decommissioning planning activities. Further information on G1WF is available on the CNSC's website at: http://nuclearsafety.gc.ca/eng/reactors/research-reactors/other-reactor-facilities/gentilly-1-facility.cfm.

Figure 7: Gentilly-1 Waste Facility, outlined in yellow *(Source: CNL)*

2.4.3 Nuclear Power Demonstration Waste Facility

The Nuclear Power Demonstration Waste Facility (NPDWF) is a partially decommissioned prototype power reactor located in Rolphton, Ontario (Figure 8) on the traditional unceded territory of the Algonquin Anishinabeg Peoples. The 20 MWe prototype CANDU power reactor was placed into service in 1962 and operated until 1987. At NPDWF, CNL safely manages low- and intermediate-level radioactive wastes. Additionally, CNL is undertaking decommissioning planning activities. Further information on NPDWF is available on the CNSC's website at: http://nuclearsafety.gc.ca/eng/reactors/research-reactors/other-reactor-facilities/nuclear-power-demonstration.cfm.

CNL continues to work on the proposal to modify the decommissioning approach for NPDWF from full dismantling to in-situ decommissioning. This application is under review by CNSC staff, and is subject to both an EA [10] pursuant to CEAA, 2012 [3] and a licence amendment. As CNL's proposal will be the subject of future Commission decisions on the EA and licence amendment, they are not discussed further in this report.

Figure 8: Nuclear Power Demonstration Waste Facility *(Source: CNL)*

3 CNSC'S REGULATORY OVERSIGHT OF CNL

The CNSC performs regulatory oversight of licensed facilities to verify compliance with the requirements of the *Nuclear Safety and Control Act* [1] and associated regulations, each site's conditions of licence and licence conditions handbook (LCH), and any other applicable standards and regulatory documents (REGDOCs) forming part of the licensing basis.

CNSC staff use the safety and control area (SCA) framework to assess, evaluate, review, verify and report on licensee performance. The SCA framework includes 14 SCAs, which are subdivided into specific areas that define its key components. Further information on the CNSC's SCA framework can be found on the CNSC's website at: http://www.nuclearsafety.gc.ca/eng/resources/publications/reports/powerindustry/safety-and-control-areas.cfm.

http://www.nuclearsafety.gc.ca/eng/resources/news-room/feature-articles/safety-and-control-areas.cfm.

3.1 Regulatory Activities

CNSC staff conducted many risk-informed regulatory oversight activities in 2022.

Licensing

CNSC staff activities for licensing includes drafting new licences, preparing Commission Member Documents (CMDs), and drafting or revising LCHs. Appendix B provides a summary of licensing activities for 2022.

As CNSC REGDOCs are published, CNSC staff request implementation plans for each site and update the LCHs as applicable. CNSC staff verify REGDOC implementation as part of ongoing compliance verification activities. Appendix C provides a list of CNSC REGDOCs implemented at CNL sites and used by CNSC staff for compliance verification.

Compliance

The CNSC ensures licensee compliance through verification, enforcement and reporting activities. CNSC staff implement compliance plans for each site by conducting regulatory activities including inspections, desktop reviews, and technical assessments of licensee programs, processes, and reports.

Appendix D contains a list of CNSC inspections carried out at each CNL site in 2022. All notices of non-compliance (NNCs) resulting from non-compliance with legislation, regulations and licensing basis requirements noted during these inspections were considered low-risk and did not have an impact on the health, safety and environment. CNSC staff determined that all NNCs were adequately addressed either through closure or an appropriate corrective action plan. Appendix E contains a list of reportable events at each CNL site in 2022. For these events, CNSC staff were satisfied with CNL's corrective actions to prevent recurrence.

3.2 Performance Ratings

The safety assessments presented in this report are based on the results of activities planned through the CNSC compliance verification program. In 2022, these activities included inspections as well as technical assessments of submissions. CNSC staff use the results of these activities to assign performance ratings to licensees. CNSC staff use the following 3 ratings to grade licensee performance in each applicable SCA:

- satisfactory (SA)
- below expectations (BE)
- unacceptable (UA)

The definitions of the ratings can be found in Appendix F.

For 2022, CNSC staff have rated CNL’s performance in each SCA as satisfactory, with the exception of the emergency management and fire protection SCA at WL and security SCA at CRL, which are rated as below expectations. Details on these ratings can be found in sections 4.10.3 and 4.12.2, respectively. Appendix G provides SCA ratings for each site from 2018 to 2022.

4 THE CNSC'S ASSESSMENT OF SAFETY AT CNL SITES

The CNSC regulates all aspects of safety at nuclear sites in Canada, including risks to workers, the public and the environment. CNSC staff assess performance in all SCAs by verifying licensee compliance through planned or reactive desktop reviews and inspections. Although all 14 SCAs are covered in the following sections, the radiation protection, conventional health and safety, and environmental protection SCAs are considered the most relevant in determining CNL's overall safety performance. In particular, the SCAs of radiation protection, and conventional health and safety are a good measure of the safety of workers at CNL sites, while the SCA of environmental protection is a good measure of the safety of the public and the environment. If the performance of a specific CNL site is not discussed under a particular SCA in this report, that means there were no findings related to this SCA in 2022 as a result of CNSC staff's oversight activities.

CNSC staff have determined that all NNCs from inspections were adequately addressed either through closure or an appropriate corrective action plan, and that the NNCs did not impact safety at CNL sites. CNSC staff conclude that CNL has met regulatory requirements and for 2022 have rated all SCAs at all CNL licensed sites as satisfactory, with the exception of the emergency management and fire protection SCA at WL and security SCA at CRL, which are rated as below expectations.

For both the radiation protection and environmental protection SCAs action levels (ALs) are used. ALs are a specific dose of radiation or other parameter that serve as an early warning to safeguard against exceedances of radiation dose limits and environmental release limits. AL exceedances are reportable to the CNSC. Further information on ALs is available on the CNSC's website at: http://www.nuclearsafety.gc.ca/eng/resources/news-room/feature-articles/radiation-dose-limits-release-limits-and-action-levels.cfm.

4.1 Management System

The management system SCA covers the framework that establishes the processes and programs required to ensure that an organization achieves its safety objectives, continuously monitors its performance against these objectives and fosters a healthy safety culture.

CNSC staff assess CNL's performance in the management system SCA through desktop reviews of program documents, reportable events (Appendix E) and through the course of inspections (Appendix D). There were no management system focused inspections conducted by CNSC staff at CNL sites in 2022. However, there were some findings related to the management system SCA found through regular licensing and compliance activities conducted at WL, DPWF and PHAI.

4.1.1 Whiteshell Laboratories

In an inspection conducted at WL in October 2022, CNSC staff identified 2 NNCs pertaining to the management system SCA. During this inspection, CNSC staff reviewed a selection of waste management daily operating logs to ensure they contained the required information. CNSC staff found the operating logs to be inconsistent in the information they contained, not following a prescribed format, not containing a CNL identification number and difficult to read. As a result of this finding, CNSC staff requested CNL to take corrective action to ensure that operating logs are compliant with the necessary requirements. Additionally, CNSC staff reviewed governing documents for the waste management program and found that several documents were beyond the required 5-year revision cycle. As a result, CNSC staff issued a second NNC requesting that CNL take corrective action to ensure their waste management suite of documents are reviewed and revised based on current practices and site operations. These findings were of low safety significance and did not pose an imminent risk to people or the environment. CNSC staff is satisfied with the corrective actions taken by CNL to address these 2 NNCs and they are now considered closed.

4.1.2 Douglas Point Waste Facility

During an inspection conducted by CNSC staff at DPWF in February 2022, 2 NNCs pertaining to the management system SCA were identified by CNSC staff, which related to the clarity of storage with surveillance (SWS) records and accuracy of documents. In order to verify that monitoring, testing and surveillance activities were performed in accordance with the SWS, CNSC inspectors requested that CNL map the SWS activities to an Operator Rounds Database (ORD) tag. CNSC staff also reviewed operating procedures that guide SWS activities and noted that monthly inspection instructions did not reference the ORD tags, and that the instructions did not cover the same scope as the SWS document. Overall, CNSC staff found that the tags in the ORD system did not clearly align with activities in the SWS. As a result, CNSC staff issued a NNC requesting that CNL take corrective action to ensure there is a clear link between the field monitoring, testing, and surveillance activities, and the activities listed in the SWS document. Additionally, CNSC staff found that the SWS document and the Detailed Decommissioning Plan Volume 2 did not accurately capture how work was being conducted. As a result, CNSC staff issued a second NNC requesting that CNL take corrective action to ensure that these documents accurately described how work is conducted. Both NNCs were considered of low safety significance and did not pose an imminent risk to people or the environment. CNSC staff is satisfied with the corrective actions taken by CNL to address these 2 NNCs and they are now considered closed.

4.1.3 Port Hope Area Initiative

In 2022, CNSC staff identified, through regular licensing and compliance activities, non-compliances with CNL's management oversight of changes and its adherence to the change control process with respect to the PHAI. CNL is required by each of its licences to implement and maintain a management system, which includes implementing and maintaining adequate measures for change control. Additionally, as per its licences, CNL is required to give written notification of changes to the licensed activities or operation, including deviation from design, operating conditions, policies, programs and methods referred to in the current licensing basis. On 2 separate occasions during the 2022 calendar year, CNSC staff found that CNL failed to provide the required written notification of changes with respect to the PHAI. In addition, it was also found that CNL applied its change control process retroactively in both cases, which CNSC staff finds to be unacceptable as this demonstrates a lack of management oversight for the implementation and maintenance of the change control process.

Previous to these occurrences, in January 2021, CNSC staff conducted inspections at the PHP and PGP with a focus on management system. One of the findings, as a result of these inspections, was that there were no clear criteria when design changes must be submitted to CNSC for acceptance. CNSC staff issued a NNC for CNL to address this finding. In response to this NNC, CNL revised applicable documentation to include clear criteria for when a notification is required, as per its licences. CNSC staff reviewed the revised document and were satisfied with the corrective actions taken by CNL. This NNC was closed by CNSC staff in October 2022. CNSC staff expect CNL to use this document notification process and criteria moving forward to ensure that the change control process is applied correctly. Despite the changes CNL has made to strengthen its process, CNSC staff will continue to monitor procedural adherence in this area. CNSC staff requested CNL to conduct a causal analysis into why these failures occurred, for the management of changes at the PHP and PGP.

In March 2023, CNL submitted a root cause analysis report on its adherence to the change control program. The root cause was determined to be a lack of management direction. Leadership had not defined the accountabilities for having intimate knowledge of the licensing basis and the responsibilities involved in reviewing and approving equipment and process changes. The main corrective actions resulting from the root cause analysis include documenting the accountability for having intimate knowledge of the licensing basis and developing and documenting the skills and competencies and training requirements for management. CNL has committed to completing these corrective actions by October 2023 and conducting an effectiveness review by May 2024.

CNSC staff have reviewed the root cause analysis report and proposed corrective actions and found them to be acceptable. In addition, CNSC staff have planned management system inspections in fiscal year 2023-2024 to ensure CNL's management system program remains effective.

4.1.4 Overall Conclusion

Despite the issues identified with respect to CNL's management oversight of changes and adherence to the change control process with respect to the PHAI, overall, CNSC staff conclude that CNL continues to implement and maintain effective management system programs in accordance with regulatory requirements.

4.2 Human Performance Management

The human performance management SCA covers activities that enable effective human performance through the development and implementation of processes that ensure a sufficient number of licensee personnel are in all relevant job areas and have the necessary knowledge, skills, procedures and tools in place to safely carry out their duties.

CNSC staff assess CNL's performance in the human performance management SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D). In 2022, CNSC staff conducted focused inspections on the human performance management SCA at both CRL and PHP.

4.2.1 Chalk River Laboratories

In March 2022, CNSC staff conducted a focused inspection on the human performance management SCA as part of the baseline compliance plan for CRL. The scope of the inspection included an evaluation of CNL's Human Performance Program and Training Program. This inspection resulted in 6 NNCs, which were raised to CNL to address. All findings resulting from this inspection were of low safety significance and did not pose an imminent risk to people or the environment.

Of the 6 NNCs, 2 of them pertained to CNL's Human Performance Program and related to reporting hours of work exceedances and managing worker fatigue. CNSC staff found that hours of work exceedances for safety-sensitive positions were not being routinely reported to the CNSC and were not submitted to CNSC as part of the previous annual compliance monitoring report. This finding was of low safety significance because there is no requirement for CNL to report each instance of an exceedance individually. However, the CNSC expects exceedances to be reported, at minimum, via the annual compliance monitoring report as per CNSC's REGDOC-3.1.2, *Reporting Requirements, Volume I: Non-Power Reactor Class I Nuclear Facilities and Uranium Mines and Mills* [11]. This would allow CNL to demonstrate that regulatory requirements associated with its Human Performance Program are being met. Additionally, CNSC staff found that CNL was maintaining records of work exceedances for safety-sensitive positions and there were no reported incidences of the minimum shift complement not being met for safety-sensitive positions. The second NNC issued was related to managing worker fatigue, as it was not evident from records reviewed of hours of work exceedances and the interviews conducted with CNL staff, what measures were being taken to manage and mitigate the effects of worker fatigue in safety-sensitive positions and whether workers are aware of the options available to them to manage fatigue at work. CNSC staff requested CNL take corrective action to ensure that safety-sensitive positions at CRL comply with the limits on hours and recovery periods as per CNSC's REGDOC-2.2.4, *Fitness for Duty: Managing Worker Fatigue* [12]. This finding was of low safety significance since it is acknowledged that exceptional circumstances may warrant exceeding the limits on hours of work and recovery periods for workers in safety-sensitive positions to limit the risk to nuclear safety and security may arise if the minimum shift complement was not maintained.

The remaining 4 NNCs pertained to CNL's Training Program and related to job and task analyses and training plans, the training change management process, and application of the Systematic Approach to Training (SAT). CNSC staff requested CNL take corrective actions to update its relevant training program documentation to ensure the identified tasks and required training are valid and accurate for radiation protection surveyors. CNSC staff also requested CNL take corrective actions to update SAT documentation to accurately list all positions/roles that require SAT-based training and ensure the updated SAT documentation adheres to the annual review requirement to make sure that the SAT positions identified in the controlled list are kept up to date.

CNL has addressed 5 out of the 6 NNCs resulting from this inspection. CNSC staff is satisfied with the corrective actions taken by CNL to address the 5 NNCs and they are now considered closed. CNL has identified corrective actions to be taken to address the remaining NNC related to managing worker fatigue. The deadline to address this NNC is by Q4 of the 2023 calendar year. This NNC will remain open until CNL addresses it to CNSC staff's satisfaction.

4.2.2 Port Hope Project

In December 2022, CNSC staff conducted a focused inspection on the human performance management SCA as part of the baseline compliance plan for the PHP. The scope of the inspection focused on CNL's training program, including CNL's implementation of corrective actions in response to a previous CNSC inspection in 2019 and CNL's implementation of actions to address its gap analysis against the requirements of CNSC's REGDOC-2.2.2, *Personnel Training* [13]. This inspection resulted in 6 NNCs, which were raised to CNL to address. The NNCs pertained to the use of a training system, documentation, training analysis and change management, design, development and evaluation of training, and training records. All findings were of low safety significance and did not pose an imminent risk to people or the environment. These findings were of low safety significance, as CNL does have a documented training system that is being implemented for all their training programs. CNSC staff have received the initial responses to the 6 NNCs and the NNCs will remain open until CNL addresses them to CNSC staff's satisfaction. The deadline to address these NNCs is by Q3 of the 2023 calendar year.

4.2.3 Overall Conclusion

CNSC staff conclude that CNL continues to implement and maintain effective human performance management programs in accordance with regulatory requirements.

4.3 Operating Performance

The operating performance SCA includes an overall review of the conduct of the licensed activities and the activities that enable effective performance.

CNSC staff assess CNL's performance for the operating performance SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D). CNL also submits annual reports on compliance monitoring and operational performance of facilities.

CNSC staff were notified of revisions to compliance verification criteria documents as outlined in CNL site LCHs. CNL's corporate-wide management system consists of high-level documentation supported by lower-level procedures. CNL maintains a comprehensive suite of procedures across all programs and sites. CNL continually updates the facility-specific procedures relating to operations, maintenance, and emergency response as needed and supports ongoing process improvements across all sites. CNSC staff regularly review procedure level documents as part of ongoing compliance verification activities. At CRL, procedures specifically related to Conduct of Operations, Commissioning, and Configuration Management were reviewed. The procedures were deemed to be acceptable by CNSC staff. CNL facility authorization (FA) and storage with surveillance (SWS) documents were submitted to the CNSC as required by the site LCHs. CNSC staff deemed submitted FAs and SWSs acceptable before being implemented by CNL.

CNSC staff were notified of reportable events (Appendix E) as required and CNL submitted annual reports as required. No significant regulatory issues were identified during CNSC staff's review of these reports. CNL revised their overarching Management Control Procedure (MCP), *CNL Reporting to Regulatory Agencies*, 900-514300-MCP-006, to further clarify and improve reporting requirements. CNSC staff have access to CNL's Improvement Action System reports which are utilized for trending purposes by CNL.

4.3.1 Chalk River Laboratories

In 2022, there was an unplanned Class IV power outage at the CRL site related to a weather event that damaged electrical infrastructure off-site. Class III power initiated as required and operated as intended. As a cautionary measure CNL-CRL's Emergency Operations Centre (EOC) was activated. CNSC staff were notified by CNL. CNSC staff is satisfied with CNL's event response. In June 2022, CNL successfully executed an annual electrical site-wide outage at CRL to perform testing, inspections, cleaning, and maintenance and repairs.

In May 2022, CNSC staff conducted an inspection at the CRL Universal Hot Cells facility that resulted in a NNC pertaining to the FA document being out of date. The FA referred to all facility work being conducted on work permits, but CNL staff had noted that facility work is no longer conducted on work permits, but rather using CNL's integrated work control system. This finding was of low safety significance as CNL's on-site work activities continue to be managed under a system and this NNC pertains to documentation to be updated. CNSC staff requested CNL to take corrective action to update the Universal Hot Cells FA document to refer to CNL's integrated work control system. CNL is working to address this NNC by Q3 of the 2023 calendar year via an FA document revision and it will remain open until it is addressed to CNSC staff's satisfaction.

In June 2022, CNSC staff conducted an inspection at the CRL Combined Electrolysis and Catalytic Exchange Upgrading and Detritiation (CECEUD) test facility that resulted in 2 NNCs pertaining to the documentation of operator surveillance on equipment monitoring, and regular performance monitoring and periodic testing of CECEUD systems, structures, and components. CNSC staff noted that the details of daily operator surveillance were not recorded in the facility daily logbook, in addition to a facility exhaust fan that was found not to be regularly maintained as required. CNSC staff requested CNL to take corrective action. CNL is working to address these NNCs by Q3 of the 2023 calendar year and they will remain open until they are addressed to CNSC staff's satisfaction.

In December 2022, CNSC staff conducted an inspection at the CRL Recycle Fuel Fabrication Laboratories (RFFL) facility that resulted in a NNC pertaining to an air flow testing station in the facility exhaust ventilation line being 2 days past due for calibration according to the calibration sticker. This finding was of low safety significance. CNSC staff requested CNL to take corrective action. CNL determined that their radiation protection program does not require air flow testing stations to undergo calibration and that the calibration sticker was mistakenly placed on the air flow testing station. CNL has since removed the calibration sticker and ensured that there were no other misplaced calibration stickers in the facility. CNSC staff determined that the corrective actions taken by CNL to address the NNC were acceptable, and the item is now closed.

4.3.2 Overall Conclusion

CNL continued to meet its reporting requirements including those associated with annual reports and reportable events, which demonstrates that facilities were operated and maintained according to the licensing basis. CNSC staff assessments conclude that CNL has conducted its activities in compliance with regulatory requirements.

4.4 Safety Analysis

The safety analysis SCA covers maintenance of the safety analysis that supports the overall safety case for the facilities. Safety analysis is a systematic evaluation of the potential hazards associated with the conduct of a proposed activity or facility and considers the effectiveness of preventative measures and strategies in reducing the effects of such hazards.

CNSC staff assess CNL's performance in the safety analysis SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D).

There were no safety analysis focused inspections conducted by CNSC staff at CNL sites in 2022. However, there were a total of 5 NNCs pertaining to safety analysis resulting from general inspections performed at CNL facilities.

4.4.1 Chalk River Laboratories

In May 2022, an inspection of the Universal Hot Cells facility at CRL resulted in a NNC pertaining to an expired training certification requirement of a Nuclear Criticality Control Officer (NCCO). CNL confirmed that the NCCO's required training was expired but clarified that the NCCO had not acted as the Universal Hot Cells' NCCO designate since the training had expired. CNSC staff requested CNL to take corrective action to ensure that NCCOs and designates have completed the required training. CNSC staff determined that the corrective actions taken by CNL to address the NNC were acceptable and the item is now closed.

In November 2022, an inspection of Building 429 at CRL resulted in a NNC pertaining to CNL not tracking an overall inventory of U-235 in the facility and being unable to determine whether the amount of U-235 in the facility exceeded the maximum 100 gram limit for non-nuclear criticality controlled areas (NCCA). CNSC staff requested CNL to take corrective action to determine the amount of U-235 in the facility and to maintain an accurate inventory of fissionable material at all times. CNL immediately determined the amount of U-235 in the facility to be less than the limit for non-NCCAs after the inspection and informed CNSC staff. CNL has since developed an accurate tracking inventory for fissionable material in the facility and the NNC has since been closed.

In June 2022, an inspection of the CECEUD facility at CRL resulted in 2 NNCs pertaining to safety analysis reports and facility operations documentation not being maintained and kept up to date to reflect the current operating status and configuration of the facility. CNSC staff requested CNL take corrective action to ensure facility operations documentation and safety analysis reports are updated. These NNCs are of low safety significance as the facility is in a safe shutdown state since April 2001 and there are no heavy water processing activities taking place in the facility. CNL is working to address these NNCs by Q4 of the 2023 calendar year and they will remain open until they are addressed to CNSC staff's satisfaction.

In September 2022, an inspection conducted on Waste Management Areas (WMA) D and H resulted in a NNC pertaining to the lack of required signage for non-NCCAs in the WMAs. CNL had recently re-organized a non-NCCA into smaller non-NCCAs but did not have signage at the point of entry to each individual non-NCCA. CNSC staff requested CNL take corrective action to ensure that there is signage posted at the point of entry of each of the non-NCCAs. CNL has since confirmed that posting the required signage is not feasible due to the movement of heavy equipment in the area and multiple outdoor storage areas. CNL has notified CNSC staff that they have revised the Nuclear Criticality Safety for Operations Standards with the constraints at WMA D and H while maintaining compliance with the requirements of CNSC's REGDOC-2.4.3, *Nuclear Criticality Safety* [14]. CNSC staff determined that the corrective actions taken by CNL to address the NNC were acceptable and the item is now closed.

4.4.2 Overall Conclusion

CNSC staff conclude that CNL continues to implement and maintain safety analysis programs in accordance with regulatory requirements.

4.5 Physical Design

The physical design SCA relates to activities that impact the ability of structures, systems, and components to meet and maintain their design basis given new information arising over time and taking changes in the external environment into account.

CNSC staff assess CNL's performance in the physical design SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D). CNSC staff have reviewed CNL's conduct of design engineering documents, to ensure activities are planned, controlled and monitored in accordance with regulatory requirements and applicable codes and safety standards.

4.5.1 Port Hope Area Initiative

In 2022, CNSC staff conducted a desktop review of the construction activities at the Port Hope Harbour which is part of the PHAI. The review focused on the design details of the harbour wall rehabilitation. CNSC staff found that the design and construction of the harbour walls are satisfactory with respect to their integrity and stability.

4.5.2 Overall Conclusion

CNSC staff conclude that CNL's programs related to the physical design SCA continue to meet regulatory requirements.

4.6 Fitness for Service

The fitness for service SCA covers activities that impact the physical condition of structures, systems, and components to ensure that they remain effective over time. This includes programs that ensure all equipment is available to perform its intended design function when called upon to do so. Regulatory oversight of the fitness for service SCA includes specific areas of equipment performance, maintenance, aging management, structural integrity and chemistry control.

CNSC staff assess CNL's performance in the fitness for service SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D).

4.6.1 Chalk River Laboratories

Throughout 2022, CNSC staff conducted inspections of CRL facilities including NRU, Molybdenum-99 Production Facility (MPF), Nuclear Fuel Fabrication Facility (NFFF), RFFL, CECEUD, and WMA D and H with one of the foci being on the fitness for service SCA. In total there were 10 NNCs raised for CNL to address that are related to fitness for service.

Of the 10 NNCs, 3 of them pertained to equipment or instrumentation that remained installed past their designated lifetime or calibration due date, or not meeting field installation requirements. In an inspection of NFFF in October 2022, CNSC staff found High Efficiency Particulate Air (HEPA) filters on active workstations installed beyond their 10-year allowable life. This finding was of low safety significance, as CNL continues to perform monitoring daily and testing of the HEPA filters on an annual frequency, where a failed test would prompt a filter replacement. In another inspection of the CECEUD facility conducted in June 2022, CNSC staff found installed instrumentation equipment with expired and/or faded calibration information labels. This finding was of low safety significance, as the instrumentation equipment was no longer in operation at the CECEUD facility. In an inspection at a CRL GC60 Class II irradiation facility in March 2022, CNSC staff found a room area radiation monitoring system without a backup power supply. CNSC staff requested CNL to take corrective action to address the non-compliances. CNSC staff determined that the corrective actions taken by CNL to address these 3 NNCs were acceptable and the items are now closed.

The remaining 7 NNCs pertain to the aging management program implementation in accordance with CNSC REGDOC-2.6.3, *Aging Management* [15] at CNL's Universal Hot Cells, NFFF and MPF. CNSC staff noted that several aging management requirements were not being met as required by the licence. These requirements included performing regular periodic reviews of conditions assessments of structures, systems and components (SSC), evaluating methods for monitoring and trending operating and maintenance data of SSCs, documenting corrective actions resulting from aging management field walkdowns in CNL's corrective action program and maintaining up to date facility SSC documentation. CNSC staff have requested CNL to take corrective action to address the non-compliances. CNSC staff determined that the corrective actions taken by CNL to address the NNCs were acceptable and the items are now closed.

CNSC staff also observed that facility aging management plans were not implemented at the MPF and NFFF during inspections conducted in March 2022 and October 2022, respectively. CNSC staff have requested CNL to take corrective action to address these NNCs. In 2022, CNL conducted a self-assessment on CRL's aging management and provided a summary to CNSC staff for review. CNL had identified several programmatic and implementation non-compliances with CRL's licence requirements as per CNSC's REGDOC 2.6.3, *Aging Management* [15]. These non-compliances comprise of partial or no implementation of several integrated aging management requirements as per CNSC's REGDOC 2.6.3, *Aging Management* [15] at several CNL facilities including WL, NPDWF, DPWF and G1WF. CNL is working to revise their aging management program standard documentation and has created an aging management implementation gap plan. The NNCs pertaining to the aging management plans at MPF and NFFF have since been closed with the submission of CNL's aging management implementation plan. CNSC staff will be reviewing CNL's implementation plan and will plan future regulatory oversight activities to verify their implementation.

All these findings were of low safety significance. Despite the issues identified with respect to the fitness for service specific area of aging management and CNL's aging management program, CNL has been performing preventative maintenance tasks, condition-based maintenance on categorized SSCs and routine monitoring of facility data that mitigates the risk of component failure due to age related degradation mechanisms.

4.6.2 Overall Conclusion

Overall, CNSC staff conclude that CNL continues to operate and maintain the facilities in accordance with regulatory requirements with respect to the equipment performance, maintenance, structural integrity and chemistry control. However, CNSC staff will be performing regulatory oversight of CNL's aging management implementation plan at CRL.

4.7 Radiation Protection

The radiation protection SCA covers the implementation of a radiation protection program in accordance with the *Radiation Protection Regulations* [16]. CNL has successfully implemented and maintained a radiation protection program which ensures that contamination levels and radiation doses received by individuals are monitored, controlled and maintained as low as reasonably achievable (ALARA).

CNSC staff assessed CNL's performance in the radiation protection SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D). These compliance activities confirmed that the facilities and its processes were operated and maintained by CNL in accordance with their licensing basis.

In addition, data on dose to workers for each CNL site from 2018 to 2022 can be found in Appendix H.

CNL continues to demonstrate compliance and have been satisfactory in the radiation protection SCA. CNSC staff conclude that CNL's radiation protection performance meets regulatory requirements.

4.7.1 Application of ALARA

CNL's application of ALARA within the radiation protection program includes management commitment and oversight, personnel qualification and training, design analyses of facilities and systems, provision of protective equipment and ALARA assessments/reviews of radiological activities.

In 2022, CNSC staff confirmed that all CNL sites continued to implement radiation protection measures to keep radiation exposures and doses received by persons ALARA. CNL continued to effectively implement the corporate ALARA process at its sites. This process integrates ALARA into design, planning, management and control of radiological activities.

At CNL sites, dose control points (DCP) are used as a dose management tool for nuclear energy workers' (NEWs) radiological exposures. If a NEW's dose exceeds their assigned DCP by more than 1 mSv, an ALARA assessment is documented to assess whether the dose received was justified and optimized, as applicable. In 2022, no NEWs exceeded their assigned DCP by more than 1 mSv.

4.7.2 Worker Dose Control

Workers, including employees and contractors, conducting work activities which present a reasonable probability that the worker may receive an occupational dose greater than 1 mSv/year, are identified as NEWs.

In 2022, no worker received a radiation dose in excess of the CNSC's regulatory dose limits. The maximum individual effective dose received by a NEW across CNL sites was at the CRL site, with a dose of 5.48 mSv, which is approximately 11% of the CNSC's regulatory limit for effective dose of 50 mSv in a 1-year dosimetry period.

4.7.3 Radiation Protection Program Performance

CNSC staff conducted regulatory oversight activities at CNL sites to verify that CNL's radiation protection programs complied with regulatory requirements. These oversight activities included inspections, desktop reviews and compliance verification activities specific to radiation protection. Through these activities, CNSC staff confirmed that CNL has effectively implemented their radiation protection programs to control occupational exposures to workers and keep doses ALARA.

Action levels for radiological exposures are established as part of CNL's radiation protection program. If an action level is reached, it triggers CNL staff to establish the cause and, if applicable, restore the effectiveness of the radiation protection program. In 2022, there were no action levels reached at CNL sites.

4.7.4 Radiological Hazard Control

Radiation and contamination monitoring programs continued to be implemented at CNL sites in 2022, to control and minimize radiological hazards and the spread of radioactive contamination. Dose rate measurements, surface contamination monitoring and, where appropriate, in-plant air monitoring are routinely performed to confirm that radiation exposures are kept ALARA. The radiological hazard surveys conducted in 2022 by CNL did not identify any adverse trends and were consistent with expected radiological conditions.

4.8 Conventional Health and Safety

The conventional health and safety SCA covers a program to manage workplace safety hazards and protect workers. As CNL sites are federally regulated, they are subject to the requirements of the *Canada Labour Code* [17] and *Canada Occupational Health and Safety Regulations* [18]. CNL has developed and implemented a program to manage the workplace safety hazards and protect workers on the job while ensuring compliance with the *Canada Labour Code* [17] and *Canada Occupational Health and Safety Regulations* [18].

Many activities at CNL sites may be performed by contractors, most of which are provincially regulated, and as such contractors are subject to the provincial requirements. In most cases, contractors work under their own health and safety programs, which are reviewed and accepted by CNL. Contractor programs must meet or exceed the requirements of CNL's licences.

CNSC staff assessed CNL's performance in the conventional health and safety SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D). These compliance activities demonstrate that the facilities and activities were operated and maintained by CNL according to their licensing basis.

CNSC staff conclude that CNL continues to implement and maintain effective conventional health and safety programs in accordance with regulatory requirements.

4.8.1 Performance

The key performance indicators for conventional health and safety are the number of recordable lost-time injuries (RLTI) that occur per year, and the RLTI severity and frequency. A RLTI is defined as a workplace injury that results in the worker being unable to return to work for a period of time. RLTI severity and frequency provide context to the number of RLTIs. Severity quantifies the number of lost workdays experienced per 100 employees, while frequency quantifies the number of lost-time injuries relative to the number of hours worked. Data on RLTI, and RLTI frequency and severity from 2018 to 2022 are included in Appendix I for all sites covered by this ROR. In 2022, there were 4 RLTIs at CNL sites, 2 were CRL employees, 1 was a CRL contractor and 1 was a PHP contractor. The total number of RLTIs decreased by 1 between 2021 to 2022. Collectively, these events led to 56 lost working days, 46 of which were related to the RLTI for the PHP contractor. Of the 2 CRL employee RTLIs, 1 involved a worker performing a routine lift which resulted in back strain and the other involved a worker who experienced pain and swelling of their knee which occurred after sustained kneeling to install flooring. For CRL employees the RLTI frequency was 0.07 and the RLTI severity was 0.15. Contractor RLTI data is based on information voluntarily provided to the CNL Health Centre by contracting companies and only includes the number of lost time injuries and working days lost. There were no RLTIs at WL, PGP, DPWF, G1WF or NPDWF in 2022.

For comparison, CNL's reported RLTI frequency for CNL employees is lower than the 2022 lost-time injury rates for comparable industries in Ontario like specialty trades construction (1.03) and printing, petroleum and chemical manufacturing (0.55), as per Ontario Workplace Safety and Insurance Board data in the 2022 Workplace Safety and Insurance Board Statistical Report [19]. CNSC staff consider this to be a conservative comparison because Ontario lost-time injury data includes only injuries for which compensation claims were allowed, rather than all reportable injuries, as is included in CNL data.

4.8.2 Practices

When evaluating safety practices at a site, CNSC staff do not distinguish between the licensee's own staff and those of contractors or visitors, considering all to be 'workers' and equally subject to CNSC requirements and licensee policies. This is notable for CNL, as many CNL sites employ contractors to perform a wide variety of tasks. CNL's Improvement Action System is used by CNL to record all events, including injuries, at CNL sites. CNSC staff review CNL's Improvement Action data to determine trends and monitor actions.

4.8.3 Awareness

CNL's COVID-19 pandemic response consisted of 5 phases. In 2022, CNL was in Phase 4, "New Normal Operations". Daily COVID-19 screening continued for all CNL staff and contractors. Masking requirements were paused in June 2022, in accordance with provincial government recommendations. During 2022, CNSC and CNL continued to have a protocol in place with respect to COVID-19 notification. The intent of the protocol was for CNL to provide notification to CNSC of confirmed COVID-19 cases that could potentially impact its ability to meet minimum shift. CNL provided proactive notification of all COVID-19 cases affecting positions defined within the protocol; however, there were no instances where CNL did not meet minimum shift complement. CNL reported COVID-19 cases to the CNSC until December 2022. Effective March 31, 2023, all CNL sites ceased all remaining COVID-19 controls due to low risk reported by public health agencies and a third-party epidemiologist, as well as the removal of public health restrictions. CNL moved from Phase 4 to Phase 5 of the CNL Pandemic Recovery Plan, with Phase 5 representing normal site operations.

4.9 Environmental Protection

Protection of the environment and the public are both assessed in the environmental protection SCA. This SCA covers programs that identify, control and monitor all releases of radioactive and hazardous substances, and the effects on people and the environment from facilities or as a result of licensed activities.

CNSC staff assess CNL's performance in the environmental protection SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D).

The CNSC publishes annual radionuclides loadings to the environment from nuclear facilities on the CNSC Open Government Portal. The data from CNL sites is available on the CNSC Open Government Portal.

Based on the review and assessment of CNL's submitted monitoring results, past performance history and the regulatory oversight to date, CNSC staff conclude that the environmental protection SCA performance for CNL facilities operated in Canada has been consistent with the previous years, with satisfactory ratings given for 2022.

4.9.1 Effluent and Emissions Control

CNL has implemented and maintains an effluent verification monitoring program that meets regulatory requirements at all sites covered by this report.

Regulatory Limit Exceedances in 2022

- Week ending June 1, 2022: There was an exceedance of the weekly release limit for copper in a composite effluent sample at PHP's waste water treatment plant (WWTP). CNL staff reported the exceedance to the CNSC, investigated the event, confirmed the source was corroded brass components on the cooling loop, and CNSC staff presented an Event Initial Report to the Commission in CMD 22-M38 [20] on June 28, 2022. This exceedance did not pose a risk to workers, the public or the environment.

Action Level Exceedances in 2022

- Week ending June 1, 2022: There was an exceedance for zinc in a composite effluent sample at PHP's WWTP. CNL staff reported the event to the CNSC, investigated the event, confirmed the source was corroded brass components on the cooling loop, and this information was included in CNSC staff's Event Initial Report presentation to the Commission in CMD 22-M38 [20] on June 28, 2022. This event did not pose a risk to workers, the public or the environment.
- Week ending June 7, 2022: There was an exceedance for arsenic in a composite effluent sample at PHP's WWTP. CNL staff reported the event to the CNSC and took immediate corrective action to successfully reduce the arsenic concentration in the effluent to return to levels below action levels. CNL found the elevated arsenic was due to a combination of old

reverse osmosis membrane filters, high water temperatures, low water levels and high proportions of arsenic in the primary collection ponds. This event was not expected to pose a risk to human health or the environment.

Airborne and waterborne releases of radioactive and hazardous substances at all other CNL sites remained below their respective regulatory limits in 2022. All these exceedances were reported to CNSC staff as per the reporting requirements of CNL's licences. Details on these events are also captured in Appendix E.

In 2022, CNL revised the CRL effluent verification program. CNSC staff reviewed the revision and determined that it met regulatory requirements.

Overall, CNSC staff determined that the effluent verification monitoring programs at CNL's sites continue to be protective of the environment and the public.

4.9.2 Assessment and Monitoring

In compliance with CSA standard N288.4, *Environmental monitoring programs at Class I nuclear facilities and uranium mines and mills* [21], CNL has environmental monitoring programs at CRL and WL. CNL provided rationale for not triggering requirements under CSA N288.4 for DPWF, G1WF and NPDWF; thus determining that environmental monitoring programs at these facilities were not required. CNSC staff assessed CNL's information and concluded as such. Of note, environmental monitoring programs are required and have been implemented at the PHP and PGP.

In 2022, CNL revised the CRL environmental monitoring program. CNSC staff reviewed the revision and determined that it met regulatory requirements.

Additionally, CNL has comprehensive groundwater monitoring programs at applicable CNL sites consistent with CSA standard N288.7, *Groundwater protection programs at Class I nuclear facilities and uranium mines and mills* [22].

CNSC staff conclude that the environmental monitoring programs in place at CRL, WL, PHP and PGP are compliant with applicable regulatory requirements and are protective of the environment and the public.

4.9.3 Environmental Management System

The CNSC requires that licensees develop and maintain an Environmental Management System to provide a documented framework for integrated activities related to environmental protection. An Environmental Management System includes activities such as establishing annual environmental objectives, goals and targets. CNL has established a corporate level Environmental Management System that is part of the overall CNL management system which applies to all CNL sites. CNL's corporate Environmental Management System conforms to International Organization for Standardization (ISO) standard 14001:2015, *Environmental Management Systems* [23], and the Environmental Management Systems for CRL and WL are registered to ISO 14001:2015.

4.9.4 Environmental Risk Assessment

The environmental risk assessment (ERA) conducted by licensees is a systematic process used to identify, quantify and characterize the risk posed by contaminants and physical stressors to the environment and human health. An ERA includes an Ecological Risk Assessment and a Human Health Risk Assessment. Most CNL facilities have CNSC REGDOC 2.9.1, *Environmental Protection: Environmental Principles, Assessments and Protection Measures* [24] in their LCH as compliance verification criteria. An ERA is a requirement in the REGDOC for Class I facilities, such as CRL, WL, DPWF, G1WF and NPDWF.

CNSC staff reviewed the submitted ERAs for the CRL, DPWF and G1WF sites and have determined that they are compliant with the requirements in CNSC's REGDOC 2.9.1, *Environmental Protection: Environmental Principles, Assessments and Protection Measures* [24], and CSA standard N288.6-12, *Environmental risk assessments at class I nuclear facilities and uranium mines and mills* [25].

An ERA for the WL lagoon and landfill areas was submitted by CNL in 2021, taking into consideration current site conditions. CNSC staff provided comments on the ERA and are expecting CNL to submit a revised WL lagoon and landfill areas ERA, as well as the initial submission of the WL site-wide ERA in 2023.

CNSC staff conclude that CNL continues to maintain and implement an effective ERA at applicable sites in accordance with regulatory requirements.

4.9.5 Protection of the Public

The protection of the public within the environmental protection SCA is related to ensuring that members of the public are not exposed to unreasonable risk with respect to hazardous and nuclear substances released from the licensed facilities. CNL provides their results of monitoring of releases of hazardous and nuclear substances within their annual environmental and compliance monitoring reports.

Based on CNSC staff assessment of the results in CNL's 2022 environmental monitoring programs, CNSC staff conclude that the releases of hazardous and nuclear substances from CNL sites met the regulatory requirements.

Estimated Dose to the Public

As part of annual reporting to the CNSC, CNL provides data on dose to a hypothetical member of the public that is representative of someone who spends considerable time in proximity to the licensed site.

In all cases, CNL's data indicates that doses to the public resulting from CNL's operations remained well below the 1 mSv/year limit prescribed in the *Radiation Protection Regulations* [16]. At no point during 2022 did the emissions from the CRL site exceed the constraint for dose to the public of 0.30 mSv/year indicated in the CRL LCH. The maximum estimated dose to the public from a CNL site was estimated to be from PGP, at 0.033 mSv/year (3.3% of the 1 mSv/year dose limit).

Further details on the estimated dose to the public are available in Appendix J.

4.10 Emergency Management and Fire Protection

The emergency management and fire protection SCA covers emergency plans and emergency preparedness programs that exist in case of emergencies and for non-routine conditions. This area also includes any results of participation in exercises.

CNSC staff assess CNL's performance in the emergency management and fire protection SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D).

4.10.1 Chalk River Laboratories

CRL conducts drills and exercises to test their emergency procedures and evaluate their response capabilities. This includes an annual emergency preparedness exercise.

In June 2022, CNL performed a stay-in exercise to test their emergency preparedness and response program at CRL. The exercise was designed to test the response capabilities of the CRL site internal response organizations during a simulated high radiation incident in the Universal Cells Facility, resulting in a site stay-in condition. CNSC on-site inspectors observed the exercise and noted no areas of non-compliance.

4.10.2 Gentilly-1 Waste Facility

In December 2022, a fire drill was conducted at the G1WF site to simulate a fire drill at G1WF. CNSC staff reviewed the CNL G1WF After Action Report and were satisfied with G1WF staff's emergency preparedness capabilities, both from CNL G1WF building emergency staff, and the non-emergency staff.

4.10.3 Whiteshell Laboratories

Background

In April 2023, CNL performed a planned self-assessment of the WL fire protection program against the requirements of CSA N393-13, *Fire Protection For Facilities That Process, Handle, Or Store Nuclear Substances* [26]. The self-assessment involved CNL reviewing fire response training, equipment and response capability for compliance with CSA N393-13 [26] and included the review of fire protection records for calendar years 2020, 2021 and 2022.

This assessment determined that training records for members of the on-site fire brigade were incomplete, and therefore CNL could not demonstrate that fire response staff were adequately trained and competent to provide fire suppression activities consistent with the fire protection program for the WL site. Deficiencies were also identified with the procedures for equipment inspection, testing, and maintenance and the use of incomplete or expired personal protective equipment. The deficiencies identified in the training and equipment of fire response staff had a direct impact on CNL's ability to maintain minimum complement of fire response personnel at the WL site.

As a result of these findings, on April 27, 2023, CNL contacted the CNSC Duty Officer to report this event in accordance with section 29(1)(a) of the *General Nuclear Safety and Control Regulations* [27] and paragraph 27(b)(ii) of the *Nuclear Safety and Control Act* [1]. CNL immediately placed the WL site into a safe shutdown state, where only essential compliance and maintenance work could be conducted.

Pursuant to CNSC’s REGDOC-3.1.2, *Reporting Requirements, Volume I: Non-Power Reactor Class I Nuclear Facilities and Uranium Mines and Mills* [11], CNL submitted the required event reports. The full event report identified additional non-compliances with the fire protection program linked to training of firefighters, the conduct of drills, the maintenance and availability of personal protective equipment for firefighters, annual inspection and maintenance for fire extinguishers, and the supply of firewater (i.e., pressure and flow). Several fire hydrants were also identified as unavailable, fixed suppression systems (sprinklers) had not been properly maintained and tested in Whiteshell Reactor-1 (WR-1), and emergency lighting in buildings had not been tested to National Fire Protection Association standards.

This event was presented to the Commission as an Event Initial Report in CMD 23-M25 [28] on June 28, 2023.

Regulatory Actions

On May 8, 2023, CNSC staff held a focused technical meeting with CNL to discuss the preliminary event report, CNL’s immediate measures taken, impacts on CRL fire response capabilities as a result of providing support to WL, next steps and timelines for action completion. Given the number and significance of the non-compliances, CNSC staff determined additional timely information was required to assess whether any enforcement response was needed in alignment with the CNSC’s graduated enforcement strategy. As a result, on May 15, 2023, a CNSC designated officer issued a 12(2) request, as outlined in CMD 23-M25 [28], requesting a number of actions be taken by CNL.

CNL responded to the 12(2) request as required by May 19, 2023. CNSC staff found CNL’s response to be acceptable, and as a result, the CNSC designated officer closed the 12(2) request on May 26, 2023.

On May 30, 2023, CNSC staff conducted a site visit to WL. The purpose of this visit was to determine if CNL had in place a safe, effective and sustainable fire response and adequate implementation of compensatory measures to address the fire protection system non-compliances and ensure the protection of all workers, responders, facilities and the environment.

CNSC staff confirmed that fire extinguishers had been replaced, signage was in place regarding emergency lighting, fire hoses had been pre-deployed to areas lacking operational hydrants and new firefighting gear was present in the firehall. CNSC staff raised a concern regarding the presence of metal halide lighting as a potential ignition source and CNL took immediate actions to mitigate the risk of the presence of these lights and has initiated the process to have them replaced. CNSC staff and CNL had productive discussions regarding the minimum shift complement of firefighters at WL, and CNL has committed to maintaining a complement that CNSC staff confirm meets regulatory requirements. During the site visit, CNSC staff requested records regarding firefighter training, shift complement, the fire screening process and the status of fire hydrants. These records were provided on June 6, 2023 and are currently under review by CNSC staff.

Following the WL site visit and closure of the 12(2) request, CNSC staff are:

- reviewing all submissions from CNL related to this matter
- waiting for the submission of the Multi-Phase Re-Start Plan for CNSC staff review and acceptance
- developing a reactive compliance plan and follow-up activities for the WL site, whereby all compliance activities in the plan will be performed by end of March 2024.

CNSC staff will be providing an update to the Commission of the progress made and status of the WL safety stand-down during the ROR presentation for CNL sites scheduled for November 1, 2023. Additionally, CNSC staff will review the event and draft a lesson learned report which will focus on CNSC’s regulatory oversight of WL from 2019 to 2022. This report and its findings will be shared with the Commission once finalized.

Conclusion

As a result of these findings, CNSC staff has rated the emergency management and fire protection SCA at WL as below expectations in 2022. CNSC staff will continue to conduct oversight in this area to ensure WL comes into compliance with regulatory requirements.

4.10.4 Overall Conclusion

Apart from WL, which received a below expectations rating, CNSC staff conclude that CNL continues to implement and maintain effective emergency management and fire protection programs at CNL sites in accordance with regulatory requirements.

4.11 Waste Management

The waste management SCA covers internal waste-related programs that form part of the facility's operations up to the point where the waste is removed from the facility to a separate waste management facility, location or site. This area also covers the planning for decommissioning.

CNSC staff assess CNL's performance in the waste management SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D).

CNL's activities involve the management of radioactive wastes, from generation to storage. Radioactive and other hazardous wastes have been previously generated from reactor operations and radioisotope production, and waste continues to be generated from on-going site operations, research and development, decommissioning and environmental remediation activities at CNL sites. CNSC staff maintain oversight of CNL's current and future management of radioactive wastes through compliance activities, including desktop reviews and inspections.

CNSC staff conclude that CNL met the applicable regulatory requirements for the waste management SCA at all CNL sites in 2022. CNSC staff were satisfied with the information provided by CNL in the annual compliance reports for all CNL sites in 2022.

Waste from institutions, including hospitals and universities from across Canada, are received at CRL on a commercial basis for safe long-term storage. This service ensures that wastes are managed in a safe, secure and environmentally-sound manner. CRL received a total of 111.6 m^3 of radioactive waste from external organizations in 2022. This includes 45.6 m^3 of commercial waste and 66 m^3 of waste returned from off-site treatment of CNL waste (for example, ash from incineration). In comparison, in 2021, CNL received a total of 61.3 m^3 of radioactive waste from external sources.

Radioactive wastes stored on the sites consist of high-, intermediate- and low-level radioactive wastes. The inventory of wastes stored at CNL sites as of December 31, 2019 is included in the seventh *Canadian National Report for the Joint Convention on the Safety of Spent Fuel Management and on the Safety of Radioactive Waste Management (October 2020)* [29].

In 2022, CNSC staff conducted a technical review of a proposed revision of the Whiteshell Laboratories Detailed Decommissioning Plan: Volume 6 – Whiteshell Reactor #1: Building 100 for the in-situ decommissioning of WR-1, and concluded that the plan did not meet all of the necessary criteria of CNSC's REGDOC-2.11.2, *Decommissioning* [30] and CSA N294-19, *Decommissioning of facilities containing nuclear substances* [31]. CNSC staff sent the review comments to CNL for their disposition. The current approved decommissioning strategy for WR-1 is deferred decommissioning (complete removal), as set out in the approved version of the Detailed Decommissioning Plan for WR-1.

In 2022, CNSC staff conducted a technical review of the Preliminary Decommissioning Plan for the PGP and concluded that the plan did not meet all the regulatory requirements of CNSC's REGDOC-2.11.2, *Decommissioning* [20], CSA N294-19, *Decommissioning of facilities containing nuclear substances* [31] and CNSC's REGDOC-3.3.1, *Financial Guarantees for Decommissioning of Nuclear Facilities and Termination of Licensed Activities* [32]. CNSC staff sent review comments to CNL for their disposition. CNL was requested to provide clarity or additional information on a number of areas including: anticipated post-operational conditions; decommissioning strategy and work plan; waste management strategy; and cost estimate for the financial guarantee. CNL provided responses to CNSC staff's comments, which are currently undergoing review. Additionally, as part of the recent licence renewal for the PHAI, CNL has committed to submitting a Preliminary Decommissioning Plan for the PHP by June 30, 2024, at which point CNSC staff will conduct a technical review for its acceptance.

CNSC staff conducted 7 inspections at CNL sites in 2022 that had a focus on waste management; 2 at DPWF, 1 at WL and 4 at CRL. As a result of these inspections, there were 5 NNCs. There was 1 to DPWF for a waste container label non-compliance; 2 to WL, 1 for a waste container label non-compliance and 1 for an incomplete site wide inventory; and 2 to CRL, 1 for vegetation growth near waste containers in the WMA and 1 for waste package removal from rooms without monitoring for radiation from Fe-55 as required. All NNCs were of low safety significance, and all are closed except the NNC issued to WL for the incomplete site wide inventory, for which CNL is implementing corrective actions to be completed by Q4 of the 2023 calendar year.

4.11.1 Overall Conclusion

CNSC staff conclude, during 2022, CNL maintained effective programs to safely manage radioactive and hazardous wastes from CNL's licensed activities and the decommissioning of its facilities.

4.12 Security

The security SCA covers the programs required to implement and support the security requirements stipulated in the in the *General Nuclear Safety and Control Regulations* [27], *Nuclear Security Regulations* [33], the licence, orders and regulatory expectations for the facility or activity.

CNSC staff assess CNL's performance in the security SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D).

4.12.1 Whiteshell Laboratories

Background

On September 27-29, 2021, CNSC staff identified areas of improvement in the implementation of the security program in relation to Tactical Response Force (TRF) equipment and training following an on-site security inspection at WL.

These areas did not pose any immediate risk to the security of nuclear substances at WL. CNL implemented a corrective action plan (CAP) with milestones and timelines to address these areas by May 27, 2022, that were accepted by CNSC staff. All actions identified in the CAP have been completed.

CNL received a rating of below expectations from 2018 to 2021 in the security SCA. However, as a result of the significant progress made by CNL during the 2022 calendar year, CNSC staff have determined that the security SCA is now rated as satisfactory at WL, which will be discussed in the next section of this report.

Regulatory Actions

On June 15, 2022, CNSC staff conducted an inspection to verify the implementation of CNL's CAP. During the inspection, CNSC staff reviewed procurement documents related to the receipt of TRF equipment and training related actions completed by CNL. CNSC staff's review of CNL's documents demonstrated that training-related corrective actions have either been completed or have been recorded on the training calendar. In addition, CNSC staff noted that all required equipment has been procured and most were received. CNSC staff concluded that CNL was monitoring the timelines of the CAP closely (from the 2021 inspection) and taking appropriate actions including maintaining regular communications with the suppliers and providing regular updates to CNSC staff as procured equipment was being received.

On September 14-16, 2022, a planned inspection was conducted by CNSC staff to assess CNL's compliance with the regulatory requirements through verification of its physical protection program that included: the protected area, physical barriers and associated systems, security practices, as well as response arrangements, drills and exercises. CNSC staff also reviewed training records that included security drills that had occurred since CNSC staff inspected the site in June 2022 and records of official qualification of fitness, firearms and use of force. CNSC staff also followed up on the progress made by CNL with the open NNCs from the 2021 inspection related to procurement of security equipment. CNL provided documentation and demonstrated that most security equipment was received and commissioned, with the remaining few to be ready and commissioned by the end of December 2022. CNSC staff were satisfied with CNL's actions and closed all NNCs from the 2021 inspection.

Conclusion

As a result of CNSC staff verification activities conducted in 2022, and the review of CNL's submissions, CNSC staff have determined that CNL has demonstrated compliance with regulatory requirements at WL and there is no immediate risk to security of the nuclear substances at WL.

CNSC staff assessed that CNL met applicable regulatory requirements in 2022, and therefore assigned a satisfactory rating for the security SCA at WL.

4.12.2 Chalk River Laboratories

Background

CNSC staff assess CNL's performance in the security SCA through desktop reviews of documents, reportable events and through the course of inspections. Following a review of CNL's Tactical Response Arrangements, CNSC staff held technical meetings with CNL focusing on the security arrangements at Waste Management Areas (WMAs) at CRL.

At the request of CNSC, CNL provided a Tactical Response Plan (TRP) with timelines that reflected all training of the Nuclear Response Force (NRF). CNSC staff determined that CNL's submission did not meet regulatory requirements. CNSC staff also indicated that CNL must ensure that it always maintains an on-site NRF capable of providing an effective intervention at the WMAs and that CNL re-submit its updated TRP for CNSC staff review.

CNSC staff was not satisfied with the timelines and the measures being proposed by CNL, which resulted in the issuance of Order 6656254 in October 2021 (amended in November 2021 by the Designated Officer), that included the immediate implementation of compensatory measures. On October 18-19, 2021, CNSC staff conducted an on-site inspection and observed multiple deficiencies in the deployment of the compensatory measures, as required by the Order. From this inspection, CNSC staff also issued several NNCs related to physical protection measures at the WMAs.

In November 2021, CNL met the compensatory measures required by the Order, and continued to provide periodic updates including submissions and status reports on their progress.

Regulatory Actions

In February 2022, during a site visit to verify compensatory measures at the WMAs, and to follow up on CNL's progress with regards to the NNCs from the October 2021 inspection, CNSC staff determined that CNL's compensatory measures and CNL's corrective measures to address the enforcement actions were satisfactory. As a result, all open NNCs from the October 2021 inspection were confirmed closed.

Following a CNL submission in May 2022 of a revised TRP corresponding with the requirements of the Order, CNSC staff held multiple in-person technical meetings with CNL to provide comments on CNL's final TRP and performed walkdowns of the WMAs. CNSC staff requested additional information on various areas of the submissions, more specifically details on CNL-CRL's response ability and CNL's approach to assuring security objectives are being met. Furthermore, CNSC staff re-iterated their concerns of the lack of adequate security measures in WMAs.

In September 2022, CNSC staff performed an unannounced security field inspection of the Protected Areas at the WMAs in order to verify the physical protection measures in place. The inspection identified non-compliances and resulted in multiple follow-up actions involving the physical protection measures at this particular WMA. CNL took immediate actions to correct these non-compliances.

In October 2022, CNSC staff communicated their concerns with regards to CNL's overall performance of security at CRL and its lack of implementation of corrective measures. CNL was directed by CNSC staff to undertake a programmatic review of the security program to better understand the circumstances behind the failures at CRL. CNL was required to identify actions to strengthen the program and prevent the recurrence of the failures. CNL's response included immediate programmatic measures that consisted of the creation of a special forum for a Nuclear Performance Assurance Review Board, implementation of project management and change control actions as well as a commitment to provide a more detailed Security Program Oversight Plan (SPOP) by December 16, 2022.

On December 15, 2022, CNL submitted a detailed SPOP that identified issues resulting from performing CNL quality assurance audits, extent of condition reviews and security management workshops. The SPOP contained a set of 17 actions broken into three themes (Management System Oversight, Audit and Assessment and Security Program Resource Review) for CNL to address, with a goal to strengthen the security program and prevent recurrence. CNL committed to monitor the performance of the SPOP actions and to provide quarterly updates to CNSC on the progress of the activities starting in 2023.

During a quarterly SPOP meeting held in April 2023, CNL provided updates on the progress of the actions as defined in the plan, the outcomes that are achieved as well as the status of focused actions taken by CNL to meet the intent of the open Security Order. At the time of writing this report, CNL confirmed closure of 12 actions, with the 5 remaining actions in progress consisting of revising program documents and completing performance reviews. CNL committed to a target date of completion of the remaining actions by November 2023. With regards to the status of the TRP, CNL submitted the revised TRP for CNSC staff review in mid-May 2023, with a formal request to close the Order. CNL committed to submitting the TRP implementation plan by end of July which will outline timelines and steps for full implementation. CNSC staff accepted CNL's revised TRP.

CNL has made significant progress since the issuance of the Order; however, continue to be rated as below expectations in 2022. During 2023, CNL has made significant improvements to the security program for addressing the Order and CNSC staff are satisfied with the progress being made.

Conclusion

The security program at CRL was assessed at below expectations in 2022. CNL has implemented adequate compensatory measures and there is no immediate risk to security of the nuclear substances at CRL. CNSC staff will continue to conduct oversight in this area to ensure CRL comes into compliance with the regulatory requirements and the effectiveness of the program is improved.

4.12.3 Overall Conclusion

Apart from CRL, which received a below expectations rating, CNSC staff conclude that CNL continues to implement and maintain effective security programs at CNL sites in accordance with regulatory requirements.

4.13 Safeguards and Non-Proliferation

The safeguards and non-proliferation SCA covers the programs and activities required for the successful implementation of the obligations arising from the Canada/International Atomic Energy Agency (IAEA) safeguards agreements, as well as other measures arising from the *Treaty on the Non-Proliferation of Nuclear Weapons* [34].

CNSC staff assessed CNL's performance in the safeguards and non-proliferation SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D). These compliance activities demonstrated that facilities were operated and maintained according to the licensing basis.

Under the terms of the Canadian-IAEA safeguards agreements, the IAEA has the right to perform independent verification activities at various types of sites in Canada, including all the CNL sites covered by this report. IAEA activities are not CNSC compliance inspections, however CNSC staff accompanied IAEA staff on 11 of their activities at the sites covered by this report in 2022. CNSC staff also provided support remotely to an additional 17 IAEA activities carried out at CNL sites in 2022.

In 2022, the IAEA carried out activities at CRL, WL, PHP, PGP, DPWF and G1WF to verify nuclear material inventories and confirm the absence of undeclared nuclear materials and activities. As a result of the inspections conducted by the IAEA, no significant issues were identified. Appendix D contains a list of IAEA lead inspections carried out at each CNL site in 2022. The safeguards program at NPDWF is limited to providing access and assistance to IAEA inspectors in the event of a complementary access request. There was no IAEA complementary access at the NPDWF in 2022.

The CNSC, IAEA and CNL continue to work together to ensure that Canada's requirements under the *Treaty on the Non-Proliferation of Nuclear Weapons* [34] are fulfilled.

4.13.1 Overall Conclusion

CNSC staff conclude that CNL continues to implement and maintain effective safeguards programs in accordance with regulatory requirements.

4.14 Packaging and Transport

The packaging and transport SCA includes the programs that cover the safe packaging and transport of nuclear substances to and from licensed facilities.

CNSC staff assessed CNL's performance in the packaging and transport SCA through desktop reviews of documents, reportable events (Appendix E) and through the course of inspections (Appendix D). There were no transport focused inspections conducted in 2022.

CNL has developed and implemented a packaging and transport program that ensures compliance with the *Packaging and Transport of Nuclear Substances Regulations, 2015* [35] and *Transportation of Dangerous Goods Regulations* [36]. This program covers elements of package design, package maintenance and the registration for use of certified packages as required by the regulations.

In 2022, 342 m^3 of low-level waste and 2.5 m^3 of intermediate-level waste was transported from WL and safely delivered to CRL.

4.14.1 Overall Conclusion

CNSC staff conclude that CNL continues to implement and maintain effective packaging and transport programs in accordance with regulatory requirements.

5 INDIGENOUS CONSULTATION AND ENGAGEMENT

5.1 CNSC Consultation and Engagement Activities

The CNSC is committed to building long-term relationships and conducting ongoing engagement with Indigenous Nations and communities who have an interest in CNSC-regulated facilities within their traditional and/or treaty territories. The CNSC's Indigenous engagement practices include sharing information, discussing topics of interest, seeking feedback and input on CNSC processes, responding to addressing issues and concerns, ongoing collaboration and two-way dialogue, collaboratively drafting relevant sections of CNSC reports, including RORs, and providing opportunities to participate in environmental monitoring through the Independent Environmental Monitoring Program (IEMP). The CNSC also makes funding support available through the CNSC's Participant Funding Program (PFP) for Indigenous Peoples to meaningfully participate in Commission proceedings and ongoing regulatory activities.

CNL's sites fall within the traditional and treaty territories of many Indigenous Nations and communities, as listed in Appendix A. The majority of the engagement and consultation activities with Indigenous Nations and communities with an interest in CNL's sites, operations and activities in 2022 occurred via both in-person and remote means. CNSC staff welcomed the opportunity to discuss and address topics of interest and concern to the Indigenous Nations and communities through various engagement activities and conduct collaborative in-person activities to continue to build and strengthen the relationships between the CNSC and each Nation.

CNSC Engagement Efforts

In 2022, CNSC staff engagement efforts in relation to CNL sites were largely focused on consultation activities for the ongoing EAs and licensing processes for the NSDF Project and the NPDWF Decommissioning Project, as well as the renewal of the PHP licence. Indigenous Nations and communities were also provided updates on ongoing licensed activities at the DPWF, WL, G1WF, PHAI, NPDWF and CRL sites.

CNSC staff ensure that all Indigenous Nations and communities with a potential interest in CNL sites, facilities and activities, are aware of the CNL ROR process and how they can get involved. As was done in 2021, the CNSC continued to hold an annual CNL ROR virtual engagement session with Indigenous Nations and communities on September 8, 2022. There were over 20 participants representing approximately 11 Indigenous Nations, communities and organizations with an interest in CNL sites and the ROR. The goal of the engagement session was to provide an overview of the ROR, CNSC staff's findings with regards to CNL's performance in 2021 as well as discuss and address feedback, concerns, comments and recommendations submitted by interested Nations and communities in relation to the 2021 CNL ROR. CNSC staff appreciated the feedback and discussions and worked to include and reflect a number of the recommendations in the 2022 CNL ROR. Based on the continued success of these virtual engagement sessions, CNSC staff plan to host another CNL ROR engagement session for the 2022 ROR in September 2023.

CNSC Communications with Indigenous Nations and Communities

In addition to the outreach and engagement sessions, CNSC staff ensure that all interested Indigenous Nations and communities are made aware of the opportunities to review the ROR and submit interventions to the Commission, including the opportunity to intervene orally, as well as opportunities to receive funding through the CNSC's PFP to support their participation in the process. As well, in 2022 CNSC staff continued to keep Indigenous Nations and communities up to date and informed with regards to CNSC staff's regulatory oversight activities at CNL sites including specific meetings on topics of interest, and ongoing discussions with regards to responding to and addressing issues, concerns and recommendations raised in their interventions to the Commission. In 2022, CNSC staff followed up with each Indigenous Nation and community who intervened with regards to the 2021 CNL ROR and offered to have specific meetings and discussions to address their concerns, comments and recommendations. In response to concerns raised by Indigenous Nations and communities, CNSC staff committed to taking the following actions to continue to improve the CNL ROR:

- Provide more detailed event descriptions for reportable events.
- Provide more information on NNCs arising from inspections.
- Include details on the CNSC's oversight strategy on climate change resiliency.
- Include an annex summarizing the issues, concerns and requests, and the status of the CNSC's responses/work to address them from intervenors from last year's ROR, including Indigenous Nations and communities.
- Continue working with Indigenous Nations and communities to address their recommendations in their interventions on the 2021 CNL ROR.
- Collaborate with Indigenous Nations and communities with whom the CNSC has a Terms of Reference (ToR) for long-term engagement on drafting summaries of engagement activities.
- Collaborate with Indigenous Nations and communities on summarizing their feedback and perspectives on engagement with CNL in 2022.

More information on the ToR engagement summaries and each Nation's perspective on CNSC staff's and CNL's engagement during 2022 can be found in Appendix L and section 5.2 of this report.

Issues and Concerns Tracking

In order to effectively track and respond to requests and recommendations from interventions submitted by Indigenous Nations and communities, CNSC staff have established an internal tracking process to capture issues, concerns and recommendations raised by each Indigenous Nation or community. This process includes populating internal tracking tables, in which CNSC staff document responses and proposed action items as needed. CNSC uses this tool to summarize the requests, concerns and recommendations included in the interventions in relation to each ROR, or other Commission proceedings as appropriate.

In response to the Commission's request for information on issues and concerns tracking, CNSC staff have included Appendix M in this report that provides key information about the number of issues, concerns and recommendations submitted by each Indigenous Nation and community in relation to the 2021 CNL ROR. Additionally, the appendix presents the number of issues and concerns that the CNSC has responded to, as well as the current status and CNSC staff's path forward to meaningfully address and close out specific requests, concerns and comments, where possible. Overall, the CNSC has been able to respond to all of the requests, concerns and comments raised by Indigenous Nations from the 2021 CNL ROR and is actively working with each intervenor to resolve or close out each request and recommendation, where possible.

CNSC staff also reached out to all Indigenous Nations and communities who intervened in the 2021 ROR, offering to meet and discuss the requests, concerns, and comments from their interventions, as well as how to address them. For Indigenous Nations and communities that have a ToR with CNSC, requests, concerns and comments raised in the ROR will be further discussed in agreed-upon regular meetings, and CNSC staff will work with the Nation or community to share and verify the data in their respective issues tracking table.

Overall, the interventions in relation to the 2021 ROR were categorized into 14 different themes including consultation and engagement, improvements to the ROR process and ROR content, and environmental monitoring.

Engagement on Monitoring Activities

In 2022, CNSC staff continued to engage and collaborate with Indigenous Nations and communities on the CNSC's IEMP. CNSC staff have made it a priority to ensure that IEMP sampling reflects Indigenous Knowledge, land use and values, where possible. In addition to IEMP sampling activities, CNSC staff sought input from Indigenous Nations and communities in the 2022 IEMP sampling plans and participation in the sampling process in-person alongside CNSC staff.

In advance of the 2022 IEMP sampling campaign around CRL, the Bruce Power site (DPWF) and WL, notification emails were sent to Indigenous Nations and communities near the sites to notify them of the sampling campaigns and to seek input on the applicable sampling plans. CNSC staff invited each interested Nation and community to provide and share Indigenous Knowledge, as well as suggestions for species of interest, valued components and potential sampling locations where traditional practices and activities may take place.

Representatives from the Algonquins of Pikwakanagan First Nation (AOPFN), Algonquins of Ontario, the Métis Nation of Ontario (MNO), Curve Lake First Nation (CLFN) and Kitigan Zibi Anishinabeg (KZA) First Nation joined the sampling team around the CRL site for sampling activities in August 2022. Representatives from Sagkeeng Anicinabe First Nation, Manitoba Métis Federation (MMF), Black River First Nation and Hollow Water First Nation joined the sampling team around WL. Representatives from the MNO, the Historic Saugeen Métis (HSM) and the Saugeen Ojibway Nation (SON) joined the sampling team at the Bruce Power site in areas surrounding the DPWF site. CNSC awarded funding through the PFP to each participating Indigenous Nation and community to support these collaborative efforts on the 2022 IEMP.

As part of the sampling field work, CNSC staff and the participating Indigenous Nations and communities discussed the IEMP in more detail and related aspects of the CNSC's Environmental Protection Framework. The CNSC's sampling team demonstrated sampling techniques as well as packaging and chain of custody procedures. Participants helped to gather samples of water, soil, sand and vegetation. CNSC staff truly appreciated the engagement, input and participation by the Indigenous Nations and communities in the CRL, Bruce Power site/DPWF and WL sampling campaigns and look forward to future collaboration on the IEMP and other sampling initiatives. Once the results are available for each of the sampling campaigns, CNSC staff will work with each Indigenous Nation and community to communicate the results to their respective leadership and community members, including collaboration on easy-to-read results cards that can be shared with community members. The CNSC is committed to continuing to engage with interested Indigenous Nations and communities with regards to the IEMP, to ensure that sampling plans and activities are reflective of and incorporate Indigenous Knowledge, values and perspectives.

In 2022, CNSC and Environment and Climate Change Canada (ECCC) engaged with participating Indigenous Nations and communities and Environmental Non-Government Organizations in Phase 1 of the Regional Information and Monitoring Network for the Ottawa River Watershed (RIMNet) Initiative. This initiative is led by the CNSC and ECCC to improve information sharing and documentation regarding the environmental effects of past, existing and proposed nuclear facilities in the Ottawa River Watershed Basin. RIMNet aims to improve understanding of environmental effects, including cumulative effects of past, existing and proposed nuclear facilities.

The AOPFN, Kebaowek First Nation (KFN), KZA and Ottawa Riverkeepers have been engaging with CNSC and ECCC to share knowledge, perspectives and priorities in relation to the RIMNet initiative. Participants met with CNSC and ECCC quarterly to receive updates on data collection and analysis, review the draft table of contents for the State of the Environment report, which included identifying sections of the report where they may have interest in contributing to, as well as share resources and/or Indigenous Knowledge, as appropriate. CNSC and ECCC are engaging with participants at all stages of Phase 1 of RIMNet to ensure a collaborative process and look forward to further collaboration in future phases of the initiative.

CNSC Terms of Reference for Long-Term Engagement with Indigenous Nations and communities

CNSC staff have formalized long-term engagement relationships with interested Indigenous Nations and communities through ToRs collaboratively developed with each Nation or community. The ToRs and associated work plans, include regular meetings, an accountability and governance structure, specific collaborative activities, as well as topics, facilities, sites and projects of interest. In 2022, the CNSC developed and finalized ToRs for long-term engagement with the following Indigenous Nations and communities with an interest in CNL sites and activities:

- AOPFN
- Mississaugas of Scugog Island First Nation
- KFN

This is in addition to existing ToRs with CLFN, the SON, the MNO and the HSM. In total, CNSC staff have signed 8 ToRs for long-term engagement to date and are working on developing a number of others in the coming years with interested Indigenous Nations and communities. CNSC staff remain open to developing ToRs for long-term engagement with other interested Nations and communities with nuclear facilities in their territories upon request. A summary of the engagement activities that occurred in 2022 in relation to each of the existing ToRs for long-term engagement with these Nations and communities which was collaboratively drafted between CNSC staff and each respective Indigenous Nation or community can be found in Appendix L.

5.2 CNL Engagement Activities

CNSC staff confirms that CNL has a dedicated Indigenous Engagement program that covers CNL's operations and activities. CNL met and shared information with interested Indigenous Nations and communities throughout 2022. CNL staff also participated in cultural awareness activities, provided capacity funding to support engagement activities, and invited Indigenous community members to CNL events.

CNL engagement with respect to CRL, NPDWF, DPWF, G1WF, PHAI and WL in 2022 generally focused on project-specific environmental assessments and licensing processes. However, discussions and activities have also addressed concerns and interest in the broader sites and ongoing licensing activities.

Chalk River Laboratories and Nuclear Power Demonstration Waste Facility Sites

For the CRL site, CNL continued to work on long-term relationship agreements in 2022. CNL has a Memorandum of Understanding (MOU) with the Algonquins of Ontario as well as an MOU with the MNO Regions 5 and 6. CNL is also in the process of working on an MOU and Contribution Agreement with KFN, as well as with KZA. CNL is working to amend a Contribution Agreement with CLFN to go until 2024 and is working to establish a Contribution Agreement with Hiawatha First Nation. CNL continued discussions with AOPFN on establishing a Guardian Program and a long-term relationship agreement. The MNO, AOPFN, KZA and KFN are also involved in CNL's public Environmental Stewardship Council. CNL continued engagement with KZA and KFN to continue to build their relationships and continued monthly meetings with the Williams Treaties First Nations (WTFN) (including CLFN). CNL has noted that Indigenous Nations and communities expressed interest in biodiversity and cultural heritage studies, as well as future site use at CRL. In response, CNL invited interested Indigenous community members to participate in archaeological assessment field studies at CRL.

Douglas Point Waste Facility

For the DPWF, CNL continued to focus on long-term engagement in 2022. CNL participated in the annual SON Tradeshow, as well the SON Environmental Office community event, provided regular project updates, provided a facility tour, and worked towards signing a ToR for long-term engagement. CNL conducted regular quarterly meetings with HSM to discuss project updates on the DPWF. CNL also met with the MNO staff and MNO Georgian Bay Traditional Territory Consultation Committee to provide project updates and discuss a relationship agreement.

Whiteshell Laboratories

In 2021, CNL shifted its approach to engaging with interested First Nations and the Red River Métis (represented by the MMF) in the vicinity of the WL site to be more relationship-based than solely project-focused. This work carried on into 2022. CNL continued to work to establish an Indigenous Advisory Committee for the WL site, as well as relationship agreements with key Indigenous Nations and communities. In 2022, CNL worked with Sagkeeng Anicinabe First Nation to establish a community liaison officer position, met with Chief and Council, provided site tours, renewed the Technical Working Group and supported the development of an independent Community Environmental Monitoring Program. In 2022, MMF participated in or observed many CNL environmental monitoring and other site activities, received updates on ongoing WL decommissioning activities, hosted CNL at a MMF Community Consultation Meeting, discussed potential collaborative initiatives, and continued negotiating a relationship agreement with CNL. In 2022, Black River First Nation and Hollow Water First Nation participated in a site tour, berry picking and mushroom collection, medicinal plant walk, environmental monitoring and extended the existing relationship agreement with CNL.

Gentilly-1

No specific engagement activities with Indigenous Nations and communities were carried out for G1WF in 2022. However, CNL has indicated its intention to share information with and seek feedback from interested Indigenous communities with respect to G1WF and has noted that planning activities for Indigenous engagement and relationship building with Indigenous Nations and communities with an interest in the G1WF site were initiated by CNL in 2022 and 2023.

Port Hope Area Initiative

In 2022 for the PHAI, CNL continued engaging with the WTFN regarding the PHAI, which is located in their shared traditional and treaty territory, as well as approximate Indigenous communities with potential interests in the area around PHAI. CNL's Indigenous engagement staff met monthly with representatives from the Mississauga First Nations, as well as the Chippewa communities (Beausoleil, Georgina Island and Rama First Nations). In April 2022, CNL staff met with representatives of the Mississaugas of Scugog Island First Nation and their business partners to discuss potential procurement opportunities. In May 2022, CNL hosted senior representatives of Anishinabek Nation for an in-person meeting in Port Hope that included an update on PHAI activities and tour of the PHP sites.

The WTFN monthly meeting for June 2022 took place in-person in Port Hope and included a PHAI project update, information on the 10-year licence renewal application and revisions to the cleanup criteria amendment application proposal. The meeting was followed by a tour of the PHP and PGP sites. In July 2022, CNL staff met with representatives of the MNO Regions 6 and 8 to provide an update on the status of the PHAI project, an update on environmental monitoring and to discuss details of a proposed site tour with MNO representatives in the fall of 2022. Preparations for the PHP 10-year licence renewal hearing were also discussed. CNL continues to hold an active Contribution Agreement with CLFN and remains open to similar PHAI-related agreements with other Indigenous communities if desired.

Feedback received by Indigenous Nations and communities on engagement with CNL in 2022

In response to concerns raised by Indigenous Nations and communities in their interventions in relation to the 2021 CNL ROR that their input was not being incorporated into CNSC's assessment of licensees, CNSC staff sought formal feedback from Indigenous Nations and communities with regards to their perspectives and feedback on CNL's engagement with them in 2022 to be included in the 2022 CNL ROR. This input was sought outside of regular meetings from all interested Nations and communities who had raised issues, concerns and recommendations in the 2021 CNL ROR. Of the Nations CNSC requested feedback from relevant to this ROR, the HSM, CLFN and the AOPFN have provided feedback. Their submissions are as follows:

1. Feedback on CNL's Engagement from the Historic Saugeen Metis:

HSM Council and staff informed CNSC staff that they appreciated the informative project updates and discussions with CNL in 2022, which also included a project site tour.

2. Feedback on CNL's Engagement from Curve Lake First Nation:

CLFN informed CNSC staff that in 2022, CNL and the WTFN continued the practice of conducting routine meetings for the WTFN communities that have shown an interest and are able to attend. Reoccurring meetings allow CLFN to stay up to date on the different CNL projects and maintain predictability of interactions based on a schedule. During meetings, CNL has asked the representatives from WTFN about what could be improved during meetings and to continue building the relationship. CLFN had the opportunity to talk about the need to improve communication tools, like having infographics instead of meeting minutes. Representatives from WTFN also suggested having more interactions and less updates, more leadership meetings, more in-person meetings, concrete actions and deliverables, as well as allowing space to learn and digest the information. At these meetings, CNL has made the effort to share public disclosures.

3. Feedback on CNL's Engagement from the Algonquins of Pikwakanagan:

In April 2023, AOPFN provided CNSC staff with a performance review of CNL's engagement activities with their community in 2022. AOPFN has developed their own Aboriginal Rights SCA Criteria to assess the quality of engagement of licensees and the CNSC, which was first discussed in AOPFN's 2021 CNL ROR submission to the Commission. AOPFN's assessment is based on AOPFN's experience with CNL in relation to their participation in engagement and outreach initiatives and activities. CNSC staff and AOPFN have collaborated on summarizing AOPFN's key findings with regards to CNL's engagement activities with them in 2022 and the summary is included below. AOPFN's full assessment will be included in their submission to the Commission in relation to the 2022 CNL ROR.

Summary of AOPFN's Assessment of CNL's Engagement Activities and Performance in 2022

AOPFN's key findings from their assessment of CNL's engagement activities and performance in 2022 include the need for CNL to provide more inclusive and accessible communications with AOPFN, the need for meaningful commitments to be made by CNL to address AOPFN's concerns and priorities, as well as the full implementation of existing commitments between AOPFN and CNL. Other findings include AOPFN's desire for CNL to recognize AOPFN as a partner with a joint decision-making role on CRL site planning activities, as well as monitoring and management activities that are not restricted due to security concerns. AOPFN notes no commitments have been made to date in relation to measures at the NPDWF site to protect or promote AOPFN rights. Neither AECL, CNL or CNSC have indicated that they will respect and adhere to AOPFN United Nation Declaration on the Rights of Indigenous People (UNDRIP), Free, Prior and Informed Consent decisions, including in relation to projects that fit under the "positive consent requirements" for hazardous waste disposal facilities outlined in UNDRIP Article 29.2.

AOPFN has determined that from their perspective, CNL was overall operating below expectations in most of their Aboriginal Rights and engagement assessment categories for 2022. These categories include the integration of Indigenous Knowledge into site monitoring and management, engagement of Indigenous Peoples in site planning, monitoring and management, and contributions to reconciliation with Indigenous Peoples. However, AOPFN notes that they are seeing some improvement as CNL invests more in its relationship with AOPFN, including the ongoing efforts to develop a long-term relationship agreement (LTRA). This has contributed to a slight upward trend in the quality of CNL's engagement and the CNL-AOPFN relationship over the past year. AOPFN did not include the LTRA in their assessment of CNL's operations as no such agreement has been finalized to date.

AOPFN has developed and shared a list of proposed commitments that they would like CNL to implement to further improve the relationship between the two parties. AOPFN has shared these commitments with CNSC and CNL. Examples of the commitments include greater CRL site access provisions for AOPFN members and Guardians (including confirmed long-term funding and initial application of the Neya Wabun Guardian Program); recognition of past impacts on traditional use, culture and well-being; long-term funding for full implementation of AOPFN-led risk communication program agreement on a procurement and employment benefits program at CNL sites in their territory; greater communication and information sharing including but not limited to reportable incidents as well as plans for importing radioactive waste; among others.

AOPFN notes that CNL has made some progress towards improving the relationship and collaborating with AOPFN with respect to CNL sites in their traditional territory. For example, AOPFN appreciates that CNL is prioritizing having regular meetings with AOPFN at both the leadership and staff levels. However, AOPFN is of the view that CNL must make greater efforts to respect AOPFN rights and interests with regards to their operations and projects.

AOPFN reaffirms their responsibility to care for their unceded territory, and to preserve and protect the lands, waters, and wildlife. As such, AOPFN maintains that they must be recognized as a rightful, respected, and principled steward of the environment and have a greater role with regards to oversight, monitoring and management of the CRL site and other CNL operations and projects in their territory.

CNSC staff are encouraged that AOPFN and CNL are making progress towards enhancing their relationship and collaboration and encourage both parties to continue to make efforts to ensure the relationship and engagement continues to progress in a positive trend. CNSC staff will continue to monitor CNL's engagement and communication activities and support the relationship and work towards addressing AOPFN's concerns and comments as appropriate.

CNSC Indigenous Consultation and Engagement Findings

CNSC staff are overall satisfied with the level and quality of Indigenous engagement conducted by CNL with regards to its operations and proposed projects at its different sites in 2022. CNSC staff encourages CNL to continue to remain flexible and responsive to the requests and needs of the Indigenous Nations and communities that have an interest in its sites, facilities and proposed projects.

6 EVENTS AND OTHER MATTERS OF REGULATORY INTEREST

This section of the ROR provides information on other matters of regulatory interest, including reportable events, the separate efforts of CNSC staff and CNL regarding public engagement, environmental protection reviews, the Independent Environmental Monitoring Program (IEMP) and nuclear liability insurance at CNL sites.

6.1 Reportable Events

Detailed requirements for reporting unplanned situations or events at CNL licensed sites to the CNSC are referenced in the applicable LCHs. CNSC's REGDOC- 3.1.2, *Reporting Requirements, Volume I: Non-Power Reactor Class I Nuclear Facilities and Uranium Mines and Mills* [11] was implemented for applicable CNL sites with the exception of PHP and PGP. CNSC's REGDOC-3.1.3, *Reporting Requirements for Waste Nuclear Substance Licensees, Class II Nuclear Facilities and Users of Prescribed Equipment, Nuclear Substances and Radiation Devices* [37] was implemented for PHP and PGP. Over the period covered by this report, CNL has complied with the requirements for submission of these reports.

Appendix E provides a list and a brief description of the reportable events which occurred in 2022. These events are of low safety significance and CNSC staff are satisfied with CNL's corrective actions to prevent recurrence.

Events which CNSC staff assess as meeting specific risk criteria are the subject of "Event Initial Reports" from CNSC staff to the Commission. In 2022, there was one Event Initial Report, which was presented to the Commission on June 28, 2022:

- Exceedance of copper discharge criteria in plant effluent for the week ending on June 1, 2022 at the PHP waste water treatment plant (WWTP), presented to the Commission in CMD 22-M38 [20]. On June 6, 2022, CNL reported that during routine compliance sampling at the PHP WWTP the composite effluent sample for the week ending June 1, 2022, exceeded the weekly release limit for copper and the action level for zinc. CNL determined that the evaporator cooling loop was the source of the abnormal copper and zinc concentrations. CNL redirected the evaporator cooling loops to the plant process drain for water treatment until brass components could be modified and then tested to confirm the absence of copper and zinc concentrations in excess of the applicable licence limits and action levels. CNL also conducted an extent of condition evaluation on all systems potentially impacting the facility's final effluent to identify and address future sources of copper (both brass and bronze). CNSC staff took confirmatory influent and effluent water samples from the PHP WWTP and had them assessed by the CNSC lab and CNSC subject matter experts. The results were below applicable licence limits and action levels. CNSC staff are satisfied with the corrective actions taken by CNL and the event is now closed. The event had no adverse environmental or health effects.

6.2 Public Engagement

6.2.1 CNSC

Public engagement consists of activities carried out directly by CNSC staff, and those activities carried out by CNL. The *Nuclear Safety and Control Act* [1] mandates the CNSC to disseminate objective scientific, technical and regulatory information to the public concerning its activities and the activities it regulates. CNSC staff fulfill this mandate in a variety of ways, including hosting in-person and virtual information sessions and through annual regulatory reports. CNSC staff also participate in local community events as well as CNL-led public meetings. CNSC staff also seek out other opportunities to engage with the public and Indigenous Nations and communities, often participating in meetings or events in communities with interest in nuclear sites. These allow CNSC staff to answer questions about the CNSC's mandate and role in regulating the nuclear industry, including CNL's sites. Additionally, CNSC staff have responded to or provided CNSC staff's path forward to meaningfully address and close out specific requests, concerns and comments raised by Indigenous Nations or communities and intervenors who raised issues or concerns in relation to the 2021 CNL ROR. More details can be found in Table A in Appendix M of this report.

CNSC staff carried out several targeted outreach activities in 2022. Some of these activities were linked to specific regulatory review and licensing processes underway, including the NSDF, the Global First Power Small Modular Reactor (SMR) EA and licensing proposals, and the PHAI licence renewal. Other activities were more generic in nature including the outreach related to the CNL ROR. Outreach related to the ROR focused on Indigenous Nations and communities that have traditional and/or treaty territories in proximity to CNL sites.

CNSC awarded $72,828.76 in participant funding to assist Indigenous Nations and communities, members of the public and stakeholders in reviewing this ROR and submitting comments to the Commission, as detailed in Appendix K.

6.2.2 CNL

The CNSC requires licensees to maintain and implement public information and disclosure programs, in accordance with CNSC's REGDOC-3.2.1, *Public Information and Disclosure* [38]. These programs are supported by disclosure protocols that outline the type of facility's information to be shared with the public as well as details on how that information is to be disseminated. This ensures that timely information about the health, safety and security of persons and the environment, and other issues associated with the lifecycle of nuclear facilities, is effectively communicated to the public.

CNSC staff monitor CNL's implementation of its public information and disclosure program to verify that it communicates regularly with its audiences in a way that is open, transparent and meaningful to them. CNSC staff also review yearly program updates to verify CNL is taking communities feedback into consideration and taking steps to implement program adjustments to meet the evolving needs of the various communities.

With the lingering impact of the COVID-19 pandemic, all licensees continued to face challenges and make ongoing adjustments to their public information programs. CNL successfully maintained and adapted its public information and disclosure program to engage their many stakeholders while adapting to the evolving restrictions and respecting all necessary protocols. CNL was able to reintroduce a number of in-person activities in 2022 and continued to deliver a hybrid approach to meetings and events, offer webinars and increase digital communications whenever possible.

Communications activities conducted by CNL included:

- maintaining a current, easy to navigate, public facing website
- regularly updating its website with information on each facility/site/project and posting its public disclosure protocol and reportable events
- extensive posting on social media with information on each facility/site/project, as well as engaging with audiences on social media; this included a total of more than 290 posts across the main platforms (Twitter/ LinkedIn/Facebook/YouTube) resulting in a 56% increase in impressions and a notable increase of followers (13% increase of followers on Twitter, 35% increase of followers on LinkedIn, 9% increase of followers on Facebook) and over 1.6 million impressions in total
- advertising on social media, local and national media including Maclean and the Toronto Star
- sending out information externally to local communities and interested stakeholders via newsletters (mailout and online), as well as internally to CNL employees via staff meetings, intranet and internal newsletters (online). CNL produces general newsletters as well as facility-, site- and project-specific newsletters for specific communities [CRL (fall edition) ~55,000 households, WR-1 (winter 2021/2022 edition) ~8,000 households]. The Kids CONTACT newsletter (winter and summer edition) was expanded to include the CRL, WL and Port Hope catchment areas in 2022 (~72,000 households).
- developing and publishing the 2022 CNL Sustainability Report on the website
- hosting and participating in several in-person events including open houses, community events, national and international conferences and tradeshows, including events to acknowledge and celebrate Indigenous Peoples, and encourage and promote youth and women in STEM. A CNL Science Camp was launched in 2022. All initiatives increased participants' awareness and understanding of CNL.
- hosting and participating in virtual events such as webinars, online conferences, career fairs and school presentations

- conducting sitewide tours at various facilities/sites for local communities, school groups, interested stakeholders and media as requested
- supporting local communities through various initiatives including an employee crowdfunding initiative
- providing mechanisms for audience feedback and responding to public inquiries including:
  - 327 website visitors who used the “Contact Us” function (down approx. 500 visitors from 2021)
  - a toll-free information line
  - breakfast briefings, technical meetings and focus groups and other community events
- consistent engagement with local and national media, both proactively and in response to requests. In 2022, CNL produced 35 news releases. By taking a more proactive approach to media relations, coverage was more accurate overall.
- conducting a Nanos research public attitude survey of more than 500 residents within Renfrew and Pontiac counties
- maintaining the community advisory panel which began in 2021 and posting meeting summaries to the CNL website

In 2022, CNL demonstrated a strong commitment to disseminating appropriate and timely health and safety information to the public and community members through the use of their website, social media, in-person and virtual events, engagement activities, and newsletters. CNL has a diverse educational program for youth. CNSC staff found that all CNL sites and facilities were in compliance with applicable public information program requirements.

6.3 Environmental Protection Reviews

CNSC staff conduct environmental protection reviews (EPRs) for all licence applications with potential environmental interactions, in accordance with CNSC’s mandate under the *Nuclear Safety and Control Act* [1] and associated regulations. An EPR is a science-based environmental technical assessment conducted by CNSC staff. The fulfillment of other aspects of the CNSC’s mandate, such as regulating safety and security, are met through other oversight activities.

Starting in 2021, the CNSC began a new approach for publishing stand-alone EPR reports online based on the scale and complexity of the environmental risk of the facility. These reports are separate from a specific licensing decision to allow interested Indigenous Nations and communities and members of the public additional time to review information related to environmental protection and engage with CNSC staff on any information in the reports. All available EPR reports can be found on the CNSC website. EPR reports are typically timed to align with the facility’s ERA cycle, which is at minimum every 5 years or sooner if there is a major change to the facility. Currently, there is only one EPR report available for CNL sites and facilities, and it is for the Port Hope Area Initiative. CNSC staff will be publishing EPR reports for the other CNL sites and facilities in the future.

- Environmental Protection Review Report: Port Hope Area Initiative [39]

The information in EPR reports support staff's recommendations to the Commission in future licensing and regulatory decisions on whether the proposal provides adequate protection of the environment and the health of people.

6.4 Independent Environmental Monitoring Program

The CNSC requires that each nuclear facility licensee develops, implements and maintains an environmental monitoring program as appropriate to demonstrate that the public and the environment are protected from any releases to the environment related to the facility's nuclear activities. CNSC staff evaluate and assess the results of these monitoring programs to determine compliance with the applicable requirements and limits, as set out in the regulations that govern Canada's nuclear industry.

The Independent Environmental Monitoring Program (IEMP) is an independent from licensee, technical environmental sampling program that is carried out by CNSC staff in publicly accessible areas around nuclear facilities. The CNSC continues to strive to build Indigenous and public trust in the CNSC's regulation of the nuclear industry; and thus implements an IEMP to confirm the effectiveness of a licensee's monitoring program and to promote more awareness and information sharing of CNSC's work in the protection of people and the environment. The IEMP is a regulatory tool that complements and informs the CNSC's ongoing compliance verification program. The IEMP does not rely on licensees to provide samples. CNSC staff or independent contractors obtain samples from publicly accessible areas around nuclear facilities, then measure and report the amounts of radiological and hazardous substances present in these samples to the Commission, Indigenous Nations and communities, and the public.

In 2022, CNSC staff conducted independent environmental monitoring around the CRL, Bruce Power (DPWF) and WL sites. There were no results of concern. In addition, these results are consistent with the results submitted by CNL. The IEMP results add to the body of evidence and supports CNSC staff's assessment that the public and the environment in the vicinity of the CRL, DPWF and WL sites are protected and that CNL's environmental protection programs are effective.

Results from all IEMP sampling campaigns are available on the CNSC's Web page.

6.5 Nuclear Liability Insurance

Pursuant to section 7 of the *Nuclear Liability and Compensation Act* [40], which came into force on January 1, 2017, and previously under the *Nuclear Liability Act* [41], CNL is required to maintain nuclear liability insurance for designated nuclear installations. The 5 nuclear installations operated by CNL that require nuclear liability insurance, as designated in the Schedule (section 2) of the *Nuclear Liability and Compensation Regulations* [42], are: CRL, WL, DPWF, G1WF and NPDWF.

The insured facilities at CRL are a single-unit reactor of over 7 megawatts, nuclear fuel waste processing facilities, retired nuclear reactor structures, facilities for nuclear fuel production and nuclear substance processing, and radioactive waste processing and storage facilities. CNL's prescribed limit of liability for this installation is $180 million, in accordance with paragraph 5(a) of the *Nuclear Liability and Compensation Regulations* [42].

The insured facilities at WL, DPWF, and G1WF have each a prescribed limit of liability of $13 million.

CNL's prescribed limit of liability for the installation at NPDWF is $1 million.

Natural Resources Canada, which is the federal department responsible for the administration of the *Nuclear Liability and Compensation Act* [40], confirms that CNL is in compliance with its obligation under the *Nuclear Liability and Compensation Act* [40] for nuclear liability insurance for all 5 designated nuclear installations.

6.6 Overall Conclusions

CNSC staff conclude that the CRL, WL, PHP, PGP, DPWF, G1WF and NPDWF sites operated safely in 2022. This conclusion is based on CNSC staff's assessments of CNL's activities which included site inspections, reviews of reports submitted by CNL, and event and incident reviews, supported by follow-up and general communication with CNL.

For 2022, the performance in all SCAs was rated as satisfactory with the exception of the emergency management and fire protection SCA at WL and security SCA at CRL, which were rated as below expectations. Despite these below expectation SCAs, overall:

CNSC staff's compliance activities confirmed that:

- Radiation protection programs at all CNL sites adequately controlled radiation exposures, keeping doses ALARA
- Conventional health and safety programs at all CNL sites continue to protect workers; and
- Environmental protection programs at all CNL sites were effective in protecting people and the environment.

CNSC staff will continue to provide regulatory oversight at all CNL sites, to ensure that CNL makes adequate provision to protect the health, safety and security of workers, Canadians, and the environment, and continues to implement Canada's international obligations on the peaceful use of nuclear energy.

GLOSSARY AND ACRONYMS

For definitions of terms and acronyms used in this document, except for those listed below, see REGDOC-3.6, *Glossary of CNSC Terminology* [43].

ACMR	Annual Compliance Monitoring Report
AECL	Atomic Energy of Canada Limited
ALARA	As Low As Reasonably Achievable
AL	Action Level
ANMRC	Advanced Nuclear Materials Research Centre
AOPFN	Algonquins of Pikwakanagan First Nation
APM	Adaptive Phase Management
BE	Below Expectation
BNGS	Bruce Nuclear Generating Station
Bq	Becquerel
CAM	Continuous Air Monitor
CANDU	Canada Deuterium Uranium
CAP	Corrective Action Plan
CEAA	Canadian Environmental Assessment Act
CECEUD	Combined Electrolysis and Catalytic Exchange Upgrading and Detritiation
CED	Committed Effective Dose
CLFN	Curve Lake First Nation
CNL	Canadian Nuclear Laboratories
CNSC	Canadian Nuclear Safety Commission
CMD	Commission Member Document
CRL	Chalk River Laboratories
CVC	Compliance Verification Criteria
CWMP	Coastal Waters Monitoring Program
DCP	Dose Control Points
DIF	Dedicated Isotope Facility
DRL	Derived Release Limits
DPWF	Douglas Point Waste Facility
EA	Environmental Assessment

EAFS	Exhaust Air Filtration System
ECCC	Environment and Climate Change Canada
EOC	Emergency Operations Centre
EPR	Environmental Protection Review
ERA	Environmental Risk Assessment
FA	Facility Authorization
G1WF	Gentilly-1 Waste Facility
HEPA	High Efficiency Particulate Air
HSM	Historic Saugeen Métis
IAEA	International Atomic Energy Agency
IEMP	Independent Environmental Monitoring Program
ISO	International Organization for Standardization
KFN	Kebaowek First Nation
KZA	Kitigan Zibi Anihsinabeg
LCH	Licence Conditions Handbook
LLRW	Low Level Radioactive Waste
LTRA	Long-Term Relationship Agreement
LTWMF	Long-Term Waste Management Facility
MCP	Management Control Procedure
MMF	Manitoba Métis Federation
MNO	Métis Nation of Ontario
MOU	Memorandum of Understanding
MPF	Molybdenum-99 Production Facility
MSIFN	Mississaugas of Scugog Island First Nation
mSv	Millisievert
MWe	Megawatt Electric
MWth	Megawatt Thermal
NCCA	Nuclear Criticality Controlled Area
NCCO	Nuclear Criticality Control Officer
NEW	Nuclear Energy Worker
NFFF	Nuclear Fuel Fabrication Facility
NNC	Notice of Non-compliance

NPDWF	Nuclear Power Demonstration Waste Facility
NRF	Nuclear Response Force
NRU	National Research Universal
NRTEOL	Nuclear Research and Test Establishment Operating Licence
NRTEDL	Nuclear Research and Test Establishment Decommissioning Licence
NSDF	Near Surface Disposal Facility
NWMO	Nuclear Waste Management Organization
OPEX	Operating Experience
PFP	Participant Funding Program
PHAI	Port Hope Area Initiative
PGP	Port Granby Project
PHP	Port Hope Project
REGDOC	Regulatory Document
RFFL	Recycle Fuel Fabrication Laboratories
RIMNet	Regional Information and Monitoring Network
RLTI	Recordable Lost-Time Injury
ROR	Regulatory Oversight Report
RP	Radiation Protection
RSSSA	Recoverable Surface Storage and Staging Area
SA	Satisfactory
SAT	Systematic Approach to Training
SCA	Safety and Control Areas
SFM	Special Fissionable Material
SMR	Small Modular Reactor
SON	Saugeen Ojibway Nation
SPOP	Security Program Oversight Plan
SSC	Structures, Systems and Components
SWS	Storage with Surveillance
ToR	Terms of Reference
TRP	Tactical Response Plan
UA	Unacceptable
UNDRIP	United Nation Declaration on the Rights of Indigenous People

WFDL	Waste Facility Decommissioning Licence
WL	Whiteshell Laboratories
WMA	Waste Management Area
WNSL	Waste Nuclear Substance Licence
WR-1	Whiteshell Reactor No. 1
WTFN	Williams Treaties First Nations
WWTP	Waste Water Treatment Plant

A. INDIGENOUS NATIONS AND COMMUNITIES THAT HAVE TRADITIONAL AND/OR TREATY TERRITORIES WITHIN PROXIMITY TO CNL SITES

Chalk River Laboratories and Nuclear Power Demonstration

- Algonquin Anishinabeg Nation Tribal Council
- Algonquin Nation Secretariat
- Algonquins of Barriere Lake
- Algonquins of Ontario
- Algonquins of Pikwàkanagàn First Nation
- Conseil de la Nation Anishnabe de Lac Simon
- Conseil de la Première Nation Abitibiwinni
- Kebaowek First Nation
- Kitcisakik First Nation
- Kitigan Zibi Anishinabeg First Nation
- Long Point First Nation
- Métis Nation of Ontario
- Mitchikanibikok Inik (Algonquins of Barriere Lake)
- Timiskaming First Nation
- Wahgoshig First Nation
- Williams Treaties First Nations:
  - Alderville First Nation
  - Beausoleil First Nation
  - Chippewas of Georgina Island First Nation
  - Chippewas of Rama First Nation
  - Curve Lake First Nation
  - Hiawatha First Nation
  - Mississaugas of Scugog Island First Nation
- Wolf Lake First Nation

Douglas Point Waste Facility

- Saugeen Ojibway Nation, comprised of:
  - Chippewas of Nawash Unceded First Nation
  - Saugeen First Nation

- Historic Saugeen Métis
- Métis Nation of Ontario

Gentilly-1 Waste Facility

- Abénakis of Wôlinak and Odanak, represented by the Grand Conseil de la Nation Waban-Aki
- Nation huronne-wendat

Whiteshell Laboratories

- Sagkeeng Anicinabe First Nation
- Black River First Nation
- Brokenhead Ojibway Nation
- Grand Council of Treaty 3
- Hollow Water First Nation
- Iskatewizaagegan #39 Independent First Nation
- Red River Métis (represented by Manitoba Métis Federation)
- Northwest Angle #33 First Nation
- Shoal Lake #40 First Nation
- Wabaseemoong Independent Nations

Port Hope Area Initiative

- Mohawks of the Bay of Quinte
- Métis Nation of Ontario
- Williams Treaty First Nations:
    - Alderville First Nation
    - Beausoleil First Nation
    - the Chippewas of Georgina Island First Nation
    - Chippewas of Rama First Nation
    - Curve Lake First Nation
    - Mnjikaming (Chippewas of Rama First Nation)
    - Hiawatha First Nation
    - Mississaugas of Scugog Island First Nation

B. LICENCES AND LICENSING ACTIVITIES

Site/ Facility/ Project	Licence Number	Previous Commission Hearing	Licensing Changes in 2022
Chalk River Laboratories	NRTEOL-01.00/2028	CMD 18-H2, January 23-25, 2018	None
Whiteshell Laboratories	NRTEDL-W5-8.00/2024	CMD 19-H4, October 2-3, 2019	
Port Hope Long-Term Low-Level Radioactive Waste Management Project	WNSL-W1-2310.02/2022	CMD 17-H101 November 29, 2017	Licensing work to renew the Port Hope Project licence and consolidate with the other PHAI licences occurred in 2022, with the new licence being valid starting January 1, 2023 (CMD 22-H13, November 22, 2022).
Port Granby Long-Term Low-Level Radioactive Waste Management Project	WNSL-W1-2311.00/2022	CMD 21-H102, Hearing in Writing, December 13, 2021	
Pine Street Extension Temporary Storage Site	WNSL-W1-182.0/2022	DNCFR-CNLRPD-DOD-21-002, December 16, 2021	
Port Hope Radioactive Waste Management Facility	WNSL-W1-344-1.8/ind	DNCFR-NPFD-DOD-16-004, September 26, 2016	
Douglas Point Waste Facility	WFDL-W4-332.03/2030	CMD 20-H4, November 25-26, 2020	None
Gentilly-1 Waste Facility	WFDL-W4-331.00/2034	CMD 18-H107, Hearing in Writing, February 8, 2019	
Nuclear Power Demonstration Waste Facility	WFDL-W4-342.00/2034		
Waste Nuclear Substance Licence (WNSL) for Low-Level Radioactive Waste Management Office (Historic Waste)	WNSL-W2-2202.0/2026	WDD-DOD-16-004, November 28, 2016	

Site/ Facility/ Project	Licence Number	Previous Commission Hearing	Licensing Changes in 2022
Canadian Nuclear Laboratories Import Licence	IL-01.00/2031	DNCFR-CNLRPD-DOD-21-001, July 7, 2021	
Canadian Nuclear Laboratories Export Licence	EL-01.00/2031		
La Prade Nuclear Substances and Radiation Devices Licence*	15193-4-26.0	N/A	
Low-Level Waste Programs Nuclear Substances and Radiation Devices Licence*	15193-5-23.0		
Dosimetry Service Licence	15193-1-26.2		
**These Nuclear Substances and Radiation Devices Licences are discussed in CMD 23-M31, Regulatory Oversight Report on the Use of Nuclear Substances in Canada: 2022 [44] and are not included as part of the content of this ROR.*			

C. REGULATORY DOCUMENT IMPLEMENTATION

Regulatory documents are a key part of the CNSC's regulatory framework for nuclear activities in Canada. They explain to licensees and applicants what they must achieve in order to meet the requirements set out in the *Nuclear Safety and Control Act* [1] and the regulations made under the *Nuclear Safety and Control Act* [1].

In 2022, the CNSC published several updated regulatory documents that impacted CNL sites, including REGDOC-3.2.2, *Indigenous Engagement, Version 1.2*, REGDOC-2.4.4, *Safety Analysis for Class 1B Nuclear Facilities*, REGDOC-3.1.2, *Reporting Requirements, Volume I: Non-Power Reactor Class I Facilities and Uranium Mines and Mills*, Version 1.1.

When a new regulatory document or revision is published, CNSC staff will formally request CNL conduct a gap analysis and provide an implementation plan. The CNSC will review the plan. The dates provided in the implementation plan are considered the date that the regulatory document becomes effective at the site, at which point it becomes compliance verification criteria.

Table C-1: CNSC REGDOC Implementation dates

REGDOC number	Publication year	Effective date						
		CRL	WL	DPWF	G1WF	NPDWF	PGP	PHP
REGDOC-2.1.1 Management system	2019	Guidance

REGDOC-3.3.1 Financial Guarantees for Decommissioning of Nuclear Facilities and Termination of Licensed Activities	2021	2022	2022			2022	2023	2023

Shaded cells indicate the REGDOC is not applicable for those facilities.

*Fully implemented with the exception of random alcohol and drug testing of workers in safety-critical positions

**All requirements in REGDOC-2.11.2, are effective March 1, 2023 with the exception of the requirements in section 6.1.1 (content of preliminary decommissioning plan) and section 7.1.1 (content of detailed decommissioning plan)

D. LIST OF INSPECTIONS AT CNL SITES

Table D-1: List of CNSC-led inspections at CRL

Inspection	Dates	SCAs Covered	Number of Notices of Non-Compliance (NNCs)
CNL-CRL-2022-01 General Inspection of Class II Nuclear Facilities at Chalk River Laboratories	March 1 – 2, 2022	• Fitness for Service • Operating Performance • Radiation Protection • Conventional Health and Safety	4 NNCs
CNL-CRL-2022-02 General Inspection of the Molybdenum 99 Production Facility, Target Residue Material Retrieval and Transfer and FISST – Building 225, 229 and 229A	March 14 – 15, 2022	• Fitness for Service • Operating Performance • Human Performance Management • Radiation Protection • Conventional Health and Safety • Emergency Management and Fire Protection • Waste Management	2 NNCs
CNL-CRL-2022-03 Focused Human Performance Management Inspection at Chalk River Laboratories	March 9 – 11, 2022	• Human Performance Management	6 NNCs
CNL-CRL-2022-04 General Inspection of Building 250, Facilities Decommissioning Project	March 22 – 23, 2022	• Operating Performance • Radiation Protection • Conventional Health and Safety • Waste Management	6 NNCs
CNL-CRL-2022-05 General Inspection of Universal Cells at Chalk River Laboratories	May 4 – 5, 2022	• Fitness for Service • Operating Performance • Safety Analysis • Radiation Protection • Conventional Health and Safety • Emergency Management and Fire Protection	7 NNCs

Inspection	Dates	SCAs Covered	Number of Notices of Non-Compliance (NNCs)
CNL-CRL-2022-06 General Inspection of the Waste Management Area B	June 1 – 2, 2022	• Operating Performance • Environmental Protection • Radiation Protection • Conventional Health and Safety • Emergency Management and Fire Protection • Waste Management	12 NNCs
CNL-CRL-2022-07 General Inspection of the Chalk River Laboratories Tritium Laboratory	June 7 – 8, 2022	• Operating Performance • Fitness for Service • Emergency Management and Fire Protection • Environmental Protection • Radiation Protection • Conventional Health and Safety	2 NNCs
CNL-CRL-2022-08 General Inspection of the Chalk River Laboratories Nuclear Fuel Fabrication Facility	October 3 – 4, 2022	• Fitness for Service • Operating Performance • Safety Analysis • Conventional Health and Safety • Radiation Protection • Human Performance Management • Emergency Management and Fire Protection	4 NNCs
CNL-CRL-2022-09 General Inspection of Building 429, Facilities and Decommissioning Project	November 7 – 8, 2022	• Operating Performance • Safety Analysis • Environmental Protection • Conventional Health and Safety • Radiation Protection • Emergency Management and Fire Protection • Waste Management	6 NNCs
CNL-CRL-2022-10 General Inspection of the Chalk River Laboratories Recycle Fuel Fabrication Laboratory	December 5 – 6, 2022	• Operating Performance • Safety Analysis • Conventional Health and Safety • Radiation Protection • Emergency Management and Fire Protection	2 NNCs
CNL-CRL-PTP-2022-01	N/A	• Security	N/A

Table D-2: List of CNSC-led inspections at WL

Inspection	Dates	SCAs Covered	Number of Notice of Non-Compliance (NNCs)
CNL-WL-2022-01 Baseline Radiation Protection Inspection at Whiteshell Laboratories	May 10 – 11, 2022	• Radiation Protection	0 NNCs
CNL-WL-2022-03 Inspection of Whiteshell Laboratories Waste Management Area	October 24 – 26, 2022	• Management System • Operating Performance • Radiation Protection • Conventional Health and Safety • Emergency Management and Fire Protection • Waste Management • Fitness for Service	5 NNCs
CNL-WL-NSD-T2-2022-001	N/A	• Security	N/A

Table D-3: List of CNSC-led inspections at PHP

Inspection	Dates	SCAs Covered	Number of Notice of Non-Compliance (NNCs)
CNL-PHAI-PHP-2022-01 General Inspection of the Port Hope Waste Water Treatment Plant and Long-Term Waste Management Facility	March 28 – April 8, 2022	• Environmental Protection • Radiation Protection • Conventional Health and Safety	3 NNCs
CNL-PHAI-PHP-2022-02 Baseline Inspection of Human Performance Management at the Port Hope Project	December 14 -16, 2022	• Human Performance Management	6 NNCs

Table D-4: List of CNSC-led inspections at PGP

Inspection	Dates	SCAs Covered	Number of Notice of Non-Compliance (NNCs)
CNL-PHAI-PGP-2022-01 General Inspection of the Port Granby Waste Water Treatment Plant and Long-Term Waste Management Facility	March 28 – April 8, 2022	• Environmental Protection • Radiation Protection • Conventional Health and Safety	0 NNCs
CNL-PHAI-PGP-2022-02 Remediation Verification of the Port Granby Former Waste Management Area	March 28 – April 8, 2022	• Environmental Protection • Physical Design	1 NNC

Table D-5: List of CNSC-led inspections at DPWF, G1WF and NPDWF*

Inspection	Dates	SCAs Covered	Number of Notice of Non-Compliance (NNCs)
CNL-DP-2022-01 General Inspection at Douglas Point Waste Facility	February 15 – 16, 2022	• Waste Management • Management System • Fitness for Service	3 NNCs
CNL-DP-2022-02 General Inspection at Douglas Point Waste Facility	July 25 – 27, 2022	• Environmental Protection • Radiation Protection • Conventional Health and Safety • Waste Management • Operating Performance	4 NNCs
G1WMF-NSD-T2-2022-001	N/A	• Security	N/A
**No inspections were performed at NPDWF in 2022.*			

Table D-6: List of IAEA-led inspections at CNL Sites

SITE/ Facility/ Project	IAEA inspections (CNSC Escort)
CRL	51 (9) (9 others supported remotely)
WL	3 (1) (2 others supported remotely)
PHP	2 (0) (2 supported remotely)
PGP	1 (1)
DPWF	2 (0) (2 supported remotely)
G1WF	2 (0) (2 supported remotely)
NPDWF	0
TOTAL	**61 (11)**

E. REPORTABLE EVENTS

This appendix contains information on the number of reportable events at the CNL sites covered by this ROR, in the 2022 calendar year. CNL is required to report events as per the *General Nuclear Safety and Control Regulations* [27], and, if applicable to the site, the criteria outlined in CNSC REGDOC-3.1.2, *Reporting Requirements, Volume I: Non-Power Reactor Class I Nuclear Facilities and Uranium Mines and Mills* [11] or CNSC REGDOC-3.1.3, *Reporting Requirements for Waste Nuclear Substance Licensees, Class II Nuclear Facilities and Users of Prescribed Equipment, Nuclear Substances and Radiation Devices* [37]. A total of 59 events were reported to and assessed by CNSC staff in 2022. CNSC staff, determined that there was no risk to the environment, nor the public associated with these events.

Table E-1: Number of reportable events at each CNL site in 2022

Site/Facility/Project	Number of events
Chalk River Laboratories	39
Whiteshell Laboratories	3
Port Hope Project	14
Port Granby Project	3
Douglas Point Waste Facility	0
Gentilly-1 Waste Facility	0
Nuclear Power Demonstration Waste Facility	0
TOTAL	59

Table E-2: Reportable events at CRL in 2022

Event Number	Title	CRL Event summary	SCA
1 HSSE-22-2889	Expanded 5 Gallon Secondary Container Found	A 5-gallon container was discovered to be bulging at the bottom of the pail presenting a pressure hazard and possible contamination. The building was evacuated. An Incident Action Plan was executed by moving the container to a ventilated and isolation room with effluent monitoring where the container was safely relieved of pressure. CNL staff took corrective action to prevent recurrence of the event and performed a full investigation. CNSC staff are satisfied with the actions completed.	Conventional Health and Safety
2 HSSE-22-1551	CNL Employee Trip and Fall Injury	A CNL employee was walking away from their workstation when their toe caught the floor and caused them to stumble, lose balance, and fall to the floor hitting their face and shoulder. The employee’s colleagues provided initial care and activated emergency response where CNL’s security, fire protection and health centre responded followed by Renfrew County Paramedics. An investigation of the accident area revealed no workplace factors which would contribute to the employee’s fall. It was determined that the cause was an unprovoked stumble. CNSC staff are satisfied with CNL’s response to the event and conclusion.	Conventional Health and Safety

Event Number	Title	CRL Event summary	SCA
3 HSSE-22-0089	Underground Fire Water Impairment South Loop	The CRL Fire Department was notified of a service water leak from fire water piping caused by repeated freezing and thawing of the ground. The CRL Fire Department implemented an impairment plan to compensate for the impaired hydrants due to the damaged fire water piping. Repairs to the firewater line were completed. CNSC staff are satisfied with the corrective measures taken by CNL.	Emergency Management and Fire Protection
4 HSSE-22-0108	Unplanned Sprinkler Impairment	A damaged building sprinkler head was discovered caused by ice buildup in the sprinkler pipe due to a defective heater in that area of the building. CNL implemented an impairment plan to compensate for the out of service sprinkler until repairs were completed for the sprinkler and heater. CNSC staff are satisfied with the corrective measures taken by CNL.	Emergency Management and Fire Protection
5 ERM-22-0386	Unplanned Level Increase in Liquid Storage Tank	A ruptured fire water line resulted in an unplanned level increase in a liquid storage tank. CNL staff transferred contents from tank 4 to other holding tanks within the Active Drainage system to restore the tank level to its previous volume. Abandoned piping to the liquid storage tank were cut and capped to prevent any recurrence. There were no effects on health, safety and security of persons,	Emergency Management and Fire Protection

Event Number	Title	CRL Event summary	SCA
		or the environment resulting from this event. CNSC staff are satisfied with the corrective measures taken by CNL.	
6 HSSE-22-0317	Chalk River Laboratories Emergency Operations Centre Activation Due to a Fire Water Line Break	A fire water line break was identified and isolated by the CRL Fire Department. No water or other anomalies were discovered in any of the surrounding buildings and areas, except for water entering a liquid storage tank. The breach of the Fire Water Service line has been attributed to repeated freezing and thawing cycles. There were no effects on health, safety and security of persons, or the environment resulting from this event. CNSC staff are satisfied with the actions taken by CNL.	Emergency Management and Fire Protection
7 HSSE-22-0772	External Fire Water Main Break	A fire water break was identified in the CRL Controlled Area and was isolated by the CRL Fire Systems Team Fire Department. An underground fire water line had a break due to ground movement from frost build-up and heavy equipment traffic. The CRL Fire Department was immediately dispatched and the fire service water was isolated by closing valves. Water samples were collected and all sample analysis test results indicated there was no contamination present above the exemption limits. CNSC staff are satisfied with CNL's	Emergency Management and Fire Protection

Event Number	Title	CRL Event summary	SCA
		actions.	
8 CTA-22-1074	Active Materials stored without a required Fire Hazard Analysis	Radium-226 material was found to be stored in a CRL building during a fire assessment walkdown. The material was moved to a concrete structure within the building with ventilation, heating, and radiation detection equipment, and contained within Special Form Capsules in a Type A Shipping Package. A Fire Hazard Assessment has been completed and submitted after the Radium-226 was moved under Fire Protection supervision. CNSC staff are satisfied with CNL's actions.	Emergency Management and Fire Protection
9 HSSE-22-1499	CRL Site-Wide Loss of Class IV Power	Power was lost at the CRL site due to a severe storm damaging electrical infrastructure off-site. Emergency backup power immediately came online and was confirmed to be operating as intended. Although the storm itself did not damage the CRL site, the off-site electrical infrastructure was significantly damaged resulting in loss of Class IV Power. CNSC staff were contacted by CNL and reported of the event. There were no effects on the health, safety and security of persons or the environment. CNSC staff are satisfied with CNL's response.	Emergency Management and Fire Protection

Event Number	Title	CRL Event summary	SCA
10 HSSE-22-1714	CRL Building Fire Alarm Panel Battery Failure	A CRL building fire alarm panel battery failed during the planned annual site-wide electrical outage. Due to the need for replacement of fire alarm panel batteries at set intervals, the Fire Protection Program had Fire Systems Staff on-site throughout the outage to rapidly perform battery replacements as required. Staff identified and replaced the battery which re-established fire panel monitoring. The fire panel, which reports fire alarms for several buildings, was impaired for 15.5 hours. CNSC staff are satisfied with the actions completed.	Emergency Management and Fire Protection
11 HSSE-22-2051	CRL Building Linear Heat Detector Impairment	CRL Fire Operations responded to a Linear Heat Detector activation alarm at a CRL building tunnel. There was no evidence of any hazards and the detector was determined to be in a fault due to nearby leaking steam in the tunnel. The detector was repaired during a steam shutdown. CNSC staff are satisfied with the corrective measures taken by CNL.	Emergency Management and Fire Protection
12 HSSE-22-2619	Lightning Strike on CRL Building Radio Tower Resulted in Loss of Fire Alarm Monitoring	During a thunderstorm, the radio tower at a CRL building was struck by lightning. This resulted in loss of fire detection, alarms and monitoring in several CRL buildings on the same fire-alarm loop. CNL implemented compensatory measures and fire alarm system components	Emergency Management and Fire Protection

Event Number	Title	CRL Event summary	SCA
		were inspected and replaced as required, followed by the restoration of fire detection, and monitoring to buildings. CNSC staff are satisfied with the corrective measures taken by CNL.	
13 S&T-22-2951	Digital Thermocouple Caught Fire in CRL Building	A fire occurred on top of an operating furnace at a CRL building shortly after initiating the heating up process for the unit and CNL staff activated the fire alarm. The fire was extinguished immediately by the staff using a portable ABC extinguisher. CNL conducted a follow up investigation and implemented corrective actions to prevent a similar recurrence. CNSC staff are satisfied with the actions completed.	Emergency Management and Fire Protection
14 HSSE-22-3198	Thermostat Failure Results in Portable Heater Fire in CRL Building	CNL staff were investigating a malfunctioning 600 V barrel heater and observed it igniting into flames. The fire did not spread beyond the heater and there were no combustibles in the area. CNL staff extinguished the fire and disconnected the electrical supply to the heater. A fire investigation was initiated, and the use of barrel heaters was paused across the site. CNL implemented corrective and compensatory actions as a result. CNSC staff are satisfied with the corrective measures taken by CNL.	Emergency Management and Fire Protection

Event Number	Title	CRL Event summary	SCA
15 HSSE-22-3810	Underground Fire Water Line Break Near CRL Building	CRL Fire Operations responded to a fire water break near the CRL Powerhouse. The water break was isolated by the fire department within one hour of the issue being identified and CNL proceeded to isolate the storm-water management pond. The EOC was activated to manage the impacts of the high volume of water at the site, to ensure the water had not entered any nuclear facilities, and to coordinate the collection of water samples at various locations for analysis. All water sample analysis results confirmed that the water was not contaminated. CNSC staff are satisfied with the actions completed.	Emergency Management and Fire Protection
16 ERM-22-1151	Non-Radiological Liquid Effluent Monthly Licence Condition Handbook Reference Limit Exceedance at the Waste Treatment Center for Mercury	The monthly average for mercury released for the final effluent of the Waste Treatment Center Liquid Waste Evaporator was measured at 0.00155 mg/L, exceeding the Action Level of 0.001 mg/L. There was no impact to human health or the environment from the release of the impacted batches due to dilution at the Process Outfall. Additional administrative controls were implemented to prevent recurrence while the investigation continued. CNL identified and resolved the root causes of the exceedances and has resumed normal operations. CNSC staff are	Environmental Protection

Event Number	Title	CRL Event summary	SCA
		satisfied with the corrective measures taken by CNL	
17 ERM-22-0575	Small Pipe Rupture Resulting in Release of Contaminated Groundwater	The re-circulation pump and heat tracing simultaneously failed, resulting in a line rupture. Between 10 L and 40 L of contaminated groundwater at 1500 Bq/L was released to the ground. CNL committed to cleaning the soil. CNSC staff concluded the event had a low safety significance and did not result in an increased risk to the environment due to the low volume, and that the water leaked in the same area where the groundwater originated. CNSC staff will follow up on the cleanup and repair activities during future compliance inspection activities.	Environmental Protection
18 ERM-22-1620	Severe heavy rainfall overfills secondary containment	Due to a severe rainfall event, secondary containment surrounding 2 shipping containers holding radiologically contaminated waste overfilled and discharged onto the surrounding soil. Samples of the water were collected and analyzed. Soil around the containers was monitored and no radioactive levels were detected. There was no impact on health, safety and security of persons. CNSC staff are satisfied with the CNL's actions.	Environmental Protection

Event Number	Title	CRL Event summary	SCA
19 HSSE-22-2658	Tritium Sample Inadvertently Released Down Sanitary Drain	A 125 mL urine sample that was intentionally spiked with tritium as part of a performance test required by CNL's Dosimetry Services was inadvertently disposed into a sanitary drain. The effect on the health, safety, and security of persons is low due to the small quantity of radioactivity released. The sample was not properly segregated due to lack of written instructions and insufficient communication during task hand-over. CNL ensured that all samples in the bioassay laboratory with high measurements were stored properly with instructions. Operating experience was communicated to CNL staff on the segregation of samples. In addition, a procedure describing the receipt of bioassay samples in the laboratory was updated to include written instructions relating to the segregation of samples. CNSC staff are satisfied with CNL’s actions.	Environmental Protection
20 ERM-22-1798	Damaged Conduit Discovered in CRL Building Main Stairwell	CNL Workers attempted to push a loose conduit bracket back into place and caused an electrical short circuit which tripped the circuit breaker. CNL implemented corrective actions to prevent a similar recurrence. CNSC site inspectors conducted a walkdown of the area where the event occurred and	Human Performance Management

Event Number	Title	CRL Event summary	SCA
		discussed the event with CNL staff. CNSC staff are satisfied with CNL's actions.	
21 ERM-22-0645	Vehicle Driven Over Snow Covered Tile Holes at Waste Management Area	A Radiation Surveyor Trainee drove over the tile holes in the waste management area while performing routine surveys due to limited visibility caused by a significant snowfall. Following the event, contamination checks of the area were done as well as visual inspections of structures and no issues were noted. To prevent these types of events from occurring in the future, when there is significant snowfall, the Radiation Surveyor will accompany the snowplow operator, and at all other times there will be two individuals in the surveying vehicle. CNSC staff are satisfied with the corrective measures taken by CNL	Human Performance Management
22 S&T-22-1226	Ac-225 Product Shipments Delivered to Incorrect Customers	Two product shipments of Ac-225 were sent to separate customers. Upon review of the documentation for the shipments, it was determined that the 2 product vials were swapped in error. Radiobiology and Health began an investigation into the event and Actinium shipments were halted until the cause of the error could be identified. It was determined that there were no effects on the health, safety and security of persons or the environment as the packaging used was	Human Performance Management

Event Number	Title	CRL Event summary	SCA
		appropriate for both shipments. CNL took corrective action to prevent future recurrence and CNSC staff are satisfied with the corrective measures taken by CNL.	
23 CTA-22-1423	Non-compliance with reporting requirements for CNL Program Description Document	The Training and Development Program Description Document was submitted to the CNSC 6 days after it was implemented rather than at the time of implementation. CNL performed an extent of condition of management system document submissions and reported this to the CNSC and updated their regulatory reporting process steps within the Information Management implementation documents to prevent recurrences. CNSC staff are satisfied with the corrective measures taken by CNL.	Management System
24 S&T-22-1768	Unauthorized access and usage of gamma cell irradiation facility	A CNL employee, without proper authorization, was permitted to access the gamma cell irradiation facility and operate the gamma cell without proper oversight. The safety and security issues associated with this event were discussed with both employees and their facility access was revoked. To prevent recurrences, both employees received gamma cell training followed by a 6-month probationary period, and a site-wide OPEX was issued. CNSC staff are	Management System

Event Number	Title	CRL Event summary	SCA
		satisfied with the corrective measures taken by CNL.	
25 ERM-22-1457	Missing Record of Visual Inspection for Waste Management Area B	In preparation for a CNSC Inspection of WMA B (CNL-CRL-2022-06), CNSC staff requested records of routine safety inspections conducted by CNL. CNL stated that the inspection took place as required, but no record of this first-quarter inspection was available. CNL provided a new revision of the Routine Inspection, Radiological Monitoring and Surveillance procedure for the waste management areas, which was updated to include a summary table of all inspections conducted, the inspection frequency and the inspection form reference. CNSC staff verified that visual inspections are now recorded in the form as per CNL's revised procedure. CNSC staff are satisfied with the corrective measures taken by CNL.	Management System
26 ERM-22-0165	Temporary Loss of Power to NRU Emergency Air Filtration System Fans	Electrical power was lost to the Dedicated Isotope Facility (DIF) causing the operating NRU reactor Exhaust Air Filtration System (EAFS) Fans to shutdown unexpectedly. It is required that a minimum fan configuration of 1 EAFS fan shall be maintained in operation. Power was restored to the DIF and the NRU EAFS Fans restarted to the normal operating	Operating Performance

Event Number	Title	CRL Event summary	SCA
		configuration. CNSC site inspectors conducted a walkdown of the area where the event occurred and discussed the event with CNL staff. CNSC staff are satisfied with the corrective measures taken by CNL.	
27 ERM-22-0866	Incoming Dangerous Goods Package Labels Obscured by Other Packing Labels	A consignment of radioactive standards was received at CRL including an incoming package containing standards of low radioactivity. The package was received but the required label identifying the package as a dangerous good was not visible and had been obscured by other labels used while shipping. As the package was expected to be radioactive, all normal operating procedures were taken to receive the package safely with the proper surveying. There was no damage to the packaging and CNL took corrective actions to prevent recurrence of the event. There were no impacts on health, safety and security of persons or the environment. CNSC staff are satisfied with the corrective measures taken by CNL.	Packaging and Transport
28 S&T-22-0209	Area Radiation Monitor discovered past due calibration	A radiation monitor remained in service past its calibration due date. CNL replaced the monitor, verified the calibration dates of other radiation monitors, and evaluated calibration strategies used across CNL to ensure routine calibrations are	Radiation Protection

Event Number	Title	CRL Event summary	SCA
		performed on time. CNSC staff are satisfied with the corrective measures taken by CNL.	
29 S&T-22-1120	Skin contamination following an undesired chemical reaction in fume hood	A bottle containing consolidated waste solutions ruptured in a laboratory fume hood. A technologist received contamination in their hair and on their hand. The technologist notified their supervisor and contacted Radiation Protection and the Health Physicist. The technologist was instructed to shower, and Radiation Protection confirmed that the contamination was removed, and the worker was cleared to return to work. The committed effective dose was determined to be less than 1 mSv for the technologist. CNL issued a stop work order and performed an extent of condition to ensure work scope and work control practices are in place for all S&T laboratories. CNSC staff are satisfied with the corrective measures taken by CNL.	Radiation Protection
30 S&T-22-1271	Accessible Dose Rates Above 2.5 mrem/h Discovered Outside CRL Building	A radiation surveyor detected unposted radiation fields in an accessible area outside of a miscellaneous storage building at CRL. The field was due to the storage inside the building of drums containing radium needles. CNL put appropriate barriers and signage in place. CNSC staff are satisfied with the	Radiation Protection

Event Number	Title	CRL Event summary	SCA
		corrective measures taken by CNL.	
31 HSSE-22-3741	Instrument found in use beyond its calibration date	The calibration date for swipe castle E4133 expired on November 11, 2022. The instrument remained in service and utilized in the facility until December 2, 2022 during which the equipment functioned as intended and passed its weekly source checks. CNL Radiation Protection (RP) performed an extent of condition on all RP instrumentation to confirm that they are all within their calibration due dates. Coaching from RP Management to RP staff was done on the importance of calibration due date checks. CNL provided an update on the corrective actions during a RP focused meeting held on March 9, 2023 and CNSC staff are satisfied with the corrective actions taken by CNL.	Radiation Protection
32 ERM-22-1763	IAEA Measuring Equipment Damaged	Four spent driver fuel were being loaded into a sealed Rod Storage Can for transport to CRL WMAs. An IAEA inspector and CNL staff were performing fuel composition measurements using a detector tool when the detector accidentally contacted a component of the Rod Bay purification system. The measurement tool was damaged rendering it inoperable. A spare detector	Safeguards and Non-proliferation

Event Number	Title	CRL Event summary	SCA
		was used to complete measurements. CNL took corrective actions to prevent recurrence of the event. There were no impacts on health, safety and security of persons or the environment. CNSC staff are satisfied with the corrective actions taken by CNL.	
33 BUS-MGMT-22-2253	Unclear Wording in Import Licence Leads to an Exceedance in Maximum Uranium Content in Samples	The CNL-CRL site received an import of samples from the IAEA for a forensic exercise. The samples contained 5.5 g of uranium enriched with 0.19 g of uranium-235. The import licence indicated that 1 g of enriched uranium could be imported. CNSC staff requested clarification on the amount of enriched uranium imported. CNL mistook the wording to mean 1 g of uranium-235 and not 1 gram of total uranium. CNL reviewed all current import and export licences with enriched uranium to ensure there were no other issues. There were no impacts on health, safety and security of persons or the environment. CNSC staff are satisfied with the corrective actions taken by CNL.	Safeguards and Non-proliferation

Event Number	Title	CRL Event summary	SCA
34 ERM-22-2680	IAEA Seal Cable Found Damaged	Work was in progress in the NRU Rod Bays involving receipt of a pressure tube and end fitting components from Building 234 Universal Cells using a fuel flask subject to IAEA safeguards controls. During transit activities, a CNL operator discovered that the seal on the top of the flask was damaged from accidental contact between the hoist cable. CNL performed an investigation and took corrective actions to prevent future recurrence of the event. There were no impacts on health, safety and security of persons or the environment. CNSC staff are satisfied with the corrective actions taken by CNL.	Safeguards and Non-proliferation
35 ERM-22-2366	Waste Management Area D and H Recoverable Surface Storage Area Non-Nuclear Criticality Controlled Area Exceedance	During a review of the inventory for CRL WMA D and H above ground waste storage areas, CNL identified that the non-nuclear criticality-controlled area limit (100 g) of fissile nuclides in special fissionable materials (SFM) had been exceeded. CNL halted acceptance of waste containing FM/SFM within WMA D and H until a criticality safety analysis is completed along with 8 remedial and corrective actions (with a final completion due date by August 31, 2023) to prevent recurrence of similar events. CNSC staff’s review of the event's full report raised	Safety Analysis

Event Number	Title	CRL Event summary	SCA
		several questions and comments for CNL's disposition. CNL proposed to arrange a meeting to answer and clarify CNSC staff questions, which was held in March 2023. CNSC staff will continue to perform compliance oversight until satisfied with CNL’s corrective action plan.	
36 HSSE-22-2660	Unauthorized Site Access	The details of this event are Classified-Confidential.	Security
37 HSSE-22-2779	Unauthorized Site Access	The details of this event are Classified-Confidential.	Security
38 HSSE-22-3486	Unauthorized Site Access	The details of this event are Classified-Confidential.	Security
39 HSSE-22-3023	Security Equipment Failure	The details of this event are Classified-Confidential.	Security

Table E-3: Reportable events at WL in 2022

Event Number	Title	WL Event summary	SCA
1 ERM-22-1559	Worker Received Electrical Shock from Non-isolated Electrical Source	CNL workers were performing planned maintenance on a pump when a worker experienced an electrical shock to both hands. The worker was assessed by First Aid Responders, and they deemed the worker fit to return to normal duties with no further medical attention needed. It was determined that an electrical circuit related to the pump motor was not isolated via lock out tag out procedures to remove the hazard to workers. CNL has proposed a corrective action plan and implemented compensatory measures to ensure planning and work control documents are reviewed in detail and approved in signature by a member of WL management before work can proceed. CNSC staff will be performing compliance and implementation oversight of CNL’s action plan.	Conventional Health and Safety
2 ERM-22-3469	Annual 3rd Party Inspection of Fire Devices Overdue	An annual fire devices inspection was delayed due to contractor workers' security clearances being outstanding. Discussions between CNL and the contractor took place to rectify the situation; however, the deadline for inspection completion was not met. The inspection was completed at the next opportunity. There has been no safety consequence because of the non-conformance. Due to the other fire device tests that are performed there, this is a low-level risk. CNSC staff are satisfied with the actions taken by CNL.	Emergency Management and Fire Protection

Event Number	Title	WL Event summary	SCA
3 HSSE-22-3025	Continuous Air Monitor in Whiteshell Laboratories Shielded Facility Waste Compactor Area Operated Past Calibration Due Date	A beta and gamma continuous air monitor (CAM) in the WL Shielded Facility waste compactor area was identified to be operating 12 days past its annual calibration due date, CNL staff had identified the CAM to be due for removal and replacement within the WL instrument calibration database, however the CAM was missed because of a temporary change in personnel assignments. There was no safety consequence because of the non-conformance. There was no waste processing during this period. The monitor was removed out of service and replaced with a calibrated instrument. An extent of condition was performed and confirmed there were no other in-service radiation protection instruments past their calibration due date on the WL site. CNSC staff are satisfied with the corrective measures taken by CNL.	Operating Performance

Table E-4: Reportable events PHP in 2022

Event Number	Title	PHP Event summary	SCA
1 ERM-22-3304	Fire Alarm Call to 228 Cavan Street, Port Hope (Pine Street Extension Site)	A building fire alarm sounded due to low voltage battery alarm. The building was provided the all clear by Fire Services and the alarm was cleared by CNL's monitoring service. The low voltage battery alarm was serviced**.** CNSC staff are satisfied with the corrective actions taken by CNL.	Emergency Management and Fire Protection

Event Number	Title	PHP Event summary	SCA
2 ERM-22-2149	39 Hayward Street – False Fire Alarm Event	A fire alarm indication was activated on the upper floor of the 39 Hayward Street field office. Fire and Emergency Services personnel determined that there was no fire in the field office and the site was secured. CNSC staff are satisfied with the corrective measures taken by CNL to prevent a similar event in the future.	Emergency Management and Fire Protection
3 ERM-22-2126	Port Hope Waste Water Treatment Plant Toxicity test failure of effluent	Final effluent sampling done in the low storage pond resulted in 100% mortality to Daphnia magna zooplankton, where a result of < 50% mortality is considered non-toxic. This resulted in a halt to releases to the environment. CNL has reviewed the factors that may have contributed to this toxicity failure and has concluded that the 100%-mortality test result was due to a lab error. Following 7 consecutive days of toxicity sampling where all toxicity tests were passed with zero mortality, CNL resumed normal plant operations. CNSC staff are satisfied with the actions taken by CNL.	Environmental Protection
4 ERM-22-3601	Gasoline Spill into Port Hope Harbour	A spill of less than 1 L of gasoline occurred from a boat at the Port Hope Harbour. There was no effect on the health, safety or security of persons or the environment. The visible gasoline was remediated from the water body. The affected boat and motor have been removed from service until an assessment and repair or replacement is completed. Site staff were	Environmental Protection

Event Number	Title	PHP Event summary	SCA
		reminded to continue to conduct equipment inspections prior to each operation. CNSC staff are satisfied with the corrective actions taken by CNL.	
5 ERM-22-1705	Arsenic Action Concentration Exceedance	During routine compliance sampling at the Port Hope waste water treatment plant (WWTP), it was determined that arsenic concentration in the final effluent from the plant for the week ending on June 7, 2022 was 41.5 ppb and thus exceeded the regulated weekly composite action concentration limit of 41 ppb. CNL took immediate corrective action and split the flow of effluent to the old Port Hope WWTP which lowered arsenic concentrations to below the action level. CNL posted a public disclosure to the PHAI website. CNSC staff are satisfied with the corrective actions taken by CNL.	Environmental Protection
6 ERM-22-1841	Environmentally Safe Vegetable Oil-Based Rock Drill Lubricant Spill	An environmentally safe vegetable oil-based rock drill lubricant spill from a drill head occurred on a drill barge. An estimated 0.6 L of oil was released to the inner harbour. Work stopped immediately when the spill was identified, and spill containment was installed. CNL took corrective action through spill contingency and equipment maintenance. There was no risk	Environmental Protection

Event Number	Title	PHP Event summary	SCA
		to human health or the environment because of this spill. CNSC staff are satisfied with the corrective measures taken by CNL.	
7 ERM-22-1698	Waste Water Treatment Plant Exceedance Of Discharge Criteria In Plant Effluent (Copper And Zinc)	CNL determined that the final effluent produced by the WWTP for the week ending on June 1, 2022 exceeded the weekly composite release limit for copper and the action level for zinc. The source of the elevated copper and zinc concentrations was due to corroding brass components on the treated effluent side of the WWTP, therefore was not related to water influent requiring treatment. CNL isolated the brass components in the cooling loop and the copper and zinc levels returned to normal operating levels. Corrective measures were put in place until the brass components could be replaced. CNSC staff are satisfied with the information provided and corrective measures taken by CNL to prevent a similar event in the future.	Environmental Protection
8 ERM-22-2612	Boiler Condensate Tank Overflow	During a routine walkdown, CNL operations staff observed water leaking from a treated water boiler steam vent piping at the Port Hope WWTP. An automatic valve failed to open and caused the tank to overflow. The spilled water entered a storm sewer drain and was contained within the system. CNL immediately shut down the boiler and drained the tank. The faulty valve was replaced. No water was observed to be released off site with the	Fitness for Service

Event Number	Title	PHP Event summary	SCA
		single discharge location noted to be free of standing water. CNSC staff are satisfied with the corrective actions taken by CNL.	
9 ERM-22-1960	Port Hope Pine Street Extension Temporary Storage Site - Delayed Submission of Annual Compliance Monitoring Report (ACMR)	CNL staff did not meet the deadline to submit the 2021 ACMR for the Pine Street Extension Temporary Storage Site Waste Nuclear Substance Licence, WNSL-W1-182.0/2022, by March 15 as required by the licence conditions handbook and was instead submitted March 31. CNL staff have taken corrective action to review, communicate, and track ACMR deadlines on an annual basis. CNSC staff are satisfied with the corrective measures taken by CNL to prevent a similar event in the future.	Operating Performance
10 ERM-22-3086	Misclassification of LSA-I Material	A shipment consisting of 50 bags of personal protective equipment was misclassified by a CNL sub-contractor. The shipment was travelling from the PHAI Harbour Center Pier Site to the Long-Term Waste Management Facility (LTWMF) in Port Hope in a covered and secured dump-truck box. The misclassification did not change the way the material was required to be	Packaging and Transport

Event Number	Title	PHP Event summary	SCA
		handled and there was no risk to workers, the public and the environment. CNSC staff are satisfied with CNL's corrective actions to ensure its contractors' packaging and transport procedures and CNL's supplier operating procedure are revised to ensure it is compliant with the *Packaging and Transport of Nuclear Substances Regulations, 2015*.	
11 ERM-22-1033	Failure to Provide CNSC Written Notification Of Licence Document Revision (Wooden Pallet Placement)	During a CNSC inspection, a CNSC inspector observed wooden pallets supporting supersacks of Cameco waste being placed into the Port Hope LTWMF, which is a deviation from one of CNL's detailed design description report documents that was previously accepted by CNSC staff. CNL failed to provide written notification to CNSC of this change to this licensing basis document as required by the PHP licence WNSL-W1-2310.02/2022. As a result of this finding, CNL submitted an event report on its failure to provide written notification. CNL is compiling a fulsome extent-of-condition report to identify if other licensing basis documents require revision and if any licensing documents have been revised and not provided to CNSC staff as required.	Physical Design
12 ERM-22-2507	Sub-Contractor Hand Scrape in Radiological (RP) Zone 3	A sub-contractor at a small scale site was holding a vacuum for dust control, while another worker was using a drill with a wire wheel to remove	Radiation Protection

Event Number	Title	PHP Event summary	SCA
		contamination from the foundation of a concrete block. During the decontamination process, the wire wheel slipped causing a fracture to the hand of the worker holding the vacuum. This resulted in a lost-time injury. CNL took corrective action and requested the contractor to determine appropriate tools and personal protective equipment to prevent a similar event from occurring again. CNL confirmed that the contractor took significant corrective actions to prevent the recurrence, which included adding an extension to the vacuum hose to keep the worker's hand further away from the drill's wire wheel and adding a second grip to the drill to give the operator better control of the drill. CNL also released an operating experience bulletin to all CNL sites and contractors with a summary of the event, causes and lessons learned. CNSC staff are satisfied with the corrective actions taken by CNL.	
13 ERM-22-3994	PHAI perimeter fences down at various project sites due to winter storm	Due to a severe winter storm, PHAI perimeter fences were temporarily down across several worksites. The severity of the storm prevented immediate safe restoration of the fencing. Contractor security providers were stationed near where the fences were down at the Harbour and the Viaduct sites excavations and radiation zones to mitigate unauthorized access. CNL has repaired the perimeter fencing and is working to improve the	Security

Event Number	Title	PHP Event summary	SCA
		robustness of the fencing. There were no adverse effects on the health, safety and security of persons or the environment. There was no evidence of public access to any of the sites. CNSC staff are satisfied with the corrective actions taken by CNL.	
14 ERM-22-2209	Attempted Trespassing	An individual known to PHAI staff and Port Hope police attempted to gain access to the Port Hope Harbour and Centre Pier site. The individual was stopped from gaining entry by the front gate attendant and turned away by a site security guard. Port Hope Police were notified of the incident and were able to track down and speak with the individual. There was no loss or breach of security at the Harbour Centre Pier. CNSC staff are satisfied with the actions taken by CNL.	Security

Table E-5: Reportable events PGP in 2022

Event Number	Title	PGP Event summary	SCA
1 ERM-20-3094	Water Collection Line Struck and Severed During Excavation	During excavation near the PGP mound a leachate pipe was damaged. Pumps were used to pump water away and divert it into the EQ pond. There were no injuries or contamination events to personnel because of this event. Following the repair of the line, the area was checked for contamination and all impacted material was removed. Following this removal, soil samples were taken and analyzed by a third-party laboratory to confirm the area was clean. CNSC staff are satisfied with the corrective actions taken by CNL.	Operating Performance
2 HSSE-22-0145	Shipment of Unclassified Material	A shipment containing process residual waste from the PGP LTWMF was shipped to the PHP LTWMF, as part of the ongoing effort to demobilize the equipment from the PGP LTWMF site. It was revealed during the paperwork consolidation that 7 of the 14 totes on the shipment had not been classified in accordance with the Off-site Transportation of Dangerous Goods Standard (900-508520-STD-001). The 7 waste packages were correctly packaged in Industrial Packaging 2; however, the associated shipping documentation did not identify them as contents of the consignment. CNL took corrective action to investigate the event to verify package contents and the adequacy of packaging and documentation. CNL also introduced a handler verification system to ensure correct packages	Packaging and Transport

Event Number	Title	PGP Event summary	SCA
		are loaded. CNSC staff are satisfied with the corrective actions taken by CNL to prevent a similar event in the future.	
3 ERM-22-2811	Port Granby Long-Term Waste Management Facility Security Breach	Overnight, a security event occurred at the PGP LTWMF that involved an unidentified male gaining access to the site. Contracting staff arriving at the site the morning after discovered that the contractor’s lunchroom trailer doors were locked, which was not typical. It was noticed that the far door to the trailer was open and upon inspection, it was noted that bottled water had been consumed. Nothing else appeared disturbed, missing or stolen. There were no adverse effects on the health, safety and security of persons or the environment because of this event. CNSC staff are satisfied with the corrective actions taken by CNL to prevent a similar event in the future.	Security

Table E-6: Reportable events at DPWF in 2022

There were no reportable events for DPWF in 2022.

Table E-7: Reportable events at G1WF in 2022

There were no reportable events for G1WF in 2022.

Table E-8: Reportable events at NPDWF in 2022

There were no reportable events for NPDWF in 2022.

F. RATING DEFINITIONS

The CNSC applies rating levels as follows:

Satisfactory (SA): The licensee meets all of the following criteria:

- Performance meets CNSC staff expectations.
- Licensee non-compliances or performance issues, if any, are not risk-significant.
- Any non-compliances or performance issues have been, or are being, adequately corrected.

Below expectations (BE): One or more of the following criteria apply:

- Performance does not meet CNSC staff expectations.
- The licensee has risk-significant non-compliance(s) or performance issue(s).
- Non-compliances or performance issues are not being adequately corrected.

Unacceptable (UA): One or both of the following criteria apply:

- The risk associated with a non-compliance or performance issue is unreasonable.
- At least one significant non-compliance or performance issue exists with no associated corrective action.

G. SAFETY AND CONTROL AREA RATINGS

Note that the following acronyms are used in this appendix:

SA = satisfactory

BE = below expectations

UA = unacceptable

H. DOSES TO NUCLEAR ENERGY WORKERS AND NON-NUCLEAR ENERGY WORKERS AT CNL SITES

This appendix presents information on doses to Nuclear Energy Workers (NEWs) and non-NEWs at CNL sites.

Chalk River Laboratories

Radiation exposures of workers at the CRL site are ascertained, recorded and monitored to ensure compliance with CNSC's regulatory dose limits and to maintain radiation doses ALARA. External and internal dosimetry are provided by CNL's licensed dosimetry service.

At CRL, workers, including employees and contractors, conducting work activities which present a reasonable probability of receiving an occupational dose greater than 1 mSv/year are identified as NEWs. In 2022, the maximum effective dose received by a NEW was 5.48 mSv, well below the CNSC's regulatory effective dose limit for NEWs of 50 mSv in a 1-year dosimetry period. Figure H-1 provides the average and maximum effective doses received by NEWs at CRL from 2018 to 2022.

Figure H-1: Effective doses to NEWs at CRL from 2018 – 2022

	2018	2019	2020	2021	2022
Average Effective Dose (mSv)	0.34	0.27	0.16	0.27	0.26
Maximum Effective Dose (mSv)	12.48	8.23	7.97	7.01	5.48
Number of NEWs Monitored	4227	4071	3679	3957	4134

The dose fluctuations from year to year are attributed to the scope and duration of the radiological work conducted, along with the dose rates associated with the work. No adverse trends were identified in 2022.

Annual average and maximum equivalent doses to the skin and extremities (hands) for NEWs at CRL from 2018 to 2022 are provided in tables H-1a and H-1b. In 2022, the maximum skin dose received by a NEW at CRL was 32 mSv, and the maximum extremity dose received by a NEW at CRL was 11.50 mSv. Doses to the skin and extremities at CRL were well below the CNSC's regulatory equivalent dose limit for NEWs of 500 mSv in a 1-year dosimetry period.

Table H-1a: Equivalent (skin) doses to NEWs at CRL from 2018 – 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Average skin dose (mSv)	0.40	0.29	0.19	0.31	0.28	N/A
Maximum skin dose (mSv)	15.84	9.65	9.37	7.43	32	500 mSv/year

Table H-1b: Equivalent (extremity) doses to NEWs at CRL from 2018 – 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Average extremity dose (mSv)	4.85	2.21	1.70	2.02	0.98	N/A
Maximum extremity dose (mSv)	44.83	21.38	11.86	28.30	11.50	500 mSv/year

Non-NEWs at CRL

In 2022, the maximum effective and equivalent (skin) doses received by a person not considered as a NEW was 0.44 mSv and 0.52 mSv, respectively, which is well below the CNSC's regulatory effective and equivalent dose limits for persons who are not NEWs of 1 mSv and 50 mSv, respectively, in one calendar year.

Whiteshell Laboratories

Radiation exposures of workers at WL are ascertained, recorded and monitored to ensure compliance with CNSC's regulatory dose limits to maintain radiation doses ALARA. WL uses CNL's licensed dosimetry services for external and internal dosimetry for site/facility staff and contractors.

At WL, workers, including employees and contractors, conducting work activities which present a reasonable probability of receiving an occupational dose greater than 1 mSv/year are identified as NEWs. In 2022, the maximum effective dose received by a NEW was 0.31 mSv, well below the CNSC's regulatory effective dose limit for NEWs of 50 mSv in a 1-year dosimetry period.

Figure H-2 provides the average and maximum effective doses received by NEWs at WL from 2018 to 2022.

Figure H-2: Effective doses to NEWs at WL from 2018 – 2022

	2018	2019	2020	2021	2022
Average Effective Dose (mSv)	0.07	0.10	0.10	0.02	0.01
Maximum Effective Dose (mSv)	1.65	3.09	2.97	0.57	0.31
Number of NEWs Monitored	595	489	376	472	570

The dose fluctuations from year to year are attributed to the scope and duration of the radiological work conducted. Worker doses decreased in 2022 with the site safety pause instituted in June. The main contribution to radiation doses to NEWs in 2022 was the replacement of hot cell roughing filters. There was continued waste handling with low level waste package removal and characterization activities; however, these activities had only a small contribution to NEW's doses.

Annual average and maximum equivalent doses to the skin and extremities (hands) for NEWs at WL from 2018 to 2022 are provided in Table H-2a and H-2b. In 2022, the maximum skin dose received by a NEW at WL was 0.66 mSv, and the maximum extremity dose received by a NEW at WL was 1.38 mSv. Doses to the skin and extremities at WL were well below the CNSC's regulatory equivalent dose limits for NEWs of 500 mSv in a 1-year dosimetry period.

Table H-2a: Equivalent (skin) doses to NEWs at WL from 2018 – 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Average skin dose (mSv)	0.12	0.20	0.16	0.02	0.02	N/A
Maximum skin dose (mSv)	3.72	7.47	6.80	0.94	0.66	500 mSv/year

Table H-2b: Equivalent (extremity) doses to NEWs at WL from 2018 - 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Average extremity dose (mSv)	5.02	4.80	1.43	0.45	0.27	N/A
Maximum extremity dose (mSv)	36.71	37.77	6.46	1.86	1.38	500 mSv/year

Non-NEWs at WL

In 2022, the maximum individual effective to a non-NEW at WL was 0.01 mSv, which was well below the CNSC's regulatory effective dose limit for persons who are not NEWs of 1 mSv, in one calendar year.

Port Hope Area Initiative

Port Hope

Radiation exposures of NEWs at the PHP are ascertained, recorded and monitored to ensure compliance with the CNSC’s regulatory dose limits and to maintain radiation doses ALARA. Dosimeters are used for measuring external doses (whole body and skin) of PHP workers. Internal doses for PHP workers, resulting from exposure to radon progeny and long-lived alpha, are determined by indirect methods using concentration levels in air and time spent in work areas, or through the use of Personal Alpha Dosimeters. In 2022, no NEW received a radiation dose in excess of the CNSC’s regulatory dose limits.

Figure H-3 provides the average effective doses and the maximum effective doses for NEWs from 2018 to 2022. In 2022, the maximum effective dose received by a NEW at the PHP was 0.59 mSv, which is well below the CNSC’s regulatory effective dose limit for NEWs of 50 mSv in a 1-year dosimetry period.

Figure H-3: Effective doses to NEWs at PHP from 2018 – 2022

	2018	2019	2020	2021	2022
Average Effective Dose (mSv)	0.04	0.03	0.03	0.02	0.01
Maximum Effective Dose (mSv)	0.59	0.38	0.27	0.43	0.59
Number of NEWs Monitored	656	935	595	919	1474

As the project continues, effective doses are expected to remain low and comparable to previous years.

Annual average and maximum equivalent doses to the skin for NEWs at the PHP from 2018 to 2022 are provided in Table H-3. In 2022, the maximum skin dose received by a NEW at the PHP was 0.49 mSv, which is well below the CNSC’s regulatory equivalent dose limit for NEWs of 500 mSv in a 1-year dosimetry period.

Table H-3: Equivalent (skin) doses to NEWs at PHP from 2018 – 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Average skin dose (mSv)	0.04	0.04	0.03	0.01	0.02	N/A
Maximum skin dose (mSv)	0.33	0.60	0.27	0.45	0.49	500 mSv/year

Port Granby Project

Radiation exposures of NEWs at the PGP are ascertained, recorded, and monitored to ensure compliance with the CNSC's regulatory dose limits and to maintain radiation doses ALARA. Dosimeters are used for measuring external doses (whole body and skin) of PGP workers. Internal doses for PGP workers, resulting from exposure to radon progeny and long-lived alpha, are determined by indirect methods using concentration levels in air and time spent in work areas. In 2022, no NEW received a radiation dose in excess of the CNSC's regulatory dose limits.

Figure H-4 provides the average effective doses and the maximum effective doses for NEWs from 2018 to 2022. In 2022, the maximum effective dose received by a NEW at the PGP was 0.42 mSv, which is well below the CNSC's regulatory effective dose limit for NEWs of 50 mSv in a 1-year dosimetry period.

Figure H-4: Effective doses to NEWs at PGP from 2018 - 2022

	2018	2019	2020	2021	2022
Average Effective Dose (mSv)	0.06	0.05	0.03	0.03	0.02
Maximum Effective Dose (mSv)	3.13	0.79	0.27	0.38	0.42
Number of NEWs Monitored	489	563	514	537	657

Effective doses of NEWs continue to be very low as expected, as capping and site closure activities are completed at the PGP.

Annual average and maximum equivalent doses to the skin for NEWs at the PGP from 2018 to 2022 are provided in Table H-4. In 2022, the maximum skin dose received by a NEW at the PGP was 0.49 mSv, which is well below the CNSC's regulatory equivalent dose limit for NEWs of 500 mSv in a 1-year dosimetry period.

Table H-4: Equivalent (skin) doses to NEWs at PGP from 2018 – 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Average skin dose (mSv)	0.05	0.05	0.03	0.01	0.03	N/A
Maximum skin dose (mSv)	2.44	0.79	0.27	0.45	0.49	500 mSv/year

Non-NEWs at Port Hope Area Initiative

In 2022, there were no measurable doses recorded for visitors and contractors that were not considered as NEWs at the PHP and PGP.

Douglas Point Waste Facility

Radiation exposures of NEWs at the DPWF are ascertained, recorded, and monitored to ensure compliance with the CNSC's regulatory dose limits and to maintain radiation doses ALARA. In 2022, no NEW received a radiation dose in excess of the CNSC's regulatory dose limits.

Figure H-5 provides the average effective doses and the maximum effective doses for NEWs from 2018 to 2022. In 2022, the maximum effective dose received by a NEW at the DPWF was 0.69 mSv, which is well below the CNSC's regulatory effective dose limit for NEWs of 50 mSv in a 1-year dosimetry period.

Figure H-5: Effective doses to NEWs at DPWF from 2018 – 2022

	2018	2019	2020	2021	2022
Average Effective Dose (mSv)	0.01	0.02	0.02	0.01	0.01
Maximum Effective Dose (mSv)	0.43	0.24	0.45	0.36	0.69
Number of NEWs monitored	123	74	76	142	168

Over 2018 to 2022, hazard reduction work activities occurred at the DPWF site. In 2018, most of the maximum individual effective dose was attributed to the Spent Resin Removal Project. In 2019 and 2020, the hazard reduction work continued in the Reactor Building, including the dry active waste removal campaigns. In 2021, work focused outside of the reactor building, in low dose rate areas. In 2022, work focused on the installation and energization of the new Class IV power system, Service Building characterization and hazard abatement, Reactor Segmentation characterization work, walk downs for the Detailed Decommissioning Plans development, and preparation work for non-nuclear building demolition activities.

Annual average and maximum equivalent doses to the skin for NEWs at the DPWF from 2018 to 2022 are provided in Table H-5. In 2022, the maximum skin dose received by a NEW at the DPWF was 0.74 mSv, which is well below the CNSC's regulatory equivalent dose limit for NEWs of 500 mSv in a 1-year dosimetry period.

Table H-5: Equivalent (skin) doses to NEWs at DPWF from 2018 - 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Average skin dose (mSv)	0.01	0.02	0.03	0.01	0.01	N/A
Maximum skin dose (mSv)	0.43	0.24	0.51	0.45	0.74	500 mSv/year

Non-NEWs at DPWF

In 2022, there were no visitors or contractors not considered as NEWs at the DPWF, and therefore no corresponding dose information.

Gentilly-1 Waste Facility

Radiation exposures of NEWs at the G1WF are ascertained, recorded, and monitored to ensure compliance with the CNSC's regulatory dose limits and to maintain radiation doses ALARA. External and internal dosimetry are provided by CNL's licensed dosimetry service. In 2022, no NEW received a radiation dose in excess of the CNSC's regulatory dose limits.

Figure H-6 provides the average effective doses and the maximum effective doses for NEWs from 2018 to 2022. In 2022, the maximum effective dose received by a NEW at the G1WF was 0.07 mSv, which is well below the CNSC's regulatory effective dose limit for NEWs of 50 mSv in a 1-year dosimetry period.

Figure H-6: Effective doses to NEWs at G1WF from 2018 - 2022

	2018	2019	2020	2021	2022
Average Effective Dose (mSv)	0.03	0.01	0.00	0.01	0.00
Maximum Effective Dose (mSv)	0.62	0.10	0.01	0.12	0.07
Number of NEWs Monitored	101	57	43	132	202

In 2018, most of the maximum individual effective dose was attributed to the Spent Resin Removal Project. From 2019 to 2021, the hazard reduction work continued, including asbestos abatement and dry active waste removal. This work had a low potential for worker exposures and resulted in low effective doses observed as compared to 2018. In 2022, hazard reduction work at the site continued; however, this work resulted in low effective doses to workers.

Annual average and maximum equivalent doses to the skin for NEWs at the G1WF from 2018 to 2022 are provided in Table H-6. In 2022, the maximum skin dose received by a NEW at the G1WF was 0.07 mSv, which is well below the CNSC's regulatory equivalent dose limit for NEWs of 500 mSv in a 1-year dosimetry period.

Table H-6: Equivalent (skin) doses to NEWs at G1WF from 2018 – 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Average skin dose (mSv)	0.03	0.01	0.00	0.01	0.00	N/A
Maximum skin dose (mSv)	0.62	0.16	0.01	0.12	0.07	500 mSv/year

Several extremity doses were recorded at G1WF during 2022 for the inspections of the spent fuel canisters. The maximum extremity dose received by a NEW at the G1WF was 0.15 mSv, which is well below the CNSC's regulatory equivalent dose limit for NEWs of 500 mSv in a 1-year dosimetry period.

Non-NEWs at Gentilly-1

In 2022, there were no visitors or contractors not considered as NEWs at the G1WF, and therefore no corresponding dose information.

Nuclear Power Demonstration Waste Facility

Radiation exposures of NEWs at the NPDWF are ascertained, recorded, and monitored to ensure compliance with the CNSC’s regulatory dose limits and to maintain radiation doses ALARA. External and internal dosimetry are provided by CNL’s licensed dosimetry service. In 2022, no NEW received a radiation dose in excess of the CNSC’s regulatory dose limits.

Figure H-7 provides the average effective doses and the maximum effective doses for NEWs from 2018 to 2022. In 2022, the maximum effective dose received by a NEW at the NPDWF was 0.02 mSv, which is well below the CNSC’s regulatory effective dose limit for NEWs of 50 mSv in a 1-year dosimetry period.

Figure H-7: Effective doses to NEWs at NPDWF from 2018 – 2022

	2018	2019	2020	2021	2022
Average Effective Dose (mSv)	0.00	0.02	0.00	0.00	0.00
Maximum Effective Dose (mSv)	0.09	0.05	0.05	0.01	0.02
Number of NEWs Monitored	186	167	125	179	249

Effective doses over these years are consistently low and reflect storage with surveillance activities such as routine inspection and maintenance, as well as some hazard reduction activities.

Annual average and maximum equivalent doses to the skin for NEWs at the NPDWF from 2018 to 2022 are provided in Table H-7. In 2022, the maximum skin dose received by a NEW at the NPDWF was 0.02 mSv, which is well below the CNSC’s regulatory equivalent dose limit for NEWs of 500 mSv in a 1-year dosimetry period.

Table H-7: Equivalent (skin) doses to NEWs at NPDWF from 2018 – 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Average skin dose (mSv)	0.00	0.02	0.00	0.00	0.00	N/A
Maximum skin dose (mSv)	0.09	0.05	0.05	0.01	0.02	500 mSv/year

Non-NEWs at NPDWF

In 2022, there were no visitors or contractors not considered as NEWs at the NPDWF and therefore no corresponding dose information.

I. LOST-TIME INJURY INFORMATION

This appendix contains information on the number, frequency and severity of recordable lost time injuries (RLTIs) at the CNL sites covered by this ROR, with information presented separately for CNL employees and contractors.

CNL Employees

Frequency and severity are calculated per 100 full-time workers (equivalent to 200,000 worker-hours per year) using the following formulas:

Frequency rate =

(# of Lost-Time Injuries) x (200 000 hrs of exposure) / (person hours worked)

Severity rate =

(# of Working Days Lost) x (200 000 hrs of exposure) / (person hours worked)

Table I-1: Summary of CRL's Employee RLTIs, frequency and severity *(Source: CNL)*

Year	2018	2019	2020	2021	2022
Person Hours Worked	5,396,450	5,729,010	5,346,690	5,358,630	5,709,410
Lost-Time Injuries	5	1	4	3	2
Working Days Lost	69	75	78	4	3
Frequency	0.19	0.03	0.15	0.11	0.07
Severity	2.56	2.62	2.92	0.15	0.15

Table I-2: Summary of WL's Employee RLTIs, frequency and severity *(Source: CNL)*

Year	2018	2019	2020	2021	2022
Person Hours Worked	688,000	642,000	584,030	684,000	812,000
Lost-Time Injuries	1	0	1	0	0
Working Days Lost	5	0	2	0	0
Frequency	0.28	0	0.34	0	0
Severity	1.45	0	0.68	0	0

Table I-3: Summary of PHP's RLTIs, frequency and severity *(Source: CNL)*

Year	2018	2019	2020	2021	2022
Person Hours Worked	-	298,377	391,875	389,016	397,443
Lost-Time Injuries	0	1	0	2	0
Working Days Lost	0	33	0	12	0
Frequency	0	0.68	0	1.03	0
Severity	0	22.57	0	6.17	0
Note that prior to 2019, CNL did not provide data on person-hours worked on the PHP site.					

Table I-4: Summary of PGP's RLTIs, frequency and severity *(Source: CNL)*

Year	2018	2019	2020	2021	2022
Person Hours Worked	-	41,622	30,000	19,614	10,513
Lost-Time Injuries	0	1	0	0	0
Working Days Lost	0	1	0	0	0
Frequency	0	4.81	0	0	0
Severity	0	4.81	0	0	0
Note that prior to 2019, CNL did not provide data on person-hours worked on the PGP site.					

Table I-5: Summary of DPWF, G1WF, and NPDWF Employee RLTIs, frequency and severity *(Source: CNL)*

Year	2018	2019	2020	2021	2022
CNL staff at the DPWF, G1WF, and NPDWF sites have not recorded a lost-time injury since 2016.					

Contractors at CNL sites

The number of contractor recordable lost-time incidents reported to CNL in 2022 is shown in Table I-6.

CNL records the number of lost-time injuries reported to CNL by their contractors. However, contractor employee hours worked is considered sensitive information and the contractors do not divulge the specific number of hours worked to CNL as their client. Therefore, CNL does not provide frequency and severity rates for contractors since these calculations require hours worked.

Table I-6: Contractor lost-time injuries in 2022 *(Source: CNL)*

Site	CRL	WL	PHP	PGP	DP	G-1	NPD
Lost-Time Injuries (Change from 2021)	1(-1)	0	1(+1)	0	0	0	0

J. ESTIMATED DOSE TO THE PUBLIC

This appendix contains information on the estimated dose to the public around CNL sites. Regulatory release limits known as Derived Release Limits (DRLs) are site-specific calculated release levels that could, if exceeded, expose a member of the public of the most highly exposed group to a committed dose equal to the regulatory annual dose limit of 1 mSv/year. DRLs are calculated using CSA standard N288.1-14, *Guidelines for calculating derived release limits for radioactive materials in airborne and liquid effluents for normal operation of nuclear facilities* [32].

As per the *Radiation Protection Regulations* [16] subsection 1(3), and considering the fact that the radiological releases from all the sites covered by this ROR have remained small fractions of the DRLs applicable to those sites, the contribution to the dose to the public from these releases remains a very small fraction of the prescribed limit for the general public.

Chalk River Laboratories

The maximum dose in each year since 2018 has been well below the dose limit of 1 mSv/year.

Table J-1: CRL maximum effective dose to a member of the public from 2018 - 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Maximum Effective Dose (mSv)	0.0360	0.0036	0.0072	0.0037	0.0026	1 mSv/year

Whiteshell Laboratories

The dose to critical groups from releases from CNL-WL in 2022 was well below the regulatory dose limit of 1 mSv/year.

Table J-2: WL maximum effective dose to a member of the public from 2018 - 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Maximum effective dose (mSv)	0.00004	0.00009	0.000005	0.00001	0.00002	1 mSv/year

Port Hope Area Initiative

A modified approach for calculating estimated dose to the public was performed by CNL for PHAI sites beginning in 2019 and includes both radon monitoring and fence line dosimeter measurements at both PHP and PGP sites.

The annual estimated doses to the public in 2022 at PHP and PGP were well below the annual regulatory dose limit of 1 mSv.

Table J-3: PHP maximum effective dose to a member of the public from 2018 - 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Maximum effective dose (mSv)	0.0275	0.0350	0.033	0.023	0.028	1 mSv/year

Table J-4: PGP maximum effective dose to a member of the public from 2018 - 2022

Dose Data	2018	2019	2020	2021	2022	Regulatory Limit
Maximum effective dose (mSv)	0.0200	0.0396	0.020	0.041	0.033	1 mSv/year

DPWF

The gap analysis against CSA standard N288.1-14 conducted in 2021 by CNL determined that given the very low levels of contaminants in airborne and waterborne effluents, there is no need for an environmental monitoring program at DPWF. CNSC staff reviewed and accepted this gap analysis. All releases of radioactive material in DPWF effluents are a small fraction of their respective regulatory limits which indicate the potential of minimal impact on the public or the environment. In addition, as DPWF is located within the Bruce Nuclear Site, the Bruce Power environmental monitoring program potentially captures any environmental impacts emanating from the small contribution of DPWF. The dose to the public from the Bruce Nuclear Site, (potentially including contributions from the DPWF), remain below 2.4µSv/year (0.0024 mSv/year).

G1WF

The effluent monitoring plan assessment conducted in 2021 by CNL determined that there is minimal or no source of airborne radioactivity from routine operations at G1WF. In addition, all liquid releases were discharged through the Gentilly-2 effluent system, operated by Hydro-Québec, and represent a small fraction of the total releases from the larger Gentilly site. Hydro-Québec's Gentilly-2 environmental monitoring program captures any environmental impacts from the small contribution from G1WF. The dose to the public from the Gentilly-2 nuclear site, including contributions from G1WF, remain below 0.01 mSv/year.

NPDWF

NPDWF is no longer discharging liquid effluents from the facility sumps to the Ottawa River, and there were no such releases during the 2022 reporting period. All other releases of radioactive material in NPDWF effluents are a small fraction of their respective DRLs and thus, continue to indicate minimal impact on the public or the environment. CNL's environmental monitoring at CRL will regionally overlap with the NPDWF, so information from CRL's off-site environmental monitoring program could also be considered. CNSC staff have determined that the public dose from NPDWF remains at a very small fraction of the public dose limit.

K. PARTICIPANT FUNDING AWARDED FOR THE 2022 REGULATORY OVERSIGHT REPORT

CNSC staff provided interested communities with notice of the opportunity for funding through the CNSC's Participant Funding Program to review and comment on this report and the opportunity to submit a written intervention and/or appear before the Commission as part of the Commission meeting.

CNSC awarded approximately $72,828.76 in participant funding to assist the following Indigenous Nations and communities, members of the public and stakeholders in reviewing this ROR and submitting comments to the Commission.

Recipient
Algonquins of Pikwanagan First Nation
Manitoba Métis Federation
Hiawatha First Nation
Nuclear Transparency Project
Chippewas of Kettle and Stony Point First Nation
Total: $72,828.76

Further information on the CNSC's Participant Funding Program can be found on the CNSC's website at: http://www.nuclearsafety.gc.ca/eng/the-commission/participant-funding-program/index.cfm

L. SUMMARY OF ENGAGEMENT IN RELATION TO CNSC'S TERMS OF REFERENCE FOR LONG-TERM ENGAGEMENT AND ASSOCIATED WORKPLANS IN 2022

These sections were drafted collaboratively between representatives of the represented Indigenous Nations and Communities below and CNSC staff.

L.1 CNSC- Historic Saugeen Métis Long-term Engagement Terms of Reference

As committed to with the Historic Saugeen Métis (HSM) as part of the Terms of Reference (ToR) for long-term engagement with the CNSC, the update below was prepared in collaboration with HSM representatives.

Following the licence renewal hearing for the Bruce Nuclear Generating Station (BNGS) in 2018, a ToR was agreed upon and signed April 12, 2019, between CNSC staff and the HSM, which ensures that HSM is provided with adequate and meaningful funding, support and capacity to participate in consultation and engagement activities required throughout the year.

Topics of discussion related to the facilities in this ROR included updates and discussions about Douglas Point such as CNSC inspections and HSM's interest in the project.

CNSC staff and HSM representatives collaborated on the IEMP sampling campaign that took place around BNGS in 2022. CNSC staff appreciated the HSM's involvement in the IEMP, through selection of samples and participating in sample collection. Their contributions have helped to strengthen the IEMP. HSM and CNSC staff also discussed how to best share results with HSM community members and committed to working collaboratively once results are available.

While the HSM did not have any outstanding concerns related to the nuclear activities on the Bruce site, they continued to actively participate and make informed contributions to address any potential impacts on HSM rights and interests. CNSC staff plan to continue to engage and update HSM on regulatory activities on a semi-annual basis as agreed upon in the ToR including updates on CNL's Douglas Point decommissioning project and communicating results from the IEMP sampling campaign in 2022.

L.2 Curve Lake First Nation and CNSC Long-term Engagement Terms of Reference

As committed to with Curve Lake First Nation (CLFN) as part of the ToR for long-term engagement with the CNSC, the update below was prepared in collaboration with CLFN representatives.

In 2020, CNSC staff started discussions with CLFN to establish a formal long-term relationship with the community, and a ToR for long-term engagement was signed between the CLFN and CNSC in February 2021. This ToR ensures that CLFN is provided with adequate and meaningful funding, support, and capacity to participate in consultation and engagement activities required throughout the year. As part of the ToR a yearly work plan is developed between the CNSC and CLFN, which provides information on the scope of work, detailed activities, and timelines associated with work items for collaboration and engagement.

In 2022 the work plan included:

- ToR maintenance and updates
- Participation in the CNSC's IEMP
- Updates and discussions on specific Projects and Ongoing Operations of Existing Nuclear Facilities of Interest
- Co-Jurisdictional Matters of Significance (i.e., Fisheries Act Authorization, Emergency preparedness and thermal emissions from Nuclear Generation Stations)
- Information, communication, and other topics (i.e., REGDOC updates, feedback on CNSC reporting and processes, PFP opportunities)
- Developing a plan for a CLFN Indigenous Knowledge Study

In 2022, due to capacity constraints and other priorities CLFN and CNSC were not able to initiate discussions on developing a plan for an Indigenous Knowledge study. However, it is CLFN and CNSC's commitment to develop a plan for a Curve Lake Indigenous Knowledge Study in 2023.

In 2022, CLFN and CNSC staff continued to meet monthly and work collaboratively to make progress on a number of the agreed upon initiatives in the work plan. Through routine monthly meetings and interactions, CLFN and CNSC have developed a good working level relationship; one that has been more conducive to open and direct communications.

Topics of discussion included updates and information sharing with regards to ongoing CNL projects and sites including NSDF, NPDWF and CRL. Discussions were also had regarding the PHAI licence renewal. CNSC staff and CLFN also met to discuss CLFN's involvement in the 2022 IEMP sampling campaign planned near the CRL site. In August 2022, CLFN observers participated in the IEMP sampling activities around the CRL site. Having CLFN representatives participate in the sampling promotes a better understanding of sampling methods and improves input into future sampling in terms of CLFN species of interest, valued components and potential sampling locations.

In 2022, CLFN and CNSC staff worked collaboratively on communication products (such as a KI Pill information sheet and pamphlet for the Cameco Fuel Manufacturing Environmental Protection Review Report) to improve how information is shared with CLFN community members.

In October 2022, CLFN hosted CNSC staff in their community for a lunch and meeting with their leadership. CLFN also shared their knowledge during a tour of the Petroglyphs Provincial Park. These activities were invaluable for building and strengthening the relationship, advancing project-specific discussions and enhancing CNSC staff cultural awareness and understanding. CNSC staff and CLFN are planning on organizing another in-person event in the CLFN community and territory in 2023.

In 2022, CLFN provided feedback through their intervention on the 2021 RORs and continue to do so through ongoing discussions. CNSC staff have made a number of improvements to reports and documentation based on the feedback, such as including land acknowledgements for each facility and creating a separate Indigenous consultation and engagement section. CNSC staff and CLFN are working together to discuss and address the common themes raised in CLFN's interventions.

CNSC staff and CLFN continue to be committed to strengthening the relationship through on-going respectful dialogue to share knowledge, information on culture, history and perspectives that help CNSC staff and CLFN learn from each other. CNSC staff will also continue to have discussions regarding areas of interest and issues or concerns related to existing CNSC-regulated nuclear activities of interest to CLFN.

In 2023, CLFN and CNSC staff are planning to initiate discussions on the scope and approach to a Territory wide study of Indigenous Knowledge and Land Use Study as it relates to CNSC-regulated facilities and activities. Discussions will include the specific funding and capacity needs in order for CLFN to be able to meaningfully participate and complete these important studies and research. CLFN and CNSC staff will also continue to foster and create a safe ethical space for Indigenous Knowledge to be collected and shared.

L.3 CNSC-Mississaugas of Scugog Island First Nation Long-term Engagement Terms of Reference

As committed to with the Mississaugas of Scugog Island First Nation (MSIFN) as part of the ToR for long-term engagement with the CNSC, the update below was prepared in collaboration with MSIFN representatives.

In September 2021, CNSC staff started discussions with MSIFN to establish a formal long-term relationship with the community, and ToR were signed between MSIFN and the CNSC in March 2022. The ToR ensures that MSIFN is provided with adequate and meaningful funding, support and capacity to participate in consultation and engagement activities required throughout the year. As part of the ToR, a yearly work plan is developed between the CNSC and MSIFN, which provides information on the scope of work, detailed activities, and timelines associated with work items for collaboration and engagement.

In 2022, the work plan included:

- Learning about and engaging in the CNSC's IEMP
- Collaborative annual reporting to the Commission and to MSIFN Chief and Council
- Updates and discussions on specific projects and ongoing operations of licensed nuclear facilities of interest
- Enhancing information sharing and communication between the CNSC and MSIFN members
- Emergency management and preparedness

In 2022, MSIFN and CNSC staff continued to meet monthly and work collaboratively to make progress on a number of the agreed upon initiatives in the work plan. In addition, in October 2022, MSIFN hosted CNSC staff in their community for a lunch and meeting with their leadership. The in-person meeting was an important step for building and strengthening the relationship, advancing project-specific discussions and enhancing CNSC staff's understanding of MSIFN priorities and areas of concern. CNSC staff and MSIFN are planning on organizing another in-person meeting and event in the MSIFN community and territory in 2023.

L.4 Algonquins of Pikwakanagan First Nation -CNSC terms of reference for long-term relationship

As committed to with Algonquins of Pikwakanagan First Nation (AOPFN) as part of the ToR for long-term engagement with the CNSC, the update below was prepared in collaboration with AOPFN representatives.

In 2022, CNSC staff and AOPFN representatives started discussions to establish a ToR for a long-term relationship. The ToR were signed on November 30, 2022, providing a formalized structure for ongoing dialogue on CNSC-regulated facilities and activities of interest in the AOPFN traditional territory. As part of the ToR, a yearly work plan was developed between the CNSC and AOPFN that provides information on the scope of work, detailed activities, and timelines associated with work items for collaboration and engagement. The work plan includes activities that CNSC staff and AOPFN will be working to implement throughout 2023 and beyond, including:

- participation in the CNSC's IEMP
- collaborative annual reporting to the Commission and to the AOPFN Chief and Council
- updates and discussions on specific projects and ongoing operations of licensed nuclear facilities of interest
- enhanced information sharing and communication between the CNSC and AOPFN members
- emergency management and preparedness

The following facilities covered in this ROR are of interest in the work plan:

- Chalk River Laboratories
- Nuclear Power Demonstration Closure Project

CNSC staff and AOPFN are committed to continuing to strengthen the relationship through ongoing, respectful dialogue to share knowledge, information on culture and history, and perspectives that help CNSC staff and AOPFN learn from each other. CNSC staff will also continue to have discussions on areas of interest and concern related to CNSC-regulated nuclear activities of interest to AOPFN.

L.5 Saugeen Ojibway Nation- CNSC Long-term Engagement Terms of Reference

As committed to with the Saugeen Ojibway Nation (SON) as part of the ToR for long-term engagement with the CNSC, the update below was prepared in collaboration with SON representatives.

The ToR were signed between the SON and the CNSC in 2019. The ToR ensures that the SON is provided with adequate and meaningful funding, support and capacity to participate in consultation and engagement activities required throughout the year. As part of the ToR, a yearly work plan is developed between the CNSC and SON, which provides information on the scope of work, detailed activities, and timelines associated with work items for collaboration and engagement.

In 2022, the work plan included:

- Joint review and analysis of licensee submissions, particularly around environmental protection
- Participation in the CNSC's IEMP
- Inclusion on the design and review of Bruce Power's study of available mitigation measures for environmental impacts
- SON community outreach
- Sharing the results of CNSC's environmental oversight, such as inspection reports
- Identifying federal, provincial, and municipal decision-making agencies, as needed
- Coordinating meetings with federal and provincial Crown agencies, as needed
- Sharing information on the Western Waste Management Facility, Douglas Point and Nuclear Waste Management Organization's (NWMO) Adaptive Phase Management (APM) initiative

The work plan sets out detailed tasks and timelines for each of these items.

Topics of discussion related to the facilities in this ROR included updates and discussions about Douglas Point.

In 2022, CNSC staff and the SON continued to meet and work collaboratively to complete a number of the agreed upon initiatives in the work plan. These activities included CNSC's funding support for a traditional land use and occupancy study to obtain a baseline inventory of mapped cultural sites in relation to the SON's Territory, including the Territory around the Bruce Power site. However, due to the pandemic and inability to meet with community members in person, this work has been delayed, however is expected to be completed in early 2023.

Work was completed on Bruce Power's mitigation measures study. The outcomes of this process have led to further collaboration between SON and CNSC staff on environmental monitoring as well as future updates to the CNSC's regulatory framework.

CNSC staff and members from the SON community participated in the IEMP sampling campaign for 2022. SON helped to select and provide samples (including fish) that would be meaningful to their community members. As part of IEMP sampling, CNSC staff also conducted outreach activities as well to explain the program as well as health impacts due to radiation.

CNSC staff participated in a number of outreach activities with the SON. Spring and Fall community information sessions were organized by the SON Environment Office staff and were well attended. This provided the opportunity for SON members to ask questions and learn more about how nuclear energy and radiation is regulated in Canada.

Additionally, SON Environment Office staff and CNSC staff provided a joint presentation at the 2022 CNS Conference on the participation by SON in regulatory inspections to share this experience with the nuclear industry.

In addition, the SON completed another year of the Coastal Waters Monitoring Program (CWMP), which is an initiative funded in cooperation with Bruce Power, but was designed, led and implemented by the SON to monitor environmental conditions in the nearshore areas of the Saugeen Peninsula. SON has recently shared with CNSC the 2022 Annual CWMP Report, as has been done in previous years. CNSC staff are interested in the results of the CWMP, as this will provide data that can be used in future environmental risk assessments in relation to the BNGS.

SON has on-going concerns regarding the storage of nuclear waste in their traditional territory. In 2022, CNSC staff provided information on the update to Natural Resources Canada's plans to update Canada's nuclear waste policy. In addition, work is on-going to provide information on how the SON can contribute to and participate in the processes around new nuclear projects in Ontario in which waste may be stored at the Western Waste Management Facility, or a potential deep geological repository sited in SON Territory.

CNSC staff and SON will continue to work collaboratively to address areas of concern, rights, and interests for the SON in relation to the Bruce site, including CNL's Douglas Point decommissioning project.

L.7 Métis Nation of Ontario-CNSC Long-term Engagement Terms of Reference

As committed to with the Métis Nation of Ontario (MNO) as part of the ToR for long-term engagement with the CNSC, the update below was prepared in collaboration with MNO representatives.

Following the licence renewal hearing for the BNGS in 2018, a ToR was agreed upon and signed on December 18, 2019, between CNSC staff and the MNO, which formally documents the engagement with their Nation. As the MNO is a province-wide organization, a specific engagement plan under the Terms of Reference was also signed in December 2019 with MNO Region 7, which is the consultation committee region that includes the Bruce site to address their areas of interest.

In 2022, the engagement plan included:

- Participation in the CNSC's IEMP
- Sharing information on NWMO's APM initiative

- Sharing information on SMRs
- CNSC to support MNO capacity building through professional development workshops
- Communication with MNO citizens

The following facilities covered in this ROR are of interest: Douglas Point.

As per the engagement plan, in 2022, CNSC staff continued to meet with MNO representatives semi-annually to discuss topics such as the Douglas Point decommissioning project, the Bruce Power Major Component Replacement project and the pressure tube findings, OPG's WWMF and NWMO's APM project. CNSC staff worked with MNO to update the work plan to identify areas of collaboration, including environmental monitoring through the IEMP and providing information related to Impact Assessments and Small Modular Reactors. In 2022, MNO representatives participated in the IEMP sample campaign that took place around BNGS. Representatives observed the air sampling station set up by Baie-du-Doré and helped with identifying vegetation in the area that is important to their citizens (e.g., plantains, cattails).

As discussed at Bruce Power's licence renewal hearing in 2018, MNO Region 7 would like to be more involved in environmental monitoring activities and addressing the concerns their citizens have regarding perceived environmental impacts related to the Bruce site. CNSC staff will continue to collaborate and engage with the MNO Region 7 on areas of interest with regards to the Bruce site including CNL's Douglas Point decommissioning project, including the upcoming midterm licence review, on a semi-annual basis as agreed upon in the Terms of Reference.

L.8 Kebaowek First Nation (KFN)-CNSC Long-term Engagement Terms of Reference

As committed to with Kebaowek First Nation (KFN) as part of the long-term relationship arrangement "the Arrangement" with the CNSC, the update below was prepared in collaboration with KFN representatives.

In 2022, CNSC staff and KFN representatives started discussions to establish an Arrangement for a long-term relationship. The Arrangement was signed on September 29, 2022, providing a formalized structure for ongoing dialogue on CNSC-regulated facilities and activities where KFN has identified concerns in relation to a project's construction or existing operations on their rights, interests, culture, current and traditional uses of their territory.

As part of the Arrangement, a yearly work plan is being developed between the CNSC and KFN that provides information on the scope of work, detailed activities, and timelines associated with work items for collaboration and engagement. The work plan includes activities that CNSC staff and KFN will be working to implement throughout 2023 and beyond, including:

- collaborative annual reporting to the Commission and to the KFN Chief and Council

- updates and discussions on specific projects and ongoing operations of licensed nuclear facilities of interest
- enhanced information sharing and communication between the CNSC and KFN members
- opportunities to comment and review policies and regulations including those related to nuclear safety, non-proliferation and Indigenous engagement.

The following facilities covered in this ROR are of interest in the to be developed work plan:

- Chalk River Laboratories
- Nuclear Power Demonstration Closure Project

CNSC staff and KFN are committed to continuing to strengthen the relationship through ongoing, respectful dialogue and the sharing of knowledge, information on culture and history, and perspectives that help CNSC staff learn from KFN. CNSC staff will also continue to have discussions on areas of interest and concern related to CNSC-regulated nuclear activities of interest to KFN.

M. SUMMARY TABLE OF THE STATUS OF ISSUES CONCERNS AND REQUESTS FROM INTERVENORS IN THE 2021 CNL ROR

In direct response to the Commission's action from the 2021 RORs, CNSC staff has established an internal CNSC issues, concerns, and comments tracking table for each intervening Indigenous Nation or Community in the 2021 CNL ROR. These tables also summarize and track CNSC's efforts to respond to and address intervenor requests concerns and comments, where feasible. In the 2021 CNL ROR meeting, the Commission noted the concerns raised by several intervenors that comments and recommendations made regarding past RORs had not been addressed directly by CNSC staff. As a result, the Commission expects to be updated on the status of CNSC staff's efforts to address and track intervenor recommendations across all RORs moving forward. The Commission has directed CNSC staff to provide an update on whether and how comments and recommendations made by Indigenous Nations and communities in particular have been, or will be, addressed, including where there are disagreements.

The purpose of this appendix is to provide a summary of information and data from the CNSC's issues tracking tables to the Commission. The tables below provide an overview of the issues raised in interventions in relation to the previous year's ROR, and the proposed path forward to address them. Table A outlines the number of specific issues and concerns raised by each intervenor and their related themes, as well as CNSC responses and proposed path forward. Table B provides an overview of the key thematic categories raised by each intervenor and the total number of times each theme or topic was raised by all intervenors in their interventions. Tracking this thematic information will provide a baseline to help direct CNSC staff to focus their efforts in future engagements and consultations to areas that generate the most concerns. This is a new ROR initiative and will continue taking shape moving forward as CNSC staff begin tracking trends in intervention topics and track progress with Indigenous Nations and Communities, as well as repeat public intervenors.

Table A: Issues and Concerns Raised in Interventions from Indigenous Nations and Communities from the 2021 CNL ROR Tracking and Response Table

The following table provides details regarding the number of specific issues and concerns raised in the interventions by Indigenous Nations and communities in relation to the 2021 CNL ROR, the number of thematic categories the issues and concerns are grouped by, and the status of the CNSC's approach to responding to and addressing each issue, concern or request raised in the interventions to date.

CNSC staff are committed to responding to and following up with the intervenors below with regards to their interventions and working collaboratively to identify options for a path forward to address the comments, where possible. For Indigenous Nations and communities that have a ToR for long-term engagement with the CNSC, requests, concerns and comments raised in relation to the ROR have been integrated into the engagement work plan and regular meetings with each Indigenous Nation or community, including sharing the specific issues and concerns tracking table with each Indigenous Nation and community in order to verify the data and discuss a path forward for meaningfully addressing their comments.

In addition, CNSC staff have also followed up with Indigenous Nations and communities who the CNSC does not currently have a ToR for long-term engagement with, in order to follow up on or set a path forward on their comments and issues.

2021 CNL ROR Interventions from Indigenous Nation and Communities	The number of Requests/ Concerns/ Comments Raised in 2021 ROR intervention	Requests/ Concerns/ Comments Responded to by CNSC staff*	Notes
Algonquins of Pikwàkanagàn First Nation (AOPFN)	9 (falling within 5 main subjects/categories)	9	The issues, concerns and recommendations raised by AOPFN in their intervention for the 2021 CNL ROR are being addressed and discussed with AOPFN through an issues tracking table and regular meetings and the associated workplan in relation to the CNSC-AOPFN ToR for long-term engagement. In addition, CNSC staff reached out to AOPFN to offer to have a specific meeting and discussions to address their concerns, comments, and recommendations from the 2021 CNL ROR. This meeting was held virtually on April 26, 2023. Examples of the themes and issues raised include CNSC's consultation and engagement activities (Indigenous and Stakeholder) and impacts on rights.
Manitoba Métis Federation (MMF)	8 (falling within 3 main subjects/ categories)	8	The issues, concerns and recommendations raised by MMF in their intervention for the 2021 CNL ROR are being addressed and discussed with MMF based on an issues tracking table developed by CNSC staff in 2021 designed to track the issues, concerns, and comments that MMF have raised in various interventions over the past few years. CNSC staff has shared the

2021 CNL ROR Interventions from Indigenous Nation and Communities	The number of Requests/ Concerns/ Comments Raised in 2021 ROR intervention	Requests/ Concerns/ Comments Responded to by CNSC staff*	Notes
			tracking table with MMF for review and offered to meet to discuss CNSC staff's responses and a path forward on addressing their comments, requests and concerns. CNSC is committed to working with MMF to address each topic to the greatest extent possible. CNSC staff reached out to offer to have a specific meeting and discussions to address MMF's concerns, comments and recommendations in relation to their interventions for the 2021 CNL ROR. This meeting was held virtually on May 1, 2023. In addition, CNSC has offered MMF a ToR for long-term engagement (offered in 2021) as well as funding and capacity support. CNSC staff look forward to hearing back from MMF with regards to working towards finalizing a ToR for long-term engagement, developing a workplan and prioritizing discussions on addressing their comments, concerns and recommendations. Examples of the themes and issues raised include CNSC's consultation and engagement activities (Indigenous and Stakeholder) and Environmental Monitoring.
Grand Council Treaty 3	29 (falling within 4	29	The issues, concerns and recommendations raised by Grand

	main subjects/categories)		Council Treaty 3 in their intervention for the 2021 CNL ROR are being addressed and discussed with Grand Council Treaty 3 based on an issues tracking table developed by CNSC staff. CNSC staff have reached out to offer to have a specific meeting and discussions to address their concerns, comments and recommendations in relation to the 2021 CNL ROR. CNSC has offered to provide Grand Council Treaty 3 funding and to establish regular meetings to support this work with the CNSC. CNSC staff look forward to hearing back from Grand Council Treaty 3 and making progress on developing the relationship and addressing their comments, concerns and recommendations. Examples of the themes and issues raised include CNSC's consultation and engagement activities (Indigenous and Stakeholder) and CNSC Oversight Activities.
Sagkeeng Anicinabe First Nation	9 (falling within 5 main subjects/categories)	9	The issues, concerns and recommendations raised by Sagkeeng Anicinabe First Nation in their intervention for the 2021 CNL ROR are being addressed and discussed with Sagkeeng Anicinabe First Nation based on an issues tracking table developed

			by CNSC staff designed to track the issues, concerns, and comments that Sagkeeng Anicinabe First Nation has raised. CNSC staff have reached out to Sagkeeng Anicinabe First Nation to offer to have a specific meeting and discussions to address their concerns, comments and recommendations. CNSC has offered to develop a ToR for long-term engagement and related work plan with Sagkeeng Anicinabe First Nation. CNSC has also offered funding support, should this be of interest to Sagkeeng Anicinabe First Nation in relation to the 2021 CNL ROR. CNSC staff look forward to hearing back from Sagkeeng Anicinabe First Nation and making progress on developing the relationship and addressing their comments, concerns and recommendations. Examples of the themes and issues raised include CNSC's consultation and engagement activities (Indigenous and Stakeholder) and impacts to rights.
Curve Lake First Nation (CLFN)	9 (falling within 2 main subjects/categories)	9	The issues, concerns and recommendations raised by Curve Lake First Nation in their intervention for the 2021 CNL ROR are being addressed and discussed with Curve Lake First Nation based on an issues

			tracking table designed by CNSC staff and regular meetings and the associated workplan in relation to the CNSC-Curve Lake First Nation ToR for long-term engagement. In addition, CNSC staff reached out to Curve Lake First Nation to offer to have a specific meeting and discussions to address their concerns, comments, and recommendations in relation to the 2021 CNL ROR. CNSC looks forward to working with CLFN to address their comments and recommendations. Examples of the themes and issues raised include CNSC's consultation and engagement activities (Indigenous and Stakeholder) and Other (some examples: Nation-specific concerns, comments relating to specific technologies).
Chippewas of Kettle and Stony Point First Nation	18 (falling within 7 main subjects/categories)	18	The issues, concerns and recommendations raised by the Chippewas of Kettle and Stony Point First Nation in their intervention for the 2021 CNL ROR are being addressed and discussed with the Chippewas of Kettle and Stony Point First Nation based on an issues tracking table designed by CNSC staff to track the issues, concerns, and comments that Chippewas of Kettle and Stony Point First Nation have raised.

2021 CNL ROR Interventions from Indigenous Nation and Communities	The number of Requests/ Concerns/ Comments Raised in 2021 ROR intervention	Requests/ Concerns/ Comments Responded to by CNSC staff*	Notes
			In addition, CNSC staff reached out to the Chippewas of Kettle and Stony Point to offer to have a specific meeting and discussions to address their concerns, comments and recommendations in relation to the 2021 CNL ROR. This meeting was held virtually on April 27, 2023. Examples of the themes and issues raised include CNSC's consultation and engagement activities (Indigenous and Stakeholder) and environmental monitoring.

** "Responded to" refers to the number of requests/concerns/comments that CNSC staff have provided dispositions to, responded to directly, or have made requests with intervenors to have a specific meeting and discussions to address their concerns, comments and recommendations. See notes column for more details.*

Engagement with Other Public Intervenors

CNSC staff are committed to engaging with the public and learning more about their values, issues and concerns. Repeat public intervenors, including individuals and civil society organizations, have been reached out to, to follow up on their issues, concerns, and recommendations. This is being facilitated through existing opportunities for engagement and individualized bilateral meetings.

Table B. Interventions by Thematic Category

The following table provides an overview of the key thematic categories raised in the interventions in relation to the 2021 CNL ROR and the number of times each theme or topic was raised in total across all interventions. In total for this ROR last year there were 10 intervenors. Some were positive and did not raise concerns, however, there were a number that raised concerns in the categories outlined below. The categories included in Table B have been ordered from most frequently raised to least. The thematic categories are derived from the review of the 2021 interventions and CNSC staff's analysis of the issues and topics raised.

CNSC staff are committed to continuing to follow up and work with each intervenor in Table A, as well as other repeat individuals and civil society organizations who intervened to continue discussions on how best to address these themes and areas of interest identified in their interventions.

Requests/Concerns/ Comments Category in the intervention for the 2021 CNL ROR	Number of times the topic category was raised across 2021 CNL ROR interventions	Number of Intervenors who raised the topic in intervention
CNSC's Consultation and Engagement activities (Indigenous and Stakeholder) (e.g., suggestions for improvements to the approach to consultation and engagement and request for meaningful responses to issues raised)	41	7
Improvements to ROR process and ROR content (e.g., requests related to: improving accessibility, providing additional information or clarification in specific sections of the report, providing information about the performance rating system and improving the format of the report)	30	2
CNSC Oversight Activities (e.g., suggestions for improvements to the approach to consultation and engagement and request for meaningful responses to issues raised)	25	4
Environmental Monitoring (e.g., requests to be included in the development of monitoring plans and for additional monitoring to occur)	18	6
Waste Management (e.g., concerns about impacts from increased amounts of waste)	5	4
Impacts to Indigenous or Treaty Rights (e.g., concerns about lack of consent from Indigenous Nations and communities in the initial establishment of nuclear operations on traditional territories)	4	2
Indigenous Knowledge (e.g., requests to clarify how Indigenous Knowledge has been considered and	4	3

Requests/Concerns/ Comments Category in the intervention for the 2021 CNL ROR	Number of times the topic category was raised across 2021 CNL ROR interventions	Number of Intervenors who raised the topic in intervention
incorporated)		
Other (some examples: Nation-specific concerns, comments relating to specific technologies)	3	1
Nuclear Emergency Management (e.g., concerns around potential nuclear emergencies and safety processes)	2	2
CNL activities and Engagement (e.g., suggestions for improving CNL's engagement with Indigenous Nations and communities)	2	2
Participant Funding Program (e.g., requests for more funding to support participation in regulatory activities)	1	1
Small Modular Reactors (e.g., concerns relating to the possibility of SMR development)	1	1
Economic Development (e.g., request for more economic opportunities resulting from the nuclear industry)	1	1
Long Term Relationship Development (e.g., requests for additional relationship development activities between the CNSC and Indigenous Nations and Communities)	1	1

Conclusion

CNSC staff take the issues and concerns raised by intervenors seriously and CNSC ROR Project officers with assistance from the Indigenous and Stakeholder Relations Division will continue to work with each intervenor identified in Table A who has raised issues and concerns on identifying approaches to addressing the different topic areas, requests and comments raised as appropriate. Furthermore, the CNSC is committed to continuously improving the quality of data included in RORs, and the ROR reporting process. CNSC acknowledges that the two main themes of issues raised in the 2021 CNL

ROR were “CNSC’s Consultation and Engagement activities” and “improvements to the ROR process and ROR content” and has made it a priority to further discuss and address these issues, where feasible. As part of this commitment, CNSC staff have included appendices in all 2022 RORs with information on the issues and concerns raised by intervenors and the status of the CNSC’s work to follow-up, respond to and address each intervention as appropriate, and are working towards the continued expansion and enhancement of reporting to the Commission on issues tracking and engagement efforts.

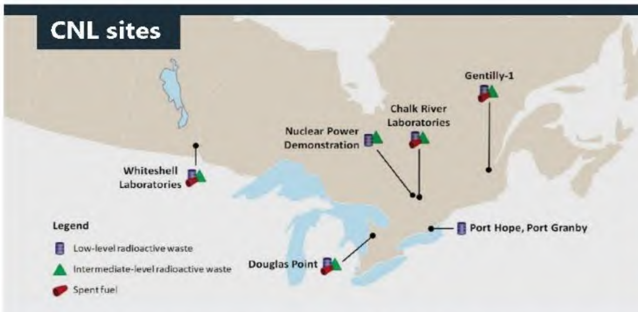
The CNSC is dedicated to continuous improvement, and actively works to identify meaningful ways and approaches for addressing the concerns, comments and recommendations made by intervenors identified in the RORs, where appropriate. In instances where issues and concerns are raised that the CNSC and the intervenor may disagree the CNSC is open to having dialogue and working towards finding solutions and building consensus around key issues within the CNSC’s mandate and authority.

N. ROR DASHBOARD

Regulatory Oversight Report (ROR) Dashboard of Canadian Nuclear Laboratories Sites: 2022

This dashboard gives an overview of the safety performance of Canadian Nuclear Laboratories (CNL) sites and the efforts of the Canadian Nuclear Safety Commission (CNSC) to ensure the safety and protection of the people and the environment around the sites in 2022.

CNL sites



8 CNSC inspectors dedicated to CNL sites

30–40 CNSC staff with regulatory effort at CNL sites

3 CNSC employees working at Chalk River Laboratories site

Safety and control areas (SCAs)

14 SCAs

Chalk River Laboratories and Whiteshell Laboratories were rated as below expectations for the SCAs of Security and Emergency Management and Fire Protection, respectively. Other SCAs for these sites were rated as satisfactory. All other sites were rated as satisfactory for all 14 SCAs.

3 SCAs of focus in the ROR

1. Environmental protection
2. Radiation protection
3. Conventional health and safety

CNSC staff concluded that all CNL sites operated safely in 2022

Activities

61 International Atomic Energy Agency-led safeguards inspections

21 CNSC inspections

73 CNSC notices of non-compliance (NNCs)

Events

59 reportable events

1 event reported to the Commission

All NNCs were of low safety significance and did not impact safety at CNL sites

Maximum doses

Regulatory limit

Estimated dose

Effective dose

The public

0.033 mSv/y — 1 mSv/y

The maximum estimated dose to the public from any CNL site in 2022 was at the Port Granby Project.

Nuclear energy workers (NEWs)

5.48 mSv/y — 50 mSv/y

The maximum effective dose received by a NEW in 2022 across CNL sites was at Chalk River Laboratories.

Public outreach

CNSC staff conducted and participated in more than 10 outreach activities with respect to CNL sites in 2022.

Independent Environmental Monitoring Program

In 2022, CNSC staff conducted independent environmental monitoring around Chalk River Laboratories, Douglas Point and Whiteshell Laboratories. There were no results of concern.

Licensing actions

In 2022, the Commission made the decision to renew the Port Hope Project licence and consolidate with the other Port Hope Area Initiative licences. This new licence was valid starting January 1, 2023.

1. PURPOSE AND SCOPE

This monitoring plan documents details of the Environmental Monitoring Program (EMP) for Whiteshell Laboratories (WL) including the decision for the need and development of the program, and shows how the planned monitoring meets the objectives of the program. It also documents and provides justification for the monitoring activities that are part of the EMP.

The EMP was developed and is executed in such a way as to conform to the *Municipal/Industrial Strategy for Abatement (MISA)* program [1] and the effluent regulations for the Electric Power Generating Sector [2], and to comply with:

a) conditions in the WL Operating Licence [3] and Licence Conditions Handbook [4];
b) the WL framework document, Whiteshell *Laboratories Integrated Environmental Monitoring Program Framework* [5];
c) the Environmental Protection Program procedure, *Environmental Monitoring Program* [6];
d) Canadian Standards Association (CSA) N288.4-10 [7];
e) the WL Environmental Assessment Follow-up Program [8];
f) other applicable regulations and standards; and
g) Canadian Nuclear Laboratories (CNL) policies.

This plan addresses the monitoring of contaminants and meteorological parameters at the WL Site.

This monitoring plan does not address any Effluent Verification Monitoring or Operational Control Monitoring in place at WL as a result of the requirements outlined in the Environmental Protection Program procedure, *Management and Monitoring of Emissions* [9].

This document is primarily intended for use by groups or laboratories which are directly involved in the WL Environmental Monitoring Program.

Note that the EMP is dynamic in nature and is continually evolving. As a result, this plan is current as of its issuance but does not necessarily completely reflect the program after this date. The most current monitoring schedules should always be consulted [10].

2. DEFINITIONS

For terms not defined below, refer to Appendices A and B in 900-509200-PDD-001, *Environmental Protection Program Description Document* [11] and *Environmental Monitoring Program* [6] for definitions and acronyms pertaining to this document. For additional terms, refer to the Acronyms, Abbreviations, and Definitions of Terms web page on the CNL Intranet.

Environmental media	Refers to both biotic and abiotic components of the environment. Environmental media is also referred to as media (or a medium) [7].
Pathway	Route of pollutant from source to receptor through one or more environmental media or compartments [7].
Pathways monitoring	Monitoring contaminant levels in abiotic or biotic components in the environment [7].
Receptor	A biological entity that can be exposed to contaminants or physical stressors, and might be subject to associated effects [7].
Reference area	A sampling area that has no effluent exposure from the facility in question; and has natural habitat features that are similar to those of the exposure areas, including anthropogenic areas [7].
Uncertainty	A quantitative expression of error that results from incomplete knowledge of information about a parameter or value [7].

3. WL SITE OPERATIONS

Whiteshell Laboratories (WL) was established by Atomic Energy of Canada Limited (AECL) in the early 1960s to carry out nuclear research and development activities. The site is a Class 1B nuclear facility which encompasses an area of 4,375 hectares as shown in Figure 3-1. The WL site is owned by AECL and operated by CNL under a licence [3] issued by the Canadian Nuclear Safety Commission (CNSC). The WL site is located near Pinawa, Manitoba; approximately 100 kilometres northeast of Winnipeg, on the east bank of the Winnipeg River. It is downstream from the towns of Pinawa and Seven Sisters Falls, and upstream of the communities of Lac du Bonnet and Pine Falls.

The Whiteshell Reactor-1 (WR-1) organic-cooled experimental test reactor was shut down in 1985. AECL made a business decision in 1997 to discontinue most of the research programs and operations at WL. Subsequently, AECL received government concurrence in 1998 to proceed with actions to achieve closure of WL.

In 2014, Canadian Nuclear Laboratories (CNL) Ltd. was created as a wholly owned subsidiary of AECL. Implementation of the Government-Owned, Contractor-Operated model was achieved with share transfer of CNL from AECL to Canadian National Energy Alliance (CNEA) in 2015 September.

Activities to complete the orderly decommissioning of the WL site, following the general plan laid out in the Comprehensive Study Report (CSR) [12] supporting the approval of the Environmental Assessment of the WL Decommissioning Project have been underway since 2003 January.

The major operating facilities are the Shielded Facilities, and the Waste Management Area (WMA). The Shielded Facilities includes the Hot Cell Facility and the Immobilized Fuel Test Facility area which includes a decontamination center and waste processing/handling area. Areas undergoing sampling and characterization activities include WR-1 Reactor Building and Active Liquid Waste Treatment Center (ALWTC). The ALWTC was shut down near the end of 2017, and is now being decommissioned. In total, these facilities are the major sources of radiological airborne effluent releases from the site. The primary source of liquid effluent releases at WL is the process water outfall (Outfall), which discharges continuously to the Winnipeg River. The secondary source of liquid effluent is the sewage lagoon (Lagoon), which is normally discharged semi-annually to the Winnipeg River.

Finally, the site contains numerous smaller non-nuclear facilities, development and analytical laboratories and support facilities (Power House, various workshops, maintenance shops, etc.). Industrial boilers are operated at the Power House to provide steam heating to the majority of the site, while some facilities in the outer areas are heated with propane.

Waste management facilities designed for the storage or disposal of wastes are located in WMA. Radiological and non-radiological contaminants that appear in groundwater down gradient of the WL WMA and other monitoring sites are largely the result of early operations.

More detailed information regarding population, as well as topography, land use, hydrography, and meteorology pertaining to the site is available in the WL Derived Release Limits document [15].

Figure 3-1 Near Field Map of WL Site

4. NEED FOR AN ENVIRONMENTAL MONITORING PROGRAM

The criteria used to determine whether there was a need to establish an EMP for the Whiteshell site are outlined in *Environmental Monitoring Program* [6]. The criteria which were met, thereby requiring the need to establish the EMP, are identified below. Note that only one of the criteria need be met to warrant the establishment of a program.

a) *A governing statute, regulation, licence, or permit requires it;*

Clause 1.8 of the current site Licence [3] and Licence Conditions Handbook [4] states that the "licensee shall implement and report on the progress of the Environmental Assessment Follow-Up Program" which identifies the requirement for maintaining an environmental monitoring program. Clause 11.1 of these two documents also state "The licensee shall implement and maintain an environmental protection program".

b) *The results of an Environmental Risk Assessment (ERA) (or equivalent) indicate a likelihood that the concentration of a contaminant or the intensity of a physical stressor could exceed a Benchmark Value (BV);*
Based on the results of the assessment of the low-level waste trenches (Volume 2 Appendix C of [12]) performed as part of the Comprehensive Study Report for the Whiteshell Laboratories site, there is reasonable likelihood that the concentration of some hazardous substances and/or physical stressors in the soil, surface water and groundwater within the WMA could exceed benchmark values. This is also the case for abandoned active drain lines and previously impacted areas on the main campus of the WL site.

c) *The effective dose to members of an off-site critical group from all radioactive emissions from the site during normal operations and anticipated transients is estimated to exceed 5×10^{-5} Sv (or 0.05 mSv) per yea*r [7][1];

Based on public dose assessments for WL for the most recent five years of normal operation (including anticipated transients), the threshold in *(c)* of 0.05 mSv per year is not exceeded. The calculated effective dose to off-site members of the public (i.e. critical groups) from all radioactive emissions from WL ranged from 0.00004 mSv in 2015 to 0.0014 mSv in 2014.

d) *The potential effective dose to members of an off-site critical group from all radioactive emissions from the site in the event of an accident is estimated to exceed 1×10^{-3} Sv (or 1 mSv) per year* [13];

In the event of a deflagration event inside a standpipe if there were flammable mixtures of gas in the void space of a standpipe and an ignition source, and a pyrophoric fire if there were flammable material and an ignition source this has the potential to result in a

[1] From Annex B 1.6.5 Calculated doses will be compared to the 1 mSv/a public dose limit and the benchmark of 50 uSv/a, which is a trigger for ALARA assessment under CNSC Regulatory Guide G-129

significant airborne release of radioactivity that could result in a dose up to 17 mSv to members of an off-site critical group [14].

e) *There are uncertainties in environmental transfer parameters such that emissions from the site could potentially cause doses exceeding the levels in c) or d); or*

   Emissions from the site are not expected to cause doses exceeding the levels in *(c)* and *(d)*

f) *There are other business reasons, i.e., stakeholder concerns, due diligence, etc.* Stakeholders want assurance that CNL is managing the site in an environmentally responsible manner.

5. SYSTEMATIC INFORMED PLANNING PROCESS

The EMP for WL was developed following a systematic, informed planning process, defined in CSA N288.4-10 [7] as consisting of six iterative steps:

STEP 1: Define the objectives of the EMP (Section 5.1).

STEP 2: Identify the information required to meet the defined objectives (Section 5.2).

STEP 3: Define the boundaries of the EMP (Section 5.3).

STEP 4: Determine how the data collected will be used to achieve the defined objectives (Section 5.4).

STEP 5: Specify performance and acceptance criteria (Section 5.5).

STEP 6: Develop the detailed design of the program that will be implemented to obtain the required data (Section 5.6).

Sections 5.1 to 5.6 provide details on each of these six steps.

The same systematic, informed planning process is applied when making changes to the EMP.

5.1 Step 1: Objectives of the EMP

The objectives of the WL EMP are shared among all of CNL's EMPS and are therefore defined in *Environmental Monitoring Program* [6].

5.2 Step 2: Information Required to Meet the Defined Objectives

In order to identify the information required to meet the defined objectives of the program, a set of monitoring criteria was established and is documented in *Environmental Monitoring Program* [6]. These include criteria that are specific to the environmental media to be monitored, the locations to be monitored, and the parameters to be measured.

Detailed sampling design to address these criteria is described in Sections 5.2.1 to 5.3. Justification is provided, in the context of the criteria, for the locations to monitor, selection of environmental media to sample, and contaminants to monitor for. In addition, further details are provided on the frequency and duration of monitoring based on guidance provided in *Environmental Monitoring Program* [6].

There have been many environmental studies completed in addition to those in the routine monitoring program. This available monitoring information was taken into account in the development of the site's *Comprehensive Study Report* [12], from which its results feed back into the decision making process as to what should be monitored under the routine EMP.

The exercise of identifying information to be obtained was completed both during the initial setup of the program and again over time as the program develops.

5.2.1 Media to be Monitored

The environmental media chosen for monitoring in and around WL include all media that trigger the environmental monitoring criteria.

The environmental media in which radioactive contaminants are measured are those that could contribute to the estimated dose to both human and non-human receptors. The selection of appropriate media is based on an understanding of receptor exposure pathways. A description of the exposure pathways for human receptors living near WL can be found in *Derived Release Limits (DRLs) for AECL's Whiteshell Laboratories* [15] and a description of the exposure pathways for non-human receptors living on or near WL can be found in the CSR [12].

The following principles are considered in the selection of environmental media for pathways monitoring:

- Where practical, monitoring is done near the end of a pathway (i.e. closer to the receptor) to reduce the uncertainties that arise from inaccuracies in the exposure/pathway models and transfer coefficients.
- The fate and distribution of the radionuclides along the pathway linking the source to the receptor are considered when selecting the media to be sampled.
- The mobility of the receptor relative to the area of contamination is considered when selecting the media to be sampled.

The selection of environmental media to be sampled and of contaminants to be measured in each medium also considers the feasibility of sampling the medium, obtaining quantitative results distinguishable from natural background, and obtaining measurements when estimated concentrations have high uncertainty.

A matrix of the relevant environmental media and their relation to the environmental monitoring criteria is summarized in Table 5-1.

5.2.2 Frequency of Monitoring

Subject to the considerations noted in *Environmental Monitoring Program* [6] and N288.4 [7], default monitoring and sample collection frequencies are provided in Table 5-1.

Samples are analyzed at the same frequency as sample collection, except where frequent sub-samples are collected for the purpose of preparing a composite (e.g. drinking water). Concentrations in the environment may vary considerably from point-to-point and day-to-day (due to temperature variations, air and water currents, and other factors). Where variability is high or unknown, a representative sample can be obtained by collecting a composite sample. This sample has a better chance of being closer to the average representative sample than any of the small samples making it up.

Deviations from the default monitoring frequencies are discussed in Section 5.2.2.1 and are justified on a case-by-case basis.

Table 5-1
Criteria and Justification for Monitoring of Environmental Media and Default Frequencies

Environmental Component	Media	Monitoring Frequency	Analysis Frequency[2]	Environmental Media Criteria (q)	(r)	(s)	(t)	(u)	(v)	Justification
Air Quality and Noise	Ambient Air	Continuous measurement by TLDs	Annual change out[3]	×	×	×				(q) Monitoring, and recording of the gamma fields on contact with, and in the immediate vicinity of, each fuelled canister is required by the CCSF FA [26] and SAR [27] documents which are referenced in WL Site Licensing Handbook [4]. Perimeter TLD monitoring is performed as confirmatory monitoring for the CCSF, WMA [14]. Radiation surveys within B100 [25] and B300 [40] are also required. TLD monitoring is also conducted around B100 and B300 Shielded Facilities [43] to confirm background radiation levels. (r) External exposure to, and inhalation of contaminants in ambient air could contribute to the dose to non-human receptors. (s) TLD monitoring in the vicinity of the B200 ALWTC is conducted to monitor the radiation field from the facility. Of particular concern was the MLW storage tank (TK-816) which has been removed. Another area of concern is 7 meters southeast of the ALWTC near active drain line break that occurred in 1980 as stated in the AL [39]. Note: The annual ambient gamma radiation at WL and the surrounding area is monitored by means of thermoluminescent lithium fluoride dosimeters (TLDs).
	Ground Surfaces	Annual Land gamma surveys – must be performed before the first snowfall	Annual	×		×				(q) Contamination could be spread by vehicles that travel between the controlled area and the supervised areas (e.g. WMAs), and by vehicles leaving the WL site. This was described as a potential residual effect in the CSR [12] as per Table 5-2 release of airborne radioactivity. (s) Gamma dose rates are measured annually on and off the WL site. Of particular interest is east side of the AWLTC due to the nature of the activities conducted in the facility and historical spills. Land gamma surveys are also conducted around B100 [44] and B300 Shielded Facilities [43] to confirm background radiation levels. Note: Off-site road monitoring is not used directly in estimating dose to human receptors. It is primarily intended to serve as a gross trend

[2] Monitoring frequencies are in line with Environmental Protection Program requirements from 900-509200-STD-010 [6], unless otherwise indicated within this table, and as outlined in Section 5.2.2.1 of this document.

[3] These TLDs may be changed out more frequently at the request of the Facility Manager, or if there was an unexpected increase in activity indicated in the air effluent data, or failure of the air monitoring equipment.

Environmental Component	Media	Monitoring Frequency	Analysis Frequency[2]	(q)	(r)	(s)	(t)	(u)	(v)	Justification
										indicator since it represents an intermediate step in environmental exposure pathways. The survey is part of the terrestrial monitoring performed to provide verification that there has not been a build-up of radioactivity due to deposition of air emissions from the site. This monitoring serves primarily as a gross trend indicator providing, for example, baseline data for emergency preparedness and response purposes. It also provides an indication of radiation fields that may be emanating from buildings on site where radioactive materials are stored or processed.
	Wet/Dry Deposition	Continuous - Monthly collection	Monthly							Note: Not triggered by any criteria. Monitoring of total wet and dry atmospheric deposits is primarily intended to serve as a gross trend indicator since it represents an intermediate step in environmental exposure pathways. This monitoring serves to verify the predictions made by the DRL model (i.e. groundshine). It also serves as a baseline for emergency preparedness purposes and provides confirmation of the absence of significant quantities of radioactive particulate material in airborne emissions. This monitoring is part of the WL EAFP [8].
	Noise	Noise Monitoring	At time of activity			×				(s) As identified in the CSR [12] as per Table 5-2, noise during periods of demolition and site restoration could impact some sensitive receptors if conducted during times of wildlife breeding, migration or could negatively impact feeding patterns [12]. Work is to be planned such that these noisy activities are only sporadic, short in duration and limited to daytime.
	Airborne Releases			Airborne releases area monitored as part of the Effluent Verification Monitoring Program (EVMP), the details of which are documented in program specific documentation [16].						
Surface Water and Public Health	Winnipeg River Water	Monthly composite of daily samples, except for K-11 which is monthly composite of weekly samples	Monthly	×	×					(q) (shall) Sampling of river water is required as part of the WL EAFP [8] which is WL Site Licence condition 1.8 [3] and referenced in WL Site Licensing Handbook [4]. (r) (shall consider) Immersion in (e.g. swimming, washing, etc.), and ingestion of contaminated river/lake water could potentially contribute to human dose [15]. (o) (may) River water has been identified as a Valued Component to the Sagkeeng Anicinabe [63] and to members of the MMF [64].
	Surface Water Run-off from WMA (Ditch Water)	Periods of Flow[4]		×		×	×			(q) (shall) The WMA Facility Authority [24] document and WMA Safety Analysis [14] document states "Surface drainage water shall be sampled and analysed for activity levels monthly during the months when surface

[4] When ditches have flowing water, usually after a rain event (>5 millimetre of rain in a 24-hour period, preceded by at least 48 hours of no precipitation) or snow melt and not more than weekly unless there is some operational concern that triggers additional sampling.

Environmental Component	Media	Monitoring Frequency	Analysis Frequency[2]	Environmental Media Criteria (q)	(r)	(s)	(t)	(u)	(v)	Justification
			At time of sampling							waters are present and not frozen". These two documents are referenced in the WL Site Licensing Handbook [4]. (s) (should) Ditch water is anticipated to contain contaminants/physical stressors of concern as identified in the CSR [12] as per Table 5-2 and should be included in the EMP. (t) (should) Ditch water in which contaminant BVs have been exceeded or are predicted to be exceeded should be considered for inclusion in the EMP for measurement of those same contaminants CSR [12] as per Table 5-2.
	Dugouts	Annual Measurement	At time of sampling			×				(s) (should) These surface and ground waters have the potential for containing contaminants/physical stressors of concern identified in the CSR [12] as per Table 5-2 (leaks from existing facilities or contamination during remediation) and should be included in the EMP. Landfill dugout water is known to have elevated levels of tritium (not above BVs) [28].
	Misc catch trays, Sumps, Excavations, Manholes	Pre-discharge collection	At time of sampling			×	×			(s) (should) These surface and ground waters have the potential for containing contaminants/physical stressors of concern identified in the CSR [12] as per Table 5-2 (leaks from existing facilities or contamination during remediation) and should be included in the EMP. (t) (should) Any environmental media in which contaminant BVs have been exceeded or are predicted to be exceeded as per Table 5-2 should be considered for inclusion in the EMP for measurement of those same contaminants.
	WMA Catch/Containment Tray for Underground Amine Waste Tank[5]	Monthly (when accessible)	At time of sampling			×	×			(s) (should) The water in the catch/containment tray has the potential for containing contaminants/physical stressors of concern identified in the CSR [12] as per Table 5-2 (leaks around existing facilities) and should be included in the EMP. (t) (should) Any environmental media in which contaminant BVs have been exceeded or are predicted to be exceeded as per Table 5-2 should be considered for inclusion in the EMP for measurement of those same contaminants.
Aquatic Biota[6] and Public Health	Fish[7] (walleye, pike, common sucker and whitefish)	Annual Collection (four to six of each type)	At time of sampling	×	×					(q) (shall) Annual sampling is required as part of the WL EAFP [8] which is WL Site Licence condition 1.8 [3] and referenced in WL Site Licensing Handbook [4]. (r) (shall consider) Ingestion of contaminated fish could contribute to human dose [15]. Although there were no predicted effects to aquatic

[5] At least quarterly monitoring of the high-level liquid waste tank tray is conducted to confirm there is no leakage from the residue remaining in the storage tanks. In the late fall of 2004, the high-level liquid waste had been removed from high-level liquid waste Tank 2 and transferred to the SF for cementation. A heel of waste remains to be removed. High-level liquid waste Tank 1 remains empty [28].

[6] Wild rice has been identified as a Valued Component to the Sagkeeng Anicinabe [63]. CNL is currently investigating the locations of harvesting areas down stream of WL site.

[7] Fish netting activities must be in compliance with the annual permit issued under the Fisheries Act (Manitoba). Report of these activities must also be completed as the conditions listed in the permit.

Environmental Component	Media	Monitoring Frequency	Analysis Frequency[2]	Environmental Media Criteria (q)	(r)	(s)	(t)	(u)	(v)	Justification
										biota identified in the CSR [12], annual sampling continues as part of the WL EAFP [8] to verify that prediction. (o) (may) Fish have been identified as a Valued Component to the Sagkeeng Anicinabe [63] and to members of the MMF [64].
	Winnipeg River Sediment (surface)	Annual Measurement	At time of sampling	×						(q) (shall) Although the contamination in the Winnipeg River sediments was found to present no risk to human or ecological health [12], annual sampling continues as part of the WL EAFP [8] to ensure that no additional impacts to Winnipeg River sediments as a result of decommissioning operations. Implementation of the WL EAFP is listed as WL Site Licence condition 1.8 [3] and referenced in WL Site Licensing Handbook [4].
	Winnipeg River Sediment (depositional zones)	Every twenty years starting (2026)	At time of sampling	×						(q) (shall) Although the contamination in the Winnipeg River sediments was found to present no risk to human or ecological health [12], sampling of depositional areas as part of the WL EAFP [8] is required to ensure that no additional impacts to Winnipeg River sediments as a result of decommissioning operations and to verify the predictions in the CSR.. Implementation of the WL EAFP is WL Site Licence condition 1.8 [3].and referenced in WL Site Licensing Handbook [4]. Note: This frequency is a deviation from 900-509200-STD-010 [6] and follows the frequency defined in WLDP-03704-REPT-007 [36] and EAFP [8] and accepted by the CNSC [37].
	Sediment (Lagoon)	Every five years (starting 1999)	At time of sampling	×						(q) (shall) As part of the WL EAFP [8] " Sewage lagoon Primary and Secondary Discharge pathway soils are required to be collected every five years (starting in 1999)" as per WLDP-03704-ENA-005 [34]. Implementation of the WL EAFP is WL Site Licence condition 1.8 [3].and referenced in WL Site Licensing Handbook [4].
	Sediment (Landfill Dugouts)	Every five years (starting 2007)	At time of sampling	×						(q) (shall) As part of the WL EAFP [8] "monitoring of the dugouts around the landfill should be continued every 5 years to determine if contamination levels have risen significantly. Enhanced monitoring of the Landfill area should be implemented to detect possible contamination of sub-surface drainage". Implementation of the WL EAFP is WL Site Licence condition 1.8 [3].and referenced in WL Site Licensing Handbook [4].
	Game, (Deer, Bear, Grouse, Rabbit) Livestock,	Annual Collection[9]	Analyzed as a sample	×	×					(q) (shall) If environmental monitoring of a media is required by any statute, regulation, licence, or permit that governs the operation of the

[9] Game are obtained by CNL staff through roadkills and/or from local trappers. Animal collection activities must be in compliance with the permit issued under the Wildlife Act. Reporting of these activities must also be completed as per the conditions listed in the permit. Species (normally deer, moose, bear, grouse or rabbit) sex and age should be report to the WL Environmental Specialist along with the radioactivity in Bq/kg, fresh weight for flesh (and bone - for deer/moose). Livestock are obtained by EnvP staff from local farmers/farmer's markets.

Environmental Component	Media	Monitoring Frequency	Analysis Frequency[2]	(q)	(r)	(s)	(t)	(u)	(v)	Justification
Terrestrial Biota and Human Health	(Beef/Pork/Lamb/Poultry)[8], Honey		set annually							nuclear facility, or otherwise directed by a regulator, then that media shall be included in the EMP. Annual sampling is required as part of the WL EAFP [8]. Implementation of the WL EAFP is WL Site Licence condition 1.8 [3].and referenced in WL Site Licensing Handbook [4]. (r) (shall consider) Ingestion of contaminated game, beef, pork, poultry, eggs and/or honey could contribute to human dose [15]. Milk was analyzed for radioactivity in 2017 [46] and all parameters were at background levels. This media has been removed from the program. Although there were no predicted effects to terrestrial biota identified in the CSR [12], annual collection continues as part of the WL EAFP [8] to verify that prediction. (o) (may) Game and honey have been identified as Valued Components to the Sagkeeng Anicinabe [63] and to members of the MMF [64].
	Native Vegetation (mixed grasses, weeds and clover)	Annual Measurement	At time of sampling	×		×	×			(q) (shall) The WMA Facility Authority [24] document and WMA Safety Analysis [14] document states "Samples of vegetation shall be collected annually and analysed for any changes in activity from normal background levels." These documents are referenced in the WL Site Licensing Handbook [4]. (s) (should) Although no residual effects are expected, deer consumption of vegetation in and around the WMA is a concern identified in the CSR [12] and this monitoring should be included in the EMP to verify no effect. (t) (should) Native vegetation within the WMA is known to have contaminants that exceed, or are predicted to exceed, BVs and should be considered for inclusion in the EMP for measurement of those same contaminants [46].
	Garden Vegetables (fruit (including berries), root, leafy (include mushrooms)) and Canola	Annual Measurement	At time of sampling	×	×					(q) (shall) Although, no residual effects were identified for terrestrial biota, annual sampling is required as part of the WL EAFP [8] to confirm effects predictions. Implementation of the WL EAFP is WL Site Licence condition 1.8 [3].and referenced in WL Site Licensing Handbook [4]. (r) (shall consider) Ingestion of contaminated vegetables or crops could contribute to human dose [15]. (o) mushrooms and berries have been identified as a Valued Components to the Sagkeeng Anicinabe [63] and to members of the MMF [64].
Soil (Geology)	Soil – WMA	Annual and periodic measurements	At time of sampling	×		×	×			(q) (shall) Impacted areas shall be characterized and remediated to clearance levels as per the WL EAFP.[8], and in accordance with the WL Closure Land-Use and End-State criteria [33]. The frequency of sampling

[8] Monitoring of milk was conducted in 2017 [46] and there is no indication of impact. This monitoring would be initiated if beef results indicate uptake. Eggs have not been monitored but would be if the results from poultry meat indicate uptake.

Environmental Component	Media	Monitoring Frequency	Analysis Frequency[2]	Environmental Media Criteria (q)	(r)	(s)	(t)	(u)	(v)	Justification
										and parameters to be tested for are included in this plan and also detailed in WLDP-03704-ENA-005 [34]. Implementation of the WL EAFP is WL Site Licence condition 1.8 [3].and referenced in WL Site Licensing Handbook [4]. (s),(t) (should) Soil within the WMA is known to have contaminants [46] that exceed, or are predicted to exceed, BVs and should be considered for inclusion in the EMP for measurement of those same contaminants.
	Soil – Lagoon Discharge path	Every five years (starting 1999)	At time of sampling	x						(q) (shall) Impacted areas shall be characterized and remediated to clearance levels as per the WL EAFP.[8], and in accordance with the WL Closure Land-Use and End-State criteria [33] and as per WLDP-03704-ENA-005 [34]. Implementation of the WL EAFP is WL Site Licence condition 1.8 [3].and referenced in WL Site Licensing Handbook [4].
	Soil – Main Campus	Continuous, as impacted areas are identified and remediated and pre-clearance	At time of sampling	x						(q) (shall) Impacted areas shall be characterized and remediated to clearance levels as per the WL EAFP.[8], and in accordance with the WL Closure Land-Use and End-State criteria [33]. Implementation of the WL EAFP is WL Site Licence condition 1.8 [3].and referenced in WL Site Licensing Handbook [4].
Groundwater	Groundwater is monitored as part of the Groundwater Monitoring Program (GWMP), the details of which are documented in program specific documentation [35].									

Criteria:

(q) (shall) If environmental monitoring of specific media is required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or otherwise directed by a regulator, then that media shall be included in the EMP..

(r) (shall consider) Any environmental media that could contribute to the dose/exposure of a receptor that is anticipated to experience an effect shall be considered for inclusion in the EMP.

(s) (should) Any environmental media for which contaminants/physical stressors of concern were identified in an ERA (or equivalent) should be included in the EMP.

(t) (should) Any environmental media in which contaminant benchmark concentrations have been exceeded or are predicted to be exceeded should be considered for inclusion in the EMP for measurement of those same contaminants.

(u) (should) Selection of the environmental media to be monitored should be based on the following principles:

- i) Where practical, monitoring should be done near the end of a pathway (i.e., closer to the receptor) to give dose/exposure estimates with fewer uncertainties that arise from inaccuracies in the models and transfer coefficients;
- ii) The fate and distribution of contaminants along the pathway linking the source to the receptor should be considered when selecting the media to be sampled; and
- iii) The mobility of the receptor relative to the area of contamination should be considered when selecting the media to be sampled.

(v) (should) Final selection of environmental media to be sampled and of contaminants to be measured in each medium should consider the feasibility of

- i) Sampling the medium;
- ii) Obtaining quantitative results distinguishable from background; and
- iii) Obtaining measurements when estimated concentrations have high uncertainty.

(o) (may) The choice of contaminants to monitor in the environment may also be based on the following:

- iv) There are other business reasons, i.e. stakeholder concerns, due diligence, etc.

5.2.2.1 Deviation from the default monitoring frequency

In certain circumstances, the EMP deviates from the default monitoring frequencies provided in Table 5-1.

When setting the sample collection frequency, a reduced frequency is considered in cases where:

- expected temporal variability in concentrations and/or conditions is low;
- capital and operating costs are high;
- the default frequency may lead to significant losses or uncertainties;
- the half-life of the radionuclide(s) being monitored is much longer than the default monitoring or sample collection frequency;
- concentrations of the radionuclide(s) being monitored are very low (at or near detection levels); and
- the likelihood of concentrations approaching or exceeding a BV is negligible.

When setting the sample collection frequency, an increased frequency is considered in cases where:

- there is high variability in releases at the source;
- expected temporal variability in concentrations and/or conditions is high (more variable quality may require more frequent sampling to obtain sufficiently precise estimates of contaminants);
- capital and operating costs are low;
- the half-life of the radionuclide(s) being monitored is much less than the default monitoring or sample collection frequency – collection frequency should not normally exceed two half-lives in such cases; and
- concentrations of the radionuclide(s) being monitored are very high (at or near BVs) and the likelihood of concentrations approaching or exceeding a BV is high.

When setting the analysis frequency, a reduced frequency (i.e. less than the sample collection frequency) is considered in cases where:

- analysis costs are large relative to sampling costs;
- analysis is labour/time intensive; and
- the objective is to estimate the mean of a population. (Note: Composite samples can produce equally precise or more precise estimates, compared to non-composite samples, with fewer analyses.)

5.2.3 Duration of Monitoring

The routine monitoring outlined in this Plan is intended to continue indefinitely unless a change is justified. The process for making modifications to the EMP is described in Section 6.

5.2.4 Sampling and analysis

The collection of environmental samples is conducted by the WL Environmental Management field team. The analysis of the environmental thermoluminescent dosimeters (TLDs) is conducted by Dosimetry Services. Analysis of all other environmental samples is conducted by, or sent to a Contract Lab by, Environmental Management staff. Detailed sampling and analysis methods are described in laboratory specific procedures per [49]. Specific analysis methods used for each parameter are given in Table 5-12.

The Environmental Management group conducts frequent internal checks of their technical capabilities as they perform their measurements. This is discussed further in Section 5.5.

5.2.5 Locations to be Monitored

Locations on the site which are in need of monitoring were determined by reviewing potential areas with the *Need for Monitoring Criteria – Location* as outlined in the *Environmental Monitoring Program* procedure [6]. The rationale used in the selection of locations to be monitored in the EMP is discussed below, and a matrix of the monitoring locations and their relation to the environmental monitoring criteria is presented in Table 5-3.

Areas identified in the Environmental Assessment (EA)

The locations monitored in the EMP represent the areas in which contaminants of concern were identified in the CSR [12] for WL. The CSR (WL EA) describes the stressors and possible residual effects arising from WL decommissioning and summarized in Table 5-2. The CSR further defines the areas subject to those stressors and possible effects, and identifies the receptors (both human and non-human) potentially affected. The stressors of potential concern that were identified, and the areas and receptors potentially affected are summarized below:

- Surface water contamination in the Project Study Area and potential migration to the Winnipeg River from the WMA, buried services and affected lands.
- Potential for groundwater contaminant migration to the Winnipeg River from the WMA, sewage lagoons and the inactive landfill.
- Winnipeg River and selected fish species (Sturgeon, Walleye, Pike and Mooneye).
- Winnipeg River Shoreline and Gullies and Ravines on site.
- Deer and moose - the risk is that these may graze in areas affected by groundwater contamination.
- Coniferous Forest on site.

- Loss of archaeological sites in the region.
- Noise
- During Decommissioning and Institutional Control period, the use of some lands will be restricted.

Table 5-2
Summary of Residual Effects from WL Decommissioning Activities

Category	Description of Residual Effect	Potential Spatial Effect	Facility/Source
Air Quality and Noise	Release of airborne radioactive particulates during disconnecting of services, decontamination retrieval and repackaging of materials and remediation	On-site	ALWTC, WR-1, B300, Decontamination Centre, B402 WMA, Buried Services, Affected Lands, North Ditch, River Sediments
	Release of airborne radioactive particulates during demolition of canisters	On-site	Concrete Canisters
	Nuisance dust and fine particulates from building demolition, and site restoration and rehabilitation	On-site	All Building Demolition
	Production of methane gases from landfill	On-site	Inactive Landfill
	Noise during demolition and site restoration	On-site	All Building Demolition
Surface Water (hydrology)	Surface water contamination associated with migration of decontamination process water, the removal of drains and other buried services and remediation	Off-site Winnipeg River	Buried Services, WMA, Affected Lands, North Ditch
	Discharge of treated water flows into Winnipeg River (active and inactive)	Off-site Winnipeg River	ALWTC, Sewage Lagoon
	Leaks into surface water from in-situ trenches	Off-site Winnipeg River	WMA
Soil and Groundwater (geology and hydrology)	Soil and Groundwater contamination during operations	Off-site Winnipeg River	WMA, Sewage Lagoons
	Contamination from leaks around existing facilities or contamination during remediation	Off-site Winnipeg River	Off-site Contaminated Lands, Sewage Lagoons, Buried Services, Affected Lands, North Ditch
	Leachate from in-situ trenches	Off-site Winnipeg River	WMA
	Leachate from remediated facilities	Off-site Winnipeg River	Inactive Landfill
Terrestrial Biota	No residual effects identified		
Aquatic Biota	No residual effects identified		
Worker Health and Safety	No residual effects identified		
Socio-economics	No residual effects identified		

Category	Description of Residual Effect	Potential Spatial Effect	Facility/Source
Public Health	No residual effects identified		
Physical and Cultural Heritage	Potential to disrupt traditional uses of the Winnipeg River	Off-site Winnipeg River Shoreline	Shoreline
Land and Resource Use	Land-use restriction associated with in-situ disposal of radioactive waste	On-site	WMA
	Land-use restrictions associated with in-situ disposal of non-radioactive waste	On-site	Inactive Landfill
Archaeology	Artifact loss during excavation near shorelines of the Winnipeg River	On-site Shoreline	Sewage Lagoon, Outfall shoreline
Aboriginal Interests	General interest in the project especially as it affects the Winnipeg River. Artifact loss during excavations near the shores of the Winnipeg River	On-site shoreline	Sewage Lagoon, Outfall shoreline

Monitoring near critical groups

A large portion of the off-site locations monitored in the EMP are representative of WL's critical groups. As part of the DRL calculations, doses were modelled for a number of potential critical groups (Figure 3-1) selected based on lifestyle and proximity to WL. Monitoring is done near all potential critical groups, with the focus being on the critical groups that are likely to receive the highest radiation doses as a result of WL operations.

While human exposures (i.e. doses to WL critical groups) do not approach regulatory dose limits, routine monitoring near critical group locations is required in order to meet the regulatory requirement for an annual public dose assessment. It also contributes to identification of the most-exposed group(s) and important exposure pathways, to ensure that these receptors and pathways are considered in calculating DRLs for WL according to CSA N288.1 [17] and Candu Owner's Group (COG) [18] guidance.

For the critical groups that are subject to annual dose assessments, it is necessary to measure radioactive contaminant concentrations in environmental media along applicable/critical exposure pathways. Not all environmental media identified in Table 5-1 represent exposure pathways to each critical group. The decision to monitor specific media are based on the environmental pathways models for WL described in *Derived Release Limits (DRLs) for AECL's Whiteshell Laboratories* [15], and the results of historic effluent and environmental monitoring.

Monitoring in nearby population centres

In cases where there is public concern regarding emissions, monitoring is established in nearby population centres other than locations of identified or potential critical groups, or identified in the CSR (WL EA) [12] and Sagkeeng Land Use and Occupancy Study [63] (Figure A-13).

Benchmark value exceedances

Certain on-site locations are included in the EMP because BVs have been exceeded or are predicted to be exceeded there. The surface water BVs for WL are listed in Table 5-11.

In order to identify locations where surface water BVs are predicted to be exceeded (e.g. WMA ditches) for the purpose of Table 5-3, surface water concentrations at all monitored locations (with the exception of those locations that have already been found to exceed the BVs) were compared to the BVs for WL Table 5-11. However, it is used as a conservative means to indicate where there is the potential for a BV to be exceeded.

Verifying the effectiveness of containment and effluent controls

Monitoring of surface water, ambient air, direct radiation, and deposition serves to verify the effectiveness of containment and effluent controls. Where monitoring is being done for this purpose, the basic design aspects of the monitoring locations (i.e. specific monitoring location, parameter(s) to be monitored, and the frequency of monitoring) take into consideration several principles, as described below;

Surface Water

Monitoring of surface water at locations downgradient of, and within reasonable proximity to, points of groundwater discharge are included in the EMP. Monitoring at these locations is intended to provide feedback to the Groundwater Monitoring Program (GWMP). The evaluation of the groundwater results together with the surface water results is done at the GWMP's annual Environmental Performance Review, and as part of the annual EMP Report. Locations that fall under this category include the WMA ditch locations and water that accumulates in excavations within the WMA as shown in Figures A-6 and A-7. Surface hydrology is taken into consideration in the selection of monitoring locations. There is only one main drainage basin identified for WL, the WL WMA Drainage Basin (Figure A-10).

Monitoring to evaluate the environmental performance of specific facilities that contain significant quantities of hazardous materials in dispersible form (i.e. monitoring for leak detection), where releases could escape detection by other monitoring means (e.g. facility-specific monitoring, groundwater monitoring), is included in the EMP where needed. Monitoring to meet this purpose is done in locations within reasonable proximity to the points of discharge and in the likely path of the discharges. Locations that fall under this category include WMA ditch locations, water that accumulates in sumps, excavations, Landfill dugouts and manholes. Figure A-12 shows the WL Site Conceptual Model indicating the Contaminant Transport from WL Waste Management Area, Landfill, Lagoon and Main Campus Affected Areas to the Winnipeg River.

Wet and dry deposition

Monitoring to verify wet and dry deposition rates and direct radiation resulting from WL airborne releases is achieved through a network of monitors (ARMS) located at the site boundary, and at strategic off-site locations. Monitoring locations established for this purpose, in most cases, are selected to be within the main upriver and downriver windrose sectors.

Direct radiation

Where monitoring of direct radiation (e.g., TLDs) is being undertaken in areas affected by airborne effluents from the WL site, monitoring at locations within reasonable proximity to the site and in the prevailing wind direction are included in the EMP. Monitoring at these locations is intended to provide feedback to the Effluent Verification Monitoring Program. Locations that fall under this category include: Controlled Area Fence, WMA Perimeter Fence, and Canister Area Perimeter Fence, and Land Gamma Survey of Roads.

Reference areas

In addition to the locations mentioned above, areas with similar environmental conditions but without the potential for facility-related effects are included in the EMP as reference locations to provide information on “normal” variations in natural background radiation and are included in Table 5-3.

Table 5-3
Need for Monitoring of Locations

Criteria Identification [6]		Need for Monitoring Criteria - Location [6]									Justification
		(a)	(b)	(c)	(d)	(e)	(f)	(g)	(h)	(i)	
Monitoring Location (emLine Code)	Comment										
Air Quality and Noise											
	Ambient Air										
On-site (Main Campus) TLDs (see Figure A-1): The annual ambient gamma radiation at WL and the surrounding area is monitored by means of thermoluminescent lithium fluoride dosimeters (TLDs). Six of these locations, labelled ARMS, have been monitored since 1966. The locations of the ARMS are indicated on Figure A-2. Five of the ARMS stations are situated within 4 km of the Building 100 stack and are arranged according to the prevailing wind direction. The sixth is located near Pinawa, about 11 km to the east-southeast. Starting in 1986, twelve TLD packages were mounted at various locations along the fence enclosing the WL site active area. Another series of twelve TLD packages were installed in 1987 along the WMA fence (see Figure A-3), and in 1994 a series of ten were installed along the Canister Area fence (see Figure A-4). The TLD package system (4 TLDs per package) was changed to a TLD holder assembly system (two TLDs per badge) in 2017.											
(a) Controlled (Active) Area Fence											(f) (should) TLD monitoring in the vicinity of the B200 ALWTC is conducted to monitor the radiation field from the facility. Of particular concern was the MLW storage tank (TK-816) which has been removed. Another area of concern is 7 meters southeast of the ALWTC near active drain line break that occurred in 1980 as stated in the AL [39]. Radiation surveys within B100 [25] and B300 [40] are also required. TLD monitoring is also conducted around B100 and B300 Shielded Facilities [43] to confirm background radiation levels.

Criteria from 900-509200-STD-010 [6]:

(a) (shall) If environmental monitoring of a location is required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or otherwise directed by a regulator, then that location shall be included in the EMP.

(b) (shall) If a location is representative of a site's identified critical group(s), then this location shall be included in the EMP.

(c) (should) If a location represents an area in which contaminants of concern, physical stressors of concern, or potential effects were identified in an ERA (or equivalent), then this location should be included in the EMP.

(d) (should) Any locations in which contaminant BVs have been exceeded or are predicted to be exceeded should be included in the EMP.

(e) (may) If a gradient in contaminant concentration is expected over a spatial extent, monitoring locations may be distributed along the gradient.

(f) (should) If environmental monitoring is being done to verify the effectiveness of containment and effluent controls, then monitoring should be in locations within reasonable proximity to the points of discharge and in the likely path of the discharges.

(g) (should) If environmental monitoring at a location is triggered by the MISA Protocol [1], then this location should be included in the EMP.

(h) (should) In addition to the locations mentioned above, locations with similar environmental conditions but without potential for facility-related effects (i.e. representative of natural background) should be included in the EMP as reference areas.

(i) (should) Consideration should be given to establishing monitoring locations in nearby population centres (other than locations of identified or potential critical groups or identified in the ERA) for the most dominant contaminants and environmental pathways where there is public concern regarding emissions.

5.2.6 Parameters to be monitored

5.2.6.1 Chemical Parameter, Physical Stressor or Effect to be Monitored

In order to determine which physical stressors and/or parameters require monitoring under the non-radioactive EMP, another set of *Need for Monitoring Criteria (Need for Monitoring Criteria – Parameter)* has been developed as outlined in *Environmental Monitoring Program* [6] and is applied to those locations determined to require monitoring.

These criteria were applied to those locations requiring monitoring (see Table 5-3). The results of this review are summarized in Table 5-5 and Table 5-6. Further details pertaining to the reasoning for this monitoring including historical changes in this monitoring are outlined in the *WL Effluent Verification Monitoring Plan* [16] and non-radiological monitoring of groundwater, soils was introduced in 2008 based on a review of the site reference hazard information and on-site effluent data.

5.2.6.2 Radionuclides

The radionuclides chosen for monitoring in and around WL include all those that trigger the environmental monitoring criteria. The rationale used in the selection of radionuclides to be monitored in the EMP is discussed below, and a matrix of the monitored parameters and their relation to the environmental monitoring criteria are presented in Table 5-5.

Fate of radionuclides in the environment

Certain conditions have to be present in order for radioactivity to accumulate to measurable levels in the environment. The radioisotope must be released in significant quantity from WL and must be capable of being efficiently transported through the environment. Also, the radioisotope must have a sufficiently long half-life to allow time for environmental transport, sample collection, sample processing and counting. These factors are considered in the selection of radionuclides for inclusion in the EMP, as well as in the selection of the monitoring (i.e. sample collection and analysis) frequency.

Significant dose contributors

There is no regulatory requirement to monitor the concentration of specific radionuclides in the environment. Also, radionuclides are only important contaminants as defined in CSA N288.4 [7] if they contribute a dose of 10% or more of the relevant dose benchmark to members of the public i.e. 1 mSv per year. They were deemed important for the EMP because of a regulatory requirement to report the potential dose to the public from WL operations. To this end, the radionuclides selected for monitoring include those estimated to contribute 1% or more of total radiation dose to a critical group, based on the results of historical monitoring and dose assessments for the WL site (Table 5-4). These doses are associated with water ingestion (Cs-137 and Sr-90), meat and fish ingestion (Cs-137), and for 2013, vegetable ingestion (Sr-90).

Table 5-4
Dose Contribution by Radionuclide for the WL Site

Parameter	2013		2014		2015		2016		2017	
	Adult	Infant	Adult	Infant	Adult	Infant	Adult	Infant	Adult	Infant
Cs-137	4%	3%	99%	85%	100%	100%	90%	85%	100%	100%
Sr-90	96%	97%	1%	15%	0%	0%	10%	15%	0%	0%

Parameters identified in the Environmental Risk Assessment

The radionuclides selected for monitoring in the EMP include those that have the potential to produce effects in the receiving environment. Tritium, carbon-14, cesium-137 and strontium-90 in surface waters in the WL WMA were identified as contaminants of potential concern in the CSR [12].

Parameters relevant to dose/exposure assessments

As part of the CSR, dose assessments were performed for Winnipeg River sediments and contaminant migration from the trenches in the WMA where contaminants of potential ecological concern (COPEC) were identified during the preliminary screening evaluation. These dose assessments considered the total dose from all radionuclides present at any given location, not only the dose from radionuclides identified as COPECs. This information was used to determine that the contaminated river sediments could be left in-situ and that remediation of at least four trenches within the WMA would be required. On-going monitoring of the Winnipeg River sediments and on-going monitoring of the surface waters around the WMA is required.

Verifying the effectiveness of containment and effluent controls

At locations where environmental monitoring is being done to verify the effectiveness of containment and effluent controls, monitoring is for radionuclides that could potentially be present in effluent discharges. These radionuclides were identified using various sources of information, including:

- The results of other environmental monitoring activities (e.g. routine effluent and groundwater monitoring, non-routine monitoring including special investigations, etc.);
- A review of radionuclide inventories and usage on site;
- Process knowledge derived from historical assessment, waste records and staff knowledge; and
- The Significant Environmental Aspects (SEA) database for WL.

Where there is limited knowledge of contaminants of potential concern, a wide array of parameters are targeted, and as monitoring data become available the suite of parameters can be reduced as appropriate. Guidelines for the reduction of monitoring are given in Section 6.2.

Table 5-5
Criteria and Justification for Monitoring of Parameters

Environmental Media/Location	Criteria for Parameters to be Monitored							Justification
	(j)	(k)	(l)	(m)	(n)	(o)	(p)	
Air Quality								
Wet/Dry Deposition								
Gross Alpha						×		(o) Measurement of radioactivity serves to support atmospheric dispersion models, confirm the absence of effects (i.e. due diligence), and provide information during an emergency. Air inhalation is a dominant dose pathway for alpha emitters. Alpha activity measurement in deposition samples can be used to confirm that absence of effect [15].
Gross Beta						×		
Gamma Emitters[13]						×		
Surface Water[14]								
Winnipeg River (up and down stream)[15]								
Tritium		×	×			×	×	(k) (shall) The concentration of a contaminant as there is the potential for the contaminant or physical stressor to produce effects in the receiving environment [12] (Section 7). (l) (should) Water ingestion is a relevant pathway for exposure to these radionuclides (tritium, Sr-90, Cs-137 (gamma/gross beta), Am-241 (gamma/gross alpha)) for critical groups that get their drinking water from the river [15]. (o) (may) Measurement of radioactivity serves to support atmospheric dispersion models, confirm the absence of effects (i.e. due diligence), and provide information during an emergency. Water ingestion of HTO, Tc-99 (gross beta) and Np-237 (gross alpha) from air effluent releases is a relevant dose pathway for these isotopes [15]. (p) (should) Parameter is released to the Winnipeg River in measurable quantities from effluent streams at WL. Monitoring is to verify the effectiveness of containment and effluent controls for WL facilities and WMAs [28].
Gross alpha		×	×			×	×	
Gross beta		×	×			×	×	
Strontium-90		×	×			×	×	
Gamma emitters		×	×			×	×	
Uranium		×	×			×	×	
Run-off from WMA (Ditch Water)[16]								
Tritium	×	×					×	(j) (shall) These parameter values are required for the WMA [14] and CCSF [27] annual safety reports.
Gross alpha	×	×					×	
Gross beta	×	×					×	

[13] Gamma radionuclides of interest include Am-241, Ce-144, Co-60, Cs-134, Cs-137 (Ba-137md), Eu-152, Eu-154, I-129, Mn-54, Nb-94, Sb-125 (Te-125md), U-235 (Th-231d), Zn-65, Pb-210, K-40, Bi-212, Pb-212, Bi-214, Pb-214, Ra-226, Th-227, Ac-228, Pa-233, Pa-234m, Th-235.

[14] The outfall effluent was reviewed and it was determined [41] that there was no need to expand the Environmental Monitoring program to include non-radiological analysis of Winnipeg River water.

[15] Isotopic Plutonium analysis and C-14 analysis are not required as C-14 is below detection limits from the OFS and plutonium is near detection levels.

[16] Ditch water will be assessed for C-14 in the 2019 field season.

Environmental Media/Location	Criteria for Parameters to be Monitored							Justification
	(j)	(k)	(l)	(m)	(n)	(o)	(p)	
								(k) (shall) There is the potential for the contaminant or physical stressor to produce effects in the receiving environment. Ditch water contains contaminants that or are predicted to exceed BVs as per WL CSR Table 5-2 from [12]. p) (should) This monitoring is being done to verify the effectiveness of containment and effluent controls, and these contaminants could potentially be present in effluent discharges.
Uranium						×		(o) (may) (iv) Crushed granite from the URL was used as base material for the construction island at the north end of the WMA and also at the south side of the WMA road near the new WMA complex. Uranium added to the parameter list as a result [28].
Gamma Emitters[17]							×	(p) (should) This monitoring is being done to verify the effectiveness of containment and effluent controls, and these contaminants could potentially be present in effluent discharges as per WL CSR Table 5-2 from [12].
Carbon-14						×		(o) (may) Measurement of radioactivity serves to confirm the absence of effects (i.e. due diligence). For Terrestrial Animals, exposure to C-14 is a relevant pathway for animals that drink water from ditches/river [15].

[17] Gamma radionuclides of interest include Am-241, Ce-144, Co-60, Cs-134, Cs-137 (Ba-137md), Eu-152, Eu-154, I-129, Mn-54, Nb-94, Sb-125 (Te-125md), U-235 (Th-231d), Zn-65, Pb-210, K-40, Bi-212, Pb-212, Bi-214, Pb-214, Ra-226, Th-227, Ac-228, Pa-233, Pa-234m, Th-235.

Environmental Media/Location	Criteria for Parameters to be Monitored							Justification
	(j)	(k)	(l)	(m)	(n)	(o)	(p)	
Strontium-90, and other possible isotopes or parameters						×		(o) (may) The results for the parameters above are evaluated using the following screening criteria. The beta emitter with the most restrictive MAC in the potential contaminants of concern for WL is Sr-90 (MAC 5 Bq/L). WL EnvP assume Sr-90 is in equilibrium with Y-90 so a screening criteria of 10 Bq/L is used for gross beta. If the sample result is above 10 Bq/L the samples are submitted for Sr-90 analysis (to confirm the theory). Gamma spec analysis provides individual results for (Co-60, Nb-94, Sb-125, Cs-134, Cs-137(Ba-137m), Pm-147, and Am-241). If all of the gross beta is accounted for then the effort is complete. If not, WL staff evaluate the data against the most restrictive isotope not already detected and assume that is what it is (most likely Tc-99). If the value is above the MAC for Tc-99 (200 Bq/L) WL staff confirm that it is present. If it is not that particular isotope staff continue the search (Cl-36, Ni-63, etc). The alpha emitter with the most restrictive MAC and likely to be present is uranium (0.5 Bq/L/20 ppb). Since the groundwater in the WL area contains natural uranium (~2 to 200 ppb) it is the most likely alpha present. The rock surrounding the WL site is slightly enriched in uranium and its decay products including Ra-226. We also know that if uranium is present, then the progeny of uranium can contribute to the alpha and beta activity (0.025 to 0.045 Bq/ppb gross alpha and 0.016 to 0.035 Bq/ppb gross beta, there is higher contributions if the samples is counted right after collection versus one week later). If uranium (and uranium progeny) does not account for the alpha activity (1 ppb uranium is ~ 0.025 Bq/L gross alpha) present staff would review the gamma spec analysis to see if Am-241 is present as it is an indicator of the presence of plutonium isotopes. If the value is above the MAC for Am-241 and/or plutonium, the samples are sent for plutonium analysis. If the value is still above the MAC for that isotope staff would continue the search. Additional analyses (metals, VOCs, SVOCs) if required.
Surface Water – Landfill Dugouts								
Gross alpha						×	×	(o) (may) The choice of contaminants to monitor in the environment was based on the following: (i) The level of risk from an unintended release of contaminants from a facility is unknown and potential of concern as per WL CSR Table 5-2 from [12]. (p) (should) This monitoring is being done to verify the effectiveness of containment and effluent controls, and these contaminants could potentially be present in effluent discharges as per WL CSR Table 5-2 from [12].
Gross beta[18]						×	×	
Gamma Emitters[19]						×	×	
Strontium-90						×	×	
Tritium						×	×	
Uranium (part of total metals)						×	×	
Non-rad parameters listed in see Table 5-6						×	×	
Surface Water – from B417 Tank catch/containment tray (WMT)								

[18] A preliminary investigation for Tc-99 and Sr-90 in the landfill dugouts was conducted in 2018 and the results were inconclusive (WL-EM-2019-005 [42]). Additional sampling will take place in 2019 during a wet period and/or after a few days of heavy rainfall.

[19] Gamma radionuclides of interest include Am-241, Ce-144, Co-60, Cs-134, Cs-137 (Ba-137md), Eu-152, Eu-154, I-129, Mn-54, Nb-94, Sb-125 (Te-125md), U-235 (Th-231d), Zn-65, Pb-210, K-40, Bi-212, Pb-212, Bi-214, Pb-214, Ra-226, Th-227, Ac-228, Pa-233, Pa-234m, Th-235.

Environmental Media/Location	Criteria for Parameters to be Monitored							Justification
	(j)	(k)	(l)	(m)	(n)	(o)	(p)	
Gross alpha	×						×	(j) (shall) These parameter values are required by the WMA Facility Authority [24] document states *"Those storage structures for solid wastes that incorporate sumps for in-leakage collection shall be monitored annually, and any accumulated water shall be removed and treated, if required*." The WMA Safety Analysis [14] has a similar statement indicating that sampling of this water is performed. (p) (should) This monitoring is performed to verify the effectiveness of containment of the B417 tank. Cesium-137 is detected in the catch/containment tray. Residual gross beta is assumed to be Sr-90/Y-90.
Gross beta	×						×	
Gamma Emitters[19]	×						×	
Surface Water – from SMAGs Sump, SSC Sump, SSC Standing Water, WMA Misc Sumps and WMA standing water (excavations)								
Gross alpha	×					×	×	(j) (shall) These parameter values are required by the WMA Facility Authority [24] document states *"Those storage structures for solid wastes that incorporate sumps for in-leakage collection shall be monitored annually, and any accumulated water shall be removed and treated, if required*." The WMA Safety Analysis [14] has a similar statement indicating that sampling of this water is performed. (o) This monitoring is performed to determine the appropriate disposition pathway for the water. Gross beta is assumed to be Sr-90/Y-90. (p) (should) This monitoring is performed to verify the effectiveness of containment of the WMA storage structures as per WL CSR Table 5-2 from [12].
Gross beta	×					×	×	
Gamma Emitters[19]	×					×	×	
Tritium	×					×	×	
pH	×					×	×	
Visual Inspection for film, sheen or discolouration, deleterious substances	×					×	×	
Surface Water – from Manholes and Excavations on WL Main Campus and Outer Areas								
Gross alpha		×				×	×	(k) (shall) As per Table 5-2, the potential effect of *"surface water contamination associated with migration of contamination from the removal of drains and other buried services and remediation"*. These parameters would are potentially present. Gross beta is assumed to be Sr-90/Y-90. (o) (may) This monitoring is performed to determine the appropriate disposition pathway for the water [9]. (p) (should) This monitoring is performed to verify the effectiveness of containment of the active drain lines as per WL CSR Table 5-2 from [12].
Gross beta		×				×	×	
Gamma Emitters[19]		×				×	×	
pH		×				×	×

Surface Water – from Primary Cell of the Sewage Lagoon								
Gross alpha						×	×	(o) (may) This monitoring is performed to determine the appropriate disposition pathway for the water [9]. (p) (should) This monitoring is performed to verify the effectiveness of operational controls in place to prevent contaminants from being dumped down the domestic drains [9]. Gross beta is assumed to be Sr-90/Y-90.
Gross beta						×	×	
Gamma Emitters[21]						×	×	
Aquatic Biota and Public Health								
Fish (up and down stream - walleye (pickerel), pike, common sucker, and whitefish)[20]								
Gross beta			×			×		

[20] Gross alpha analysis is not performed on fish, the dominant dose pathway is gross beta/gamma emitters.

Environmental Media/Location	Criteria for Parameters to be Monitored							Justification
	(j)	(k)	(l)	(m)	(n)	(o)	(p)	
Gamma Emitters[21]			×			×		(l) (should) Fish ingestion is a relevant pathway for exposure to these radionuclides (Zn-65, Cs-134, Cs-137 (gamma/gross beta) for critical groups that consume fish from the Winnipeg River [15]. (o) (may) The choice of contaminants to monitor in the environment may also be based on the following: iv) There are other business reasons, i.e. stakeholder concerns, due diligence, etc [8].
mass	×							(j) shall be measured if required by Annual Fish Permit.
length	×							(j) shall be measured if required by Annual Fish Permit.
Number of each species	×							(j) shall be measured if required by Annual Fish Permit.
Sediment (surface)								
Gross alpha	×					×	×	(j) (shall) Although the contamination in the Winnipeg River sediments was found to present no risk to human or ecological health [12], annual sampling continues as part of the WL EAFP [8] to ensure that no additional impacts to Winnipeg River sediments as a result of decommissioning operations. These parameters are in the effluent from the site and could be present in the sediment. (o) (may) The choice of contaminants to monitor in the environment may also be based on the following: iv) There are other business reasons, i.e. stakeholder concerns, due diligence, etc. (p) (should) This monitoring is being done to verify the effectiveness of containment and effluent controls, and these contaminants could potentially be present in effluent discharges as per WL CSR Table 5-2 from [12].
Gross beta	×					×	×	
Gamma Emitters	×					×	×	
Strontium-90							×	(p) (should) If environmental monitoring is being done to verify the effectiveness of containment and effluent controls, then monitoring should be for those contaminants that could potentially be present in effluent discharges. Strontium-90 included based on current and past liquid effluent. Composite sample for each sampling site [46].
Sediment (depositional cores)								
Gross alpha	×							(j) (shall) If concentration of a contaminant is required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or otherwise directed by a regulator, then that location shall be included in the EMP. Although the contamination in the Winnipeg River sediments was found to present no risk to human or ecological health [12], sampling of depositional areas as part of the WL EAFP [8] to ensure that no additional impacts to Winnipeg River sediments as a result of decommissioning operations and to verify the predictions in the CSR. Full parameter list is also included in reference [36].
Gross beta	×							
Gamma Emitters[22]	×							
Strontium-90	×							
Metals referenced in [36] and included in Table 5-6.	×							
Terrestrial Biota and Public Health								

[21] Gamma radionuclides of interest include Am-241, Ce-144, Co-60, Cs-134, Cs-137 (Ba-137md), Eu-152, Eu-154, I-129, Mn-54, Nb-94, Sb-125 (Te-125md), U-235 (Th-231d), Zn-65, Pb-210, K-40, Bi-212, Pb-212, Bi-214, Pb-214, Ra-226, Th-227, Ac-228, Pa-233, Pa-234m, Th-235.

[22] Gamma radionuclides of interest include Am-241, Ce-144, Co-60, Cs-134, Cs-137 (Ba-137md), Eu-152, Eu-154, I-129, Mn-54, Nb-94, Sb-125 (Te-125md), U-235 (Th-231d), Zn-65, Pb-210, K-40, Bi-212, Pb-212, Bi-214, Pb-214, Ra-226, Th-227, Ac-228, Pa-233, Pa-234m, Th-235.

Environmental Media/Location	Criteria for Parameters to be Monitored							Justification
	(j)	(k)	(l)	(m)	(n)	(o)	(p)	
Game (Deer, Bear, Grouse, Rabbit), Livestock (Beef, Pork, Lamb, Poultry) – flesh (muscle) [23]								
Gross alpha			×			×		(l) (should) The EMP should include contaminants relevant to the exposure/dose assessments that are normally part of an ERA (or equivalent). Meat ingestion is a relevant pathway for exposure to these radionuclides for critical groups. These include C-14[24], gross beta emitters (Cs-134 (also gamma), Cs-137 (also gamma), Fe-55, I-129, Ni-63, Pm-147, Sr-90 (Y-90)), Zn-65 (also gamma), gross alpha emitters, U-234, U-235 (also gamma), U-238) [15]. Contaminant concentrations measured in biota are useful in the ERA in assessing contaminant bioavailability, assessing food-chain exposures at higher trophic levels, and facilitating estimation of organism dose. (o) (may) The choice of contaminants to monitor in the environment may also be based on the following: iv) There are other business reasons, i.e. stakeholder concerns, due diligence, etc. Annual monitoring is part of the EAFP [8]. These parameters are in the site effluent and could be present in game and/or livestock.
Gross beta			×			×		
Gamma Emitters[18]			×			×		
Game Animals (moose, deer) – bone								
Gross beta			×			×		(l) (should) The EMP should include contaminants relevant to the exposure/dose assessments that are normally part of an ERA (or equivalent). Contaminant concentrations measured in biota are useful in the ERA in assessing contaminant bioavailability, assessing food-chain exposures at higher trophic levels, and facilitating estimation of organism dose. These include C-14, gross beta emitters (Cs-134 (also gamma), Cs-137 (also gamma), Fe-55, I-129, Ni-63, Pm-147, Sr-90 (Y-90)), Zn-65 (also gamma), gross alpha emitters, U-234, U-235 (also gamma), U-238) [15]. (o) (may) The choice of contaminants to monitor in the environment may also be based on the following: iv) There are other business reasons, i.e. stakeholder concerns, due diligence, etc. Annual monitoring is part of the EAFP [8]. These parameters could be in the bone of game animals.
Strontium-90			×			×		
Gamma Emitters[18]			×			×		
Honey, Canola								
Tritium (free and OBT)						×		(o) (may) Released to the air in measurable/significant quantities from WR1. Concentrations are not expected to be elevated in river or on land. Monitoring serves to confirm the absence of impacts [15].
Native Vegetation (mixed grasses, weeds, and clover)								
Gross alpha	×		×				×	(j) (shall) The WMA Facility Authority [24] document and WMA Safety Analysis [14] document states "Samples of vegetation shall be collected annually and analysed for any changes in activity from normal background levels." These parameters allow this analysis. (l) (should) Terrestrial plant ingestion is a relevant pathway for exposure to Ce-144 (part of gamma/gross beta) [15].
Gross beta	×		×				×	
Gamma Emitters[25]	×		×				×	
Strontium-90	×		×				×	

[23] Water ingestion is a dominant dose pathway for air and liquid emissions of tritium so tritium analysis is not required for this media.

[24] Carbon-14 analysis of air effluents are not anticipated to be of significance and will be assessed in 2019 before introducing this pathway analysis.

[25] Gamma radionuclides of interest include Am-241, Ce-144, Co-60, Cs-134, Cs-137 (Ba-137md), Eu-152, Eu-154, I-129, Mn-54, Nb-94, Sb-125 (Te-125md), U-235 (Th-231d), Zn-65, Pb-210, K-40, Bi-212, Pb-212, Bi-214, Pb-214, Ra-226, Th-227, Ac-228, Pa-233, Pa-234m, Th-235.

Environmental Media/Location	Criteria for Parameters to be Monitored							Justification
	(j)	(k)	(l)	(m)	(n)	(o)	(p)	
								(p) (should) This monitoring is being done to verify the effectiveness of containment and effluent controls, and these contaminants could potentially be present in effluent discharges as per WL CSR Table 5-2 from [12].
Tritium (free and OBT)						×		(o) (may) Released to the air in measurable/significant quantities from WR1. Concentrations are not expected to be elevated in river or on land. Monitoring serves to confirm the absence of impacts [15]. (o) (may) Released to the surface in measurable/significant quantities from WMA. Concentrations may be elevated vegetation. Monitoring serves to confirm the absence of impacts [15].
Garden Vegetables (leaf[26], root, fruit)								
Gross alpha			×				×	(l) (should) Garden Crop ingestion (Sr-90) is a relevant pathway for exposure to these radionuclides for critical groups [15]. Contaminant concentrations measured in biota are useful in the ERA in assessing contaminant bioavailability, assessing food-chain exposures at higher trophic levels, and facilitating estimation of organism dose. Annual monitoring is part of the EAFP [8]. (p) (should) This monitoring is being done to verify the effectiveness of containment and effluent controls, and these contaminants that could potentially be present in effluent discharges as per WL CSR Table 5-2 from [12].
Gross beta			×				×	
Gamma Emitters[25]			×				×	
Strontium-90			×				×	
Soil (Geology)								
Soil – WMA								
Gross alpha		×	×			×		(k) (should) As per Table 5-2, the potential effect of "leaks into surface water from in-situ trenches" was identified. (l) (should) Annual monitoring is part of the EAFP [8]. Ground shine is a relevant pathway for exposure to these gamma emitting radionuclides (Co-60, Eu-152, Eu-154, Mn-54, Nb-94, Sb-125) [15]. (o) (may) The choice of contaminants to monitor in the environment is as a gross trend indicator of contaminant migration.
Gross beta		×	×			×		
Strontium-90		×	×			×		
Gamma Emitters[25]		×	×			×		
Soil – Land clearance								
Gross alpha	×		×					(j) (shall) The concentration of a contaminant, intensity of a physical stressor, or effect on the environment shall be measured if required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or as otherwise directed by a regulator. Need for demonstration of no or acceptable impact [33]. (l) (should) Ground shine is a relevant pathway for exposure to these gamma emitting radionuclides (Co-60, Eu-152, Eu-154, Mn-54, Nb-94, Sb-125) [15].
Gross beta	×		×					
Strontium-90	×		×					
Gamma Emitters[27]	×		×					
Non-rad parameters listed in see Table 5-6	×		×					

[26] Leafy vegetables should include local wild mushrooms and fruit should include local wild blueberries.

[27] Gamma radionuclides of interest include Am-241, Ce-144, Co-60, Cs-134, Cs-137 (Ba-137md), Eu-152, Eu-154, I-129, Mn-54, Nb-94, Sb-125 (Te-125md), U-235 (Th-231d), Zn-65, Pb-210, K-40, Bi-212, Pb-212, Bi-214, Pb-214, Ra-226, Th-227, Ac-228, Pa-233, Pa-234m, Th-235.

Environmental Media/Location	Criteria for Parameters to be Monitored							Justification
	(j)	(k)	(l)	(m)	(n)	(o)	(p)	
Sediment/Soil –Lagoon and Lagoon Discharge Path								
Gross alpha	×		×					(j)(shall) The concentration of a contaminant, intensity of a physical stressor, or effect on the environment shall be measured if required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or as otherwise directed by a regulator. Need for demonstration of no or acceptable impact [33]. The full list of parameters are also shown in [34] and [38]. (l) (should) Ground shine is a relevant pathway for exposure to these gamma emitting radionuclides (Co-60, Eu-152, Eu-154, Mn-54, Nb-94, Sb-125). (l) (should) These parameters were chose to support the ERA for the closure of the Sewage Lagoon.
Gross beta	×		×					
Strontium-90[28]	×		×					
Gamma Emitters[27]	×		×					
Non-rad parameters listed in see Table 5-6	×		×					
Sediment - Landfill Dugouts								
Gross alpha	×		×					(j)(shall) The concentration of a contaminant, intensity of a physical stressor, or effect on the environment shall be measured if required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or as otherwise directed by a regulator. Need for demonstration of no or acceptable impact [33]. The full list of parameters and locations are also shown in [34] and [38]. (l) (should) These parameters were chose to support the ERA for the closure of the Landfill.
Gross beta	×		×					
Strontium-90[28]	×		×					
Gamma Emitters[27]	×		×					
Non-rad parameters listed in see Table 5-6	×		×					

Criteria:

(j) (shall) The concentration of a contaminant, intensity of a physical stressor, or effect on the environment shall be measured if required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or as otherwise directed by a regulator.

(k) (shall) The concentration of a contaminant or the intensity of a physical stressor shall be measured if based on the results of an ERA (or equivalent), there is the potential for the contaminant or physical stressor to produce effects in the receiving environment.

(l) (should) The EMP should include contaminants relevant to the exposure/dose assessments that are normally part of an ERA (or equivalent).

(m) (should) The radioactive contaminant(s) chosen for monitoring should be those estimated to contribute 1% or more of total radiation dose to members of a critical group.

(n) (should) The non-radioactive contaminant(s) chosen for monitoring should be those triggered by the MISA Protocol [1].

(o) (may) The choice of contaminants to monitor in the environment may also be based on the following:

- i) The level of risk from an unintended release of contaminants from a facility is unknown or has been determined by the ERA (or equivalent), to be of concern;
- ii) The level of risk from unmonitored releases of contaminants from a facility is unknown or has been determined by an ERA (or equivalent) to be of concern;
- iii) The emission of contaminants is highly variable;
- iv) There are other business reasons, i.e. stakeholder concerns, due diligence, etc.

(p) (should) If environmental monitoring is being done to verify the effectiveness of containment and effluent controls, then monitoring should be for those contaminants that could potentially be present in effluent discharges.

[28] If gross beta levels are not accounted for by K-40 and Cs-137 (or other beta/gamma emitters), Sr-90 analysis is performed.

Table 5-6
Non-Radiological Parameters and Frequencies for Environmental Samples

ATG	*Parameter*	*Landfill Dugout Water*	**Surface water[29] (not used as drinking water)**	*Soil[30] (Land Clearance)*	*WPG River Sediment[33]*	*Lagoon & Discharge Pathway Soil and Sediments[31]*	*Landfill Dugout Sediments[32]*

[34] BTEX analysis has been performed on the landfill dugout for many years with no detection of these parameters so this analysis has been discontinued [42].

[35] HB 40 by UV if GC/MS concentration is over 75 ppm.

[36] CCME PHC CWS (F1-F4) categorized as F2 (C10-C16), F3(C16-C34), and F4 (C34-C50) ranges

[37] A one-time analysis for confirmation of absence purposes.

5.2.7 Quality assurance (QA) and quality control (QC)

In order to ensure that the data collected through the program is valid, the monitoring performing laboratories have strong QA/QC programs as required by the *EnvP Program Radiological and Non-Radiological Monitoring Service Quality Assurance Plan* [47]. These laboratories utilize QC tools such as blanks, spiked blanks, and replicate samples to address precision, accuracy, sensitivity, and to detect errors in the data. The field and laboratory QC programs are described in laboratory specific sampling and analysis procedures as per [48] and [49].

The quality verification data generated by the laboratories are supplied to the Environmental Specialist who performs an evaluation to confirm that the performance and acceptance criteria in Section 5.5 are met.

5.2.7.1 Field Quality Verification Monitoring

In order to ensure that the data collected through the program is valid, the laboratories performing monitoring for the program have strong QA/QC programs as required by the *EnvP Program Radiological and Non-Radiological Monitoring Services Quality Assurance Plan* [47]. Note: This QA Plan is in line with the requirements of N288.4 [7].

In addition to this, field Quality Verification (QV) monitoring is in place for both the Effluent Verification Monitoring Program and the EMP with the frequency set to accommodate both of the programs. MISA requires that sampling take place annually on one effluent stream but recommends all ATGs be part of the field QV program. The MISA recommended frequencies [1] are outlined in Table 5-7:

Table 5-7
Field QV Frequency Recommended by MISA

Sampling Frequency	Field QV Frequency
Daily	Monthly
Weekly	Quarterly
Monthly	Semi-annual
Quarterly	Semi-annual
Semi-annual	Annual

With the current QV monitoring schedule, the WL site exceeds the field QV requirements outlined by MISA and conforms with most the MISA recommendations.

More specifically, the majority of the field QV is completed on one of the *effluent* monitoring points, the Outfall (OFS) as this is the most frequently and widely monitored of all of the monitoring points. However, for those parameters which are not monitored at OFS but are monitored elsewhere, one of the locations with the most frequent monitoring of that parameter was chosen for the collection of field QV samples. The current field quality verification monitoring schedule can be found in [50].

It should be noted that the field samples collected on a daily, weekly and monthly frequency are taken on the same day as the semi-annual monitoring under the EMP (i.e. whether frequency is daily, weekly, monthly or semi-annual, all will be taken on the same day as the monitoring sample for that parameter under the non-radioactive EMP).

The type of field QV sampling applicable for each of the Analysis Test Groups is outlined in Section 10.0 of the *Protocol for the Sampling and Analysis of Industrial/Municipal Waste Water* [1]. These include the following types of samples serving different purposes and re required in different combinations depending on the parameter:

<u>Types and Purposes</u>:

A. Duplicate – Precision
B. Travelling Blank – Contamination
C. Spiked Blank – Accuracy

5.2.8 Additional Monitoring Details

5.2.8.1 Type of Data to be Collected

For surface water media types requiring non-radiological parameter monitoring, water concentrations are measured and further information can and is calculated (e.g. loading/flux).

NOTE: There have been no environmental concerns identified through contaminant monitoring where toxicity tests (i.e. biological effects monitoring) was deemed necessary therefore, there has been no toxicity testing completed at these monitoring locations under the routine non-radioactive EMP.

5.3 Step 3: Boundaries of the EMP

The EMP includes monitoring within the site boundary, to address potential biological effects and exposure pathways for ecological receptors; and in areas outside the boundary of the WL site, to address pathways leading to human exposure.

The boundaries of the EMP are shown in Figure 3-1. Monitoring starts beyond the final point of control for an airborne or waterborne release, and extends beyond the site boundary to include the locations of all potential critical groups for the WL site.

A more detailed description of locations where potentially impacted areas intersect with ecological receptor habitat within the site boundary is available in the CSR [12] and Affected Lands and Contaminated Structures Detailed Decommissioning plan [51].

This monitoring plan does not address effluent monitoring at WL and it does not address the exposure of workers or visitors to the WL site to nuclear substances, which is controlled by CNL's Radiation Protection Program. A summary of all monitoring activities for the WL site is given in Table 5-8.

Table 5-8
Summary of WL Monitoring Activities

Environmental Component	Sampling Location	Parameters	Sampling Frequency
Air	WL Perimeter and Off-Site	γ (Thermoluminescent Dosimeters (TLDs))	Continuous
	WL Site	Dust Particulates (TSP, PM_{10}, Gross α/β, γ-spec) Quantities of fuel combusted for building heating. Diesel burned in their standby generators. Quantity of Total (filterable) Particulate Matter, particulate below 10 microns (PM_{10}), particulate below 2.5 microns ($PM_{2.5}$)[38] Record of Dust Control Treatments and Site Inspections Halocarbon	Continuous during building demolition Internal worksheet tools are used to perform the calculations required to report to the NPRI. In addition, Environment Canada provides companies with various calculators (road dust, landfill gas) All releases of halocarbons are recorded and those over 10 kg are reported to Environment Canada
Air Effluents	WL Facilities (B100 (WR1), B200, B300) and WMA Facilities	Gross α/β, γ-spec, C-14[39] tritium[40]	Continuous
Noise	WL Site	Noise monitoring	During periods of high activity
Topography	Surface drainage areas	Visual inspection of OFS pipe (above ground) for evidence of subsidence Visual Inspection of WMA ditch system and other drainage pathways identified in Storm Water Management plan Visual Inspection of the Winnipeg River Bank in the vicinity of the WL site	Semi-Annually
Surface Water	Winnipeg River	Gross α/β, Sr-90, Tritium, Uranium, γ-spec	Daily to Weekly, monthly composite analyzed
	WMA Ditches[41]	Tritium, Uranium, Gross α/β, γ-spec, C-14[42]	Periodically during ice free

[38] As the result of travel on gravel roads, sand blasting activities, use of gas powered vehicles, propane tanks, other CO_2 emissions, burn pile.

[39] Air effluents needs to be assessed in 2019 for the presence of Carbon-14.

[40] Tritium analysis is only required for B100 air effluent.

[41] If gross beta levels are above 10 Bq/L the samples are submitted for Sr-90. If the alpha activity is above 0.5 Bq/L and not all alpha is accounted for by uranium and Am-241 is present in the gamma spec, the samples may be submitted for isotopic plutonium analysis. Additional analyses may be performed at the request of Facility Management or EnvP Program Manager.

[42] Ditch water will be assessed for C-14 in the 2019 field season.

Environmental Component	Sampling Location	Parameters	Sampling Frequency
			periods[43]
	Landfill Dugouts	Gross α/β, Tritium, non-radiological (total metals including uranium)	Annually
	Primary Cell of the Sewage Lagoon	Gross α/β, γ-spec	Prior to isolation from Secondary Cell and/or Discharge
	Main Campus Miscellaneous (manholes, excavations, sumps)	Gross α/β, γ-spec, pH, visual inspection for film, sheen or discoloration, deleterious substances, and other parameters (Table 5-6)	Prior to pump-out/relocation
Surface Water	B417 Tank catch/containment tray	Gross α/β, γ-spec	Monthly (April to October)
	SMAGs Sump, SSC Sump, SSC Standing Water, WMA Misc Sumps and WMA standing water (excavations)	Gross α/β, γ-spec, tritium, pH, visual inspection for film, sheen or discoloration, deleterious substances, and other parameters (Table 5-6)	Prior to pump-out/relocation
Atmospheric Deposition	Off-Site	Gross α/β, γ-spec	Monthly
Groundwater [62]	WMA[44]	Gross α/β, tritium, uranium non-radiological, field measurement of pH, conductivity and temperature water level measurements	Semi-Annually
	Landfill, Lagoon[39]	Gross α/β, tritium, uranium non-radiological, field measurement of pH, conductivity and temperature water level measurements	Annually (Spring)
	Main Campus (including locations in the vicinity of, and up and down gradient of, WR1)	Gross α/β, tritium, uranium non-radiological, field measurement of pH, conductivity and temperature Water Level measurements	Semi-Annually (basal and bedrock), Annually (water table and clay-till)
Liquid Effluents [16]	B100 (WR1) and B300 tanks, Outfall Sampling Location Sewage	Gross α/β, tritium, γ-spec. Sr-90, uranium, non-radiological,	Continuous on discharge

[43] Ditch locations are checked and, if water is flowing, are sampled after rain events greater than 5 millimetre of rain in a 24-hour period, preceded by at least 48 hours of no precipitation. Samples should also be taken during the spring (snow) melt and not more than weekly unless there is some operational concern that triggers additional sampling.

[44] If gross beta levels are above 2 Bq/L the samples are submitted for gamma spectrometric analysis, if it exceeds 5 Bq/L the samples are submitted for Sr-90 analysis. If the alpha activity is above 0.5 Bq/L, the samples are submitted for gamma spectrometric analysis and possibly isotopic plutonium analysis. Additional analyses may be performed at the request of Facility Management or EnvP Program Manager.

Environmental Component	Sampling Location	Parameters	Sampling Frequency
	Lagoon, Ditch location 8, 9 and Control	Pu-238, Pu-239/240[45], C-14[46]	
Sediments	Winnipeg River (depositional zone cores)	Gross α/β, γ-spec, Sr-90 (composite for each sample) and other parameters (Table 5-6)	Every 20 years starting 2006[47]
Sediments	Winnipeg River (surface sediment)	Gross α/β, γ-spec, Sr-90 (composite for each sample)	Annually
Fish[48]	Winnipeg River (one upstream location and two downstream)	Gross β, γ-spec	Annually
Wildlife Deer, Bear, Grouse, Rabbit	On-Site, Off-Site	Gross α/β, γ-spec, Sr-90 (bone)	As Available[49]
Garden Crop[50]	Up and Downstream of Whiteshell Laboratories	Gross α/β, γ-spec, and Sr-90	Annually
Honey/Canola[51]	Off-site local sources	Tritium (free and organically bond)	Annually
Beef/Pork/Lamb/Poultry[52]	Off-site local sources	Gross α/β, γ-spec	Annually
Native Vegetation	WL Perimeter ARMs, WMA	Gross α/β, γ-spec, Sr-90, Tritium (free and organically bond)	Annually
Soils	WMA affected areas	Gross α/β, γ-spec	Annually
Soils/sediments	Excavations/Land Clearance[53]	Gross α/β, γ-spec, non-radiological parameters (Table 5-6)	Pre-clearance
Soils/sediments	Landfill Dugouts[53]	Gross α/β, γ-spec, non-radiological parameters (Table 5-6)	Every 5 years (starting 2007)
Soils/sediments	Sewage Lagoon Sludge	Gross α/β, γ-spec, Sr-90,	Every 5 years (starting 1999)

[45] Plutonium (quarterly composite) analysis (Pu-238, Pu-239/240) is performed out outfall effluent.

[46] C-14 analysis is performed on B100 tank discharges and on the Outfall Sampling location.

[47] For Deposition Areas, thirteen cores are collected at each site. More information on sampling locations and sampling method is detailed in WLDP-03704-REPT-007. Depositional zones are to be samples every 20 years to verify validity of EA conclusions.

[48] Fish netting activities must be in compliance with the annual permit issued under the Fisheries Act (Manitoba). Report of these activities must also be completed as the conditions listed in the permit.

[49] Game are obtained by CNL staff through roadkills and/or from local trappers. Animal collection activities must be in compliance with the permit issued under the Wildlife Act. Reporting of these activities must also be completed as per the conditions listed in the permit. Species (normally deer, moose, bear, grouse or rabbit) sex and age should be report to the WL Environmental Specialist along with the radioactivity in Bq/kg, fresh weight for flesh (and bone - for deer/moose).

[50] Leafy vegetables should include local wild mushrooms and fruit should include local wild berries (possible choices - blue berries, Saskatoon berries, raspberries, strawberries, plums, gooseberries, chokecherries, pin cherries) [63].

[51] This is an air deposition pathway, canola, honey, poultry, pork, and beef can be obtained from the local colony near Whitemouth. Background samples can be obtained from local stores that bring in produce from un-impacted areas.

[52] Livestock are obtained by EnvP staff from local farmers/farmer's markets.

[53] If gross beta levels are not accounted for by K-40 and Cs-137 (or other beta/gamma emitters), Sr-90 analysis is performed.

Environmental Component	Sampling Location	Parameters	Sampling Frequency
	and Discharge Paths	non-radiological parameters (Table 5-6)	
Land Surveys	On-Site, Off-Site	γ-spec	Annually[54]
Species at Risk (Barn Swallows and Bats)	On-Site	Monitor Compensatory Habitat	Semi-Annually
Wildlife Mortality	On-site (plant road)	Track wildlife mortality (including birds, reptiles and mammals)	Continuous, as reported by staff

5.4 Step 4: How the Monitoring Results will be Used to Meet the Defined Objectives

This section outlines how the monitoring identified in Section 5.2 will be used to meet the program objectives. The process for the interpretation and reporting of the EMP results is outlined in *Environmental Monitoring Program* [6].

5.4.1 Monitoring to Assess the Level of Risk to Human Health

The radioactive data obtained from the EMP are used to assess the level of risk to human health and safety by calculating radiation doses to the most exposed off-site members of the public (i.e. critic groups) as identified in the DRL model for WL [15].

These calculations address the significant exposure pathways and, where available, incorporate local intake fractions based on a site-specific survey of human receptors in the area. Calculations are based on the CSA N288.1 guidelines and the COG Guidance Document (when available, site-specific data on use of local food and water sources are used), and are performed using spreadsheets and/or the IMPACT code [15]. Recent dose reports [46] outline the dose calculation methods in detail.

Annual average contaminant concentrations are used to calculate annual average dose to the public. Human exposure concentrations are corrected for natural background using the results of monitoring at reference locations so that the dose contribution from WL can be compared to the public dose limit. Radionuclides present below the detection level (L_D) are included in the dose calculations. Radionuclides present below the critical level (L_C) are not included in the dose calculations.

Calculated doses are compared to the regulatory limits in Section 5.4.2.1.

5.4.2 Monitoring to Demonstrate Compliance with Limits

The discussion in the Annual EMP Report will mostly be focused on the most significant impacts observed during the monitoring year, as determined by high contaminant concentrations or

[54] Land Gamma (Road Survey) must be performed in the fall before the first snowfall.

deviations in contaminant trends. Significant impacts are identified by the use of different types of limits.

Three types of limits are applied in the EMP:

- regulatory limits;
- screening criteria, to detect contaminant concentrations above natural background; and
- ecological effects-based criteria (i.e. BV) to identify areas where there is a potential for ecological risk.

5.4.2.1 Regulatory limits

Calculated doses to members of the public, as described in Section 5.4.1, are compared to

- the public dose limit of 1 mSv/a [75]; and,
- the dose triggers for ALARA [76] of 50 µSv/a to individual members of the public, and 1 person-Sv annual collective dose (both occupational and public).

5.4.2.2 Background Screening Criteria

The evaluation process initially involves the application of background screening criteria selected to identify contaminant concentrations that are abnormal.

The screening criteria consist of a combination of generic background concentrations (e.g. background concentrations from the literature, or regionally applicable data on natural background concentrations) and site-specific background concentrations. The site-specific background concentrations are determined by monitoring conditions at one or more reference areas, which are located on or near the WL site but have not been adversely affected by WL operations. The site-specific values usually consist of the upper limit (e.g. mean plus two standard deviations) of the average for the reference location(s). These values are identified and included in Table 5-9 and Table 5-10.

The background screening review is used to generate a list of “parameters of interest (key or critical parameters)” that are subject to further evaluation. The evaluation process involves the generation of trend charts, a review of the trends, and discussion in the Annual EMP Report.

Exceedance of a background screening criterion is not considered a non-conformance.

Table 5-9
Environmental Monitoring Radiological Method Detection Limits (MDL) and Background Values

Environmental Medium	Parameter	Unit	MDL[55]	Background Value	Source
Air Quality and Noise	TLDs	µGy/a	85[56]	< 1200 145-515	[52] [53]
	Land Gamma Survey	nSv/h	10	< 60	[46] (mean plus 2s of background of 2012 to 2017 data)
	Noise	dB	28-42	47	[68]
Wet/Dry Deposition[57]	Gross Alpha	Bq/m^2	1	2	BG is mean plus (n-1) times the standard deviation of 2012 to 2017 [46]
	Gross Beta	Bq/m^2	6	14	
	Cesium-137	Bq/m^2	0.1	0.3	
	Potassium-40	Bq/m^2	6	12	
	Strontium-90[58]	Bq/m^2	0.5	0.7	
Surface water (not used as drinking water)[59]	Gross Alpha	Bq/L	0.30	0.3	BG is geometric mean plus two times the standard deviation of 2009 to 2017 control locations data MAXXAM MDL
	Gross Beta	Bq/L	0.30	0.3	
	Potassium-40	Bq/L	10	0.3	
	Cesium-137	Bq/L	1	< 1	MAXXAM MDL
	Carbon-14	Bq/L	2	< 2	MAXXAM MDL [46]
	Strontium-90	Bq/L	1	< 1	[46] MAXXAM/PACE MDL
	Technetium-99	Bq/L	0.2	< 0.2	
	Americium-241	Bq/L	0.05	< 0.05	MAXXAM MDL [46]
	Tritium oxide	Bq/L	8	< 8	[46]
	Total Uranium	Bq/L (ppb)	0.003 (0.1)	0.025 (< 10[60])	[46]
	Gross Alpha	Bq/L	10	< 10	[45]
	Gross Beta	Bq/L	10	< 10	[45]
	Tritium	Bq/L	8	< 8	[45]

[55] MDLs were calculated using background or blank values as per EPA MDL method 40 CFR Part 136 Appendix B or are from Annual Safety Reports normally based on sample size, count times and counting statistics or value is from Contract Lab analysis sheet.

[56] Detection limit calculated using background values from 2012 to 2017.

[57] The MDL is based on a rain pail (1,320 cm2) or snow sheet sample (1,320 cm2) resulting in 0.2 g of sample ash and counted 100 min for gross beta and Sr-90 analysis, and 400 minutes for gross alpha or 800 min for Cs-137, and K-40 analysis.

[58] Strontium-90 analysis of atmospheric deposition samples was discontinued in 2019. Tritium analysis was considered due to emissions from WR1 (1.5E+09 Bq/wk) but discounted as the average release of tritium from the site is 9E-05 %DRL.

[59] Control ditch location unaffected by WL operations. These are normally collected as 1 litres samples and are ashed before alpha, beta and gamma counting.

[60] Local well waters within the Canadian Shield contain naturally occurring uranium [59] at concentrations >100 ppb, the presence of uranium and its progeny are not unexpected. The reason for high uranium concentrations can be attributed to the presence of dissolved carbonate which is effective for leaching naturally occurring uranium from minerals under oxidizing conditions.

Environmental Medium	Parameter	Unit	MDL[55]	Background Value	Source
Surface Water (Sumps, SL1 and Water Relocation Samples within the WMA)[61]	Cesium-137	Bq/L	5	< 5	[45]
	Americium-241	Bq/L	10	< 10	[45]
	Potassium-40	Bq/L	100	<100	[45]
Surface water (used as drinking water)	Cesium-137	Bq/L	0.003	0.007	BG is average plus two standard deviations of 2007 to 2017 of upstream (SFD) data [46]
	Gross Alpha	Bq/L	0.023	0.050	
	Gross Beta	Bq/L	0.023	0.090	
	Potassium-40	Bq/L	0.040	0.087	
	Strontium-90	Bq/L	0.003	0.009	
	Americium-241	Bq/L	0.006	< 0.002	
	Total Uranium	Bq/L (ppb)	0.003 (0.1)	0.025 (<10)	
	Tritium oxide	Bq/L	3	7	
Fish	Gross beta	Bq/kg (fresh weight)	5	200	BG is the geometric mean plus 2 times the standard deviation of of 2012 to 2017 upstream data (rounded) [46]
	K-40	Bq/kg (fresh weight)	6	200	
	Cs-137	Bq/kg (fresh weight)	1	1.7	
Game, Livestock	Gross alpha	Bq/kg (fresh weight)	5	<11	[66], [58]
	Gross beta	Bq/kg (fresh weight)	5	Deer – 162 Grouse – 233	BG is the geometric mean plus 2 times the standard deviation of 2001 to 2016 data (outer areas)
	Cesium-137	Bq/kg (fresh weight)	1	Deer - 6 Grouse – 5	
	Potassium-40	Bq/kg (fresh weight)	100	Deer - 149 Grouse – 260	
	Strontium-90 (Deer bone)	Bq/kg (fresh weight)	8	64	
Canola	Tritium (free and OBT)	Bq/kg (fresh weight)	HTO 30 OBT 8	HTO < 40 OBT < 8	[60]
Honey	Tritium (free and OBT)	Bq/kg	HTO 30 OBT 19	HTO < 40 OBT < 19	[60]
Native Vegetation	Gross alpha	Bq/kg (fresh weight)	60	90	[46], BG is geometric mean plus 2 standard deviation of 2012 to 2017 data
	Gross beta	Bq/kg (fresh weight)	50	822	

[61] Normally collected as a one litre samples, gamma MDL is based on counting a 500 mL sample for 30 minutes and three 1 mL samples counted for alpha and beta. These samples include sump water, SL-1 (primary cell grab sample), manhole water and standing water from excavations. Gross alpha is assumed to be Am-241 and gross beta is assumed to be Sr-90.

Environmental Medium	Parameter	Unit	MDL[55]	Background Value	Source
	Potassium-40	Bq/kg (fresh weight)	100	960	[66], for BG value in ()
	Cesium-137	Bq/kg (fresh weight)	7	13 (4)

5.4.2.3 Benchmark Values (BV)

The evaluation process also involves the application of ecological effects-based criteria, i.e. BVs, selected to identify areas where there is a potential for ecological risk.

The BVs consist of a combination of

- Federal or provincial guidelines for environmental quality [19], [20], [21], [22], [23], [68], [70], [69], [72];
- Predicted levels from WL CSR [12];
- Lowest observable effect levels from the literature [60], [56];
- Radiation Screening Criteria used for identifying COPECs [56], [58]; or
- The geometric mean plus three times the standard deviation of the background values.

Benchmark values are intended to identify significant changes or high concentrations of contaminants at the monitoring locations. Exceedance of a BV does not necessarily indicate that ecological impacts would occur, but instead indicates that there is some potential for ecological impacts.

Note: Not all parameters measured under this program have an associated *Benchmark Value,* in fact, there are a number which do not; these generally consist of measures of environmental indicators (e.g. BOD) instead of pollutants; or they could be pollutants but have not had guidelines developed yet as they have not been federally identified as federal priority pollutants requiring the development of a guideline [21].

The BVs are listed in Table 5-11 and Table 5-12.

Exceedance of a BV is considered a non-conformance.

Table 5-11
Environmental Monitoring Radiological Method Detection Limits (MDL) and Benchmark Values (BVs)

Environmental Medium	Parameter	Unit	MDL[65]	Benchmark Value	Source
Air Quality and Noise	TLDs	µGy/a	85 145-515	< 2,000 (WL Main Campus)[66] < 10,000 (WL WMA. Canister Area)	[46], [65] BV is the geometric mean plus 3 times the standard deviation of 2012 to 2017 (perimeter fence for main campus and canister area for WMA)
	Land Gamma Survey	nSv/h	10	< 500	[46], [54]
	Noise	dB	28-42	85	[69]
Wet/Dry Deposition	Gross Alpha	Bq/m^2	1	3	[46], BV - average value for this station for 2012 to 2017 plus three standard deviations.
	Gross Beta	Bq/m^2	6	13 (17)	[55], BV in () is average value of results for this station for 2012 to 2017 plus three standard deviations.
	Cesium-137	Bq/m^2	0.1	3 (0.3)	
	Potassium-40	Bq/m^2	6	14	[46], BV - average value for this station for 2012 to 2017 plus three standard deviations.
	Strontium-90	Bq/m^2	0.5	3 (1)	[55], BV in () average value for this station for 2012 to 2017 plus three standard deviations.
Surface water (not used as drinking water)[67]	Gross Alpha	Bq/L	0.30	16.2 (20)	MDL based on Control Ditch Location data 2009 to 2018 [56] ([57])
	Gross Beta	Bq/L	0.30	666 (10)	
	Cesium-137	Bq/L	1	291	[56]

[65] MDLs were calculated using background or blank values as per EPA MDL method 40 CFR Part 136 Appendix B or are from Annual Safety Reports normally based on sample size, count times and counting statistics or value is from Contract Lab analysis sheet.

[66] The benchmark values were assessed against radiological safety zone classifications. The main campus is expected to be very low radiation hazard (< 0.5 microsievert/hour/< 4380 microgray per year) and the WMA and Canister Areas are expected to be low radiation hazard (> 0.5 but less than 10 microsievert/hour/< 87600 microgray per year)

[67] Normally collected as a one litre samples, gamma MDL is based on counting a 500 mL sample for 30 minutes, gross alpha and gross beta MDL assumes ash of ~100 mg and a 100 minute count time, Sr-90 is 100 mL aliquot radiochemical separation followed by 100 minute count time. These samples include ditch water, landfill dugout and catch/containment tray, sump water, manhole water and standing water from excavations.

Environmental Medium	Parameter	Unit	MDL[65]	Benchmark Value	Source
				3 (for WMA catch/containment tray[68])	
	Potassium-40	Bq/L	10	NA	MAXXAM MDL NA
	Carbon-14	Bq/L	2	200	MAXXAM MDL [20]

	Americium-241	Bq/L	10	16.2	[56]
	Potassium-40	Bq/L	100	NA	NA
Surface water (used as drinking water)[71]	Cesium-137	Bq/L	0.003	10	[19]
	Gross Alpha	Bq/L	0.023	0.5	[19]
	Gross Beta	Bq/L	0.023	5	[19]
	Potassium-40	Bq/L	0.040	NA	
	Strontium-90	Bq/L	0.003	5	[19]
	Americium-241	Bq/L	0.006	0.7	[20]
	Total Uranium	Bq/L (ppb)	0.003 (0.1)	0.5 (20)	[19]
	Tritium oxide	Bq/L	3	7,000 (5.0 background level[72])	[19]
Fish	Gross beta	Bq/kg (fresh weight)	5	250	

[68] Alert Environmental Specialist if the Cs-137 activity in the Catch/Containment Tray exceeds 3.0 Bq/L of at any time (see WLWMA-106030-OP-001 [30]).

[69] Local well waters within the Canadian Shield contain naturally occurring uranium [59] at concentrations >100 ppb, the presence of uranium and its progeny are not unexpected. The reason for high uranium concentrations can be attributed to the presence of dissolved carbonate which is effective for leaching naturally occurring uranium from minerals under oxidizing conditions.

[70] Normally collected as a one litre samples, gamma MDL is based on counting a 500 mL sample for 30 minutes and three 1 mL samples counted for alpha and beta. These samples include sump water, manhole water and standing water from excavations. Gross alpha is assumed to be Am-241 and gross beta is assumed to be Sr-90.

[71] Normally collected as at least 25 litres samples, separate aliquot for tritium analysis, remainder is evaporated to dryness and the ash is alpha, beta and gamma counted, then processed for Sr-90 counting.

[72] Background levels of tritium taken from Health Canada's Canadian Radiological Monitoring Network – tritium in drinking water (saved as excel file).

Environmental Medium	Parameter	Unit	MDL[65]	Benchmark Value	Source
	K-40	Bq/kg (fresh weight)	6	250	BV is geometric mean plus 5 times the standard deviation of 2012 to 2017 upstream data (rounded)
	Cs-137	Bq/kg (fresh weight)	1	4[73]	[46]
Game, Livestock	Gross alpha	Bq/kg (fresh weight)	5	33	[66], [58]
	Gross beta	Bq/kg (fresh weight)	5	Deer – 193 Grouse – 294	BV is 3 times the geometric mean of 2001 to 2016 data
	Cesium-137	Bq/kg (fresh weight)	1	Deer [74] - 33 Grouse – 45	
	Potassium-40	Bq/kg (fresh weight)	100	Deer - 174 Grouse – 320

Honey	Tritium (free and OBT)	Bq/kg	HTO 30 OBT 19	HTO[62] 2.5E6 OBT 1.3E6	[60], [15]
Native Vegetation	Gross alpha	Bq/kg (fresh weight)	60	130	[46], BV is 3 times the geometric mean of 2012 to 2017 data
	Gross beta	Bq/kg (fresh weight)	50	1550[76]	
	Potassium-40	Bq/kg (fresh weight)	100	1550	
	Cesium-137	Bq/kg (fresh weight)	7	21	
	Americium-241	Bq/kg (fresh weight)	4	NA	
	Beryllium-7	Bq/kg (fresh weight)	6	NA	

[73] The concentration of Cs-137 in fish would have to be 1750 Bq/kg to trigger an ALARA (0.05 mSv/a) review.

[74] The concentration of Cs-137 in game would have to be 240 Bq/kg to trigger an ALARA (0.050 mSv/a) review.

[75] Values from the CNSC Implementation of Recommendations from the Tritium Studies Synthesis Report. It states that the IEMP Screening levels were developed by CNSC staff using the methodology outlined in CSA standard N288.1-14 and conservative assumptions. The screening level for a particular radionuclide in a particular medium (e.g., water, air, foodstuffs) represents the activity concentration that would result in a dose of 0.1 mSv per year, a dose at which no health impacts are expected.

[76] Dose to meadow grass for gross beta as Sr-90 would be 0.02 mGy/d, which is well below the benchmark values of 100 µGy/h (2.4 mGy/d) for doses to terrestrial biota [58].

Environmental Medium	Parameter	Unit	MDL[65]	Benchmark Value	Source
	Strontium-90	Bq/kg (fresh weight)	10 (0.05 Bq/g ash)	8	[46], BV is 3 times the geometric mean of 2012 to 2017 data
	Tritium (free and OBT)	Bq/kg (fresh weight)	HTO 10 OBT 4	HTO [62] 104,000 OBT 45,2000	[60]
Garden Crop	Gross alpha	Bq/kg (fresh weight)	4	Fruit - 10 Root – 10 Leaf – 20	MDLs are from Kinetrics, BV is geometric mean plus 3 times standard deviation of 2012 to 2017 data [46], or 0.05 mSv/a potential dose (trigger for ALARA review) whichever is less.
	Gross beta	Bq/kg (fresh weight)	13	Fruit - 130 Root - 210 Leaf – 1600	
	Potassium-40	Bq/kg (fresh weight)	10	Fruit – 140 Root - 250 Leaf – 2300	
	Cesium-137	Bq/kg (fresh weight)	1	Fruit - 2 Root - 2 Leaf – 1	
	Americium-241	Bq/kg (fresh weight)	4	Fruit - 6 Root - 4 Leaf – 6	
	Beryllium-7	Bq/kg (fresh weight)	8	Fruit - 1000 Root - 1000 Leaf – 1000	BV is based on a <0.005 mSv/a dose to a member of the public
	Strontium-90	Bq/kg (fresh weight)	0.1	Fruit - 10 Root - 10 Leaf – 20	BV is geometric mean plus 3 times standard deviation of 2012 to 2017 data (rounded), [46]
Soil (WMA)	Gross alpha	Bq/kg	100	1E+05	Maxxam Lab MDL, BVs from [57]
	Gross beta	Bq/kg	100	8E+02 [77]	
	Potassium-40	Bq/kg	3	900[78]	
	Cesium-137	Bq/kg	10	8E+02	
	Americium-241	Bq/kg	10	1E+05	
	Strontium-90	Bq/kg	100	2E+06	
Soil (Land Clearance)	Gross alpha (as Am-241)	Bq/kg	100	2436 (agriculture land use)	Maxxam Lab MDL, BVs from [61][79]

[77] Gross beta is assessed after K-40 contribution and Cs-137 contributions are removed and residual is assumed to be Sr-90/Y-90.

[78] BV for K-40 is mean plus 3 standard deviations of unaffected area soils.

[79] The soil BV is the soil activity concentration resulting in a 0.1 mSv/a dose for the residential land use identified in Table 3-2 of WL-509420-REPT-001.

Environmental Medium	Parameter	Unit	MDL[65]	Benchmark Value	Source

	Strontium-90	Bq/kg	100	(1900) 2E+05 [56] 1000 [74]	

5.4.3 Short-term Evaluation of EMP Data

The following 3-Step process is followed to determine whether the program's monitored results are of ecological concern.

Step 1: Calculate the annual average concentration[81]:

Step 2: Determine if above the *Benchmark Value* (see Table 5-11 and Table 5-12).

Note: Not all parameters measured under this program have an associated *Non-Radioactive Benchmark Value*, as discussed in the previous section.

Nevertheless, it is possible that the generic CWQGs and PWQGs are over or under-protective at sites with unique conditions. For example, at the Control Ditch location, certain substances (iron) are naturally present in the environment at concentrations above the guidelines.

[80] Gross beta is assessed after K-40 contribution and Cs-137 contributions are removed and residual is assumed to be Sr-90/Y-90.

[81] Annual average (as opposed to annual maximums) is appropriate for comparison to *Non-radiological Benchmark Values* as these guidelines are based on long-term no-effects concentrations.

Therefore, CNL needs to take this background information into consideration when interpreting results as discussed below in Step 3.

Step 3: Determine if measured concentrations are above local background values. In order to do this, an upper limit of background is calculated for each associated background monitoring location using the 1989 Dunn method of the annual mean + 2SD value for the association between the Whiteshell site's background monitoring locations (Control Location Ditch and Intake) and monitoring locations.

The highest upper limit over a number of years is used where data is available. Annual averages of monitoring results per monitoring station are then compared to the watershed's upper limit of background. If the annual mean exceeds both the *Benchmark Value* and the upper limit of background, there is a potential for ecological concern and close attention should be paid to the situation which might include further sampling/ investigation. In the instance where the monitoring results are above the *Benchmark Value* but not above the background limit, there is no ecological concern. Figure 5-1 illustrates this 3-Step Process:

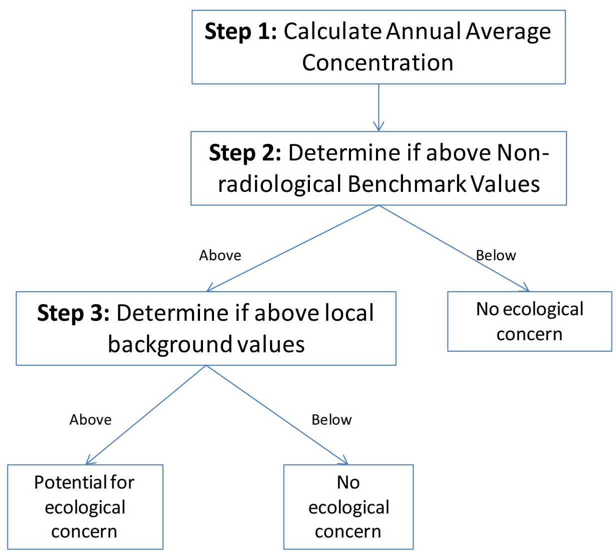

Figure 5-1 Short-Term Evaluation of Surface Water Monitoring Data

5.4.3.1.1 Short and Long-Term Evaluation of EMP Data

The monitoring results are routinely reviewed looking for anomalous results and trends within the given monitoring year or over a number of years. It should be noted that concentrations of non-radioactive results tend to be variable in surface waters due to natural occurrences (e.g. rain fall events etc.) and therefore changes in monitoring results over time are not necessarily a direct result of anthropogenic activities.

5.4.3.1.2 Long-term Evaluation of EMP Data

The program itself is routinely reviewed to ensure the monitoring in place is appropriate, as the program is dynamic in nature. The types and frequencies of these reviews are shared among the Integrated Environmental Monitoring Program and are therefore outlined in *Whiteshell Laboratories Integrated Environmental Monitoring Program Framework* [5].

5.4.4 Monitoring to Confirm the Effectiveness of Containment / Effluent Control

Emissions based on effluent monitoring are compared to those inferred from the results of environmental monitoring to see how well they agree:

- The control of radionuclide releases to the Winnipeg River is determined by monitoring radionuclides in the effluent streams (e.g. Process Outfall and Sewage Lagoon) that discharge to the river. An approximate check on the accuracy of this effluent monitoring can be obtained by concurrent measurements of radionuclide concentrations in the river downstream of the discharges. The emissions data are used together with hydrological data reference water quality data to model water concentrations to confirm that the measured concentrations in the Winnipeg River are reasonable.
- The containment of active waste within the WMAs can be confirmed by monitoring surface water at upstream and downstream locations. The EMP will identify if any concentrations are increased downstream, indicating loss of containment.

If there is a discrepancy between the results of effluent monitoring and environmental monitoring, for example if certain radionuclides begin showing up in environmental samples that were not there previously, this is an indication that the present effluent monitoring and/or control measures are lacking. As new measures are instituted, progress is monitored by watching for those nuclides in future environmental samples.

5.4.4.1 Relocation of Water from Sumps, Standing water and/or Excavations within the WL WMA

Discharges shall not be directed to WMA ditch or released to the ground in the WMA, unless otherwise approved by the EnvP Program, in circumstances where the liquid has the following characteristics**:**

A pH less than 6 or greater than 9;
A temperature greater than 40°C; or,
A visible film, sheen or discolouration.
The risk for high levels of metals, TSS, organic content is assessed.

The liquid contains any of the following:
Animate products of biotechnology, Concrete mixtures, Floating debris, Food waste, Fuel, Motor oil, Paint and organic solvents, Sewage of any kind, Solvent extractable matter of animal, vegetable, mineral or synthetic origin.

Radiological contaminants in excess of the limits specified below;
Gross Beta 10 Bq/L;
Gross Alpha 10 Bq/L;
Tritium 7000 Bq/L;
Any gamma isotopes detected are above the applicable water quality guideline

If the radioactivity is above these levels and the decision is to discharge to the ditch system or ground in the WMA the value is assessed against the Radiation Screening Criteria [56]. There must be assurance that this surface water is not used as drinking water and is not being discharged near a drinking water well. Any water higher than these levels shall be assessed for treatment and/or disposal through the processed, storm or domestic drain. If the calculated levels are below admin levels for the OFS, the water can be put to the storm drain or process drain and discharged through the B300 and/or B100 LLLW systems. If the calculated levels would result in a site release above the Admin Levels the water can be further assessed to determine if there is a risk of exceeding the Action Levels for the site. If there is no risk that the level will approach the Action Level then the water can be discharged through the process drain to the B300 and/or B100 LLLW systems. This allows the discharge to be isolated if the levels are higher than calculated. If there is a risk the water will go over the Action Levels for the site, it should be evaporated in the B300 Shielded Facility and disposed of as solid waste.

Table 5-13
Radiation Screening Criteria

Americium-241	Bq/L	16.2
Cesium-137	Bq/L	291
Strontium-90	Bq/L	666
Tritium oxide	MBq/L	12.7

The water is normally run through a 5 micron filter prior to discharge. If the pH is not between 6 to 9, it should be adjusted before release.

5.4.4.2 Relocation of Water from Manholes and/or Excavations on the WL Main Campus

Discharges shall not be directed to the process, domestic or storm drain, or released to the ground, unless otherwise approved by the EnvP Program, in circumstances where the liquid has the following characteristics:

A pH less than 6 or greater than 9;
A temperature greater than 40°C; or,
A visible film, sheen or discolouration.
The risk for high levels of metals, Total Suspended Solids (TSS), organic content is assessed.

The liquid contains any of the following:
Animate products of biotechnology, Concrete mixtures, Floating debris, Food waste, Fuel, Motor oil, Paint and organic solvents, Sewage of any kind, Solvent extractable matter of animal, vegetable, mineral or synthetic origin.

Radiological contaminants in excess of the limits specified below;
Gross Beta 5 Bq/L ;
Gross Alpha 0.5 Bq/L;
Any gamma isotopes detected are above the applicable water quality guideline

If tritium is potential present – 7000 Bq/L

If the radioactivity is above these levels and the decision is to discharge to the process drain system or storm drain system, a comparison of the activity level to be discharged must be made against the site Admin Levels. If the calculated levels are below admin levels for the OFS the water can be put to the storm drain or process drain and discharged through the B300 and/or B100 Low Level Liquid Waste (LLLW) systems. If the calculated levels would result in a site release above the Admin Levels the water can be further assessed to determine if there is a risk of exceeding the Action Levels for the site. If there is no risk that the level will approach the

Action Level then the water can be discharged through the the B300 and/or B100 LLLW systems. This allows the discharge to be isolated if the levels are higher than calculated. If there is a risk the water will go over the Action Levels for the site, it should be evaporated in the B300 Shielded Facility and disposed of as solid waste.

If there is concern about high TSS in addition to the level of activity, the water can discharged through the domestic drain provided that the level of activity is below the Ecological Effect Concentration levels in Table 5-13.

For all discharges, it is best if the water is run through a 5 micron filter prior to discharge. If the pH is not between 6 to 9, it should be adjusted before release. If it is impractical to adjust the pH the water should be directed to the B300 or B100 LLLW system.

If there is a need to discharge the water to the ground and it is above the rad limits, an assessment of the potential radiological contaminants should be made using the following guidance and assessment of potential risk.

Each potential contaminant of concern will be part of either the Gross Beta or Gross Alpha analysis result. Of these, some can be detected individually by gamma spec analysis or alpha spec analysis. The beta emitter with the most restrictive Maximum Acceptable Concentration (MAC) in the potential contaminants of concern for WL is Sr-90 (MAC 5 Bq/L). WL EnvP assume Sr-90 is in equilibrium with Y-90 so a screening criteria of 10 Bq/L is used for gross beta. If the sample result is above 10 Bq/L the samples are submitted for Sr-90 analysis (to confirm the theory). Gamma spec analysis provides individual results for (Co-60, Nb-94, Sb-125, Cs-134, Cs-137(Ba-137m), Pm-147, and Am-241). If all of the gross beta is accounted for then the effort is complete. If not, WL staff evaluate the data against the most restrictive isotope not already detected and assume that is what it is (most likely Tc-99). If the value is above the MAC for Tc-99 (200 Bq/L) WL staff confirm that it is present. If it is not that particular isotope staff continue the search (Cl-36, Ni-63, etc). The alpha emitter with the most restrictive MAC and likely to be present is uranium (0.5 Bq/L/20 ppb). Since the groundwater in the WL area contains natural uranium (~2 to 200 ppb) it is the most likely alpha present. The rock surrounding the WL site is slightly enriched in uranium and its decay products including Ra-226. We also know that if uranium is present, then the progeny of uranium can contribute to the alpha and beta activity (0.025 to 0.045 Bq/ppb gross alpha and 0.016 to 0.035 Bq/ppb gross beta, there is higher contributions if the samples is counted right after collection versus one week later). If uranium (and uranium progeny) does not account for the alpha activity (1 ppb uranium is ~ 0.025 Bq/L gross alpha) present staff would review the gamma spec analysis to see if Am-241 is present as it is an indicator of the presence of plutonium isotopes. If the value is above the MAC for Am-241 and/or plutonium, the samples are sent for plutonium analysis. If the value is still above the MAC for that isotope staff would continue the search.

5.4.5 Monitoring to provide an indication of unusual or unforeseen conditions

The EMP serves as a second line of defence by detecting unusual levels in the environment in the event of an unknown release of activity that was not detected by other early warning systems (e.g. leak detection, administrative/action levels).

The detection of significant deterioration in the quality of surface water in the course of tracking the environmental performance of facilities leads to follow-up investigations of the cause of that deterioration.

5.4.6 Verify model predictions, refine models, and reduce uncertainty in model predictions

Monitoring at all potential critical group locations generates results that can be used to verify the predictions and reduce the uncertainty made by the DRL model, as well as to refine the DRL model.

Aquatic emissions data concurrent with water sampling will be available from the effluent monitoring program. The emissions can be used with hydrological data to model water concentrations to verify aquatic dilution factors.

5.4.7 Monitoring to demonstrate due diligence

One objective of environmental monitoring is to increase the credibility of the image of a facility in the eyes of the public. CNL has adopted the approach that they will maintain a more extensive EMP than the minimum specified in the regulations.

Since the DRL model has not suggested any likelihood of human health effects from radionuclides released from WL, and since CNSC RegDoc-3.1.1 [77] requires reporting of doses for persons at critical group or groups locations, monitoring at other locations demonstrates due diligence. Similarly, since the monitoring to check on effluent control and continuing containment is precautionary, it also serves to demonstrate due diligence.

5.5 Step 5: Performance and Acceptance Criteria

5.5.1 Performance criteria

Performance criteria for the EMP are defined in terms of

- the percent of planned samples obtained; and
- the percent of samples within data acceptance criteria (Section 5.5.4).

It is expected that a certain number of samples each year will be unavailable due to sampling equipment malfunction, garden crop failures, or other logistical reasons. The minimum targets for the number of planned samples to be obtained for acceptable EMP performance are listed in Table 5-14, with all parameters meeting data acceptance criteria.

The 90% and 75% targets are based on the potential effect that missing a monthly or quarterly sample would have on the annual average concentrations. In both cases, based on expected variability among samples, one missing sample would not significantly affect the annual average, or unacceptably reduce the precision in dose assessments based on average concentrations.

Table 5-14
Targets for Percent of Planned Samples to be Obtained in all Environmental Media

Collection frequency	Minimum target for % of planned samples obtained
Weekly	90%
Monthly	90%
Quarterly	75%
Semi-annual	100%
Annual	100%

5.5.2 Acceptance Criteria

1. **QV Limits**: The acceptance criteria in place on Quality Verification (QV) measurements for WL are established and documented in the lab level quality verification procedures as listed in [49]:

The handling of sample data for those samples is included in the program's *Environmental Monitoring Program* procedure [6].

2. **Sample Unavailability**: Sample unavailability for the Effluent Verification Monitoring Program (EVMP) could be the result of a number of circumstances; for example sampling according to the monitoring schedule was missed, the collected sample was contaminated or lost, an automatic sampler failure, etc. Acceptance Criteria for such events are shared company-wide and therefore are outlined in *Management and Monitoring of Emissions* [9], along with steps which need be taken to compensate for the missed data.

5.5.3 LMDLs versus WL Monitoring Limits:

Table 5-11 and Table 5-12 and compares the programs current Laboratory Method Detection Limits (LMDLs) for each parameter to the applicable monitoring limit(s) for that parameter. The program's LMDLs are all well below the benchmark values therefore ensuring that the monitoring results can be used to demonstrate compliance with these values.

5.5.4 Data acceptance criteria

The Environmental Management group conducts frequent internal checks of their technical capabilities as they perform their measurements. These are referred to as Quality Verification tests, and are grouped as follows according to purpose:

- Contamination Tests, such as measurement of the reagent blank, establish the level of analyte present resulting from contamination of the analysis system or system components. Acceptance criteria for these performance tests are related to each analyte's method detection limit.
- Reproducibility Tests, such as measurement of sample replicates, establish the relative precision of the method(s). To be acceptable, replicate measurements must agree within limits established by long-term method performance.
- Accuracy Tests, such as blanks or samples, each spiked with known amounts of the analyte(s), establish the presence or absence of any biases due to sample matrix, sample preparation, or instrument function. To meet acceptance criteria, the spike quantity must be recovered within limits established by long-term method performance.

These internal quality verification tests are summarized and reported on each year and assessed against acceptance criteria.

In addition Environmental Management group participates in semi-annual proficiency testing programs and the results of these tests are summarized and included in the Environmental Monitoring report.

Samples sent to contract laboratory for analysis include;

- Animal, Fish and Vegetation samples for gross alpha, gross beta and Gamma Spectrometry,
- Soil sediments for gross alpha, gross beta and Gamma Spectrometry, and
- Groundwater and groundwater samples for gross alpha, gross beta, Sr-90, and Gamma Spectrometry.

Certificates of analysis are reviewed and results of all the analyses are verified to be within acceptance criteria.

The data acceptance criteria for specific parameters and environmental media are established by the Quality Assurance group in conjunction with the Environmental Management team. The criteria are applicable to the results of QC samples that are associated with each batch of program samples analyzed.

Quality assurance test results are compared against the acceptance criteria. Failures are grouped in accordance with analytical method used to evaluate them and tracked through CNL's ImpAct system for trending purpose. The failed results are investigated to determine if they have significant effect on the validity of analysis results. Corrective action plans associated with the non-conformances are initiated and all of the associated non-conformances are being tracked through CNL's ImpAct system. All affected results are reviewed and sample aliquots are reprocessed, where required.

A series of annual memos are prepared documenting the lab/field team performance acceptance criteria and a summary is included in the annual Environmental Monitoring report [67].

5.6 Step 6: Detailed design of the EMP

5.6.1 Planned samples and analyses

The detailed design of the EMP, including a schedule of the planned samples and analyses, is provided in the EMP monitoring schedule [10].

6. MODIFICATION OF THE EMP

Periodic reviews and annual performance assessments are the processes for making changes (i.e. reductions or additions) to the media, locations, or parameters being monitored as part of the EMP. If necessary, changes can also be made during the program year. The decision and rationale for any changes are formally documented as per the requirement in *Environmental Monitoring Program* [6].

6.1 Additions to the EMP

Additions to the EMP are made in the context of the systematic informed planning process described in Section 5.

6.2 Reduction of monitoring

Deletion of samples from the EMP and reductions in sampling or analysis frequency are appropriate if the changes do not impact the effectiveness of the EMP.

In cases where the absence of anomalous results and/or the absence of results above the detection level are observed over a five year monitoring period, the monitoring frequency may be reduced based on the professional judgment of EMP Staff. Consideration is given to operational experience, the results of the local population survey (e.g. the survey indicates the absence or unavailability of the sample media), and the results of historical monitoring (e.g. the results demonstrate that the contaminants are not present).

If there is a need to reduce the frequency of sample collection or analysis, the justification should include an evaluation showing that the increased sampling interval does not impact the accuracy of the results (e.g. longer analysis intervals may not be appropriate for radionuclides with a short half-life). This can be done by comparing the sample results at the current monitoring frequency with the sample results at the proposed monitoring frequency using appropriate statistical methods.

Reductions in monitoring can be absolute or can be made under the caveat that the parameters be periodically (e.g. every five years) analysed in order to confirm their continued absence. This periodic re-checking is referred to as “confirmational monitoring”. Should the contaminants be detected in anomalous concentrations from the confirmational monitoring, the previous sampling frequency is restored.

TABLES

1. SCOPE

This document outlines the framework in place at Canadian Nuclear Laboratories' (CNL) Whiteshell Laboratories (WL) for the Integrated Environmental Monitoring Program as required by the company-wide procedures *Management and Monitoring of Emissions* [1], *Environmental Monitoring Programs* [2] and the *Protection and Monitoring of Groundwater* [3], as well as the WL Environmental Assessment Follow-Up Program [4] specification document and the *Environmental Protection Program Radiological and Non-Radiological Monitoring Services Quality Assurance Plan* [5].

This framework is applicable to all individual monitoring programs which comprise WL's Integrated Environmental Monitoring Program; therefore this document includes:

a) Program details which are <u>WL-specific</u> and common among each of the individual programs (e.g. program reviews).

This framework document does <u>not</u> include:

a) Program details which are not common among all of the individual programs making up WL's Integrated Environmental Monitoring Program; instead these details are included in the specific programs' monitoring plan(s) (e.g. the systematic informed planning process used to develop each program); or,

Program details which are company-wide (instead these are included in the company-wide procedures [1], [2], [3] and [5]).

Given the large amount of documentation in place to fulfill this program, this framework document is intended to be used by the WL Environmental Protection (EnvP) Program as a convenient tool to both document and communicate the structure which is in place for the WL Integrated Environmental Monitoring Program.

2. PURPOSE

Firstly, this framework document provides an overview of the WL site and its operations, providing key information of the site's environmental aspects for which the site's Integrated Environmental Monitoring Program has been developed (Section 4). This outline is then followed by an introduction of the Integrated Environmental Monitoring Program, (Section 4.2). Lastly, details on the monitoring program's execution, specifically those execution details which are common to all of the individual monitoring programs making up the Integrated Monitoring Program are provided, including: associated documentation (Section 5.2.1), program reviews (Section 5.2.2), program objectives (Section 5.2.3), and program responsibilities and training (Section 5.2.4).

3. DEFINITIONS

Refer to Appendices A and B in 900-509200-PDD-001, Environmental Protection Program Description Document [6] and Management and Monitoring of Emissions [1] for definitions and acronyms pertaining to this document. For additional terms, refer to the Acronyms, Abbreviations, and Definitions of Terms web page on the CNL Intranet.

4. OVERVIEW

4.1 WL Site Operations

Whiteshell Laboratories (WL) was established by Atomic Energy of Canada Limited (AECL) in the early 1960s to carry out nuclear research and development activities. The site is a Class 1B nuclear facility which encompasses an area of 4,375 hectares as shown in Figure 1. The WL site is owned by Atomic Energy of Canada Ltd. (AECL) and operated by CNL under a licence [7] issued by the CNSC. The WL site is located near Pinawa, Manitoba; approximately 100 kilometres northeast of Winnipeg, on the east bank of the Winnipeg River. It is downstream from the towns of Pinawa and Seven Sisters Falls, and upstream of the communities of Lac du Bonnet and Pine Falls.

The Whiteshell Reactor-1 (WR-1) organic-cooled experimental test reactor was shut down in 1985. AECL made a business decision in 1997 to discontinue most of the research programs and operations at WL. Subsequently, AECL received government concurrence in 1998 to proceed with actions to achieve closure of WL.

In 2014, Canadian Nuclear Laboratories (CNL) Ltd. was created as a wholly owned subsidiary of AECL. Implementation of the Government-Owned, Contractor-Operated model was achieved with share transfer of CNL from AECL to Canadian National Energy Alliance (CNEA) in 2015 September.

Activities to complete the orderly decommissioning of the WL site, following the general plan laid out in the Comprehensive Study Report [9] supporting the approval of the Environmental Assessment of the WL Decommissioning Project have been underway since 2003 January.

The Whiteshell document WL-508200-PRO-212 [8] lists the main nuclear facilities at the WL site. The Nuclear Facilities are: Concrete Canister Storage Facility, Active Liquid Waste Treatment Center, Shielded Facilities, Waste Management Area, Research and Development Facilities Complex (Building 300), Health and Safety Facilities (Building 402 and B305), and WR-1 Reactor.

The major operating facilities are the Shielded Facilities, and the WMA. The Shielded Facilities includes the Hot Cell Facility and the Immobilized Fuel Test Facility area which includes a decontamination center and waste processing/handling area. Areas undergoing sampling and characterization activities include WR-1 Reactor Building and Active Liquid Waste Treatment Center (ALWTC). The ALWTC was shut down near the end of 2017, and is now being decommissioned. In total, these facilities are the major sources of radiological airborne effluent releases from the site. The primary source of liquid effluent releases at WL is the process water outfall (Outfall), which discharges continuously to the Winnipeg River. The secondary source of liquid effluent is the sewage lagoon (Lagoon), which is normally discharged semi-annually to the Winnipeg River.

Finally, the site contains numerous smaller non-nuclear facilities, development and analytical laboratories and support facilities (Power House, various workshops, maintenance shops, etc.). Industrial boilers are operated at the Power House to provide steam heating to the majority of the site, while some facilities in the outer areas are heated with propane.

Waste management facilities designed for the storage or disposal of wastes are located in WMA. Radiological and non-radiological contaminants that appear in groundwater down gradient of the WL WMA and other monitoring sites are largely the result of early operations.

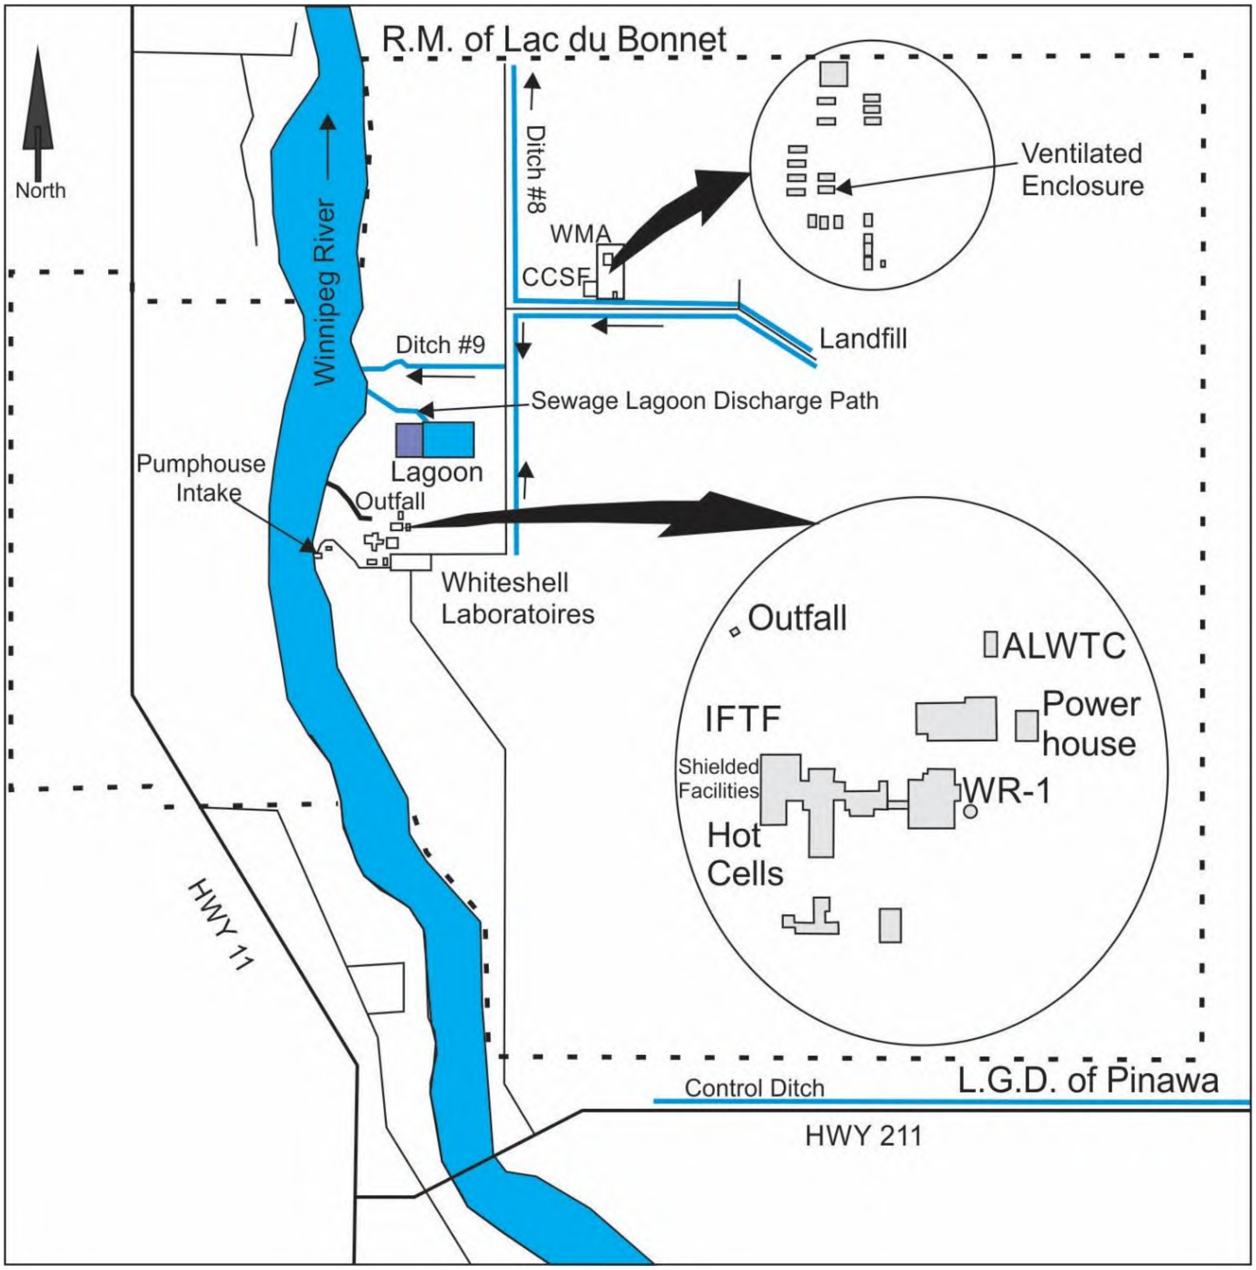

Figure 1: Near Field Map of WL Site

4.2 WL's Integrated Environmental Monitoring Program

WL's Integrated Environmental Monitoring Program is designed to track radiological and non-radiological contaminants throughout the different compartments of the geosphere, atmosphere, and biosphere and consists of three distinct programs: the Effluent Verification Monitoring Program (EVMP), the Environmental Monitoring Program (EMP) and the Groundwater Monitoring Program (GWMP) (see Figure 2). Historically, WL's Effluent and Environmental Monitoring Programs have been separated into radiological and non-radiological components which continue to be evident in the program's documentation structure; however, it should be noted that the combining of these programs into a single effluent and a single environmental program has been initiated and is reflected in recently revised and created documentation.

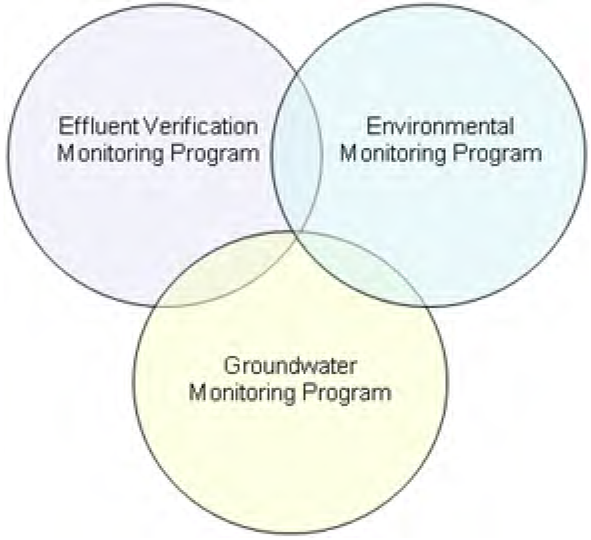

Figure 2: WL's Monitoring Programs which make up the Site's Integrated Environmental Monitoring Program

Each of the programs aligns with the associated Canadian Standards Association (CSA) Standard as outlined in Figure 5.

The monitoring and evaluation of environmental impacts from WL operations and decommissioning activities is carried out using a wide range of effluent, groundwater and environmental monitoring activities that enable the measurement of concentrations and fluxes of contaminants in every significant compartment involved in the migration of contaminants throughout the environment. The exchange of environmental data and evaluations of conditions and environmental performance between these activities provides an integrated approach to monitoring the fate of contaminants in the environment, and this integration (depicted pictorially as the overlapping of the circles in Figure 2) also ensures consistency among the various monitoring programs in terms of monitoring location and parameter. The network of contaminant pathways is illustrated in a general sense in Figure 3 with the first tier of potential impact from a facility or operation being its effluents (airborne and waterborne) and, for some facilities, groundwater.

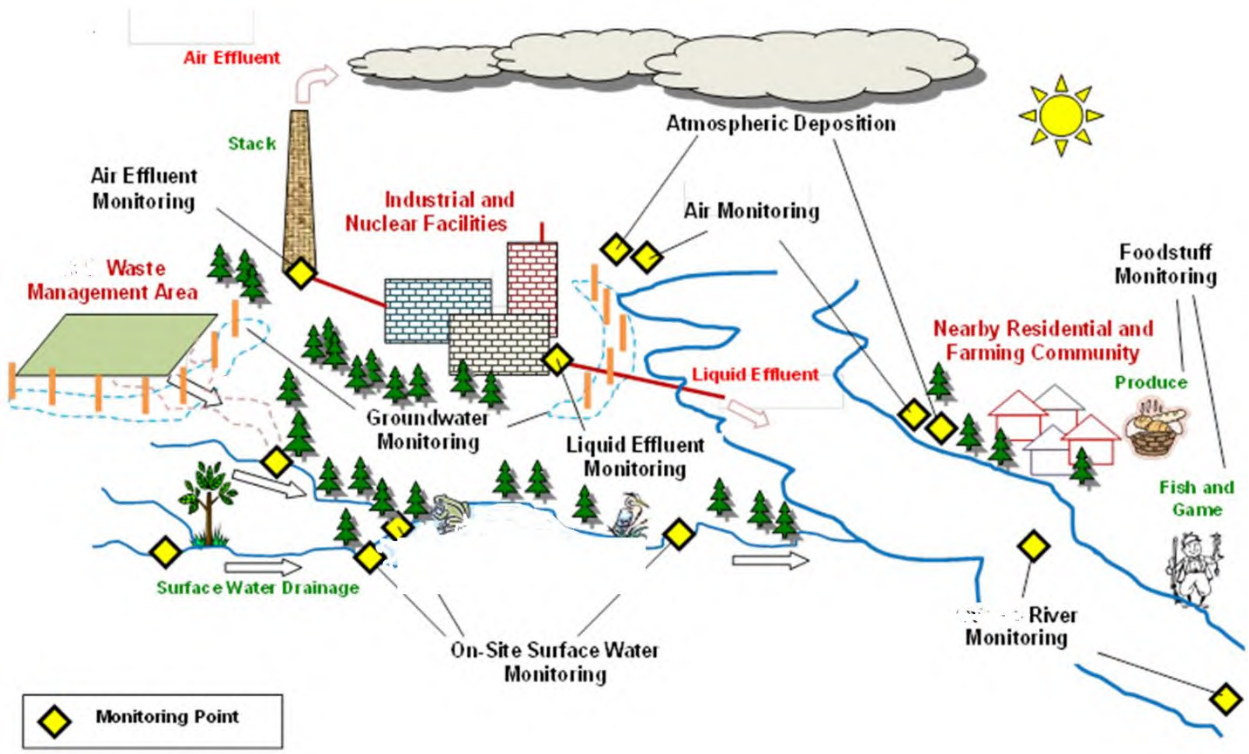

Figure 3: The Integrated Environmental Monitoring Program Concept

Waterborne effluents, whether storm water, or treated facility waste waters, can affect the quality of nearby surface waters and in turn lead to exposure to humans living downstream of the site. These exposures can result from the ingestion of water or of food (e.g., fish) that has come into contact with the water, and from direct exposure through swimming or bathing.

Airborne effluents can initially lead to exposure through inhalation and air immersion, and the deposition of airborne contaminants onto soil, vegetation, and surface water. Airborne effluents can also lead to uptake by farm and game animals through a variety of direct and indirect exposure pathways, leading to the contamination of animal products such as milk, beef, poultry etc. The monitoring of contaminants in airborne and waterborne effluents and in the different environmental compartments (e.g., surface water, drinking water, vegetable produce, milk, beef, game animals, etc.) along exposure pathways is therefore an important element in evaluating the impacts of WL operations.

The transfer of contaminants from facilities and site operations to soils can have an impact on the quality of groundwater as infiltrating rainwater and snow melt flush the contaminants downward into the water table. Unlike the contaminant migration associated with airborne and waterborne effluents, this form of contaminant migration in the environment occurs very slowly because of the slow velocity of groundwater travel and the tendency of most contaminants to adsorb to soil and organic matter, reducing their mobility in groundwater. Nevertheless, contaminants that do exhibit mobility in groundwater flow systems eventually discharge into surface waters on the WL site which drain to the Winnipeg River, or discharge directly to the Winnipeg River. Sampling of groundwater and surface water along this migration route is therefore another important element in evaluating the impacts of site operations.

In effect, as illustrated in Figure 4, the Integrated Environmental Monitoring Program achieves three main tasks:

a) Direct release monitoring (via the EVMP);

b) Contaminant pathways monitoring (via the combination of EVMP, GWMP, and EMP); and,

c) Biological effects monitoring (via the EMP).

This integrated approach to environmental monitoring means that the evaluation of impacts on the environment from WL facilities and operations is carried out in a logical, comprehensive manner and is used to demonstrate compliance and protection of the environment and health and safety of the public.

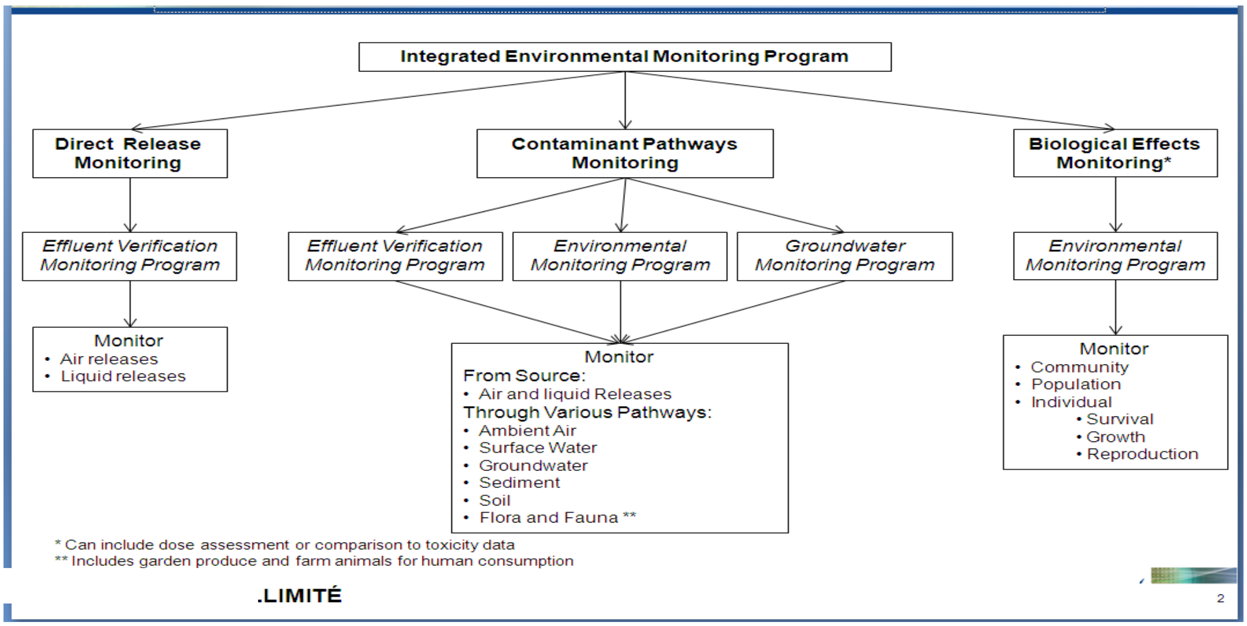

Figure 4: WL's Integrated Environmental Monitoring Program Design

5. PROCESS

5.1 Dynamic Nature of WL's Integrated Environmental Monitoring Program

The Integrated Environmental Monitoring Program is dynamic in nature meaning that it is continually evolving based on various sources of information received. A depiction of this dynamic nature is illustrated in Figure 5.

The basis for the program is the WL Comprehensive Study Report (CSR) [9] and the WL Site's Dose Model [10]. The CSR [9] and the results from the Environmental Assessment Follow-up Program (EAFP) [4] serve to evaluate the risk to relevant human and non-human biota receptors resulting from exposure to contaminants and stressors related to the WL site and its activities, and recommends further monitoring or assessment as needed based on the results, to clarify risks or reduce uncertainties in this assessment. The preparation of a site wide environmental risk assessment was initiated in 2020 to update the information in the CSR [9]. This assessment will generate conclusions which will be used to design and update the monitoring program, as well as any recommendations for further work required to adequately determine WL's environmental risk. These recommendations are generally completed separately from the routine monitoring program in Supplementary Studies/Special Investigations, however, they could result in changes to the routine programs.

The WL Site Dose Model [10] provides Derived Release Limits (DRLs) for the operation of the nuclear facilities at WL which are limits that apply to emissions of both radiological airborne and waterborne effluents during normal operations below which WL is required to operate. These limits represent release rates that correspond to human critical group exposures at the public dose limit.

Additional routine inputs into the monitoring program which can result in changes to the program design include:

a) Data generated from the routine monitoring itself (e.g., a trend of interest is identified resulting in the need to increase monitoring in that location);

b) Outcomes of both integrated and annual program reviews (e.g., the need for an additional monitoring location based on site past or present operations);

c) Changes made to regulatory documents and/or standards;

d) Findings identified through internal or external audits (e.g., recommendation for the use of a different analysis method); and/or

e) Changes in the routine operations of the site which are periodically reviewed through the Environmental Aspect Assessment process (e.g., a new process is implemented resulting in a change to a facility's routine emissions).

In addition to these routine inputs, there are various non-routine sources of information which can influence the monitoring program. These may include:

a) Reviews of non-routine operations through an environmental review and/or Environmental Assessment;

b) Supplementary Studies/ Special Investigations which could result from recommendations stemming from the site EAFP, program audits, program reviews, etc. NOTE: These studies are run in parallel with the monitoring programs and the results, if applicable, are fed into the routine monitoring program; and/or

c) Results from Operation Control Monitoring (OCM), performed by site facilities for the early detection of unplanned releases. This data can be used by the monitoring program for troubleshooting purposes, if needed.

All of the routine and non-routine inputs identified above incorporate the ALARA concept (As Low As Reasonably Achievable) which meets the continual improvement requirement of CNL's management of its environmental impacts and risks.

The progress on, and results from, the EAFP are reviewed on an annual basis. Site Dose Model documents are updated approximately every five years, integrating knowledge from the routine and non-routine information gathering which has taken place since the last update. These updates result in conclusions and recommendations for the monitoring programs and the cycle once again commences.

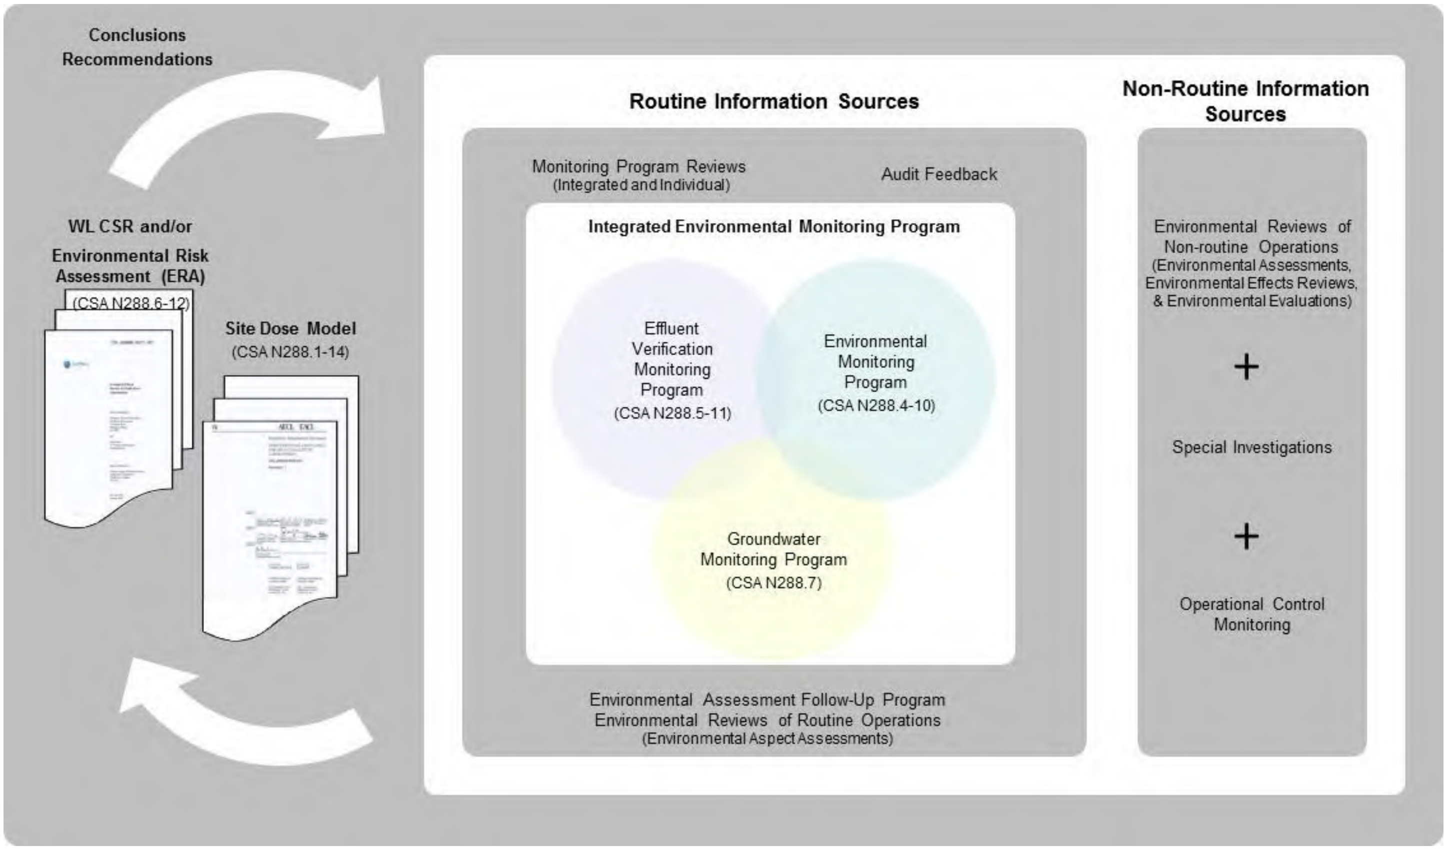

Figure 5: Dynamic Nature of WL's Integrated Environmental Monitoring Program

5.2 Execution of WL's Integrated Environmental Monitoring Program

This section provides information on the execution of the WL Integrated Environmental Monitoring Program. Program details which are common to all constituent programs that make up WL's Integrated Environmental Monitoring Program are found in [1], [2], [3] and [5].

5.2.1 Program Documentation

5.2.1.1 Procedure Structure

Figure 6 illustrates the hierarchy of the documentation outlining WL's Integrated Environmental Monitoring Program.

This first tier of documents, depicted by the top row, consists of three requirements documents, outlining the general requirements and responsibilities for each of the three monitoring programs. Note: Those with "CW" and "900" numbering are CNL company-wide procedures.

This framework document is in Tier 2; it takes the requirements from the first tier documents and introduces WL's Integrated Environmental Monitoring Program, addressing commonalities among the three separate programs.

The third tier of documents include the details of each of the monitoring programs, including reasoning behind the monitoring which is in place for each individual program.

The fourth tier of documents consists of methods and details, including specifics on Quality Assurance (QA) programs, for each laboratory performing monitoring for the Integrated Environmental Monitoring Program.

The entire program is encompassed by a Quality Assurance Plan, ensuring that the data used by the program are technically valid.

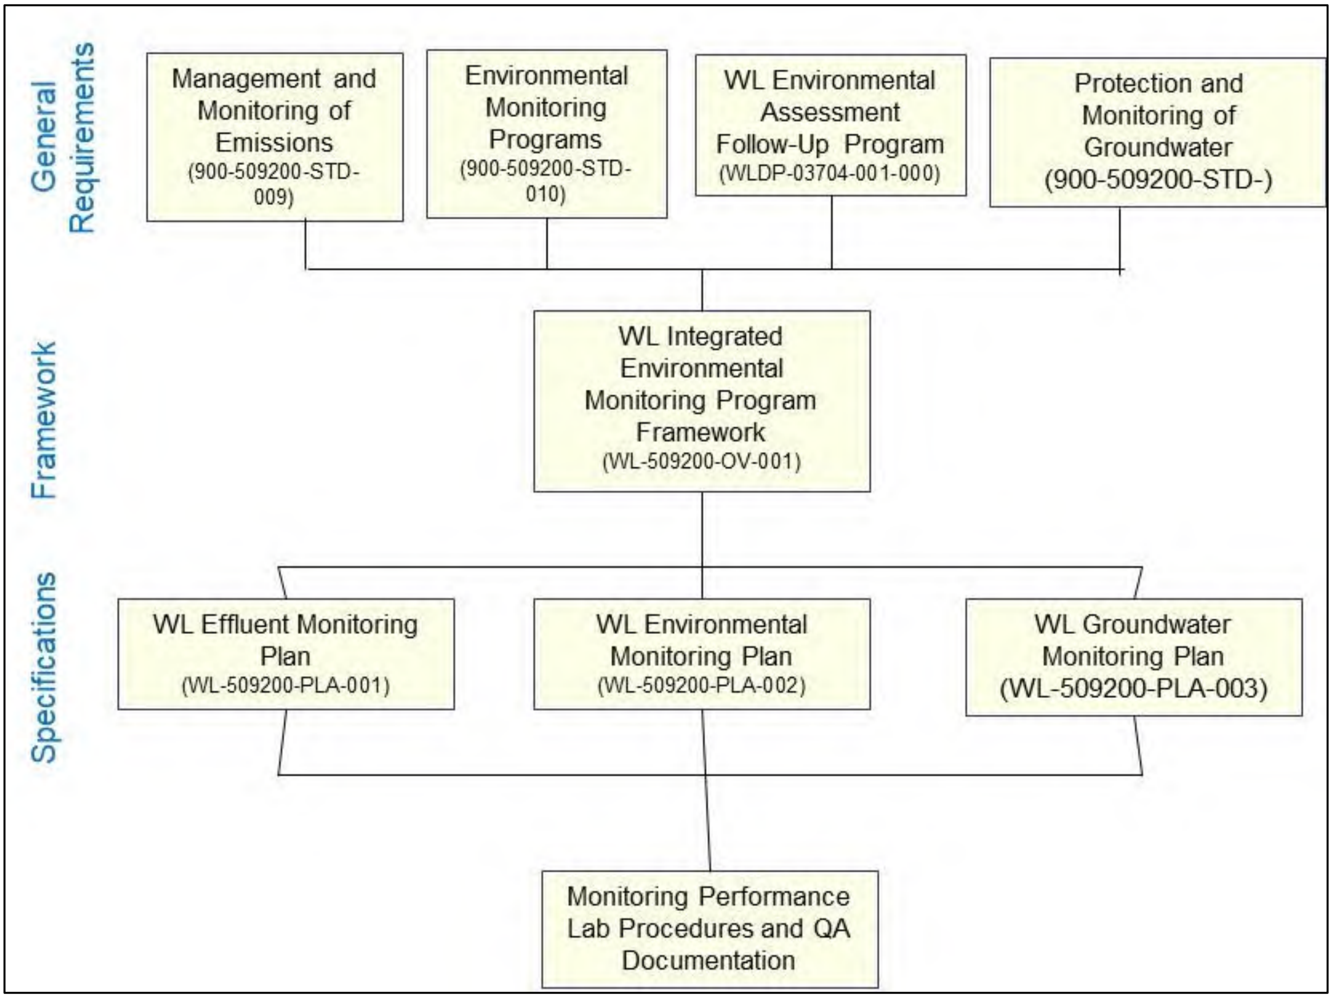

Figure 6: WL's Integrated Environmental Monitoring Program Documentation Structure

The complete list of the documentation used to execute the program is included in Appendix B.

5.2.1.2 Reports

WL produces a consolidated annual report each calendar year to present the details from the monitoring under the Integrated Environmental Monitoring Program (latest issue - *Progress Report on the Environmental Assessment Follow-Up Program for Whiteshell Laboratories* [11]) as required by the WL's Site Licence [7].

In addition to this overall report, further details on the EVMPs are reported each calendar year in the WL *Annual Safety Review in 2019* [12] (latest report) as required by the CSA Standard N288.5 [13], and the EMP and GWMP in the annual *WL Environmental Monitoring Report* [14] (latest report) and the *Progress Report on the Environmental Assessment Follow-Up Program for Whiteshell Laboratories* [11] as required by CSA Standard N288.4 [15] and CSA Standard N288.7 [16].

5.2.1.3 Roadmap of WL's Compliance with the CSA N288.4, N288.5 and N288.7 Standards

As evidenced in *Management and Monitoring of Emissions* [1] and *Environmental Monitoring Programs* [2], the WL Radiological and Non-radiological EMP and EVMPs have been revised to come into compliance with CSA Standard N288.4 [15] and the CSA Standard N288.5 [13]. This is also true of the *Protection and Monitoring of Groundwater* [3]. A companywide document has been issued in compliance with CSA N288.7 [16]. The series of program documentation developed and under development to ensure this compliance is mapped out in Appendix A for reference purposes.

As noted in the CSA Standards themselves, compliance with the Standard requires adherence to only those clauses in the standard qualified by the terms "shall: or "shall consider". Not all parts of the Standards will be implemented at WL. Instead some recommendations and permissions (i.e., those parts of the Standard which use the wording "should" or "may") have not been adopted for various reasons. These decisions are documented in gap analyses [17], [18], [19] and [20] performed between the monitoring programs and the CSA Standards.

5.2.2 Program Reviews

5.2.2.1 Annual Assessments

In addition to the continual review of monitoring results throughout the year, an annual assessment of the data for each of the individual monitoring programs is completed in preparation of the programs' annual reports [11], [12] and [14].

This annual assessment includes the comparison of results to previous years' results looking to identify trends etc., which may not have become evident during the routine review of the data.

A hydrogeological assessment is performed each year by a contractor [21].

Findings from these annual assessments are included in the programs' annual reports [11], [12] and [14]. Any required changes to the program resulting from this review are captured in the program's subsequent Annual Program Review (see Section 5.2.2.2).

5.2.2.2 Annual Program Review

Individual periodic Program Reviews are completed for the EMP, EVMPs and GWMP. These programs are scheduled based on the calendar year (CY); as such, efforts are made to complete the reviews and incorporate any changes into the program's monitoring schedule in advance of the next year's sampling campaign.

Generally, these reviews cover:

a) The effectiveness of the existing program in accomplishing its objectives;
b) Any program design problems or gaps which have been identified;
c) Any program procedural problems (within EnvP or the labs);
d) A summary of monitoring results from the previous CY and any major issues where the Program needs to be changed; and
e) The disposition of corrective actions from the last Annual Program Review.

Documentation of the reviews is prepared (e.g., meeting minutes, report etc.). Resulting actions from the review are included in both the review's report as well as CNL's action tracking database (ActionWay). Closure verification of the actions by the action's responsible manager may be required thereby ensuring verification of the effectiveness of these corrective actions is completed.

5.2.2.3 Periodic Integrated Environmental Monitoring Program Review

An Integrated Periodic Program Review covering the EVMP, EMP and GWMP involves re-examining the need for and the adequacy of the Integrated Monitoring Program and each of its elemental programs through:

a) A review of the criteria for determining the need to establish an EVMP, EMP and GWMP; and
b) A review of the adequacy of the program with respect to the identified environmental risks on the site which were identified through the CSR, or other studies of similar type.

Documentation of the review in the form of a formal report or memo is prepared.

The need for, and adequacy of, the program addressed shall be reviewed:

a) prior to applying for a licence to begin a new stage in the lifecycle of the nuclear facility or licensed activity;
b) following the proclamation or amendment of any pertinent statute, regulation, licence, or permit that governs the nuclear facility or licensed activity;
c) following any change in the commitments made to a regulatory agency or other stakeholder;
d) following any modification of the physical plant or any change in the nuclear facility or licensed activity or the site ecology or surrounding land uses that has the potential to substantially alter the nature of what is covered under the program;
e) following any change in the receiving environment that that has the potential to significantly change the potential risk to pathways/receptors as a result of the nuclear facility or licensed activity
f) following a significant revision to the CSM;
g) following any update or revision of the Environmental Assessment and/or ERA for the facility;
h) if otherwise required by the Authority Having Jurisdiction;
i) if new scientific advances require change to the approach of a program; and,
j) not more than five years after the last review of the need for and adequacy of the program.

5.2.3 Program Objectives

5.2.3.1 Effluent Verification Monitoring Program

The monitoring objectives of the WL EVMP are listed in the first column in Table 1 below. Note that the second column in Table 1 provides a linkage between the monitoring criteria listed in *Management and Monitoring of Emissions* [1] and the monitoring objectives. In effect, this linkage illustrates how the application of the effluent monitoring criteria (demonstrated in the individual monitoring plan [22]) helps ensure that monitoring activities fall directly under one or more of the programs' monitoring objectives.

Table 1: WL EVMP Monitoring Objectives

Monitoring Objectives	Effluent Verification Monitoring Criteria (taken from [1])
Primary Monitoring Objectives	
a) To demonstrate compliance with regulatory emission limits and any other regulatory requirements (e.g., Action Levels) concerning the emission of nuclear/hazardous substances from the source;	(a) (shall) If monitoring of the effluent stream is designated for monitoring in-, or is required to demonstrate compliance with-, a site or facility operating/decommissioning licence, statute, regulation, or permit, then that effluent stream shall be monitored. (h) (shall) If effluent monitoring of a contaminant or physical stressor is explicitly specified by a site or facility operating/decommissioning licence or required by a statute, regulation or permit to discharge, then that contaminant or physical stressor shall be monitored. (n) (should) If a contaminant is likely to approach or has the potential to exceed regulatory emission limits or internal emission limits, then that contaminant should be monitored. (o) (should) If a non-radioactive contaminant is a reportable substance under the National Pollutant Release Inventory (NPRI) and is released in an effluent stream at greater than 10% of the mass or concentration threshold for that contaminant, then it should be monitored.
b) To demonstrate adherence to internal levels set on emission amounts (e.g., Administrative Levels or Internal Investigation Levels), for purposes of effluent control;	(b) (shall) In the case of effluent streams not subject to Derived Release Limits (DRL), if the total Maximum Probable Emission Rate (MPER) for an effluent stream may exceed 1% of the applicable limits specified by the CNSC, then that effluent stream shall be monitored. (c) (should) If the total MPER for an effluent stream exceeds 0.0005 mSv per year to a member of an off-site critical group, then that effluent stream should be monitored. Normal emission rates, instead of MPER, may be used if the effluent stream has an Operational Control Monitoring Program (OCMP) in place. Note: The dose as a result of MPER emissions may be expressed as a fraction of the applicable Derived Release Limit (DRL) times the annual dose limit from which the DRL was derived. (l) (should) If the site-wide MPER for a radioactive contaminant exceeds 0.0001 mSv per year to a member of an off-site critical group, then that radioactive contaminant should be monitored. “70% Rule: The choice of effluent streams to monitor for this particular radioactive contaminant should be such that at least 70% of site emissions are monitored, e.g., monitor the top most significant effluent streams plus a sufficient number of other streams to ensure that at least 70% of site emissions of that radioactive contaminant are monitored. If this is not possible, then the need for monitoring for that radioactive contaminant should be assessed by an Environmental Specialist or equivalent based on professional judgment.

	Note: The dose as a result of MPER emissions may be expressed as a fraction of the applicable DRL times the annual dose limit from which the DRL was derived." (n) (should) If a contaminant is likely to approach or has the potential to exceed regulatory emission limits or internal emission limits, then that contaminant should be monitored.
c) To confirm the adequacy of controls on emissions from the source;	g) (should) In addition to the effluent streams mentioned above, locations with similar environmental conditions but without potential for facility-related effects (i.e., representative of natural background) should be included in the EVMP as reference. k) (shall) If there is an operational need to identify an unplanned or uncontrolled emission (reasonably foreseeable upset event) of a contaminant into the environment, then that contaminant shall be monitored.
d) To provide an indication of unusual or unforeseen conditions that might require corrective action or additional monitoring;	k) (shall) If there is an operational need to identify an unplanned or uncontrolled emission (reasonably foreseeable upset event) of a contaminant into the environment, then that contaminant shall be monitored.
e) To provide data to assess the level of risk on human health and safety, and the potential biological effects in the environment of the nuclear/hazardous substances of concern released from the facility; and	d) (should) If the effluent stream has potential to contribute to biological effects (as determined in an ERA or equivalent risk assessment), based on its constituent radioactive or non-radioactive contaminants, then that effluent stream should be monitored. e) (should) If the effluent stream contributes significantly to the dose/exposure for a receptor that has been identified as needing a dose/exposure assessment in an ERA or equivalent risk assessment, then that effluent stream should be monitored. Note: An effluent stream that contributes more than 10% of the relevant dose/exposure for the identified receptor can be considered to make a significant contribution. (i) (shall) If the results of an ERA or equivalent risk assessment indicate potential concern with the release of a contaminant, or with a physical stressor, then that contaminant or physical stressor shall be monitored. (j) (shall) If effluent monitoring of a contaminant supports a radiation dose assessment or assessment of potential exposure, then that contaminant shall be monitored. (m) (should) In the case of a waterborne effluent stream, and when no ERA (or equivalent risk assessment) exists that can provide more specific guidance on the parameter(s) to be monitored, if annual average contaminant concentrations at a point of discharge from CNL site property or to a permanent surface water body on site may exceed Guidelines for Canadian Drinking Water Quality (or equivalent) for a radioactive contaminant, then that contaminant should be monitored.

f) To confirm predictions in environmental assessments.	e) (should) If the effluent stream contributes significantly to the dose/exposure for a receptor that has been identified as needing a dose/exposure assessment in an ERA or equivalent risk assessment, then that effluent stream should be monitored. Note: An effluent stream that contributes more than 10% of the relevant dose/exposure for the identified receptor can be considered to make a significant contribution.
Secondary Monitoring Objectives	
a) To provide data for trend analysis;	q) (should) If monitoring is required for other business reasons (e.g., stakeholder concerns, due diligence, etc.).
b) To provide assurance to employees and the public on the effectiveness of effluent control;	(f) (should) If monitoring of the effluent stream is triggered under the Municipal/Industrial Strategy for Abatement (MISA) Program, then that effluent stream should be monitored. (p) (should) If effluent monitoring of a non-radioactive contaminant is triggered under the MISA Protocol, then that contaminant should be monitored.
c) To provide data which, when combined with the results of environmental monitoring and modelling, can be used to test or refine the models of the environment used in the ERA (or equivalent) or dose/exposure assessments;	(j) (shall) If effluent monitoring of a contaminant supports a radiation dose assessment or assessment of potential exposure, then that contaminant shall be monitored.
d) To provide baseline data and capability for monitoring and assessment in emergency conditions; and	(k) (shall) If there is an operational need to identify an unplanned or uncontrolled emission (reasonably foreseeable upset event) of a contaminant into the environment, then that contaminant shall be monitored. (q) (should) If monitoring is required for other business reasons (e.g., stakeholder concerns, due diligence, etc.).
e) Other business purposes (e.g., demonstrating due diligence, meeting a stakeholder commitment, etc.).	q) (should) If monitoring is required for other business reasons (e.g., stakeholder concerns, due diligence, etc.).

5.2.3.2 Environmental Monitoring Program

The monitoring objectives of the WL EMP are listed in the first column in Table 2 below. Note that the second column in Table 2 provides a linkage between the monitoring criteria listed in *Environmental Monitoring Programs* [2] and the monitoring objectives. In effect, this linkage illustrates how the application of the environmental monitoring criteria (demonstrated in the individual monitoring plan [23]) helps ensure that monitoring activities fall directly under one or more of the programs' monitoring objectives.

Table 2: WL EMP Monitoring Objectives

Monitoring Objectives	**Environmental Monitoring Criteria (taken from [2])**
Primary Monitoring Objectives	
a) To assess the level of risk on human health and safety, and the potential biological effects in the environment of the contaminants and physical stressors of concern arising from the facility;	(b) (shall) If a location is representative of a site's identified critical group(s), then this location shall be included in the EMP. (c) (should) If a location represents an area in which contaminants of concern, physical stressors of concern, or potential effects were identified in an ERA (or equivalent), then this location should be included in the EMP. (d) (should) Any locations in which contaminant Benchmark Values (BV) have been exceeded or are predicted to be exceeded should be included in the EMP. (e) (may) If a gradient in contaminant concentration is expected over a spatial extent, monitoring locations may be distributed along the gradient. (k) (shall) The concentration of a contaminant or the intensity of a physical stressor shall be measured if based on the results of an ERA (or equivalent), there is the potential for the contaminant or physical stressor to produce effects in the receiving environment. (m) (should) The radioactive contaminant(s) chosen for monitoring should be those estimated to contribute 1% or more of total radiation dose to members of a critical group. (r) (shall consider) Any environmental media that could contribute to the dose/exposure of a receptor that is anticipated to experience an effect shall be considered for inclusion in the EMP. (t) (should) Any environmental media in which contaminant BVs have been exceeded or are predicted to be exceeded should be considered for inclusion in the EMP for measurement of those same contaminants.
b) To demonstrate compliance with limits on the concentration and/or intensity of contaminants and physical stressors in the environment or their effect on the environment;	(a) (shall) If environmental monitoring of a location is required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or otherwise directed by a regulator, then that location shall be included in the EMP. (j) (shall) The concentration of a contaminant, intensity of a physical stressor, or effect on the environment shall be measured if required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or as otherwise directed by a regulator. (q) (shall) If environmental monitoring of specific media is required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or otherwise directed by a regulator, then that media shall be included in the EMP.
c) To check, independently of effluent monitoring, on the effectiveness of containment and effluent control, and provide	(f) (should) If environmental monitoring is being done to verify the effectiveness of containment and effluent controls, then monitoring

public assurance of the effectiveness of containment and effluent control;	should be in locations within reasonable proximity to the points of discharge and in the likely path of the discharges. (o) (may) The choice of contaminants to monitor in the environment may also be based on the following: i. The level of risk from a potential spill or other unintended release of contaminants from a facility is unknown or has been determined by the ERA (or equivalent) to be of concern; ii. The level of risk from unmonitored releases of contaminants from a facility is unknown or has been determined by an ERA (or equivalent) to be of concern; iii. The emission of contaminants is highly variable; and/or iv. There are other business reasons, i.e., stakeholder concerns, due diligence, etc. (p) (should) If environmental monitoring is being done to verify the effectiveness of containment and effluent controls, then monitoring should be for those contaminants that could potentially be present in effluent discharges.
d) Further to the objective described above, which provides an indication on effectiveness of <u>effluent</u> control, where waste storage facilities and contaminated lands exist, the objective is to provide an indication of unusual or unforeseen conditions that might require corrective action or additional monitoring such as groundwater monitoring; and	(f) (should) If environmental monitoring is being done to verify the effectiveness of containment and effluent controls, then monitoring should be in locations within reasonable proximity to the points of discharge and in the likely path of the discharges. (o) (may) The choice of contaminants to monitor in the environment may also be based on the following: i. The level of risk from a potential spill or other unintended release of contaminants from a facility is unknown or has been determined by the ERA (or equivalent) to be of concern; ii. The level of risk from unmonitored releases of contaminants from a facility is unknown or has been determined by an ERA (or equivalent) to be of concern; (p) (should) If environmental monitoring is being done to verify the effectiveness of containment and effluent controls, then monitoring should be for those contaminants that could potentially be present in effluent discharges.
e) To verify the predictions made by an ERA (or equivalent), Derived Release Limit (DRL) model, and/or Environmental Assessment (EA), refine the models used in the ERA (or equivalent), DRL model and/or EA, or reduce the uncertainty in the predictions made by the ERA (or equivalent), DRL model and/or EA.	(l) (should) The EMP should include contaminants relevant to the dose/exposure assessments that are normally part of an ERA (or equivalent). (s) (should) Any environmental media for which contaminants/physical stressors of concern were identified in an ERA (or equivalent) should be included in the EMP. (t) (should) Any environmental media in which contaminant BVs have been exceeded or are predicted to be exceeded should be considered for inclusion in the EMP for measurement of those same contaminants. (u) (should) Selection of the environmental media to be monitored should be based on the following principles:

	i. Where practical, monitoring should be done near the end of a pathway (i.e., closer to the receptor) to give dose/exposure estimates with fewer uncertainties that arise from inaccuracies in the models and transfer coefficients; ii. The fate and distribution of contaminants along the pathway linking the source to the receptor should be considered when selecting the media to be sampled; and The mobility of the receptor relative to the area of contamination should be considered when selecting the media to be sampled.
Secondary Monitoring Objectives	
a) To provide data required to support site restoration programs, site operations or to plan for future stages of the facility lifecycle (e.g., decommissioning);	(o) (may) The choice of contaminants to monitor in the environment may also be based on the following: There are other business reasons, i.e., stakeholder concerns, due diligence, etc.
b) To provide resources and data that can be of value during the response to an accident or upset, and in the recovery from such an event;	(o) (may) The choice of contaminants to monitor in the environment may also be based on the following: i. The level of risk from a potential spill or other unintended release of contaminants from a facility is unknown or has been determined by the ERA (or equivalent) to be of concern;
c) To demonstrate due diligence;	(g) (should) If environmental monitoring at a location is triggered by the MISA Protocol, then this location should be included in the EMP. i.(should) The non-radioactive contaminant(s) chosen for monitoring should be those triggered by the MISA Protocol.
d) To meet a stakeholder commitment; and	(o) (may) The choice of contaminants to monitor in the environment may also be based on the following: iv. There are other business reasons, i.e., stakeholder concerns, due diligence, etc.
e) For other business purposes (e.g., monitoring emissions to support international treaties).	(i) (should) Consideration should be given to establishing monitoring locations in nearby population centres (other than locations of identified or potential critical groups or locations identified in an ERA or equivalent) for the most dominant contaminants and environmental pathways where there is public concern regarding emissions. (o) (may) The choice of contaminants to monitor in the environment may also be based on the following: iv. There are other business reasons, i.e., stakeholder concerns, due diligence, etc.

5.2.3.3 Groundwater Protection and Monitoring Program

The monitoring objectives of the WL GWPP and GWMP are listed in the first column in Table 3 below. Note that the second column in Table 3 provides a linkage between the monitoring criteria listed in *Protection and Monitoring of Groundwater* [3] and the monitoring objectives. In effect, this linkage illustrates how the application of the environmental monitoring criteria (demonstrated in the individual monitoring plan [24]) helps ensure that monitoring activities fall directly under one or more of the programs' monitoring objectives.

Table 3: WL GWPP and GWMP Goals and Objectives

Monitoring Goals and Objectives	Groundwater Monitoring Criteria taken from [3] and [24].
General Goals	
a) Demonstrate compliance with requirements of the CNSC (e.g. RegDoc 2.9.1 [14]) concerning the protection of groundwater and monitoring for the release of nuclear and hazardous substances from facilities;	(b) (Shall) If there are significant inventories of dispersible nuclear or hazardous substances, and these inventories are, or have been, in a location where a release to the ground would not be detected by past or existing, in facility monitoring, than that facility shall be included in the GWMP; (f) (should) If a location is needed for detection, and possibly quantification, of leakage from a specific SSC;(i.e. proximity or near source monitoring)
b) Have control measures to prevent or minimize the release of nuclear or hazardous substances directly or indirectly to groundwater by design and operation of SSCs;	(b) (Shall) If there are significant inventories of dispersible nuclear or hazardous substances, and these inventories are, or have been, in a location where a release to the ground would not be detected by past or existing, in facility monitoring, than that facility shall be included in the GWMP; (f) (should) If a location is needed for detection, and possibly quantification, of leakage from a specific SSC;(i.e. proximity or near source monitoring)
c) Understand the potential risks to human and ecological receptors from releases that affect GW;	(c) (should) If contaminants of concern, physical stressors of concern, or potential effects were identified in an ERA (or equivalent), then that area should be included in the GWMP; b) (should) The monitoring program should address the COPCs derived from the evaluation of sources and potential releases to the subsurface described in Section 4.3.2.2 (i.e. those identified in the EA, ERA, and CSM) and those identified in the objectives of the GWMP.
d) Have in place a GWMP to provide timely data confirming that uncontrolled releases are not occurring and, if uncontrolled releases do occur, to signal when and where, and, e) Protect the identified groundwater end-uses that are potentially affected by releases to groundwater.	(b) (Shall) If there are significant inventories of dispersible nuclear or hazardous substances, and these inventories are, or have been, in a location where a release to the ground would not be detected by past or existing, in facility monitoring, than that facility shall be included in the GWMP; (f) (should) If a location is needed for detection, and possibly quantification, of leakage from a specific SSC;(i.e. proximity or near source monitoring) (d)(should) If contaminant benchmark values for soil or groundwater have been exceeded or are predicted

<table>
<tr><td colspan="2"></td><td>to be exceeded, than that area should be included in the GWMP.

(d) (should) In addition to monitoring for the presence of nuclear and hazardous substances, physical parameters such as conductivity and hydraulic head should also be considered. Physical parameters can serve well in indicating changing conditions

(g) (should) Indicator parameters should be considered to provide earlier identification of a COPC released to the subsurface than would monitoring that was limited to the contaminants of more concern (e.g., tritium, conductivity).</td></tr>
<tr><td colspan="3">(shall) Specific groundwater protection goals for a site shall:</td></tr>
<tr><td colspan="2">a) Be developed based on the conceptual site model (CSM);</td><td>g) (should) If a location is needed to further characterize the groundwater flow system or other aspects of the conceptual site model.

c) (should) The parameters selected for groundwater monitoring should be integrated with the parameters used in the EMP to track the fate of COPC migration throughout different environmental media (i.e., integration of pathways monitoring). Complete accordance between COPCs monitored in groundwater and downgradient surface water bodies is not required due to the limited mobility of many COPC’s;</td></tr>
<tr><td colspan="2">b) Include protection of human and ecological receptors potentially affected by GW contamination; and,</td><td>c) (should) If contaminants of concern, physical stressors of concern, or potential effects were identified in an ERA (or equivalent), then that area should be included in the GWMP</td></tr>
<tr><td colspan="2">c) Include consideration of risks from potential contamination of the soil by groundwater or by non-aqueous phase liquids.</td><td>b) (shall) If there are significant inventories of dispersible nuclear or hazardous substances, and these inventories are or have been, in a location where a release to the ground would not be detected by past or existing, in facility monitoring, then that facility shall be included in the GWMP.</td></tr>
<tr><td colspan="2">(should) The development of specific groundwater protection goals for a site should take into account baseline conditions.</td><td>d) (should) Locations up-gradient of the facility should be included in the GWMP as baseline conditions</td></tr>
<tr><td colspan="3">(shall) Where a GWMP is determined to be necessary for a site or facility, the applicability of the following general objectives for a GWMP shall be considered:</td></tr>
<tr><td>a)</td><td>support the overall, general, and specific goals of the Groundwater Protection Program (GWPP);</td><td>(a) (shall) If groundwater monitoring is required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or otherwise directed by a regulator, then that area shall be included in the GWMP;</td></tr>
</table>

		(b) (Shall) If there are significant inventories of dispersible nuclear or hazardous substances, and these inventories are, or have been, in a location where a release to the ground would not be detected by past or existing, in facility monitoring, than that facility shall be included in the GWMP; (f) (should) If a location is needed for detection, and possibly quantification, of leakage from a specific SSC;(i.e. proximity or near source monitoring) (d)(should) If contaminant benchmark values for soil or groundwater have been exceeded or are predicted to be exceeded, than that area should be included in the GWMP. (d) (should) In addition to monitoring for the presence of nuclear and hazardous substances, physical parameters such as conductivity and hydraulic head should also be considered. Physical parameters can serve well in indicating changing conditions (g) (should) Indicator parameters should be considered to provide earlier identification of a COPC released to the subsurface than would monitoring that was limited to the contaminants of more concern (e.g., tritium, conductivity).
b)	demonstrate compliance with requirements of the Authority Having Jurisdiction (AHJ) concerning the release of nuclear and hazardous substances from the source;	(a) (shall) If groundwater monitoring is required by any statute, regulation, licence, or permit that governs the operation of the nuclear facility, or otherwise directed by a regulator, then that area shall be included in the GWMP; a) (shall) The monitoring program shall address the COPC's and physical stressor required by any statute, regulation, licence or permit that governs the operation of a nuclear facility.
c)	provide data to verify the predictions made and models used in the Environmental Assessment (EA) or Environmental Risk Assessment (ERA), or reduce the uncertainty in predictions;	(c) (should) If contaminants of concern, physical stressors of concern, or potential effects were identified in an ERA (or equivalent), then that area should be included in the GWMP; b) (should) The monitoring program should address the COPCs derived from the evaluation of sources and potential releases to the subsurface described in Section 4.3.2.2 (i.e. those identified in the EA, ERA, and CSM) and those identified in the objectives of the GWMP.
d)	characterize baseline groundwater flow and groundwater quality;	A baseline characterization study was conducted prior to the operation of the site. (k) (should) Locations up-gradient of the facility should be included in the GWMP as background reference conditions
e)	characterize groundwater flow and groundwater quality during other phases of a site's lifecycle;	(l) (should) If a location is needed to further characterize the groundwater flow system or other aspects of the conceptual site model.

f)	provide an indication of unusual or unforeseen conditions that might require corrective action or additional monitoring;	(d)(should) If contaminant benchmark values for soil or groundwater have been exceeded or are predicted to be exceeded, than that area should be included in the GWMP. (d) (should) In addition to monitoring for the presence of nuclear and hazardous substances, physical parameters such as conductivity and hydraulic head should also be considered. Physical parameters can serve well in indicating changing conditions (g) (should) Indicator parameters should be considered to provide earlier identification of a COPC released to the subsurface than would monitoring that was limited to the contaminants of more concern (e.g., tritium, conductivity).
g)	to the extent possible, monitor for releases from high risk Structures, Systems, and Components (SSCs) associated with a given facility;	(f) (should) If a location is needed for detection, and possibly quantification, of leakage from a specific SSC;(i.e. proximity or near source monitoring (g) (should) Indicator parameters should be considered to provide earlier identification of a COPC released to the subsurface than would monitoring that was limited to the contaminants of more concern (e.g., tritium, conductivity).
h)	evaluate monitoring data against groundwater evaluation criteria related to nuclear and hazardous substances in groundwater;	Data evaluation criteria (i.e., criteria against which the data are evaluated in order to determine the significance or meaning of the data) are developed for interpretation of monitoring results in relation to the objectives of the monitoring program. It should be noted that not all parameters measured under the GWMP have an associated criterion; these generally consist of measures of environment indicators instead of pollutants; or they could be pollutants but have not had guidelines developed yet as they have not been federally or provincially identified as priority pollutants requiring the development of a guideline
i)	provide information to assess risks from site-affected groundwater to human health and the environment;	(g) (should) If a location is needed for the detection of COPC release from a distributed source; (h) (should) If a location is needed for detection of COPC releases from a region or site containing multiple potential sources; (i) (should) If a location is needed for periodic evaluation of ongoing COPC migration from a past or ongoing release to the subsurface; (i.e. Plume Monitoring) (j) (should) If a location is needed for monitoring at the perimeter of a facility or an operation; Note: Perimeter can refer to the legal property boundary or a defined area of interest within the site
j)	provide site characterization data to address gaps in the site CSM;	(g) (should) If a location is needed for the detection of COPC release from a distributed source; (h) (should) If a location is needed for detection of COPC releases from a region or site containing multiple potential sources;

		(i) (should) If a location is needed for periodic evaluation of ongoing COPC migration from a past or ongoing release to the subsurface; (i.e. Plume Monitoring) (j) (should) If a location is needed for monitoring at the perimeter of a facility or an operation; Note: Perimeter can refer to the legal property boundary or a defined area of interest within the site (c) (should) The parameters selected for groundwater monitoring should be integrated with the parameters utilized in the EMP to track the fate of COPC migration throughout different environmental media (i.e., integration of pathways monitoring).
k)	Demonstrate due diligence;	(e) (may) If monitoring (of an area) is required for other business reasons, (e.g. stakeholder concerns, due diligence).
l)	Meet a stakeholder commitment;	(e) (may) If monitoring (of an area) is required for other business reasons, (e.g. stakeholder concerns, due diligence).
m)	or other business reasons;	(e) (may) If monitoring (of an area) is required for other business reasons, (e.g. stakeholder concerns, due diligence).

5.2.4 Program Responsibilities & Training

Table 4 below outlines the positions responsible for all activities and responsibilities required in the EVMP and EMP, with a reference to the relevant training documentation for those positions. Note that program activities, and qualification and training requirements for staff with overall responsibility for the GWMP, are listed in the WL Groundwater Monitoring Program Specification document [35].

Table 4: Effluent Verification, Environmental and Groundwater Monitoring Program Activities and Positions Responsible

Activity/Role	Responsibilities	Dept.	Position(s) Responsible	Reference to Relevant Training Documentation
Environmental Risk Assessment (or equivalent)	Coordinate and assist with periodic updates to the WL Environmental Assessment Follow-up Program	EM and WLDP	• Decommissioning and Environmental Protection Program Staff	ENVP-509200-PLA-009 [25]
Monitoring Program Design & Implementation Oversight	Develop and maintain the design of the monitoring programs, and oversee their implementation.	EM	• Radiological Monitoring Specialist • Non-Radiological Monitoring Specialist • Groundwater Monitoring Specialist	ENVP-509200-PLA-009 [25]

Activity/Role	Responsibilities	Dept.	Position(s) Responsible	Reference to Relevant Training Documentation
			• Contract Hydrologist/Hydrogeologist	Qualifications outlined in Statement of Work
Sampling & Analytical Procedures	Sample collection and sample analysis and field measurements.	EM and Licensing	• Technician/Technologist /Quality Assurance Staff • Section Head	WL-514200-GDI-001 [26] and WL-514200-QAP-001 [27] training sections in each analytical procedure
		RP	• RP Surveyor/RP Surveyor Assistant • Section Head	900-508740-STD-001[28] CW-508740-TNA-003 [29] 191-508740-OP-033 [31]
	Sampling and analysis techniques *(providing expert advice on the adequacy of sample and analysis techniques, and overseeing the development of new techniques as needed)*	EM	• Section Head • Laboratory Technologist	WL-514200-GDI-001 [26] and WL-514200-QAP-001 [27], and training sections in each analytical procedure
		RP	• Technical Support Health Physicist	900-508740-STD-001[28] RADP-508740-TPL-006 [30]
Interpretation of Data	Interpret data generated by the monitoring programs.	EM	• Radiological Monitoring Specialist • Non-Radiological Monitoring Specialist • Groundwater Monitoring Specialist • Contract Hydrologist/Hydrogeologist	ENVP-509200-PLA-009 [25] Qualifications outlined in Statement of Work
Quality Assurance and Quality Control	Sampling design, measurements, and QC *(design and oversee implementation of the sampling and measurement QC)*	EM	• Radiological Monitoring Specialist • Non-Radiological Monitoring Specialist • Groundwater Specialist	ENVP-509200-PLA-009 [25]
		EM	• Technician/Technologist /Quality Assurance Staff • Section Head	WL-514200-GDI-001 [26] and WL-514200-QAP-001 [27], and training sections in each analytical procedure

Activity/Role	Responsibilities	Dept.	Position(s) Responsible	Reference to Relevant Training Documentation
		Licensing	• Quality Assurance Representative	WL-514200-GDI-001 [26] and WL-514200-QAP-001 [27], and training sections in each analytical procedure
		RP	• Technical Support Health Physicist	900-508740-STD-001[28] RADP-508740-TA-006 [30]
			• RP Surveyor/RP Surveyor Assistant • Section Head • Instrument Technologist	900-508740-STD-001[28] CW-508740-TNA-003 [29] 191-508740-OP-033 [31]
	Equipment maintenance	EM	• Section Head • Laboratory Technologist	WL-514200-GDI-001 [26] and WL-514200-QAP-001 [27], and training sections in each analytical procedure
		Licensing	• Quality Assurance Representative	WL-514200-GDI-001 [26] and WL-514200-QAP-001 [27], and training sections in each analytical procedure
		RP	• Instrument Technologist • RP Surveyor • Section Head	900-508740-STD-001[28] CW-508740-TNA-003 [29] Note: Every time a new piece of equipment is acquired, the manufacturer's training course is taken. 191-508740-OP-033 [31]
			• Technical Support Health Physicist	900-508740-STD-001[28] RADP-508740-TA-006 [30]
	Non-conformance management and performance verification *(managing non-conformances, schedu*	EM	• Radiological Monitoring Specialist • Non-Radiological Monitoring Specialist • Groundwater Specialist	ENVP-509200-PLA-009 [25]

Activity/Role	Responsibilities	Dept.	Position(s) Responsible	Reference to Relevant Training Documentation
	ling checks for procedural compliance, intralaboratory and interlaboratory checks, etc.)	EM	• Technician/Technologist • Quality Assurance Representative • Section Head	WL-514200-GDI-001 [26] and WL-514200-QAP-001 [27], and training sections in each analytical procedure
		RP	• RP Surveyor • Section Head • Instrument Technologist	900-508740-STD-001[28] CW-508740-TNA-003 [29] 191-508740-OP-033 [31]
	Procedures and sample verification *(developing and validating the sampling and analytical procedures)*	EM	• Section Head • Environmental Specialists • Environmental Chemist/Scientist • Contract Hydrologist/Hydrogeologist • Environmental Technologists	WL-514200-GDI-001 [26] and WL-514200-QAP-001 [27], and training sections in each analytical procedure Qualifications outlined in Position Description Qualifications outlined in Statement of Work
		RP	• RP Surveyor • Section Head • Instrument Technologist	900-508740-STD-001[28] CW-508740-TNA-003 [29] 191-508740-OP-033 [31]
			• Technical Support Health Physicist	900-508740-STD-001[28] RADP-508740-TA-006 [30] 191-508740-OP-033 [31]
	Records and data management	EM	• Technician • Technologist • Section Head • Quality Assurance Representative	WL-514200-GDI-001 [26] and WL-514200-QAP-001 [27], and training sections in each analytical procedure
		RP	• RP Surveyor • Section Head	900-508740-STD-001[28] CW-508740-TNA-003 [29] 191-508740-OP-033 [31]

Activity/Role	Responsibilities	Dept.	Position(s) Responsible	Reference to Relevant Training Documentation
Program Reviews	Periodically review the adequacy of monitoring program design and effectiveness of programs.	EM	• Radiological Monitoring Specialist • Non-Radiological Monitoring Specialist • Groundwater Specialist	ENVP-509200-PLA-009 [25]
Annual Report	Prepare annual reports summarizing the results of the monitoring programs.	EM	• Radiological Monitoring Specialist • Non-Radiological Monitoring Specialist • Groundwater Specialist • Contract Hydrologist	ENVP-509200-PLA-009 [25] Qualifications outlined in Statement of Work
Program Audits	Periodic audits of the monitoring programs.	External	• Contractor	Qualifications outlined in Statement of Work

APPENDIX A RELATIONSHIPS BETWEEN CSA STANDARDS AND WL DOCUMENTATION

TABLE A-1 CSA STANDARD N288.4 – 10, ENVIRONMENTAL MONITORING PROGRAMS AT CLASS I NUCLEAR FACILITIES AND URANIUM MINES AND MILLS

Contents of CSA N288.4	Applicable CNL Document(s) [Location of Requirement (R) & Location of Implementation Details (I)]
4 Objectives of an environmental monitoring program (EMP) 4.1 General objectives 4.2 Additional objectives	R: 900-509200-STD-010 – *Environmental Monitoring Programs* – Lists the EMP objectives. I: WL-509200-OV-001 - W*L's Integrated EMP Framework* – Details the WL monitoring program's specific objectives pulled from those identified in 900-509200-STD-010. I: WL-509200-PLA-002 - *Environmental Monitoring Plan* – Details how these objectives are met through the monitoring performed at WL.
5 Criteria for establishing and revising an environmental monitoring program 5.1 General 5.2 Criteria for determining the need to establish an EMP 5.3 Criteria for determining the need to revise an EMP	R: 900-509200-STD-010 – *Environmental Monitoring Programs* – Lists both sets of criteria. I: WL-509200- PLA-002 - *Environmental Monitoring Plan* – Details which of these criteria were met thereby requiring WL to establish an EMP.
6 Design of an EMP 6.1 General 6.2 Systematic planning process for the development of an EMP	R: 900-509200-STD-010 – *Environmental Monitoring Programs* – Outlines the systematic process to be used when designing an EMP. I: WL-509200- PLA-002 - *Radiological Environmental Monitoring Plan*- Details the systematic process specifically used by WL to design the EMP.
7 Guidance for the design elements of an EMP 7.1 General 7.2 Contaminants and physical stressors to be monitored 7.3 Receptors of interest 7.4 Measures of biological effect 7.5 Media to be measured or sampled 7.6 Monitoring locations 7.7 Monitoring duration, frequency, intensity and magnitude 7.8 Supplementary studies 7.8.1 General 7.8.2 Entrainment and Impingement 7.8.3 Wildlife interactions with traffic and structures 7.8.4 Measurements of meteorological or hydrological data	R: 900-509200-STD-010 – *Environmental Monitoring Programs* – Outlines the monitoring which should be in place for a CNL EMP. I: WL-509200- PLA-002 - *Environmental Monitoring Plan*- Outlines the monitoring in place for WL's EMP.
8 Sampling and analytical procedures 8.1 General 8.2 Sampling collection 8.3 Sampling analysis and field measurements 8.4 Sampling and analysis techniques	R: EnvP-01913-QAP-001 – *EnvP Program Quality Assurance Plan* - Includes both requirements and guidance for sample collection and analysis. I: WL-509200-OV-001 - *WL's Integrated EMP Framework* - Provides a list of laboratory documents which cover the sample station design, sample collection and sample analysis in place for the WL EMP.

Contents of CSA N288.4	Applicable CNL Document(s) [Location of Requirement (R) & Location of Implementation Details (I)]
9 Interpretation of data 9.1 General 9.2 Statistical analysis 9.3 Uncertainty 9.3.1 General 9.3.2 Types and sources of uncertainty 9.3.3 Assessment, reduction, and reporting of uncertainties 9.3.4 Significant figures 9.4 Exposure and dose assessment	R: 900-509200-STD-010 – *Environmental Monitoring Programs* – includes general requirements on the handling of uncertainty, significant figures and dose assessment for a CNL EMP. R: EnvP-01913-QAP-001 – *EnvP Program Quality Assurance Plan* – Includes requirements and guidance on measurement uncertainty. I: WL-509200-OV-001 – W*L's Integrated EMP Framework* – Includes a list of laboratory analytical procedures for data handled under the EMP as well as applicable procedures used when reporting lab results. I: WL-509253-PRO-001 - Estimating Measurement Uncertainty Arising From Measurement And Sampling. I: WL-509243-ASR-XXXX – *Annual Environmental Monitoring at WL* – Provides the interpretation of the data collected under the EMP. I: WL-509246-ASR-XXX – Annual Progress Report on the Environmental Assessment Follow-up Program for WL – provides additional interpretation of the data collected under the EMP.
10 Quality Assurance (QA) and Quality Control (QC) 10.1 General 10.2 Roles and responsibilities 10.3 Sampling design and QC 10.4 Measurements and QC 10.4.1 Equipment maintenance 10.4.2 Non-conformance 10.4.3 Performance verification 10.4.4 Procedures and sample verification 10.5 Records	R: 900-509200-STD-010 – *Environmental Monitoring Programs* – Outlines requirement to have a QA/QC program. R: EnvP-01913-QAP-001 – *EnvP Program Quality Assurance Plan* - Details the required design of an EMP QA/QC program. I: WL-509200-OV-001 - W*L's Integrated EMP Framework* - Provides a list of laboratory documents which detail procedural steps to execute QA/QC as well as a list of laboratory QA plans and Maintenance and Calibration requirements for associated equipment. I: WL-509200-PLA-002 - *Environmental Monitoring Plan* – Provides details on the field QA/QC in place and points to EnvP-01913-QAP-001 and lab procedures containing specific QA information.
11 Reporting, review and audit 11.1 General 11.2 Reporting 11.3 Annual assessment of the EMP 11.4 Periodic review of the EMP 11.5 Audits	R: 900-509200-STD-010 – *Environmental Monitoring Programs* – Provides requirements for reporting, reviews and audits. I: WL-509200-OV-001 – W*L's Integrated EMP Framework* – Includes details on WL's reporting and program reviews (but not audits) in place to meet these requirements.
12 Staff qualification and training 12.1 Personnel qualifications 12.2 Training 12.3 Maintenance of training records	R: 900-509200-STD-010 – *Environmental Monitoring Programs* – Outlines that staff involved in the monitoring programs must be qualified and trained. R: EnvP-01913-QAP-001 – *EnvP Program Radiological and Non-radiological Monitoring Services Quality Assurance Plan* – Outlines that staff involved in the monitoring programs must be qualified and trained. I: WL-509200-OV-001 - W*L Integrated EMP Framework* – Includes the list of training documents for staff involved in the EMPs including training needs and qualifications (Note: Many of these are company-wide processes). I: 900-510200-STD-001 – Training Analysis I: 900-510200-FM-003 – Personnel Qualifications and Training Needs
13 Documentation	R: 900-509200-STD-010 – *Environmental Monitoring Programs* – Outlines which documents are required to be kept. R: EnvP-01913-QAP-001 – *EnvP Program Quality Assurance Plan* – Outlines the documents associated with QA/QC which must be kept, including details such as retention time. I: WL-509200-OV-001 – WL*'s Integrated EMP Framework* – Includes details on WL's reports and program reviews (but not audits) in place to meet these requirements.

TABLE A-2
CSA STANDARD N288.5-11, EFFLUENT MONITORING PROGRAMS AT CLASS I NUCLEAR FACILITIES AND URANIUM MINES AND MILLS

Contents of CSA N288.5	Applicable CNL Document(s) [Location of Requirement (R) & Location of Implementation Details (I)]
4 Objectives of an effluent monitoring program 4.1 General objectives 4.2 Additional objectives	R: 900-509200-STD-009 – *Management and Monitoring of Emissions* – Lists the EVMP objectives. I: WL-509200-OV-001 - W*L's Integrated EMP Framework* – Details the WL monitoring program's specific objectives pulled from those identified in 900-509200-STD-009. I: WL-509200-PLA-001 – *WL Effluent Verification Monitoring Plan* – Details how these objectives are met through the monitoring performed at WL.
5 Criteria for establishing an effluent monitoring program	R: 900-509200-STD-009 – *Management and Monitoring of Emissions* – Lists EVMP establishment criteria. I: WL-509200-PLA-001 – WL *Effluent Verification Monitoring Plan* – Details which of these criteria were met thereby requiring WL to establish an EVMP.
6 Design of an Effluent Monitoring Program 6.1 General 6.2 Systematic planning process for the development of an Effluent Monitoring Program	R: 900-509200-STD-009 – *Management and Monitoring of Emissions* - Outlines this systematic process to be used by any CNL site when designing an effluent monitoring program. I: WL-509200-PLA-001 – *WL Effluent Verification Monitoring Plan* – Details the systematic process specifically used by WL to design the EVMP.
7 Guidance for the design elements of an Effluent Monitoring Program 7.1 General 7.2 Nuclear and Hazardous Substances to be monitored 7.3 Selecting Effluent Streams to be Monitored 7.4 Initial Characterization of an Effluent Stream 7.5 Choice of Monitoring Strategy (air and water) 7.6 Sampling locations (air and water) 7.7 Sampling frequency (air and water) 7.8 Sampling Volume 7.9 Supplementary Studies and Other Monitoring Activities	R: 900-509200-STD-009 – *Management and Monitoring of Emissions* - Outlines what the design of an CNL EVMP should include. I: WL-509200-PLA-001 – WL *Effluent Verification Monitoring Plan* – Outlines the monitoring in place for WL's EVMP.
8 Sampling and analytical procedures 8.1 General 8.2 Representative Sampling 8.3 Sampling of waterborne effluents 8.4 Sampling of airborne effluents 8.4 Sampling and analytical techniques	R: EnvP-01913-QAP-001 – *EnvP Program Quality Assurance Plan* - Includes both requirements and guidance for sample collection and analysis. I: WL-509200-OV-001 – WL*'s Integrated EMP Framework* - Provides a list of laboratory documents which cover the sample station design, sample collection and sample analysis in place for the WL EVMP.
9 Interpretation of data 9.1 General 9.2 Statistical analysis 9.3 Uncertainty 9.3.1 General 9.3.2 Assessment, reduction, and reporting of uncertainties 9.3.3 Significant Figures	R: 900-509200-STD-009 – *Management and Monitoring of Emissions* – includes general requirements on the handling of uncertainty, significant figures and interpretation of data for an CNL EVMP. R: EnvP-01913-QAP-001 – *EnvP Program Quality Assurance Plan* – Includes requirements and guidance on measurement uncertainty. I: WL-509200-OV-001 – W*L's Integrated EMP Framework* – Includes a list of laboratory analytical procedures for data handled under the EVMP as well as applicable procedures used when reporting lab results. I: WL-00583-ASR-XXXX, *Effluent Verification Monitoring at Chalk River Laboratories in YYYY*– Provides the interpretation of the annual data collected under the WL EVMP.

Contents of CSA N288.5	**Applicable CNL Document(s)** **[Location of Requirement (R) & Location of Implementation Details (I)]**
10 Quality assurance (QA) and quality control (QC) 10.1 General 10.2 Roles and responsibilities 10.3 Measurements and QC 10.3.1 Equipment maintenance 10.3.2 Non-conformance 10.3.3 Performance verification 10.3.4 Procedures and sample verification 10.4 Records	R: 900-509200-STD-009 – *Management and Monitoring of Emissions* - Outlines requirement to have a QA/QC Program. R: EnvP-01913-QAP-001 – Details the required design of an EVMP QA/QC program. I: WL-509200-OV-001 - W*L's Integrated EMP Framework* - Provides a list of laboratory documents which detail procedural steps to execute QA/QC as well as a list of laboratory QA plans and Maintenance and Calibration requirements for associated equipment.
11 Reporting, review and audit 11.1 General 11.2 Reporting 11.3 Periodic review of the Effluent monitoring program 11.4 Annual assessment of the Effluent Monitoring program 11.5 Audits	R: 900-509200-STD-009 – *Management and Monitoring of Emissions* - Provides requirements for program reporting, reviews and audits. I: WL-509200-OV-001 – W*L's Integrated EMP Framework* – Includes details on WL's program reporting and reviews (but not audits) in place to meet these requirements.
12 Staff qualification and training 12.1 Personnel qualifications 12.2 Training 12.3 Maintenance of training records	R: 900-509200-STD-009 – *Management and Monitoring of Emissions* – Provides requirement for staff involved in the monitoring programs to be qualified and trained. R: EnvP-01913-QAP-001 – *EnvP Program Radiological and Non-radiological Monitoring Services Quality Assurance Plan* – Outlines that staff who work with the monitoring programs must be qualified and trained. I: WL-509200-OV-001 - W*L Integrated EMP Framework* – Includes the list of training documents for staff involved in the EVMPs including training needs and qualifications (Note: Many of these are company-wide processes). I: 900-510200-STD-001 – Training Analysis I: 900-510200-FM-003 – Personnel Qualifications and Training Needs
13 Documentation	R: 900-509200-STD-009 – *Management and Monitoring of Emissions* – Outlines which documents are required to be kept. R: EnvP-01913-QAP-001 – *EnvP Program Quality Assurance Plan* – Outlines the documents associated with QA/QC which must be kept, including details such as retention time. R: 900-511300-MCP-001 Rev. 0 RECORDS MANAGEMENT and 900-511300-STD-003, Document Control – details the process to define which documents are required to be kept under EVMPs Company-wide including the type of record, the regulatory requirement for keeping it, the retention period and the Locations of the records to be kept. I: WL-509200-OV-001 – W*L's Integrated EMP Framework* – Includes details on WL's program reports, reviews and audits in place to meet these requirements.

TABLE A-3
CSA STANDARD N288.7-15, GROUNDWATER MONITORING PROGRAMS AT CLASS I NUCLEAR FACILITIES AND URANIUM MINES AND MILLS

Contents of CSA N288.7	Applicable CNL Document(s) [Location of Requirement (R) & Location of Implementation Details (I)]
4 Goals and Objectives of Groundwater Protection and Groundwater Monitoring program (GWMP) 4.1.1 Overall Goal 4.1.2 General Goals 4.2 General Objectives	R: 900-509200-STD-015 – Protection and Monitoring of Groundwater R: WLDP-03704-001-000 – Environmental Assessment Follow-Up Program for Whiteshell Laboratories. I: WL-509200-OV-001 - W*L's Integrated EMP Framework* – Details the WL monitoring program's specific objectives pulled from those identified in 900-509200-STD-015. I: WL-509200-PLA-003 – *Groundwater Monitoring Plan* – Details how these objectives are met through the monitoring performed at WL.
5 Criteria for establishing groundwater protection and groundwater monitoring programs. 5.1 Criteria for the need for establishing Groundwater Protection Programs (GWPP) 5.2 Criteria for determining the need to establish a Groundwater Monitoring Program (GWMP)	R: 900-509200-STD-015 – Protection and Monitoring of Groundwater. R: WLDP-03702-041-000-0008 Rev. 2, WLDP-03702-041-000-0009 Rev. 2, WLDP-03702-041-000-0010 Rev. 0, *"Whiteshell Laboratories Decommissioning Project Comprehensive Study Report"*, Volumes 1, 2, and 3, 2001 March – Volumes 1 and 2 and 2001 November – Volume 3. R: WLDP-03704-001-000 – Environmental Assessment Follow-Up Program for Whiteshell Laboratories. I: WLDP-03705-041-000-0022– *Monitoring Plan for the Ongoing Assessment of the WMA, Lagoon and Landfill Physical and Chemical Hydrogeological Conditions* –discusses the criteria for establishing groundwater protection and groundwater monitoring programs. I: WL-509200-PLA-003 – *Groundwater Monitoring Plan* – Details which of these criteria were met thereby requiring WL to establish a GWMP.
6 Design of a GWPP 6.1 General 6.2 Establishing a Conceptual Site Model 6.3 Prevention and Minimization of Potential Releases to Groundwater 6.4 Development of Specific Groundwater Protection Goals 6.5 Development of a Groundwater Monitoring Program 6.6 Development of Other Programs Associated with Groundwater Protection	R: 900-509200-STD-015 – Protection and Monitoring of Groundwater R: and I: WLDP-03705-041-000-0022– Monitoring Plan for the Ongoing Assessment of the WMA, Lagoon and Landfill Physical and Chemical Hydrogeological Conditions –discusses the groundwater flow system and migration. R: WLDP-03704-001-000 – Environmental Assessment Follow-Up Program for Whiteshell Laboratories. R: 900-509200-STD-009 – *Management and Monitoring of Emissions* R: and I: 900-509200-PRD-001 Program Requirements Document, Groundwater Protection is assured through adherence to the Environmental Program Protection requirements. In particular, Storage Tank Systems for Petroleum Products and Allied Petroleum Products Regulations, PCB regulations, Wastewater Effluent Systems Regulations, Management of Designated Toxic Substances and Waste Management Facilities Regulation. I: WLDP-03704-ENA-004 – EAFP: Enhanced Monitoring Program, Hydrogeology Plan – Whiteshell Laboratories Waste Management Area, Landfill and Lagoon I: WL-509200-PLA-003 – *Groundwater Monitoring Plan* – Details which of these criteria were met thereby requiring WL to establish a GWMP. I: 900-509200-STD-005 – Environmental Incident Reporting, Investigation, and Mitigation. I: WL-508600-PRO-723 – Waste Management and Effluent Control I: WL-509200-PLA-001 – WL Effluent Verification Monitoring Plan I: WL Environmental Aspect Assessment and Operational Control Assessment Reports I: Environmental Protection Category 1 to 4 training as well as subject specific training.

Contents of CSA N288.7	Applicable CNL Document(s) [Location of Requirement (R) & Location of Implementation Details (I)]
7. Design of a GWMP 7.1 General 7.2 Systematic planning process for the development of a Groundwater Monitoring Program 7.3 Selection of Monitoring Strategy 7.4 Nuclear and hazardous substances to be monitored 7.5 Boreholes and Monitoring wells 7.6 Sampling Locations 7.7 Sampling Frequency 7.8 Supplementary Studies and other Monitoring Activities 7.8.2 Refinement of conceptual site model 7.8.3 Characterization of potential effects from plume discharge	R: 900-509200-STD-015 – Protection and Monitoring of Groundwater I: WL-509200-PLA-003 – *Groundwater Monitoring Plan*
8 Sampling and analytical procedures 8.1 General 8.2 Sampling equipment 8.3 Sample collection 8.4 Sample volume, containers, and preservatives 8.5 Field measurements and sample analysis	R: EnvP-01913-QAP-001 – *EnvP Program Quality Assurance Plan* - Includes both requirements and guidance for sample collection and analysis. I: WL-509200-OV-001 - *WL's Integrated EMP Framework* - Provides a list of laboratory documents which cover the sample station design, sample collection and sample analysis in place for the WL EMP.
9 Interpretation of data 9.1 Objectives of data 9.2 Data evaluation 9.3 Parameters 9.4 Comparison to groundwater evaluation criteria 9.5 Statistical Analysis 9.6 Contextual considerations when interpreting results 9.7 Data management 9.8 Significant Figures	R: 900-509200-STD-015 – Protection and Monitoring of Groundwater – includes requirements for data interpretation, evaluation, management and significant figures R: EnvP-01913-QAP-001 – *EnvP Program Quality Assurance Plan* – Includes requirements and guidance on measurement uncertainty. I: WL-509200-OV-001 – W*L's Integrated EMP Framework* – Includes a list of laboratory analytical procedures for data handled under the GWMP as well as applicable procedures used when reporting lab results. I: WL-509253-PRO-001 - Estimating Measurement Uncertainty Arising From Measurement And Sampling. Includes a discussion on Significant Figures. I: WL-509243-ASR-XXXX – *Annual Environmental Monitoring at WL* – Provides the interpretation of the data collected under the GWMP. I: WL-509246-ASR-XXX – Annual Progress Report on the Environmental Assessment Follow-up Program for WL – provides additional interpretation of the data collected under the GWMP. I: WLDP-03704-041-000 – Annual Hydrogeological Assessment prepared by Contract Hydrogeologist provides interpretation of groundwater flow and conditions.

13 Documentation 13.1 Groundwater protection program documentation 13.2 Groundwater monitoring program documentation	R: 900-509200-STD-015 – Protection and Monitoring of Groundwater Outlines which documents are required to be kept. R: EnvP-01913-QAP-001 – *EnvP Program Quality Assurance Plan* – Outlines the documents associated with QA/QC which must be kept, including details such as retention time. I: WL-509200-OV-001 – WL*'s Integrated EMP Framework* – Includes details on WL's reports and program reviews (but not audits) in place to meet these requirements.

APPENDIX B PROGRAM DOCUMENTATION

TABLE B-1
SUMMARY OF PROGRAM DOCUMENTATION

Document Name	Document Number	Description	Owner
1 Integrated Environmental Monitoring Program			
1(a) Requirements Documents and Procedures			
Management and Monitoring of Emissions	900-509200-STD-009	Defines the key requirements, responsibilities and processes for the management of radiological and non-radiological emissions which includes: a) identification and assessment of emission routes, b) Control and treatment of emissions, c) Operational control monitoring, and d) Effluent verification monitoring.	EnvP
Environmental Monitoring Programs	900-509200-STD-010	Defines the key requirements, responsibilities and processes for the establishment, design, and conduct of an Environmental Monitoring Program covering both radiological and non-radiological contaminants.	EnvP
Protection and Monitoring of Groundwater	900-509200-STD-015	Defines the key requirements, responsibilities and processes for the establishment, design, and conduct of a Groundwater Protection and Monitoring Program covering both radiological and non-radiological contaminants.	
WL Environmental Assessment Follow-Up Program	WLDP-03704-001-000	Defines the key requirements, responsibilities and process for the execution of the Environmental Assessment Follow-up Program. Defines the overall objectives of the GWMP and the ways these objectives are met. Defines the general working level requirements and management processes for the WL GWMP and is intended to establish a formalized administrative framework for the program and is primarily intended to be used in guiding the ongoing operation of the program and for training and quality assurance purposes.	EM
EnvP Program Radiological and Non-radiological Monitoring Services Quality Assurance Plan	EnvP-01913-QAP-001	Specifies general requirements for the competence to carry out Radiological and Non-Radiological monitoring services provided to the	EnvP

Document Name	Document Number	Description	Owner
		EnvP Program and provides a framework for planning, documenting, executing and verifying work conducted by Monitoring Services. This plan is used by EM.	
Monitoring Plan for the Ongoing Assessment of the WMA, Lagoon and Landfill Physical and Chemical Hydrogeological Conditions	WLDP-03705-041-000-0022	Discusses the groundwater flow system and migration.	EnvP
Program Requirements Document	900-509200-PRD-001	Groundwater Protection is assured through adherence to the Environmental Program Protection requirements. In particular, Storage Tank Systems for Petroleum Products and Allied Petroleum Products Regulations, PCB regulations, Wastewater Effluent Systems Regulations, Management of Designated Toxic Substances and Waste Management Facilities Regulation	EnvP
Records Management	900-511300-MCP-001	Details the process to define which documents are required to be kept under EVMPs Company-wide including the type of record, the regulatory requirement for keeping it, the retention period and the Locations of the records to be kept.	IT
Document Control	900-511300-STD-003		IT
1 (b) WL Monitoring Plans			
WL's Environmental Monitoring Plan	WL-509200-PLA-002	Provides reasoning behind the design and implementation of WL's Environmental Monitoring Program.	EnvP
WL Effluent Monitoring Plan	WL-509200-PLA-001	Provides reasoning behind the design and implementation of WL's Effluent Monitoring Program.	EnvP
WL Groundwater Monitoring Plan	WL-509200-PLA-003	Provides working level guidelines and responsibilities for WL's Groundwater Monitoring Program.	EnvP
EAFP: Enhanced Monitoring Program – Hydrogeology Plan	WLDP-03704-ENA-004	Discusses the design and installation of the more recent WL Groundwater Monitoring wells.	EnvP
Monitoring Plan for the Ongoing Assessment of the WMA, Lagoon and Landfill Physical and Chemical Hydrogeological Conditions	WLDP-03705-041-000-0022	Discusses the groundwater flow system and basis for the new Groundwater Monitoring Plan WL-509200-PLA-003.	EnvP

Document Name	Document Number	Description	Owner
WL Biodiversity Management Plan	WL-509213-410-000	Identifies Canadian Nuclear Laboratories (CNL) legal obligations towards the management of Species at Risk areas and provide mitigation measures to reduce any potential adverse impacts.	EnvP
2 Quality Assurance Plans			
EnvP Program Radiological and Non-radiological Monitoring Services Quality Assurance Plan	EnvP-01913-QAP-001	Specifies general requirements for the competence to carry out Radiological and Non-Radiological monitoring services provided to the EnvP Program and provides a framework for planning, documenting, executing and verifying work conducted by Monitoring Services. This plan is used by EM.	EnvP
Environmental Protection and Monitoring Quality Assurance Plan	WL-514200-QAP-001	Describes the QA Program for the Environmental Management Branch. This Plan is in line with EnvP-01913-QAP-001.	WL
3 Maintenance and Calibration			
Effluent Verification Monitoring and Environmental Monitoring Station Maintenance and Calibration Plan	WL-509200-TEP-001	Applies to equipment stationed in situ that are essential for effluent verification monitoring and environmental monitoring at and around the WL site.	EnvP
RP Instrument Shop Overview	191-508237-OP-009	Describes the current RP Instrument Shop Instrument Calibration and Maintenance Program.	RP
Measuring and Sampling Equipment	WL-514200-GDI-001	List procedures that describe the requirements, responsibilities and process for the acquisition, control, and calibration of measuring and sampling equipment (EM) used in the EM Labs.	WL
4 Staff Qualification and Training			
4(a) EnvP Program Staff			
Orientation and Training for ENVP Program Staff	ENVP-509200-PLA-009	Outlines the training requirements for all Environmental Protection Program staff and environmental analysts, including those working on the Monitoring Programs.	EnvP
4(b) Laboratory Staff Training (WL and RP)			

Document Name	Document Number	Description	Owner
Training Analysis	900-510200-STD-001	Describes the process for analyzing training needs for all personnel performing technical work as CNL employees on the EMP (RP, WL).	Training and Development
Training Design and Development Standard	900-510200-STD-001	Describes the process for determining training requirements, incorporating these requirements into training program plans, and developing the associated training and assessment materials for all positions performing technical work as CNL employees on the EMP (RP, WL).	Lab Manager
Accountability Statements and Position Descriptions	900-510000-MCP-014	Described the process for preparing Accountability Statements for management positions and Position Descriptions for non-management positions.	Human Resources
Position Description	900-510000-FM-008	A position description form is filled out for each position involved in the WL EMP, including laboratory staffing RP and WL.	Lab Manager
Personnel Qualification and Training Needs	900-510200-FM-003	A personnel qualification and training need form is filled out for each staff member performing work on the WL EMP (i.e. laboratory staffing RP and WL).	Lab Manager
5 Sample Station Design Standards			
Nuclear Facility Ventilation System Design	145-508120-REQ-002	Describes the requirements for nuclear ventilation system design.	Engineering
Radioactive Air Effluent Monitoring Standard for Sampling Stations	118-61300-STD-001	Describes the requirements for radioactive air effluent releases sampling stations (devices and systems) that are used for regulatory compliance purposes.	AEML
RP Instrument Shop Overview	191-508237-OP-009	Describes the current RP Instrument Shop Instrument Calibration and Maintenance Program.	RP
6 Field Sampling Procedures			
6(a) EM			
Animal: Tissue Sampling Procedure	WL-509251-PRO-001	Details the collection and preparation of animal samples for analysis.	EM
Fish: Tissue Sampling Procedure	WL-509251-PRO-002	Details the collection and preparation of fish samples for analysis.	EM

Document Name	Document Number	Description	Owner
Inactive Landfill Site: Water Sampling Procedure	WL-509251-PRO-003	Details the collection and preparation of Landfill Dug out water samples for analysis.	EM
Lagoon: Discharge Sampling Procedure	WL-509251-PRO-004	Details the collection and preparation of lagoon discharge water samples for analysis.	EM
Outfall: Water Sampling Procedure	WL-509251-PRO-005	Details the collection and preparation of outfall process water samples for analysis.	EM
Precipitation: Fallout Sampling Procedure	WL-509251-PRO-006	Details the collection and preparation of deposition samples for analysis.	EM
Vegetation: Sampling, Drying And Ashing Procedure	WL-509251-PRO-007	Details the collection and preparation of vegetation (native and garden crop) samples for analysis.	EM
Waste Management Area: Soil Sampling Procedure	WL-509251-PRO-008	Details the collection and preparation of soil samples for analysis.	EM
Waste Management Area: Surface Water Sampling Procedure	WL-509251-PRO-009	Details the collection and preparation of ditch water samples for analysis.	EM
Waste Management Area: Tray Water Sampling Procedure	WL-509251-PRO-010	Details the collection and preparation of amine tank containment tray water samples for analysis.	EM
Waste Management Area: Well Water Level Measurement And Water Sampling Procedure	WL-509251-PRO-011	Details the collection and preparation of groundwater water samples for analysis.	EM
Winnipeg River: Sediment Sampling And Sample Preparation Procedure	WL-509251-PRO-012	Details the collection and preparation of river sediment samples for analysis.	EM

EXECUTIVE SUMMARY

This report provides revised Derived Release Limits (DRLs) for the operation of Canadian Nuclear Laboratories' (CNL's) Whiteshell Laboratories (WL). These DRLs supersede the values established in 2016 [1].

The DRLs were calculated using the same methodology as in 2016 [1], which is based on Canadian Standards Association (CSA) Guideline N288.1-08, which was developed with Canadian Nuclear Safety Commission (CNSC) involvement. The DRL calculations were performed using the Integrated Model for Probabilistic Assessment of Contaminant Transport (IMPACT) computer code, which embodies the recommended methodology. Previous versions of this code have been validated against experimental data and have been confirmed to be compliant with CSA Standard N286.7, which addresses the quality assurance of computer programs. The results of the DRL assessment were extensively verified to ensure the accuracy of the calculations.

The assumptions regarding the locations and characteristics of population groups located around the WL site are documented and justified. In following the current DRL modelling guidance, conservative assumptions and parameter values were adopted for exposures and intakes, and best-estimate values were used for many environmental transfer parameters and contaminated food source fractions. To the extent possible, site-specific values were used for parameters describing environmental conditions at the WL site, adding to the accuracy of the assessment.

In 2016, DRL's were calculated for one stack location, two roof vent locations and one Waste Management Area (WMA) location for airborne effluents, and for one liquid effluent release location. However, based on the introduction of three new systems in the WMA and the release of tritiated water (HTO) from one or more of these systems, the airborne DRLs had to be recalculated. DRLs for potential releases of seven more radionuclides (i.e., Ac-227, Eu-155, Kr-85, Ra-226, Sm-151, Th-228 and U-233) from WMA systems were added.

The potential critical groups considered in the assessment were the same as in 2016 [1], which include three farm groups having full-time occupancy and a farm group that has limited occupancy. Within these groups, six different age classes were considered, and for the two infant age classes, three milk sources were assessed (cow milk, breast milk and formula milk). Considering the number of release locations, potential critical groups and age classes included in the modelling, the WL DRL study is deemed comprehensive.

For airborne effluents, DRLs for 12 radionuclides are approximately 2% lower than the 2016 DRLs [1]. For one radionuclide (Zn-65), the bounding release location changed from B200 to the WMA and the magnitude of the DRL was lowered by 1%. A new DRL was added for HTO released from the WMA (5.61E+14 Bq week^{-1}) and the previous DRL for HTO released from B100 (1.65E+15 Bq week $^{-1}$) [1] is still valid. The DRL tables have been expanded to include seven additional radionuclides.

There is no change to the liquid effluent from the 2016 DRLs [1].

1. INTRODUCTION

1.1 Revision of WL DRLs

This report provides revised Derived Release Limits (DRLs) for emissions of radioactive materials in both airborne and liquid effluents from Canadian Nuclear Laboratories' (CNL) Whiteshell Laboratories (WL) site during normal operation. The WL DRLs have been revised because of the introduction of three new systems in the Waste Management Area (WMA) and the potential releases of tritiated water (HTO) and seven more radionuclides (i.e., Ac-227, Eu-155, Kr-85, Ra-226, Sm-151, Th-228 and U-233) from one or more of these systems. As a result of these changes, the airborne effluent DRLs had to be recalculated. The airborne effluent DRLs in this report supersede those established in 2016 [1], with no change to the liquid effluent DRLs.

The methodology used in the recalculation of the DRLs is identical to that used in 2016 [1]. It is the recommended DRL calculation methodology that is documented in the Canadian Standards Association (CSA) Guideline N288.1-08 [2] (hereafter referred to as N288.1), which is based on the earlier CANDU Owner's Group (COG) DRL Guidance (hereafter referred to as the CDG) [3]. The Canadian Nuclear Safety Commission (CNSC) participated in the preparation of N288.1 [2].

In following N288.1 [2], only values associated with critical group exposure factors, occupancy factors and intake rates are treated conservatively. Other parameters such as the fractions of food and water intakes drawn from contaminated sources have been assigned realistic values. This is intended to reduce the degree of conservatism in the DRLs, as it is broadly recognized that multiple conservatisms yield dose projections that are not representative of the critical group concept (i.e., the projections are representative of extreme individuals). On the same basis, best-estimate values were used for environmental transfer parameters to provide better agreement between model predictions and actual measured environmental concentrations.

1.2 The IMPACT Computer Code

Integrated Model for Probabilistic Assessment of Contaminant Transport (IMPACT) [4], the modelling software used to calculate the DRLs, implements almost all aspects of the methodology recommended in the N288.1 [2]. It includes a database of parameter values, as well as user-friendly interfaces to facilitate the input of scenario-specific information. It outputs compartmental radionuclide concentrations and dose rates as well as DRLs.

The DRL calculations reported here were carried out using the same version (Version 5.4.0) of the IMPACT [4] code and database that was used in 2016 [1]. This version of the code incorporates all the sub-models required for application at WL, including methods for calculating dispersion in a river and air immersion dose rates from three-dimensional plumes of contaminated airborne material. The default database has been updated with error corrections as of 2010 July 9 [5] to make it consistent with N288.1 [2]. The software has been subject to validation and verification testing as discussed in [6] and [7]. The development of the previous version of the code (Version 5.2.2) was analyzed and found to be consistent [8] with the requirements of CSA Standard N286.7 [9], which relates to software quality assurance. The development of Version 5.4.0 was also guided by, and is expected to meet the requirements of, that standard.

1.3 The Whiteshell Laboratories Site

The 4,375-hectare WL site is located in the Local Government District of Pinawa in southeastern Manitoba, about 100 km northeast of Winnipeg. Most of the site and all the facilities are located on the east bank of the Winnipeg River (Figure 1), which in this area, flows from south to north.

The WL site is in the zone of transition between farmland to the west and the exposed part of the Precambrian Shield to the east, and is overlain by glacial till and sediments. The surrounding terrain is relatively flat, except for the small hills on both sides of the river. Part of the surrounding land is used for farming, with the rest being wooded. Sport fishing is carried out in the Winnipeg River, but there is no commercial fishing in the area.

The area surrounding WL is sparsely populated. The nearest population centres are Lac du Bonnet (population approximately 1,000, located 8.6 km north), Pinawa (population approximately 1,500, located 13.4 km east-southeast), River Hills (population less than 100, located 11.8 km south) and Seven Sisters (population less than 100, located 8.9 km south-southeast) (Figure 1). Of greater interest for this study are farms which are much closer to WL.

A near-field map of the WL site is shown in Figure 2. There are four main sources of airborne radioactive effluents at WL: Building 100 (B100) (reactor building), Building 200 (B200) (Active – Liquid Waste Treatment Centre) and Building 300 (B300) (shielded facilities and other laboratories), which are located in the complex of buildings in the main part of the site (WL-Main), and the WMA. In the previous DRL [1], the only sources of airborne effluents in the WMA were from the compactor/baler and incinerator. However, three new systems in the WMA will be introduced; the Standpipe Waste Retrieval System (SWRS), the Bunker Waste Retrieval System/Sorting and Conditioning Unit (BWRS/SCU), and the Intermediate Level Liquid Treatment System (ILLTS), which will also contribute to airborne effluents. The compactor/baler and incinerator are no longer in service, but they are discussed in this report to clarify the changes between the 2016 DRL [1] report and this assessment. The only significant source of liquid radioactive effluents from the site is the process outfall from the new Low Level Liquid Waste (LLLW) processing systems in B100 and B300. All of the B100 LLLW is now being tested, treated and released in a controlled manner to the river in the B100 LLLW system and likewise in B300. All of the collection tanks in B200 were then isolated and taken out of service. The B200 sumps have also been taken out of service, and any water collected from the sumps and associated piping was put into drums for processing.

The WL site is currently being decommissioned by CNL. There are no longer tenant businesses on site. There are farm workers on land leased from CNL on the west bank of the Winnipeg River (Farm E). They are not classified as Nuclear Energy Workers and their radiation exposure is not required to be monitored.

Farm E is the farming location which is closest to a source of WL effluents. However, farm workers are present at this location for only a limited duration each year. The closest farming property with year-round occupancy (Farm F) is also on the west bank of the Winnipeg River, but it is further downriver.

The DRLs presented in this report were calculated assuming the current WL site boundary and the supervised area, as shown by a black line in Figure 2. If the site boundary and/or the supervised area are to be reduced as a result of ongoing decommissioning of the WL site, and there are changes in the use of affected land, then the impact on DRLs will need to be evaluated.

Figure 1: Location of WL site.

Figure 2: Near-field map of WL site showing effluent release locations and potential critical group locations.

2. DERIVED RELEASE LIMITS

CNL's nuclear facilities are required to operate in such a way that radionuclide releases to the environment are well below their DRLs. These limits represent release rates that correspond to critical group exposures at the public dose limit. They are calculated by the licensee from the combined radiation dose that a member of the public receives through all pathways of exposure to a radionuclide that is routinely released to the environment. The DRLs are based on individual doses to average members of a critical group. The critical group is defined so as to represent a group of individuals likely to receive the highest exposures to radionuclides released from a particular source.

Where two or more potential critical groups exist and it is not obvious which would receive the greatest dose, separate calculations are made for each group. Similarly, separate calculations are performed for each age class within a group. The DRL for the radionuclide in question is set equal to the smallest DRL across the age classes and potential critical groups.

N288.1 considers only three age classes (adult, 10-year-old child and 1-year-old infant). However, in the current assessment, the six age classes defined in the International Commission on Radiological Protection (ICRP)-72 [10] and the CDG were considered. These are adult, 15-year-old teenager, 10-year-old child, 5-year-old child, 1-year-old infant and 3-month-old infant. The transfer parameters from nursing mother to infant are also from CDG.

A separate DRL is calculated for each radionuclide released. However, in order to simplify compliance monitoring some radionuclides can be grouped. For example, the gross beta/gamma-emitting radionuclides released to air (and similarly to water) can be grouped together and the DRL for the most restrictive radionuclide can be applied to that group.

Since the DRL for a given radionuclide (or radionuclide group) is calculated as though only that radionuclide was present in the effluent, facilities must operate to satisfy the following additional condition:

$$\sum \frac{R_i}{DRL_i} < 1.0 \qquad (1)$$

where: R_i is the release rate of the ith radionuclide (or group), DRL_i is the derived release limit for that radionuclide, and the summation takes place over all n radionuclides for releases to both air and water from all effluents.

This condition ensures that all releases combined will not cause a member of the public to receive a dose in excess of the public dose limit.

In order to ensure that this condition is met, and in order to keep public doses as low as reasonably achievable, WL facilities operate with releases at a small fraction of the DRL.

DRLs are calculated assuming that releases from the facility are reasonably continuous and that long-term steady-state is reached in the environment. Consequently, the doses and DRLs calculated in this report are not likely to be indicative of doses that would result from short-term incidents involving abnormal radioactive releases.

Since DRLs reflect the annual dose limit, they can be calculated as annual releases. However, for operational control purposes, airborne release limits are expressed in terms of a period of one week and liquid limits are expressed in terms of a period of one month. Therefore, the DRLs calculated in this assessment are also expressed in these terms.

3. DOSE LIMITS FOR MEMBERS OF THE PUBLIC

The dose limits for members of the public, as set out in the CNSC Radiation Protection Regulations [11], are given in Table 1. These limits are based on the 1991 recommendations of the ICRP [12], and are intended to prevent deterministic effects and to limit the occurrence of stochastic effects to an acceptable level.

Table 1: Dose limits for members of the public.

Application		Annual Dose Limits (mSv a^{-1})
Effective Dose ($D_{effective}$)		1
Equivalent Dose	Skin (D_{skin})	50
	Lens of the Eye (D_L)	15
	Hands and Feet	50

Paragraph S29 of ICRP Publication 60 [12] recommends that restrictions on effective dose are sufficient to ensure the avoidance of deterministic effects in all body tissues and organs except possibly the lens of the eye and the skin, which may be subject to localized exposures. Hence, there is no equivalent dose limit for other body tissues and organs.

Section 2.1.2 of the CDG [3] states "It has been shown that the equivalent dose to the lens of the eye will not be limiting for the purpose of setting Derived Release Limits [13]. For the lens dose (D_L) to be limiting, it must be true that D_L >15* ($D_{effective}$) and D_L >0.3* (D_{skin}). This condition is met only for Kr-83m, and the dose from this radionuclide is insignificant in comparison to other noble gases. Thus, calculations of effective dose and skin dose are sufficient for determining facility DRLs." Accordingly, only the effective and the skin doses were calculated in this WL analysis.

The possibility of the release of some energetic beta-emitting radionuclides being limited by skin dose was checked. Skin dose calculations were made for all external dose situations (air immersion, groundshine, beachshine and water immersion) for all radionuclides. In no case was the DRL based on skin dose lower than the DRL based on effective dose; hence, only the results for effective doses are discussed further.

4. CALCULATION OF DERIVED RELEASE LIMITS

The steps taken in this assessment to recalculate the DRLs for WL were identical to those used in 2016 [1], which are as follows:

1. Identify the potentially most affected members of the public, determine their characteristics with respect to exposure to radionuclides released from WL to the environment, and select a set of potential critical groups that will form the basis for the DRLs. Determine the parameter values for these groups (Section 5).
2. Identify and characterize the sources of airborne and liquid effluents, the factors influencing atmospheric and aquatic dispersion, and the specific radionuclides to be included (Sections 6 and 7).
3. Identify the environmental pathways models to be used in calculating the DRLs and any assumptions to be made in applying them (Sections 5 and 8).
4. Specify values for the transfer parameters and other data used in the model calculations and any assumptions to be made in applying them (Sections 5, 6 and 7).
5. Set up the model scenarios with the appropriate modelling software (IMPACT) (Section 9).
6. Perform a screening analysis to reduce the number of potential critical groups and release locations for which detailed dose calculations are required (Section 10).
7. Execute the final DRL calculations for each combination of effluent type, radionuclide, critical group, age class and potentially bounding release location (Section 8.4.8.1).
8. Determine the most restrictive DRLs for each radionuclide for airborne and liquid effluents from the DRLs based on the different age classes of the critical group and potentially bounding release locations (Section 11).
9. Confirm the results (Section 12).

Site-specific data were used in the calculations, where possible.

5. CRITICAL GROUPS

5.1 General Discussion

A critical group is a relatively homogeneous group of members of the public who represent the people most highly exposed to radionuclides released from a facility. This may be by virtue of their location or characteristics. DRLs are calculated from the mean dose in the critical group per unit radionuclide release. Recently, N288.1 has replaced the term "average member of the critical group" with the term "representative person". This is a purely cosmetic change. N288.1 states that the representative person "is the equivalent of … the average member of the critical group". The term "critical group" will be used here.

The critical groups considered in the recalculation of the DRLs for WL are identical to those used in 2016 [1]. Potential critical groups have been characterized based on site-specific information rather than by making hypothetical worst-case assumptions. Assumptions related to exposure pathways, occupancy factors, and fractions of the diet that consisted of local food and water were confirmed by interviewing some WL employees residing in surrounding communities. The local fractions applied in this DRL assessment were checked against the default recommendations in Table G.9c of N288.1 in 2016 [1] and were found to be conservative. Assumptions related to newly added pathways in IMPACT were consistent with the recent 2007 Chalk River Laboratories (CRL) DRL calculations [6] and 2010 Nuclear Power Demonstration Site DRL calculations [14].

5.2 Potential Critical Groups

In applying the critical group concept discussed above, a range of types of potential critical groups were identified as being representative of different locations and characteristics of population groups residing in the vicinity of WL.

5.2.1 Potential Critical Groups for Airborne Effluents

For airborne effluents, two types of potential critical groups were considered: farms that have year-round occupants and raise livestock (Farms A, D and F in Figure 2), and a farm that has limited occupancy and grows canola (Farm E). Table 2 gives the distances and directions of these groups from B200 at WL (more details in Table 20). The livestock farms are located adjacent to the WL site boundary and lie in high-frequency wind-direction sectors (N, S and NNW) from the effluent sources. A potential critical group location closer to the WMA than Farm A was not selected because the terrain to the east of Farm A is not suitable for farming.

Table 2: Distance and direction of airborne effluent potential critical groups from Building 200.

Potential Critical Group	Location Relative to Building 200		
	Distance (m)	Direction	
		Degrees from North	Sector
Farm A (livestock)	2,993	353	N
Farm D (livestock and honey)	2,913	177	S
Farm E (canola)	1,313	258	WSW
Farm F (livestock)	2,708	335	NNW

A wide range of types and scales of farming exists on both sides of the Winnipeg River from Seven Sisters Falls to Lac du Bonnet. While it is more common for a particular farm to specialize in one animal product, in this assessment it was conservatively assumed that the livestock farm groups grow most of the animal products that they consume. All the livestock farms were assumed to be identical, except that honey is only produced at Farm D and is supplied to all others.

The canola farm (Farm E) was conservatively assumed to be occupied for only 16 hours per day, for two weeks for planting, two weeks for fertilizing and two weeks for harvesting (total of 672 hours per year; this occupancy factor of 0.08 is referred to in Sections 5.4.4 and 10.1).

Individual members of the public who occasionally carry out recreational activities (e.g., boating, fishing and swimming) on the Winnipeg River, closer to the WL site than the locations of the above mentioned potential critical groups, are not explicitly considered in the DRL assessment. This is because these activities are not typical for population groups in the area, but are done by a few extreme individuals. In the recent CRL DRL calculations [6], a scoping analysis was carried out to show that the radiological risk from short-term, occasional occupancy of the river close to CRL is not significantly higher than that from the chronic exposure received by the more remote critical groups over extended periods of time. There is no reason to suspect that the risk for similar extreme individuals at WL would be significantly higher.

In view of the nature of the potential critical groups, screening calculations were performed to reduce the number of combinations of potential critical groups and release location for which detailed dose calculations were required. The screening calculations identified Farm A as the critical group for all nuclides except HTO (see Section 10.1 for details). For an HTO release from B100, Farm F was identified as the critical group. The characteristics of these two groups are the same and only the characteristics of these groups are discussed further in subsequent sections.

5.2.2 Critical Group for Liquid Effluents

Dilution and dispersion studies by Merritt ([15]and [16]) have shown that effluents released from the process outfall move downstream along the east bank of the Winnipeg River and do not reach the west bank in the vicinity of WL. Therefore, the critical group for liquid effluents is obvious, being Farm A on the east bank of the Winnipeg River, adjacent to the site boundary and 2,810 m downstream of the release point (Figure 2).

5.3 Characteristics of the Critical Groups

5.3.1 Critical Groups for Airborne Effluents (Farm A or F)

The group members:

- reside on a full-time basis at their assumed locations,
- maintain a large garden from which they obtain a significant fraction of their fruit and vegetable needs (see Section 5.4.2 for information on food sources),
- are self-sufficient in meeting their milk, poultry and egg requirements, and semi self-sufficient in beef and pork,
- feed their animals entirely on forage grown on their farm,
- meet their honey requirements by acquiring it from another local farm,
- partake in hunting on their own property to fulfill their game (deer) meat requirement,
- obtain their water from a well located on the property, and
- use a backyard swimming pool filled with well water during four months of the year.

The exposure pathways applicable to the critical groups are summarized in Table 3.

Table 3: Airborne exposure pathways applicable to the critical groups (Farm A or F).

Pathway	Comments

5.3.2 Critical Group for Liquid Effluents (Farm A)

The group members:

- reside on a full-time basis at their assumed location,
- obtain their water for domestic needs (drinking, washing) from the river,
- maintain a large garden from which they supply a significant fraction of their fruit and vegetable needs,
- irrigate their lawns and gardens (a total area of 2,500 m^2) with river water,
- do not irrigate forage crops (hay, grain, corn),
- are self-sufficient in meeting their milk, poultry and egg requirements, and semi self-sufficient for beef and pork,
- water their animals with river water,
- swim in the river during the summer months and in a pool filled with river water during the remainder of the year,
- spend a fraction of the time occupying the shoreline for recreational purposes, and
- fish in the Winnipeg River, from which they obtain a fraction of their fish ingestion needs.

The exposure pathways applicable to the critical group are summarized in Table 4.

Table 4: Liquid exposure pathways applicable to the critical group (Farm A).

5.4 Critical Group Parameters

5.4.1 Water Sources

The water source assumptions for the critical groups are summarized in Table 5 and are justified in the discussions below.

Table 5: Water source assumptions.

Critical Group	Drinking		Washing and Bathing		Swimming		Irrigation		Animals	
	Source	Percentage	Source	Percentage	Source	Percentage	Source	Percentage	Source	Percentage
Airborne Effluents	Well	100	Well	100	Pool filled with well water	100*	Well**	100	Well for livestock, Pond for deer	100
Liquid Effluents	Winnipeg River	100	Winnipeg River	100	Winnipeg River beaches and swimming pools filled with Winnipeg River water	100	Winnipeg River	100	Winnipeg River for livestock Pond for deer	100

* An outdoor pool is assumed to be operated for only four summer months in a year.

** Grey shading indicates pathways and exposures that are not included in the calculations.

For the groups considered in this assessment, water was assumed to be used for the following applications:

- drinking by humans,
- showering, washing and other domestic uses,
- swimming,
- lawn and/or garden irrigation, and
- animal watering.

Some inhabitants of the banks of the Winnipeg River, in the vicinity of WL, use well water and some use river water. In the absence of detailed population survey information, average values for the usage of water that is radiologically contaminated by WL effluents could not be derived and applied. Instead, it was generally assumed that 100% of the water is obtained from sources that are radiologically contaminated by WL effluents.

In N288.1 [2], the only surface water bodies that are assumed to become contaminated by airborne effluents are small ponds. This distinction is made because larger bodies (lakes and rivers) provide significant dilution of activity deposited locally from the atmosphere. Moreover, natural removal processes are more effective for larger water bodies. As a result, concentrations are lower in large water bodies, reducing the significance of the water exposure pathways.

5.4.1.1 Drinking Water Assumptions

For liquid effluent modelling, the critical group was conservatively assumed to draw all their water from the Winnipeg River. Thus, 100% of the drinking water was assumed to be contaminated.

For modelling airborne effluents, the critical groups were assumed to obtain their drinking water from wells, which were assumed to be contaminated.

5.4.1.2 Immersion Assumptions (external exposures from washing, bathing and swimming)

For modelling airborne effluents, the critical groups were conservatively assumed to obtain all their water for washing and bathing from wells, which were assumed to be contaminated.

For liquid effluent modelling, 100% of the water for washing and bathing was assumed to be contaminated because it was conservatively assumed to come from the Winnipeg River.

Immersion exposure from swimming in the Winnipeg River during three summer months was assumed for the critical group for liquid effluents. Immersion exposures from swimming in a pool, supplied with water from the Winnipeg River, for the remainder of the year was also assumed. In reality, a pool at a hotel in Lac du Bonnet (filled with municipal water taken from the River) is accessible to the public. However, in this assessment, a community pool was conservatively assumed to be located at the location of the critical group, where river water concentrations are much higher than those at the Lac du Bonnet municipal water intake point.

For modelling airborne effluents, members of the critical groups were assumed to swim in a pool filled with well water during four months of the year.

5.4.1.3 Irrigation Assumptions

In N288.1 [2], lawn and garden irrigation with well water is not included in the modelling of airborne effluents. Inclusion is normally not warranted because the relative contribution of radioactivity to soil and plant tissue from irrigation is usually minor compared to the contribution from direct atmospheric deposition. On this basis, irrigation was not included in the modelling of the critical groups for airborne effluents.

In contrast, irrigation was included in the modelling of the critical group for liquid effluents. Lawn and garden watering was assumed to be done using water from the Winnipeg River.

5.4.1.4 Animal Watering Assumptions

It is discussed in the 2007 CRL DRL report [6] that a well (and not a river) is commonly used for watering of livestock. However, to be conservative, in this assessment it was assumed that livestock are watered from wells when modelling airborne effluents, and they receive water drawn from the Winnipeg River when modelling liquid effluents.

Deer are more likely to drink from small streams and ponds in forested areas than the exposed banks of the Winnipeg River. Therefore, it was assumed that game (deer) drink only from small contaminated ponds at the locations of the critical groups. Therefore, the ingestion of contaminated water by deer was modelled for airborne effluents only.

5.4.2 Food Sources

The percentages of the various food items in the diet of the critical groups that were assumed to come from contaminated sources are summarized in Table 6. The percentages are based upon site-specific information and judgement rather than statistical analysis, and are justified in the discussions in Sections 5.4.2.1 through 5.4.2.3 below. The sub-sections in this assessment remained identical to those in 2016 [1].

Table 6: Percentage of food from contaminated sources.

Critical Group	Terrestrial Animal Products							Plant Products				Fish
	Beef	Pork	Poultry	Venison	Eggs	Cow or Breast Milk	Honey	Fruit	Above-Ground Vegetables	Potatoes	Grain	
Airborne Effluents	50	50	100	100	100	100	100*	15	25	100	0**	0
Liquid Effluents	50	50	100	0	100	100	0	15	25	100	0	30

* Honey is produced on Farm D only and supplied to the critical group.

** Grey shading indicates pathways and exposures that are not included in the calculations.

In general, the percentages of food products from contaminated sources were assumed to be higher than those recommended in Table G9c of N288.1 [2]. The exceptions were: the contaminated fruit percentage was reduced from 20% to 15 %, the contaminated grain percentage was reduced from 1% to 0% and the contaminated fish percentage was reduced from 100% to 30%.

5.4.2.1 Plant Products

The critical groups were assumed to grow 15% of the fruit that they eat. N288.1 gives a default value of 20%, which is appropriate for climate conditions in southern Ontario, Quebec and New Brunswick. Since southern Manitoba has a harsher climate, a lower percentage is considered reasonable.

The critical groups were assumed to grow 25% of the above ground vegetables and 100% of the potatoes (including other root vegetables) in their diet.

As stated in the 2001 DRL report [17], there are some farms in the neighbourhood of WL that produce grain (wheat and oats), but these crops are sold to large companies and the contamination in the final food products is diluted to negligible levels. Therefore, consumption of contaminated grain was not included in the calculations.

The contaminated percentages discussed above apply for modelling both airborne and liquid effluents, for which crop contamination occurs through airborne deposition and irrigation, respectively.

5.4.2.2 Terrestrial Animal Products

Currently, no animal products are produced at the locations of the critical groups. However, within 10 km of WL there is a mix of beef and dairy farms, with some of their products are being consumed on the farms. At about 20 km south-southeast from WL, there are farmers who are self-sufficient in milk, chicken and eggs, and semi self-sufficient in beef and pork. It is possible that a farmer in the vicinity of WL could start producing beef, pork, poultry, eggs and milk, with some being for their own consumption. However, it is unlikely that they would be self-sufficient in beef and pork. Therefore, it was conservatively assumed that the critical groups are 50% self-sufficient in beef and pork, and 100% self-sufficient in poultry, eggs and milk, as was done in the 2001 DRL calculations [17].

The milk consumed by the 1-year-old infant was assumed to be either 100% cow milk or 100% formula milk. The formula milk was assumed to be prepared with local contaminated water. Either 100% formula milk or 100% breast milk was assumed to be the source of milk for the 3-month-old infant.

Deer is the main game animal in the area, and the critical groups were assumed to hunt and get all the venison required from their own property. As the deer are assumed to drink from small ponds on the property and not from the Winnipeg River, the venison is contaminated by airborne effluents from WL, but not by liquid effluents.

For modelling airborne effluents, it was assumed that 100% of the honey consumed is contaminated because it is available locally from Farm D. For modelling liquid effluents, the honey was assumed to be uncontaminated because the bees generally feed on forage crops, which are not contaminated by liquid effluents.

5.4.2.3 Fish

The critical group exposed to liquid effluents was assumed to eat fish caught nearby in the Winnipeg River. This is reasonable given that fishing is a popular activity in the area. It was assumed that 30% of the total fish consumed is contaminated. This was based on interviews with local sportsmen.

5.4.3 Intake Rates for Humans

The assumed intake rates for food, water, soil, sediment and air are shown in Table 7. Most of these values are the recommended default values provided in Tables 17, 18, 19 and G9c, and Clause 7.10.2 of N288.1 for three of the age classes; and Tables 4-15, 4-16, 4-17 and G20c, and Clause 5.11 of the CDG for all of the age classes. These are the 90^{th} or 95^{th} percentiles of their respective distributions, which is consistent with the philosophy of using conservative values for intake rates. The adult intake rates are those for a male.

Since beef offal, veal, lamb and rabbit are a small percentage of the diet in the WL area, they were combined into the "beef +" category in Table 7. Similarly, mushrooms were combined with above-ground vegetables.

The venison intake rates of the critical groups were assumed to be much higher than those recommended in N288.1 and the CDG because deer hunting is much more common among farmers in the WL area than in the general population. The intakes for the "beef +" category in Table 7 were assumed to be correspondingly lower, such that the total intake from these two categories is the same as in N288.1 and the CDG. This adjustment ensures a balanced energy intake for the receptors. Because of the abundance of deer in the area, it was assumed that the intakes from the venison and "beef +" categories were equal, which is similar to what was assumed in the 2007 CRL DRL calculations [6].

The DRLs were not calculated for a nursing mother, but her intake rates were required to estimate radionuclide concentrations in breast milk fed to infants. The nursing mother was modelled in the same way as a terrestrial animal, but with intake rates being at the 90^{th} percentiles rather than the median values that were used for other terrestrial animals. The higher values were used because of the increased energy requirements resulting from lactation. These intake rates are similar to those recommended by Wong [18].

Table 7: Intake rates of food, water, soil and air.

Food Categories and Items	3-Month-Old Nursing Infant	3-Month-Old Formula-Milk-Drinking Infant	1-Year-Old Cow-Milk-Drinking Infant	1-Year-Old Formula-Milk-Drinking Infant	5-Year-Old Child	10-Year-Old Child	15-Year-Old Teenager	Adult (Male)	Nursing Mother
Freshwater Fish(kg a^{-1})	0.31	0.31	0.91	0.91	2.69	3.1	3.48	7.41	4.75
Milk (mother's milk or cow's milk) (L a^{-1})	416	0*	371	0*	277	305	327	265	170
Beef + Beef Offal + Veal + Lamb + Rabbit (kg a^{-1})	6.1	6.1	5.4	5.4	9.6	15	20	34	22
Venison (kg a^{-1})	6.1	6.1	5.4	5.4	9.6	15	20	34	22
Pork (kg a^{-1})	0	0	3.2	3.2	7.3	11	15	29	19
Poultry (kg a^{-1})	0	0	4.6	4.6	7.7	9.8	11	20	13
Eggs (kg a^{-1})	2.9	2.9	8.4	8.4	9.6	11	15	30	19
Honey (kg a^{-1})	0.8	0.8	0.34	0.34	0.91	1.1	1.1	2	1.3
Fruit and Berries (kg a^{-1})	69	69	66	66	92	93	91	174	112
Above-Ground Vegetables + Mushrooms (kg a^{-1})	26	26	44	44	91	114	144	236	152
Potatoes (kg a^{-1})	4.6	4.6	23	23	47	63	80	104	67
Total Water Intake (L a^{-1})	0	347	0	358	365	511	657	840	840
Soil Intake (kg a^{-1})	0.044	0.044	0.044	0.044	0.12	0.12	0.12	0.12	0.12
Sediment Intake (kg a^{-1})	0.044	0.044	0.044	0.044	0.12	0.12	0.12	0.12	0.12
Inhalation Rates (m^3 a^{-1})	1,140	1,140	2,740	2,740	6,390	7,850	8,210	8,400	8,400

* Formula-milk-drinking infants (3-month-old and 1-year-old) have zero milk intake and proportionately higher water intake.

5.4.4 Occupancy Factors

The occupancy factors applied to the critical groups and the different age classes were in general the recommended default values in N288.1, which include full-time residential occupancy at the assumed receptor location.

First exception was with respect to swimming occupancy. For modelling liquid effluents, beach swimming was assumed to be based on a three-month period per year, rather than a four-month period, because the Winnipeg River water is colder than the average on which the N288.1 recommendations are based. N288.1 assumes that swimming takes place indoors during the period when beach swimming does not, so the pool occupancy is based on eight months per year. However, for the WL calculations, it was assumed that the critical group swims in an indoor pool during nine months per year.

Second exception was that an occupancy factor of 0.08 was applied to Farm E as discussed in Section 5.2.1, and referred to in Section 10.1.

6. SOURCE CHARACTERISTICS AND DISPERSION

6.1 Airborne Effluents

6.1.1 Sources

Airborne effluents are discharged at four locations: the B100 stack, the B200 roof vent, the B300 roof vent and the WMA. In the 2016 DRL [1], although the WMA had two sources (the incinerator and the compactor/baler), they were treated as one. This was reasonable because they were close to each other and had similar release heights, so that at the downwind distances of the potential critical groups, the differences had a marginal impact on radionuclide concentrations. However, now that three new systems (the SWRS, the BWRS/SCU and the ILLTS) will be introduced in the WMA, the sources of airborne effluents in the WMA were re-evaluated.

6.1.2 Atmospheric Dispersion Model

Atmospheric dispersion was modelled using the sector-averaged Gaussian model described in N288.1 and implemented in IMPACT 5.4.0.

The characteristics of the sources are shown in Table 8, together with the dimensions of the adjacent building.

Table 8: Source characteristics and building dimensions considered in the atmospheric dispersion model.

Parameter	B100	B200	B300	WMA			
				Compactor/ Baler**	SWRS	BWRS/ SCU	ILLTS
Physical Height of Release (m)	30.4	0	0	7.3	7.92	7.92	5.18
Stack Inside Diameter (m)	1.98	-	-	-	0.203	0.254	0.127
Stack Exit Velocity (m s^{-1})	4.6	-	-	-	15.24	15.24	0.00080
Stack Gas Temperature (°C)	25	-	-	-	28.06*	28.06*	10
Ambient Air Temperature (°C)	0.4	-	-	-	0.4	0.4	0.4
Height of Nearby Building (m)	18.5	7.6	12	5.5	5.5	5.5	5.5
Smallest Horizontal Dimension of Nearby Building (m)	55	12.8	35	12.5	12.5	12.5	12.5
Cross-Sectional Area of Nearby Building (m^2)	1,000	100	400	70	70	70	70

* An average of the winter and summer values.

** The compactor/baler is no longer in service, but it is discussed in this report to clarify the changes between 2016 DRL [1] and this assessment.

The B100 stack was treated as an elevated source with excess momentum and buoyancy, and accompanying plume rise. The release was assumed to be affected to some extent by the wake of the adjacent building. The B200 and B300 roof vents were treated as ground-level sources because of building entrainment occurring at them.

In the 2016 DRL [1], the WMA was treated as an elevated source, but without excess momentum and buoyancy. Even though the incinerator stack (12.2 m high) and the roof vent of the compactor/baler (7.3 m high) were both sources of airborne effluents, a conservative value of 7.3 m was used for the release height in the calculations. However, with the introduction of the three new systems (SWRS, BWRS/SCU and ILLTS), all the WMA parameter values need to be compared to determine which ones should be used in the new DRL calculations.

Effective release height is an important intermediate parameter when modelling releases from different geometries. When comparing the parameter values in Table 8, it is expected that the effective release heights corresponding to the SWRS and the BWRS/SCU will be higher than that of the compactor/baler, as modelled in the 2016 DRL [1]. On the other hand, the effective release height of the ILLTS will be lower to the ground than that of the compactor/baler, as modelled in the previous DRL [1], resulting in higher air concentrations from that source. This initially indicates that the doses will be the highest from the ILLTS, and the WMA DRLs should be calculated using its release geometry. However, effective release height is not only dependent on release geometry, but also on the stability class and the wind speed class (as defined in Table 10). To establish their overall effect, the effective release heights were extracted using a research and development (R&D) tool CSA-DRL [19]. The results (see Figure 3) demonstrate that the effective release height corresponding to the ILLTS geometry will be lowest in all cases compared to the other three release geometries. This also indicates that the doses will be the highest from the ILLTS and, thus, the DRL will be the lowest (and most conservative) for all radionuclides when calculated using the ILLTS geometry.

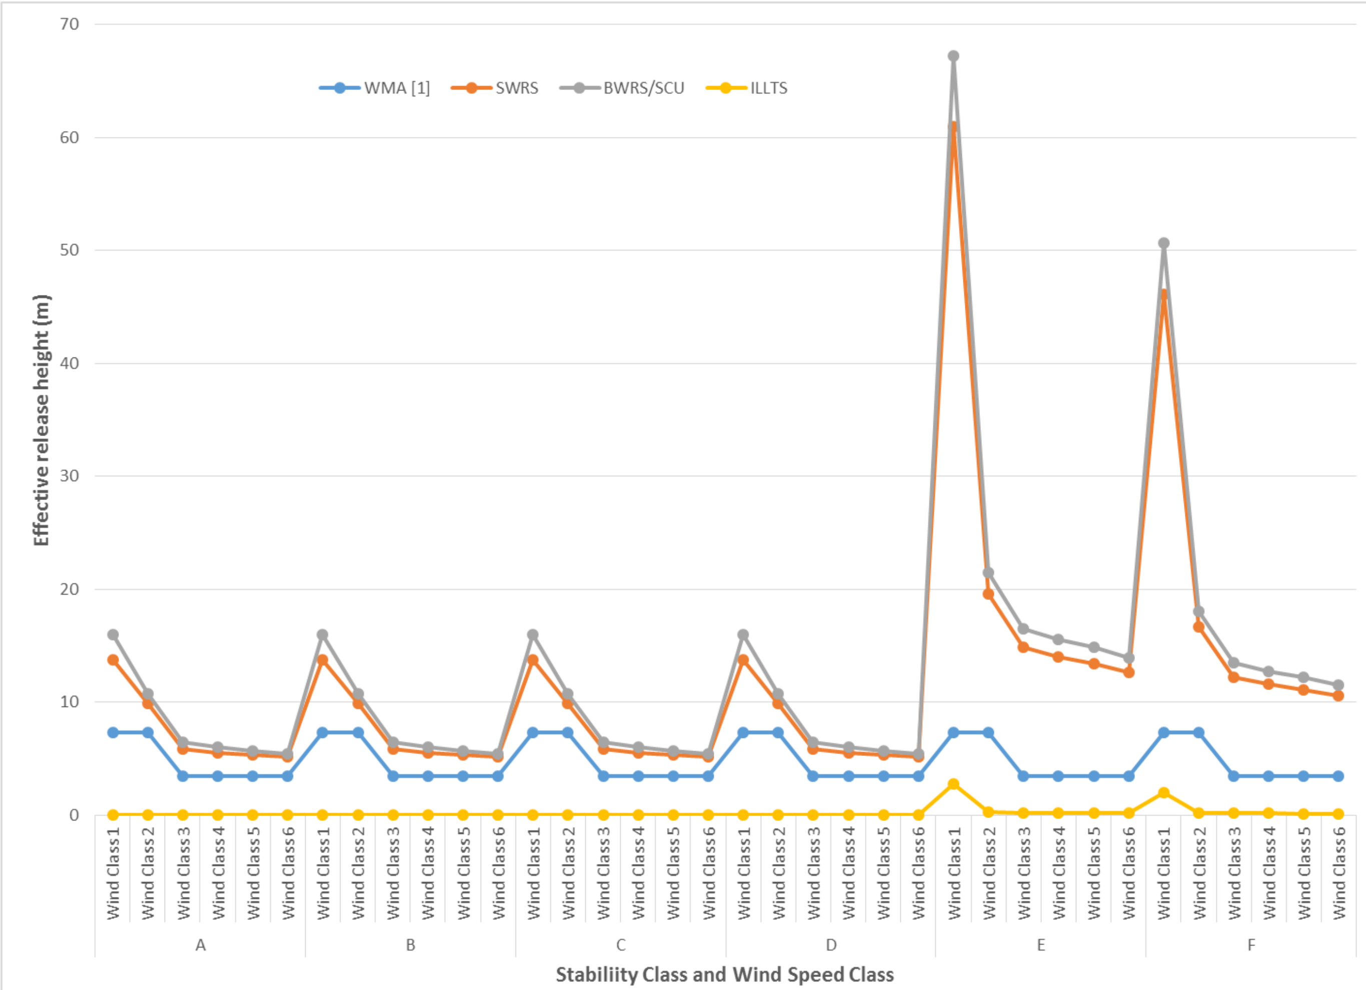

Figure 3: Comparison of the effective release heights corresponding to each stability class and each wind speed class for the WMA release location.

A sample calculation was then carried out in IMPACT [4] for a unit release (1 Bq s^{-1}) of Cs-137 from the SWRS, the BWRS/SCU and the ILLTS to compare the total dose to an adult at the critical group A location. The results from the 2016 DRL [1] and the current calculations are compared in Table 9. It can be seen that the highest dose was predicted using the ILLTS geometry and, therefore, all WMA DRLs calculated using this geometry will be conservative.

Table 9: Example dose from unit release of Cs-137 to show a combined effect of release geometry, stability classes and wind speed classes.

Release Location	Total Dose (Sv a^{-1})
Compactor/Baler	4.01E-08
SWRS	2.07E-08
BWRS/SCU	1.90E-08
ILLTS	4.08E-08

Site-specific meteorological data collected routinely by CNL at WL in the past were used in the dispersion calculations. Temperature, wind speed, wind direction and standard deviation of wind direction were measured at heights of 6, 25 and 61 m on the tower located within a 2-ha clearing about 300 m south-west of

B300. Quality-assured values for each of these variables are available every hour from 1988 to 1995. The data from the 6-year period (1990-1995, inclusive) were used for the present calculations. The 25-m level of the tower is at about the same height as the B100 stack. Meteorological conditions are, therefore, similar at the two locations and the 25-m data were used in calculations involving releases from B100. In contrast, B200 and B300 were treated as the ground-level sources and releases from the WMA occur from a short stack. The 6-m data represent best the meteorological conditions experienced by low-level releases and were used for these sources.

Limited, more recent meteorological data is available for the WL site. Environment Canada routinely measures temperature and wind data at a single level above the ground surface. However, the older CNL data is more suitable for the current DRL calculations for the following reasons:

- multi-level temperature measurements can be used to significantly improve estimates of the atmospheric stability class,
- higher-level data better represents the meteorological conditions experienced by the release from B100,
- the quality assurance of the selected CNL data is believed to be better than that of the Environment Canada data, and
- although there may have been some changes in meteorological conditions over the last 23 years, these are relatively small considering the uncertainties in the atmospheric dispersion modelling.

The CNL data from the period of 1990-1995 were also used in the 2001 DRL [17] calculations.

For each tower level, triple joint frequency distributions of wind speed, wind direction and stability class were calculated from the hourly data. The full triple joint frequency distributions are reported in Appendix A. Wind roses for the two measurement levels are shown in

Figure 4 and Figure 5. The average wind speeds in each wind speed class, which were also required by the model, are listed in Table 10.

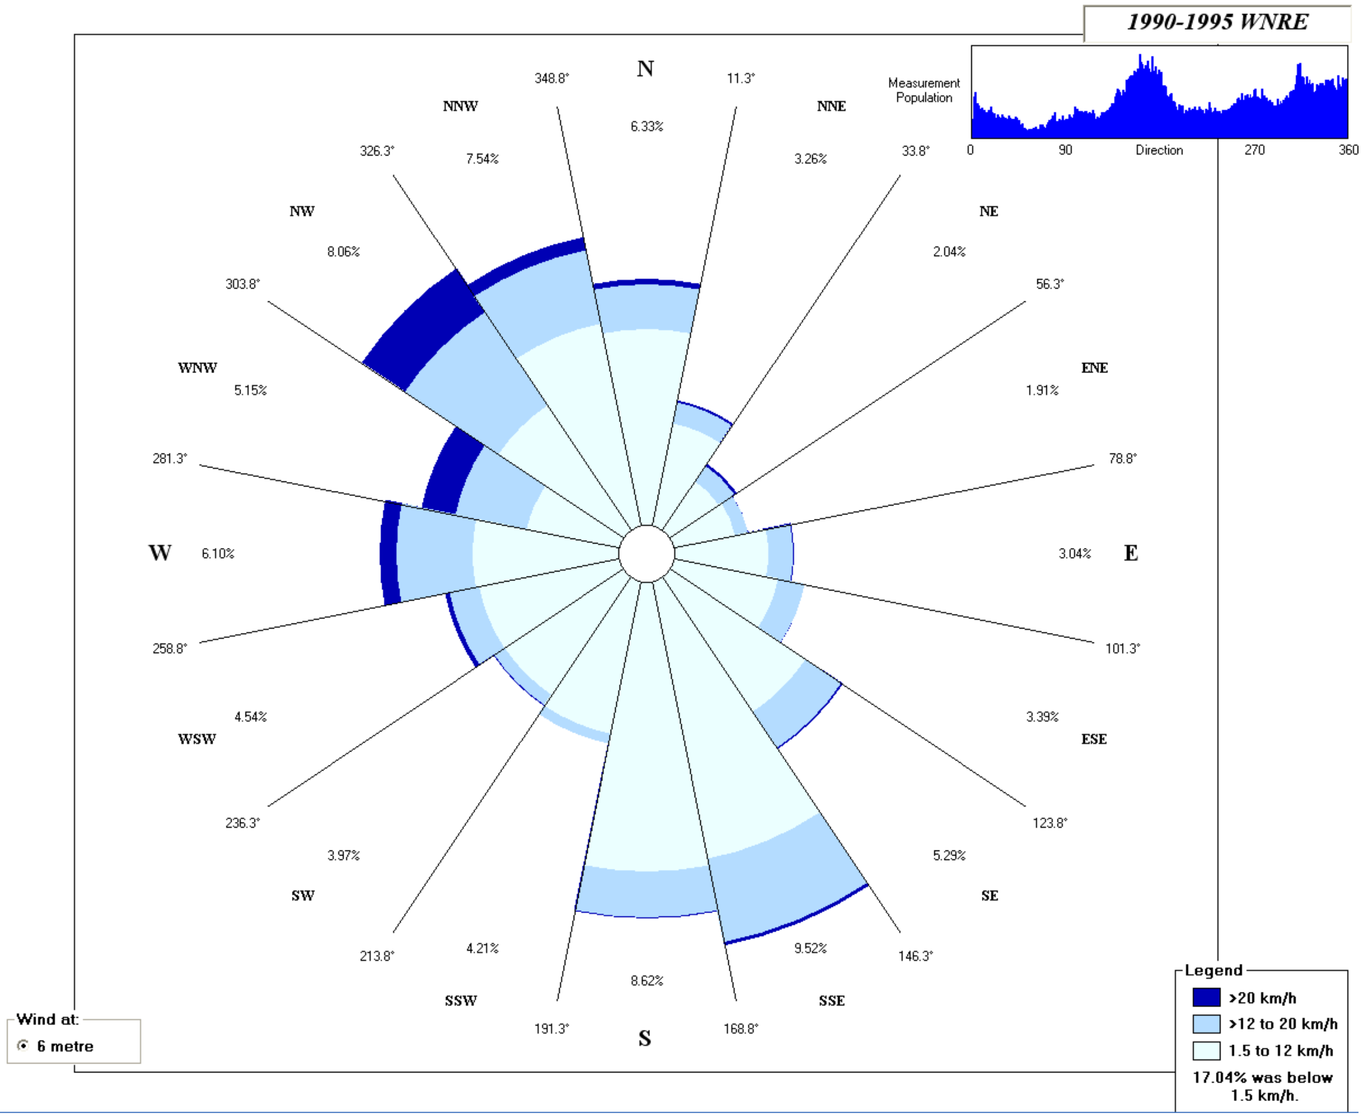

Figure 4: Wind rose diagram for the 6-m level.

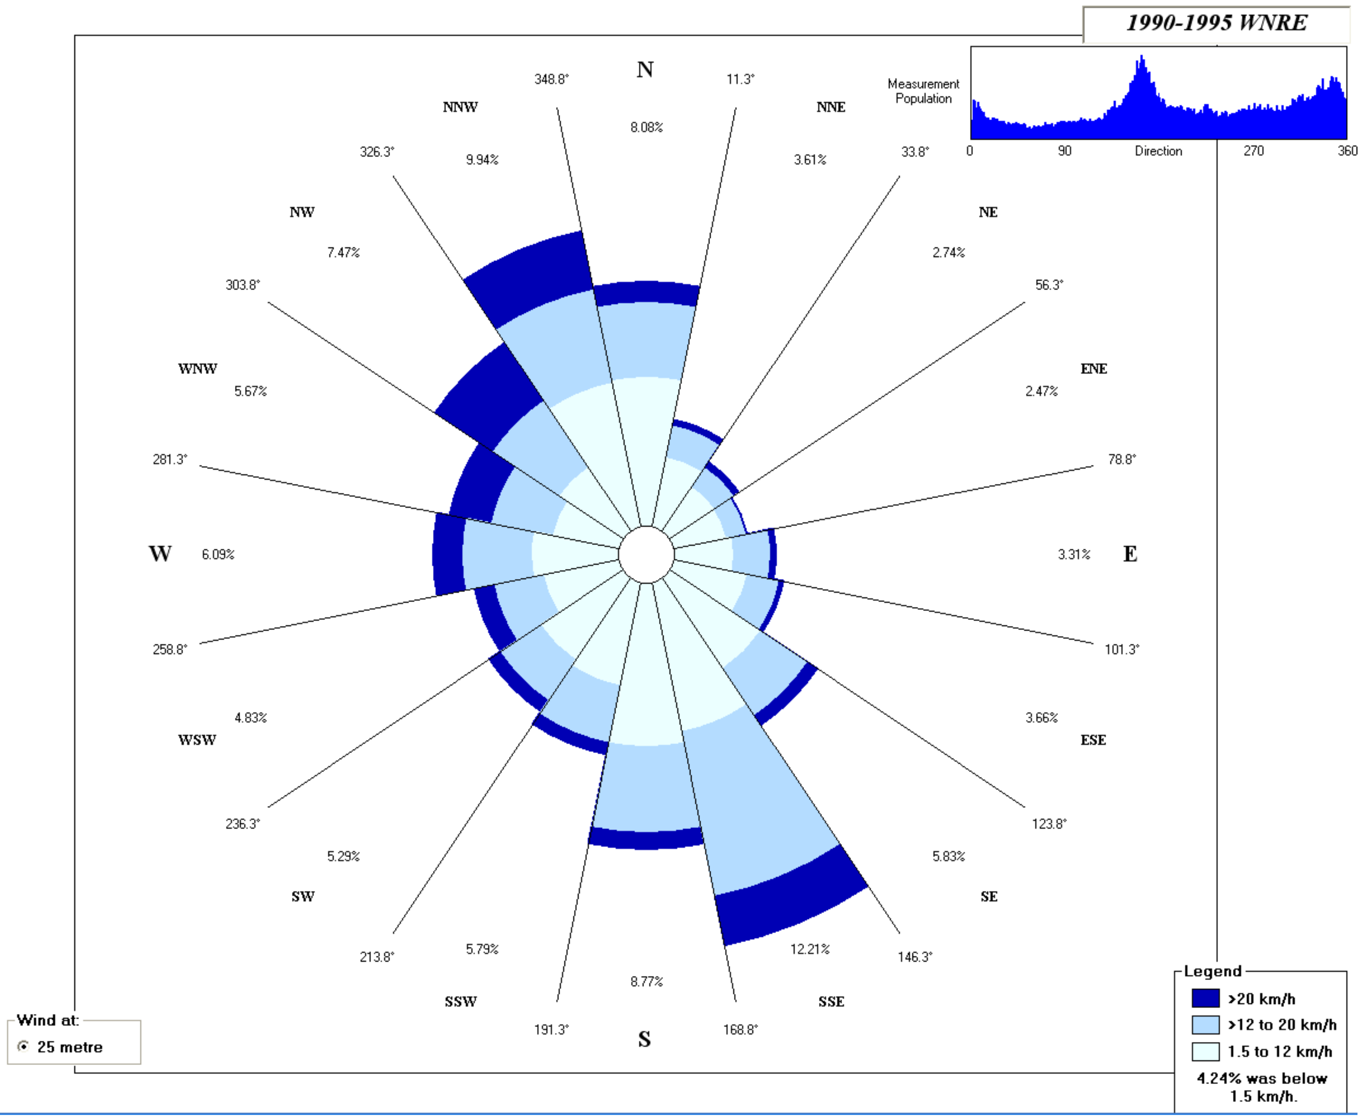

Figure 5: Wind rose diagram for the 25-m level.

Table 10: Mean wind speeds for each wind speed class.

Wind Speed Class	Wind Speed Range (m s^{-1})	Mean Speed (m s^{-1})	
		6-m Level	25-m Level
1	0-2	0.85	1.14
2	2-3	2.47	2.50
3	3-4	3.44	3.47
4	4-5	4.42	4.45
5	5-6	5.44	5.45
6	> 6	7.05	7.28

The land between the sources and the potential critical groups is partly wooded and partly farmland. Therefore, the meteorological roughness length was set equal to 0.4 m, as was done in the 2001 DRL [17] calculations.

All other parameters required to calculate atmospheric dispersion were assigned the values recommended in N288.1 [2].

6.2 Liquid Effluents

6.2.1 Sources

At the WL site, liquid effluents are discharged to the Winnipeg River continuously through the process outfall, twice a year from the sewage lagoon and intermittently through small natural streams. Of these sources, only the process outfall (shown as "Outfall" in Figure 2) is significant enough for explicit inclusion in the calculation of DRLs. As has been done in the past, the DRLs calculated for the process outfall can be applied to the sewage lagoons because the distance between the two sources is small compared to their distances from the critical group.

6.2.2 River Dispersion Model

The concentrations of radionuclides in the river water, at the location of the water intake for the critical group, have been calculated using the two-dimensional advection-dispersion model of N288.1 [2]. The model parameters include the river width, the river depth, the current velocity, the longitudinal and lateral dispersion coefficients, the offshore distance to the release point and the offshore distance to the point of water intake.

The river width was estimated from a topographic map to be 470 m. Based on the average river flow rate of 1.01E6 L s^{-1} for the period 2003-2008 [20] and Merritt's study [15], the current velocity was estimated to be 0.28 m s^{-1}. Based on this width, flow rate and velocity, the river depth was estimated to be 7.7 m. The release point is located 8 m offshore. The offshore distance to the point of water intake was conservatively assumed to be 8 m also.

N288.1 [2] recommends that values of longitudinal and lateral dispersion coefficients for the model are best determined from site-specific dispersion studies. In the 2001 DRL calculations [17], the dilution resulting at the location of the water intake was estimated based on the results of a short-term tracer test [15]. However, the radionuclide concentrations measured subsequently during routine monitoring of river water at a location 1,930 m downstream of the release point and 880 m upstream of the point of water intake were consistently much higher than estimates based on the measured release rates and the dilution estimated from the tracer test. This has led to doubts as to the applicability of the results of the tracer test in the DRL calculations.

Therefore, for the 2016 DRL [1] calculations, it was decided to calibrate the river model using Sr-90 and C-137 concentration data obtained from ten years (2003-2012) of routine monitoring of the river water at the location 1,930 m downstream of the release point, the river water upstream of the release point and the effluent in the process outfall ([20], [21], [22] and [23]). In this calibration, the longitudinal dispersion coefficient was set equal to 150 m^2 s^{-1}, the value recommended by N288.1 [2] for the Ottawa River downstream of the CRL site. This was done because data limitations made it impossible to estimate independent values of the longitudinal and lateral coefficients, and because the model predictions are very insensitive to the value of the longitudinal dispersion coefficient. The value for the Ottawa River was selected because the Ottawa River is similar in size to the Winnipeg River. The lateral dispersion coefficient was calibrated to be 7.4E-7 $m^2 s^{-1}$. The calibration done here (using the observed data) is equivalent to the validation of this sub-model.

7. RADIONUCLIDES

The DRLs have been calculated for all thirty-seven parent radionuclides that have been recently found or are reasonably expected to be found in WL's airborne and liquid effluents (see Table 11). In the 2016 DRL [1], an airborne effluent DRL was calculated for HTO released from B100 only. However, based on the introduction of three new systems in the WMA and the release of HTO from one or more of these systems, a separate airborne effluent DRL was calculated for HTO released from the WMA.

Table 11: Radionuclides considered for airborne and liquid effluents.

Ac-227#	HTO**	Ra-226#
Am-241	I-129	Sb-125 (Te-125md)
Am-243 (Np-239d, Pu-239dd)	Kr-85#	Sm-151#
C-14*	Mn-54	Sr-90 (Y-90d)
Ce-144 (Pr-144d)	Nb-94	Tc-99
Cm-244	Ni-63	Th-228 (Ra-224d)#
Co-60	Np-237 (Pa-233d)	U-233 (Th-229d, Ra-225dd)#
Cs-134	Pm-147	U-234
Cs-137 (Ba-137md)	Pu-238 (U-234d)	U-235 (Th-231d)
Eu-152	Pu-239	U-238 (Th-234d, Pa-234mdd)
Eu-154	Pu-240	Zn-65
Eu-155#	Pu-241 (Am-241d)	
Fe-55	Pu-242	

* For airborne effluents, C-14 was assumed to be released as CO_2.

** For airborne effluents, HTO was assumed to be released from B100 and the WMA.

Only for airborne effluents assumed to be released from the WMA.

In Table 11, radioactive daughters which are possibly significant (e.g., Np-239d, Pu-239dd) are given in parentheses after their parent (e.g., Am-243). They are not released directly, but the ingrowth of these daughters and their transfer through the environment were modelled explicitly in IMPACT [4], and were taken into account in determining the DRL for the parent. The letter 'd' following the radionuclide name indicates the first daughter, and the letters "dd" indicates the second daughter.

8. ENVIRONMENTAL PATHWAYS MODELS

8.1 General Discussion

The environmental pathways models described in N288.1 [2] were used in this analysis. These are illustrated in Figure 6 and Figure 7 as flowcharts, which provide a summary of the environmental compartments and transfer mechanisms applied in the current modelling for the critical groups. Each compartment treated in the model is numbered and the quantity in compartment i is denoted by X_i. Transfer from compartment i to compartment j is characterized by a transfer parameter P_{ij}, such that the amount present in compartment j under steady-state conditions due to transfer from compartment i is $P_{ij}X_i$. The various compartments, transfer parameters and their units are summarized in Table 12 and Table 13.

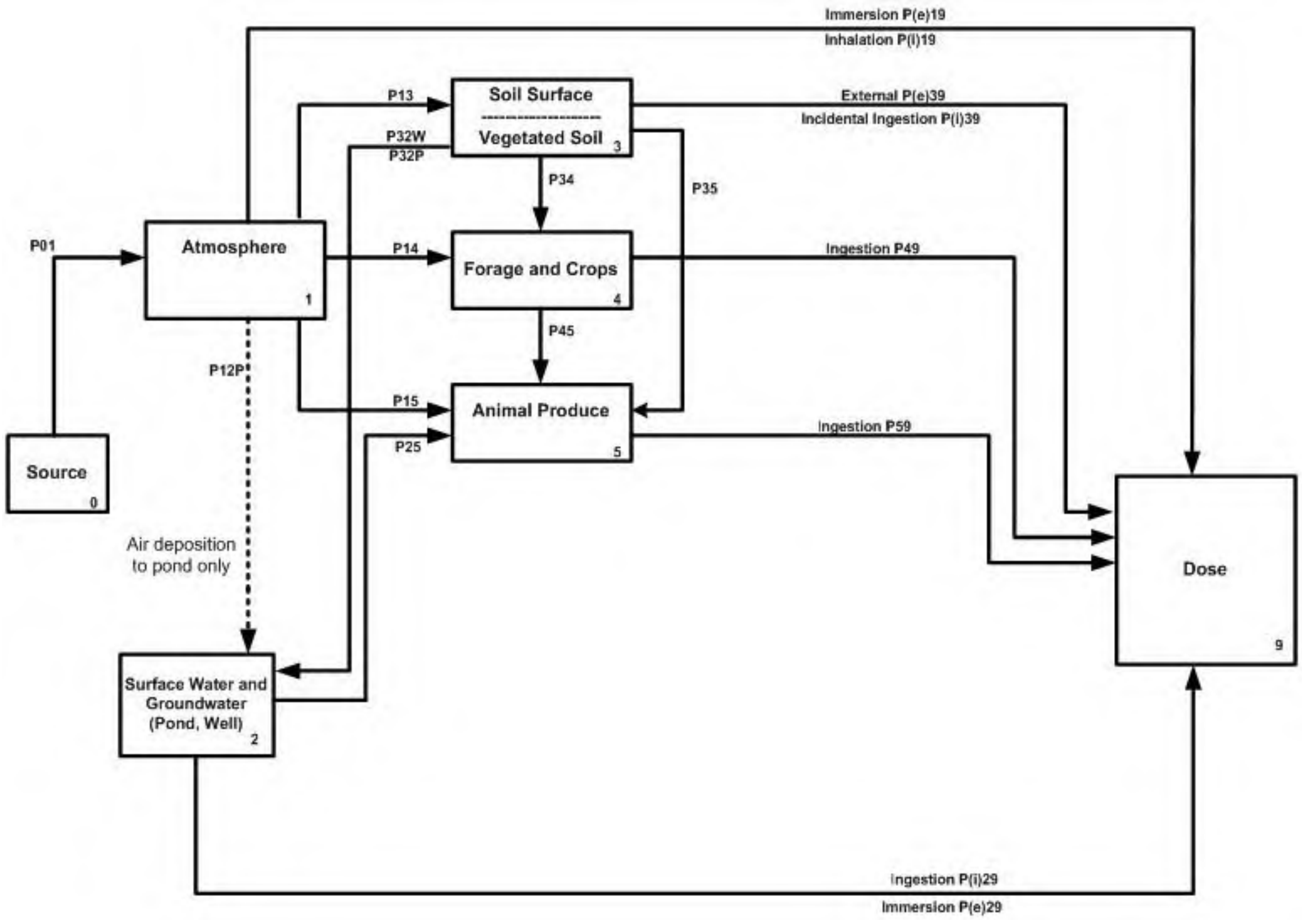

Figure 6: Environmental transfer model for airborne effluent modelling.

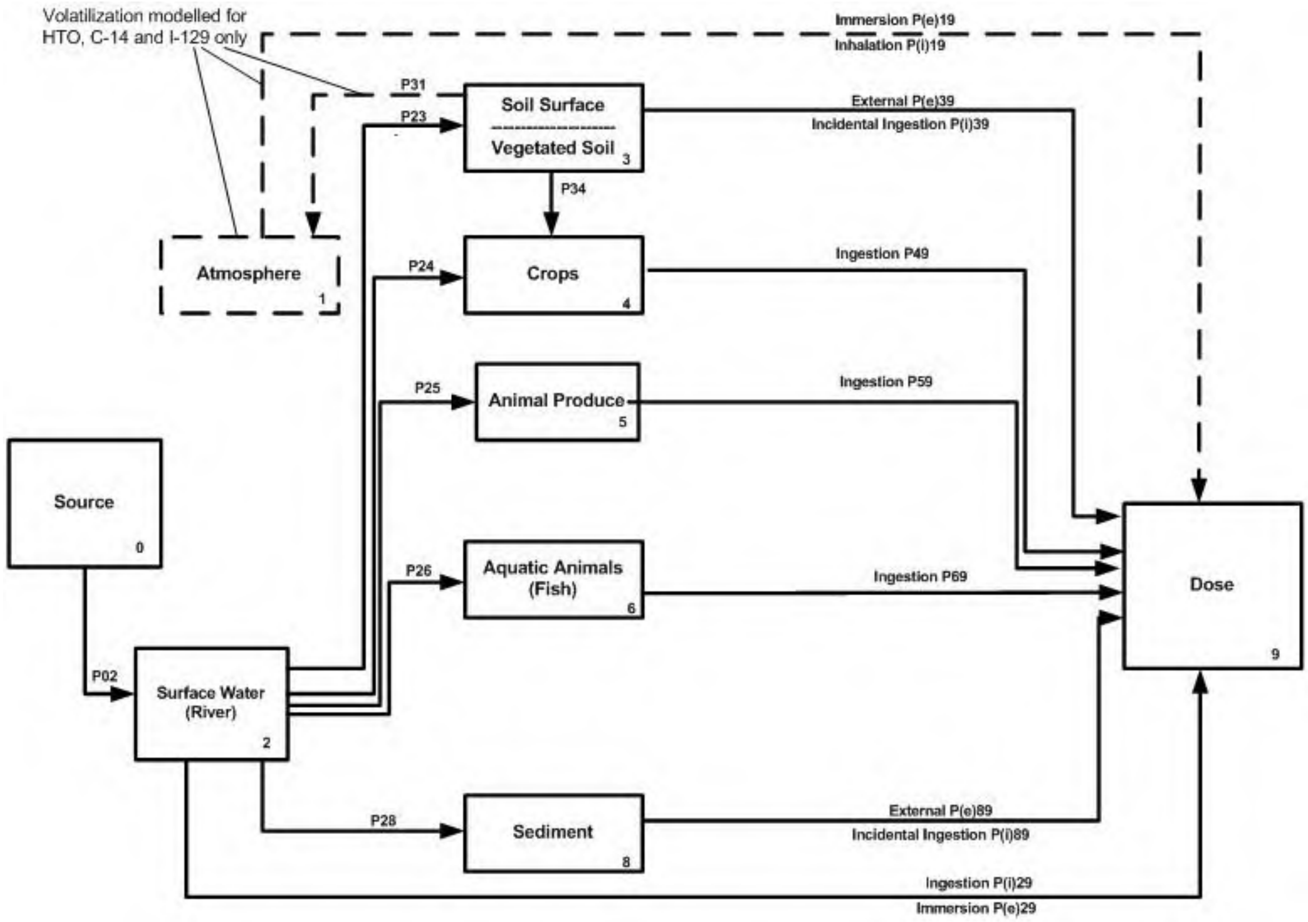

Figure 7: Environmental transfer model for liquid effluent modelling.

Table 12: Transfer compartments and their units.

Compartment Number	Compartment Name	Units
0	Source	$Bq \cdot s^{-1}$
1	Atmosphere	$Bq \cdot m^{-3}$

* For C-14 and radioiodine only.

** For HTO only.

The application of the models from N288.1 [2] to the WL assessment is discussed briefly in the sections below, emphasizing the few cases where it was necessary to deviate from the recommended models and parameter values.

8.2 Special Radionuclides

8.2.1 Tritium and Carbon 14

As recommended in N288.1 [2], the models used to calculate the DRLs for HTO and C-14 were based mainly on specific activity (SA) concepts. For tritium, SA models were used for all pathways except for the final calculation of doses, where an uptake model was used instead. For C-14, SA models were used for all pathways except transfers to animals (where a transfer factor was used, which was still derived from SA consideration), and the calculation of dose (where an uptake model was used). HTO absorption by skin was taken into account by increasing the dose from HTO inhalation by 50%, as recommended in N288.1 [2].

HTO can form stable bonds with carbon in plants and animals, in which case it is known as organically bound tritium (OBT). The DRLs for HTO take into account OBT formed in the environment. As a unit release of HTO will result in doses from both HTO and OBT in the environment, the dose from these two sources of uptake were added together and used to back calculate the HTO DRL.

The default parameter values recommended in N288.1 [2] were used throughout the tritium and C-14 models.

8.2.2 I-129

I-129 was modelled in the same manner as other radionuclides except that, in the case of liquid effluents, its volatile nature was taken into account by including volatilization following irrigation. Resulting air inhalation and immersion doses were calculated from the air concentrations estimated by the model.

8.3 Special Receptors

In order to facilitate the modelling of infant dose from the consumption of mother's breast milk, the concentrations of radionuclides in the milk were calculated. This modelling was carried out in IMPACT by modelling the lactating mother in the same way as a terrestrial animal and considering breast milk to be an animal product. The animal transfer models in N288.1 [2] were used for the mother, as shown in Figure 8. The nursing mother's intakes of food, water and air were discussed and listed in Section 5.4.3 and Table 7. Values for all of the other parameters required by the model were left at the default values in the IMPACT database. Figure 8 is provided to demonstrate only the contribution from mother's milk to infant's ingestion dose. Infants receive additional doses from other pathways as shown in Figure 6 and Figure 7.

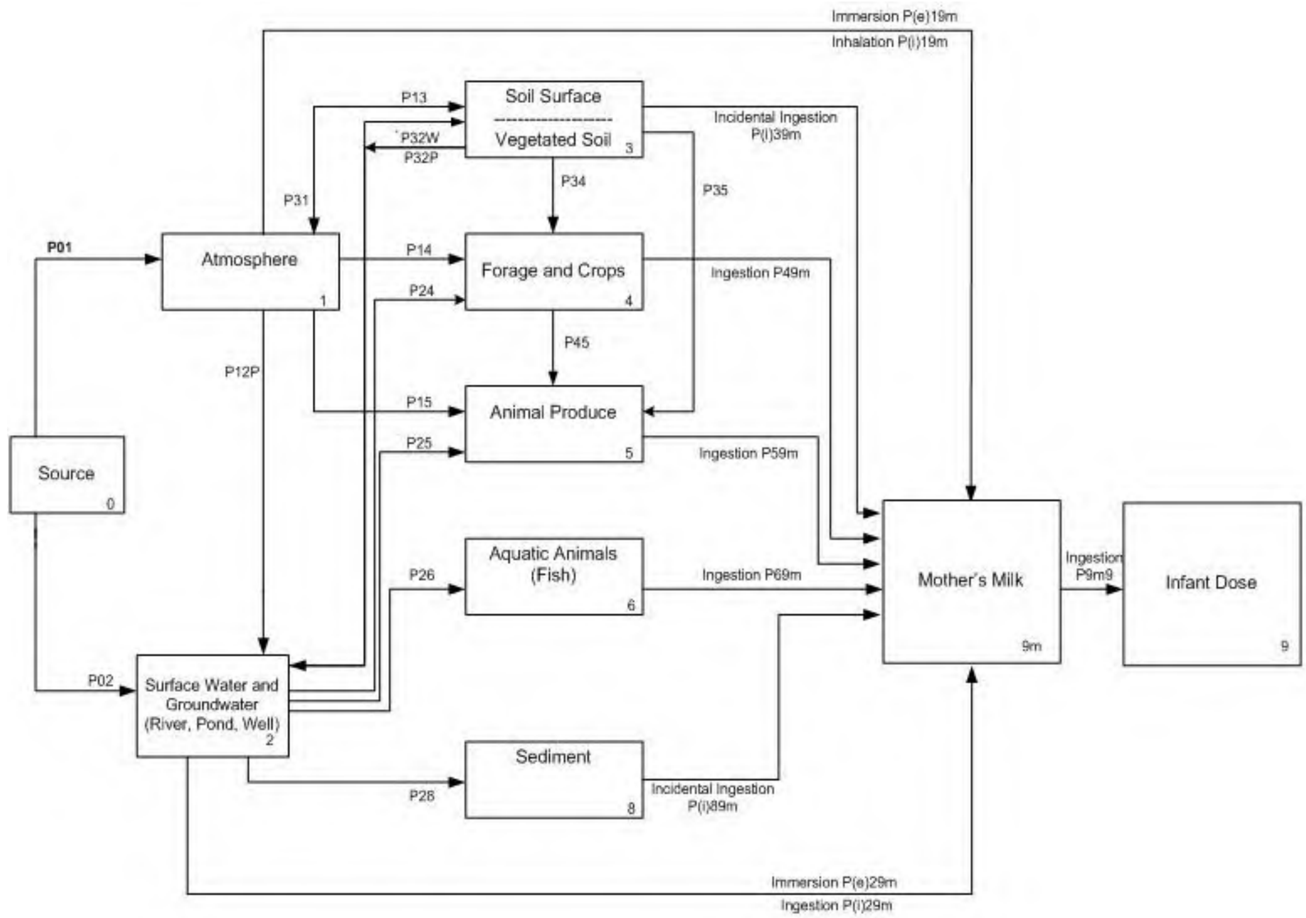

Figure 8: Supplemental model for mother's milk.

8.4 Other Parameter Values

8.4.1 Soil Types

The surface soil in the vicinity of WL was assumed to be clay, based on the recommendations of Killey [24]. The subsoil was conservatively assumed to be sand.

8.4.2 Well Depth

In areas having clay over bedrock, water supply wells are most likely to extend into the bedrock until some sufficiently permeable fracture zone is encountered, possibly at depths up to 100 m [22]. However, in some areas close to the WL site, sands and sandy till are present and it is possible to obtain a domestic water supply with a very shallow (5-10 m depth) dug well. Since the shallow supply well is conservative, a well depth of 6 m was assumed in this assessment.

The dose results generated from the DRL modelling demonstrate that the groundwater pathway is not of great importance for most radionuclides. However, for HTO, Tc-99 and Np-237, well water ingestion is one of the dominant pathways**.**

8.4.3 Pond Model

Although, in reality, ponds are fed by precipitation, groundwater and surface water inflows, only precipitation and groundwater inflow were included in the IMPACT pond model. This is conservative because uncontaminated surface water inflow flushes radioactivity from the pond.

The parameter values assumed for the small ponds that were assumed to provide drinking water for deer are listed in Table 14. These are the values suggested in N288.1 [2]. In the IMPACT default database, the value for the sediment dry bulk density was found to be incorrect and the database maintainers were notified of this error.

Table 14: Parameters values used in the pond model.

Parameter	Value
Effective Soil Porosity	0.2
Pond Surface Area (m^2)	5000
Pond Depth (m)	2
Horizontal Linear Groundwater Velocity ($m\ s^{-1}$)	1.58E-7
Groundwater Inflow Rate to Pond ($L\ s^{-1}$)	5.06E-3
Sediment Dry Bulk Density ($kg\ m^{-3}$)	400

8.4.4 Wet Deposition Velocity

The calculation of the wet deposition velocity involves a term f_{pj}, which is defined as the fraction of the time that precipitation occurs when the wind blows from sector j. Precipitation data routinely collected by CNL at WL, in the past, is incomplete in that it does not include the contribution from snow. Therefore, the f_{pj} values were created using Environment Canada's meteorological data for the WL site for the period of 2004 May to 2009 April, inclusive (see Table 15).

Table 15: Values of f_{pj}.

Sector	f_{pj} Value
N	0.087
NNE	0.114
NE	0.111
ENE	0.084
E	0.072
ESE	0.064
SE	0.061
SSE	0.04
S	0.047
SSW	0.047
SW	0.052
WSW	0.053
W	0.057
WNW	0.071
NW	0.065
NNW	0.061

The calculation of the wet deposition velocity also requires a value for the annual average precipitation (rain + snow). The value measured at WL for the period of 1971 to 2000 [25], 565 mm, was used.

8.4.5 Volatilization from Irrigation Water

The critical group associated with liquid releases was assumed to irrigate its backyard gardens and lawns with contaminated water. In the calculations, the size of the irrigated area was assumed to be 50 m by 50 m, which was intended to account for a front yard, a back yard and a large garden plot. In calculating air concentrations following volatilization of volatile radionuclides (HTO, C-14 and I-129), the receptor was placed on the contaminated field, implying continuous exposure to the re-emitted activity.

8.4.6 Absolute Humidity

Values of annual average absolute humidity, average absolute humidity over the snow-free period and average absolute humidity over the growing season are required for modelling HTO. For the WL area, the snow-free period is approximately from May 15 to November 15, and the growing season is estimated to be from June 1 to September 30. Based on Environment Canada data measured at the WL site between 2008 October 1 and 2009 September 30, the following humidity values were used: annual average absolute humidity 0.00541 L m^{-3}, average absolute humidity over the snow-free period 0.0085 L m^{-3}, and average absolute humidity over the growing season 0.0102 L m^{-3}.

8.4.7 External Dose Coefficients

There are two approaches to modelling the contributions of daughter radionuclides to the dose resulting from the release of a parent radionuclide to the environment. The preferred approach is to explicitly model the ingrowth of these daughters, their transfer through the environment and the resulting dose from them. A second approach which is simpler, but in certain cases less accurate, is to explicitly model the parent only and include the contributions to dose from the daughters in the dose coefficients (DCFs). IMPACT has been designed so that either approach can be used. For the current DRL calculations, the explicit approach was used. However, the external DCFs in the default IMPACT database include the contributions of daughters. Since there is a potential for errors when correcting the many external DCFs, and since the external doses are either much less than the ingestion doses or the contributions from the daughters to external doses are much less than those from the parent, the default external DCFs were used for the current calculations. This approach is slightly conservative.

8.4.8 Additional Changes to IMPACT Default Database

Table 16 shows changes to parameter values in the IMPACT default database that were made for the WL assessment and are not described elsewhere in this report.

8.4.8.1 Parameter Values for Additional Radionuclides Identified for Airborne Effluents from the WMA

DRLs were required for seven more radionuclides (i.e., Ac-227, Eu-155, Kr-85, Ra-226, Sm-151, Th-228 and U-233) for potential releases from WMA systems. For five radionuclides (Eu-155, Kr-85, Ra-226, Th-228 and U-233), the parameter values were already present in the IMPACT default database. For Ac-227 and Sm-151, IMPACT default database did not contain any parameter values. In fact, the parameter values for both elements (Ac and Sm) were completely missing and, therefore, it became necessary to add all the parameter values for them.

Sm-151 does not have any progeny, but Ac-227 decays into Fr-223 and Th-227. Both these radionuclides (Fr-223 and Th-227) were also missing in IMPACT database. Given that Ac-227 and the other six radionuclides are expected to be present at WL site very rarely, and to keep the calculations simple, Fr-223 and Th-227 progenies were ignored.

All the parameter values corresponding to Ac-227 and Sm-151 were estimated as shown in Table 17, Table 18 and Table 19, and entered into IMPACT database for performing the DRL calculations.

Table 16: Other parameter values in the IMPACT default database that were modified for the WL calculations.

Compartment	Parameter Name	Unit	IMPACT Default Database Value	Value Used in WL Model	Reference and Comment
Surface Water (River)	Partition coefficient for Np	$L\ kg^{-1}$	25	40	N288.1 Clause 7.8.2
Surface Water (Pond)	Partition coefficient for Np	$L\ kg^{-1}$	65	125	N288.1 Clause 6.6.2.2
Surface Water (Pond)	Net Precipitation Rate	$mm\ a^{-1}$	369	6	=WL precipitation rate – WL evapotranspiration rate [26]
Groundwater (Well)	Rate of Infiltration to Aquifer	$m^3\ m^{-2}\ s^{-1}$	4.757E-9	4.043E-9	Assumed same as soil infiltration rate below, although N288.1 Clause 6.5.2.2 suggests that it can be lower than soil.
Soil	Infiltration Rate	$m^3\ m^{-2}\ s^{-1}$	1.142E-8	4.043E-9	= 0.5 (WL precipitation rate – 0.31) m a^{-1}, N288.1 Clause 6.3.6.3
Soil (link from water via air)	Annual Average Irrigation Rate	$L\ m^{-2}\ s^{-1}$	Not available	1.1E-5	N288.1 Clause 7.2.3.2.2
Terrestrial Plants	Fraction of Plant Carbon Derived from Air (all sources other than irrigation water)	-	1	0.7 or 1.0*	N288.1 Clauses 6.4.9.3 and 7.3.4.3
Sediment (River)	Partition coefficient for Np	$L\ kg^{-1}$	25	40	N288.1 Clause 7.8.2
Sediment (Pond)	Partition coefficient for Np	$L\ kg^{-1}$	65	125	N288.1 Clause 6.6.2.2
Dose	Fraction of Year Spent Swimming in a Surface Water Body (Beach Swimming)	-	0.014	0.011	Based on 3 months per year
Dose	Fraction of Year Spent Swimming in a Pool Filled with River Water	-	0.028	0.032	Based on 9 months per year
Full Simulation	Facility Life	years	Not available	57	When the 2010 DRLs were calculated, WL site had been in existence for 47 years (opened in 1963) and the DRLs were expected to be used for another 10 years.

* This value is set at 0.7 when calculating liquid effluent DRLs, but is set at 1 when calculating airborne effluent DRLs.

Table 17: Radionuclide specific parameter values takes from different references.

Parameter	Radionuclide						Comment

9. MODELLING SCENARIOS

9.1 General Discussion

In the 2016 DRL [1], a scenario file was set up using IMPACT [4]. A map covering the region of interest was imported into the model and calibrated to ensure the UTM coordinates were properly aligned. All effluent release locations and potential critical group locations were then entered into the model. Links between compartments were set up, including transfers between adjacent environmental compartments, and between the potential critical groups and their food supply locations. All site-specific and scenario-specific parameters needed by the pathways models were then incorporated.

Once the scenario file was finalized, eight sub-scenario files were created. Four of these were for screening calculations for airborne effluents. Two were for detailed calculations for airborne releases of all radionuclides, except HTO, one for each potentially bounding release location. Another was for detailed calculations of the release of HTO from B100. The final one was for detailed calculations for liquid effluents. For each combination of effluent type, radionuclide, critical group, age class and potentially bounding release location, calculations of dose rate per unit release were carried out by running IMPACT. The results were searched to identify the highest dose rates per unit release for each combination of effluent type and radionuclide among all age classes and potentially bounding release locations. These dose rates per unit release were then used to calculate the DRLs for each combination of effluent type and radionuclide. For each of these combinations, the dominant exposure pathway and its percent contribution to the dose rate were also determined.

In the current assessment, from the scenario files described above, the file corresponding to the WMA airborne releases was modified to include the release of HTO and to replace the release geometry of the compactor/baler with that of the ILLTS. The results of the analysis are presented in Section 11.

9.2 Scenarios for Airborne Effluent Modelling

Table 20 lists the UTM coordinates of the release locations and potential critical group locations considered in the analysis of airborne effluents.

Table 20: Release and potential critical group locations for airborne effluent modelling.

Location	Easting (m)	Northing (m)
Release		
Building 100 Stack	709,909	5,562,658
Building 200	709,928	5,562,834
Building 300	709,714	5,562,668
WMA Gate	711,322	5,564,260
Potential Critical Group		
Farm A	709,547	5,565,803
Farm D	710,067	5,559,924
Farm E	708,642	5,562,571
Farm F	708,783	5,565,288

The exposure pathways for the critical groups for airborne effluents are air inhalation, air immersion, water immersion, groundshine, soil ingestion, water ingestion, plant ingestion and ingestion of terrestrial animal products.

9.3 Scenario for Liquid Effluent Modelling

Table 21 lists the UTM coordinates of the release and critical group locations considered in the analysis of liquid effluents.

Table 21: Release and critical group locations for liquid effluent modelling.

Location	Easting (m)	Northing (m)
Release		
WL Process Outfall	709,474	5,562,997
Critical Group		
Farm A	709,547	5,565,803

The exposure pathways for the critical group for liquid effluents are air inhalation, air immersion, water immersion, groundshine, soil and sediment ingestion, water ingestion, plant ingestion, ingestion of terrestrial animal products, fish ingestion and beach shine.

10. SCREENING CALCULATIONS FOR AIRBORNE EFFLUENTS

10.1 Potential Critical Groups and Release Locations

As in the 2016 DRL [1], screening calculations for airborne effluents were performed, which helped reduce combinations of potential critical groups and release locations (from 16 (4 releases X 4 receptors) to **3**) for which detailed dose calculations were required. The findings can be summarized as follows, with further details provided below:

1. Review of air concentrations indicated that releases from B300 would result in the highest predicted dose at the Farm E critical group. However, because Farm E has an occupancy factor of 0.08, it was not calculated to be the bounding case. The releases from **B200 result in the highest predicted dose at the Farm A critical group**, and thus emerged as a bounding case for about half of the radionuclides.
2. Consideration of the combined effect of the wind and precipitation frequencies on the predicted soil concentrations resulted in **WMA release point and Farm A critical group** emerging as a bounding case for the remaining radionuclides.
3. Consideration of different rates of decay of parent radionuclides and ingrowth of progenies during the plume travel time, as well as the predicted air and soil concentrations for logically selected radionuclides, did not result in any additional release location or critical group bounding cases.
4. Knowledge that tritium is not released from B200 resulted in **B100 as a release point and Farm F as critical group** as a bounding case.

In view of the similar nature of the potential critical groups, the screening was based on:

1. The predicted annual-average air concentrations at each group location, resulting from a unit release of each radionuclide at a release location. Concentrations at Farm E were multiplied by a factor of 0.08 to account for the fact that it has limited occupancy (672 hrs per year) (as clarified in Sections 5.2.1 and 5.4.4).
2. The predicted annual-average soil concentration at each group location, resulting from a unit release of each radionuclide at a release location, except for C-14 and HTO, for which doses do not depend on soil concentration. Concentrations at Farm E were multiplied by a factor of 0.08 to account for the limited occupancy.

Table 22 shows the predicted air concentrations for a subset of the radionuclides released, along with the predicted air concentrations of their daughters. Predictions for all released radionuclides having daughters are included to illustrate the differing effects of ingrowth for different combinations of potential critical groups and release locations. Also included in Table 22 are predictions for the slowest- and fastest-decaying released radionuclides that have no daughters, I-129 and Zn-65. Predictions for HTO, which was previously released from B100 only, now includes separate predictions for HTO released from the WMA. The highest concentrations for each radionuclide are indicated by yellow shading.

Even though the air concentrations in the WMA have increased by approximately 2% for all radionuclides, the release location and critical group corresponding to the highest concentration for each radionuclide remain the same as in the 2016 DRL [1]. For all radionuclides, except Pu-239dd (second daughter of released radionuclide Am-243) and HTO (released from both B100 and the WMA), the highest predicted air concentrations are for the combination of Farm A and release from B200. For Pu-239dd, the air concentration is also highest at Farm A, but in this case in combination with release from B300. However, the air concentrations of Pu-239dd are ten orders of magnitude lower than those of its parent, Am-243, so the dose contribution from Pu-239dd will be negligible compared to that of Am-243 and it need not be considered further. Although Farm E is the potential critical group closest to release locations B100, B200 and B300, it has limited occupancy and is not located in one of the high-frequency wind-direction sectors relative to them (Figure 2, Figure 4 and Figure 5). Therefore, the scaled predicted air concentrations at this group location are lower than the concentrations at other group locations. Although the WMA is closer to Farm A than B200 is, the WMA is not the bounding release location for air concentrations because Farm A is in a low-frequency wind-direction sector relative to the WMA (Figure 2 and Figure 4).

For HTO released from the WMA, the air concentration is also highest at Farm A, but in this case in combination with release from the WMA. This is because HTO is only released from B100 and the WMA, and each case was treated individually to allow for separate DRLs. For HTO released from the B100, the highest predicted air concentration is at Farm F, not at Farm A. This is because releases from B100 were assumed to be driven by the meteorological conditions typical of a height of 25 m, whereas releases from the other locations were assumed to be driven by the meteorological conditions typical of a height of 6 m. The meteorological conditions at these two heights differ significantly (Figure 2 and Figure 4).

Table 22: Predicted air concentrations (Bq m^{-3}) at potential critical group locations as a result of the unit release of radionuclide (1 Bq s^{-1}) to the atmosphere at a release location.

* The values listed for Farm E are the predicted concentrations multiplied by a factor of 0.08 to account for the limited occupancy.

** The predicted air concentrations for releases from the WMA are revised values from the 2016 DRL [1].

*** Yellow shading indicates the highest concentrations for each radionuclide.

† Separate HTO DRLs are required for B100 and the WMA, thus, both are shaded yellow.

Table 23 shows the predicted soil concentrations for a subset of the radionuclides released (except for C-14 and HTO), along with the predicted soil concentrations of their daughters. The highest concentrations for each radionuclide are indicated by yellow shading.

Even though the soil concentrations in the WMA have increased by approximately 2% for all radionuclides, the release location and critical group corresponding to the highest concentration for each radionuclide remain the same as in the 2016 DRL [1]. The highest predicted soil concentrations are for the combination of Farm A and release from the WMA for all parent radionuclides, except I-129. Farm A also has the highest predicted air concentrations, but the release location resulting in the highest air concentrations is different (B200). The difference is because precipitation occurs more frequently when the wind is blowing toward Farm A from the WMA than when it is blowing from B200 (see Figure 2 and Table 15), with the net result being more wet deposition and higher soil concentrations, even though the air concentrations are lower.

For I-129, the highest predicted soil concentration is for the same combination as the highest predicted air concentration (Farm A and B200). This is because, for I-129, wet deposition is less significant than dry deposition, whereas the opposite is true for the other radionuclides of interest. The washout ratio for I-129 is much lower than that for the other radionuclides (1.6e5 vs. 5.5e6), and the dry deposition velocity for I-129 is higher (7.5e-3 m s^{-1} vs. 1.4E-3 m s^{-1}).

For many of the daughter radionuclides, the highest predicted soil concentrations are for the combination of Farm A and release from B300. However, the soil concentrations of the daughters are several orders of magnitude lower than those of the parents, so they can be ignored.

In summary, based on the results of the screening calculations in the 2016 DRL [1], detailed dose calculations were required for only three combinations of potential critical group and release locations: Farm F and B100 for HTO, Farm A and B200 for radionuclides other than HTO, and Farm A and the WMA for radionuclides other than HTO. However, based on the results of the screening calculations, detailed dose calculations need to be revised for the combination of Farm A and the WMA (using the ILLTS geometry) for all radionuclides with the addition of HTO. Since Farm A has been determined previously to be the bounding critical group for all radionuclides released from the WMA, and since seven radionuclides introduced in 2020 are only releasing from WMA, further screening to determine the bounding critical group was not required.

Table 23: Predicted soil concentrations (Bq kg^{-1}dw) at potential critical group locations as a result of the unit release of radionuclide (1 Bq s^{-1}) to the atmosphere at a release location.

** Yellow shading indicates the highest concentrations for each radionuclide.

11. DRL RESULTS

11.1 Summary of Results

For each effluent type, the DRL for a given radionuclide was calculated from:

$$DRL_i = \frac{DL_{eff}}{D_i} \tag{2}$$

where: DRL_i is the derived release limit for radionuclide i (Bq s^{-1}), DL_{eff} is the annual effective dose limit for members of the public (0.001 Sv a^{-1}), D_i is the dose rate per unit release rate ((Sv a^{-1})/(Bq s^{-1})) for radionuclide i, summed over all applicable exposure pathways, for the age class leading to the highest dose.

The calculated DRLs for each radionuclide are summarized in Table 24 and Table 25 for airborne and liquid effluents, respectively. For airborne effluents, the DRLs are expressed on a weekly basis and for liquid effluents they are expressed on a monthly basis. The tables also provide information on the bounding age classes, the dominant exposure pathways and the percent contributions from the dominant pathways to the total dose rates.

Table 24: DRLs for airborne effluents released from WL.

Radionuclide (and daughters)	DRL (Bq week^{-1})	Bounding Release Location	Bounding Critical Group	Bounding Age Class*	Dominant Pathway**	Percent Contribution from Dominant Pathway to Total Dose Rate

11.2 Evaluation of Results

For airborne effluents, B200 is the bounding release location for sixteen of the thirty radionuclides. The WMA is the bounding release location for all others, except for HTO, released from B100. The adult is the bounding age class for eleven radionuclides, with air inhalation being the dominant pathway for seven of these. For all other radionuclides, except one, infant age classes are bounding with ingestion of terrestrial animal products and mother's milk being the dominant pathway for half of these.

For liquid effluents, there are no changes from the 2016 DRLs [1]. The 3-month-old formula-milk-drinking infant is the bounding age class for twenty-three radionuclides, with water ingestion being the dominant pathway for seventeen of these and groundshine being the dominant pathway for the remainder.

11.3 Facility DRLs

The DRL values calculated in Table 24and Table 25 are intended to be applied directly to all nuclear facilities at WL. For air effluents, staff should use the DRLs in Table 24. For liquid effluents, facilities that release activity to the Winnipeg River should use the DRLs in the liquid effluent table (Table 25). These liquid effluent DRLs can also be used in assessing releases from other liquid discharge points (storm water runoff, internal effluent discharges to the process drain) that discharge into the Winnipeg River.

Where effluent monitoring is carried out using gross parameters (i.e., gross beta and gross alpha activity), the DRL (Table 26) for the most limiting, and likely to be present, radionuclide in the mixture should be applied to the gross parameter. The radionuclide for gross alpha for airborne emissions is Pu-239 and for gross beta is Sr-90. For liquid emissions the isotope for gross alpha activity is Pu-238 (most limiting and occasionally detected) and for gross beta is Sr-90.

Table 26: DRL values for gross parameters.

Release Type	Gross Parameter	Limiting Nuclide	Release Limit
Airborne – Stack Emissions	Gross Beta	Sr-90	6.79E+09 Bq/wk
	Gross Alpha	Pu-239/240	1.73E+09 Bq/wk
Liquid – Process Outfall and Sewage Lagoon	Gross Beta	Sr-90	1.30E+10 Bq/mo
	Gross Alpha	Pu-238	1.16E+09 Bq/mo

12. VERIFICATION

In the 2016 DRL [1], the analysis assumptions, the selection of input parameter values, the contents of IMPACT code input files and the determination of DRLs were verified in several ways. Draft assumptions and the selection of some key input parameter values were reviewed by appropriate CNL staff prior to the start of calculations. As the DRL results were generated, those for selected radionuclides (C-14, Co-60, Cs-134, Cs-137 (Ba-137m), HTO (OBT), I-129, Pu-239, Sr-90 (Y-90) and Ce-144 (Pr-144)) were checked using the independent code CSA-DRL. Finally, the assumptions, input files and calculated DRLs were independently verified through a comprehensive internal CNL review [32].

The initial checking using the CSA-DRL code did not identify any problems with the results generated using the IMPACT code. The final CNL verification identified two errors with the selection of input parameter values, one of which was significant. This review also identified one minor transcription error in the input files. These errors were subsequently corrected.

Subsequently, it was realized by the authors that there was an error in the screening calculations. This was corrected, although it did not significantly change the results.

In the current assessment, all the changes relating to the airborne effluent DRL calculations were made by Sohan Chouhan and independently verified by Bruce Reavie and Lisa Campagna [33] to ensure that they were successfully transcribed into the IMPACT code [4]. Compilations of the IMPACT results into the summary DRLs were also verified.

The DRLs for seven additional radionuclides introduced in 2020 were calculated by Sohan Chouhan and independently verified by Karen Ross [34].

12.1 Sample Calculations

These DRLs were additionally verified by performing sample calculations (details in Appendix B) for the most limiting, and likely to be present, radionuclide for airborne (Sr-90) and liquid (Pu-238) releases.

13. COMPARISON OF REVISED DRLS WITH PREVIOUS VALUES

The revised DRLs have been compared with those established in 2016 [1]. Reasons for the differences were mentioned briefly in Section 1 and Section 6 of this report.

In summary, for 12 radionuclides from airborne effluents, the revised DRLs are approximately 2% lower than the 2016 DRLs [1]. For one radionuclide (Zn-65), the bounding release location changed from B200 to the WMA and the magnitude of the DRL was lowered by 1%. The main reason for the decreases in the DRLs is the introduction of the three new systems (SWRS, BWRS/SCU and ILLTS) in the WMA, which resulted in lowering the effective release height. A new DRL was added for HTO released from the WMA (5.61E+14 Bq week^{-1}) and the previous DRL for HTO released from B100 (1.65E+15 Bq week $^{-1}$) [1] is still valid. DRLs were calculated for seven additional potential radionuclides in airborne effluent released from WMA.

There is no change to the liquid effluent DRLs.

APPENDIX B SAMPLE CALCULATIONS FOR THE MOST LIMITING, AND LIKELY TO BE PRESENT, RADIONUCLIDE FOR AIRBORNE AND LIQUID RELEASES

This appendix demonstrates the accuracy of WL DRL calculation via sample calculation done for the most limiting, and likely to be present, radionuclide for airborne (Sr-90) and liquid releases (Pu-238).

This sample calculation scenarios are consistent with all the information discussed in the report and the results given in Table 24and Table 25; therefore, only illustrative points are mentioned below.

Most of the acronyms used in Table 29and Table 30 are same as those defined in Table 12 and Table 13, but some additional ones are: **w** well, **p** pond, **frg** forage, **frt** fruits, **grd** garden vegetables, **ptt** potatoes, **cmlk** cow milk, **bmlk** breast milk, **chkn** chicken, **fwf** freshwater fish, **ar** air, **ih** inhalation, **ig** ingestion, **ex** external, **ef** effective, **wt** Winnipeg River water, **g** ground, **tr** terrestrial, **pl** plant, **an** animal, and **aq** aquatic.

B.1 SAMPLE CALCULATIONS BEHIND THE DRL FOR AIRBORNE EFFLUENT (SR-90) RELEASE FROM WL

When calculating DRLs for Sr-90 (nuclide **A**), the dose contribution from its progeny Y-90 (nuclide **B**) was calculated explicitly in this scenario (Table 29). Any compartment showing negligible concentration or dose (e.g., groundwater well concentration for Y-90) were omitted (along with the corresponding transfer parameter values) from Table 29.

In this scenario, only the bounding release location (WMA), the bounding critical group (Farm A), and the bounding age class (3-month-old nursing infant) were modelled. Full detail of the dominant pathway (terrestrial animal and mother's milk) are available in Table 29, which also contains details of nursing mother's milk calculations.

As shown in the Table 6, for airborne effluents, Farm-A critical group was self-sufficient in all food product except honey, which is produced on Farm D only and supplied to Farm-A critical group. This was accounted by doing separate compartmental concentration and dose calculations at Farm D corresponding to all pathways related to honey, and to the nursing mother's milk, and to dose to a 3-month-old nursing infant.

IMPACT code version 5.4.0 used in the calculation does not provide transfer parameter values, which were obtained using an R&D tool CSA-DRL [19]. This DRL was calculated in both codes (IMPACT and CSA-DRL), both gave the same final DRL value of 6.79E+09 Bq/week. Then the relevant compartmental values and transfer parameter values were outputted from CSA-DRL and populated in Table 29.

Some compartmental concentrations values are intentionally repeated in some rows in Table 29 (and similarly also in Table 30) to make it very intuitive. The dependency between all compartments can be best understood by going from left to right for each compartment and then move sequentially from top to bottom in this table.

The resulting DRL value from this sample calculation table matched exactly with the result of Table 24, and hence verified the accuracy of DRL calculation corresponding to airborne effluents.

Table 29: Airborne release scenario.

B.2 SAMPLE CALCULATIONS BEHIND THE DRL FOR LIQUID EFFLUENT (PU-238) RELEASE FROM WL

When calculating DRLs for Pu-238 (Nuclide **A**), the dose contribution from its progeny U-234 (nuclide **B**) was calculated explicitly in this scenario (Table 30).

In this scenario, the sole release location (WL Process Outfall), the sole critical group (Farm A), and the bounding age class (3-month-old formula milk drinking infant) were modelled. Full detail of the dominant pathway (water intake) are available in Table 30.

As shown in the Table 6, for liquid effluent, Farm-A critical group was self-sufficient in all food product.

IMPACT code version 5.4.0 used in the calculations does not provide any transfer parameter values, which were obtained using an R&D tool CSA-DRL [19]. The DRL was calculated in both codes (IMPACT and CSA-DRL), both gave the same final DRL value of 1.16E+09 Bq month^{-1}. Then the relevant compartmental values and transfer parameter values outputted from CSA-DRL and populated in Table 30.

The resulting DRL value from this sample calculation table matched exactly with the result of Table 25, and hence verified the accuracy of DRL calculation corresponding to liquid effluents.

Table 30: Liquid release scenario.

Sample calculations for liquid releases shown for parent radionuclide Pu-238 marked as "a" and a progeny radionuclide U-234 marked as "b"

Section **Page**

1. Scope and Applicability

This document specifies the Administrative Level (AdL) values and Action Level (AL) values for all radiological air and liquid effluent verification monitoring final discharge points that are a part of the WL Radiological Effluent Verification Monitoring Program (EVMP). This document applies to Whiteshell Laboratories only.

This document does not cover responsibilities of Facility Managers/Authorities (or equivalent), the Environmental Protection Designated Representative of the Licence (DROL), the Environmental Protection Program Manager, or the Environmental Specialist(s). These are covered in *Management and Monitoring of Emissions* [1].

This document does not cover the use or rules around the recording or reporting of calculated exceedances based on unavailable equipment or failed calibration of effluent verification monitoring equipment.

2. Purpose

This document provides relevant stakeholders with the AdL and AL values for all final discharge points that are part of the WL Radiological Effluent Verification Monitoring Program for use in routine monitoring and evaluation of effluent verification monitoring results. The levels in this document were developed in compliance with the Canadian Standards Association N288.8 document Establishing and implementing action levels for releases to the environment from nuclear facilities [2]. In addition, this document describes the methodology used to set the AL and AdL values.

3. Requirements

For requirements regarding the following:

- Planned emissions in excess of AdLs or ALs; and
- Reporting of exceedances of AdLs and ALs

Refer to 900-509200-STD-009, *Management and Monitoring of Emissions* [1].

4. Definitions and Acronyms

4.1 Definitions

This document relies primarily on word meaning as found in common dictionaries. The current *Glossary of Controlled Terms and Acronyms* [3] contains specific meanings for those words that require further clarification.

For definitions of Administrative Level and Action Level, refer to the *Environmental Protection Program Document Description* [4].

4.2 Acronyms

The current *Glossary of Controlled Terms and Acronyms* [3] contains specific meanings for those acronyms that require further clarification.

5. Roles and Responsibilities

For a description of responsibilities of Facility Managers/Authorities (or equivalent), the CNL Environmental DROL, the WL Environmental Protection Program Manager, and Environmental Specialists concerning AdLs and ALs, refer to *Management and Monitoring of Emissions* [1].

6. Standards

6.1 Methodology for Setting Administrative Levels

The purpose of AdLs is to provide warning of above normal emissions with the intent of aiding in the application of the As Low As Reasonably Achievable (ALARA) process. Hence, AdLs are established for indicator parameters representative of key radionuclides in the effluent stream at levels close to normal or predicted emissions. They are calculated for each final discharge point using a combination of statistical parameters applied to a chosen set of historical emission data:

1. A minimum of three years emission levels that are deemed representative of near-future emissions are used as the data set on which the AdL is based. The resulting data set must be comprised of a minimum of 36 data points to ensure a data set of adequate size. In the case where three years of operational performance is not available, the AdL is set based on less than three years of operational performance if this history is deemed representative of near-future emissions, or on best estimates/predictions based on professional experience and judgement. The choice of a representative data set is made in consultation with facility staff to ensure that the resulting AdL reflects actual future operating conditions.
2. If item 1) above yields a data set that includes both detects and non-detects, the following truncating guidelines are considered. Note that there are varying approaches to truncating the data to ensure that the calculated statistical parameters appropriately reflect emission levels of a facility in operational mode. The following guidance ensures that the AdL is set at a level that differs from background and is representative of actual emissions resulting from a facility during operation:
   i. Emission levels that do not differ statistically from analytical/instrument background, i.e., that are below the Critical Level (L_C), are removed from the data set as they most likely represent periods of inactivity and are not representative of regular operation.
   ii. When it is unfeasible to differentiate periods of inactivity from periods of regular operation, then this $<L_C$ data is <u>not</u> removed from the data set. Experience and

past reviews of emission data reveals that it becomes unfeasible to differentiate between inactivity and regular operation when more than 75% of the data set is comprised of $<L_C$ data. For facilities that experience low emissions, retaining the $<L_C$ data makes for a data set that is representative of regular operations (the $<L_C$ measurements occur during operation).

3. Any data points within the data set that represent abnormal emission events are removed to yield a data set that is most representative of normal emission levels. This is done as follows:
   i. Any data point that is known to be the result of an abnormal emission event is removed from the data set.
   ii. Any data point remaining within the data set after carrying out i) above that is judged suspect, is inconsistent with the rest of the data and cannot be explained by an intermittent or temporary operation, is deemed to be an outlier, and is also removed. The mean and standard deviation are recalculated on the updated data set. If the removed suspect data point differs from the new mean by more than three standard deviations, then it is rejected as an outlier, otherwise it is reinstated in the data set.
4. It is imperative that the number of false positives, i.e., where an AdL exceedance is not related to an abnormal emission event but is instead due to normal operation, is kept to a minimum. To this effect, the AdLs are set as follows:
   i. The AdL is set at the upper limit of the 99.7% confidence interval for the data set. It is expected that AdL exceedances will occur occasionally due to normal variation; an acceptably low percentage of the data points, 0.15% ([100%-99.7%]/2), is expected to represent these false positive AL exceedances. To calculate the upper limit of the 99.7% confidence interval, the statistical distribution of the data set is first determined, and an appropriate calculation method specific to the distribution is chosen.
   ii. Environmental or emission data most often follows a normal or log-normal distribution. If the data does not fit a normal (or log-normal) distribution, this may be due to working with a 'combined' data set, i.e., a data set that represents more than one distinct process each reflecting a different situational condition. For example, a facility's emissions may be duplicitous in that they vary according to intermittent campaign schedules or varying types of work based on customer requests. This results in a data set that effectively captures a combination of various operational modes. Interferences from other emission sources can also result in a combined data set. If the varying sources of emissions have different distributions parameters (e.g., one has consistently low emissions with little variability, and another has intermittent emissions with high variability), the combined data will not follow a normal (or log-normal) distribution.
   Because using such combined data sets decreases the fit of the emission data to the normal (or log-normal) distribution, this in turn affects the accuracy of the

99.7% confidence interval and thus the AdL. In this case, a coverage factor can be applied to the calculated AdL to decrease the number of false positives. This decision is made based on a review of historical operational performance, upcoming campaigns and work, potential for interferences, and professional judgement.

iii. Finally, a risk-based lower cap on the AdL is applied to afford operational flexibility for those final discharge points that have historically operated at very low emissions close to background. The historical data although representative of past emissions, could be unrepresentative of the operational envelope of the facility. Therefore, the caps address the situation where a very small change in operation could trigger an exceedance that is unwarranted. The determination of the level for the lower cap is based on the professional judgement of the Environmental Protection Program Manager.

6.2 Methodology for Setting Action Levels

ALs represent a level of emission that is significantly below the Derived Release Limits (DRLs) [5], below the Site Target (0.3 x DRL) and higher than the AdLs, and is sufficiently low and close to operational performance such that the requirement to keep doses ALARA is not jeopardized if this level is reached. In line with this requirement, individual ALs shall be set-to five times the respective AdLs, except in cases where a calculated AL is more than 50% of the respective site annual dose limit when the above methodology is applied, in which case the AL shall be set at a value equal to 50% of the site annual does limit.

Note: Changes to ALs will require notification to the CNSC.

6.3 Review Process

The AdLs should be reviewed at least once every three years or more frequently if warranted.

7. Documented Information

Creation, Capture and Use of Information Assets [6] provides current information on the storage, preservation, turnover and retention requirement for records.

The calculations and methodology of decision making for each station/parameter combination are recorded on individual Excel spreadsheets and are uploaded to ATOM once the AdLs have been approved for use by both EnvP and the facility. Records associated with this process include:

1. Excel spreadsheets used in the calculation of the levels [7].

These are considered permanent records and are stored in ATOM using the following identifier (191-509211-055-000).

Appendix A Administrative Levels and Action Levels for Airborne Radioactive Effluents[1]

Building	Source Description	Sampling Station	EmLine Station Code	Parameter	Administrative Level (Bq/wk)	Action Level (Bq/wk)
WR-1 Stack, B100[2]	WR-1 structure & building ventilation exhaust to reactor stack	Stack	WR1	Tritium	5.66E+09	2.83E+10
				Gross Alpha	6.69E+03	3.34E+04
				Gross Beta	3.01E+04	1.51E+05
HCF, B300[3]	Hot Cells Facility (HCF), Building 300	Stack	HCF	Gross Alpha	3.40E+03	1.70E+04
				Gross Beta	1.56E+04	7.79E+04
IFTF, B300[4]	IFTF (Compactor Location), Building 300	Stack	IFTF	Gross Alpha	3.23E+03	1.61E+04
				Gross Beta	4.74E+04	2.37E+05

[1] All AdLs and ALs are based on the past at least ten years of operational history, i.e. years 2009-2019. Exceptions to this are specified where applicable. The B200 facility is no longer in operation and is in the process of being decommissioned.

[2] The current alpha and beta emissions from this facility are very low (near DL). Decommissioning plans involve work in the facility that could result in higher releases. Hence, the past eleven years of emissions data was not deemed representative of upcoming emissions and a coverage factor of 5 was applied to allow for the anticipated increase in emissions. If an action level was reached the dose (alpha 0.000019 mSv and beta 0.000025 mSv) as a result of the emissions would still be below 0.0005 mSv/a.

[3] The current alpha emissions from this facility are very low (near DL). Decommissioning plans involve work in the facility that could result in higher releases. Hence, the past eleven years of emissions data was not deemed representative of upcoming potential emissions and coverage factors of 5 was applied to the alpha emissions to allow for the anticipated increase in emissions. If an action level was reached the dose (alpha 0.00001 mSv) as a result of the emissions would still be below 0.0005 mSv/a.

[4] A coverage factor of five was applied to alpha emissions and ten for beta emissions to allow for the anticipated increase in emissions due to the effect that various decommissioning activities have on facility emission. If an action level was reached the dose (alpha 0.000009 mSv and beta 0.00007 mSv) as a result of the emissions would still be below 0.0005 mSv/a.

Appendix B Administrative Levels and Action Levels for Liquid Radioactive Effluents

Discharged To	Sampling Station	EmLine Station Code	Parameter	Administrative Level (Bq/month)	Action Level (Bq/month)
Winnipeg River	Process Outfall (includes effluent from B100 and B300 LLLW tanks and storm drains)	OFS	Gross Alpha[5]	1.18E+07	1.18E+08
			Gross Beta[6]	9.39E+07	4.70E+08
			Tritium	7.29E+09	3.30E+10
Winnipeg River	Sewage Lagoon (includes effluent from domestic waste water and inactive laundry facility)	SL2	Gross Alpha[7]	1.24E+07	6.21E+07
			Gross Beta[8]	3.88E+07	1.94E+08

[5] AL was increased by a factor of two to allow space between the AdL and AL, value does not exceed 50% of the Annual Site Dose Limit. Gross alpha assumed to be Pu-238 (most limiting and occasionally detected), emissions data indicates significant contributions of the gross alpha are from uranium and its progeny. Gross beta is assumed to be Sr-90.

[6] AL was increased by a factor of two to allow space between the AdL and AL, value does not exceed 50% of the Annual Site Dose Limit. Gross beta is assumed to be Sr-90.

[7] Gross alpha assumed to be Pu-238 (most limiting and occasionally detected), emissions data indicates significant contributions of the gross alpha are from uranium and its progeny. Gross beta is assumed to be Sr-90.

[8] Gross beta is assumed to be Sr-90 (most limiting and occasionally detected)

EXECUTIVE SUMMARY

This annual compliance monitoring report for the 2022 calendar year has been prepared as per licence condition 3.2 of the Whiteshell Laboratories (WL) Licence NRTEDL-W5-8.00/2024 [1] and Canadian Nuclear Safety Commission (CNSC) REGDOC-3.1.2, *Reporting Requirements, Volume I: Non-Power Reactor Class I Facilities and Uranium Mines and Mills* [3] as a summary report of annual compliance monitoring and operational performance.

Canadian Nuclear Laboratories (CNL) acknowledges that its operations take place on ceded, unceded and unsurrendered traditional territories of numerous First Nations and the Red River Métis. At CNL, we recognize the unique history, spiritual beliefs, cultural practices and languages of Indigenous People in Canada, and we appreciate the responsibility they have as stewards of the environment. We remain firmly committed to being an active participant on Canada’s journey towards healing and reconciliation.

This stand-alone, unrestricted document provides CNL compliance monitoring and performance information for WL and is organized by CNSC’s 14 Safety and Control Areas (SCA). This report provides site-specific information to supplement information in the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for 2022 [1], which provides programmatic updates and performance of the 14 SCAs, and CNL’s Indigenous engagement activities and Public Information and Disclosure program as applicable to all CNL sites.

The following provides overall performance highlights for 2022 activities:

- All licensed activities continued to be carried out safely and securely.
- No member of the public received a radiation dose that exceeded any regulatory limit.
- No worker at WL received a dose in excess of any of the respective radiation dose limits for radiation workers, as defined in the Radiation Protection Regulations.
- All releases of radioactive material in WL effluents during 2022 were below their respective Derived Release Limits (DRL).
- Demolition of Building 402/305, the former Health and Safety Facilities is complete, with some site cleanup remaining.
- A revised Environmental Impact Statement supporting the proposed in situ decommissioning of the WR-1 reactor, addressing previous comments, was submitted to CNSC.
- The WL site maintained safe and compliant performance under COVID-19 Pandemic conditions and protocols.

CNL recognizes the importance of, and places value on, ongoing engagement with Indigenous communities and organizations. CNL continues to work collaboratively with Sagkeeng First Nation (SFN), Manitoba Métis Federation (representing the Red River Métis), Black River First Nation, Hollow Water First Nation, Brokenhead Ojibway Nation, Wabaseemoong Independent Nations and Grand Council Treaty #3. Major project updates are shared with Iskatewizaagegan #39 Independent First Nation, Shoal Lake Independent Nation #40, and Northwest Angle #33, with opportunities for further engagement available to those communities at their discretion.

Environmental protection and environmental monitoring activities continue to be a regular topic of CNL's discussions with all Nations. In 2022, CNL and SFN focused on the development of the community-led Community Environmental Monitoring Program (CEMP) at WL, which was recognized through a traditional signing ceremony for SFN, CNL and Atomic Energy of Canada Limited (AECL) in December. CNL continued to work closely with the Manitoba Métis Federation (MMF) on the ongoing development of a Harvesting Sample Collection Program that will be led by the Red River Métis. Black River First Nation and Hollow Water First Nation, as well as with Grand Council Treaty #3, are working with CNL on developing monitoring programs that involve these communities to the degree they wish.

When pandemic restrictions were reduced and allowed in-person engagement to resume, CNL hosted tours of the site, the WR-1 reactor, and the Waste Management Area for the SFN Community Liaison Committee, the MMF, Black River First Nation and Hollow Water First Nation. CNL recognizes the importance of supporting culture and ceremony during these visits and identified spaces on site that could safely support activities such as smudging and water ceremony.

CNL remains interested in developing Long-Term Relationship Agreements with Nations that will support their capacity to participate meaningfully in the Whiteshell Laboratories Restoration Project (WLRP). While recent focus has been on the WR-1 project Environmental Impact Statement, environmental monitoring and other matters, CNL is committed to developing these agreements when the Nations are ready to move forward with these discussions.

Below is a summary of the SCAs for calendar year 2022.

- **SCA - Management System**: WL has continued its focus on implementation of the corporate management system, as well as the WL Quality Assurance program for decommissioning, which was revised/updated in 2022. Three CNSC staff inspections were carried out.
- **SCA - Human Performance Management**: WL enlisted the support of the CNL Strike Team, comprised of experts from across CNL, to conduct an investigation into a Lock-Out Tag-Out event that resulted in a safety pause at the WL site. An outcome of this was improvements made to the tracking of training. CNL has a sufficient number of qualified staff to perform their licensed activities.
- **SCA - Operating Performance**: WL decommissions and operates its facilities according to prescribed programs and procedures, and monitors safety performance in the operational area through the concept of "events". The total number of internal event reports raised continues to show a strong reporting culture. There were three CNSC reportable events in 2022.
- **SCA - Safety Analysis**: Effective Safety Analysis Reports and Facility Authorizations continue to be in place for WL's nuclear facilities, helping meet health, safety, security, environmental and regulatory requirements. Safety analyses continue to be developed for the standpipe/bunker remediation, Intermediate-Level Liquid Waste Processing

Centre and Cask Loading facilities being constructed in the Waste Management Area. A Nuclear Safety Note was sent to the CNSC in support of the Phase 1 retrieval of fuel baskets from the Concrete Canister Storage Facility (for retrieval of Douglas Point fuel).

- **SCA - Physical Design**: The Certificate of Authorization was renewed with Engineers Geoscientists Manitoba, authorizing CNL to engage in the practice of professional engineering in Manitoba. The current Certificate of Authorization from Inspection and Technical Services Manitoba is valid until 2024 August. The Certificate of Authorization permits CNL to perform Pressure Boundary work as described in the Quality Assurance Plan.
- **SCA - Fitness for Service**: The Periodic Inspection Plan (PIP), previously developed to confirm the ongoing fitness-for-service of the concrete storage facilities at the Waste Management Area (WMA), continued implementation with no significant issues identified. Regular preventive or corrective maintenance and testing of WL's safety-related systems were carried out to ensure the systems were fit-for-service. Facility Maintenance Plans, which list the Preventive Maintenance items relating to Safety Related Systems for the Shielded Facilities, WMA and WR-1, are being revised.
- **SCA - Radiation Protection**: No worker received a whole-body dose (including committed) in excess of any of the respective dose limits for radiation workers as defined in the Radiation Protection Regulations, and average individual doses remain a small fraction of these limits. Maximum dose to a person working at WL was 0.31 mSv and collective doses for the WL site remained below 50 person-mSv (17.2 person-mSv) No member of the public received a radiation dose that exceeded the regulatory limit.
- **SCA - Conventional Health and Safety**: Implementation of CNL's Occupational Safety and Health program at WL continues to drive improvements in safety and safety culture. Safety advisories are regularly issued to staff about imminent issues that could impact their safety. There were no lost-time injuries although there were two hazardous occurrences that were reported to Employment and Social Development Canada at WL.
- **SCA - Environmental Protection**: Radiological emissions were 0.00015% of the Derived Release Limit (DRL) for air emissions and 0.58% of the DRL for liquids. The results of the radiological and non-radiological effluent monitoring program demonstrate that controls for the release of potentially hazardous substances currently in place at WL continue to provide substantial protection of the environment, and confirms that the WL site is operating in a manner that also protects workers and the public. WL maintained their ISO-14001 registration.
- **SCA - Emergency Management and Fire Protection**: The Emergency Management program's focus on COVID-19 gradually declined over the year, allowing focus to shift to program documentation. There were no emergency events requiring activation of the EOC. Interdepartmental fire training with the Town of Pinawa was interrupted by the COVID-19 pandemic and other issues, which were resolved with joint training set to resume in early 2023.

- **SCA - Waste Management**: WL continued to reuse or recycle as much material as was practicable. Radioactive, clearable and hazardous wastes were generated from both ongoing operational activities and decommissioning projects, including disposition of 344.1 m^3 of radioactive waste to Chalk River Laboratories (CRL), 65.8 m^3 of radioactive waste to an off-site processor, 9.2 m^3 of solid and liquid hazardous waste to an off-site disposal facility, and 2,352 m^3 (2,434,265 kg) of clean and recycled waste shipped off-site. The WL Site Overview Detailed Decommissioning Plan was revised and accepted by CNSC.
- **SCA – Security**: The Security Program at WL supports the CNL Corporate Security mandate and addresses the regulatory requirements for high-security sites. Nuclear Security Officers assigned regular duties continued to meet the physical and psychological fitness requirements for Security Officers as required by the CNSC. All enforcement items from a 2021 Type II Security inspection were closed.
- **SCA - Safeguards**: There were no issues identified with the three International Atomic Energy Agency (IAEA) Safeguards inspections conducted at WL.
- **SCA - Packaging and Transport**: There were 37 radioactive transport packages making up 53 loads that were safely and successfully sent off-site, including approximately 342 m^3 of low-level waste and 2.5 m^3 of intermediate-level waste shipped to CRL.
- **Other matters of regulatory interest**: Two meetings of the WL Public Liaison Committee took place, the second a return to in-person engagement. Numerous virtual and in-person public information sessions and webinars were held on the plan for the proposed in-situ decommissioning of the Whiteshell reactor and on overall activities of the WL Restoration Project. CNL engaged a consultant to conduct a public attitude survey to gauge public opinion and understanding about the WL Restoration Project, with results indicating generally positive attitudes towards CNL and the project.
- **Facilities** (operating nuclear facilities, permanently shut down facilities, facilities being decommissioned and the non-nuclear facilities): All the licensed activities in these facilities continue to be carried out safely and securely with acceptable radiation doses to personnel and releases to the environment. The following notable facility-specific activities took place: demolition of the Health and Safety Facilities, Building 402/305 was completed, the Building 405 lunchroom/offices (formerly the library) was shut down and operational cleanup was completed to prepare the building for demolition, the Recoverable Surface Staging and Storage Area in the Waste Management Area was put into service, progress continued for the off-site fabrication of Standpipes/Bunkers remediation equipment, and progress has been made installing equipment at the waste management areas for additional power needed for future waste extraction activities, monitoring equipment and the future Cask Loading Facility.

CNL is committed to achieve high standards of operational safety and security. The information and data presented in this report support the conclusion that safe and secure performance was achieved at the Whiteshell Laboratories site, while enhancements were implemented to further improve results.

ACKNOWLEDGEMENT

The “Author” of this document would like to thank the many Whiteshell Laboratories authors and reviewers from the various Functional Support Areas and Facilities for their production of the individual sections of the report.

TABLES

Introduction

Whiteshell Laboratories (WL) was established by Atomic Energy of Canada Limited (AECL) in the early 1960s to carry out nuclear research and development activities. The site is a Class 1B nuclear facility which encompasses an area of 4,375 hectares. The WL site is located near Pinawa, Manitoba; approximately 100 kilometres northeast of Winnipeg, on the eastern bank of the Winnipeg River. AECL made a business decision in 1997 to discontinue most of the research programs and operations at WL. Subsequently, AECL received government concurrence in 1998 to proceed with actions to achieve closure of WL. This work transitioned to Canadian Nuclear Laboratories (CNL) who are carrying out the work to achieve site closure on behalf of the site owner, AECL.

Activities are now underway to complete the orderly decommissioning of the WL site following the general plan laid out in the Comprehensive Study Report supporting the approval of the Environmental Assessment of the WL Decommissioning Project. The exception to this is the change in strategy for Whiteshell Reactor (WR) -1 (see the Decommissioning Strategies Section below).

Name:	*Whiteshell Laboratories*

Licence Information and Reporting Period

This annual compliance monitoring report is produced to comply with licence condition 3.2 of the Whiteshell Laboratories Licence NRTEDL-W5-8.00/2024 [1], in accordance with the compliance verification criteria Compliance Monitoring: Annual Report of the *Licence Conditions Handbook for Whiteshell Laboratories,* herein referred to as “Licence Conditions Handbook” [2], and section 3 Annual Compliance Monitoring Report of Canadian Nuclear Safety Commission (CNSC) REGDOC-3.1.2, *Reporting Requirements, Volume I: Non-Power Reactor Class I Nuclear Facilities and Uranium Mines and Mills* [3]. Information included in this report is for the period of 2022 January 01 to December 31.

This report provides site-specific information to supplement information in the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* [4], which provides corporate updates to 14 Safety and Control Areas as they are applied across all of CNL.

The intent of this report is to provide sufficient detail to demonstrate how Whiteshell Laboratories programs are meeting the regulatory requirements as specified in the licence [1] and the Licence Conditions Handbook for Whiteshell Laboratories [2].

Changes to Organizational Structure

In 2022 June, a new General Manager (was the WL Deputy General Manager) and Site Licence Holder of the WL Closure Project was announced [5]. In November, an additional Deputy

General Manager position was added to the organizational structure, reporting to the General Manager, and a candidate was selected.

While not an organizational structure change, in 2022 December the “Whiteshell Laboratories Closure Project” was renamed the “Whiteshell Laboratories Restoration Project”, to better reflect the work being carried out at the WL site, and encompasses all activities under the WL licence.

Facilities Included in this Report

Appendix A through G of the report provide information that is pertinent to the Nuclear and Non-Nuclear Facilities (including operating and permanently shut down facilities, and facilities being decommissioned).

The Nuclear Facilities included in this report are: Concrete Canister Storage Facility, Active Liquid Waste Treatment Center, Shielded Facilities, Waste Management Area, Research and Development Facilities Complex (Building 300), Health and Safety Facilities (Building 402 and Building 305), and WR-1 Reactor.

Summary of Licensed Activities

There were no new licenced activities.

Decommissioning Strategies

Since 2015, work has been underway to complete decommissioning of the entire WL site. This includes leaving in-situ the selected Waste Management Area (WMA) trenches as per the Comprehensive Study Report under institutional control, and transporting active waste off-site for disposal or storage. A significant departure from the end-states defined in the Comprehensive Study Report is in situ decommissioning (also referred to as in situ disposal) of the WR-1 reactor. Work continues for an environmental assessment and regulatory approvals required for this proposed change. The Environmental Impact Statement (EIS) supporting this is in progress, and a revised version addressing previous comments was submitted to CNSC.

Financial Guarantees

CNSC was previously sent a letter from the Honorable G. Rickford [6], advising that as an agent of Her Majesty in Right of Canada, AECL’s liabilities associated with the decommissioning of WL are ultimately liabilities of Her Majesty in Right of Canada (note: AECL retains ownership of the lands, assets and liabilities associated with CNL's licences). This financial guarantee remains valid and in effect, as per the communication issued on 2020 August 25 [7].

1 Management System

1.1 Management System Program

Whiteshell Laboratories adheres to CNL's Management System Functional Support Area. See Section 1 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

The WL Quality Assurance Plan [8] supports the CNL Management System Manual [9] and summarizes the processes and practices applicable to WL licensed activities, while still retaining compliance to *Management System Requirements for Nuclear Facilities,* Canadian Standards Association (CSA) N286-12 [10] and *Decommissioning Quality Assurance for Nuclear Power Plants,* N286.6-98 [11]. The Quality Assurance Plan [8] was revised in 2022 and provide to CNSC [12].

1.2 Updates to Management System Documents

The CNSC has previously been provided notifications of revisions to Management System documents identified in CNL's individual Licence Conditions Handbooks as listed in Section 1.1.2 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* [1], including WL's Licence Conditions Handbook, in addition to two other document notifications specific to the WL Licence Conditions Handbook [12],[13].

1.3 Audits, Inspections and Self-Assessments

As per the requirements of the *Management System* [9], both functional support programs (Safety and Control Areas) and facilities conduct various audits, inspections, and self-assessments to ensure that the management system is functioning according to expectations and that any policy, programmatic, or procedural deficiencies are identified and appropriate actions taken to resolve them.

All actions resulting from audits, inspections, reviews and self-assessments are managed and tracked through CNL's Corrective Action Program.

1.3.1 Audits

See Section 1.2 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* [1] for a list of all CNL-wide Audits for the reporting year 2022.

1.3.1.1 External Audits

The external audits conducted at WL in 2022 are summarized in the table below.

Table 1: External Audits

Title	Type of Audit	No. of Non-Compliances Raised	No. of Actions Raised[a]	No. of Actions Completed
External International Standards Organization (ISO) 14001 Surveillance (S1) Audit	Surveillance	0	1	0

a The actions raised may also include Opportunities for Improvement.

1.3.1.2 Internal Quality Audits

The internal audits completed by the Quality Audits and Processes branch in 2022 are summarized in the table below.

Table 2: Internal Quality Audits

Title	Audit Scope	No. of Non-Compliances Raised	No. of Corrective Actions Raised[a]	No. of Corrective Actions Completed
Environmental Protection	Environmental Protection Program	0	4	1

a The actions raised may also include Opportunities for Improvement.

1.3.2 Inspections

CNSC Inspections

The following CNSC Inspections were conducted at Whiteshell Laboratories.

Table 3: CNSC Inspections Conducted at Whiteshell Laboratories in 2022

Inspection No.	Area Inspected	No. of NNCs	No. of Recommendations	No. of NNC[a]s Closed
CNL-WL-2022-01	Radiation Protection	0	3	N/A
CNL-WL-NSD-T2-2022-001	Security	0	1	N/A
CNL-WL-2022-03	Waste Management Area	5	2	1

NNC Notice of Non-Compliance
a Closed as of 2022 Dec 31

Inspections by Other Regulatory Bodies

A Physical Inventory Verification inspection was carried out by the International Atomic Energy Agency (IAEA) on 2022 May 02. This inspection was a sampling of accessible items containing Special Fissionable Material. A Design Information Verification inspection was carried out by the IAEA on 2022 May 03. This inspection verified the information provided in the Design

Information Questionnaire. Two actions were raised and have been completed based on these inspections. A Complimentary Access inspection was carried out by the IAEA on 2022 June 01. This inspection was to assure the absence of undeclared nuclear materials and activities, to resolve a question or an inconsistency relating to correctness and completeness of the information provided in Canada's annual update to the IAEA, and to confirm the decommissioned status of a facility.

1.3.3 Self-Assessments

In 2022, there were 10 self-assessments conducted at WL covering various aspects of the management system, including both Safety and Control Areas, and various facilities.

Table 4: List of Self-Assessments Conducted at WL in 2022

Title	Facility/Safety and Control Area
Adherence to document control and development processes related to the Environmental Impact Statement and Decommissioning of WR-1	Management Systems
Occupied Buildings for WL site Emergency Response Readiness	Emergency Preparedness
Registration and Control of Radiation Sources	Radiation Protection
Radiation Protection Program Compliance Review for the WL Restoration Project	Radiation Protection
Inspection, testing and maintenance of the fire and related life safety systems. (General Fire Protection, Fixed Suppression, Fire Extinguishers)	Fire Protection
Maintenance and Revision WL Procedures	Management Systems
Verification Process for Decommissioning Work	Management Systems
Compliance to N286.6 Section 3.15 Records	Management Systems
WL Radiation Dose Reporting to Nuclear Energy Workers	Radiation Protection
Manager Dose Control Points and Radiation Protection Training Designation Annual Reviews	Radiation Protection

1.4 Management Reviews

A Whiteshell Laboratories Quality Assurance Program/Management System Review was completed for calendar year 2020 to evaluate the effectiveness of the management system. The review identified 2 actions, one is complete and the other is in progress. The 2021 review has been initiated.

2 Human Performance Management

2.1 Human Performance Program

Whiteshell Laboratories adheres to CNL's Performance Assurance Functional Support Area. See Section 2 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

The effectiveness of the Human Performance program at WL has been enhanced through the following improvements:

- On 2022 May 27, WL experienced an event (ERM-22-1559 in Table 7) where a worker, while performing maintenance activities on a pump, received an electrical shock. As a result of this incident, WL Senior Leadership immediately initiated a safety stand down of all hazardous energy control work. Initial evaluation by a CNL investigative team revealed the event was due to non-adherence to the company-wide hazardous energy control procedure, resulting from human performance errors that identified a lack of thorough hazard identification and mitigation with an overall weakness in the release of work and maintenance supervision. On 2022 June 13, a site-wide safety pause of all fieldwork was declared. Immediate corrective and compensatory actions included a re-evaluation and retraining of the "Core 5" (Work Permit Authorization, Job Safety Analysis, Pre-job Brief, Stop/Pause Work and Integrated Work Controls) as well as other key training courses, such as Lock-Out Tag-Out. Also included in the corrective and compensatory actions was rigorous senior leadership oversight of work approval for all work on-site. Throughout the months of June, July and August, WL senior leadership were focussed on developing a comprehensive plan for the safe restart of activities at the site. Phases of the plan were focussed on communication, management oversight, work activity reviews, training, extent of condition, restart authorization, and a phased approach to the full return to fieldwork, which occurred on 2022 December 09.
- In 2022 September, a WL Town Hall Session was held where WL employees were invited to join members of the Safety Excellence team and the Performance Assurance team for an open forum focused on CNL's ImpAct and Corrective Action Plan system. The Performance Assurance group worked on improving and addressing a number of issues and challenges with the ImpAct system and overall process. The session provided employees with the opportunity to have an open and constructive discussion on the Corrective Action Program.
- In 2022 October, the Independent Performance Assessment Team conducted a review of Whiteshell Implementation of/performance to *Management System Requirements for Nuclear Facilities*, CSA N286-12 [10]. The Atkins Nuclear Secured is chartered to perform senior independent reviews of project operations as an element of Atkins Nuclear Secured commitment to advance safety performance and the effectiveness of project team improvement actions. The team also reviewed the 2022 June Lock-Out Tag-Out event, and other unplanned events as appropriate, and evaluated WL's work pause implementation, communications, and corrective actions that supported re-

starting work. The Independent Performance Assessment Team review identified areas of focus (issues) and corresponding recommendations to improve on: safety culture, effective teamwork and communication across various levels of the organization, resource management and building trust across the organization. A total of 26 recommendations were made, and actions have and are being taken to address the recommendations.

2.2 Training program

Whiteshell Laboratories adheres to the Corporate Training and Development Functional Support Area. See Section 2 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

2.2.1 Program Improvements and Accomplishments

The effectiveness of WL Training Program has been enhanced through the following improvements:

- A Master Training Qualification Card that defines the qualifications requirements for WL Project Supervisors was developed.
- Training Qualification Cards that defines the qualification requirements for the WL Occupational Safety and Health (OSH) Specialist and Section Head were developed.
- Practical training modules were developed for air quality monitoring instruments.
- Detailed training matrices to track training compliance were developed for projects as part of the safe restart of activities at the WL.
- The Concrete Canister Storage Facility (CCSF) Training Analysis and Training Plan developed, and specific training modules are under development.
- Revisions to seven WL specific training, in support of WL restart activities, to ensure updated and accurate course content.
- Identification of position specific training for WL operational positions. This information is being used to develop WL position specific training certifications in CNL’s new Learning Management System in 2023.

2.2.2 Systematic Approach to Training

CNL maintains a list of positions and roles requiring Systematic Approach to Training programs in compliance with REGDOC-2.2.2, Personnel Training [14].

Training and Development evaluated the training programs for listed positions and roles at WL against the main elements of Systematic Approach to Training. The evaluation identified gaps in some training program documentation required to be consistent with a Systematic Approach to Training compliant training program. WL training resources are developing an action plan to upgrade these training programs in 2023. In the interim, while training program documentation is being upgraded, WL has ensured that employees assigned to perform listed positions and roles are controlled and that WL staff serving in these positions and roles are assessed for their ability to competently perform these assignments. CNL is confident that all staff are qualified to perform their job duties. CNL has a sufficient number of qualified staff to perform their licensed activities.

2.2.3 Required Training

Whiteshell Laboratories maintained a sufficient number of qualified workers to carry on the licensed activities safely and in accordance with the Nuclear Safety and Control Act [35] and the regulations made under the Nuclear Safety and Control Act.

All Whiteshell Laboratories personnel, both employees and contractors, are adequately trained (and refreshed) to ensure safe operation of their facilities and to conduct work under the licence [1]. Section 2 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* [1] provides the 2022 CNL Employee and Manager/Supervisor required training. The table below provides a list of federally/provincially legislated training courses that appear in position-specific training plans at Whiteshell Laboratories.

Table 5: Whiteshell Laboratories Operating Staff Training in 2022

Course Code	Course Title	No. of Attendees 2021*	No. of Attendees 2022**
OSH-1001-Online	Crane (Safe Indoor Hoist) – Theory	44	23
OSH-1002-Online	Lift Truck Operation – Theory	40	39
OSH-1003-Online	Aerial Work Platform – Theory	59	53
OSH-1004-Online	Lock Out / Tag Out Exam	28	153
OSH-3048	Lock Out / Tag Out Practical	N/A	118
OSH-1005-Online	Working at Heights – Theory	84	121
OSH-1006	Confined Space Entry	14	N/A
OSH-1006-Online	Confined Space Exam	15	N/A
OSH-9118	Confined Space Entry	N/A	134
OSH-9119	Confined Space Awareness	N/A	16
OSH-1007	Asbestos Module 6E	51	23
OSH-1033-Online	Ladder Safety	27	60
OSH-1046-Online	Heat Stress	7	38
OSH-3001-E	Crane – Safe Indoor Hoist – Practical – Jib Crane	3	0
OSH-3001-F	Crane – Safe Indoor Hoist – Practical – Bridge Crane	3	1
OSH-3001-J	Crane – Safe Indoor Hoist – Practical Gantry Crane	2	3
OSH-3001-K	Crane – Safe Indoor Hoist – Practical	1	3

Course Code	Course Title	No. of Attendees 2021*	No. of Attendees 2022**
OSH-3001-L	Crane – Safe Indoor Hoist Only	13	3
OSH-3001-MULTI	Crane – Safe Indoor Hoist – Practical – All Equipment Codes	8	3
OSH-3002-C	Lift Truck Practical – Counter Balance	18	8
OSH-3002-MULTI	Lift Truck Practical –Telehandler >9 ton to <15 ton	N/A	8
OSH-3002-MULTI	Lift Truck Operation – Practical/All Equipment Codes	4	1
OSH-3003-B	Aerial Work Platform Practical – Articulating Boom 60 ft (or less)	21	3
OSH-3003-C	Aerial Work Platform Practical – Rough Terrain Scissor Lift	27	0
OSH-3003-D	Aerial Work Platform Practical – Scissor Lift	25	5
OSH-3003-E	Aerial Work Platform Practical – Single Person Up-Up	1	0
OSH-3003-Multi	Aerial Platform – Practical (All Equipment Codes)	34	3
OSH-3005	Working at Heights – Practical	88	62
HU-1036-Online	Pre job Brief	12	2
WL-306	Pre Job Brief	N/A	105

* Where the 2021 attendance appears as N/A, course attendance was not reported in the 2021 ACMR.
** Where the 2022 attendance appears as N/A the course was not offered in 2022 and was replaced by an alternate course (e.g. OSH-1006 Confined Space Entry became OSH-9118).

2.2.4 Contractor Training

Before accessing the Whiteshell Laboratories site, contractors are required to complete the following training:

- Whiteshell Site Orientation
- Radiation Protection Group 4 (if required to work unescorted)
- Whiteshell Contractor Awareness

These courses are provided to contractors via classroom training upon arrival on their first day at the Whiteshell site and tracked by the WL branch of Human Performance and Training.

WL utilizes the contract terms and conditions, in addition verifying and approving the contractor company’s safety programs and training records, to ensure contractors are qualified to work at WL. CNL Contractor Representatives are required to verify contractor training records prior to the commencement of work.

WL oversees contractors’ work in the field and all WL work control protocols apply.

2.2.5 Training Evaluations Summary

In 2022 WL continued to utilize trainee feedback forms to capture learner input as part of training program improvement and maintenance activities. WL also implemented a Manager training evaluation program in 2022. The WL Management team performed management observations of training, on a rotational basis. 11 different training courses had Management Evaluations performed with 69 individual course feedback forms received and processed. The average number of feedback forms was just over 6 per course. While most were scoring in the 80-90% satisfaction range, suggestions and opportunities for improvements were all assessed, the results were tracked and improvements managed by Training and Development staff.

2.3 Hours of Work Exceedances

As per REGDOC-2.2.4, *Fitness for Duty: Managing Worker Fatigue* [49] Sections 4.2 and 4.3, CNL has recorded all exceedances of hours of work for Security's safety-sensitive positions. See Table 6 below for a list of exceedances for 2022. Note: the COVID-19 pandemic had a direct contribution to Table 6 as it relates to the maintenance of the WL Security minimum shift complement.

Table 6: Hours of Work Exceedances for Nuclear Security Officers and Tiered Response Force Personnel at WL

Limits	2021				2022			
	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
>16 hrs in a 24-hour period	3	4	7	4	19	28	11	10
> 28 hrs in a 48-hour period	15	21	28	11	16	25	10	6
> 120 hrs in a 14-day period	6	4	1	1	0	9	5	7
Min recovery 48 hrs after 2 consecutive nights	19	11	5	15	7	7	19	9
Min recovery 72 hrs after 3 consecutive nights	2	5	3	2	1	2	2	3
Total	45	45	44	33	35	43	71	47

3 Operating Performance

3.1 Operating Program

Whiteshell Laboratories adheres to the Operating and Cleanup Functional Support Areas. See Section 3.1 and Section 11.2 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

Whiteshell Laboratories decommissions and operates its facilities according to prescribed programs and procedures. Operating performance is monitored through the nuclear performance assurance review board and other internal assessment activities such as self-assessments and audits (see Section 1.2).

3.1.1 Operations

Operational details on facilities identified in the *Site Licences, Certificates, Permits, Building/Facility Contacts, and Licence Representatives* [15] for WL are given in Appendix A through F.

3.1.1.1 Conduct of Operations

Conduct of operations documents ensure appropriate integration and adequate reflection of safe operation practices to meet the business requirements.

3.1.1.2 Modification to Facilities and Processes

All temporary and permanent modifications to facilities at WL are made following defined Engineering Change Control [16] processes.

Relevant modifications to WL facilities are given in Appendix A through G (Facility Changes subsection of Appendices).

3.2 Reporting Requirements

3.2.1 Reportable Events to CNSC

In 2022, there were 3 events that occurred at WL that were deemed reportable to the CNSC. They are listed in the table below.

3.2.2 Reportable Events to Other Regulators

Reports to other regulatory agencies consisted of:

- 2 Hazardous Occurrence Investigation Reports made to Employment and Social Development Canada (see Section 8 Conventional Health and Safety for further details)

Table 7: Reportable Events to the CNSC at Whiteshell Laboratories in 2022

ImpAct No.	Title	SCA	Facility (if applicable)
ERM-22-3469	WL - Annual 3rd party inspection of Fire Devices Overdue	Fire Protection Program	
HSSE-22-3025	WL - Continuous Air Monitor in WL SF Waste Compactor Area Operated Past Calibration Due Date		Whiteshell Shielded Facilities
ERM-22-1559	WL - A Worker Receives an Electrical Shock while Performing Maintenance on a Fire System Water Pump		Whiteshell Laboratories Operations

3.2.3 Corrective Action Program

3.2.3.1 Trending of Events Related to Operational Activities

As events at WL occur, they are recorded in the Improvement Action (ImpAct[1]) system. This information is regularly reviewed and analyzed to identify any trends. To identify trends, Event Code based trend reports are also prepared to analyse ImpAct data on a monthly basis. Monthly site wide and WL specific trend reports are prepared by CNL Performance Assurance and shared with WL. WL specific trends are also specified in the monthly Contractor Assurance System scorecard.

The following trends were identified and raised as ImpActs:

- ERM-22-0593, WL TREND - Contractors Arriving to Site without Proof of Training
- HSSE-22-3640, WL TREND - Environmental Release Exceedances

The use of the Corrective Action process continues to foster the internal reporting of lower significance level events (Level 4 and some Level 3), affording the opportunity to implement continuous improvement initiatives through a robust Corrective Action Program.

In 2022, a total of 374 ImpActs were raised by CNL employees at WL. Table 8 summarizes ImpActs raised over the past 5 years by Significance Level[2].

The reporting of lower significance level events continues to be encouraged (e.g., Near Miss Reporting – see Section 8, which is an industry best practice), and efforts to improve safety culture (Event Free Tools use, Event Free Day Reset, Observation and Coaching, etc.) have been adopted by both management and staff.

1 ImpAct – Abbreviation for Improvement and Action. It is an internal process used to identify events, problems, non-conformities, opportunities for improvements, and personnel injuries. The process also identifies and tracks actions to correct or remediate problems.

2 Significance Level: Levels assigned to an event (SL1 being most significant, SL4 being least significant) based on the actual or potential result in safety, environmental, or business consequences.

Table 8: Number of ImpActs raised at Whiteshell Laboratories

Year	Level 0[a]	Level 1	Level 2	Level 3	Level 4	Total
2018	10	0	0	39	532	581
2019	8	0	0	54	547	609
2020	13	0	3	58	276	350
2021	5	0	2	81	336	424
2022	2	1	4	61	306	374

a Level 0 will be assigned if the ImpAct is deemed to be a "non- problem" and a recommendation to close the Impact will be given.

4 Safety Analysis

4.1 Safety Analysis Program

Whiteshell Laboratories adheres to CNL's Safety Analysis Functional Support Area. See Section 4.1 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

4.1.1 Safety Analysis Reports

Safety Analysis Reports (SARs) are produced to demonstrate that the facilities are appropriately designed to meet health, safety, security, environmental and regulatory requirements, and operated safely. These SARs form part of the basis for a set of limiting conditions for safe operation that are documented within Facility Authorizations for each nuclear facility. At WL, three facilities have SARs and Facility Authorizations: Shielded Facilities (SF), WMA and Concrete Canister Storage Facility (CCSF).

Work has been initiated to revise the SF SAR, and an assessment is in progress to determine if the WMA SAR needs to be revised.

A Nuclear Safety Note is being developed for the non-robotic retrieval of materials from non-fissile-bearing Standpipes in the WMA, and will be submitted to CNSC in 2023. A SAR is being prepared for the standpipe/bunker remediation, Intermediate-Level Liquid Waste Processing Centre and conversion of the Shielded Modular Above Ground Storage (SMAGS) building to a Cask Loading Facility. This document will be an addendum to the existing WMA SAR and will be submitted to the CNSC before these facilities are operated. The WMA SAR is also being revised.

A Nuclear Safety Note was sent to the CNSC in support of the Phase 1 retrieval of fuel baskets from the CCSF (Douglas Point fuel). The CCSF SAR will be updated prior to Phase 2 fuel retrieval activities.

4.2 Nuclear Criticality Safety Program

Whiteshell Laboratories adheres to CNL's Nuclear Criticality Safety Functional Support Area. See Section 4.2 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

As the Nuclear Criticality Safety Program is a company-wide program, enhancements and improvements made were intended to target all sites including WL and are identified in [1].

4.2.1 Nuclear Criticality Safety Documents

The WL Criticality Safety Documents (CSDs) for the Intermediate-Level Liquid Waste Processing Centre (CSD-74), Concrete Canister Storage Facility (CSD-11), and the Fuel Basket Transfer Flask (CSD-54) are in progress to allow retrieval of waste from the WMA and CCSF.

5 Physical Design

5.1 Design Program

Whiteshell Laboratories adheres to the CNL's Design Authority and Design Engineering Functional Support Area. See Section 5.1 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

The Design Authority and Design Engineering Functional Support Area maintains and controls the design basis for all design activities performed at WL, and it ensures that design is planned, executed, verified and documented according to applicable codes, standards, and regulatory and customer requirements.

The Certificate of Authorization was renewed with Engineers Geoscientists Manitoba in 2022 March. This authorizes CNL to engage in the practice of professional engineering in the province of Manitoba in accordance with the provisions of *The Engineering and Geoscientific Professions Act*.

5.1.1 Items Important to Safety

In 2022, the Design Authority and Design Engineering Program ensured that any structures, systems and components important to safety met and maintained their design basis, and any changes made were controlled through the Engineering Change Control Process [16].

5.2 Pressure Boundary Program

Whiteshell Laboratories adheres to CNL's Pressure Boundary Functional Support Area. See Section 5.2 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

The Pressure Boundary Functional Support Area applies to design, procurement, fabrication, installation, examination, testing, repair, modification, construction and maintenance of pressure retaining systems and components performed by CNL at WL.

The *WL Pressure Boundary Quality Assurance Plan* [17] details the specific scopes of pressure boundary work carried out at WL, as permitted by the Certificates of Authorization issued by Inspection and Technical Services Manitoba, describes the controls, authorities, and responsibilities applicable at the WL site, and is consistent with CNL's Pressure Boundary Program requirements.

The current Certificate of Authorization from Inspection and Technical Services Manitoba is valid until 2024 August. The Certificate of Authorization permits CNL to perform Pressure Boundary work as described in the Quality Assurance Plan [17].

6 Fitness for Service

6.1 Fitness for Service Program

Whiteshell Laboratories adheres to CNL's Fitness for Service Functional Support Area. See Section 6.1 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

The Site and Nuclear Operations Branch provides monitoring and operation of building and facility processes and support systems. Housekeeping inspections are performed monthly to provide a formal walkthrough of facilities to ensure compliance for specific areas relating to facility performance. Further inspections are conducted of waste storage structures by qualified personnel to maintain them in a fit for service state.

Operating procedure reviews are conducted on a five year cycle. Most of these procedures having reached the five-year timeline for review. A team was formed to facilitate the review and publishing of these documents. WL is behind in the 5 year procedure updates and are scheduled to complete the updates in 2023. These documents include Facility Maintenance Plans, which list the Preventive Maintenance items relating to Safety Related Systems for the Shielded Facilities, Waste Management Area, and WR-1. The revised Facility Maintenance Plans are to be published in 2023.

In 2022, the Aging Management Program conducted an assessment which showed that WL was fully and partially implementing REGDOC-2.6.3 [18]. In 2023, a review will be conducted to determine if any further actions are needed.

As facilities are decommissioned, procedures related to those buildings or processes are voided.

Details on various inspection and maintenance activities are provided in the following sub sections.

6.1.1 Planned Maintenance, Testing & Inspections

As part of Fitness for Service, WL staff ensure that critical systems, structures and components related to the safe operation and decommissioning of WL are understood and that activities are put in place to assure their safe continued operation as they age. An integrated set of programs and activities ensures that performance requirements for all critical systems, structures and components are met on an ongoing basis. These processes include:

- Maintenance, In-Service Inspection and Functional Testing, where preventive maintenance work done in the facilities is tracked to ensure it is completed.
- WL operational regulatory tasks are tracked on a weekly basis to ensure required compliance and facility checks are completed, this includes the tasks set out in the Facility Authorization documents.
- Inspections required to meet the conditions of WR-1 Monitoring and Surveillance Plan.
- Inspections of waste storage structures for fitness for service.

6.1.2 Equipment Fitness for Service/Equipment Performance

Preventive maintenance of safety-related systems in WL's nuclear facilities is carried out by qualified maintainers, in accordance with the Facility Maintenance Plan, and approved maintenance procedures. Preventive Maintenance per the Facility Maintenance Plan is defined as the pre-planned routine testing, calibration, inspection, service, and overhaul of safety-related systems, structures, and components. Preventive maintenance is performed to prevent failures from occurring and to assure the continuing capability of the system, structure or component to perform its design function. The maintenance tasks and frequencies specified in the Facility Maintenance Plans are based on recommendations from qualified WL engineering and maintenance personnel, plus vendor's data where available. Situations where there is evidence of deteriorating conditions or suggestions of an increased probability of upcoming failure are addressed. Maintenance scheduling is conducted with assistance of a Computerized Maintenance Management System which outputs preventive maintenance tasks for scheduling by maintenance and work planning staff.

Issues with missed and archived preventive maintenance activities were identified in 2021 and previously reported to the CNSC. A corrective action plan was developed, and continues to be implemented in order to fix the issues and prevent recurrence. The effectiveness of the corrective action plan will be investigated upon completion of the actions.

During maintenance of a firewater pump resulting in a Lock-Out Tag-Out event that was reported to the CNSC (see ImpAct ERM-22-1559 in Table 7), it was noted that part of the issue was the lack of a dedicated maintenance group on site that was adequately staffed, trained and qualified to maintain the licensed facilities. As part of the corrective action plan it was determined to return to having a dedicated maintenance group. Work to staff and organize that group occurred and the group was considered to be sufficiently staffed and functional by 2022 December. The focus in 2022 was on overdue preventive maintenance work, first focussing on those relating to safety related systems with corrective maintenance being given an increased focus later in 2022. There are outstanding preventive maintenance checks remaining at the end of 2022 for transformers for Buildings 423 and 923 at the WMA. There is an increased yet still low risk that either transformer could lose some functionality.

6.1.3 Condition of Structures

Waste storage structures include the WMA concrete storage facilities (termed "bunkers") and CCSF concrete canisters.

As a requirement of the Environmental Assessment Follow-up Program, a Periodic Inspection Plan (PIP) for WL Concrete Bunkers [19] was developed in 2007 and continues to be implemented to confirm the ongoing fitness-for-service of the bunkers at the WMA. The PIP describes methods for conducting scheduled inspection surveys of these structures. The inspection is defined as examination, measurement and testing work done, to ensure the bunker systems are functioning as designed and the bunkers remain fit-for-service. The inspections are documented annually, with preventive maintenance and repairs occurring as needed. As the bunkers at the WMA are removed from service as part of the overall decommissioning of the WL site, they will be removed from the inspection process. The 2022 annual inspection of WL WMA concrete bunkers was conducted in accordance with the PIP [19]. Low Level Waste Bunker 6 and B923 were de-inventoried and were removed from waste storage usage. They are no longer inspected as part of the PIP [19]. Both are in the process of being converted to waste processing structures.

The concrete canisters are inspected quarterly for concrete spalls and any changes in the hairline cracks of the concrete. In most cases, quarterly inspections of fuelled canisters have shown no significant cracking or spallation of concrete, however existing cracks and pour pockets were regularly checked for changes. Requests for patching were placed in 2021 and 2022, and several canisters require more extensive patching of pour pockets that have gradually become more noticeable over time, however no increased radiation field was noted.

Environmental monitoring was conducted in the ditches at the perimeters of the WMA and the CCSF and show no evidence that any activity has been released from the bunkers or concrete canisters.

7 Radiation Protection

7.1 Radiation Protection Program

Whiteshell Laboratories adheres to CNL's Radiation Protection Functional Support Area. See Section 7 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

Whiteshell Laboratories uses the Chalk River Laboratories (CRL) licensed dosimetry service provider for external and internal dosimetry for site/facility staff and contractors.

Whiteshell Laboratories staff and contractors who work at the WL site are assigned Thermoluminescent Dosimeters (TLDs) to monitor for external radiation exposures.

7.1.1 ALARA Initiatives and Activities

As Low as Reasonably Achievable (ALARA) and Radiation Protection (RP) program improvement initiatives and activities performed at WL in 2022 included:

- Radiation Material Management training was developed for WL project and facility supervisors and piloted to WL radiation protection staff.
- A number of site RP forms were reviewed and updated. A new form was developed and implemented to perform RP inspections of radioactive material storage areas.
- New radiological barriers were implemented to delineate boundaries of radioactive material areas, areas of elevated dose rates and contaminated areas.
- Existing long term radioactive material storage areas in WL nuclear facilities were formally registered with the WL RP program.
- Process improvements were made on scheduling and verifying RP instruments are removed from the work place and sent for calibration 30 days ahead of the annual calibration due date.
- Process improvements were made for the TLD badging of delivery truck drivers to demonstrate drivers do not receive radiation dose while on site. A single TLD badge is issued to each delivery company which is issued to drivers.

WL RP performance metrics are measured and tracked weekly through WL Restoration Project status reports and quarterly through the Nuclear Performance Assurance Review Board. These are designed to identify and address program and performance deficiencies, opportunities for improvement, and establish and effectively implement corrective and preventive action plans.

7.1.2 Contamination Control

Regular contamination surveys of workplaces, material transfers, and personnel exiting nuclear facilities and controlled areas, are used to confirm the absence of unknown contaminated material or the spread of contamination. Workplace air monitors are employed to confirm the adequacy of controls, and to warn of abnormal or unplanned airborne contamination conditions.

Table 9 shows the number of personnel, workplace and material contamination events identified in 2022 and over the past five years. None of the contamination events in 2022 resulted in a recordable whole-body, skin or internal dose.

Material contaminations decreased from 11 in 2021 to two in 2022. There were two workplace surface contaminations in 2022 compared to one in 2021. These were localised surface contamination found during routine compliance surveys in nuclear facilities. There were no worker skin or clothing contaminations in 2022.

In 2022, there were no airborne contamination exposure events and no radioactive material spills.

Table 9: Contamination Events

	Skin and Clothing Contamination				Workplace Contamination	
	Skin[a]	Personal Clothing[a]	Radiological Work Clothing[b]	Total	Surface[c, d]	Vehicle / Materials [b, c]
2018/19 FY	1	0	5	6	6	0
2019 CY	3	0	4	7	2	4
2020 CY	2	0	3	5	1	1
2021 CY	0	0	0	0	1	11
2022 CY	0	0	0	0	2	2

a Total surface contamination found is greater than 1 Bq/cm^2 beta-gamma or 0.2 Bq/cm^2 alpha over a 100 cm^2 averaging area.

b Total surface contamination found is greater than 4 Bq/cm^2 beta-gamma or 0.4 Bq/cm^2 alpha over a 100 cm^2 averaging area.

c Removable surface contamination found is greater than 0.2 Bq/cm^2 beta-gamma or 0.01 Bq/cm^2 alpha over a 300 cm^2 averaging area for Contamination Zone 1 areas

d Removable surface contamination found is greater than 10 times the maximum allowable levels for Contamination Zone 2 and higher designated areas.

7.1.3 Dose Control

Regular radiation surveys are performed by RP staff to confirm: the radiological safety zones are correctly designated; areas with local elevated radiation doses rates are posted in accordance with the RP Regulations; and sufficient access control provisions are in place. In 2022, there were no occurrences of dose rates exceeding permissible levels for the designated radiological safety zones and there were no occurrences of work places with accessible dose rates exceeding 25 µSv/h not being posted or with inadequate access control.

Electronic Personal Alarming Dosimeters (PADs) are worn by workers in addition to TLD badges to track and control job specific daily and accumulated doses. The PADs have dose and dose rate alarms which are established by job specific radiological work assessments. The dose alarms are a back-out condition and the dose rate alarms are an alert condition. Table 10 summarizes maximum daily recorded doses and dose rates for PAD work in 2022 and the previous four years. In 2022, the maximum PAD recorded daily dose received by a worker was 0.08 mSv and the highest dose rate measured in the year was 4.8 mSv/h. These were associated with the replacement of hot cell roughing filters. There were no PAD dose alarm exceedances and the PAD records demonstrates there were no unplanned whole-body radiation exposure exceeding the WL Action Level of 0.5 mSv in a day.

Table 10: PAD Dose Readings Summary

	2018	2019	2020	2021	2022
PAD[a] – Maximum Daily Dose (mSv)	0.24	0.42	0.28	0.22	0.08
PAD – Maximum Dose Rate (mSv/hr)	4.95	5.82	5.56	3.10	4.80

a Personal Alarming Dosimeter

At the beginning of 2022, managers assigned and confirmed Dose Control Points (DCPs) for employees and contractors. DCPs are used by managers and supervisors to perform individual whole-body dose management for worker radiation dose for non-emergency work situations. DCPs of either 1 mSv or 2 mSv are assigned by WL managers and represent the worker's maximum allowable dose for the calendar year. The DCPs may be adjusted as necessary during the year upon approval of a Health Physicist after confirmation that additional dose is justified. At the end of 2022, there were no individuals with an assigned DCP higher than 2 mSv, 41 individuals with an assigned DCP of 2 (RP and nuclear operations staff), and the remainder of workers with a DCP of 1 mSv. No worker dose exceeded their assigned DCP in 2022.

7.1.4 Sealed Sources

Radiation sources are registered and tracked in accordance with CNL procedures.

In 2022, there were no lost or stolen radiation sources. Leak testing was completed as required with all sources passing their leak tests.

As of 2022 December 31, the total number of registered sealed or contained sources at WL, was 53. One Californium-252 source was added to the registry and one Cesium (Cs)-137 was removed. The Californium-252 is a source contained in a neutron scatterometer that was removed from waste storage in the WMA and relocated to the SF and awaiting processing to remove and re-package the source. The removed Cs-137 source was a check source from an area radiation monitor that was sent to CRL for waste disposal.

7.2 Dosimetry

7.2.1 Interpretation of Reported Dose Quantities

WL uses the CRL licensed dosimetry service provider for external and internal dosimetry for CNL staff, non-CNL employees and visitors. Compliance with the regulatory document REGDOC-2.7.2, *Dosimetry*, Volume II [20] requires external exposure measurements to meet performance criteria with respect to the measurement of personal dose equivalent, $H_p(d)$. This is the quantity currently measured using TLDs worn on the trunk of the body. External whole-body dose (photon) and external surface (photon plus beta) dose as reported herein can be interpreted as $H_p(10)$ (for photons) and $H_p(0.07)$ (for photons and betas), respectively. Effective dose is the sum of the components external penetrating, neutron, tritium and non-tritium committed effective dose.

External radiation whole-body and skin doses are individually monitored using TLDs for persons entering or working in either radiological Controlled or Supervised Areas at WL[3].

Extremity dosimeters are worn for a defined job by a person who is likely to receive an extremity dose exceeding 1 mSv and significantly greater than a surface dose as monitored by their TLD, or if there is a reasonable probability that an extremity will be exposed to a beta and/or photon dose rate greater than 10 mSv/h.

Lens of the eye dosimeters are worn when workers are subject to non-uniform exposures to the eyes and the dose to the eye may have a reasonable probability of exceeding 15 mSv per year after taking shielding into account. Eye dosimeters are also required if exposed to beta, x-ray or gamma dose rates greater than 10 mSv/h without taking shielding into account, or if the potential dose to the eye could exceed 1 mSv taking shielding from personal protective equipment and clothing into account.

Neutron dosimeters are issued to individuals who may be exposed to neutrons resulting in dose in excess of 1 mSv in a year or where accidental neutron exposures are possible.

WL staff participate in a routine bioassay program when there is a reasonable probability of receiving a committed effective dose from occupational intakes exceeding 1 mSv per year.

7.2.2 Radiation Doses to Personnel

The dose data in all tables below represent doses delivered at WL for all monitored persons, which includes employees (including those in temporary employment such as students), contractors and visitors.

Doses have not been broken down by individual facilities because employees, contractors, and visitors routinely move between facilities without changing TLDs, making it difficult to accurately determine how much dose can be attributed to an employee, contractor, or visitor at a single facility.

In 2022, there was one exception for individual monitoring of non-CNL employees and visitors at WL, other than drivers of delivery trucks and building demolition debris haulers in radiological Supervised Areas. The exception was granted for delivery of trailers within the Supervised Area.

There were no operations of exposure devices in 2022 which required employees or contractors to be placed on a two-week dosimetry period, and there were no formal dose

[3] Exceptions are authorized on a case-by-case basis by the responsible RP Program Manager or RP Program Functional Support Manager (exceptions are noted in Section 7.2.2).

calculations required during 2022 for local area skin contamination. Additionally, no lens of the eye dosimetry was performed in 2022.

Neutron dosimeters were assigned to two individuals during the leak testing of a neutron source in 2022. All neutron doses were below the detection threshold. Doses are summarized in Table 11 through Table 14.

In 2021 May the building (B402) that housed the WL Whole Body Counter (WBC) underwent decommissioning and demolition and a new building (B543) is currently being commissioned to house the WBC. This work is continued into 2023. During this outage, workers who normally participate in annual or bi-annual WBCs were evaluated against the site's current radiological activities to determine which workers required alternative monitoring. Workers with reasonable potential for an intake which warranted alternate monitoring were placed on a gamma spectrometry in urine analysis (provided by CRL Dosimetry Services) which provides similar minimum detectable doses to the WBC analysis. Additional random (biased toward likelihood of an intake) urine bioassay monitoring of workers who did not meet the alternative monitoring criteria is being undertaken until the new facility is ready.

In 2022, 189 individuals underwent internal bioassay, which involved strictly urinalysis during the continued WBC outage. Ten individuals underwent confirmatory and follow-up Pu-in-urine bioassay monitoring and there were no individuals requiring tritium-in-urine monitoring. No committed effective dose estimates were necessary as a result of any bioassay sampling in 2022.

The instances of Nuclear Energy Worker (NEW) visitors listed below were associated with personnel previously designated as NEWs but not associated with radiological work at WL in 2022. These included former AECL/CNL personnel, contractors, and CNSC staff visits. The one instance of a non-NEW employee is associated with a fully remote worker who visited the WL site.

Table 11: Effective Dose for Whiteshell Laboratories

a All quantities are measured in mSv unless otherwise noted.
b Average of all measured doses that exclude the zero dose value, rounded to two decimal places.
c Average of all measured doses that include the zero dose value, rounded to two decimal places.
d Visitor NEWs are persons who were historically employee and/or contractor NEWs, but have returned to the site as visitor while retaining their historical NEW status.

7.2.2.1 Discussion of Dose Data

The Regulatory effective dose limit for a NEW in a calendar year is 50 mSv. The maximum individual effective dose to a NEW at WL in 2022 was 0.31 mSv and the site collective dose was 17.19 p-mSv.

The Regulatory effective dose limit for a NEW in a five-year period is 100 mSv. The maximum individual effective dose to a NEW at WL for the current five-year dosimetry period (2021 January 01 to 2025 December 31) was 0.57 mSv received by a pipe fitter.

The Regulatory skin dose limit for a NEW in a calendar is 500 mSv. The maximum individual skin dose to a NEW at WL in 2022 was 0.66 mSv and the site collective dose was 18.80 p-mSv.

The Regulatory hands and feet dose limit for a NEW in a calendar is 500 mSv. The maximum individual hands and feet dose to a NEW at WL in 2022 was 1.38 mSv and the site collective dose was 7.06 p-mSv.

The Regulatory effective dose limit for a pregnant NEW is 4 mSv for the remainder of their pregnancy. In 2022, the maximum annual individual effective dose for a pregnant NEW was 0.06 mSv.

The Regulatory effective dose limit for non-NEWs is 1 mSv in a calendar year. In 2022, the maximum individual effective dose to a non-NEW at WL was 0.01 mSv.

Table 15 provides a summary of radiation doses by worker group in 2022. The majority of radiation doses were received by RP, Nuclear Operations and Trades staff.

7.2.2.2 Radiation Dose Changes or Trends

Table 16 shows external whole body dose received from 2018 to 2022, and Figure 1 displays the maximum individual and collective dose from 2001-2022.

Worker doses decreased in 2022 with the site safety pause instituted in 2022 June.

The site collective dose decreased from 19 p-mSv in 2021 to 17 p-mSv in 2022. The number of workers receiving occupational doses above 0.2 mSv in a calendar year decreased from 11 workers in 2021 to 5 workers in 2022. This is a continued decrease compared to a maximum number of 42 workers in 2017. There were no workers receiving an annual radiation dose above 1 mSv in 2022.

Main contribution to radiation dose in 2022 was operational replacement of hot cell roughing filters. There was continued waste handling with low level waste package removal and characterization activities in the WL WMA. However, these activities had only a small contribution to site worker doses.

Table 15: Summary of Worker Group Radiation Doses at WL for 2022

	Total Number of Persons	Individual Whole-Body Dose (Effective Dose[a])		Collective Whole-Body Dose (Effective Dose[a])	Collective Surface Dose (photon plus neutron plus beta)	Collective Extremity
		Average[b] (mSv)	Maximum (mSv)	p·mSv	p·mSv	p·mSv
Nuclear Facilities:						
SF Staff (HCF and IFTF)[c]	5	0.13	0.28	0.64	1.02	0.83
WR1 Staff	5	0.02	0.05	0.11	0.11	0
WMA and CCSF Staff[c]	8	0.03	0.09	0.22	0.22	0
Support Workgroups:						
Radiation Protection Staff [d]	49	0.06	0.31	3.09	4.08	3.77
Trades Staff [e]	105	0.04	0.15	4.38	4.62	2.46
All Remaining Staff:						
Other Staff [f]	564	0.02	0.19	8.75	8.75	0
WL Site[g]:	736	0.02	0.31	17.19	18.80	7.06

a Includes photon and neutron; there were no tritium committed effective doses for 2022.

b Average of all measured doses that includes the zero dose values, rounded to two decimal places. Includes employees and contractors.

c SF= Shielded Facilities; HCF = Hot Cell Facilities; IFTF = Immobilized Fuel Test Facility; WMA= Waste Management Area; CCSF= Concrete Canister Storage Facilities; WR1 = An experimental test reactor built at WL – WR-1 featured an organic liquid coolant.

d Radiation Protection staff include Radiation Surveyors, Radiation Protection Assistants, Contamination Monitors, and Decontamination Operators.

e Trades staff provide services for all listed facilities and decommissioning activities as well as the WL site in general. In 2022 this group was expanded to include Heavy Equipment Operators and Utilities staff. There was also a large hiring campaign of trades staff.

f Other staff is comprised of all remaining staff and includes decommissioning, administrative, management, engineering, quality assurance, researchers, contractors and tenants.

g WL Site includes 466 CNL staff (WL and staff visiting from other CNL sites) and 270 contractors working at the WL site during 2022. This tally does not include visitor doses.

7.2.3 Program Exceedances

During 2022, radiation dose to all persons working at WL were below the WL dose Action Levels [2] and the respective CNSC regulatory limits [21]. In addition, there were no individual doses exceeding their respective DCP as a result of activities at WL.

Table 16: WL External Whole-Body Dose Performance 2018 to 2022

Performance Metric	2018	2019	2020	2021	2022
Site Collective Worker Dose (p-mSv)	40.2	49.6	33.4	18.9	17.2
Max Individual Worker Dose (mSv)	1.65	3.09	2.97	0.57	0.31
Number of Workers > 0.2 mSv in a year	39	38	25	11	5
Number of Workers > 1 mSv in a year	12	14	8	0	0

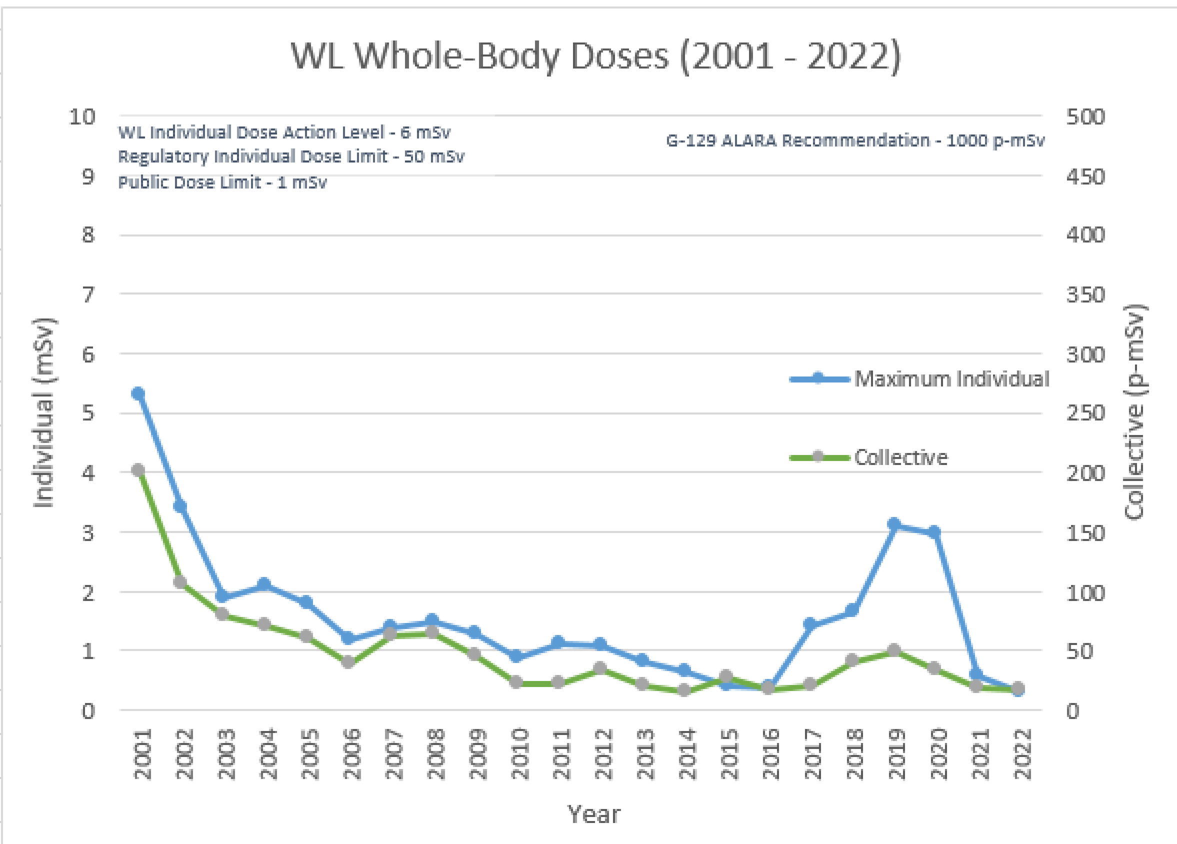

Figure 1: Whole-Body Effective Doses (2001 – 2022)

8 Conventional Health and Safety

8.1 Conventional Health and Safety Program

Whiteshell Laboratories adheres to the Corporate Conventional Health and Safety Program. See Section 8 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [4].

In support of reducing the number and impact of incidents with the potential for injuries or incidents at WL, the following initiatives began or are continuing in 2022:

- Facilitated two of the five core mandatory courses that resulted from the safety pause.
- Supported Training in delivering all OSH related courses throughout the year.
- Provided Site Safety and Health Committee training. Work place inspection training was complete with committee members in the field. Practical Training was complete using various staged hazards and members had to identify/find them while walking through the designated area.
- Completed existing Confined Space assessments throughout the WL Site (due every three years). Working with facilities on any new space assessments.
- Tracking employee exposure hours to asbestos and support the Health Centre with scheduling medical baseline testing for workers who perform asbestos type one and two abatement work. The baseline medical testing (includes chest x-rays, lung function testing) is continuing to allow for scheduled abatement work to proceed.
- Provided virtual ergonomic assessments for remote workers and in person assessments for workers on site.
- OSH personnel were present in the field at pre-job briefings, walk downs and daily work plan meetings together with early involvement in the planning process have contributed to many of WL's safety successes.
- Increased contractor oversight continued by participating in activities such as site visits, pre-job briefs, pre-bid meetings and OSH orientation for contractors.
- Continued participation in the Rapid Learning Morning Call to quickly share safety information with all CNL sites, as well as gather safety information relevant for the WL site.
- Completed 10 internal safety advisories and 1 learning advisory which was sent to WL site employees. The bulletins inform WL employees about imminent issues that could impact their safety as a proactive approach to safety.
- Near miss reporting (a known industry best practice) continued with a focus on early hazard recognition and strong situational awareness culture, supporting the minimization or elimination of hazards prior to resulting in injury (see Table 17). Near miss reporting at WL always includes an investigation/fact finding session. The majority of near miss reports also generate an ImpAct. The possibility of a human

error trap being involved in the near miss incident is always considered, evaluated and followed up as appropriate.

- OSH Program weekly review of company injury/illness reports in support of recognizing trends and disseminating lessons learned.
- Focus on disability management / return to work in support of minimizing the impact to an injured employee and subsequent days lost.
- Ongoing bi-weekly, quarterly and annual potable water samples were completed to test for turbidity, bacteria, mercury, metals and other materials.

Table 17: Summary of WL Near Miss Reporting

Year	2018	2019	2020	2021	2022
Near Misses Reported	53	46	10	26	19

8.1.1 Site Safety and Health Committee

The Site Safety and Health Committee is the principal forum at WL for joint employee/ management consultation and development of solutions to safety and health concerns at the WL site. The WL Site Safety and Health Committee meets on a monthly basis, holding a minimum of (9) nine meetings per year.

In 2022, the WL Site Safety and Health Committee received 244 inquiries – 69 brought to member/OSH, and the remaining 175 from the Site Safety and Health suggestion box. Out of these 244, 42 remained open and in progress. The Site Safety and Health Committee is employee led and acts as an oversight body, therefore these actions are largely related to the Site Safety and Health Committee's need for more information that provides them with assurance of the effectiveness of the actions of the functional safety groups on site.

8.1.2 Inspections

There were 64 site health and safety inspections completed in 2022. ImpActs were raised to address any findings from the inspections and remedial or corrective actions were taken as appropriate.

8.1.3 Hazardous Occurrence Investigation Reports and Lost-Time Injuries

There were two hazardous occurrences at WL that were reported to Employment and Social Development Canada in 2022. CNSC staff received a copy of the notifications, as per the requirements of the CNSC REGDOC-3.1.2 [3].

The following is a summary of injury rate data for the last 5 years.

Table 18: Summary of Whiteshell Laboratories Injury Rate Data

	2018	2019	2020	2021	2022
WL Employees					
Person Hours Worked	688,000	642,000	584,030	684,000	812,000
Lost-Time Injuries	1	0	1	0	0
Working Days Lost	5	0	2	0	0
Frequency[a]	0.25	0	0.34	0	0
Severity[b]	1.45	0	0.68	0	0
WL Contractors[c]					
Lost Time Injuries	0	0	0	0	0
Working Days Lost	0	0	0	0	0

a Frequency rate equals # of Lost-Time Injuries x 200 000 hrs of exposure divided by person hours worked (based on 100 Full Time workers).

b Severity rate equals # of Working Days Lost x 200 000 hrs of exposure divided by person hours worked (based on 100 Full Time workers).

c The Number of Person Hours worked are not divulged by Contractors. As such, Frequency and Severity rates cannot be calculated.

The Recordable Lost Time Injury rate over the last five years at WL in Manitoba is significantly lower than local lost-time injury rates for construction and manufacturing, as per the data from the Workers Compensation Board of Manitoba found in Table 1.4 in *The Manitoba Workplace Injury and Illness Statistics Report (safemanitoba.com).*

No Assurance of Voluntary Compliance or Directions were issued by Employment and Social Development Canada in 2022.

9 Environmental Protection

9.1 Environmental Protection Program

Whiteshell Laboratories adheres to CNL's Environmental Protection Functional Support Area. See Section 9 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

WL has an integrated Environmental Protection Program designed to track radiological and non-radiological contaminants throughout the different compartments of the geosphere, atmosphere, and biosphere, and consists of three distinct programs: the Effluent Verification Monitoring Program, the Environmental Monitoring Program, and the Groundwater Monitoring Program. The WL Environmental Protection Program is designed to implement the requirements of:

- CSA N288.4-10, *Environmental Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills* [22],
- CSA N288.5-11, *Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills* [23],
- CSA N288.6-12, *Environmental Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills* [24],
- CSA N288.7-15, *Groundwater Protection Programs at Class I Nuclear Facilities and Uranium Mines and Mills* [25],
- CSA N288.8-17, *Establishing and Implementing Action Levels for Releases to the Environment from Nuclear Facilities* [26], and
- ISO 14001:2015, *Environmental Management Systems* [27].

The integrated Environmental Protection Program is dynamic in nature, meaning that it is continually evolving based on various sources of information received.

Program documentation is updated on an ongoing and/or required basis.

This report will focus and discuss the implementation of the WL Effluent Verification Monitoring Plan [28]. This plan defines the methodologies and protocols followed in performing the effluent verification monitoring required in CSA N288.5-11 [23].

The WL site has maintained its ISO 14001 [27] registration in 2022 with initial registration in 2010.

The CNSC has previously been notified of revisions to *Environmental Protection documents* [29], as per the *Licence Conditions Handbook.*

9.2 Quality Assurance

In order to ensure that the data collected through the program is valid, the laboratories performing monitoring for the program have strong Quality Assurance/ Quality Control programs as required by CSA N288.5 [23]. General quality assurance objectives for CNL's Environmental Protection Program are set out in quality assurance plans. Radiological analysis is conducted in accordance with laboratory-specific environmental monitoring quality assurance plans. The plans include detailed working procedures for field operations, laboratory operations, laboratory administration, equipment performance, and quality verification of analytical results. The plans were written to align to ISO/IEC 17025 [30] for analytical laboratories.

Whiteshell Laboratories' Environmental Management group conducts frequent internal checks of their technical capabilities as they perform their measurements. These are called Quality Verification Tests, and are grouped as follows according to purpose:

- *Reproducibility Tests*, such as measurement of sample replicates, establish the relative precision of the method(s). To be acceptable, replicate measurements must agree within limits established by long-term method performance.
- *Accuracy Tests*, such as blanks or samples, each spiked with known amounts of the analyte(s), establish the presence or absence of any biases due to sample matrix, sample preparation, or instrument function. To meet acceptance criteria, the spike quantity must be recovered within limits established by long-term method performance.

Environmental Management performed 3764 quality verification tests during 2022 on WL's radiochemical counting equipment. Of these tests, 99.6% fully complied with acceptance criteria. The results of these tests are shown Table 19.

Table 19: Whiteshell Laboratories' Summary of Quality Verification Test Performed

Method	No. of Tests	No. of Failures	% Pass
Total Alpha (Instrumentation)	1,201	2	99.8
Total Beta (Instrumentation)	1,210	1	99.9
Gamma (Instrumentation)	1,104	2	99.8
Tritium	249	11	95.6
2022 Total	**3,764**	**16**	**99.6**

In 2022, the WL Effluent verification program continued performing regular field Quality Verification testing on the Outfall, Lagoon, and Ditch effluent sampling (Table 20). The program is using traveling blanks to determine and account for any possible introduction of contamination into the sample being analyzed by the sampling methodology being employed by the program, and the program is also collecting duplicate samples to demonstrate sampling reproducibility.

LMDL = Laboratory Method Detection Limit

Out of the 195 duplicate quality verification tests, 182 of these tests meet the acceptance criteria (+/- 20% of the actual result) of the program, to yield a 93% pass rate.

In 2022, the WL Environmental Management group took part in three inter-laboratory comparison studies. Two of these studies, which focused on radiological analyses, were offered through the Environmental Research Associates. The other study which focused on non-radiological analyses, was offered through the Canadian Association for Laboratory

Accreditation. The results of the WL Environmental Monitoring laboratory performance are shown in Table 21 and Table 22. There was only one inter-laboratory testing performed on the non-radiological parameters in 2022, as CNL was unable to participate in the March testing.

There were also two individual tests in the fall Radiological testing that CNL was unable to perform due to laboratory equipment being taken out of commission for servicing. This prevented CNL from being able to process the Gross Alpha and Gross Beta in water samples for MRAD-37.

For all inter-laboratory tests pertaining to the effluent verification monitoring program CNL had a 100% passing rate.

Table 21: Environmental Research Association Inter-Laboratory Comparison Program for CNL WL - 2022

MRAD* Study	Matrix	Analyte	Units	MRAD Assigned Value	WL Reported Value	Acceptance Limits	Performance Evaluation

9.3 Supplementary Studies

In 2020, the WL site began to do temporary enhanced monitoring on the effluent verification ditches for the year. The enhanced monitoring is being done to confirm the absence of a number of radiological and non-radiological parameters. The enhanced monitoring involved doing an open scan for Volatile Organic Carbons, semi-volatile organic carbons, and an expansion of the metals and gamma isotopes list currently being used to monitor the ditches.

This study was concluded in 2022. Whiteshell is reviewing the data, and is evaluating the need for additional parameters within the effluent verification monitoring program.

9.4 Effluent Monitoring – Radiological

This section addresses the licence requirement regarding radiological monitoring of airborne and liquid effluents for the WL site, located on the Winnipeg River near Pinawa, Manitoba. It also addresses the effluent monitoring requirements listed under the Environmental Assessment Follow-Up Program [31] for WL.

Results of environmental monitoring and progress on the Environmental Assessment Follow-Up Program work packages will be provided in their respective annual reports, *Environmental Monitoring in 2022 at Whiteshell Laboratories* [32] and *2022 Progress Report on the Environmental Assessment Follow-Up Program for Whiteshell Laboratories* [31].

9.4.1 Effluent Monitoring

9.4.1.1 Site Effluent Verification Monitoring System and Results Evaluation

Monitoring locations for airborne and liquid effluent streams are representative of the final discharge to the off-site environment, and may include the combined discharge from a number of facilities. Additional monitoring points are maintained at upstream locations as an aid in identifying the specific sources of emissions. Sampling system design ensures that samples are representative of the total content of the stream at each location.

Figure 2 includes a map of the effluent monitoring locations/effluent streams at WL.

Effluent streams are monitored for all groups of radionuclides that are likely to be present and significant contributors to the total, expressed as a percentage of applicable Derived Release Limits (DRLs) [33]. The DRLs in use at WL came into effect on 2021 January 31. All current and historical data in this report has been compared against these DRLs. Monitoring is conducted either by direct measurement on location or by sampling and laboratory analysis. In many cases, gross-measurement parameters (e.g., gross beta) are monitored and reported rather than specific radionuclides. This is done provided that either the relative composition of radionuclides indicated by the gross parameter is not likely to vary significantly, or total emissions of the gross parameter are very small relative to the DRLs. For comparison with DRLs, the gross parameters are always evaluated conservatively. They are either assumed to consist solely of the most restrictive radionuclide, based on DRL value that is likely to be present in measurable quantities, or are assumed to be the radionuclide(s) known to be present in the effluent. To ensure proper selection of the DRL values, the effluents are periodically characterized using, for example, gamma spectrometry to identify individual gamma emitters, or chemical extraction and analysis of individual beta emitting radionuclides, such as Strontium (Sr)-90, complemented by examination of historical data.

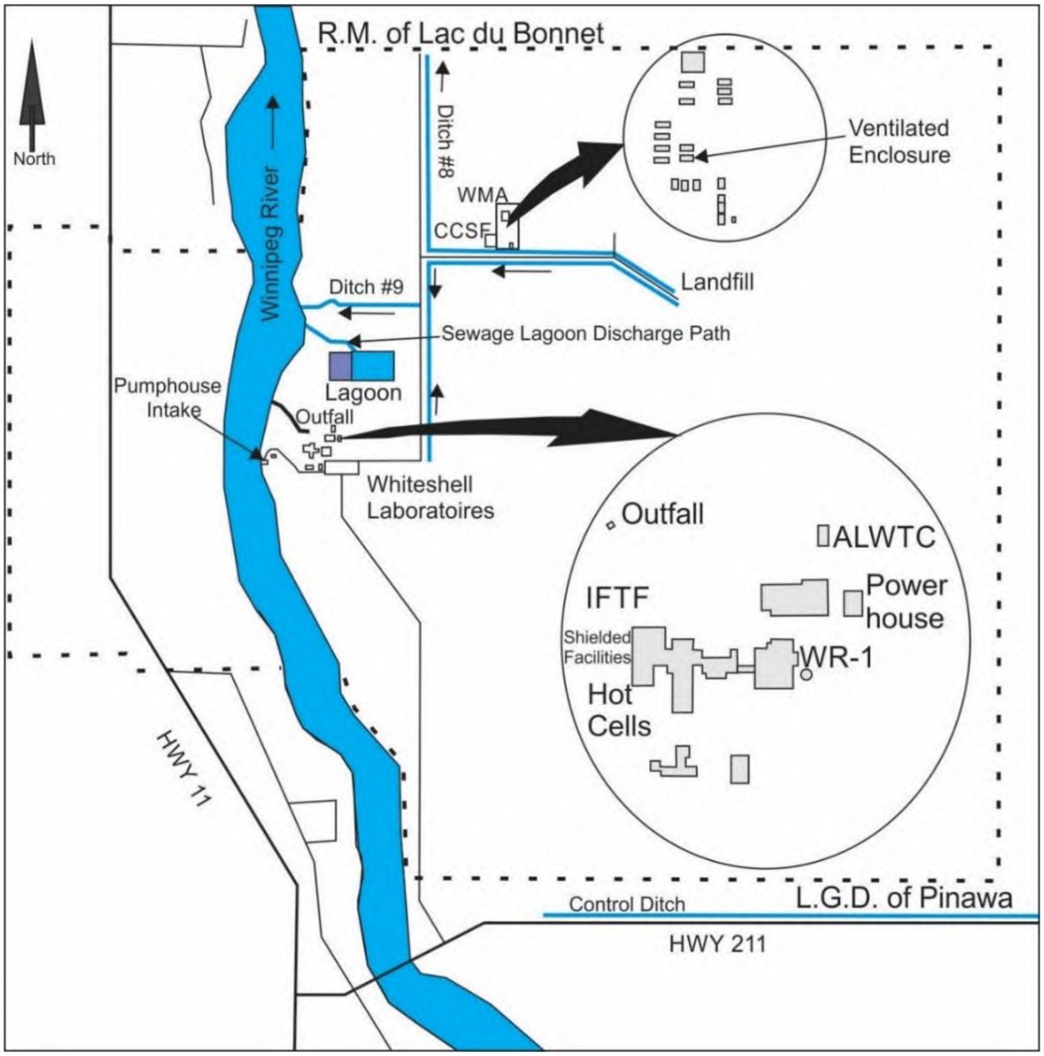

Figure 2: Effluent Monitoring Locations

The significance of the measured radioactive materials in airborne and liquid effluents is assessed by comparison with DRLs that relate the releases to the potential radiation dose to the identified, most exposed groups (i.e., critical groups). DRLs are the upper limits for releases of radionuclides in airborne or liquid effluents from a facility or site. WL's DRLs were calculated in accordance with the principles and methodology in CSA N288.1-08 [34]. The DRL for a particular radionuclide is derived from the regulatory dose limit for members of the public, 1 mSv in a year, as specified in the Radiation Protection Regulations under the Nuclear Safety and Control Act [35]. The intention of the DRL is to establish a release limit such that compliance with it will give reasonable assurance that the annual regulatory dose limit for members of the public is not exceeded. Weekly DRLs are calculated and applied for airborne effluents, and monthly DRLs for liquid effluents.

For multiple effluents and radionuclides at a site, verifying that the sum of all releases as a percentage of the respective DRLs is less than 100% provides a reasonable assurance[4] that the annual dose limits have not been exceeded. This is a conservative approach since the critical group may differ for different release paths and radionuclides. The actual releases are a very small fraction of the DRL as discussed in the following sections and shown in Figure 3. As discussed in Section 9.4.1.3, the increase in 2019 to 2022 liquid effluents is due to an increase in detection limit values for Am-241 and Plutonium (Pu)-239/240. When the activities of radionuclide contaminants are not detected it is standard practice to report detection limit values as if they were observed concentrations. For example, Pu isotope activities were always detection level values and Am-241 and Cs-137 activities are very close to detection levels.

Analytical models of all significant environmental pathways to an individual in the critical group are used in the DRL calculations. DRLs for WL have been calculated for a large number of radionuclides, many of which are currently not detected in site effluents. Derived Release Limit calculations (of a wide range of radionuclides) provide a means of determining which radionuclides may be significant dose contributors. Thus, they aid in determining which nuclides warrant inclusion in the monitoring program, and in interpreting monitoring results.

Performance is also measured against the regulatory Administrative and Action Levels[5] as specified in Reference [36]. The Action Levels were calculated based on current CNSC guidance to meet CSA N288.8 [26] and to better reflect current waste streams, and were released for use based on an implementation date of 2017 January 01.

[4] The effluent DRL model and assumptions are further verified annually through results from the WL environmental monitoring program. The program assesses radiation doses to members of the public using direct measurements of radioactivity in the environment (e.g., in air, water, and food).

[5] Action Level – In the context of CNL's Environmental Protection Program, an "Action Level" for radioactive emissions is a release rate of radioactive emissions that, if reached, may represent a loss of control of performance for a facility's environmental protection program or emission control system. Releases above Action Levels must be investigated and reported to CNSC staff. Action Levels for WL radioactive effluents are lower than the DRLs.

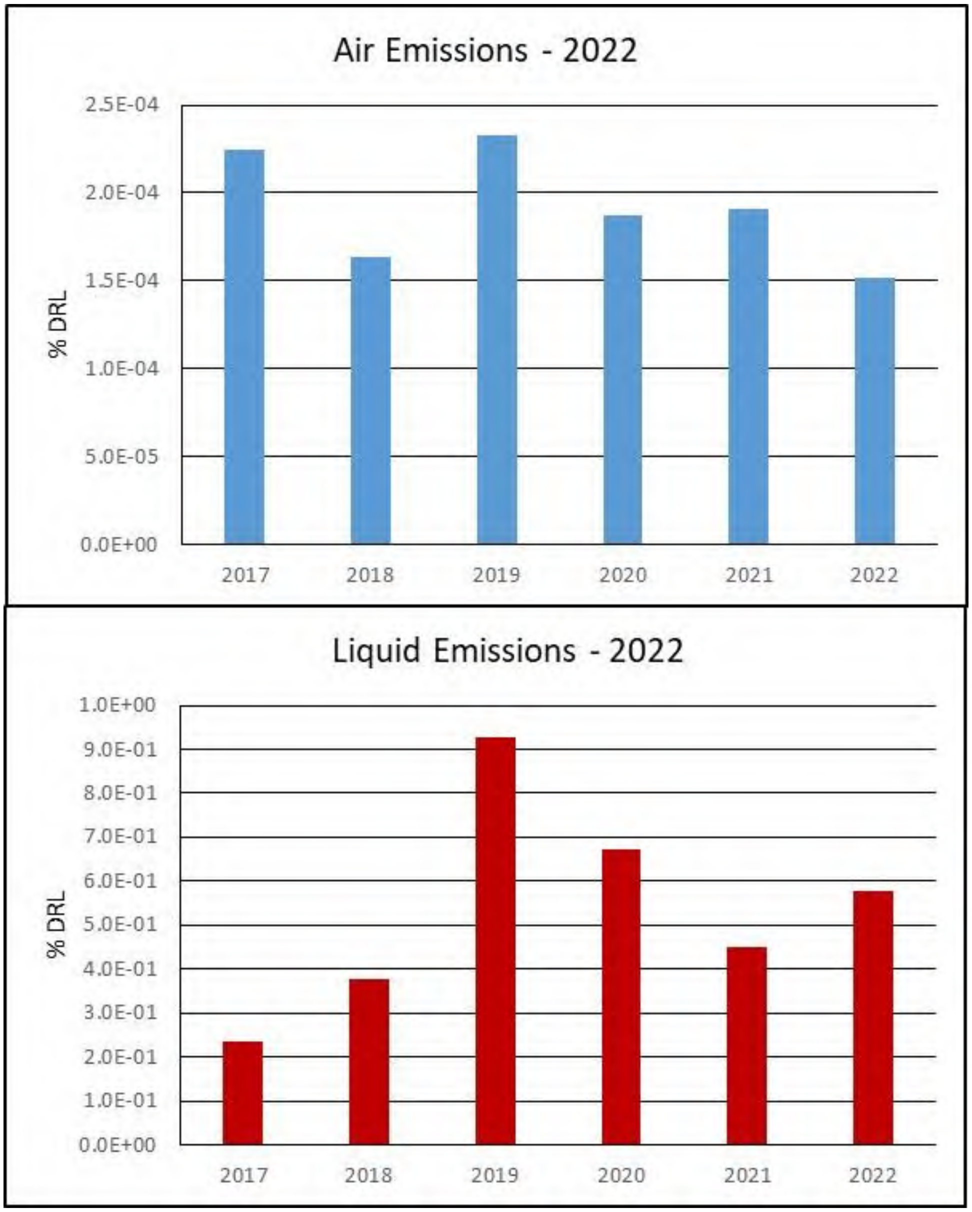

Figure 3: Trends for Airborne and Liquid Emissions form WL for 2017 to 2022

9.4.1.2 Airborne Effluent Monitoring

9.4.1.2.1 Monitoring Points, Schedules and Parameters

Cleanup and operational activities associated with decommissioning the site have been underway since 2003 January. The main sources of airborne radioactive effluents, as a result of this work and historical activities at WL, are the:

- Hot Cells Facility (Building 300)
- Immobilized Fuel Test Facility (Building 300)
- Reactor Building (Building 100)

Air effluents from Buildings 100 and 300 were sampled continuously throughout the year. The frequency and type of monitoring will continue to be evaluated over time, and adjusted to reflect findings from the monitoring activities. The current monitoring schedule and locations are noted in Table 23. Cessation of a monitoring activity will occur once it can be shown that an effect has stabilized or has been reduced to a level where it is no longer considered significant by regulatory requirements or community concerns.

Table 23: Radiological Air Effluent Monitoring Schedule – 2022

Sample Location	Sample Collection		Analytical Method and/or Parameter			
	Frequency	Method	Gross Beta	Gross Alpha	Tritium	Gamma Spec
Building 100 Stack	Cont	GFA Filter	W	W	N/A	W
	Cont	Charcoal Filter (Cartridge)	N/A	N/A	N/A	W
	Cont	Bubbler	N/A	N/A	W	N/A
Building 300 HCF	Cont	GFA Filter	W	N/A	N/A	W
	Cont	Charcoal Filter (Cartridge)	N/A	N/A	N/A	W
	Cont	Millipore Filter	N/A	W	N/A	N/A
Building 300 IFTF	Cont	GFA Filter	W	N/A	N/A	W
	Cont	Charcoal Filter (Cartridge)	N/A	N/A	N/A	W
	Cont	Millipore Filter	N/A	W	N/A	N/A

Cont The air effluent is measured but passing a continuous sample of the exhaust through a filter. The GFA filter is normally used for beta-gamma, the Millipore normally for alpha, charcoal or silver zeolite for radioiodine, and a water Bubbler for tritium.

W Weekly

N/A Not Applicable

The air to be monitored from the buildings and facilities is drawn past sample probes located in the exhaust vents, pumped through filters and then returned to the exhausts. The WL maintenance planning team performs the measurements for the stack flows and the RP team measures the sampler flow. The sampler flows at WL are checked during each sample collection period to ensure that they are within the established acceptance criteria, and are re-measured and verified on an annual basis. The release factors are calculated by the WL Environmental Management staff and verified independently on an annual basis. Activities measured in the laboratory are used in conjunction with sampler and exhaust stack flow rates to calculate the release in Becquerels (Bq). The Lower Limit of Detection (LLD) is the product of the release factor of the source and the laboratory Minimum Detectable Activity. For a given radionuclide, the Minimum Detectable Activity and LLD can vary, as they are calculated assuming a 30-minute count time and average detector efficiency, both of which can change.

Derived Release Limits have been calculated for 74 radionuclides for airborne effluents at WL [33]. Separate DRLs have been calculated for on-site workers and for members of the public at the site boundary. For gross alpha and gross beta activities, the DRL applied is the most restrictive from amongst those of the radionuclides that could be present (Sr-90 for gross beta and Pu-239 and Pu-240 for gross alpha).

Sampling procedures, field operating procedures, laboratory procedures, equipment performance checks, quality verification procedures, and laboratory administrative procedures are described in detail in the governing WL Environmental Management documentation.

9.4.1.2.2 Monitoring Results

The airborne emission results are summarized in Table 24 and Figure 3 for the years 2017 to 2022. Average weekly emissions, in Becquerels, are shown for gross alpha, and gross beta for facilities in Buildings 100, 200, and 300. Emissions from Building 100 also include tritium. In addition, the current year releases, the average release for the past five years and the maximum weekly emissions as a percent of the DRL are given. Emissions from these identified release points are added for each year to provide an indicator of the performance of the site. The reader should be aware that the values for 2022 in Table 24 represent averages that include detection limit values where nothing has actually been detected.

Airborne emissions remain a small fraction of the release limit. The result for 2022 (0.00015% of the DRL) is lower than in 2021 and the average for the last five years. Total site gross alpha in 2022 is lower than in 2021 and the last five years average. It remains near detection limit values. The gross beta emissions are less than in 2021 and the last five-year average. In 2022, the air emissions from all facilities were below Administrative Levels and regulatory Action Levels. In 2021, Building 200 was demolished no longer contributes to air emissions. The average values of the previous five years shows that Building 200 had contributed 16 percent of the total alpha air emissions and 8 percent of the total beta air emissions.

Tritium emissions from the WR-1 stack were slightly higher than in 2021 and the five year average. During the Phase 1 Decommissioning of WR-1, all bulk heavy water was removed from WR-1, and an exhaustive process of eliminating heavy water and tritium from the reactor piping and tanks occurred. It was concluded that over the lifetime of WR-1, tritiated heavy water was adsorbed into the pipe and tank walls and probably also into concrete walls and floors. Therefore, the moderator system continues to be purged with air flow in order to remove additional tritium from the system and the tritium removal rates have been measured. The tritium emissions from the facility fluctuate with the humidity and temperature as the tritiated water is drawn out of the system. The maximum releases were all below the administrative level (7.29E+09 Bq/week) for the facility and well below the Action Level (3.30E+10 Bq/week) and DRL (1.65E+15 Bq/week). As many gross alpha and gross beta measurements are at or below the LLD, the yearly variations within these extremely small numbers are of very little consequence.

Localized operational workplace air monitoring is conducted as part of the Radiation Protection Program, and this was performed during operational shutdown and decontamination activities associated with Building 100, and work in the Shielded Facilities and Concrete Canister Storage Facility. Environmental airborne dust monitoring was performed close to the east, north, west and south boundaries of the WL campus during building demolitions. The results of the 2022 dust monitoring are described in the *2022 Progress Report on the Environmental Assessment Follow-Up Program for Whiteshell Laboratories* [31].

Table 24: Radionuclides in Air Effluents from WL Facilities – 2017 to 2022

Location/ Parameter	DRL[a] (Bq/wk)	Action Level (Bq/wk)	2017 (Bq/wk)	2018 (Bq/wk)	2019 (Bq/wk)	2020 (Bq/wk)	2021(Bq/ wk)	Five-Year Average		2022		2022 Maximum

9.4.1.3 Liquid Effluent Monitoring

9.4.1.3.1 Monitoring Points, Schedules and Parameters

Figure 2 shows the locations of the sources of liquid effluents to the Winnipeg River, including the process water outflow (Outfall), the Lagoon and the numbered ditches.

The primary source of liquid radioactive effluents is the Outfall, which discharges continuously to the Winnipeg River. The discharge from the Outfall is composed of storm water runoff from paved roadways, around buildings through the weeping tile system, cooling water used in process and experimental facilities, and discharges from the Low Level Liquid Waste treatment systems tanks based in Building 100 and Building 300. The Active Liquid Waste Treatment Centre (ALWTC) was taken out of service in 2017 as part of preparations for the decommissioning of Building 200. Holding tanks collect water containing low levels of radioactivity, as a result of cleanup activities associated with operational and decommissioning work, as well as historical activities at WL. The current monitoring schedule and locations are listed in Table 25.

Table 25: Radiological Liquid Effluent Monitoring Schedule – 2022

Cleanup and operational activities associated with decommissioning the site have been underway since 2003 January. Specific activities that may have influenced the 2022 liquid releases are similar to those for the past five years, and include cleaning of footwear and respirators. Radiation Protection introduced the use of disposable rubber shoe covers in 2018, which reduced the contribution from the washing of footwear. The water from these cleaning activities is combined with Building 300 sump water into the Building 300 receiver tanks. Sump water from Building 100 is directed to the Building 100 receiver tanks. The liquids from these holding tanks are discharged to the Winnipeg River through the Outfall.

An automatic sampler continuously samples the outflow from the Outfall, proportional to its rate of flow. A weekly screening sample (4 L), representative of effluent released from the Outfall during the preceding week, is collected and submitted for uranium and gross beta analysis and scanned by gamma spectrometry.

Monthly composite samples (at least 32 L) are gathered for analysis of total uranium, gross alpha, gross beta, tritium, radio strontium and other radionuclides (Am-241, Cs-137) by gamma spectrometry. Starting in 2017, 3 month composite samples were collected for Pu-239/240, Pu-238 and Pu-241 isotopic analyses. Monitoring for Carbon (C-14) and tritium in Outfall samples was initiated in 2020 because they are known to exist in WR-1, and decommissioning activities have a potential for releasing these isotopes. The activities of tritium and C-14 at the Outfall continued to be below the lower limits of detection.

The secondary source of liquid effluent is the Sewage Lagoon (Lagoon). The Lagoon collects sanitary and wastewater from most buildings on the site, as well as from the laundry facility. The minimum residence time for the lagoon is equal to the amount of time the secondary cell is isolated from the primary cell, to allow for biodegradation and settling. This is typically around 45 days. Prior to each planned discharge, the secondary cell is isolated, and tested for a series of non-radiological parameters (discussed in detail in Section 9.5.1.4.5.1). If these are acceptable, the accumulated contents of the secondary cell only are released to the Winnipeg River via a small drainage ditch leaving the Lagoon's north side. In 2022, the effluent from the Lagoon was discharged in October.

Whenever there is a discharge from the Lagoon, the outflow is continuously sampled. The resulting composite sample is analyzed for gross alpha, gross beta, and radio strontium, and it is also scanned by gamma spectrometry.

Small quantities of radionuclides at levels seen at sampling locations 7 and 8 in Ditch 8 (see Figure 15), are released to the Winnipeg River through Ditches 8 and 9 (Figure 2). Water from the recharge area east of the WMA is diverted around the WMA to the west-flowing Ditch 9 and into the Winnipeg River. The other, Ditch 8, running northward, drains the land north of the WMA up to the site boundary and beyond. The volume of water in the ditches and resulting flow to the river is entirely dependent on rainfall and spring runoff. Precipitation (687 mm) in 2022 was significantly more than in 2021 (395 mm), and in 2020 (441 mm). The spring precipitation in 2022 April and May was 2 to3 times higher than normal. June precipitation was normal, while July was dry. August was above normal, while the remaining months of 2022 had normal amounts of precipitation. As a result of the 2022 precipitation, ditches were sampled during April, May, June, July and August.

One-litre water samples to be analyzed for radioactivity are collected from the two ditches carrying drainage from the WMA whenever there is sufficient flow from runoff to enable sampling of discharge to the river. At the same time, samples were also collected from the northern ditch bordering Highway 211. This is far enough from CNL's operation to be a reasonable background (Control) sample[6]. The samples are analyzed for gross alpha, gross beta, gamma spec and tritium. If the level of the gross beta measurement exceeds 10 Bq/L, the samples are submitted for radio strontium analysis. Uranium activities are calculated from uranium concentrations obtained from total metals analysis. Surface water samples are collected in and around the WL WMA from locations upstream from these two ditches. The results of these operational control samples are reported in Appendix D of this report.

Derived Release Limits for 63 radionuclides were calculated for liquid effluents at WL [33]. Gross alpha and gross beta measurements provide a quick measurement of the total alpha and beta radioactivity produced by a number of radionuclides, without having to test for those radionuclides. However, as in the case of airborne effluents, the most restrictive DRLs apply to gross beta and gross alpha activity: Cs-137 for beta activity and Pu-239 and Pu-240 for alpha activity. With the introduction of total uranium (U) and isotopic plutonium analysis for the processed outfall, a comparison can be made to the individual contributors to the gross alpha activity. Therefore the comparison to the %DRL of the individual isotopes is presented and the sum of those reported. This is also the case for gross beta.

9.4.1.3.2 Monitoring Results

The liquid emission results are summarized in Table 27 and Figure 3 for the years 2017 to 2022. Average monthly emissions, in Becquerels, are shown for gross alpha, gross beta, total U (including U-234, U-235, and U-238), Am-241, Sr-90 and Cs-137 for the releases from the Outfall and the Lagoon. The monitoring of tritium from the Outfall began in 2019. In addition, quarterly activities of Pu-239/240 and Pu-238 were reported for Outfall effluents. A plot of the monthly Cs-137 and Sr 90 releases as Bq from the Outfall in 2022 is compared with radioactivity (Bq) discharged to the Outfall from the Low Level Liquid Waste (LLLW) treatment systems in Figure 4. Discharges to the Outfall from the LLLW treatment tanks occurred in all months. The total releases of Sr-90 and Cs-137 from the tanks in 2022 were 1.05E+06 Bq and 4.03E+06 Bq, respectively. These releases were only a fraction of the total Sr-90 (2.24E+07 Bq) and Cs-137 (8.20E+06 Bq) releases from the Outfall. There was good correlation between the patterns of releases from the tanks with the pattern of releases from the Outfall. Normally 1 to 3 tank volumes are discharged per month. However, due to the previously mentioned significantly higher precipitation in 2022, the number of discharged tanks increased in April, May, June, July and August to 7, 11, 6, 3, and 5, respectively. This led to a spike in radioactivity discharged

[6] The Control Ditch sample is collected from a location not influenced by CNL's operation, and therefore serves as an indicator of the natural background conditions in the area.

during these months. The additional Sr-90 and Cs-137 activities noted at the Outfall may be from pre-existing contamination in the storm drain system from historical site contamination events and historical radioactivity disposition in the storm drain line from Building 200 LLLW discharges. Some of this contamination may have been from unplanned emissions from the Hot Cells in the 1970’s, although more likely from the Building 200 drain line.

Note, all monthly releases from the Outfall were well below the administrative release levels of 1.18E+07 Bq/month for gross alpha, 9.39E+07 Bq/month for gross beta and 7.29E+09 Bq/month for tritium [7]. Releases of gross alpha were less than the 2021 releases and the five year average. Gross beta releases in 2022 were higher than the 2021 releases and less than the five year average. Sr-90 releases in 2022 were less than in 2021 and the five year average. The Cs-137 releases were less than the 2021 releases and the five year averages. Am-241 releases were less than 2021 releases, and the five year average. The total uranium releases were higher than in 2021 and the five year average. The relatively constant emissions of gross alpha, gross beta, Sr-90 and Cs-137 from the Outfall over the years suggest a constant source, more like contaminated piping than the effects of recent decommissioning activities. Pu-239/240 and Pu-238 releases were very low, being based on detection level concentrations (% of the DRL less than 0.2). In 2022, Outfall water was also analyzed for the presence of C-14, which could be introduced by the discharge tanks from Building 100. C-14 was below detection levels (varying from 1.03 to 1.52 Bq/L) in Outfall samples. Given that the DRL for C-14 is 7.67E+10 Bq/month, a detection limit of 1.52 Bq/L would correspond to a %DRL value of 0.21.

As stated above the Lagoon was discharged in October of 2022. In 2022 the lagoon contributed 14.6% to the total liquid discharges from the site. From 2016 till 2020, the Lagoon discharge contributed 3 to 23 percent of the total effluent discharge.

The averaged results for the two drainage ditches and control sample are shown in Table 26. The reported errors are the standard deviations of parameter values indicating their variability between different sampling events.

[7] An Administrative Level is a CNL internal reporting level for radioactive emissions by way of an individual effluent stream. The Administrative Levels are established and maintained by CNL to provide timely warning of above normal radioactive emissions, with the intent of aiding in the application of the ALARA process.

a Compliance with Guidelines for Canadian Drinking Water [37] may be inferred if the measurement for the gross alpha and gross beta are less than 0.5 Bq/L and 1.0 Bq/L, respectively. LLD is based on a 1 L sample resulting in less than 100 mg of sample ash and counted for 100 minutes.

b LLD = Lower Limit of Detection.

c Uncertainties are expressed as the standard deviation of the average activity of the processed samples.

During 2022, the gross beta activities in Ditches 8 and 9 were higher than in 2021. The 2022 gross alpha activities were higher in Ditch 8 and in Ditch 9 compared to 2021. The average gross beta values were similar to the control sample collected off of Highway 211, given the variability in their values. The gross alpha values were similar to the control ditch. The control sample is unaffected by CNL's operations. Compliance with the *Guidelines for Canadian Drinking Water Quality* [37] may be inferred for gross beta activity since the measurements are all less than 1.0 Bq/L. The gross alpha activity was below the drinking water screening level of 0.5 Bq/L for all samples. The local well waters within the Canadian Shield contain naturally occurring uranium [38] at levels ranging from 0.04 Bq/L to in excess of 2.5 Bq/L. Vertical flow occurs in the surficial Clay unit and in the intermediate Clay Till unit. The head gradient is upward leading the water in these layers to discharge to the surface. Naturally occurring uranium and its progeny are contributors to the total alpha activity, and could account for levels seen in some of the ditch water samples. In addition, naturally occurring alpha emitters may be present in suspended sediment in some of the samples.

As discussed in Appendix D of this report, the WMA contains a number of trenches with varying amounts of low-level radioactive and conventional waste. Tritium was identified as potentially capable of migrating to the ditches surrounding the WMA. The amounts measured in drainage Ditch 8 (4.9 ± 1.7 Bq/L) and Ditch 9 (6.2 ± 4.5 Bq/L) were not significantly different from that noted at the control location (4.1 ± 0.7 Bq/L). A number of ditches close to WMA are known to contain tritium. In 2022, the amount of tritium reaching the Ditch 8 and 9 locations was not significant. The tritium activities measured at all three ditch locations are much lower than the Guidelines for Canadian Drinking Water Maximum Acceptable Concentration for tritium (7000 Bq/L) [37].

Table 27 summarizes the data for releases of liquid effluents[8] for the years 2017 to 2022. The average monthly releases, expressed as a percent of the DRLs, are added for the various sources on site to provide a quantitative indicator of the performance of the site. The average total release for 2022 was 0.58 % of the DRL, which is higher than 2021 and the five-year average (0.54%). The main reason for the higher 2019, 2020, 2021 and 2022 liquid releases was an increase in the detection limit values for Am-241 and Pu-239/240, since both isotopes were below detection limits. The highest monthly release from the Outfall in 2022 was Pu-239/240 at 0.40 % of the DRL. The lagoon was discharged in 2022 October.

9.4.2 Unavailability of Effluent Verification Monitoring

The unavailability of effluent verification monitoring is determined for all on-line Environmental Protection Program monitors as follows:

- Absence of monitoring or monitoring results as a result of equipment failure, maintenance/calibration outages, or operator action requires “unavailability” to be assigned.
- Routine sample media changes on the monitoring equipment are not considered to be part of unavailability of the equipment.
- Unavailability criteria (see Table 28) for monitoring equipment on effluent streams with effluent rates that are normally ≥ 0.5% of weekly DRLs are set more stringent (for unplanned unavailability) than for those streams with normal effluent rates < 0.5% of weekly DRLs. Unavailability is expressed in hours of unmonitored effluent releases per year, and applies separately to each monitored parameter, on each effluent stream.

---

[8] The radioactivity from Ditches 8 and 9 was found to be below the Canadian Drinking Water Screening Level [37] for both gross beta and gross alpha activity, within the uncertainty of the analysis. Tritium levels were well below the Canadian Drinking Water Maximum Acceptable Level. The contributions were considered insignificant due to the small volume of release, and are not included in the liquid release table.

Table 27: Radionuclides in Liquid Effluents from WL – 2017 to 2022

a In 2018 monitoring for Outfall began for U-total, Pu-239/240 and Pu-238. In the Lagoon Pu-239/240 was calculated from gross alpha mass balance. The %DRL is reported for these isotopes instead of gross alpha. Note that Pu isotope activities are detection level values and Am-241 and Cs-137 activities are very close to detection levels.

b Gross beta releases are not included in the %DRL totals as the regulated components of the gross beta (Cs-137 and Sr-90) are already accounted.

Table 28: Effluents Monitoring Equipment Unavailability – 2022

	Unavailability Criteria[a]		Number of Exceedances
Air effluent streams with normal emission rate ≥ 0.5% of weekly DRL.	Planned	168 hours/year/stream	0
	Unplanned	84 hours/year/stream	0
Air effluent streams with normal emission rate < 0.5% of weekly DRL.	Planned	168 hours/year/stream	0
	Unplanned	288 hours/year/stream	0
Continuously monitored liquid effluent streams.	Planned	168 hours/year/stream	0
	Unplanned	288 hours/year/stream	0

a See Table 7 in 900-509200-STD-009.

Unavailability criteria (see Table 28) are set separately for planned and unplanned events.

Examples of planned unavailability include routine maintenance or inspections, and calibration activities, while unplanned unavailability includes events such as detection and repair of unexpected monitor or monitoring equipment failures.

In 2022, there were no instances in which the unavailability criteria (Table 28) outlined above were exceeded. In fact there were 0 hours of planned or unplanned unavailability of monitoring for air and liquid effluents. Had there been an instance of monitoring unavailability, an estimate of the release during unavailability would be calculated as per procedure (if the lost time is 5 percent or greater of the total monitoring interval).

9.4.3 Overall Performance

Figure 3 summarizes the data presented in Table 24 and Table 27 on site-wide airborne and liquid emissions, expressed as totals of percentages of DRLs (the lower rows of the tables) for the years 2017 to 2022. The average emissions for the past six years continue to be very small. Liquid emissions of radioactive material from WL in 2022 were below CNL's Administrative Levels and Action Levels, and continue to be very small compared with the applicable DRLs [33]. All air emissions were below CNL's Administrative Levels and Action Levels.

Total radioactive airborne emissions from the WL site during 2022 continue to be very low, averaging 0.00015% of the DRL, which is lower than 2021 and lower than the five year average.

Radioactivity in the WL liquid releases for 2022 was 0.58% of the DRL which is higher than in 2021 (0.45%) and the last five-year average (0.54%). The main reason for the higher 2019 to 2022 liquid releases was an increase in the detection limit values for Am-241 and Pu-239/240, since both isotopes were below detection limits. Pu-239/240, at detection limit values, was the primary contributor to the Outfall, averaging 0.18% of the DRL. Another factor for higher liquid releases in 2022 was the above average level of precipitation which increased the total amount of released radioactivity. The level of tritium activity noted in the two ditches carrying drainage from the WMA remains well below the Maximum Acceptable Concentration for Drinking Water.

The 2022 release results, as well as the previous years' trends, indicate that CNL has taken reasonable precautions to control the release of radioactive nuclear substances within the site, and into the environment, as a result of the licensed activity. All airborne and liquid release results are consistent with the clean-up and operational activities associated with decommissioning of the site.

The results of the monitoring program demonstrate that controls for the release of potentially hazardous substances currently in place at WL continue to provide substantial protection of the environment.

9.5 Effluent Monitoring – Non-Radiological

This section addresses the licence requirement on hazardous substances monitoring of liquid and airborne effluents for the WL site for 2022. It also fulfills similar effluent monitoring requirements listed under Work Package 1 of the *Environmental Assessment Follow-Up Program* [31].

9.5.1 Liquid Effluent Monitoring

9.5.1.1 Monitoring Points, Schedules, and Parameters

Whiteshell Laboratories staff members collect samples for non-radiological parameters from eight different monitoring points. The first four are the Lagoon at point of discharge to the Lagoon drainage ditch, the Outfall, the North drainage ditch (referred to as Ditch 8), and the West drainage ditch (referred to as Ditch 9). These effluents flow directly to the Winnipeg River. Two monitoring locations measure internal process wastes leaving the Low-Level Liquid Waste Treatment Systems (LLLWTS) from Building 300 and Building 100. The remaining two monitoring locations are used as background monitoring locations, and are the Intake water taken from the Winnipeg River at the Pump House (Building 902), and a control ditch on provincial Highway 211. More details for each monitoring area are provided in the sections that follow.

Referring to Section 9.4 of this report, Figure 2 shows the locations of the waste stream sources monitored, and where appropriate, their source or release points to the Winnipeg River. Ditch 8 meets the river some distance downstream (north) of the site boundary.

Table 29 lists the non-radiological parameters monitored at the inlet and effluent streams sampled, and the sampling schedule that is followed. The WL monitoring program follows the protocols from the Ontario Ministry of Environment [39] in its Municipal/Industrial Strategy for Abatement program. Under that system, parameters that are normally measured by the same analytical technique are grouped into numbered Analytical Test Groups. These are described in Table 30, which includes information about the Regulatory Method Detection Limit (RMDL), Laboratory Method Detection Limit (LMDL) and the Smallest Reporting Increment. The LMDL and Smallest Reporting Increment were decided following protocol. The WL monitoring program also meets the requirements set out in the Federal Wastewater Systems Effluent Regulations [40], and the standards from CSA N288.5-11, *Effluent Monitoring Programs at Class 1 Nuclear Facilities and Uranium Mines and Mills* [23].

Table 29: Schedule for Non-Radiological Monitoring at WL

ATG[a]	Parameter	Intake[b]	Lagoon	Outfall	Ditches 8, 9 & Control	LLLWTS Tanks

16	Chloroform	Monthly	-	Discharge	-	-	-
25	Oil & Grease	Monthly	Discharge	Discharge	Discharge	Discharge	Discharge

a ATG = Analytical Test Group; BOD = Biochemical Oxygen Demand; CBOD = Carbonaceous Biochemical Oxygen Demand; TSS = Total Suspended Solids.

b The Monthly = grab sample taken once within each month.

Intake water was sampled each month as grab-samples are drawn from the wet well of the Pump House (Building 902).

In 2022, there was one discharge of the Lagoon during the fall.

At the Outfall, daily monitoring and weekly samples are collected for non-radiological parameters.

The ditches are sampled only when water is flowing freely within them, and at a maximum frequency of once per week. This occurs after snowmelt or significant rainfall, of which there were twelve sampling events in 2022.

Whenever a tank was discharged at either of the LLLWTS, the effluent was sampled.

9.5.1.2 Analytical Protocol and Results Evaluation

With minor modification, the protocols for sample collection, and result reporting used here, are adopted from the Ontario Ministry of Environment publication *Protocol for the Sampling and Analysis of Industrial/Municipal Wastewate*r [39]. The protocols are used under Ontario's industry-specific effluent monitoring and limits regulations. The system supplies a justifiable set of methods to ensure that the final reported result is representative of the effluent sampled. Guidance is given on sampling of wastewater streams, sample handling including pre-treatment, and acceptable analytical techniques. Some of these are common to more than one parameter, so they are grouped into Analytical Test Groups, listed in Table 30. Ontario Ministry of Environment protocols were used again this year, as they have been historically. It should be noted that the Manitoba government has no such comprehensive protocols for sample collection, preservation, analyses, and result reporting.

Table 30: Listing of Analytical Test Groups

ATG	Parameter Name	Method[a]	Unit[b]	RMDL[c]	CNL LMDL[d]	CNL SRI[e]	Contracted Lab's LMDL

16	Chloroform	GC-MS	mg/L	--	--	--	0.0005
25	Oil & Grease	Gravimetry	mg/L	1	--	--	1.0

a The method ICP = Inductively Coupled Plasma Spectrometry. This is a common method for metals analysis.

b The unit MPNU = Most Probable Number Unit, as reported by accredited contract laboratory. The MPNU is a common estimate of bacterial counts, especially for sewage effluent.

c RMDL = Regulation Method Detection Limit

d The LMDL = Laboratory Method Detection Limit (“MDL” also used).

e The SRI = Smallest Reporting Increment.

9.5.1.3 Unavailability of Effluent Verification Monitoring

The unavailability of effluent verification monitoring is found for all on-line Environmental Protection Program monitors as follows:

- Absence of monitoring or monitoring results because of equipment failure, maintenance/calibration outages or operator action requiring “unavailability” to be assigned.
- Routine sample media changes on the monitoring equipment are not considered to be part of unavailability of the equipment.
- Unavailability criteria (see Table 28) are set separately for planned and unplanned events.

Examples of planned unavailability include routine maintenance or inspections, and calibration activities, while unplanned unavailability includes events such as detection and repair of unexpected monitor or monitoring equipment failures.

In 2022, there were no instances in which the unavailability criteria (Table 28) outlined above were exceeded. In fact there were 0 hours of planned or unplanned unavailability of monitoring for air and liquid effluents. Had there been an instance of monitoring unavailability, an estimate of the release during unavailability would be calculated as per procedure (if the lost time is 5 percent or greater of the total monitoring interval).

9.5.1.4 Monitoring Results

In the following sections, there are two types of presentation formats used in reporting the results obtained in 2022. These include an averages summary table and a comparison against the CNL's Monthly Guideline Acceptance criteria, for the effluent at identified monitoring locations.

9.5.1.4.1 Averages Summary Table

Summarized results for 2022 are presented in Table 31 through Table 35. The first two columns in the tables identify the Ministry of Environment ATG and parameter names [39]. The next three give the CNL monthly guideline concentration, LMDL (Table 30) and units for each measurement. The next six columns provide comparison of the average concentrations reported for the five previous years, followed by their arithmetic mean. The next seven columns have a summary of the results for the 2022 monitoring period (explained further below).

WL previously discontinued on-site analysis of most of the non-radiological parameters. The samples are now shipped to external ISO 17025 accredited laboratories through a sample management office. The LMDL for the laboratory analyzing the parameter is provided in Table 30.

Within the 2022 results section, the number of samples included in the average ("# Spl.") is reported. This number is not constant down the table. It depends on the sampling frequency chosen for each parameter, and sample mixing to prepare composites for analysis. The next column (labelled "ND's") gives the number of samples in which the analyte was not detected and was therefore deemed a "zero" result.

The minimum, maximum and average values of each parameter are based on individual results and not monthly averages. These results are given in the tables found at the end of the section, and include any results that were zero by virtue of being non-detectable in the laboratory. The relative standard deviation of all results is also reported, expressed as a percentage of the average. This number allows some evaluation of scatter inherent in the samples and measurement method. Usually, sample variability dominates (i.e., the effluent composition changes over time).

In Table 32 through Table 35, yearly average values for parameters marked with an asterisk show that a monthly guideline was exceeded for at least one month during the calendar year being presented.

For convenience, the total annual load to the environment (Winnipeg River) represented by each of the analytes is also presented, expressed in kilograms. The calculation process is described in detail in Section 9.5.1.5 (where the results for the Lagoon and Outfall monitoring points have been collected in Table 37, and compared to the previous five years).

a Monthly Guide is from WL's non-radioactive effluent limits procedure. For mercury, the Daily Guideline is given instead, as there is no Monthly Guideline specified.

b # Spl. is the number of samples analyzed and reported.

c NDs is the number of samples in which analyte was not detected (i.e., Code = "< DL", result = 0).

d RSTD = Relative Standard Deviation calculated using Vol Wt Average

e MPNU = MPN Units, as given by Most Probable Number bacterial estimation technique.

f The Lagoon discharges are considered to occur in two "months" – Spring and Fall. Note: There were no discharges in 2021 of the Lagoon.

g Geometric Mean actually used instead of Vol Wt average for this parameter, due to exponential growth of microbes

h Simple average actually, as this parameter is measured prior to the lagoon being permitted to discharge.

Notes: Any averages with an asterisk show that a monthly guideline was exceeded in one or more months for the given parameter in the year.

N/A Not Applicable.

Acute lethality test results are discussed in Section 9.5.1.4.5.1

--	Number of batches discharged			--	24	50	68	40	33	43	44						

a All results below the LMDL, originally flagged as "< DL" when reported, are only estimates.
b Averages were calculated by setting to zero results reported as "< DL."
c Monthly Guide is from CNL's limits for non-radiological parameters in liquid effluents procedure. For mercury, the Daily Guideline is given instead, as there is no Monthly Guideline specified
d # Spl. is the number of samples analyzed and reported.
e NDs is the number of samples in which analyte was not detected (i.e., Code = "< DL," result = 0).
f RSTD = Relative Standard Deviation
N/A not applicable
Notes: Any averages with an asterisk show that a monthly guideline was exceeded in one or more months for the given parameter in the year.
Discharges of effluent coming from the new low level liquid waste treatment systems are being combined, as it allows for comparisons to the data collected over the previous 5 years

9.5.1.4.2 Monthly Guideline Acceptance

CNL guidelines were used as the basis against which emissions from WL were evaluated. These guidelines are not regulatory requirements, but instead have been adopted by CNL to routinely evaluate the environmental significance of both process-type and non-process type discharges from WL. Table 36 supplies a summary of each of the liquid effluent parameters that had exceeded its CNL monthly guideline in 2022 or at any time during the previous five years.

As with the average summary table provided, for each monitoring point, the first two columns in the table identify the Ontario Ministry of Environment ATG and parameter names. The next three columns give the CNL monthly guideline concentration, LMDL, and the units of measurement. The next six columns present the monthly guideline acceptance for each of the five previous years and the average of those five years expressed as a percentage. The last three columns show the number of months during which discharges occurred, the number of times the monthly guideline was exceeded for each parameter, and the subsequent percent of times the parameter levels met the acceptance criteria.

To assess any significant level of change and evaluate program performance, this table will be referred to in each section discussing monitoring point results.

Table 36: Parameters that Failed to Conform to CNL Monthly Guidelines

						Monthly Guideline Acceptance (%) for Previous Five Years						Results for Year 2022		
Effluent Stream	**ATG**	**Parameter**	**Monthly Guide**	**LMDL**	**Unit**	**2017**	**2018**	**2019**	**2020**	**2021**	**Average**	**# Mth.**	**> Monthly Guide**	**Accept (%)**
LLLWTS /ALWTC	6	Phosphorus	1.0	0.003	mg/L	100	100	83	100	67	90	12	4	67
	8	TSS	25	1.0	mg/L	78	92	100	92	100	92	12	1	92
	9	Copper	0.5	0.0005	mg/L	67	33	42	58	83	57	12	1	92
	9a	Iron	1.0	0.010	mg/L	44	50	83	42	33	50	12	3	75
	9	Zinc	0.5	0.005	mg/L	100	100	100	100	92	98	12	0	100
	14	Phenolics	0.02	0.0010	mg/L	100	92	100	100	100	98	12	2	83
Outfall	8	TSS	25	1.0	mg/L	100	100	100	100	100	100	12	3	67
	9a	Iron	1.0	0.010	mg/L	100	100	100	100	100	100	12	4	67

Notes: Effluent stream parameters which have not exceeded a monthly guideline in the current year or in the previous five years have not been included to this table. Discharges of effluent coming from the new low level liquid waste treatment systems are being considered as emanating from the ALWTC, as it allows for comparisons to the data collected over the previous 5 years

9.5.1.4.3 Monthly Guideline Plots

For parameters that have a value higher than a CNL monthly guideline, the monthly plot of values is shown for that parameter at the monitoring point. This year there were 8 months when one of five parameters (Iron, Copper, Phosphorous, TSS, and Phenols) from the LLLWTS or the Outfall monitoring station had monthly values higher than CNL monthly guidelines. Figure 5 shows the number of times the monthly guidelines have been exceeded at any monitoring point over the last five years. Plots are displayed in Figure 6, Figure 7, Figure 8, Figure 9, Figure 10, Figure 11, and Figure 12 for each parameter, and the explanations for the observed high values can be found in Sections 9.5.1.4.5.2, and 9.5.1.4.6. The monthly or daily guideline limit for the parameter in question is shown by a broken red line in the corresponding figures.

9.5.1.4.4 Monitoring of Intake Water from Winnipeg River

Except for bottled drinking water, all the water needed to run the WL site is drawn from the neighbouring Winnipeg River at the Intake. The amount of water drawn from the Winnipeg River varies from year-to-year.

Grab-samples are collected each month from the Building 902 wet well to assess the levels of certain parameters that may be entering the site directly from the Winnipeg River. The measurements are summarized in Table 31, where they are compared to available data for the previous five years. Figure 13 shows the estimated amount of water used monthly for 2022.

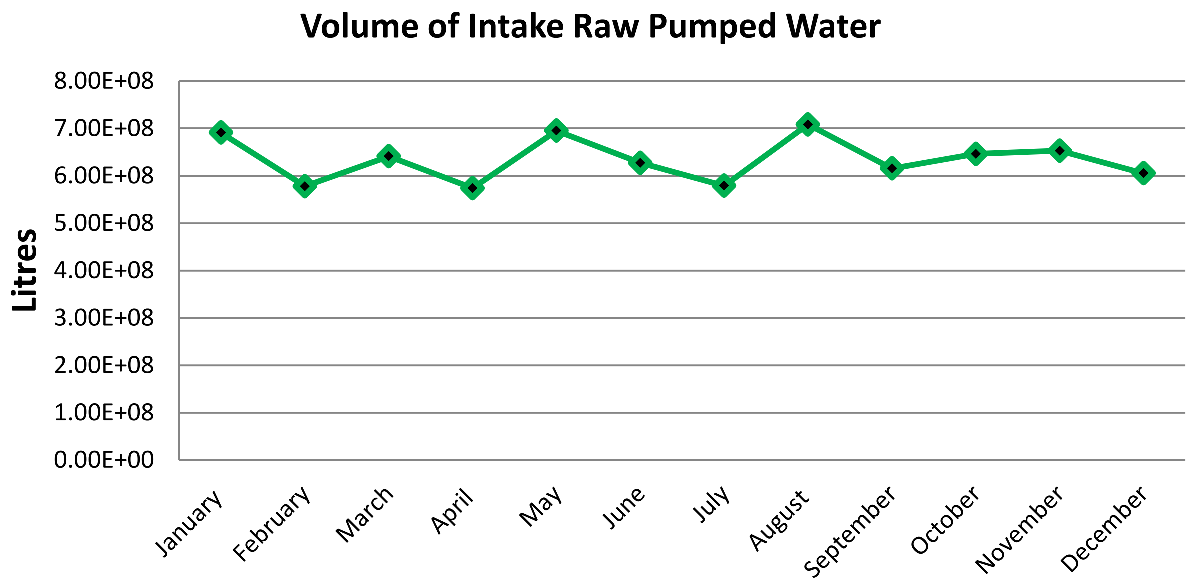

Figure 13: Monthly 2022 Intake Raw Pumped Water for the WL Usage

The following are notable points for the 2022 Intake water from the Winnipeg River:

- The Pump House flow meter recorded that 7.61E+06 m^3 of water was pumped from the river over the year. This is an increase of 5 times the previous five-year average. This increase is reflective of the water used during the demolition projects conducted over the winter of the 2021/2022 fiscal year to keep particulate generation down, a significant fire hydrant flushing campaign conducted by site operations, and a fire water line break that went undiagnosed during the winter months at the start of 2022.
- Compared to the five-year average, increased concentrations (> 10%) were seen for Phosphorous, TSS, Potassium, and Mercury. Mercury saw a 300% increase in the concentrations observed at the Intake.
- Parameters that had their concentrations decrease (> 10%) this year compared to the average seen for the last five years are Copper, Lead, Nickel, Zinc, and Bromodichloromethane.

Intake water results can have a significant impact on the environmental performance of the WL site and they will continue to be monitored closely.

9.5.1.4.5 Monitoring of Liquid Effluents to the Winnipeg River

Two effluent streams, the Lagoon and Process Outfall, discharge significant volumes of water to the Winnipeg River. Normal surface land run off also reaches the river through Ditches 8 and 9. Results from monitoring each of these sources are discussed below.

9.5.1.4.5.1 Lagoon

The WL Lagoon secondary cell was discharged in the fall of 2022. The total amount of effluent discharged from the Lagoon in 2022 was 4.15E+04 m^3.

Prior to discharge, the lagoon was tested for CBOD, fecal and total coliform bacteria, and acute lethality (a biological assessment on the survivability of trout in the proposed effluent). These samples are collected by the Lagoon operators at defined areas in the secondary cell after isolation of the secondary cell occurs, and will determine whether discharging the lagoon is permissible. During the actual lagoon discharge, grab-samples are collected close to the pipe emptying into the receiving ditch that leads to the Winnipeg River. Individual samples for most parameters are collected on a weekly basis during the discharge.

The vertical scale from which surface height is found was carefully adjusted to read absolute depth from the original floor of the Lagoon. This was done because the equation for calculating the contained volume in the secondary cell for any depth is derived from the calculation for the volume of a rectangular trapezoidal trough:

Volume (in L) = Height x [Width_Bottom x Length_Bottom
+ 0.5(Width-Width_Bottom) Length_Bottom
+ 0.5(Length-Length_Bottom) Width_Bottom
+ (1/3) (Width-Width_Bottom) (Length-Length_Bottom)]

Knowing the dimensions and geometry, the contained volume in the secondary cell can be calculated accurately for any depth using the following equation:

$$\text{Volume (in L)} = 636\,655{*}d + 206.886{*}d^2 + 0.02133{*}d^3 \text{ for depth “d” (in cm)}$$

The position of the Lagoon’s water surface would be recorded once or twice daily while emptying. The daily flow would then be calculated from changes in the contained volume. This permits the calculation of volume-weighted concentrations and overall loads (see Section 9.5.1.5). Volume-weighted averages for a given period (month or year) are given by summing the product of the concentration for each day multiplied by the volume released that day, then dividing that sum by the total volume discharged during the period. Unlike other monitoring points (which are continuous or batch releases of fixed volume), the Lagoon discharge flow rate can vary widely. The variation makes weighting corrections highly significant in deciding meaningful average concentrations.

Discharging of the secondary cell is only allowed to proceed after initial testing. Once discharging begins, the pH is checked daily throughout the discharge period.

Table 32 summarizes the results of the fall discharge. Some notable points are:

- The Lagoon was only discharged during the fall of 2022.
- There were no instances of CNL’s monthly guidelines being exceeded at the Lagoon.

- Compared to the five-year average, there was an increase in concentrations (> 10%) for CBOD, Total Residual chlorine, fecal coliforms, Conductivity, TSS, Copper, and Zinc.
- Compared to the five-year averages Unionized Ammonia, total coliforms, Iron, Nickel, and oil and grease, were all substantially lower (> 10% decrease).
- No signs of Chromium, Lead, Mercury, and Phenolics in the discharged effluent.
- No trout mortality was observed in the fall Lagoon effluent sample that underwent acute lethality testing.

The WL Lagoon discharge was compared against the limits set by the federal government in the Wastewater Systems Effluent Regulations in The Canadian Gazette [40]. The limits in force were met in all cases.

The results of the federally regulated parameters are indicated below:

- Carbonaceous Biochemical Oxygen Demand - annual volume weighted average was 8.2 mg/L, which is less than the 25 mg/L limit.
- TSS - annual volume weighted average was 5.2 mg/L which is less than the 25 mg/L limit.
- Un-ionized Ammonia - the volume weighted average concentration was 0.0002 mg/L which is less than the 1.25 mg/L limit.

9.5.1.4.5.2 Process outfall

The Outfall monitoring station functioned as expected during 2022. The total discharge volume was 1.45 GL. This volume is higher than the previous five-year average of 1.20 GL.

The Outfall discharges continuously. Measurements were performed on the samples weekly. This provided 52 samples of each parameter for the year.

Table 33 summarizes the results obtained in 2022, and compares them to averages for the previous five years. Notable results for the Outfall are:

- There were seven instances of CNL's monthly guidelines being exceeded at the Outfall monitoring station. Elevated TSS concentrations were observed in August through October, and elevated Iron concentrations were observed July through to October.
- The parameters that had a notable increase (> 10%) compared to the 5-year average were Total Organic Carbon, Phosphorus, TSS, Chromium, Iron, Lead, Magnesium, Nickel, Potassium, Sodium, and Mercury.
- The increased sediment loads entering the storm drain are responsible for the increases being noted. The increased sediment loads are a result of the demolition/construction work happening on site spreading soil and tearing up the landscape so increased soil erosion is happening on site. Annual street sweeping was not performed in the spring of 2022, however it has been recognized due to the increased sediment loads that street sweeping needs to be performed each spring going forward.

- The parameters that had a notable decrease (>10%) compared to the five-year average were Copper, Zinc, Bromodichlormethane, Chloroform, and Phenolics concentration levels
- Quarterly Acute Lethality Testing on the Outfall effluent was performed for three of the four quarters in 2022. All three samples came back showing no mortality on the rainbow trout tested. In Q2 the sample was collected and submitted to a contract laboratory, but a paper work error on CNL's end resulted in the sample not being analysed. Corrective action has been taken.
- Resulting from the Environmental Risk Assessment on the lagoon and landfill, the Environmental Management program began tracking Manganese in 2022, at the outfall monitoring station and the intake. The soils on the Whiteshell site are naturally elevated in Manganese, and it was noted as a parameter of concern. During the 2022 calendar year, this parameter's concentration exceeded the Action Level (a self-imposed operational control limit that signifies a potential loss of control from routine operations requiring the regulator to be notified) that was established for it, for the months of July through October. The cause of the increase has been attributed to the quantity of the sediments entering the storm drain.

9.5.1.4.5.3 Drainage Ditches

Much of the land surrounding key remote facilities at WL is drained by two structures. Ditch 8 drains the land north of the WMA up to the northern site boundary and beyond. Water from the landfill and recharge area on the east is diverted instead around the WMA to the west-flowing Ditch 9, and into the Winnipeg River. These ditches are monitored for radiological and non-radiological content. The radiological part is discussed in Section 9.4 of this report and the non-radiological part is discussed here.

Ditches 8 and 9 were grab-sampled each time water was flowing off-site. This was after heavy rainfalls, of which there were twelve sampling events from 2022 April to October. At these same times, a sample was collected from the northern ditch bordering Highway 211. This is far enough from CNL operations to be a reasonable background (Control). It was not possible to measure the flow rates at any of the locations, or to sample representatively over entire rain events; therefore, no loads can be calculated.

Comparisons are made to CNL guidelines (although they are intended for process discharges). All values were below CNL monthly guidelines in 2022. The measurement data are summarized in Table 34. The following are notable points for the 2022 ditches results:

- There were twelve sampling events for the ditches. However only ten samples were collected from ditch 8 as this ditch took longer to thaw in April.
- The sample events were equally influenced by the spring melt, and the subsequent rainfalls throughout the year.
- All concentrations remain well below the CNL's monthly guidelines.

- Phosphorus, TSS, Iron, Nickel, Zinc, Mercury, and Oil and Grease were the parameters that had a notable increase in concentration (>10%) compared to the previous five-year average for Ditch 8. The parameters that had a notable increase in concentration (>10%) compared to the previous five-year average for Ditch 9 were Phosphorus, TSS, Iron, Zinc, Mercury, and Oil and Grease. The parameters that had a notable increase in concentration (>10%) compared to the previous five-year average for the control ditch were TSS, Chromium, Copper, Iron, lead, Nickel, Mercury and Oil and Grease.
- Metal concentrations detected are very close to the detection limit, so a slight increase seen in the concentrations has a significant percentage increase being observed in Ditch 8 and Ditch 9.
- The five year average for Phosphorus in Ditch 9 was higher this year due to the limited sampling in the fall. It is not uncommon for the spring melt to observe elevated Phosphorus concentrations due to the decaying vegetation from the previous fall. Typically these results are balanced out with the concentrations observed later in the calendar year, but there was minimal rain events where sufficient flow was observed in the fall. As the majority of the sampling events occurred from April-June, the result for Phosphorous were higher than previous years.
- All parameters measured in Ditch 8 and Ditch 9 are comparable to those measured within the Control Ditch, indicating that WL had negligible effects on the environment through these two pathways.
- For the month of July Ditch 9 did have elevate levels of Iron being noted in the water, but a similar trend of greater magnitude was also noted in the Control ditch for that month as well, because of this no further investigation was performed for Ditch 9.

It should be noted that sediment control measures were put in place for projects in the WMA in 2022, as was the case in previous years.

9.5.1.4.6 Internal Liquid Discharge Monitoring

Building 300 and Building 100 both have a LLLWTS; each system represents a major area that generated low-level radioactive liquid wastes. Individual tank releases are monitored for operational control purposes.

A full tank must be emptied while a second tank is being filled. When full, tanks are sampled; if the pH and radioactivity levels meet discharge criteria, they are discharged. The LLLWTS tank pre-discharge criteria do not include all parameters listed in CNL's non-radiological guideline limit values; however, the post-discharge analysis includes all these parameters. CNL staff have determined, through historical data analysis from post-discharge samples, if the pH in the tank is adjusted to neutral, all other parameters will normally meet the guideline limit values. All post-discharge data is reviewed to ensure this process is working as intended, and program requirements are met. All effluents pass through a 5-micron bag filter to the Process Outfall, leading via the Outfall to the Winnipeg River.

The tanks in the new system have a smaller holding capacity so the frequency of discharges has increased. The new system was designed with a shorter life span in mind than the earlier system that was employed by CNL. This was done to align with the decommissioning schedule being implemented by CNL. Discharging requires a day or less to complete, and can be more gradual if needed.

Grab-samples are taken after the filter, and at the beginning of each release from the individual tanks. Measurements are performed on the effluent of each discharge to measure pH and conductivity. For other analytes, grab-samples are collected and analyzed by a designated laboratory to complete the characterization of the effluent being discharged.

In regards to monitoring the non-radiological parameters of the effluent for this reporting period, discharges of the new systems are being compared to the discharges from the ALWTC that was used in previous years. This allows for comparisons of the previous 5-years of effluent to continue to be made, as the effluent streams emanating from the Research and Development (R&D) Complex in Building 300 and Building 100 are similar enough that a comparison is worthwhile.

In 2022, 0.12 ML was discharged from the LLLWTS.

The weighted averages of the joint releases from the LLLWTS are presented in Table 35 and monthly plots for the parameters that exceed the monthly guidelines as indicated in Table 36 are in Figure 6, Figure 7, Figure 8, Figure 9, and Figure 10 .

The following are notable results for 2022:

- None of the monthly exceedances that occurred at the LLLWTS resulted in exceedances being observed at the Outfall monitoring location downstream in the process. All exceedances that occurred at the Outfall are observed in different months than the exceedances observed in the LLLWTS for TSS and Iron.
- There were increases (> 10%) in average conductivity reading, when compared to the previous five-year average.
- Except for pH, all other parameter concentrations were noticeably less than the observed five year average. The pH average was comparable to the five year average.
- The Iron concentration coming from the LLLWTS exceeded the CNL monthly guidelines three times (February, March, and November). The overall Iron concentration seen for the year is lower than the previous 5-years. The Iron exceedances for February and March are related to soil, likely entering the system through the decontamination center’s boot and respirator washers, based on the fact elevated TSS concentrations are also observed in these months, which aligns with the demolition work occurring on site. The cause of November’s exceedance is unknown.
- The TSS concentration coming from the LLLWTS exceeded the CNL monthly guidelines a single time in 2022 (March).
- The Copper concentration coming from the LLLWTS exceeded the CNL monthly guidelines a single time in 2022 (February). Frequent exceedances are being seen in relation to the

new tank systems that were installed in Building 300 as a decision was made to use copper piping in the new system instead of the stainless steel that was used in the old system. As soon as the new tanks were commissioned and used, the copper concentrations of the generated effluent noticeably increased to the guideline limit, but the concentration seen at the Outfall is still well below the monthly guideline limits.

- The Phenols concentrations exceeded the monthly guideline twice in 2022 (March and October). No cause has been identified for the increase.
- The Phosphorus concentration in the Building 300 effluent has returned to normal from last year's doubling. The phosphorus concentration still exceeded the CNL monthly guideline limit four times throughout the calendar year (January, September, October, and November). No cause has been identified for the exceedances.

9.5.1.5 Loading Calculations

For the Lagoon, the volume-weighted average concentration of a parameter was calculated as follows:

1. The measured concentration for each day was averaged with that of the next day;
2. The average was multiplied by the estimated volume discharged over the 24-hour period;
3. The products for all days were summed, then;
4. The resulting sum was divided by the total volume released during the period (Spring, Fall or entire year). The load was then given as the product of the calculated volume-weighted average concentration, multiplied by the total volume for the period.

At the Outfall, the total discharge volume for each month was multiplied by the monthly average concentration of the parameter.

Table 37 shows the results from the calculations described above, grouped by parameter and by final outflow source. All mass-related parameters are shown. The table also compares them to previous years, and to the five-year averages.

Note that LLLWTS discharges are not included here, as they are reflected in the Outfall loads, and ditches are also not included as lack of flow data prevents their calculation.

When examining the WL site total loads, notable results are:

- CBOD, Organic Carbon, Phosphorus, TSS, Iron, Lead, Nickel, Potassium, Sodium, Strontium, Uranium, Zinc, and Mercury are the parameters that had a load increase greater than 10% when compared to the five-year average.
- The majority of the increase is related to the large amount of soil and sediments that made it into the storm drain system over the 2022 calendar year. The Iron and TSS loads increased by approximately 400 %. See Section 9.6 for more information.
- Un-ionized Ammonia, Total Residual Chlorine, Chromium, Phenolics, Bromodichloromethane, and Chloroform all had notable decreases of 10% or more in their loads when compared to the 5-year average.

Table 37: Loading for the Current Year and Previous Five Years

ATG	Parameter	Monitoring Point	Loadings from Previous Five Years (kg) [a]						Results for Year 2022

a Averages were calculated by setting to zero results reported as “< DL.”
b # Spl. is the number of samples analyzed and reported.
c NDs is the number of samples in which analyte was not detected (i.e., Code = “< DL”, result = 0).

9.5.2 Airborne Effluent Monitoring

Airborne emissions from the WL site are compiled on an annual basis for the purpose of reporting under the National Pollutant Release Inventory (NPRI) and the federal Greenhouse Gas (GHG) report. These emissions are also recorded for trending and improvement purposes. Radiological releases are covered in Section 9.4 of this report. Only non-radiological releases to the air will be covered in the following sections.

9.5.2.1 Fuel Use for Building Heating

Historically, the main stationary source for non-radiological emissions to air from the WL site was the Powerhouse which supplied district heating to various buildings on the site (see Figure 2). Starting in 2013, use of, and emissions from Number 2 fuel oil heating operations at the Powerhouse, ceased due to the completion of building conversions to either propane or electrical heating. Subsequently, a substantial increase was seen for cleaner burning propane used on site. Table 38 presents WL heating fuel consumption from 2017 to 2022. Fuel consumption continues to trend downward (see Section 9.7.2 and Figure 14).

Table 38: Fuel Use for Building Heating from WL

		Data for Previous Five Years						Data for 2022
Parameter	**Unit**	**2017**	**2018**	**2019**	**2020**	**2021**	**Average**	
Fuel Burned								
Number 2 Fuel Oil	L	0	0	0	0	0	0	0
Propane	L	287,982	209,158	243,268	190,372	160,159	218,188	172,865
Energy Released								
Number 2 Fuel Oil[a]	TJ	0	0	0	0	0	0	0
Propane[b]	TJ	7.827	5.685	6.612	5.1743	4.3531	5.9303	4.6985
Total	**TJ**	7.827	**5.685**	**6.612**	**5.1743**	**4.3531**	**5.9303**	**4.6985**
Heating Demand								
Heating Degree Days	HDD	5,403	5,855	6,079	5,615	5,233	5,637	6,064

a Energy released calculated from consumption at 3.868E-05 TJ/L for Number 2 fuel oil.

b Energy released calculated from consumption at 2.718E-05 TJ/L for propane

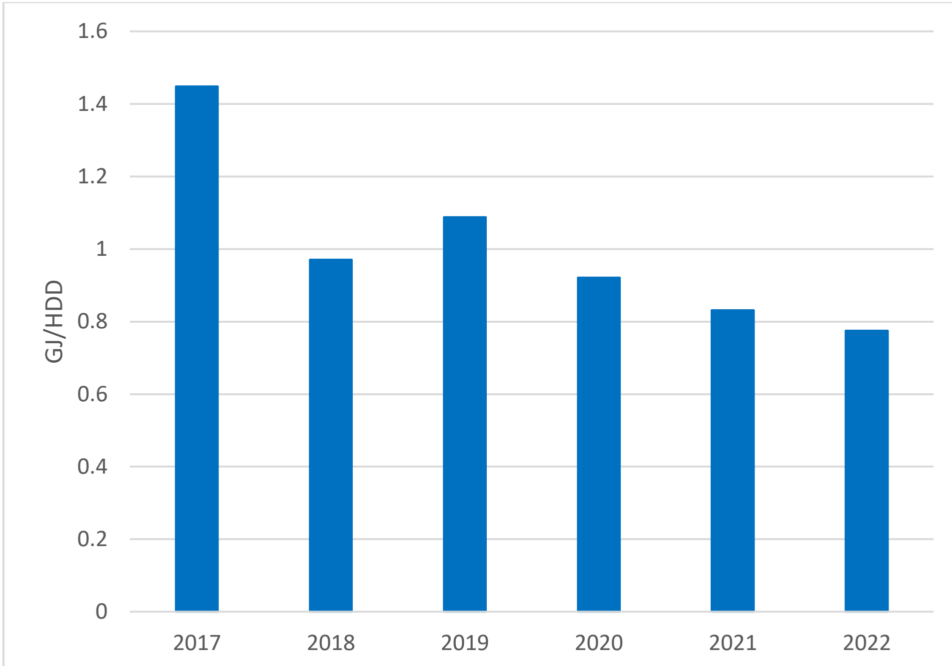

Figure 14: Annual Heating Energy Use from Fossil Fuels (per Heating Degree Days)

9.5.2.2 Reporting Under the National Pollutant Release Inventory

Under the authority of the *Canadian Environmental Protection Act*, 1999 [41], WL currently calculates releases of Part 4 substances for the NPRI program, using government reporting guidelines [42]. These releases to air include emissions caused by burning of Number 2 fuel oil and propane for heating (as discussed above), as well as diesel fuel used from site generators, dust emissions from unpaved roads, and excavation projects.

Emission factors are applied to fuel consumption data, as well as estimated kilometres travelled on unpaved roads, to determine the amount of Criteria Air Contaminants (CACs) that are generated on site. Criteria Air Contaminants consist of carbon monoxide, oxides of nitrogen, sulphur dioxide, total (filterable) particulate matter (PM), and particulate matter below 10 microns (PM10), particulate matter below 2.5 microns (PM2.5), and Volatile Organic Compounds. Dust emissions from excavation projects were estimated based on a calculation for total particulate matter generated per excavation day. Dust generated from demolition activities in 2022 will be captured in the *2022 Progress Report on the Environmental Assessment Follow-up Program for Whiteshell Laboratories* [31]. Table 39 outlines the annual CACs generated from site activities, and shows a large increase in emissions seen in 2022 compared to the 5-year average for the values for total particulate matter, PM10, and PM2.5. This is a result of CNL not applying any dust suppressant to the gravel road ways in 2022. As a result the Whiteshell site has reached the reporting thresholds for the generation of all types of particulate matter. This includes total particulate matter, PM10 and PM2.5. In previous years, Whiteshell would only need to report on PM10. Whiteshell Laboratories intends to continue to apply dust suppressant in future years.

Table 39: Stationary Combustion Data and Emissions from WL

Parameter	Unit	Data for Previous Five Years						Data for 2022	NPRI Reporting Threshold
		2017	2018	2019	2020	2021	Average		
Airborne Emissions									
NO_x (as NO_2)	Mg	0.753	0.536	0.621	0.602	0.331	0.569	0.485	20
SO_2	Mg	0.020	0.014	0.016	0.017	0.005	0.014	0.014	20
CO	Mg	0.348	0.233	0.271	0.256	0.162	0.254	0.202	20
Total Particulate Matter	Mg	13.651	14.562	10.574	8.883	8.174	11.17	46.9	20
PM_{10}	Mg	3.499	3.726	2.712	2.281	2.091	2.862	11.97	0.5
$PM_{2.5}$	Mg	0.376	0.391	0.292	0.249	0.218	0.305	1.21	0.3
Volatile Organic Compounds	Mg	0.059	0.042	0.049	0.048	0.026	0.045	0.038	10

9.5.2.3 Greenhouse Gas Emissions

Under the authority of the *Canadian Environmental Protection Act*, 1999 [41] WL must report releases under the GHGs emissions notice [43] providing the facility emits over 10,000 tonnes of carbon dioxide equivalent or more within the calendar-year.

Greenhouse Gas emissions from WL include carbon dioxide, methane, and nitrous oxide. Emissions are primarily from the burning of propane, the use of diesel generators, the on-site transportation fleet, the on-site landfill, and open-pit wood burning. They are measured in CO_2 equivalent tonnes which is a measure used to compare between gases that have different Global Warming Potential. Table 40 outlines the GHG emissions from the WL site for the last six years. These emissions from the site have decreased significantly from 2020. This decrease can be attributed to the decrease in propane needed to heat the site, however when compared to 2021, there was a slight increase in emissions as there was an increase in the number of heating degree days (i.e., increased demand for building heat based on temperature) as shown in Table 38. Overall, greenhouse gases in 2022 are 26% less than the average for the last 5 years.

Table 40: WL Site Greenhouse Gas Emissions

Parameter	Releases from Previous Five Years						2022 Releases
	2017	2018	2019	2020	2021	5-yr. Avg.	
GHG CO_2e tonnes	1,873	1,678	1,756	1,692	1,177	1,635.2	1,215

Note: GHG CO2e tonnes - A unit of measure used to compare between gases that have different Global Warming Potential. For example, the Global Warming Potential for methane is 25. This means that emissions of one metric ton of methane is equivalent to emissions of 25 metric tons of carbon dioxide.

9.5.2.4 Halocarbons

In the atmosphere, halocarbons contribute both to global warming and to ozone depletion, via separate mechanisms. Losses of halocarbon refrigerants and fire suppressants are reported semi-annually to Environment and Climate Change Canada, following the Federal Halocarbon Regulations [44]. All releases greater than 10 kg are considered reportable.

As seen in Table 41, there were no reportable releases of halocarbons in 2022.

Table 41: Halocarbon Losses from WL

			Losses from Previous Five Years (kg)					Losses in 2022	
Type	Global Warming Potential[b]	Ozone Depleting Potential[c]	2017	2018	2019	2020	2021	Number of Losses	Annual Loss (kg)
Refrigerants[a]									
CFC (R-11)	4,600	1	0	0	0	0	0	0	0
CFC (R-12)	10,600	1	0	0	0	0	0	0	0
CFC+HCFC (R-502)[d]	4.1	0.28	0	0	0	0	0	0	0
HCFC (R-22)	1,700	0	0	0	0	0	0	0	0
HFC (R-134a)	1,300	0	12.47	0	0	0	31.8	0	0
Fire Suppressants									
Halon (R-1301)	6,900	10	0	0	0	0	0	0	0

a CFC = Chlorofluorocarbons; HCFC = Hydrochlorofluorocarbons; HFC = Hydrofluorocarbons
b Global Warming Potential per unit mass, compared to CO2 = 1.00
c Ozone Depleting Potential per unit mass, compared to CFC R-11 = 1.00
d The data for the CFC+HCFC(R-502) is from [44]

9.5.3 Overall Performance

The non-radiological effluent monitoring program set up by CNL continues to supply valuable information about the potential impacts of operations on the Winnipeg River, and thus the local environment.

There were notable increases (>10%) in the loadings being released in the effluent to the Winnipeg River, and with the amount of particulate generated in the air. See Section 9.6 for more information.

There were four months (July –October) when CNL monthly guideline limits were exceeded at the Outfall for the parameters of TSS and Iron for a total of seven exceedances. The Whiteshell environmental program investigation is attributing these occurrences to the amount of soil/sediments that were able to make their way into storm drain system on site.

The Whiteshell site also reached the reporting threshold for the generation of all types of particulate matter this includes total particulate matter, PM_{10} and $PM_{2.5}$. In previous years, Whiteshell would only need to report on PM_{10}.

There were no discharges from the Lagoon in 2022 which exceeded any of the current CNL monthly guideline limits.

9.6 Regulatory Limit Exceedances and Contamination Incidents

There were no Regulatory Limit exceedances in 2022. However, there was one reportable event made to the CNSC regarding an Action Level being exceeded at the Outfall Monitoring Station for Manganese (July through October). The event was discovered and reported in 2023 for the 2022 event. As discussed in Section 9.5.1.4.5.2, increased sediment loads entering the storm drain were responsible for the exceedance due to not performing street sweeping in the spring of 2022, however it has been recognized due to the increased sediment loads that street sweeping needs to be performed each spring going forward.

9.7 Discussion of Improvement Initiatives

The following sections describe some of the ongoing efforts the WL site is undertaking to enhance the effluent verification monitoring program.

9.7.1 Monitoring Site Intake Water and Outfall Effluent

In 2020, the WL site expanded the monitoring program to encompass additional parameters at the site’s Intake and Outfall monitoring station. This expansion resulted from the enhanced monitoring that was performed on the Intake and the Outfall in 2019 to address the gaps in baseline data when assessed against the monitoring criteria in Table 19-1 of the *WL Effluent Verification Monitoring Plan* [28]. It was decided that when there was a 20% change in concentration when comparing the results for a given parameter at the Intake and Outfall, that these parameters would be incorporated in the effluent verification monitoring program.

Under this criteria, Total Organic Carbon, Strontium, Uranium, Magnesium, Potassium, Sodium, and the volatiles Bromodichloromethane, Chloroform and Toluene have been added to the list of parameters being measured at these stations. In 2022, the parameter of Toluene was dropped again from the monitoring requirements for the Intake and the Outfall Monitoring station, as both 2020, and 2021 yielded nothing but non-detects on all submitted samples.

In 2022, Manganese was added as a parameter to be monitored at the Intake and Outfall. This parameter is being reported on for 2022 as it has been identified as a contaminant of concern, through the Environmental Risk Assessment that was performed on the Lagoon and Landfill, as elevated levels of Manganese were found in the surrounding soils.

Although the need to monitor for these parameters is currently captured in *WL Effluent Verification Monitoring Plan* [28], WL laboratories acknowledges that the plan needs to be updated to reflect that these parameters are actively being monitored, and plans to revise Reference [28] in 2023.

9.7.2 Reducing Energy Use from Fossil Fuels

The largest quantity of non-radiological effluents to air comes from burning fossil fuels, to heat the site buildings. Starting in 2013, use of and emissions from Number 2 fuel oil heating operations at the Powerhouse ceased due to the completion of building conversions to either propane or electrical heating.

Figure 14 shows the annual fossil energy consumption since 2016, relative to the number of Heating Degree Days in each year. Heating Degree Days are calculated for each day as the difference between 18°C and the median ambient temperature.

From Figure 14, it is apparent that energy use has started to stabilize and any further reductions will be resulting from final closure of site buildings, reducing or removing their heating supply. In 2022, it was the first year where Buildings 305 and 402 no longer were heated as demolition activities for these building began in 2021, and carried over to 2022.

9.8 Environmental Assessment Follow-Up and Monitoring

Details about the Environmental Assessment Follow-Up and Monitoring Program are discussed in the *2022 Progress Report on the Environmental Assessment Follow-Up Program for Whiteshell Laboratories* [31] (to be issued to the CNSC by 2023 June 30).

10 Emergency Management and Fire Protection

10.1 Emergency Preparedness Program

Whiteshell Laboratories adheres to CNL's Emergency Preparedness Functional Support Area. See Section 10.1 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

Whiteshell Laboratories Emergency Preparedness continues to adapt to the changes on site, including the demolition of buildings/assets, the construction of temporary structures, the number and composition of staffing levels, and the organisational structure. Vacated buildings are transitioned from detailed building emergency procedures to construction/demolition specific emergency placards. The *WL Site Emergency Response Plan* [45] is being updated to reflect necessary changes in the Officer-In-Charge program, and re-working content to reflect current site and staff realities, and will be implemented in 2023.

Planning for and responding to COVID-19 gradually declined over 2022 and should not be a primary focus of the Emergency Preparedness Functional Support Area at WL in 2023.

10.1.1 Drills and Exercises

As COVID-19 restrictions were reduced over 2022, the focus of WL's Emergency Preparedness shifted to reviewing program documentation, as the drills and exercises are based on the program documentation. The decrease in COVID-19 risks across the province also resulted in renewed interest in joint training from some key external response partners. WL plans to take full advantage of this in the coming year.

As COVID-19 restrictions were reduced over 2022, the focus of WL's Emergency Preparedness shifted to ensuring all program documentation was compliant and still appropriate for the current and forecast condition of the site. This documentation forms the basis from which the exercise and drill campaign is run. The decrease in COVID-19 risks across the province also resulted in renewed interest in joint training from some key external response partners. WL plans to take full advantage of this in the coming year.

In 2022, a total of 127 exercises and drills were conducted at WL. Training

There were changes to the Emergency Operations Centre (EOC) staff in 2022, with new alternates being added to positions where the alternates had resigned or been promoted to active positions. Training will be offered at the earliest convenience. Work is underway to alter the building emergency team composition, with training and implementation to occur in 2023. Personnel in active positions are fully trained.

Table 42 provides details on the number and type of the exercises and drills conducted in 2022.

10.1.2 Training

There were changes to the Emergency Operations Centre (EOC) staff in 2022, with new alternates being added to positions where the alternates had resigned or been promoted to active positions. Training will be offered at the earliest convenience. Work is underway to alter the building emergency team composition, with training and implementation to occur in 2023. Personnel in active positions are fully trained.

Table 42: WL Emergency Preparedness Exercises – 2022

Type of Drill or Exercise	Number Completed in 2022
Fire Drills	9
Site-wide Specialty Drills	86
Table Top Exercises [a]	1
Targeted Communication Exercise	17
Site-wide Communication Exercise	12
Field Exercises (Functional)	2

a Table Top exercises include EOC skill workshops and EOC teaching sessions. Each workshop focuses on a unique aspect of EOC operations.

10.1.3 Status of Emergency Resources and Facilities

Whiteshell Laboratories maintains a physical EOC, and conducts monthly tests of the technical equipment stored for use in that location. Repairs, improvements, and updates are requested as required and when identified. All checks were completed in 2022. A cache of emergency food rations is also maintained at WL, which have a five year shelf life. The rations were replaced in 2019. The cache is stored in a secure location and the condition of the cases is checked annually.

10.1.3.1 Emergency Operation Center

As part of WL's EOC framework, there are two teams of EOC staff, and an alternate person for each of the team positions that can be engaged to cover for members of either team. These two teams operate on a two week on-call rotation. There was also an alteration to the structure of the team, with one function being removed from the mandatory attendance list as the focus of that function was more on the field operations than the work of the EOC. EOC documentation was updated to reflect this change.

There were no emergency events requiring activation of the EOC in 2022.

10.1.3.2 Mobile Nuclear Laboratory

Canadian Nuclear Laboratories continues to maintain the Mobile Nuclear Laboratory for response both on-site and off-site. The unit continues to be maintained by WL Radiation Protection staff and is inspected at a regular interval to maintain control of inventory and equipment.

There were no emergency events requiring the activation of the Mobile Nuclear Laboratory in 2022.

10.1.3.3 Equipment Checks

Respirators make up the majority of the equipment in the strategically placed emergency cabinets that remain on-site. These cabinets are opened and inspected monthly by Radiation Protection staff. Once a satisfactory inspection is complete, the cabinets are re-sealed and signed off by the inspector. All scheduled checks were completed in 2022.

There were no emergency events requiring the use of this equipment in 2022.

10.1.3.4 Public Address System

The Public Address system is the primary system used for communicating emergency events to WL employees. The system functioned normally in 2022.

10.1.3.5 EOC Notification System

WL continued to use the Everbridge mass notification system in 2022. The system continues to perform very well, with a 100% coverage for all monthly communication tests for the fourth year in a row. The monthly tests include only the on-call members for the EOC team.

In addition to these regularly scheduled monthly drills, WL continues to conduct random quarterly drills. These drills are scheduled for random times and dates, involving weekends, evenings, and work hours. These random drills include the expanded EOC teams, including all alternates and non-routine staff. Table 43 identifies the response rates of the 2022 WL EOC Staff to the Quarterly Random EOC call out drills, with an average of 91% response. Only responses received within an hour of the notification being sent out are considered a positive response; the rest are considered ‘no response’.

Table 43: WL EOC Random Quarterly Communication Tests: 2022

	Q1	Q2	Q3	Q4
Response Percentage	95%	95%	75%	100%

10.1.4 External Collaborations

In 2022, contact was maintained with a variety of external emergency response/management organizations and interested public groups. Due to COVID-19 many of these were once again virtual meetings or connections. WL Emergency Preparedness:

- Engaged with Pinawa Volunteer Fire Department in the fall. A recent change in the department’s management has created a renewed interest in joint training and exercises. The first joint exercises is currently being planned and will be run in 2023.
- Participated in the Manitoba Provincial Flood and Forest Fire forecasting sessions in the spring.

- Continued to participate in the Manitoba Municipal Relations Governance COVID-19 teleconference meetings in early 2022, at which time the province ceased these meetings.
- Engaged with the Ontario Office of Emergency Management to reach out to the community emergency planners and responders along the potential shipping path of radioactive material shipments in Northern Ontario. A virtual information session was held with the planning district representatives on responding to accidents that involve radiological materials.
- WL Emergency Preparedness attended the Northern Ontario Fire Conference as a tradeshow member in an effort to connect with first responders in the area and raise awareness on potential responses involving radioactive material shipments on the regions highways.
- Continued to communicate with the Federal Coordination Working Group via email, helping to maintain relationships with multiple federal agencies including (but not limited to) Public Safety Canada, the Royal Canadian Mounted Police, Health Canada, Department of Defence, Public Health Agency of Canada, and Environment & Climate Change Canada. These relationships continue to be leveraged to support organizational project and response planning at WL.
- The Prairie Region Federal Coordination Working Group did not meet virtually or in person in 2022. There was a large amount of staff changes for the Winnipeg Public Safety Canada office this year, who facilitate these meetings. WL has been in contact with the new team and an orientation visit to the WL site is scheduled for early 2023.

10.1.5 Unplanned Emergency Events

There were no incidents requiring initiation of the WL Site Emergency Plan in 2022.

10.2 Fire Protection Program

Whiteshell Laboratories adheres to CNL's Fire Protection Functional Support Area. See Section 10.2 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

Whiteshell Laboratories maintains a comprehensive fire program with fire inspection, project fire screenings and assessments, alarm systems and an equipped 24/7 response force.

There was one reportable event connected to the fire program at WL in 2022 related to fire detection system verification testing (see ImpAct ERM-22-3469 in Table 7). The annual third party fire detection system verification testing was conducted two months late due to scheduling conflicts arising with the contractor. An alternate vendor was selected to carry out the testing in December, bringing the site back into alignment with the annual testing requirement.

10.2.1 Fire Response Drills

In 2022, WL conducted all seven fire drills that are an annual requirement in accordance with the National Fire Code of Canada [46] and CSA standard N393-13 Fire Protection for Facilities that Process Handle, or Store Nuclear Substances [47]. There were no findings associated with the fire drills in 2022.

10.2.2 External Collaborations

The 2019 Fire Protection Service Agreement between Whiteshell Laboratories and the Town of Pinawa remains in effect. Interdepartmental training was interrupted by the COVID-19 pandemic, and by personnel challenges at the Pinawa Fire Department. These issues were resolved at the end of 2022, and arrangements are being made to resume joint training and exercises in early 2023.

10.2.3 Third Party Audits & Inspections

Preparations began this year to engage a qualified third party consultant to assess the fire response capabilities at WL through an exercise. This exercise and assessment will meet the requirements of CSA N393-13, *Fire Protection for Facilities that Process, Handle, or Store Nuclear Material Substances* [47], which requires a third party Fire Protection Audit to be conducted once every three years. It is expected that the contract will be in place and the exercise run in spring of 2023.

10.2.4 Fire Hazard Analysis

A third party fire hazard analysis was conducted in 2022 for all nuclear facilities in alignment with a corrective action plan sent to the CNSC. Associated nuclear facility’s assessments will be completed in subsequent years as per the submitted corrective action plan.

11 Waste Management

11.1 Waste Management Program

Whiteshell Laboratories adheres to CNL's Waste Management Functional Support Area. See Section 11.1 of the *Annual Compliance Monitoring Report for Canadian Nuclear Laboratories* for details [1].

The Waste Management Program continues to provide effective and efficient delivery of Waste Management services.

Significant activities for the Waste Management Program in 2022 included:

- Continued to refine and communicate the Integrated Waste Strategy to integrate waste lifecycle management across all CNL-operated sites and to capture the CNL baseline waste strategies and defined pathways for all CNL wastes.
- Collaboration between CRL and WL sites to effectively disposition radioactive wastes, leading to the advancement of remediation and transportation projects.
- Enhanced support to existing activities and new activities in support of the new schedule for the WL Restoration Project. The support improved segregation protocols and ensured continued adherence to waste processes.

The waste acceptance criteria for the waste receiving facilities on-site (including the Waste Handling Area and the WMA storage facilities) remained unchanged for 2022.

11.1.1 Waste Management Operations

Radioactive, clean and hazardous wastes were generated from both ongoing operational activities and decommissioning projects. The packaged solid radioactive wastes were stored in designated storage facilities in the WL WMA depending on the hazard level and packaging, as well as dispositioned to CRL for storage.

Demolition of Buildings 402 and 305 was completed in 2022. A total of 1,852 m^3 clean waste was generated in 2022; 906 m^3 of concrete material was dispositioned to an off-site receiver for future re-use, 24 m^3 of metal was recycled, while 899 m^3 of asbestos-containing material, 11 m^3 of polychlorinated biphenyl (PCB) contaminated materials and 11 m^3 of construction and demolition waste was dispositioned to appropriate off-site waste receivers.

Volumes of radioactive wastes (201 m^3 of low-level waste (LLW) and 77.5 m^3 of intermediate-level waste (ILW)) generated from the demolition of Building 200 Active Liquid Waste Treatment Centre in 2021 remain safely stored in certified transportation packages within the demolition Controlled Area. The 77.5 m^3 of ILW consists of a former intermediate level liquid mixing tank. To enable its consignment as a Surface Contaminated Object, accessible areas of the tank (which were created from collecting several coupons for characterization purposes) must be made inaccessible. This work is expected to be completed in 2023. The 201 m^3 of LLW is planned for dispositioning to CRL in 2023.

De-inventorying efforts of legacy waste stored in LLW Bunker 5 continued. Wastes are undergoing additional qualification and inspection to ensure transportation and waste criteria compliance are met. This activity has generated 430 m^3 of LLW to date, of which approximately half of this volume has been safely shipped to CRL, with the remaining volume safely stored in certified transportation packages awaiting shipment to CRL in 2023.
