NUCLEAR RESEARCH AND TEST ESTABLISHMENT DECOMMISSIONING LICENCE

WHITESHELL LABORATORIES

I) LICENCE NUMBER: **NRTEDL-W5-8.00/2024**

II) LICENSEE: Pursuant to section 24 of the *Nuclear Safety and Control Act*, this licence is issued to

Canadian Nuclear Laboratories Ltd
Laboratoires Nucléaires Canadiens Ltée
286 Plant Road
Chalk River, Ontario
K0J 1J0

III) LICENCE PERIOD: This licence is valid from January 1, 2020 and remains in effect until December 31, 2024 unless otherwise suspended, amended, revoked or replaced.

IV) LICENSED ACTIVITIES:

This licence authorizes the licensee to:

a) operate and decommission the Whiteshell Laboratories (hereinafter “WL”) located in Pinawa, Province of Manitoba as further described in the Whiteshell Laboratories *Licence Conditions Handbook* (LCH) ,

b) produce, possess, process, refine, transfer, use, package, manage, and store the nuclear substances that are required for, associated with or arise from the activities described in a),

c) possess, use, produce and transfer prescribed equipment that is required for, associated with, or arises from the activities described in a),

d) possess, use and transfer prescribed information that is required for, associated with, or arises from the activities described in a),

e) carry out the site preparation, construction or construction modification or undertaking that is required for, associated with or arise from the activities described in a).

V) EXPLANATORY NOTES:

(i) Nothing in this licence shall be construed to authorize non-compliance with any other applicable legal obligation or restriction.

(ii) Unless otherwise provided for in this licence, words and expressions used in this licence have the same meaning as in the *Nuclear Safety and Control Act* and associated Regulations.

(iii) The Whiteshell Laboratories Licence Conditions Handbook (LCH) provides compliance verification criteria used to verify compliance with the conditions set out in this licence, including information regarding delegation of authority and applicable versions of documents and a process for version control of codes, standards or other documents that are used as compliance verification criteria.

VI) CONDITIONS:

G GENERAL

G.1 The licensee shall conduct the activities described in Part IV of this licence in accordance with the licensing basis, defined as:

(i) the regulatory requirements set out in the applicable laws and regulations;

(ii) the conditions and safety and control measures described in the facility's or activity's licence and the documents directly referenced in that licence; and

(iii) the safety and control measures described in the licence application and the documents needed to support that licence application;

unless otherwise approved in writing by the Canadian Nuclear Safety Commission (hereinafter "the Commission").

G.2 The licensee shall give written notification of changes to the facility or its operation, including deviation from design, operating conditions, policies, programs and methods referred to in the licensing basis.

G.3 The licensee shall maintain a financial guarantee for decommissioning that is acceptable to the Commission.

G.4 The licensee shall implement and maintain a public information and disclosure program.

1 MANAGEMENT SYSTEM

1.1 The licensee shall implement and maintain a management system.

2 HUMAN PERFORMANCE MANAGEMENT

2.1 The licensee shall implement and maintain a human performance program.

2.2 The licensee shall implement and maintain a training program.

3 OPERATING PERFORMANCE

3.1 The licensee shall implement and maintain an operating program, which includes a set of operating limits.

3.2 The licensee shall implement and maintain a program for reporting to the Commission or a person authorized by the Commission.

4 SAFETY ANALYSIS

4.1 The licensee shall implement and maintain a safety analysis program.

4.2 The licensee shall implement and maintain a nuclear criticality safety program.

5 PHYSICAL DESIGN

5.1 The licensee shall implement and maintain a design program.

5.2 The licensee shall implement and maintain a pressure boundary program.

6 FITNESS FOR SERVICE

6.1 The licensee shall implement and maintain a fitness for service program.

7 RADIATION PROTECTION

7.1 The licensee shall implement and maintain a radiation protection program, which includes a set of action levels. When the licensee becomes aware that an action level has been reached, the licensee shall notify the Commission within seven days.

8 CONVENTIONAL HEALTH AND SAFETY

8.1 The licensee shall implement and maintain a conventional health and safety program.

9 ENVIRONMENTAL PROTECTION

9.1 The licensee shall implement and maintain an environmental protection program, which includes a set of action levels. When the licensee becomes aware that an action level has been reached, the licensee shall notify the Commission within seven days.

10 EMERGENCY MANAGEMENT AND FIRE PROTECTION

10.1 The licensee shall implement and maintain an emergency preparedness program.

10.2 The licensee shall implement and maintain a fire protection program.

11 WASTE MANAGEMENT

11.1 The licensee shall implement and maintain a waste management program.

11.2 The licensee shall implement and maintain a decommissioning plan.

12 SECURITY

12.1 The licensee shall implement and maintain a security program.

12.2 The licensee shall complete the implementation of all security arrangements as outlined in the corrective action plan: *Implementation Plan: Tiered Response Force (TRF)* 119-508710-PLA-010, no later than May 1, 2020

13 SAFEGUARDS AND NON-PROLIFERATION

13.1 The licensee shall implement and maintain a safeguards program.

14 PACKAGING AND TRANSPORT

14.1 The licensee shall implement and maintain a packaging and transport program.

SIGNED at OTTAWA, DEC 1 9 2019.

Rumina Velshi, President
on behalf of the Canadian Nuclear Safety Commission

CANADA

CONSOLIDATION

Canadian Environmental Assessment Act, 2012

[Repealed, 2019, c. 28, s. 9]

NOTE

[Enacted by section 52 of chapter 19 of the Statutes of Canada, 2012, in force July 6, 2012, *see* SI/2012-56.]

Current to June 19, 2024

Last amended on August 28, 2019

Published by the Minister of Justice at the following address:
http://laws-lois.justice.gc.ca

CODIFICATION

Loi canadienne sur l’évaluation environnementale (2012)

[Abrogée, 2019, ch. 28, art. 9]

NOTE

[Édictée par l’article 52 du chapitre 19 des Lois du Canada (2012), en vigueur le 6 juillet 2012, *voir* TR/2012-56.]

À jour au 19 juin 2024

Dernière modification le 28 août 2019

Publié par le ministre de la Justice à l’adresse suivante :
http://lois-laws.justice.gc.ca

OFFICIAL STATUS OF CONSOLIDATIONS

Subsections 31(1) and (2) of the *Legislation Revision and Consolidation Act*, in force on June 1, 2009, provide as follows:

Published consolidation is evidence

31 (1) Every copy of a consolidated statute or consolidated regulation published by the Minister under this Act in either print or electronic form is evidence of that statute or regulation and of its contents and every copy purporting to be published by the Minister is deemed to be so published, unless the contrary is shown.

Inconsistencies in Acts

(2) In the event of an inconsistency between a consolidated statute published by the Minister under this Act and the original statute or a subsequent amendment as certified by the Clerk of the Parliaments under the *Publication of Statutes Act*, the original statute or amendment prevails to the extent of the inconsistency.

CARACTÈRE OFFICIEL DES CODIFICATIONS

Les paragraphes 31(1) et (2) de la *Loi sur la révision et la codification des textes législatifs*, en vigueur le 1er juin 2009, prévoient ce qui suit :

Codifications comme élément de preuve

31 (1) Tout exemplaire d'une loi codifiée ou d'un règlement codifié, publié par le ministre en vertu de la présente loi sur support papier ou sur support électronique, fait foi de cette loi ou de ce règlement et de son contenu. Tout exemplaire donné comme publié par le ministre est réputé avoir été ainsi publié, sauf preuve contraire.

Incompatibilité — lois

(2) Les dispositions de la loi d'origine avec ses modifications subséquentes par le greffier des Parlements en vertu de la *Loi sur la publication des lois* l'emportent sur les dispositions incompatibles de la loi codifiée publiée par le ministre en vertu de la présente loi.

LAYOUT

The notes that appeared in the left or right margins are now in boldface text directly above the provisions to which they relate. They form no part of the enactment, but are inserted for convenience of reference only.

MISE EN PAGE

Les notes apparaissant auparavant dans les marges de droite ou de gauche se retrouvent maintenant en caractères gras juste au-dessus de la disposition à laquelle elles se rattachent. Elles ne font pas partie du texte, n'y figurant qu'à titre de repère ou d'information.

NOTE

This consolidation is current to June 19, 2024. The last amendments came into force on August 28, 2019. Any amendments that were not in force as of June 19, 2024 are set out at the end of this document under the heading "Amendments Not in Force".

NOTE

Cette codification est à jour au 19 juin 2024. Les dernières modifications sont entrées en vigueur le 28 août 2019. Toutes modifications qui n'étaient pas en vigueur au 19 juin 2024 sont énoncées à la fin de ce document sous le titre « Modifications non en vigueur ».

E-DOCS-#: 3884369 (WORD)
E-DOCS-#: 3990749 (PDF)

Summary

Atomic Energy of Canada Limited (AECL) is in the process of decommissioning the Whiteshell Laboratories (WL) facility in accordance with Nuclear Research and Test Establishment Licence no. NRTEDL-08.01/2018, issued by the Commission for a ten-year term valid from January 1, 2009 to December 31, 2018.

CNSC staff are updating the Commission, as requested, with respect to AECL's performance and compliance with CNSC regulatory requirements. This report covers the period from January 1, 2009 to December 31, 2011.

CNSC staff's assessment concludes that AECL is decommissioning and operating the licensed facility in compliance with CNSC regulatory requirements, and the continued decommissioning and operation of the facility does not pose unreasonable risks to the health and safety of persons, the environment, and national security.

This CMD is for information only. No action is requested from the Commission in this regard.

Résumé

Énergie atomique du Canada limitée (EACL) est en train de déclasser l'installation des Laboratoires de Whiteshell conformément au permis d'exploitation d'établissement de recherche et d'essais nucléaires n° NRTEDL-08.01/2018, délivré par la Commission pour une période de dix ans, soit du 1er janvier 2009 au 31 décembre 2018.

Le personnel de la CCSN tient au courant la Commission, à la demande de celle-ci, en ce qui concerne le rendement d'EACL et de sa conformité aux exigences réglementaires de la CCSN. Le présent rapport couvre la période du 1er janvier 2009 au 31 décembre 2011.

L'évaluation effectuée par le personnel de la CCSN permet de conclure qu'EACL déclasse et exploite l'installation autorisée conformément aux exigences réglementaires de la CCSN et que la poursuite du déclassement et de l'exploitation de l'installation ne présente aucun risque inacceptable pour la santé et la sécurité des personnes et de l'environnement ainsi que pour la sécurité nationale

Ce CMD est fourni à titre d'information seulement. Aucune mesure n'est demandée par la Commission dans ce dossier.

Directorate of Nuclear Cycle and Facilities Regulation

Directeur général par intérim de la

Direction de la réglementation du cycle et des installations nucléaires

TABLE OF CONTENTS

EXECUTIVE SUMMARY

Atomic Energy of Canada Limited (AECL) operates the Whiteshell Laboratories, a Class IB nuclear facility under a research and test establishment decommissioning licence located near the town of Pinawa, Manitoba, licence no. NRTEDL-08.01/2018 [1]. The licence was issued for a ten-year period commencing on January 1, 2009 to December 31, 2018.

As per the Commission's request [2], CNSC staff and the licensee are required to submit two interim status reports at the three and seven-year points in the licensing period reviewing the performance of the licensee with regard to decommissioning activities. This report summarizes AECL's performance with regard to key Safety and Control Areas (SCAs) since the licence was issued.

A separate CMD (CMD 12-M47.A), which is confidential, includes information on AECL's performance related to security.

The summary table below lists the rating for the AECL performance in the applicable Safety and Control Areas.

Functional Areas	Safety and Control Areas	Rating
1. Management	1.1 Management System	SA
	1.2 Human Performance Management	SA
	1.3 Operating Performance	SA
2. Facility and Equipment	2.1 Safety Analysis	SA
	2.2 Physical Design	SA
	2.3 Fitness for Service	SA
3. Core Processes	3.1 Radiation Protection	SA
	3.2 Conventional Health and Safety	SA
	3.3 Environmental Protection	SA
	3.4 Emergency Management and Fire Protection	SA
	3.5 Waste Management	SA
	3.6 Security	FS
	3.7 Safeguards	SA
	3.8 Packaging and Transport	SA

Note: SA = Satisfactory, FS = Fully Satisfactory (For definitions of ratings refer to Addendum E)

CNSC staff concludes that AECL continues to decommission WL in compliance with its licence, the *Nuclear Safety and Control Act*, and the *Regulations* made under the *Act*.

1 OVERVIEW

1.1 Background

The facility operated for about 40 years as a nuclear research and test establishment, first under operating licences issued by the Atomic Energy Control Board (AECB), and since coming into force of the NSCA under operating licenses issued by the CNSC. Based on its decision to discontinue operations at WL, AECL applied for a licence to decommission the facility in 2002.

The Commission issued Nuclear Research and Test Establishment Decommissioning Licence NRTEDL-02.00/2008 to AECL in December 2002, following a two-day Public Hearing. The six-year licence was valid from January 1, 2003 to December 31, 2008.

Following a one-day Public Hearing, the Commission renewed AECL's Nuclear Research and Test Establishment Decommissioning Licence, NRTEDL-08.00/2018, in December 2008 for a ten-year licensing period.

This CMD reviews the period from January 1, 2009 to December 31, 2011, with the inclusion of some additional information occurring in 2012.

1.2 Facility Overview

Atomic Energy of Canada Limited (AECL) owns and manages Whiteshell Laboratories (WL). The nuclear research and test establishment is located on the east bank of the Winnipeg River, about 100 km northeast of Winnipeg, and about 10 km west of the town of Pinawa. The WL site encompasses an area of 4,375 hectares. The facility is comprised of a number of nuclear and non-nuclear facilities and activities, including the Whiteshell Reactor (WR-1), the Shielded Facilities (SF), the liquid and solid radioactive waste management facilities, and various research laboratories. Aerial views of the facility are illustrated in Figures 1 and 2.

1.2.1 Decommissioning Status

In 2006, WL became a part of the Nuclear Legacy Liabilities Program (NLLP), which is part of the Federal Government's long-term strategy to deal with the nuclear legacy liabilities at AECL sites. Through this program, an accelerated approach to decommissioning was introduced. Addendum A provides a decommissioning long-term timeline and a comparison table (Addendum B) of the decommissioning status for buildings at WL facility at three time points: the beginning of the licence (January 1, 2009), the current status and the end of the licensing period (December 31, 2018).

During the review period, AECL's decommissioning activities included the demolition of redundant non-nuclear buildings; continued decommissioning of Building 300 (Research & Development Complex); and the construction of enabling facilities and remediation of existing buildings, such as the construction of the Shielded Modular Above Ground Storage (SMAGS) building and the remediation of Shielded Facilities (SF) area to support decommissioning activities. Additionally, AECL is currently replacing the central oil-fired heating system with an electrical heating system.

Of the major facilities that were operated on the site, the Van de Graff Accelerator and the Neutron Generator were fully decommissioned during the previous licensing period. The WR-1 reactor at WL is permanently shutdown, de-fuelled and partially decommissioned. The facility continues to be monitored and maintained by AECL staff. Decommissioning of the WR-1 reactor is currently scheduled in 2024 (See Addendum A)

The SF includes the Hot Cell Facility and the Immobilized Fuel Test Facility (IFTF). With the decommissioning and removal of the warm cells, the additional floor space within the SF was re-designated for the waste handling area to support the newly constructed SMAGS.

Building 300, the Research and Development Complex, housed more than 170 labs and approximately 400 office spaces, mechanical rooms, and a high bay area for large-scale engineering projects. This facility is being decommissioned and demolished in seven stages reflecting how the facility was constructed. The process for decommissioning Building 300 is following seven main steps: operational shutdown, active drain system removal, dismantlement and decontamination, active ventilation system removal, release survey, demolition and site remediation. While five of the seven stages of Building 300 will be operational at the end of the licensing period, decommissioning and demolition of stages 4 and 7 is planned to be completed (See Addendum B).

All eight redundant Non-nuclear Buildings at WL have been decommissioned and demolished during the current licensing period. The remaining buildings are still operational and will be decommissioned following the WR-1 Reactor decommissioning (See Addendum B).

As part of the enabling facilities at WL, AECL has constructed the SMAGS building in the Waste Management Area (WMA). AECL commenced operation of the SMAGS with the acceptance of its first waste package on April 24, 2012. Additionally, within the WMA, AECL has constructed a Soil Storage Compound for the increased volumes of low-level contaminated soil generated from decommissioning the WL site. The current layout of the WMA is illustrated in Figure 3, with the exception of the Soil Storage Compound, which is located across from Building 431.

As previously mentioned, to improve the efficiency of the heating system for the non-redundant buildings at WL, AECL reconfigured the heating system from oil to electricity. Approximately 60% of the central oil-fired heating system has been converted to stand-alone electric heating systems. The transition from oil to electricity allows for advanced decommissioning of the central oil-fired heating plant, which includes boilers, storage tanks and distribution piping.

1.3 Licensing Status

The Commission issued a 10-year licence [1] to AECL, valid from January 1, 2009 to December 31, 2018, following a one day Public Hearing on November 5, 2008 [3]. To date, one licence amendment has been made, occurring in April 2010. CNSC staff plan to change the format of the WL licence and introduce a Licence Condition Handbook at the next major amendment.

In April 2010, the licence was amended [4] to:

1. change the submission dates for the annual reports to align with the AECL Chalk River Laboratories (CRL) operating licence, and;
2. correct two errata in the appendices of the licence, as they were outdated and not representative of the facility and its conduct of operations.

These changes were considered administrative in nature, and amendments were made through an abridged hearing resulting in the current licence, NRTEDL-08.01/2018. To date, AECL has applied for additional licence amendments. This is currently in the process for an abridged hearing.

1.4 Follow-up from November 2008 Renewal

At the renewal hearing, CNSC staff reported the quality assurance program developed over the licence period met requirements, but the implementation of the program was below expectations. Subsequent to CNSC staff review of AECL's corrective action plan and verification of activities during the 2009 inspection follow-up, CNSC staff provided status updates [5][6] to the Commission in March and May of 2010 with the conclusion that AECL progressed in the implementation of the corrective actions, and the rating was satisfactory. The rating of the Management System SCA remains satisfactory (See Section 3.1).

2 MATTERS FOR CONSIDERATION

2.1 CNSC Compliance plan

The compliance plan consists of compliance inspections, review of operations reports, review of reportable events and other occurrences that are reported to CNSC staff outside of any formal reporting requirements.

Based on a facility's relative risk, CNSC staff has established baseline compliance activity plans for all nuclear facilities. These plans include the minimum number of compliance inspections to be conducted by CNSC staff at each facility. In accordance with this plan, CNSC staff conduct routine inspections at WL on a semi-annual basis. Safeguards and security inspections are also conducted at the facility to verify compliance with applicable regulatory requirements. Additionally, an audit follow-up of the quality assurance program and implementation for WL was conducted in 2009. The results of the inspections conducted during the review period are provided in the applicable Safety and Control Areas, in Section 3.0 of this CMD.

2.2 Relevant Safety and Control Areas

As part of the CNSC continuous improvements in its regulatory processes, this CMD incorporates the new Safety and Control Areas (SCA). There are now fourteen SCAs. Each SCA is comprised of a specific area of regulatory interest. However the detailed requirements associated with each SCA vary between facility types. Addendum C, "Safety and Control Framework", contains further information about SCAs. Addendum D maps the new SCAs framework compared to the Safety Areas framework that was applied in previous CMDs for AECL-WL.

2.3 Other Matters of Regulatory Interest

The following table identifies other matters of regulatory interest and their relevance to this CMD. Relevant areas are further discussed in Section 4.0 of this document.

Other Matters of Regulatory Interest	
Area	**Relevance to this CMD**
Environmental Assessment	No
CNSC Consultation - Aboriginal	Yes
CNSC Consultation - Other	No
Cost Recovery	Yes
Financial Guarantees	Yes
Improvement Plans and Significant Future Activities	No
Nuclear Liability Insurance	No
Licensee's Public Information Program	Yes

3 GENERAL ASSESSMENT OF SCA'S

In previous licensing CMDs for this facility, CNSC staff rated both the licensee's program and the continuing implementation. In this CMD, CNSC staff rate performance of the programs which were approved at the last licensing hearing. The current rating is based on information from all compliance activities including reviews of annual reports, compliance inspections, and reviews and assessments of other licensee submissions. Addendum E, Rating Levels, provides a definition for the rating levels used by the CNSC.

The rating for 2012 has not been included in each of the 14 SCA trending tables. However, the licensee continues to demonstrate performance in 2012 that is consistent with the 2011 ratings provided.

3.1 Management System

The following table indicates the overall performance for Management System over the review period. This area was addressed at the licence renewal under SCA Quality Management. The current rating level is SATISFACTORY (SA).

Management System				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	BE	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

Subsequent to the licence renewal in 2008, the Commission requested CNSC staff to provide an update on the status of the Quality Assurance (QA) program and implementation following CNSC staff's review in 2009. This was to address the deficiencies resulting from the QA Audit, and the Below Expectations rating of the Decommissioning Quality Assurance (QA) Program implementation.

In June 2010, CNSC staff concluded, through documentation review and an inspection follow-up, that AECL had made progress in the implementation of the accepted Corrective Action Plan (CAP) to ensure an improved safety performance at AECL WL. The rating of the program implementation improved to Satisfactory.

All directives and action notices relating to the 2008 QA Audit at WL have been closed. CNSC staff concluded that the licensee has established and effectively implemented a record control process, for all records associated with decommissioning activities that complies with the QA requirements of the CSA Standard N286.6-98: *Decommissioning Quality Assurance for Nuclear Power Plants.*

In May 2011, AECL revised the Facility Authorization (FA) documents and submitted these to CNSC staff. CNSC staff reviewed the documentation and determined that the functional responsibilities defined were not clearly and completely documented in the revised documents for all positions pertaining to the licensee's organization, a requirement of the CSA N286.6-98 standard. These are minor in nature and do not introduce any elevated risk or reduce the integrity of the QA program. CNSC staff instructed AECL to address the review findings in the next revision of the FA documents.

Conclusion

Based on the information presented above, CNSC staff conclude that the AECL's Decommissioning QA program, as established and implemented, continues to meet CNSC requirements.

3.2 Human Performance Management

The overall compliance performance with regard to Human Performance Management is shown in the table below. This area was not addressed as a stand-alone area at the licence renewal, but was considered satisfactory under Quality Management and Radiation Protection. The current rating is SATISFACTORY (SA).

Human Performance Management				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	SA	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

During the October 2011 Type II Compliance Inspection at WL, CNSC staff reviewed the training procedures and records relating to the AECL Corporate Training Plan for new employees in Decommissioning and Waste Management. The review of training records indicated that WL has an established training program and process to ensure that new WL staff or contractors are trained prior to conducting work at WL.

AECL has in place a corporate wide Human Performance Program (HPP) which is followed at WL. During compliance inspections, CNSC staff have confirmed that the appropriate program elements are being followed.

Improvements

AECL has implemented a fire fighter physical fitness program for the evaluation of fire fighters as part of overall fitness for duty.

Conclusion

Overall, CNSC staff are satisfied with the Human Performance Program and its implementation at WL.

3.3 Operating Performance

The following table indicates the overall performance for Operating Performance over the review period. This area was addressed at the licence renewal under SCA Decommissioning Performance. The current rating level is SATISFACTORY (SA).

Operating Performance				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	SA	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

As previously mentioned, CNSC staff conducted semi-annual inspections under its baseline compliance program. The CNSC inspections confirmed programs, procedures, and work plans for the decommissioning and operations at WL remain in place. No issues relating to safety related systems were identified during the inspections. However, weaknesses in overall housekeeping were noted and subsequently corrected to the satisfaction of CNSC staff.

CNSC staff had reviewed the WL Annual Safety Reports for the review period. AECL has satisfactorily addressed all of CNSC staffs comments and recommendations relating to the 2009 ASR. CNSC staff continue to check that future versions of the annual report reflect staff comments.

All AECL facilities have transitioned to the use of the Improvement Action (ImpAct) process for internal reporting of issues since 2007. Reporting culture improved with the implementation of this process and provided AECL an opportunity for trending and continuous improvement in operations. Hence, over the reporting period, there was an increase in reportable events to CNSC, as depicted in the following table. Along with the improved reporting culture, contributing to the increase in 2010 were around the security alarm system, maintenance, and the aging fire protection systems hardware, as noted in Section 3.10 of this report.

Table 1: Reportable Events at WL 2009 - 2011

Year	Number of Reportable Events
2009	6
2010	24
2011	10

CNSC staff has reviewed the reportable events and the associated corrective action plans. All of which are closed to CNSC staffs satisfaction, and at no time was there an impact to the health and safety of the public, workers or the environment.

Decommissioning performance as assessed by radiation dose to workers (Section 3.7), and effluent releases and environmental monitoring (Section 3.9), indicates that decommissioning programs and controls are adequate and being implemented.

Conclusion

AECL had adequately addressed CNSC staffs concerns resulting from the baseline compliance inspections and review of annual compliance reports. CNSC staff are satisfied with AECL’s operating performance during the review period.

Further, CNSC staff conclude that AECL has operated the Whiteshell Laboratories facility safely, in accordance with the Act, regulations and the licence, while meeting the requirements of their program and procedures.

3.4 Safety Analysis

The overall compliance performance with regard to Safety Analysis is shown in the table below. This area was not addressed as a stand-alone area at the licence renewal, but was considered satisfactory under Fire Protection and Nuclear Criticality Safety. The current rating is SATISFACTORY (SA).

Safety Analysis				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	SA	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

Fire Hazard Assessment

At the renewal hearing, CNSC staff reported the licensee's Fire Hazard Assessment (FHA) for Building 300 (B300) met regulatory requirements, subject to the completion of AECL's CAP. AECL has since completed the actions identified in the CAP. CNSC staff conclude they have met the regulatory requirements.

Safety Analysis Reports

In April 2012, AECL began operation of the SMAGS Building for the storage of low and intermediate level waste (L&ILW). As required in the licence for the operation of a newly constructed nuclear facility, AECL submitted the Safety Assessment Report (SAR): Safety and Hazard Assessment for the SMAGS Facility at WL. Following CNSC staff's review, the licensee was notified to have met the requirements of the licence, and the operation of the SMAGS facility provided adequate protection to the health and safety of persons, workers and the environment.

Following the events at the Fukushima site in Japan CNSC requested all Class I nuclear facilities review the lessons learned and re-examine the safety case. AECL identified no significant gaps for the WL facility, thus adequately addressing the request from CNSC. However, AECL identified areas for improvement to update the WL safety case documentation to current standards. Following this, AECL reported to have scheduled the revision of all AECL SAR`s based on a priority ranking system. During the review period, AECL began the revision of the SF SAR and the WMA SAR, with the submission of these documents to CNSC staff in 2013.

Nuclear Criticality Safety

As reported at the licence renewal, there remains no activities associated with fissionable material at WL, other than storage of used fuel in the Concrete Canister Storage Facility (CCSF), which AECL and CNSC staff consider to be low-risk and low priority. In October 2010, AECL reported the removal of all fissionable material from *Building 418: Fissionable Materials Storage*. This action reassigned the function of the building from a Nuclear Criticality Controlled Area to a non-nuclear building, as currently in the licence amendment application. CNSC staff confirmed the removal of this material as part of the baseline compliance inspections at WL in October 2011.

The Nuclear Criticality Safety (NCS) Program at AECL is a corporate-wide program, and is the process used at WL and CRL. As reported at the renewal and through AECL's NCS Program schedule for revising the current Criticality Safety Documents (CSD), AECL has provided CNSC staff with temporary limits to be used as the Upper Sub-critical Limits (USL) until all CSDs are revised to include explicit USLs. CNSC staff has reviewed the temporary USLs and concluded they are consistent with CNSC regulatory requirements.

Improvements

As mentioned, AECL has developed a corporate-wide *Nuclear Criticality Safety Program* set of documents in accordance with the Regulatory Commitments. Further, AECL has completed the initial stage of implementation, to establish the requirements of the NCS Program.

Outstanding Actions and Future Plans

Based on AECL's risk-graded approach, the licensee continued to progress with the NCS Program requirements. Semi-annual updates are provided to the CNSC on the NCS Program progress and target dates.

Conclusions

Through desktop review, CNSC staff conclude that AECL has satisfactorily addressed the CAP for the B300 FHA.

With respect to nuclear criticality safety, CNSC staff conclude that AECL's update of the CSDs will lead to a consistent and gradual implementation of the nuclear criticality requirements at WL, which are based on modern national and international standards.

3.5 Physical Design

The overall compliance performance with regard to Physical Design is shown in the table below. This area was not addressed as a stand-alone area at the licence renewal, but was considered satisfactory under decommissioning performance and quality management. The current rating is SATISFACTORY (SA).

Physical Design				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	SA	SA	SA	SA

The discussion and conclusion for this SCA are provided in the following subsections.

Discussion

As reported to CNSC staff through the annual safety report, changes to the WL facility are controlled as per the *Engineering Change Control* procedure, which has been adopted from the CRL process.

Shielded Modular Above-Ground Storage (SMAGS) Building

The WL SMAGS building is a new storage building, which was designed based on the *2005 National Building Code of Canada (NBC)*. The SMAGS building consists of precast concrete walls on a slab-on-grade foundation, designed for low-level radiation shielding with specific design requirements for assuring waste containment of solid low-level radioactive waste material at the WL site.

AECL has provided a systematic examination of failure modes for the SMAGS facility systems, concluding there are no credible accidents that may result in serious radiological consequences. Further, the safety related systems have been analyzed, designed and implemented into the SMAGS building, which includes the building structure, comprised of a geomembrane/sub-base system, sump collection tanks, the building envelope and the fire detection system.

These systems ensure the protection of the health and safety of people and the environment from any radiological hazards associated with the SMAGS.

Pressure Boundaries

In May 2011, CNSC staff requested that AECL submit information relating to the pressure boundary systems at WL. CNSC staff has reviewed the information submitted by AECL, and concludes the pressure boundary systems at WL meet regulatory requirements.

Improvements

The current decommissioning licence is in the process for being updated to include the new standards for pressure boundaries. With this amendment, CSA Standards N285.0-2008 and B51-03 (R2007) will replace outdated standards to comply with CNSC regulatory requirements.

Outstanding Actions and Future Plans

AECL has submitted a preliminary code classification list for all pressure boundary systems at WL and will submit the final code classification for all systems to the CNSC by March 2013.

Conclusion

CNSC staff conclude that the licensee is in compliance with the regulatory requirements, and that AECL performed satisfactorily with respect to Physical Design.

3.6 Fitness for Service

The overall compliance performance with regard to Fitness for Service is shown in the table below. This area was not addressed as a stand-alone area at the licence renewal, but was considered satisfactory under decommissioning performance and Protection of the Environment and Public. The current rating is SATISFACTORY (SA).

Fitness for Service				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	SA	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

In 2009, the Periodic Inspection Plan, meeting the requirements of CSA N291-08 for the WMA storage structures, was developed following a 2008 fitness-for-service evaluation. This plan was implemented at WL to ensure continued facility fitness for service.

CNSC staff reviewed the inspection and maintenance related information provided in AECL's Annual Safety Reports, which confirmed that all safety-related inspection and maintenance activities have been effectively conducted and no significant issues were identified during the review period. Additionally, CNSC staff has reviewed the Safety and Hazard Analysis Report (SAR) and the Commissioning Report of the new SMAGS building, and concluded the proposed SMAGS maintenance program is appropriate.

In 2009, AECL provided a technical basis to demonstrate that the Standpipe structures will be fit for service, in which AECL stated that there was considerable planning on developing testing and monitoring methods for Standpipe structures. Field work to complete the inspection and monitoring activities for the Standpipe continued in 2012 with adequate controls in place to address potential safety concerns.

AECL reported one unplanned event during the review period relating to civil structures fitness for service. In May 2011, AECL discovered radiologically contaminated soil between in ground Medium Level Waste (MLW) bunkers 1 and 2, located in the Waste Management Area. The contamination was restricted to an area adjacent to the bunker of 1.0 × 0.5 meters, approximately 0.7 meters deep. AECL's investigation concluded the source of contamination was water ingress and subsequent leakage out of the bunker's adjoining roof slab and wall seam. Soil samples taken indicated the activity concentrations to be below the exemption quantities provided in the *Nuclear Substances and Radiological Devices Regulations*. The contaminated soil was recovered and remediated. AECL developed a CAP which included the prevention further water ingress, an interior monitoring system and the implementation of this system in similar MLW Bunkers. CNSC staff will continue to monitor the completion of the corrective actions committed to by AECL. CNSC staff conclude there remains adequate protection to the health and safety of persons and the environment.

Improvements

The areas which need improvement are house keeping, acceleration of complete implementation of the computerized maintenance management system and acceleration of completion of the field work for the inspection and monitoring of the Standpipes.

Conclusions

In general, CNSC staff is satisfied with the progress made by AECL in the areas of periodic inspection of the MLW and Low-Level Waste (LLW) concrete storage bunker structures at Whiteshell Laboratories. In addition, inspection activities and remediation actions, where appropriate, for the concrete storage bunker structures have been effectively conducted.

3.7 Radiation Protection

The following table indicates the overall performance for radiation protection over the current licensing period. The current rating is SATISFACTORY (SA).

Radiation Protection				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	SA	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

The SCA 'Radiation Protection' covers the licensee's implementation of its radiation protection program in accordance with the *Radiation Protection Regulations*. This program must ensure that radiation doses to persons and contamination are monitored and controlled as low as reasonable achievable (ALARA), where social and economic factors are taken into account. This is achieved by management control over work practices; personnel qualification and training; and control of occupational and public exposure to radiation.

Estimated Dose to the Public

AECL is required to determine the doses to the most exposed members (critical group) of the public from both airborne and liquid effluents from Whiteshell Laboratories, and then verify that they are below the annual dose limit for members of the public in the Regulations made pursuant to the *Nuclear Safety and Control Act*. CNSC staff concluded the results shown between 2009 and 2011 for the total estimated dose to a member of the public is below the regulatory limit of 1 mSv/year.

Table 2: Estimated Dose to the Public				
Dose	**2009**	**2010**	**2011**	**Regulatory Limit**
Airborne Effluent (mSv)	0.000005	0.000006	0.000005	1 mSv/yr
Liquid Effluent (mSv)	0.00017	0.0018	0.00062	
Airborne (% of regulatory dose limit)	0.0005	0.0006	0.0005	N/A
Liquid (% of regulatory dose limit)	0.017	0.18	0.062	N/A

Worker Dose Control

CNSC staff reviewed dose data from 2009 to 2011, as shown below in Tables 3 and 4[1]. These indicate that radiation doses to personnel are being adequately controlled to levels well below the regulatory limits. During the review period, the maximum individual effective annual dose for a Nuclear Energy Worker (NEW) was 1.3 mSv, or 2.6% of the annual regulatory limit of 50 mSv. The maximum dose to a non-NEW worker was 0.07 mSv, well below the regulatory limit of 1 mSv/year.

Table 3: Effective Dose Statistics for NEWs at WL

Dose Statistics	2009	2010	2011	Regulatory Limit
Total Persons Monitored	781	798	771	N/A
Average Effective Dose (mSv/year)	0.06	0.03	0.03	
Maximum Individual Effective Dose (mSv/year)	1.35	0.89	1.12	50 mSv/year
Maximum Individual Effective Dose over 5 years (mSv)	4.01 (2006-2010)			100 mSv/5 years

Table 4: Effective Dose Statistics for non-NEWs at WL

Dose Statistics	2009	2010	2011	Regulatory Limit
Total Persons Monitored	603	570	559	N/A
Average Effective Dose (mSv/year)	0.00	0.00	0.00	
Maximum Individual Effective Dose (mSv/year)	0.07	0.04	0.02	1 mSv/year

AECL also measured internal doses to staff at WL that are at risk of internal intake of radioactive material. The workers participated in a routine bioassay program, which involves urine analysis and/or whole-body counting. During the review period, all internal doses due to tritium and non-tritium sources have been zero.

Action Levels

Action levels (ALs) have been established as performance indicators or early warnings that a potential loss of control within a certain aspect of the radiation protection program may have occurred. There have been no action level exceedances at WL facility for the 2009-2011 reporting period.

Historically, AECL has used the Corporate AECL action levels for WL, as stipulated in their Radiation Protection manual. The effective dose action levels are 6 mSv/monitoring period and 20 mSv/year. CNSC staff had deemed these action levels inappropriate as, historically, the average annual doses to workers at WL have been far below the doses typically seen at other AECL sites.

[1] All reported average doses in tables 3 and 4 include zero dose values.

Following a number of communications between CNSC and AECL, AECL developed a set of new ALs for WL that CNSC staff found acceptable. The new action levels, found in Table 5 below, have been in place at WL since 2010. This change will be formally implemented into the framework of the amended licence.

Table 5: List of new action levels for NEWs at WL

Category	Previous AL - 2010		Revised AL - 2012	
	mSv/monitoring period	mSv/year	mSv/monitoring period	mSv/year
Effective Dose	6	20	2	6
Equivalent Dose to skin	100	200	20	60
Equivalent Dose to extremities	100	-	100	-

Contamination Control

AECL continued to maintain and implement a surface contamination monitoring program at WL to effectively control contamination at its facility.

Based on CNSC staff's assessment through inspection observations and record review, contamination monitoring continued to be effectively performed at WL.

Personnel Dosimetry

AECL continued to utilize its own internal dosimetry service at WL, licensed by the CNSC to ascertain whole-body dose, extremity beta/gamma dose, and internal dose. Neutron whole-body dose is monitored using CR-39 dosimeters supplied by Health Canada's National Dosimetry Services, which is licensed by the CNSC. For immediate monitoring of individual gamma doses, direct reading electronic dosimeters are used.

AECL continued to effectively implement and maintain a personnel dosimetry program to monitor and record worker doses at WL.

Application of ALARA

AECL continued to strive to maintain doses to staff ALARA. An example of which was the development and implementation of WL-508770-GL-190-01, "Job Scope and Safety Analysis", which provides an all hazards integrated approach to planning and executing decommissioning work packages and non-routine nuclear facility activities. Through this process, AECL are maintaining exposures and potential for unplanned exposure ALARA at WL through the application of "remove the hazard", "guard the hazard" and "guard the worker" hazard controls and safety measures. The focus has been on defining clear limiting conditions for work and applying aggressive safe back-out points for early detection of unexpected or abnormal hazards.

As a result of this process, AECL-WL have executed many radiological work packages in the 2009 to 2011 period with minimal dose consequence, no internal intakes and no significant contamination or exposure events. Examples of this include the Building 300 plutonium laboratory glove box removal, the Hot Cell Facility windows refurbishment, and the Warm Cells active drain line and ventilation duct removal.

Conclusion

CNSC staff conclude that AECL is effectively maintaining and implementing their radiation protection program to adequately control radiation exposures and doses to workers. Therefore, the Radiation Protection SCA is rated as ‘Satisfactory (SA)’ – meeting requirements.

3.8 Conventional Health and Safety

The overall compliance performance with regard to Conventional Health and Safety is shown in the table below. In the 2008 renewal CMD, this SCA was not provided with a rating; however, CNSC staff did assess this SCA through compliance performance and concluded that AECL has provisions for conventional hazards at WL and was considered satisfactory.

Operating Performance				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	--	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

AECL is required to comply with the *Canada Labour Code Part II* and the associated regulations, such as the *Regulations Respecting Occupational Health and Safety* and the *Safety and Health Committees and Representatives Regulations*; the *Nuclear Safety and Control Act* and its regulations; and the decommissioning licence for WL.

The licensee followed the AECL corporate-wide Occupational Safety and Health (OSH) Program. The OSH Program provides a management framework and processes that, together with active employee involvement, and is designed to ensure the health and safety of people involved in all aspects of AECL’s activities. The AECL OSH Program is applicable to all AECL organizational units, facilities, and projects.

The framework for the OSH Program is established though AECL’s current *Occupational Safety and Health Program Manual*. Further documentation includes processes, procedures, supporting documents, records, forms and training packages to be used in achieving the objectives of the OSH Program. These allow for site-specific and project-specific needs, while still ensuring consistent application of the OSH Program requirements. In addition, AECL schedules monthly site Safety and Health Committee meetings, whereby the minutes, safety advisories, and other important OSH bulletins are posted and made fully accessible to workers.

During routine compliance inspections, CNSC staff noted some non-compliances relating to health and safety, mainly housekeeping issues of low significance. CNSC staff continued to monitor housekeeping at WL and in this regard, there have been no other observations by CNSC staff in the area of conventional health and safety.

As reported annually, AECL provides information relating to loss-time accidents at the WL facility. During the review period, the frequency of such accidents has increased slightly, from five loss-time accidents in 2008 to nine in 2011. The majority of these accidents are related to strain injuries, struck by/struck against, and slips, trips and falls. In order for AECL to prevent any future occurrences, an educational awareness effort for employees and line management has been initiated. The aim is to raise awareness of the statistics and the roles and responsibilities of staff in support of reducing hazards with emphasis on hazard recognition, early reporting and resolution. CNSC staff is satisfied with AECL's efforts to reduce loss-time accidents and increase the occupational health and safety of WL employees.

Conclusion

Based on the review above, CNSC staff conclude that AECL's performance in the SCA of Conventional Health and Safety is satisfactory, and that appropriate provisions are made by AECL for conventional hazards at WL.

3.9 Environmental Protection

The following table indicates the overall performance for environmental protection over the review period. The current rating level is SATISFACTORY (SA).

Environmental Protection				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	SA	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

Performance levels for the Environmental Protection Safety and Control Area (SCA) have remained stable between 2009 and 2011 at the Whiteshell Laboratories site. This review is based upon both radioactive and non-radioactive emissions, compliance with Derived Release Limits (DRLs) for radioactive emissions, compliance with AECL effluent guidelines for non-radioactive emissions, environmental monitoring and the estimated dose to the public.

Effluents and Emissions (releases)

Airborne Radiological Emissions

The main sources of airborne radiological emissions from Whiteshell Laboratories are the Hot Cells Facility, Immobilized Fuel Test Facility, Reactor Building, Active Liquid Waste Treatment Centre and the Incinerator and Compactor/Baler in the Waste Management Area. The airborne radiological emissions from Whiteshell Laboratories between 2009 and 2011 remain below the DRLs. Table 6 shows the airborne radiological releases from the site between 2009 and 2011 are similar to previous years, displaying a consistent, low site release.

Table 6: Total Airborne Radiological Emissions at WL Facility

Release as a % of DRL	2009	2010	2011
Site Total Airborne Release	0.00532	0.00559	0.000521

Airborne Releases of Hazardous Substances

The largest hazardous (non-radiological) gaseous emissions from the Whiteshell Laboratories site are related to fuel combustion for building heating and steam generation purposes, and inadvertent losses of halocarbons used in research, cooling and fire suppression applications.

The main source of fuel combustion releases is the combustion of #2 fuel oil and propane gas to generate heat. The fuel consumption data is used to estimate the air emissions for Criteria Air Contaminants. Those that exceed the National Pollutant Release Inventory (NPRI) threshold for reporting are then reported under the NPRI. Estimated emissions between 2009 and 2011 remained low and fall below the NPRI reporting thresholds.

AECL reports semi-annually to Environment Canada under the *Federal Halocarbon Regulations* on releases in excess of 10 kg from halocarbon (Ozone Depleting Substances {ODS}) systems at all AECL facilities, including WL. AECL maintains an inventory of ODS for the WL site and make any reports as required. During the review period there was one reportable event for the fire suppressant loss of Halon (11.4 kg in the Control Room of the RD-14M). This event was reported to Environment Canada and the CNSC, as per the regulations and AECL procedures, respectively. Notwithstanding this was a reportable release, CNSC staff are satisfied this is a low significance event and that the hazardous substance emissions do not pose risks to the public or the environment. Additionally, as a remedial action and to continue with the phase-out of applicable ODS, AECL performed an evaluation that indicated the halon fire suppression system in that area was no longer required, and it has since been removed.

Liquid Radiological Emissions

The main source of liquid radiological emissions from Whiteshell Laboratories is the process water outfall, which discharges on a regular basis to the Winnipeg River. Secondary sources of liquid effluent are the Sewage Lagoon and the Waste Management Area’s two drainage ditches. The liquid radiological emissions from the site between 2009 and 2011 remain below the DRLs. The liquid radiological releases between 2009 and 2011 are similar to previous years.

Table 7: Total Liquid Radiological Emissions at WL Facility			
Release as a % of DRL	**2009**	**2010**	**2011**
Site Total Liquid Release	0.0113	0.00896	0.00687

Liquid Releases of Hazardous Substances

The Whiteshell Laboratories site routinely discharged, in various liquid effluents, many hazardous substances to the environment (the Winnipeg River) via the sewage lagoon, process sewer outfall, drainage ditches and internal liquid discharges. In total, AECL routinely monitors nine different monitoring points for hazardous substances such as metals, organic and phosphorous.

AECL's *Environmental Management System for AECL Sites in Canada* established monthly guidelines against which it assesses Whiteshell's performance. AECL's reports on the discharges between 2009 and 2011 show overall satisfactory performance in comparison to the guidelines; however, there were certain problem areas such as Total Suspended Solids (TSS), iron, mercury, oil and grease exceedences against AECL's internal guidelines in the Active Liquid Waste Treatment Centre discharges. In addition, there were TSS, iron and mercury exceedences in the discharges from the drainage ditches. AECL has on-going actions to lessen guideline exceedences through initiatives such as improving wastewater quality and managing decontamination effluent. CNSC staff is tracking these exceedences through the review of the annual safety reports.

Environmental Monitoring Program

The Whiteshell Laboratories Environmental Monitoring Program consists of radiological and non-radiological monitoring of several environmental media at various locations at the site and the surrounding communities. Its purpose is to confirm that radiation doses caused by releases of radioactive material in site effluents remain below the annual dose limit for members of the public.

Radiological monitoring results between 2009 and 2011 confirmed that the levels of radiation and radioactive contamination in the environment outside the Whiteshell Laboratories site due to operations at the site, as well as the resulting radiation doses to members of the public, were below the regulatory limit of 1 mSv/year. Monitoring of atmospheric radiological effluent exposure pathways did not indicate any measurable dose concentrations from the site in excess of natural background levels.

Monitoring of liquid radiological exposure pathways indicate small but measurable contributions from Whiteshell Laboratories operational and decommissioning activities. Radioactivity in the Winnipeg River is a small fraction of the allowable levels defined in the Canadian Drinking Water Standard.

Overall, the environmental monitoring results of Whiteshell Laboratories operations indicate that the risk is low for human health and the environment. Also, the trending indicates stable performance with no cases of widespread degrading conditions.

EA Follow-up Monitoring Program

AECL submitted the Annual Status Reports on Environmental Assessment Follow-Up Actions at Whiteshell Laboratories for 2009 through 2011. The reports summarized the activities related to nine individual work packages from the EA of the Whiteshell Laboratories Decommissioning Project which were performed during each reporting period.

Environmental Risk Assessment

Based on CNSC staffs assessment of the WL Monitoring Program for radiological, no-radiological and groundwater component, risk to humans and the environment is expected to be low.

Action Levels

The CNSC requires Class I licensees to establish action levels for controlled releases from licensed facilities. The purpose of these action levels is to give warning to the licensee and the CNSC of potential loss of control of a process or facility. During the review period there were no releases exceeding AECL's action levels from 2009 to 2011.

Outstanding Actions and Future Plans

In 2010, AECL assessed the Whiteshell Laboratories Environmental Monitoring System against CSA N288.4-10 *Environmental Monitoring Programs at Class 1 Nuclear Facilities and Uranium Mines and Mills* for the purpose of updating the EM Program with the CSA Standard. AECL documented any identified gaps and will address them, within a reasonable timeline, to improve the future performance of Whiteshell Laboratories' Environmental Monitoring Program.

Conclusion

Whiteshell Laboratories performance in its environmental programs (effluent monitoring, environmental monitoring and EA follow-up) indicates that Whiteshell Laboratories' Environmental Management System is adequately implemented.

CNSC staff conclude that AECL's performance in the area of Environmental Protection meets regulatory requirements and CNSC staff expectations. Overall, the risk for human health and the environmental is considered low. Therefore, the Environmental Protection SCA is rated as 'Satisfactory (SA)' – meeting requirements.

3.10 Emergency Management and Fire Protection

The following table indicates the overall performance for emergency management and fire protection over the review period. The current rating level is SATISFACTORY (SA).

Emergency Management and Fire Protection				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	SA	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

At the 2008 renewal, emergency management and fire protection were rated separately. Both the AECL WL emergency management and fire protection programs and implementation were rated as satisfactory.

Emergency Management

The AECL Whiteshell Site Emergency Plan and related site-specific emergency procedures, as part of the AECL WL emergency preparedness program requirements, was reviewed by CNSC staff and determined that the Whiteshell Site Emergency Plan is consistent with the requirements of CNSC Regulatory Guide, G-225, *Emergency Planning at Class I Nuclear Facilities and Uranium Mines and Mills*. The AECL WL emergency preparedness documentation is appropriate for the anticipated degree of emergencies at the WL site.

During the review period, AECL reported two minor issues pertaining to the site alerting system (sirens) which encountered some operational problems due to extreme cold weather. In both cases, WL management and staff took appropriate action to implement temporary measures and satisfactory solutions until the problem with the sirens could be corrected. Appropriate corrective actions were initiated and completed to resolve the problem with the sirens.

Overall, CNSC staff conclude that AECL has adequately demonstrated its ability to effectively respond to and manage an emergency at the WL site, and to provide for the protection of the environment and the health and safety of persons.

Improvements

As a result of CNSC staff reviews and comments relating to the 2010 ASR, repairs and improvements were made to the site-wide Public Address (PA) system to ensure its functionality. However, further improvements are required to ensure broader coverage and audibility for staff working at the WL site.

With respect to fire response status and capability, AECL WL has recently implemented a fire fighter physical fitness program, and to date approximately ninety percent of the fire fighters have successfully completed the fitness evaluation. The remainder of the fire fighters are receiving additional fitness coaching and opportunities to meet the fitness requirements.

Fire fighter training has been enhanced with the addition of two new fire training facilities, one to practice their search and rescue skills and the other to allow live fire response training. In addition, enhancements are under development to provide computer based training for on-site fire fighters to gain site-specific knowledge designed to inform and evaluate fire fighter knowledge. Plans to implement a new fire command and communications protocol are scheduled to begin in 2012 September.

Fire Protection

The Fire Protection Program (FPP) has been established to comply with the requirements of the *National Building Code (2005)*, the *National Fire Code (2005)*, and *National Fire Protection Association, NFPA-801(2008).* During the review period, AECL submitted the revised WL Fire Protection Program. The FPP identifies the procedures, processes and supporting analyses necessary to demonstrate a planned, coordinated and controlled approach to fire protection at the facility. The continued implementation and maintenance of the WL FPP will continue to be monitored through routine regulatory oversight and future fire protection inspections.

Biennially, AECL submits a Third Party Review (TPR) of fire protection features at the facility which includes inspection, testing and maintenance (ITM) activities as required by the operating licence [1]. The TPR confirmed that the ITM activities relating to fire safety systems and equipment meet the intent of the NFCC. CNSC staff has reviewed the TPR, and the AECL corrective action plan to address the recommendation of the TPR, and concludes it is acceptable. CNSC staff is tracking the remaining four open items, of which AECL has made a commitment to provide an update to CNSC staff by July 29, 2012. There remains adequate protection to persons and the environment. AECL-WL also continues to submit third party reviews of any proposed modifications of the WL with the potential to impact protection from fire.

AECL has reported the completion of all the corrective actions relating to the focused Fire Protection Type II Compliance Inspection, with the exception of replacing an aging fire alarm system due to the complexity of the system and the decommissioning activities. AECL provided a status update regarding the outstanding action plan to replace the aging fire alarm system it was indicated that the design work has been completed and a supplier will be chosen by May 2012. CNSC staff will be verifying the completion of the closed actions and status of the remaining action items during the CNSC compliance inspection in the fall of this year.

During the reporting period, WL reported six unplanned events related to the failure of the Fire Alarm Monitoring System at WL. WL staff took the appropriate actions following the events and notified the CNSC as required. There remained adequate protection to persons and the environment.

Outstanding Actions and Future Plans

Relating to the PA system repairs, AECL has initiated an investigation to incorporate the site emergency tone through the PA system more evenly. In addition, AECL WL has committed to investigating methods of maximizing the emergency notification process and reporting the results of that investigation to CNSC staff by 2012 September 30.

Conclusion

Based on the review of AECL WL emergency preparedness documentation, CNSC staff has concluded that the emergency preparedness program meets the regulatory requirements, and it has been demonstrated through the implementation of that program that they are adequately prepared to effectively respond to and manage an on-site emergency, and provide for the protection of the environment and the health and safety of persons.

Further, CNSC staff conclude that AECL continued to maintain its Fire Protection Program and the licensee is in compliance with regulatory requirements. Therefore, AECL Whiteshell Laboratories performed satisfactorily with respect to this SCA.

3.11 Waste Management

The overall compliance performance with regard to Waste Management is shown in the table below. This area was not addressed as a stand-alone area at the licence renewal, but was considered satisfactory under Decommissioning Performance, Radiation Protection and Protection of the Environment and Public. The current rating level is SATISFACTORY (SA).

Waste Management				
Overall Compliance Ratings				
Year	2008	2009	2010	2011
AECL-WL	SA	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

As AECL decommissions the WL facility, waste volumes continued to increase, which has required the need for additional LLW storage space. To address this need, AECL constructed the SMAGS building which is based on the CRL design, currently stores LLW radioactive solid waste from the decommissioning of B300, B100, B200 and B411. The SMAGS has a storage capacity of approximately 4000 m^3 of waste, and is anticipated to meet the need for retrievable LLW storage over the next 5-6 years.

Some of the other waste management enabling facilities at WL include the waste handling area (WHA) located in Building 300, the waste clearance facility (WCF) or Building 304, and the new Soil Storage Compound located in the WMA. The WHA comprises of compaction and waste assay scanning equipment for the purpose of minimizing radiologically contaminated waste volumes. The WCF is used to verify uncontaminated waste for uncontrolled clearance.

Decommissioning and demolition waste are radiologically screened and segregated at the source as either “Likely Clean” or “Presumed Active”. “Likely Clean” waste is monitored for clearance either at the source or at the WCF. Cleared materials are segregated and characterized as recyclable, reusable, landfill, or hazardous materials. Materials identified as contaminated during clearance monitoring are sent to the WHA for processing.

“Presumed Active” materials are inventoried and sent to the WHA for decontamination, volume reduction, packaging, and radiological characterization. Decontaminated materials are sent to the WCF for clearance monitoring. Contaminated materials are sent to the WMA for storage.

The WMA provides storage facilities for radioactive wastes and small volumes of hazardous industrial waste. It consists of an organic incinerator, the new SMAGS building, bunkers and Quonset storage buildings used to store low-level waste (LLW) and medium-level waste (MLW) generated from WL decommissioning.

Waste generated during decommissioning activities is characterized, segregated, packaged and sent either for disposal or storage in the WL Waste Management Area (WMA). Clean waste that can be re-used or recycled is sent off-site; clean waste that is non-reusable is placed in the on-site landfill. All contaminated materials are safely removed and stored in the on-site WMA.

Table 8 provides information on the percentage of space in the waste storage building that is filled and the estimate number of years of storage space remaining. There are also two empty standpipes in the WMA.

Table 8: Partially-filled Waste Storage Buildings in the WMA (December 31, 2011)

Building No.	% Full	Years of Storage Space Remaining
LLW B5	99	I month
LLW B6	60	1
MLW B4	70	2-3
MLW B6*	60	2-3
MLW B7	85	2-5
431 (LLW Storage Building)	60	3
433 (LLW Storage Building)	80	2
SMAGS Building #1	2	5-6
Soil Storage Compound**	0	6-8

* MLW B6 is currently not accepting waste due to water ingress issues
** Currently in the approval process for operation

The Concrete Canister Storage Facility (CCSF) is located adjacent to the WMA and has stored irradiated fuel since 1975. During the licensing period, only one change was made to the CCSF; the concrete base beneath each canister was built up above the surrounding ground to ensure there is no accumulation of surface waters around the base of the canister.

Active liquid waste from Buildings 100 (WR-1), 300 and 400 (Decontamination Centre) is routinely transferred via underground pipes to the ALWTC where the liquids are stored in two separate holding tanks, based on their radioactivity levels. Low-level liquid waste is then processed, sampled and discharged into the Winnipeg River once the release criteria are met.

To help reduce waste at the WL landfill, AECL set up “Recycling Stations” throughout the facility to encourage recycling and redirect waste.

Outstanding Actions and Future Plans

Construction of the Soil Storage Compound was completed in 2011 and is expected to be operational in 2012 for the purpose of storing contaminated soils associated with WL decommissioning activities. This 30m by 40m engineered compound is capable of containing 2000 m^3 of soil, and was designed to Canadian Council of Ministers of the Environment (CCME) hazardous waste landfill specifications.

Conclusion

Based on the above review, CNSC staff conclude that AECL’s performance in the area of Waste Management meets regulatory requirements and CNSC staff’s expectations.

3.12 Security

The following table indicates the overall performance for Security over the review period. The current rating level is FULLY SATISFACTORY (FS).

Security				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	SA	SA	SA	FS

The rating trend, discussion and conclusion for this SCA are provided in the following subsections and CMD 12-M47.A.

Discussion

Previously, security ratings were treated as prescribed information. These are now being publicly released, but the information supporting the performance rating will remain classified and will be presented to the Commission in a separate classified document (CMD 12-M47.A).

AECL continues to perform satisfactorily in the prevention of loss, theft or sabotage of nuclear material or sabotage at the Concrete Canister Storage Facility (CCSF) and the Standpipes, located in the Waste Management Area.

AECL has a security program for the CCSF and the Standpipes in accordance with CNSC requirements. Although the CNSC is actively overseeing the licensee's security program, the related security inspection and assessment information is confidential and is not publicly available. As a result, a separate security protected CMD (CMD 12-M47.A) has been produced to address AECL security program at the WL facility.

Conclusion

Based on the information assessed and described in CMD 12-M47.A, CNSC staff conclude that the implementation of the security program at the Whiteshell Laboratories facility is adequate and meets all regulatory requirements.

3.13 Safeguards

The following table indicates the overall performance for Safeguards over the review period. The current rating level is SATISFACTORY (SA).

Safeguards				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	SA	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

Performance levels for this SCA have been consistent over the licensing period at the WL site. At the 2008 renewal hearing, a rating level of B (equivalent to meets requirements - SA) was assigned for the safeguards program and its implementation at WL. The safeguards SCA covers the programs required for the implementation of the obligations arising from the Canada/IAEA safeguards agreements.

AECL maintains a safeguards program to comply with the requirements set out in the operating licence for the WL facility. Compliance activities include the timely provision of reports on the movement and location of all nuclear materials, the provision of access and assistance to IAEA inspectors for verification activities, and the submission of annual operational information as well as accurate design information on plant processes and procedures.

During the review period, WL provided the CNSC and IAEA with all reports and information necessary to comply with the safeguards regulatory requirements, including those related to nuclear material accounting and reporting. During this period the IAEA performed a number of activities, including three inspections, one Physical Inventory

Verification (PIV), three Design Information Verifications (DIV), and one Complementary Access (CA) visit. In addition, the CNSC performed an evaluation of the licensee's preparedness for PIV in 2009 and 2011, when WL was not selected by the IAEA for a PIV. In all cases the licensee provided the IAEA and CNSC with the necessary access and assistance to perform their activities, and fully complied with all regulatory requirements.

Improvements

Prior to October 2010, the WL facility maintained a nuclear material inventory system. Since then, WL has implemented a new nuclear material accounting system that is compliant with RD-336, *Accounting and Reporting of Nuclear Material*, and which provides more efficient reporting.

Conclusion

CNSC staff is satisfied that the safeguards program and its implementation at WL meets regulatory requirements and provides the measures required to implement the international obligations to which Canada has agreed.

3.14 Packaging and Transport

The overall compliance performance with regard to Packaging and Transport is shown in the table below. This area was not address as a stand-alone area at the licence renewal, but was considered satisfactory under decommissioning performance. The current rating level is SATISFACTORY (SA)

Packaging and Transport				
Overall Compliance Ratings				
Year	**2008**	**2009**	**2010**	**2011**
AECL-WL	SA	SA	SA	SA

The rating trend, discussion and conclusion for this SCA are provided in the following subsections.

Discussion

The SCA ‘Packaging and Transport’ covers the safe packaging and transport of nuclear substances and radiation devices to and from the licensed facility. The specific areas that comprise this SCA at AECL’s Whiteshell Laboratories include AECL’s radioactive material transportation program and CNSC staff inspection results.

AECL must adhere to the CNSC *Packaging and Transport of Nuclear Substances Regulations* and Transport Canada’s *Transportation of Dangerous Goods Regulations* for all shipments leaving the site. The *Packaging and Transport of Nuclear Substances Regulations* apply to the packaging and transport of nuclear substances, including the design, production, use, inspection, maintenance and repair of packages, and the preparation, consigning, handling, loading, carriage and unloading of packages.

AECL is required to have appropriate training for personnel involved in the handling, offering for transport and transport of dangerous goods, and is required to issue a training certificate to those workers in accordance with the *Transportation of Dangerous Goods Regulations*.

AECL has developed and implemented a Radioactive Material Transportation Program for activities at all AECL's Canadian sites. CNSC staff conducted a compliance inspection of AECL's program in April 2009, and concluded that it meets the regulatory requirements and the requirements of the licence.

In July 2007, AECL received CNSC recovered radioactive sources from the Enviropac issue and provided secure, temporary storage at the Whiteshell facility. AECL staff characterized the sources prior to its shipment to the CRL in March 2012 for long-term storage.

Conclusion

Based on the information that was assessed CNSC staff conclude that AECL carried out packaging and transport of nuclear substances in compliance with the *Packaging and Transport of Nuclear Substances Regulations* and the *Transportation of Dangerous Goods Regulations* at the WL facility.

4 OTHER MATTERS OF REGULATORY INFORMATION

4.1 Cost Recovery

AECL remains in compliance with the CNSC *Cost Recovery Fee Regulations*

4.2 Financial Guarantee

As per condition 12.1 in the licence, AECL submitted an updated cost estimate for the WL decommissioning plan, of approximately $1.5 billion for 2009 to 2064 in 2009 dollars. The revised cost estimate was accepted by CNSC staff in 2011 [7]. The implementation of the Detailed Decommissioning Plan is funded through the NLLP.

AECL has maintained a detailed decommissioning plan and financial guarantee as per condition 12.2 in the licence. The financial guarantee is in the form of an expressed commitment from the federal government[2]. This guarantee was accepted by the Commission in its Record of Proceedings published on October 2004 for the Hearing that took place in September, 2004 [8].

Conclusion

CNSC staff is satisfied with the AECL's revised cost estimate. The financial guarantee for WL, as accepted by the Commission in 2004, remained valid and in effect.

[2] *Honourable H. Dhaliwal, P.C., M.P., Minister of Natural Resources Canada, Letter to L. Keen, President and Chief Executive Officer, Canadian Nuclear Safety Commission, 2003 December 11.*

4.3 Public Information Program

During the review period, AECL continued to conduct Public Liaison Committee (PLC) Meetings. Formed in 2003, the PLC consists of local municipal officials, provincial government officials and on-site business tenants. These biannual meetings set out to discuss regulatory developments, the status of WL decommissioning activities and other issues, relating to the PLC Terms of Reference. CNSC staff has attended several meetings of the PLC, and will continue to attend these meetings.

In addition, AECL provided three requested site tours to members of the public during the review period: Manitoba Hydro regional staff (managers and supervisors), Ear Falls (Ontario) Town Council (looking at hosting a nuclear waste disposal facility), and Beausejour Town Council.

Improvements

Several initiatives have been undertaken to improve communication with the public through public postings on the AECL website, including the WL environmental performance reports. The Nuclear Legacy Liabilities Program launched a public website that includes information on decommissioning activities at Whiteshell Laboratories. AECL has developed and distributed a newsletter to mailboxes throughout the local WL communities.

Outstanding Actions and Future Plans

AECL has an action plan in place for the development of a Public Information Program and Public Disclosure Protocol to align with the new CNSC regulatory document, *RD/GD-99.3, Public Information and Disclosure*. CNSC staff will review the program and protocol against the regulatory document prior to the implementation at WL.

Conclusion

Overall, the licensee's public information activities conducted for the review period are acceptable and satisfactory.

4.4 Aboriginal Consultation

The common law duty to consult with Aboriginal groups applies when the Crown contemplates actions that may adversely affect established or potential Aboriginal or treaty rights. The CNSC, as an agent of the Crown, and as Canada's nuclear regulator recognizes and understands the importance of consulting and building relationships with Canada's Aboriginal peoples. The CNSC ensures that all its licensing decisions under the *Nuclear Safety and Control Act* (NSCA) uphold the honour of the Crown and consider Aboriginal peoples' potential or established Aboriginal or treaty rights pursuant to section 35 of the *Constitution Act*, 1982.

Background

The Comprehensive Study level environmental assessment (EA) for the Whiteshell Decommissioning project began before a formalized Aboriginal consultation process was established by the Crown. Nevertheless, at the outset of the project, efforts were made as part of the WL public consultation program to ensure that Aboriginal issues and concerns related to the project were identified and addressed.

In 2002, the EA concluded that the project was “not likely to cause significant adverse environmental effects taking into account the mitigation measures recommended in the report; that there were not likely to be any cumulative effects associated with the project; and that public concerns raised about the project, were adequately addressed”, including those brought forth by First Nations. With a view to establishing and maintaining long-term relationships with interested parties beyond the project’s EA phase and throughout the entire decommissioning program, the WL public consultation program was designed. The public consultation program is still actively used as a means of engaging communities located close to the project site.

Discussion

The Whiteshell Laboratory property is located within the western boundary of Treaty #3 and slightly east of the Treaty #1 boundary.

Since the beginning of the project, the Sagkeeng First Nation (signatory to Treaty #1, also known as Fort Alexander First Nation and located 75 kilometers downstream from the facility), has demonstrated a sustained interest in the project and to this effect established a communications protocol with AECL-Whiteshell in 1999.

During the present licensing period, the Sagkeeng First Nation has communicated directly with the CNSC requesting that they be kept informed of the activities occurring on-site. CNSC staff has worked to support its information-sharing relationship with the leadership of the Sagkeeng First Nation. Specifically, the CNSC has provided to the Sagkeeng First Nation written information about the CNSC’s regulatory role and processes, site information, waste management, CNSC hiring practices, licence amendment updates and notification of this mid-term meeting.

Conclusion

CNSC staff will continue to provide Sagkeeng First Nation with information updates on activities occurring at the AECL-Whiteshell site. CNSC staff will also ensure that the Sagkeeng First Nation and other Aboriginal groups who might express an interest in the decommissioning project are informed of future regulatory decisions that the Commission may take in relation to this licence and will encourage them to participate in the review process.

As the information provided in this report is for information purposes and whereas the Commission is not expected to make a licensing decision, this activity does not trigger a specific duty to consult.

5 OVERALL CONCLUSION

In summary, CNSC staff is satisfied with the licensee's overall performance and that the licensee continues to comply with all regulatory requirements in an acceptable manner. CNSC staff conclude that AECL is qualified to continue decommissioning at the Whiteshell Laboratories.

Further, the licensee, in carrying on the licensed activities, has made adequate provisions for the protection of the environment, the health and safety of persons and the maintenance of national security and measures required to implement international obligations with which Canada has agreed.

	B402 – Health & Safety	Operational	Operational	Operational
	WR-1 Reactor (B100)	Storage with Surveillance	Storage with Surveillance, decommissioning planning resumed	Decommissioning in progress5

---

3 Current status of Shielded Facilities decommissioning:
- Six of the twelve Hot Cells (Cells 6-11) partially decommissioned (manipulators, services (air, distilled and process water, electrical), and equipment have been disconnected/removed, and the cells have been partially decontaminated and are presently in a defined interim end-state as they share active drain and ventilation systems with operating Hot Cells 1-5). Associated experimental equipment such as a Scanning Electron Microscope and Hot Cell 12 (which contained a Metallographic Microscope) were dismantled and removed.
- The HCF storage blocks have been decontaminated and are presently in a defined interim end-state.
- Seven canisters in the Irradiated Fuel Test Facility (IFTF) were fully decommissioned (dismantled and removed).
- The IFTF's Warm Cells 14-18 and Main Floor Operating Area facilities were fully decommissioned (dismantled and removed).

4 Current status of B300 decommissioning:
- All active drain lines removed, all active ventilation devices and systems removed from the High Bay area (Stage 3), all redundant office, laboratory and experimental equipment and furnishings removed from all stages except Stage 7, all ventilation devices removed from Stages 1 and 4 (over 100 fumehoods removed), initiated removal of office and laboratory equipment and furnishings in Stage 7. Building 300 is a 17000 m^2 structure.

5 This does not coincide with the bar chart as the timelines for WR-1 decommissioning are being revised.

ADDENDUM C – SAFETY AND CONTROL AREA FRAMEWORK

SAFETY AND CONTROL AREA FRAMEWORK			
Functional Area	**Safety and Control Area**	**Definition**	**Specific Areas (may include, but are not limited to)**
Management	Management System	Covers the framework which establishes the processes and programs required to ensure an organization achieves its safety objectives and continuously monitors its performance against these objectives and fostering a healthy safety culture.	▪ Management System (including Safety Management/Quality Management Oversight) ▪ Organizational structure, roles and responsibilities, resource management, leadership ▪ Organizational/Management change ▪ Internal Communications ▪ Safety Culture
	Human Performance Management	Covers activities that enable effective human performance through the development and implementation of processes that ensure that licensee staff are sufficient in number in all relevant job areas and have the necessary knowledge, skills, procedures and tools in place to safely carry out their duties.	▪ Personnel Training ▪ Human Performance Programs (procedural adherence, identification of error) ▪ Awareness, Safety Meetings, Review Topics ▪ Work Organization and Job Design (minimum shift complement, hours of work limitation) ▪ Fitness for Duty
	Operating Performance	This includes an overall review of the conduct of the licensed activities and the activities that enable effective performance.	▪ Conduct of licensed activity ▪ Adequacy of Procedures ▪ Operating Experience (OPEX) (Corrective Actions Programs, Root Cause Analysis, Effectiveness Review) ▪ Reporting and Trending

SAFETY AND CONTROL AREA FRAMEWORK			
Functional Area	**Safety and Control Area**	**Definition**	**Specific Areas (may include, but are not limited to)**
Facility and Equipment	Safety Analysis	Maintenance of the safety analysis that supports that overall safety case for the facility. Safety analysis is a systematic evaluation of the potential hazards associated with the conduct of a proposed activity or facility and considers the effectiveness of preventative measures and strategies in reducing the effects of such hazards.	▪ Hazard Analysis (internal and external) including: fire, flood, seismic ▪ Safe Operating Envelope ▪ Job hazard analysis process ▪ Change management ▪ Criticality Safety
	Physical Design	Relates to activities that impact on the ability of systems, components and structures to meet and maintain their design basis given new information arising over time and taking changes in the external environment into account.	▪ System Classification ▪ Site Characterization ▪ Engineering Change Control ▪ Equipment Qualification ▪ Pressure Boundary Design ▪ Process and Control Systems ▪ Waste Management Systems ▪ Package Certification ▪ Structure and Storage Container Design
	Fitness for Service	Covers activities that impact on the physical condition of systems, components and structures to ensure that they remain effective over time. This includes programs that ensure all equipment is available to perform its intended design function when called upon to do so.	▪ Equipment Fitness for Service/Equipment Performance (e.g. System Health Report) ▪ Maintenance ▪ Structural Integrity ▪ Aging Management

SAFETY AND CONTROL AREA FRAMEWORK			
Functional Area	**Safety and Control Area**	**Definition**	**Specific Areas (may include, but are not limited to)**
Core Control Processes	Radiation Protection	Covers the implementation of a radiation protection program in accordance with the RP Regulations. This program must ensure that contamination and radiation doses received are monitored and controlled	▪ Application of ALARA ▪ Dosimetry Services ▪ Worker Dose Control ▪ Contamination Control
	Conventional Health and Safety	Covers the implementation of a program to manage workplace safety hazards and to protect personnel and equipment.	▪ Compliance with the applicable Labour Code (regulations and Programs) ▪ House Keeping (fire, chemical, tripping hazard, etc.) ▪ Safety statistics ▪ Safety awareness
	Environmental Protection	Covers programs that identify, control and monitor all releases of radioactive and hazardous substances and effects on the environment from facilities or as the result of licensed activities	▪ Effluent and Emissions (releases) ▪ Environmental Monitoring ▪ Estimated Dose to Public ▪ Environmental Risk Assessment ▪ Environmental Management System (EMS)
	Emergency Management and Fire Protection.	Covers emergency plans and emergency preparedness programs which exist for emergencies and for non-routine conditions. This also includes any results of exercise participation.	▪ Nuclear Emergency Management ▪ Fire Protection and Response ▪ Conventional Emergency Response ▪ Business continuity
	Waste Management	Covers internal waste-related programs which form part of the facility's operations up to the point where the waste is removed from the facility to a separate waste management facility. Also covers the planning for decommissioning	▪ Waste minimization, segregation and characterization ▪ Waste storage and processing ▪ Preliminary Decommissioning Plans

SAFETY AND CONTROL AREA FRAMEWORK			
Functional Area	**Safety and Control Area**	**Definition**	**Specific Areas (may include, but are not limited to)**
	Security	Covers the programs required to implement and support the security requirements stipulated in the regulations, in their license, in orders, or in expectations for their facility or activity.	▪ Facility and Equipment ▪ Access Control Site Security Drills and Exercises ▪ Response Force
	Safeguards	Covers the programs required for the successful implementation of the obligations arising from the Canada/IAEA Safeguards Agreement.	▪ Nuclear Material Accountancy and Control ▪ Access and Assistance to the IAEA ▪ Operational and Design Information ▪ Safeguards Equipment, Containment and Surveillance
	Packaging and Transport	Programs that cover the safe packaging and transport of nuclear substances and radiation devices to and from the licensed facility.	▪ Adherence to CNSC, TC and International Regulations on packaging and transport

ADDENDUM D – SAFETY AND CONTROL AREA COMPARISON

Comparison of Safety and Control Areas	
New SCA Framework	**Previous WL SCAs**
Management System	Quality Management Decommissioning Performance
Human Performance Management	Quality Management Radiation Protection Decommissioning Performance
Operating Performance	Quality Management Decommissioning Performance
Safety Analysis	Nuclear Criticality Safety Fire Protection
Physical Design	Protection of the Environment and Public
Fitness for Service	Protection of the Environment and Public Decommissioning Performance

Safeguards	IAEA Safeguards
Packaging and Transport	Decommissioning Performance

ADDENDUM E – RATING LEVELS

The following rating levels reflect a recent transition in the rating terminology used by the CNSC.

Fully Satisfactory (FS)

Compliance with regulatory requirements is fully satisfactory. Compliance within the area exceeds requirements and CNSC expectations. Compliance is stable or improving, and any problems or issues that arise are promptly addressed.

Satisfactory (SA)

Compliance with regulatory requirements is satisfactory. Compliance within the area meets requirements and CNSC expectations. Any deviation is only minor, and any issues are considered to pose a low risk to the achievement of regulatory objectives and CNSC expectations. Appropriate improvements are planned.

Below Expectations (BE)

Compliance with regulatory requirements falls below expectations. Compliance within the area deviates from requirements or CNSC expectations to the extent that there is a moderate risk of ultimate failure to comply. Improvements are required to address identified weaknesses. The licensee or applicant has taken, or is taking appropriate corrective action.

Unacceptable (UA)

Compliance with regulatory requirements is unacceptable and is seriously compromised. Compliance within the overall area is significantly below requirements or CNSC expectations, or there is evidence of overall non-compliance. Without corrective action, there is a high probability that the deficiencies will lead to an unreasonable risk. Issues are not being addressed effectively, no appropriate corrective measures have been taken, and no alternative plan of action has been provided. Immediate action is required.

EXECUTIVE SUMMARY

Each year, the Canadian Nuclear Safety Commission (CNSC) produces a report on the performance of Atomic Energy of Canada Limited (AECL) Chalk River Laboratories. This year, the scope has been expanded to include an assessment of AECL's Nuclear Sites and Projects. The report, entitled *Annual Performance Report AECL's Nuclear Sites and Projects: 2013* summarizes CNSC staff's assessment of the safety performance of:

- Chalk River Laboratories (CRL)
- Whiteshell Laboratories (WL)
- Port Hope Area Initiative (PHAI); includes the Port Hope project and the Port Granby project

Through inspections, reviews and assessments, CNSC staff conclude that AECL has operated all facilities and activities safely during 2013. The evaluations of all findings for the safety and control areas show that, overall, AECL made adequate provision for the security, the protection of health and safety of persons and the environment from the use of nuclear energy, and took the measures required to implement Canada's international obligations.

The following observations support the conclusion of safe operation:

- No member of the public received a radiation dose that exceeded the regulatory limit
- No worker at any AECL site received a radiation dose that exceeded the regulatory limits
- The frequency and severity of non-radiological injuries to workers was minimal
- No radiological releases to the environment from the sites/projects exceeded the regulatory limits
- AECL complied with their licence conditions concerning Canada's international obligations

This page was intentionally left blank.

1 INTRODUCTION

As part of the assessment, CNSC staff evaluated how well AECL is meeting regulatory requirements and expectations for the performance of programs in 14 safety and control areas (SCAs). The report makes comparisons and shows trends, where possible, and it highlights emerging regulatory issues pertaining to AECL's nuclear sites and projects.

2 OVERVIEW

The review of each nuclear site or project's safety performance in the SCA framework confirms that AECL has made adequate provisions for the protection of the health and safety of Canadians and the environment, as well as to ensure that Canada continued to meet its international obligations on the peaceful use of nuclear energy.

Ratings for CRL for the year 2013 ranged from "below expectations" to "satisfactory". A notable rating change was issued for the SCA Management System previously reported as "below expectations" in CMD 13-M14: *Report for the Performance of Atomic Energy of Canada Limited Chalk River Laboratories* and now rated as "satisfactory". As indicated, this SCA was in an improving trend. Since, AECL has completed several improvements which have resulted in the satisfactory rating. For SCA Fitness for Service, CNSC staff continue to rate this as "below expectations" due to the aging and legacy issues of systems, structures and components at CRL, particularly the National Research Universal (NRU) reactor.

For WL, ratings for 2013 were deemed "satisfactory" or "fully satisfactory" for the reporting period which remains unchanged from reports previously made to the Commission in CMD 12-M47: *Interim Status Report on the Progress of Decommissioning Activities at Whiteshell Laboratories*.

Unchanged ratings were also noted for AECL's projects (Port Hope and Port Granby), as previously reported in CMD 11-H10: *Application by Atomic Energy of Canada Limited for a Waste Nuclear Substance Licence for the Port Granby Long-Term Low-Level Radioactive Waste Management Project* and CMD 12-H10: *Application by Atomic Energy of Canada Limited for Amendment of Waste Nuclear Substance Licence for the Port Hope Long-Term Low-Level Radioactive Waste Management Project*. All SCAs for these two projects continue to be rated as "satisfactory" for the year 2013.

3 CONSULTATION

A draft version of the report was posted on the CNSC Web site, in both official languages, for consultation from October 15, 2014 to November 17, 2014. The public was invited to comment, in writing, on this report. Written submissions will be filed with the Secretariat of the Commission. It is noted that all submissions will be available to the public upon request to the Secretariat.

CNSC staff will review each comment, and would be pleased to provide feedback to the Commission.

4 OVERALL CONCLUSIONS

Following this meeting, *Annual Performance Report AECL's Nuclear Sites and Projects: 2013* will be published on the CNSC Web site and made available to licensees and stakeholders.

EXECUTIVE SUMMARY

Each year, the Canadian Nuclear Safety Commission (CNSC) produces a report on the performance of Atomic Energy of Canada Limited (AECL) Chalk River Laboratories. This year the scope of the report has been expanded to include an assessment of AECL’s Nuclear Sites and Projects. The report, entitled *Annual Performance Report AECL’s Nuclear Sites and Projects: 2013* summarizes CNSC staff’s assessment of the safety performance of AECL sites and projects where physical operations occurred in 2013:

- Chalk River Laboratories (CRL)
- Whiteshell Laboratories (WL)
- Port Hope Area Initiative (PHAI), which includes the Port Hope Project and the Port Granby Project

The report highlights the regulatory requirements and expectations in selected areas, and discusses significant events, licence changes, major developments and overall performance. It provides performance data on all 14 of the safety and control areas (SCAs) where applicable.

The report is organized by nuclear site and project and covers CRL, WL, the Port Hope Project and the Port Granby Project. The information presented covers the complete 2013 calendar year and, when applicable, compares information to previous years. The report also provides recent updates on key issues up to June 30, 2014.

Overall performance highlights

CNSC staff efforts during the reporting period for AECL’s nuclear sites and projects focused on desktop reviews, performance analyses, and site compliance inspection activities. Inspections conducted in 2013 covered various aspects of many SCAs, commensurate with the risk associated with the facilities. In 2013, a total of 28 inspections were conducted by CNSC staff, 22 at CRL, three at WL, three for the PHAI (1 at Port Hope and 2 at Port Granby). Through these inspections and additional reviews and assessments, CNSC staff conclude that AECL operated all facilities and activities safely during 2013. Overall, AECL made adequate provisions for security, the protection of health and safety of persons and the environment and took the measures required to implement Canada’s international obligations.

The following observations support the conclusion of safe operation:

- No member of the public received a radiation dose that exceeded the regulatory limit
- No worker at any AECL site received a radiation dose that exceeded the regulatory limits
- The frequency and severity of non-radiological injuries to workers were minimal
- No radiological releases to the environment from the sites/projects exceeded the licence limits
- AECL complied with its licence conditions concerning Canada’s international obligations

Tables 1, 5, 10 and 12 summarize the 2013 ratings for AECL's nuclear sites and projects. These tables present the SCAs for each site/project, along with the ratings that gauge the overall safety performance. The rating categories are "fully satisfactory" (FS), "satisfactory" (SA), "below expectations" (BE) and "unacceptable" (UA). A rating of "satisfactory" indicates the licensee's safety and control measures are effective while a "fully satisfactory" indicates they are highly effective. An SCA rating of "below expectations" indicates the safety and control measures are marginally ineffective, while "unacceptable" indicates the safety and control measures are significantly ineffective.

Ratings for CRL for the year 2013 ranged from "below expectations" to "satisfactory". A notable rating change was issued for the SCA "management system" previously reported as "below expectations" in Commission Member Document (CMD) 13-M14: *Report for the Performance of Atomic Energy of Canada Limited Chalk River Laboratories* and now rated as "satisfactory". As indicated in the CMD, this SCA was in an improving trend. Since that report, AECL has completed several improvements that have resulted in the satisfactory rating. Regarding the SCA "fitness for service", CNSC staff continue to rate this SCA as "below expectations" due to the aging and legacy issues of structures, systems and components at CRL, particularly the National Research Universal (NRU) reactor.

For WL, the 2013 ratings were deemed "satisfactory" or "fully satisfactory" for the reporting period which remains unchanged from reports previously made to the Commission in CMD 12-M47: *Interim Status Report on the Progress of Decommissioning Activities at Whiteshell Laboratories*.

Unchanged ratings were also noted for AECL's projects (Port Hope and Port Granby), as previously reported in CMD 11-H10: *Application by Atomic Energy of Canada Limited for a Waste Nuclear Substance Licence for the Port Granby Long-Term Low-Level Radioactive Waste Management Project* and in CMD 12-H10: *Application by Atomic Energy of Canada Limited for Amendment of Waste Nuclear Substance Licence for the Port Hope Long-Term Low-Level Radioactive Waste Management Project.* All SCAs for these two projects continue to be rated as "satisfactory" for the year 2013.

During the review period for the CRL site, CNSC staff have focused and continue to focus oversight efforts on the implementation of the Integrated Implementation Plan (IIP). CNSC staff have been monitoring the progress of the IIP actions throughout the review period. An assessment was performed by CNSC staff in February 2014 to evaluate the implementation of IIP. Overall, CNSC staff conclude that most of the actions reported by AECL as closed have been completed as scheduled (with supporting documented evidence); however, there are many instances where closure of some actions may be delayed. AECL continues to emphasize that the delayed actions have no adverse effect on safety, stating that the overall progress supports ongoing confidence in the safety of the NRU reactor. CNSC staff are following up on these delayed actions with AECL. For more details regarding this assessment, see the related SCA within this report.

Addressing the lessons learned from the nuclear accident at the Fukushima Daiichi nuclear power plant in Japan continues to be a focus area for CNSC staff in 2013 for both the CRL and WL sites. AECL reviewed its existing safety cases and emergency management program against the ability to withstand extreme external events. By reviewing AECL's reports, CNSC staff concur that the underlying defence-in-depth provisions are in place to deal with natural disasters. AECL has identified a number of improvements for CRL and included them in the IIP.

CNSC staff's evaluations conducted throughout the review period identified that AECL has operated the nuclear sites and projects safely. This conclusion is based on CNSC staff's assessment activities which included: site inspections, desktop reviews, event review, follow-up and general communication and exchange of information with the licensee. CNSC staff continue to plan compliance activities over the next year to confirm the effective implementation of AECL's planned activities.

Annual Performance Report of AECL’s Nuclear Sites and Projects: 2013

1 OVERVIEW

1.1 Background

This report on the annual performance of AECL’s nuclear sites and projects: 2013 summarizes CNSC staff’s assessment for the safety performance of AECL sites where physical operations occurred in 2013:

- Chalk River Laboratories (CRL)
- Whiteshell Laboratories (WL)
- Port Hope Area Initiative (PHAI), which includes the Port Hope Project and the Port Granby Project

The report highlights AECL’s performance against the regulatory requirements and expectations, discussing significant events, licence changes, and major developments. It provides performance data on all 14 of the SCAs, where applicable.

The report is organized by nuclear site and project, covering CRL, WL, Port Hope and Port Granby. The information presented covers the complete 2013 calendar year and, when applicable, compares information to previous years. The report also provides recent updates on key issues up to June 30, 2014.

This report has 10 appendices:

- Appendix A: Safety and Control Area Framework
- Appendix B: Rating Methodology and Definitions
- Appendix C: Trend in Safety and Control Area Ratings
- Appendix D: Financial Guarantees
- Appendix E: Worker Dose Data
- Appendix F: Environmental Data
- Appendix G: Status of Fukushima Actions
- Appendix H: Changes to Licence(s) and Licence Conditions Handbook(s)
- Appendix I: Links to Licensee Websites
- Appendix J: Acronyms

1.2 AECL's restructuring

On February 28, 2013, the Minister of Natural Resources announced that Canada would undertake a competitive procurement for a contractor to manage the operations of AECL's nuclear laboratories using a government-owned, contractor-operated model. Similar models are used in the management of nuclear operations in other jurisdictions, such as in the United States and the United Kingdom. Going forward, the nuclear laboratories will focus on three key areas: (i) managing radioactive waste and decommissioning responsibilities; (ii) performing science and technology activities to meet core federal responsibilities; and (iii) supporting Canada's nuclear industry through access to science and technology facilities and expertise on a commercial basis.

The federal government is undergoing a procurement process to obtain the services of a contractor to manage the Canadian Nuclear Laboratories Limited (CNL). The CNL was created in June 2014 as a wholly owned subsidiary of AECL. The plan is that this company will become operational in the fall of 2014; it is anticipated to then become the employer of the majority of AECL's employees. The CNL will perform most of the functions and operations that AECL currently performs, including the management of operations of AECL's nuclear laboratories, dependent upon the attainment of the necessary regulatory approvals. The CNL will hold all necessary licences, permits and other regulatory approvals required to operate AECL's properties and assets. Because the CNL will be a wholly owned subsidiary of AECL, it will retain its overall governance and executive structure and will not fundamentally change.

AECL has applied to transfer (in July 2014) from the AECL parent body to the CNL: (i) CNSC licences (Commission issued, and Designated Officer issued); and (ii) exemptions from *Class II Nuclear Facilities and Prescribed Equipment Regulations* and *Cost Recovery Fees*. CNSC staff are currently drafting a CMD for the transfer of Commission-issued licences and the regulations exemptions that will be presented at an abridged hearing in October. AECL has requested that the effective date of the transfer be coincident with the stand-up (i.e., bringing into operation) of the CNL, which is expected to occur on November 3, 2014. The amendments made to the Commission-issued licences and the issuance of exemptions to the regulations is strictly administrative in nature; the requirements of the licences and the licensing periods will remain the same. The transfer of licences issued by Designated Officers will be processed separately. CNSC staff are monitoring the situation to understand the implications of AECL's restructuring for licensing and compliance activities for its sites.

In late 2015, it is anticipated that the federal government will complete its procurement of a contractor to manage all AECL laboratories and sites. At that time, the ownership of the CNL will be transferred to the contractor, and the contractor will own the CNL for the term of the contract and any subsequent extension. It is anticipated that the CNL will have a new executive team provided by the contractor. It is also expected that the contractor will institute changes in the CNL to bring about business efficiencies. In this regard, CNSC staff have been confirming that the necessary change management requirements are in place and that they will remain in place throughout the transition.

1.3 CNSC's regulatory efforts

The CNSC regulates Canada's nuclear research and testing establishments and waste nuclear substances in order to protect the health and safety of persons, to protect the environment, and to ensure that Canada continues to implement its international obligations on the peaceful use of nuclear energy. The CNSC achieves this mission by ensuring compliance through verification, enforcement and reporting.

CNSC staff establish compliance plans for each licensed facility based on the relative risks of the facility's activities in order to identify appropriate levels of regulatory monitoring and control. Modifications to the compliance plans are made on an ongoing basis in response to events, facility modifications and changes in licensee performance.

CNSC staff efforts during the reporting period for AECL's nuclear sites and projects focused on desktop reviews, performance analyses, and site compliance inspection activities. Inspections conducted in 2013 covered various aspects of many SCAs, commensurate with the risk associated with the facilities. For CRL, WL, and the PHAI, CNSC staff's assessments and inspections confirmed that:

- no member of the public received a radiation dose that exceeded the regulatory limit
- no worker received a radiation dose that exceeded the regulatory limits
- the frequency and severity of injuries/accidents involving workers were minimal
- no radiological releases exceeded the regulatory limits
- AECL complied with its licence conditions

CNSC staff also verified compliance through desktop reviews of reports, applications and licensee programs which are supplemented with meetings, presentations, and facility visits.

In 2013, CNSC staff efforts continued to focus on the lessons learned from the nuclear accident at the Fukushima Daiichi nuclear power plant in Japan. For each of the facilities covered by this report, AECL reviewed existing safety cases and emergency management programs against its sites' abilities to withstand extreme external events. CNSC staff reviewed and verified the licensee reports and findings. CNSC staff conclude that the underlying defence-in-depth controls are in place to deal with natural disasters, confirming that the facilities continue to be operated safely. AECL continues to make improvements identified in the Fukushima action plan.

CNSC staff previously updated the Commission regarding CNSC's Fukushima action plans. These updates were presented in October 2012 and August 2013, as referenced below:

- CMD 12-M56 Status Update on the CNSC Action Plan: Lessons Learned from the Fukushima Accident, October 2012; and

- CMD 13-M34 Status Update on the CNSC Integrated Action Plan: Lessons Learned from the Fukushima Accident, August 2013.

The current status of the Fukushima actions for CRL and WL can be viewed in appendix G. There are no Fukushima actions for the PHAI.

1.4 Public information and disclosure

Licensees have an important responsibility to inform the public about their respective nuclear facilities and activities. To ensure Class I licensees (such as CRL and WL) provide open and transparent information to the public, in 2012, the CNSC published new regulatory requirements in RD/GD-99.3, *Public Information and Disclosure*.

These regulatory requirements include:

- The identification of clear and measurable objectives
- The identification of target audiences
- The tracking of public comments and concerns related to licensee activities
- The development of strategies for open and transparent communication of information
- The establishment and implementation of rules for the public disclosure of information
- The review and evaluation of the public information and disclosure programs to determine their effectiveness and the identification of improvements
- The documentation of records to demonstrate that public information and disclosure requirements are met

Since 2011, AECL has made significant progress in developing its Corporate Public Information Program (PIP) and disclosure protocol and incorporating its activities among its various sites which meets the requirements of RD/GD-99.3. A challenge remains, however, in balancing the level of public interest, involvement and information disclosure commensurate with the public perception of risk for each site/project in one corporate program. Although the varied risk levels of each site are recognized, this challenge needs to be articulated within the PIP to provide the context and scope for individual evaluations. AECL is addressing this as part of the regular updates to its PIP as required by RD/GD-99.3.

Further information on the performance of specific site/project PIPs can be found in corresponding sections of this report.

1.5 Nuclear Legacy Liabilities Program

The Nuclear Legacy Liabilities Program (NLLP) was established by the Government of Canada in 2006 to manage Canada's nuclear legacy liabilities at AECL sites (other than the PHAI). The main objective of the NLLP is to safely and cost-effectively reduce the nuclear legacy liabilities on AECL's sites and the associated risks based on sound waste management and environmental principles. The NLLP includes projects to design, construct and operate waste processing and storage facilities; to identify viable long-term management, waste acceptance criteria, and interim end state criteria; to develop decommissioning strategies; and to remediate contaminated lands and areas arising from past practices and legacy wastes.

Canada's nuclear legacy liabilities comprise aging nuclear facilities and associated infrastructure, a wide variety of buried and stored waste, and contaminated lands, all the result of nuclear research and development, medical isotope production and the production of heavy water for use in nuclear power reactors. The earliest liabilities were generated in 1944 by the National Research Council, as part of the national Second World War effort, and since 1952 by AECL, the federal Crown Corporation established to exploit the peaceful applications of the atom. The nuclear legacy liabilities are associated with a number of sites (figure 1), as follows:

- Chalk River Laboratories in Chalk River, Ontario
- Whiteshell Laboratories in Pinawa, Manitoba and the nearby Underground Research Laboratory
- The partially decommissioned Douglas Point prototype power reactor in Kincardine, Ontario
- The partially decommissioned Nuclear Power Demonstration (NPD) prototype power reactor in Rolphton, Ontario
- The partially decommissioned Gentilly-l prototype power reactor located near Bécancour, Quebec
- The site of the former heavy water plant in Laprade, Quebec (near the Gentilly-l reactor)

Currently, Douglas Point, NPD, and Gentilly-1 are each in a safe storage state with no operational activities taking place during 2013.

In addition to the NLLP, the PHAI is funded separately. In a news release from January 13, 2012, Canada's Minister of Natural Resources announced that the Government of Canada is investing $1.28 billion over 10 years to clean up low-level radioactive waste in the Port Hope area.

Figure 1: AECL sites associated with the Nuclear Legacy Liabilities Program

The CRL and WL sites contain the majority of the nuclear legacy liabilities. At these sites, the inventory of legacy wastes includes used nuclear fuel, and intermediate-level and low-level solid and liquid radioactive waste, as well as contaminated lands, buildings, structures, and tanks. It also includes waste from site clean-up work performed across Canada (e.g., contaminated soils) and radioactive waste received from Canadian hospitals, research facilities, and universities. Prior to the NLLP, most of the legacy waste was in an unconditioned form, and limited characterization information was available for the waste generated in the past. Efforts are currently being made by AECL to both re-package and characterize these wastes as part of the NLLP.

In January 2014, AECL and CNSC staff agreed to a series of meetings to discuss strategic initiatives associated with the NLLP activities. The objective of the meetings was to ensure a better informed approach and alignment with international best practice in the development of waste solutions, executing selected projects and developing an acceptable disposal strategy that includes in-situ disposal, all to be considered in the context of the NLLP.

The NLLP projects and associated actions/milestones are also subject to the CNSC compliance activities. AECL submits semi-annual progress updates on key NLLP projects and matters of interest. Compliance findings for the projects executed under the NLLP are listed within this report under the SCA "waste management" for CRL and WL.

PART I: NUCLEAR SITES

2 OVERVIEW

The Chalk River Laboratories (CRL) are located in the province of Ontario, 160 kilometres northwest of Canada's national capital, Ottawa, and represent the largest single complex within Canada's science and technology infrastructure. The site contains several nuclear facilities, including the National Research Universal (NRU) reactor, Molybdenum Production Facility, waste management areas, and many other facilities and laboratories.

The Whiteshell Laboratories (WL), located 100 kilometres northeast of Winnipeg, Manitoba, operated from 1961 to 1997. This is where AECL pioneered the development of dry storage containment facilities for used nuclear fuel, a technology that is now in use throughout the world. The site is no longer operating and is currently being decommissioned.

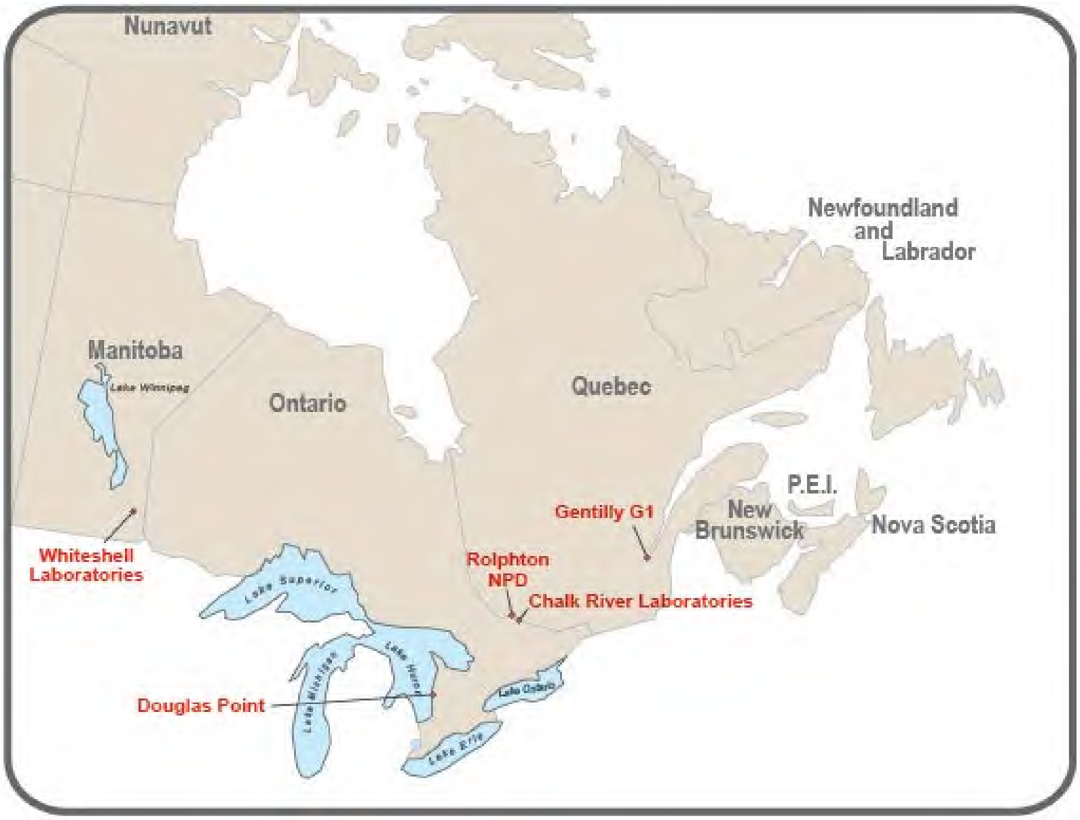
In addition to these two sites, AECL also maintains a number of nuclear reactor facilities that include Douglas Point, Nuclear Power Demonstration, and Gentilly-l. At the time of writing of this report, these sites were transitioning to modern licences and were therefore not included in the report. An abridged hearing was held on June 30, 2014, where an update on these sites was given via CMD 14-H107: *Application by Atomic Energy of Canada Limited to Replace the AECL Prototype Waste Management Facility Licences*.

Part I of this report focuses on two of AECL nuclear sites in Canada. These sites are:

- AECL's Chalk River Laboratories
- AECL's Whiteshell Laboratories

The locations of AECL's nuclear sites in Canada are shown in figure 2.

Figure 2: Location of AECL's nuclear sites



2.1 Chalk River Laboratories

2.1.1 Overview

Figure 2-1: Chalk River Laboratories as seen from above

(Source: AECL)

Located on the south shore of the Ottawa River, 160 kilometres northwest of Ottawa, CRL is one of the most complex nuclear facilities in Canada. The CRL site is occupied by 159 buildings. Outside the built-up area, there are several waste management areas for handling and storage of both nuclear and non-nuclear waste. AECL employs approximately 3000 people at the CRL site. The site is expected to continue operating for many years, although some facilities will undergo decommissioning activities. For planning purposes, the remaining operational life of the site is assumed to be approximately 85 years.

The CRL site provides for the production of medical isotopes, the delivery of various nuclear services and the conduct of a wide variety of research and development programs. The site includes 12 Class I nuclear facilities in an operational state and six either in extended shutdown or in storage with surveillance, including research reactors, processing facilities, fuel manufacturing facilities, and hot cells. The site also includes 13 different waste management areas, five in operation and eight in long-term monitoring, three Class II nuclear facilities such as accelerators and irradiators, and more than 50 radioisotope laboratories, support facilities and offices.

After a two-day public hearing held on June 8, 2011 and October 4, 2011, the CNSC issued a five-year operating licence to AECL for the operation of the CRL site, valid from November 1, 2011 to October 31, 2016 [2]. To support licence renewal, AECL conducted an Integrated Safety Review of the NRU reactor which resulted in a list of actions referred to as the Integrated Implementation Plan (IIP). The IIP drives improvements related to the NRU reactor for the current licensing period (expiring 2016), and provides an overview of additional action plans for the period of 2016 to 2021. CNSC staff have been monitoring the progress of IIP actions throughout the review period. Details of the compliance activities related to oversight of IIP implementation are provided in the relevant SCA.

CNSC staff continue to verify implementation of AECL's programs at CRL and assess them against the performance objectives and compliance verification criteria defined in the regulations, the licence [1] and the Licence Conditions Handbook (LCH) [2, 3]. Verification includes desktop reviews and site inspections. Program documents referenced in the LCH are revised by AECL as needed; these are subject to desktop review by CNSC staff, as appropriate. Many inspections have been carried out during the review period; details of these are provided in the related SCAs within the report.

An update on the performance of CRL operations by SCA follows. For 2013, the ratings concerning each SCA are based on CNSC staff assessment for the review period. The review period for CRL is the complete 2013 calendar year and, when applicable, compares information to previous years. The report also provides recent updates on key issues through June 30, 2014.

2.1.2 Public information and disclosure

As previously stated, licensees are required to have a robust public information program and public disclosure protocol as a fundamental element in accordance with RD/GD-99.3, *Public Information and Disclosure*. As a component, where the public has indicated an interest to be informed, the program shall include a protocol for ongoing, timely communication of information related to the licensed facility during the course of the licence period.

AECL has met the requirement of RD/GD-99.3 when it comes to keeping the public informed of and disclosing activities at CRL, including for example, any environmental releases, emergency preparedness drills/exercises, and the posting of reports. AECL is aware of its role in the community and is also aware of sensitivities, which AECL regularly brings to its Environmental Stewardship Council.

When dealing specifically with Aboriginal communities interested in CRL, AECL conducts engagement activities targeted to them, including ensuring there is representation from Aboriginal groups on the Environmental Stewardship Council. During the review period, CNSC staff have been satisfied with AECL's engagement activities and deem them appropriate to keep interested Aboriginal groups informed.

2.1.3 Safety and control areas

Table 1 presents the ratings for CRL for the year 2013. All SCA ratings ranged from "below expectations" to "satisfactory" for this reporting period. A notable rating change was issued for the SCA "management system" previously reported as "below expectations" in CMD 13-M14 [4] and now rated as "satisfactory". As indicated in [4], this SCA has been exhibiting an improving trend. Since the last CNSC staff report, AECL has completed several improvements that have resulted in the satisfactory rating. Regarding the SCA "fitness for service", CNSC staff continue to rate this SCA as "below expectations" due to the aging and legacy issues of structures, systems and components (SSCs) at CRL, particularly the NRU reactor. More details on this SCA and the performance of all SCAs are contained within the particular sections below.

Table 1: Performance ratings for Chalk River Laboratories

Safety and control area	Rating
Management system	**SA**
Human performance management	**SA**
Operating performance	**SA**
Safety analysis	**SA**
Physical design	**SA**
Fitness for service	**BE**
Radiation protection	**SA**
Conventional health and safety	**SA**
Environmental protection	**SA**
Emergency management and fire protection	**SA**
Waste management	**SA**
Security	**SA**
Safeguards and non-proliferation	**SA**
Packaging and transport	**SA**

Notes:

- For specific areas within the SCAs where there were no significant observations from CNSC staff compliance verification activities, no information is given in the subsection of the report.
- The information presented below is site specific; general trends are not identified.

Management system

RATINGS FOR MANAGEMENT SYSTEM		
Overall Performance Ratings		
2011	2012	2013
BE	BE	SA
For the review period, CNSC staff rate the "management system" SCA at CRL as "satisfactory" primarily based on progress related to AECL's transition to the CSA (Canadian Standards Association, now called the CSA Group), standard N286-05, *Management System Requirements for Nuclear Power Plants*, improvements made in safety culture and further implementation of the Operating Experience (OPEX) program.		

The "management system" SCA covers the framework establishing the processes and programs required to ensure an organization achieves its safety objectives, continuously monitors its performance against these objectives, and fosters a healthy safety culture.

For CRL, this SCA encompasses the following specific areas:

- Management system
- Organization (see section 1.2 on AECL restructuring)
- Performance assessment, improvement and management review (no significant observations to report)
- Operating experience
- Change management
- Safety culture
- Records management (no significant observations to report)
- Management of contractors (no significant observations to report)
- Business continuity (no significant observations to report)

Management system

<u>Transition towards compliance with CSA N286-05</u>

At licence renewal in 2011, CNSC staff indicated that AECL was transitioning to a management system for CRL, that met the requirements of CSA N286-05, *Management System Requirements for Nuclear Power Plants*. AECL's transition plan to CSA N286-05, including the timelines, is listed in the LCH.

In the last review [4], CNSC staff noted that AECL was taking steps to implement the transition in accordance with its Project Execution Plan [6], identifying the actions and timelines to meet the requirements of the standard.

In July 2013, AECL reported that the transition activities included in Phase I of the Project Execution Plan were completed and concluded that "AECL's Management System substantially complies with the requirements of CSA N286-05", addressing over 80 percent of the previously identified gaps. CNSC staff observed that AECL had recognized the need to execute additional transition activities for gaps associated with the following elements of the standard:

- Operating procedures
- Changes are controlled
- Safety analysis
- Verification of work
- Preparation and distribution of documents are controlled
- Identification and labelling of systems and components
- Surveillance testing

AECL submitted the revised version of the Project Execution Plan, including in it, revised due dates for actions and additional transition activities (identified at the completion of Phase I) required for AECL's management system to become fully compliant with the standard. AECL progress against Phase II, ending June 30, 2015, is currently on track. CNSC staff recognize that this transition is a very lengthy process and that a cautious approach is required. The complete transition to CSA N286-05 is scheduled for June 2016.

As stated in CMD 13-M14 [4], acknowledging that AECL is taking appropriate steps to complete the transition to a management system fully compliant with the requirements of the standard, CNSC staff are conducting compliance verification activities of AECL's management system. Thus, CNSC staff are currently reviewing a sample of AECL's programmatic documents that have been revised as part of Phase I transition to CSA N286-05. Also, CNSC staff have conducted an inspection to assess AECL's implementation of its revised processes. These verification activities have focussed on key AECL processes, such as procurement, construction, installation, commissioning and turnover processes. Improvements are needed in the conduct of commissioning and completion assurance. AECL has submitted its proposed actions to address these elements which CNSC staff are reviewing.

Management System Manual

As previously reported [4], CNSC staff reviewed revision 2 of AECL's *Management System Manual* and identified opportunities for improvement related to consistent definitions of roles and responsibilities, and clarification of interfaces.

AECL recently revised its *Management System Manual* which documents the framework through which all work is managed and executed. CNSC staff are in the process of reviewing this manual, including several subsidiary documents to which it refers.

Operating experience

The OPEX program at AECL comprises the processes that ensure the organization uses the experience both from within the organization and from industry peers to improve the safety of operations, improve operational performance, and reduce the significance and the occurrence of unplanned events. OPEX provides the process for the identification and investigation of unplanned events, the apparent cause analysis and root cause analysis, determination of corrective actions, notification of stakeholders, trending and information sharing internally and between industry peers.

The OPEX program has matured significantly since licence renewal in 2011, when many recently introduced processes were still in early development. Such processes include AECL's Improvement Action process which is the vehicle used for reporting adverse conditions, with a specific focus on events with potential consequences on health, safety, security and the environment.

The OPEX program was one of the areas identified as needing improvement under AECL's Voyageur Phase-II improvement plan, including the strengthening of the cause analysis processes, corrective action, trending and ensuring the broad use of lessons learned by AECL personnel to improve safety, reliability, time at risk and overall performance. All actions from the Voyageur Phase-II were completed, including those on OPEX processes. More details on the Voyageur Phase-II can be found in the safety culture section below.

Other processes under the OPEX program, such as trending, internal and external sharing of safety issues, communication of safety information and benchmarking appear to be effective and satisfactory. CNSC staff will continue to confirm this during an assessment of components of the OPEX program in 2015. The OPEX program has increased its presence at AECL, and its overall contribution to safety, by way of integration into processes, procedures, plans and operations has been beneficial.

Change management

In September 2012, CNSC staff conducted an inspection of the organizational change control process, implemented at CRL in March 2011 within the 'Operations' Division. CNSC staff found that AECL followed this process for the reorganization; however, CNSC staff identified that AECL did not perform a post-reorganization assessment to evaluate the impact of the change as required by its processes. Consequently, CNSC staff requested AECL to conduct a post-reorganization self-assessment. AECL communicated the results of its self-assessment which was reviewed and accepted by CNSC staff. Further inspections of AECL's organizational change control process will be conducted to verify all elements of the process are being performed.

CNSC staff also identified the need for AECL to conduct self-assessments during the inspections of the NRU extended outage in 2012 and the system health program in 2013 (see the specific area "outage management performance" in the SCA "operating performance"). In both instances, AECL has committed to conducting self-assessments of these newly established processes to identify opportunities for improvement.

In conclusion, CNSC staff have observed that AECL would benefit from periodic reviews and self-assessments of important initiatives to confirm that they (1) meet requirements, (2) bring about the goals of the organization, and (3) identify opportunities for improvement. CNSC staff will continue to monitor AECL's performance of assessments during the remainder of the licence period.

Safety culture

Safety culture at AECL has been the object of important strides for improvement, especially since the 2009 vessel leak event [5], which highlighted some shortcomings in the areas of safety culture and human performance. In response to this event, AECL undertook a significant effort to improve a wide range of programs and elements of safety culture and human performance. AECL built upon the Voyageur theme introduced in 2006 and revitalized this improvement plan as the Voyageur Phase-II. The Voyageur Phase-II included 98 actions linked to each of the contributing factors of the vessel leak event, many of which were in the area of safety culture. CNSC staff have closely followed the implementation of this plan, ensuring that AECL carries out the actions as committed in the Voyageur Phase-II. During the review period, CNSC staff verified that all actions under the Voyageur Phase-II were completed.

Changes in safety culture within AECL have been noticeable in a wide range of activities. CNSC staff observed the use of event free tools (questioning attitude, pre-job-briefings, procedure adherence, three-way communication, Stop-Think-Act-Review) in daily operations. Observation and coaching is also carried out broadly, contributing to improvements in safe practices.

Human performance management

RATINGS FOR HUMAN PERFORMANCE MANAGEMENT		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continued to rate the "human performance management" SCA at CRL as "satisfactory". Significant improvements were made during the review period including the completion of the Voyageur Phase-II, the creation of a formal Human Performance program, a program based on the Systematic Approach to Training and the development of the Practical Learning Facility.		

The "human performance management" SCA covers the activities that enable effective human performance through the development and implementation of processes that ensure a sufficient number of licensee personnel are in all relevant job areas and have the necessary knowledge, skills, procedures and tools in place to safely carry out their duties.

For CRL, this SCA encompasses the following specific areas:

- Human performance program
- Personnel training
- Personnel certification
- Work organization and job design (no significant observations to report)
- Fitness for duty (no significant observations to report)

AECL employees participating in an on-the-job training session

Human performance program

AECL has made significant efforts to develop and improve human performance in all operations at CRL during the review period, particularly via the Voyageur Phase-II program. AECL has also implemented a Practical Learning Facility. The facility includes the following practice stations: Lock-Out Tag Out, use of harnesses, three-way communication simulator, including a rig with pumps circulating water with different controls and actuators, foreign material exclusion, fire response, and radiation protection.

In February 2013, during a controlled shut down of the NRU reactor, a potential loss-of-flow event occurred when inadvertent closure of the main heavy water pump outlet isolation valves was manually initiated. This event was reported to the Commission via an Event Initial Report (EIR) in May 2013 [6]. AECL completed a root cause analysis that identified causal factors and corrective actions, with a focus on training and the use of event free tools, to prevent recurrence of this event. AECL also performed a technical assessment of the potential consequences had the error not been discovered and the valves not been re-opened. CNSC staff continue to follow-up with AECL on this event and AECL's subsequent assessment of the potential impacts of a loss-of-flow event on the safety of the NRU reactor. As a corrective measure stemming from this event, all NRU direct operational personnel are required to complete Operator Fundamentals training in the Practical Learning Facility. CNSC staff note this facility and the mandatory training are significant developments in promotion of better human performance.

Personnel training

In 2013, CNSC staff conducted an inspection of AECL's Radiation Protection training program. The objective of the inspection was to verify compliance with AECL's Systematic Approach to Training (SAT), as required by section 3.2 of the LCH for the Chalk River Laboratories.

This inspection concluded that, although AECL has established training processes and procedures in accordance with SAT, AECL's Radiation Protection training program is not fully compliant with the processes and procedures under AECL's SAT-based training system. AECL subsequently developed an action plan to address the inspection findings which was found acceptable by CNSC staff. Completion of actions is targeted for April 2016. CNSC staff are monitoring the progress to completion of these actions.

Personnel certification

AECL is required to maintain a sufficient number of certified senior reactor shift engineers and NRU health physicists to support NRU operations. During the review period, AECL successfully certified four senior reactor shift engineers and one health physicist. CNSC staff are confident that all certified staff at CRL are competent to perform the duties of their respective positions.

The current complement of reactor engineers is deemed sufficient; however, CNSC staff have expressed concerns with the current complement of certified health physicists. Frequently, during the review period, NRU operations was reliant on one certified health physicist due to the unavailability of the other certified health physicist. The reliance upon one certified health physicist resulted in AECL requesting time limited changes from the LCH to allow a former certified health physicist to cover for periods of rest and vacations. This interim measure was accepted by CNSC staff with the commitment from AECL to develop a plan that will ensure sustainability of this position for future NRU operations. CNSC staff are tracking this plan closely.

Operating performance

RATINGS FOR OPERATING PERFORMANCE		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
The rating for the "operating performance" SCA over the review period is "satisfactory". Overall, AECL operated CRL safely and in compliance with the *Nuclear Safety and Control Act* (NSCA), regulations, conditions of the licence and the Licence Conditions Handbook, and in accordance with the licensing basis.		

The "operating performance" SCA includes an overall review of the conduct of the licensed activities and the activities that enable effective performance.

For CRL, this SCA encompasses the following specific areas:

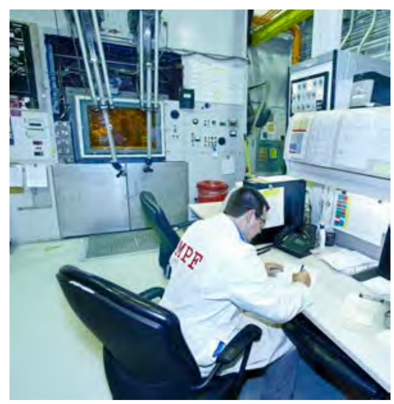
- Conduct of licensed activity
- Procedures
- Reporting and trending
- Outage management performance (NRU reactor)

Conduct of licensed activity

Facilities at CRL are governed by AECL's *Facility Authorization* and *Conduct of Operations* documents, which indicate the operational limits and conditions for the various facilities. Facilities in storage with surveillance or undergoing active decommissioning are governed by storage-with-surveillance plans or decommissioning plans.

These governing documents prescribe how each facility are operated and maintained to ensure nuclear safety and keep the risk to the public acceptably low. As such, they are referenced in the CRL operating licence and listed in the LCH.

CNSC staff assessments conclude that AECL has conducted its activities at CRL in compliance with regulatory requirements and the licensing basis for CRL.



Molybdenum-99 production technician

Procedures

AECL maintains a comprehensive suite of procedures across all programs and facilities at the CRL site. During the review period, facility-specific procedures relating to operations, maintenance, and emergency response were reviewed and updated as required. There were no significant changes to operating documentation that could have affected the safe operation of facilities at CRL.

As part of the IIP, AECL is prepared to update operating manuals for the NRU reactor and issue the revised manuals for use. AECL has developed the framework by which the manuals will be revised, updated and validated to meet best practice. AECL continues to work toward the target end date of March 31, 2016, for this project.

Reporting and trending

The requirements for reporting unplanned situations or events at CRL to the CNSC are prescribed in appendix H of the CRL's LCH. AECL has complied with the requirements for submission of these reports during the review period.

AECL categorizes reportable events by Significance Level as follows:

- Significance Level 1: Highly significant problem
- Significance Level 2: Significant problem
- Significance Level 3: Problem
- Significance Level 4: Minor problem/improvement

Events reported to the CNSC by Significance Level category are presented in table 2:

Table 2: Reportable events for CRL (2011-2013)

	2011	2012	2013
Level 1	-	-	1
Level 2	17	24	14
Level 3	162	95	110
Level 4	44	34	41
Total	**223**	**153**	**166**

The Level 1 event was reported to the Commission via an EIR [6] and is discussed in the human performance management SCA. CNSC staff's review of the other reports did not identify significant regulatory concerns, thus those were not subject to EIRs or otherwise reportings to the Commission.

AECL also submits annual reports on compliance monitoring and operational performance of facilities at CRL, as required by condition 4.16 of the CRL operating licence. No significant regulatory issues were identified during CNSC staff's review of these reports.

Outage management performance (NRU reactor)

Continued operation of the NRU reactor has historically relied upon periodic outages to conduct maintenance that cannot be performed with the reactor at power. AECL operates the NRU reactor for two to three weeks and then shuts it down for planned five-day maintenance outages.

Condition 16.1 of the CRL operating licence additionally requires AECL to implement extended outages for the NRU reactor in order to perform maintenance, inspection, repair and replacement activities that cannot be completed during the regular monthly maintenance outages, including hardware improvements required by the IIP.

CNSC staff closely monitored the 2011, 2012, and 2013 extended outages. AECL's performance in the planning and preparation of these outages has improved over time. Further monitoring will be conducted in order to assess AECL's management and implementation of activities.

Safety analysis

RATINGS FOR SAFETY ANALYSIS		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "safety analysis" SCA at CRL as "satisfactory" based on the information assessed. CNSC staff conclude that the implementation of the safety analyses at CRL meets applicable regulatory requirements.		

The "safety analysis" SCA covers maintenance of the safety analysis that supports the overall safety case for CRL facilities. Safety analysis is a systematic evaluation of the potential hazards associated with the conduct of a proposed activity or facility and considers the effectiveness of preventive measures and strategies in reducing the effects of such hazards.

For CRL, this SCA encompasses the following specific areas:

- Deterministic safety analysis
- Hazard analysis
- Probabilistic safety analysis
- Criticality safety
- Severe accident analysis
- Environmental risk assessment

Deterministic safety analysis

The safety analyses for CRL facilities are mostly deterministic complemented in cases by probabilistic safety analysis (PSA) and hazard analysis.

A formal Safety Analysis Report (SAR) is required under the *Class I Nuclear Facilities Regulations* for Class I nuclear facilities. In addition, AECL has performed safety analyses for its Class II nuclear facilities, radioisotope laboratories and other locations at CRL where nuclear materials are used. There are currently 33 safety analyses documented for Class I and Class II nuclear facilities. AECL has updated five SARs (for Recycle Fuel Fabrication Laboratories, Tritium Facility, Health Physics Neutron Generator, Fuel and Materials Cells Facilities, and the Van de Graaff Accelerator) and produced a SAR for the new Fuel Packaging and Storage facility. The safety analyses demonstrate that, for operation of the nuclear facilities, operational limits are not exceeded, radiological doses to workers and members of the public are within the prescribed limits, and releases of radioactive materials into the environment are within the limits allowed by the licence.

AECL has committed to completing the revision of the NRU reactor SAR by March 30, 2016, through the IIP. The revised SAR will incorporate and integrate results of previously submitted deterministic safety analyses, PSA, hazard analyses, criticality safety, and severe accident analyses. During an assessment, CNSC staff confirmed that AECL has taken some measures to expedite the initiation and execution of work by a contractor to recover delays in the project under IIP.

Hazard analysis

Various hazard analysis techniques are used to determine internal and external events to be considered for the design basis of new nuclear facilities at CRL. The major techniques used are Preliminary Hazard Analysis, Hazard and Operability Study, Failure Modes and Effects Analysis and "What If" Analysis. In addition, systematic review of hazards from similar facilities is performed. The extensive use of these hazard identification methods by AECL gives confidence that all major hazards are identified and have produced a clear design basis.

Fire protection

AECL has a robust fire protection program in place for the CRL site which complies with the current licence and associated LCH, the *National Building Code*, the *National Fire Code*, and NFPA-801: *Fire Protection for Facilities Handling Radioactive Material*. During the review period, CNSC and AECL fire protection staff held regular meetings to discuss the progress of projects and any other programmatic matters or subjects of interest.

Probabilistic safety analysis

The probabilistic safety analysis is used where methods and data are available to complement the deterministic safety analysis in support of safety case for CRL facilities, and to evaluate and optimize facility design.

AECL has conducted Level 1 and Level 2 PSA for the NRU reactor according to REGDOC-2.4.2, *Probabilistic Safety Assessment (PSA) for Nuclear Power Plants*. CNSC staff have reviewed AECL's Level 1 and Level 2 PSA and deemed them acceptable.

Criticality safety

This specific area addresses operations with fissionable materials outside nuclear reactors and prevention of nuclear criticality events.

CNSC requirements for the prevention of criticality accidents in operations with fissionable materials are documented in RD-327, *Nuclear Criticality Safety*. The associated GD-327, *Guidance for Nuclear Criticality Safety*, provides information on how to meet those requirements.

The CRL site operating licence requires AECL to implement and maintain a nuclear criticality safety program compliant with RD-327, *Nuclear Criticality Safety*. AECL has developed a suite of nuclear criticality safety program documents acceptable to CNSC staff. AECL has made significant progress in the implementation of the program through revisions and updates to the nuclear criticality safety documents.

There are currently 46 criticality safety documents for CRL. Due to the nature of the work changing since 2011, AECL has revised and updated 11 of these documents. AECL continues to conduct updates as needed.

Severe accident analysis

Regulatory document: REGDOC-2.3.2, *Severe Accident Management Program for Nuclear Reactors*, issued in September 2013, describes CNSC's expectation that AECL develops and implements measures to:

- prevent the escalation of a reactor accident into an event involving severe damage to the reactor core
- mitigate the consequences of an accident involving severe damage to the reactor core
- achieve a safe, stable state of the reactor and plant over the long term

Related to this specific area, AECL continues to implement the Fukushima action items established to address the recommendations of the CNSC Fukushima Task Force through the NRU's IIP. The progress of these actions can be viewed in appendix G of this report.

AECL has performed a severe accident analysis for the NRU reactor and developed a framework for development and implementation of an NRU severe accident management program (SAMP). The completion of SAMP implementation is targeted for September 30, 2015. CNSC staff confirmed through an assessment that AECL's project management tools and practices are helping AECL toward the successful completion of the SAMP project.

Environmental risk assessment

AECL has performed an environmental risk assessment for the CRL site based on the CSA standard N288.6, *Environmental Risk Assessment at Class I Nuclear Facilities and Uranium Mines and Mills*. The assessment has predicted acceptably low risk and adequate provision for the protection of the environment and public.

On December 16, 2013, a Memorandum of Understanding (MOU) was signed between the CNSC and the Department of Fisheries and Oceans (DFO). Under the MOU, the CNSC is now responsible for reviewing licence applications for potential impacts to fish and fish habitats and informing the DFO of all applications where a *Fisheries Act* authorization is anticipated. The CNSC will also monitor compliance with any condition relating to fish and fish habitat in CNSC licences. The issuance of *Fisheries Act* authorizations remains the responsibility of the DFO Minister.

Physical design

RATINGS FOR PHYSICAL DESIGN		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff continue to rate the "physical design" SCA at CRL as "satisfactory" as the information assessed meets regulatory requirements.		

The "physical design" SCA relates to activities that impact upon the ability of structures, systems, and components (SSCs) and to meet and maintain their design basis given new information arising over time and taking changes in the external environment into account.

For CRL, this SCA encompasses the following specific areas:

- Design governance
- Site characterization
- Facility design
- Structure design (no significant observations to report)
- System design (no significant observations to report)
- Component design (no significant observations to report)

Design governance

Requirements specified in AECL's conduct of design engineering document and associated procedures and instructions ensure that:

- design activities are defined, effectively planned, and controlled
- work activities are coordinated and progress monitored
- performance of work is verified to meet design, customer, and regulatory requirements in accordance with approved procedures and applicable codes and safety standards

Several documents were updated in 2013 to improve the overall design engineering process addressing topics such as:

- Conduct of design engineering
- Design engineering and configuration management
- Engineering change control, including reduced risk engineering change control
- Field change control
- Technical operability evaluation
- Environmental qualification
- Human factors
- Contractor supplied design
- Release of design documents for manufacturing and construction
- Conduct of procurement engineering

Changes were also made to safety engineering procedures that impact upon the control of design processes. The changes to safety engineering procedures are discussed in the safety analysis SCA.

Site characterization

AECL document *CRL Site Characteristics* provides details on the CRL site characteristics most commonly used in the preparation of other documentation, such as safety analysis reports. The information in this document is also intended to be used in the design of new, and modification of existing, nuclear facilities at CRL or CRL site infrastructure.

AECL revised and updated the document to include the lessons learned from Fukushima event. Some of the notable changes are:

- design basis tornado for the CRL site, which increased from a 1 to a 2 on the Enhanced Fujita Scale

- provisions of additional details added to the flood analysis to (a) summarize the analysis basis, its facts and assumptions, (b) address possible effects of a frozen river, and (c) review the models used to calculate flood levels and also the simulation software used to implement the models
- review of class IV power to address the expected improvements in class IV reliability as a result of class IV upgrade project
- information regarding the population around CRL which has been updated according to 2011 census data

Facility design

CNSC staff reviewed the design of two new facilities: the Fuel Packaging and Storage (FPS) Facility and the Shielded Modular Above-Ground Storage building (SMAGS 3), located in the waste management areas.

Fuel Packaging and Storage facility

AECL has over 750 tile holes (below-grade vertical cylindrical concrete pipes sitting on a poured concrete base and backfilled with sand) located in the Waste Management Area B containing spent fuel rods used in research reactors and as prototypes. Approximately 100 tile holes have shown signs of degradation (e.g., fuel corrosion, production of hydrogen gas). AECL designed and built the FPS facility in order to retrieve the spent fuel from specific tile holes and store them in a better controlled and monitored facility and up to current standards.

The storage block of the FPS facility is designed to last at a minimum 50 years and will provide safe interim storage for the packaged fuel until a disposal or a long-term storage facility is available. The Nuclear Waste Management Organization (NWMO) assumes responsibility for long-term management of Canada's used nuclear fuel. The NWMO estimates an operating repository will be available within the next 30 to 40 years.

The Fuel Packaging and Storage facility storage block

The safety analysis report for the FPS facility demonstrates the adequacy of the facility design, and the Commission granted the approval to operate the FPS facility [7]. For more information on the FPS facility, see the waste management SCA.

Shielded Modular Above-Ground Storage building

SMAGS are engineered facilities designed for the storage of packaged low-level solid radioactive waste. CNSC staff have reviewed the design requirements document for the SMAGS 3 and concluded the SMAGS 3 was designed to an appropriate set of codes and standards. Subsequently, CNSC staff granted AECL the approval to construct the SMAGS 3.

Fitness for service

RATINGS FOR FITNESS FOR SERVICE		
Overall Performance Ratings		
2011	**2012**	**2013**
BE	BE	BE
For the review period, CNSC staff continue to rate the "fitness for service" SCA at CRL as "below expectations" due to the aging and legacy issues of systems, structures and components, particularly the NRU reactor.		

The "fitness for service" SCA covers activities that impact the physical condition of SSCs to ensure that they remain effective over time. This area includes programs that ensure all equipment is available to perform its intended design function when called upon to do so.

For CRL, this SCA encompasses the following specific areas:

- Equipment fitness for service / equipment performance
- Maintenance
- Structural integrity
- Aging management
- Chemistry control

Equipment fitness for service / equipment performance

During the review period, AECL addressed a number of issues previously reported to the Commission [4], including the NRU reactor ceiling repairs, the active drain system lines replacement, the NRU reactor fixed radiation monitors, and the fire water supply system. Hardware improvements for the NRU reactor have also been implemented through the IIP. These improvements were confirmed by CNSC staff during the IIP assessment, and found that, for most of the items assessed, the equipment inspections or replacements had progressed or had been completed as planned. For instance, CNSC staff confirmed the completion of inspections of Building 440's (Emergency Water Supply) 35 cm and 50 cm pipes and valves, the replacement of the small gasholders bellows, the replacement and inspection of the heat exchangers 23 and 50, and rectifier #2.

AECL continues to experience challenges due to equipment aging; however, in all instances, AECL has taken action to mitigate or correct the deficiencies. For example, there have been a number of issues with the NRU fuel rod flask and reactor control system that have been addressed by the replacement of the faulty components. AECL is implementing a more systematic approach to prevent recurrence of these events. CNSC staff will continue to monitor the reliability improvement of these NRU reactor systems during future assessments.

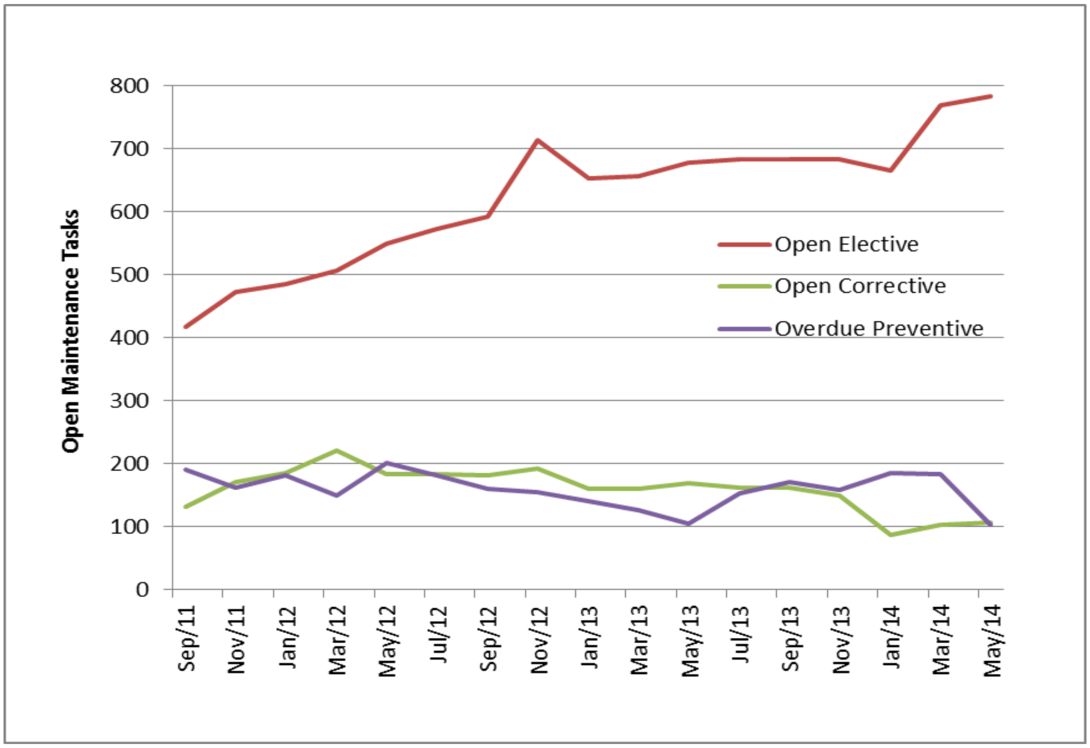
Finally, AECL has also reported a number of failures or degradations at the CRL steam system, which provides building heat to a majority of the CRL facilities and to some process systems. CNSC staff are satisfied by AECL's commitment to address the failures and degradation of the steam system, which has exceeded its design life, by repairing steam system components as they fail. In addition, AECL has launched a project to replace the Controlled Area-2 steam, condensate and compressed air systems. CNSC staff hold regular meetings with AECL to discuss the ongoing site infrastructure inspection, maintenance and systems replacement progress and implementation.

Maintenance

Licence condition 7.1 requires AECL to develop, implement and maintain a maintenance program for SSCs important to safety. From the review of AECL's governing documents for the conduct of maintenance at CRL, CNSC staff conclude that the program meets the requirements of the licence and the criteria described in the LCH. Future planned inspections will focus on the implementation of the maintenance program at CRL.

Given the regulatory significance of the NRU reactor at CRL, CNSC staff focused on maintenance backlogs for the NRU reactor which are indicators of maintenance effectiveness and the facility's equipment condition.

Figure 3: NRU reactor maintenance backlogs for CRL September 2011 to May 2014



As shown in figure 3, an improvement has been observed since 2011 with respect to the NRU reactor corrective maintenance backlog, while the preventive maintenance backlog has remained constant and the elective maintenance backlog has steadily increased. Elective maintenance is the classification of any work on isotope production SSCs for which identified potential or actual degradation is minor and does not threaten component design function or performance criteria. Due to elective maintenance being considered lower priority work than preventive maintenance, the backlog has grown over the year. There will always be a certain level of maintenance backlog, due in part to the normal work management process, emergent conditions, and equipment aging. A reduction of the maintenance backlog in the NRU facility will remain a focus area for CNSC staff for the remainder of the licence period.

AECL has improved the preventive maintenance program by establishing categories of preventive maintenance tasks, along with a preventive maintenance deferral process that requires escalated approvals to defer preventive maintenance work based on safety significance. AECL is also developing a process to better incorporate technical basis into the NRU reactor's preventive maintenance activities as part of the overall equipment reliability program for the NRU reactor. AECL is improving the information available for preventive maintenance to better support execution. Additional NRU reactor outages are planned for 2014 to reduce the maintenance backlog.

A key item for the improvement of equipment safety and reliability is AECL's system health program which is being rolled out with the assessment of 46 systems in the NRU reactor and three Molybdenum Production Facility (MPF) systems. Even though the system health program's implementation is new to CRL, AECL is planning to expand the monitoring of the system health program to include the Power House. CNSC staff's review of the program governing documents and selected output documents from the system health monitoring concluded that AECL's governance is in line with the industry guidance and practice. However, some of the system performance monitoring plans and system health reports were incomplete and did not, in all instances, identify key issues affecting system reliability, such as critical spare parts and obsolescence.

In December 2013, CNSC staff conducted an inspection of the system health program implementation. From the inspection, CNSC staff concluded that the program is not fully implemented. Progress on a number of initiatives is required to sustain the program and its implementation. CNSC staff also noted that system health goals and priorities are not provided to assist personnel in making decisions, taking actions and implementing changes that contribute to the safe and reliable operation of the facilities. Finally, CNSC staff observed that the system health program would benefit from self-assessments to confirm that it meets requirements and to identify opportunities for improvement. CNSC staff consider that these additional improvements are required for the program to fulfill its stated objectives to increase safety and reliability of the nuclear facilities at CRL. AECL has developed an action plan to address the inspection findings which was found acceptable by CNSC staff. Completion of actions is targeted for the end of 2014. CNSC staff are monitoring the progress to completion of these actions.

Structural integrity

To satisfy licence condition 7.1, AECL is required to establish inspection programs to monitor the structural integrity of fluid boundary systems and components and civil structures that are important to safety, including those in the Main Heavy Water System, the U-1 and U-2 Loops and the Loop Test Sections. AECL has developed programs using guidance from CSA standards N285.4, *Periodic inspection of CANDU nuclear power plant components*, and CSA N291, *Requirements for safety-related structures for CANDU nuclear power plants*.

CNSC staff have reviewed the governing program documents and identified elements of the programs that do not meet the CSA standards. AECL has committed to addressing these elements in upcoming program revisions. CNSC staff have also identified other areas for improvements such as meeting program schedules, implementing program updates and the timely submission of annual inspection reports. CNSC staff will continue to monitor the implementation of the programs primarily through desktop reviews of the annual inspection reports and dispositions of inspection findings prepared by AECL.

In addition to the periodic inspection program, AECL is required to implement an in-service inspection program for the NRU vessel. The NRU vessel in-service inspection program is being implemented in accordance with the current program document. CNSC staff carry out desktop reviews of the annual vessel condition monitoring assessment which summarizes the inspection activities and CNSC site inspectors carry out on-site monitoring. The information provided to date by AECL indicates that annulus side corrosion of the vessel wall has not progressed at a rate that would challenge the current structural integrity of the vessel; however, CNSC staff remain concerned that the possibility of a localized leak that could challenge operability of the vessel cannot be completely ruled out. CNSC staff requested that AECL provides updates on the leak mitigation strategies.

Aging management

Licence condition 7.4 requires AECL to develop, implement and maintain an aging management program at the CRL site. The progress of this initiative is tracked under the IIP for the NRU reactor. CNSC staff conducted a desktop review of AECL's submissions related to aging management, including: the aging management program documentation, obsolescence management program and the NRU aging management plan and NRU spare parts. Overall, CNSC staff conclude that AECL's aging/obsolescence management program and plan comply with the requirements in the LCH.

During the system health program inspection, CNSC staff confirmed that aging-related degradation mechanisms that required monitoring and inspections have been incorporated into the system health monitoring plans.

Chemistry control

AECL is required by licence condition 4.14 to implement and maintain a chemistry control program for the NRU reactor main heavy water system and the waste contained in the Fissile Solution Storage Tank (FISST). This involves monitoring and analysis of chemistry parameters to demonstrate compliance with limiting conditions for operation of these facilities. AECL reported two limit exceedances at the NRU facility and one limit exceedance at the MPF. The events consisted of a defected fuel at the NRU facility, which led to exceedances of AECL's concentration limits for uranium and iodine in the main heavy water system. AECL is taking steps to return water chemistry to the normal range which includes addressing issues with the purification system (evaporator and ion exchange column).

With respect to the MPF, AECL reported an exceedance of an operating limit regarding the aluminum concentration in FISST. CNSC staff followed up on the approach implemented by AECL and confirmed the mitigation measures returned the chemistry to normal.

Radiation protection

RATINGS FOR RADIATION PROTECTION		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff continue to rate the "radiation protection" SCA at CRL as "satisfactory". AECL has implemented and maintained a radiation protection program to control the radiological hazards present in its facilities and to ascertain doses for each person who performs duties in connection with their licensed activities, as required by the *Radiation Protection Regulations*. In addition, doses to the public continue to be well below the regulatory annual public dose limit.		

The "radiation protection" SCA covers the implementation of a radiation protection program in accordance with the *Radiation Protection Regulations*. This program must ensure that contamination levels and radiation doses received by individuals are monitored, controlled, and maintained as low as reasonably achievable (ALARA).

For CRL, this SCA encompasses the following specific areas:

- Application of ALARA
- Worker dose control
- Radiation protection program performance
- Radiological hazard control
- Estimated dose to the public

Application of ALARA

As required by the *Radiation Protection Regulations*, AECL implemented a radiation protection program that integrates ALARA into planning, scheduling and work control.

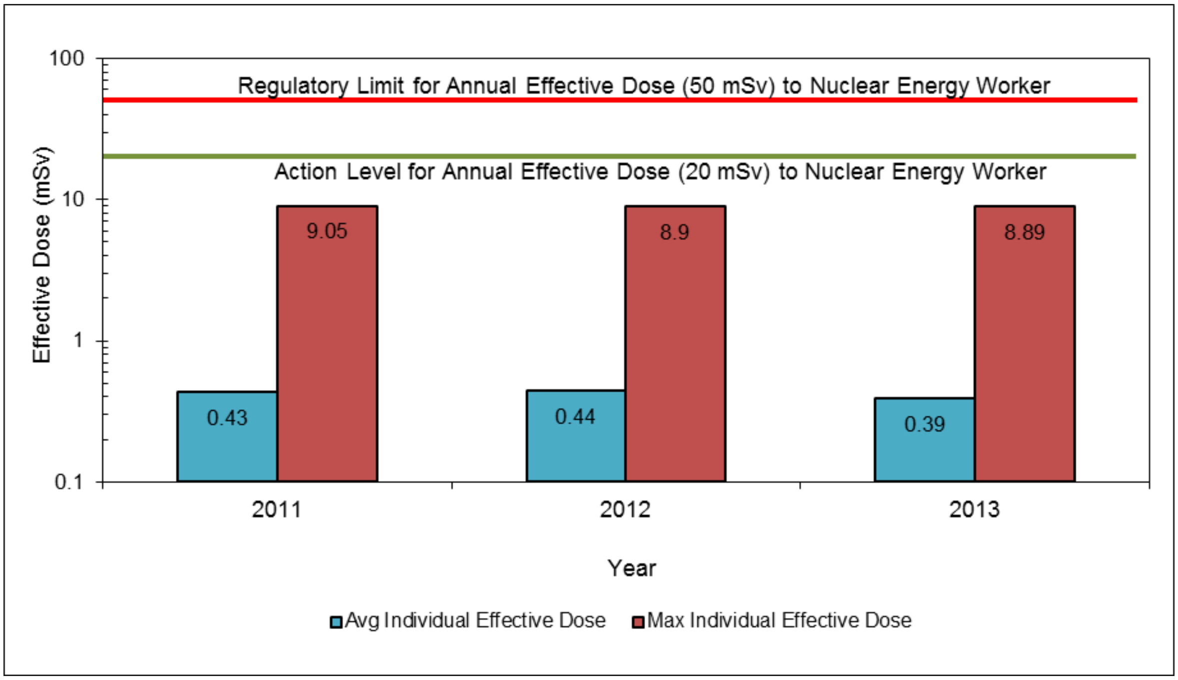
During the review period, AECL ensured that radiation exposures and doses to workers remain ALARA, taking into consideration social and economic factors.

Worker dose control

AECL has a well-established system in place to control radiation doses received by workers, which CNSC staff monitored for adequacy and effectiveness via inspections and document reviews. At no time from 2011 to 2013, did AECL report that an employee received a radiation dose exceeding the regulatory limits for nuclear energy workers, as specified in the *Radiation Protection Regulations*. Figure 4 provides the average and maximum individual annual effective worker doses at CRL from 2011 to 2013. Additional worker dose statistics can be found in appendix E.

CNSC staff's review of AECL's dose data for the CRL site concluded that AECL adequately controlled worker doses.

Figure 4: AECL-CRL worker effective dose (2011-2013)



Radiation protection program performance

AECL's performance in regards to radiation protection has been assessed through CNSC staff compliance activities. These activities included inspections of CRL facilities by CNSC site inspectors with a focus on radiation protection to assess compliance with regulatory and AECL's programmatic requirements, as well as to assess the effectiveness of the program's implementation.

Although these compliance activities identified areas for improvement, CNSC staff's assessment is that overall, AECL's corrective actions stemming from the findings have been appropriate, and that compliance with the radiation protection program has been acceptable.

One component of AECL's radiation protection program is its dosimetry service. In 2013, AECL discovered that approximately 1650 worker dose records were not transferred to the National Dose Registry as required by AECL's Dosimetry Service Licence [8]. This event was reported to the CNSC and also to the Commission via an EIR [9]. Upon further investigation, AECL reported an additional event where tritium doses were not assigned and subsequently not included in the dose totals for approximately 100 contractors and visitors. This event was also reported to the CNSC and to the Commission via CMD 14-M5: *Compliance Activities Following Discovery of Dose Records not submitted to the National Dose Registry*.

CNSC staff view the consequences of these two events as minimal, since the magnitude of each of the doses involved was small. To date, AECL has implemented several improvements to strengthen dosimetry record control, review, and acceptance within dosimetry services. However, the radiation protection program is dependent on the reliable provision of accurate dose results to optimize the control of work, to limit radiation exposure to acceptable levels, and to evaluate the effectiveness of the program. Therefore, future verification activities are planned by CNSC staff to ensure the accuracy and completeness of AECL's dose records. This will include a review of the dosimetry program with program elements and interfaces with AECL's operating licence.

Radiological hazard control

As part of its Radiation Protection program, AECL has established a number of action levels that, if reached, trigger its staff to establish the cause for reaching the action level and, if applicable, restore the effectiveness of the Radiation Protection program. AECL reports all action level exceedances to the CNSC.

Worker measuring dose rates

During the review period, no radiation exposures received by workers at the CRL site resulted in a dose that exceeded the regulatory limits. Furthermore, the maximum whole body dose has remained less than 20 mSv, with no worker exceeding any of AECL's dose action level in the years 2012 or 2013.

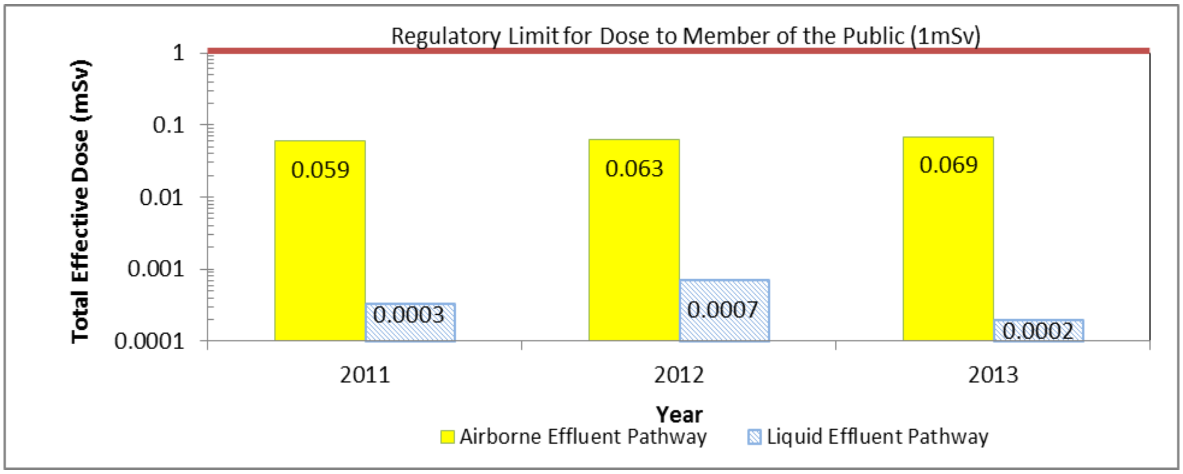
There was, however, one instance of an action level exceedance in 2011. In this case, a worker was assigned a skin dose of 273 mSv due to a local-area (1 cm^2) skin contamination event; this value exceeded AECL's action level of 50 mSv. In that case, CNSC staff determined that AECL took appropriate measures to decontaminate the individual, to investigate the cause and to enact corrective measures.

Estimated dose to the public

The dose to the public from CRL operations is calculated by using environmental monitoring results. Components including Ottawa River water, ambient air, sand along the Ottawa River shoreline, and food are measured both on the CRL site and off site in neighboring communities. Airborne and liquid exposure pathways such as inhalation and ingestion are also taken into account when determining public dose.

Doses to the public continue to be well below the regulatory annual public dose limit of 1 mSv, as shown in figure 5.

Figure 5: Effective dose to a member of the public (2011-2013)



Conventional health and safety

RATINGS FOR CONVENTIONAL HEALTH AND SAFETY		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "conventional health and safety" SCA at CRL as "satisfactory". Overall, compliance verification activities conducted throughout all licensed facilities at CRL confirm that AECL continues to view conventional health and safety as a paramount consideration in all activities. AECL has demonstrated a satisfactory ability to keep its workers safe from occupational injuries.		

The "conventional health and safety" SCA covers the implementation of a program to manage workplace safety hazards and to protect personnel and equipment.

For CRL, this SCA encompasses the following specific areas:

- Performance
- Practices
- Awareness

Performance

A key performance measure for this SCA is the number of Recordable Lost-Time Injuries (RLTIs) that occur per year. An RLTI is an injury that takes place at work and results in the worker being unable to return to work to carry out their duties for a period of time. In reviewing RLTIs, CNSC staff must also consider the severity of these injuries (e.g., the total days lost) and the frequency as they relate to the size of the workforce. The severity rate is a measure of the total number of days lost due to injury for every 200,000 person-hours worked at a site and the frequency is the number of fatalities and injuries (lost time and medically treated) due to accidents for every 200,000 person-hours worked at a site.

As per table 3, the frequency and the severity rates of RLTIs in 2013 are reduced below the levels in the previous two years (2011 and 2012). The reduction in severity rate is a direct result of increased management focus on the return to work program. This program supports safe and early return to work within the abilities of the injured worker, leading to fewer lost work days.

In 2013, AECL provided more training to its employees, increasing the awareness of occupational hazards, and has put further measures in place to reduce the exposure to conventional hazards (such as improved machine guarding, protective equipment and clothing and introduction of a safe lifting, hoisting and rigging procedure).

Table 3: Recordable lost-time injuries (RLTI), frequency and severity at CRL 2011-2013

Year	RLTIs	RLTI Frequency	RLTI Severity
2011	13	0.53	6.55
2012	21	0.68	5.65
2013	18	0.56	2.68

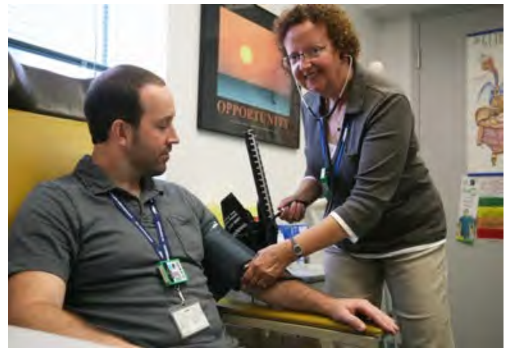
Practices

In addition to the NSCA and its regulations, AECL's activities and operations at the CRL site must comply with Part II of the *Canada Labour Code* and the *Canada Occupational Health and Safety Regulations*, the *Hazardous Products Act*, *Controlled Products Regulations*, *Workplace Hazardous Materials Information System*, and other applicable federal and provincial health and safety-related acts and regulations.

CNSC staff have confirmed through its various inspections that AECL has met the performance objectives and requirements for housekeeping and management of conventional hazards, in accordance with the regulatory requirements and AECL's own occupational health and safety program.

Awareness

AECL continues to develop and maintain a comprehensive Occupational Health and Safety program for the CRL site.



AECL nurse on the job

During the reporting period, AECL has improved aspects of the program based on best industry practices and results from incident investigations as well as results of internal focused audits. CNSC staff have noted improvements in the work authorization and approvals process and in the oversight and management of contractors.

In 2013, a Practical Learning Facility was constructed that allows enhanced hands-on training for conventional hazards encountered at CRL - such as confined space entry, Lock-Out Tag-Out, and working at heights (see specific area human performance program for more details). Additionally, AECL has executed due diligence training and rolled out a company-wide initiative called the "Rules to Live By". Both of these initiatives aim to heighten worker and management awareness of conventional hazards. CNSC staff will continue to monitor the effectiveness of these improvements through future inspections.

Environmental protection

RATINGS FOR ENVIRONMENTAL PROTECTION		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff rate the "environmental protection" SCA at CRL as "satisfactory". AECL continues to implement and maintain an environmental protection program to control and monitor liquid and air releases of nuclear and hazardous substances to the environment.		

The "environmental protection" SCA covers the programs that identify, control and monitor all releases of nuclear and hazardous substances, and the effects on the environment from facilities or as the result of licensed activities.

For CRL, this SCA encompasses the following specific areas:

- Environmental management system
- Effluent and emissions control (releases)
- Assessment and monitoring
- Protection of the public

Environmental management system

AECL must have adequate provision for protection of the environment via policies, programs and procedures at CRL, as required by the CNSC S-296, *Environmental Protection Policies, Programs and Procedures at Class I Nuclear Facilities and Uranium Mines and Mills*. AECL's environmental protection program consists of an environmental policy, along with comprehensive programs and procedures to protect the environment. These include an environmental monitoring program at CRL comprising of three integrated components: effluent monitoring, environmental monitoring, and groundwater monitoring. Through sampling and analysis for nuclear and hazardous substances, this program assists in verifying that releases from CRL do not pose hazards to the environment or human health.

The AECL environmental management system is ISO-14001 registered, and is subject to periodic audits and reviews to identify potential improvements.

Effluent and emissions control

CSA N288.5, *Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills*, was published in 2011 and listed within the LCH. AECL assessed the existing CRL effluent monitoring program against this standard to identify areas of non-conformance. Appropriate modifications to the program were made such that it is now fully compliant.

The supporting data for the environmental protection SCA section are located in appendix F and discussed below.

Nuclear substance releases

Annual liquid and airborne effluent release limits were introduced into the CRL operating licence in 2011 (appendix A of [1]). These limits are based on a dose limit to the critical group of 0.3 mSv due to the sum of all releases from CRL in any period of 12 consecutive months. During 2012 and 2013, there were no airborne or liquid exceedances of these release limits, either by individual parameter or in any 12-month period.

As part of its environmental protection program, AECL has established a number of action levels that if exceeded may indicate a loss of operational control. If an action level is reached, AECL is required to establish the cause and if applicable, restore the effectiveness of the program. AECL is required by the LCH to report all action level exceedances to the CNSC.

In 2012, there were no action level exceedances at the CRL site.

In 2013, there were no action level exceedances for liquid releases at the CRL site.

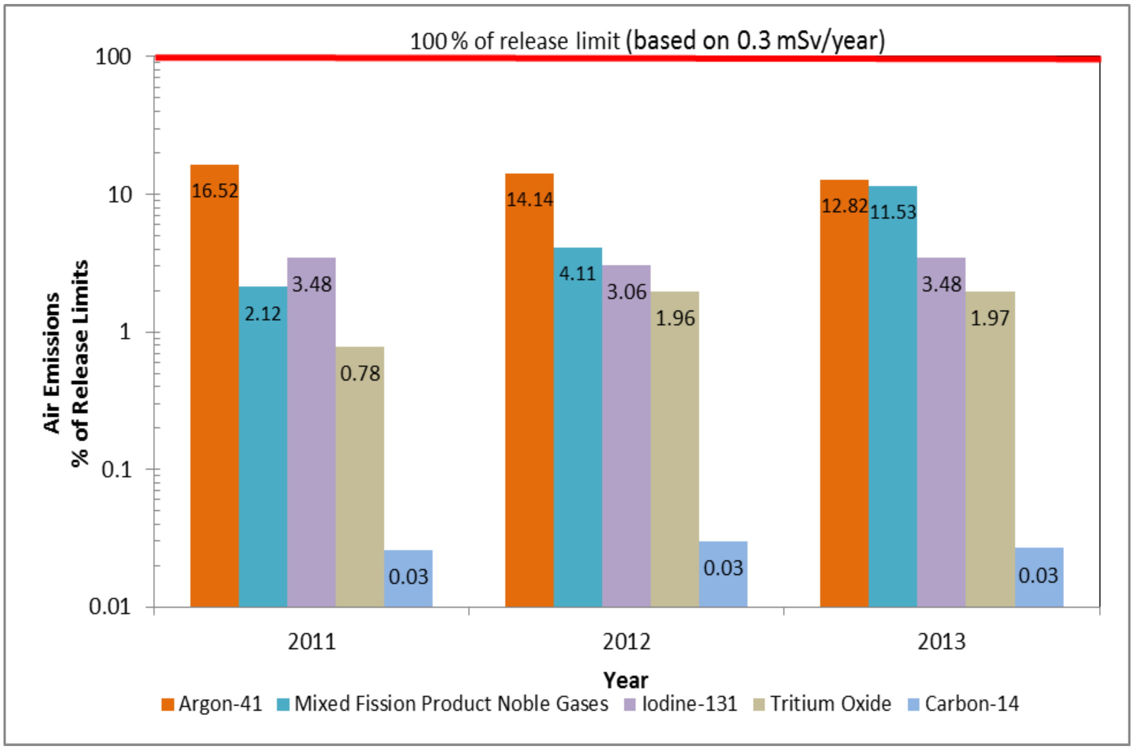
There were, however, 30 action level exceedances for airborne releases in 2013. Of particular note were 15 iodine-131 exceedances that occurred in October 2013 at different locations across the CRL site. The increased emissions did not result in an exceedance of regulatory limits for worker dose or environmental releases. AECL conducted a consolidated investigation into these exceedances to identify potential common causes. AECL's investigation concluded that the higher Iodine-131 emissions were related to operations of the MPF and the isotope production process. AECL has identified corrective and remedial actions, including reinstating more frequent operating equipment maintenance and cleaning. CNSC staff will monitor AECL's implementation of these corrective actions.

Airborne nuclear substance releases

AECL's radiological air effluent verification program at CRL comprises 51 monitoring points, including the NRU reactor stack and the MPF stack. Monitoring is either by direct measurement or by sampling and analysis for radionuclides.The main airborne contaminants are argon-41 from the NRU reactor stack, noble gases from the MPF, iodine-131 from the cemented molybdenum waste process, carbon-14 and tritium oxide (see appendix F).

The airborne radiological emissions from the CRL continue to be effectively controlled and below the annual release limits, as shown in figure 6.

Figure 6: AECL's CRL airborne nuclear substance releases (2011-2013)

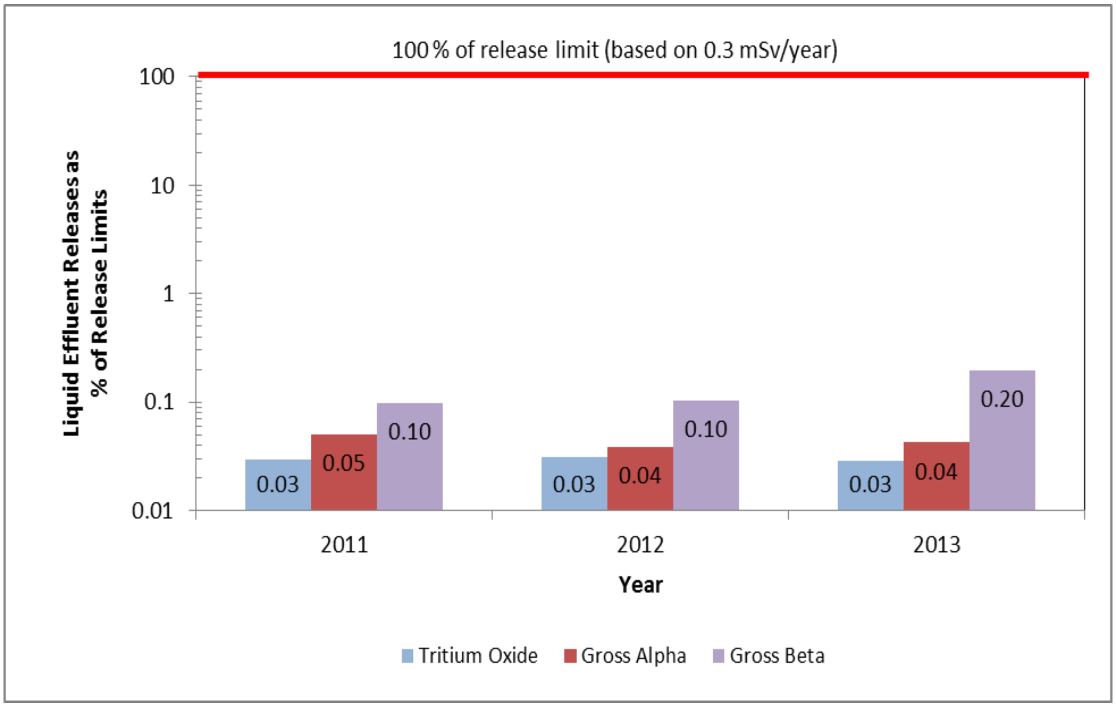


<u>Liquid nuclear substance releases</u>

AECL's nuclear liquid effluent verification program at CRL comprises 14 monitoring points for effluent streams flowing into the Ottawa River, discharges to Maskinonge Lake, and groundwater to the Ottawa River. Monitoring is either by direct measurement or by sampling and analysis for radionuclides including tritium oxide, gross alpha and gross beta.

The liquid nuclear emissions from the CRL continue to be effectively controlled and below the annual release limits, as shown in figure 7.

Figure 7: AECL's CRL liquid nuclear substance releases (2011-2013)



Airborne hazardous substance releases

The main stationary sources of hazardous effluents to air from the CRL site are the Powerhouse stacks. The Powerhouse burns Number 6 fuel oil to supply district heating and process steam to the main buildings. AECL estimates emissions using oil consumption data and emission factors provided by Environment Canada. The estimated emission results are compared to the compliance verification criteria set forth in the CRL's LCH. These criteria include limits for Air Contaminants such as: carbon monoxide, nitrogen oxides, sulphur dioxide, total particulate matter, particulate matter < 10 µm, particulate matter < 2.5 µm, and volatile organic compounds.

For 2012 and 2013, the estimated releases for each parameter were compliant with the compliance verification criteria set in the CRL LCH.

Liquid hazardous substance releases

AECL monitors 12 effluent streams that discharge to the Ottawa River from the CRL site for hazardous parameters, and compares the concentrations of significant effluent against compliance verification criteria set forth in the LCH and AECL's internal guideline values. A wide variety of parameters are measured including mercury, phenolics, zinc, iron, phosphorus, nickel, and Total Suspended Solids.

In 2012, there were no exceedances of the liquid compliance verification criteria set out in the CRL's LCH. In 2013, there was one exceedance of the criteria, for mercury in the Waste Treatment Centre's Liquid Water Evaporator.

The number of AECL guideline exceedances for 2012 and 2013 were 25 and 32, respectively. The exceedances occurred at the Waste Treatment Center (Liquid Waste Evaporator and Building 205 tanks) for phenolics, iron and Total Suspended Solids; at the Sanitary Outfall for Biological Oxygen Demand and nickel at the Storm Outfall (4F7) for iron. CNSC staff accept AECL's conclusion that there were no identified negative impacts on the environment due to guideline exceedances.

Assessment and monitoring

CSA N288.4, *Environmental Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills*, was revised and reissued in 2010 and listed within the LCH. AECL assessed the existing CRL environmental monitoring program against this standard to identify areas of non-conformance. Appropriate modifications to the program were made such that it is now fully compliant.

Environmental monitoring

AECL maintains a comprehensive environmental monitoring program for CRL to verify that radiation doses to members of the public, as a result of nuclear releases from the CRL site, remain ALARA, social and economic factors being taken into account. The program also serves to verify that hazardous releases do not pose hazards to human health and that neither nuclear releases, hazardous releases, nor physical stressors pose hazards to the environment.

The nuclear component of the program is conducted through routine collection and analysis of environmental samples from locations at the CRL site and in the surrounding area. Monitored media include ambient air, foodstuffs (such as milk, fish, garden fruits and vegetables), large game and farm animals, groundwater, Ottawa River water and other surface waters onsite and offsite. Monitoring of beach sand and river sediments is also performed.

The hazardous component focuses on onsite surface waters and groundwater. Environmental sampling for hazardous analysis is performed on nine surface monitoring points on the CRL site. It also includes monitoring for physical stressors, biodiversity (including species at risk) and fish impingement.

Environmental monitoring results in 2012 and 2013 continue to demonstrate AECL's successful implementation of an environmental monitoring program at CRL. The environmental monitoring program assists in verifying that releases from CRL do not pose hazards to the environment or human health.

In 2012, CNSC staff conducted an inspection of the environmental monitoring program at CRL. No compliance actions were identified.

Ottawa River monitoring

Along with monitoring surface water from locations on the CRL site, AECL also samples surface water at nine locations along the Ottawa River between Rolphton and Pembroke, and at 14 locations along streams outside the CRL boundary. Water samples are analyzed for radionuclides such as tritium, gross alpha, gross beta, total strontium and cesium-137. The sampling results for 2012 and 2013 demonstrate that radionuclide concentrations in the Ottawa River water remain very low. Tritium concentrations at all monitoring locations are well below the Maximum Acceptable Concentration of 7000 Bq/L indicated in Health Canada's *Guidelines for Canadian Drinking Water Quality*. Specifically, annual average concentrations of tritium in water ranged from 3 to 64 Bq/L in 2012 and from 2 to 43 Bq/L in 2013, with the maximum values occurring downstream at the CRL site boundary (Pointe au Baptême). Tritium concentrations decrease with distance from the CRL site, with average tritium concentrations at Petawawa and Pembroke of 4 Bq/L in 2012 and 2.5 Bq/L in 2013.

Groundwater monitoring

AECL's groundwater monitoring program involves approximately 180 monitoring wells located at 32 different monitoring sites. Groundwater from these wells is sampled on an annual or semi-annual frequency and analyzed for radionuclides including tritium, strontium-90, cobalt-60, gross beta, and gross alpha.

Workers sampling ground water at CRL

The legacy plumes in the waste management areas and Controlled Area 1 (built up area, non-radiological side) are contained within the CRL site. The Controlled Area 2 (built up area, radiological side) region contains two plumes that extend from the National Research Experimental (NRX) and the NRU reactor source areas to the Ottawa River. The NRX plume is dominated by strontium-90 and the NRU reactor plume is dominated by tritium. Groundwater monitoring results demonstrate that the plumes are essentially stable. Tritium concentrations downgradient of NRU are expected to decrease over time following the swap of the NRU rod bays water which occurred in November 2012.

Environmental assessment follow-up

In accordance with the *Canadian Environmental Assessment Act*, several environmental assessments have been completed for projects at the CRL site. Some of these assessments identified follow-up commitments to verify the accuracy of the assessments conclusions and the effectiveness of mitigation measures.

AECL is required by condition 10.5 of the CRL operating licence to report on the environmental assessment follow-up programs. To date, AECL has submitted the annual reports as required, and has completed many of the follow-up commitments. CNSC staff continues to review and assess AECL's follow-up reports.

Protection of the public

The CNSC receives reports of discharges to the environment through the reporting requirements outlined in the CRL licence and LCH.

Review of hazardous (non-radiological) discharges to the environment for CRL in 2012 and 2013 indicate that no significant risks to the public or environment occurred during this period.

In 2013, CNSC staff conducted an inspection of the CRL hazardous waste management program. Most requirements of this program were effectively implemented and several positive operating practices were observed; however, some findings such as incomplete Waste Management Plans and not following the Waste Management program's process for disposing of hazardous waste were also identified. AECL provided an action plan to address the inspection findings, which has been accepted by CNSC staff. CNSC staff have continued and will continue to monitor the effective implementation of the corrective action plan.

Emergency management and fire protection

RATINGS FOR EMERGENCY MANAGEMENT AND FIRE PROTECTION		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "emergency management and fire protection" SCA at CRL as "satisfactory". Overall, compliance verification activities conducted at CRL confirm that AECL continues to maintain a comprehensive and well-documented emergency management program and fire response that met applicable regulatory requirements.		

The "emergency management and fire protection" SCA covers emergency plans and emergency preparedness programs that exist for emergencies and for non-routine conditions. This area also includes any results of participation in exercises.

For CRL, this SCA encompasses the following specific areas:

- Conventional emergency preparedness and response
- Nuclear emergency preparedness and response
- Fire emergency preparedness and response

Conventional emergency preparedness and response

AECL continues to maintain and enhance its conventional emergency preparedness and response capabilities at CRL. CNSC staff have verified the response programs against the regulatory criteria set out in the operating licence and the LCH. The programs continue to be maintained through training, and the execution of drills and exercises.

Nuclear emergency preparedness and response

AECL continues to maintain and improve its nuclear emergency preparedness and response capabilities at the CRL site. Proficiency within this area was achieved through regular and on-going training, drills and exercises, as specified in the site emergency management program documentation.

As per the CNSC inspection schedule, CNSC staff performed an inspection of a site stay-in exercise during the annual report review period. This inspection confirmed that AECL maintains sufficient provisions for emergency preparedness and response capability needed to mitigate the effects of an accidental release of nuclear and/or hazardous substances. However, areas for improvement were identified (which AECL has since addressed); these included immediate access to emergency facilities, communication protocols and alternate sheltering requirements for the affected building.

Fire emergency preparedness and response

CNSC staff performed two inspections of AECL's Industrial Fire Brigade response at CRL and concluded that improvements were required in the interoperability of responders. AECL has executed a comprehensive corrective action plan to ensure fire fighters can perform firefighting duties without undue delay.

CRL fire department

This was achieved by documenting interoperability requirements and training all responders on the expectations. CNSC staff will continue to monitor the effectiveness of these improvements via future inspections. Of note, significant investment has been made in acquiring additional firefighting equipment (aerial platform vehicle) to enhance the firefighting capabilities. This equipment was purchased in response to the events related to Fukushima. For more information on the status of Fukushima actions, see appendix G.

Waste management

RATINGS FOR WASTE MANAGEMENT		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff conclude that the rating for "waste management" SCA at CRL is "satisfactory". All radioactive waste is managed in accordance with applicable regulations and internal procedures. The CRL waste management program documents and implements requirements for minimization, segregation, characterization, handling, monitoring, storing, and processing of radioactive waste.		

The "waste management" SCA covers internal waste-related programs that form part of the facility's operations up to the point where the waste is removed from the facility to a separate waste management facility. This area also covers the planning for decommissioning.

For CRL, this SCA encompasses the following specific areas:

- Waste characterization and minimization
- Waste management practices
- Decommissioning plans

Waste characterization and minimization

The Waste Management Areas (WMA) provides interim storage capability for the solid radioactive waste produced at the CRL from operational and decommissioning activities and from offsite organizations. Radioactive liquid waste is collected, sampled and transferred to the Waste Treatment Centre where it is processed prior to release to the process outfall.

AECL's waste management program establishes the requirements for waste management activities at AECL sites for both radioactive and hazardous wastes. The CRL waste management program identifies, documents and implements requirements for waste minimization at the source, and for segregation, characterization, packaging, processing, storage, and properly disposal of the waste.

Waste management practices

Waste management practices align and comply with the AECL's program requirements and procedures, CRL licence conditions, applicable federal and provincial acts, regulations and guidelines, and national/international codes, standards and guidelines.

During the review period, AECL has either completed a number of waste management projects or made significant progress including the following:

- As indicated previously in the physical design SCA, construction completion of the FPS facility and construction approval for the SMAGS 3 were granted to AECL
- Final repair of the active drain line between the decontamination centre (B468) and B242 with a like for like piping system
- Remediation of the active liquid waste in WMA "A". Radioactive liquid was successfully removed from the tanks and shipped offsite for processing
- WMA "C" engineered cover project completed. A multi-layer impermeable cover was installed over WMA "C" to prevent infiltration of rainwater and intrusion into the buried waste
- South Swamp Initiative: The permeable reactive barrier has been installed down-gradient of WMA "A" to intercept and treat the contaminated groundwater. Installation of the cover over WMA "A" is planned following completion of intrusive characterization activities in WMA "A"

The following subsection describes the progress of some projects under the Nuclear Legacy Liabilities Program, as previously described in section 1.5.

<u>Stored Liquid Waste Cementation project</u>

The intent of the Stored Liquid Waste Cementation (SLWC) project is to recover and solidify the remaining contents (liquid and/or sludge) of 20 legacy liquid waste tanks, and prepare the tanks for decommissioning.

AECL continues its care, maintenance and monitoring of the legacy tanks, and also improves the monitoring program to strengthen reliability. AECL removed almost 75 percent (32 m^3) of the radioactive liquid waste from Tank 40D (single walled direct buried with the most significant liquid inventory) in 2013 with further removal planned for 2014.

AECL engaged in negotiations with three proponents who had been selected based on their submissions in response to the SLWC project request for proposal. AECL has awarded three conceptual design contracts to contractors. AECL anticipates having the conceptual design selected by January 2015, which will provide basis for the project description preparation.

From a project perspective, AECL has developed product performance criteria to meet the interim storage and long-term waste management requirements and, through testing, reduced the risk of identifying potential concerns with increasing the waste product mass to the production scale.

AECL anticipates that the inventory of the remaining legacy tanks can be addressed by 2021/2022.

Very Low-Level Waste facility

The Very Low-Level Waste (VLLW) facility will provide for the long-term management of waste such as slightly contaminated soil, vegetation, concrete, asphalt and decommissioning rubble and building materials that is considered as exceeding the waste acceptance criteria and unconditional release limits for offsite landfills. Two preferred sites at CRL were selected to host the facility, the conceptual design is complete and the contract for the detailed design was awarded in December 2013.

Highly-Enriched Uranium Repatriation project

In April 2010, the governments of Canada and the United States (U.S.) committed to work cooperatively to repatriate spent highly-enriched uranium (HEU) fuel currently stored at Chalk River Laboratories to the United States. Repatriation activities are part of the Global Threat Reduction Initiative, a broad international effort to consolidate HEU inventories in fewer locations around the world. In March 2012, Prime Minister Harper announced that Canada and the U.S. were expanding their efforts to return additional inventories of HEU materials, including those in liquid form. HEU in Canada is essentially of U.S. origin, and has been used over decades in fuel for research reactors and for the production of medical isotopes. AECL is currently working to fulfill Canada's commitment to return these inventories to the U.S.

All shipments of HEU follow stringent transportation and security requirements. HEU is transported in packages (casks) that are specifically designed for this purpose. The CNSC, the U.S. NRC and the U.S. Department of Transportation certify these transportation packages. Certification of these packages is in accordance with international safety requirements established by the International Atomic Energy Agency (IAEA).

Shipments are also subject to stringent security plans. Specific details on shipments are considered prescribed information (as per the *General Nuclear Safety and Control Regulations*) and details on transportation activities are limited to persons who have a legitimate need to know. Transportation routes and security measures put in place are pre-approved and agreed to by authorities in both Canada and the U.S.

In 2013, AECL completed the repatriation of two disassembled Highly Enriched Uranium SLOWPOKE research reactor fuel cores to the U.S. In addition, the transport package for the repatriation of spent fuel rods from research reactors in Chalk River, were certified both in Canada and the U.S. The certification process for the transport package for HEU in liquid form remains on going.

In support of repatriation activities, AECL has undertaken a communication program that consists of the production and maintenance of online information (www.AECL.ca) and the provision of repatriation updates to local stakeholders.

Decommissioning plans

In March 2014, pursuant to the CRL licence condition 12.2, AECL submitted an updated version of the Comprehensive Preliminary Decommissioning Plan (CPDP). The CRL CPDP has been updated to reflect and incorporate changes since the last revision, including other changes resulting from the 2013 review of the AECL nuclear legacy liabilities cost estimate. CNSC staff reviewed AECL's submission and found it acceptable.

During the review period, several CRL buildings and facilities were planned for decommissioning. The decommissioning of the Pool Test Reactor has been completed and the space has been released for other uses. The Heavy Water Upgrading Plant decommissioning is progressing well with the goal of returning the building to other uses planned to take place in 2015/2016 at which time the end state report will be submitted to CNSC staff.

Regulatory approval has been granted by the Commission to decommission the Plutonium Tower, the Waste Water Evaporator and other ancillary buildings associated with the NRX reactor. The associated decommissioning activities are planned to begin within the 2015/2016 time period.

Security

RATINGS FOR SECURITY		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
AECL has sustained its "security" SCA during the review period at a satisfactory rating. AECL continues to implement a security program at CRL that meets the requirements of the *Nuclear Security Regulations* and associated regulatory documents.		

The "security" SCA covers the programs required to implement and support the security requirements stipulated in the regulations, the licence, orders, or expectations for the facility or activity.

For CRL, this SCA encompasses the following specific areas:

- Facilities and equipment
- Security practices
- Response arrangements
- Drills and exercises

Facilities and equipment

AECL is required to maintain security devices and equipment in accordance with manufacturer specifications. AECL reported some equipment deficiencies during the review period where devices were affected for brief periods resulting in AECL implementing compensatory measures until repairs were undertaken. All events were related to repeat issues of minor significance due in most part to system upgrades. AECL demonstrated the effective maintenance of facilities and equipment, and met regulatory requirements.

AECL Nuclear Response Force

CNSC staff conducted five security inspections and one security exercise during the review period. Findings related to facilities and equipment were technical in nature, where devices were showing signs of aging and in need of minor repairs and/or calibration. All findings have been closed to the satisfaction of CNSC staff. Action plans and corrective measures are currently being tracked.

Security practices

AECL is required to control access to the CRL site through physical and administrative security measures. The events related to security practices that were reported to CNSC staff were administrative in nature and of minor significance. AECL continues to demonstrate procedural compliance and is equipped with access control measures that meet regulatory requirements.

In late 2011, CNSC staff reported potential indicators of a reduced security culture at CRL. AECL conducted a third party review and are committed to enhancing the security culture as part of their overall security review. CNSC staff are satisfied with AECL's proposed path forward and will continue to monitor AECL's progress.

CNSC staff reported findings during five security inspections and the security exercise conducted during the review period. Various procedural issues with respect to Site Access Security Clearances were in need of review and updating. AECL has modernized procedures to enhance the security program and findings have been closed to the satisfaction of CNSC staff. AECL continues to maintain good practices through robust corporate governance.

Response arrangements

AECL maintains a qualified Nuclear Response Force (NRF) to meet the requirements of the *Nuclear Security Regulations* and of S-298, *Nuclear Response Force* (now REGDOC-2.12.1). AECL has reported issues related to response arrangements in the review period that were administrative in nature. Documents were corrected or updated and events are now closed.

The findings reported during CNSC staff's inspections that were related to response arrangements were linked to the NRF training documentation. CRL files were reviewed and corrections were made to the satisfaction of CNSC staff.

In previous years, AECL sent NRF recruits to the Bruce Power basic officer training course. In the summer of 2012, CRL conducted its first in-house NRF training course. This opportunity allowed AECL to produce site-specific training that will result in skilled members who are familiar with the facility.

Drills and exercises

AECL is required to hold drills every 30 days and an exercise every two years. CNSC staff have completed the third cycle of their performance testing program at high-security nuclear facilities in Canada, which included CRL. The third Force on Force exercise at CRL was evaluated in October 2012. The licensee received an evaluation that highlighted a marked improvement from previous exercises. Findings have been closed to the satisfaction of CNSC staff. AECL continues to support the performance testing program.

Safeguards and non-proliferation

RATINGS FOR SAFEGUARDS AND NON-PROLIFERATION		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
Based on the information assessed from 2011 to 2013, CNSC staff conclude that the implementation of the safeguards program for the "safeguards and non-proliferation" SCA at CRL met all applicable regulatory requirements with a satisfactory performance.		

The "safeguards and non-proliferation" SCA covers the programs required for the successful implementation of the obligations arising from the Canada/ and the International Atomic Energy Agency (IAEA) safeguards agreements, as well as all other measures arising from the treaty on the *Non-Proliferation of Nuclear Weapons*.

For CRL, this SCA encompasses the following specific areas:

- Nuclear material accountancy and control
- Access and assistance to the IAEA
- Operational and design information
- Safeguards equipment, containment and surveillance

Nuclear material accountancy and control

During the review period, CRL provided the CNSC and IAEA with all nuclear material accounting reports and information in an accurate and timely manner, as required by RD-336, *Accounting and Reporting of Nuclear Material*.

Access and assistance to the IAEA

AECL has granted access and assistance to the IAEA both for inspection activities and for the maintenance of the IAEA's equipment installed at CRL. From 2011 to 2013, the IAEA conducted in total 96 inspections at various facilities at CRL. Details of the IAEA inspections can be found in table 4.

Table 4: IAEA verification activities at CRL

Year	SNRI	PIV	DIV	UI	Total
2011	12	5	3	12	32
2012	10	12	7	8	37
2013	13	7	2	5	27
Total Inspections					96

SNRI - Short Notice Random Inspection
PIV - Physical Inventory Verification
UI - Unannounced Inspection
DIV - Design Information Verification

The IAEA has indicated that the results from their inspection activities at CRL were satisfactory and no actions were requested from either facility. On this basis, the IAEA concluded that all nuclear material at CRL facilities remained in peaceful activities.

Operational and design information

AECL submits annual operational program and quarterly updates, as required. These documents provide a forward-looking plan of CRL's activities and are updated by AECL, as needed. AECL also submits information under the *Additional Protocol to the Canada - IAEA Safeguards Agreement*, including a description of each building, the scale of its operations, and future plans for nuclear fuel research and development activities. In addition, Design Information Questionnaire documents were updated as required for various facilities and submitted to CNSC staff.

Safeguards equipment, containment and surveillance

AECL continues to provide assistance to the IAEA for the installation and maintenance of the IAEA's equipment at CRL.

In 2013, the IAEA installed remotely monitored safeguard equipment, specifically at the new FPS Facility (see waste management SCA for more details on the FPS facility). The IAEA also upgraded the cameras at the NRU reactor with the Next Generation Surveillance System.

Packaging and transport

RATINGS FOR PACKAGING AND TRANSPORT		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff rate the "packaging and transport" SCA at CRL as "satisfactory". AECL continues to effectively implement the transport program at the CRL site. The transport of nuclear substances to and from the CRL site continues to be performed in a safe manner.		

The "packaging and transport" SCA covers the safe packaging and transport of nuclear substances shipped to and from the CRL site. CRL has a packaging and transport program that ensures compliance with the *Packaging and Transport of Nuclear Substances Regulations* and the *Transportation of Dangerous Goods Regulations*.

For CRL, this SCA encompasses the following specific areas:

- Package design and maintenance (no significant observations to report)
- Packaging and transport

Packaging and transport

During the review period, CNSC staff performed an inspection of AECL's radioactive material transportation program to verify compliance with the regulatory requirements. There were no findings noted during the inspection. CNSC staff conclude that the program continues to be effectively implemented and that the transport of nuclear substances to and from CRL is performed in a safe manner.

2.2 Whiteshell Laboratories

2.2.1 Overview

Figure 8: Whiteshell Laboratories, near Pinawa, Manitoba

(Source: AECL)

AECL operates the Whiteshell Laboratories (WL), comprising nuclear facilities under a research and test establishment decommissioning licence, located near the town of Pinawa, Manitoba. The licence was issued for a 10-year period commencing on January 1, 2009 and running to December 31, 2018 [10].

The WL site encompasses an area of 4,375 hectares. The site comprises of a number of nuclear and non-nuclear facilities and activities, including the Whiteshell Reactor (WR-1), the Shielded Facilities, the liquid and solid radioactive waste management facilities, and various research laboratories.

The facility operated for approximately 40 years as a nuclear research and test establishment, first under an operating licence issued by the Atomic Energy Control Board, and since then coming into force of the NSCA under an operating licence issued by the CNSC. Based on its decision to discontinue operations at WL, AECL applied for a licence to decommission the facility in 2002.

AECL's decommissioning activities included the demolition of redundant non-nuclear buildings, continued decommissioning of Building 300 (Research and Development Complex), and the construction of enabling facilities and remediation of existing buildings, such as the construction of the SMAGS building and the remediation of the Shielded Facilities area to support decommissioning activities.

Of the major facilities that were operated on the site, the Van de Graff Accelerator and the Neutron Generator were fully decommissioned during the previous licensing period. The WR-1 reactor at WL is permanently shut-down and de-fuelled. In keeping with the evolution of international best practices, AECL's decommissioning strategy has been moving toward reduced deferment periods. Therefore, the decommissioning of WR-1 initially planned for 2024 is planned to start in 2015.

CNSC staff continue to verify implementation of AECL's programs at WL and assess them against the performance objectives and compliance verification criteria defined in the regulations and the licence. Inspections have been carried out by CNSC staff during the review period. Details of these are shared in the various SCA within the report.

An update on the performance of WL operations by SCA follows. In 2013, the ratings for each SCA are based on CNSC staff's assessment for the review period. The information in this report covers the complete 2013 calendar year and, when applicable, compares information to previous years. The report also provides recent updates on key issues through June 30, 2014.

2.2.2 Public information and disclosure

As mentioned in section 1.4, AECL's corporate Public Information Program (PIP) meets the requirements of RD/GD-99.3. However, there is no distinct public disclosure approach for WL that reflects the different nature of the site when compared to CRL. The protocol should be distinct from the requirements outlined in a licence or LCH, and must focus on communications with all the key audiences for WL, as identified in section 3.2 of AECL's PIP. A new version of the PIP (with disclosure protocol) has been submitted and is currently being reviewed by CNSC staff.

CNSC staff were satisfied, based on the information reviewed, that AECL has kept the Sagkeeng First Nation (who reside in close proximity to WL) informed regarding AECL's activities at WL. CNSC staff encourage AECL to continue to provide the Sagkeeng First Nation with information updates and further establish direct lines of communication with the appropriate representative(s).

2.2.3 Safety and control areas

Table 5 presents the ratings for WL for the year 2013. All SCA ratings are "satisfactory" or "fully satisfactory" for the reporting period which remains unchanged from reports previously made to the Commission [11].

Table 5: Performance ratings for Whiteshell Laboratories

Safety and control area	Rating

Notes:

- For specific areas within the SCAs where there were no significant observations from CNSC staff compliance verification activities, no information is given in the subsection of the report
- The information presented below is site specific; general trends are not identified

Management system

RATINGS FOR MANAGEMENT SYSTEM		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff continue to rate the "management system" SCA for WL as "satisfactory" as the decommissioning quality assurance program is well established and effectively implemented.		

The "management system" SCA covers the framework that establishes the processes and programs required to ensure an organization achieves its safety objectives, continuously monitors its performance against these objectives, and fosters a healthy safety culture. For WL, this SCA encompasses the following specific areas:

- Management system
- Organization (see section 1.2 on AECL restructuring)
- Performance assessment, improvement and management review
- Operating experience (no significant observations to report)
- Change management (no significant observations to report)
- Safety culture (no significant observations to report)
- Configuration management (no significant observations to report)
- Records management (no significant observations to report)
- Management of contractors
- Business continuity (no significant observations to report).

Management system

The activities at WL are broadly governed under the AECL corporate management system, and more specifically defined in the *WL Decommissioning Quality Assurance Plan* which is required by licence condition 2.1. CNSC staff have reviewed and accepted this document as it meets CSA N286.6-98, *Decommissioning Quality Assurance for Nuclear Power Plants*. AECL has proceeded to carry out the decommissioning activities at WL in accordance with this program.

During the reporting period, AECL developed a *Detailed Decommissioning Plan* (DDP), describing the decommissioning work of WR-1 and Building 100. This document describes a relatively complex component of the WL decommissioning activities.

Performance assessment, improvement and management review

According to CSA N286.6-98, AECL must evaluate its effectiveness in achieving organizational goals, using both self and independent assessments. In addition, a formal review of the effectiveness of its Decommissioning Quality Assurance program shall be conducted annually.

CNSC staff reviewed the results of AECL's assessments and identified some minor areas for improvement. These areas included the adequacy of AECL's assessment methodology as it was not evident that AECL's methodology ensured all components of the program would be assessed.

AECL committed to conducting future assessments using AECL's "Management System Assessment Framework" instead of the previously used methodology. This activity is in progress and CNSC staff will continue to review and assess the results of these and future assessments.

Management of contractors

AECL stated that its Decommissioning Quality Assurance program applies to all staff and contractors who participate in, or support, projects or activities. However, CNSC staff determined that the information included in the DDP does not provide a clear description of how AECL would manage external contractors involved in this project.

To clarify some aspects, AECL was requested to ensure all requirements of CSA N286.6-98 are fully addressed by all workers, including contractors, involved in AECL decommissioning activities. This activity is currently in progress. CNSC staff will continue to monitor the progress of this improvement.

Human performance management

RATINGS FOR HUMAN PERFORMANCE MANAGEMENT		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff continue to rate the "human performance management" SCA for WL as "satisfactory". AECL has implemented a human performance program that ensures personnel receive the appropriate training to safely carry out their duties.		

The "human performance management" SCA covers activities that enable effective human performance through the development and implementation of processes that ensure a sufficient number of licensee personnel are in all relevant job areas and who have the necessary knowledge, skills, procedures and tools in place to safely carry out their duties. For WL, this SCA encompasses the following specific areas:

- Human performance program (no significant observations to report)
- Personnel training
- Personnel certification
- Work organization and job design (no significant observations to report)
- Fitness for duty (no significant observations to report)

Personnel training

During an inspection in October 2013, CNSC staff reviewed the training records relating to the AECL corporate training plan for employees in decommissioning and waste management. The review of these records verified that AECL has established a training program to ensure staff are trained prior to conducting work at WL.

Personnel certification

CNSC staff verified during an inspection that personnel assigned to the industrial radiography were Certified Exposure Device Operators/Qualified Operators. Their certification cards were reviewed and found valid.

Operating performance

RATINGS FOR OPERATING PERFORMANCE		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff continue to rate the "operating performance" SCA for WL as "satisfactory". Procedures are in place and followed by AECL staff. Events are reported as per the requirements and actions are put in place to avoid recurrence.		

The "operating performance" SCA includes an overall review of the conduct of the licensed activities and the activities that enable effective performance.

For WL, this SCA encompasses the following specific areas:

- Conduct of licensed activity
- Procedures
- Reporting and trending

Conduct of licensed activity

Facilities at WL are governed by AECL's *Facility Authorization* and *Conduct of Operations* documents, which describe the roles and responsibilities of positions with authority within AECL's organization.

In May 2011, AECL revised four of these documents. CNSC staff's review noted that some functional responsibilities were not clearly and completely documented in the revised documents for all positions within the AECL's organization. AECL committed to submitting the revised facility authorizations in 2014/2015. As this activity is still in progress, CNSC staff will continue to monitor progress of these improvements.

WR-1 reactor hall

Procedures

CNSC staff conducted semi-annual inspections under the baseline compliance program. CNSC staff's inspections confirmed that programs, procedures, and work plans for the decommissioning and operations at WL remain in place. Some minor issues have been reported, such as posting of radiation warning signs and maintenance records of instrumentation. All were corrected to the satisfaction of CNSC staff.

CNSC staff reviewed the WL Annual Safety Report during the review period. AECL has satisfactorily addressed all CNSC staff's comments and recommendations relating to these reports.

Reporting and trending

The requirements for reporting unplanned situations or events at WL to the CNSC are prescribed in licence condition 9. AECL has complied with the requirements for submission of these reports during the review period.

As stated previously, AECL categorizes reportable events by Significance Level as follows:

- Significance Level 1: Highly significant problem
- Significance Level 2: Significant problem
- Significance Level 3: Problem
- Significance Level 4: Minor problem/improvement

Events reported to the CNSC by Significance Level category are presented in table 6:

Table 6: Reportable events for WL (2011-2013)

	2011	2012	2013
Level 1	0	0	0
Level 2	0	0	0
Level 3	7	4	1
Level 4	3	1	3
Total	**10**	**5**	**4**

CNSC staff have reviewed the reportable events and their associated corrective action plans. All actions have been closed to CNSC staff's satisfaction. These events did not have an impact on the health and safety of the public, workers or the environment.

Safety analysis

RATINGS FOR SAFETY ANALYSIS		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "safety analysis" SCA for WL as "satisfactory". AECL's safety analysis is in line with the Fukushima actions and no other activities with fissionable material occur at WL other than what is stored.		

The "safety analysis" SCA covers maintenance of the safety analysis that supports the overall safety case for the facility. Safety analysis is a systematic evaluation of the potential hazards associated with the conduct of a proposed activity or facility and considers the effectiveness of preventative measures and strategies in reducing the effects of such hazards.

For WL, this SCA encompasses the following specific areas:

- Deterministic safety analysis
- Hazard analysis
- Criticality safety

Deterministic safety analysis

In April 2012, AECL commenced operation of the SMAGS building for the storage of low- and intermediate-level waste. As required by the licence for the operation of a newly constructed nuclear facility, AECL submitted the SAR: *Safety and Hazard Assessment for the SMAGS facility at WL*. CNSC staff's review concluded that AECL met the requirements of the licence, and that the operation of the SMAGS facility provided adequate protection for the health and safety of persons, workers and the environment.

Following the events at the Fukushima site in Japan, CNSC staff requested all Class I nuclear facilities review the lessons learned and re-examine the facilities safety case. During the review, AECL identified no significant gaps for WL, thus adequately addressing the request from CNSC staff. However, AECL identified areas for improvement to update the WL safety case documentation. During the review period, AECL began the revisions to the SAR documentation, with the submission of these revised documents due to CNSC staff in December 2014. For more information on the status of Fukushima actions, see appendix G.

Hazard analysis

Fire protection

AECL has a fire protection program in place to minimize both the probability of occurrence and the consequences of fire at WL and comply with the requirements of the *National Building Code* (2005), the *National Fire Code* (2005), and National Fire Protection Association, NFPA-801: *Fire Protection for Facilities Handling Radioactive Material* (2008). There were no significant reportable events during the review period that had an effect on the licensees' fire protection program or its implementation.

AECL has reported the completion of all the recommendations of the Biennially Independent Third Party Review and all the corrective actions relating to the focused fire protection inspection, with the exception of replacing an aging fire alarm system due to the complexity of the system and the decommissioning activities. The replacement of the fire alarm system is currently underway. This activity is planned to be completed by the end of the fiscal year 2014/2015.

Criticality safety

There remain no activities associated with fissionable material at WL, other than storage of used fuel in the Concrete Canister Storage Facility and the waste management area's standpipes, which AECL and CNSC staff consider to be low risk and low priority.

The nuclear criticality safety program at AECL is a corporate-wide program, and is used at both WL and CRL. AECL has implemented limits to be used as the Upper Subcritical Limits (USL) until all Criticality Safety Documents are revised to include explicit USLs. CNSC staff have reviewed the temporary USLs and concluded the limits are consistent with CNSC regulatory requirements.

Physical design

RATINGS FOR PHYSICAL DESIGN		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "physical design" SCA as "satisfactory" as changes at the WL are controlled as per the Engineering Change Control procedure.		

The "physical design" SCA relates to activities that impact the ability of SSCs to meet and maintain their design basis given new information arising over time and taking changes in the external environment into account.

Given that the WL site is undergoing decommissioning, there is very little work on physical design.

For WL, this SCA encompasses the following specific areas:

- Design governance
- Site characterization (no significant observations to report)
- Facility design (no significant observations to report)

Design governance

For more details on AECL's design governance, see the corresponding CRL section.

Fitness for service

RATINGS FOR FITNESS FOR SERVICE		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff continue to rate the "fitness for service" SCA as satisfactory. A periodic inspection plan is effectively in place at WL.		

The "fitness for service" SCA covers activities that impact the physical condition of SSCs to ensure that they remain effective over time. This area includes programs that ensure all equipment is available to perform its intended design function when called upon to do so.

For WL, this SCA encompasses the following specific areas:

- Equipment fitness for service / equipment performance (no significant observations to report)
- Maintenance
- Structural integrity

Maintenance

In 2009, the Periodic Inspection Plan, met the requirements of CSA N291-08, *Requirement for Safety Related Structures for CANDU Nuclear Power Plants*, for the WMA storage structures, and was developed following a 2008 fitness-for-service evaluation. This plan was implemented at WL to ensure the waste storage structures continued to be fit for service.

CNSC staff reviewed the inspection and maintenance related information provided in AECL's Annual Safety Reports, which confirmed that inspection and maintenance activities of the waste storage structures have been conducted and no significant issues have been identified. Additionally, CNSC staff have reviewed the SAR and the Commissioning Report of the new SMAGS building, and concluded the proposed SMAGS maintenance program is appropriate.

In the winter of 2013, some water leakage (in the form of icicles) was detected between the seam of the roof and the north-east wall structure of the SMAGS. The leakage was caused from drainage water freezing in the scupper causing new melting water to pool and make its way through the seam. The leakage was not infringing on any of the waste bins currently stored in the SMAGS. In February 2014, a heat tape was installed to eliminate any ice buildup.

Structural integrity

The standpipes are vertical tile holes, partially or fully covered, buried in the ground, containing historical radioactive waste. In 2009, AECL provided a technical document to demonstrate that the standpipe structures are fit for service, in which AECL stated there was considerable planning on developing testing and monitoring methods for these structures. Field work to complete the inspection and monitoring activities for the standpipe was performed in 2012. Excavation work around the standpipes, in order to examine the condition of the concrete, was done during the summer of 2013. The results will be provided to CNSC staff for review.

AECL continues to perform the annual inspection of the WMA concrete bunkers in accordance with the Periodic Inspection Plan. The inspection findings are evaluated by AECL and the information is submitted to CNSC staff for review and acceptance. No significant degradation has been identified in the inspections but some minor repairs will be carried out. AECL has provided target dates for these repairs. CNSC staff plan to conduct an inspection on the implementation of the periodic inspection program in the next 12 to 15 months.

Radiation protection

RATINGS FOR RADIATION PROTECTION		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "radiation protection" SCA as "satisfactory". AECL has implemented and maintained a radiation protection program to control radiological hazards, ascertain doses to workers, and estimate doses to the public.		

The "radiation protection" SCA covers the implementation of a radiation protection program in accordance with the *Radiation Protection Regulations*. This program must ensure that contamination levels and radiation doses received by individuals are monitored, controlled, and maintained as low as reasonably achievable (ALARA).

For WL, this SCA encompasses the following specific areas:

- Application of ALARA
- Worker dose control
- Radiation protection program performance
- Radiological hazard control
- Estimated doses to the public

Application of ALARA

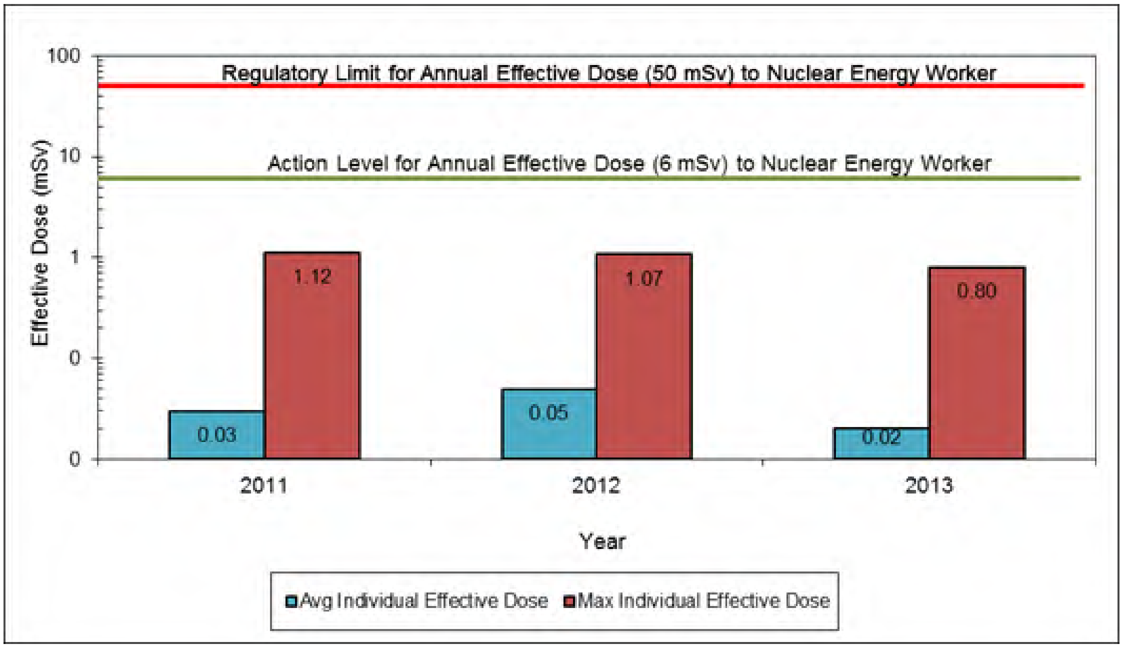
AECL continues to strive to maintain doses to workers ALARA. An example of which was the development and implementation of the document: *Job Scope and Safety Analysis*, which provides an all hazards integrated approach to planning and executing decommissioning work and non-routine nuclear facility activities. Through this process, AECL maintains exposures and potential for unplanned exposure ALARA through the application of "remove the hazard", "guard the hazard" and "guard the worker" hazard controls and safety measures. The focus has been on defining clear limiting conditions for work and applying aggressive safe back-out points for early detection of unexpected or abnormal hazards.

As a result of this process, AECL has executed radiological work in the 2009 to 2013 period with minimal dose consequence, no internal intakes and no significant contamination or exposure events. Examples of this include the Building 300 plutonium laboratory glove box removal, the hot cell facility windows refurbishment, and the warm cells active drain line and ventilation duct removal.

Worker dose control

CNSC staff review of dose data from 2011 to 2013 indicates that radiation doses to workers are being adequately controlled to levels well below the regulatory limits (figure 9). During the review period, the maximum individual effective annual dose for a Nuclear Energy Worker (NEW) was 1.12 mSv, or 2.24 percent of the annual regulatory limit of 50 mSv. Annual dose averages include all reported doses, including zero values.

Figure 9: Effective dose statistics for nuclear energy workers at AECL's WL (2011-2013)



Radiation protection program performance

AECL continues to maintain and implement a radiation protection program, including its own dosimetry service licensed by the CNSC to ascertain whole-body dose, extremity beta/gamma dose, and internal dose. When applicable, neutron whole-body dose is monitored using CR-39 dosimeters supplied by Health Canada's CNSC licensed National Dosimetry Services. For immediate monitoring of individual gamma doses, direct reading electronic dosimeters are used.

Radiological hazard control

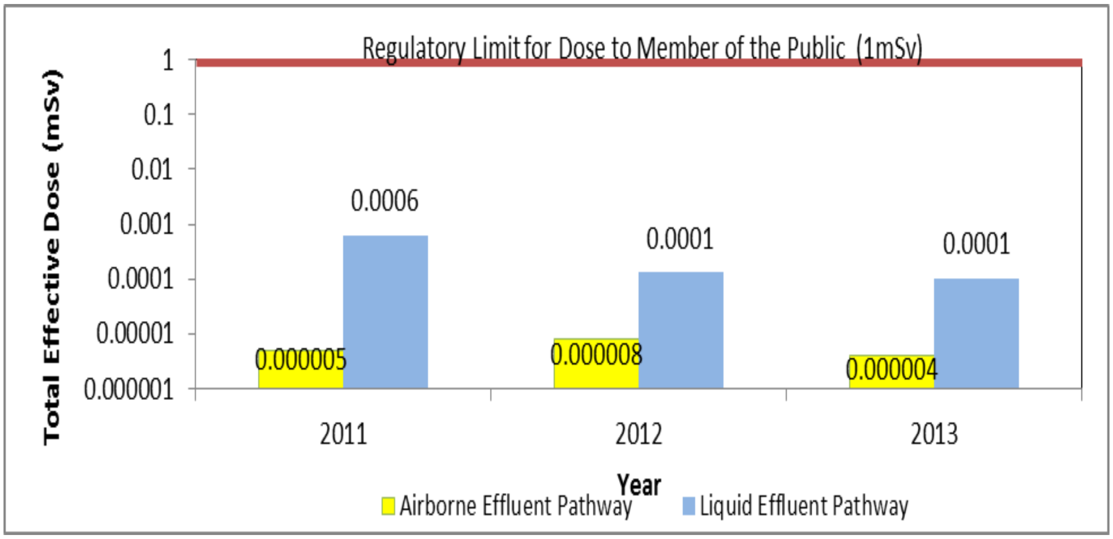
Action levels have been established as part of the WL radiation protection program. If one is reached, it triggers AECL staff to establish the cause for reaching the action level and, if applicable, restore the effectiveness of the radiation protection program.There have been no action level exceedances at WL over the review period.

AECL continues to effectively maintain and implement a surface contamination monitoring program to effectively control contamination at WL.

Estimated dose to the public

The dose to the public from WL activities is calculated by using environmental monitoring results. The dose due to airborne exposure pathways was estimated by multiplying the WL total air release, as a fraction of the derived release limit (DRL), by 1 mSv and is negligible. The dose due to the liquid exposure pathways was calculated using the river water, fish, game meat and vegetable components. Doses to the public continue to be well below the regulatory annual public dose limit of 1 mSv, as seen in figure 10.

Figure 10: Total effective dose (mSv) to a member of the public (2011-2013)



Conventional health and safety

RATINGS FOR CONVENTIONAL HEALTH AND SAFETY		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "conventional health and safety" SCA at WL as "satisfactory" as AECL continues to view conventional health and safety as a paramount consideration in all decommissioning activities.		

The "conventional health and safety" SCA covers the implementation of a program to manage workplace safety hazards and to protect personnel and equipment.

For WL, this SCA encompasses the following specific areas:

- Performance
- Practices
- Awareness (no significant observations to report)

Performance

A key performance measure for this SCA is the number of RLTIs that occur per year. An RLTI is an injury that takes place at work and results in the worker being unable to return to work to carry out their duties for a period of time. In reviewing RLTIs, CNSC staff must consider the severity of these injuries (e.g., the total days lost) and the frequency as they relate to the size of the workforce. The severity rate is a measure of the total number of days lost due to injury for every 200,000 person-hours worked at a site and the frequency is the number of fatalities and injuries (lost time and medically treated) due to accidents for every 200,000 person-hours worked at a site.

As per table 7, the number of RLTIs and their frequency is relatively stable; however, the severity rate is increasing. This means a considerable number of injuries at WL are resulting in extended absences from the workplace. Although most of these injuries are minor (requiring first aid), improvements to the return to work program are still required to minimize the number of days lost. AECL is currently in the process of implementing these improvement actions.

Table 7: Recordable lost-time injuries (RLTI), frequency and severity at WL 2011-2013

Year	RLTIs	RLTI Frequency	RLTI Severity
2011	8	2.28	9.98
2012	5	1.69	12.19
2013	7	2.29	20.27

Practices

In addition to the NSCA and regulations, AECL's activities and operations at the WL site must comply with the *Canada Labour Code* Part II and the Canada *Occupational Health and Safety Regulations, Hazardous Products Act, Controlled Products Regulations, Workplace Hazardous Materials Information System*, and other applicable federal and provincial health and safety related acts and regulations.

Environmental protection

RATINGS FOR ENVIRONMENTAL PROTECTION		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff rate the "environmental protection" SCA at WL as "satisfactory". AECL continues to implement and maintain an environmental protection program to control and monitor liquid and air releases of radioactive and hazardous substances to the environment.		

The "environmental protection" SCA covers the programs that identify, control and monitor all releases of radioactive and hazardous substances, and the effects on the environment from facilities or as the result of licensed activities.

For WL, this SCA encompasses the following specific areas:

- Environmental management system
- Effluent and emissions control (releases)
- Assessment and monitoring
- Protection of the public

Environmental management system

AECL worker gathering samples for environmental monitoring at WL

Licensees must have adequate provision for the protection of the environment via policies, programs and procedures, as required by REGDOC-2.9.1, *Environmental Protection: Environmental Protection Policies, Programs and Procedures*. AECL's environmental protection program consists of an environmental policy along with comprehensive programs and procedures to protect the environment. This includes an effluent monitoring program and an environmental monitoring program at WL. Through sampling and analysis of nuclear and non-nuclear substances, these programs assist in verifying that releases from WL do not pose hazards to the environment or human health.

AECL's environmental management system is ISO-14001 registered, and is subject to periodic audits and reviews to identify potential improvements.

Effluent and emissions control

CSA N288.5, *Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills*, was published in 2011. Unlike CRL, as specified earlier in the report, AECL is currently transitioning toward this standard at WL with a target date of March 2015.

Nuclear substance releases

Established DRLs for airborne and liquid effluents are listed in the WL licence. The DRLs represent the maximum radionuclide releases to the environment to maintain the public annual dose below the 1 mSv annual regulatory dose limit. During 2012 and 2013, there were no airborne or liquid exceedances of these release limits. The total releases of airborne and liquid effluents for 2012 and 2013 were well below the 1 mSv limit.

As part of its environmental protection program, AECL has established a number of action levels, which if exceeded may indicate a loss of operational control. If an action level is reached or exceeded, AECL is required to establish the cause and, if applicable, restore the effectiveness of the program. AECL is required to report all action level exceedances to the CNSC.

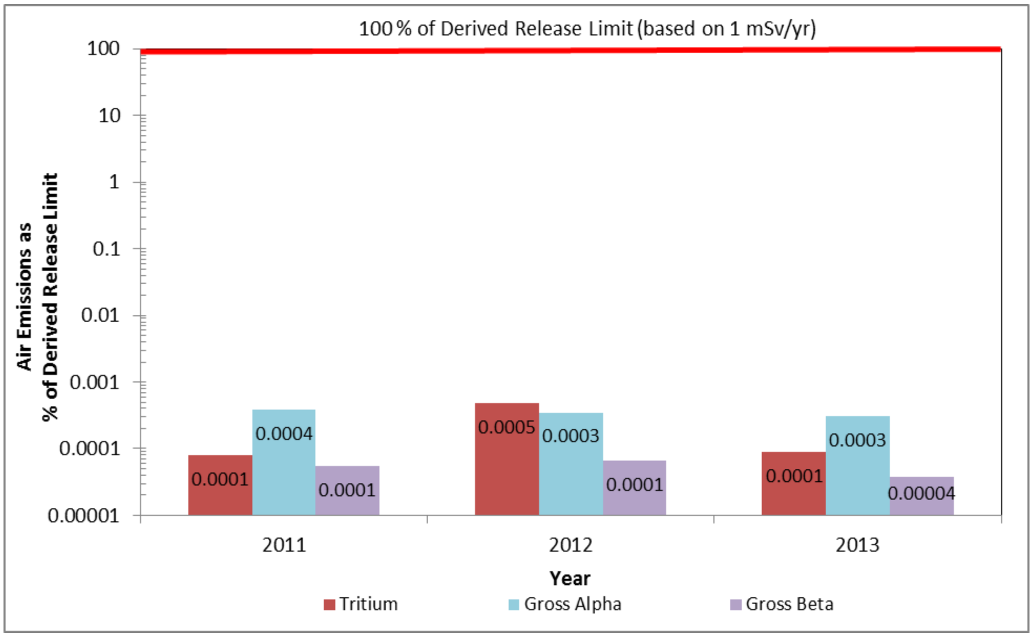
In 2012 and 2013, there were no action level exceedances of airborne or liquid releases at WL.

Airborne nuclear substance releases

AECL's radiological air effluent verification program at WL comprises eight monitoring points, including the Hot Cells Facility, Immobilized Fuel Test Facility, Reactor Building, Active Liquid Waste Treatment Centre and the Incinerator and Compactor/Baler in the waste management area. Monitoring is by sampling and analysis for radionuclides, including tritium, gross alpha and gross beta.

The airborne radiological emissions from WL continue to be effectively controlled and below the annual DRLs, as shown in figure 11.

Figure 11: Airborne nuclear substance releases for WL (2011-2013)

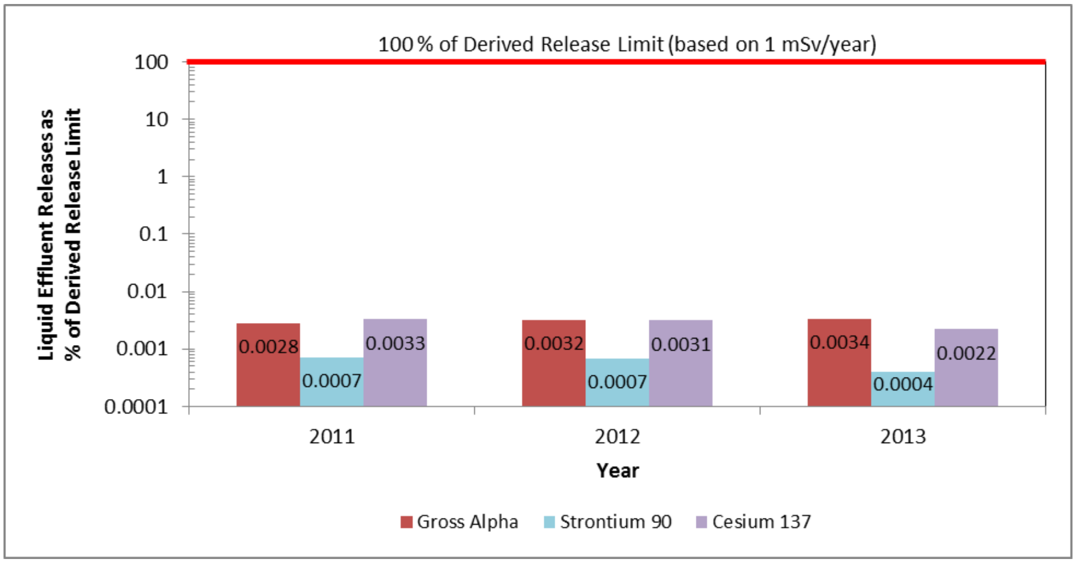


<u>Liquid nuclear substance releases</u>

AECL's radiological liquid effluent verification program for WL comprises eight monitoring points for process water outfall flowing into the Winnipeg River, discharges from the sewage lagoon and the waste management area's two drainage ditches. Monitoring is by sampling and analysis for radionuclides, gross alpha, strontium-90 and cesium-137.

The liquid radiological emissions from the WL continue to be effectively controlled and below the annual DRLs, as shown in figure 12.

Figure 12: Liquid nuclear substance releases for WL (2011-2013)



Airborne hazardous substance releases

The main stationary sources of non-radiological effluents to air from the WL are related to fuel combustion for building heating and steam generation purposes, and inadvertent losses of halocarbons used in research, cooling and fire suppression applications. The main source of fuel combustion releases is the combustion of Number 2 fuel oil and propane gas to generate heat. AECL does not routinely monitor these emissions instead estimates are calculated using oil consumption data and emission factors provided by Environment Canada.

The fuel consumption data is used to estimate the air emissions for Criteria Air Contaminants. Those that exceed the National Pollutant Release Inventory threshold are then reported to Environment Canada. Estimated emissions between 2012 and 2013 remained low and fall below the reporting thresholds.

Liquid hazardous substance releases

The WL routinely discharges, in various liquid effluents, many non-radiological substances to the environment (the Winnipeg River) via the sewage lagoon, process sewer outfall, drainage ditches and internal liquid discharges. In total, AECL routinely monitors nine different monitoring points for non-radiological parameters and compares the performance of significant effluent concentrations against AECL guidelines.

A wide variety of parameters are measured including mercury, phenolics, copper, zinc, iron, nickel, and total suspended solids. The number of guideline exceedances for 2012 and 2013 were five and two respectively. The guideline exceedances occurred at the Active Liquid Waste Treatment Center for copper, iron and mercury in 2012, and iron and phenolics in 2013. All lagoon, ditches and Outfall emissions conformed to AECL emission guidelines. In cases of reoccurring exceedences, AECL investigates the cause and potential corrective actions. CNSC staff are tracking these exceedences through the review of the annual safety reports.

Assessment and monitoring

A revision to CSA N288.4, *Environmental Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills*, was issued in 2010. In 2010, AECL assessed the WL environmental monitoring system against the revised standard to identify areas of non-compliance and make appropriate modifications to the program. In 2012, AECL initiated work on the identified subtask activities required to implement the revised standard. This transition is still in progress.

Environmental monitoring

AECL maintains a comprehensive environmental monitoring program for WL to verify that radiation doses to members of the public as a result of radioactive releases from WL remain ALARA, social and economic factors being taken into account. The program also serves to verify that non-radioactive releases do not pose hazards to human health and that neither radioactive releases, non-radioactive releases, nor physical stressors pose hazards to the environment.

The radiological component of the environmental monitoring program is conducted through the routine collection and analysis of environmental samples from locations at the WL site and in the surrounding area. Monitored media include ambient air, precipitation, fish, garden vegetables, game meat, groundwater, Winnipeg River water and river sediments.

The non-radiological component focuses on groundwater samples from wells located at the waste management area lagoon and landfill.

Environmental monitoring results in 2012 and 2013 continue to demonstrate AECL's successful implementation of this program at WL.

Winnipeg River monitoring

AECL samples surface water at four locations along the Winnipeg River between Pinawa and the Great Falls generating station. Water samples are analyzed for radionuclides such as tritium, gross alpha, gross beta and strontium-90. The sampling results for 2012 and 2013 demonstrate that radionuclide concentration in the Winnipeg River water remain very low. Specifically, annual average concentrations of tritium in water ranged from 2.5 to 3.5 Bq/L, which is well below the Maximum Acceptable Concentration of 7000 Bq/L indicated in Health Canada's *Guidelines for Canadian Drinking Water Quality*.

Protection of the public

At WL, systems that discharge conventional (non-radiological) contaminants to the environment are not regulated by the province since WL is a federal site. As a result, AECL has developed its own AECL guidelines to manage non-radiological liquid releases. See the specific area "effluent and emission control" for additional information.

CNSC staff receives reports of discharges to the environment through the reporting requirements outlined in the WL licence.

Review of non-radioactive discharges to the environment for WL in 2012 and 2013 indicate that no significant risks to the public or environment occurred during the licensing period.

Emergency management and fire protection

RATINGS FOR EMERGENCY MANAGEMENT AND FIRE PROTECTION		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "emergency management and fire protection" SCA at WL as "satisfactory". Overall, compliance verification activities conducted confirm that AECL continues to maintain a comprehensive and well-documented emergency management program that meets all applicable regulatory requirements.		

The "emergency management and fire protection" SCA covers emergency plans and emergency preparedness programs that exist for emergencies and for non-routine conditions. This area also includes any results of participation in exercises.

For WL, this SCA encompasses the following specific areas:

- Conventional emergency preparedness and response
- Nuclear emergency preparedness and response (no significant observations to report)

- Fire emergency preparedness and response (no significant observations to report)

Conventional emergency preparedness and response

The AECL *WL Site Emergency Plan* and related site specific emergency procedures were reviewed by CNSC staff and determined to be consistent with the requirements of G-225, *Emergency Planning at Class I Nuclear Facilities and Uranium Mines and Mills*. AECL's emergency preparedness documentation is appropriate for the anticipated degree of emergencies at the WL site.

Waste management

RATINGS FOR WASTE MANAGEMENT		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff conclude that the rating for "waste management" SCA at WL was "satisfactory". All radioactive waste is managed in accordance with applicable regulations and internal procedures.		

The "waste management" SCA covers internal waste-related programs that form part of the facility's operations up to the point where the waste is removed from the facility to a separate waste management facility. This area also covers the planning for decommissioning.

For WL, this SCA encompasses the following specific areas:

- Waste characterization and minimization
- Waste management practices
- Decommissioning plans

Waste characterization and minimization

Dismantling and demolition waste produced at WL are radiologically screened and segregated at the source as either "Likely Clean" or "Contaminated". Likely Clean waste is monitored for radiological clearance. If found clean, the waste is either dispositioned for reuse or recycling where possible, or disposed of in the WL landfill or transferred to an appropriate storage or process facility for hazardous material. Contaminated waste will be decontaminated to meet clearance criteria where feasible or characterized and sent to the WMA for processing as per CSA N292.3, *Management of low- and intermediate-level radioactive waste*.

Waste management practices

The WMA provides storage facilities for radioactive wastes and small volumes of hazardous industrial waste. It consists of an organic incinerator, the new SMAGS building, bunkers and Quonset storage buildings used to store low-level radioactive waste (LLW) and intermediate-level radioactive waste (referred to in this report as medium-level waste, or MLW) generated from WL decommissioning.

Table 8 provides information on the percentage of space that is filled and the estimate number of years of storage space remaining in the waste storage building. There are also two empty standpipes in the WMA.

Table 8: Status of waste storage buildings at WL (as of December 31, 2013)

Building No.	% Full	Years of Storage Space Remaining
LLW B5	100 (sealed)	N/A
LLW B6	60	1
MLW B4	70	2-3
MLW B6 *	60	2-3
MLW B7	85	2-5
431 (LLW Storage Building)	60	3
433 (LLW Storage Building)	80	2
SMAGS Building #1	5	10
Soil Storage Compound	0.5	10

* MLW B6 is currently not accepting waste due to water ingress issues.

The Concrete Canister Storage Facility is located adjacent to the WMA and has stored irradiated fuel since 1975. In January 2014, AECL reported that canister C-5 is slightly leaning (less than 1°). AECL will continue to survey the canister to ensure that there is no movement with that canister. CNSC staff continue to monitor the results of AECL's surveys during monthly licensing meeting.

To study the distribution of dose received by living organisms, AECL constructed a cesium pond in 1966. This pond was decommissioned in 2013 with work on segregating the cesium soil being completed in 2013. The soil is presently stock piled within the fenced area of the WMA for the short term, while AECL assesses long-term storage. Concrete blocks have been used to form a retaining wall around the north and west sides of the stock pile. On the inside of the retaining wall, a sand fill space was placed in a geo-membrane. This membrane acts as a silt fence and porewater pressure drainage for removing water from the soil. Finally, a large tarp was placed over the pile to prevent erosion. To support the conclusion, these measures ensure the pile remains in a safe state and that the environment is protected. AECL has submitted additional information. CNSC staff are currently reviewing this information.

Decommissioning plans

AECL decided to reduce the deferment period of the decommissioning of its installations. Therefore, AECL presented to CNSC staff the detailed decommissioning plan for WR-1 in September 2013. As previously indicated, work is planned to start in 2015. This work will consist of the removal of the remaining systems like the reactor vessels and the primary heat transport system, to name two. Building 200 (Active Liquids Waste Treatment Centre) and Building 411 (Decontamination Centre) are planned to be decommissioned next. The activities presently conducted in these buildings will be moved to Building 300. The activities described above fall under the Nuclear Legacy Liabilities Program, as previously described in section 1.5.

Security

RATINGS FOR SECURITY		
Overall Performance Ratings		
2011	2012	2013
FS	FS	FS
Based on the information assessed, CNSC staff continue to rate the SCA "security" as "fully satisfactory" at WL. AECL has implemented a security program that meets the *Nuclear Security Regulations* and associated regulatory documents.		

The "security" SCA covers the programs required to implement and support the security requirements stipulated in the regulations, the licence, orders, or expectations for the facility or activity.

For WL, this SCA encompasses the following specific areas:

- Facilities and equipment
- Response arrangements
- Security practices
- Drills and exercises

Facilities and equipment

During the review period, AECL demonstrated the effective maintenance of facilities and equipment, and met regulatory requirements at WL.

Response arrangements

AECL maintains a security force of qualified Nuclear Security Officers at WL to meet the requirements of the *Nuclear Security Regulations*. The security force employs a response strategy based on defence-in-depth and the graded approach. Arrangements also exist with the Royal Canadian Mounted Police (RCMP), its offsite response force.

Security practices

AECL continues to demonstrate procedural compliance and is equipped with access control measures at WL that meet regulatory requirements. AECL maintains good practices through robust corporate governance.

Drills and exercises

AECL continues to conduct security exercises every two years at WL in coordination with the offsite response force as per section 36(2) of the *Nuclear Security Regulations*. AECL conducted a successful security exercise in October 2013 where AECL demonstrated effective intervention capabilities against a credible threat in coordination with the RCMP. The physical protection system was realistically tested and assessed.

Safeguards and non-proliferation

RATINGS FOR SAFEGUARDS AND NON-PROLIFERATION		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
Based on the information assessed from 2011 to 2013, CNSC staff conclude that the implementation of the safeguards program for the "safeguards and non-proliferation" SCA at WL met all applicable regulatory requirements with a "satisfactory" rating.		

The "safeguards and non-proliferation" SCA covers the programs required for the successful implementation of the obligations arising from the Canada/IAEA safeguards agreements, as well as all other measures arising from the treaty on the *Non-Proliferation of Nuclear Weapons*.

For WL, this SCA encompasses the following specific areas:

- Nuclear material accountancy and control
- Access and assistance to the IAEA
- Operational and design information
- Safeguards equipment, containment and surveillance

Nuclear material accountancy and control

During the review period, AECL provided the CNSC and IAEA with all nuclear material accounting reports and information in an accurate and timely manner, as required by RD-336, *Accounting and Reporting of Nuclear Material*.

Access and assistance to the IAEA

From 2011 to 2013, the IAEA conducted six inspections at WL. Details of the IAEA inspections can be found in table 9:

Table 9: Verification activities by the IAEA at WL

Year	SNRI	PIV	DIV	Total
2011	1	0	1	2
2012	1	0	1	2
2013	0	1	1	2
Total Inspections				6

SNRI - Short Notice Random Inspection
PIV - Physical Inventory Verification
DIV - Design Information Verification

The IAEA has indicated that the results from their inspection activities at WL were satisfactory and no actions were requested from AECL. On this basis, the IAEA concluded that all nuclear material at this site remained in peaceful activities.

Safeguards equipment, containment and surveillance

There is no IAEA equipment installed at WL.

Operational and design information

AECL submits annual operational program and quarterly updates, as required. These documents provide a forward-looking plan of WL's activities, and are updated by AECL as needed. AECL also submits information under the *Additional Protocol to the Canada - IAEA Safeguards Agreement*, including a description of each building, the scale of its operations, and future plans for nuclear fuel research and development activities. In addition, Design Information Questionnaire documents were updated as required for various facilities and submitted to CNSC staff.

Packaging and transport

RATINGS FOR PACKAGING AND TRANSPORT		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff continue to rate the "packaging and transport" SCA for WL as "satisfactory". Transportation of dangerous goods training is in place and the handling, packaging and offering for transport of radioactive material is conducted by certified personnel.		

The "packaging and transport" SCA covers programs for the safe packaging and transport of nuclear substances to and from the licensed facility.

For WL, this SCA encompasses the following specific area:

- Packaging and transport

Packaging and transport

AECL must adhere to the *Packaging and Transport of Nuclear Substances Regulations* and *Transport Canada's Transportation of Dangerous Goods Regulations* for all shipments leaving the site.

AECL is required to have appropriate training for personnel involved in the handling, offering for transport and transport of dangerous goods, and is required to issue a training certificate to those workers. During an inspection, training certificates were reviewed and found to be missing required information. This has been satisfactorily addressed by AECL.

This page was intentionally left blank.

PART II: PROJECTS

3 OVERVIEW

Port Hope Area Initiative

The Port Hope Area Initiative (PHAI) comprises two community-based projects to develop and implement a safe, local, long-term management solutions for historic low-level radioactive waste (LLRW) in Port Hope and Port Granby. The PHAI is defined by a legal agreement between the Government of Canada and the Municipalities of Port Hope and Clarington for the management of the historic LLRW within each of the respective communities [12]. The agreement came into effect in March 2001.

Under the terms of the agreement, the Government of Canada, through Natural Resources Canada (NRCan) has made a financial commitment to clean up and to provide long-term safe management of the historic LLRW in Port Hope and Port Granby (see appendix D for more information). These wastes arose from the activities of a former federal Crown Corporation (Eldorado Nuclear) and its private sector predecessors.

AECL was engaged by NRCan as the proponent for environmental and licensing approvals associated with the PHAI projects and as overall project manager. Under the governance framework established by NRCan, the PHAI Management Office is led by AECL, and the responsibility for all major contracting activities is assigned to Public Works and Government Services Canada (PWGSC). A tripartite federal steering committee oversees the PHAI Management Office and provides strategic direction to the General Manager (AECL). The PHAI Management Office conducts its work and coordinates its activities with those of the participating organizations: AECL, NRCan and PWGSC.

The PHAI includes two distinct and separate projects:

- The Port Hope Long-Term Low-Level Radioactive Waste Management Project (the "Port Hope Project")
- The Port Granby Long-Term Low-Level Radioactive Waste Management Project (the "Port Granby Project")

The status for each project (Port Hope versus Port Granby) is presented separately in the following sections (3.2 and 3.3). Currently, the projects are at the same stage of development and therefore, the information presented per SCA is very similar and may appear to be duplication. However, it was deemed important to separate the two projects into distinct sections as the information that will be included in future reports will differ as the projects progress independently.

3.1 Public information and disclosure

AECL is currently implementing its *PHAI Phase II Communication Plan* and is committed to disclosing information about the projects with stakeholders in a timely, accurate and comprehensive manner.

In 2013, AECL conducted public information activities for PHAI that met CNSC regulatory requirements. These activities included:

- The posting recent project news and updates and environmental monitoring data to the website www.phai.ca
- The Public Information Exchange, which is located at the PHAI Management Office, is open five days a week and contains two 3-D, to scale models to help visualize how the engineered mound will look post-construction
- Citizen Liaison Groups for the Port Hope and Port Granby Projects have been launched to supplement the exchange of information with communities; the groups, which meet on a quarterly basis, each consists of volunteer citizen members who meet with AECL team leaders to discuss the project activities and community concerns
- AECL has conducted outreach activities at fairs and trade shows, site tours (37 in 2013), newsletters (mailed to 15, 000 residents), and PHAI Facebook (received about 4,500 views)
- AECL plans to update its Communication plan to reflect the progress on the projects in 2014

Residents attending a public information session

To engage Aboriginal groups interested in the PHAI, AECL also conducted activities such as regular meetings, workshops, site tours, and invitations to join a community liaison group. Based on the information received, CNSC staff are satisfied that AECL's Aboriginal engagement activities related to the PHAI are appropriate to keep interested Aboriginal audiences informed.

3.2 Port Hope Project

3.2.1 Overview

The purpose of the Port Hope Project (PHP) is to remediate sites containing historic low-level radioactive waste (LLRW) and other specified industrial waste located in the Municipality of Port Hope, and to consolidate and manage this waste in a new Long-Term Low-Level Radioactive Waste Management Facility (LTWMF) developed on lands comprising and adjacent to the existing Welcome Waste Management Facility (WMF). The current contents of the Welcome WMF will be incorporated into the new LTWMF.

Figure 13: The municipality of Port Hope

(Source: AECL)

The historic LLRW is the result of radium and uranium refining activities associated with the processing of pitchblende ores during the period from 1933 to 1955. Process residues and other materials were discarded or used in construction and landscaping activities at various locations within the community. The historic LLRW currently exists within licensed facilities including the existing Welcome WMF, and at miscellaneous unlicensed sites including the Port Hope Harbor and the former municipal landfill site.

PHP activities include the construction and operation of the LTWMF, remediation of the existing Welcome WMF and remediation of sites containing historic LLRW located within the Municipality of Port Hope.

The PHP is being conducted in three phases – transition, implementation and closure.

- Phase I (transition) activities are confined to the continued operation, care and maintenance of the Welcome WMF, assumed from Cameco in March 2012
- Phase II (implementation) activities include the operation, care and maintenance of the Welcome WMF; redevelopment of the facility into the Port Hope LTWMF; operation, care and maintenance of the LTWMF; and offsite remedial activities
- Phase III (closure) activities include long-term maintenance and monitoring of the Port Hope LTWMF

In 2014, the second year of Phase II of the PHP, AECL is preparing for construction of the LTWMF, completing construction of the new water treatment plant, and delineating contaminated offsite areas to facilitate development of remediation plans. As the project proceeds, AECL continues to inform and engage the public through various mechanisms under their public information program including the Port Hope Citizen Liaison Group. Further details regarding the public information program can be found in section 3.1 of this report.

Phase II activities are governed under the PHP licence [13], which was issued on November 15, 2012. Under that licence, AECL is required to implement programs for PHP to ensure compliance with the accepted design, safe conduct of the approved activities and protection of people and the environment. These programs are referenced in the LCH [14].

CNSC staff continue to verify implementation of AECL's programs with respect to this project and assess them against the performance objectives and compliance verification criteria defined in the regulations, the licence and the LCH. Verification activities include desktop reviews and site inspections. Many program documents referenced in the LCH are currently undergoing revision; desktop reviews of these will be conducted by CNSC staff. The most recent site inspection was conducted on October 29, 2013.

As previously stated, the information presented per SCA is very similar between the two projects. It is important to separate the two projects into distinct sections because the information that will be included in future annual reports will differ as the projects progress independently. Therefore, an update on the status of the PHP by SCA follows. Prior to 2012, the PHP performance was not rated according to the SCAs. In 2012, the ratings assessed for each SCA were based on information submitted in support of the licence application. In 2013, the ratings for each SCA were based on CNSC staff assessment for the review period. The review period for the PHP is from November 15, 2012 (licence issuance) to December 31, 2013; recent updates on key issues through June 30, 2014 are also provided.

It must be noted that many of the specific areas under the SCAs do not apply to the PHP, and this is reflected in the discussion below. This is due largely to the nature of the project. Unlike CRL and WL, the PHP is not a nuclear facility. Further, many of the activities in Phase II, upon which AECL embarked with the issuance of the current licence, involve conventional construction, for example construction of the new Water Treatment Plant (WTP).

3.2.2 Safety and control areas

Table 10 presents the ratings for PHP for the year 2013. All SCA ratings are "satisfactory" for the reporting period which remains unchanged from reports previously made to the Commission [15].

Table 10: Performance ratings for Port Hope project for 2013

Safety and control area	Rating
Management system	**SA**
Human performance management	**SA**
Operating performance	**SA**
Safety analysis	**N/A**
Physical design	**SA**
Fitness for service	**SA**
Radiation protection	**SA**
Conventional health and safety	**SA**
Environmental protection	**SA**
Emergency management and fire protection	**SA**
Waste management	**N/A**
Security	**SA**
Safeguards and non-proliferation	**N/A**
Packaging and transport	**SA**

Notes:

- For specific areas within the SCAs where there were no significant observations from CNSC staff compliance verification activities, no information is given in the subsection of the report.
- The information presented below is site specific; general trends are not identified.

Management system

RATINGS FOR MANAGEMENT SYSTEM		
Overall Performance Ratings		
2011	**2012**	**2013**
Not rated	SA	SA
For the review period, CNSC staff continue to rate the "management system" SCA for the PHP as "satisfactory". AECL continues to implement the *PHAI Quality Assurance Plan* and conducts oversight activities.		

The "management system" SCA covers the framework that establishes the processes and programs required to ensure an organization achieves its safety objectives, continuously monitors its performance against these objectives, and fosters a healthy safety culture.

For the PHP, this SCA encompasses the following specific areas:

- Management system
- Operating experience
- Safety culture
- Records management (no significant observations to report)
- Management of contractors

Management system

The activities of the PHP are broadly governed under the AECL corporate management system, and more specifically guided by the *PHAI Quality Assurance Plan*. This plan summarizes the processes and practices applicable to the PHAI licensed activities during execution of Phase II and clarifies the extent of their applicability to participants. These processes and practices comply with the quality management system defined in CSA-ISO 9001:08 *Quality Management Systems – Requirements*. The Quality Assurance plan, and adherence to it, is a requirement of licence condition 2.2.

Operating experience

As previously stated in the report, the OPEX program at AECL comprises the processes that ensure the organization uses the experience both from within the organization and from industry peers to improve the safety of operations, improve operational performance, and reduce the significance and the occurrence of unplanned events.

PHP reviews OPEX bulletins for relevance and applicability through the Improvement Action process.

Safety culture

AECL staff receives mandatory training in Human Performance to help reduce human error and thus, the frequency and severity of events at PHP. Initiatives by AECL's Human Performance Branch are designed, amongst other things, to strengthen AECL's safety culture.

During the review period, safety culture related training conducted for PHP staff included *Field Observation and Coaching Fundamentals; Reinforcing Leadership Development; Communicating for Leadership Success and Building Trust;* and *Coaching for Peak Performance*.

Management of contractors

AECL's responsibilities include defining the licence requirements to be included in contracts awarded by PWGSC for the execution of construction and remediation activities. AECL conducts oversight to ensure licence requirements are met. The *PHAI Oversight Procedure* governs how AECL oversight is conducted to confirm compliance with licensing commitments, technical requirements, and contractual obligations.

Within the review period, AECL conducted oversight for the WTP construction, the abandoned WMF pipeline resurvey, small scale site resurveys, known sites investigation, the Sculthorpe Marsh investigation, and dust monitoring associated with the construction of the new WTP.

Human performance management

RATINGS FOR HUMAN PERFORMANCE MANAGEMENT		
Overall Performance Ratings		
2011	**2012**	**2013**
Not rated	SA	SA
For the review period, CNSC staff continue to rate the "human performance management" SCA for the PHP as "satisfactory". AECL continues to implement an acceptable training program to ensure AECL staff has the necessary skills and knowledge to safely carry out their duties.		

The "human performance management" SCA covers activities that enable effective human performance through the development and implementation of processes that ensure a sufficient number of licensee personnel are available in all relevant job areas and have the necessary knowledge, skills, procedures and tools in place to safely carry out their duties. For the PHP, this SCA encompasses the following specific area:

- Personnel training

Personnel training

A training program, and adherence to it, is a requirement under licence condition 2.5. To meet this requirement, AECL has implemented the *PHAI Training Plan*. During the review period, AECL conducted 17 training courses for PHP staff including those reported under the specific area safety culture, above.

CNSC staff conducted a general assessment of facility operations during an inspection in October 2013. At that time, CNSC staff reviewed training records for facility managers and operational staff and found them complete. AECL's corporate database is utilized to identify and track training needs, and to file staff training records.

Operating performance

RATINGS FOR OPERATING PERFORMANCE		
Overall Performance Ratings		
2011	**2012**	**2013**
Not rated	SA	SA
For the review period, CNSC staff continues to rate the "operating performance" SCA at PHP as "satisfactory". AECL continues to meet licensing and regulatory requirements in conducting Phase II activities, implementing procedures and reporting on activities.		

The "operating performance" SCA includes an overall review of the conduct of the licensed activities and the activities that enable effective performance.

For the PHP, this SCA encompasses the following specific areas:

- Conduct of licensed activity
- Procedures
- Reporting and trending

Conduct of licensed activity

Licensed activities for Phase II, the current phase of the PHP, include:

- the operation of the existing Welcome Waste Management Facility (WMF)
- the construction of the new Water Treatment Plant (WTP)
- the construction of the new Long-Term Waste Management Facility (LTWMF)
- offsite remediation site

AECL plans to conduct the Phase II licensed activities over a 10-year timeframe.

Operation of Welcome Waste Management Facility

The Welcome WMF was transferred from Cameco to AECL on March 31, 2010. Under the licence, AECL is authorized to operate and maintain the Welcome WMF, as per the operational procedures and protocols specified in the *Licensing Manual – Information in Support of the Port Hope Long-Term Low-Level Radioactive Waste Management Project Licence Application*.

CNSC staff conducted a general assessment of facility operations during an inspection in October 2013. At that time, CNSC staff visually inspected the WTP, the treatment ponds and the interceptor ditch and observed that the facility was maintained in good operating condition.

Construction of the new Water Treatment Plant

AECL is required, under licence condition 2.6, to construct the new WTP in accordance with design documentation specified in the LCH. Construction of the WTP is being managed and overseen by PWGSC; AECL continues to conduct oversight activities for WTP construction as well as dust monitoring associated with the construction.

The building envelope of the new WTP was completed in the fall of 2013. Fitting of the building with water treatment equipment is ongoing. The plan for active commissioning has been submitted by AECL, as required under section 3.2.6 of the LCH, and has been accepted by CNSC staff.

Construction of the new Long Term Waste Management Facility and remediation of Welcome Waste Management Facility

AECL has begun site preparation activities, including removal of trees and shrubs, in preparation for construction of the LTWMF.

Before initiating remediation of the Welcome WMF, AECL is required under licence condition 2.6 to construct and commission the new WTP. However, AECL has requested authorization to conduct some construction activities prior to commissioning the WTP, in order to maintain its current project schedule. These early works include construction of Cell 1 of the LTWMF containment mound (into which contents of the existing mound will be transferred); construction of onsite infrastructure and support facilities; and excavation and temporary onsite stockpiling of affected soil. CNSC staff have reviewed AECL's submissions with respect to this work and have granted the authorization to proceed.

Offsite remediation sites

AECL is required, under licence condition 2.6, to remediate sites containing historic LLRW within the Municipality of Port Hope in accordance with design documentation specified in section 3.2.6 of the LCH.

Currently, AECL is conducting a radiological resurvey of the small-scale sites in Port Hope to characterize and delineate the contamination. The survey includes exterior gamma scanning, borehole testing and soil sampling, and interior contamination monitoring. During the review period, AECL made significant progress toward delineating contamination at the small scale sites including full radiological survey of 450 sites; and partial survey (radon monitoring) at 950 sites. There are approximately 4,800 small scale sites. Resurvey of these sites began in 2012 and is expected to continue into 2016.

Detailed design descriptions for the groups of small scale sites were submitted by AECL before licensing and accepted by CNSC staff. Following resurvey, AECL will submit site specific remediation plans for CNSC staff review and acceptance. The basic remediation strategy at all sites will involve the excavation of the contaminated material and transfer to the LTWMF. The clean-up criteria are given in appendix C to the current licence.

AECL is required, under licence condition 2.1, to conduct remedial work in accordance with the clean-up criteria specified in appendix C to the licence. AECL will verify completion of remedial activities utilizing its *Remediation Verification Standard Operating Procedure*. CNSC staff will conduct independent oversight and verification of remediation activities.

Procedures

AECL maintains a suite of procedures specifically applicable to the activities of the PHP. These procedures are designed to operate within the broader framework of AECL's corporate documented programs. During the review period, project-specific procedures relating to commissioning of the WTP and authorization of early works were submitted to the CNSC for review and acceptance.

Reporting and trending

As specified in licence condition 2.3, AECL is required to submit written reports for action level exceedances; quarterly liquid effluent monitoring; quarterly liquid effluent toxicity testing; annual compliance data; and a report of any failure that resulted in, or could have resulted in the release of a nuclear substance or hazardous substance from the facility. AECL has complied with the requirements for submission of these reports during the review period.

AECL reported three consecutive action level exceedances (0.0320mg/L, 0.0590 mg/L, and 0.051 mg/L) of arsenic in liquid effluent from the existing WTP in July 2013. The action level for arsenic is 0.0264 mg/L. AECL promptly instituted corrective actions and established a new procedure to prevent reoccurrence. No regulatory concerns were identified during CNSC staff's review of these event reports.

It should be noted that the events did not lead to an exceedance of the monthly effluent release limit for arsenic, as specified in appendix B of the licence (monthly average limit of 0.50 mg/L). For more information on these exceedances, see the environmental protection SCA section of this report.

Safety analysis

RATINGS FOR SAFETY ANALYSIS		
Overall Performance Ratings		
2011	2012	2013
N/A	N/A	N/A
Not applicable		

The "safety analysis" SCA covers maintenance of the safety analysis that supports the overall safety case for the facility. Safety analysis is a systematic evaluation of the potential hazards associated with the conduct of a proposed activity or facility and considers the effectiveness of preventative measures and strategies in reducing the effects of such hazards. There is no specific requirement for conducting safety analysis in support of an application for a Waste Nuclear Substance Licence, such as that which governs the PHP.

Physical design

RATINGS FOR PHYSICAL DESIGN		
Overall Performance Ratings		
2011	2012	2013
Not rated	SA	SA
For the review period, CNSC staff continue to rate the "physical design" SCA at PHP as "satisfactory". AECL continues to implement internal verification processes to ensure licence and legislative requirements for facility design are met.		

The "physical design" SCA relates to activities that impact the ability of structures, systems and components (SSCs) to meet and maintain their design basis given new information arising over time and taking changes in the external environment into account.

For the PHP, this SCA encompasses the following specific areas:

- Design governance
- Facility design

Design governance

All design and equipment changes are subject to the controls defined in the *PHAI Quality Assurance Plan*. Details on the plan can be viewed under the management system SCA.

AECL workers reviewing design drawings

Facility design

The detailed design documentation for the LTWMF and the WTP were assessed and accepted by CNSC staff prior to issuance of the licence, and are referenced in section 3.2.6 of the LCH. Under licence condition 2.6, AECL is required to conduct project activities in accordance with the design documentation.

The proposed new WTP is a two-stage treatment process with chemical precipitation and clarification followed by a reverse osmosis stage using specific membrane technology manufactured by "ROCHEM".

Because the Port Hope LTWMF is not a nuclear facility and the ROCHEM units will not be used as nuclear equipment, CNSC staff assigned non-nuclear Class 6 for the certification of the units. Consequently, CSA B51, *Boiler, pressure vessel, and pressure piping code*, is the governing standard for registration of the units with the Technical Standards and Safety Authority.

Fitness for service

RATINGS FOR FITNESS FOR SERVICE		
Overall Performance Ratings		
2011	**2012**	**2013**
Not rated	SA	SA
For the review period, CNSC staff continue to rate the "fitness for service" SCA at PHP as "satisfactory". AECL continues to implement an acceptable program to ensure structures and equipment performs as its intended function.		

The "fitness for service" SCA covers activities that impact the physical condition of SSCs to ensure that they remain effective over time. This area includes programs that ensure all equipment is available to perform its intended design function when called upon to do so.

For the PHP, this SCA encompasses the following specific areas:

- Equipment fitness for service / equipment performance (no significant observations to report)
- Maintenance
- Structural integrity (no significant observations to report)
- Aging management (no significant observations to report)

Maintenance

AECL continues to maintain the existing facilities in accordance with the previous licensee's (Cameco) operational procedures and protocols, as accepted by CNSC staff at the time of licensing.

Radiation protection

RATINGS FOR RADIATION PROTECTION		
Overall Performance Ratings		
2011	**2012**	**2013**
Not rated	SA	SA
For the review period, CNSC staff continue to rate the "radiation protection" SCA at PHP as "satisfactory". AECL continues to implement and maintain a radiation protection program to control radiological hazards, ascertain doses to workers, and estimate doses to the public.		

The "radiation protection" SCA covers the implementation of a radiation protection program in accordance with the *Radiation Protection Regulations*. This program must ensure that contamination levels and radiation doses received by individuals are monitored, controlled, and maintained as low as reasonably achievable (ALARA).

For the PHP, this SCA encompasses the following specific areas:

- Application of ALARA
- Worker dose control
- Radiation protection program performance
- Radiological hazard control
- Estimated dose to the public

AECL is required by the *Radiation Protection Regulations*, and licence condition 2.7, to implement and maintain a radiation protection program for the PHP. The *PHAI Radiation Protection Plan* is referenced in section 3.2.7 of the LCH and forms the primary compliance criteria for radiation protection.

Application of ALARA

The *PHAI Radiation Protection Plan* has been developed and implemented at PHP. It defines the radiation protection measures applicable to PHAI projects and is consistent with AECL's corporate radiation protection program.

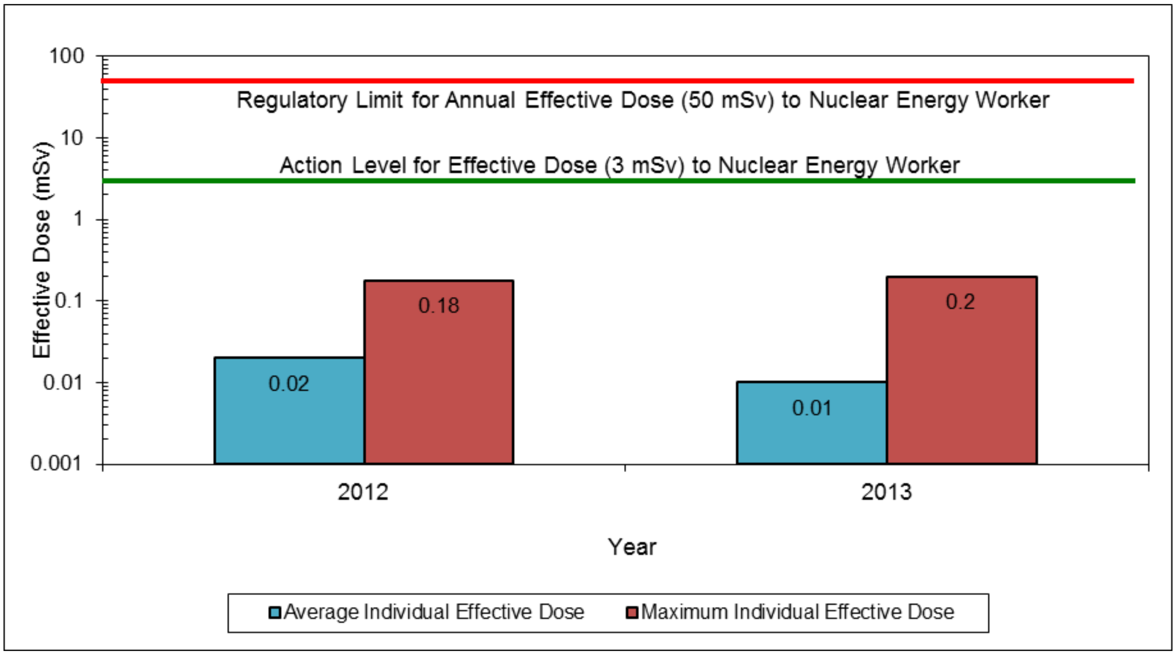
The *PHAI Radiation Protection Plan* describes the basis for protection from ionizing radiation, and for ascertaining and recording radiation exposures and doses during the PHP activities. It also defines a management framework and processes that are designed to ensure that radiation exposures arising from project activities will be maintained below regulatory dose limits and ALARA.

Worker dose control

The system to control radiation exposures and doses to workers is established in the *PHAI Radiation Protection Plan*. All employees working regularly at PHP wear thermo luminescent dosimeters (TLDs) for external radiation exposure monitoring; these are provided by AECL's licensed dosimetry service. To date, AECL has not monitored worker doses independently between the two projects (see figures 14 and 16).

CNSC staff have concluded, following review of AECL's dose data for PHP, that AECL adequately controlled radiation doses to workers during the review period. The maximum doses to workers were 0.18 mSv and 0.20 mSv in 2012 and 2013, respectively; this is well below the CNSC's regulatory effective dose limit for nuclear energy workers.

Figure 14: Effective dose statistics for nuclear energy workers at AECL's PHP



Radiation protection program performance

AECL's performance in its radiation protection program has been assessed through various CNSC compliance activities, including inspections and desktop reviews. CNSC staff's assessment is that, overall, AECL's compliance with the *Radiation Protection Regulations* and licence requirements has been acceptable.

AECL worker retrieving environmental TLD from perimeter fence

As part of the *PHAI Radiation Protection Plan*, AECL has established a number of action levels. Radon monitors are deployed in five separate locations onsite: four are located at the boundaries of the waste mound (north, south, east and west), and one is located at the operations trailer near the collection pond. An action level for occupational radiation exposure of 50 Bq/m^3 for radon was established by AECL for Phase II construction and remediation activities; this action level was being applied to the ambient radon concentration in air measured by these monitors.

During the review period, AECL reported a total of eight action level exceedances over all monitoring locations. An elevated radon concentration at the locations being monitored results in negligible risks to workers since it occurs at locations where currently persons are not located for long periods of time. CNSC staff conclude that the radiation dose action levels for workers implemented by AECL are effective to control both internal and external components of radiation dose, and the *PHAI Radiation Protection Plan* assures that appropriate protective measures are in place for workers.

Radiological hazard control

Site specific contamination control requirements are implemented by AECL at PHP, consistent with the *PHAI Radiation Protection Plan*. These requirements include personal protective equipment and clothing requirements for workers and visitors, and contamination monitoring checks for personnel and equipment. During the review period, there were no incidents of personnel contamination that resulted in a risk to workers or members of the public.

Estimated dose to the public

Under the *Radiation Protection Regulations*, AECL is required to estimate dose to the public due to the PHP. Environmental TLDs posted on the perimeter fence at the Port Hope WMF are utilized for this purpose.

Monitoring results for the review period indicate an estimated dose to the public well below the regulatory limit of 1 mSv/year.

Conventional health and safety

RATINGS FOR CONVENTIONAL HEALTH AND SAFETY		
Overall Performance Ratings		
2011	**2012**	**2013**
Not rated	SA	SA
For the review period, CNSC staff continue to rate the "conventional health and safety" SCA at PHP as "satisfactory". AECL continues to maintain an acceptable conventional health and safety program as no lost-time injuries have occurred at PHP during the review period.		

The "conventional health and safety" SCA covers the implementation of a program to manage workplace safety hazards and to protect personnel and equipment.

For the PHP, this SCA encompasses the following specific areas:

- Performance
- Practices
- Awareness (no significant observations to report)

Performance

One of the key indicators of performance with respect to conventional health and safety is recordable lost-time injury incidents (RLTI). An RLTI is an injury that takes place at work and results in the worker being unable to return to work to carry out their duties for a period of time. In reviewing RLTIs, CNSC staff must also consider the severity of these injuries (e.g. the total days lost) and the frequency as they relate to the size of the workforce. The severity rate is a measure of the total number of days lost due to injury for every 200,000 person-hours worked at a site and the frequency is the number of fatalities and injuries (lost time and medically treated) due to accidents for every 200,000 person-hours worked at a site.

As can be seen from table 11, AECL has had no lost-time injury incidents at PHP.

Table 11: Recordable lost-time injuries (RLTI), frequency and severity at PHP 2011-2013

Year	RLTIs	RLTI Frequency	RLTI Severity
2011	0	0	0
2012	0	0	0
2013	0	0	0

Practices

In addition to the *Nuclear Safety and Control Act* and its regulations, project activities at the PHP must comply with Part II of the *Canada Labour Code*, the *Canada Occupational Health and Safety Regulations* and other applicable federal and provincial health and safety-related acts and regulations.

Under licence condition 2.8, AECL is required to have a program for occupational health and safety for the PHP. The *PHAI Occupational Safety and Health (OSH) Plan*, which is referenced in section 3.2.8 of the LCH, is the primary criteria for assessing compliance, and defines the OSH program applicable to the PHP. It is consistent with AECL's corporate OSH program which covers the company-wide procedures, training, oversight and reporting. The plan also includes oversight mechanism to ensure that all workers, including contractors, follow proper health and safety procedures.

The Port Hope/Port Granby Site Safety and Health Committee oversees site specific health and safety matters, meets a minimum of nine times per year, and conducts regular site inspections.

Environmental protection

RATINGS FOR ENVIRONMENTAL PROTECTION		
Overall Performance Ratings		
2011	**2012**	**2013**
Not rated	SA	SA
For the review period, CNSC staff continue to rate the "environmental protection" SCA at PHP as "satisfactory". AECL continues to implement and maintain an acceptable environmental program, and effectively monitors and controls effluent releases.		

The "environmental protection" SCA covers programs that identify, control and monitor all releases of radioactive and hazardous substances and effects on the environment from facilities or as the result of licensed activities.

For the PHP, this SCA encompasses the following specific areas:

- Effluent and emissions control (releases)
- Assessment and monitoring

Effluent and emissions control (releases)

Licence conditions 2.9 and 2.10 require AECL to implement an environmental protection program, and to monitor and control releases to the environment, respectively. These requirements pertain specifically to liquid effluent releases, as there are no atmospheric release limits for this site. AECL has implemented programs to meet these requirements at the PHP including the *Environmental Management and Protection Plan for On-Site Construction and Remediation Activities* and the *Environmental Monitoring Plan*, both of which are consistent with AECL's corporate environmental management system.

CNSC staff reviewed the data submitted for the review period and found that all treated liquid effluent releases were monitored and no exceedances of the licence release limits occurred. Similarly, tests for toxicity conducted over the same timeframe demonstrated that the effluent was non-acutely lethal. Effluent monitoring results for this period can be found in appendix F.

CNSC staff conducted a general assessment of facility operations during an inspection in October 2013. At that time, analytical results for samples collected during the inspection were well below the release limits specified in the licence.

As specified in section 3.2.9 of the LCH, action level exceedances are reportable by AECL when three consecutive exceedances occur. AECL reported three consecutive exceedances of arsenic in July 2013. The WTP was shut down, and effluent was re-circulated for further treatment as per AECL's procedure. Following internal investigation, AECL determined that seasonal dry periods, which increase arsenic concentrations, combined with the necessity to continue operation of the WTP to maintain safe levels in the east collection pond, had resulted in the exceedances. The capacity in the east collection pond had been significantly reduced as a result of construction activities. AECL subsequently issued the *Brand Road Welcome Waste Management Facility Effluent Action Level Exceedance Mitigation Procedure* to address this issue. CNSC staff are satisfied with AECL's investigation and the corrective actions taken.

Regulatory oversight with respect to environmental protection is also provided by Environment Canada and the Ontario Ministry of Environment. In 2013, a joint regulatory group comprising the CNSC, Environment Canada and the Ontario Ministry of Environment was established to coordinate regulatory oversight in this area.

Assessment and monitoring

<u>Groundwater monitoring</u>

Groundwater monitoring for radium-226, arsenic, and pH is conducted at the Welcome WMF in order to identify changes in groundwater conditions around the site. The results of groundwater sampling conducted in 2013 were consistent with the historical groundwater monitoring data from Cameco, the former licensee.

Offsite surface water monitoring

Offsite surface water monitoring for arsenic, radium-226, uranium, and pH was conducted on a monthly basis at Brand's Creek, the main stream in the watershed, which is located west of the Welcome WMF.

CNSC staff reviewed the results of this sampling for 2013 and found that concentrations of these contaminants remain within background levels.

Brand Creek environmental monitoring

Environmental assessment follow-up monitoring

As required under licence condition 2.11, AECL is continuing to conduct environmental assessment follow-up monitoring to obtain environmental baseline data, including offsite suspended particulate matter, groundwater, soil, sediment, surface water, and drainage water.

Emergency management and fire protection

RATINGS FOR EMERGENCY MANAGEMENT AND FIRE PROTECTION		
Overall Performance Ratings		
2011	**2012**	**2013**
Not rated	SA	SA
For the review period, CNSC staff continue to rate the "emergency management and fire protection" SCA at PHP as "satisfactory". AECL maintains an acceptable emergency response plan, and has arranged service agreements with local emergency response organizations.		

The "emergency management and fire protection" SCA covers emergency plans and emergency preparedness programs that exist for emergencies and for non-routine conditions. This area also includes any results of participation in exercises.

For the PHP, this SCA encompasses the following specific areas:

- Conventional emergency preparedness and response
- Fire emergency preparedness and response

AECL is required to have an emergency preparedness program under licence condition 2.12. The *PHAI Emergency Plan*, which is consistent with AECL's corporate emergency preparedness program, describes planning and operational requirements for response to an emergency directly or indirectly affecting the PHP during Phase II. The *PHAI Emergency Plan* is referenced in section 3.2.10 of the LCH and forms the primary compliance verification criteria for this SCA.

Conventional emergency preparedness and response

In 2012, AECL signed emergency response agreements/memorandums of understanding with the Northumberland County Emergency Medical Services, Port Hope Police Services, and Northumberland Ontario Provincial Police. The PHAI does not have dedicated security or fire personnel.

Fire emergency preparedness and response

Fire has been identified as one of the potential hazards associated with PHP sites and buildings. However, because PHP is not a nuclear facility, the specific area of fire emergency preparedness and response is not addressed separately in this report. Mitigation measures and response to fire incidents are covered in the *PHAI Emergency Plan* and the emergency response agreements/memorandums of understanding as noted above.

Waste management

RATINGS FOR WASTE MANAGEMENT		
Overall Performance Ratings		
2011	**2012**	**2013**
N/A	N/A	N/A
Not applicable		

The "waste management" SCA covers internal waste-related programs that form part of the facility's operations up to the point where the waste is removed from the facility to a separate waste management facility. This area also covers the planning for decommissioning. This SCA is not relevant to the PHP as waste management is the core operation for the project. The PHP is a remediation project to provide suitably constructed, environmentally safe, socially acceptable and appropriately controlled long-term management for historic LLRW.

Security

RATINGS FOR SECURITY		
Overall Performance Ratings		
2011	**2012**	**2013**
Not rated	SA	SA
For the review period, CNSC staff continue to rate the "security" SCA at PHP as "satisfactory". AECL continues to implement and maintain an acceptable security program for the PHP.		

The "security" SCA covers the programs required to implement and support the security requirements stipulated in the regulations, the licence, orders, or expectations for the facility or activity.

For the PHP, this SCA encompasses the following specific area:

- Security practices

Security practices

In response to licence condition 2.13, which requires that a security program be in place for the PHP, AECL has implemented the *PHAI Security Plan* that establishes the security arrangements required for the PHAI projects.

Safeguards and non-proliferation

RATINGS FOR SAFEGUARDS AND NON-PROLIFERATION		
Overall Performance Ratings		
2011	2012	2013
N/A	N/A	N/A
Not Applicable		

The "safeguards and non-proliferation" SCA covers the programs and activities required for the successful implementation of the obligations arising from the Canada/IAEA safeguards agreements, as well as all other measures arising from the *Treaty on the Non-Proliferation of Nuclear Weapons*.

No safeguarded material is currently stored at the Welcome WMF; consequently, the SCA for safeguards does not apply. However, discussions are ongoing between CNSC staff and the IAEA with respect to currently-safeguarded material stored at Cameco's Port Hope Conversion Facility and that is destined for the Port Hope LTWMF. CNSC staff requested that IAEA reconsider their proposal to install IAEA neutron slabs to monitor the transfer of safeguarded material to the Port Hope LTWMF and proposed, instead, that an inspection-based scheme be employed. In order to accept the safeguarded wastes at Port Hope LTWMF, AECL will be required to implement a safeguards program based on criteria established via this dialogue.

Packaging and transport

RATINGS FOR PACKAGING AND TRANSPORT		
Overall Performance Ratings		
2011	2012	2013
Not rated	SA	SA
For the review period, CNSC staff continue to rate the "packaging and transport" SCA at PHP as "satisfactory". AECL continues to implement and maintain an acceptable program for radioactive material in anticipation of waste transfer slated to begin in 2015.		

The "packaging and transport" SCA covers programs for the safe packaging and transport of nuclear substances to and from the licensed facility.

For the PHP, this SCA encompasses the following specific area:

- Packaging and transport

Packaging and transport

AECL has in place the *PHAI Radioactive Material Transportation Plan* to govern transport of radioactive material. During the review period, no radioactive material was transported.

3.3 Port Granby Project

3.3.1 Overview

Located in the Municipality of Clarington, the Port Granby WMF contains LLRW including process residues, scrap equipment, industrial trash and soils that were received at the site between 1955 and 1988. The waste storage area is a relatively flat central plateau that terminates in steep bluffs, falling approximately 35 metres to the shore of Lake Ontario. On either side of the central plateau are east or west gorges; it was into these gorges that wastes were initially placed. Later trenches were dug in the central plateau and were used to house wastes.

Figure 15: The Port Granby waste management facility

(Source: AECL)

The purpose of the Port Granby Project (PGP) is to construct a new LTWMF, away from the shores of Lake Ontario, and to provide long-term storage for the contents of the existing WMF, which will then be remediated.

PGP activities include the construction and operation of the LTWMF; construction of the new WTP; remediation of the existing Port Granby WMF; and decommissioning of the existing WTP.

The PGP is being conducted in three phases – transition, implementation and closure.

- Phase I (transition) activities are confined to the continued operation, care and maintenance of the Port Granby WMF, assumed from Cameco in March 2010
- Phase II (implementation) activities include the operation, care and maintenance of the Port Granby WMF, development of the new LTWMF, and remediation of the existing WMF
- Phase III (closure) activities include long-term maintenance and monitoring of the Port Granby LTWMF

In 2014, the third year of Phase II of the PGP, AECL is preparing for construction of the LTWMF, and completing construction of the new WTP. As the project proceeds, AECL continues to inform and engage the public through various mechanisms under its public information program including the Port Granby Citizen Liaison Group. Further details regarding the public information program can be found in section 3.1 of this report.

Phase II activities are governed under the PGP licence [16], which was issued in November 2011. Under that licence, AECL is required to implement programs to ensure compliance with the accepted design, safe conduct of the approved activities and protection of people and the environment. These programs are referenced in the LCH [17].

CNSC staff continue to verify implementation of AECL's programs with respect to this project and assess them against the performance objectives and compliance verification criteria defined in the regulations, the licence and the LCH. Verification includes desktop reviews and site inspections. Many program documents referenced in the LCH are currently undergoing revision; desktop reviews of these will be conducted by CNSC staff. The most recent site inspection was conducted on October 29, 2013.

As previously stated, the information presented per SCA is very similar between the two projects. It is important to separate the two projects into distinct sections because the information that will be included in future annual reports will differ as the projects progress independently. An update on the status of the PGP by SCA follows. Ratings are provided for each SCA for 2011, 2012 and 2013. In 2011, the ratings assessed for each SCA were based on information submitted in support of the licence application. In 2012 and 2013, the ratings for each SCA were based on CNSC's staff assessment for the review period that calendar year. The review period for PGP includes 2013, and provides recent updates on key issues through June 30, 2014.

Many of the specific areas under the SCAs do not apply to the PGP, and this is reflected in the discussion below. This is due largely to the nature of the project. Unlike CRL and WL, the PGP is not a nuclear facility. Further, many of the activities in Phase II, upon which AECL embarked with the issuance of the current licence, involve conventional construction, for example construction of the new WTP.

3.3.2 Safety and Control Areas

Table 12 presents the ratings for PGP for the year 2013. All SCA ratings are "satisfactory" for the reporting period which remains unchanged from reports previously made to the Commission [18].

Table 12: Performance ratings for Port Granby Project, 2013

Safety and control area	Rating

Notes:

- For specific areas within the SCAs where there were no significant observations from CNSC's staff compliance verification activities, no information is given in the subsection of the report
- The information presented below is site specific; general trends are not identified

Management system

RATINGS FOR MANAGEMENT SYSTEM		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continues to rate the "management system" SCA for the PGP as "satisfactory". AECL continues to implement the *PHAI Quality Assurance Plan*, and conducts oversight activities.		

The "management system" SCA covers the framework that establishes the processes and programs required to ensure an organization achieves its safety objectives, continuously monitors its performance against these objectives, and fosters a healthy safety culture. For the PGP, this SCA encompasses the following specific areas:

- Management system
- Operating experience
- Safety culture

- Records management (no significant observations to report)
- Management of contractors

Management system

The activities of the PGP are broadly governed under AECL's corporate management system, and more specifically guided by the *PHAI Quality Assurance Plan*. The plan summarizes the processes and practices applicable to the PHAI licensed activities during execution of Phase II and clarifies the extent of their applicability to participants. These processes and practices satisfy the requirements identified above and comply with the quality management system defined in CSA-ISO 9001:08 *Quality Management Systems – Requirements.* The quality assurance plan (and adherence to it) is a requirement of condition 2.3 of the licence.

Operating experience

As previously stated in the report, the OPEX program at AECL comprises the processes that ensure the organization uses the experience both from within the organization and from industry peers to improve the safety of operations, improve operational performance, and reduce the significance and the occurrence of unplanned events.

PGP reviews OPEX bulletins for relevance and applicability through the Improvement Action process.

Safety culture

AECL staff receives mandatory training in Human Performance to help reduce human error and thus, the frequency and severity of events at AECL. Initiatives of AECL's Human Performance Branch are designed, amongst other things, to strengthen AECL's safety culture.

During the review period, safety culture related training conducted for PGP staff included *Leadership Academy; Field Observation and Coaching Fundamentals; Nuclear Safety Culture Workshop; Communicating for Leadership Success and Building Trust;* and *Coaching for Peak Performance*.

Management of contractors

AECL's responsibilities within the PHAI Management Office include defining the licence requirements to be included in contracts awarded by PWGSC for the execution of construction and remediation activities. AECL conducts oversight to ensure licence requirements are met. The *PHAI Oversight Procedure* governs how AECL oversight is conducted to confirm compliance with licensing commitments, technical requirements, and contractual obligations.

Within the review period, AECL conducted oversight of the construction of the new WTP and the Elliott Road upgrades.

Human performance management

RATINGS FOR HUMAN PERFORMANCE MANGEMENT		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff continue to rate the "human performance management" SCA at PGP as "satisfactory". AECL continues to implement an acceptable training program to ensure staff has the necessary skills and knowledge to safely carry out their duties.		

The "human performance management" SCA covers activities that enable effective human performance through the development and implementation of processes that ensure a sufficient number of licensee personnel are available in all relevant job areas and have the necessary knowledge, skills, procedures and tools in place to safely carry out their duties. For the PGP, this SCA encompasses the following specific area:

- Personnel training

Personnel training

A training program, and adherence to it, is a requirement of the PGP licence. To meet this obligation, AECL has implemented the *PHAI Training Plan*. During the review period, AECL conducted 41 training courses for PGP including those reported under "safety culture", as listed in "safety culture".

CNSC staff conducted a general assessment of facility operations in October 2013. At that time, CNSC staff reviewed training records for facility managers and operational staff and found them complete. AECL's corporate database is utilized to identify and track training needs, and to file staff training records.

Operating performance

RATINGS FOR OPERATING PERFORMANCE		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff continue to rate the "operating performance" SCA at PGP as "satisfactory". AECL continues to meet licence and legislative requirements in conducting Phase II activities, implementing procedures and reporting on activities.		

The "operating performance" SCA includes an overall review of the conduct of the licensed activities and the activities that enable effective performance.

For the PGP, this SCA encompasses the following specific areas:

- Conduct of licensed activity
- Procedures
- Reporting and trending

Conduct of licensed activity

Licensed activities for Phase II, the current phase of the PGP, include:

- the operation of the existing Port Granby Waste Management Facility (WMF)
- the construction of the new Water Treatment Plant (WTP)
- the construction of the new Long-Term Waste Management Facility (LTWMF) and remediation of the existing WMF

Operation of the existing Port Granby Waste Management Facility

The Port Granby WMF was transferred from Cameco to AECL on March 29, 2012. At that time, AECL was authorized by the licence to continue operation and maintenance of the existing Port Granby WMF, as per the operational procedures and protocols specified in the *Licensing Manual – Information in Support of the Port Granby Long-Term Low-Level Radioactive Waste Management Project Licence Application*.

Construction of the new Water Treatment Plant

AECL is required, under licence condition 2.7, to construct the new WTP in accordance with design documentation specified in section 3.2.7 of the LCH. Construction of the WTP is being managed and overseen by PWGSC; AECL continues to conduct oversight activities for construction of the new WTP.

The building envelope of the new WTP was completed in the fall of 2013. Fitting of the building with water treatment equipment is ongoing.

The plan for active commissioning has been submitted by AECL, as required under section 3.2.7 of the LCH, and accepted by CNSC staff.

Construction of the Long-Term Waste Management Facility and Remediation of Port Granby Waste Management Facility

The tendering process for the final construction contract for the new LTWMF is underway. The contract will include the construction of the Lakeshore Road underpass, removal of LLRW from the existing WMF and emplacement in the new LTWMF, and remediation of the existing WMF.

Potentially contaminated trees currently growing on the existing WMF must be removed to facilitate excavation activities. AECL has developed a plan for assessing the contamination of the trees which includes core sampling a select number of trees and scanning for contamination. AECL has identified and tagged the trees which will be sampled. The strategy for removal and disposal of the trees that will be determined based on the assessment results.

In 2009, Leader Resources Corp. proposed to construct a renewable energy project, consisting of five wind turbines, on property adjacent to the Port Granby LTWMF. AECL subsequently commissioned an independent study to evaluate the impact of the proposed project on AECL's dust management plan. AECL's response is consistent with the broad responsibility of licensees to assess external hazards to ensure the ongoing safe operation of their facility. The study concluded that the wakes from the proposed wind turbines will not impact AECL's operations with respect to data collection and dust management. Currently, Leader Resources Corp.'s application for a Renewable Energy Approval remains under review by the Ontario Ministry of Environment and Climate Change. CNSC staff will continue to monitor the progress of the wind turbine project to ensure that AECL's licensing requirements continue to be met.

Procedures

AECL maintains a suite of procedures specifically applicable to the activities of the PGP. These procedures are designed to operate within the broader framework of AECL's corporate documented programs. During the review period, project-specific procedures relating to commissioning of the WTP and to investigation of toxicity test failures were submitted to the CNSC for review and acceptance.

Reporting and trending

As specified in licence condition 2.4, AECL is required to submit written reports for action level exceedances; quarterly liquid effluent monitoring; quarterly liquid effluent toxicity testing; annual operational and compliance data; any failure that resulted in, or could have resulted in the release of a nuclear substance or hazardous substance from the facility; and quarterly project progress. Written reports at completion of project activities are also required.

Safety analysis

RATINGS FOR SAFETY ANALYSIS		
Overall Performance Ratings		
2011	**2012**	**2013**
N/A	N/A	N/A
Not applicable		

►

The "safety analysis" SCA covers maintenance of the safety analysis that supports the overall safety case for the facility. Safety analysis is a systematic evaluation of the potential hazards associated with the conduct of a proposed activity or facility, and considers the effectiveness of preventative measures and strategies in reducing the effects of such hazards. There is no specific requirement for conducting safety analysis in support of an application for a Waste Nuclear Substance Licence, such as that which governs the PGP.

Physical design

RATINGS FOR PHYSICAL DESIGN		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "physical design" SCA at PGP as "satisfactory". AECL continues to implement and maintain an internal verification process to ensure licence and legislative requirements for facility design are met.		

The "physical design" SCA relates to activities that impact the ability of SSCs to meet and maintain their design basis given new information arising over time and taking changes in the external environment into account.

For the PGP, this SCA encompasses the following specific areas:

- Design governance
- Facility design

Design governance

All design and equipment changes are subject to the controls defined in the *PHAI Quality Assurance Plan*. Details on this plan can be viewed under the management system SCA.

Facility design

The detailed design documentation for the LTWMF and the WTP were assessed and accepted by CNSC staff prior to issuance of the licence, and are referenced in section 3.2.7 of the LCH.

The plan for active commissioning has been submitted by AECL, as required under section 3.2.7 of the LCH, and has been accepted by CNSC staff. Commissioning of the WTP is expected to take place during the summer of 2014.

Fitness for service

RATINGS FOR FITNESS FOR SERVICE		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "fitness for service" SCA at PGP as "satisfactory". AECL continues to implement and maintain an acceptable program for maintenance at the Port Granby WMF.		

The "fitness for service" SCA covers activities that impact the physical condition of structures, systems and components to ensure that they remain effective over time. This area includes programs that ensure all equipment is available to perform its intended design function when called upon to do so.

For the PGP, this SCA encompasses the following specific areas:

- Equipment fitness for service / equipment performance (no significant observations to report)
- Maintenance
- Structural integrity
- Aging management (no significant observations to report)

As the existing WMF and WTP are replaced by the new LTWMF and WTP, reporting under specific areas not relevant during this review period is anticipated.

Maintenance

AECL continues to maintain the existing facilities in accordance with the previous licensee's (Cameco) operational procedures and protocols, as referenced in section 2.4.1 of the LCH.

For the new facilities (LTWMF and WTP), AECL will be required to develop new procedures which will be incorporated into the LCH.

Structural integrity

Geo-technical inspections are conducted semi-annually by AECL to ensure that the integrity of the existing WMF is not compromised by erosion or slope instability.

Port Granby Bluffs

Further assessments for remedial actions are triggered, if active erosion extends to within 15 metres horizontally of the upper fence line. Verification conducted by CNSC staff during the review period included desktop reviews of reports produced by AECL's geotechnical consultants. CNSC staff also conducted a geo-technical inspection in August 2013. Based on these verification activities, CNSC staff concluded that, for the review period, the integrity of the existing WMF was not at risk and no remedial actions were required.

Radiation protection

RATINGS FOR RADIATION PROTECTION		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff continue to rate the "radiation protection" SCA at PGP as "satisfactory". AECL continues to implement and maintain a radiation protection program to control radiological hazards, ascertain doses to workers, and estimate doses to the public.		

The "radiation protection" SCA covers the implementation of a radiation protection program, in accordance with the *Radiation Protection Regulations*. This program must ensure that contamination levels and radiation doses received by individuals are monitored, controlled, and maintained as low as reasonably achievable (ALARA).

For the PGP, this SCA encompasses the following specific areas:

- Application of ALARA
- Worker dose control
- Radiation protection program performance
- Radiological hazard control
- Estimated dose to the public

Application of ALARA

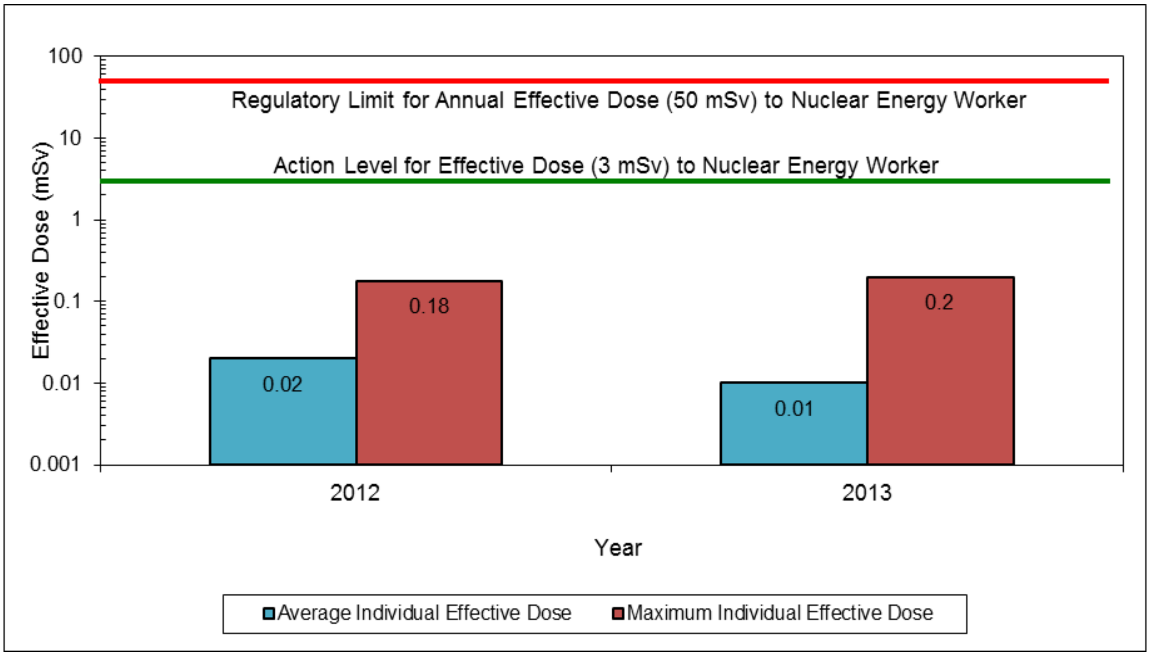
As required by the *Radiation Protection Regulations* and by its licence, AECL continues to implement the *PHAI Radiation Protection Plan* for the PGP. The *PHAI Radiation Protection Plan* defines the radiation protection measures applicable to PGP, consistent with AECL's corporate radiation protection program. The *PHAI Radiation Protection Plan* describes the basis for protection from ionizing radiation, and for ascertaining and recording radiation exposures and doses during the PGP activities. It also defines a management framework and processes designed to ensure that radiation exposures arising from project activities will be maintained below regulatory dose limits and ALARA.

Worker dose control

The system to control radiation exposures and doses to workers is established in the *PHAI Radiation Protection Plan*, implemented for PGP. All employees working regularly at PGP wear TLDs for external radiation exposure monitoring, provided by AECL's in-house licensed dosimetry service. To date, AECL has not monitored worker doses independently between the two projects (see figures 14 and 16).

CNSC staff have concluded, following review of AECL's dose data, that AECL adequately controlled radiation doses to workers at PGP during the review period. The maximum doses to workers were 0.18 mSv and 0.20 mSv in 2012 and 2013, respectively; this is well below the CNSC's regulatory effective dose limit for nuclear energy workers.

Figure 16: Effective dose statistics for nuclear energy workers at AECL's PGP



Radiation protection program performance

AECL is required by the *Radiation Protection Regulations* and licence condition 2.8, to implement and maintain a radiation protection program for the PGP. The *PHAI Radiation Protection Plan* is referenced in section 3.2.8 of the LCH and forms the primary compliance criteria for radiation protection. Action levels for occupational radiation exposure from Phase II activities are also referenced in the LCH.

AECL's performance in radiation protection has been assessed through various CNSC compliance activities including desktop reviews and inspections. CNSC staff's assessment is that, overall, AECL's compliance with the *Radiation Protection Regulations* and CNSC licence requirements has been acceptable.

As part of the *PHAI Radiation Protection Plan*, AECL has established a number of action levels. Radon monitors are deployed in five separate locations on site: at the boundaries of the buried waste, and near the lagoon. An action level for occupational radiation exposure of 50 Bq/m^3 for radon was established by AECL for Phase II construction and remediation activities; this action level was being applied to the ambient radon concentration in air measured by these monitors.

During the review period, AECL reported three exceedances of this action level at three of the five monitoring locations. An elevated radon concentration at the locations being monitored result in negligible risks to workers, since it occurs at locations where currently persons are not located for long periods of time. CNSC staff conclude that the radiation dose action levels for workers implemented by AECL are effective in the control of both internal and external components of radiation dose, and the *PHAI Radiation Protection Plan* assures that appropriate protective measures are in place for workers.

Radiological hazard control

Site specific contamination control requirements are implemented by AECL at PGP, consistent with the *PHAI Radiation Protection Plan*. These requirements include personal protective equipment and clothing requirements for workers and visitors, and contamination monitoring checks for personnel and equipment. During the review period, there were no incidents of personnel contamination that resulted in a risk to workers or members of the public.

Estimated dose to the public

Under the *Radiation Protection Regulations*, AECL is required to estimate dose to the public due to the PGP. Environmental TLDs posted on the perimeter fence at the Port Granby WMF are utilized for this purpose.

Monitoring results for the review period indicate an estimated dose to the public is well below the regulatory limit of 1 mSv/year.

Conventional health and safety

RATINGS FOR CONVENTIONAL HEALTH AND SAFETY		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "conventional health and safety" SCA at PGP as "satisfactory". AECL continues to maintain an acceptable conventional health and safety program and has had no lost-time injuries at PGP during the review period.		

The "conventional health and safety" SCA covers the implementation of a program to manage workplace safety hazards and to protect personnel and equipment.

For the PGP, this SCA encompasses the following specific areas:

- Performance
- Practices
- Awareness (no significant observations to report)

Performance

One of the key indicators of performance with respect to conventional health and safety is recordable lost-time injury incidents (RLTI). An RLTI is an injury that takes place at work and results in the worker being unable to return to work to carry out their duties for a period of time. In reviewing RLTIs, CNSC staff must also consider the severity of these injuries (e.g., the total days lost) and the frequency as they relate to the size of the workforce. The severity rate is a measure of the total number of days lost due to injury for every 200,000 person-hours worked at a site and the frequency is the number of fatalities and injuries (lost time and medically treated) due to accidents for every 200,000 person-hours worked at a site.

As can be seen from table 13 below, AECL has had no lost-time injury incidents at PGP.

Table 13: Recordable lost-time injuries (RLTI), frequency and severity at PGP, 2011-2013

Year	RLTIs	RLTI Frequency	RLTI Severity
2011	0	0	0
2012	0	0	0
2013	0	0	0

Practices

In addition to the *Nuclear Safety and Control Act* and its associated regulations, all project activities at the PGP must comply with Part II of the *Canada Labour Code*, the *Canada Occupational Health and Safety Regulations* and other applicable federal and provincial health and safety-related acts and regulations.

Under licence condition 2.9, AECL is required to have a program for occupational health and safety for the PGP. The *PHAI Occupational Safety and Health (OSH) Plan*, which is referenced in section 3.2.9 of the LCH, defines the OSH program applicable to the PGP. It is consistent with AECL's corporate OSH program which covers the company-wide procedures, training, oversight and reporting. The plan includes an oversight mechanism to ensure that all workers, including contractors, follow proper health and safety procedures.

The Port Hope/Port Granby Site Safety and Health Committee oversees site specific health and safety matters, meets a minimum of nine times per year, and conducts regular site inspections.

Environmental protection

RATINGS FOR ENVIRONMENTAL PROTECTION		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "environmental protection" SCA at PGP as "satisfactory". AECL continues to implement and maintain an acceptable environmental program, to effectively monitor and control effluent releases.		

The "environmental protection" SCA covers programs that identify, control and monitor all releases of radioactive and hazardous substances and effects on the environment from facilities or as the result of licensed activities.

For the PGP, this SCA encompasses the following specific areas:

- Effluent and emissions control (releases)
- Assessment and monitoring

Effluent and emissions control (releases)

AECL is required, by the licence, to implement an environmental protection program and to monitor and control releases to the environment. This pertains specifically to liquid effluent releases as there are no atmospheric release limits for this site. AECL has implemented programs to meet these requirements at the PGP including the *Environmental Management and Protection Plan for On-Site Construction and Remediation Activities* and the *Environmental Monitoring Plan*, both of which are consistent with AECL's corporate environmental management system.

CNSC staff reviewed data submitted for the review period and found that all treated liquid effluent releases were monitored and no exceedances of the licence release limits occurred. Similarly, tests for toxicity conducted over the same timeframe demonstrated that the effluent was non-acutely lethal. Effluent monitoring results for this period can be found in appendix F.

CNSC staff conducted a general assessment during an inspection in October 2013. Analytical results for samples collected during that inspection were well below the release limits specified in the licence.

AECL reported a toxicity test failure for the WTP effluent in January 2013. Following an investigation (by AECL and CNSC staff), laboratory error was determined to be the cause. As a result of this event, AECL has developed a procedure for investigating toxicity test failures which has been reviewed and accepted by CNSC staff.

AECL is currently characterizing contaminants in the groundwater stream collected from the northern perimeter sub-drain in order to assess whether they could pose an unreasonable risk to the environment. This stream is combined with the treated effluent forming the total interceptor discharge stream which is monitored prior to release into Lake Ontario. The work is being done at the request of CNSC staff, based on observations of potentially elevated contaminant concentrations in this stream.

Assessment and monitoring

AECL continues to implement environmental monitoring programs that establish baseline conditions around the site. These include groundwater monitoring, bluff seepage monitoring, geo-technical monitoring, and environmental assessment follow-up monitoring.

<u>Groundwater monitoring</u>

Groundwater monitoring for radium-226, arsenic, uranium, fluoride, nitrate and ammonium is conducted at the Port Granby WMF in order to identify changes in groundwater conditions around the site. The results of groundwater sampling conducted in 2012 and 2013 are consistent with the historical groundwater monitoring data.

<u>Bluff seepage monitoring</u>

Bluff seepage from the south bluffs at Port Granby WMF has been sampled for radium-226, arsenic, uranium and total suspended solids on a quarterly basis since June 2012, at the request of CNSC staff. Results submitted for the review period indicate there is no unreasonable impact to the aquatic environment.

<u>Environmental assessment follow-up monitoring</u>

As required under licence condition 2.12, AECL continues to conduct environmental assessment follow-up monitoring to obtain environmental baseline data, including offsite suspended particulate matter, noise, groundwater, soil, sediment, surface water and drainage water. CNSC staff have reviewed the results for the review period and found that the offsite environmental quality data were within environmental background level or below the PHAI cleanup criteria.

Emergency management and fire protection

RATINGS FOR EMERGENCY MANAGEMENT AND FIRE PROTECTION		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "emergency management and fire protection" SCA at PGP as "satisfactory". AECL continues to implement an acceptable emergency response plan.		

The "emergency management and fire protection" SCA covers emergency plans and emergency preparedness programs that exist for emergencies and for non-routine conditions. This area also includes any results of participation in exercises.

For the PGP, this SCA encompasses the following specific areas:

- Conventional emergency preparedness and response
- Fire emergency preparedness and response

AECL is required, under licence condition 2.13, to have an emergency preparedness program for the PGP. The *PHAI Emergency Plan*, which is consistent with AECL's corporate emergency preparedness program, describes planning and operational requirements for response to an emergency directly or indirectly affecting the PGP during Phase II activities. The *PHAI Emergency Plan* is referenced in section 3.2.11 of the LCH and forms the primary compliance criteria for emergency management and fire protection.

Conventional emergency preparedness and response

In 2012, AECL signed emergency response agreements/memorandums of understanding with the Whitby Detachment of the Ontario Provincial Police, Durham Regional Police Service, Durham Region EMS and Clarington Fire Services. The PGP does not have dedicated security or fire personnel due to the size, location and nature of the project.

Subsequent to signing the emergency response agreements/memorandums of understanding, AECL developed the *PHAI Incident Response Coordination Procedure.* This procedure describes responsibilities of PHAI management office personnel and the processes used for planning and managing response to emergencies/incidents under the *PHAI Emergency Plan*.

Fire emergency preparedness and response

Fire has been identified as one of the potential hazards associated with PGP sites and buildings. However, as PGP is not a nuclear facility, the specific area of fire emergency preparedness and response is not addressed separately in this report. Mitigation measures and response to fire incidents are covered in the *PHAI Emergency Plan* and the emergency response agreements/memorandums of understanding as noted above.

Waste management

RATINGS FOR WASTE MANAGEMENT		
Overall Performance Ratings		
2011	**2012**	**2013**
N/A	N/A	N/A
Not applicable		

The "waste management" SCA covers internal waste-related programs that form part of the facility's operations up to the point where the waste is removed from the facility to a separate waste management facility. This area also covers the planning for decommissioning. This SCA is not relevant to the PGP, because waste management is the core operation for the project. The PGP is a remediation project to provide suitably constructed, environmentally safe, socially acceptable and appropriately controlled long-term management for historic low-level radioactive waste.

Security

RATINGS FOR SECURITY		
Overall Performance Ratings		
2011	**2012**	**2013**
SA	SA	SA
For the review period, CNSC staff continue to rate the "security" SCA at PGP as "satisfactory". AECL continues to implement and maintain an acceptable security program for the PGP.		

The "security" SCA covers the programs required to implement and support the security requirements stipulated in the regulations, the licence, orders, or expectations for the facility or activity.

For the PGP, this SCA encompasses the following specific area:

- Security practices

Security Practices

AECL is required, under section 3.2.12 of the LCH to have a security program for the PGP. In response, AECL has implemented the *PHAI Security Plan* that establishes the security arrangements required for the PHAI projects.

Safeguards and non-proliferation

RATINGS FOR SAFEGUARDS AND NON-PROLIFERATION		
Overall Performance Ratings		
2011	2012	2013
N/A	N/A	N/A
Not Applicable		

The "safeguards and non-proliferation" SCA covers the programs and activities required for the successful implementation of the obligations arising from the Canada/IAEA safeguards agreements, as well as all other measures arising from the Treaty on the Non-Proliferation of Nuclear Weapons.

This SCA is not relevant to the PGP as the material that will be handled under this remediation project has no obligations arising from the Canada/IAEA safeguards agreement.

Packaging and transport

RATINGS FOR PACKAGING AND TRANSPORT		
Overall Performance Ratings		
2011	2012	2013
SA	SA	SA
For the review period, CNSC staff continue to rate the "packaging and transport" SCA at PGP as "satisfactory". AECL continues to implement and maintain an acceptable program for radioactive material in anticipation of waste transfer slated to begin in 2015.		

The "packaging and transport" SCA covers programs for the safe packaging and transport of nuclear substances to and from the licensed facility.

For the PGP, this SCA encompasses the following specific area:

- Packaging and transport

Packaging and transport

AECL has implemented the *PHAI Radioactive Material Transportation Plan* to govern transport of radioactive material. The plan meets regulatory requirements and is consistent with AECL's corporate program for radioactive material transportation. Under this plan, contaminated material will be transported to the LTWMF via the prescribed internal haul routes. No waste will be transported on public roads. During the review period, no radioactive material was transported.

This page was intentionally left blank.

GLOSSARY

Commission

A corporate body of not more than seven members, established under the *Nuclear Safety and Control Act* and appointed by the Governor in Council, to perform the following functions:

- Regulate the development, production and use of nuclear energy and the production, possession, use and transport of nuclear substances
- Regulate the production, possession and use of prescribed equipment and prescribed information
- Implement measures respecting international control of the development, production, transport and use of nuclear energy and nuclear substances, including those respecting the non-proliferation of nuclear weapons and nuclear explosive devices
- Disseminate scientific, technical and regulatory information concerning the activities of the CNSC and the effects on the environment and on the health and safety of persons, of the development, production, possession, transport and uses referred to above

Commission Member Document (CMD)

A document prepared for Commission hearings and meetings by CNSC staff, proponents and interveners. Each CMD is assigned a specific identification number.

Derived Release Limit (DRL)

A limit imposed by the CNSC on the release of a radioactive substance from a licensed nuclear facility, such that compliance with the DRL gives reasonable assurance that the regulatory dose limit is not exceeded.

Effective Dose

The sum of the products, in sieverts, obtained by multiplying the equivalent dose of radiation received by and committed to each organ or tissue set out in column 1 of an item of schedule 1 of the *Radiation Protection Regulations*, by the weighting factor set out in column 2 of that item.

Equivalent Dose

The product, in sieverts, obtained by multiplying the absorbed dose of radiation of the type set out in column 1 of an item of schedule 2 of the *Radiation Protection Regulations*, by the weighting factor set out in column 2 of that item.

Fissionable

Fissionable refers to the capability to undergo fission.

Fissile Solution Storage Tank (FISST)

A radioactive waste vessel used for the storage of fissile liquid waste resulting from the processing of irradiated targets for the production of medical isotopes (Molybdenum-99 and Xenon isotopes), from 1986 to 2003.

Frequency Rate

The number of fatalities and injuries (lost time and medically treated) due to accidents for every 200,000 person-hours (approximately 100 person-years) worked at a site.

International Atomic Energy Agency (IAEA)

An independent international organization related to the United Nations system. The IAEA, located in Vienna, works with its Member States and multiple partners worldwide to promote safe, secure and peaceful nuclear technologies. The IAEA reports annually to the UN General Assembly and, when appropriate, to the Security Council regarding non-compliance by States with their safeguards obligations, as well as on matters relating to international peace and security.

Lost-Time Incident

An injury that takes place at work and results in the worker being unable to return to work for a period of time.

Severity Rate

A measure of the total number of days lost due to injury for every 200,000 person-hours worked at a site.

Severe Accident Management Program (SAMP)

A document that establishes

(a) actions to be taken during the course of a severe accident to prevent escalation of the accident into an event involving severe damage to the reactor core, to mitigate the consequences of the accident, or to achieve a safe, stable state of the reactor over the long term

(b) preparatory measures necessary for implementation of such actions

Note: SAMPs are sometimes referred to as severe accident management guidelines.

APPENDIX A: SAFETY AND CONTROL AREA FRAMEWORK

The CNSC evaluates how well licensees meet regulatory requirements and CNSC expectations for the performance of programs in 14 safety and control areas (SCAs), including the SCA for security. The specific areas within each SCA have been identified by CNSC staff. The specific areas are different for Chalk River Laboratories, Whiteshell Laboratories, the Port Hope project, and the Port Granby project. The 14 SCAs are grouped according to their functional area as management, facility and equipment, or core control processes.

This page was intentionally left blank.

A:1 Safety and Control Area Framework

Functional area	Safety and control area	Definition	Chalk River Laboratories specific areas	Whiteshell Laboratories specific areas	Port Hope specific areas	Port Granby specific areas
Management	**management system**	Covers the framework that establishes the process and programs required to ensure an organization achieves its safety objectives, continuously monitors its performance against these objectives, and fosters a healthy safety culture	• Management System • Organization • Performance Assessment, Improvement and Management Review • Operating Experience • Change Management • Safety Culture • Records Management • Management of Contractors • Business Continuity	• Management System • Organization • Performance Assessment, Improvement and Management Review • Operating Experience • Change Management • Safety Culture • Configuration Management • Records Management • Management of Contractors • Business Continuity	• Management System • Operating Experience • Safety Culture • Records Management • Management of Contractors	• Management System • Operating Experience • Safety Culture • Records Management • Management of Contractors
	human performance management	Covers activities that enable effective human performance through the development and implementation of processes that ensure that enough licensee staff are in all relevant job areas and have the necessary knowledge, skills, procedures and tools in place to safety carry out their duties.	• Human Performance Program • Personnel Training • Personnel Certification • Work Organization and Job Design • Fitness for Duty	• Human Performance Program • Personnel Training • Personnel Certification • Work Organization and Job Design • Fitness for Duty	• Personnel Training	• Personnel Training

APPENDIX B: RATING METHODOLOGY AND DEFINITIONS

Performance ratings used in this report are defined as follows:

Fully Satisfactory (FS)

Safety and control measures implemented by the licensee are highly effective. In addition, compliance with regulatory requirements is fully satisfactory, and compliance within the SCA or specific area exceeds requirements and CNSC expectations. Overall, compliance is stable or improving, and any problems or issues that arise are promptly addressed.

Satisfactory (SA)

Safety and control measures implemented by the licensee are sufficiently effective. In addition, compliance with regulatory requirements is satisfactory. Compliance within the area meets requirements and CNSC expectations. Any deviation is only minor, and any issues are considered to pose a low risk to the achievement of regulatory objectives and CNSC expectations. Appropriate improvements are planned.

Below Expectations (BE)

Safety and control measures implemented by the licensee are marginally ineffective. In addition, compliance with regulatory requirements falls below expectations. Compliance within the area deviates from requirements or CNSC expectations to the extent that there is a moderate risk of ultimate failure to comply. Improvements are required to address identified weaknesses. The licensee or applicant is taking appropriate corrective action.

Unacceptable (UA)

Safety and control measures implemented by the licensee are significantly ineffective. In addition, compliance with regulatory requirements is unacceptable and is seriously compromised. Compliance within the overall area is significantly below requirements or CNSC expectations, or there is evidence of overall non-compliance. Without corrective action, there is a high probability that the deficiencies will lead to an unreasonable risk. Issues are not being addressed effectively, no appropriate corrective measures have been taken, and no alternative plan of action has been provided. Immediate action is required.

APPENDIX H: CHANGES TO LICENCE AND LICENCE CONDITIONS HANDBOOK(S)

H-1: AECL's CRL CHANGES TO LICENCE AND LICENCE CONDITIONS HANDBOOK

Licence

The CRL operating licence NRTEOL-01.01/2016 was amended once [1] to extend the due date for licence condition 16.3 regarding the submission of a plan for the future of NRU Reactor from June 30, 2014 to June 30, 2015.

At the time of drafting this report, AECL has expressed its intent to apply for

- amendment to the CRL site licence expiry date
- transfer of the CRL operating licence from AECL to a new operating organization

Licence Conditions Handbook

Revision 1 to the LCH for CRL, incorporating all previously CNSC approved updates, was issued on February 15, 2013 [2]. There was one CNSC approved update to Revision 1 of the LCH [3]. The more significant changes are shown in Table H-1.

Table H-1: AECL's CRL CHANGES TO THE LCH

Section	Description of change	Revision type
4.4	Added new compliance verification criteria (CVC) to clarify the requirements for decommissioning and the release for reuse and/or removal of decommissioned property.	Technical
4.16	Added new CVCs to clarify the requirements for reporting on chemistry and hours of work indicators.	Technical
5.1	Added the IAEA documents GSR-4 *Safety Assessment for Facilities and Activities*, SSG-20 *Safety Assessment for Research Reactors and Preparation of the Safety Analysis Report*, and SSG-22 *Use of a Graded Approach in the Application of the Safety Requirements for Research Reactors*, as well as the Department of Energy standard DOE-STD-3009-94 *Preparation Guide for U.S. Department of Energy Nonreactor Facility Documented Safety Analyses* that may be used as guidance in preparing the safety analyses for CRL facilities.	Technical
10.1	Added new CVC requiring the use of CSA standard N288.6, *Environmental Risk Assessment at Class I Nuclear Facilities and Uranium Mines and Mills*, when performing environmental risk assessment for CRL facilities.	Technical

Section	Description of change	Revision type
Appendix B	Updated the information on CRL facilities.	Administrative
Appendix D	Updated the information on licensing basis documents for CRL facilities.	Administrative
Appendix K	Updated the information to record AECL's progress to closing transitional provisions.	Administrative
Appendix M	Updated the information to record new approvals granted by the Commission or CNSC staff under various licence conditions.	Administrative

H-2: AECL's WL CHANGES TO LICENCE AND LICENCE CONDITIONS HANDBOOK

Licence

The WL decommissioning licence NRTEDL-08.02/2018 [10] has been amended twice since its issuance in 2008.

In April 2010, the licence was amended to:

- change the submission dates for the annual reports to align with the AECL Chalk River Laboratories (CRL) operating licence
- correct two errata in the appendices of the licence, as they were outdated and not representative of the facility and its conduct of operations

In July 2012, the licence was amended to:

- update the licensee's address
- update editions of codes and standards listed in licence condition
- make minor changes to three licence conditions
- update the reference to the revised action levels
- update appendices

Licence Conditions Handbook

Currently, there is not an LCH for WL. CNSC staff are presently developing one for WL.

H-3: AECL's PHP CHANGES TO LICENCE AND LICENCE CONDITIONS HANDBOOK

Licence

The Port Hope long-term low-level radioactive waste management project licence WNSL-W1-2310.00/2022 [13] was issued in November 2012. There have been no amendments to this licence since it was issued.

Licence Conditions Handbook

No changes to the PHP LCH [14] have taken place since licensing in November 2012. Documents listed within the LCH are currently being revised. The LCH will be updated to reflect the new versions in the fall of 2014.

H-4: AECL's PGP CHANGES TO LICENCE AND LICENCE CONDITIONS HANDBOOK

Licence

The Port Granby long-term low-level radioactive waste management project licence WNSL-W1-2310.00/2021 [16] was issued in November 2011. There have been no amendments to this licence since it was issued.

Licence Conditions Handbook

No changes to the PGP LCH [17] have taken place since licensing in November 2012. Documents listed within the LCH are currently being revised. The LCH will be updated to reflect the new version in the fall of 2014.

Summary

This Commission Member Document (CMD) provides information on the status of CNL's three shut down power reactors: Douglas Point, Gentilly-1 and Nuclear Power Demonstration.

The CMD also presents an update on the progress of decommissioning at CNL's Whiteshell Nuclear Laboratories.

There are no actions requested of the Commission. This CMD is for information only.

Résumé

Le présent document à l'intention des commissaires fournit de l'information sur l'état des trois réacteurs nucléaires arrêtés des Laboratoires nucléaires canadiens : celui de Douglas Point, celui de Gentilly-1 et le réacteur nucléaire de démonstration.

Le document à l'intention des commissaires présente aussi une mise à jour des progrès du déclassement des Laboratoires nucléaires de Whiteshell.

Aucune mesure n'est requise de la Commission. Ce CMD est fourni à titre d'information seulement.

EXECUTIVE SUMMARY

As part of CNSC staff's commitment to keep the Commission informed on the status of major projects, this CMD provides an update on the Canadian Nuclear Laboratories Limited (CNL) facilities that are undergoing decommissioning. These facilities are the three shut down power reactors, Douglas Point in Tiverton, ON, Gentilly-1 in Bécancour, QC, Nuclear Power Demonstration in Rolphton, ON and the Whiteshell Laboratories (WL), a nuclear research and test facility located near Pinawa, Manitoba.

The three shut down power reactors (also known as the prototype waste facilities) ceased operations in the 1980s and were placed in a safe storage state with surveillance, in accordance with their approved decommissioning plans. In addition to surveillance, CNL updates programs to reflect modern standards, maintains the facilities and reduces hazards and liabilities to improve safety and to prepare for final decommissioning and site closure.

WL consists of research and support facilities, the Whiteshell Reactor No. 1 (WR-1) and the SLOWPOKE demonstration reactor. WR-1 was shut down in 1985, and in the late 1990s, AECL decided to discontinue most research programs and operations at WL. A CNSC decommissioning licence was issued in 2003, and in 2008, the Commission approved accelerated decommissioning, as requested by AECL under the Government of Canada's Nuclear Legacy Liabilities Program. CNL's current decommissioning plan anticipates site closure by 2037.

CNSC staff confirm through inspections and desktop reviews that CNL is maintaining these facilities safely, in compliance with the requirements of the *Nuclear Safety and Control Act* and their respective licences, and is making progress on the accelerated decommissioning of the Whiteshell Laboratories.

1 OVERVIEW

As authorized by the Commission, Canadian Nuclear Laboratories (CNL) is decommissioning a number of facilities, including three shut down power reactors, Douglas Point (DP), Gentilly-1 (G-1) and Nuclear Power Demonstration (NPD), and the Whiteshell Laboratories (WL), a nuclear research and test facility that consists of two shut down reactors: Whiteshell Reactor No. 1 (WR-1) and the SLOWPOKE demonstration reactor (SDR). The three shut down power reactors, which ceased operating in the 1980s, are in a storage with surveillance state, while CNL is proceeding with dismantling WL in accordance with their approved decommissioning plans.

All of these facilities hold CNSC decommissioning licences. Decommissioning encompasses a wide variety of different activities to retire a licensed facility or site permanently from service and render it to a predetermined end-state. It may include for example, de-energizing and emptying circuits, dismantling equipment and facilities, segregating and transferring wastes, recycling materials, developing waste storage or work facilities and areas, or maintaining facilities in a storage with surveillance state. Decommissioning end points are documented in the decommissioning plans that are associated with each facility and form part of the approved licensing basis. Appendix A provides a summary of the status of the shut down reactor facilities.

Atomic Energy of Canada Limited (AECL) was the licensee of these facilities until November 3, 2014, when CNL became the licence holder due to the Government moving to a government-owned, contractor-operated model. CNL now operates the facilities while AECL retains ownership of the assets and liabilities. The Commission authorized the licence transfer to CNL in October 2014 (CMD 14-H117).

AECL developed a three-phase approach to reactor decommissioning. The decommissioning plans and interim end-state reports for each facility describe this approach. The three phases are:

- Phase 1 - bring the facility to a safe sustainable shutdown state suitable for storage with surveillance;
- Phase 2 - the storage with surveillance period; and
- Phase 3 - final decommissioning where the facility achieves its final end state.

While the decommissioning phases are the same for these reactor facilities, the period of each phase may vary. The decommissioning plans state that used fuel will remain on site at G-1, DP and WL until a long term management facility for used fuel is available in Canada. The Government of Canada has mandated the Nuclear Waste Management Organization (NWMO) to implement the long term management approach for Canada’s used nuclear fuel. If a long term management facility for used fuel is not available at the time when final dismantlement occurs, CNL’s plans are to place the fuel into on-site or off-site storage facilities, whichever is the most suitable at the time.

According to the decommissioning plans approved by the CNSC, the shut down power reactors are to be maintained in storage with surveillance with final dismantlement planned to begin in 2053-2103 (G-1), 2056-2106 (NPD) and 2103 (DP).

The currently approved decommissioning strategy for the shut down power reactors is the eventual removal of used fuel, (G-1, DP), removal of radioactive components/wastes and demolition of the buildings and structures with return of the land for unrestricted use. Long-term institutional controls after decommissioning will not be required.

For WL, decommissioning was originally planned to be completed by 2062 following a 60 year decommissioning program. In 2008, the Commission approved an accelerated decommissioning schedule as requested by AECL under the Government of Canada’s Nuclear Legacy Liability Program. At that time, the expectation for site closure was advanced to 2037 from 2062.

The currently approved decommissioning strategy for WL is based on the complete removal of radioactive materials from the site with the exception of contaminated river sediments and the low-level radioactive waste (LLW) trenches located in the Waste Management Area (WMA) that will be disposed of in-situ. A long-term institutional control period of 200 years after the cessation of physical decommissioning activities is planned. It should be noted that the final safety case for in-situ disposal of was not fully developed for this proposal and still needs to be provided and assessed by the CNSC prior to CNL proceeding.

The currently approved decommissioning strategy for the WR-1 reactor is to fully remove and package all activated and contaminated components for disposal in offsite facilities, to decontaminate the facility structure and then to demolish the building to achieve unrestricted release criteria.

In a letter dated October 23, 2015, CNL notified the CNSC of its intent to accelerate and change the decommissioning strategy for NPD and WL.

The letter makes reference to the submission of initial regulatory applications by March 31, 2016 for NPD and March 31, 2017 for WL. This letter also provided advance notice of a new project at Chalk River Laboratories that is required to advance decommissioning of WL and NPD. In a subsequent letter dated February 9, 2016, CNL informed the CNSC that it intends to advance the submission of the initial regulatory application for WL by ten months to May 2016.

CNSC staff note that if the proposed decommissioning strategy and end state for these projects vary from what has been previously approved by the Commission, CNL will be required to seek the Commissions approval through a licence amendment process, considering that the current licences only authorize pre-assessed and pre-approved activities. Additionally, CNL would also need to revise, update and reassess key planning tools for the proposals, such as the detailed decommissioning plans, the work plans/work instructions and the environmental assessment.

CNL states that it now plans to complete the decommissioning of WL by 2025, and the decommissioning of NPD by 2021. The timelines for final decommissioning of DP and G-1 remain unchanged at this time.

2 REGULATORY OVERSIGHT

In order to ensure compliance with the NSCA, its regulations and the licences, CNSC staff have established a compliance program for each facility. The compliance program consists of inspections, desktop reviews of reports, plans or other submissions and reviews of events that CNL reports to the CNSC.

The baseline inspection program is tailored to the specific risks of each facility and to its compliance record. Consequently, the number of baseline inspections in any given year may vary depending on conditions and activities occurring on site, and on the compliance record of the licensee. CNSC staff may also conduct other inspections, such as those related to security and safeguards to verify that the licensee is operating in compliance with CNSC regulatory requirements.

For the shut down power reactors, CNSC staff currently conducts annual baseline compliance inspections. For the Whiteshell Laboratories, CNSC staff currently conducts semi-annual baseline compliance inspections.

Table 1 provides a summary of the CNSC compliance effort associated with these facilities from 2011/12 to December 2015.

Table 1: CNSC Compliance Effort 2011/12 to December 2015

Shut Down Power Reactors	2011/12	2012/13	2013/14	2014/15	2015/16 (Q1-Q3)
Inspections	3	3	3	3	3
Desktop Reviews	3	7	4	5	11
Total Person Days of Compliance Effort (Actual)	71	64	53	44	47
Whiteshell Laboratories	**2011/12**	**2012/13**	**2013/14**	**2014/15**	**2015/16 (Q1-Q3)**
Inspections	2	2	3	2	3
Desktop Reviews	4	30	18	11	22
Total Person Days of Compliance Effort (Actual)	240	221	175	120	142

The CNSC expects that each facility, including those that are in storage with surveillance, be maintained safely and that physical systems and programs that are required for surveillance, inspection, servicing and maintenance be maintained.

Physical systems include for example: electrical power, emergency lighting, drainage, heating/ventilation, security, fire alarm and remote monitoring systems. Programs to be maintained include for example: radiation protection, environmental protection, occupational health and safety, training and aging management.

The CNSC requires that CNL submit an annual report for each facility. The purpose of the report is to demonstrate compliance with the terms and conditions of the licence and applicable regulations. CNL's annual compliance reports provide information on:

- operating experience of the facility,
- waste inventory and any changes to it,
- effluent treatment and waste processing,
- modifications to the facility,
- radiation protection program and the health and safety program performance,
- results of facility monitoring and environmental monitoring,
- new discoveries,
- compliance with other Federal or Provincial legislation,
- training conducted,
- public information program changes, and
- reports submitted to the CNSC during the year.

CNSC staff assess these reports and assess the licensee's implementation of their programs when conducting compliance inspections.

CNL reports regularly to CNSC staff on the status of activities at these facilities and based upon site inspections and desktop reviews, CNSC staff are satisfied that CNL takes adequate measures to ensure that these sites remain safe as required by the licences.

Fukushima Action Plan

Since the last update to the Commission on the shut down power reactors was provided just prior to the Fukushima accident, CNSC staff is including an update in this CMD. CNSC staff note that these facilities were included in the overall updates to the Commission on the CNSC Fukushima Action Plan in CMD 12-M56.

In March 2011, the CNSC issued requests pursuant to subsection 12(2) of the *General Nuclear Safety and Control Regulations* to all Class I facility licensees, including CNL, to confirm the safety case for each facility and to address the lessons learned from the Fukushima nuclear accident.

After assessing the licensees' responses and examining its own regulatory framework, the CNSC developed the Fukushima Action Plan with clear deliverables in the short, medium and long terms for both licensees and the CNSC. As part of the action plan, the CNSC requested that CNL re-examine the safety cases for these facilities with a focus on:

- External hazards such as seismic, flooding, fire and extreme weather events;
- Measures for the prevention and mitigation of severe accidents; and
- Emergency preparedness.

As has been previously reported to the Commission, CNL completed the actions and reported that no significant issues were identified for these facilities that required immediate corrective or compensatory measures.

However, CNL did identify opportunities to improve safety case documentation and emergency response procedures at WL. These activities were completed and the information was submitted to CNSC staff. CNSC staff reviewed the information and concluded that it met regulatory requirements.

CNSC staff report to the Commission that CNL has completed all of the identified improvements arising from the subsection 12(2) request and that all actions associated with these facilities have been closed.

3 PROJECT STATUS/PROGRESS

3.1 Shut Down Power Reactors

Licensing

The Atomic Energy Control Board (AECB), the Commission's predecessor until 2000, licensed DP, G-1 and NPD in the 1980's under individual waste facility operating licences. In 2014, AECL requested that these three facilities be consolidated together under a single prototype waste facilities decommissioning licence for a 20 year period (CMD 14-H107). The Commission issued this licence in the updated licence format with an associated Licence Conditions Handbook in July 2014.

In October 2014, the Commission approved the transfer of the prototype waste facilities decommissioning licence from AECL to CNL (CMD 14-H117), with an expiry date of December 31, 2034. CNL became the licence holder due to the Government moving to a government-owned, contractor-operated model. CNL is now responsible for these facilities while the Federal Government, through AECL, retains ownership of the assets and liabilities.

In addition to the previous licensing actions, CNSC staff last updated the Commission on the status of the shut down power reactors on January 20, 2011 in CMD 11-M11, as requested by the Commission.

3.1.1 Douglas Point

Background

The DP power reactor is located on the Bruce Power site, between Kincardine and Port Elgin, in Tiverton, Ontario (Figure 1). DP is a 200 MW CANDU power reactor that was put into service in 1968 and permanently shut down in May 1984.

The main components of the facility are the reactor building, the service building, the turbine building/administration wing, the concrete canister storage area for used nuclear fuel and several outbuildings.

Phase 1 (preparation for safe storage) activities were conducted from 1984 to 1988 and since that time, the facility has been maintained in a Phase 2 (storage with surveillance) state.

Figure 1: Douglas Point Reactor

Radioactive wastes on-site consist of used nuclear fuel and low and intermediate-level radioactive waste. Appendix B provides the inventory of stored wastes as reported in *Canada's Fifth National Report for the Joint Convention on the Safety of Spent Fuel Management and on the Safety of Radioactive Waste Management (Oct 2014).*

Progress Update

As a result of CNL's assessment of radiation protection practices, CNL has relocated and reconfigured the transition areas between nuclear and non-nuclear areas to improve access through these areas and to improve the application and removal of personal protective equipment at the zone boundary. In the area of fire protection, CNL has achieved a significant reduction in combustibles at DP and is upgrading fire detection systems.

As part of projects to reduce hazards and liabilities, CNL has reduced the inventory of LLW being stored at DP in the reactor and service buildings. CNL has also removed most of the contents of the turbine building. This includes the non-radioactive unused office areas on the second floor, where a substantial number of office cubicles and furniture had remained. Under CNL's waste management program, waste that is likely not radioactive (i.e. clean) is monitored and segregated at the source for disposal by conventional means, minimizing the quantity of radioactive waste generated.

CNL has also initiated a procurement process to issue a contract for the transfer of ion exchange resins stored at DP to Chalk River Laboratories. Until the resins are moved, CNL continues to monitor and verify the integrity of the storage tanks, which continue to perform well.

3.1.2 Gentilly-1

Background

The G-1 power reactor (Figure 2) is located adjacent to the Gentilly-2 Nuclear Generating Station in Bécancour, Québec, on the shores of the St. Lawrence River, 15 km east of Trois-Rivières. G-1 is a 250 MW boiling light water reactor put into service in May 1972. The reactor operated for 183 effective full power days until 1978 when it was concluded that significant modifications would be required if it were to remain in operation. In 1982, AECL decided to not modify the reactor and the following year it was permanently shut down.

Figure 2: Gentilly 1

The main components of the facility are the reactor building, the service building and the turbine building. A concrete canister storage facility was constructed inside the turbine building in 1986 to house the used nuclear fuel.

Phase 1 (preparation for safe storage) activities were conducted from 1984 to 1986 and since that time, the facility has been maintained in a Phase 2 (storage with surveillance) state.

Radioactive wastes on-site consist of used nuclear fuel and low and intermediate-level radioactive waste. Appendix B provides the inventory of stored wastes as reported in *Canada's Fifth National Report for the Joint Convention on the Safety of Spent Fuel Management and on the Safety of Radioactive Waste Management (Oct 2014).*

Progress Update

As part of the improvements identified by the assessment of their radiation protection practices, CNL has installed new hand and foot monitors and a new whole body monitor at G-1. In the area of fire protection, CNL has achieved a significant reduction in combustibles and is upgrading fire detection systems.

CNL conducts projects to reduce hazards and liabilities, and as a result, has reduced the inventory of LLW being stored at G-1 in the turbine building. In addition, asbestos evaluations conducted at G-1 have resulted in projects to address asbestos hazards. Tenting has been installed to protect workers entering the reactor building and additional safety requirements have been put in place with the requirement for additional personal protective equipment when entering hazardous areas. CNL plans to continue with asbestos abatement projects in the reactor building in 2016.

CNL has also initiated a procurement process to issue a contract for the transfer of ion exchange resins stored at G-1 to Chalk River Laboratories. Until the resins are moved, CNL continues to monitor and verify the integrity of the storage tanks which, to date, continue to perform well.

3.1.3 Nuclear Power Demonstration

Background

The shut down NPD power reactor (Figure 3) is located in Rolphton, Ontario, adjacent to the Ottawa River, approximately 25 kilometers upstream from Chalk River Laboratories.

NPD is a 20 MW CANDU reactor that was put into service in 1962 providing power to the grid and serving as a power reactor training facility.

The main components of the facility were the reactor building, the training centre and several support buildings. Currently, only the reactor building, ventilation stack and gatehouse remain.

Phase 1 (preparation for safe storage) activities were conducted from 1984 to 1986 and since that time, the facility has been maintained in a Phase 2 (storage with surveillance) state.

Figure 3: Nuclear Power Demonstration Facility

On-site radioactive waste is classified as LLW. Due to its proximity to CRL, most operational and decommissioning waste, including the used nuclear fuel were moved to CRL during Phase 1 (preparation for safe storage) activities. Appendix B provides the inventory of stored wastes as reported in *Canada's Fifth National Report for the Joint Convention on the Safety of Spent Fuel Management and on the Safety of Radioactive Waste Management (October 2014).*

Progress Update

As a result of CNL’s assessment of radiation protection practices, CNL installed new hand and foot monitors and a self-contained decontamination/emergency shower at NPD. Also, the transition areas between nuclear and non-nuclear areas were relocated and reconfigured to improve access through these areas and to improve the application and removal of personal protective equipment at the zone boundary.

In the area of fire protection and emergency management, CNL has significantly reduced combustibles at NPD. Other improvements related to fire detection and mitigation include road upgrading to enable access to river water for first responders. In addition, fire detection upgrades have been completed. Also associated with emergency management, CNL installed diesel generators at NPD to provide an independent source of stand-by power.

CNL has conducted projects to reduce hazards and liabilities and has removed most of the LLW that was stored at NPD.

CNL has conducted asbestos evaluations at NPD resulting in projects to address the hazard. For the protection of workers on site, CNL has installed tenting to allow access to the boiler room, along with requiring the use of additional personal protective equipment when staff need to access hazardous areas. CNL plans to proceed with asbestos abatement projects in the NPD boiler room in 2016.

3.2 Whiteshell Laboratories

Licensing

The Whiteshell Laboratories was established by AECL in the early 1960s to carry out nuclear research and development activities. In 1997, AECL decided to discontinue most research programs and operations. The WR-1 reactor had previously been shut down in 1985.

The Commission originally issued WL a decommissioning licence in January 2003 for a six-year period (CMD 02-H19). The Commission then renewed the licence in November 2008 for a ten-year period (CMD 08-H24) and approved amendments requested by AECL in April 2010 (CMD 10-H109) and in October 2012 (CMD 12-H120). These amendments had no impact on the safety of the facility; they pertained to changes in report submission dates, references and action levels.

In October 2014 (CMD 14-H117), the Commission approved the transfer of the licence from AECL to CNL. Subsequently, in January 2016, the Commission approved an administrative amendment to issue the licence in the updated format with an associated Licence Conditions Handbook (CMD 16-H100).

CNSC staff presented WL interim status reports to the Commission on September 13, 2012 in CMD 12-M47 and on December 18, 2014 in CMD 14-M79.

Background

WL is a large site with an area of 4,375 hectares, although only about one third of that is associated with nuclear activities. It was established in the early 1960s to carry out research and development of higher temperature versions of the CANDU reactor and to conduct reactor fuel research.

An early focus of WL was WR-1, a 60 MW organically cooled research reactor that operated from 1965 to 1985. While WR-1 was initially the main focus of WL, other significant programs were later added, including the nuclear fuel waste management program, various research programs including environmental and radiation studies, and technology demonstration programs including accelerator projects and the SDR.

The main campus of WL (Figure 4) consists of offices, laboratories, hot cell facilities, the WR-1 research reactor, the SDR, radioactive liquid waste treatment facilities and numerous support buildings. A large WMA which contains LLW, intermediate-level radioactive waste (ILW) and high-level radioactive waste (HLW), including spent nuclear fuel, is located approximately 2.7 km north-east of the main campus.

Progress Update

Since the decommissioning licence was issued in 2003, there has been a gradual progression in the number of decommissioning activities being performed. The facility continues to operate laboratories, conduct research, conduct surveillance and maintain facilities but the overall focus is on decommissioning.

Figure 4: Whiteshell Laboratories

Some areas of the facility support surveillance (environmental laboratories) while some areas of the facility are not used but remain available to support future decommissioning (such as hot cells). Support services and supporting facilities need to be maintained while decommissioning planning and decommissioning activities continue. As parts of the facility are decommissioned, reconfiguring services and infrastructure must be conducted.

CNL is planning, implementing and completing decommissioning activities, in accordance with CNSC approved decommissioning plans. Associated with their waste management program, CNL is segregating, packaging, storing and reusing or recycling radioactive, hazardous and conventional wastes. Additionally, CNL is maintaining the WR-1 reactor in a Phase 2 (storage with surveillance) state while preparing for Phase 3 (final decommissioning).

For wastes in the WMA, CNL is conducting repackaging activities (WR-1 wastes) and implementing serviceability assessments and investigations to the condition and contents of some of the subsurface containment structures (bunkers and in-ground containers).

As with CNL's other facilities, improvements to programs such as radiation protection, occupational health and safety, security and fire detection are conducted to reflect updated standards. CNL must maintain and ensure that facility structures remain accessible for inspection and maintenance and they must also maintain monitoring and surveillance programs.

Following is a list of activities that are being conducted at WL associated with the decommissioning program.

Building B300: Building B300 is the central research complex that contained more than 170 laboratories and approximately 400 offices, mechanical rooms, and areas for large-scale engineering projects. The building was constructed in seven separate stages, and decommissioning will be conducted in stages as well. This is because certain areas must remain in service to support activities and dismantlement occurring in other areas of WL. The first two stages to be dismantled are stages 4 and 7, as shown in Figure 5.

Dismantling began with the removal of the office interiors, mechanical rooms and laboratories. Building services, such as ventilation, electrical and water systems were de-energized, capped and isolated, areas of contamination removed and other services were rerouted as necessary (the LLW liquid waste line which is still needed had to be rerouted as it passed though the stage 4 crawl space). In addition, a new access road was developed to support demolition.

CNL expects that the dismantlement of stages 4 and 7 of Building B300 will be completed by the end of March 2016.

Figure 5: B300, Stages 4 & 7

Active Liquid Waste Treatment Centre & Decontamination Centre: Constructed of reinforced concrete, the active liquid waste treatment centre (Building B200, Figure 6) contains two floors, a crawl space and an external underground concrete vault. The building houses 12 storage tanks, glove boxes, piping, and other related equipment.

The active liquid waste treatment centre was originally built to manage liquid ILW and liquid LLW streams. The ILW circuit was shut down in 2001 while the LLW circuit continues to operate.

The decontamination centre (Building B411, Figure 7) originally housed a laundry for contaminated clothing and equipment, decontamination services for tools and items and respirator cleaning and maintenance services. It contains aqueous and solvent cleaning areas, holding tanks, a respirator maintenance area, offices and washrooms.

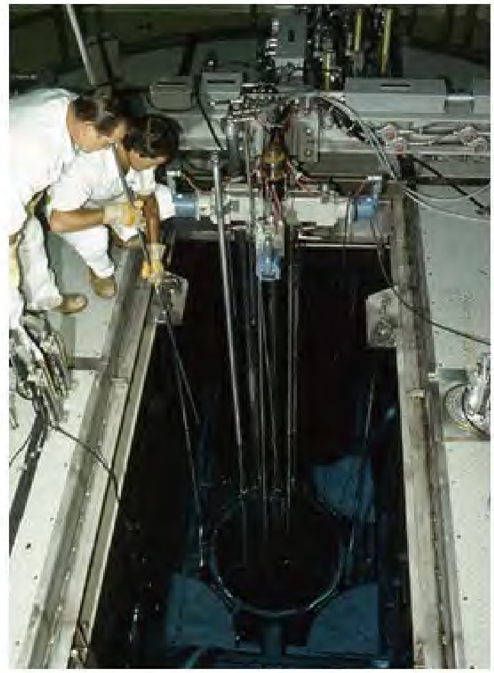
In order to prepare for decommissioning, CNL has transferred some of these services to alternative locations on the site. An active laundry was no longer required as disposable coveralls are now used for radiological work.

Figures 6 and 7: B200 (left) and B411 (Right)

A conventional laundry facility was still required and was developed in Building B300. Decontamination services and respirator cleaning and maintenance services were also transferred to reconfigured areas of Building B300. Decommissioning planning continues for Buildings B200 and B411.

SLOWPOKE Demonstration Reactor: The SDR (Figures 8 and 9) located in Building B100 was developed to demonstrate the viability of using it for heating communities and commercial establishments. AECL operated the SDR for 614 hours between 1989 and 1990.

After shutdown, fuel was removed as was the reactor control system. The pool water level was lowered, and in 1996, the remainder of the pool and piping were drained. LLW (activated reactor components such as shim plates, beryllium blocks and lower support brackets) were then removed and transferred to the WMA.



Figures 8 and 9: SLOWPOKE Demonstration Reactor circa 1990

Final dismantlement includes the removal of the remaining systems, including the cooling and shutdown systems, the remaining control system, instrumentation, auxiliary systems and the stainless steel pool liner. The end state is complete removal of the reactor components with the concrete pool vault remaining intact and covered. CNL expects to complete dismantlement of the SDR by March 2016.

WR-1 Reactor: Activities associated with decommissioning of the WR-1 reactor located in Building B100 (Figure 10) are focussed on planning and documenting the various steps associated with the detailed decommissioning plan.

Figure 10: B100

The removal of asbestos and clearing space for dismantlement activities (SDR decommissioning) has been a recent focus and decommissioning planning continues.

CNL has completed asbestos abatement in the non-restricted areas and as noted previously, CNL is proposing that decommissioning be completed by 2025.

Waste Management Area: WL's WMA (Figure 11) was developed when the facility was first opened. CNL conducts projects to re-characterize the performance and condition of structures, assess waste conditions, assess environmental conditions and assess the potential for environmental impacts. CNL is also conducting projects to improve access to the area and to reduce and repackage existing waste. Projects include:

- continuing waste characterization studies and condition assessments in standpipes, evaluating remediation options, and developing future strategies;
- continuing studies in the ILW storage bunkers and developing approaches for future management, including gathering information on ground conditions, radionuclide inventories, waste characteristics and condition assessments;
- developing a modular workspace complex; a support pad has been constructed, however the project is currently on hold pending completion of a needs analysis;
- reconfiguring Building B421 as a waste repackaging facility for wastes from the early decommissioning of WR-1. Wastes are being sorted and repackaged to reduce fire loading and to reduce waste volumes. Currently, the project is well underway and radioactive wastes are being repackaged into steel containers for placement in the Shielded Modular Above Ground Storage Building.

Figure 11: Waste Management Area including the concrete canister storage facility

Other Activities: As the number of buildings on site has reduced, CNL has reconfigured WL's heating system to convert it from a centralized oil system to a localized electrical/propane heating system. As part of this project, the oil storage tanks from the power house were decommissioned and removed. The power house remains in operation as it provides water services to the site.

CNL is conducting other projects including:

- the removal of storage sheds;
- the remediation of the meteorological tower area and the removal of associated sheds, electrical panels, communication equipment and tower sections;
- the relocation of the truck monitor, the removal of the gate house and the construction of a new entry gate system;
- ongoing maintenance and evaluations (reroofing projects, aging management inspections, fire protection system testing and maintenance and facility and support systems safety reviews.

4 OVERALL CONCLUSIONS

CNSC staff conclude that:

- CNL is maintaining Douglas Point, Gentilly-1, Nuclear Power Demonstration and the Whiteshell Laboratories safely in compliance with the requirements of the *Nuclear Safety and Control Act* and their licences; and
- CNL is making progress on the decommissioning of Whiteshell Laboratories in accordance with their approved decommissioning plans.

GLOSSARY

Summary

This Commission Member Document (CMD) provides the Commission with a progress update on licensed activities as of April 1, 2018 at Canadian Nuclear Laboratories' prototype waste facilities (Douglas Point, Gentilly-1, Nuclear Power Demonstration), Whiteshell Laboratories, as well as remediation activities under the Port Hope Area Initiative.

Canadian Nuclear Laboratories is the licence holder for all of these sites.

There are no actions requested of the Commission. This CMD is for information only.

Résumé

Le présent document à l'intention des commissaires (CMD) fournit à la Commission un rapport d'étape sur les activités autorisées au 1er avril 2018 aux installations prototypes de gestion des déchets (à Douglas Point, Gentilly-1 et au réacteur nucléaire de démonstration) et aux Laboratoires de Whiteshell, ainsi que sur les activités du projet de remise en état prévues dans le cadre de l'Initiative dans la région de Port Hope des Laboratoires Nucléaires Canadiens.

Laboratoires Nucléaires Canadiens sont le titulaire de permis pour chacun de ces sites.

Aucune mesure n'est requise de la Commission. Ce CMD est fourni à titre d'information seulement.

EXECUTIVE SUMMARY

This CMD provides a progress update on Canadian Nuclear Laboratories' (CNL) licensed decommissioning activities at three shut down power reactors (Douglas Point, Gentilly-1 and Nuclear Power Demonstration, also known as prototype waste facilities) and Whiteshell Laboratories, as well as licensed remediation activities under the Port Hope Area Initiative (PHAI). This CMD is provided in response to the Commission's requests of October 24, 2012 and April 6, 2016 to receive periodic updates on the status of these projects.

The three shut down power reactors are Douglas Point (DP) in Tiverton, ON, Gentilly-1 in Bécancour, QC and Nuclear Power Demonstration in Rolphton, ON. These facilities ceased operations in the 1980s and were placed in safe shut down states. Since that time, the facilities have been in storage-with-surveillance phase. This is a planned phase of a deferred decommissioning strategy for nuclear reactors. As part of storage-with-surveillance, CNL continues to carry out care and maintenance activities, reduces hazards and liabilities, and undertakes decommissioning planning activities for final decommissioning and site closure.

Whiteshell Laboratories (WL) is a nuclear research and test facility located near Pinawa, Manitoba, which was originally operated by Atomic Energy of Canada Limited (AECL). It consists of the Whiteshell Reactor No. 1 (WR-1), a SLOWPOKE demonstration reactor, and other research and support facilities; WR-1 was shut down in 1985. In the late 1990s, AECL discontinued most research programs and operations at WL. A CNSC decommissioning licence was issued in 2003, renewed in 2008 and amended in 2016 to include a Licence Conditions Handbook. CNL continues to decommission the Whiteshell site under the current decommissioning licence, which expires in December 2018. In 2016, CNL submitted to the CNSC a project description to change the CNSC-approved decommissioning approach (full dismantling) to a new proposed approach for the WR-1 reactor (*in-situ* decommissioning). In order to have time to disposition comments received on the new proposed approach, in 2018, CNL applied for a licence renewal for a one-year term.

The PHAI represents the Government of Canada's commitment to the development and implementation of a safe, local, long-term management solution for historic low-level radioactive waste in the municipalities of Port Hope and Clarington, Ontario. The PHAI is being carried out as two separate projects, the Port Hope Project and Port Granby Project, under separate CNSC licences. At Port Granby, the long-term waste management facility (LTWMF) base liner construction was completed in 2016 and the excavation and emplacement of legacy wastes in the LTWMF is nearing completion. At Port Hope, the construction of the first of three cells of the LTWMF has been completed and emplacement of wastes has begun. CNL continues to conduct surveys of residential and commercial properties in Port Hope, aimed at identifying and remediating those that have historic low-level radioactive waste.

CNSC staff confirmed through inspections and desktop reviews that CNL continued carrying out work at these sites safely, and in compliance with the requirements of the *Nuclear Safety and Control Act* and their respective licences.

Referenced documents in this CMD are available to the public upon request.

1 OVERVIEW

During a Commission Meeting held on April 6, 2016 CNSC staff committed to provide periodic progress updates for the three CNL shut down power reactors, and Whiteshell Laboratories (WL), a shut down nuclear research and test facility. The shut down power reactors are Douglas Point in Tiverton, ON, Gentilly-1 (G-1) in Bécancour, QC and Nuclear Power Demonstration (NPD) in Rolphton, ON. These three facilities are also known as prototype waste facilities. CNSC staff's previous update to the Commission on these sites was included in CMD 16-M12. During a Commission Meeting held on October 24, 2012 CNSC staff committed to provide progress updates on the Port Hope Area Initiative (PHAI), a clean-up of historic wastes in the region of Port Hope, ON. CNSC staff's last update to the Commission on the PHAI was delivered on November 9, 2016 as CMD 16-M44. CNSC staff have combined these two commitments to provide progress updates into this Commission Member Document (CMD).

The information presented in this CMD covers the period from January 1, 2016 to April 1, 2018 for the three shut down power reactors and WL, and from July 1, 2016 to April 1, 2018 for the PHAI. The start dates of these periods correspond to the end dates in the previous progress updates to the Commission.

2 REGULATORY OVERSIGHT

The Commission authorized CNL to conduct the activities related to decommissioning and remediation at the project sites that are covered by this report following the CNSC's public hearing process. Table 1 lists the licences, their expiration dates, and makes reference to Commission Records of Decision for CNL's licence projects covered by this report.

Table 1: Licences covered by this CMD

Licence Number	Facility/Site	Expiry	Record of Decision
WFDL-W4-332.01/2034	Douglas Point Gentilly-1 Nuclear Power Demonstration	December 31, 2034	e-Doc 4471304
NRTEDL-W5-8.04/2018	Whiteshell Laboratories	December 31, 2018	e-Doc 3008086
WNSL-W1-2310.02/2022	Port Hope Long-Term Low-Level Radioactive Waste Management Project	December 31, 2022	e-Doc 4083842
WNSL-W1-2311.01/2021	Port Granby Long-Term Low-Level Radioactive Waste Management Project	December 31, 2021	e-Doc 3846017
WNSL-W1-182.0/2021	Pine Street Extension Temporary Storage Site	December 31, 2021	e-Doc 4535241
WNSL-W1-344-1.8/ind.	Port Hope Radioactive Waste Management Facility	Indefinite	e-Doc 5067125
WFDL = Waste Facility Decommissioning Licence NRTEDL = Nuclear Research and Test Establishment Decommissioning Licence WNSL = Waste Nuclear Substance Licence			

CNSC staff evaluate and confirm compliance with the licence and the licensing basis through verification, enforcement and reporting activities. CNSC staff develop compliance plans for each site, commensurate with the risk associated with the licensed activities at each site. Compliance verification activities conducted by CNSC staff include inspections, review of reports submitted by the licensee on a broad range of technical assessments, and the review and assessment of licensee programs and processes.

A summary of CNSC staff's compliance and licensing efforts associated with the shut down power reactors, WL and PHAI can be found in tables 2 and 3.

Table 2: CNSC regulatory effort on CNL's shut down power reactors and Whiteshell Laboratories, from January 1, 2016 to March 31, 2018

<table>
<tr><th>Facility</th><th>Number of onsite inspections</th><th>Person days for compliance</th><th>Person days for licensing activities</th></tr>
<tr><td>Douglas Point</td><td>4</td><td rowspan="3">573</td><td rowspan="3">707</td></tr>
<tr><td>Gentilly-1</td><td>3</td></tr>
<tr><td>Nuclear Power Demonstration</td><td>2</td></tr>
<tr><td>Whiteshell Laboratories</td><td>6</td><td>575</td><td>527</td></tr>
</table>

Table 3: CNSC regulatory effort on Port Hope Area Initiative licences, from July 1, 2016 to March 31, 2018

Facility	Number of onsite inspections	Person days for compliance	Person days for Licensing activities
Port Hope Project	10	582	148
Port Granby Project	11	413	38
Radioactive waste management facility	2	31	5
Pine Street Extension Temporary Storage site	2	43	3

Based on all the regulatory oversight activities that CNSC staff have conducted, CNSC staff are satisfied that CNL takes adequate measures to ensure that the public, workers and the environment are protected, and that these sites remain safe.

CNSC Independent Environmental Monitoring Program

The CNSC carries out its Independent Environmental Monitoring Program (IEMP) to verify and confirm that the public and the environment around licensed nuclear facilities remain safe. The IEMP is a regulatory tool that complements the CNSC's ongoing compliance verification program. The IEMP involves CNSC staff taking samples from publically accessible areas around nuclear sites, and measuring and analyzing the level of relevant contaminants in those samples.

Samples may be taken for air, water, soil, sediment, vegetation, and some food, such as locally-grown produce. Samples are analyzed at the CNSC's laboratory for both radiological and non-radiological contaminants related to the activities of the nuclear site. CNSC staff compare contaminant levels in samples to applicable guidelines and/or natural background levels. All IEMP sample results and associated standards are posted on the CNSC's IEMP website.

In 2016 and 2017, CNSC staff conducted independent environmental monitoring around the sites covered by this CMD as shown in table 4. Detailed IEMP results for the areas surrounding these sites are available on the CNSC's IEMP website and indicate that the public and the environment, in the vicinity of these sites, are protected. Independent environmental monitoring is scheduled to occur in 2018 around the NPD site in Rolphton, ON.

Table 4: IEMP activities around sites covered by this report, January 1, 2016 to April 1, 2018

Site	Date(s)
Gentilly-2 Nuclear Facility (including the Gentilly-1 Waste Facility)	October 2016
Bruce Nuclear Generating Station (including the Douglas Point Waste Facility)	October 2016
Whiteshell Laboratories	July/August 2017
Welcome (Port Hope) and Port Granby Waste Management Facilities	May 2017 and August 2017

Waste Inventories

Radioactive wastes stored on the sites covered by this report consist of high-intermediate and low-level radioactive waste. Appendix A provides the inventory of wastes stored as reported in *Canada's Sixth National Report for the Joint Convention on the Safety of Spent Fuel Management and on the Safety of Radioactive Waste Management (October 2017)*. The report can be found on the CNSC's website.

3 PROJECT UPDATE

3.1 Decommissioning Projects

3.1.1 Background

CNL is currently decommissioning three shut down power reactors and a shut down nuclear research and test facility. Decommissioning encompasses a wide variety of activities to retire a licensed facility or site permanently from service and render it to a predetermined end-state. It may include any or all of the following activities: de-energizing and emptying systems, dismantling equipment and facilities, segregating and transferring wastes to waste storage areas, or maintaining facilities in a storage-with-surveillance state. The decommissioning strategy and end point are documented in the decommissioning plans that are associated with each site and form part of the approved licensing basis. CNL has developed decommissioning plans that include final end-state objectives and provided associated financial guarantees (FG) to assure the CNSC that it can access adequate funding upon demand, should the licensee not be able to fulfill its obligations. A FG must be sufficient to cover decommissioning work resulting from licensed activities or activities that will take place under the current licence.

As described in the decommissioning plans for DP, G-1, NPD and WL, CNL is employing a deferred decommissioning strategy. The three phases of deferred decommissioning are:

- Phase 1 – bring the facility to a safe sustainable shut down state suitable for storage with surveillance
- Phase 2 – the storage with surveillance period
- Phase 3 – final decommissioning where the facility achieves its final end state

While the decommissioning phases are the same for all facilities, the duration of each phase may vary depending on the specific CNSC-approved decommissioning plan for each of the facilities.

Shut Down Power Reactors

DP, G-1 and NPD, are in Phase 2 – storage-with-surveillance. The current licence for these facilities authorizes only Phase 2 activities.

As part of Phase 2 activities for decommissioning, the CNSC licence requires that CNL implement and maintain programs such as radiation protection, occupational health and safety, security and fire protection. CNL must ensure that facility structures that have yet to be finally decommissioned remain accessible for inspection and maintenance and they must also maintain monitoring and surveillance programs.

As described in the shut down power reactor preliminary decommissioning plans (PDPs), by the end of final decommissioning phase (i.e., decontamination, the dismantling, disposal, and site restoration), the shut down power reactor sites will be free of industrial hazards. The used fuel, radioactive wastes and all radioactive contamination in excess of the clearance levels established in CNSC Regulations and all other hazardous materials will have been removed from the sites. All of the systems will have been dismantled and all of the buildings demolished. Subsurface structures will have been drained, de-energized and decontaminated. The proposed end-states for the sites are brown field restored for industrial use.

According to the current PDPs, these facilities are to be maintained in storage-with - surveillance with Phase 3 activities planned to begin in 2053-2103 (G-1), 2030-2043 (NPD) and 2103 (DP). Prior to performing Phase 3 activities, CNL will have to submit Detailed Decommissioning Plans (DDPs) to the Commission for acceptance.

Whiteshell Laboratories

The WL site is currently in Phase 3 – final decommissioning, with the exception of the WR-1 reactor, which remains in Phase 2-storage with surveillance. The current CNSC-approved decommissioning approach for the WR-1 reactor is to fully remove and package all activated and contaminated components for disposal in licensed offsite facilities, to decontaminate the facility structure and then to demolish the building to achieve unrestricted release criteria.

As described in WL's CNSC-approved DDP, the end-state is the complete removal of radioactive materials from the site, with the exception of contaminated river sediments and the low-level radioactive waste (LLW) trenches that will be disposed of *in-situ*. CNL's current CNSC-approved decommissioning plan foresees that decommissioning will be completed by 2050. CNL plans a long-term institutional control period of 200 years after the cessation of physical decommissioning activities. It should be noted that the final safety case for the *in-situ* disposal of the LLW trenches was not fully developed for this plan and still needs to be provided to and assessed by CNSC staff prior to CNL proceeding.

3.1.1.1 CNL's Proposed Accelerated Decommissioning Approach

In a letter dated October 23, 2015 CNL notified CNSC staff of its intent to accelerate and change the decommissioning approach for NPD and WL. Under this proposed accelerated schedule, CNL expects to complete the final decommissioning of WL in 2024, and the decommissioning of NPD in 2020. CNSC staff note that the proposed decommissioning approach and end-state for these projects vary from what has been previously approved by the Commission. CNL is required to seek the Commissions' approval to amend the current licences. CNL is further required to revise, update and reassess key planning tools for the new approaches, such as the DDPs. Additionally, new environmental assessments (EA) for NPD and WL are required under CEAA 2012; these new EAs have begun. Licensing for NPD and WL are further discussed in sections 3.1.4.2 and 3.1.5.2, respectively.

3.1.2 Douglas Point

The Douglas Point Waste Facility is located on the Bruce nuclear site near Kincardine, Ontario (figure 1). It is comprised of a reactor building, service building, turbine building/administration wing, an area for the storage of concrete canisters filled with used nuclear fuel and several outbuildings.

Figure 1: Douglas Point Waste Facility *(Source: CNL*)

The 200 megawatt electric (MWe) prototype CANDU power reactor was put into service in 1968 and permanently shut down in May 1984. Following the shut down of the reactor, the primary heat transport and moderator medium (heavy water) were safely drained and shipped to other licensed operating sites. The booster rods were safely removed and shipped to Chalk River Laboratories (CRL) for storage in February 1985. Non-radioactive hazardous materials, such as combustible and flammable materials, laboratory supplies and oils, were identified and safely disposed. The transfer of spent fuel from wet storage in the reactor pool to a dedicated licensed dry storage facility was completed in 1988.

Disassembly and decontamination of equipment, and consolidation of wastes, were completed as required. All radioactive or radioactively contaminated components that were not shipped to other facilities were consolidated onsite.

Since that time, the facility has been maintained in Phase 2 – storage-with-surveillance as part of deferred decommissioning. As part of Phase 2, the CNSC licence requires that CNL implement and maintain programs such as radiation protection, occupational health and safety, security and fire protection. CNL must ensure that facility structures remain accessible for inspection and maintenance. Hazard reduction activities can also form part of Phase 2, such as CNL's plans to reduce the footprint of the DP facility by demolishing some non-nuclear facilities over the next seven years, such as the Emergency Cooling Injection System Tank and Bunker, the Turbine Building and the Service Building, among others.

CNL anticipates beginning final decommissioning in 2059. The current CNSC-approved approach and end-state for DP is the eventual removal of used fuel and of radioactive components/wastes to licensed storage and/or disposal facilities, followed by the demolition of the buildings and structures. The proposed end-state for the site is a brown field restored for industrial use consistent with the rest of the Bruce Site.

3.1.2.1 Progress Update

CNL has been carrying out hazard reduction work at DP over the period covered by this report. CNL continues to provide CNSC staff with plans and progress updates for the activities they are carrying out under the programs approved by their CNSC licence and in accordance with the PDP. Since the last update to the Commission, CNL safely transferred approximately 35,000 gallons of lightly contaminated water that was stored in tanks at the DP site to CRL for treatment. In addition, CNL has characterized ion exchange resins stored at DP. The resins will be recovered and packaged in containers for storage at CRL following the resins retrieval at G-1 (described in section 1.1.1). Until the resins are moved, CNL continues to monitor and verify the integrity of the storage tanks which, to date, continue to perform well.

With approval from CNSC staff, CNL carried out the following non-nuclear decommissioning activities at DP in the period covered by this report:

- Demolition of the guard house, machine shop, plate shop and tool crib, according to DDPs approved by CNSC staff. All waste was proven non-radioactive and cleared from the site for recycling or disposal in municipal landfills.
- Characterization of the Emergency Cooling Injection System (ECIS) Tank in support of a DDP approved by CNSC staff. The ECIS tank is planned to be removed in 2018.

CNSC staff verified CNL's compliance with regulatory requirements through inspections and by review of relevant CNL documentation. CNSC staff have confirmed that all actions raised during this reporting period have been closed.

3.1.3 Gentilly-1

The G-1 Waste Facility is situated within Hydro-Québec's Gentilly-2 nuclear power plant boundary in Bécancour, Québec (figure 2). The facility consists of a permanently shut down, partially decommissioned prototype reactor and associated structures and ancillaries.

Figure 2: Gentilly-1 Waste Facility *(Source: CNL)*

The G-1 reactor was a 250 MWe boiling light water reactor put into service in May 1972. It was operated intermittently for a total of 183 effective full-power days until 1978, when it was determined that some modifications and considerable repairs would be required. In 1984, a decommissioning program was initiated to bring the G-1 station to a safe sustainable shut down state that permitted storage-with-surveillance.

The moderator (heavy water) was safely drained and shipped to other licensed operating sites. Non-radioactive hazardous materials, such as combustible and flammable materials, laboratory supplies and oils, were identified and safely disposed of. The transfer of spent fuel from wet storage to dry storage in the purpose-built canister storage area was completed in 1986. Disassembly and decontamination of equipment, and consolidation of wastes, were completed as required. All radioactive or radioactively contaminated components that were not shipped to other facilities were consolidated onsite in either the reactor building or turbine building.

Since 1986, the facility has been maintained in Phase 2 – storage-with-surveillance as part of deferred decommissioning. As part of Phase 2, the CNSC licence requires that CNL implement and maintain programs such as radiation protection, occupational health and safety, security and fire protection. CNL must ensure that facility structures remain accessible for inspection and maintenance. Hazard reduction activities can also form part of Phase 2.

CNL anticipates beginning final decommissioning in 2064. The current CNSC-approved approach and end-state for G-1 is the eventual removal of used fuel and of radioactive components/wastes to licensed storage and/or disposal facilities, followed by the demolition of the buildings and structures. The proposed end-state for the site is a brown field restored for industrial use.

3.1.3.1 Progress Update

CNSC staff continue to receive plans and progress updates from CNL for the activities they are carrying out under the programs approved by their CNSC licence and in accordance with the PDP.

In the early spring of 2018, a system was designed and deployed to retrieve the Heat Transport Purification System (HTPS) resins from the underground vaults in which they have been stored for the last 30 years; approximately 90 m^3 of the total 126 m^3 of resins have been safely retrieved and transferred to CRL for interim storage. A separate system has been designed and successfully tested to retrieve the Moderator Purification System (MPS) resins; this system will be deployed following completion of the HTPS retrievals. In March of 2018, CNSC staff conducted an inspection at the G-1 site and observed the resin retrieval process. CNSC staff noted a number of good practices by the licensee in the fields of radiation protection, conventional health and safety, and management systems.

CNL is progressively dispositioning low-level waste stored in the reactor building. 45,000 kg of wastes have been safely transferred to a licensed waste processing facility and a contract is in place to retrieve and transfer an additional 250,000 kg of waste. Processing residues will be sent to CRL for interim storage. In addition, asbestos abatement work has been carried out in both the Turbine Building and the Reactor Building. Further abatement will be carried out in the reactor building to enable the removal of the low-level waste.

CNSC staff verified CNL's compliance with regulatory requirements through inspections and by review of relevant CNL documentation. CNSC staff have confirmed that all actions raised during this reporting period have been closed.

3.1.4 Nuclear Power Demonstration

The NPD site (figure 3) is located in Rolphton, ON, adjacent to the Ottawa River and approximatively 25 km upstream of the CRL site.

Figure 3: Nuclear Power Demonstration Facility *(Source: CNL)*

NPD was a 20 MWe prototype CANDU power reactor that was placed in service in October 1962, and operated until May 1987. It was then permanently shut down; all process systems not required were drained and removed from service, including the heavy water moderator and heat transport system. The spent fuel was safely transferred to the CRL site, and the facility was placed in a state of storage-with-surveillance.

The current CNSC staff-approved PDP for NPD indicates that final decommissioning will begin in the 2030-2043 timeframe. The deferred decommissioning approach and end-state includes the removal of radioactive components/wastes and demolition of the buildings and structures, with wastes sent to a licensed storage/disposal facility. This will allow return of the land to unrestricted use. CNL has requested an amendment to the current licence covering NPD (see section 3.1.4.2).

3.1.4.1 Progress Update

Under its current licence, CNL continues to maintain the NPD site in Phase 2 – storage-with-surveillance. As part of Phase 2, the CNSC licence requires that CNL implement and maintain programs such as radiation protection, occupational health and safety, security and fire protection. During this phase, routine inspections, housekeeping and continuous monitoring of the facility are performed regularly by CNL. CNL is also currently carrying out a number of CNSC-authorized preparatory activities (e.g., hazard reduction, characterization) for final decommissioning. For example, CNL completed the removal of accessible asbestos from the site's boiler room in June 2017. Safety improvements completed by CNL during this period include repairs to ladders, railings and platforms throughout the facility, along with relocating the personal protective equipment change room and radiation protection storage area to a more appropriate location. CNL also re-established access and maintained contamination control between the NPD Reactor Hall (a non-nuclear area) and NPD's Stairwell 21 (a nuclear area) with removal of a previously blocked up access way and installation of a fire door.

In preparation for decommissioning, CNL has completed several characterization activities of the facility structure and systems during the reporting period, this includes: the primary heat transport and moderator system, the reactor system and the building structure.

CNSC staff verified CNL's compliance with regulatory requirements through inspections and by review of relevant CNL documentation. CNSC staff have confirmed that all actions arising during this reporting period have been closed with the exception of one low-risk item related to CNL's internal inspection documentation for the NPD site. This item is anticipated to be closed in the summer of 2018.

3.1.4.2 Licensing

In March 2016, CNL submitted to the CNSC a Project Description to change the CNSC-approved decommissioning approach (full dismantling of NPD) to a new proposed approach, that is, *in-situ* decommissioning of the NPD reactor (also known as entombment). *In-situ* decommissioning is an approach in which the remaining radioactive material is permanently encapsulated in place, effectively creating a waste repository.

CNSC staff have determined that, in accordance with the *Canadian Environmental Assessment Act, 2012* (CEAA 2012) and the *Nuclear Safety and Control Act* (NSCA) and their associated Regulations, an environmental assessment (EA), conducted under CEAA 2012, and an amendment to the current licence, are required for the new proposed NPD Closure Project. Under CEAA 2012, CNSC staff are the Responsible Authority to ensure an EA for the project is conducted in accordance with requirements. In September 2017, CNL submitted a draft environmental impact statement (EIS) in support of the EA and an application to amend the current licence for review by CNSC staff. CNSC staff are leading the review and comment on the draft EIS by federal and provincial authorities (Environment and Climate Change Canada, Health Canada, Government of Quebec, and the Ontario Ministry of Environment and Climate Change), Indigenous groups and the public.

As part of the CEAA 2012 process, CNL has determined they need additional time to address the large number of comments raised by the public, First Nations, Métis communities and regulators in relation to the draft EIS. Consequently, on June 6, 2018, CNL informed the Commission that the final EIS, originally expected in June 2018, and the public hearing, which had been tentatively planned for December 2018, will be delayed. Both the EA and the licence amendment application will be subject to decisions made by the Commission at a future date through a public hearing process.

3.1.5 Whiteshell Laboratories

The Whiteshell Laboratories was established by AECL in the early 1960s to carry out nuclear research and development activities. In 1997, AECL decided to discontinue most research programs and operations at Whiteshell and applied to the CNSC for a decommissioning licence.

The WL site is 4,375 hectares in size and consists of a main campus area and a waste management area. The main campus includes the WR-1, a 60 megawatt thermal (MWth) research reactor, which operated from 1965 to 1985.

While the WR-1 reactor was initially the main focus of the facility, other programs were added, including the nuclear fuel waste management program, various research programs including environmental and radiation studies, and technology demonstration programs including accelerator projects and a SLOWPOKE demonstration reactor (SDR).

Figure 4: Whiteshell Laboratories Main Campus *(Source: CNL)*

The main campus of WL (figure 4) consists of offices, laboratories, hot cell facilities, the WR-1 research reactor and numerous support buildings. Located approximately 2.7 km north-east of the main campus, the waste management area (figure 5) contains Low-Level (LLW), Intermediate-Level (ILW) and High-Level (HLW) radioactive waste.

Figure 5: Whiteshell Laboratories Waste Management Area *(Source: CNL)*

3.1.5.1 Progress Update

Since the last update to the Commission in 2016, there has been continued progress made in decommissioning activities being performed at the Whiteshell site. CNL is planning, implementing and completing decommissioning activities, in accordance with CNSC approved decommissioning plans. CNL is also maintaining the WR-1 reactor in a state of storage-with-surveillance, while preparing for final decommissioning. As part of ongoing work, the CNSC licence for WL requires that CNL implement and maintain programs such as radiation protection, occupational health and safety, security and fire protection. CNL must ensure that facility structures that have yet to be decommissioned or are undergoing decommissioning remain accessible for inspection and maintenance.

The following are some of the WL decommissioning program activities that have been conducted by CNL, since the last update to the Commission in 2016.

Research Building B300

Building B300 was a central research complex that originally contained numerous laboratories, offices, mechanical rooms and areas for large-scale engineering projects. B300 was constructed in seven separate stages, and decommissioning is being conducted according to those stages. The first two stages dismantled were stages 4 and 7, as shown in figure 6. CNL completed demolition of stages 4 and 7 of Building B300 in 2016 as shown in figure 7.

Figure 6: Whiteshell Laboratories B300, stages 4 & 7 *(Source: CNL)*

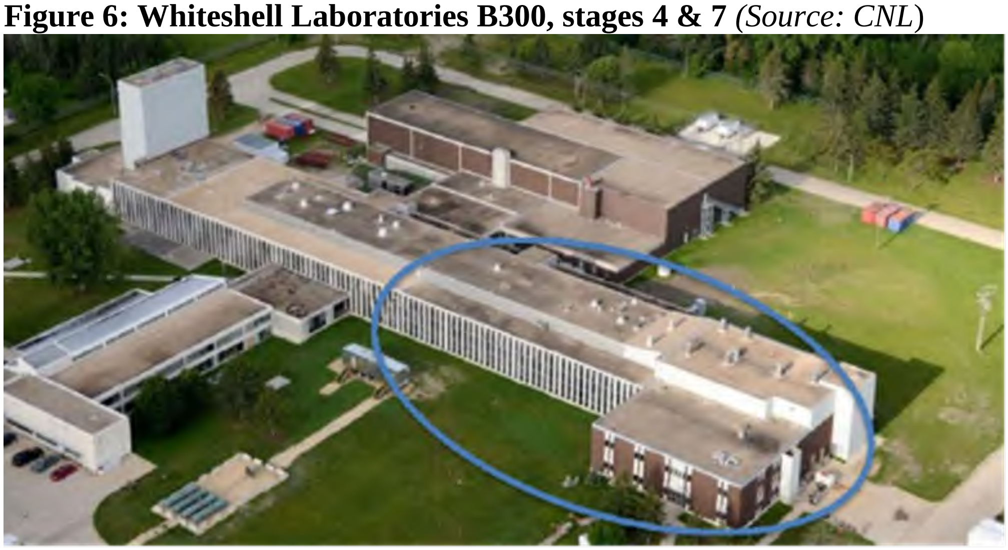

Figure 7: Whiteshell Laboratories B300 after removal of stages 4 & 7 *(Source: CNL)*

Decontamination Centre

Building B411, the WL decontamination centre (figure 8) originally housed a laundry for contaminated clothing, decontamination services for tools and items and respirator cleaning and maintenance services. The building was shut down in 2016, with decommissioning/demolition complete in 2017.

Figure 8: Whiteshell Laboratories B411 Decontamination Centre *(Source: CNL)*

Active Liquid Waste Treatment Centre

The active liquid waste treatment centre (building B200, figure 9) was originally constructed to manage both ILW and LLW liquid waste streams from buildings B411, B100 and B300. Constructed of concrete, the active liquid waste treatment centre is an indoor tank farm consisting of 12 storage tanks, glove boxes, piping, and other related equipment.

The ILW circuit was shut down in 2001 while the LLW circuit was shut down in 2017. Any liquid waste currently being generated within B300 or B100 is now collected and treated with new, independent systems located in each building.

Decommissioning activities have begun in B200, including characterization and hazard reduction in preparation for building demolition. Hazard reduction activities have included asbestos remediation, application of fixatives on the interior of tanks, the removal of active drain lines, the drum filling station and fume hoods. Building demolition is planned for 2019.

Figure 9: Whiteshell Laboratories B200 Active Liquid Waste Treatment Centre *(Source: CNL)*

SLOWPOKE Demonstration Reactor (SDR)

The SDR was developed in Building B100 to demonstrate the potential of using SLOWPOKE reactors for heating communities and commercial establishments. AECL operated the SDR for 614 hours between 1989 and 1990.

After shut down, fuel was removed and shipped to CRL. The pool water level was lowered, and in 1996, the remainder of the pool and piping was drained. Final dismantlement of the reactor, with the exception of the stainless steel pool liner, was completed in 2016. The pool liner will be decommissioned as part of the B100 building structure demolition, planned for 2022.

WR-1 Reactor

The WR-1 reactor is located in building B100 (figure 10). Recent decommissioning activities in this building have included the relocation of office areas, the removal of asbestos in accessible areas and characterization of reactor components.

Figure 10: Whiteshell Laboratories Building B100 *(Source: CNL)*

CNL's current CNSC-approved decommissioning plan foresees that decommissioning will be completed by 2050, while CNL's new proposed accelerated decommissioning approach would lead to WR-1 being decommissioned *in-situ* by 2025.

Waste Management Area

WL's Waste Management Area (WMA, figure 5) was developed when the facility was first opened. CNL conducts projects to re-characterize the performance and condition of structures, assess waste conditions, assess environmental conditions and assess the potential for environmental impacts. As part of the CNSC approved decommissioning plans, CNL is conducting projects to improve access to the area, reduce and repackage existing waste, and prepare facilities to be decommissioned.

CNSC staff have evaluated CNL's compliance during inspections of the waste management areas and are satisfied that CNL is carrying out decommissioning work in accordance with the licensing basis.

Some of the WL decommissioning activities that have been conducted by CNL at the Waste Management Area since the last update to the Commission are listed below:

- Preparing for the extraction of waste from the ILW bunkers and standpipes. This work began in 2017 and includes contracting out the design/build of systems for remediating these facilities (60% design complete).
- Construction work for expansion of the protected area in the WMA that surrounds the standpipes. This is required to allow space for the extraction of wastes noted above. The expanded protected area encompasses the standpipes and the ILW bunkers and will be activated in 2018.
- Developing a modular workspace complex at the entrance of the WMA to control and coordinate worker access to the WMA.

- Completing waste segregation and repackaging. Since 2016, most WR-1 and some other WMA wastes have been sorted and repackaged, in order to reduce fire loading in storage buildings and to reduce waste volumes. Repackaged wastes have been placed into steel containers and transferred to storage in the Shielded Modular Above Ground Storage building.

- Shipping to CRL of over sixty Cs-137 and Cf-252 sources and approximately 1500 m^3 of soil waste from the former Experimental Cesium Pond.

Other Activities

- The decommissioning/demolition of several non-nuclear buildings, totaling more than 4700 m^2 of floor space dispositioned to licensed disposal facility.

- Ongoing inspections maintenance (aging management inspections, fire protection system testing and maintenance, and facility and support systems safety reviews).

3.1.5.2 Licensing

The first decommissioning licence for WL was issued by the Commission following a public hearing in January 2003 (CMD 02-H19). This licence was subsequently renewed for a 10-year period in November 2008 (CMD 08-H24).

In September 2017, CNL submitted its renewal application for the WL licence for a 10-year period to the CNSC. As part of the application, CNL proposed a new decommissioning approach for the WR-1 reactor, moving from the original deferred dismantling strategy to *in-situ* decommissioning. CNSC staff have reviewed the licensing basis documentation and provided comments to CNL.

Under the NSCA, CNL's proposal requires an amendment to its existing licence issued by the Commission. CNL's proposal also requires an EA be conducted under CEAA 2012 and EA decision affirming that the proposed activities will not cause significant adverse environmental effects. Under CEAA 2012, CNSC staff are the Responsible Authority to ensure an EA for the project is conducted in accordance with requirements. In September 2017, CNL submitted a draft environmental impact statement (EIS) in support of the EA for review by CNSC staff. CNSC staff are leading the review and comment on the draft EIS by federal and provincial authorities (Environment and Climate Change Canada, Health Canada, Natural Resources Canada and Manitoba Sustainable Development), Indigenous groups and the public.

As part of the CEAA 2012 process, CNL has determined they need additional time to address the large number of comments raised by the public, First Nations, Métis communities and regulators in relation to the draft EIS. Consequently, on March 13, 2018, CNL requested that the Commission renew their current licence for a one-year period with no changes, with a requested expiry date of December 31, 2019. CNL plans to use this time to address comments and provide documentation to support their safety case.

3.1.6 Public Information Program for CNL Decommissioning Projects

To ensure licensees provide open and transparent information to the public, in 2012, the CNSC published RD/GD 99.3, *Public Information and Disclosure*. CNL's public information program for the decommissioning projects has been developed in accordance with CNSC regulatory guide RD/GD 99.3 and allows members of the public to obtain information on all aspects of these projects, for instance CNL's website on decommissioning projects, as well as ensuring appropriate disclosure following the occurrence of unplanned events.

In May 2018, the CNSC published REGDOC-3.2.1 *Public Information and Disclosure.* A transition plan will be developed to incorporate requirements of this updated standard into licensing basis documents for CNL projects.

Indigenous Engagement

CNSC staff confirm that CNL performs outreach with Indigenous groups that have expressed interest in the decommissioning projects covered by this CMD. CNL's approach to Indigenous engagement follows the guidance found in CNSC REGDOC-3.2.2 *Aboriginal Engagement*. These efforts have included emails, letters, meetings, site visits and tours, and community visits, among others. CNL has stated that the Indigenous groups included in these efforts were Sagkeeng First Nation, Black River First Nation, Brokenhead Ojibway Nation, Hollow Water First Nation, Wabaseemoong Independent Nations, the Manitoba Métis Federation, Algonquins of Ontario, the Métis Nation of Ontario, the Algonquins of Pikwàkanagàn, the Algonquin Anishinabeg Nation Tribal Council, Eagle Village First Nation, Kitigan Zibi Anishinabeg First Nation, Williams Treaties First Nations, Alderville First Nation, Beausoleil First Nation, the Chippewas of Georgina Island First Nation, Chippewas of Rama First Nation, Curve Lake First Nation, Hiawatha First Nation, Mississaugas of Scugog Island First Nation, Union of Ontario Indians, and the Algonquin Nation Secretariat.

3.2 Port Hope Area Initiative

3.2.1 Background

The historic low-level radioactive waste (LLW) contamination found in Port Hope and Port Granby is a result of the area's long involvement with the nuclear industry. This legacy extends back to the 1930s with the commencement of radium refining activities by Eldorado Gold Mines Ltd. In the 1940s, Eldorado switched its focus to uranium processing, and became a Crown Corporation (Eldorado Mining and Refining Limited, later renamed Eldorado Nuclear Limited). During those early years, wastes from radium and uranium production were stockpiled at various locations in the Port Hope area, and also used for fill material in construction and landscaping.

In 1948, Eldorado began placing process wastes in the Welcome Waste Management Facility (WMF) in the Township of Hope. The Welcome WMF continued to receive wastes until 1955, when Eldorado began operating the Port Granby WMF, located in nearby Clarington, Ontario. The Port Granby WMF received process wastes and other waste materials until 1988. Although these facilities represented an improvement over earlier practices, they do not provide for acceptable long-term management of LLW.

In the late 1990s, the Township of Hope, the Town of Port Hope and the Municipality of Clarington each developed a proposal for the establishment of long-term management facilities for the LLW found in their municipalities. These proposals formed the basis for what is now the PHAI, which represents the Government of Canada's commitment to the development and implementation of a safe, local, long-term solution for the management of historic LLW in the municipalities of Port Hope and Clarington.

The Port Hope Area Initiative

The PHAI is defined by "An Agreement for the Cleanup and the Long-Term Safe Management of Low-Level Radioactive Waste Situate in the Town of Port Hope, the Township of Hope, and the Municipality of Clarington", hereafter "the Legal Agreement". The Legal Agreement was signed in 2001[1] by the Government of Canada and the Municipalities of Port Hope and Clarington. In 2012, the Government of Canada, through Natural Resources Canada, made a financial commitment of $1.28 billion towards the clean-up of LLW and implementation of the PHAI.

The PHAI is comprised of two separate projects, each authorized under licences issued by the Commission to CNL as shown in table 1.

[1] The Legal Agreement was amended in 2003, 2006 and 2009.

Figure 11: The Port Hope area with insets showing the PGP and PHP sites
(Source: CNL)

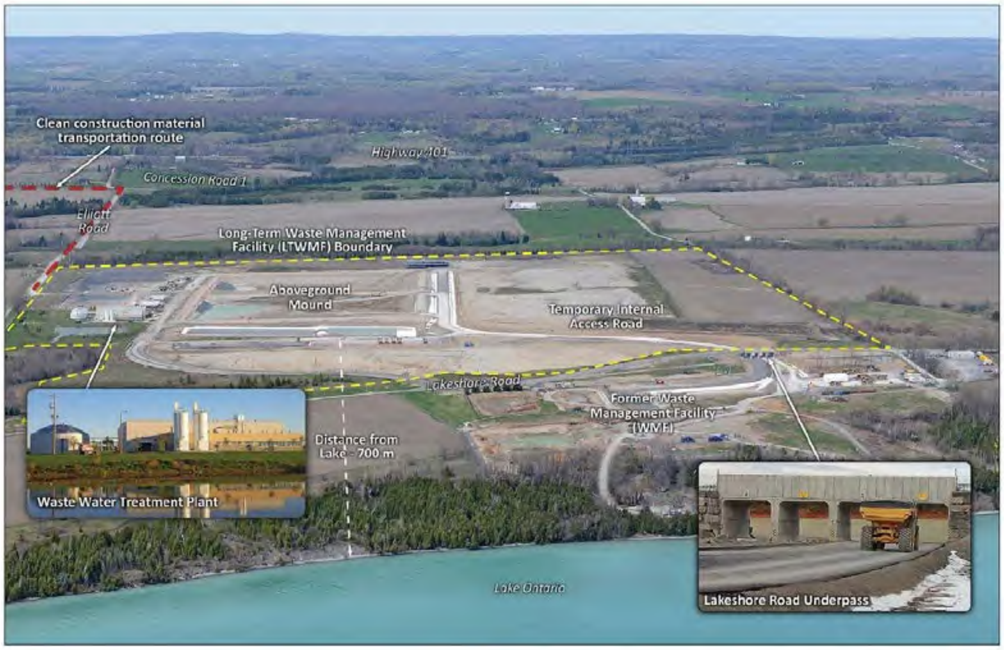
The Port Hope Project and the Port Granby Project each involves the construction of an engineered above-ground containment mound, which will safely isolate legacy LLW. In both cases, the project involves the excavation of waste from a legacy waste management facility, and its emplacement in a nearby modern long-term waste management facility (LTWMF). In Port Hope, the project further includes excavation of LLW from various sites in the urban area of the municipality.

CNL also holds two additional Designated Officer licences that have connection to the PHAI. These licences are for the care and maintenance of interim LLW storage locations in Port Hope that will be transferred to the new Port Hope LTWMF. Further details on these licences are discussed in section 3.2.4.

3.2.2 Port Granby Project

The objective of the Port Granby Project is to remediate and remove approximately 450,000 m^3 of historic LLW from the existing Port Granby WMF, and to consolidate and manage this waste at a new LTWMF. The Port Granby WMF is located in the Municipality of Clarington, Ontario, and it received wastes resulting from former radium and uranium refining operations at Eldorado Nuclear in Port Hope beginning in 1955 and continuing until 1988. The new LTWMF is an engineered above-ground mound which is located approximately 700 m north of the shoreline of Lake Ontario (see figure 12).

Figure 12: Location of the Port Granby WMF and new LTWMF. The LTWMF facility boundary is indicated by the dashed yellow line. *(Source: CNL)*



The Port Granby Project is currently in the second of three project phases. The first phase included ongoing operation, care and maintenance of the Port Granby WMF, and development of detailed technical information such as LTWMF design and other documentation to support licensing. CNSC staff reviewed and confirmed the information met all regulatory requirements. Following acceptance of this technical information, the Commission issued a licence amendment in November 2011 permitting the implementation phase, Phase 2, to commence.

Building on Phase 1 activities, the implementation phase includes the construction and operation of a new Waste Water Treatment Plant (WWTP); the construction and operation of a new LTWMF, including the excavation and emplacement of LLW; the capping of the LTWMF once complete; and the remediation and restoration of the existing Port Granby WMF site. CNSC staff continue to verify and evaluate compliance during the implementation phase.

The LTWMF base liner design consists of multiple layers of natural and synthetic materials which effectively prevents the release of contaminants to the environment. Within the base liner, a leachate collection system has been installed which directs contaminated water to the WWTP for treatment prior to discharge.

Following the completion of LLW placement on the LTWMF base liner, a cap consisting of a multi-layered cover system will be constructed to prevent water ingress and intrusion. Once complete, the Port Granby LTWMF will resemble a large grassy hill with radiation levels expected to be similar to natural background levels. CNL expects to begin capping the LTWMF in 2019.

Following completion of Phase 2, the Port Granby Project will enter into Phase 3, that is, long-term monitoring and maintenance of the LTWMF. CNL will install systems within and around the Port Granby LTWMF which will monitor the facility, and visual inspection and monitoring of WWTP influent will confirm the performance of the cover system. CNL will further monitor groundwater quality using a series of wells at the base of the mound and the perimeter of the site. CNSC regulatory oversight will continue for as long as the site is licensed.

3.2.2.1 Progress Update

Significant progress has been made at the Port Granby LTWMF, since the last update to the Commission in 2016. Construction of the base liner system in the waste cells, including the leachate collection system, was completed in 2016. CNSC staff carried out several inspections to confirm the integrity of the base liner system before the emplacement of waste began on November 1, 2016, and an additional inspection to verify that the base liner was being suitably winterized in December 2016. CNSC staff concluded that the base liner was properly installed and suitably winterized.

To facilitate the safe transfer of LLW from the existing WMF to the new LTWMF, a temporary underpass has been constructed to enable trucks carrying waste to travel beneath Lakeshore Road (see inset in figure 12). This underpass, completed in September of 2016, provides an internal haul road for use when travelling between the existing WMF and the LTWMF, thus eliminating the possibility of contaminating public roads.

As of April 1, 2018, CNL estimates that roughly 525,000 tonnes of the legacy LLW at the Port Granby WMF has been excavated and emplaced in the Port Granby LTWMF. In some areas of the WMF, CNL has progressed to verifying the effectiveness of the remediation by sampling soil in the remediated area and measuring the samples to ensure that excavations have been extensive enough to remove contamination in excess of the clean-up criteria specified in the licence. This stage will be followed by the final step in the remediation, backfilling, grading and seeding the remediated areas so as to achieve a natural end-state. CNSC staff's compliance activities related to remediation include inspections to verify the effectiveness of the remediation activities, collecting samples for analysis at the CNSC laboratory, and inspection of radiation protection, contamination control and worker health and safety measures. To facilitate these inspections, a CNSC inspector has been deployed to the Port Hope/Port Granby area.

Portions of the old Port Granby WMF site are quite steep leading down to Lake Ontario, and in 2017, CNL undertook significant work to ensure slope stability on the site, especially in the east and west gorge reservoirs (see figure 15). These undertakings to ensure worker safety were verified by CNSC staff during several inspections in 2017, with CNSC staff concluding that CNL has taken adequate measures to ensure slope stability on the Port Granby site.

As noted in table 4, in 2017, CNSC staff carried out independent environmental sampling in the area of the old Port Granby WMF under the CNSC's Independent Environmental Monitoring Program (IEMP).

Detailed IEMP results are available on the CNSC's IEMP website, and results from the Port Granby area indicate that the public and the environment in the vicinity of that site are protected.

CNL expects remediation of the old Port Granby WMF to continue into 2019, and capping of the new LTWMF mound to begin in 2019.

3.2.2.2 New Waste Water Treatment Plant

Construction of the new WWTP was completed for the Port Granby Project in 2014. On April 1, 2016, CNL shifted treatment of collected groundwater at the existing WMF from the previous system to the new WWTP, resulting in an immediate and marked improvement in the effluent quality being discharged to Lake Ontario. Commissioning of the new WWTP was completed in October 2016. The new WWTP will continue to operate for the foreseeable future during Phase 3 of the Port Granby Project. The old water treatment building was demolished in 2017.

Figure 13: Port Granby Waste Water Treatment Plant *(Source: CNL)*

As required by the Port Granby Project LCH, in 2017, CNL established action levels for the new WWTP, and further established release limits for the new WWTP as well. CNSC staff have assessed the adequacy of the limits and sampling frequencies proposed by CNL and have agreed that they are appropriate and should become part of the licensing basis for the Port Granby licence. These new action levels and release limits will be incorporated into the LCH for the Port Granby Project in the coming months.

In order to evaluate WWTP performance, weekly composite effluent samples are collected by CNL from the effluent stream and sent to an accredited external laboratory for analysis. CNL submits quarterly reports to CNSC staff which include the maximum weekly result for each month. CNSC staff review and verify these data to ensure they meet regulatory requirements and standards.

Effluent quality results available as of April 1, 2018 indicate that the WWTP is performing well within the regulatory release limits. CNSC staff's independent analysis of effluent samples taken from the Port Granby WWTP during inspections have confirmed the validity of the results provided by CNL. CNL's most recent effluent results as of the date of this report are presented in Appendix A.2.

3.2.2.3 Events of Regulatory Significance at Port Granby

There were no lost-time injury events at the Port Granby Project during the period covered by this report. The following is a summary of events that occurred at the Port Granby Project during the same period.

Hazardous Substances at the Port Granby WMF

There were two events related to hazardous materials encountered by workers during the process of waste excavation and emplacement. The presence of certain hazardous materials in the Port Granby WMF was known from historic records prior to the commencement of excavations.

- In December of 2016, a drum containing an ammonia-based chemical was excavated from the Port Granby WMF and was ruptured during emplacement at the Port Granby LTWMF. Two workers suffered temporary eye and respiratory irritation. Workers were not wearing elevated levels of Personal Protective Equipment (PPE) because hazardous substances had not been expected in that area of the Port Granby WMF where the drum was found. CNL halted waste excavation until revised procedures and engineering controls were put in place and workers trained. These included the use of PPE offering a high level of respiratory and skin protection, and the installation of air supply tanks and ballistic protection on key excavation equipment (see figure 14).

- In May of 2017, while a specialist contractor was performing excavations in an area known to contain cylinders of potentially hazardous chemicals, slightly elevated levels of hydrogen fluoride in air were measured next to a cylinder being unearthed. As per the protocols in place, workers evacuated the area and returned in a higher class of PPE to continue work. The cylinder was safely unearthed using a hydro-vac truck, which is less likely to cause mechanical damage than conventional excavation equipment.

CNL's implementation of corrective measures related to these events has been verified by CNSC staff through document review and inspection activities, with CNSC staff concluding that worker safety has been clearly enhanced.

Figure 14: A bulldozer on the Port Granby WMF site, fitted with steel gratings over windows and air tanks on the roof

Hydrogen Sulphide Exposure at the Port Granby WWTP

On January 13, 2017, hydrogen sulphide gas (H_2S) built up in the Port Granby WWTP, exposing several workers and triggering an alarm which caused the WWTP to be evacuated. Two workers exhibited symptoms such as mild headaches and nausea, but were cleared to return to work later the same day after medical evaluation. The H_2S gas was generated in stagnant solids in the WWTP's bioreactor, and released as workers disposed of that material. In response, CNL committed to put in place additional measures such as the mandatory use of personal H_2S monitors in specified areas of the WWTP, the provision of Self-Contained Breathing Apparatuses (SCBAs) for emergency use, and upgrades to building ventilation and the ambient H_2S monitoring system.

CNSC staff consider that CNL's H_2S corrective actions will result in increased worker safety. CNSC staff verified those corrective actions during a subsequent inspection and found upgrades to the ambient H_2S monitors were not yet complete. CNSC staff issued a compliance notice to CNL prohibiting the use of H_2S-generating portions of the WWTP until all corrective actions are complete. CNSC staff continue to monitor CNL's H_2S corrective actions.

Water Overflow Event at the East Gorge Reservoir

On June 23, 2017, heavy rains in the Port Granby area led to an unplanned discharge of untreated water from the East Gorge Reservoir (EGR) at the Port Granby WMF (see figure 15). The entire blue shaded area in figure 15 is under remediation; therefore, CNL must treat water from this area as being potentially contaminated. According to the Port Granby Project licensing basis, CNL is not authorized to release any untreated water from the site.

Figure 15: Partial layout of the Port Granby Project site *(Source: CNL)*

CNL determined that the overflow was due to valves having been incorrectly sequenced, which caused a restriction in the flow of water and resulted in an overflow. CNL estimated that up to 5 m^3 of untreated water was discharged over 20 minutes, before valves were properly reconfigured and the problem corrected. CNL staff performed radiation surveys and took soil samples which indicated that contaminant levels in the path of the overflow are less than the average initial contaminant concentrations for the Port Granby WMF site, as identified in the EA. There was no impact to the environment as a result of this event.

CNSC staff carried out a reactive inspection of the Port Granby and Port Hope sites on June 26 and 27, 2017, which included representatives from the Ontario Ministry of Environment and Climate Change (MOECC) and Environment and Climate Change Canada (ECCC). As a result, an Order was issued to CNL against the Port Hope Project licence, as discussed further in section 3.2.3.4. In response to the Order, CNL has made significant updates to their emergency water management strategy, obtained supplies and developed detailed water management plans for the Port Granby site.

CNL has also installed multiple 6,000 m^3 water tanks, two of which are shown on figure 15, to increase water storage capacity. CNSC staff have verified during inspections that emergency water management supplies as listed in CNL's Port Granby water management documents are present.

As a result of the same weather event, an unplanned discharge also occurred on the same day at the Port Hope LTWMF, and is discussed in section 3.2.3.4. An Event Initial Report on both events was presented to the Commission in August 2017 under CMD 17-M38.

Water Overflow Event at the West Gorge Reservoir

On January 23, 2018, there was an unplanned discharge of untreated water from the West Gorge Reservoir (WGR) at the Port Granby WMF (see figure 15). Upon observing the overflow, CNL ceased pumping water into the WGR and the overflow stopped shortly afterwards. CNL estimated the duration of the release to have been 30 to 45 minutes, and the volume of the release to be no more than 7 m^3. CNL has concluded that the overflow was due to a restriction in the pipe running from the WGR to the adjacent sump where the WGR pumps draw water. After the overflow, CNL staff performed radiation surveys and took soil samples which indicated that contaminant levels in the path of the overflow are less than the average initial contaminant concentrations for the Port Granby WMF site, as identified in the EA. There was no impact to the environment as a result of this event.

CNL carried out various corrective actions in response to this incident, most significantly moving the sump from adjacent to the WGR, to directly in the WGR. CNSC staff performed an inspection in February 2018 at the Port Granby site and verified that the corrective measures were in place. CNSC staff continue to monitor and assess CNL's water management measures at the Port Granby site.

3.2.3 Port Hope Project

The objective of the Port Hope Project (figure 16) is to remediate and remove historic LLW from various locations in the Municipality of Port Hope (MPH), and to consolidate and manage this waste at a new LTWMF. The site of the Port Hope LTWMF encompasses the Welcome Waste Management Facility (WMF), which until 1955 was used to manage radioactive wastes arising from the refining of uranium and radium (cells 2a and 2b in figure 16).

The Port Hope Project involves the remediation of LLW from a variety of locations throughout the municipality, including:

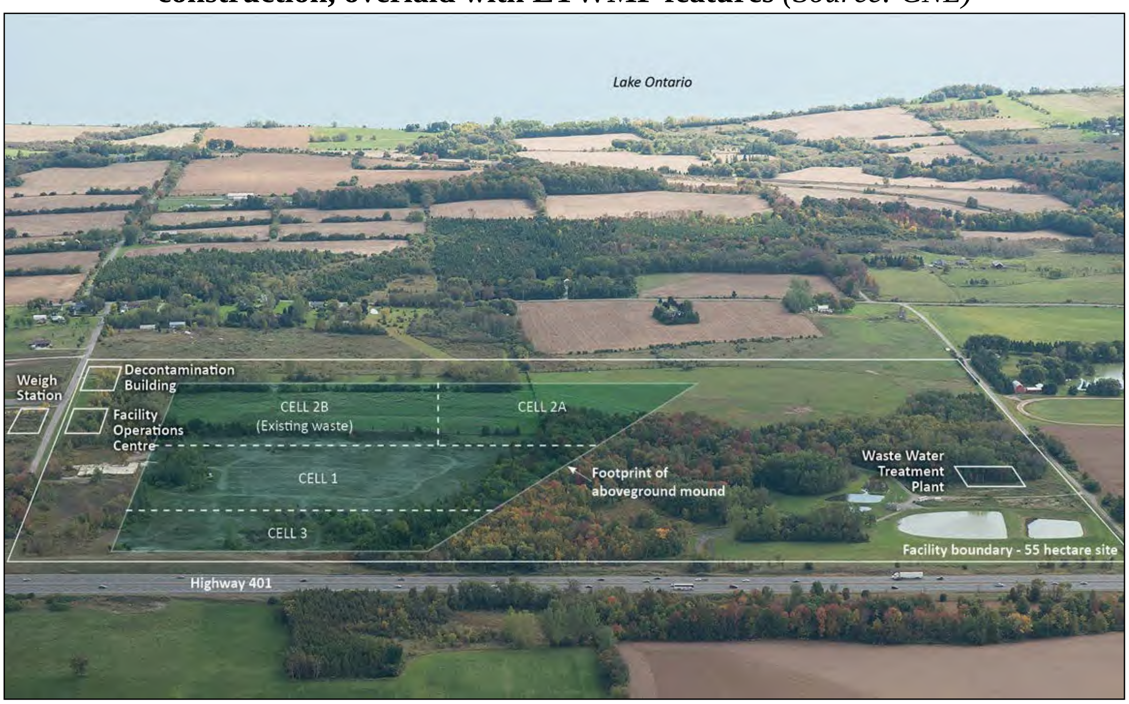
- 450,000 m^3 of LLW from the existing Welcome WMF
- 572,000 m^3 of waste from various remediation sites throughout Port Hope including the Port Hope Harbour, the closed-down Municipal Landfill on Highland Drive, and numerous residential properties

- 150,000 m^3 of Cameco-owned waste generated prior to 1988 and waste from building demolition associated with Cameco's Vision in Motion project
- 51,250 m^3 of waste from industrial waste contaminated sites (i.e., Port Hope Centre Pier, Lions Park, and the municipal sewage treatment plant)

The Port Hope Project is currently in the second of three project phases. The first phase included ongoing operation, care and maintenance of the Welcome WMF, and development of detailed technical information such as LTWMF design and other documentation to support licensing. CNSC staff reviewed and confirmed the information met all regulatory requirements. Following acceptance of this technical information, in November 2012, the Commission issued a licence amendment permitting the implementation phase, Phase 2, to commence. Building on Phase 1 activities, Phase 2 includes the construction and operation of a new WWTP; the construction and operation of the new Port Hope LTWMF, including the excavation and emplacement of LLW; the remediation and restoration of excavated areas; and the capping of the LTWMF once it is complete. CNSC staff continue to verify and evaluate compliance during Phase 2 activities.

The Port Hope Project LTWMF is designed for the safe long-term storage of LLW, and is conceived as an engineered above-ground mound with a design capacity of 1.9 million m^3 of LLW. The design allows for a 30% contingency on waste volume estimates.

Figure 16: An overview of the Welcome WMF site prior to Port Hope LTWMF construction, overlaid with LTWMF features *(Source: CNL)*



The LTWMF design comprises a single mound with four waste storage cells. These cells will be developed progressively to permit efficient construction and operation of the facility. The base liner design consists of multiple layers of natural and synthetic materials which will effectively prevent the release of contaminants to the environment. Within the base liner, a leachate collection system has been installed which will direct contaminated water to the WWTP for treatment prior to discharge. Excavation and emplacement of wastes is expected to continue to 2023.

As noted in table 4, in 2017, CNSC staff carried out independent environmental sampling in the area of the old Welcome WMF under the CNSC's Independent Environmental Monitoring Program (IEMP). Detailed IEMP results are available on the CNSC's IEMP website, and results from the Welcome WMF area indicate that the public and the environment in the vicinity of that site are protected.

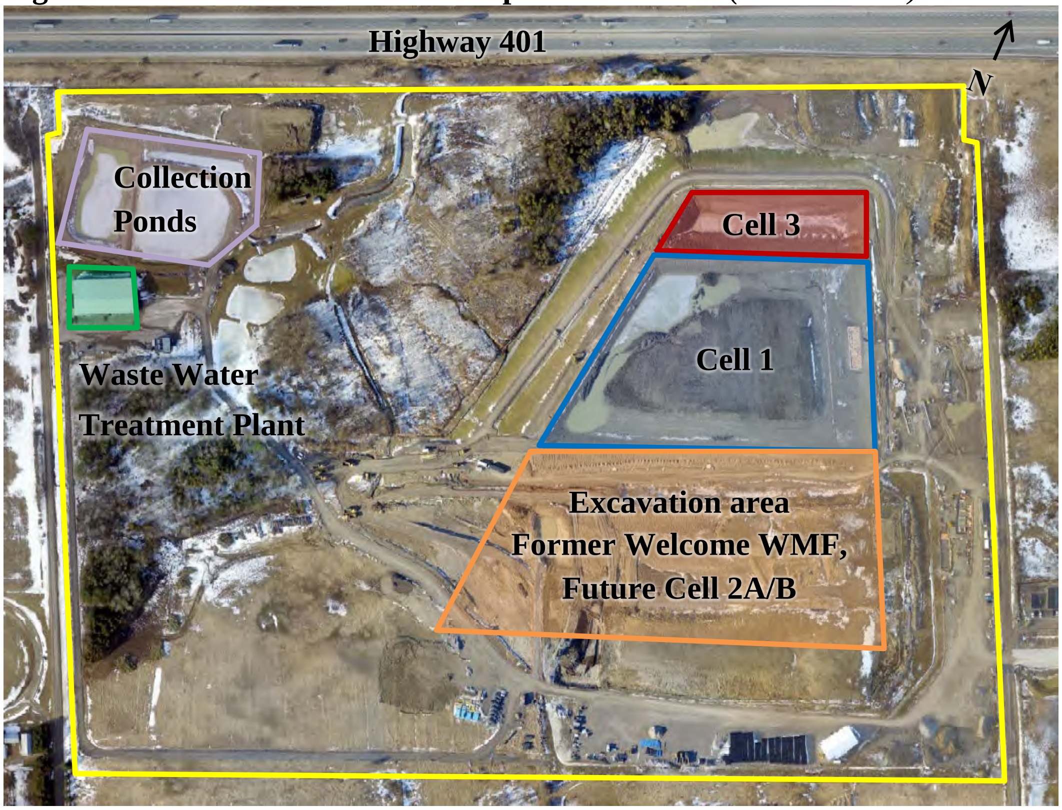
Following the completion of LLW placement on the LTWMF base liner, a cap consisting of a multi-layered cover system will be constructed to prevent water ingress and intrusion. Once capping is complete, the Port Hope LTWMF will resemble a large grassy hill. Radiation levels on the mound are expected to be similar to natural background levels. The final phase of the project, Phase 3, will involve long-term monitoring and maintenance of the LTWMF under continued CNSC regulatory oversight.

3.2.3.1 Progress Update

Significant progress has been made at the Port Hope LTWMF, since the last update to the Commission in 2016. Following completion of site preparation in the spring of 2016, contractors began construction of Cell 1. The base liner of that first cell was completed in 2017, and significant progress has also been made on the construction of Cell 3. CNSC staff carried out several inspections to confirm the integrity of the Cell 1 base liner system during its installation, and a further inspection to verify that the site was being suitably winterized in December 2017. No significant deficiencies were noted.

On December 1, 2017, CNL began excavation of onsite wastes from the Welcome WMF, and emplacement of those wastes in Cell 1 of the Port Hope LTWMF. As of April 1, 2018, CNL estimates that roughly 15% of onsite waste has been excavated from the Welcome WMF and emplaced in Cell 1.

Figure 17: An aerial view of Port Hope LTWMF site *(Source: CNL)*



As the extent of excavation grows, so too does the need to collect and treat the water from the site to ensure that no untreated water is released outside the boundary. The two collection ponds adjacent to the WWTP (figure 17) serve this purpose. In order to ensure that sufficient capacity exists to cover all probable water inflow scenarios, CNL is in the midst of an expansion of the collection ponds. The ponds, with an original capacity of roughly 18,000 m^3, have been expanded to 23,800 m^3, and will be expanded to a total capacity of 47,000 m^3 by October 2018.

CNL expects to begin receipt of offsite wastes in June 2018, beginning with contaminated soils and Cameco wastes from the Centre Pier at the Port Hope Harbour. Centre Pier remediation activities are discussed further under section 3.2.3.3.

3.2.3.2 New Waste Water Treatment Plant

CNL has constructed a new WWTP on the Port Hope LTWMF site, as shown in figure 18. In January 2017, CNL began discharging treated water from the new WWTP, resulting in an immediate and marked improvement in effluent quality. Commissioning of the new WWTP was completed in December 2017. The new WWTP will continue to operate for the foreseeable future during the long-term monitoring phase of the Port Hope Project.

Figure 18: The Port Hope Waste Water Treatment Plant *(Source: CNL)*

As required by the Port Hope Project LCH, in 2018, CNL established action levels for the new WWTP, which were accepted by CNSC staff in March 2018. CNL expects to have release limits in place for the Port Hope WWTP by mid-2018 and once accepted by CNSC staff, the action levels and release limits will be incorporated into the LCH for the Port Hope Project.

As part of routine operation of the WWTP, samples are collected from the effluent stream by CNL and sent to an accredited external laboratory for analysis. Effluent quality results obtained from CNL during commissioning and operation indicate that the WWTP is performing significantly better than the design objectives for the WWTP found in the Port Hope Project LCH. CNL's most recent effluent results as of the date of this report are presented in Appendix A.3.

CNSC staff have performed inspections related to the commissioning of the WWTP at the Port Hope LTWMF, and over the course of the inspections collected samples of influent and effluent for independent analysis at the CNSC laboratory. CNSC results were in agreement with CNL results.

The old Welcome WMF water treatment building remains in place and operable, as a part of CNL's contingency plan for water management at the Port Hope LTWMF.

3.2.3.3 Remediation Activities in Port Hope

CNL's Preparation for Remediation Activities in Port Hope

In preparation for remediation in the urban area of the Municipality of Port Hope, CNL is currently preparing key documents that will guide the work. Among those documents are the *Remediation Verification Standard Operating Procedures* (RVSOP) and the *Port Hope Special Circumstances Protocol*, both currently under development by CNL.

The RVSOP suite of procedures describe the approach that CNL will implement following remediation to demonstrate the cleanup has met the requirements of the licence.

The *Port Hope Special Circumstances Protocol* has been developed by CNL to address situations where property specific constraints make it impractical to meet the cleanup criteria prescribed in the licence for the Port Hope Project. Application of the special circumstance protocol will be managed by CNL and is expected for only a very small number of sites.

CNSC staff have reviewed and provided comments on drafts of these documents and CNL has been updating the documents accordingly. Representatives from the Municipality of Port Hope (MPH) have also been active participants in the review of these documents and have met collectively with CNL and CNSC staff on this topic, most recently in March 2018.

Remediation of Major Sites in Port Hope

CNL has defined the various major sites throughout Port Hope which are subject to remediation under the Port Hope Project. These are listed in table 5 below, including a brief update on their status. Interactive maps of these sites can be found on the [PHAI website.]

Table 5: Major Remediation Sites in Port Hope

Title	Description	Remediation Timeline
Temporary Storage Sites	These include the Centre Pier Temporary Storage Site (TSS), Pine Street Extension TSS, and Sewage Treatment Plant TSS. More detail is provided in Section 3.2.4 below.	Expected to begin in 2018
Waterfront Area	This includes the West Beach and former Waterworks site, the Alexander Street Ravine, the Centre Pier, Port Hope Harbour, the Mill Street South site, and the CN/CP Viaducts area. The waterfront area is complex and remediation work will be ongoing for some years.	Expected to begin at the former Waterworks site and the Port Hope Harbour in 2018
Highland Drive Area	This includes the Highland Drive landfill, roadbed, and south ravine; the Pine Street Extension Consolidation Site; and the Pine Street North Extension roadbed.	Expected to begin in 2019
Industrial Sites	This includes areas of the Centre Pier, Lions Recreation Centre Park, Former Coal Gasification Plant, Chemetron Lagoon, and Sewage Treatment Plant Storage Cell.	Expected to begin in 2019
Central Area and Known Sites	This includes the former St. Mary's School, Strachan Street Ravine Consolidation Site, Caroline Street Park, Abandoned Pipeline, and Peter Street Mound.	Expected to begin in 2018 or 2019

Figure 19 - The Port Hope waterfront area

Waste Arising from Cameco Decommissioning Activities

The Legal Agreement specifies the accommodation of up to 150,000 m^3 of defined "Cameco Decommissioning wastes" in the new Port Hope LTWMF. This includes stored legacy wastes that were generated as a consequence of uranium and radium refining at the site of the current conversion facility in Port Hope prior to 1988, and other historic LLW located at this facility, the Dorset Street warehousing facility, and the Centre Pier. Cameco has initiated the "Vision in Motion" project to transfer eligible wastes to the Port Hope LTWMF, in addition to other improvements to the Cameco site. In 2017, Cameco began preparing a variety of legacy Eldorado materials anticipation of their transfer to the Port Hope LTWMF.

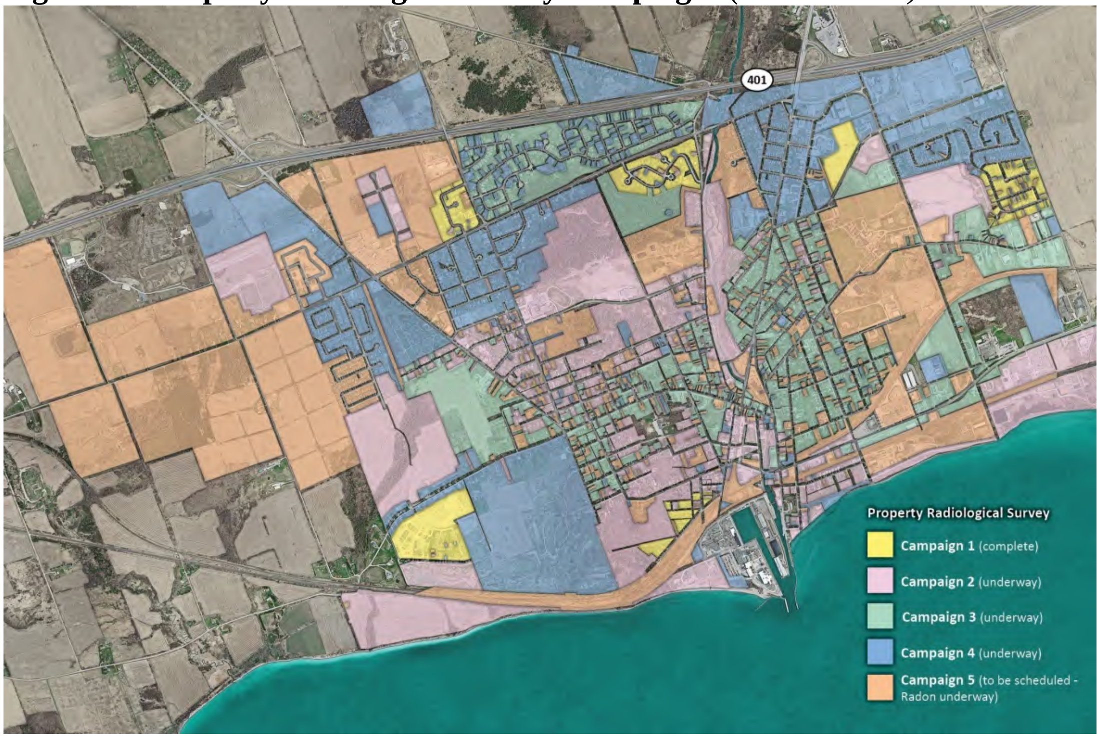
CNL and Cameco routinely meet to ensure agreement and understanding on logistics of these activities, and both CNL and Cameco keep CNSC staff informed of developments.

Small-Scale Sites

As previously indicated, the PHAI involves identification of LLW on residential and commercial properties in the Port Hope area. Surveys are being undertaken on all urban and some rural properties in the Port Hope area, for a total of roughly 4,800 properties. Through this program, properties will undergo four tests for detecting the presence of LLW: interior radon testing, interior gamma radiation surveys, exterior gamma radiation surveys, and subsurface soil sample analysis. This program was implemented in 2012 and is expected to be completed in 2023.

Port Hope properties have been organized into a series of five campaigns for the execution of property surveys, as shown in figure 20.

Figure 20: Property Radiological Survey Campaigns *(Source: CNL)*



Based on historic information, CNL initially estimated that at least 375 properties in Port Hope would have contamination at levels which require remediation, but as of April 1, 2018, has found LLW at 745 properties to date, and now estimates more than 800 properties will require remediation. The status of CNL's small-scale site sampling program, as of April 1, 2018 is summarized in Appendix B.

For each small-scale site requiring remediation, CNL is preparing a site-specific remediation plan which will serve to inform property owners of the extent of remediation activities on their property. CNL is currently working on roughly 45 such plans, and they form an important vehicle for consultation between CNL and property owners. Small-scale sites will temporarily become subject to the Port Hope Project licence during their respective remediation periods. During that time, CNSC staff may carry out inspections on these sites to verify CNL's compliance with their licensing basis.

3.2.3.4 Events of Regulatory Significance at Port Hope

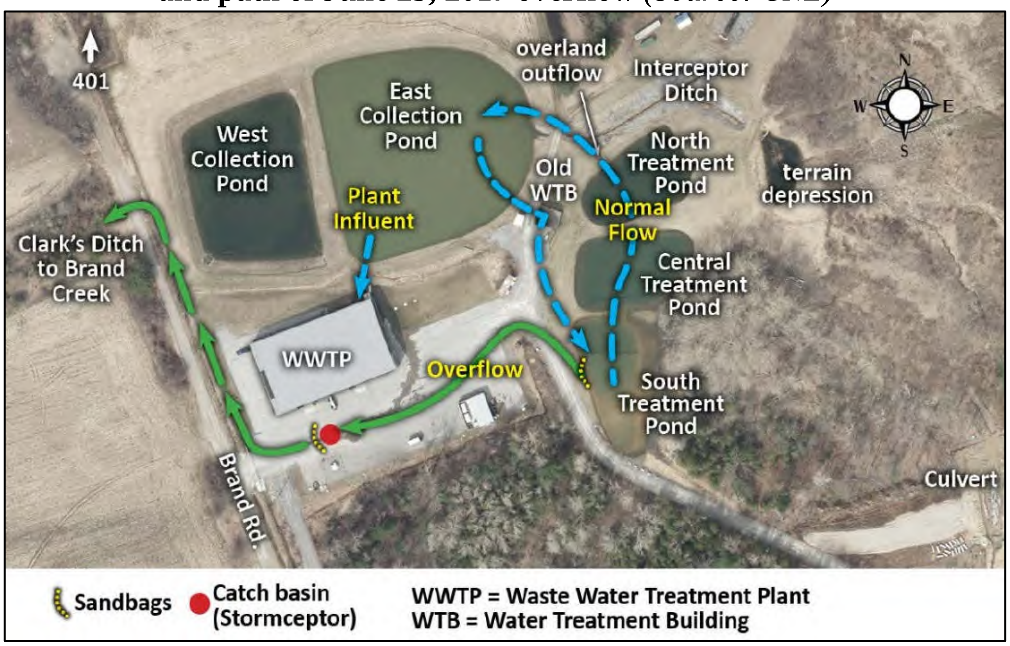
There were no lost-time injury events at the Port Hope Project during the period covered by this report. During the period covered by this report, one event occurred at the Port Hope Project which was of particular interest to CNSC staff. This event is summarized below.

Water Overflow Event at the South Treatment Pond

On June 23, 2017 sustained heavy rains (up to 70 mm) led to an unplanned discharge of untreated water from the Port Hope LTWMF site. An unplanned discharge also occurred on the same day at the Port Granby WMF site, as discussed above in section 3.2.2.3. An Event Initial Report was presented to the Commission in August 2017 under CMD 17-M38.

As shown in figure 21, the heavy rain event caused an overflow from the South Treatment Pond into the WWTP parking lot and then to Brand Creek and Lake Ontario (green lines). The normal flow of water is shown with blue lines. In response, CNL staff deployed sandbags at the point of overflow (yellow dots), and pumped water from the South Treatment Pond into the East Collection Pond. Sandbags were used to force most of the overflow into the Stormceptor drain (red dot), in order to minimize the sediment in the water being released. The overflow gradually lessened and was halted roughly 4-1/2 hours after its discovery.

Figure 21: Layout of water management features at the Port Hope LTWMF, and path of June 23, 2017 overflow *(Source: CNL)*



CNL conducted an extensive sampling campaign to determine whether there were any environmental impacts resulting from this event. Based on these results, CNL has concluded that there was no risk to the health and safety of workers or the public, and no lasting impact to the environment. CNSC staff reviewed CNL's sampling data and concurred with their conclusions.

CNSC staff carried out a reactive inspection of the Port Granby and Port Hope sites on June 26 and 27, 2017, which included representatives from the MOECC and ECCC. CNSC staff took various water samples from downstream of the LTWMF site and confirmed that there was no risk to public and the environment as a result of this overflow.

As a result of the inspection, CNSC staff identified the lack of a documented water contingency plan and the lack of emergency equipment and supplies were contributing factors to this overflow. Accordingly, CNSC staff issued an Order which required CNL to ensure its emergency preparedness measures are available to mitigate accidental releases of untreated water from the site and additionally to review and update its water management strategy to ensure that no further unauthorized releases would occur.

As of September 2017, CNSC staff have concluded that CNL has fulfilled the conditions of the Order through the submission of updated water management plans for the Port Hope Project. In subsequent inspections, CNSC staff verified that emergency water management supplies, as listed in CNL's water management documentation, are present. CNSC staff continue to monitor and assess CNL's water management measures at the Port Hope site.

3.2.3.5 Other Topics of Regulatory Significance

Licence Amendment related to *in-situ* Arsenic Management

On November 29, 2017 the Commission approved an amended licence for the PHP which includes revised requirements related to arsenic for specified portions of the Port Hope LTWMF site. Specifically, the amended licence exempts certain portions of the Port Hope LTWMF footprint from the clean-up criterion for arsenic of 40 parts per million, as specified in Appendix C of the Port Hope Project licence. This variance is acceptable because these areas are within the Port Hope LTWMF fence line, meaning that there will be no impact to the public or the environment resulting from this licensing change. The issuance of the amended licence allowed CNL to begin excavation of onsite wastes at the Port Hope LTWMF site, beginning with the high-arsenic wastes from the Welcome WMF, and emplacement of those wastes in the Port Hope LTWMF. As of January 31, 2018, all high-arsenic materials from the Welcome WMF have been excavated and emplaced in Cell 1 of the Port Hope LTWMF. Further information on this licence amendment is available in the Commission's Record of Decision, available on the CNSC's website.

IAEA Safeguards at the Port Hope LTWMF

Pursuant to the *Treaty on the Non-Proliferation of Nuclear Weapons*, Canada has entered into a Comprehensive Safeguards Agreement and an Additional Protocol with the International Atomic Energy Agency (IAEA) (hereafter, the safeguards agreements). The objective of the safeguards agreements is for the IAEA to provide annual assurance to Canada and to the international community that all declared nuclear material is in peaceful, nonexplosive uses and that there is no indication of undeclared material.

The CNSC provides the mechanism, through the NSCA and Regulations, for the IAEA to implement the safeguards agreements. Under these agreements, CNL is required to maintain and declare detailed accounting records of all transactions involving nuclear material, allow access to IAEA inspectors for inspections, accept the installation of IAEA equipment for remote verification or surveillance where necessary, and to provide relevant design and operational information to the IAEA periodically.

The waste inventory destined for the LTWMF includes 17,000 drums of historical uranium-bearing waste currently under safeguards at Cameco's Port Hope Conversion Facility (PHCF). This material was generated by historical uranium processing activities at PHCF and contains approximately 1,400 tons of uranium. The uranium-bearing waste transferred to the LTWMF is subject to IAEA safeguards.

The IAEA, the CNSC, CNL, and Cameco have developed practical arrangements which codify the safeguards expectations at the LTWMF. As part of these arrangements, CNL will facilitate the installation of an IAEA unattended monitoring system to verify the safeguarded uranium bearing waste as it arrives at the LTWMF. The LTWMF will also be subject to measures provided for under the safeguards agreements for the IAEA to verify the absence of undeclared nuclear activities and materials.

CNSC staff have concluded that the practical arrangements and the CNL's safeguards program will meet the safeguards obligations of the licensee with respect to this project.

3.2.4 Other PHAI-Related CNL Licences in Port Hope

In addition to the PHAI licences for the Port Hope Project and Port Granby Project, CNL holds two Designated Officer-issued licences as shown in table 1.

The purpose of both of these licences is for the interim management of LLW until the Port Hope LTWMF is ready to begin receiving wastes. The Pine Street Extension Temporary Storage Site continues to accept new wastes, as identified by CNL's Construction Monitoring Program (CMP), while the Port Hope Radioactive Waste Management Facility is not accepting any new wastes. Through the CMP, excavations in properties in the Municipality of Port Hope are monitored and if the presence of historical LLW is confirmed, the material is collected and safely transported to the Temporary Storage Site.

The materials stored under these licences are among the first in Port Hope that will be remediated, with work expected to begin in 2018. CNL may choose to keep the pads at the Pine Street Extension Temporary Storage Site open and active during wider remediation work in Port Hope, in order to support the Construction Monitoring Program.

The data from CNL's annual reports and the results of CNSC staff's most recent inspection of these sites (conducted in November 2017) leads CNSC staff to conclude that CNL continues to conduct activities at these sites safely, and in accordance with the requirements of its licences.

3.2.5 Public Information Program for PHAI

As per the licences for the Port Hope and Port Granby projects, CNL is required to have a public information program. CNL's public information program for the PHAI has been developed in accordance with CNSC regulatory guide RD/GD 99.3 *Public Information and Disclosure*, and allows members of the public to obtain information on all aspects of the PHAI, as well as ensuring appropriate disclosure following the occurrence of unplanned events. CNSC staff confirm through compliance activities that CNL has shown willingness to share project-related information freely with interested parties and taken proactive steps to build positive relationships with stakeholders. In May 2018, the CNSC published REGDOC-3.2.1 *Public Information and Disclosure* and CNSC staff will ensure that this updated standard is included in the LCHs for the Port Hope and Port Granby projects in the coming months.

A primary information source for the public is the Project Information Exchange (PIE) located at the PHAI management office at 115 Toronto Road in Port Hope, Ontario, where members of the public can obtain documents or speak directly to CNL staff about the projects, including plans for the remediation of their properties. CNL's website for the PHAI also provides interested parties up-to-date information on current project activities. CNSC staff have observed that CNL also engages the public through opinion surveys, presentations, information sessions, newsletters, resident notifications, site tours, open houses, Indigenous engagement sessions, citizen liaison groups, etc.

CNL informs CNSC staff of the dates of its meetings in the community, and CNSC staff have participated in the past to answer questions about the CNSC's mandate and role in regulating the PHAI. CNSC staff have also participated in community events such as the "Port Hope & District Agricultural Society Fair" in the past, and CNSC staff meet bilaterally with the Municipality of Port Hope on an as-needed basis. Given that both the Port Hope and Port Granby projects are currently in extremely active phases, a CNSC inspector has been seconded to live in the area, to allow a more flexible approach to CNSC staff's compliance verification activities. This staff member will be able to carry out more frequent and smaller-scale compliance activities which are adapted to CNL's current project activities, and will allow CNSC staff to be more engaged in community activities.

Evolution of Citizen Liaison Groups

Since 2013, CNL has maintained a Citizen Liaison Group (CLG) for each project. CLG meetings provide a mechanism for CNL to provide information and updates directly to local residents and also receive important feedback from the community.

Up to 2018, the CLGs met four times per year. Beginning in 2018, CNL has changed the frequency of CLG meetings for the Port Granby Project to twice annually. This reduced frequency is reflective of the fact that the Port Granby Project is nearing completion. CNL is also transitioning the Port Hope CLG away from a fixed-membership model to several new approaches designed to encourage participation from members of the community from areas in which remediation work is currently underway.

CNSC staff confirm that these updated strategies and approaches meet the objectives of REGDOC-3.2.1 and demonstrate that CNL is proactive in ensuring the Port Hope and Port Granby communities are in possession of up-to-date information on the PHAI.

Indigenous Engagement

CNSC staff confirm that CNL holds an information session for Indigenous groups that have expressed interest in the projects on an annual basis. The most recent session was held in June 2017, and was attended by Curve Lake First Nation, Hiawatha First Nation, Mississaugas of Scugog Island First Nation, and Alderville First Nation. As part of their public disclosure program, CNSC staff confirm that CNL provided updates on both the Port Granby and Port Hope Projects, with a focus on remediation at the Port Hope Waterfront, followed by a walking tour of waterfront sites.

4 OVERALL CONCLUSIONS

Through site inspections and desktop verifications, CNSC staff conclude that CNL is maintaining and operating the various facilities covered by this report in accordance with the requirements of the NSCA, CNSC Regulations and the terms of the applicable licences.

Since the last reports to the Commission on these licensed activities, CNL is making progress on the decommissioning of Whiteshell Laboratories in accordance with their approved decommissioning plans, and has made significant progress in the Port Hope Project and Port Granby Projects.

CNSC staff continue to provide oversight and monitoring of CNL’s adherence with regulatory requirements. Given the increasing activity at many of these sites, CNSC staff intend to provide another progress update to the Commission on these projects every two years.

CNSC staff conclude that:

- CNL is maintaining Douglas Point, Gentilly-1, Nuclear Power Demonstration and the Whiteshell Laboratories safely and in compliance with the requirements of the NSCA, CNSC Regulations and its licences.
- CNL is making progress on the decommissioning of Whiteshell Laboratories in accordance with their approved decommissioning plans.
- CNL is carrying out work under the Port Hope Area Initiative safely and in compliance with the requirements of the NSCA, CNSC Regulations and its licences.

LIST OF ACRONYMS

AECL	Atomic Energy of Canada Limited
CEAA	*Canadian Environmental Assessment Act*
CLG	Citizen Liaison Group
CNL	Canadian Nuclear Laboratories
CNSC	Canadian Nuclear Safety Commission
CRL	Chalk River Laboratories
CMD	Commission Member Document
CMP	Construction Monitoring Program
DDP	Detailed Decommissioning Plans

A.1 Waste Inventory Information[2]

Location	Classification of Waste	Description of Waste	Storage Method	Number of Bundles or Volume	Activity (TBq)
Douglas Point	High-level waste	Used nuclear fuel	Dry storage in concrete canisters	22,252 bundles	N/A
	Intermediate-level waste	Waste from reactor decommissioning	Reactor building	60 m^3	N/A
	Low-level waste	Contaminated soils	205-litre drums	66 m^3	N/A
	Low-level waste	Waste from reactor decommissioning	Reactor building	35 m^3	<1
Gentilly-1	High-level waste	Used nuclear fuel	Dry storage in concrete canisters	3,213 bundles	N/A
	Intermediate-level waste	Waste from reactor decommissioning	Reactor building	58 m^3	<1
	Low-level waste	Contaminated soils	205-litre drums	1 m^3	N/A
	Low-level waste	Waste from reactor decommissioning	Reactor building	607 m^3	N/A
Nuclear Power Demonstration	Low-level waste	Waste from reactor decommissioning	Reactor building	12 m^3	<1
Whiteshell Laboratories	High-level waste	Used nuclear fuel	Dry storage in concrete canisters	2,268 bundles	N/A
	Intermediate-level waste	Research reactor waste and waste from reactor decommissioning	In-ground concrete bunkers	863 m^3	2,794
	Intermediate-level waste	Waste from decommissioning activities	In-ground concrete bunkers	22 m^3	148
	Low-level waste	Research reactor waste and waste from reactor decommissioning	Above-ground concrete bunkers	19,700 m^3	325
	Low-level waste	Waste from decommissioning activities	Above-ground concrete bunkers	1,598 m^3	6
Port Hope	Low-level waste	Contaminated soils	*In-situ* and consolidated storage	720,000 m^3	N/A
Port Granby	Low-level waste	Waste and contaminated soils	Trench burial	438,200 m^3	N/A

[2] Waste inventory information from the *Canadian National Report For The Joint Convention On The Safety Of Spent Fuel Management And The Safety Of Radioactive Waste Management*, October 2017. Some radioactive waste at the NPD site is included in the CRL inventory as shown in Table D.5 of that report. The volume of LLW at Port Granby has increased over original estimates and will be larger than shown here.

A.2 Effluent Quality at the Port Granby Waste Water Treatment Plant

Parameter	Units	Maximum Weekly Results January 2018	February 2018	March 2018	Weekly Action Levels	Weekly Release Limits	Monthly Release Limits

Section **Page**

1. Introduction

Canadian Nuclear Laboratories Ltd. (CNL) has a management system comprised of an integrated set of documented policies, expectations, standards, procedures and responsibilities through which CNL is governed and managed, from the setting of direction through to day-to-day operations, all within a coherent control and accountability framework.

CNL's integrated management system demonstrates and documents commitment to maintaining a high-level of quality, strong customer service, and excellence in management within an environment that has safety as a first priority, is focused on the customers, and fosters continual improvement.

The management system provides the framework of processes, procedures and practices used to ensure that CNL can fulfill all tasks required to achieve our objectives safely and consistently. This foundational framework delivers quality in research & development; design engineering; procurement; manufacturing; qualification testing; construction; commissioning; operations; decommissioning; demolition; waste management; inspection; maintenance and plant life management; and project management; for nuclear power plants, research reactors, nuclear/non-nuclear facilities and installations.

A core prerequisite for CNL's success in consistently bringing high value to its customers and stakeholders is the effective and efficient governance and management. CNL is committed to excellence in management, thereby providing the foundation on which the Company and our employees can thrive.

1.1 Purpose

The CNL Management System Manual (Manual) sets the framework of policies, processes, and practices used to ensure that CNL can fulfill our mission and achieve our objectives. The top-tier reference document is this Manual. The Manual is complemented by learning materials, tools, and web-based products, which are accessible through the CNL intranet and Learning Management System. The Manual describes the relevant statutory, regulatory, contractual, and corporate frameworks within which CNL exists and operates. CNL's Management System is based on and complies to the requirements of CSA N286-12, ISO 9001:2015 and ISO 14001:2015; details of additional requirements informing the management system are identified in *Codes, Regulations, Standards, and Other Documents* [1].

1.2 Scope

The management system applies to all CNL management and execution activities. Management activities include setting expectations, enabling, planning and budgeting, and assessing all aspects of business, thereby ensuring delivery against commitments within appropriate accountabilities and controls. Execution activities include the safe, effective, and efficient conduct of work across all CNL lines of business.

The management system applies to all work performed by CNL employees, contractors and sub-contractors, as well as third parties engaged through external partnerships or collaborations that perform work for and/or on behalf of CNL. It is expected that they are trained and competent, and have sufficient knowledge of the management system in order to conduct work according to CNL's expectations and requirements as reflected in policies and procedures. For more specific information regarding contractors and sub-contracts see *Supply Chain* [2].

CNL is comprised of organizational units at the following sites across several provinces of Canada:

- Chalk River Laboratories and Deep River offices (Chalk River and Deep River, Ontario);
- Historic Waste Program Management Office (Port Hope, Ontario);
- Nuclear Power Demonstration Reactor Waste Facility (Rolphton, Ontario);
- Douglas Point Waste Facility (Tiverton, Ontario);
- CNL Ottawa Office, (Ottawa, Ontario);
- Whiteshell Laboratories, (Pinawa, Manitoba);
- CNL Site Offices (Fredericton, New Brunswick);
- La Prade Heavy Water Storage Facility (Bécancour, Québec); and
- Gentilly-1 Waste Facility (Bécancour, Québec).

1.3 Principles

The CNL management system ensures that the following principles, as provided in Canadian Standards Association standard, *Management System Requirements for Nuclear facilities* [3], are applied and considered when executing all CNL work:

- Safety is the paramount consideration guiding decisions and actions;
- The business is defined, planned, and controlled;
- The organization is defined and understood;
- Resources are managed;
- Communication is effective;
- Information is managed;
- Work is managed;
- Problems are identified and resolved;
- Changes are controlled;
- Assessments are performed;
- Experience is sought, shared, and used; and
- The management system is continually improved.

2. Corporate Profile- Who We Are

2.1 Purpose

Advancing nuclear science and technology for a clean and secure world.

2.2 Vision 2030

At the heart of Vision 2030 is more than 70 years of pioneering research in nuclear science and technology. In planning its future, CNL has developed a strategy that harnesses this expertise, and realigns our priorities to match real-world opportunities. At CNL, we fulfill three strategic priorities on behalf of the Government of Canada – restoring and protecting the environment, clean energy for today and tomorrow, and contributing to the health of Canadians. That work is critically important to the future of this country, and to the health and well-being of Canadian citizens.

To achieve success in our current priorities for energy, health and environment, we work with our partners by applying CNL's world-class capability in managing the full-life cycle of nuclear materials. We underpin our core capability by integrating across a wide range of scientific and technical disciplines that include materials science, engineering, process modelling, robotics, artificial intelligence (AI), cyber security, biology, environmental science, and detection and forensics. Recognizing that science and technology are not static we continually invest in expanding and modernizing our capabilities while also exploring their application to new and emergent problem sets that are important to the safety and prosperity of Canadians.

Vision 2030 is enabled through a revitalized Chalk River Laboratories. The campus is being carefully restored through an integrated strategy of facility decommissioning and waste disposal, which are, in turn, coupled with the construction of new state-of–the-art research facilities. The decommissioning and waste disposal activities improve accessibility to the site and ensure the protection of the environment, our workforce and the public. These activities also create the space needed to accommodate cutting-edge research facilities and provide CNL with the necessary waste management, disposal and processing facilities to enable its scientific missions into the future. This process of renewal also extends to CNL's people. CNL has transformed its workplace policies and organizational structure to establish an innovative work environment that embraces flexibility. These changes will not only improve how our employees interact with one another, collaborate and innovate as a company – both in-person and remotely – but they will revitalize the tools, technologies and environment that we use to do so.

2.3 Mission

We will provide the world with sustainable energy solutions, including the extension of reactor operating lifetimes, hydrogen energy technologies and fuel development for the reactor designs of tomorrow.

We will restore and protect Canada's environment by reducing and effectively managing nuclear liabilities.

Together with partners, we will demonstrate the commercial viability of advanced reactor designs, including small modular reactors.

We will work collaboratively with medical/educational institutions and pharmaceutical companies to pioneer new Alpha therapies for cancer treatments that save countless lives.

We will leverage all of our capabilities for commercial success in Canadian and international markets.

2.4 Core Values- What We Believe In

An integrated framework of values set out the ethical standards, behaviours and foundations expected of every employee across the company. These values inform CNL's policies, processes, and practices, the conduct of work, and the professional conduct of all.

Safety - Safety is freedom from harm, danger, injury or loss to people and the environment. It is the foundation on which our decision-making stands. It is our primary focus, with no compromise.

Teamwork - Teamwork is the ability to work together, in a collaborative way, toward a common goal.

Accountability - Accountability is both an attitude and a set of actions that affect how we impact people, situations and results in a positive way.

Integrity - Integrity is adhering to high ethical standards and strong moral principles, even under pressure.

Respect - Respect is placing a high value on others, treating them fairly, and empathizing with their needs. It is the foundation of building relationships and trust.

Excellence - Excellence is striving to achieve an ever-rising standard of quality through continual improvement and innovation.

2.5 Vivid Description

CNL stands proud as a global leader advancing nuclear science and technology. The world comes to CNL to solve the toughest technological challenges. CNL has the most effective industrial partnerships of any national laboratory. Our campuses are home to a vibrant community of the world's brightest innovators. Our people know they are making a difference in the lives of people around the world. CNL is valued by the Canadian government and customers in industry.

2.6 Corporate Policies

CNL's corporate policies provide intentions and expectations to management and employees that inform all that we do and how we do it. The following corporate policies have been authorized by the Board of Directors and approved by the President and Chief Executive Officer (CEO).

Table 1: Corporate Policies

Corporate Policy	Functional Support Area
Nuclear Safety [4]	Conduct of Operations
Safety and Health [5]	Occupational Safety & Health
Environment [6]	Environmental Protection
Ethics and Business Conduct [7]	Legal Services
Quality [8]	Quality
People [9]	Human Resources
Security [10]	Security
Supply Chain [11]	Supply Chain
Asset Management [12]	Property (Asset) Management
Intellectual Property [13]	Legal Services

2.7 Strategic Overview and Funding

CNL is Canada's premier nuclear science and technology organization. CNL delivers science and technology solutions to meet current, and future, Canadian Government, public, and private commercial priorities in four program areas: Energy, Health, Environment, and Safety & Security. CNL is transforming its Chalk River Laboratories (CRL) through the revitalization of essential site infrastructure, the decommissioning of aging infrastructure, and a significant investment in new, world-class science facilities. This transformation will position CNL to remain a leader in developing peaceful and innovative solutions.

To achieve the strategic objective of a world-class, sustainable national nuclear laboratory, CNL will continue to transform into a high performing organization. CNL will build upon existing strengths, continuously improve delivery, and pursue new capabilities in response to Canada's and the world's challenges. Our diversified workforce will enable the safe and efficient execution of the missions in a constantly changing, competitive world. Further details can be found in *10-Year Integrated Plan Summary 2020-2030* [14].

2.7.1 Environmental Remediation Management

The Environmental Remediation Management mission supports a commitment to a clean and healthy environment for Canadians. Innovative technologies, modern facilities and technical expertise are provided in support of the safe storage and long-term management of radioactive waste. Redundant buildings and infrastructure are decommissioned in a prioritized manner reducing the legacy liability and associated risks and site operating costs. Environmental remediation processes apply systematic risk assessments, based on sound science and remediation solutions that help ensure all activities are protective of the environment and human health. Activities focus on addressing and managing health, safety, security, environment and quality risks.

2.7.2 Science and Technology

CNL is known and respected nationally and internationally for its scientific capabilities, which are used to progress Science and Technology (S&T) priorities. The expertise of staff, when coupled with our unique S&T facilities, positions CNL well to meet customers' current and emerging needs. CNL has been able to meet the needs of customers through collaborations with national and international companies and universities. CNL's reputation is a significant factor for attracting commercial customers who recognize that we can solve industry's toughest challenges.

Additionally, CNL is performing a broad program of work aimed at meeting the nuclear S&T needs of federal government departments and maintaining nuclear S&T capabilities. Under this program, CNL serves both individual federal departments and agencies and, as a whole, national priorities that meet the needs of Canadian citizens.

Alignment of this mission with federal needs is further enhanced through the recent establishment of the Federal Nuclear S&T Interdepartmental Committee that oversees the federally-funded S&T program.

2.7.3 Capital

As Canada's premier nuclear laboratories, infrastructure is being modernized and capabilities enhanced to provide vibrant, safe, and world class nuclear S&T facilities and supporting infrastructure that will support Canada's needs well into the future. Currently, priority is given to infrastructure upgrades that address immediate safety, environmental and regulatory requirements, and to new projects that will provide a high return on investment. These early investments at CNL's site at Chalk River will enable implementation of new infrastructure projects that will further enhance CNL's capabilities.

Chalk River Laboratories (CRL) assets include more than 50 unique facilities and laboratories. These facilities are enabled by radioactive material handling, processing and storage facilities; conventional municipal infrastructure as well as maintenance, manufacturing and engineering programs tailored to CNL's diverse needs.

2.7.4 General Services

CNL's General Services create the conditions that are required to achieve strong organizational performance, and management excellence in the delivery of effective programs and services. CNL's General Services include the programs and activities capturing corporate governance and management oversight, in Health, Safety, Security, and Environment (HSSE), Central Technical Authority, Business Management, Human Resources, Legal, Corporate Affairs, Infrastructure Development Group, and Business Development.

3. Corporate Governance- How We Are Controlled

CNL is a private corporation that exists for the purpose of performing work and other obligations under contract to Atomic Energy of Canada Limited (AECL). CNL's shares are wholly owned by Canadian National Energy Alliance Limited (CNEA) as part of a Government Owner Contractor Operated arrangement. CNL is obliged to operate lawfully as a Canadian corporation; comply with applicable licenses, registrations, certificates and permits; submit to the governance of the shareholder (CNEA), and fulfill obligations to AECL under the Prime Contracts.

The Corporate Governance Model is depicted in Figure 1: CNL Corporate Governance Model. Board of Directors membership is documented in an organizational chart (available on CNL intranet).

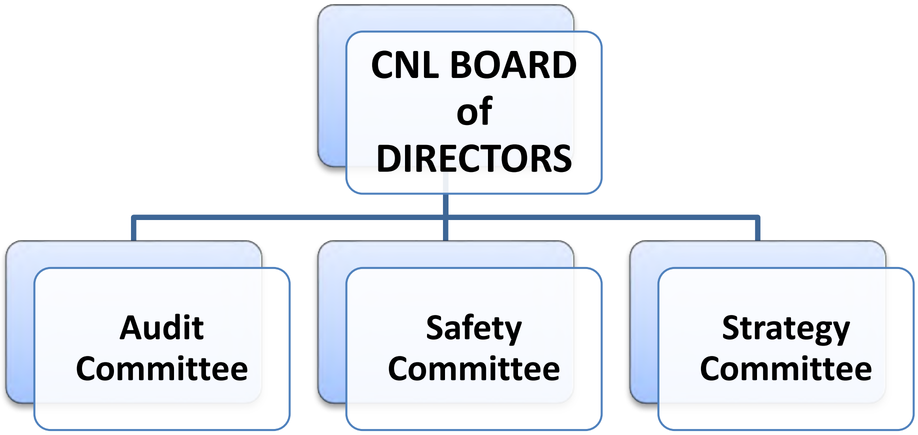

Figure 1: CNL Corporate Governance Model

The Board governance model provides active assurance to CNEA of the performance of CNL and is consistent with the requirements of the *CNEA Shareholder Declaration* [15]. The CNEA Board appoints from its members the Chair and two Directors of the CNL Board of Directors. This provides CNEA with direct involvement at the Board level of CNL. CNEA also appoints the directors, officers, and specific management positions of CNL. The CNL President & CEO and Chief Financial Officer (CFO) attend the CNEA Board meetings and report matters of interest to the Board, such as corporate performance and progress against the Annual Program of Work and Budget (APWB).

3.1 Integrated Decision Making

Without exercising any element of control in relation to the discharge of CNL's obligations as a nuclear site licence holder, the *CNEA Shareholder Declaration* [15] identifies:

- Those matters which the CNL Board of Directors need to refer to the CNEA Board for approval including those decisions to be taken unanimously by the CNEA Board; and
- Those decisions that are reserved to the CNEA Shareholders themselves.

This mechanism provides transparency, oversight and an integrated flow of information to the shareholder.

3.2 Contract and Corporate Governance

The CNL governance model is principally contained in the following documents:

- CNEA Governance: The *CNEA Shareholder Declaration* [15];
- The Prime Contracts [16], [17], [18], [19]; and

- CNL Governance: The constating documents, including Articles of incorporation and CNL By Law 1 and the Terms of Reference of the CNL Board of Directors [20] and Committees of the Board [21], [22], [23].

3.3 Licences and Regulatory Governance

CNL operates in a highly regulated environment, particularly with respect to its licensed nuclear activities. External regulators grant CNL licences that authorize the licence holder to undertake certain activities in accordance with defined expectations. These licences define reporting accountabilities and subject CNL to periodic regulatory inspections to confirm compliance with conditions imposed by the licence. These include the following licensed nuclear activities and are documented in *Site Licences, Certificates, Permits, Building/Facility Contacts, & Licence Representatives* [24], and authorized by the Canadian Nuclear Safety Commission (CNSC):

- Operate, wholly or in part, any nuclear facility;
- Maintain in storage with surveillance any nuclear facility, or any parts thereof;
- Decommission any nuclear facility, or any parts thereof;
- Construct, modify or abandon any nuclear facility;
- Produce, possess, process, refine, transfer, use, package, manage, store, dispose or abandon nuclear substances;
- Produce, possess, use, service, transfer or abandon prescribed equipment;
- Possess, use, transfer or abandon prescribed information;
- Operate dosimetry services;
- Export and import nuclear substances and prescribed equipment and information;
- Process, store or dispose of waste received from off-site clients; and
- Receive, repair, modify, store and return contaminated equipment from off-site clients.

A list of other Regulatory drivers can be found in *Codes, Regulations, Standards, and Other Documents* [1]. Licensing support and general regulatory compliance oversight of Canadian Nuclear Safety Commission (CNSC), Technical Standards and Safety Authority (TSSA), Environment and Climate Change Canada (ECCC), and Employment and Social Development Canada (ESDC) are managed according to the processes documented in *Compliance* [25].

4. Organizational Structure- How We Are Structured

CNL's organizational structure is approved by the CNL Board of Directors on recommendation of CNL's President & CEO. Responsibility for the management and operations of each element of its structure is assigned to executives and senior management reporting to the President & CEO. CNL's current organizational structure is depicted in Figure 2.

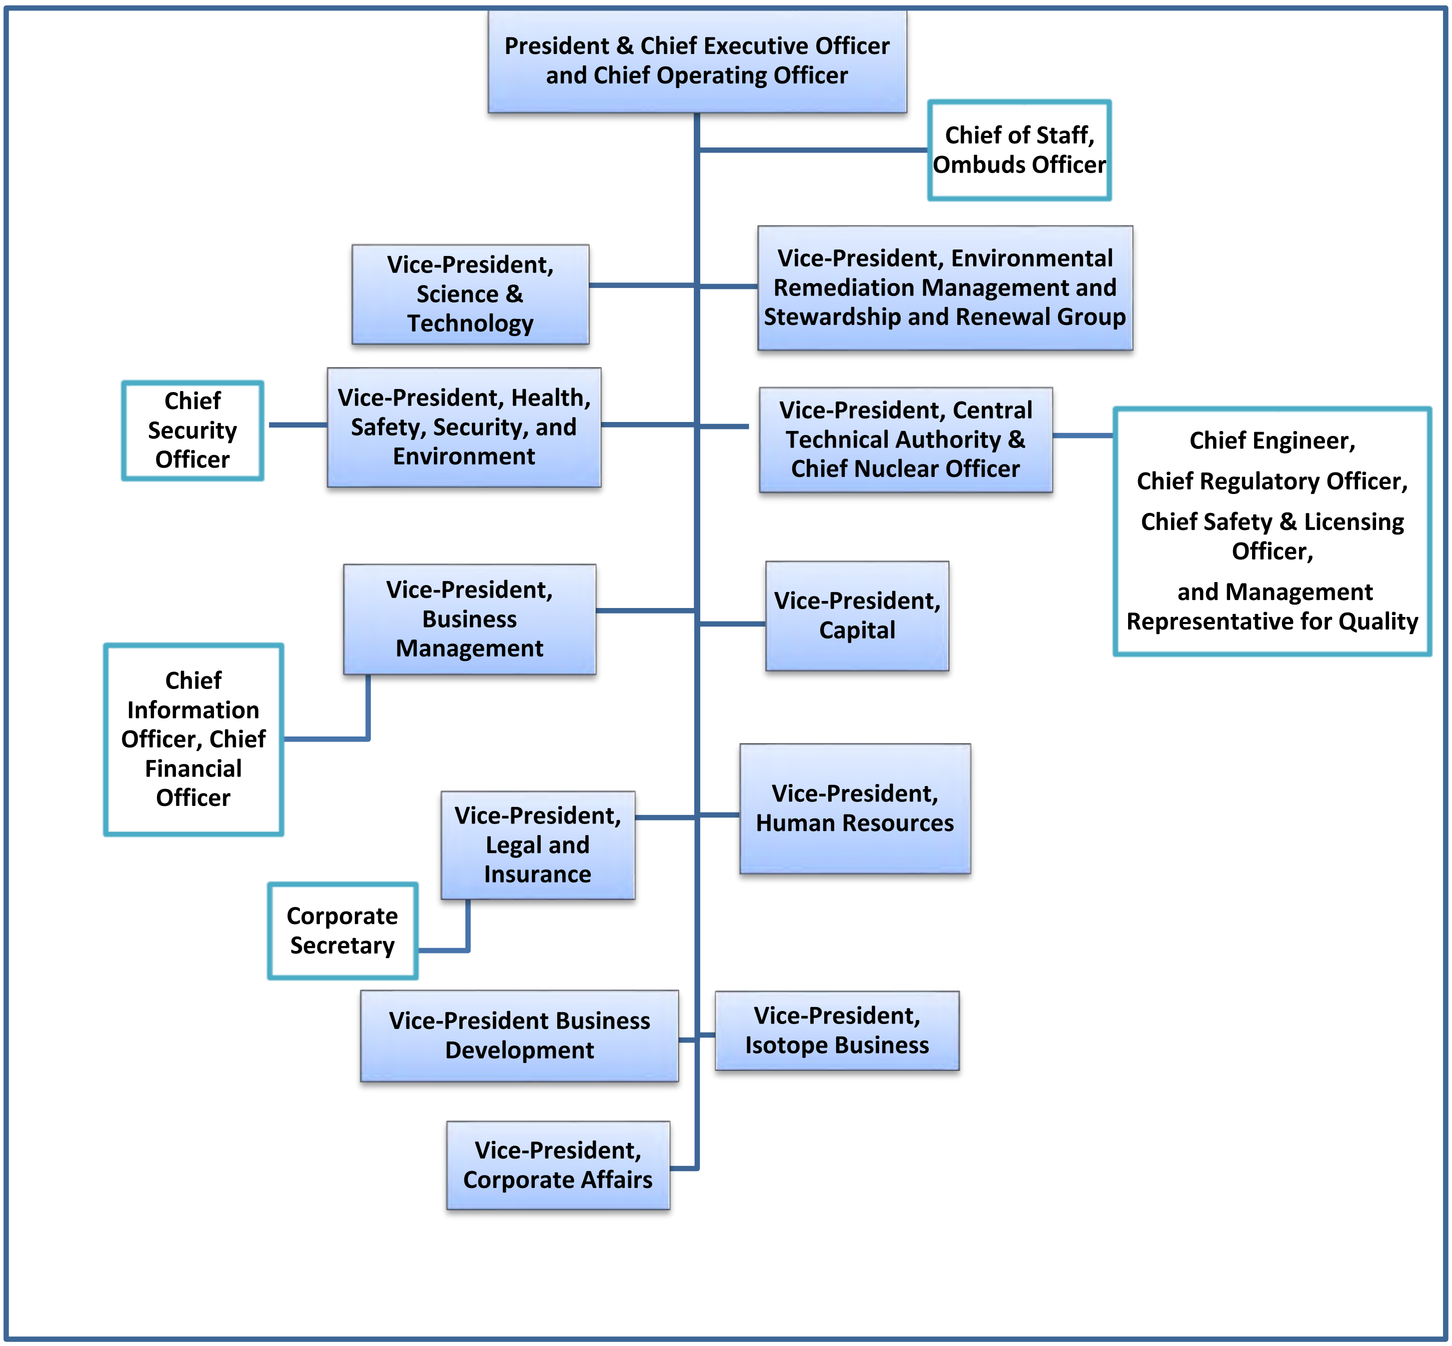

Figure 2: CNL Executive Team and Corporate Functional Authorities

Each member of CNL's Executive Team is accountable to the President & CEO for specific areas of CNL business and operations as recorded in Appendix A, individual position descriptions and current assignments are tracked in *Functional Authorities* [26].

CNL's organizational structure combines line management and functional authority designed to deliver work safely, ethically, and in compliance with requirements and in pursuit of achieving company goals.

All of CNL resources are assigned primarily as line management. Line management is any management level within the organization, which is responsible and accountable for directing and conducting work. The line management structure consists of the following hierarchical levels:

- Company: CNL as an entity comprised of all organizational units, divisions and departments. The President & CEO is responsible for the Company.
- Organizational Unit: The 2nd level within CNL's hierarchical structure. A Vice-President is responsible for the management of an organizational unit. An organizational unit is made-up of departments.
- Department: Sub-structures within an organization unit.

The line management structure is controlled, subject to *Organizational Change Control* [27], to ensure that any organizational changes are evaluated for impacts to CNL and is reflected in Appendix A.

A selected group of individuals are then, in addition to their line management role, assigned a functional authority role. A corporate functional authority spans horizontally across all organizations, and is an authority assigned by the President & CEO. This authority, operating on behalf of the President & CEO, includes providing associated direction and guidance, assessing whether activities meet expectations, and identifying gaps requiring further action.

Functional authorities have responsibility for defining, interpreting, and maintaining functional requirements, ensuring implementation of requirements are consistent company-wide, and for supporting line management in their implementation.

The functional authority structure is controlled, subject to *Functional Requirements and Framework Management* [28] to ensure that any changes are evaluated for impacts to CNL and reflected in Appendix B (which describes the functional authority structure), and *Functional Authorities* [26] (which describes the role assignment).

Figure 3 depicts how line management and functional authority interact.

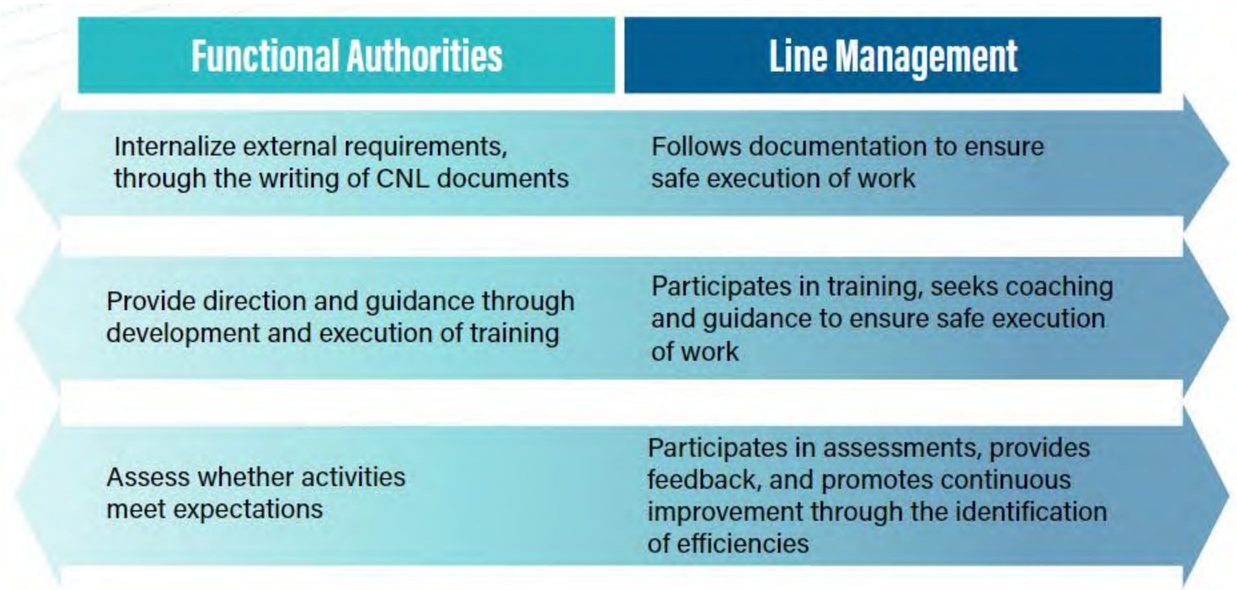

Figure 3: Examples of Interface between Line Management and Functional Authority

4.1 Line Management Structure

Line management consists of the CNL President & CEO, Line Management Executives, Department Managers, and First Line Supervisors.

4.1.1 Line Management Executives

Line Management Executives include job titles such as Vice-Presidents and Deputy Vice-Presidents. A Line Management Executive is assigned to organizational units as directed by the President & CEO. Line Management Executives are responsible for selecting and prioritizing projects within their assignments, defining the scope, establishing priorities, and requesting the funding to accomplish the scope in a safe, secure, cost effective, and compliant manner. In this capacity, Line Management Executives are responsible to:

- Be accountable and responsive to the President & CEO and CNL Board of Directors;
- Be appropriately knowledgeable of CNL's requirements, policies, processes, and practices;
- Support the company vision, strategic outcome and actions as defined in the 10 Year Strategic Plan;
- Establish an effective, balanced and transparent oversight framework to provide line of sight to important and emergent issues;
- Intervene to manage risks in their area of responsibility;
- Act as a role model for leadership and management excellence consistent with management system expectations;

- Provide strategic direction, leadership, and support to staff;
- Manage the assets, capabilities and human resources within their respective organizational unit;
- Contribute to the development and continual improvement of CNL's management system;
- Maintain effective communications and working relationships with all levels of line management and functional authority;
- Ensure, and take full accountability for, compliance with CNL policies and procedures and required legislations;
- Safely and compliantly complete activities within the approved scope, schedule, and budget;
- Ensure consideration for functional resource needs when establishing or changing budgets;
- Act as safety champions encouraging worker involvement in company safety programs;
- Ensure excellence in project team communication;
- Establish and maintain detailed work plans and the lifecycle baseline;
- Contribute to maximum operating efficiency through effective financial planning and monitoring, and the resolution of departmental issues to ensure responsible fiscal stewardship;
- Review and approve business cases for staff hiring, equipment, and facilities within the bounds of the budget;
- Support and maintain positive interactions with customers, stakeholders, and the public;
- Support and participate in continuous improvement and corrective action initiatives;
- Obtain and integrate feedback from employees concerning quality, health, safety, and environmental issues into facility and company lessons learned;
- Ensure that employees under their direction have requisite training and access to professional development opportunities consistent with corporate objectives and management system expectations;
- Ensure defined roles, responsibilities, and oversight are provided for workers;
- Functionally accountable to the Site Licence Holder for ensuring safety and compliance with all applicable codes, standards, legislation, regulations and site licence conditions when assigned responsibilities that directly or indirectly impact or involve the

management and/or execution of licensed activities. This includes the operation, maintenance and use of nuclear facilities, radioisotope laboratories and supporting facilities, as well as the provision of supporting corporate services;

- Support and implement assessment plans to evaluate implementation of programs appropriate to the projects; and
- Utilize appropriate project metrics to monitor, evaluate, and improve area project performance.

4.1.2 Department Managers

Department Managers implement the CNL goals and expectations for achieving safe, compliant, and efficient operations. Department Managers encompasses titles such as General Manager, Head of Directorates, Director, and Manager. Department Managers are responsible for ensuring that work is performed safely by implementing and ensuring operations are conducted within CNL's requirements (such as safety basis, rules, regulations and permits) in their respective department and facilities.

Principal responsibilities of the Department Manager include:

- Ensure work, performed by CNL employee or contractors, is done safely within the assigned area of responsibility;
- Manage the assets, capabilities and human resources within their respective department;
- Understand the full scope of accountabilities, authorities, and the associated expectations;
- Ensure effective implementation of the management system, including consistent adherence to functional support area requirements and procedures across assigned area of responsibility;
- Ensure that equipment is safe, meets all regulatory requirements and is suitable for the work, and that all necessary periodic inspections have been undertaken prior to use;
- Ensure work is directed through the appropriate department;
- Develop integrated schedules to accomplish the work according to project priorities and resolve priority conflicts between sub-projects;
- Ensure work, including that of subcontractors, is defined, hazards identified and analysed, controls developed and implemented, work executed within controls, and feedback provided and used to continuously improve;
- Ensure that commitments related to work are maintained and communicated regularly;

- Ensure that operations are conducted in compliance with facility requirements such as the authorization basis, license-required conditions, and environmental regulations and permits;
- Communicate risks to employees and ensure that appropriate controls are in place to mitigate and protect the worker from harm;
- Ensure that investigations are held for unusual events and near misses so that feedback is given to workers and lessons learned are captured and shared;
- Actively participate or lead required investigations; document root causes and findings; and implement corrective actions in a timely manner, securing the needed budget and resources;
- Obtain feedback from employees concerning issues and incorporate into lessons learned;
- Actively promote and support process improvement initiatives;
- Perform periodic monitoring and self-assessment of work and take action as needed to address issues and correct nonconformities;
- Prepare and manage business/project plans and supporting scorecards and metrics;
- Support the accomplishment of work and remove unnecessary obstacles;
- Interface with matrixed and embedded personnel to ensure all requirements are met within assigned area of responsibility;
- Ensure that training requirements are defined and implemented for each employee and support training as necessary;
- Participate in integration discussions and activities—as a team effort—to enhance the effectiveness of the organizational structures and processes in support of CNL goals;
- Foster an environment of respect, diversity, equity and inclusion, and overall engagement;
- Demonstrate appropriate workplace behaviour aligned to the code of conduct and workplace values and managing complaints and resolutions;
- Demonstrate due diligence to applicable laws, regulations and changing mandates;
- Functionally accountable to the Site Licence Holder for ensuring safety and compliance with all applicable codes, standards, legislation, regulations and site licence conditions when assigned responsibilities that directly or indirectly impact or involve the management and/or execution of licensed activities. This includes the operation, maintenance and use of nuclear facilities, radioisotope laboratories and supporting facilities, as well as the provision of supporting corporate services;

- Identify resource needs, and obtain and manage resources to accomplish project milestones and objectives;
- Manage resources, including recruiting, assigning, redeploying, and terminating; and
- Manage the performance of their employees by:
    - Ensuring that their employees understand their responsibilities under the CNL management system;
    - Ensuring their employees have the requisite competence, objectivity, knowledge and training to safely and effectively exercise their assigned roles and responsibilities;
    - Setting and reinforcing expectations and managing employee performance;
    - Evaluating overall performance of employees, and providing timely performance feedback;
    - Managing hours of work and attendance requirements, taking into consideration remote working arrangements;
    - Respecting collective agreements and terms and conditions of employment;
    - Providing professional development opportunities as part of succession planning; and
    - Providing specific feedback and assessing employee performance against expectations to develop and sustain performance.

4.1.3 First Line Supervisors

First Line Supervisors include titles such as Shift Supervisors, Foreperson, and Facility Managers. First Line Supervisors have direct authority over other workers or a specific work location. First Line Supervisors have the following responsibilities:

- Exercise departmental authorities that have been delegated to them;
- Carry out their activities with due regard for all areas of authority and any corresponding direction;
- Conduct all work consistently with CNL's processes and procedures;
- Promote safety as a priority throughout all work activities;
- Provide daily instruction and direction to workers;
- Serve as role models for employees under their supervision;
- Encourage workers to report violations, wrongdoings, and issues; and
- Resolve issues as they arise or escalate to departmental management for resolution.

4.1.4 Employees

In addition to items listed in sections 4.1.1, 4.1.2, and 4.1.3, Line Management Executives, Department Managers, and First Line Supervisors are also Employees and this section is applicable to them. All Employees are accountable to their management and supervision for the following:

- Perform duties safely, and to the expected level of quality, in accordance with instructions and training;
- Know their individual responsibilities and their employment expectations;
- Know and abide by requirements that include the Code of Conduct, workplace values how to work safely, rules regarding leave, procedures, and reporting;
- Know their collective agreements, if applicable;
- Monitor their employment information and immediately report changes, errors or concerns including personal information (e.g., pay matches salary, leave matches entitlement);
- Be compliant with all required training and attend training as scheduled;
- Support, operate, and maintain nuclear and non-nuclear facilities with a profound respect for safety and with an over-arching charge to preserve the health and safety of the general public and fellow employees as well as the environment;
- Adhere to CNL management system policies, process requirements and procedures, including safety protocols, in all activities;
- Report problems, deficiencies, incidents, accidents, and unsafe conditions immediately to supervisor or manager;
- Cooperate with investigations and with company processes;
- Understand their specific role and how it aligns with the overall mission;
- Understand how performance will be measured and expect and solicit feedback;
- Actively participate in the effort to develop and improve skills and performance;
- Carry out their duties ethically and with integrity, consistent with corporate policies; and
- Safeguard company information and assets.

4.2 Functional Authority Structure

The functional authority structure consists of Responsible Executives, Functional Support Managers, and Functional Support Manager Designates as listed in *Functional Authorities* [26].

4.2.1 Responsible Executives

Responsible Executives are appointed by, and accountable to, the President & CEO and are responsible for one or more Functional Support Area(s). Responsible Executives also identify Functional Support Managers and Functional Support Manager Designate(s) as needed to manage Functional Support Areas.

The role of the Responsible Executive is to ensure that the Functional Support Areas within their scope, meets external requirements; protects workers, the public, and the environment; and adequately addresses other vulnerabilities (e.g., financial, legal, reputational, or security). Responsible Executives ensure implementation of requirements of CNL as described in Program Requirements Documents for the Functional Support Area(s) within their scope.

Principal responsibilities common to all Responsible Executives include:

- Define and serve as ultimate CNL authority for applicable requirements for their grouping of Functional Support Areas;
- Approve any changes affecting the composition of the Functional Support Area(s) such as transfer or creation of new Functional Support Areas; and assignment or re-assignment of Functional Support Managers and Functional Support Manager Designate(s) (as per *Functional Requirements and Framework Management* [28] and *Authority Management* [29]);
- Establish programs and maintain effective systems, policies, and procedures in the assigned Functional Support Area(s);
- Ensure that commitments related to CNL projects are maintained and the status of the commitments is communicated regularly to employees;
- Promote a positive, collaborative work environment;
- Ensure effective and consistent implementation of functional programs across CNL;
- Interface with line management to improve processes through application of lessons learned and feedback;
- Ensure that assigned functional support workers are trained and qualified to perform their scope;
- Develop and implement a programmatic assessment plan to evaluate implementation of program elements in accordance with *Integrated Assessment Plan* [30];
- Perform assessments and oversight as per management review [31];
- Provide initiatives as part of continuous improvement; and
- Oversee and ensure compliance within other Functional Support Areas to the CNL management system.

4.2.2 Functional Support Managers

Functional Support Managers (FSM) are appointed by, and accountable to, their respective Responsible Executive, and are the single point of contact for their individual area of responsibility. Functional Support Managers are the document owners for documents listed in their respective Governing Document Index (GDI) which implement the requirements of their specific Functional Support Area(s). Additional responsibilities of Functional Support Managers include:

- Ensure that applicable requirements are implemented in an appropriate implementing document;
- Act as final authority for interpretation and applicability of their functional requirements to line management;
- Perform applicability reviews on new and revised requirements, including identification of required resources, impacts, and implementation schedules and strategies;
- Establish and implement the discipline-specific technical attributes and training expectations for the training and qualification of affected personnel;
- Ensure that the quality of standard equipment, hardware, software, and documentation that is under the direct purview of the Functional Support Area meets company and facility requirements;
- Establish and maintain effective relationships and coordination of CNL interfaces with AECL, regulators, and oversight organizations;
- Maintain effective communication and working relationships with line management and other Functional Support Managers; and
- Develop and perform programmatic assessment plan in accordance with *Integrated Assessment Plan* [30], to evaluate implementation of program elements to verify that Functional Support Area requirements have been adequately implemented across CNL.

4.2.3 Functional Support Manager Designate(s)

Functional Support Manager Designate(s) are accountable to a Functional Support Manager. Responsibilities of Functional Support Manager Designate(s) include:

- Assist Functional Support Managers to fulfill responsibilities listed above;
- Maintain effective communication and working relationships with line management and other Functional Support Manager Designates;
- Interface with facilities, projects, and other support organizations to ensure that the quality of standard equipment, hardware, software, and documentation meets site and facility requirements;

- Maintain proficient knowledge of assigned Functional Support Area requirements;
- Provide support to line management by identifying and interpreting the Functional Support Area requirements in assigned laws and regulations, contract clauses and language, and other contractual language as they apply to current contract work scope;
- Develop and submit documentation for implementation of the requirements of assigned Functional Support Area;
- Support and monitor training and qualification programs to ensure that requirements are implemented effectively and workers are trained and qualified to perform work;
- Participate in operational readiness reviews, readiness assessments, management assessments, third party audits, or other assessments and reviews, as requested;
- Be familiar with events and issues within facilities, projects, and other support organizations, assisting in developing corrective plans and lessons learned; and
- Support Functional Support Area programmatic assessment plan to evaluate implementation of program elements.

4.3 Interfaces

4.3.1 Line Management and Line Management Interface

To achieve objectives, line management will utilize resources from other line management organizations. Assignment on temporary basis of the employees to the work can be managed utilizing a variety of existing processes that clarify agreement between the management teams on topics such as safety of workers, budget, scope, timecard approvals, and work assignment. Project execution plans [32] are utilized to cover programmatic responsibility for work authorization and execution, notification and reporting, emergency preparedness, scope of work, budget and document control. Meanwhile, *Integrated Work Control* [33] process is utilized to manage the same topics for activity specific field work, with the fundamental principle of the line management responsible for authorizing the work is also responsible for safety of the workers.

4.3.2 Line Management and Functional Authority Interface

The success of the CNL management system depends on the integration and collaboration between line management and functional authority counterparts. Both must work together to develop and implement processes and procedures for the safe, compliant, and efficient conduct of work. Figure 3 above illustrates this interface.

Specifically, the following general expectations must be met:

- Line personnel are accountable for safety. This includes accomplishing work in a safe and compliant manner and being responsive to / complying with functional authority direction and guidance.
- Functional personnel define, interpret, and maintain functional requirements that support line personnel in consistent implementation company-wide, while at the same time assessing whether activities are meeting those expectations.
- All personnel will adhere to processes and procedures as written.
- When revisions to procedures are needed, the document owner will engage all relevant stakeholders for review and comment. The document may not be issued until all comments have been resolved per the guidance in *Creation, Capture, and Use of Information Assets* [34].
- Both line and functional personnel work together as a team to resolve implementation issues as they arise and in a timely manner.
- If timely resolution cannot be achieved at the working level, the issue is escalated to management. If necessary, respective Responsible Executive and Line Management Executive may be requested to support resolution.
- Both line and functional personnel are held accountable for their role in safely accomplishing the missions of CNL.

4.3.3 Functional Support Personnel Embedded Versus Matrixed within Line Management Structure

Functional personnel can either be ‘embedded’ or ‘matrixed’ to a line management structure as shown in Figure 4.

The responsibilities of both embedded and matrixed functional personnel include:

- Interface with the appropriate corporate functional authority on lessons learned, process initiatives, and technical difficulties.
- Implement the training and qualification process required by the Functional Support Area for functional personnel.
- Participate in the assessment process to ensure effective implementation.
- Implement procedures from respective Functional Support Area associated with the assigned work.

When functional support personnel are matrixed to a line organization they report directly (or hard lined) to their functional authority, while reporting (or dotted lined) to line management in support of the work. Matrixed functional personnel work in areas such as occupational safety and health, radiation protection, supply chain, and quality, and are responsible for implementing functional requirements, in a support role for a line organization. Matrixed personnel report to the functional authority and are responsible to implement functional authority requirements and standards. The line organization provides work assignment direction to matrixed personnel to support achievement of mission objectives. Line management provides input to performance evaluations and job rotations which are led by functional authority.

When functional support personnel are embedded within a line management, they are part of the line management organization, and report directly (hard lined) to line management. Embedded functional support personnel work in areas such as engineering and maintenance. Line management directs the day-to-day work of embedded functional support personnel to support achievement of mission objectives. Functional authority provides technical direction, guidance and technical training for embedded functional support personnel to achieve mission objectives. Both the line management and the embedded functional personnel are required to comply with functional requirements specified in the management system by the functional authority. Functional authority provides input to performance evaluations and job rotation which are led by line management.

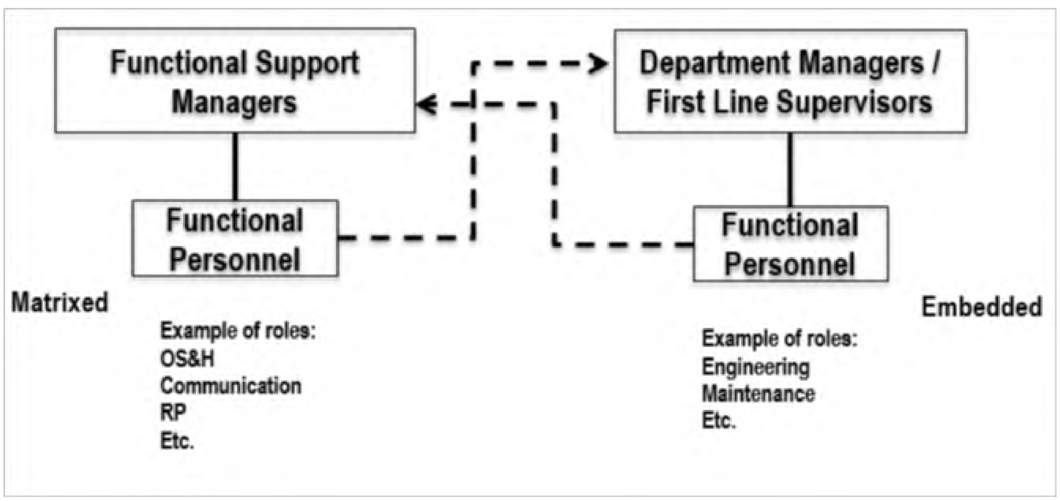

Figure 4: Reporting relationships of matrixed and embedded functional personnel

4.4 General Expectations

CNL recognizes leadership, safety, and collaborative teamwork expectations as important benchmarks to enable safety, execution, and innovation. The following behavioural expectations apply to all levels of CNL.

4.4.1 Leadership Expectations

The impact of management behavior on organizational performance is extensive. Compliance with CNL's *Code of Conduct* [35] is mandatory. The following leadership behaviors are critical to organizational success:

- Regularly communicate, model, and reinforce the CNL vision, values, standards, expectations, and strategies to align the organization to achieve excellence;
- Be visible, active, and engaged at job sites;
- Seek out and act on worker feedback;
- Demonstrate a firm and unwavering commitment to nuclear, radiological, industrial, and environmental safety; event-free conduct of work; and, effective emergency response;
- Demonstrate commitment to organizational learning and professional growth;
- Demonstrate a self-critical approach;
- Demonstrate a questioning attitude;
- Demonstrate ownership of requirements implementation;
- Demonstrate insistence on high standards;
- Hold themselves and employees accountable for performance; and
- Utilize employee recognition programs to increase desired behaviors.

4.4.2 Safety Expectations

Prevention of dangerous or hazardous situations and appropriate proactive strategies to positively impact and continuously improve all aspects of safety and health, are considered fundamental in everything CNL does. As such, the following safety behaviors are critical:

- Establish safety as an organizational value and a prerequisite for all work;
- Through processes such as assessment, worker feedback, and personal observation, ensure that a safe work environment is established and maintained;
- Take pre-emptive actions in response to degrading conditions. While prompt response to adverse occurrences and conditions is expected, management will ensure that processes such as critical assessment, performance metrics collection, and direct field observation of processes in progress, are available to aid in forming and executing pre-emptive actions; and
- Utilize response to adverse events for overall performance improvement. The emphasis in this response is on accurately determining causes, then properly responding, including response to underlying causes in management system processes. Management must ensure that adequate extent of condition considerations are utilized to preclude similar events elsewhere in the organization. Similarly, evaluation of information obtained from adverse events occurring in other organizations is required to preclude similar events.

4.4.3 Collaborative Teamwork

CNL promotes the overall successful accomplishment of mission objectives by sharing the same vision, trusting that all areas are capable of completing their portion of the mission, and being able to coordinate and communicate effectively across departments. The following behaviors are critical to ensuring that departmental goals align with the overall mission of CNL:

- Acknowledge collaboration as part of the value of teamwork and a prerequisite for all work;
- Actively sponsor teamwork and integration;
- Strive to eliminate the formation of silos within the organization;
- Encourage all departments to share information and knowledge to increase efficiency of the organization as a whole; and
- Promote a culture of coordination to achieve common goals for the organization.

4.5 Delegation of Authority

Authority may be delegated downward from the President & CEO, however, overall responsibility remains with the delegating individual. Accountability flows upwards from the working level to President & CEO. Authority is assigned throughout the CNL management system utilising management system documents such as job descriptions, controlled lists or processes like the *Financial Approvals and Delegation of Authority* standard [36]. The process for establishing or revoking temporary or permanent authority is in accordance with *Delegation of Authority* [37].

Those personnel with departmental or corporate functional authority may:

- Delegate to others the execution of duties associated with delegated authorities,
- Give direction on how those authorities are to be exercised, and;
- Hold delegates accountable for the exercise of these delegated authorities.

If delegation of authority is not documented/communicated, by default, authority will always revert upward.

5. Management System Document Hierarchy

CNL's document hierarchy is depicted in Figure 5 and is applicable company-wide. Site-specific nuisances related to scope or applicability of a process or document (based on graded approach or differing license conditions) is clearly defined within the applicable management system document. The management system documentation hierarchy cascades from the top downward. The Corporate Policies provide the direction and expectation to management and employees. The Manual defines the vision, mission, expectations, core values, roles, responsibilities, authorities, and accountabilities, the associated programs and processes, and interfaces.

Individual program description, requirements, and governing indices form the foundation of the management system internal control components and are referred to as "interpretation" documents.

The implementing documents flow from the interpretation documents. They describe the controlling activities required to implement the business processes and employees' day-to-day activities identifying the expectations and relevant procedural actions.

A complete list of functional areas and corresponding GDIs is available in *Functional Authorities* [26]. This document hierarchy serves to ensure that CNL policies and applicable program requirements are effectively implemented company-wide.

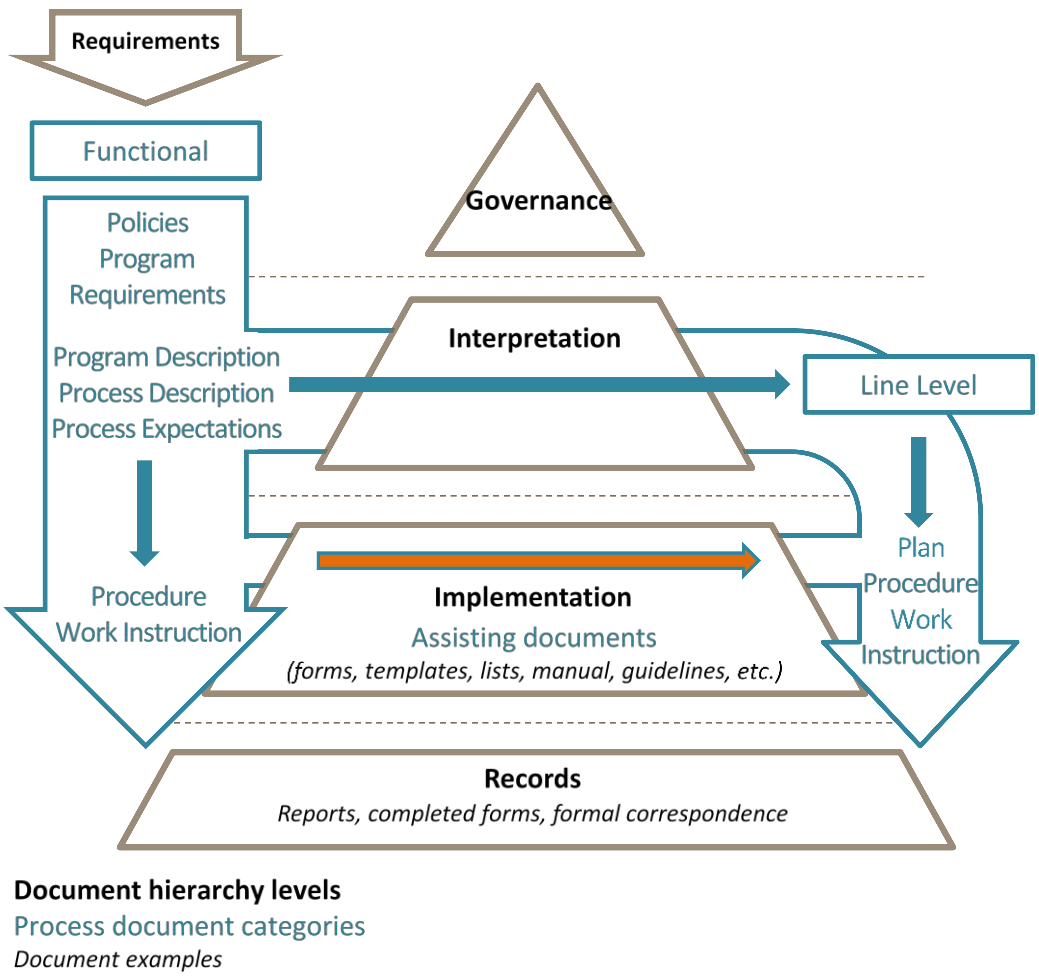

Figure 5: CNL Management System Document Hierarchy

These processes and procedures are concise, accessible, understood, and applied in a graded approach. The documents utilize best industry practices, leverage and integrate technology, and provide the basis for consistent implementation.

CNL's Management System is based on documentation, roles, responsibilities and authorities originated from CNL's predecessor AECL. Employees are responsible to ensure they are utilizing the most recent revision of implementing documents available within the electronic document records management system.

For more detailed information on the management system documentation hierarchy, see *Creation, Capture, and Use of Information Assets* [34].

6. Contractor Assurance System (CAS)

A *Contractor Assurance System* [38] is an integrated framework of assessment and oversight mechanisms employed to manage performance consistent with the Prime Contracts. It is used as a framework to assess performance, provide data to CNL's management decision-making process, and allows CNL to effectively manage processes, resources and outcomes. The system provides transparency between CNL, CNEA, and AECL to ensure alignment across the enterprise and to accomplish mission needs.

Integral elements of the CAS include assessment, management review, worker feedback, issue management, risk management, operating experience, continual improvement and performance measures. These programs and processes provide the means to identify and address program or performance deficiencies and opportunities for improvement. The CAS is implemented through operational and business systems using a graded approach based on risk, hazard and experience. This is done in accordance with requirements to ensure that CNL satisfies it's legal and contractual obligations, and to ensure that it is able to operate safely, securely, cost effectively and efficiently.

7. How We Operate

7.1 Risk Management

Risk (corporate, project, work package [39], task) management is the identification of barriers to achieving the corporation's strategic goals and objectives. By highlighting enterprise level risks [40], senior management can strategically position resources and funding to manage potential or upcoming risk events. Project and program risk management, as well as the management of safety risks, are embedded in the management system.

7.2 Grading

One objective of the management system is to ensure that the work being performed to meet requirements is both consistent and predictable. Where appropriate, the degree and level of rigor applied to program elements, items, or activities is based on a graded approach that takes into account the complexity of work to be performed and the magnitude of the hazards to maintain an acceptable level of risk. The level of analysis, extent of documentation, and degree of rigor of process control is applied commensurate with their significance; importance to safety; consequence of error; design complexity; process complexity; service characteristics; service conditions; or economics. The graded approach applies to both internal CNL activities as well as procurement of external products and services, and is documented within the associated procedural documents, or embedded in supporting forms and templates.

8. Ombuds Service

The leadership at CNL aims to engage in transparent communications and has created an independent mechanism – the Ombuds Service – through which stakeholders such as individuals, organizations, and leadership can share their concerns about a particular issue or provide general feedback and recommendations for improving the workplace at CNL. The Ombuds Service provides CNL stakeholders with an outlet to raise issues while encouraging positive dialogue and culture.

The mission of the Ombuds Service is to offer an informal, impartial and independent approach to conflicts raised by CNL stakeholders, providing a neutral and, to the extent permitted by law, confidential resource while advocating for fair, efficient, and transparent policies and procedures.

9. Definitions and Acronyms

9.1 Definitions

This document relies primarily on word meaning as found in common dictionaries. The current *Glossary of Controlled Terms and Acronyms* [41] contains specific meanings for those words that require further clarification.

Accountability	The state of being responsible and answerable for an activity.
Authority	The degree of power vested in a worker by virtue of their role to demand performance and/or make decisions.
Functional authority	Management that has responsibility for defining, interpreting, and maintaining functional requirements, and for supporting the line management in their implementation.
Functional support area	A set of interrelated or interacting processes or programs that are characterized by a set of inputs and value added tasks that assure specific business outputs, products and services. The FSA's are a critical part of CNL's Management System Framework, and are driven by requirements to meet the objectives and goals of the

	organization such as safe workers, products, profit, good brand, customer satisfaction, industry leadership.
Line management	Any management level within the organization, which is responsible and accountable for directing and conducting work.
Position	A position is identified by a business title and is a worker's primary line job for which they were hired to perform.
Responsibility	A thing one is required to do as part of a job, role, or legal obligation.
Role	Functional duties and assignments, in addition to their existing position, that any CNL employee performs in order to facilitate delivery of a process.
Safety	The condition of being protected from or unlikely to cause danger, risk, or injury.
Worker	Someone who performs an occupational duty. Occupational duty is a term that describes the responsibilities that are a regular part of a person's job.

9.2 Acronyms and Abbreviations

AECL	Atomic Energy of Canada Limited
APWB	Annual Program of Work and Budget
CAS	Contractor Assurance System
CEO	Chief Executive Officer
CFO	Chief Financial Officer
CNEA	Canadian National Energy Alliance Limited
CNL	Canadian Nuclear Laboratories Limited
CNO	Chief Nuclear Officer
CNSC	Canadian Nuclear Safety Commission
COG	CANDU Owners' Group
COO	Chief Operating Officer

CRL	Chalk River Laboratories
CTA	Central Technical Authority
ERM & SRG	Environmental Remediation Management and Stewardship and Renewal Group
FSA	Functional Support Area
FSM	Functional Support Manager
HSSE	Health, Safety, Security, and Environment
NPD	Nuclear Power Demonstration
S&T	Science & Technology
WL	Whiteshell

Appendix A Roles, Responsibilities, Accountabilities, and Authorities

This appendix describes the role and responsibilities of the CNL Executive Team. The Executive Team of the Company comprise the following:

- President and Chief Executive Officer (CEO)
- Chief Operating Officer (COO)
- Vice-President, Science & Technology (S&T)
- Vice-President, Environmental Remediation Management and Stewardship and Renewal Group
- Vice-President, Capital
- Vice-President, Business Management
- Vice-President, Central Technical Authority (CTA) and Chief Nuclear Officer (CNO)
- Vice-President, Health, Safety, Security and Environment (HSSE)
- Vice-President, Human Resources
- Vice-President, Legal and Insurance
- Vice-President, Corporate Affairs
- Vice-President, Business Development
- Vice-President, Isotope Business

A.1 President and Chief Executive Officer (CEO)

The CNL President & Chief Executive Officer (CEO) provides overall leadership and direction. The President & CEO sets the mission, vision, direction, and strategy that create a cost-effective accomplishment of the scope of work. The President & CEO obtains the funding, manages the execution of work within the defined cost, scope, and schedule by ensuring the development of the integrated work schedule, and is ultimately responsible for the safe completion of work. The President & CEO maintains strategic relationships with regulatory agencies and oversight organizations, and with stakeholders and the public. The President & CEO is specifically responsible for:

- Ensuring high standards for HSSE and quality are clearly established and supported by a robust infrastructure of people, practices, and oversight mechanisms;
- Ensuring the scientific, technological and product developments necessary to enable CNL to serve Canada's objectives in nuclear and related areas while maximizing the return on the funds invested in S&T;
- Meeting CNL's policy objectives, commercial objectives, and financial targets;
- Ensuring the implementation and continual improvement of the management system;
- Developing the organization's managerial competence and culture with a view to continually improving CNL's performance;

- Maintaining and improving the credibility and support of CNL with the public, including creating public awareness of the value of the nuclear industry to Canada's future sustainable economic development;
- Meeting CNL's responsibilities for managing legacy liabilities; and
- Designating, in conjunction with the Site Licence Holder, Emergency Operations Centre Commanders for managing CNL and site emergency responses.

A.2 Chief Operating Officer (COO)

The Chief Operating Officer (COO) is the primary delegate of the President & CEO and supports the Executive Team in safe execution of the CNL mission, while being specifically responsible for:

- Executing CNL's Strategy on behalf of the President & CEO (internal facing);
- Developing operational plans as appropriate, setting out objectives and priorities for the Company;
- Developing and influencing corporate strategies, in particular transformational activities;
- Developing policies, processes, practices and strategies working with the relevant areas of the business;
- Building organizational competence and capacity;
- Briefing the President & CEO on performance, risk and opportunities for the Company gleaned from line and functional authority;
- Leading the organizational unit of Chief Operating Officer with the following departments: Site Planning and Asset Management, and Ombuds Service;
- Establishing, maintaining, assessing, and continuously improving the company-wide processes and programs for the following Functional Support Areas: Management System and Property (Asset) Management; and
- Acting as a key advisor to the President & CEO.

A.3 Vice-President, Science & Technology

The Vice-President, Science & Technology is responsible for:

- Ensuring the safe conduct of licensed activities associated with the nuclear facilities, and radioisotope laboratories at the LaPrade site;
- Ensuring the safe conduct of licensed activities associated with the operation of the radioisotope laboratories and nuclear facilities within Science & Technology;

- Ensuring the quality and effective, efficient and economical delivery of the products and services developed and delivered by S&T;
- Administering contracts between CNL and CANDU Owners' Group (COG), including the COG budget, business planning for COG programs, and related policy issues;
- Overseeing the development and management of the following technological areas: fuel channels, reactor chemistry and systems, hydrogen and heavy water technology, safety technology, fuel and fuel cycles, environmental technologies, health physics, software performance, and reactor core technology;
- Leading the organizational unit of Science & Technology with the following departments: Chief Scientist, and Deputy Vice-President Office S&T (S&T Business Management Office, S&T Facilities Operations Division, Reactor Fleet Sustainability Division, Isotopes, Radiobiology & Environment, Advanced Reactors Directorate, Safety & Security Directorate, Hydrogen & Tritium Technologies, Small Modular Reactors Project, and S&T Isotope Production Project); and,
- Establishing, maintaining, assessing, and continuously improving the company-wide processes and programs for the Conduct of Research Functional Support Area.

A.4 Vice-President, Environmental Remediation Management and Stewardship and Renewal Group (ERM & SRG)

The Vice-President, Environmental Remediation Management and Stewardship and Renewal Group is responsible for:

- Ensuring the safe conduct of licensed activities associated with the nuclear facilities, and radioisotope laboratories at Chalk River (under ERM control), Nuclear Power Demonstration, Douglas Point, Gentilly-1, Whiteshell Laboratories, and the Historic Waste Programme (HWP) at Port Hope;
- Managing decommissioning, waste management, and environmental remediation facilities and services, and related projects at company sites;
- Overseeing of the Liability Cost Estimate, which is the funding provided to address legacy responsibilities associated with the Government of Canada and CNL's operations;
- Overseeing the Low-Level Radioactive Waste Management Office, funded by the Government of Canada, to address historic wastes at specific sites in Canada;
- Overseeing the Port Hope Area Initiative Management Office, the federal operating agency declared by the Government of Canada to implement the Legal Agreement of the Port Hope Area Initiative on its behalf;
- Providing associated support resources to the CRL site, including maintenance trades, planning and assessment services, logistics, and fleet;

- Delivering site maintenance services that ensures high reliability and availability of nuclear facilities and site infrastructure facilities;
- Managing commercial waste management and decommissioning undertakings;
- Leading the organizational unit of Environmental Remediation Management and Stewardship and Renewal Group with the following departments: Historic Waste Program Management (HWP Health, Safety, Security, Environment & Quality, HWP Business Operations, HWP Major Sites, HWP Small-Scale Sites, and HWP Waste Management Operations), WL Restoration Project (WL Site & Nuclear Operations, WL Business Operations, WL Engineering, WL End-State Strategy , WL Decommissioning and Demolition, Waste Management Area Decommissioning and Demolition, WL Waste Management, WL Project Controls and Report), and Stewardship and Renewal Group (Fuel Programme & Project Division, ERM Program Management, Decommissioning & Environmental Remediation, Near Surface Disposal Facility, ERM Integrated Functional Support Services, Contractor Management, Waste Services, and Infrastructure Development Group); and
- Establishing, maintaining, assessing, and continuously improving the company-wide processes and programs for the following Functional Support Areas: Cleanup, Transportation of Dangerous Goods, and Waste Management.

A.5 Vice-President, Capital

The Vice-President, Capital, is responsible for:

- Leading the development, performance and management of capital infrastructure projects which includes operational plans, budgets, and schedules to ensure projects are within budget and on time, establishing challenging performance metrics, conducting operational reviews to ensure targets are being met;
- Delivering required budget documents to the Chief Financial Officer, the Executive Team and our shareholder (this includes key information to support the budget funding obligations);
- Serving as the intermediary among Finance, Executive Team and other stakeholders on all budget matters associated with capital investment;
- Evaluating overall APWB integration with project delivery, long and near-term strategies, and processes while continuing to deploy innovative enhancements and upgrades to improve efficiency and effectiveness;
- Leading the organizational unit of Capital with the following departments: New Builds, Capital Projects, and Capital Project Program;
- Establishing, maintaining, assessing, and continuously improving the company-wide processes and programs for the Construction Functional Support Area.

A.6 Vice-President, Business Management

The Vice-President, Business Management is responsible for the following:

- Developing and executing supply chain strategies and plans;
- Providing financial review, reporting, business decision support, business advice/strategies, financial modelling, negotiation support, billing, and routine project/product accounting activities for CNL;
- Overseeing the development and execution of a Business Continuity Program;
- Monitoring and controlling the APWB, planning and budget guidance, strategy development, associated risks, assumptions for future spending and use of performance measures to assess program performance;
- Managing processes to protect, manage, and safeguard records and information assets;
- Advising the CNL Board on Financial, IT and Supply Chain matters, and significant project investment justifications;
- Leading the organizational unit of Business Management with the following departments: Supply Chain, Program Management Office, Prime Contracts, Integrated Services, and Information Management and Technology;
- Establishing, maintaining, assessing, and continuously improving the company-wide processes and programs for the following Functional Support Areas: Supply Chain, Prime Contract, Information Management, Project Management Office, Information Technology, Nuclear Cyber Security, and Finance.

A.7 Vice-President, Central Technical Authority (CTA) and Chief Nuclear Officer (CNO)

In the role of Vice-President, Central Technical Authority, is responsible for the following:

- Setting and applying the standards necessary to achieve technical excellence in all aspects of the work performed by CNL;
- Providing CNL-wide processes and services to support the missions’ tasks and to recognize when, for whatever reason, CNL is falling short of technical excellence;
- Developing and implementing plans to address strategic business issues;
- Ensuring awareness of customer requirements are promoted throughout CNL;
- Promoting, measuring, and providing continual improvement for the site safety and security cultures;
- Reporting to the Executive Team on performance of the Management System and any need for improvement;

- Performing assessments of the implementation of regulatory requirements to ensure that they are being appropriately implemented in accordance with the graded approach allowed by the implementing documents;
- Ensuring the independent assessment program maintains its independence and is adequately performing its intended function;
- Leading the organizational unit of Central Technical Authority with the following departments: CTA Deputy VP, Engineering, Compliance, Quality and Operational Excellence; and
- Establishing, maintaining, assessing, and continuously improving the company-wide processes and programs for the following Functional Support Areas: Conduct of Operations, Fitness for Service, Design Authority and Design Engineering, Configuration Management, Pressure Boundary, Electrical Safety, Safety Analysis, Training & Development, Commissioning, Quality, Performance Assurance, Compliance, Nuclear Criticality Safety and Nuclear Materials & Safeguards Management.

In the role of CNO, is responsible for:

- Ensuring nuclear safety is an overriding priority at all CNL sites;
- Ensuring conditions and requirements of licences and certificates granted by the CNSC are communicated to CNL Management (for site licences, this is the responsibility of the site licence holder);
- Authorizing, where required, changes to programs and processes that support the site licences where such changes affect safe or compliant operation at more than one site;
- Representing CNL at CNSC meetings on matters relating to organization-wide licensing matters;
- Acting for CNL in dealings with the CNSC;
- Providing oversight of all CNL nuclear facilities and programs to ensure performance meets and/or exceeds regulatory expectations and industry best practices; and
- Ultimately responsible to ensure compliance with CNSC license requirements at all CNL sites. This does not relieve the individual site license holder from their responsibility as separately described in this Manual.

A.8 Vice-President, Health, Safety, Security and Environment (HSSE)

The Vice-President for Health, Safety, Security and Environment provides strategic direction and oversight to HSSE functional programs and services that meet site licence requirements, business operational needs and reflect industry best practices for CNL, and is responsible for:

- Promoting integration of HSSE requirements into all work activities, and assessing integration;

- Working with line organizations to implement actions to improve HSSE integration;
- Supporting and promoting worker involvement in CNL safety processes;
- Ensuring regulatory requirements for HSSE functions are properly documented, controlled and implemented;
- Interfacing with regulators and stakeholders on HSSE matters;
- Providing direction and guidance for proper implementation and improvement of the Radiation Protection program, Dosimetry program, Wellness program and Environmental Protection program;
- Leading the organizational unit of Health, Safety, Security and Environment with the following departments: Corporate Radiation Protection, Corporate Occupational Safety and Health, HSSE Business Operations, Corporate Environmental Protection, Deputy VP Office, Corporate Fire and Emergency Management, and Corporate Security; and
- Establishing, maintaining, assessing, and continuously improving the company-wide processes and programs for the following Functional Support Areas: Environmental Protection, Radiation Protection, Occupational Safety & Health, Health Centre, Emergency Preparedness, Fire Protection, and Security.

A.9 Vice-President, Human Resources

The Vice-President, Human Resources is responsible for:

- Providing overall strategic human resources and labour relations direction and leadership to the organization;
- Overseeing the development, implementation and administration of human resource policies, programs and services, including employee and labour relations, employment practices, prevention of harassment and violence process, diversity, equity and inclusion program, compensation, benefits and pension, recruitment and orientation, talent management including engagement, retention and succession planning; and legislative and regulatory compliance relative to human resources and labour relations;
- Engaging in the strategic planning process by supporting the execution of organizational unit strategies and plans through the implementation of Human Resource and labour relations strategies and solutions that support short and long-term business objectives;
- Leading the organizational unit of Human Resources with the following departments: Talent Management, Labour Relations, and Total Rewards; and
- Establishing, maintaining, assessing, and continuously improving the company-wide processes and programs for the Human Resources Functional Support Area.

A.10 Vice-President, Legal & Insurance

The Vice-President, Legal & Insurance is responsible for:

- Providing legal advice and support in relation to all legal, commercial and regulatory matters at CNL;
- Managing and overseeing the performance of the Ethics and Business Conduct Office, Corporate Secretariat, Export & Import compliance, and the Internal Audit function at an organisational level;
- Leading the development and implementation of CNL Intellectual Property policy, plans, and procedures;
- Managing all legal claims that relate to the operations of CNL;
- Providing CNL with all necessary insurance and related risk management advice to enable CNL to meet its statutory and contractual obligations and to use insurance as a strategic risk management tool;
- Overseeing all engagements with outside legal counsel;
- Providing legal advice and support to support CNL intellectual property resources;
- Providing legal advice and support in relation to statutory and regulatory compliance, including operational elements of privacy requirements;
- Leading the organizational unit of Legal and Insurance Department with the following departments: Ethics and Business Conduct, and Legal Department;
- Establishing, maintaining, assessing, and continuously improving the company-wide processes and programs for the Legal Services Functional Support Area; and
- Providing a high level of assurance to CNL’s Executive and Board of Directors that:
    - The business activities and operations are being carried out to meet or exceed CNL’s regulatory and legal obligations and other applicable standards,
    - All employees know and understand their compliance roles and responsibilities; and
    - CNL’s employees, officers and directors of the company are acting ethically and with integrity.

A.11 Vice-President, Corporate Affairs

The Vice-President, Corporate Affairs leads a team responsible for developing and conducting communications, information dissemination, public engagements, and maintaining an overall public affairs program including internal and external communications; community involvement and outreach; interactions with the media, businesses, and the scientific and technical community and is responsible for:

- Delivering and lead the Public Information Program, a CNSC licence condition;
- Managing relationships with key stakeholders including industry associations and Indigenous communities;
- Liaising and consulting with indigenous groups, local, provincial, and federal levels of government with an overall goal to enhance the benefits of CNL to its host communities and Canada;
- Establishing and maintaining effective working relationships with community stakeholders in order to build awareness, understanding, and support for company activities and operations;
- Developing initiatives to bring benefits to the host communities, including, participation in community initiatives, fundraisers, and community service announcements, local events, while continuing to champion and encourage local development;
- Building constructive community engagement and support;
- Managing brand awareness including speeches, website, and conferences and tradeshows;
- Managing sponsorships, fundraisers, public tours, school programs, and special events and occasions;
- Supporting marketing and advertising;
- Acting as official corporate media spokesperson including receiving, responding to, and managing all media requests and press releases;
- Ensuring timely, open and transparent communications in response to issues or emergencies;
- Providing support to the Office of the President & CEO, CNL and CNEA Board of Directors, the Executive Team, Special Advisors, and special projects through Corporate Affairs;
- Building employee engagement and understanding of corporate plans, priorities and strategies;
- Supporting morale and employee recognition programs (i.e. Voyageur luncheon series, Awards Gala);
- Managing myCNL, All Staff engagements, and the CONTACT and Voyageur newsletters;
- Leading the organizational unit of Corporate Affairs with the following departments: Corporate Communications, and HWP Communications and Stakeholder Relations; and
- Establishing, maintaining, assessing, and continuously improving the company-wide processes and programs for the Corporate Affairs Functional Support Area.

A.12 Vice-President, Business Development

The Vice-President, Business Development is responsible for the following commercial strategic and transactional activities:

- Leading the market analysis and commercial strategy development with respect to growing CNL's Energy, Health, Environment, and Safety/Security products and services business;
- Leading the marketing and market engagement/ongoing interaction with existing customers and leading market associations;
- Leading the interaction with primary client, AECL, to ensure endorsement of commercial strategies, and clear understanding and support for short, medium, and long term goals;
- Leading improvement initiatives required to achieve long term business development and organizational sustainability;
- Leading the development, review/analysis, and endorsement of business cases for potential public private partnerships and Make or Buy opportunities;
- Driving or assisting in the implementation of approved business cases;
- Structuring and managing the routine engagement with internal organizational areas to ensure strategy alignment, planning, and execution with respect to commercial work;
- Planning and coordinating all new sales, proposals, and account management activities that facilitate response to current and potential customers including scope development, risk assessment, cost estimating, pricing, terms and conditions, contractual structure, and legal/contracts review;
- Managing new and existing strategic customer relationships including external and internal interfaces (e.g. S&T Program Directors) as required in order to meet customer expectations and focus on improvements that increase customer satisfaction and potential revenue growth;
- Providing the interface between CNL's customer and line organizational units for the purpose of commercial sales planning and scheduling to ensure notifications, production, scheduling, and product delivery are coordinated;
- Ensuring Intellectual Property policy/protection/exploitation as applicable to performing federal work and negotiating commercial contracts;
- Leading the organizational unit of Business Development with the Business Development and Commercial department; and

- Establishing, maintaining, assessing, and continuously improving the company-wide processes and programs for the Business Development and Commercial Ventures Functional Support Area.

A.13 Vice-President, Isotope Business

The Vice-President, Isotope Business is responsible for the following commercial strategic and transactional activities:

- Providing the interface between CNL's customer and line organizational units for the purpose of Isotopes Sales planning and scheduling to ensure notifications, production, scheduling, and product delivery are coordinated; and
- Leading the organizational unit of Isotopes Business.

Corporate Functional Authority Roles

Additional corporate functional authority roles have been established in response to regulatory and other legislative requirements. These roles have an independent reporting relationship to the President & CEO:

- Chief of Staff
- Ombuds Officer
- Corporate Secretary
- Chief Information Officer
- Chief Financial Officer
- Chief Engineer
- Chief Safety & Licensing Officer
- Chief Regulatory Officer
- Chief Security Officer
- Management Representative for Quality
- Site Licence Holder

A.14 Chief of Staff

The Chief of Staff is accountable to the CEO/COO, representing them with internal and external stakeholders, while fulfilling the following responsibilities:

- Acting as the communication arm for the CEO/COO with other Executives, the Client, the Board, and other stakeholders as required. Facilitates communications with CEO/COO, ensuring wants, needs, concerns, and ideas are communicated effectively and efficiently in both directions;
- Acting as a strategic advisor and counsel for the CEO, COO and Executive Team;

- Improving current processes and coordinating organizational procedures for optimized efficiency and productivity, enabling the CEO/COO to focus on larger strategic organizational initiatives;
- Creating and maintaining strong cross-departmental relationships to enable collaborative leadership success;
- Preparing the CEO/COO for emerging issues and opportunities; and
- Delegating tasks/activities on behalf of the CEO/COO.

A.15 Ombuds Officer

The Ombuds Officer is accountable to the CEO/COO, representing them with internal and external stakeholders, while fulfilling the following responsibilities:

- Addressing concerns about transparency, fairness, and process consistency, as well as other issues of significance to the stakeholder community without sacrificing CNL’s mission;
- Improving CNL’s understanding of the workforce concerns and, more specifically, how the company can institute changes to address those concerns when appropriate;
- Being an accessible resource and actively participating in resolution processes, informal conversations, and neutral conflict coaching;
- Identifying areas for improvement, from a conflict resolution perspective, which might serve to benefit CNL processes;
- Evaluating and upgrading the efficiency of CNL’s conciliation and mediation processes, as necessary;
- Providing a confidential, to the extent permitted by law, and trustworthy channel for conflict resolution for CNL stakeholder community;
- Creating a climate in which CNL workforce feels comfortable contacting the Ombuds Service while dispelling the notion that raising issues or concerns with CNL will adversely impact employees in the future;
- Equipping CNL staff and the stakeholder community with conflict resolution skills;
- Ensuring that stakeholders and CNL staff understand the benefits of respectful, transparent, and efficient communications; and
- Remaining accessible and visible to CNL and external stakeholders through speaking engagements.

A.16 Corporate Secretary

The Corporate Secretary to the Board of Directors, is accountable to the Board of Directors and is responsible for:

- Advising on the appropriateness of CNL'S governance strategies and that its governance obligations are being met including those relating to ethics and business conduct;
- Ensuring the integrity of the corporate governance system, and compliance with statutory and regulatory board governance requirements;
- Acting as a trusted adviser to the Board of Directors;
- Tracking implementation of decisions made by the Board of Directors;
- Administering interactions with the Board of Directors including Board and Board committee meetings, minutes of meetings, and corporate records;
- Liaising with Directors and Corporate Officers, as well as with shareholders, auditors, and external advisor on board governance issues; and
- Supporting the Board of Directors in engaging the Shareholder and AECL on relevant governance issues.

A.17 Chief Information Officer

The Chief Information Officer (CIO) provides strategic direction and leadership in the efficient and effective use of information and information technology across CNL.

The Chief Information Officer (CIO) responsibilities are further described in the Program Description Document for *Information Technology* [42].

A.18 Chief Financial Officer

The Chief Financial Officer is responsible for:

- Ensuring the financial integrity and strategy of the business;
- Advising senior management on overall long- and short-term strategic issues, including matters related to financial management, performance management strategies, revenue/market growth strategies, and organization structure;
- Developing structure for internal financial controls;
- Developing accounting policies;
- Ensuring the integrity of CNL's financial systems and controls, and safeguarding and controlling the associated records; and
- Working closely with the Executive Team on their planning activities to ensure the plans support the profitability and continued financial viability of the company.

A.19 Chief Engineer

The Chief Engineer assumes professional responsibility for all engineering services provided by CNL to the public under CNL's Professional Engineering Certificate(s) of Authorization, and has authority for establishing and maintaining the design of CNL facilities.

The Chief Engineer is responsible for:

- Executing the design authority function for CNL facilities, design and licensing basis and engineering activities;
- Maintaining appropriate Professional Engineering Certificate(s) of Authorization;
- Conducting technical review and oversight of engineering activities to ensure compliance with design requirements, codes, standards, regulatory requirements, quality standards and engineering practices;
- Acting as the Functional Authority for Engineering processes including Configuration Management, Design Authority and Design Engineering; and
- Executing the owner's duties for CNL sites as defined by Pressure Boundary codes and standards.

A.20 Chief Safety & Licensing Officer

The Chief Safety & Licensing Officer responsibilities are further described in the Program Description Document for *Safety Analysis* [43].

A.21 Chief Regulatory Officer

The Chief Regulatory Officer responsibilities are further described in the Program Description Document for *Compliance* [25].

A.22 Chief Security Officer

The Chief Security Officer provides oversight to confirm that CNL meets its obligations under the Treasury Board Policy on Government Security in ensuring that information, assets and services are protected against compromise and individuals are protected against workplace violence.

The Chief Security Officer responsibilities are described in the Program Description Document for *Compliance* [25].

A.23 Management Representative for Quality

The Management Representative for Quality has organizational independence, functional responsibility and authority for:

- Ensuring that quality assurance processes needed for the management system are established, implemented and maintained;
- Ensuring awareness of customer requirements are promoted throughout CNL;
- Identifying and recording quality problems or conditions adverse to quality and compliance;
- Initiating, recommending, or providing solutions;
- Verifying implementation of solutions; and
- Ensuring that further processing, delivery, installation, or use of an identified nonconformity is controlled until corrective actions have occurred.

The Management Representative for Quality responsibilities are further described in the Program Description Document for *Quality* [44].

A.24 Site Licence Holders

Site Licence Holders are designated Executives and Senior Management responsible for the management and control of CNSC-licenced activities at their respective CNL-managed sites. Site Licence Holders are appointed by the President & CEO with the concurrence of the Chief Nuclear Officer and have the necessary functional authority to discharge responsibility for assuring the safe conduct and compliant operation of all licenced activities at their respective sites, including the authority for operating or shutting down nuclear facilities and radioisotope laboratories.

Specifically, the Site Licence Holder is responsible for:

- Ensuring no activity requiring a licence under the *Nuclear Safety Control Act* [45] is carried out on the site, other than those activities listed in the licence, as stated in the application for licence renewal, and as approved by the CNSC;
- Ensuring the management system is effective and implemented at the site, and that the senior management is committed to and meets its responsibility for reviewing and ensuring the success of the management system and safety management, including the ongoing proactive oversight and surveillance of nuclear safety activities and compliance with regulatory requirements;
- Ensuring site and facility operations meet health, safety, security, environmental, quality, and regulatory requirements, and take appropriate action for non-compliances up to and including ceasing operations;
- Taking site safety, quality, licensing, and technical issues to the Executive level for resolution where these cannot be resolved at the site;
- Representing CNL at CNSC meetings on matters relating to their respective site;

- Ensuring that conditions and requirements of site licences granted by the CNSC are communicated to site and facility management;
- Ensuring that "Obligations of Licensee" in the *General Nuclear Safety and Control Regulations* [46], where applicable, are met;
- Ensuring Facility Authorities are appointed for all nuclear facilities;
- Authorizing, where required, changes to programs and processes that support the site licences where such changes affect safe or compliant operation of the site;
- Ensuring adequate preparedness for responses to anticipated operational occurrences and emergency conditions and that appropriate actions have been taken to provide for the protection of site personnel, the public, and the environment;
- Ensuring that arrangements are in place to manage the situations that fall outside normal operating procedures at the site; these arrangements shall ensure that appropriate controls are maintained and due consideration is given to the safety implications of the situation; and
- As required, recommending to the CEO the appointment of Emergency Operations Centre Commanders for managing CNL and site emergency responses.

Appendix B Management System Framework Overview

The CNL Management System is based on a framework developed through benchmarking of industry standards, review and application of lessons learned from previous experience and systems, and alignment with the strategic direction of the corporation.

Functional Authorities have responsibility for defining, interpreting, and maintaining functional requirements, and for supporting the Missions in their implementation. The Functional Authority structure consists of Responsible Executives, Functional Support Managers, and Functional Support Manager Designates, as identified in the *Functional Authorities* list [26], who work closely together to ensure that implementation of standards and requirements specific to their Functional Support Area(s) are consistent company-wide.

Table 2: Management System Framework Overview

Responsible Executive	Functional Support Area	Purpose
President & CEO and Chief Operating Officer	**Management System**	Enables effective corporate governance and interfacing between the Board of Directors, Executive, and Management. Formalizes and institutionalizes the controls and accountabilities by which CNL manages and executes work, in conformance with legislative, regulatory, shareholder, and commercial requirements. Drives key improvement initiatives to address common opportunities and challenges to meet corporate objectives. Facilitates organizational transformation and provides assurance that action plans effect sustainable improvement through the application of effective change management principles.
	Property (Asset) Management	Ensures stewardship of AECL resources in accordance with CNL objectives. Ensures decisions regarding the acquisition, accounting for, control, utilization, maintenance, service, protection, preservation, and disposition of resources is based on defined service levels, informed by asset conditions and risks, considers whole life costs and is aligned with CNL business needs and strategic requirements.
VP Business Management	**Supply Chain**	Effectively establishes and builds integrated capabilities from the supply chain to support delivery of CNL's work scope and obligations to AECL. CNL's supply profile includes contracted

Responsible Executive	Functional Support Area	Purpose
		work and material requirements for decommissioning and waste management, science and technology, capital works, as well as general support to programs and operational activities. Drives best value for CNL and AECL, and includes a framework that enables the development of small and medium-sized enterprises in addition to local and indigenous businesses where capabilities exist.
	Prime Contract	Involves the management and administration of the Site Operating Company Agreement, the Whiteshell Laboratories Target Cost Agreement, and Nuclear Power Demonstration Reactor Target Cost Agreement between AECL and CNL. Establishes communication processes to support monitoring of the contracts, reporting on performance, and controlling any changes, variations, or amendments to the contracts.
	Information Management	Governs the creation, classification, capture, use, dissemination, retention, preservation, and disposition processes of information throughout the company. Develops, implements, and monitors controls that apply to all structured, unstructured, or transitory Information Assets to ensure the authenticity, reliability, and integrity of the records, and minimize the risk associated with disclosure and loss while allowing for inspection of records to ensure their continued preservation. Provides on-site information resources, and access to worldwide resources through online subscriptions and inter-library loans.
	Project Management Office	Ensures that CNL uses a standardized framework of processes, procedures, tools and systems to plan, control and monitor the strategic plan of CNL. The Project Management Office function provides guidelines; oversight and monitoring to ensure that projects, and site facility operations, are performed using CNL rules, follow industry best practices, and add value to the business.

Responsible Executive	Functional Support Area	Purpose
	Information Technology	Establishes effective governance practices, tools, and processes required to ensure the safety and security of information and technology assets falling within the mandate of CNL. Ensures industry best practices for IT services management and delivery and ensures a relevant and secure infrastructure for its continuing business.
	Nuclear Cyber Security	Facilitates compliance with all applicable requirements for the protection of nuclear cyber assets and information. Delivers nuclear cyber security services and solutions to the business and ensures confidentiality, availability, and integrity of all systems, information, data, and intellectual property under the control of CNL.
	Finance	Establishes a framework for all financial activities to ensure: financial resources are consumed in accordance with approved plans, budgets and/or allocated funding; financial transactions are undertaken in compliance with governing legislation, policies, and procedures; and financial reporting is timely, complete, accurate, and delivered in accordance with prescribed accounting and reporting standards. Provides financial stewardship and controllership for CNL and, supports the full scope of departmental and functional financial accountabilities including: sound financial policies, strong internal controls, accurate, responsive and timely financial reporting, and timely decision support.
VP Human Resources	**Human Resources**	Fosters a positive union-company relationship through management of Collective Agreements including: compliance, interpretation and negotiation. Optimizes organizational design, alignment, health, and change to support strategic workforce and business requirements. Enables competitive, cost effective benefits and compensation programs to attract, retain, motivate, align and reward employee performance.

Responsible Executive	Functional Support Area	Purpose
		Enables management to clearly set expectations in line with corporate culture and business objectives, and to support, recognize, and manage employee performance. Ensures awareness of each individual's responsibilities to ensure CNL's culture is inclusive, respectful, and supportive; ensures individuals are empowered to speak out when concerned with how they are being treated by another; and, ensures everyone has access to tools and resources to resolve conflict. Builds and sustains excellence in: securing top talent; developing talent; optimizing the application of capabilities across CNL; retaining and engaging talent employees; and managing the employee lifecycle.
VP Legal	**Legal Services**	Ensures the business' of CNL are executed in a strategic, legally compliant, risk informed, and ethical manner and assists and supports all CNL departments in the execution of their related legal and ethical responsibilities.
VP Corporate Affairs	**Corporate Affairs**	Ensures effective communications for engaging our employees, our Shareholder, Natural Resources Canada, and our key stakeholders that foster alignment with corporate objectives and strategies.
VP Business Development	**Business Development & Commercial Ventures**	Facilitates customer acquisition and retention, including the evaluation of investment in new capabilities to expand commercial offerings for CNL.
VP Science & Technology	**Conduct of Research**	Maintains integrity in research, and ensures research activities do not adversely affect the health and safety of the worker, the environment or the quality of data obtained, waste resources, or damage CNL's reputation or credibility with customers. Ensures adherence to good research practices leading to more attention to the details of scientific research including qualitative analysis, quantitative and statistical techniques, more thoughtful collaboration among investigators, performing work safely and cost effectively and complying

Responsible Executive	Functional Support Area	Purpose
		with all requirements while meeting the needs of the customer(s).
VP Health, Safety, Security, and Environment	**Environmental Protection**	Ensures protection of our natural environment in and around CNL sites. It provides the framework to implement CNL's Environment Policy [6]. The Environmental Protection (EnvP) requirements apply to operations and activities that may affect the environment in and around CNL sites. A graded approach to requirements is applied based upon environmental risks/events that could occur at any given location and considering the amount of control or influence that CNL has on the activity. The EnvP Program considers life cycle perspective for activities, products and services on and around CNL sites where CNL has control or influence and on products or services off site which the company has influence.
	Radiation Protection	Prescribes limits and requirements for safe work practices in a radiological environment and the monitoring required. Limits employee exposure and maintains doses to workers As Low As Reasonably Achievable (ALARA), social and economic factors taken into account.
	Occupational Safety & Health	Prevents accidents and injury to health arising out of, linked with or occurring to employees in the course of employment, and to all persons on sites or workplaces controlled by CNL. Supports industrial safety, industrial hygiene, and respiratory safety and the alignment of various safety programs.
	Health Centre	Ensures a safe and healthy workplace for employees. Enables employees to maintain, improve, and regain their health when needed.
	Emergency Preparedness	Enables the prevention and mitigation of, preparedness for, response to, and recovery from abnormal or emergent events.
	Fire Protection	Ensures an immediate coordinated response to fire and other incidents/emergencies.

<table>
<tr><th>Responsible Executive</th><th>Functional Support Area</th><th>Purpose</th></tr>
<tr><td rowspan="2"></td><td></td><td>Establishes a risk graded approach in conjunction with the defence-in-depth principles to its operations and activities in so far as they may affect fire protection.</td></tr>
<tr><td>Security</td><td>Ensures the physical protection of assets, safeguarding the public and personnel and resumption of business and ensuring the protection of CNL employees, assets, and operations.</td></tr>
<tr><td rowspan="3">VP Environmental Remediation Management and Stewardship and Renewal Group</td><td>Transportation of Dangerous Goods</td><td>Supports the protection of public and environment by ensuring dangerous goods are adequately packaged and controlled for company activities.</td></tr>
<tr><td>Waste Management</td><td>Ensures (a) activities involving planning for, handling, processing, transporting, storage and disposal of wastes are performed in a manner that protects workers, public, and environment, and are in compliance with applicable regulatory and licence requirements; and (b) waste hierarchy is effectively implemented across CNL sites.</td></tr>
<tr><td>Cleanup</td><td>Ensures a CNL wide approach to effective land use planning, decommissioning, demolition, and environmental remediation. The Function ensures there is adequate and appropriate Indigenous, public, and stakeholder engagement, which is conducted as part of the planning process and considered throughout the facility lifecycle. The facility lifecycle includes:
a) Design
b) Construction
c) Commissioning
d) Operation
e) Decommissioning & Demolition
f) Remediation.
This will enable a consistent approach to CNL sites with clear processes and guidance on key requirements. The Cleanup Function provides guidance to new builds on incorporating end state planning and next land use considerations as part of their project plans.</td></tr>
<tr><td>VP Capital</td><td>Construction</td><td>Manages, controls, and monitors construction and installation activities in accordance with the contract and compliant with requirements.</td></tr>
</table>

Responsible Executive	Functional Support Area	Purpose
VP Central Technical Authority & CNO	**Conduct of Operations**	Provides a framework which ensures facility operations are managed, organized, and conducted in a manner that results in high levels of safety, performance, and reliability, while maintaining compliance with requirements. Ensures Class I and Class II Nuclear Facilities are operated within their limiting conditions for safe operation.
	Fitness for Service	Ensures maintenance is carried out adequately and effectively. Decreases the likelihood, or impact of system, equipment, or component failures on nuclear safety, the health and safety of workers, public, security, environment, equipment, and property. Ensures safety-related systems function reliably in accordance with the relevant design and performance criteria, including any safety goals of the Facility and Canadian Nuclear Safety Commission. Enables evaluation of equipment, development, and implementation of long-term equipment improvement plans, monitoring of equipment performance and condition, and adjustment of preventive maintenance tasks and frequencies based on equipment performance.
	Design Authority & Design Engineering	Manages the organizational responsibility to ensure the technical integrity of designs and design processes, establishing the requirements for CNL design work. (Chief Engineer) Ensures design is planned, executed, verified and documented according to applicable codes, standards, regulatory, and design customer requirements. Controls the design basis of CNL within approved safety margins and regulatory requirements. (Design Authority)
	Configuration Management	Facilitates orderly management of system/facility information and system/facility changes for such beneficial purposes as to revise capability, improve performance, reliability or maintainability, extend life, reduce cost, risk and liability, or

Responsible Executive	Functional Support Area	Purpose
		correct defects within approved safety margins and regulatory requirements. Ensures changes are assessed, approved, designed, implemented, commissioned, and placed into service within the safety envelope at all CNL sites, in accordance with the design requirements.
	Pressure Boundary	Assures that pressure-retaining systems and components are designed, constructed and operated in full compliance with statutory and legislative requirements, while promoting and supporting performance excellence with a strong safety culture. The ultimate objective is “no pressure boundary failures”.
	Electrical Safety	Prevents electrical accidents and injury to health arising out of, linked with or occurring to employees in the course of employment, and to all persons on sites or workplaces controlled by CNL. Provides the framework to eliminate or reduce the risk of worker exposure to electrical hazards in the workplace. Ensures that electrical work executed at CNL is compliant to all applicable requirements.
	Safety Analysis	Conducts and maintains nuclear safety analysis to permit the successful completion of safe engineering design in support of new build, facility modification, facility operation, research and product development, decommissioning and disposal.
	Training & Development	Supports the Organization’s operational capabilities by ensuring that workers are effectively and efficiently trained to safely and competently perform their position or role.
	Commissioning	Ensure the as-constructed structures, systems, and components satisfy the functional, performance, and safety design requirements and meet the needs of the users. Provide a systematic and objective method that enables commissioning to proceed in a controlled manner, safely and to a high quality, and ensuring the necessary assurances and evidence are provided.

Responsible Executive	Functional Support Area	Purpose
	Quality	Ensures the efficient delivery of high-value, and quality products and services, and oversees that all activities and tasks are accomplished to maintain a desired level of excellence with alignment to requirements. Utilizes a combination of internal, second and third party audits and evaluations to provide performance oversight and reporting.
	Performance Assurance	Supports CNL's ability to improve operational performance, enhance safety, and reduce the occurrence of unplanned events. Provides an improvement framework to assist in decision making while promoting organizational learning, innovation, and continual improvement.
	Compliance	Ensures compliance with the verification criteria for each of the 14 Safety and Control Areas (SCA) established by the CNSC, consistent with CNL's licence obligations. Provides the regulatory and licensing framework, and independent technical reviews, for a coordinated and consistent approach in managing relationships with regulators throughout CNL.
	Nuclear Criticality Safety	Establishes the framework for ensuring that accidental nuclear criticality is prevented, and that the consequences of accidental nuclear criticality are mitigated during operations with fissionable material outside nuclear reactors.
	Nuclear Materials & Safeguards Management	Enables the tracking of our fissionable materials and supports international non-proliferation agreements.

Certification and Management Commitment

A) This document describes the Quality Assurance Program for the WL Decommissioning Project.

B) The document is supplementary to, and meets the requirements of, the *CNL Management System Manual*, 900-514100-MAN-001 [1] and the *CNL Quality Assurance Program Description Document*, 900-514200-PDD-001 [2].

C) The Quality Assurance Program for the WL Decommissioning Project satisfies the requirements of the CSA N286-12 Standard, *Management system requirements for nuclear facilities* [3] and CSA N286.6-98, *Decommissioning Quality Assurance for Nuclear Power Plants* [4].

D) Management is committed to the implementation and maintenance of the Quality Assurance Program described herein.

Kerry Rod, WL Site Head & General Manager	Matt King, WL Deputy General Manager
Allan Caron, Director, WL ERPL&Q	Douglas Cram, Director, CNL Quality Assurance
Brian Wilcox, Director, NPD & WR-1 Reactor Division	Bobby Gibson, WL Senior Project Manager, D&D
Jim Reynolds, Director, WL Waste Management	Gina Barnett, Director, WL Business Operations
David Gilson, Senior Manager, WL WMA D & D	Shane Richardson, Senior Manager, WL Project Controls

Table of Contents

Section **Page**

1. Scope and Applicability

This document describes the quality assurance program of the Whiteshell Laboratories Decommissioning Project (WLDP)[1] organization [5] within Canadian Nuclear Laboratories (CNL).

The WLDP provides integrated operational, compliance, and project services to Whiteshell Laboratories (WL) and carries out the decommissioning of the WL site including facilities, buildings, and clean-up of contaminated lands.

The quality assurance program outlined in this document applies to the nuclear and non-nuclear facilities being decommissioned, and the associated supporting activities at WL, as described in the WL Decommissioning Licence [6].

2. Purpose

This document describes the quality assurance program applied to decommissioning and supporting activities at WL. Compliance with the quality assurance program contributes to achieving the decommissioning objectives, protecting the health and safety of persons and the environment, and meeting the requirements of relevant codes, standards, regulations, and customers.

This document supplements the following documents:

- *CNL Management System Manual* [1], which describes the management system in place for CNL.
- *Quality Program Description Document* [2], which describes the policy for quality and expresses CNL's commitment to the Management System.
- *Cleanup Program Description Document* (PDD) [7] and the *Program Requirements Document* (PRD) [8], which describe the CNL decommissioning process that applies to CNL facilities.

The WL Site Head & General Manager, WLCP retains overall accountability for the implementation and effectiveness of the WL Decommissioning Project QA Plan. Comments or suggestions for improvement of this document should be communicated to the WL Site Head & General Manager, WLCP.

3. Definitions and Acronyms

Terms and acronyms specific to this Quality Plan are defined below. For all other terms, refer to the *Glossary of Controlled Terms and Acronyms* [9] on the CNL intranet or those found in common dictionaries.

---

[1] Also referred to as the Whiteshell Laboratories Closure Project (WLCP).

3.1 Definitions

As Low As Reasonably Achievable	Defined by the International Commission on Radiological Protection to mean the optimization of protection so that the magnitude of individual doses, number of people exposed, and risk of unplanned exposures are as low as reasonably achievable, economic, and social factors taken into account.
Decommissioning	Those actions taken, in the interest of health, safety, security and protection of the environment, to retire a licensed activity/facility permanently from service and render it to a predetermined end-state condition.
Detailed Decommissioning Plan	A plan setting out the detailed work program, safety and environmental protection procedures and management systems that will be followed in the decommissioning of a licensed activity/facility.
Decommissioning Project	A set of activities undertaken to demolish a building, retire a facility permanently from service, prepare a building, facility, or site for reuse and/or to bring a building, facility, or site to a defined end-state.
End-state (final, interim)	The final end-state is the proposed physical, chemical, and radiological condition of the facility at the end of the decommissioning project for the facility. An interim end-state is a sustainable safe shutdown state into which the facility is put by one of the sub-projects that together constitute the project.
Facility Authority	The person accountable through the established line organization for health, safety, and environmental protection of a nuclear facility.
Facility Authorization	A document that sets out the key requirements, conditions, and limits for safe operation, in accordance with the WL Decommissioning Licence.
Facility Manager	The person who reports functionally to the Facility Authority and is responsible for the day-to-day operation and maintenance of a nuclear facility.
Landlord	The person accountable through the established line organization for health, safety, and environmental protection of a non-nuclear facility.
Preliminary Decommissioning Plan	An overview of the proposed approach to decommission a facility. The preliminary plan provides the structural outline of the subsequent detailed decommissioning plan(s) for the facility.

Procedure	A step-by-step detailed description of how a task or activity is to be carried out, including safety measures such as precautions before the work is started, personal protective equipment to be used, hold-points for safety checks and independent verifications to be carried out.
Project	A temporary endeavor undertaken to create a unique product.
Project Leader	A person responsible for executing one or more work plans.
Radiological Work Assessment	The assessment of requested work with the objective of assessing the radiological aspects, concern and significance of the work and determining the ALARA work package and approval requirements to allow the work to be executed.
Radiological Work Plan	Document describing the radiation protection requirements, procedures, limits, and back-out conditions for radiological work, as defined by the ALARA review and assessment process.
Shutdown (permanent, final)	No longer operating and not intended ever to be restored to operation.
Storage-with-Surveillance	A planned interval during the decommissioning of a facility when the remaining contaminated materials, equipment, structures, building, and site are maintained and are kept under planned surveillance in a sustainable safe shutdown state.
Surveillance	A planned evaluation to confirm that an activity or condition conforms to specified requirements at selected and identified points during the execution of activities.
Verification	The act of reviewing, inspecting, testing, checking or otherwise determining and documenting whether items, processes, services, or documents conform to specified requirements.
Work Plan	Document detailing the steps to follow to safely accomplish the objectives for a specific scope of work.

3.2 Acronyms and Abbreviations

AECL	Atomic Energy of Canada Limited
ALARA	As Low As Reasonably Achievable, social, and economic factors being taken into account
ANSI	American National Standards Institute
ASI	AECL Subject Index

BSI	Basic Subject Index
CARB	Corrective Action Review Board
CMMS	Computer Maintenance Management System
CNSC	Canadian Nuclear Safety Commission
CW	Company-Wide
D&WM	Decommissioning & Waste Management (unit)
DDP	Detailed Decommissioning Plan
EmP	Emergency Preparedness (program)
EnvP	Environmental Protection (program)
EOC	Emergency Operations Centre
FA	Facility Authority (person)
FA	Facility Authorization (document)
FM	Facility Manager (person)
FSA	Functional Support Areas
GDI	Governing Documentation Index
GM	General Manager
HSSE	Health, Safety, Security & Environment
ImpAct	Improvement Action (process)
IWC	Integrated Work Control
LST	Controlled List
MRM	Management Review Meeting
MSD	Management System Document
MST	Management Screening Team
NPARB	Nuclear Performance Assurance Review Board
OPEX	Operating Experience (program)
ORG	Organization (document)
OSH	Occupational Safety & Health (program)
PDP	Preliminary Decommissioning Plan

PDD	Program Description Document
PRD	Program Requirement Document
QA	Quality Assurance
QAP	Quality Assurance Plan
RP	Radiation Protection (program)
RPM	Radiation Protection Manuals
RWA	Radiological Work Assessment
RWP	Radiological Work Plan
SAT	Systematic Approach to Training
SME	Subject Matter Expert
SRC	Safety Review Committee
SSHC	Site Safety & Health Committee
STD	Standard
SwS	Storage-with-Surveillance
WHMIS	Workplace Hazardous Materials Information System
WIP	Work Instruction Package
WLDP	Whiteshell Laboratories Decommissioning Project
WMA	Waste Management Area

4. Management Systems Documents

The purpose of the CNL management system is to integrate the organization's structures, capabilities, resources, and processes to enable effective and efficient program delivery, while maintaining compliance with requirements to safety, quality, and applicable legislation and regulations.

CNL's management system is based on a comprehensive framework that covers all aspects of the business as described in the *CNL Management System Manual* [1]. The Functional management structure consists of Functional Lead Areas which can be further broken down into individual Functional Support Areas, and the functional organization made up of Functional Responsible Executives, Functional Support Managers, and Subject Matter Experts as listed in the CNL *Functional Authorities List* document [10].

The application of the management system requirements shall be graded so as to deploy appropriate resources, based upon:

- The significance and complexity of the activity.
- The hazards and magnitude of the potential impact (risk) associated with the health, safety, security, environment (HSSE) and quality.
- The possible consequence if an activity is carried out incorrectly.

The selected grading needs to be consistent with the applicable CNL requirements, applicable external codes, and standards, as well as licence and regulatory requirements.

The Management System document hierarchy applicable to the WLDP Quality Assurance Plan (QAP) includes the following documents:

- The *Whiteshell Laboratories Organization* document (ORG) [5] describes the management structure, specific roles and responsibilities and interfaces.
- The *Site Licences, Certificates, Permits, Facilities & Representatives* [11] document provides the names of individuals responsible for facilities and laboratories and the *Functional Authorities List* [10] for supporting processes and programs.
- The *Whiteshell Laboratories Site Governing Document Index* [15] has a listing of key procedures, governing documents, and an index of the external requirements and governing documents to support the facility or organization.

4.1 Management System Governing Documents

The following documents make up the suite of Management System Governing documents:

- *Management System Manual* [1]
- *Management System Governing Documentation Index* [12]
- *Functional Authorities List* [10]
- *Site Licences, Certificates, Permits, Facilities & Representatives* [11]
- *Codes, Regulations, Standards and Other Documents* [13]

4.2 Cleanup Program Governing Documents

The following documents make up the suite of Cleanup Program Governing documents:

- *Cleanup Program Description Document* [7]
- *Cleanup Program Requirement Document* [8]
- *Cleanup Governing Documentation Index* [14]

4.3 Whiteshell Laboratories Governing Documents

The following documents make up the suite of Whiteshell Laboratories Governing documents:

- *Whiteshell Laboratories Decommissioning Project Quality Assurance Plan* (this document)
- *Whiteshell Laboratories Organization* [5]
- *Whiteshell Laboratories Site Governing Documentation Index* [15]

5. Management Statement of Commitment

As members of the management team for WL, we are committed to the development, implementation, and continual improvement of the *CNL Management System Manual* [1] and the quality assurance program described in this QA Plan and will seek the same commitment of our staff. We comply with the organization's policies while continually improving the underlying processes to support our decommissioning and supporting activities.

Management shall issue a statement committing the management and staff of the organization to adhere to the requirements of the *CNL Management System Manual* [1] and the quality assurance program.

See Certification and Management Commitment on page 7.

5.1 Policy

The WL Decommissioning Quality Assurance Program is established under the authority of the CNL *Management System Manual* [1] and the CNL *Quality Program Description Document* [2]. CNL has set up of Policies (including one specifically on *Quality* [2]) and supporting principles, which are described in the *Management System Manual* [1].

CNL applies the Decommissioning Quality Assurance Program described in this QA plan to all activities related to decommissioning and supporting activities at WL. Compliance with the QA Program contributes to achieving the decommissioning objectives, protecting the health and safety of persons and the environment (HSE), and meeting the requirements of relevant codes, standards, regulations, and customers.

6. Management Assessment of Effectiveness

6.1 Management System Assessment

The CNL *Management System Manual* [1] describes the requirements for conducting periodic reviews of the effectiveness of the overall management system.

Management shall review the management system with sufficient frequency to confirm its continuing effectiveness. In addition to assessing adherence to requirements, the review shall evaluate the need for changes to the management system itself, including its scope and principles.

An annual *Integrated Management System Review* [16] is completed which includes support documents including review meeting, minutes, presentations, analyses results, and functional support area assessments. A survey is conducted among internal customers of all Functional Support Areas (FSA) that measures how the Effectiveness of each FSA is perceived by FSA's customers. The Effectiveness is determined through questions related to Efficiency, Enable Mission and Sustainability. The review identifies any important, cross-organizational and/or systemic issues, which require intervention or further investigation.

6.2 WL Committees

Various committees provide oversight of WLDP activities. These committees are made up of senior managers, managers, technical experts, and are augmented by supporting staff as needed. Terms of Reference documents describe the committees' mandate, membership and structure, responsibilities, and reporting requirements.

6.2.1 WL Nuclear Performance Assurance Review Board

The WL Nuclear Performance Assurance Review Board (NPARB) provides a functional oversight for processes and facilities important to continued licensing of the WL site. The board reviews important and emerging risk areas, the performance and effectiveness of WL nuclear facilities, and the implementation of supporting processes and compliance programs needed to achieve operational excellence.

The NPARB meets quarterly and is currently chaired by the WL Site Head & General Manager (GM) and WL Site Licence Holder, and co-chaired by a senior manager appointed by the chair. The Terms of Reference for NPARB are documented in the *Nuclear Performance Assurance Review Board* document [17].

6.2.2 Management Review Meeting

The Management Review Meeting (MRM) considers the ImpActs [18] (see Section 7.11 of this QA Plan) and provides management oversight and advice to the MRM Chair for the ImpAct process to ensure prompt and proper disposition of significant problems affecting safe and effective operation. The MRM meets weekly. The Terms of Reference for MRM are documented in *Improvement Action (ImpAct) Management Review Meeting and Management Screening Team Terms of Reference* [19].

6.2.3 WL Site Safety & Health Committee

The WL Site Safety & Health Committee (SSHC) is dedicated to the promotion and improvement of the safety and health of employees and provides a forum for joint employee/management consultation and resolution of safety and health concerns in the workplace. The SSHC is mandated to meet at least nine times per year, but aims to meet monthly, and the meeting is co-chaired by a worker representative and a management representative. The Terms of Reference are documented in *WL Site Safety and Health Committee* [20].

6.2.4 Effectiveness Reviews and Corrective Action Review Board

The *Corrective Action Effectiveness Review Process* [21] describes the methodology and documentation of an effectiveness review. The *Corrective Action Review Board Terms of Reference* [22] defines its mandate and process. The Corrective Action Review Board (CARB) is a CNL Senior Line Management forum that provides continuous oversight of the health and effectiveness of the corrective action and improvement program.

6.2.5 WL Electrical Safety Committee

The WL Electrical Safety Committee (ESC) provides WL employees with a competent technical resource for guidance concerning implementation of electrical safety and work practices and also provides recommendations for the continued improvement of electrical safety at WL. The WL ESC meets monthly and is chaired by the Director, Environment, Radiation Protection, Licensing, & Quality. The Terms of Reference are documented in WL *Electrical Safety Committee* [23]. The ESC also has a representative on the company-wide Electrical Safety Working Group.

6.3 CNL Committees with WL Participation

Various company-wide committees provide oversight of CNL activities. These committees are formed of senior managers, managers, technical experts and augmented by supporting staff as needed. Terms of Reference documents describe the committees' mandate, membership and structure, responsibilities, and reporting requirements. These CNL committees include:

- *Training Oversight Committee* [24]
- *CNL Sustainability Leadership Committee* [25]
- *Health and Safety Policy Committee* [26]
- *Electrical Safety Working Group* [27]

7. Generic Requirements

7.1 The Business is Defined, Planned, and Controlled

WLDP provides integrated operational, compliance and project services to WL, and carries out the decommissioning of the WL site including shut down facilities, buildings, and clean-up of contaminated lands. WLDP's responsibilities include:

- Managing and reducing the risks such as Health, Safety, Security and Environment (HSSE) business and the liabilities associated with the WL site.
- Creating and operating the necessary systems, processes, and facilities for the safe, cost-effective, and compliant management of operational and decommissioning wastes at the WL site.
- Establishing a sound technical base that supports waste management, decommissioning and environmental remediation activities associated with legacy and operational wastes at the WL site.

The mandate of the WLDP is to manage and eliminate the nuclear liabilities safely and effectively (to protect the environment for future generations).

The vision of the WLDP is to be the "best in class" environmental site decommissioning team in Canada through our people, practices, and innovation.

The mission of the WLDP is to decommission safely and efficiently the Whiteshell site using sound environmental and waste management practices while optimizing value to the Canadian public.

The current decommissioning objectives of the WLDP are to:

- Deliver our decommissioning mission safely, more efficiently and effectively, increasing the percentage of our time spent on decommissioning, eliminating wasteful processes, improving our work throughput, and fostering innovation.
- Develop a world-class waste management organization fully integrated with CNL's waste management organization.
- Open, honest, and transparent communications both internally and externally to build trust within our staff, our regulator, our stakeholders, and regional Indigenous groups.
- Implement and use a site-wide work planning process that integrates with, and adds value to, existing processes to help achieve commitments, deliverables, and milestones.
- Work safely, in compliance with applicable requirements, and find innovative ways to expedite completion of Whiteshell decommissioning.
- Develop our highly skilled workforce to support our vision.

Under the WL Target Cost Agreement, CNL prepared a *Performance Baseline and Earned Value Management Plan* [28]. The Performance Baseline is a comprehensive, resource-loaded plan to execute the scope contained in the WL Target Cost Agreement. The Earned Value Management Plan reflects a systematic approach to the integration and measurement of cost, schedule, and technical accomplishments required to achieve closure of WL. In addition, WL developed a *Waste Management Plan* [29] and a *Risk Management Plan* [30]. The Waste Management Plan includes data related to WL waste volumes, waste type/characteristics, and packaging requirements for all wastes to be transported, disposed, or stored. The Risk Management Plan provides a comprehensive process for implementing Risk and Opportunity management.

7.2 The Organization is Defined and Understood

The overall organizational structure is described in the *CNL Management System Manual* [1] and the *Whiteshell Laboratories Organization* [5].

The WL Site Head & GM is the Site Licence Holder for the WL site. The responsibilities of the Site Licence Holder are described in the CNL *Management System Manual* [1].

The current list of individuals with responsibility for nuclear and non-nuclear facilities and buildings at WL is maintained in *Responsibility for Facilities and the Safety of Operations at the Whiteshell Laboratories* [31].

7.3 Personnel are Competent at the Work They Do

WLDP personnel shall be trained and qualified to perform tasks assigned to them. The selection and qualification criteria (i.e., competence, skills, knowledge, and experience) needed for each position shall be listed in accountability statements and position descriptions, prepared according to *Accountability Statements and Position Descriptions* [32]. In addition:

- Personnel shall be selected according to *CNL Staff Hiring* [33].
- Training plans shall be prepared for personnel in accordance with *Training Analysis* [34].
- Records shall be kept of training in accordance with *Conducting Training* [35].

Trades personnel working on decommissioning tasks shall have an inter-provincial certificate in their respective trade, or work under the direction of a tradesperson who has such a certificate. WLDP personnel shall be trained on CNL programs such as Occupational Safety & Health (OSH), Radiation Protection (RP), Environmental Protection (EnvP), Emergency Preparedness (EmP), and equipment requirements.

Specific training on CNL's *Performance Assurance PDD* [36] shall be provided to personnel with the aim of minimizing human performance errors, ensuring competent and safe execution of activities, and supporting a strong safety culture based on a formal and disciplined approach to all activities.

Management shall review training programs of their staff annually to determine if additional training is needed. Directors, Managers and Supervisors involved in decommissioning and supporting activities shall also perform periodic observation and coaching sessions, as described in *Observation and Coaching* [37], to promote a strong safety culture by reducing human errors and improving safety practices and work processes.

Training needs of WL nuclear facilities persons performing licensed activities (previously referred to as personnel in direct operating positions) shall be assessed and training programs shall be developed as described in the staffing and training plans for WL nuclear facilities, based on the CNL Systematic Approach to Training (SAT) process, as described in *Training and Development* (PDD and PRD) [38] [39].

7.4 Personnel Know What is Expected of Them

The responsibilities held by individuals shall be specified in accountability statements for managers and position descriptions for staff, prepared according to *Accountability Statements and Position Descriptions* [32].

Detailed Decommissioning Plans (DDPs) are created for individual facilities. Decommissioning objectives for WL are documented in *The Whiteshell Laboratories Detailed Decommissioning Plan* (*Volumes 1* to *Volume 12*). Details of proposed end-states and the steps needed to reach them are found in *Volume 1 – Program Overview* [40].

WLDP personnel are individually accountable to their respective Manager, Facility Manager, or Building Superintendent for the safety and quality of their own work. In turn, the Manager, Facility Manager or Building Superintendents are accountable to the Facility Authority or Landlord for executing decommissioning work safely and to the WL Site Head & GM for achieving decommissioning objectives.

Detailed decommissioning results are measured and compared to the expectations in the facility end-state reports. Performance is judged against the goals for the year (during performance appraisals for staff according to *Performance Management and Review Forms for Unionized Employees* [41] and *Performance Management for Non-Unionized Employees* [42]), and against deliverables in the annual review of progress for projects.

The establishment of decommissioning objectives and schedules take into account the required planning and oversight to ensure that decommissioning activities are performed safely and in compliance with applicable regulatory requirements and CNL compliance programs.

7.5 Work is Planned

WLDP maintains integrated resource-loaded schedules for projects and activities that provide a level of detail necessary to manage the work, identify project critical paths, and plan for necessary resources. A master site-wide schedule is maintained to reflect the latest plans as the decommissioning process evolves.

Day-to-day work is covered in various work planning documents and includes work requests, training plans, quality plans, inspection and test plans, work packages, and project execution plans.

The plan for decommissioning the WL site is presented in the *Whiteshell Laboratories Detailed Decommissioning Plan. Volume 1 – Program Overview* [40]. DDPs for individual facilities shall be prepared following the requirements of the CNL *Decommissioning Process* (STD) [64], CNSC Guide G-219 *Decommissioning Planning for Licensed Activities* [43], and *Independent Technical and Readiness Reviews* [45].

For decommissioning work, personnel prepare and coordinate the preparation of Work Plans. The Work Plans are documents containing higher-level plans and instructions for executing individual decommissioning work packages following the requirements of the *Work Planning for WL Decommissioning* [46].

These considerations are further developed to a work-ready state for execution using the *WL Integrated Work Control Process* [51] and documented within the project-specific *WL Decommissioning Work Instruction Package Process* [48].

The Work Plans shall also plan verification activities associated with the decommissioning work package (see Section 7.10 of this QA Plan). Work Plans shall be accompanied by an overview of verification activities, describing execution and verification activities of the decommissioning work. Details of the planned verification items preparation are described in Section 7.10 of this QA Plan.

In addition, any supporting or decommissioning activity that involves a risk of exposure to radiation or contamination shall be planned in accordance with *ALARA Review and Assessment – Planning and Control of Radiation Work* [47] and documented as part of the *Whiteshell Decommissioning Work Instruction Package (WIP) Process* [48].

Work activities for nuclear facilities shall be controlled, executed, and documented according to *Control of Operations* [49] and *Operations & Process Work Change Control* [50]. Work activities for the Maintenance Planning & Work Management will follow the *WL Integrated Work Control Process* [51]. Work activities for Engineering will follow *Design Authority and Design Engineering* (PDD and PRD) [52] [53].

7.6 Experience is Sought, Shared and Used

WLDP staff shall collect and evaluate information and experience from the previous operating phases of the facilities, and from previous and current decommissioning activities to improve decommissioning safety practices and performance standards.

Decommissioning experience (from CNL sites and non-CNL sites) is shared through discussion at Decommissioning Project meetings, Division meetings, Plan of Day meetings and Senior Management team meetings. Safety issues are discussed at regular WL site, branch, and work group meetings, for which a record is kept.

Safety performance and lessons learned of executed work are reviewed and captured in post-job reviews and post-work As Low As Reasonably Achievable (ALARA) reviews, in accordance with the ALARA program, *Radiation Protection* (PRD) [54], *ALARA Review and Assessment – Planning and Control of Radiation Work* [47], *Integrated Work Control* [55] and *Benchmarking* [56]. Benchmarking exercises are performed in order to both gain and share operating experiences with other CNL sites and external organizations.

Sharing of operating experience with other CNL groups as well as other external organizations is also done through CNL's *Performance Assurance* program [36]. Performance Assurance processes to provide feedback include:

- Documentation and distribution of lessons learned from internal and external sources, using communication methods including posting on myCNL, posting on the OPEX website, inclusion in the OPEX Bulletin, inclusion in the OPEX database and inclusion in ImpAct.
- Screening of industry information (any information that may have application to CNL is sent to Branch/Process/Facility Managers).
- Periodic trend analysis of information in the OPEX database, with reporting of trends and other information to facility authorities and senior management.

In addition, experience gained from *problems* (as defined in Section 7.11) shall be used to enhance safety and prevent the recurrence of such *problems*. *Problems* shall be reported, assessed, categorized, and investigated, if necessary, as described in Section 7.11 of this QA Plan.

7.7 Information is Provided in Time to the People Who Need It

WLDP staff are directed to electronic databases on myCNL or to the CNL's Document/Record Management System to access essential information to ensure that the right people have the current and correct information at the right time to prevent the use of obsolete documents.

The *Whiteshell Laboratories Organization* [5] identifies interfaces associated with WLDP, the nature of interface interactions, and functional positions/personnel responsible for controlling the information flow across the organizational boundaries.

7.8 The Performance of Work is Controlled

The safe execution of decommissioning activities, as well as contracted work, shall be controlled using the *WL Integrated Work Control Process* [51], documented within the *WL Decommissioning Work Instruction Package Process* [48] packages.

The safe execution of decommissioning activities, as well as contracted work also follows the *Decommissioning and Demolition Transfer Certificates process* [57] which collectively describes the considerations for final approval and authorization of decommissioning work, as well as adhering to the *Work Permit* procedure [58]. The *Engineering Change Control* process [66] also provides process assurance relevant to the control of decommissioning authorizations & approvals.

Decommissioning work activities shall also be controlled, executed, and documented according to written and authorized procedures. Supporting procedures and instructions shall be issued, as necessary, before any decommissioning activity is started.

Work activities for licensed nuclear facilities shall be controlled, executed, and documented according to *Control of Operations* [49] and *Operations & Process Work Change Control* [50].

Routine work at operating nuclear facilities is controlled through adherence to approved and authorized procedures. The policy of adherence is conveyed to staff through training in the use of the QA plan and Event Free Tools, as well as through periodic safety meetings.

7.9 The Preparation and Distribution of Documents are Controlled

The identification, review, approval, and issue of documents, and removal of obsolete ones, shall be controlled as described in *Creation, Capture, and Use of Information Assets* [59] and *Document Numbering Principles* [60]. New and revised documents shall be reviewed for adequacy and approved for release by authorized personnel, in accordance with *Processes to Create, Capture, and Use Records* [61].

Whiteshell Laboratories Site Governing Documentation Index [15] shall be used to provide a mandatory list of reviewers and an approval responsibility matrix for WLDP formal documents. Formal documents shall follow the requirements of *Protection of Information* [62] to ensure that the sensitivity of CNL information is assessed and the proper level of protection is applied.

7.10 Work is Verified to Confirm that it is Correct

Required verification activities, the extent of which varies depending on the complexity of the work and the potential impact on safety or the environment, shall be specified in work plans and work procedures, including nuclear facility procedures.

Project Leaders shall document planned verification activities as a part of the decommissioning work planning process (see Section 7.5 of this QA Plan) according to *Event Free Tools* [63]. This is done under guidance of the *WL Integrated Work Control Process* [51], within the *WL Decommissioning Work Instruction Package Process* [48] packages, following the *Decommissioning and Demolition Transfer Certificates process* [57], and *Engineering Change Control process* [66].

These processes and resulting documents, together with *Work Planning for WL Decommissioning* [46] shall be used together to plan the execution and verification activities to be performed during decommissioning work.

Work instruction packages, describing execution and verification activities of a specific decommissioning work plan, shall be prepared according to the *WL Integrated Work Control Process* [51], and the *WL Decommissioning Work Instruction Package (WIP) Process* [48] and will form the basis of work execution verification control.

Decommissioning work shall be authorized and documented in accordance with the above referenced processes. The verification of the condition of a facility after decommissioning is partially or totally completed shall be documented in an End-State Report per the CNL *Decommissioning Process* [64]. Radiological release surveys of materials, equipment and buildings shall be conducted using survey methods, techniques, and acceptance criteria compliant with CNL*'s Radiation Protection* requirements [54] and *Radiological Disposition and Clearance of Buildings, Lands and Materials* [65].

Design Engineering verification activities are outlined in *Design Authority and Design Engineering* (PDD and PRD) [52] [53], *Engineering Change Control* [66] and *Execution of Design Review and Verification* [67].

Decommissioning and non-decommissioning verification activities, including prerequisites, inspections, tests, and sequences, hold and witness points, acceptance criteria and required documentation, can also be specified in inspection and test plans. Examples of test plans are Manufacturing Inspection and Test Plan (MITP) and Piping Inspection and Test Plan (PITP).

CNL document *Surveillance* [68] describes the requirements, responsibilities, and process for planning, executing, and recording surveillance activities during design, fabrication, construction/ installation, commissioning, and decommissioning services including surveillance of work performed by external contractors.

7.11 Problems are Identified and Resolved

Problems defined as any event, issue, non-conformance, or opportunity for improvement, shall be identified, reported, tracked, and corrected in accordance with the *Improvement Action (ImpAct) Corrective Action Program* [18]. ImpAct is a standardized process to document and correct problems, prevent occurrence/recurrence of significant problems and address opportunities for improvement at CNL, including WL. ImpAct is part of CNL's *Performance Assurance* program [36] (see Section 7.6 of this QA Plan).

During decommissioning activities, ImpAct shall be used to:

- Document and address *problems* and opportunities for improvement.
- Assign responsible individuals to address *problems* and opportunities for improvement.
- Determine causes of *problems* and implement required corrective, remedial, or compensatory actions.
- Identify trends of *problems* and start corrective actions.
- Identify lessons learned and undertake actions to prevent recurrence.

The trend analysis of problems, conducted in accordance with *Trend Analysis* [69], shall be used to address adverse trends and start corrective action.

The annual review of the management system shall incorporate relevant information resulting from such analysis as outlined in the *Integrated Management System Review* [16].

Improvement Action (ImpAct) Corrective Action Program [18] shall be followed to analyze recurring or serious problems, assign their significance level, determine their causes, and devise corrective, remedial, or compensatory actions to prevent recurrence. ImpAct shall also be used to correct the causes of potential problems to prevent their occurrence.

7.12 Changes are Controlled

Change control applies to any changes during the execution of decommissioning work including but not necessarily limited to scope, schedule, resourcing, documents, processes and practices, technique, configuration, methodology, equipment, and implementation. Changes include the deviation, alteration, or augmentation of the original planned work.

In addition, the requirements of *Independent Technical and Readiness Reviews* [45] shall be followed when a change is made to a DDP or Work Plan that affects the original HSE evaluation.

Changes to formal and support documents (including documents that describe processes and practices) shall be proposed, reviewed, approved, implemented, and documented as described in:

- *Creation, Capture, and Use of Information Assets* [59]
- *Document Numbering Principles* [60]
- *Processes to Create, Capture, and Use Records* [61]

Changes in engineering design, including decommissioning work performed in operating nuclear facilities, shall be proposed, reviewed, approved, implemented, and documented as outlined in *Engineering Change Control* [66].

Changes to nuclear facilities operations and processes shall be proposed, reviewed, approved, and executed as per *Operations & Process Work Change Control* [50].

Changes to organizations are outlined in the *Organizational Change Control Process* [70]. This procedure assigns accountabilities and related requirements for preparing, reviewing, approving, implementing, documenting, and monitoring changes to roles and responsibilities, and to governing documentation.

Changes to the contract between AECL and CNL are managed per the variation process outlined in the WL Target Cost Agreement.

7.13 Records are Maintained

Records provide documented evidence that items and services meet specified requirements. *Retention, Preservation, and Disposition of Information Assets* [71] and *Processes to Retain, Preserve, and Dispose of Information Assets* [72] details how project essential records shall be identified, stored, maintained, protected, and retrieved. In some cases, the procedure is supplemented by local procedures, for example, *WL Engineering Records Management* [73] or *Construction Document & Records Control* [74].

All essential records are stored in CNL'S Document/Record Management system. CNL'S Document/Record Management system is backed up regularly, and records are inspected. Information Management ensures records are complete, valid, legible, retrievable, and traceable as per *Creation, Capture, and Use of Information Assets* [59].

Essential records, formal records, and documents shall be identified and submitted for archiving to Information Management with the corresponding Subject Index (SI). For the current and complete list of AECL Subject Index (ASI) or Basic Subject Index (BSI) number, refer to the official lists on myCNL.

7.14 Assessments are Performed

The effectiveness of the CNL management system and the quality assurance program shall be reviewed on an ongoing basis. This monitoring process includes self-assessments, program surveillance, management system assessments, and independent assessments (see Sections 7.14.1 and 7.14.2 of this QA Plan). Management shall confirm that work activities meet the requirements of the management system and the quality assurance program and identify opportunities for improvement in accordance with *Integrated Management System Review* [16] and *Nuclear Performance Assurance Review Board* [17] processes, which provide functional oversight of the decommissioning and supporting activities.

7.14.1 Self-Assessment

Management shall periodically assess compliance of the implementation of the management system and quality assurance program. The WL Section Head QA/QC, in consultation with the WL Site Head and GM, Directors and the Quality Assurance Specialists, shall prepare an annual line assessment plan which is merged with the company-wide integrated assessment plan to confirm compliance of the implementation of the management system and the quality assurance program. Such self-assessments shall be conducted as specified by the *Self-Assessment* procedure [75]. WLDP personnel shall help with these assessments when requested by management.

7.14.2 Independent Assessments

Independent assessments of the CNL Management System and Quality Assurance program shall be conducted periodically to:

- Evaluate the effectiveness of processes in meeting goals, strategies, plans, and objectives.
- Determine the adequacy of work performance and leadership.
- Evaluate the organization's safety culture.
- Monitor product quality.
- Identify opportunities for improvement.

CNL's Quality Assurance division is responsible for scheduling, planning, preparing, conducting, and reporting quality audits for WLDP, in accordance with *Quality Audits* [76]. An Annual Audit Schedule is prepared based on the Audit Program Plan and is revised, as necessary.

The results of independent assessments shall be documented and reported to the level of management having sufficient responsibility to ensure that any identified problems are resolved.

8. Specific Requirements

8.1 Design

The *Engineering Change Control* process [66] covers the proposal, review, approval, authorization, implementation, and documentation of permanent and temporary changes to facility equipment, systems, structures and components, processes, and controlled computer software as well as the use of non-identical items.

Design work is processed systematically from the receipt of a Change Request, through all work phases to job closure.

Design Authority and Design Engineering (PDD and PRD) [52] [53] defines the technical requirements of the design process for WL Decommissioning. *Execution of Design Review and Verification* [67] defines the process for verification activities to ensure that the design will meet the design requirements. When verifiers are not available within the design organization, verification is performed by competent personnel from outside the WL organization by a qualified third party, the client, or the client's delegate.

Line Management monitors work progress through all phases and verification is conducted at defined stages to provide relevant checks and inputs. The *Contracts and Contractor Management* [77] and *Oversight of Design Agencies* [78] documents provide direction on the management of external design engineering services for use within WL Decommissioning.

The requirements, responsibilities, and process for controlling the preparation, review, approval, and issue of all formal design documentation produced by WL are provided by *Production and Acceptance of Design Documents* [79]. Where traceability is needed in subsequent phases, the affected systems, components, and structures are identified in the design output documents.

Design activities involving pressure boundary items are carried out in conjunction with the *WL Pressure Boundary Quality Assurance Plan* [80].

NOTE: Any software used for safety analysis or design calculations must meet the requirements of CSA N286.7 [81] as per the *Analytical, Scientific, and Design Computer Programs* [82] QAP. As well, any Instrument and Control (I&C) Systems that have real-time programmable electronic systems (PES) must meet the requirements of IEC 61513 as per *Real-Time Programmable Electronic Systems* (PES) [83] QAP.

Engineering at WL must adhere to the *WL Engineering Governing Documentation Index* [89].

8.2 Safety Analysis

Non-routine work to take place in a nuclear facility shall first be reviewed and approved in accordance with *Operations & Process Work Change Control* [50]. Proposed modifications and non-routine work shall be subject to Safety Review Committee (SRC) review as described in *Independent Technical and Readiness Reviews* [45] if they meet the conditions described therein.

Safety Analysis (PDD) [84] defines the requirements, responsibilities and process for the planning, performance, checking, review, and approval of safety analysis.

A requirement for independent review of new facilities, including requirements for safety analysis reports, is described in *Independent Technical and Readiness Reviews* [45].

NOTE: Any software used for safety analysis or design calculations must meet the requirements of CSA N286.7 [81] as per the *Analytical, Scientific, and Design Computer Programs* [82] QAP.

8.3 Safe Operating Envelope

A Facility Authorization (FA) sets out the key requirements, conditions, and limits for safe operation of nuclear facilities, in accordance with the *WL Decommissioning Licence* [6]. The WL Decommissioning Licence lists the Facility Authorization documents.

Operating nuclear facilities at WL must adhere to the *Whiteshell Laboratories Waste Characterization and Processing Governing Documentation Index* [85] or the *Waste Storage and Disposition Facilities Governing Documentation Index* [86].

8.4 Purchasing and Material Management

Procurement activities for services and items required by WLDP shall be performed in accordance with the *Supply Chain* (PDD and PRD) [87] [88] and associated procurement and material management procedures referenced therein.

Specifically, as regards to procurement, items that must meet certain specifications or requirements of technical standards shall be procured from authorized vendors/suppliers and inspected on arrival. Procurement, receipt, handling, storage, and issue of material shall be controlled in accordance with the *Supply Chain* (PDD and PRD) [87] [88].

Other aspects of material control, including selection of quality program requirements, identification, traceability, and inspection and testing, shall be performed in accordance with the *WL Engineering Governing Documentation Index* [89], the *Whiteshell Laboratories Governing Document Index* (GDI) [15], and procedures referenced therein. In particular, for pressure-retaining components and systems the quality control program described in *WL Pressure Boundary Quality Assurance Plan* [80] shall apply.

8.5 Identification and Labelling of Systems and Components

In developing Work Plans, personnel shall ensure that systems, structures, and components in a facility or site area, shall be assigned an equipment code to ensure they can be accurately described in applicable documents and records. Where ambiguity may exist, identification shall be applied before work begins. Equipment codes are recorded and maintained by WL Engineering personnel in accordance with the *WL Engineering Drawing Office Manual* [90].

Items of field equipment required in a facility are assigned an identification code to ensure that equipment can be related to work activities, applicable documents, and records. Equipment requiring maintenance is tracked in the computer maintenance management system database (CMMS).

Systems, structures, and components presenting radiological and non-radiological hazards shall be also labelled.

Equipment that may be required to be operated in an emergency is known to those trained to respond to emergencies (e.g., firefighters, Radiation Protection personnel), including locations and how to use the equipment, and are labelled as needed.

Radiological hazards shall be identified with caution signs in accordance with *Radiation Protection* [54] and associated Radiation Protection Manuals (RPM), such as *Areas and Zones* (RPM-7.2) and *Radiological Hazard Warning Signs* (RPM-7.4).

Non-radiological hazards shall be identified with caution signs in accordance with *Occupational Safety and Health* (PDD) [91] and *Safety Signage* [92].

8.6 Security

Nuclear facilities at WL are located within secured areas surrounded by a security fence. Where required, the individual facilities are locked and have the proper restricted entry signage displayed. Access to facilities shall be controlled following the requirements of *Security* (PDD and PRD) [93] [94] and *Access Control* [95].

The Manager, Emergency Services Operations, is responsible for providing access control, visual monitoring and patrolling, an extensive surveillance system to detect and deter unauthorized access to the laboratories and facilities, and site fire protection. CNL adheres to the security policies of the Government of Canada. The measures for WL Security are specified in *Whiteshell Laboratories Site Security Report* [96].

8.7 Construction and Installation

Construction and installation of nuclear and safety-related systems shall be done in accordance with the requirements of *Construction* [97].

8.8 Commissioning

Commissioning activities shall be done in accordance with the requirements of *Commissioning* [98].

8.9 Turnovers

The turnover process is how a facility, system, building, area or parts thereof is turned over from one lifecycle phase to another (e.g., design to construction, construction to commissioning, commissioning to operations, and operations to decommissioning).

The turnover process requires that, prior to acceptance:

- Turnover documentation shall be completed and collected.
- Boundaries and other information relating to status of a facility, structure, or system shall be clearly defined, for example in the specific decommissioning Work Plan of that facility, structure, or system.
- A walk down shall be completed to verify conditions of the facility, structure, or system.
- Regulatory requirements have been met.

The turnover process of facilities, structures and systems at WL shall be performed and documented in accordance with the requirements described in *Decommissioning and Demolition Transfer Certificates* [57] and *Engineering Change Control* [66].

8.10 Complete Assurance

Design, purchasing, construction, commissioning, and decommissioning activities shall be considered sufficiently complete and safe for the intended use. Completion assurance shall be performed and documented in accordance with the requirements described in *Engineering Change Control* [66], *Commissioning Completion Assurance* [99], *Commissioning* [98] and *Independent Technical and Readiness Reviews* [45].

8.11 Operating the Plant

The current list of individuals with responsibility for nuclear and non-nuclear facilities and buildings at WL is maintained in *Responsibility for Facilities and the Safety of Operations at the Whiteshell Laboratories* [31]. The Facility Authorities and Landlords are responsible for protection of the environment, and the overall safe operation and use of nuclear and non-nuclear facilities and buildings at WL. The Facility Managers and Building Superintendents are responsible for ensuring that activities taking place in those facilities are in compliance with the:

- Respective Facility Authorization documents.
- Requirements of the WL Decommissioning Licence.
- Regulations from the CNSC.
- Applicable federal and provincial legislation.
- Requirements of the Safety Review Committee (SRC) described in *Independent Technical and Readiness Reviews* [45].
- Management System and Quality Assurance program described in this QA Plan.

The facility/building personnel are responsible for day-to-day safe operation, use, and maintenance of the facilities, in accordance with established practices as well as approved and authorized procedures.

The Facility Authorities and Landlords and the Facility Managers and Building Superintendents, each have the authority to cease or halt the operation of any facility under their control, or any activity within a facility under their control, for reasons of safety or non-compliance with regulatory requirements.

In the absence of Line or Facility Management, Group 1 Radiation Protection staff also has the authority to cease or halt an activity for radiation safety reasons in accordance with *Radiation Protection* [54]. Also, Quality Assurance has the authority to cease or halt an activity for conditions adverse to quality in accordance with the *Stop/Start Work Authority* [100].

8.12 Communications

Clear, concise, and correct communication, within WLDP organization and between WLDP and other organizations, shall be performed through the requirements outlined in the procedure *Event Free Tools* [63]. The aim of this communication is to minimize human performance errors, ensuring competent and safe execution of activities and reaching quality goals.

Directors, Managers, Supervisors, and Project Leaders shall conduct observation and coaching sessions to provide feedback on the work performance, as described in *Observation and Coaching* [37].

Facility Managers and Supervisors shall also hold informal meetings with WLDP staff, and contractor personnel to go over the planned activities and ensure that assignments are clearly communicated and understood.

Technical details of work activities, such as potential hazards, safety measures, and contingencies, shall be communicated to the decommissioning and contractor personnel before the job is undertaken, through pre-job briefings (which may include walk downs). The communication of the technical details of the work activities will follow the requirements outlined in:

- *ALARA Review and Assessment – Planning and Control of Radiation Work* [47]
- *Event Free Tools* [63]
- *Work Planning for WL Decommissioning* [46]
- *Whiteshell Decommissioning Work Instruction Package Process* [48]

8.13 Plant and Status Control

Systems and equipment are entered in the WL maintenance database, which is maintained by WL Maintenance Planning & Work Management personnel. The WL maintenance database identifies both scheduled (preventive) maintenance and demand maintenance (service requests).

Turnover certificates, produced as per *Decommissioning and Demolition Transfer Certificates* [57] (see Section 8.9 of this QA Plan), shall be generated to transfer information on the status of systems, structures and components being decommissioned.

Work areas shall be identified as per *Safety Signage* [92] and *Temporary Safety Barriers* [101]. The status of equipment, systems, structures, components being decommissioned shall be described in the corresponding Work Plan of the facility, as outlined in *Work Planning for WL Decommissioning* [46].

The status of equipment, systems, structures, and components shall be also communicated to WLDP staff during pre-job briefings, following the requirements outlined in:

- *Radiation Protection* [54]
- *Event Free Tools* [63]
- *Work Planning for WL Decommissioning* [46]
- *Work Permit* [58]
- *Hazardous Energy Control* [102]

Changes to systems, structures and components shall be approved, documented, and communicated to WLDP staff. WLDP staff shall record the status of systems, structures, and components in decommissioning or facility logbooks. Deficient equipment shall be identified and isolated, following the requirements of *Occupational Safety and Health* (PDD) [91].

Permitted activities shall be controlled using the *Work Permit* procedure [58]. *Hazardous Energy Control* [102] shall be used, where applicable, to safeguard personnel and property from unexpected release of uncontrolled hazardous substances or energy from equipment, processes or systems, or loss of protective systems inadvertent during the performance of the work.

8.14 Operator Surveillance

Surveillance of WL facilities includes performing routine alarm and equipment tests, radiological surveys, and physical inspections to assess the working condition of structures, systems, and equipment, and to detect and minimize the impact of any potential problems.

Facility staff or maintenance personnel as specified in facility operating procedures shall perform alarm and equipment tests as per *Surveillance and Testing* [103]. Facility staff shall inspect any permanently shut down nuclear facility (as listed in the *WL Decommissioning Licence* [6]) or part of a permanently shut down nuclear facility, to assure that the safe shutdown state is maintained.

Facility staff shall also routinely perform housekeeping inspections on each nuclear facility being decommissioned as described in *Housekeeping Activities in WL Nuclear Facilities* [104]. In turn, Emergency Services Operations staff shall daily inspect any permanently shut down non-nuclear facility to assure that the safe shutdown state is maintained.

For facilities in Storage-with-Surveillance (SwS) phases of decommissioning, SwS plans shall be prepared in accordance with *Decommissioning Process* standard (STD) [64] including details of facility-specific inspection programs specifying the frequency and responsibilities for physical inspections, equipment testing, and monitoring of operating systems.

8.15 Surveillance Testing

Surveillance testing shall be carried out in accordance with *Surveillance and Testing* [103].

8.16 Operating Procedures

The process and responsibilities for the preparation, revision, approval, authorization, review, control, and maintenance of procedures in use at the operating WL nuclear facilities are described in the following documents:

- *Creation Capture and Use of Information Assets* [59]
- *Document Numbering Principles* [60]
- *Document Number Reference System* [105]
- *Standard Format and Presentation of CNL Documents* [106]

Operating procedures and working-level documents providing detailed step-by-step descriptions of tasks and activities, are written to ensure consistent and safe working practices. The level of detail included in an operating procedure is proportionate with the complexity of the activity and the potential hazard.

Procedures shall be reviewed for technical content and presented in a manner that can be easily interpreted and followed by trained facility staff. *Creation Capture and Use of Information Assets* [59] and the *Standard Format and Presentation of CNL Documents* [106] also gives the requirements for the contents and format of operating procedures for WL nuclear facilities.

Temporary procedures are required for planned activities for which routine procedures cannot be used, e.g., during equipment performance testing. These procedures shall be authorized for use for a specified period and shall be reviewed regularly to ensure the conditions governing their application still exist.

When temporary procedures no longer apply, they shall be removed from use (e.g., by being marked “Obsolete”) as soon as practical. The use and duration of temporary procedures shall be minimized. *Creation Capture and Use of Information Assets* [59] gives the requirements for the contents of operating procedures, including temporary procedures, for the WL nuclear facilities.

Operating procedures shall be used and adhered to, including a Usage Classification designation, in accordance with *Event Free Tools* [63]. Operating procedures shall also be made available to staff in a controlled manner as described in *Processes to Create, Capture, and Use Records* [61]. The policy of adherence is conveyed to staff through training in the use of this QA Plan and Event Free Tools, as well as through periodic safety meetings.

8.17 Emergency Procedures

Emergency procedures for buildings shall be developed and maintained to address non-routine conditions calling for immediate response (e.g., bomb or terrorist threat, fires, unexpectedly high radiation fields or airborne contamination as documented in Section 8.25 and 8.26 of this QA Plan, *Emergency Preparedness Requirements* [107] and *Whiteshell Laboratories Emergency Plan* [108]). Current copies of emergency procedures shall be kept in prominent and easily accessible locations in buildings.

If a serious upset or emergency condition occurs and the existing procedure is inadequate or there is no procedure for the situation, WLDP staff shall perform a safe-back-out and put the facility in a safe state. WLDP staff shall also notify the proper Facility Manager and RP personnel, and shall, in any event, document their actions as described in Section 7.11 of this QA Plan (e.g., raising a *Problem*).

The actions taken may include such measures as restricting access to the affected area, limiting the release of contamination, and curtailing the source of the problem, as described in *Whiteshell Emergency Operations Centre Operating Procedure* [109].

Depending on the degree and significance of the event, the Site Emergency Officer can be contacted and the *Whiteshell Laboratories Emergency Plan* [108] can be activated to help deal with the emergency.

8.18 Infrequently Performed Operations

Infrequently performed operations shall be conducted in accordance with the *WL Integrated Work Control Process* [51], *Operations & Process Work Change Control* [50] and *Work Permit* [58]. Technical details of decommissioning or supporting activities, such as potential hazards, safety measures, and contingencies, shall be communicated to personnel before the job is undertaken.

This communication is done through pre-job briefings, following the requirements of *Event Free Tools* [63] and for detailed work planning by following the *Whiteshell Decommissioning Work Instruction Package (WIP) Process* [48] and *Work Permit* [58].

8.19 Maintenance

Systems, structures, and components in nuclear and non-nuclear facilities are maintained through a combination of maintenance activities, as described in the *WL Integrated Work Control Process* [51]. Maintenance activities are conducted by following procedures and practices which have been approved through processes defined in procedure *WL Integrated Work Control Process* [51] as well.

The Maintenance Program at WL covers all maintenance activities including the program basis, work assessment, work planning/scheduling, monitoring, inspecting, testing, calibrating, servicing, overhauling, repairing, modification, and replacement of parts to ensure that systems, structures, and components function as per design.

Maintenance at WL must adhere to *Maintenance* [110].

8.20 Calibration of Measuring and Monitoring Devices

Calibration of system instrumentation by MP&WM is carried out as per *Calibration* [112]. A maintenance database is used to schedule preventive maintenance and instrument calibrations (see Section 8.19 of this QA Plan).

Radiation-protection equipment shall be maintained and calibrated in accordance with the requirements of *Radiation Protection* [54], *Radiation Protection Instrumentation* [113], and *Care and Control of Calibrated Monitoring and Measurement Equipment* [114].

NOTE: The *Calibration Program QAP* [111] and associated *Calibration* procedure [112] outlines the calibration policies and procedures involved in the selection, use, calibration, and control of equipment and instruments used during calibration.

8.21 Periodic Inspection

Periodic inspections shall be carried out for a nuclear and non-nuclear facility in conformance with applicable codes and standards, as part of the *WL Integrated Work Control Process* [51]. Facility operation and use shall be scheduled to accommodate the required periodic inspections.

8.22 Systems Health Monitoring

The condition of structures, systems, and components are evaluated through the *WL Integrated Work Control Process* [51], which takes into consideration common and recurring problems and recommends changes and/or improvements.

8.23 Chemistry Control

Chemistry control encompasses activities associated with maintaining the radiological and chemistry specifications for the active liquid waste and the lagoons, including:

- Monitoring of chemical parameters to detect abnormal conditions and correct them in a prompt fashion.
- Periodic sampling, analysis, and screening of chemical data for chemistry control problems.

The active liquid waste treatment systems and the lagoons have Standard Operating Procedures specifying how to perform technical activities in that facility.

Additionally, bulk chemicals, laboratory chemicals, corrosive agents, and cleaning agents shall be effectively controlled to ensure safe and proper handling, storage, and use in accordance with *Safe Storage and handling of Hazardous Products* [115], *Operation of WL Hazardous Waste Storage Facility Building 570* [116]. The requirements of *Workplace Hazardous Material Information System (WHMIS)* [117] shall be followed for labelling all such materials.

8.24 Radiation Protection

WLDP management shall ensure that the principles of *Radiation Protection* [54] are effectively applied and implemented in aspects of WLDP activities. Particularly, they shall:

- Provide and maintain a radiologically safe working environment.
- Satisfy themselves that WLDP personnel have proper Radiation Protection training proportional with the nature of their duties.
- Put into place measures to minimize radiation exposure hazards.
- Monitor dosimetry data to assess the effectiveness of Radiation Protection measures.

Personnel dosimetry, radiological surveys and zoning, radiological work planning, engineering controls, access control, and a comprehensive radiation protection training program shall be in place to ensure that the radiological dose received by personnel is maintained ALARA.

Such measures shall be carried out according to *Radiation Protection* [54] and *Occupational Safety and Health* (PDD) [91], which ensure the safety and protect the health of WLDP personnel and contractors from radiological and non-radiological hazards while working at WL. In particular, safety and training requirements for contractors shall be assessed and documented in accordance with *Contractor HSE Assessments* [118].

Non-radiological hazardous material and industrial hazards shall be controlled through compliance with *Occupational Safety and Health* (PDD) [91] and *Environmental Protection* (PDD) [119]. Non-radiological hazards shall be identified with safety signage according to *Safety Signage* [92].

Particularly, non-radioactive hazards created by the decommissioning activities at WL, such as open holes, unsafe flooring, and excavation, shall be identified through commercially available industry standard safety signs in accordance with the *American National Standard Institute*, ANSI Z535.2 [120].

Contamination shall be controlled in accordance with *Radiation Protection* [54] and the associated Radiation Protection Manuals (RPM) governing contamination control, such as *Design and Modifications* (RPM-7.1), *Radiological Areas and Zones* (RPM-7.2), *Access Control* [95], *Radiological Hazard Warning Signs* (RPM-7.4), etc. In addition, workers shall be protected against non-radiological contamination according to the requirements of *Occupational Safety and Health* (PDD) [91].

Specific radiological contamination and decontamination control measures for decommissioning activities shall be assessed, documented, and controlled in accordance with *ALARA Review and Assessment – Planning and Control of Radiation Work* [47] and *Work Planning for WL Decommissioning* [46].

8.25 Fire Protection

A fire safety program, as outlined in *Fire Protection* (PDD) [121], shall be applied to ensure that fire safety measures are in place at WL.

Fire Protection at WL must adhere to the *Fire Protection Governing Documentation Index* [122].

8.26 Emergency Preparedness

Emergency procedures, compliant with the *Emergency Preparedness* (PDD) [107], have been developed and implemented to ensure the protection of personnel, the public, the environment, and the facilities from radiological and non-radiological hazards resulting from unplanned events and abnormal conditions.

These procedures are described in the *Whiteshell Laboratories Emergency Plan* [108]. The *Whiteshell Emergency Operations Centre Operating Procedure* [109] provides procedures for setting up and operating the WL Emergency Operations Centre (EOC), which is the planned location for site decision-making and communication during control and recovery from emergency events.

This procedure describes the:

- Emergency conditions that may occur
- Emergency signals and alarms
- Organization, authority, and responsibilities of personnel in emergency situations
- Communications
- Resources
- Emergency response training
- Correct response for each identified emergency condition

Procedures shall be reviewed and accepted by the WL Emergency Preparedness Program Manager prior to issue. Emergency procedures shall be prepared, reviewed, revised, approved, authorized, and distributed in a controlled manner as outlined in *Creation, Capture, and Use of Information Assets* [59]*, Processes to Create, Capture, and Use Records* [61]*, and Retention, Preservation and Disposition of Information Assets* [71].

Building emergency procedures are also applicable to decommissioning activities performed within a building or facility. These procedures shall be updated or supplemented if the decommissioning activities introduce a risk for hazards or emergencies outside the scope of the hazards and response procedures described in the building emergency procedure.

The effectiveness of the Emergency Preparedness program is evaluated on a regular basis using drills, exercises, inspections of emergency equipment/supplies, and audits.

Dissemination of public information will follow the requirements set out in *Public Information Program for Canadian Nuclear Laboratories* [123].

8.27 Workplace Safety

Specific training on CNL's *Performance Assurance* program [36] and *Occupational Safety and Health* program [91] shall be provided to WLDP personnel. This training has the goal of minimizing human performance errors, ensuring competent and safe execution of activities, and supporting a strong safety culture based on a formal and disciplined approach to all activities.

The Rules to Live By are CNL's commitment to the health and well-being for all employees. WLDP personnel are responsible for our own safety and the safety of those we work with. The Rules to Live By (listed below) are critical to ensuring safety:

- Hazardous Energy Control: De-energize and secure equipment/systems before work.
- Working at Heights: Use required fall protection systems when working at heights.
- PPE & C: Wear appropriate personal protective equipment and clothing.
- Hoisting / Rigging: Use proper lifting, hoisting, and rigging techniques.

- Confined Space Entry: Obtain necessary approval prior to entering any confined space.
- Temporary Safety Barriers: Respect and comply with barriers.
- Hot Work: Obtain proper clearances required for any hot work.

For WL, the following three Rules to Live By (for a total of ten Rules to Live By) are also included due to the decommissioning work taking place:

- Traffic Safety: Follow local law and regulations regarding traffic controls and safety (speed limits, signs, etc.).
- Heavy Equipment: Stay alert and be aware at all times while in areas where heavy equipment is operating.
- Excavations: Confirm utility locates, verify slopes are stable, and be aware of potential atmospheric hazards.

WLDP management and staff shall ensure that a strong safety culture, based on a formal and disciplined approach, prevails on activities related to WLDP work, as outlined in *Performance Assurance* (PDD) [36].

WLDP personnel shall also carry out their duties in compliance with the applicable compliance programs. They shall use and adhere to approved working documents, as described in *Event Free Tools* [63].

WLDP personnel shall also apply safe work practices using a systematic, formal, and disciplined approach while performing their duties, as described in *Event Free Tools* [63].

Self-Checking practices, as per *Event Free Tools* [63] shall be performed in WLDP work to enhance attention to detail, prevent errors, and detect abnormal equipment or errors in verbal and written instructions.

In addition, WLDP personnel, when faced with an uncertain situation, shall apply Conservative Decision-Making in such a way that the final decision made always reflects Caution, as described in *Event Free Tools* [63].

WLDP management and staff shall promote a strong safety culture within the WL Decommissioning Project organization [5] and other organizations, as described in *Observation and Coaching* [37]. In addition, they shall ensure that the principles of *Radiation Protection* [54] are effectively applied and implemented in all aspects of WLDP activities.

More specific worker safety measures shall be described in detail in the work plan or in enhanced planning support documentation (e.g., a radiation work plan (RWP)), prepared, according to *Work Planning for WL Decommissioning* [46], to decommission a specific facility).

Particularly, the corresponding hazard assessments prepared as *Whiteshell Decommissioning Work Instruction Package (WIP) Process* [48] or *ALARA Review and Assessment – Planning and Control of Radiation Work* [47], shall describe worker safety requirements such as protective clothing and equipment, internal and external dosimetry, and radiological control hold points.

In addition, worker safety measures shall also be addressed in a comprehensive manner though pre-job briefing sessions, in accordance with *Event Free Tools* [63].

Prior to execution, WLDP work shall be documented, controlled, and authorized as described in:

- *WL Integrated Work Control Process* [51]
- *WL Decommissioning Work Instruction Package Process* [48]
- *Decommissioning and Demolition Transfer Certificates process* [57]
- *Engineering Change Control* process [66]

The requirements described in *Workplace Hazardous Material Information System (WHMIS)* [117] shall be followed for hazardous materials.

8.28 Hazardous Waste Management

Wastes generated as part of routine activities and projects in facilities being decommissioned shall be characterized and segregated into radioactive and non-radioactive categories as outlined in *Waste Management* (PDD) [124]. Wastes shall be minimized through good housekeeping, proper practices, and decontamination.

Radiological Disposition and Clearance of Buildings, Lands and Materials [65] provides the requirements, processes, and procedures for planning, conducting, evaluating, and documenting radiological disposition and clearance surveys in support of the decommissioning of buildings and lands at WL. This includes building materials and equipment, interior and exterior building surfaces, ground surfaces, and excavated soils.

During WLDP (decommissioning and supporting) work activities, wastes shall be identified, tagged, and traced to their final storage or disposition in appropriate waste management facilities.

Hazardous radioactive and non-radioactive solid and liquid waste shall be managed in compliance with *Management of Waste* [125] and *Non-Radioactive Hazardous Chemical Waste Handling and Storage* [126], which deals with the various categories of non-radioactive hazardous waste at WL. Handling and storage of radioactive liquid and solid waste currently takes place in Buildings 100 and 300, the Waste Handling Area and Waste Management Area (WMA).

Non-radioactive wastes and materials shall receive radiological clearance surveys in accordance with *Radiological Disposition and Clearance of Buildings, Lands and Materials* [65] and *Whiteshell Laboratories Closure Project Waste Management Process Plan* [127].

8.29 Effluent Control

Environmental Protection Program requirements are documented in *Environmental Protection* (PDD) [119] and supplemented by *Environmental Protection Governing Documentation Index*

[128]. The Environmental Protection Program provides the framework to implement CNL's *Environment Policy* [129].

Effluent monitoring shall comply with *Management and Monitoring of Emissions* [130], and shall be provided as part of the Environmental Protection Program, in accordance with the following WL procedures:

- *Waste Management and Effluent Control* [131]
- *WL Effluent Verification Monitoring Plan* [132]
- *Verification Monitoring and Environmental Monitoring Station Maintenance and Calibration Technical Procedure* [133]
- *WL Environmental Monitoring Plan* [134]

Additional monitoring is conducted to meet the WL Decommissioning Licence requirement and reported annually (e.g., WL Compliance Monitoring Report [135]).

8.30 Decommissioning

Cleanup (PDD and PRD) [7] [8] and *Decommissioning Process* (STD) [64] describe the decommissioning process as applied to decommissioning activities throughout the facility lifecycle. This lifecycle spans from preliminary decommissioning planning prior to construction, through shutdown, detailed decommissioning planning, and execution until the final end-state is achieved. The decommissioning process is applied in a graded manner for licensed and non-licensed facilities, buildings, engineered structures, and sites.

The CNL *Cleanup Governing Documentation Index* [14] provides an index to governing and procedural documents approved and authorized for use in the Decommissioning Program. The process is based on fundamental principles and sound practices for excellence in decommissioning practices.

The decommissioning process supports the Management System Framework described in the *Management System Manual* [1] and *Quality* [2].

The *WLDP Quality Assurance Plan* (this document) describes the quality assurance program applied to WLDP (decommissioning and supporting) activities at WL.

9. Normative Annex

9.1 Supplementary Requirements for Decommissioning

9.1.1 Decommissioning Organization

The overall organizational structure is described in the *CNL Management System Manua*l [1] and the *Whiteshell Laboratories Organization* [5].

The WL Site Head & General Manager is the Site Licence Holder for the WL site. The responsibilities of the Site Licence Holder are described in the *CNL Management System Manual* [1].

The current list of individuals with responsibility for nuclear and non-nuclear facilities and buildings at WL is maintained in *Responsibility for Facilities and the Safety of Operations at the Whiteshell Laboratories* [31].

The organizational roles and responsibilities for the decommissioning process are described in *Cleanup* (PDD) [7].

9.1.2 Decommissioning Stages

Cleanup (PDD and PRD) [7] [8] and *Decommissioning Process* (STD) [64] describes the decommissioning process steps and activities that occur throughout the lifecycle, including design, construction, commissioning, operations, and decommissioning. The decommissioning process applies until the final end-state is achieved; including any required environmental remediation of soils and affected lands as described in the *Environmental Remediation Process* [136] document.

9.1.3 Preliminary Decommissioning Plan

The *Whiteshell Laboratories Detailed Decommissioning Plan. Volume 1 – Program Overview* [40] provides information equivalent to that contained in Preliminary Decommissioning Plans (PDPs). For any new nuclear facility construction, the Facility Authority shall prepare a PDP before construction begins using guidance as provided within the *Land Use Process* [137] and in consideration of the *Cleanup* program description and program requirements documents (PDD and PRD) [7] [8].

PDPs shall include the information listed in the *Decommissioning Planning for Licensed Activities* [43] and *Decommissioning Process* (STD) [64] documents and shall be revisited and updated, as necessary.

9.1.4 Detailed Decommissioning Plan

WLDP staff has prepared several volumes of a collection of Detailed Decommissioning Plans (DDPs) to describe the scope, organization, and schedule of the WL decommissioning efforts. *The Whiteshell Laboratories Detailed Decommissioning Plan. Volume 1 – Program Overview* [40] provides the details of the overall WL decommissioning program.

The subsequent volumes of DDPs for specific facilities shall be prepared in accordance with the *Decommissioning Planning for Licensed Activities* [43] and *Independent & Technical Readiness* [45] that describes the requirements for independent review of CNL's facilities, buildings, and sites in Canada.

These DDPs shall be prepared in accordance with the *Decommissioning Planning for Licensed Activities* [43] and *Independent & Technical Readiness* [45], using guidance as provided within the *Land Use Process* [137] and in consideration of the *Cleanup* program description and program requirements documents (PDD and PRD) [7] [8].

The DDPs shall be reviewed and approved by facility management and confirmed by the CNL Safety Review Committee (SRC) and, if necessary, by CNSC staff, before decommissioning work is undertaken.

9.1.5 Waste Assessment

Waste streams and volumes expected to be generated during each decommissioning stage shall be documented in facility DDPs. More specifically, Work Plans of facilities, structures or components being decommissioned shall include a summary of the expected waste volumes to be generated while performing the decommissioning work.

The Work Plans shall also include reuse and recycling initiatives, as well as storage and disposal options, as outlined in *Work Planning for WL Decommissioning* [46] and the creation of associated waste management plans. Requirements governing the safe management of radioactive material and waste during the decommissioning activities, and described in the Work Plan, shall be identified in the following corresponding safe work documents:

- *Whiteshell Decommissioning Work Instruction Package Process* [48] or in Radiological Work Assessments (RWA)
- Radiological Work Plans (RWP) as described in *ALARA Review and Assessment – Planning and Control of Radiation Work* [47].

Assessments for radioactive and non-radioactive wastes shall be based on the waste categories described in *Management of Waste* [124], and in *Whiteshell Laboratories Closure Project Waste Management Process Plan* [127]. Acceptance criteria for waste categories and transfer from the decommissioning place to the Waste Management Area shall be based on the requirements outlined in *Safety Analysis Report for the Whiteshell Laboratories Waste Management Area* [138].

9.1.6 Hazards Assessment

Hazards shall be assessed for facilities at WL to be decommissioned as part of the preparation of the DDP. The hazard sources are characterized based on facility history (process knowledge) and operating records, surveys of hazardous materials inventories (e.g., asbestos, PCBs), and radiological surveys.

The specific analytical tools used to assess hazards are developed on a case-by-case basis, depending on the size and complexity of the facility and the magnitude of the hazard sources. General information on hazards shall appear in the DDP.

Specific and rigorous hazards assessments shall be performed during the preparation of the Work Plan for decommissioning of a facility, as described in *Work Planning for WL*

Decommissioning [46] and further developed as part of the *WL Work Instruction Package (WIP) Process* [48], as per the *WL Integrated Work Control Process* [51].

In particular, the ALARA Program described in *Radiation Protection* [54] shall be used to assess radiological and industrial hazards as described in *ALARA Review and Assessment – Planning and Control of Radiation Work* [46] and *Whiteshell Decommissioning Work Instruction Package (WIP) Process* [48].

Work involving exposure to hazards and potential process system damage shall be controlled and assessed with the *Work Permit* procedure [58] to ensure that proper protective measures are applied.

The hazards assessment for a facility shall be updated for the needs of the next phase of decommissioning, as the successive decommissioning end-states are reached.

When required, Fire Safety Plans shall be prepared for specific decommissioning work in accordance with the requirements of the National Building Code of Canada [139] and National Fire Code of Canada [140].

9.1.7 Decommissioning Procedures

The process and responsibilities for the revision, review, approval, authorization, control, and maintenance of all decommissioning procedures are described in:

- *Creation, Capture, and Use of Information Assets* [59]
- *Document Numbering Principles* [60]
- *Processes to Create, Capture, and Use Records* [61]
- *Retention, Preservation and Disposition of Information Assets* [71]

Formal documents produced by WLDP staff shall follow the requirements of *Protection of Information* [62] to ensure that the sensitivity of CNL information is assessed and the proper level of protection is applied.

Personnel shall prepare Work Plans to describe the activities involved in decommissioning work, in accordance with *Work Planning for WL Decommissioning* [46]. Work Plans are intended to ensure the work is performed safely (see Section 7.5 of this QA Plan).

Working-level documents providing detailed systematic descriptions of routine tasks and activities are written to ensure consistent working practices. The level of detail included in a procedure shall be proportional with the complexity of the activity and the potential hazards. These documents shall be reviewed for technical content and correctness by reviewers selected according to *Creation, Capture, and Use of Information Assets* [59].

Procedures shall be presented in a manner that trained WLDP staff can easily understand, following the requirements of *Standard Format and Presentation of CNL Information* [106].

9.1.8 Decommissioning End-States

The licensee shall submit an end-state report to the CNSC for acceptance. The end-state report should be submitted no more than two years after completing the decommissioning activities [44].

An end-state report shall be prepared once the predetermined interim or final end-state condition specified in a specific Work Plan has been achieved. Alternatively, the reason why the pre-determined interim or end-state condition was not achieved shall be documented.

The end-state report shall include a summary of decommissioning activities performed, lessons learned, post-work ALARA reviews, results, observations, and findings collected during the execution of the Work Plan, as well as the requirements outlined in *Decommissioning Process* [64].

Final end-state documentation shall also be prepared once the predetermined final end-state condition specified in the facility DDP has been achieved. This final end-state documentation shall review the decommissioning process described in the DDP. This decommissioning review process will include references to "end-state reports of work package", lessons learned, post-work ALARA reviews, and formal post-job reviews generated during the execution of the DDP.

Where the decommissioning strategy includes a deferment period, an interim end-state report is required at the beginning of the deferment period, as outlined in *REGDOC-2.11.2, Decommissioning* [44]. In that situation, the end-state report supports the Storage-with-Surveillance (SwS) plan for the facility.

The content of final end-state reports shall conform to the requirements of *Independent Technical and Readiness Reviews* [45] and *REGDOC-2.11.2, Decommissioning* [44]. Final end-state reports shall be prepared, revised, reviewed, approved, and distributed following *Creation, Capture, and Use of Information Assets* [59].

Following the final stage of decommissioning of the WL site, end-state documentation shall be placed on public record in the National Archives of Canada.

Revision History

Rev. No.	Date	Details of Rev.	Authored By	Reviewed By	Approved By
7.1	2023/06/05	Issued as “Approved for Use”.	A. Dash	S. Toelly	A. Coulas
7.1D1	2023/05/26	Issued for “Review and Comment”. Minor revision Updated as per Memos from Responsible Executives and formal announcements. Adopted new template and updated references.	A. Dash	S. Toelly	
7	2022/06/23	Issued as “Approved for Use”.	A. Dash	A. Coulas	A. Coulas
7D1	2022/06/10	Issued for “Review and Comment”. Updated as per Memos from Responsible Executives and formal announcements. Adopted new template.	A. Dash	A. Coulas T. Lamb	
6	2021/12/10	Issued as “Approved for Use”.	A. Dash	A. Coulas	A. Coulas
6D1	2021/09/01	Issued for “Review and Comment”. Updated as per Memos from Responsible Executives and formal announcements.	A. Dash	A. Dash	
5	2021/03/19	Issued as “Approved for Use”.	W. Patey	A. Coulas	A. Coulas
5D1	2021/03/12	Issued for “Review and Comment”. Updated as per Memos from Responsible Executives and formal announcements.	W. Patey	A. Coulas	
4	2020/04/13	Issued as “Approved for Use”.	W. Patey	A. Coulas	A. Coulas
4D1	2020/04/10	Issued for “Review and Comment”. Updated as per Memos from Responsible Executives and formal announcements.	W. Patey	A. Coulas	
3	2019/11/11	Issued as “Approved for Use”. Updated as per Memos from Responsible Executives.	E. Edwards	A. Coulas	A. Coulas
2	2019/01/09	Issued as “Approved for Use”.	W. Patey	A. Coulas	A. Coulas

2D1	2018/12/07	Issued for "Review and Comment". Updated personnel listed in roles. Updated framework structure. Removed tables for Program Authority (absorbed into Functional Support Manager and Designated Representative of the License roles) and Senior Quality Representative (absorbed into Quality and Information Management Roles).	E. Edwards	C. Williams M. Steedman R. Sadhankar S. Karivelil D. McIntyre K. Leroux L. Fleury P. Boyle Y. Dube A. Coulas	
1	2018/01/10	Issued as "Approved for Use".	E. Edwards	A. Coulas	A. Coulas
1D1	2017/12/07	Issued for "Review and Comment". Updated personnel listed in roles.	E. Edwards	K. Daniels M. Steedman D. McIntyre T. Preisig A. Coulas Y. Dube K. Leroux S. Cotnam	
0	2016/12/20	Issued as "Approved for Use". Supersedes: 145-514100-016-000-0001	G. Garrett	G. Garrett	K. Daniels

Table of Contents

1. Scope and Applicability

Information contained in this list is applicable to all activities, and those who perform them, managed by the Canadian Nuclear Laboratories Ltd. (CNL).

2. Purpose

This document captures the current status of appointments of personnel to Corporate Governance and Corporate Functional Authority roles such as CNL Board of Directors, Executive Team, Functional Authorities and Responsible Executives that are integral to the management system. The management system is defined in the *CNL Management System Manual* [1].

This document also provides an index to governing documents for Functional Support Areas that make up the management system framework.

This document is not used to assign an individual to a role. Such appointments are covered by other processes, as described in *Authority Management* [2] or *Organizational Change Control* [3].

3. Roles and Responsibilities

Responsibilities associated with the roles defined in this document are captured in the *CNL Management System Manual* [1].

3.1 Management System Functional Support Manager

The Management System Functional Support Manager is responsible for:

- Maintaining the controlled list of Functional Authorities; and
- Providing a copy of approved versions of this document to the Canadian Nuclear Safety Commission (CNSC) for information.

4. List

This section identifies individuals appointed to Corporate Governance roles and specific Corporate Functional Authority roles.

4.1 Canadian Nuclear Laboratories Board of Directors

Role	Name	Effective Date
Chair of the Board	Jane Preston	2019 August 17
Member of the Board	Jack Craig	2019 February 02
Member of the Board	Keith Wettlaufer	2015 September 13
Member of the Board	Howard Shearer	2016 August 25

Role	Name	Effective Date
Member of the Board	Terry Michalske	2018 May 31
Member of the Board	Yaprak Baltacioglu	2019 April 01
Member of the Board	Colin Jones	2023 February 14
President and Chief Executive Officer	Joe McBrearty	2020 April 01

4.2 Canadian Nuclear Laboratories Executive Team

Role	Name	Effective Date
President and Chief Executive Officer	Joseph McBrearty	2020 April 01
Chief Operating Officer	Peter Stalker	2022 February 01
Vice-President, Science & Technology	Jeffrey Griffin	2020 March 23
Vice-President, Business Management	Randy Hendrickson	2023 April 10
Vice President, Environmental Remediation Management and Stewardship and Renewal Group	Monica Steedman	2023 January 01
Vice-President, Central Technical Authority and Chief Nuclear Officer	Andy Tisler	2022 July 27
Vice-President, Capital	Brian Savage	2019 June 19
Vice President, Corporate Affairs / Vice-President Business Development	Lou Riccoboni	2020 July 01
Vice-President, Health, Safety, Security, and Environment	Jeff Willman	2020 July 01
Vice-President, Legal & Insurance	Doug McIntyre	2020 July 01
Vice-President, Human Resources	Todd Cook	2021 April 19
Vice-President, Isotope Business	Ram Mullur	2021 April 5

4.3 Canadian Nuclear Laboratories Corporate Functional Authorities

Role	Name	Effective Date
Chief Engineer	John Slade	2016 May 09
Chief Security Officer	Will Graydon	2022 June 20
Chief Regulatory Officer	Sarah Brewer	2022 June 20

Role	Name	Effective Date
Chief Information Officer (Acting)	Tom Vaughan	2022 October 03
Chief of Staff	Kirstie York	2020 June 22
Ombuds Officer	Tricia Gazarek	2021 March 01
Chief Safety & Licensing Officer	David Garrick	2018 August 13
Management Representative for Quality	Doug Cram	2019 April 23

4.4 Canadian Nuclear Laboratories Management System Functional Authorities

Responsible Executive	Functional Support Area	Functional Support Manager	Functional Support Manager Designate(s)	Governing Document Index
President & CEO, Joseph McBrearty and Chief Operating, Officer Peter Stalker	**Management System**	Angela Coulas	Alexandra Dash	900-514100-GDI-001

Summary

This Commission member document (CMD) concerns the Regulatory Oversight Report for sites operated by Canadian Nuclear Laboratories (CNL) for the 2018 calendar year. CNL is the licensee for each of these sites.

No actions are required of the Commission. This CMD is for information only.

Résumé

Ce document à l’intention des commissaires (CMD) porte sur le Rapport de surveillance réglementaire pour les sites exploités par les Laboratoires Nucléaires Canadiens (LNC). LNC est le titulaire de permis pour chacun de ces sites.

Aucune mesure n’est requise de la Commission. Ce CMD est fourni à titre d’information seulement.

EXECUTIVE SUMMARY

The *Regulatory Oversight Report for Canadian Nuclear Laboratories Sites: 2018* is a Commission member document (CMD) which presents the Canadian Nuclear Safety Commission (CNSC) staff's assessment of licensee performance at sites that are licensed to Canadian Nuclear Laboratories (CNL) for the 2018 calendar year. This report also provides an update on CNSC staff's activities related to public information, community engagement and relevant aspects of the CNSC's Independent Environmental Monitoring Program.

CNSC staff use the safety and control area framework to evaluate the performance of each licensee. This report provides performance ratings for all 14 safety and control areas (SCAs); it focuses on radiation protection, environmental protection and conventional health and safety, in particular. Taken together, these SCAs provide a meaningful overview of the safety performance of the facilities addressed in this report. Highlights of the other 11 SCAs are also provided where relevant. The report also includes information on the licensee's public information programs, its engagement with Indigenous groups and communities, reportable events, significant facility modifications and areas of increased regulatory focus, where applicable to the sites. Where possible, trends are shown and information is compared to previous years.

In order to assess the safety performance of licensees, the CNSC conducts regulatory oversight activities consisting of onsite inspections, technical assessments, reviews of reports submitted by licensees, reviews of events and incidents, general communication with licensees and exchanges of information with them. While licensee performance across all SCAs is not explicitly documented in this report, CNSC staff's regulatory oversight activities extend to all SCAs. CNSC staff confirm that in 2018, CNL sites continued to perform licensed activities safely. For this reporting year, CNSC staff rated all SCAs as "satisfactory" with the exception of the security SCA at Whiteshell Laboratories which was rated as "below expectations". This will be elaborated upon during the October 2/3, 2019 Whiteshell relicensing hearings.

Overall, CNSC staff's compliance activities determined that:

- radiation protection programs at all sites adequately controlled radiation exposures, keeping doses as low as reasonably achievable (ALARA)
- environmental protection programs at all sites were effective at protecting people and the environment
- conventional health and safety programs at all sites continued to protect workers

Therefore, CNSC staff conclude that in 2018, the CNL sites covered by this regulatory oversight report made adequate provisions for the health and safety of workers, the protection of the public and the environment, and Canada's international obligations. Documents referenced in this CMD are available to the public upon request.

1 INTRODUCTION

For the purposes of the *Nuclear Safety and Control Act* (NSCA) [1], and its associated Regulations, the Canadian Nuclear Safety Commission (CNSC) regulates Canada's nuclear industry to protect the health, safety, security and the environment; to implement Canada's international commitments on the peaceful use of nuclear energy; and to disseminate objective scientific, technical and regulatory information to the public. Licensees are responsible for operating their facilities safely, and are required to implement programs that make adequate provision for meeting legislative and regulatory requirements.

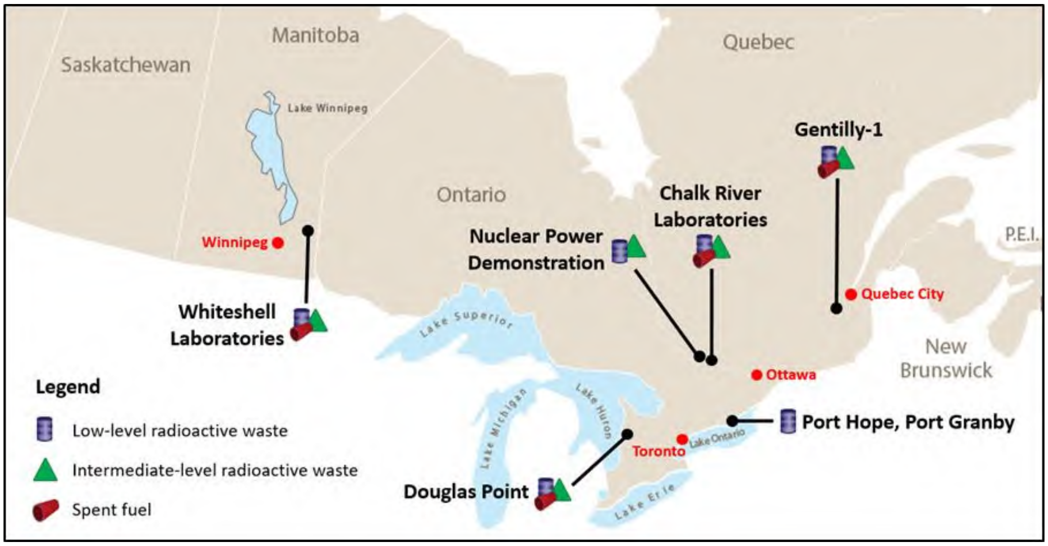
CNSC staff produce regulatory oversight reports (ROR) on various sectors of the Canadian nuclear industry as a means to report to the Commission on CNSC staff oversight activities at those sites and on licensee performance. The Commission has directed CNSC staff to report to the Commission annually on the safety performance of sites operated by Canadian Nuclear Laboratories (CNL) in the form of an ROR. This is the first report to cover all major CNL sites. This ROR includes data for the 2018 calendar year and describes:

- Information on licensee operations, licence changes, major developments at licensed facilities and sites, as well as any significant events;
- The CNSC's regulatory efforts, public information and Indigenous and community engagement activities, and Independent Environmental Monitoring Program (IEMP) results;
- The performance rating for all safety and control areas (SCAs) relevant to each CNL site;
- Performance data on the SCAs of radiation protection, environmental protection, and conventional health and safety for each CNL site; and
- Highlights from other SCAs as applicable.

The sites covered by this report are shown in Figure 1, and the licences are listed in Table 1. These sites were most recently before the Commission in relation to the following Commission member documents (CMD):

- CMD 18-H2 [2], the relicensing of the Chalk River Laboratories site;
- CMD 18-M30 [3], a progress update covering all CNL sites with the exception of CRL;
- CMD 18-H103 [4], the one-year extension of the Whiteshell Laboratories licence;
- CMD 18-H107 [5], the separation of the single licence which previously covered the Douglas Point, Gentilly-1 and Nuclear Power Demonstration sites into three licences, each covering one site; and
- CMD 19-H101 [6], an amendment to the Port Granby Project licence.

Figure 1: Sites covered by this CMD



Within the CNSC, compliance and licensing activities at the sites covered by this report are regulated under the fuel cycle program. The risk classification of these sites within the fuel cycle program is included in Table 1. Each licensed facility or activity under the fuel cycle program is categorized into low, medium and high categories. The appropriate category is determined based on considerations such as the safety of workers and the public (i.e. radiation protection and conventional health and safety), the safety of the environment, and security. For example, a facility's or activity's risk is assessed based on the types of hazards, the consequences of a program failure and the complexity of the operations. This classification is reassessed if licensed activities were to substantially change, or when there are changes to the information and assumptions used for the initial categorization. Each regulatory program within the CNSC establishes the risk considerations most appropriate for the types of facilities and activities being regulated.

Table 1: Licences covered by this CMD

SITE/FACILITY/PROJECT	LICENCE NUMBER	FUEL CYCLE PROGRAM RISK CLASSIFICATION
Chalk River Laboratories (CRL)	NRTEOL-01.00/2028	High
Whiteshell Laboratories (WL)	NRTEDL-W5-8.05/2019	Medium
Port Hope Project (PHP)	WNSL-W1-2310.02/2022	Medium
Port Granby Project (PGP)	WNSL-W1-2311.02/2021	Medium
Douglas Point (DP) Waste Facility	WFDL-W4-332.02/2034	Low
Gentilly-1 (G-1) Waste Facility	WFDL-W4-331.00/2034	Low
Nuclear Power Demonstration (NPD) Waste Facility	WFDL-W4-342.00/2034	Low
Port Hope Pine Street Extension Temporary Storage Site	WNSL-W1-182.0/2021[1]	Low
Port Hope Radioactive Waste Management Facility	WNSL-W1-344-1.8/ind[1]	Low
NRTEOL = Nuclear Research and Test Establishment Operating Licence NRTEDL = Nuclear Research and Test Establishment Decommissioning Licence WNSL = Waste Nuclear Substance Licence WFDL = Waste Facility Decommissioning Licence		

Note that the last four digits of these licence numbers is the year in which they will expire. “ind” stands for “indefinite”. Not covered by this ROR are CNL’s nuclear substance licences, which are included in the annual *Regulatory Oversight Report on the Use of Nuclear Substances*. In 2018, DP, G-1 and NPD were collectively licensed under WFDL-W4-332.01/2034.

A licence issued under the NSCA contains the period for which the licence is valid, licensed activities and a standard set of licence conditions. A licence conditions handbook (LCH) accompanies each licence in Table 1, with the exception of WNSL-W1-182.0/2021 and WNSL-W1-3441.8/ind, which are small temporary storage sites for low level waste. A LCH contains compliance verification criteria used by CNSC staff to ensure compliance with the conditions of the licence. The risk classifications listed in Table 1 are among the factors used by CNSC staff in determining the frequency and scope of regulatory activities at each of these sites. This approach is part of the CNSC’s risk informed considerations for regulating a broad range of facilities and activities.

[1] These licences cover small areas containing low-level waste which will be cleaned up under the PHP. For the remainder of this document, they are included under the PHP unless mentioned separately.

Section 2 of this report includes a brief description of each site and major licensed activities in the period covered by this report.

CNSC staff conduct regular oversight activities to ensure CNL continues to meet the regulatory requirements of these licences, as described in more detail in Sections 3, 4 and 5 of this document. Changes made to licences or LCHs during this review period are described in Section 3.

2 CANADIAN NUCLEAR LABORATORIES

CNL is responsible for the management of nuclear sites owned by Atomic Energy of Canada Limited (AECL). The content in this ROR encompasses the sites listed in Table 1 above, and are described in more detail in the sections below.

CNL took responsibility for operating these sites from AECL in 2014, as part of AECL's transition to a Government-Owned, Contractor-Operated model. In 2015, AECL transferred all shares in CNL to the Canadian National Energy Alliance, a consortium of engineering and technology companies, that manages and operates CNL under a Government-Owned, Contractor-Operated model.

2.1 Chalk River Laboratories

Chalk River Laboratories (CRL) is located in the province of Ontario, 160 kilometers (km) northwest of Ottawa and occupies a total area of 37 km^2 and a built-up area of approximately 0.4 km^2 (Figure 2). The site is immediately adjacent to the Ottawa River. CRL operates under a single licence, which includes 12 Class I nuclear facilities in an operational state, such as the Zero Energy Deuterium (ZED-2) research reactor, processing facilities, fuel manufacturing facilities, and hot cells. The site also includes 13 different waste management areas (five in operation and eight in long-term monitoring), four Class II nuclear facilities that contain prescribed equipment such as accelerators and irradiators, and more than 50 radioisotope laboratories, support facilities and offices[2].

Figure 2: A view of the CRL built-up area

[2] A detailed description of this site is included in CMD 18-H2, which was presented to the Commission on January 23-25, 2018

CNSC staff have classified CRL as ‘high’ risk due to the diversity of activities currently carried out on the site, the storage of large quantities of radioactive waste including spent nuclear fuel and legacy liabilities from past activities. The cessation of molybdenum-99 production in 2016 and the permanent shut down of the National Research Universal (NRU) reactor in 2018 have significantly lowered the risk profile of the site. The level of risk at the site will decrease further as CNL’s decommissioning work and repatriation of highly enriched uranium (HEU) continues. The public and Indigenous groups in the CRL area continue to show a high level of interest in CNL’s current activities at CRL, and in CNL’s future plans for the site.

2.1.1 Major Activities at CRL in 2018

The CRL site is undergoing a period of rapid change. Where permitted by the current licensing basis, CNL is shutting down and decommissioning legacy facilities, and constructing and commissioning replacement facilities throughout the site. CNL has also advanced their program to host a Small Modular Reactor at the CRL site, and has further proposed to construct and operate a Near-Surface Disposal Facility at the CRL site; these topics are discussed in more detail in sections 5.4 and 5.5, respectively.

Permanent Shutdown of the NRU Reactor and the Molybdenum-99 Production Facility

The NRU reactor operated until March 31, 2018, when it was permanently shut down. By the end of May 2018, CNSC staff confirmed the reactor had been defueled and CNL had moved all fuel into wet storage in the NRU rod bays. By the end of September 2018, CNSC staff assessed that all heavy water had been drained from the NRU reactor vessel and temporarily stored safely, pending processing and storing in metal drums. CNL is progressively and permanently draining and/or de-energizing systems which are no longer needed so that the NRU facility can be placed in a state of storage with surveillance.

Figure 3: The NRU Reactor Hall

CNL's Molybdenum-99 Production Facility (MPF) had ceased to operate in October 2016, at which time CNL placed it in a standby state in case the decision was made to produce more molybdenum-99. The MPF depended on the NRU reactor for irradiated targets, and with the shutdown of NRU CNSC staff have confirmed it has since transitioned to a safe shutdown state.

Repatriation of Highly Enriched Uranium (HEU)

Under the joint regulatory oversight of the CNSC and the United States Nuclear Regulatory Commission (USNRC), CNL has been safely returning materials which contain HEU to the United States. Both countries have rigorous regulatory requirements in place based on international standards, and shipments take place when both the CNSC and USNRC give approval. The HEU originates from materials imported to Canada for research and medical isotope production at CRL. It consists of spent HEU fuel rods from the National Research Experimental (NRX) and NRU reactors and HEU dissolved in acid, a by-product of CNL's past production of molybdenum-99. As of the end of 2018, CNSC staff conclude that CNL's repatriation work continues safely. To date, CNL has repatriated upwards of 95% of HEU in spent fuel from the CRL site, and upwards of 75% of liquid HEU. The movement of HEU has led to increased monitoring from the International Atomic Energy Agency (IAEA), which will continue for the duration of the repatriation project.

2.2 Whiteshell Laboratories

Whiteshell Laboratories (WL) is a former nuclear research and test facility located near Pinawa, Manitoba that was established by AECL in the early 1960s. The main campus (Figure 4) hosts the 60 megawatt thermal (MWth) Whiteshell Reactor No. 1 (WR-1), a SLOWPOKE demonstration reactor (SDR), and other research and support facilities. Located approximately 2.7 km north-east of the main campus is a waste management area which contains low-level waste (LLW), intermediate-level waste and high-level radioactive waste.[3]

Figure 4: WL Main Campus *(Source: CNL)*

The WR-1 reactor and SDR were permanently shut down in 1985 and 1990 respectively, and in 1997 AECL discontinued most research programs and operations at WL. Decommissioning commenced in 2003. Currently, CNL is carrying out active decommissioning work at the site with the exception of WR-1, which remains in storage with surveillance.

According to CNL's Detailed Decommissioning Plans (DDPs) for WL, decommissioning will be completed by 2050 with plans for a subsequent 200-year period of institutional control.[4] In 2016, the CNSC received an application by CNL to change the decommissioning approach for WR-1 from full dismantlement to in-situ decommissioning. This new approach is currently under review by CNSC staff, and is described further in Section 5.9.

[3] A detailed description of this site is included in CMD 19-H4 [7], which will be presented to the Commission on October 2/3, 2019.
[4] A detailed description of this site is included in CMD 18-M30, which was presented to the Commission on August 22, 2018.

CNSC staff have classified WL as ‘medium’ risk given the presence of used nuclear fuel and other radioactive wastes at the site, CNL’s ongoing decommissioning work, and the legacy of past research operations at the site. The public and Indigenous groups in the WL area continue to show a high level of interest in CNL’s current decommissioning activities at WL, and in CNL’s future plans for the site.

2.2.1 Major Activities at WL in 2018

As authorized by its current licence, in 2018 CNL carried out hazard reduction and characterization activities at the site in preparation for planned demolition of the active liquid waste treatment centre. These activities included the removal of asbestos, application of fixatives on the interior of tanks, and the removal of various equipment. CNL also carried out hazard reduction and characterization activities in preparation for the decommissioning of WR-1, such as the removal of asbestos and the characterization of reactor components.

2.3 Remediation Sites

CNL is the licensee responsible for the implementation of the Port Hope Area Initiative (PHAI), which consists of the Port Hope and Port Granby projects. These projects involve the clean-up of historic low-level radioactive waste contamination found in Port Hope and Port Granby, and its emplacement in new long-term waste management facilities (LTWMFs), one located in each community. The scope of the PHAI is defined by a legal agreement between the municipalities of Port Hope and Clarington and the Government of Canada, originally signed in 2001. The legacy wastes in Port Hope and Port Granby are a federal liability because they ultimately derive from the operations of a former Crown Corporation, Eldorado Nuclear Limited (ENL). ENL became the privately-held Cameco Corporation (Cameco) in 1988 and wastes produced after that time are the responsibility of Cameco.

The Port Hope and Port Granby projects are each divided into three phases, namely:

- Phase 1 – ongoing operation, care and maintenance of existing legacy facilities, and development of design and licensing documentation;
- Phase 2 – implementation, including the construction and operation of new LTWMFs, and the remediation of legacy waste; and
- Phase 3 – long-term monitoring and maintenance of the LTWMFs.

CNSC staff have assessed CNL’s work under the PHAI as ‘medium’ risk. While the radiological and environmental hazards posed by the work are low, the conventional health and safety risks are elevated due to the extensive use of heavy equipment on these sites. CNL’s remediation work carried out under the PHAI is also extremely visible to the public, as it takes place in and around the communities of Port Hope and Port Granby. This has led to an elevated level of interest from Indigenous groups and the public.

2.3.1 The Port Hope Project

The Port Hope Project (PHP) involves the construction of an engineered above-ground containment mound, which will safely isolate legacy LLW in the Municipality of Port Hope. The project involves the excavation of roughly 1,500,000 m^3 of uranium and radium refining waste from a legacy waste management facility (WMF) and waste from various sites in the urban area of the municipality, and its emplacement in a LTWMF (Figure 5). The PHP is currently in the implementation phase (Phase 2) of its three phase project. Phase 2 includes the construction and operation of a waste water treatment plant (WWTP); the construction and operation of the LTWMF, including the excavation and emplacement of LLW in cells prepared to accept this waste; site remediation and restoration; and, the capping of the LTWMF once complete. Excavation and emplacement of wastes is expected to continue to 2023. As part of Phase 2 of the PHP, CNL is performing extensive radiological surveys of residential and commercial properties in Port Hope. To date, CNL has identified over 1,000 properties which will need remediation. Remediation work on these small-scale sites began in December 2018 with three properties and is conducted according to CNL procedures reviewed by CNSC staff.

The final phase of the project (Phase 3) will involve long-term monitoring and maintenance of the LTWMF under continued CNSC regulatory oversight.[5]

Figure 5: An overview of the site prior to Port Hope LTWMF construction, overlaid with LTWMF features *(Source: CNL)*

[5] A detailed description of this site is included in CMD 18-M30, which was presented to the Commission on August 22, 2018.

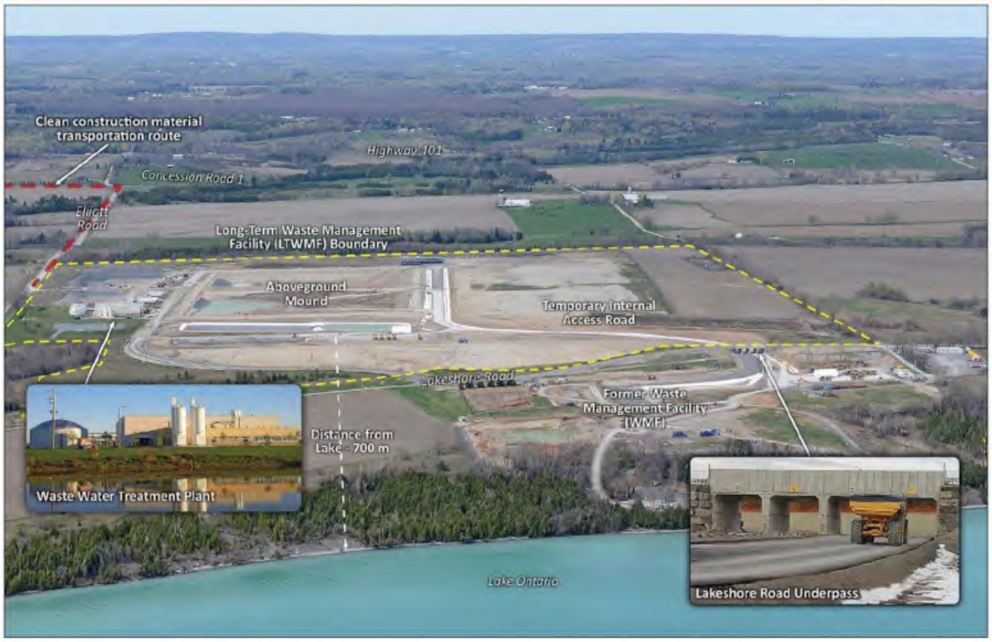
In addition to the main licence for the PHP, CNL holds two other licences for the interim management of legacy LLW in Port Hope, which are associated with and included under the PHP. The Port Hope Pine Street Extension Temporary Storage Site and the Port Hope Radioactive Waste Management Facility will both be remediated under the PHP, with the LLW being transferred to the Port Hope LTWMF.

2.3.2 Port Granby Project

The Port Granby Project (PGP) involves the construction of an engineered above-ground containment mound, which will safely isolate legacy LLW in the Municipality of Clarington. The project involves the excavation of roughly 450,000 m^3 of uranium and radium refining waste from a legacy WMF, and its emplacement in a LTWMF (Figure 6). The PGP is currently in the implementation phase (Phase 2) of a three phase project, which includes the construction and operation of a WWTP; the construction and operation of the LTWMF, including the excavation and emplacement of LLW in cells prepared to accept this waste; the capping of the LTWMF once complete; and site remediation and restoration. The excavation and transfer of LLW has been under way in Port Granby since 2016. The final phase of the project (Phase 3), will involve long-term monitoring and maintenance of the LTWMF under continued CNSC regulatory oversight.[6]

[6] A detailed description of this site is included in CMD 18-M30, which was presented to the Commission on August 22, 2018.

Figure 6: Location of the Port Granby WMF and new LTWMF (LTWMF boundary indicated by dashed yellow line) *(Source: CNL)*



2.3.3 Major Activities at Remediation Sites in 2018

CNSC staff confirmed that CNL has continued with construction, operation and remediation work during 2018 at both the PHP and the PGP. This has included:

- At the PHP, the completion of construction of Cell 3 of the LTWMF, and continued construction work on Cell 2; the ongoing emplacement of LLW into Cell 1; the expansion of the collection pond associated with the WWTP, to allow CNL to better manage impacted water generated at the site; ongoing surveys and the commencement of remediation at small-scale sites (e.g. residential properties) and industrial sites (e.g. the Centre Pier) in Port Hope; the commissioning of an IAEA portal monitor to independently measure safeguarded uranium being transferred from Cameco's Port Hope Conversion Facility; and, significant preparations for the remediation of the Port Hope harbour.
- At the Port Hope Pine Street Extension Temporary Storage Site and the Port Hope Radioactive Waste Management Facility, the removal of all LLW from several of the sites covered by these licences.
- At the PGP, the continued excavation and emplacement of LLW; the verification of large areas of the legacy Port Granby WMF as meeting the clean-up criteria in the licence, and the backfilling of some of those areas; the addition of temporary storage for impacted water via the construction of eight 6,000 m^3 tanks; and, continued preparation for the closure and capping of the PGP LTWMF (the end of Phase II), currently scheduled to begin in 2019.

Figure 7: A remediated section of the old Port Granby Waste Management Facility

2.4 Prototype Power Reactors

The Douglas Point (DP), Gentilly-1 (G-1), and Nuclear Power Demonstration (NPD) waste facilities are three shutdown power reactors which are undergoing decommissioning. For these sites CNL is employing a deferred decommissioning strategy. The three phases of deferred decommissioning are:

- Phase 1 – bring the facility to a safe sustainable shut down state suitable for storage with surveillance;
- Phase 2 – the storage with surveillance period; and
- Phase 3 – final decommissioning where the facility achieves its final end state.

The duration of each phase may vary depending on the decommissioning plan for each of the facilities; these plans are reviewed by CNSC staff prior to implementation. Note that these phases are distinct from the three phases of the remediation projects described in Section 2.3 above.

Currently the DP, G-1 and NPD sites are each in a state of storage with surveillance (Phase 2), as authorized by their licences. All are required to implement and maintain programs such as radiation protection, occupational health and safety, security and fire protection.

CNSC staff have classified the Prototype Power Reactor sites as ‘low’ risk, given that these three sites are all in storage with surveillance. Should CNL begin active decommissioning or otherwise make major changes to operations at these sites, the risk classification would be reevaluated by CNSC staff. The public and Indigenous groups in the area of the DP, G-1 and NPD sites continue to show a high level of interest in CNL’s future plans for these sites, especially in regards to CNL’s proposed accelerated decommissioning activities, discussed further in Section 5.9.

2.4.1 Douglas Point Waste Facility

DP, located in Tiverton, Ontario on the Bruce nuclear site (Figure 8) is a partially decommissioned prototype power reactor. The 200-megawatt electric (MWe) prototype Canada deuterium uranium (CANDU) power reactor was put into service in 1968 and permanently shut down in 1984. At DP, CNL is managing low- and intermediate-level radioactive wastes and used nuclear fuel in concrete dry storage canisters. Additionally, CNL is undertaking decommissioning planning activities for Phase 3 to render the site appropriate for industrial use. CNSC staff have assessed CNL's preliminary decommissioning plans (PDPs), and noted that Phase 3 activities are planned to begin in 2060.[7] In July of 2019, CNL submitted to the CNSC an application for a licence amendment which would allow CNL to begin dismantlement work at DP. Such an amendment will require a separate decision by the Commission with the hearing currently expected to be in 2020.

Figure 8: DP Waste Facility *(Source: CNL)*

[7] A detailed description of this site is included in CMD 18-M30, which was presented to the Commission on August 22, 2018.

2.4.2 Gentilly-1 Waste Facility

G-1, located in Bécancour, Québec within Hydro-Québec's Gentilly-2 site (Figure 9, outlined in yellow and adjacent to Hydro-Québec's Gentilly-2 reactor), is a partially decommissioned prototype power reactor. The 250 MWe boiling water reactor was put into service in 1972 and shut down in 1984. At G-1, CNL is safely managing low- and intermediate-level radioactive wastes and used nuclear fuel in concrete dry storage canisters. Additionally, CNL is undertaking decommissioning planning activities in support of Phase 3 to render the site appropriate for industrial use. According to current decommissioning plans accepted by CNSC staff, Phase 3 activities are planned to begin in 2064, well outside the term of the current licence.[8] The commencement of dismantlement work at G-1 would first require a separate decision by the Commission.

Figure 9: G-1 Waste Facility, outlined in yellow *(Source: CNL)*

[8] A detailed description of this site is included in CMD 18-M30, which was presented to the Commission on August 22, 2018.

2.4.3 Nuclear Power Demonstration Waste Facility

NPD located in Rolphton, Ontario (Figure 10) is a partially decommissioned prototype power reactor. The 20 MWe prototype CANDU power reactor was placed into service in 1962, and operated until 1987. At NPD, CNL is managing low- and intermediate-level radioactive wastes, according to their CNSC assessed and accepted storage with surveillance plan. Additionally, CNL is undertaking decommissioning planning activities in support of Phase 3 to render the licensed site appropriate for industrial use. According to CNL's decommissioning plans, Phase 3 activities are planned to begin in 2030.[9] In 2016 CNL submitted an application to the CNSC to modify the decommissioning approach for NPD from full dismantling to in-situ decommissioning, which could accelerate the decommissioning process. This new approach requires the Commission's approval as outlined in Section 5.9.

Figure 10: NPD Waste Facility *(Source: CNL)*

2.4.4 Major Activities at Prototype Power Reactors in 2018

CNL is currently carrying out a number of hazard reduction and waste characterization activities at DP, G-1 and NPD, in line with decommissioning plans reviewed and accepted by CNSC staff.

[9] A detailed description of this site is included in CMD 18-M30, which was presented to the Commission on August 22, 2018.

Examples of activities carried out by CNL in 2018 include:

- At DP, CNL demolished various ancillary buildings and structures, including the Emergency Cooling Injection System (ECIS) tank and characterized the ECIS bunker; installed a new membrane on the reactor building roof to repair damage caused by seagulls; removed all Moderator Purification System resins and shipped them for processing in the United States; and transferred all low-activity liquid waste (135,000 litres) to CRL’s Waste Treatment Centre.
- At G-1, CNL removed and processed various low-level wastes from the reactor building; removed all Heat Transport Purification System and Moderator Purification System resins, which were shipped to CRL for storage; and, shipped Moderator Purification System cover water (20,000 litres) to CRL’s Waste Treatment Centre.
- At NPD, CNL conducted geological, structural, and radiological characterization activities in support of their proposed in-situ decommissioning plan; and, ceased routine batch releases of effluent to the Ottawa River. CNL now ships all contaminated water from the NPD sumps to CRL for treatment.

3 THE CNSC'S REGULATORY OVERSIGHT OF CNL

This section of the 2018 CNL ROR contains information on the licensees' compliance with the requirements of the NSCA and associated Regulations made under the NSCA, each site's licence and LCH, and any other applicable standards and regulatory documents.

The information provided in this ROR covers the 2018 calendar year and, where applicable, includes trends and comparisons to previous years. CNSC staff use the SCA framework to assess, evaluate, review, verify and report on licensee performance. The SCA framework includes 14 SCAs, which are subdivided into specific areas that define its key components. Appendix B provides definitions of these SCAs and their specific areas, Appendix C provides information on the CNSC's ratings methodology, and Appendix D contains detailed SCA ratings for each site.

This ROR report largely focuses on three SCAs, namely radiation protection, environmental protection, and conventional health and safety, as they provide a good overview of safety performance at CNL sites. The varied nature of CNL's activities across their different licenses means that not all SCAs apply equally to all sites or activities. Although not explicitly documented in this report, all relevant SCAs are assessed during compliance inspections and reviews of CNL's documents, and a rating is generated for each SCA each year. CNSC staff use RORs to inform the Commission of major findings or topics of interest in all SCAs, as shown in Section 5. The report also includes information on CNL's public information programs, engagement with Indigenous groups and communities, 2018 reportable events, any significant facility modifications, and areas of increased regulatory focus.

In addition, the report includes a list of references, the definitions of acronyms, a glossary and other appendices. Appendix A is a list of CNSC inspections carried out at CNL sites in 2018, Appendices E and F contain information on dose to workers and the public respectively, Appendix G contains health and safety information, Appendix H provides the total annual releases of radionuclides for each CNL site during 2018, and Appendix I lists select relevant websites.

3.1 Regulatory Activities

The CNSC ensures licensee compliance through verification, enforcement and reporting activities. CNSC staff develop compliance plans for each site commensurate with the risk associated with the site. CNSC staff implement the compliance plans by conducting regulatory activities including on-site inspections, desktop reviews and technical assessments of licensee programs, processes and reports. These activities can result in licensees being found in non-compliance with CNSC requirements, at which point CNSC staff will place corrective enforcement actions on the licensee and track those actions to completion.

During the reporting period, CNSC staff spent over 42,000 hours working on compliance and licensing at CNL sites. This included effort from CNSC staff in 36 different divisions spread over nine directorates.

Compliance Activities

In 2018, CNSC staff spent 2,700 hours in the field conducting 28 inspections, and nearly 22,000 hours in the office conducting desktop reviews, technical assessments of licensee documents, and preparing for inspections.

A summary of CNSC staff's inspection activities is shown in Table 2, and a more detailed table of inspections is available in Appendix A. All inspections include verification activities related to the conventional health and safety and radiation protection SCAs. The enforcement actions which resulted from these inspections were provided to CNL via detailed inspection reports and recorded in the CNSC regulatory information bank to ensure they are tracked to completion. CNSC staff verify on an ongoing basis that the licensee has complied with the conditions of enforcement actions and that all actions are closed in the specified timeframes. CNSC staff's assessment of the risk significance of the enforcement actions issued in each inspection are included in Appendix A.

Table 2: Compliance Inspections at CNL Sites during 2018

Site, Facility or Project	Inspections in 2018	Enforcement Actions Issued
Chalk River Laboratories	12	12
Whiteshell Laboratories	2	1
Port Hope Project	5	14
Port Granby Project	6	22
Douglas Point Waste Facility	1	2
Gentilly-1 Waste Facility	1	None
Nuclear Power Demonstration Waste Facility	1	None

The number of inspections carried out at a given site in a year varies with CNSC staff's assessment of the risk of that site and the activities the licensee is carrying out at the site. It is also informed by incidents or situations that may warrant a reactive (unplanned) inspection. For context, compare the number of inspections in 2018 to Table 3 below, which shows the baseline number of inspections CNSC staff expect to carry out over a 10-year period at CNL sites, based on a site's risk categorization. This baseline is augmented as needed to take into account facility- or site-specific information. Annually, the plan is reviewed and the number of inspections increased or the focus areas changed, as justified by changes in licensee activities, or in order to ensure licensee compliance.

Table 3: 10-year Baseline Inspection Plan for CNL sites

Site risk categorization	High	Medium	Low
Minimum number of inspections over a 10-year period	32	15	3

Licensing Activities

In 2018, CNSC staff spent about 17,500 hours on licensing activities, which includes the drafting of new licences, the preparation of Commission Member Documents, the drafting and/or revision of LCHs, and discussions with CNL on all of the above. A summary of changes to CNL's licences and LCHs over the period covered by this ROR is shown in Table 4 below.

Table 4: Changes to CNL Licences and LCHs in 2018

Site, Facility or Project	Licence Changes in 2018	LCH Changes in 2018
Chalk River Laboratories	Issuance of new 10-year licence in March 2018, following public hearings in January 2018.	A new LCH was issued in May 2018, associated with the new licence.
Whiteshell Laboratories	Issuance of 1-year extension to the previous licence in August 2018, valid for the 2019 calendar year and with no change to any authorizations.	No change to the LCH in 2018.
Port Hope Project	No change to the licence in 2018.	No change to the LCH in 2018.
Port Granby Project	No change to the licence in 2018. In 2018, CNL requested a licence amendment to incorporate Release Limits for the new Waste Water Treatment Plant, as described in CMD 19-H101. The Commission granted approval for the revised licence in April 2019.	No change to the LCH in 2018. A new LCH was issued in April 2019, associated with the new licence.
Douglas Point, Gentilly-1 and Nuclear Power Demonstration waste facilities	No change to the licence in 2018. In 2018, CNL requested a separation of the single licence covering these three sites into individual licences for each site, as described in CMD 18-H107. The Commission granted approval for separation of the licence in February, 2019.	No change to the LCH in 2018. Three new LCHs have been issued in 2019, associated with the licence separation.

IAEA Safeguards Activities

Under the terms of the Canada-IAEA safeguards agreements, the IAEA has the right to perform independent verification activities at various types of sites in Canada. The Port Granby Project is the only site covered by this ROR which is not under IAEA safeguards. CNL must submit various types of information to the CNSC and IAEA in order to support the IAEA's verification activities, in addition to providing access to the site to the IAEA. In 2018, CNL provided information and access as required.

In 2018, the IAEA carried out activities at CNL sites as shown in Table 5 below to verify nuclear material inventories and assure the absence of undeclared nuclear material and activities. IAEA activities are not CNSC compliance inspections, but CNSC staff accompany the IAEA in roughly 75% of their activities. They may therefore result in CNSC staff issuing recommendations or enforcement actions to the licensee. In 2018, no enforcement actions resulted from CNSC staff's participation in IAEA activities. Sites which did not host an IAEA activity in 2018 are omitted from the table.

Table 5: Activities carried out by the IAEA at CNL sites during 2018

Site, Facility or Project	Activity					
	PIV	DIV	SNRI	IIV	UI	CA
Chalk River Laboratories	16	23	9	0	2	1
Whiteshell Laboratories	0	1	0	0	0	0
Port Hope Project	0	1	0	2	0	0
Gentilly-1 Waste Facility	1	1	0	0	0	0
PIV = Physical Inventory Verification DIV = Design Information Verification SNRI = Short Notice Random Inspection	IIV = Interim Inventory Verification UI = Unannounced Inspection CA = Complementary Access					

3.2 Chalk River Laboratories

For 2018, CNSC staff rated all 14 SCAs for CRL as "satisfactory". CNSC staff performed 12 inspections at the CRL site in 2018, and issued 12 enforcement actions, 10 of which remain open at the time of this report. The majority of the open actions are related to an inspection which was conducted in December 2018 and which focused on training at the CRL site. The open actions do not pose any immediate threat to safety, security or the environment, but require CNL to make programmatic changes to address the findings. In order to ensure that these findings are adequately addressed, CNSC staff will be performing further follow-up work on training at CNL in 2019.

During a desk-top review of CRL's safeguards reports in 2018, CNSC staff determined that previously identified issues with timely reporting persisted. In response, CNL submitted and began implementing an action plan in December 2018. During 2019 CNSC staff have continued to monitor the accuracy of the CRL's safeguards reports.

Due to the complexity of the CRL site and the risk level it poses, CNSC staff have a permanent site office at the CRL site which is staffed by CNSC inspectors. These inspectors are allowed unrestricted access to the CRL site, and carry out both scheduled inspections and frequent walk-downs of CRL facilities and activities. This allows them to maintain a more organic level of knowledge of the activities at the site, and to perform compliance verification activities in response to any situations of concern.

3.3 Whiteshell Laboratories

For 2018, CNSC staff rated 13 of 14 SCAs for WL as "satisfactory", the exception being the SCA of Security, discussed further below. CNSC staff performed two inspections at the WL site in 2018, and issued one enforcement action, which has since been closed.

During the period covered by this report, CNSC staff raised concerns regarding ongoing issues with CNL's security program at Whiteshell Laboratories. These concerns led to the CNSC issuing an inspector's Order to CNL, to implement changes to CNL's security posture at the site. CNSC staff have evaluated CNL's 2018 performance at the WL site in the SCA of Security as 'below expectations'. CNL has provided an action plan to CNSC staff, and has made significant progress in addressing the conditions of the Order. In June 2019, CNSC staff and CNL provided an update to the Commission on the progress against the Order in a closed session.

CNSC staff expect CNL's performance in this SCA to improve in 2019. CNSC staff have nonetheless increased regulatory oversight of this SCA at Whiteshell in 2019 as a part of its graduated enforcement strategy.

3.4 The Port Hope Area Initiative

For 2018, CNSC staff rated all 14 SCAs for each of the PHP and PGP sites as "satisfactory". CNSC staff performed 11 inspections at PHAI sites in 2018, and issued 37 enforcement actions, four of which remained open at the time of this report. These open actions relate to CNSC staff's requests for further documentation regarding the installation of the baseliner system in Cell 3 of the Port Hope LTWMF, and so do not pose a threat to safety, security or the environment. These actions are being tracked to completion by CNSC staff.

Due to CNSC staff's verification of specific milestones in CNL's construction and remediation work, such as the installation of baseliner systems at the LTWMF, a relatively high number of inspections were carried out by CNSC staff at PHAI sites in 2018. Similarly, CNSC staff also carried out inspections of CNL's remediation verification at the PGP, that is, CNL's work to ensure that a given area is now clean. Such verifications must be carried out prior to CNL backfilling the remediated area.

Figure 11 - CNSC inspector observes CNL's radiation survey of a residential property in Port Hope

CNSC staff's targeting of these milestones has led to a higher number of inspections than otherwise would be the case, given the risk profile of PHAI sites. The relatively high number of enforcement actions at the PHAI in 2018 is due to the higher number of inspections and the non-routine nature of PHAI operations relative to other CNL sites, which have been in steady operation for decades. Enforcement actions at PHAI sites in 2018 were of low safety significance.

3.5 DP, G-1 and NPD Waste Facilities

For 2018, CNSC staff rated all 14 SCAs for each of the DP, G-1 and NPD sites as "satisfactory". CNSC staff performed one inspection at each of the DP, G-1 and NPD sites in 2018, and issued two enforcement actions (both at DP), which have since been closed. These enforcement actions were of low safety significance such as ensuring that the site-specific emergency phone number is listed on radiation zoning signs. Given that these facilities remained in a state of storage with surveillance in 2018, they continued to be categorized as low risk by CNSC staff and received limited inspection effort.

3.6 Focused Inspections at CNL sites in 2018

The CNSC uses an external complaint process as a method to learn of and address unreported non-compliances associated with its regulatory mandate. In some cases, CNSC staff carry out reactive focused inspections in order to address specific concerns raised through this process. In 2018, CNSC staff carried out two such inspections, one at CRL and one at the PHAI sites. These were carried out in response to information received by CNSC staff which alleged deficiencies in safety culture at those sites, specifically related to the raising issues by CNL staff. As part of these inspections, CNSC staff reviewed CNL documents and records, and interviewed current and former CNL staff.

Neither inspection found evidence that CNL discourages staff from raising safety-related issues, although the team identified some reluctance amongst those workers interviewed on CNL sites with regards to raising other issues in general. CNSC staff have requested that CNL carry out a safety culture self-assessment by the end of December 2019, and communicate the results of that self-assessment to CNSC staff by the end of March, 2020.

4 THE CNSC'S ASSESSMENT OF SAFETY AT CNL SITES

The CNSC regulates all aspects of safety at nuclear sites in Canada, including risks to workers, the public and the environment, among others. Information related to the SCAs of radiation protection, environmental protection and conventional health and safety are presented in this section, as these three SCAs are representative of CNL's overall safety performance. In particular, the SCAs of radiation protection and conventional health and safety are a good measure of the safety of workers at CNL sites, while the SCA of environmental protection is a good measure of the safety of the public and the environment.

For both the radiation protection and environmental protection SCAs, the concept of Action Levels (ALs) are used. ALs are a specific dose of radiation or other parameter that, if reached, may indicate a loss of control of part of a licensee's radiation protection program or environmental protection program. If an AL is exceeded, CNL must establish the cause and, if applicable, take steps to restore the effectiveness of relevant programs. Action level exceedances are reportable to the CNSC under the Radiation Protection Regulations and the timing to report any exceedances is provided in the REGDOC-3.1.2 Reporting Requirements, Volume I: Non-Power Reactor Class I Nuclear Facilities and Uranium Mines and Mills [8].

4.1 The Environment and the Public

Protection of the environment and the public are linked in the SCA of environmental protection, which covers programs that identify, control and monitor all releases of radioactive and hazardous substances and the effects on the environment from facilities or as a result of licensed activities.

CNSC staff concluded that the environmental protection SCA at CNL sites covered by this ROR met applicable regulatory requirements and was thus "satisfactory" in 2018, unchanged from the previous year.

Table 6: Environmental Protection Ratings for CNL Sites in 2018

Safety and control area	CRL	WL	PHP[10]	PGP	DP	G-1	NPD
Environmental protection	SA	SA	SA	SA	SA	SA	SA

CNSC staff have arrived at this conclusion on the basis of independent assessment of CNL's effluent and emissions monitoring data and environmental monitoring data, ongoing evaluation of CNL's Environmental Management System (EMS, a part of CNL's overall Management System), and also on the basis of activities carried out during inspections at CNL sites in 2018.

[10] Note that WNSL-W1-182.0/2021 and WNSL-W1-344-1.8/ind are included under the PHP in this table

Effluent and Emissions Control at CNL sites

At all CNL sites, airborne and waterborne releases of radioactive and hazardous substances remained below regulatory limits in 2018. As required by the Class I Nuclear Facilities Regulations [9], at CRL, WL, DP, G-1 and NPD, CNL implements effluent and environmental monitoring programs. Although they are not Class I facilities, similar programs are also in place for PHAI sites.

Of note in 2018:

- Releases to the environment from the CRL site have decreased due to the permanent shutdown of the NRU reactor, in addition to the decrease in 2016 from the shutdown of the Molybdenum-99 Production Facility. Releases to the environment from the CRL site are tabulated in Tables H-1 and H-2 of Appendix H.
- Notwithstanding the overall decrease in emissions, CRL exceeded Action Levels for environmental protection three times for releases of radioactive substances to the air. These three exceedances were all associated with work being carried out in the NRU facility. Two of these exceedances were in adjacent weeks and were related to a planned defect-fuel experiment being carried out by CNL, while the third was related to work on the heavy water purification system, after NRU had been permanently shut down. CNSC staff have assessed that there was no impact on workers, the public or the environment as a result of these exceedances.
- Following a recommendation from CNSC staff, CNL ceased direct releases of liquid effluent (both radiological and hazardous) to the environment from the Wells Area Sump in NPD, and began collecting that effluent and shipping it to CRL for treatment prior to release. These former releases of liquid effluent did not exceed any action levels or regulatory limits, but were not a best practice for waste management.

CNL's Environmental Management System

The CNSC requires that licensees develop and maintain EMSs in order to provide a documented framework for integrated activities related to environmental protection. CNL has established a corporate EMS, a part of the overall CNL Management System, which applies to all CNL sites in Canada. CNL's EMSs for CRL and WL conform to, and are registered to, the International Standards Organization 14001:2015 Standard, Environmental Management Systems – Requirements with Guidance for Use [10]. EMSs include activities such as establishing annual environmental objectives, goals and targets. CNSC staff confirmed that CNL meets objectives, goals and targets through regular compliance verification activities.

Assessment and monitoring

CNSC staff confirmed that CNL, in accordance with its environmental protection and monitoring programs, successfully carried out required effluent and environmental monitoring, site inspections, environmental awareness training and program implementation for the sites covered by this ROR. Through compliance activities conducted during 2018, CNSC staff concluded that environmental monitoring conducted at CNL sites and the discharge of treated effluent from CNL sites both met regulatory requirements.

Of note in 2018:

- CNL continued to sample and analyze groundwater for radiological and hazardous contaminants at the PHAI, CRL, and WL. Results in 2018 were consistent with historical data, and in some cases concentrations of contaminants have decreased.
- In 2017 the Commission amended the licence for the PHP with regards to in-situ management of arsenic in groundwater under Cell 1. CNL established a trigger level of 50µg/l in groundwater down-slope from Cell 1, and no results in 2018 were above this level.

Protection of the Public

CNL is required to demonstrate that the health and safety of the public are protected from exposures to hazardous substances released from their licensed operations. The effluent and environmental monitoring programs currently conducted by the licensee are used to verify that releases of hazardous substances do not result in environmental concentrations that may affect public health.

CNSC receives reports of discharges to the environment through the reporting requirements outlined in CNL's licences and LCHs. The review of hazardous (non-radiological) discharges to the environment from CNL's sites indicates that the public and environment are protected.

Based on CNSC staff reviews of the programs at CNL sites, CNSC staff concluded that the public continues to be protected from CNL operational emissions.

Environmental Risk Assessment

CNSC staff develop monitoring requirements and compliance plans for each site, commensurate with the risk associated with the licensed activities. The Environmental Risk Assessment (ERA) is a systematic process used to identify, quantify and characterize the risk posed by contaminants and physical stressors in the environment to human and non-human (biological) receptors. Currently, all CNL sites covered by this ROR have acceptable environmental protection programs in place to ensure the protection of the public and the environment.

Of note in 2018:

- CNSC staff evaluated the results of CNL's 2018 groundwater monitoring at the PHP and CRL, and concluded that results remain consistent with historic data and in some cases are showing improving results over time.
- CNSC staff continue to monitor CNL's sampling of groundwater seeping through the bluffs overlooking Lake Ontario at the PGP, which contain elevated levels of fluoride, arsenic, uranium and nitrates. The water quality in these seeps is expected to improve over time as CNL continues to excavate and remove the legacy wastes which is the source of these contaminants.
- CNSC staff received an updated ERA covering the entire CRL site, as an update to the previous 2012 ERA. Among other topics, the 2018 ERA covers buildings/facilities/infrastructure constructed or in the process of construction since 2012, as well as buildings demolished, decommissioned or in the process of decommissioning since 2013. CNSC staff are reviewing this document and will provide comments to CNL in 2019.
- CNSC staff reviewed CNL's Environmental and Biophysical Monitoring Plan for both the Port Hope and Port Granby projects. Monitoring data for all environmental media are within or below the predictions made in the previous Environmental Assessments for those projects, demonstrating that the risks from emissions from PHAI sites are very low.

4.1.1 Independent Environmental Monitoring Program (IEMP) Results

In addition to licensees carrying out required monitoring of their operations, the CNSC carries out its Independent Environmental Monitoring Program (IEMP) to verify and confirm that the public and the environment around licensed nuclear facilities remain safe. The IEMP is a regulatory tool that complements the CNSC's ongoing compliance verification program. The IEMP involves CNSC staff taking samples from publicly accessible areas around nuclear sites, and measuring and analyzing the level of relevant contaminants in those samples.

Samples may be taken for air, water, soil, sediment, vegetation, and some food, such as locally-grown produce. Samples are analyzed at the CNSC's laboratory for both radiological and non-radiological contaminants related to the activities of the nuclear site. CNSC staff compare contaminant levels in samples to applicable guidelines and/or natural background levels. All IEMP sample results and associated standards are posted on the CNSC's IEMP website, which is linked in Appendix I.

Figure 12: CNSC staff collect water samples on the St. Lawrence River near G-1 and G-2 in September 2018

In 2018, CNSC staff conducted independent environmental monitoring around the sites covered by this CMD as shown in Table 7. IEMP results for the areas surrounding these sites indicate that the public and the environment in the vicinity of these sites are protected.

Table 7: IEMP Activities Around Sites Covered by this Report in 2018

Site	Date(s)
Nuclear Power Demonstration	August and October 2018
Gentilly-2 Nuclear Facility (including the Gentilly-1 Waste Facility)	September 2018

It is a priority for the CNSC that IEMP sampling reflects Indigenous traditional land use, values and knowledge where possible. As part of the CNSC's ongoing relationship building with Indigenous communities, CNSC staff collaborated with the Algonquins of Ontario (AOO) in the development of the sampling plan for the NPD Waste Facility. CNSC staff included many of AOO requested locations in the sampling plan conducted in August. Additionally, in October, CNSC staff collected a variety of samples with the aid of AOO Knowledge Holders. This included traditional and medicinal plants. The results were provided to the AOO in May 2019.

CNSC staff plan to carry out IEMP sampling campaigns in the vicinity of the CRL, DP, and PHAI sites in 2019.

4.2 Protection of Workers at CNL Sites

The mandate of the CNSC includes consideration of the safety of all workers at licensed sites, including licensee staff, contractors, and sub-contractors, etc. The SCAs of radiation protection and conventional health and safety are considered to be the most direct measure of the licensee's performance in these areas.

Table 8: Radiation Protection and Conventional Health and Safety Ratings for CNL Sites in 2018

Safety and control area	CRL	WL	PHP[11]	PGP	DP	G-1	NPD
Radiation protection	SA	SA	SA	SA	SA	SA	SA
Conventional health and safety	SA	SA	SA	SA	SA	SA	SA

4.2.1 Radiation Protection

The radiation protection SCA covers the implementation of a radiation protection program in accordance with the *Radiation Protection Regulations* [11]. The program must ensure that contamination levels and radiation doses received by individuals are monitored, controlled and maintained as low as reasonably achievable (ALARA). CNL sites are required to implement and maintain a radiation protection program; this program meets the requirements of the *Radiation Protection Regulations*.

For 2018, CNSC staff rated the radiation protection SCA at all CNL licensed sites as "satisfactory" based on regulatory oversight activities. CNSC staff have come to these conclusions on the basis of inspections performed at CNL sites, along with desktop reviews.

Application of ALARA

In 2018, CNL continued to implement the ALARA program, and the subsidiary site-specific radiation protection plans for the sites covered by this ROR. These site-specific plans contain commitments to apply ALARA measures for all CNL activities.

CNL's application of ALARA within their radiation protection program includes management commitment and oversight, personnel qualification and training, design analyses of facilities and systems, provision of protective equipment and ALARA assessments/reviews of radiological activities.

[11] Note that WNSL-W1-182.0/2021 and WNSL-W1-344-1.8/ind are included under the PHP in this table

The CRL site is the most complex of CNL's sites, with diverse work activities that represent radiological risks to workers. At CRL in 2018, CNL developed 39 radiological work assessments and four radiological work plans/procedures to ensure that work activities at the CRL site were consistent with the ALARA principle. These documents incorporate radiological control hold points and radiological control measures.

Worker dose control

At CNL, workers, including employees and contractors, conducting work activities which present a reasonable probability of receiving an occupational dose greater than 1 millisievert (mSv)/year are considered as Nuclear Energy Workers (NEWs). Workers, whose job function do not present a reasonable probability of receiving an occupational dose greater than 1 mSv/year, are considered non-NEWs. Radiation exposures to NEWs and to non-NEWs are monitored by CNL to ensure compliance with the CNSC's regulatory dose limits and to maintain radiation doses ALARA.

CNL uses CNSC licensed dosimetry for measuring and controlling external doses. Internal exposure is assessed through a routine bioassay program dependent on worker tasks or duties.

In 2018, no worker at a CNL site (whether a NEW or a non-NEW) received a radiation exposure in excess of the CNSC regulatory effective dose limits. More detailed data on doses to NEWs and non-NEWs at CNL sites is available in Appendix E.

Radiation protection program performance

Radiation protection program performance at CNL sites was assessed in 2018 through CNSC staff compliance activities, including inspections and desktop reviews. CNL's compliance with the *Radiation Protection Regulations* and CNSC licence requirements was satisfactory.

Action levels for radiological exposures are established for each of the CNL sites as part of CNL's radiation protection program. In March of 2018, a radiation protection action level exceedance occurred at the PGP. A NEW received a committed effective dose from exposure to radon of 0.70 mSv and a whole body effective dose of 0.46 mSv, for a total of 1.16 mSv effective dose over a 4 week period, exceeding CNL's action level of 1 mSv over a 4 week period. The worker was present in waste excavation areas, where levels of radon gas above natural background are likely. Through an investigation, CNL concluded that this action level exceedance did not represent a loss of control of their radiation protection plan, due to the nature of the work activities being performed by the worker. CNSC staff are satisfied with CNL's reporting and investigation of the action level exceedance. CNL's radiation protection action levels at the PHAI had been in force since before the excavation of waste began at PHAI sites. In February 2019, CNL revised the PHAI radiation protection plan action levels to 3 mSv over a 4 week period, which better aligns with current work activities at the PHAI sites and the likelihood of exposure to radon at levels above natural background.

There were no other radiation protection action level exceedances in 2018 at the other sites covered by this ROR.

Radiological hazard control

Radiation and contamination monitoring programs continued to be implemented at CNL's sites in 2018, to control and minimize radiological hazards and the spread of radioactive contamination. These programs include the use of radiological safety zones to maintain effective management of radiological hazards, along with control measures and monitoring for surface contamination, personnel contamination, radiation dose rates, and airborne radioactivity.

CNL performed routine contamination monitoring of the workplace to identify surface contamination in order to prevent inadvertent transfer of contamination. Dose rate measurements and, where appropriate, in-plant air monitoring were routinely performed in the workplace to confirm that radiation exposures are kept ALARA. The radiological hazard surveys conducted in 2018 by CNL's staff did not identify any adverse trends, and were consistent with expected radiological conditions.

Estimated dose to the public

As part of their annual reporting to the CNSC, CNL provides data on dose to a hypothetical member of the public, who is representative of someone who spends considerable time in proximity to the licensed site. In all cases, CNL's data indicates that doses to the public resulting from CNL's operations are orders of magnitude less than the 1 mSv limit prescribed in the *Radiation Protection Regulations*. This dose data is available in Appendix F.

4.2.2 Conventional Health and Safety

The conventional health and safety SCA covers the implementation of a program to manage workplace safety hazards and protect workers. CNL licenced sites must develop, implement and maintain effective safety programs to promote safe and healthy workplaces and minimize incidences of occupational injuries and illnesses.

For 2018, CNSC staff rated the conventional health and safety SCA at all CNL licenced sites as "satisfactory" based on regulatory oversight activities. These included inspections, desktop reviews of CNL documentation, and an ongoing review of items raised via CNL's 'improvement action' or ImpAct tool. CNL uses the ImpAct tool to record all incidents at all CNL sites, from relatively minor occurrences such as wildlife on site roads, to events which are reportable to the CNSC. All of CNL's ImpAct data is available to CNSC staff, whether that data relates to events which must be reported to the CNSC or to events of lower significance. Overall, the compliance verification activities conducted by CNSC staff at CNL sites confirmed that CNL continues to view conventional health and safety as an important consideration.

Practices

In addition to the NSCA and its associated regulations, CNL's activities must comply with Part II: Occupational Health and Safety of the Canada Labour Code [12], its Canada Occupational Health and Safety Regulations [13], and other applicable federal and provincial health and safety acts and regulations.

CNL's Occupational Safety and Health program applies to all work performed by CNL employees, and CNL is accountable for ensuring the health and safety of contractors at work places controlled by CNL. When evaluating safety practices at a site, CNSC staff do not distinguish between the licensee's own staff and staff employed by contractors or sub-contractors, considering all to be 'workers' and equally subject to CNSC requirements and to the licensee's policies and procedures for the site. This is relevant for CNL as at many CNL sites there are numerous contractors performing a wide variety of different tasks.

During 2018, CNSC staff verified CNL safety practices during compliance inspections and site walk-downs, all of which incorporated the verification of aspects related to conventional health and safety, as well as during desktop reviews and technical assessments.

Performance

The key performance indicators for conventional health and safety are the number of recordable lost-time injuries (RLTI) that occur per year, RLTI severity and RLTI frequency. An RLTI is defined as a workplace injury that results in the worker being unable to return to work for a period of time. RLTI severity and frequency provide context to the number of RLTIs. RLTI severity quantifies the number of lost work days experienced per 100 employees, while RLTI frequency quantifies the number of lost-time injuries relative to the number of hours worked.

Data on RLTI, RLTI frequency and RLTI severity since 2014 are included in Appendix G for all sites covered by this ROR.

There were no RLTIs at PHAI sites, DP, NPD, and G-1 in 2018. Both CRL and WL had RLTIs in 2018, but these sites also had relatively more hours worked than the sites that had no RLTIs.

For comparison, CNL's reported RLTI frequency is lower than lost time injury rates at most comparable industries in Ontario (for instance, construction and manufacturing) in 2018, as per the Ontario Workplace Safety and Insurance Board (WSIB) data [14] included in Appendix G. CNSC staff consider this to be a conservative comparison because Ontario LTI data includes only injuries for which compensation claims were allowed, rather than all reportable injuries as is included in CNL's data. Ontario numbers are also lower than those for Manitoba, the location of the only CNL site which is both outside of Ontario and reported an LTI in 2018. On the basis of compliance activities carried out in 2018 and a review of CNL's data, CNSC staff are satisfied with CNL's conventional health and safety performance at the sites covered by this ROR.

5 EVENTS AND OTHER MATTERS OF REGULATORY INTEREST

5.1 Reportable Events

Detailed requirements for reporting unplanned situations or events at CNL licensed sites to the CNSC are included in the applicable LCH. CNSC Regulatory Document 3.1.2 *Reporting Requirements for Non-Power Reactor Class I Facilities and Uranium Mines and Mills* came into force for applicable CNL licensees in January 2019. Over the period covered by this report, CNL has complied with the requirements for submission of these reports.

A summary of events reported to the CNSC by CNL in 2018 are presented in Table 9.

Table 9: Number Reportable Events by Site from January 1, 2018 to December 31, 2018

Site	Number of Events
Chalk River Laboratories	35
Douglas Point Waste Facility	0
Gentilly-1 Waste Facility	0
Nuclear Power Demonstration Waste Facility	2
Whiteshell Laboratories	0
Port Hope	5
Port Granby	5

For each event, CNL completed an investigation and established corrective actions, where appropriate. For simpler events, CNL reported on both the event and the corrective actions in one report, while for more complicated events, multiple reports (e.g. initial verbal report, preliminary written and full written reports) may be submitted. In all cases, CNSC staff reviewed this information, came to a consensus determination of qualitative safety significance, and further steps (follow-up questions, incorporation of follow-up activities into subsequent compliance activities, etc.) were taken as appropriate. For reportable events which occurred in 2018, CNSC staff are satisfied with CNL's corrective actions.

Many of these events were of low safety significance, such as the failure to calibrate radiation detectors in unoccupied buildings at the prescribed frequency, and had no impact on the health and safety of workers or the public, the environment, or security.

Eight events at CRL were directly related to the operation of the now shut-down NRU reactor. There were three instances of releases of radioisotopes to the environment which exceeded action levels, therefore necessitating reporting to the CNSC and an internal investigation by CNL. These releases did not exceed regulatory limits. Events related to NRU operation will no longer occur now that it is permanently shut down, although work continues in the NRU building in order to transition that facility into a state of storage with surveillance.

Events which CNSC staff assess as meeting specific risk criteria are the subject of "Event Initial Reports" from CNSC staff to the Commission. In 2018, there were no Event Initial Reports related to events at CNL sites. There have been two Event Initial Reports thus far in 2019, which for completeness are shown in Table 10 below and are available on the CNSC's website. CNSC staff continue to follow up on both events; they will be covered in more detail in the 2019 ROR for CNL sites.

Table 10: Event Initial Reports at CNL Licensed Sites from January 1, 2018 to Present

CMD Number	Event
19-M9	Worker injured on January 9, 2019 at CNL Port Granby Project
19-M10	Power Outage at Chalk River Laboratories

5.2 Public Engagement

The area of public engagement has two aspects, those of activities carried out directly by CNSC staff, and of activities carried out by CNL.

5.2.1 CNSC staff

The NSCA mandates the CNSC to disseminate objective scientific, technical and regulatory information to the public concerning its activities and the activities it regulates. CNSC staff fulfill this mandate in a variety of ways, including the publishing of RORs and through 'Meet the Regulator' sessions. CNSC staff also seek out other opportunities to engage with the public and Indigenous groups, often participating in meetings or events in communities with interest in nuclear sites. These allow CNSC staff to answer questions about the CNSC's mandate and role in regulating the nuclear industry, including CNL's sites.

A list of outreach activities carried out by CNSC staff in 2018 and targeted at, or otherwise relevant to, CNL's activities is presented in Table 11 below. These are separate from CNSC staff's Indigenous engagement activities described in Section 5.3 below

Table 11: CNSC Staff Outreach Related to CNL Sites and Projects in 2018

Date	Event	Location
June, 2018	Meet the Regulator Session – CNL focus	Ottawa, ON
June, 2018	Meet the Regulator Session	Gatineau, QC
September, 2018	Port Hope & District Agricultural Society Fair, Port Hope, ON	Port Hope, ON

Of the events listed, the Port Hope & District Agricultural Society Fair in Port Hope, ON, was considered to be particularly successful by CNSC staff. CNSC staff participated in a pre-existing and well-attended event in the community and were able to discuss the CNSC's role and mandate with a large number of members of the public from the region.

Figure 13 - CNSC staff speaking to members of the public at the 2018 Port Hope & District Agricultural Society Fair

Given the success of that event, and given CNL's many new plans for its various sites, in 2019 CNSC staff have continued to carry out targeted outreach activities at pre-existing events in communities near CNL's sites.

5.2.2 Canadian Nuclear Laboratories

To ensure open and transparent information about nuclear facilities is available to the public, the CNSC requires licensees to implement and maintain a public information program and disclosure protocol (PIDP). All of the CNL sites covered by this ROR are required to have such a program, and CNSC staff consider that CNL's PIDPs for the sites covered by this ROR meet all requirements.

Public Information Program for CRL

CNL's PIDP for the CRL site meets all regulatory requirements for public information and disclosure. CNL provides open and transparent means for the public to obtain desired operational, environmental, and safety information about the facility. CNL has a public website, listed in Appendix I, where members of the public and Indigenous groups can access extensive environmental reporting and information about reportable events at CNL sites. CNL also has regular engagement sessions with the community to update stakeholders on licensed activities and uses multiple communications tools to allow the public access to facility information. CNSC staff consistently oversee CNL's implementation of the PIDP to ensure that CNL continues to meet its obligations regarding dissemination of information.

Public Information Program for PHAI

CNL's public information program for the PHAI has been developed based on CNSC requirements for public information and disclosure, and allows members of the public to obtain plain-language information on all aspects of the PHAI projects. CNL also ensures timely public disclosure following the occurrence of any unplanned events at PHAI sites via its website. CNSC staff confirm through compliance activities that CNL proactively shares project-related information with interested parties and continues to build relationships with its stakeholders. CNL's public information strategies and approaches ensure the Port Hope and Port Granby communities have access to up-to-date information on the PHAI.

Public Information Program for WL, DP, G-1 and NPD

CNL's public information program for WL, DP, G-1 and NPD has been developed in accordance with CNSC regulatory requirements, and allows members of the public to obtain plain language information on all aspects of these projects. CNL maintains up-to-date information on all decommissioning projects on their website, and ensures appropriate public disclosure following the occurrence of unplanned events. CNL also regularly engages with their communities to confirm they are receiving desired information on project activities.

5.3 Indigenous Consultation and Engagement

As an agent of the Government of Canada and as Canada's nuclear regulator, the CNSC recognizes and understands the importance of consulting and building relationships with Indigenous peoples in Canada.

CNSC staff are committed to building long-term relationships with Indigenous groups who have interests in nuclear facilities' regulation within their traditional and/or treaty territories. By pursuing informative and collaborative ongoing interactions, the CNSC's goal is to build partnerships and trust. The CNSC's Indigenous engagement practices, which include information sharing and funding support (through the CNSC's Participant Funding Program (PFP)) for Indigenous peoples to meaningfully participate in Commission proceedings and ongoing regulatory activities, are consistent with the principles of upholding the honour of the Crown and reconciliation.

CNSC staff efforts in 2018 supported the CNSC's ongoing commitment to meeting its consultation obligations and building relationships with Indigenous peoples with interests in the CNL sites covered by this ROR. In particular, CNSC staff continued to work to meet its Duty to Consult obligations with regards to CNL's proposed projects (the NSDF, the NPD Closure Project, and in-situ decommissioning of the WR-1 reactor), topics discussed further in Sections 5.5 and 5.9 below. CNSC staff also continued to identify opportunities for formalized and regular engagement throughout the lifecycle of the other CNL sites, including meetings and workshops. Through this engagement, CNSC staff welcomed the opportunity to discuss and address all topics of interest and concern to the Indigenous communities.

In addition, to ensure that interested Indigenous communities were made aware of this ROR, CNSC staff provided interested communities with notice of the PFP opportunity to review and comment on the report and the opportunity to submit a written intervention and/or appear before the Commission as part of the Commission meeting. As well, copies of the report will be sent to all Indigenous communities and organizations who have requested to be kept informed of activities at the CNL sites.

To ensure licensees engage Indigenous communities, in February 2016 the CNSC published REGDOC-3.2.2, *Aboriginal Engagement*, which sets out requirements and guidance for licensees proposing projects that may raise the Crown's duty to consult. CNSC staff continued to monitor the engagement work conducted by CNL to ensure that they continue to actively engage and communicate with Indigenous groups who have interest in their facilities, and that they are following the guidance of REGDOC 3.2.2 when appropriate. Below is a summary of the engagement activities specific to each facility in this report conducted by CNSC and CNL during the reporting period.

5.3.1 Chalk River Laboratories and Nuclear Power Demonstration

The CRL and NPD sites fall within the traditional territories of the Algonquins of Ontario (AOO), Algonquins of Quebec, the Métis Nation of Ontario and the Williams Treaties First Nations. The Indigenous groups and organizations who have expressed a direct interest in the CRL and NPD sites include: the Algonquins of Ontario, Algonquins of Pikwàkanagàn, Métis Nation of Ontario (MNO), the Algonquin Anishinabeg Nation Tribal Council, Kebaowek First Nation, Kitigan Zibi Anishinabeg First Nation, Anishinabek Nation, the Algonquin Nation Secretariat, and Williams Treaties First Nations: Alderville First Nation, Beausoleil First Nation, the Chippewas of Georgina Island First Nation, Chippewas of Rama First Nation, Curve Lake First Nation, Hiawatha First Nation, Mississaugas of Scugog Island First Nation.

CNSC consultation and engagement activities

In 2018 the focus of CNSC staff's consultation and engagement activities with regards to the CRL and NPD sites has been on the proposed NSDF for low level waste at CRL and the proposed NPD closure project. CNSC staff have continued to send letters with key project information updates, conduct phone calls, and engage in meetings with the above mentioned groups to discuss their areas of interest related to the proposed NSDF and NPD closure projects and how the CNSC will be incorporating their comments and addressing their concerns as part of the regulatory process, including the ongoing environmental assessments being conducted under the *Canadian Environmental Assessment Act*, 2012 (CEAA 2012, [15]) for each project. In addition, through its PFP, the CNSC has funded two Indigenous Knowledge (IK) studies for AOO and MNO in relation to the two projects. The CNSC also continued to offer funding under the PFP to interested Indigenous groups to help them participate in the remainder of the regulatory process, including for additional meetings with CNSC staff. The CNSC will continue to consult with Indigenous groups who have interests or concerns in relation to the NSDF and NPD closure projects, as well as on other areas of interest related to CRL.

CNL engagement activities

CNSC staff observed that CNL has a dedicated Indigenous engagement program that covers their operations and activities at the CRL and NPD sites.

Consistent with the requirements and guidance of CNSC REGDOC 3.2.2: *Aboriginal Engagement* [16], throughout 2018, CNL met and shared information with interested Indigenous communities and organizations. These efforts have included emails, letters, meetings, site visits and tours, community visits, and workshops among others with a major focus being on the NSDF and NPD Closure projects. CNL is also in the process of negotiating Memorandums of Understanding with AOO and MNO, and has contributed funding to above-mentioned IK studies conducted in relation to NSDF and NPD closure by AOO and MNO.

CNSC staff continue to be satisfied with the level and quality of Indigenous engagement conducted by CNL with regards to their operations and proposed projects at the CRL and NPD sites and continue to adhere to the guidance of REGDOC 3.2.2.

5.3.2 Whiteshell Laboratories

The WL site falls within the traditional territories of Sagkeeng First Nation, Manitoba Métis Federation (MMF), Brokenhead Ojibway Nation, Black River First Nation, Hollow Water First Nation, and the First Nations represented by Grand Council of Treaty 3 and Chiefs of Ontario: Northwest Angle #33, Shoal Lake #40 First Nation, Wabaseemoong Independent Nations, and Iskatewizaagegan #39 Independent First Nation. These Indigenous groups and organizations have all expressed interest in the WL site.

CNSC consultation and engagement activities

In 2018 the focus of CNSC staff's consultation and engagement activities with regards to the WL site has been on the proposed in-situ decommissioning of WR-1 and the proposed licence renewal for the WL site. CNSC staff have continued to send letters with key project information updates, conduct phone calls, and engagement meetings with the above mentioned groups to discuss their areas of interest related to WR-1 and WL relicensing. CNSC staff have continued to discuss with interested Indigenous groups how their comments and concerns will be incorporated and addressed as part of the regulatory process, including the ongoing environmental assessment being conducted under CEAA 2012 for WR-1.

In addition, through its PFP the CNSC has funded three IK studies in relation to the WR-1 project, including for Sagkeeng First Nation, MMF, and one for Black River First Nation, Brokenhead Ojibway Nation, and Hollow Water First Nation. The CNSC also continued to offer funding under the PFP to interested Indigenous groups to help them participate in the remainder of the regulatory process including additional meetings with CNSC staff. The CNSC will continue to consult with Indigenous groups who have interests or concerns in relation to WR-1, the WL licence, as well as on other areas of interest related to WL.

CNL engagement activities

CNSC staff observed that CNL has a dedicated Indigenous engagement program that covers their operations and activities at the WL site.

Consistent with the requirements and guidance of CNSC REGDOC 3.2.2: *Aboriginal Engagement*, throughout 2018, CNL met and shared information with interested Indigenous communities and organizations. These efforts have included emails, letters, meetings, site visits and tours, community visits, and workshops among others with a major focus being on WR-1. CNL has also contributed funding to the above-mentioned IK study conducted in relation to WR-1 by Sagkeeng First Nation. CNSC staff continue to be satisfied with the level and quality of Indigenous engagement conducted by CNL with regards to their operations and proposed projects at WL and continue to adhere to the guidance of REGDOC 3.2.2.

5.3.3 The Port Hope Area Initiative

The PHAI falls within the traditional territories of the Williams Treaties First Nations and the MNO. The Indigenous groups and organizations who have expressed a direct interest in the Port Hope and Port Granby Projects include: Mohawks of the Bay of Quinte, MNO, and the Williams Treaties First Nations: Alderville First Nation, Beausoleil First Nation, the Chippewas of Georgina Island First Nation, Chippewas of Rama First Nation, Curve Lake First Nation, Hiawatha First Nation, Mississaugas of Scugog Island First Nation.

CNSC consultation and engagement activities

CNSC staff regularly engage with Indigenous groups with interest in the Port Hope Project and the Port Granby Project. In 2018, CNSC staff met with the Williams Treaties First Nations, and MNO Region 8 in order to provide updates on a number of CNSC regulated facilities and activities in their traditional territories, including the Port Hope and Port Granby projects. As part of these meetings the interested Indigenous groups did not raise any issues or concerns with regards to these CNL projects. However, CNSC staff welcome the opportunity to continue to provide project updates and discuss any areas of interest and concern with Indigenous groups in relation to the Port Hope and Port Granby projects.

CNL engagement activities

CNSC staff observed that CNL has a dedicated Indigenous engagement program that covers their remediation sites. CNSC staff confirm that CNL invited representatives from Curve Lake First Nation, Hiawatha First Nation, Mississaugas of Scugog Island, and Alderville First Nation for an in-person engagement in November 2018 for an update on the Port Hope Area Initiative and a tour of the project sites. CNL also continues to send information about Port Hope and Port Granby and their potential impacts on the environment to interested Indigenous groups, as well as invitations to participate in events and public information sessions.

5.3.4 DP and G-1 Waste Facilities

The Douglas Point reactor falls within the Traditional Territory of the Chippewas of Nawash Unceded First Nation and Saugeen First Nation, who together form the Saugeen Ojibway Nation (SON). The Douglas Point reactor also falls within the asserted traditional harvesting territory of the Métis Nation of Ontario (MNO). In addition, the Douglas Point reactor falls within the asserted traditional harvesting territory of the Historic Saugeen Métis (HSM). The Indigenous groups and organizations who have expressed a direct interest in Douglas Point include SON, MNO, and HSM. The G-1 site lies within the traditional territory of the Abénakis of Wôlinak and Odanak, represented by the Grand Conseil de la Nation Waban-Aki (GCNWA) as well as the Nation huronne-wendat.

CNSC consultation and engagement activities

CNSC staff regularly engage with Indigenous groups with an interest in the Douglas Point reactor. In 2018, CNSC staff met with SON, HSM and MNO Region 7 on multiple occasions in order to provide updates on a number of CNSC regulated facilities and activities of interest. Although the discussions during 2018 focused on the Bruce Nuclear Generating Station licence renewal, CNSC staff welcome the opportunity to discuss any areas of interest with Indigenous groups in relation to Douglas Point as they arise.

More recently in May 2019, CNSC staff signed a Terms of Reference with SON to formalize the engagement on numerous items regarding nuclear activities in SON Traditional Territory. CNSC staff are open to including updates related to the Douglas Point reactor as a part of their formalized engagement with SON, should SON express an interest. CNSC staff are also in the process of signing a Terms of Reference with MNO to formalize engagement. CNSC staff are open to including activities related to the Douglas Point reactor as part of their formalized engagement with MNO Region 7, should they express an interest. CNSC staff have also signed a Terms of Reference with HSM to formalize engagement. CNSC staff are open to discussing the Douglas Point reactor as part of their formalized engagement with HSM, should they express an interest.

In 2018, CNSC staff have not received any questions, comments or feedback from Indigenous groups with an interest in the Gentilly site regarding issues or concerns they may have in relation to the Gentilly-1 reactor. However, CNSC staff welcome the opportunity to discuss any areas of interest with Indigenous groups in relation to Gentilly-1 upon request.

CNL engagement activities

CNSC staff observed that CNL has a corporate wide program dedicated to Indigenous engagement. In 2018, CNL has not received any questions or communications from Indigenous groups expressing interest in DP or G-1. CNL has informed CNSC staff that they welcome the opportunity to engage with Indigenous groups on these facilities should they express an interest.

5.4 Possible Small Modular Reactors at CNL sites

In April of 2018, CNL extended an invitation to proponents of Small Modular Reactor (SMR) demonstration projects to be considered in CNL's evaluation process for the possible construction and operation of an SMR at a site owned by AECL. In March of 2019, Global First Power (GFP), the proponent of a 5MWe high-temperature gas cooled reactor, submitted to the CNSC an application for a licence to prepare a site for an SMR at the CRL site. In June of 2019, CNSC staff received updated documents from GFP in support of the application, and in July of 2019, the Project Description was posted on the Canadian Environmental Assessment Agency's website for comment by the public, Indigenous groups, and other interested stakeholders.

Decisions on the environmental assessment pursuant to CEAA 2012 and the application for the licence to prepare a site will be made by the Commission at a future public hearing.

5.5 CNL's Proposed Near Surface Disposal Facility

CNL is currently proposing to construct and operate a low-level radioactive waste disposal facility known as the Near Surface Disposal Facility (NSDF) on a portion of the CRL site. The construction and operation of such a facility is not included in the current licensing basis for the CRL site.

The NSDF is intended to accept low-level radioactive waste, predominantly that generated by CNL's decommissioning work, contaminated soil, and legacy waste from past operations. The waste CNL proposes to accept into the NSDF will largely be from the CRL site, but will also include a small amount of waste from other CNL sites. CNL submitted a draft Environmental Impact Statement (EIS) in March of 2017 for comment by the public, the CNSC and other provincial and federal departments, and submitted a licence application to the CNSC at the same time. CNL received extensive comments on the draft EIS, and CNSC staff further provided extensive comments on technical documentation related to the licence application. CNL expects to submit a revised EIS and licence application in October of 2019.

The NSDF proposal requires an EA decision under CEAA 2012 by the Commission affirming that the project will not cause significant adverse environmental effects. Should the Commission decide favourably, the proposal requires approval by the Commission to proceed with the construction of the facility. The possible construction and operation of the NSDF is out of the scope of this ROR.

5.6 Certified Staff at CRL

Condition 2.3 of the CRL licence requires that persons appointed to the positions of Senior Reactor Shift Engineer and NRU Health Physicist be certified by the CNSC. This licence condition was put in place when NRU was still an operating reactor. The position of Senior Reactor Shift Engineer became obsolete once NRU was permanently defueled and dewatered.

At present, CNSC staff confirm that CNL retains an adequate complement of certified NRU Health Physicists to support radiological work in NRU. CNSC staff continue to evaluate the conditions under which the requirement for certified NRU Health Physicists will no longer apply.

5.7 Fitness for Duty at High Security Sites

In January of 2018, the CNSC published REGDOC-2.2.4 *Fitness for Duty, Volume II: Managing Alcohol and Drug Use*, version 2 [17]. This REGDOC "…sets out requirements and guidance for managing fitness for duty of workers in relation to alcohol and drug use and abuse at all high-security sites, as defined in the *Nuclear Security Regulations*." REGDOC-2.2.4 Volume II, version 2, will apply to the CRL and WL sites, and requires that licensees use a urine drug-testing process to test staff in safety-critical and safety-sensitive positions for the presence of drugs above specified limits.

Licensees have requested that their implementation dates for this REGDOC be delayed to allow consideration of industry-proposed amendments regarding the use of oral fluid testing. CNSC staff have agreed to this delay and are assessing the industry-proposed amendments. Should the REGDOC be amended, the revised draft will be subject to Commission approval at a future date.

5.8 Updates to CNL's Corporate Programs

During 2018 CNL has continued its work to transition its management system away from the older suite of AECL documentation and towards a modern CNL-specific set of documentation. The most visible aspect of this work for CNSC staff is CNL's creation and revision of their Corporate-level program documentation, which can apply to all sites under the control of CNL and as such are the keystone of their management system.

Key Corporate-level documents are listed in the LCHs for multiple CNL sites, and form part of the licensing basis for those sites. CNSC staff consider that including these high-level documents in LCHs renders all relevant subsidiary CNL documents in the licensing basis. This provides CNSC staff with access on request to the documentation necessary to verify CNL's compliance with CNSC requirements.

During 2018, CNSC staff received 52 Corporate-level documents from CNL for technical review. These reviews often resulted in comment being returned to CNL for action or for consideration, which in turn can lead to revised documents being provided by CNL to CNSC staff for comment.

5.9 Waste and Decommissioning

CNL's activities at each of the sites covered by this report involve the generation, storage and managing of radioactive wastes. CNL has pursued accelerated decommissioning strategies at many of its sites, resulting in an actual or planned increase in the rate of generation of radioactive wastes. CNSC staff maintain oversight of CNL's current and future management of radioactive wastes via inspections, desktop reviews, and technical assessments.

Radioactive wastes stored on the sites covered by this report consist of high, intermediate and low-level radioactive waste. The inventory of wastes stored at CNL sites is included in *Canada's Sixth National Report for the Joint Convention on the Safety of Spent Fuel Management and on the Safety of Radioactive Waste Management (October 2017)* [18]. The report can be found on the CNSC's website.

During 2018, CNL continued to employ effective programs for the characterization, minimization, segregation, handling, storage, monitoring, and processing (where applicable) of radioactive and hazardous wastes. CNL sorts and compacts wastes where possible in order to minimize the volume which must be stored.

CNL participated in "Waste Reduction Week in Canada" during October of 2018. The goal of this annual program is to educate, engage, and empower Canadians to reduce, reuse, and recycle waste. During the waste reduction week, CNL conducted various promotional activities to engage employees to learn about waste reduction and environmental sustainability.

The Chalk River Site

Two major activities related to radioactive waste were underway at CRL in 2018. Firstly, CNL continued to retrieve fuel from legacy tile holes for transfer to the Fuel Packaging and Storage facility. CNL also began to store sea containers of radioactive waste generated through decommissioning work; this work began once CNSC staff determined that it was within the licensing basis for the CRL site. CNL intends to eventually transfer much of this material to the proposed NSDF, should that facility receive Commission approval. CNSC staff carried out inspections of CRL's Waste Management and Decommissioning program in 2018 to ensure the ongoing safety of these activities. CNSC staff also reviewed three Detailed Decommissioning Plans for buildings at CRL, and CNL's Comprehensive Preliminary Decommission Plan for the CRL site. CNSC staff have assessed and concluded that these documents met regulatory requirements. During 2018, CRL continued to accept radioactive waste from locations across Canada, and continued to use off-site contractors for volume reduction work on select wastes.

CNL continued decommissioning work in various facilities on the CRL site in 2018, including in ancillary buildings associated with the NRX reactor and the Plutonium Recovery Laboratory, among others.

Accelerated Decommissioning Proposals for WL and NPD

Decommissioning at CNSC licensed sites must be carried out according to decommissioning plans which are reviewed and accepted by the CNSC. CNL has such plans in place, but for the WL and NPD sites, CNL is now seeking to change both the timelines and the methods to be used to decommission.

The CNSC has received formal proposals from CNL to accelerate decommissioning at NPD and the WR-1 reactor at WL. Both of these proposals involve ‘in-situ decommissioning’, where major underground structures would be left in place, filled with grout, and capped. In both cases, in-situ decommissioning is not permitted by the current licensing basis, nor is it the end-state documented in CNL’s current CNSC staff-accepted decommissioning plans.

For each of the NPD and WR-1 projects, CNL has submitted a licence application to the CNSC and prepared a draft EIS for comment by the public, the CNSC and other provincial and federal departments. CNSC staff undertook a review of CNL’s draft EISs and conducted licensing reviews pursuant to the NSCA and its associated regulations. As the responsible authority, and working with other federal departments, CNSC staff have identified a number of areas where additional information will need to be included in the final EISs and other technical supporting documentation. For each project, complete licensing and EIS submissions are required before CNSC staff can complete their assessment and proceed to public hearings.

For each project, following receipt of a complete licensing submission and final EIS, CNSC staff will write a CMD containing staff’s assessment of the licence amendment and the EA report, in support of a hearing on the topic. This CMD will be available to the public and Indigenous groups prior to the Commission’s public hearing, the date of which has not been set. The public will be offered the opportunity to submit written and/or oral interventions. Because there will be separate Commission decisions on these projects, they are out of the scope of this ROR.

Financial Guarantees for CNL sites

AECL is a Schedule III, Part 1 Crown Corporation under the *Financial Administration Act* and an agent of Her Majesty in Right of Canada. As an agent of Her Majesty in Right of Canada, AECL’s liabilities are ultimately liabilities of Her Majesty in Right of Canada. While the restructuring of AECL has seen the ownership of CNL transferred to the Canadian National Energy Alliance, AECL retains ownership of the lands, assets and liabilities associated with CNL’s licences. These liabilities have been officially recognized by the Minister of Natural Resources in a letter dated July 31, 2015 [19]. CNSC staff thus consider that specific financial guarantees for AECL’s sites are not required.

5.10 Emergency Management at the CRL site

During the January 2018 relicensing hearing for the CRL site, the Commission requested an update on emergency planning at the CRL site following the permanent shutdown, defueling and dewatering of the NRU reactor.

CNL has assessed that a severe accident in the NRU facility, that is, an accident involving severe fuel degradation, is no longer possible. CNSC staff concur with this assessment. Due to this reduction in risk, CNL's Severe Accident Management Program (designed specifically for NRU operations) is no longer in use. Ongoing work in NRU is now managed under CNL's Emergency Operating Procedure, as is used for the remainder of the CRL site. CNSC staff are in agreement with this change.

6 OVERALL CONCLUSIONS

This report summarizes the CNSC staff assessment on the performance of CNL at the CRL, WL, PHAI, DP, G-1 and NPD sites in 2018. CNSC staff concluded that these sites operated safely during 2018. This conclusion is based on assessments of licensee activities that included site inspections, reviews of reports submitted by licensees, and event and incident reviews, supported by follow-up and general communication with the licensees.

For 2018, the performance in all 14 SCAs was rated as “satisfactory” with the exception of the Security SCA at WL, which was rated “below expectations”.

CNSC staff’s compliance activities confirmed that:

- Radiation protection programs at all CNL sites adequately controlled radiation exposures, keeping doses ALARA;
- Environmental protection programs at all CNL sites were effective in protecting the environment; and
- Conventional health and safety programs at all CNL sites continue to protect workers.

CNSC staff will continue to provide regulatory oversight at all CNL sites, to ensure that CNL continues to make adequate provision to protect the health, safety and security of workers, Canadians and the environment, and continues to implement Canada’s international obligations on the peaceful use of nuclear energy.

B. SAFETY AND CONTROL AREA DEFINITIONS

The CNSC evaluates how well licensees meet regulatory requirements and CNSC performance expectations for programs in 14 safety and control areas (SCAs). The SCAs are grouped into three functional areas: management, facility and equipment, and core control processes.

Table B-1: Safety and Control Area Framework

Functional area	Safety and control area	Definition	Specific areas
Management	**Management system**	Covers the framework that establishes the processes and programs required to ensure an organization achieves its safety objectives, continuously monitors its performance against these objectives, and fosters a healthy safety culture.	▪ management system ▪ organization ▪ performance assessment, improvement and management review ▪ operating experience (OPEX) ▪ change management ▪ safety culture ▪ configuration management ▪ records management ▪ management of contractors ▪ business continuity
	Human performance management	Covers activities that enable effective human performance through the development and implementation of processes that ensure a sufficient number of licensee personnel are in all relevant job areas and have the necessary knowledge, skills, procedures and tools in place to safely carry out their duties.	▪ human performance program ▪ personnel training ▪ personnel certification ▪ initial certification examinations and requalification tests ▪ work organization and job design ▪ fitness for duty
	Operating performance	Includes an overall review of the conduct of the licensed activities and the activities that enable effective performance.	▪ conduct of licensed activity ▪ procedures ▪ reporting and trending ▪ outage management performance ▪ safe operating envelope ▪ severe accident management and recovery ▪ accident management and recovery
	Safety analysis	Covers maintenance of the safety analysis that	▪ deterministic safety analysis ▪ hazard analysis

Functional area	Safety and control area	Definition	Specific areas
Facility and equipment		supports the overall safety case for the facility. Safety analysis is a systematic evaluation of the potential hazards associated with the conduct of a proposed activity or facility and considers the effectiveness of preventive measures and strategies in reducing the effects of such hazards.	▪ probabilistic safety analysis ▪ criticality safety ▪ severe accident analysis ▪ management of safety issues (including research and development programs)
	Physical design	Relates to activities that impact the ability of structures, systems and components to meet and maintain their design basis given new information arising over time and taking changes in the external environment into account.	▪ design governance ▪ site characterization ▪ facility design ▪ structure design ▪ system design ▪ component design
	Fitness for service	Covers activities that impact the physical condition of structures, systems and components to ensure that they remain effective over time. This area includes programs that ensure all equipment is available to perform its intended design function when called upon to do so.	▪ equipment fitness for service/equipment performance ▪ maintenance ▪ structural integrity ▪ aging management ▪ chemistry control ▪ periodic inspection and testing

Functional area	Safety and control area	Definition	Specific areas
Core control processes	**Radiation protection**	Covers the implementation of a radiation protection program in accordance with the *Radiation Protection Regulations*. The program must ensure that contamination levels and radiation doses received by individuals are monitored, controlled and maintained as low as reasonably achievable (ALARA).	▪ application of ALARA ▪ worker dose control ▪ radiation protection program performance ▪ radiological hazard control ▪ estimated dose to public
	Conventional health and safety	Covers the implementation of a program to manage workplace safety hazards and to protect workers.	▪ performance ▪ practices ▪ awareness
	Environmental protection	Covers programs that identify, control and monitor all releases of radioactive and hazardous substances and effects on the environment from facilities or as the result of licensed activities.	▪ effluent and emissions control (releases) ▪ environmental management system ▪ assessment and monitoring ▪ protection of the public ▪ environmental risk assessment
	Emergency management and fire protection	Covers emergency plans and emergency preparedness programs that exist for emergencies and for non-routine conditions. This area also includes any results of participation in exercises.	▪ conventional emergency preparedness and response ▪ nuclear emergency preparedness and response ▪ fire emergency preparedness and response
	Waste management	Covers internal waste-related programs that form part of the facility's operations up to the point where the waste is removed from the facility to a separate waste management facility. This area also covers the planning for decommissioning.	▪ waste characterization ▪ waste minimization ▪ waste management practices ▪ decommissioning plans

<table>
<tr><th>Functional area</th><th>Safety and control area</th><th>Definition</th><th>Specific areas</th></tr>
<tr><td>Core control processes</td><td>Security</td><td>Covers programs required to meet security requirements stipulated in the regulations, the licence, orders or expectations for the facility or activity.</td><td>▪ facilities and equipment
▪ response arrangements
▪ security practices
▪ drills and exercises</td></tr>
<tr><td rowspan="2"></td><td>Safeguards and non-proliferation</td><td>Covers the programs and activities required for the successful implementation of the obligations arising from the Canada/International Atomic Energy Agency (IAEA) safeguards agreements, as well as all other measures arising from the Treaty on the Non-Proliferation of Nuclear Weapons.</td><td>▪ nuclear material accountancy and control
▪ access and assistance to the IAEA
▪ operational and design information
▪ safeguards equipment, containment and surveillance
▪ import and export</td></tr>
<tr><td>Packaging and transport</td><td>Programs that cover the safe packaging and transport of nuclear substances to and from the licensed facility.</td><td>▪ package design and maintenance
▪ packaging and transport
▪ registration for use</td></tr>

</table>

C. SAFETY AND CONTROL AREA RATING METHODOLOGY

Performance ratings used in this report are defined as follows:

Fully satisfactory (FS)

Safety and control measures implemented by the licensee are highly effective. In addition, compliance with regulatory requirements is fully satisfactory, and compliance within the safety and control area or specific area exceeds requirements and Canadian Nuclear Safety Commission (CNSC) expectations. Overall, compliance is stable or improving, and any problems or issues that arise are promptly addressed.

Satisfactory (SA)

Safety and control measures implemented by the licensee are sufficiently effective. In addition, compliance with regulatory requirements is satisfactory. Compliance within the safety and control area or specific area meets requirements and CNSC expectations. Any deviation is only minor, and any issues are considered to pose a low risk to the achievement of regulatory objectives and the CNSC's expectations. Appropriate improvements are planned.

Below expectations (BE)

Safety and control measures implemented by the licensee are marginally ineffective. In addition, compliance with regulatory requirements falls below expectations. Compliance within the safety and control area or specific area deviates from requirements or CNSC expectations to the extent that there is a moderate risk of ultimate failure to comply. Improvements are required to address identified weaknesses. The licensee or applicant is taking appropriate corrective action.

Unacceptable (UA)

Safety and control measures implemented by the licensee are significantly ineffective. In addition, compliance with regulatory requirements is unacceptable and is seriously compromised. Compliance within the overall safety and control area or specific area is significantly below requirements or CNSC expectations or there is evidence of overall non-compliance. Without corrective action, there is a high probability that the deficiencies will lead to an unreasonable risk. Issues are not being addressed effectively, no appropriate corrective measures have been taken, and no alternative plan of action has been provided. Immediate action is required.

D. SAFETY AND CONTROL AREA RATINGS

Note that the following acronyms are used in this appendix:

FS = fully satisfactory SA = satisfactory BE = below expectations

E. DOSES TO NUCLEAR ENERGY WORKERS AND NON-NUCLEAR ENERGY WORKERS AT CNL SITES

This appendix presents information on doses to Nuclear Energy Workers (NEWs) and non-NEWs at CNL sites.

Chalk River Laboratories

Figure E-1 provides the average effective doses and the maximum effective doses to NEWs from 2014 to 2018. The maximum annual effective dose received by a NEW in 2018 was 12.48 mSv; approximately 25 percent of the regulatory limit for effective dose of 50 mSv in a one-year dosimetry period.

The dose fluctuations from year to year are attributed to the scope and duration of the radiological work conducted along with the dose rates associated with the work.

Figure E-1: Average and maximum effective doses to NEWs at CRL from 2014-2018

	2014	2015	2016	2017	2018
Average Effective Dose (mSv)	0.43	0.45	0.49	0.44	0.34
Maximum Effective Dose (mSv)	8.66	10.72	12.24	13.13	12.48
Number of Persons Monitored	4615	4410	4387	4515	4227

As shown in tables E-1 and E-2, equivalent doses (skin and extremity) at the CRL site were below the CNSC regulatory equivalent dose limit for a NEW of 500 mSv/year. The maximum equivalent (skin) dose received by a NEW in 2018 was 15.84 mSv; approximately 3 percent of the regulatory limit for equivalent dose of 500 mSv in a one-year dosimetry period. The maximum equivalent (extremity) dose received by a NEW in 2018 was 44.83 mSv; approximately 9 percent of the regulatory limit for equivalent dose of 500 mSv in a one-year dosimetry period.

Table E-1: Equivalent (skin) doses to NEWs at CRL from 2014-2018

Dose Data	2014	2015	2016	2017	2018	Annual Regulatory Dose Limit for a NEW
Average skin dose (mSv)	0.53	0.55	0.60	0.53	0.40	n/a
Maximum skin dose (mSv)	21.73	15.75	16.54	19.95	15.84	500 mSv/year

Table E-2: Equivalent (extremity) doses to NEWs at CRL from 2014-2018

Dose Data	2014	2015	2016	2017	2018	Annual Regulatory Dose Limit for a NEW
Average extremity dose (mSv)	3.26	2.84	3.71	6.10	4.85	n/a
Maximum extremity dose (mSv)	22.50	29.32	41.59	85.06	44.83	500 mSv/year

Non-NEWs at CRL

In 2018, the maximum annual effective dose received by a non-NEW was 0.32 mSv; approximately 32 percent of the regulatory limit for effective dose of 1 mSv in a one-year dosimetry period.

Whiteshell Laboratories

Figure E-2 provides the average effective doses and the maximum effective doses to workers from 2014 to 2018. The maximum annual effective dose received by a NEW in 2018 was 1.7 mSv, approximately 3 percent of the regulatory limit for effective dose of 50 mSv in a one-year dosimetry period. The highest annual average effective dose in this period was 0.07 mSv. These slight increases in individual exposures, both occurring in 2018, are attributed to decommissioning activities performed in the Building 200 Active Liquid Waste Treatment Centre (ALWTC).

Figure E-2: Average and maximum effective doses to NEWs at WL from 2014-2018

	2014	2015	2016	2017	2018
Average Effective Dose (mSv)	0.02	0.04	0.02	0.03	0.07
Maximum Effective Dose (mSv)	0.70	0.40	0.40	1.40	1.65
Number of NEWs Monitored	797	753	659	607	595

As shown in tables E-3 and E-4, equivalent doses (skin and extremity) at the WL site were below the CNSC regulatory equivalent dose limit for a NEW of 500 mSv/year. The maximum equivalent (skin) dose received by a NEW in 2018 was 3.72 mSv; approximately 1 percent of the regulatory limit for equivalent dose of 500 mSv in a one-year dosimetry period. The maximum equivalent (extremity) dose received by a NEW in 2018 was 36.71 mSv; approximately 7 percent of the regulatory limit for equivalent dose of 500 mSv in a one-year dosimetry period. The increasing trend in 2017 and 2018 is attributed to decommissioning activities in the ALWTC and maintenance activities (notably manipulator maintenance).

Table E-3: Equivalent (skin) doses to NEWs at WL from 2014-2018

Dose Data	2014	2015	2016	2017	2018	Annual Regulatory Dose Limit for a NEW
Average skin dose (mSv)	0.02	0.04	0.02	0.05	0.12	n/a
Maximum skin dose (mSv)	1.6	0.65	0.36	2.90	3.72	500 mSv/year

Table E-4: Equivalent (extremity) doses to NEWs at WL from 2014-2018

Dose Data	2014	2015	2016	2017	2018	Annual Regulatory Dose Limit for a NEW
Average extremity dose (mSv)	0.36	0.09	0.05	1.51	5.02	n/a
Maximum extremity dose (mSv)	1.25	0.72	0.11	11.35	36.71	500 mSv/year

Non-NEWs at WL

In 2018, external dosimeters issued to non-NEWs at WL did not record any measureable doses.

Remediation Sites

Port Granby

Figure E-3 provides the average effective doses and the maximum effective doses for all NEWs from 2014 to 2018. In 2018, the maximum total effective dose for a NEW at the PGP was 3.13 mSv, approximately 6 percent of the regulatory limit for effective dose of 50 mSv in a one-year dosimetry period. The average effective dose for all NEWs was 0.06 mSv. In 2018, occupational doses at PGP were higher than previous years. This was attributed to an increase in the scope of work that was performed.

The 2018 total effective dose includes whole body dose, assessed with external dosimetry, and internal dose, assessed from radon and ling-lived alpha (LLA) in air. The total number of NEWs includes all contractors involved in work at the PGP as well as CNL staff.

Figure E-3: Average and maximum effective doses to NEWs at PGP from 2014-2018

	2014	2015	2016	2017	2018
Average Effective Dose (mSv)	0.02	0.01	0.01	0.03	0.06
Maximum Effective Dose (mSv)	0.20	0.16	0.30	0.39	3.13
Number of NEWs Monitored	91	118	309	430	489

As shown in Table E-5 below, skin doses at the PGP were also well below the CNSC regulatory equivalent dose limit for a NEW of 500 mSv/year. The maximum skin dose for a NEW at the PGP in 2018 was 2.44 mSv, and the average skin dose for all NEWs was 0.05 mSv.

Table E-5: Equivalent (skin) doses to NEWs at PGP from 2014-2018

Dose Data	2014	2015	2016	2017	2018	Annual Regulatory Dose Limit for a NEW
Average skin dose (mSv)	0.01	0.01	0.01	0.04	0.05	n/a
Maximum skin dose (mSv)	0.16	0.16	0.30	0.34	2.44	500 mSv/year

Port Hope

Figure E-4 provides the average effective doses and the maximum effective doses for all NEWs from 2014 to 2018. In 2018, the maximum total effective dose for a NEW at the PHP was 0.59 mSv, approximately 1 percent of the regulatory limit for effective dose of 50 mSv in a one-year dosimetry period. The average effective dose for all NEWs was 0.04 mSv. December 2017 marked the beginning of hauling on-site waste into the newly constructed Cell 1 mound at the PHP.

The 2018 total effective dose includes whole body dose, assessed with external dosimetry, and internal dose, assessed with PAD and/or results from radon progeny and LLA in air. The total number of NEWs includes all contractors involved in work at the PHP as well as CNL staff.

Figure E-4: Average and maximum effective doses to NEWs at PHP from 2014-2018

	2014	2015	2016	2017	2018
Average Effective Dose (mSv)	0.02	0.01	0.01	0.03	0.04
Maximum Effective Dose (mSv)	0.20	0.16	0.30	0.34	0.59
Number of NEWs Monitored	91	118	309	343	656

As shown in Table E-6, skin doses at the PHP were also well below the CNSC regulatory equivalent dose limit for a NEW of 500 mSv/year. The maximum skin dose for a NEW at the PHP in 2018 was 0.33 mSv, and the average skin dose for all NEWs was 0.04 mSv.

Table E-6: Equivalent (skin) doses to NEWs at PHP from 2014-2018

Dose Data	2014	2015	2016	2017	2018	Annual Regulatory Dose Limit for a NEW
Average skin dose (mSv)	0.01	0.01	0.01	0.04	0.04	n/a
Maximum skin dose (mSv)	0.16	0.16	0.30	0.34	0.33	500 mSv/year

Non-NEWs at Remediation Sites

In 2018, the maximum annual effective dose received by non-NEWs were 0.004 mSv at the PGP, and 0.02 mSv at the PHP. These doses are well below the annual regulatory dose limit of 1 mSv in a one-year dosimetry period.

DP, G-1 and NPD Waste Facilities

Douglas Point Waste Facility

Figure E-5 provides the average effective doses and the maximum effective doses to NEWs from 2014 to 2018. In 2018, the maximum effective dose received by a NEW at DP was 0.43 mSv, approximately 1 percent of the regulatory limit for effective dose of 50 mSv in a one-year dosimetry period.

There has been an increase in the number of workers at DP over these years, mainly attributed to an increase in project work activities. These work activities have resulted in slight increases in the maximum effective doses to workers when compared to previous years.

Figure E-5: Average and maximum effective doses to NEWs at DP from 2014-2018

	2014	2015	2016	2017	2018
Average Effective Dose (mSv)	0.00	0.00	0.01	0.01	0.01
Maximum Effective Dose (mSv)	0.16	0.06	0.11	0.37	0.43
Number of NEWs Monitored	-	64	80	92	123

Annual average and maximum equivalent (skin) dose results for NEWs at DP from 2014 to 2018 are provided in Table E-7. In 2018, the maximum skin dose received by a NEW at DP was 0.43 mSv, which is well below the CNSC's annual regulatory equivalent dose limit of 500 mSv.

Table E-7: Equivalent (skin) doses to NEWs at DP from 2014-2018

Dose Data	2014	2015	2016	2017	2018	Regulatory Limit
Average skin dose (mSv)	0.00	0.00	0.01	0.01	0.01	n/a
Maximum skin dose (mSv)	0.12	0.06	0.11	0.37	0.43	500 mSv/year

Non-NEWs at DP

In 2018, external dosimeters issued to non-NEWs at DP did not record any measureable doses.

<u>Gentilly-1 Waste Facility</u>

Figure E-6 provides the average effective doses and the maximum effective doses to NEWs at G-1 from 2014 to 2018. In 2018, the maximum effective dose received by a NEW at the G-1 was 0.62 mSv, approximately 1 percent of the regulatory limit for effective dose of 50 mSv.

In 2014, no NEW received any measureable dose above the detection limit of 0.1 mSv for the dosimeter type. The total number of NEWs monitored in 2014 is unavailable.

Since 2015, there has been an increase in the number of workers on site, along with slight increases in radiation doses to NEWs, due to an increase in planned work activities (both maintenance tasks and project activities).

Figure E-6: Average and maximum effective doses to NEWs at G-1 from 2014-2018

	2014	2015	2016	2017	2018
Average Effective Dose (mSv)	-	0.01	0.01	0.01	0.03
Maximum Effective Dose (mSv)	-	0.04	0.08	0.18	0.62
Number of NEWs Monitored	-	22	49	83	101

Annual average and maximum equivalent (skin) dose results for NEWs at G-1 from 2014 to 2018 are provided in Table E-8. In 2018, the maximum skin dose received by a NEW at G-1 was 0.62 mSv, which is well below the CNSC's annual regulatory equivalent dose limit of 500 mSv.

Table E-8: Equivalent (skin) doses to NEWs at G-1 from 2014-2018

Dose Data	2014	2015	2016	2017	2018	Annual Regulatory Dose Limit for a NEW
Average skin dose (mSv)	-	0.01	0.01	0.01	0.03	n/a
Maximum skin dose (mSv)	-	0.04	0.08	0.18	0.62	500 mSv/year

Note: "-" means that no measurable dose was recorded.

Extremity dosimeters were worn by certain contractors in 2018 due to the conduct of hazard reduction projects where the hands were preferentially exposed. The maximum dose recorded on an extremity dosimeter was 17.27 mSv, which is well below the CNSC's annual regulatory equivalent dose limit of 500 mSv.

Non-NEWs at G-1

In 2018, external dosimeters issued to non-NEWs at G-1 did not record any measureable doses.

Nuclear Power Demonstration Waste Facility

Figure E-7 provides the average effective doses and the maximum effective doses to NEWs from 2014 to 2018. In 2018, the maximum effective dose received by a NEW at NPD facility was 0.09 mSv, which is well below the CNSC's annual regulatory effective dose limit of 50 mSv.

Since 2014, there has been a significant increase of work activities at NPD, including the management of low level radioactive waste and various characterization activities. Particularly in 2017, characterization work and hazard reduction activities (i.e., asbestos abatement) resulted in an increase in radiation doses to NEWs when compared to previous years. The maximum individual effective dose of 3.02 mSv was received by a contractor engaged in asbestos abatement activities in the Boiler Room.

Figure E-7: Average and maximum effective doses to NEWs at NPD from 2014-2018

	2014	2015	2016	2017	2018
Average Effective Dose (mSv)	0.00	0.00	0.00	0.05	0.00
Maximum Effective Dose (mSv)	0.09	0.12	0.05	3.02	0.09
Number of NEWs Monitored	177	211	212	265	186

Annual average and maximum equivalent (skin) dose results for NEWs at NPD, from 2014 to 2018, are provided in Table E-9. In 2018, the maximum skin dose received by a NEW at NPD was 0.09 mSv, which is well below the CNSC's annual regulatory equivalent dose limit of 500 mSv.

Table E-9: Equivalent (skin) doses to NEWs at NPD from 2014-2018

Dose Data	2014	2015	2016	2017	2018	Annual Regulatory Dose Limit for a NEW
Average skin dose (mSv)	0.00	0.00	0.00	0.04	0.00	n/a
Maximum skin dose (mSv)	0.09	0.12	0.00	3.03	0.09	500 mSv/year

Non-NEWs at NPD

In 2018, external dosimeters issued to non-NEWs at NPD did not record any measureable doses.

F. ESTIMATED DOSE TO THE PUBLIC

This appendix contains information on the estimated dose to the public around CNL sites. Regulatory release limits known as derived release limits or DRLs are site-specific calculated releases that could, if exceeded, expose a member of the public of the most highly exposed group to a committed dose equal to the regulatory annual dose limit of 1 mSv/year. DRLs are calculated using CSA standard N288.1-14, *Guidelines for calculating derived release limits for radioactive materials in airborne and liquid effluents for normal operation of nuclear facilities*. [20]

As per the *Radiation Protection Regulations* subsection 1(3), and considering the fact that the radiological releases from all the sites covered by this ROR have remained small fractions of the DRLs applicable to those sites, the contribution to the dose to the public from these releases remains a very small fraction of the prescribed limit for the general public.

Chalk River Laboratories

CNL has implemented an Environmental Monitoring Program (EMP) at CRL, which complies with the CSA N288.4, *Environmental Monitoring Program at Class I Nuclear Facilities and Uranium Mines and Mills*. Table F-1 provides dose to the public from CNL-CRL site since 2014.

Table F-1: Maximum Effective Doses to a Member of the Public from 2014-2018

Dose Data	2014	2015	2016	2017	2018	Regulatory Dose Limit
Maximum Effective Dose (mSv)	0.060	0.082	0.078	0.087	0.036	1 mSv/year

The maximum dose in each year since 2014 has been well below the dose limit of 1 mSv/year. Furthermore, at no point during that period did the emissions from the CRL site exceed the constraint for dose to the public of 0.30 mSv/yr.

Whiteshell Laboratories

The dose to critical groups from releases from CNL-WL in 2018 was 0.000036 mSv, which is well below the regulatory dose limit of 1 mSv/year.

Table F-2: Maximum effective dose to a member of the public, CNL-WL, 2014-2018

Dose data	2014	2015	2016	2017	2018	Regulatory dose limit
Maximum effective dose (mSv)	<0.002	<0.001	7.5E-05	4.8E-05	3.6E-05	1 mSv/year

Remediation Sites

A modified approach for calculating estimated dose to the public was performed by CNL for PHAI sites in 2018, and included both radon monitoring and fence line dosimeter measurements at both PHP and PGP sites.

The annual estimated doses to the public at PGP and PHP sites in 2018 were 0.020 mSv/year and 0.0275 mSv/year, respectively, which are well below that annual regulatory dose limit of 1 mSv.

Table F-3: Maximum effective dose to a member of the public, PGP, 2014-2018

Dose data	2014	2015	2016	2017	2018	Regulatory dose limit
Maximum effective dose (mSv)	0.00383	0.0084	0.00543	0.00571	0.020	1 mSv/year

Table F-4: Maximum effective dose to a member of the public, PHP, 2014-2018

Dose data	2014	2015	2016	2017	2018	Regulatory dose limit
Maximum effective dose (mSv)	0.02867	0.09352	0.01195	0.0045	0.0275	1 mSv/year

Douglas Point Waste Facility

All releases of radioactive material in DP effluents are a small fraction of their respective DRLs and thus, continue to indicate minimal impact on the public or the environment. DP is located within the Bruce Nuclear Site. The Bruce Power environmental monitoring program captures any environmental impacts from the small contribution from DP. The dose to the public from the Bruce Nuclear Site, including contributions from the DP, remain *de minimus* (below 0.01 mSv/year).

Gentilly-1 Waste Facility

The effluent monitoring plan assessment conducted in 2016 by CNL determined that there is minimal or no source of airborne radioactivity from routine operations at G-1. In addition, all liquid releases were discharged through Gentilly-2 effluent system, operated by Hydro-Québec, and represent a small fraction of the total releases from the larger Gentilly site. The Hydro-Québec's Gentilly-2 environmental monitoring program captures any environmental impacts from the small contribution from G-1. The dose to the public from the Gentilly-2 nuclear site, including contributions from G-1, remain *de minimus* (below 0.01 mSv/year).

Nuclear Power Demonstration Waste Facility

NPD is no longer discharging liquid effluents from the facility sumps to the Ottawa River, and there were no such releases during the 2018 reporting period. All other releases of radioactive material in NPD effluents are a small fraction of their respective DRLs and thus, continue to indicate minimal impact on the public or the environment. CNL's environmental monitoring at CRL will regionally overlap with the NPD waste facility, so information from CRL's off-site environmental monitoring program could also be considered. CNSC staff have determined that the public dose from NPD remains at a very small fraction of the public dose limit.

G. LOST-TIME INJURY INFORMATION

This appendix contains information on the number, frequency and severity of recordable lost-time injuries at the CNL sites covered by this ROR, with data presented back to 2014.

Frequency and severity are calculated per 100 full-time workers (equivalent to 200,000 worker-hours per year) using the following formulas:

Frequency rate = (# of Lost-Time Injuries) x (200 000 hrs of exposure) / (person hours worked)

Severity rate = (# of Working Days Lost) x (200 000 hrs of exposure) / (person hours worked)

Table G-1: Summary of CRL's recordable lost time injuries (RLTI), frequency and severity *(Source: CNL)*

Year	2014	2015	2016	2017	2018
Person Hours Worked (all CNL)	6 248 900	6 294 295	6 405 670	-	-
Person Hours Worked (CRL only)	-	-	-	5 597 015	5 369 450
Lost-Time Injuries	9	2	6	4	5
Working Days Lost	37	7	47	10	69[a]
Frequency	0.29	0.06	0.19	0.14	0.18
Severity	1.18	0.22	1.47	0.36	2.47
[a] Lost time and work days lost in 2018 data is based on US Occupational Safety and Health Administration Guidelines, therefore the rates will be slightly increased .					

Note that prior to 2017, CNL did not provide data for person-hours worked on CRL site alone, therefore total CNL hours worked are used in place of that data. This skews frequency and severity data for the CRL site for the 2014-2016 years, and makes comparison between pre- and post-2017 data for CRL difficult.

For 2018, 69 working days were lost at CRL, the most since 2014. 60 of these were attributable to a single injury, which was incurred when a worker tripped and fell from a flat-bed truck trailer.

Table G-2: Summary of WL's recordable lost time injuries (RLTI), frequency and severity *(Source: CNL)*

Year	2014	2015	2016	2017	2018
Person Hours Worked	883 500	741 000	684 450	706 000	688 000
Lost-Time Injuries	4	0	1	3	1
Working Days Lost	54	0	5	27	5
Frequency	0.9	0	0.29	0.85	0.28
Severity	12.2	0	1.46	7.67	1.45

The frequency numbers for CRL and WL can be compared to lost-time injury rate data from the Ontario Workplace Safety and Insurance Board (WSIB); the WSIB's lost-time injury rate is calculated using the same formula as frequency rate shown above. WSIB data is shown in Table G-3 below.

Table G-3: WSIB Lost-Time Injury Rates data for select industries

Industry Sector	2014	2015	2016	2017	2018
Automotive	1.06	0.94	1.06	1.05	1.14
Construction	1.13	1.09	1.15	1.15	1.13
Municipal	1.51	1.44	1.49	1.65	1.64
Transportation	1.83	1.59	1.76	1.74	1.90
Chemicals/Process	0.69	0.6	0.75	0.73	0.77
Electrical	0.35	0.37	0.4	0.43	0.41
Manufacturing	0.64	0.59	0.67	0.64	0.70

It can be seen that Frequency for lost-time injuries at CNL sites is less than WSIB data for most industries since 2014.

The PHP, PGP, DP, G-1 and NPD sites have not recorded a lost-time injury since 2014; the person-hours worked for these sites are provided below for comparison with the same data for CRL and WL. RLTI frequency and severity cannot be calculated if there are no lost-time injuries over the period in question.

Table G-4: Person-hours worked at PHP, PGP, DP, G-1 and NPD *(Source: CNL)*

Year	2014	2015	2016	2017	2018
Person Hours Worked – PHAI	Not Available				260 776
Person Hours Worked – DP	20 400	28 960	29 600	30 080	31 320
Person Hours Worked – G-1	4 600	6 160	7 240	8 600	9 320
Person Hours Worked – NPD	20 000	32 800	34 900	34 500	30 300
Lost-Time Injuries for PHP, PGP, DP, G-1 and NPD	0	0	0	0	0

H. DERIVED RELEASE LIMITS (DRLS) AND TOTAL ANNUAL RELEASE OF RADIONUCLIDES DIRECTLY[12] TO THE ENVIRONMENT

During the December 2018 Commission meeting, CNSC staff committed to providing an annual update to the Commission on the decision on radionuclide reporting in the National Pollutant Release Inventory (NPRI). The CNSC is making radionuclide release data more readily accessible to the public as part of its commitment to open government and its mandate to disseminate this information to the public. The commitment to provide data on the total annual release of radionuclides in the appendices of the ROR continues within this year's RORs. In addition, the CNSC and the NPRI are working together to establish active links between the CNSC and NPRI web sites. Stakeholder sub-group consisting of environmental non-governmental organizations and industry are completing active beta testing of the links between the NPRI site and existing CNSC data products (RORs, etc). The CNSC has also commenced the creation of downloadable digital databases of radionuclides releases further supplementing the range of CNSC environmental data products linked to the NPRI website. The downloadable databases are expected to become part of the active beta testing activities in the latter part of 2019.

Derived Release Limits

While it is possible to calculate a specific DRL for each radionuclide released by a given site, it may not be practical nor necessary to monitor each of these separately. In such cases, emitted radionuclides may be organized into groups that are selected based on factors such as physicochemical properties and method of monitoring. DRLs can then be established for the radionuclide group applying a number of simplifying and conservative (i.e., protective) assumptions such as assuming that the group is composed entirely of the most restrictive radionuclide representative of the group. The most restrictive radionuclide can differ for different nuclear facilities depending on releases, local conditions and the choice of the representative person. Emission monitoring may then be carried out using a non-radionuclide-specific method for the group rather than for specific radionuclides. The most common DRL groupings for airborne releases are noble gases, radio-iodines, particulate beta/gamma, and particulate alpha, while the most common DRL groupings for liquid releases are beta/gamma emitters and alpha.

Licensees are required to demonstrate that their releases are not only below their respective DRLs but that the sum of their release are below 1 mSv/year, the public regulatory dose limit. To ensure these limits are respected, licensees also are required to develop action levels significantly below their DRLs as a means of detecting elevated releases meriting follow-up investigations and actions to ensure releases are adequately controlled.

[12] Using definitions of the National Pollutant Release Inventory, these are on-site releases directly to atmosphere or surface waters and do not include releases to sewer or off-site treatment, storage or disposal facilities.

Total Annual Release of Relevant Radionuclides to the Environment

The following tables provide the annual load of key radionuclides directly released to atmosphere or to surface waters from licensed facilities operated by CNL for the reporting period of 2014 – 2018. Applicable DRLs are also presented, where they exist. There are no comparisons to limits and guidelines for PHAI sites because the Port Granby Project and the Port Hope Project have limits in their licences which are based on either monthly mean, weekly mean, or each grab sample.

Over this reporting period, there have been no exceedances of licence derived release limits and licence limits.

As CNL is the licence holder for the G-1 waste management facility, releases would be reported in this ROR. However, an effluent monitoring plan assessment conducted in 2016 confirmed that there is minimal or no source of airborne radioactivity at G-1. Therefore, airborne emissions are no longer monitored. Furthermore, all liquids from facility sumps were transferred to the Gentilly-2 facility effluent system to be managed and discharged by Hydro-Quebec. These releases are included in the reported Gentilly-2 releases available in the 2017 and in the 2018 *Regulatory Oversight Report for Nuclear Power Generating Sites*.

Chalk River Laboratories

Table H-1: Chalk River Laboratories annual radionuclide releases to atmosphere for 2014 – 2018.

Year	Tritium: (HTO:Bq)	Carbon-14 (Bq)	Noble Gas (Bq-MeV)	Iodine-131 (Bq)	Argon-41 (Bq)	Xenon-133 (Bq)
DRL	**1.25E+16**	**2.14E+15**	**4.96E+16**	**3.96E+12**	**6.50E+16**	**8.35E+17**
2018	2.29E+14	2.54E+11	6.50E+12	1.02E+08	2.59E+15	N/A [a]
2017	2.50E+14	4.90E+11	6.50E+12	3.82E+08	1.16E+16	N/A [a]
2016	2.30E+14	4.84E+11	8.50E+14	5.17E+10	1.07E+16	3.12E+15
2015	2.77E+14	3.77E+11	1.20E+15	1.03E+11	1.29E+16	4.89E+15
2014	2.60E+14	8.69E+11	2.11E+15	2.06E+11	9.37E+15	8.68E+15

[a] After the safe shutdown of the Molybdenum Production Facility in 2017, there are no longer airborne releases of Xenon-133.

Table H-2: Chalk River Laboratories annual radionuclide releases to surface water for 2014-2018.

Year	Tritium: (HTO: Bq)	Gross Alpha (Bq)	Gross Beta (Bq)
DRL	**1.03E+17**	**1.32E+12**	**2.70E+13**
2018	1.93E+13	6.88E+08	2.84E+10
2017	3.81E+13	7.66E+08	4.17E+10
2016	3.50E+13	6.60E+08	3.22E+10
2015	3.94E+13	6.94E+08	3.96E+10
2014	3.07E+13	9.07E+08	2.62E+11

Whiteshell Laboratories

Table H-3: Whiteshell Laboratories annual radionuclide releases to atmosphere for 2014-2018.

Year	Tritium: (HTO: Bq)	Gross Alpha (Bq)	Gross Beta (Bq)
DRL	**8.58E+16**	**9.00E+10**	**3.60E+11**
2018	1.31E+10	9.13E+04	1.70E+05
2017	5.03E+10	9.34E+04	2.24E+05
2016	3.24E+10	9.46E+04	2.12E+05
2015	9.88E+10	9.79E+04	2.26E+05
2014	3.48E+10	8.82E+04	3.97E+05

Table H-4: Whiteshell Laboratories annual radionuclide releases to surface water for 2014-2018.

Year	Gross Alpha (Bq)	Uranium-total (Bq)	Plutonium -239/240 (Bq)	Plutonium -238 (Bq)	Americium-241 (Bq)	Gross Beta (Bq)	Strontium-90 (Bq)	Cesium -137 (Bq)
DRL	**1.33E+10**	**1.50E+11**	**1.33E+10**	**1.39E+10**	**1.25E+10**	**a**	**1.56E+11**	**1.39E+11**
2018	3.90E+07	1.16E+07	2.32E+07	1.84E+07	4.21E+06	1.94E+08	3.21E+07	1.51E+07
2017	3.88E+07	1.69E+07	1.20E+07	8.69E+06	5.10E+06	2.97E+08	6.67E+07	1.89E+07
2016	4.59E+07	N/A[b]	N/A	N/A	N/A	2.83E+08	6.08E+07	1.28E+07
2015	4.08E+07	N/A	N/A	N/A	N/A	2.23E+08	3.96E+07	1.65E+07
2014	4.76E+07	N/A	N/A	N/A	N/A	9.31E+07	6.61E+07	2.66E+07

[a] There is no DRL for gross beta because there is a DRL for the regulated components of gross beta (cesium-137 and strontium-90).

[b] Monitoring of uranium-total, plutonium-239/240, plutonium-238, and americium-241 began in 2017.

Port Granby Project

Table H-5: Port Granby Project annual radionuclide releases to surface water for 2014-2018.

Year	Radium-226 (MBq)	Uranium (kg)
2018	1.0	1.3
2017	1.0	1.4
2016	2.4	15.6
2015	4.6	29.0
2014	5.4	36.7

Port Hope Project

Table H-6: Port Hope Project annual radionuclide releases to surface water for 2014-2018.

	Releases from routine operations		Releases from non-routine operations	
Year	Radium-226 (MBq)	Uranium (kg)	Radium-226 (MBq)	Uranium (kg)
2018	0.7	0.5	5676.9	14.6
2017	0.8	0.1	15868.0	110.1
2016	3.3	19.3	N/A	
2015	4.5	20.7	N/A	
2014	7.7	23.0	N/A	

Table H-6 shows both releases from the Port Hope Project due to routine operations, and from emergency releases of treated water. In 2017, CNL began using the new Waste Water Treatment Plant to treat contaminated water, in place of the old Water Treatment Building. Due to heavy rainfall events in both 2017 and 2018, CNL restarted the Water Treatment Building to treat excess contaminated water, in accordance with their water contingency plan, and in order to avoid a release of untreated water to the environment. CNL's water management challenges in 2017 were the subject of an Event Initial Report to the Commission [21]. For both 2017 and 2018, there were no exceedances of regulatory limits and toxicity testing showed that the water was not acutely lethal to fish or to aquatic life.

For both the Port Granby Project and the Port Hope Project, the loadings were calculated by multiplying the monthly total volume released by the monthly average concentrations. The total annual loadings are a sum of the monthly loads.

Douglas Point

Table H-7: Douglas Point annual radionuclide releases to atmosphere for 2014-2018

Year	Tritium: (HTO: Bq)	Gross Alpha (Bq)	Gross Beta (Bq)	Carbon-14 (Bq)
DRL	**5.46E+17**	**3.69E+12**	**3.69E+12**	**3.22E+15**
2018	7.96E+11	3.07E+03	4.55E+04	1.51E+09
2017	1.12E+11	1.64E+03	2.29E+04	N/A[b]
2016	1.59E+11	1.68E+03	1.91E+04	N/A
2015	1.33E+10	N/A[a]	N/A	N/A
2014	2.74E+11	N/A	N/A	N/A

[a] Monitoring of gross alpha and gross beta began in 2016.

[b] Monitoring of carbon-14 started in 2018 because new activities that have a potential for a measurable release of C-14 started.

Table H-8: Douglas Point annual radionuclide releases to surface water for 2014-2018.

Year	Tritium: (HTO: Bq)	Gross Alpha (Bq)	Gross Beta (Bq)
DRL	**2.04E+17**	**3.43E+13**	**3.43E+13**
2018	2.73E+10	1.18E+07	1.97E+07
2017	3.57E+10	1.12E+07	2.56E+07
2016	2.23E+10	9.00E+06	1.05E+07
2015	4.24E+10	N/A [a]	7.31E+07
2014	5.19E+10	N/A [a]	6.37E+07

[a] Monitoring of gross alpha began in 2016.

Nuclear Power Demonstration

Table H-9: Nuclear Power Demonstration annual radionuclide releases to atmosphere for 2014-2018.

Year	Tritium: (HTO: Bq)	Gross Beta (Bq)
DRL	**4.52E+16**	**3.83E+12**
2018	3.08E+11	4.23E+04
2017	1.48E+12	1.84E+05
2016	2.53E+11	4.30E+04
2015	2.15E+11	4.81E+04
2014	2.63E+11	5.27E+04

Table H-10: Nuclear Power Demonstration annual radionuclide releases to surface water for 2014-2018

Year	Tritium: (HTO: Bq)	Gross Beta (Bq)
DRL	**4.33E+17**	**2.56E+13**
2018	1.80E+09	5.91E+04
2017	1.08E+11	1.15E+06
2016	7.36E+10	2.56E+06
2015	6.61E+10	4.13E+06
2014	9.60E+10	6.08E+06

Table of Contents

1. Scope and Applicability

This company-wide Interpretation document applies to all activities unique to the Performance Assurance Function, performed by Canadian Nuclear Laboratories' (CNL) employees, contractors and sub-contractors, as well as third parties engaged through external partnerships or collaborations that perform work for and/or on behalf of CNL.

The Performance Assurance Function supports CNL's responsibility to ensure the safety of its employees and the public, and to protect the environment from potential hazards by implementing the following comprehensive programs which work collaboratively to establish a system that ensures worker safety and promotes continual improvement:

- Problem identification and resolution enables the timely reporting of issues, problems, opportunities for improvement, and events and is inclusive of investigation and corrective action processes. These processes enable CNL to implement measures and mitigations to prevent recurrence.
- Measuring and monitoring processes support the creation of leading indicators through the collection and trending of data and promotes continual improvement through the implementation of programmatic reviews and assessments to confirm compliance to requirements and assesses program health.
- Continual improvement combines measuring and monitoring data with knowledge gained from benchmarking and lessons learned to ensure CNL effectively and efficiently implements improvement changes.
- Human performance provides workers with tools and skills to reduce errors and prevent/eliminate events.

2. Purpose

Performance Assurance supports CNL's ability to improve operational performance, enhance safety, and reduce the occurrence of unplanned events. The Function provides an improvement framework to assist in decision-making while promoting organizational learning, innovation, and continual improvement.

3. Definitions and Acronyms

This document relies primarily on word meaning as found in common dictionaries. The current *Glossary of Controlled Terms and Acronyms* [1] contains specific meanings for those words that require further clarification.

3.1 Definitions

Action Manager	Any individual assigned to perform the task of implementing an action to prevent recurrence, assigned through the ImpAct and regulatory processes.

Active Error	An action (behaviour) that changes equipment, system, or plant state triggering immediate undesired consequences.
Adverse Trend	A negative change in performance data that knowledge, experience, statistical significance, and judgement indicate is unacceptable because of the adverse impact on safety or reliability, quality, budget or schedule or because of the relatively large number of similar performance problems in a bin that indicates a more significant problem is likely to occur if the issue is not addressed.
Apparent Cause	A reasonable conclusion about how and why an adverse condition occurred based on the results of a limited evaluation (from between a day to a week). A limited investigation used to gain a better understanding of what happened or to determine the cause of lower- level performance gaps or adverse trends so that action can be taken to avoid a more serious event.
Apparent Cause Analysis	Analysis performed for a reasonable conclusion about how and why an adverse condition occurred based on the results of a limited evaluation (anywhere from a day to a week).
Barrier Analysis	An analysis technique that identifies any administrative, physical, or engineered controls that are intended to prevent or inhibit an undesirable condition.
Benchmarking	A performance improvement process for measuring and evaluating processes, procedures, and tools utilized by top performing organizations; with the intent of incorporating the best safety, organizational, and business practices within CNL.
Casual Factors	Factors that contribute to the cause of the problem.
Cause Code	A trend code utilized to facilitate binning (grouping) data.
Cause Determination Effort	The various levels of investigation required to determine the cause of the problem.
Cognitive Trend	The perception of multiple occurrences of undesired events or decline in performance without supporting evidence. Relying only on knowledge, attention, memory, and judgement.
Continuous Use	The document usage classification requiring the document to be in hand while conducting work and a place keeping method is used to track activity step completion.
Corrective Action	A measure taken and documented to reasonably prevent the occurrence of a problem or non-conformance based on the identified cause(s).

Corrective Action Plan	A plan of action(s) that corrects or is intended to correct one or more current conditions and/or future behaviours, actions, inactions, thus mitigating the risks or reducing the severity of potential adverse consequences.
Critical Step	A procedure step, series of steps, or action that, if performed improperly, will cause irreversible harm to plant equipment, people, the environment or have a significant impact on plant operations
Effectiveness Review	A formal review and evaluation of a corrective action plan to ensure action implementation addresses cause and will reasonably prevent recurrence.
Error-Likely Situation	Also referred to as Error Traps or Error Precursors. Unfavourable factors embedded in the job site that increases the probability of error during the performance of a specific task by a particular individual.
Event Code	A code used to facilitate binning (grouping) data based on the attributes of the event, problem or opportunity for improvement.
Event Free Tools	A set of discrete behaviours and techniques that assist employees to maintain positive control of a work task. When used thoroughly and rigorously, they minimize human error potential (i.e.) anticipate, prevent, or catch active errors before they cause harm to person, property, or environment.
Extent of Condition	The extent to which the actual condition(s) exist in other equipment, processes, or human performance.
Fact Finding	The process of collecting necessary information immediately after an unplanned/undesired event or condition.
Failure Mechanism	The process or sequence of events that caused a defect or failure.
Flawed Barrier	A procedure, process, or human performance tool designed to promote successful completion of an activity that has failed due to incorrect use or omission.
Human Performance	The outcomes of human behaviours and actions, in a specified environment, that reflect the ability of workers and management to meet a system's defined performance under the conditions in which the system will be employed.
Improvement Action (ImpAct)	ImpAct is an abbreviation of the words 'Improvement' and 'Action' and refers to CNL's problem identification tool which enables the formal documentation, monitoring and disposition of events,

	problems, non-conformances, opportunities for improvement and personnel injuries.
Information Use	The document usage classification that requires knowledge and adherence but does not need to be at the work location.
Initiating Action	The action which initiates an event; something that causes something else to happen; to actuate or set off.
Initiator	The individual who raises the ImpAct record first documenting the event.
Latent Organizational Weakness	Undetected deficiencies in organizational processes or values creating workplace conditions that may provoke error and degrade the integrity of defences.
Lessons Learned	Information originating within CNL and other industry sources that describe events, significant safety issues, equipment failures, guidelines and good practices that may represent opportunities to apply lessons to be learned to prevent events and/or improve processes within CNL. Insights and learnings discovered that should be communicated to the organization.
Near Miss	An unplanned event or situation that under the exact circumstances and less fortuitous conditions, had the potential to result in a highly consequential situation such as a severe personal injury or substantial damage to equipment, property, materials, the environment, or significant negative business impact.
ObservationWay	Observation and Coaching module designed to capture data from Observation and Coaching sessions.
Place Keeping	Physically marking steps in a procedure to prevent the omission or duplication of the steps to maintain an account of steps in progress, steps completed, steps not applicable, and steps not yet performed.
Post-Job Review	A discussion with the work team, intended to identify and capture lessons learned following performance of a task.
Pre-Job Brief	A dialogue with all involved staff regarding identified risks and control measures, specific to a job, prior to performing work.
Problem Statement	A description of an issue to be addressed or a condition to be improved upon. It identifies the gap between the current problem and goal.
Reference Use	The document usage classification that requires the document to be available at the work location.

Remedial Action	An action taken and documented to remedy the symptom of problems, events, incidents, or error likely situations. The action remedies the problem but does not address the cause(s).
Responsible Manager	An individual in a management role assigned overall responsibility for the resolution of an issue. The owner of the issue, responsible for the entire process from determining the significance level to correcting the problem or closing out the nonconformity.
Root Cause	The fundamental reason for the occurrence of a problem.
Root Cause Analysis	Analysis performed to determine the fundamental reason for the occurrence of a problem.
Safety Culture	An organization's values and behaviors, modeled by its leaders and internalized by its employees that serve to make safety the overriding priority.
Significance Level	One of four levels assigned to a problem (1 being most significant, 4 least significant) based on actual or potential and resulting in safety, environment or business consequences of the problem. There is a fifth level selection (0) available that is reserved for ImpActs raised in error or duplicate ImpAct items identifying the same event.
Stop and Seek-Out	A technique used in the face of uncertainty to evaluate and resolve a situation before proceeding.
The System	Refers to the framework around which work occurs. This includes the human infrastructure, the management infrastructure, and the physical infrastructure that all support work operations.
Trend Code	Alphabetic, numeric, or alphanumeric codes applied to ImpActs to bin (group) data to facilitate analysis.
Usage Classification	A classification that specifies the required frequency with which an individual will refer to a procedural document.

3.2 Acronyms

ACA	Apparent Cause Analysis
CAP	Corrective Action Plan
CARB	Corrective Action Review Board
CDE	Cause Determination Effort
CI	Continual Improvement
CM	Change Management

D-EFDR	Departmental Event Free Day Reset
DST	Dedicated Screening Team
EFDR	Event Free Day Reset
EFT	Event Free Tools
HU	Human Performance
ImpAct	Improvement Action
MMI	Maturity Model Indicator
MRM	Management Review Meeting
O&C	Observation and Coaching
OPEX	Operating Experience
RCA	Root Cause Analysis
RLMC	Rapid Learning Morning Call
RM	Responsible Manager
S-EFDR	Site Event Free Day Reset
SL	Significance Level
SMARTER	Specific, Measurable, Accountable, Reasonable, Timely, Effective and Reviewed
SSCA	Safety and Security Culture Assessment
STAR	Stop, Think, Act, Review

4. Roles and Responsibilities

4.1 Responsible Executive

In addition to the responsibilities of Responsible Executives identified in the *Canadian Nuclear Laboratories Management System Manual* [2], the Responsible Executive of the Performance Assurance Function is responsible for:

- Establishing and communicating the goals, vision and core values of the human performance program.
- Establishing and maintaining measures to promote a just culture, including implementation of problem identification and resolution processes that enable personnel to freely raise safety concerns.
- Encouraging feedback and suggestions for improvement from across the organization.

4.2 Functional Support Manager, Performance Assurance

In addition to the responsibilities of Functional Support Managers identified in the *Canadian Nuclear Laboratories Management System Manual* [2], the Performance Assurance Functional Support Manager (FSM) is responsible for:

- Establishing and implementing a systematic approach to managing human performance that supports safe and effective work for all workers.
- Establishing and implementing human performance processes and training to ensure factors that influence human performance are considered in continual improvement.
- Establishing and implementing the requirements for the identification and systematic analysis of factors related to human performance in the analysis of events.
- Establishing a Safety and Security Culture assessment framework to assess the maturity of cultural indicators throughout CNL.
- Promoting a just culture through the implementation and promotion of CNL's blameless problem identification and resolution processes.
- Establishing and maintaining performance indicators that measure the health of the Contractor Assurance System and delivering the Corporate Scorecard to Atomic Energy of Canada (AECL) in compliance with the requirements of the Site Operating Contract Agreement (SOCA).

4.3 Oversight Bodies

Oversight bodies of CNL's problem identification and resolution program include the Dedicated Screening Team (DST), Management Review Meeting (MRM) and the Corrective Action Review Board (CARB). Members of the affiliated Performance Assurance oversight bodies are responsible for:

- Ensuring application of a just and blameless culture through the screening and dispositioning of problem identification records by protecting workers who participate in the self-reporting of events or who highlight practises that need improvement.
- Identifying and sharing occurrences, results and knowledge across the organization so that the systemic nature of work is understood and leveraged.

4.4 Program Specialists

Program Specialists include roles and/or designations such as ImpAct Coordinator and Cause Analyst and are responsible for:

- Maintaining appropriate cause analysis training and qualification, as required.
- Acting as a Performance Assurance subject matter expert to the organization to ensure compliant and effective implementation of associated processes.

- Enabling continual improvement through collection of programmatic feedback, documentation of opportunities for improvement and dispositioning of applicable lessons learned.

4.5 Human Performance Officers

Human Performance Officers are responsible for:

- Championing the human performance program through promotion and training of human performance tools.
- Developing and delivering leadership training focused on supporting and improving human performance across the organization.
- Monitoring and evaluating the effectiveness of the human performance program by conducting periodic assessments that analyze key work activities to understand the gaps between tasks and activities.
- Implementing CNL's Safety and Security Culture assessment framework to assess the maturity of cultural indicators throughout CNL.

4.6 Line Management

Line Management is responsible for:

- When appropriate, assuming the role of Responsible Manager and ensuring problems are effectively and efficiently managed as per CNL's problem identification and resolution processes.
- Proposing and assisting in the development of metrics required to assess the ongoing health and effectiveness of the programs within their area of responsibility, and monitoring for trends.
- Implementing actions within their area of responsibility as required by CNL's problem identification and resolution processes, or as required to ensure employee, equipment and environmental safety as the immediate response to degraded conditions or problems.
- Capturing, documenting and sharing applicable lessons learned.
- Encouraging and cultivating a just culture through promotion of problem identification in a blameless manner.
- Promoting adherence to the Event Free Tools and embedding them within work processes where appropriate and applicable.
- Reinforcing standards of excellence, continually striving for improvement and intervening to correct performance at early signs of decline.

- Actively participating in event investigation processes as required, including reporting of events through the Rapid Learning Morning Call, execution of Fact Findings, and participation in cause analyses.

4.7 Employees

Employees are responsible for:

- The timely reporting and documentation of problems.
- Application and utilization of Event Free Tools to mitigate human performance errors.
- Identifying and applying lessons learned.
- Actively participating in CNL's problem identification and resolution processes through assisting in collection and documentation of facts and implementation of immediate actions to return to safe working conditions.

5. Functional Programs

The Performance Assurance Function supports CNL's responsibility to ensure the safety of its employees and the public, and to protect the environment from potential hazards by implementing four comprehensive programs which work collaboratively to establish a system that ensures worker safety and promotes continual improvement.

- Problem identification and resolution
- Measuring and monitoring
- Continual improvement
- Human performance

5.1 Problem Identification and Resolution

Problem identification and resolution is an established framework of processes which are utilized to report, identify, investigate, implement, and resolve problems and issues. At the conclusion of problem disposition is the capability to test for effectiveness to ensure appropriate and effective framework application and confirm implementation of suitable disposition and mitigation techniques.

The application of problem identification and resolution processes, as shown in Figure 1, can be iterative, so long as resolution is achieved.

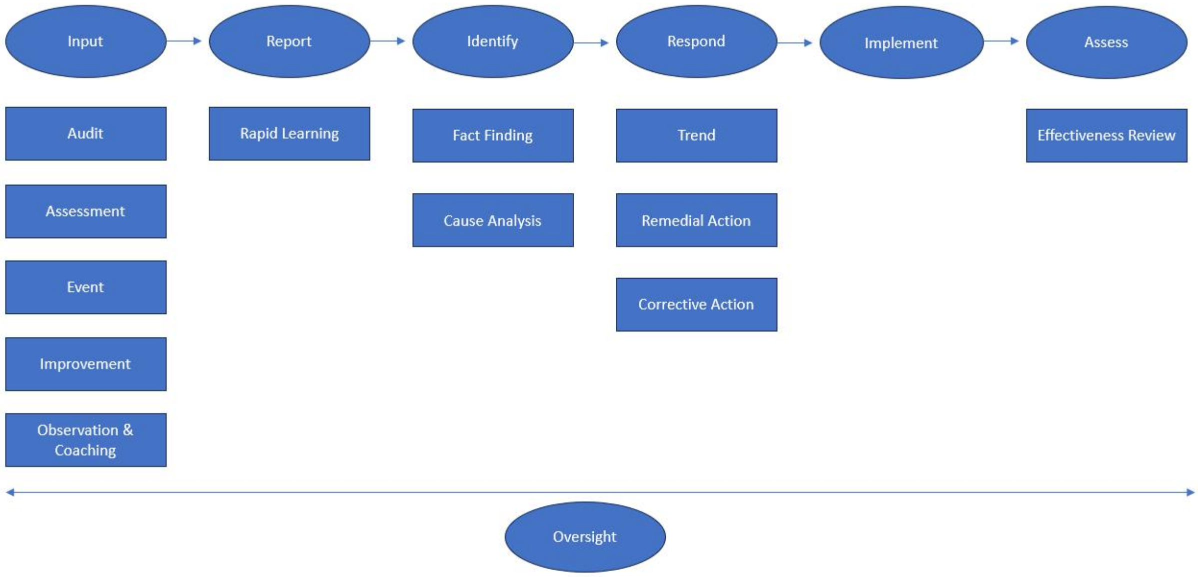

Figure 1: Problem Identification and Resolution

All issues, problems, opportunities for improvement and events are documented and tracked via an Improvement Action (ImpAct) record [3]. For each occurrence, an ImpAct record is raised to document details and important information, assign a Responsible Manager accountable for the remediation of the documented event or problem, and raise and monitor action completion. Each ImpAct receives management oversight to ensure adherence to established problem identification and resolution processes.

5.1.1 Rapid Learning Morning Call

Promptly upon discovery of problems, events, issues or opportunities for improvement, facts are shared with the organization via a centralized process to ensure early notification and involvement of necessary parties. The *Rapid Learning Morning Call (RLMC)* [4] provides a singular platform for the sharing of facts and information direct to a diverse employee group across the organization. The RLMC provides CNL, AECL and Canadian Nuclear Safety Commission (CNSC) staff the forum to deliver and receive swift notification of information which may affect or impact work activities and serves as a vehicle to ensure lessons learned are shared across the organization.

5.1.2 Fact Finding

Fact Finding [5] is executed in response to an event, issue or problem to enable gathering of pertinent information, artifacts and witness statements in a timely manner. Fact Finding will support the establishment of a timeline of events and serve as a means of assembling the appropriate staff needed to assist in event reconstruction. This process aids in the early development of corrective actions and supports the immediate implementation of remedial actions and compensatory measures to mitigate the risk of future occurrence of events arising from similar circumstances.

Fact Finding is intended to supplement the cause analyses and corrective action determination processes but not replace them. Completed Fact Finding Reports [6] are used to support cause analyses when the event significance level requires it, or when Fact Finding leaves unanswered questions regarding cause that need to be determined to prevent risk of reoccurrence.

5.1.3 Cause Analysis

Cause analyses are systematic approaches carried out to determine the cause of an issue or event. The type of cause analysis employed is determined using a graded approach, based on risk of recurrence and severity of the initial event. Determination of the appropriate cause analysis tool is aided by completion of initial investigation, such as *Fact Finding* [5]. The information gained from initial investigation is used to support the cause analysis process in determining the most probable, or root cause of an event.

5.1.3.1 Apparent Cause Analysis

The *Apparent Cause Analysis* [7] process establishes a systematic approach to identify the most probable causes of an issue and determine the corrective actions required to reduce or eliminate recurrence. This process is used for significance level 2 or 3 events where it is required to determine the most probable causes, but determination of root cause is not required. An apparent cause analysis (ACA) therefore, is carried out when the casual analysis effort is commensurate with the consequences of the event and the organization’s tolerance and/or risk of potential recurrence.

To ensure consistent analysis techniques are applied to correctly identify causes and develop effective corrective actions, ACAs are completed using the *Apparent Cause Analysis Report* [8] and receives management oversight and acceptance.

5.1.3.2 Root Cause Analysis

The Root Cause Analysis [9] process establishes a systematic approach to determine the underlying factor(s), identify the root cause, and document the corrective actions required to mitigate the risk of recurrence. A root cause analysis (RCA) is undertaken to find evidence-based facts, determine how their shared interactions caused the unplanned event, and use the learnings gleaned from the analysis to identify and implement effective solutions. An RCA is required for the highest significance events (significance level 1), but may be undertaken for significance level 2 events where determination of root cause is required due to risk and probability of recurrence.

To ensure consistent analysis techniques, adequate level of rigor commensurate with risk, accurate casual identification and effective corrective action development, the completed Root Cause Analysis Report [10] receives management oversight and acceptance.

5.1.4 Action Development

Action development and implementation is executed using a graded approach based on risk and problem/event severity.

Immediate actions are taken to ensure worker and system safety. These actions can be compensatory measures pending corrective action implementation, or they can standalone as sufficient in ensuring ongoing safe operations and conditions. Low significance events with no consequences or risk to safety may be closed without additional action; however, all problems identified and documented within CNL's issues management system will be used for trending purposes, ensuring that identified leading indicators are investigated and actioned before conditions create events.

Remedial actions are those taken to address the symptom of problems, events, incidents, or error-likely situations. The action remedies the problem but does not address the cause and is therefore implemented for low significance events, or to supplement corrective action implementation.

Corrective actions are those taken to reduce or eliminate the causes of an event and to reasonably prevent the recurrence of a problem or adverse condition based on the identified causes. Corrective actions are required for significance level 1, 2, and 3 events and are required to follow the SMARTER (Specific, Measurable, Accountable, Reasonable, Timely, Effective, Reviewed) criteria [3].

To ensure adherence to SMARTER criteria leading to effective action development, oversight is provided for all significance level 1 and 2 action plans, and selected Quality audit non-conformances. *The Corrective Action Review Board* [11] is a senior management forum chaired by the Chief Nuclear Officer that ensures findings are properly addressed, appropriate actions are identified, the plan has set priorities basked on risk, and effectiveness measures are established. The CARB provides oversight of the health and effectiveness of the corrective action program by ensuring senior management involvement with, commitment to, and accountability for significant event corrective actions.

5.1.5 Effectiveness Review

The Effectiveness Review [12] process describes the mechanism for monitoring and evaluating the effectiveness of the organization's corrective action plans to ensure all corrective actions will address and correct underlying causes and conditions, and to aid in the early intervention of potentially weak corrective actions that risk implementation of proper mitigation measures. Effectiveness reviews are required for corrective action plans developed to address significance level 1, 2, and 3 actions.

All effectiveness reviews are presented to CARB for approval. In the event the effectiveness review concludes that the original corrective action plan was insufficient in appropriately dispositioning the problem, additional actions will be developed and implemented until CARB is satisfied that all appropriate mitigation measures to prevent recurrence have been implemented.

5.1.6 Oversight Bodies

All ImpAct records raised receive screening and management oversight to ensure appropriate application of problem identification and resolution processes. Management oversight is applied in a graded approach based on significance level. All ImpAct records are evaluated by the Dedicated Screening Team and the Responsible Manager (RM); significance level 4 ImpActs where the cause determination effort and/or significance level was altered by the RM, as well as significance level 1, 2, and 3 ImpActs are reviewed by the Management Review Meeting; and the investigation and corrective actions for significance level 1 and 2 ImpActs are reviewed by CARB.

5.1.6.1 Dedicated Screening Team

All ImpAct records are screened in a timely and consistent manner by the *Dedicated Screening Team* [13]. The DST completes initial review and classification of ImpActs utilizing problem identification and resolution criteria to ensure program compliance and consistency. The DST is comprised of Performance Assurance personnel, a Quality Program representative, and subject matter experts and ImpAct Coordinators as required.

5.1.6.2 Management Review Meeting

Management Review Meetings [14] are mandated to ensure senior management level oversight and engagement in CNL's problem identification and resolution program. MRMs provide rigorous review of ImpAct records, cause analysis reports, corrective action plans, and effectiveness reviews.

MRM teams are comprised of a diverse representation of key functions of the business, that are tasked with reviewing events, near misses, problems and opportunities for improvement from a systemic prospective to gain a deeper understanding of systemic issues and move the organization towards proactive ways to promote efficiencies and improve safety.

The *Management Review Meeting* [14] Terms of Reference details requirements related to establishing meeting quorum, frequency, agenda items and roles and responsibilities.

5.1.6.3 Corrective Action Review Board

The CARB reviews and accepts all corrective action plans developed to address significance level 1 and 2 events to ensure the findings are properly addressed, appropriate actions are identified, the plan has set priorities based on risk, and effectiveness measures are established. To fulfill this mandate, the CARB reviews RCAs, ACAs and Effectiveness Reviews which support the significance level 1 or 2 event. At the discretion of the CARB Chair, significance level 3 events can be brought in front of the CARB for review and approval.

The *Corrective Action Review Board Terms of Reference* [11] details requirements related to CARB's organization and membership, mandate, meeting frequency and roles and responsibilities.

5.2 Measuring and Monitoring

Data from systematic and repeatable processes is monitored to identify trends, leading indicators and identify areas for performance improvement.

5.2.1 Trending

Through the ongoing and consistent monitoring of data, trends in performance can be readily identified. Repeatable process measures and trend code application ensure consistency in data and enable effective monitoring and measuring. Trends are identified, investigated, and dispositioned as per *Trend Analysis* [15].

5.2.2 Contractor Assurance System Scorecard

The Contractor Assurance System (CAS) scorecard is an interactive tool used to display organizational performance measures based on the requirements applicable to CNL. The CAS Scorecard is one of several tools used to measure the performance of the overall *Contractor Assurance System* [16]. Performance Assurance collects data from across the organization and plots it to show variance in performance and adherence to goals to allow for early intervention should an adverse trend appear.

5.2.3 Management Review

Management Review critically assesses the implementation of the management system to ensure its continuing suitability, adequacy and effectiveness. The review enables assessment of outputs of various management system assessment processes to ensure the management system's continued evolution remains aligned with company goals and objectives and enables safe, effective and efficient conduct of work that ultimately achieves planned and desired results.

Management Review [17] outlines the process of assembling the outputs of ongoing weekly, monthly, and quarterly assessment and monitoring activities for the fiscal year, in addition to fiscal year assessments and audits. Analysis is then completed utilizing a holistic view of data, including trends from various monitoring and measuring activities, to determine the impact against the company's performance measures and objectives. The completed analysis report and findings are received by the Executive Team. Should formal action be required to appropriately manage or disposition findings, CNL's problem identification and resolution process will be followed [3] to effectively manage action execution.

5.2.4 Program Review

In addition to ongoing assessments, program reviews are conducted for individual programs to analyze and assess data from a specified timeframe. Often an annual review, results are compared to previous years to enable a more wholesome analysis than routine data monitoring offers. While certain program reviews are required by regulation, any program can be assessed to determine:

- The effectiveness of the existing program in accomplishing its goals and objectives.
- The existence of any program design problems or gaps.
- If process documentation requires revision due to changing requirements, incorporation of industry best practice or opportunities for improvement.
- If actions from the previous program review have been dispositioned and remain effective.

Program reviews are documented, with formal actions raised as a result of findings in accordance with CNL's problem identification and resolution processes.

5.2.5 Safety and Security Culture Assessment

A healthy safety culture is an interpretation of how safety is integrated into everyday work and interactions. It is reinforced in how people, including leadership, work together to create a deeper understanding of the culture and its impacts on safety. Monitoring to understand safety culture forms the foundation for building systemic safety improvements over time. Safety culture monitoring is executed in alignment with CNL's *Safety and Security Culture Assessment Framework* [18] which sets out the basis for the systematic review of safety culture against a defined set of characteristics.

5.3 Continual Improvement

Continual improvement of the management system is embedded within various Performance Assurance processes including:

- *Benchmarking* [19]; a performance monitoring and improvement tool used to improve CNL's knowledge, skills and safety performance via review of other high-performing organizations.
- *Trend Analysis* [15]; a method to analyse performance data and identify trends before the onset of problems or events.
- *Change Management* [20]; a process to manage change communication and resistance, enabling stakeholder adoption of the change.
- *Management Review* [17]; a critical assessment of the implementation of the management system to ensure its continued suitability, adequacy, and effectiveness.
- *Process Improvement* [21]; a framework to help CNL functional support areas, business lines, and departments identify more strategically aligned opportunities, and execute those improvements in a sustainable way.

- Problem identification and resolution [3]; process for identifying, prioritizing, investigating, documenting, trending, tracking, preventing, and resolving problems and opportunities for improvement.
- Lessons learned/Operating Experience (OPEX) [22]; a process which promotes the identification and dissemination of operating experience and lessons to be learned from internal and external industry events in order to improve safety, reliability, and business processes, while reducing time at risk and improving the overall performance of CNL.

5.3.1 Lessons Learned

Lessons learned are identified, documented, and disseminated to ensure that knowledge gained from experience is leveraged. Lessons learned, or OPEX, rely on the accurate and timely reporting of events to enable prompt notification of learnings to the organization for the timely implementation of action(s) to prevent recurrence, improvement safety and business processes, and improve the overall performance of CNL.

Lessons learned are created and disseminated both internally and externally, ensuring that use of experience is shared with the organization and industry. Similarly, external lessons learned are shared with CNL. External lessons learned are reviewed for relevance and significance and shared to the appropriate CNL personnel for action.

5.3.2 Change Management

Change Management [20] promotes the successful implementation of changes impacting CNL workers through planning and implementing communications and resistance management activities that help transition employees from current state to future state. *Change Management* [20] provides a structured approach to communicating and managing resistance to change, and helps ensure the change is:

- Supported by the appropriate change activities (e.g. communications, engagement, training, etc.).
- Documented and communicated to stakeholders.
- Understood by stakeholders.
- Managed effectively through the planning and implementation of resistance mitigation strategies.

5.4 Human Performance

CNL's human performance program establishes a good practise set of practical methods and techniques for anticipating, preventing and catching active human errors, and identifying and mitigating latent errors attributable to organizational factors. When used effectively, the tools can improve human performance in the workplace; thus, reducing errors, and helping to eliminate events.

Human performance (HU) tools provide error-reduction methods supervisors and managers can use in their quest to identify organizational weaknesses or conditions that increase the likelihood or the consequences of error, such as:

- *Observation and Coaching* [23]; a process intended to drive safety culture improvements through proactive internal organizational learning. Observation and Coaching (O&C) enables managers and leaders to assess and interact with workers within the worker's environment. This enables managers to be a positive presence within the workers' environment and fosters a collaborative approach to verifying that work meets the requirements of the management system. It also enables managers and employees to collectively identify system error traps and deficiencies, and to implement system improvements and/or coaching if it does not.
- *Event Free Day Reset* [24]; a process which establishes the primary metric used to identify, track and trend human performance events and communicate findings to the organization. These indicators help identify HU organizational vulnerabilities and ensure focused reinforcement of targeted HU methodologies to promote a safer working environment.

The HU program also defines a set of discrete behaviours to help individuals and work teams anticipate, prevent, or catch errors before they cause harm to people, facilities, or the environment, such as:

- *Event Free Tools* [25]; a set of discrete behaviours and mentalities to be used by all workers to help reduce the rate of error while performing tasks. The Event Free Tools (EFT) help workers maintain positive control of a work situation to achieve the desired results. When used thoughtfully and rigorously, they minimize human error, and anticipate, prevent or catch active errors before they cause harm to person, property or environment.

6. Interfaces

6.1 Internal Interfaces

Functions/Lines Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Designated Representative of the Licensee (DROL)	Communicating with, and responsible to all licensing bodies for the function.	Email, meetings	Management System DROL
Quality	Acceptance of final dispositions of non-	Email, Management	Quality FSM

Functions/Lines Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
	conformances as identified in ImpAct records, member of the Dedicated Screening Team.	Review Meetings, Dedicated Screening Team meetings	
Management System	Assists with process implementation and review.	Email, meetings	Management System FSM
Training and Development	Assists with process implementation and administration of training.	Email, meetings	Training and Development FSM
Design Analysis and Design Engineering	Assessing operability concerns as per the Technical Operability Evaluation process when flagged in an ImpAct record.	Email, Management Review Meetings	Design Analysis and Design Engineering FSM
Compliance	Assessing reportability concerns when flagged in an ImpAct record.	Email, Management Review Meetings	Compliance FSM
Information Management	Embedding usage classification requirements within document templates, revising Program Requirements Document and Program Description Document templates as requested.	Email, meetings	Information Management FSM
Integrated Work Control	Embedding pre-job and post-job brief into Integrated Work	Email, meetings	Management System FSM

Functions/Lines Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
	Control documents and practices.		
Line Management	Provides metrics to be measured and monitored, provides feedback to assist with continual improvement and safety culture assessments, participates in event investigations and cause analyses, raises ImpActs and actions as per the problem resolution and identification process, participates in DST, MRM and CARB as required.	Email, issues management software, meetings	Responsible Managers, Line Management employees

6.2 External Interfaces

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
AECL	Submission of the CAS Scorecard, audience member of the RLMC, receives and reviews the daily ImpAct Initiation Report.	Email, RLMC, SharePoint	AECL personnel
Candu Owners Group (COG)	Source of external OPEX.	Email, weekly screening meeting	Screening Team
DevonWay	Vendor of CNL’s issues management software.	Email	DevonWay personnel

Table of Contents

1. Scope and Applicability

This company-wide document applies to all activities unique to Performance Assurance performed by Canadian Nuclear Laboratories' employees, contractors, and sub-contractors, as well as third parties engaged through external partnerships or collaborations that perform work for and/or on behalf of CNL.

2. Purpose

The following is a mapping of requirement source documents to the Management System documentation that implements those requirements. It reflects the current operational implementation of the requirements. Given the diverse nature of the CNL business, the dynamic nature of the regulatory environment, and the complexity of the regulations, the mapping is not intended to be complete for every possible requirement.

3. Requirements and Flowdown

Quality Assurance Requirements for Nuclear Facility Applications, ASME NQA-1		
Section and Title	**Description**	**Implementing Document(s)**
Requirement 16 - Corrective Action	100 GENERAL Conditions adverse to quality shall be identified promptly and corrected as soon as practicable. In the case of a significant condition adverse to quality, the cause of the condition shall be determined and corrective action taken to preclude recurrence. The identification, cause, and corrective action for significant conditions adverse to quality shall be documented and reported to appropriate levels of management. Completion of corrective actions shall be verified.	*Improvement Action (ImpAct) Corrective Action Program,* 900-514000-MCP-004 *Management Review Meeting,* 900-514000-TOR-001

Section and Title	**Description**	**Implementing Document(s)**
5.3 Organizational roles, responsibilities and authorities	Top management shall ensure that the responsibilities and authorities for relevant roles are assigned and communicated within the organization. Top management shall assign the responsibility and authority for:	*Performance Assurance*, 900-514000-PDD-001

Environmental management systems - Requirements with guidance for use, **ISO 14001:2015**		
Section and Title	**Description**	**Implementing Document(s)**
	b) Reporting on the performance of the environmental management system, including environmental performance, to top management.	
9.1.1 General	The organization shall monitor, measure, analyse and evaluate its environmental performance. The organization shall determine: a) what needs to be monitored and measured; b) the methods for monitoring, measurement, analysis and evaluation, as applicable, to ensure valid results; c) the criteria against which the organization will evaluate its environmental performance, and appropriate indicators; d) when the monitoring and measuring shall be performed; and e) when the results from monitoring and measurement shall be analysed and evaluated. The organization shall ensure that calibrated or verified monitoring and measurement equipment is used and maintained, as appropriate. The organization shall evaluate its environmental performance and the effectiveness of the environmental management system. The organization shall communicate relevant environmental performance information both internally and externally, as identified in its communication process(es) and as required by its compliance obligations.	*Performance Assurance*, 900-514000-PDD-001

Environmental management systems - Requirements with guidance for use, ISO 14001:2015		
Section and Title	**Description**	**Implementing Document(s)**
	The organization shall retain appropriate documented information as evidence of the monitoring, measurement, analysis and evaluation results.	
9.3 Management review	Top management shall review the organization's environmental management system, at planned intervals, to ensure its continuing suitability, adequacy and effectiveness. The management review shall include consideration of: a) the status of actions from previous management reviews; b) changes in: 1) External and internal issues that are relevant to the environmental management system. 2) The needs and expectations of interested parties, including compliance obligations. 3) Its significant environmental aspects. 4) Risks and opportunities. c) the extent to which environmental objectives have been achieved; d) information on the organization's environmental performance, including trends in: 1) Nonconformities and corrective actions. 2) Monitoring and measurement results. 3) Fulfilment of its compliance obligations. 4) Audit results. e) adequacy of Resources; f) relevant communication(s) from	*Management Review*, 900-514100-STD-003

***Environmental management systems - Requirements with guidance for use*, ISO 14001:2015**		
Section and Title	**Description**	**Implementing Document(s)**
	interested parties, including complaints; and g) opportunities for continual improvement. The outputs of the management review shall include: — conclusions on the continuing suitability, adequacy and effectiveness of the environmental management system; — decisions related to continual improvement opportunities; — decisions related to any need for changes to the environmental management system, including Resources; — actions, if needed, when environmental objectives have not been achieved; — opportunities to improve integration of the environmental management system with other business processes, if needed; — any implications for the strategic direction of the organization. The organization shall retain documented information as evidence of the results of management reviews.	
10.1 General	The organization shall determine opportunities for improvement (see 9.1, 9.2 and 9.3) and implement necessary actions to achieve the intended outcomes of its environmental management system.	*Process Improvement,* 900-514000-STD-003

Table 6: *Quality Management Systems – Requirements*, CSA ISO 9001:2015

***Quality Management Systems – Requirements*, CSA ISO 9001:2015**		
Section and Title	**Description**	**Implementing Document(s)**
4.4.1 a)	The organization shall determine the processes needed for the quality management system and their application throughout the organization, and shall: a) determine the inputs required and the outputs expected from these processes;	*Trend Analysis*, 900-514000-STD-001 *Process Improvement*, 900-514000-STD-003
4.4.1 g)	The organization shall determine the processes needed for the quality management system and their application throughout the organization, and shall: g) evaluate these processes and implement any changes needed to ensure that these processes achieve their intended results;	*Process Improvement,* 900-514000-STD-003 *Management Review,* 900-514100-STD-003
4.4.1 h)	The organization shall determine the processes needed for the quality management system and their application throughout the organization, and shall: h) improve the processes and the quality management system.	*Process Improvement*, 900-514000-STD-003
5.3 Organizational roles, responsibilities and authorities	Top management shall assign the responsibility and authority for: b) ensuring that the processes are delivering their intended outputs;	*Management Review*, 900-514100-STD-003
6.1.1	When planning for the quality management system, the organization shall consider the issues referred to in 4.1 and the requirements referred to in 4.2 and determine the risks and opportunities that need to be addressed to:	*Management Review*, 900-514100-STD-003

Section and Title	**Description**	**Implementing Document(s)**
	Good Industry Practice; (iv) in continuous pursuit of improvements in aspects of performance of the Work where cost-effective and efficient improvements can reasonably be achieved.	
3.1 AECL Oversight	(b) CNL shall self-assess its performance of all of the Work, including its compliance with its obligations under this Agreement, identify deficiencies and implement required improvements in accordance with the terms and conditions of this Agreement, regardless of whether AECL has evaluated CNL's performance in any area of this Agreement. AECL's oversight shall not relieve CNL from its obligation to assess its performance, which obligation is independent of AECL's oversight role. Without limiting the generality of the foregoing, CNL shall develop a contractor assurance system that is executed by Contractor in accordance with the requirements of the Contractor Contract and implemented throughout CNL's organization. The contractor assurance system, at a minimum shall include the following key attributes: (i) a comprehensive description of the contractor assurance system with processes, key activities and accountabilities clearly identified (ii) a method for verifying and ensuring effective contractor assurance system processes, such as third party audits,	*Performance Assurance,* 900-514000-PDD-001

Revision History

Rev. No.	Date	Details of Rev.	Authored By	Reviewed By	Approved By
5	2023/07/24	Issued as “Approved for Use”.	E. Whyte	H. Simpson	N. Deighton

5D1	2023/03/09	Issued for “Review and Comment”. Major changes include:
		• Updated to new formal document template.
		• Section 1, Scope and Applicability – added scope statement.
		• Section 3.1, Definitions – corrected definition for “Qualification”, added definitions for “Specialized Training” and “Training Developer”.
		• Section 4.11, Roles and Responsibilities
		  - Merged FSM & Manager roles
		  - Added Training Steering Committee
		• Section 5, Functional Programs – added new Figure 1: Process Flowchart – When to use SAT versus CNL Learning and Development Process.

4	2022/02/17	Issued as “Approved for Use”. Minor change - Updated to new PDD template.	E. Whyte	N. Deighton J. Luckasavitch	C. Bennett
4D1	2021/12/21	Issued for “Review & Comment”. Major changes include: • Section 2, Purpose statement updated. • Section 3, Definitions and Acronyms – new and alignment of existing definitions to be consistent with REGDOC2.2.2 and associated standards. New definitions for “positions” and “roles” agreed upon with Management Systems. • Section 4, Roles and Responsibilities aligned with	E. Whyte	N. Deighton J. Luckasavitch C. Bennett A. Dash D. Cram T. Beres	

		updates to associated standards. • Section 5, Process Descriptions language updated: includes new CNL Learning and Development instructional design process for non-List positions. Added new subsection for oversight of Training and Development program. • Section 6, Interfaces updated to more accurately reflect internal and external interfaces.			
3	2020/03/31	Issued as “Approved for Use”. Minor Changes: - Removed Facilities Training Lead - Added: Safety Function definition - Included reference to “Application of SAT at CNL Controlled List” - Updated ‘Process Description’ - No R&C required	M. MacCormack	C. Bennett	C. Bennett
2	2019/03/27	Issued as “Approved for Use”. Minor change to update the Pilot Delivery definition incorrectly entered in revision 1.	D. Kilby		R. McNamara
1	2018/03/21	Updated to align terminology and process description based on revisions to SAT process documents issued as new Standards. Minor changes. No R&C required	T. Shorter		R. McNamara
0	2016/12/20	Issued as “Approved for Use”. Cancels and Supersedes: CW-510000-MAN-001, *AECL Systematic Approach to Training (SAT)*.	T. Shorter		T. Shorter
D1	2016/11/30	Issued for “Review and Comment”.		A. Bakewell C. Bennett A. Coulas J. DeRuiter R. Hardin	T. Shorter

Table of Contents

1. Scope and Applicability

This Program Description Document (PDD) describes Canadian Nuclear Laboratories' (CNL) Training and Development Functional Support Are (FSA) program. The PDD also establishes program boundaries and describes oversight, compliance and services for training and development activities.

This Company-wide Interpretation document applies to all activities unique to Training and Development performed by Canadian Nuclear Laboratories (CNL) across all sites.

2. Purpose

Training and Development supports the Organization's operational capabilities by ensuring that workers are effectively and efficiently trained to safely and competently perform their position or role.

3. Definitions and Acronyms

This document relies primarily on word meaning as found in common dictionaries. The current *Glossary of Controlled Terms and Acronyms* [1] contains specific meanings for those words that require further clarification.

3.1 Definitions

Acceptable Level of Performance (ALP)	The required level of achievement during an assessment process that determines trainee's success/failure.
Assessment	A process to observe, evaluate and document trainee progress, confirm learning objectives have been met, and confirm trainee competence.
Authorization/Authorized (Personnel)	The granting of written permission to perform the duties and responsibilities accompanying a position on the basis of demonstrated and verified competence for the position.
Certification	A written attestation from an external body that a person meets the qualification requirements for a position as required by regulation.
CNL Learning and Development Model	A flexible framework for the analysis, design, development, implementation, and evaluation of training at both the course and program level.
Competence	The ability to perform the duties and responsibilities of a position in a safe, effective and efficient manner.

Continuing Training	Training that maintains and enhances the competence of an individual who has been previously qualified. Update training, refresher training and just-in-time training are considered continuing training.
Course Code	An alpha numeric identifier of a course in the learning management system (LMS).
Course Description	A broad statement that describes the overall purpose of the training and/or identifies the gap the training.
Field Checkout (FCO)	A formal evaluation conducted in the job setting evaluating actual task performance involving skill demonstration and oral questioning to ensure that the knowledge and skills associated with a task performance have been learned.
Formative Assessment	Formative assessments are used during the conduct of training to provide ongoing feedback to both Trainers and Trainees on the progress being made towards achieving learning objectives.
Fully Qualified	A person who has achieved all of the qualification requirements (knowledge, skill and experience) of a position or role. This is also known as SQEP (suitably qualified and experienced personnel).
Gap Analysis	A gap analysis is a process used to examine the delta between the actual state and the desired state (e.g. industry recognized standard of excellence, performance standard, licensing/SAT requirements).
Initial Training	The training delivered to address gaps in knowledge, skills and/or performance leading to initial qualification on a task.
Instructional Design	The process of analysing, designing, developing, implementing, and evaluating training (used in reference to CNL's Learning and Development Process).
Job	The work performed by an incumbent(s) in a position or role.
Job Analysis	A process to identify the job functions or tasks of a specific position or role.
Just-in-time Training (JITT)	Initial or continuing training that is delivered prior to task performance to address a knowledge, skill or performance gap.
Learning Management System (LMS)	CNL's software system used for the planning, administration, documentation, tracking, reporting and delivery of training.

Learning Objective	A statement that describes the topic and/or content that will be covered in training (whether at a course or program level). A Learning objective is also referred to as an enabling objective.
Learning Outcome	A statement of what the trainee will be able to do upon successful completion of training (whether at a course or program level). It is written from the trainee's perspective and describes the action that is to be performed, the conditions under which it is to be completed, and the standard for measuring performance. A learning outcome is also referred to as a terminal objective.
Lesson Plan	An outline that guides the conduct of a training activity to ensure that all learning objectives as defined in the training requirements are met.
Performance Support	Job aids that are easily accessible in the moment of need that are used to improve and increase on-the-job performance and productivity (e.g. reference guides, infographics, process maps, checklists, on-demand video tutorials, wallet cards, FAQ sheets, etc.)
Person Analysis	A process to examine an individual's current knowledge, skills and experience against a defined training program or job profile.
Pilot Delivery	Trial run of a training activity for the purpose of validating duration, training method, content, materials and logistics.
Position	A position is identified by a business title and is a worker's primary function for which they were hired to perform as per Line Management.
Practical Training	Training that is conducted in a job setting demonstrating actual, or simulated, task performance and using supporting equipment and documentation to prepare for formal task performance evaluation (e.g. on-the-job training (OJT), just-in-time training (JITT), practical skills training, etc.)
Qualification	A recognized level of mastery of task performance, which is normally acquired through successful completion of training. It involves mastery of all the knowledge, skills, and safety-related attributes required for successful task performance on the job.
Refresher Training	Training identified as requiring, on a scheduled basis, a refresher to ensure qualified workers maintain knowledge of fundamental knowledge and skills.

Remedial Training	Training used to correct identified knowledge, skill and/or performance gaps.
Role	Functional duties and assignments, in addition to their existing position, that any CNL employee performs in order to facilitate delivery of a process.
SAT-Listed Positions and Roles	A list of positions and roles at CNL that require a Systematic Approach to Training (SAT) compliant program. These positions and roles are identified in the *Application of the Systematic Approach to Training (SAT) at CNL* [2], which is commonly referred to as “the List”.
Skill	A mental and/or physical activity that requires a measured degree of proficiency. The words "skill" and "ability" are often used interchangeably.
Specialized Training	Training for tasks that are unique in nature and only performed by select individuals. Line Supervisors/Managers determine which individuals are assigned to complete specialized training.
Summative Assessments	Summative assessments are used upon completion of a training activity to assess a Trainee’s mastery of the learning objectives against the identified success criteria and/or acceptable level of performance (ALP).
Systematic Approach to Training (SAT)	A phased approach to training consisting of: • An analysis phase, which is the identification of the competencies in terms of knowledge and skills required by a position and determines the scale and scope of the training required. • A design and development phase, which is the conversion of competency requirements into Learning Outcomes and Learning Objectives followed by preparation of the training material to support their achievement. • A conduct phase, which is conducting the training using the material developed. • An evaluation phase, which analyzes feedback on training program elements and job performance to assess training efficiency and effectiveness, and identify appropriate improvement actions.
Task	A measurable, well-defined unit of work, with an identifiable beginning and end. Typically defined in a verb-noun format.

Task Analysis	A process to examine a job task to identify knowledge and skills required for its performance.
Trainer	Personnel that have been assigned to instruct or lead a training activity and have been qualified to do so (e.g. instructor, facilitator, etc.).
Training	A process by which knowledge and skills for a position or role are identified, delivered, and acquired.
Training Activity(ies)	A training activity can be either a single course or multiple courses that, in combination, create a training program.
Training Assessor	An individual who has the technical expertise to assess if the acceptable level of performance has been met
Training Developer	An individual who is assigned to lead the instructional design process. For SAT-Listed positions or roles, this individual is a Training Consultant. For positions or roles not on the List, this individual can be a subject matter expert assigned by Line Management who consults with a Training Consultant.
Training Plan	The compilation of all training requirements (initial, continuing, and/or specialized) for a position or role, typically identified through a training analysis.
Training Program	The compilation of all training analyses, plans, and materials that support the training required for a given position or role.
Training Program Owner	The individual, as defined in a facility or organization's governing documentation, with the overall responsibility for the training requirements of a specific training program. This can include responsibility for a training program to qualify for a position (e.g. Line Manager), or responsibility for a training program area (e.g. Nuclear Criticality Safety Functional Support Manager)
Training Qualification Card (TQC)	A format to document and track the progressive completion of the training qualification requirements for a task or position including the process for assessment.
Training Requirements Analysis	A process to analyze new requirements, performance gaps or problems, identify causes, and determine whether training is the appropriate solution.
Transfer of Learning	The effective post-training application of knowledge and skills learned through training resulting in genuine behavioural change in the workplace.

Update Training	Continuing training that is delivered as required to address significant regulatory, procedural, process and/or equipment changes.

3.2 Acronyms

ALP	Acceptable Level of Performance
CRC	Curriculum Review Committee
DIF	Difficulty, Importance, Frequency Analysis
FCO	Field Check Out
JITT	Just-in-time Training
LMS	Learning Management System
OJT	On-the-job Training
PLA	Lesson Plan
SAT	Systematic Approach to Training
TOC	Training Oversight Committee
TQC	Training Qualification Card

4. Roles and Responsibilities

4.1 Responsible Executive

The Responsible Executive is responsible for:

- Ensuring the development, implementation and effectiveness of the Training and Development Function.
- Ensuring that adequate resources are provided for the development, implementation and maintenance of the Training and Development function requirements.
- Appointing a Designated Recipient.
- Reviewing the Training and Development functions performance through Executive Committee Meetings, AECL client meetings, and/or other Management meetings.
- Supporting all other Responsible Executives in the successful implementation of Training programs within their organizational units.

4.2 Functional Support Manager, Training and Development

The Functional Support Manager is responsible for:

- Ensuring that all Training and Development Management System Documentation is developed and maintained in compliance to applicable requirements.

- Providing a structured, documented and auditable set of training processes that, when implemented, provide management with assurance that personnel are trained and qualified for the work they do and that training programs meet licence requirements.
- Directing the overall implementation of CNL's training program and interpretation of both the SAT-based training framework and the CNL Learning and Development process.
- Ensuring SAT operates within the overall context of CNL's Management System framework.
- Providing direction and advice to Line Management responsible and accountable for personnel competence within their respective organization.
- Ensuring the development of training programs for all CNL business and licence-compliance programs, line organizations in all nuclear facilities, laboratories and supporting facilities including the following:
    - Ensuring that the controlled list of positions and roles requiring SAT compliant training programs, as identified in the *Application of the Systematic Approach to Training (SAT) at CNL* [20] (hereafter, "the List"), is maintained.
    - Ensuring that SAT is applied to all positions and roles on the List [2] in order to comply with regulatory requirements as defined in CNL's operating licences.
    - Leading and supporting the Training and Development function by providing oversight, including CNL's Training Oversight Committee (TOC) structure.
    - Ensuring CNL's Learning Management System (LMS) is configured and maintained to enable training compliance and management of training records.
    - Ensuring improvement opportunities to training programs identified through evaluations, audits, inspections, operating experience and lessons learned are addressed.
    - Supporting CNL's transitional projects including change management and training of all affected personnel to support integration of new or different processes.
    - Ensuring training is scheduled, tracked and recorded in accordance with requirements.

4.3 Training Consultants

Training Consultants are responsible for:

- Leading the analysis, design, development, conduct and evaluation of CNL training programs utilizing the SAT process or the CNL Learning and Development process.
- Supporting the implementation of training program improvements identified through evaluations, audits, inspections, operating experience, and lessons learned.

4.4 Training Compliance Analyst

Training Compliance Analysts are responsible for:

- Partnering with Training Consultants and line management to ensure employee required training compliance.
- Analyzing data to support oversight of training program performance, improvements and corrective actions.

4.5 Technical Trainer

Technical Trainers are responsible for:

- Completing training requirements and maintaining qualification as a CNL Trainer as per the *CNL Trainer Training Analysis and Training Requirements* [3] Training Analysis.
- Facilitating training to CNL workers, primarily on the safe operation of tools and equipment.
- Identifying improvements and collaborating with Training and Development Personnel to ensure training programs are maintained.
- Maintaining knowledge of CNLs safety standards and management control procedures.

4.6 Training Coordinators

Training Coordinators are responsible for:

- Providing front-line customer service for the delivery of training programs, including procurement, scheduling, reporting, and recording of training.

4.7 Training Program Owners

Training Program Owners are responsible for:

- Approving training program requirements.
- Collaborating with Training and Development to ensure training programs are compliant with requirements.
- Collaborating with Training and Development to identify positions or roles to be included on the List [2].
- Ensuring adequate resources are available to enable successful development and implementation of training programs.

Note: The FSM or Line Manager sometimes fulfills the role of the Training Program Owner.

4.8 Line Managers

Line Managers are responsible for:

- Ensuring workers are qualified to perform their assigned tasks.
- Collaborating with Training and Development to ensure training programs are compliant with requirements.

- Collaborating with Training and Development to identify positions or roles to be included on the List [2].
- Ensuring adequate resources are available to enable successful development and implementation of training programs.

4.9 Trainers

The role of Trainer can be fulfilled by any employee at CNL. Trainers are responsible for:

- Completing training requirements and maintaining qualification as a CNL Trainer as per the *CNL Trainer Training Analysis and Training Requirements* [3] Training Analysis.
- Facilitating training to CNL workers.
- Identifying improvements and collaborating with Training and Development personnel to ensure training programs are maintained.
- Maintaining knowledge of relevant CNL standards and management control procedures.

4.10 Training Oversight Committee (TOC)

The Training Oversight Committee (TOC) is responsible for:

- Providing oversight of CNL's training strategy and direction.
- Reviewing and approving changes to training program requirements that have a company-wide impact.

4.11 Training Steering Committee

Mission-specific Training Steering Committees are responsible for:

- Ensuring that a Systematic Approach to Training is applied within the mission-area as determined by *Application of Systematic Approach to Training at CNL* [2].
- Ensuring that *CNLs Learning and Development* [4] standard is applied within the mission-area for positions, roles and training activities not requiring the full application of SAT.
- Ensuring that training program activities align with the mission/company vision, values, and strategic direction.
- Endorsing and recommending priorities for training development action plans.
- Allocating training resources based on priority and action plans.
- Reviewing worker performance and making training recommendations in order to address performance gaps.
- Reviewing training conduct and training compliance against existing position-specific training plans and pre-approving the implementation of training affecting large audiences.

- Identifying areas for training program improvement utilizing training evaluation methods such as self-assessments, audits, inspections, impacts, or other feedback mechanisms.

5. Functional Programs

CNL maintains a list of positions and roles that require a Systematic Approach to Training (SAT) compliant program. These positions and roles are identified in the *Application of the Systematic Approach to Training (SAT) at CNL* [2] (hereafter, "the List"). The process used to identify and update positions and roles included on the List is described in CNL's *Training Analysis* [5] standard. For non-List positions, the *CNL Learning and Development* [4] standard provides guidance on the instructional design of training programs.

The process flow chart in Figure 1 illustrates when to use CNL's SAT process versus the CNL Learning & Development process.

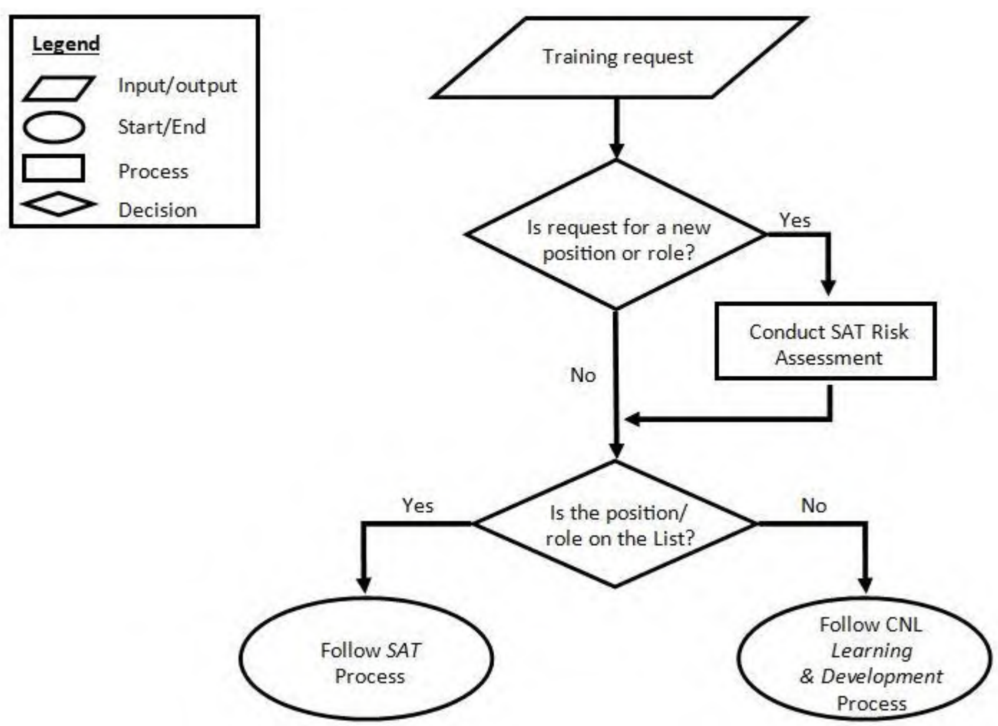

Figure 1: Process Flow Chart- When to use SAT versus CNL Learning & Development

6. Systematic Approach to Training (SAT)

CNL's Systematic Approach to Training (SAT) process provides a standardized approach to training and qualification used to ensure that CNL is in compliance with conditions in the applicable license. It provides Management with the assurance that personnel are trained, competent and qualified for the work they are assigned to do.

A SAT program systematically analyzes [5], designs and develops [6], conducts [7] and evaluates [8] training.

Figure 2: Overview of the Systematic Approach to Training Process (Diagram)

7. CNL Learning and Development Model

For positions and roles that are not on the List, the *CNL Learning and Development* [4] standard is a model that provides a flexible framework for the analysis, design, development, implementation, and evaluation of training (hereafter, "instructional design") at both the course and program level.

The *CNL Learning and Development* [4] model is a non-linear instructional design process that includes a number of recommended inputs (see Figure 3 below). These inputs offer flexibility in the methods used and the sequence in which they occur while ensuring that training programs are designed and implemented in a structured manner, using industry best practice

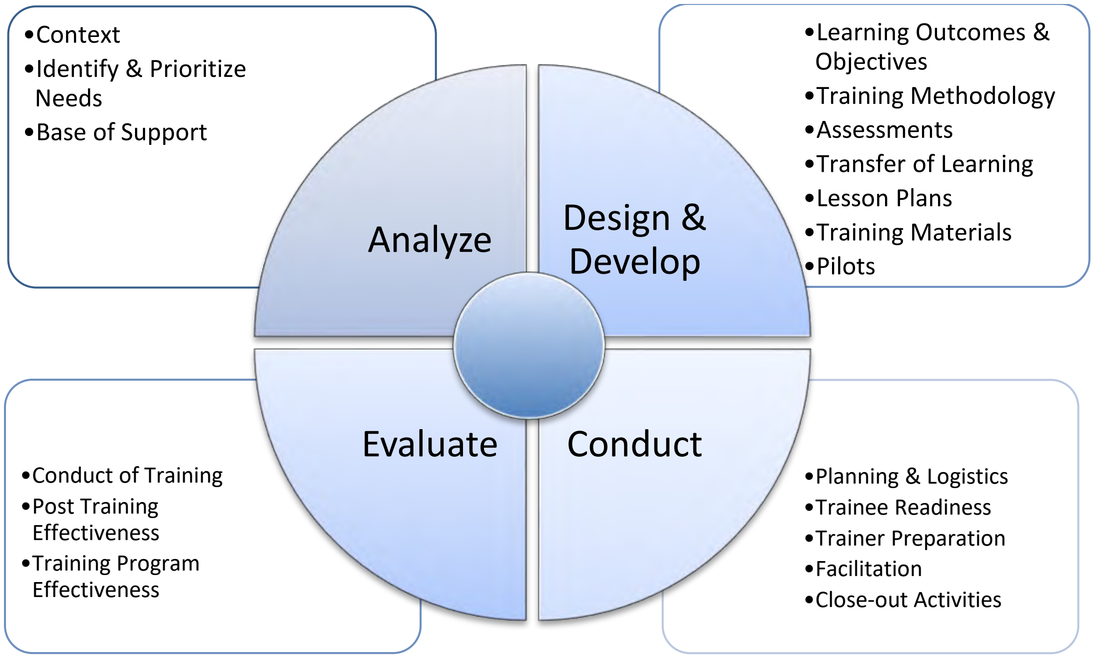

Figure 3: CNL Learning and Development Model for Instructional Design

8. Training Oversight

CNL provides oversight for the Training and Development program through various committees. The primary committees used for SAT compliant training programs are the:

- Training Oversight Committee
- Training Steering Committee
- Curriculum Review Committee

The Training Oversight Committee (TOC) provides a company-wide oversight to ensure that training aligns with CNL's mission, vision and goals. The function of the TOC is described in *Training Oversight Committee Terms of Reference* [9].

Training Steering Committees provide oversight of organizational divisions and evaluate how well training is addressing the mission's business needs and improves employee performance, while making training recommendations based on the findings of these assessments. The Training Steering Committee establishes program health requirements and monitoring of training compliance across mission areas. The function of the Training Steering Committee is described in its mission-specific terms of reference [10].

Curriculum Review Committees (CRC) are used at the line organization level to provide training oversight of individual training programs supporting line organizations and associated positions. Guidance on the CRC's mandate, membership, meeting frequency, process and standing agenda items is described in the *CNL Training Curriculum Review Committee* [11] terms of reference.

Table of Contents

Section **Page**

1. Scope and Applicability

This company-wide document applies to all activities unique to Training and Development performed by Canadian Nuclear Laboratories (CNL) across all sites.

2. Purpose

This document maps the requirements that inform the Training and Development function and demonstrates compliance to those requirements. The following is a mapping of requirement source documents to the Training and Development Management System documentation that implements those requirements. It reflects the current operational implementation of the requirements. Given the diverse nature of the CNL business, the dynamic nature of the regulatory environment and the complexity of the regulations, the mapping is not intended to be complete for every possible requirement.

3. Requirements and Flowdown

The following requirements are applicable to Training and Development (Table 1 to Table 16 show how CNL meets each of these requirements documents):

- *Management system requirements for nuclear facilities*, N286-12 (R2022), Canadian Standards Association, June 2012. (Table 1).
- *General principles for the management of radioactive waste and irradiated fuel*, N292.0-19, Canadian Standards Association, March 2019. (Table 2).
- *Quality management systems - requirements*, CAN/CSA-ISO 9001:16 (ISO 9001:2015, IDT), Canadian Standards Association, February 2016. (Table 3).
- *Environmental management systems - requirements with guidance for use*, CAN/CSA-ISO 14001:16 (ISO 14001:2015, IDT), Canadian Standards Association, February 2016. (Table 4).
- *Fire protection for facilities that process, handle, or store nuclear substances*, N393-13 (reaffirmed 2018), Canadian Standards Association, December 2013. (Table 5).
- *Environmental monitoring programs at class I nuclear facilities and uranium mines and mills,* N288.4-10 (reaffirmed 2015), Canadian Standards Association, May 2010. (Table 6).
- *Effluent monitoring programs at class I nuclear facilities and uranium mines and mills,* N288.5-11 (reaffirmed 2021), Canadian Standards Association, April 2011. (Table 7).
- *Groundwater protection programs at class I nuclear facilities and uranium mines and mills,* N288.7-15 (reaffirmed 2022), Canadian Standards Association, June 2015. (Table 8).
- *Nuclear criticality safety*, Version 1.1, REGDOC-2.4.3, Canadian Nuclear Safety Commission, September 2020. (Table 9).
- *Chalk River Laboratories Nuclear Research and Test Establishment Operating Licence NRTEOL-01.00/2028,* Licence Conditions Handbook, NRTEOL-LCH-01.00/2028 Revision

3/CRL-508760-HBK-002 Revision 3, Canadian Nuclear Safety Commission, February 14, 2023. (Table 10).

12.2 Training	A training and orientation program appropriate to the organization and to the activities performed should be documented and implemented in accordance with Clause 4.5.2 of CSA N286. 12.2.1 The training requirements for personnel involved in the EMP shall be described. A training and orientation program appropriate to the organization and to the activities performed should be implemented. If it has been determined that existing training documentation (such as the EMS) is appropriate to the EMP, it may be cited and applied without document duplication. 12.2.2 If training is being provided, a systematic approach to training (SAT) should be followed. The SAT should be based on the identification of the knowledge and skills required to perform the work. Note: The SAT framework generally consists of the following five phases: (a) analysis; (b) design; (c) development; (d) implementation; and (e) evaluation. 12.2.3 Training objectives for personnel should be identified prior to the	900-510200-STD-001, Training Analysis 900-510200-STD-002, Training Design and Development 900-510200-STD-003, Conducting Training 900-510200-STD-004, Training Evaluation

Table 11: *Personnel Training, Version 2,* REGDOC-2.2.2, Canadian Nuclear Safety Commission, December 2016.

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
REGDOC-2.2.2 All (1 and 1.1)	As required by the General Nuclear Safety and Control Regulations, workers shall be trained to carry on the licensed activity. This regulatory document sets out the CNSC's requirements for licensees regarding the development and implementation of a training system. It also provides guidance on how these requirements should be met.	900-510200-PDD-001, Training and Development
2. Principles	The training system developed and implemented by each licensee shall adhere to the following two fundamental principles: 1. Performance-oriented: Training is preparation for performance on the job. All instruction that is subject to this regulatory document shall focus on essential knowledge, skills and safety-related attributes required to meet job requirements and nuclear-safety-specific needs throughout the lifecycle of the facility. 2. Systematically developed: Training shall be defined, produced and maintained through an iterative and interactive series of steps, leading from the identification of a training requirement to the confirmation that the requirement has been satisfied.	900-510200-PDD-001, Training and Development
3. Training System for Nuclear Facilities	Licensees shall ensure workers who carry on licensed activities are qualified to do the work assigned to them through the use of a training system to systematically analyze, design, develop, implement,	900-510200-PDD-001, Training and Development

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
	evaluate, document and manage new training and the revision of existing training, including continuing training. It shall be used whether the training is defined, designed, developed, implemented, evaluated, recorded and managed internally by licensees or externally through vendors or contractors. Requirements included in this section are to be applied in a manner that is commensurate with risk. All requirements shall apply but the associated training-related processes and procedures may vary depending upon the safety significance and complexity of the work being performed. In considering safety, factors to be examined include the relative importance to safeguards and security; the magnitude of any hazard involved; the lifecycle stage of the facility; the type of facility or licensed activity; the particular characteristics of the facility or licensed activity (e.g., remote location, densely populated areas with easy access to qualified workers); and any other relevant factors. Licensees shall: 1. identify all performance requirements of a job or duty area relating to licensed activities by conducting a job analysis to determine all of the tasks involved 2. define and document the necessary general worker training, initial job training and continuing training requirements for workers, based on a task analysis of the knowledge, and skills required to perform each task and the	

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
	safety-related attributes required to perform their duties 3. ensure that appropriate training is designed, developed and implemented to meet the qualification requirements 4. ensure that trainers meet and maintain documented qualification requirements, particularly in the areas of subject matter expertise and instructional skills 5. ensure that formal evaluations are used to confirm and document that all trained workers are qualified to perform their duties 6. implement a training change-management process that will systematically analyze procedural and equipment changes, changes in job descriptions, and operating experience feedback (including facility and industry-wide events), in order to identify changes to the tasks and task lists and to assess potential training implications leading to training modifications 7. ensure continuing training is provided to workers as deemed necessary through the job and task analyses processes, and that it includes updates to training programs stemming from the change-management process as identified through the training needs analysis process 8. evaluate training regularly and incorporate the results of the evaluations into a training improvement process 9. ensure that workers' records in support of training and qualifications are	

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
	established and maintained 10. ensure that workers have a level of training related to nuclear safety corresponding to the duties of their position and employment, including but not limited to radiation safety, fire safety, onsite emergency arrangements, and conventional health and safety	
4. Records Management for a Training System	Licensees shall develop and manage documentation related to all phases of their training including analysis, design, development, implementation and evaluation. Licensees shall maintain records on the training and qualifications of all workers. These records shall be managed and controlled, and may be requested by CNSC staff at any time. Additionally, workers' supervisors and managers shall have immediate, unencumbered and readily available access to the workers' qualification records related to work being assigned or performed. The training record for each worker, including temporary workers and contractors, shall include all qualifications and certifications granted by or relied on by the licensee to fulfill requirements of this document and that are related to the duties of the worker at that facility. Records shall include expiration dates for time-sensitive qualifications and certifications, and all requalification or recertification requirements.	900-510200-PDD-001, Training and Development
5. Guidance on the Systematic Approach to Training	The systematic approach to training (SAT) is a proven and highly successful education and training methodology,	900-510200-PDD-001, Training and Development

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
	which licensees may adopt to meet the requirements in section 3.0 of this regulatory document. SAT is also widely known as the instructional system design model (ISDM) or analysis, design, development, implementation and evaluation (ADDIE) model. A SAT-based training system provides interdependent functions consisting of analysis, design, development, implementation and evaluation. This cyclic process (see figure 1) allows training to be systematically analyzed, defined, designed, developed, implemented, evaluated, documented and managed – in order to not only meet operational and organizational requirements, but also to react quickly to changes in those requirements. Appendix A provides licensees with further guidance on using a systematic approach to training, particularly for the development of radiation safety training programs.	
5.1 Analysis Phase	The analysis phase is the foundation of any training course or training program and includes inputs from operational staff, end-users, subject-matter experts and training development experts. Its purpose is to specify the required outcome of the training in terms of essential on-the-job performance as defined by role documents, procedures or written instructions. The analysis should consider the following points: • rationale and purpose of training • scope of the training	900-510200-STD-001, Training Analysis 900-510200-STD-002, Training Design and Development

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
	• target audience • training method • location of the training • time frame for completion of the training	
5.1.1 Training Needs Analysis	A training needs analysis (TNA) is often triggered by a performance gap or deficiency that has identified training as the solution. A TNA can be used to systematically assess job performance requirements against existing performance (gap analysis) and identify specific areas that require training. A TNA may also be used to assess skills and knowledge gaps created by engineering design and equipment changes, operational changes, revised procedures, and modifications to regulatory requirements.	900-510200-STD-001, Training Analysis
5.1.2 Job and Task Analysis	To identify all performance requirements of a job or duty area, a job analysis should be conducted to determine all of the tasks involved with all states of the nuclear facility, including normal operations, accident conditions and emergencies. The end result of a job analysis is a list of tasks that should be completed to perform the job correctly. Task difficulty, importance and frequency (DIF) are considered to determine which tasks need to be part of training and to determine the initial and continuing training content. A task analysis is conducted to determine the method of task performance and associated knowledge, skills and safety-related attributes. While the knowledge and skills	900-510200-STD-001, Training Analysis

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
	should be determined for each task, safety-related attributes need not be developed for each task but can be developed collectively and documented for a job or duty area.	
5.1.3 Learning Objectives	Terminal learning objectives (TLOs) are statements of the tasks that the workers must be able to demonstrate after completing the training. TLOs should be measurable and define exactly when, what and how well the trainee must be capable of performing on the job upon completion of the training. A terminal learning objective should include the following: • Performance statement: states the task to be performed • Condition statement: describes conditions under which the performance must be completed • Standards: state the measurable criteria that describe how well the performance should be completed	900-510200-STD-002, Training Design and Development
5.1.4 Target Audience Analysis	A target audience analysis determines the numbers and categories of workers to be trained and, where possible, the characteristics of the individuals who will receive the training (e.g., current job experience and prior background, experience, education and training). This information ensures that the training is designed, developed and implemented at the correct level, and assists with determining any necessary training prerequisites, including the minimum entry level education and training.	900-510200-STD-001, Training Analysis 900-510200-STD-002, Training Design and Development

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
5.2 Design Phase	The design phase should include the selection and description of the training and an environment that will enable the trainees to achieve the TLOs determined in the analysis phase. The design phase starts with the results of the analysis phase and ends with a plan for the development of the training. The design phase takes the output from the analysis phase and specifies how the information will be presented and how the knowledge, skills and safety-related attributes will be tested.	900-510200-STD-002, Training Design and Development
5.2.1 Trainee Characteristics	As a result of the analysis phase, the target audience should have been broadly defined. During this phase, the trainee characteristics should be further described in terms of their entry-level knowledge, skills and safety-related attributes, and those characteristics likely to affect their responses to particular instructional activities. Information obtained in this process will guide subsequent decisions such as those regarding appropriate instructional sequences, methods and media, and help tailor the training to trainees' needs and learning characteristics.	900-510200-STD-001, Training Analysis 900-510200-STD-002, Training Design and Development
5.2.2 Instructional Program Design	The instructional program design determines the knowledge, skills and safety-related attributes required to perform a task. These knowledge, skills and safety-related attributes lead to enabling objectives (EOs), which document the knowledge, skills and safety-related attributes. These EOs are then grouped and sequenced into the	900-510200-STD-001, Training Analysis 900-510200-STD-002, Training Design and Development

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
	order most suitable for learning.	
5.2.3 Enabling Objectives	EOs are the principal units of learning and constitute a major step towards achieving the associated TLOs. As sub-components of TLOs, EOs represent manageable units of work: units that are coherent in terms of logic, learning of work, and that have a suitable scope and are appropriate for testing learning progress. Like a TLO, an EO is composed of three essential parts: • Performance statement: an observable action normally stated as one action associated with a single verb. If the action is complicated or if more than one verb is used, then the EO needs to be broken down further into other EOs with simple actions. • Conditions statement: a description of the setting or conditions under which the task is to be performed. Ideally, the conditions should mirror those in the workplace where the operation is performed. • Standard: one or more measurable criterion stating the level of acceptable performance of the task in terms of quantity, quality or time limitations. It should answer questions such as “How many?”, “How fast?” or “How well?”	900-510200-STD-002, Training Design and Development
5.2.4 Learning Assessment Plan	A learning assessment plan describes the use of formal evaluations within the qualification program. The learning assessment plan determines how	900-510200-STD-002, Training Design and Development

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
	progress towards, and achievement of, the required performance is checked and verified. While an assessment should be based upon the performance defined in the TLOs or EOs, limiting factors (such as time) may not permit direct observation of the full range of desired performance. The assessment plan describes how a valid and reliable sample of trainee performance will be measured and evaluated.	
5.2.5 Instructional Strategies	The instructional strategy is the combination of media, methods and environment used in the delivery of training. The advantages and disadvantages of each instructional strategy, as applied to the TLOs and EOs, should be examined to ensure that the most effective solution is selected to produce graduates capable of performing tasks as indicated in the TLOs.	900-510200-STD-002, Training Design and Development
5.2.6 On-the-job Training	On-the-job training (OJT) requirements should be considered when one or more of the TLOs may not be suitable for traditional instructional methods. If OJT is necessary, then OJT learning objectives, complete with performance statements, conditions and standards, should be produced. Subsequently, each OJT learning objective should be formally assessed using on-the-job evaluation.	900-510200-STD-002, Training Design and Development
5.2.7 Training Development Plan	The training development plan documents the decisions made during the design phase. Outcomes and decisions regarding items covered in sections 5.2.1 through 5.2.6 should be documented and used during the development phase.	900-510200-STD-002, Training Design and Development

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
5.3 Development Phase	The development phase involves the procurement or production of effective instructional materials in accordance with the training development plan.	900-510200-STD-002, Training Design and Development
5.3.1 Procurement/ Production of Instructional Materials	Instructional materials should support the learning activities. Such items include instructor lesson plans, interactive courseware such as computer-based training and training aids of all types including equipment, references, job aids and testing materials. The instructional materials should include the following, where necessary: • Trainee manuals: These are reference handbooks to be used and often retained by the trainees. • Instructor guides: These are instructional specifications for use by the instructor during training preparation and delivery. They outline the specific training steps that must be used to satisfy the training development plan. • Handouts: These additional aids can supplement the trainee manuals in areas identified as difficult and/or particularly important. • Computer-based training or other media: These are to be used where they are the recommended solution based on the instructional analysis and the selection of the instructional strategy. • Question banks and some sample tests: When used during the	900-510200-STD-002, Training Design and Development

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
	training, these should include guidance on where and when they should be used.	
5.3.2 Assessment Tests	Assessment tests, which address the requirement for formal evaluation, cover both progress and final testing. In general, there are two types and both should be developed. Knowledge or cognitive assessments: Usually written, these tests can include multiple choice, multiple response, dichotomous or binary (e.g., yes/no; true/false), matching, resequencing, and open-ended questions. Performance or skill-based assessments: These are practical tests based on realistic scenarios of the most important and significant skills and safety-related attributes derived from the TLOs and EOs.	900-510200-STD-002, Training Design and Development
5.3.3 Conduct of Trials (Pilot Courses)	To assess the effectiveness of the training and related materials, these materials should be reviewed by subject-matter experts, tested with individuals who are representative of the target training audience, and approved by the appropriate managers. The training and instructional materials should be revised according to the findings of the trials.	900-510200-STD-002, Training Design and Development 900-510200-STD-004, Training Evaluation
5.4 Implementation Phase	The implementation phase is to enable the trainees to successfully perform the tasks to the standards defined in the TLOs. This phase encompasses both the instructor preparation phase as well as the actual delivery of the training. It should include: • lesson plans based on the training	900-510200-STD-003, Conducting Training

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
	development plan and the instructor guides prepared during the development phase • set-up of the training environment • continual monitoring to ensure that learning is taking place • arrangements for follow-on training, where necessary	
5.5 Evaluation Phase	The evaluation phase involves the assessment of the effectiveness and efficiency of the training as delivered and verification of whether the trainees have mastered the TLOs and acquired the competence needed to perform the job safely. The evaluation phase includes the following: • Formal trainee evaluation: The trainees' abilities to perform the tasks, as defined in the TLOs, should be measured through tests and assessments. This activity can be included as a process within the implementation phase. • Content and delivery: All course content and instructional strategies, methodologies and activities, including trainee evaluations, are monitored and assessed so that corrective actions can be taken if necessary. Sources of feedback include the trainees, the instructors, the support staff and the responsible managers and supervisors. • Effectiveness: This means the graduates' ability to perform, in	900-510200-STD-003, Training Conduct 900-510200-STD-004, Training Evaluation

REGDOC-2.2.2		
Section and Title	**Description**	**Implementing Document(s)**
	the workplace, the tasks for which they were trained. The primary sources of this information are the graduates and their supervisors. Additionally, information may be available through various sources ranging from needs assessments and lessons-learned reports to incident reports and rework statistics. Managers and supervisors should have continuous input to the training. • Change management: In accordance with the principles of a SAT methodology, inputs such as new or revised regulatory requirements, engineering design and equipment changes, operational changes, revised procedures, modifications and operating experience feedback (including facility and industry-wide events) should be regularly fed into the appropriate processes through the analysis phase.

5. Requirements Specifying Assessment Activities

The requirements specifying assessment activities section provides a summary and traceability of the requirements that indicate a compliance need for an assessment.

There are no assessment activities for requirements.

Federal Court   Cour fédérale

Date: 20230606

Docket: T-1222-21

Citation: 2023 FC 793

Toronto, Ontario, June 6, 2023

PRESENT: Mr. Justice Diner

BETWEEN:

POWER WORKERS' UNION, SOCIETY OF UNITED PROFESSIONALS, THE CHALK RIVER NUCLEAR SAFETY OFFICERS ASSOCIATION, INTERNATIONAL BROTHERHOOD OF ELECTRICAL WORKERS LOCAL 37, CHRIS DAMANT, PAUL CATAHNO, SCOTT LAMPMAN, GREG MACLEOD, MATTHEW STEWART AND THOMAS SHIELDS

Applicants

and

ATTORNEY GENERAL OF CANADA, ONTARIO POWER GENERATION, BRUCE POWER, NEW BRUNSWICK POWER CORPORATION AND CANADIAN NUCLEAR LABORATORIES

Respondents

Table of Contents

JUDGMENT AND REASONS

I. Overview

[1] A decade ago, the Canadian Nuclear Safety Commission [CNSC] began a process to implement pre-employment and random alcohol and drug testing for the most sensitive positions in Canada's nuclear power plants. The CNSC engaged in various broad-based, public stakeholder consultations to refine the policy over the years. It released a final draft in 2020, requiring Class 1 high-security nuclear sites to implement random and pre-placement drug and alcohol testing for Safety-Critical Workers.

[2] The Applicants – six individuals employed in various Safety-Critical positions at Canada's Class 1 high security nuclear plants, and their Unions – now bring this Application, a judicial review challenging the CNSC's pre-placement and random testing provisions of the policy as being unconstitutional in several facets.

[3] On January 21, 2022, the Applicants obtained an injunction from this Court staying the implementation of the impugned provisions of the policy, pending the final disposition of this Application for Judicial Review (see *Power Workers Union v Canada (Attorney General)*, 2022 FC 73 [*Power Workers 2022*]).

[4] For the reasons set out below, this judicial review will be dismissed.

II. Background

[5] Parliament established the CNSC through the *Nuclear Safety and Control Act*, SC 1997, c 9 [*Act*] to regulate the nuclear industry in the public interest. The objects of the CNSC are set out in section 9 of the *Act* (relevant sections are reproduced at Annex A to these Reasons). All nuclear facilities in Canada must be licensed by the CNSC [Licensees].

[6] The CNSC includes (i) staff working within the regulatory body; and (ii) a quasi-judicial tribunal and court of record [the “Commission”]. The Commission’s functions include rendering decisions to adopt policies on recommendation from staff, including the one challenged in this Application.

[7] The Respondents are comprised of the Attorney General of Canada [AGC] and all the licensed high-security Class 1 nuclear facilities regulated by the CNSC, namely Bruce Power L.P., Ontario Power Generation Inc., Canadian Nuclear Laboratories Ltd., and New Brunswick Power Corporation [together, the “Employers”]. The Employers operate Canada’s 19 nuclear fission technology reactors and provide most of Ontario’s energy, as well as a significant quantity of New Brunswick’s electricity. They employ the workers impacted by the RegDoc (defined below).

[8] The Applicants comprise unions representing workers at CNSC regulated nuclear facilities, namely the Power Workers’ Union, the Society of United Professionals, the Chalk River Nuclear Safety Officers Association, and the International Brotherhood of Electrical

Workers, Local 37, [together, the "Unions"] and six affected workers: Chris Damant, Paul Catahno, Thomas Shields, Matthew Stewart, Scott Lampman and Greg MacLeod. The Unions represent the workers in Safety-Critical positions [Safety-Critical Workers] affected by the pre-placement and random testing provisions of the policy in question, namely REGDOC-2.2.4, Fitness for Duty, Volume II: Managing Alcohol and Drug Use Version 3 [RegDoc] (reproduced at Annex B to these Reasons).

[9] The definition of Safety-Critical positions has evolved with the development of the RegDoc, and now consists of (i) workers certified under subsection 9(2) of the *Class 1 Nuclear Facilities Regulations*, SOR/2000-204 [*Class 1 Regulations*], excluding certified health physicists; and (ii) on-site Nuclear Response Force workers, as defined in the final version of the RegDoc, which is the subject of this Application. Workers certified under the *Class 1 Regulations* include Authorized Nuclear Officers and Unit Control Room Operators. In sum, the workers impacted by the RegDoc's pre-placement and random testing provisions are a subset of highly trained, armed, nuclear security officers, who are responsible for maintaining the security of nuclear facilities. By way of reference to other sensitive positions, the fire brigade and emergency response team members are not considered "Safety-Critical" positions, but are rather classified as "safety-sensitive" positions.

A. *The development of the RegDoc*

[10] Regulatory documents form a critical component of the CNSC's licencing and compliance framework. They typically contain two types of information for Licensees: (i) requirements; and (ii) guidance. Compliance with the regulatory document requirements is

mandatory for Licensees that use nuclear substances, operate nuclear facilities or conduct other types of licensed activities. Regulatory document guidance, on the other hand, supplements the requirements. Licensees are expected to review and consider a regulatory document's guidance, and provide an explanation to the CNSC should they choose not to follow it.

[11] In 2012, CNSC staff began public consultation to develop a regulatory document for fitness for duty, which included pre-placement and random drug and alcohol testing. This public consultation resulted in the publication of a discussion paper, including a summary of comments received from stakeholders on the draft discussion paper (What We Heard Report – DIS-12-03, published in November 2013). In November 2015, the CNSC issued and published a first draft of the RegDoc for another round of consultation from relevant stakeholders.

[12] Many stakeholders, including the Applicants, reiterated objections they had initially raised in response to the draft discussion paper, including their claims of: (i) the unclear statutory basis for imposing testing; (ii) infringement of sections 8 and 15 of the *Canadian Charter of Rights and Freedoms*, Part 1 of the *Constitution Act, 1982*, being Schedule B to the *Canada Act 1982* (UK), 1982, c 11 [*Charter*]; and (iii) inconsistencies between the arbitral case law and the proposed testing.

[13] In August 2017, CNSC staff issued a second draft of the RegDoc, restricting the scope of pre-placement and random testing to Safety-Critical Workers. This version also narrowed the definition of a Safety-Critical Worker (see paragraph [9] of these Reasons), which remains the definition in the final version of the RegDoc.

[14] In terms of the feedback received during the RegDoc's development, CNSC staff presented to the Commission the second draft of the RegDoc, at a public meeting in August 2017. The Minutes of that meeting reflect that concerns were raised about the pre-placement and random testing provisions of the RegDoc, and that the Commission directed staff to amend the RegDoc and send it back for re-consideration and approval.

[15] In an October 2017 closed meeting, CNSC staff presented a third draft of the RegDoc to the Commission, with recommended amendments. Upon consideration of the third draft, the Commission approved the current version of the RegDoc for publication and use.

[16] The impugned provisions of the RegDoc are sections 5.1 (pre-placement testing) and 5.5 (random testing). These provisions require Licensees to implement pre-placement and random drug and alcohol testing for Safety-Critical Workers. CNSC estimates that out of approximately 12,000 workers across nuclear facilities, under 10% are Safety-Critical.

[17] Section 5.1 requires Licensees to conduct pre-placement testing for all successful candidates who apply for a Safety-Critical position at a high-security nuclear facility. Pre-placement testing must be implemented for both new and incumbent workers. The RegDoc indicates that pre-placement testing is not a screening tool and should only be administered once a candidate has met all other qualifications necessary.

[18] Section 5.5 requires Licensees to have all Safety-Critical Workers submit to random drug and alcohol testing, as distinct from section 5.1 pre-placement testing. At least 25% of the Safety-Critical Worker population of all facilities must be tested randomly every year.

[19] Under section 6.1 of the RegDoc, Licensees must test for alcohol through the collection of breath samples using approved instruments defined at section 2 of the *Approved Breath Analysis Instruments Order*, SI/85-201. The testing is to be administered by qualified technicians who are independent from workgroups subject to testing.

[20] Section 6.2 of the RegDoc, indicates that for drug testing, Licensees can choose to implement laboratory urine testing, laboratory oral fluid testing, or a combination of both. Licensees must retain and utilize the services of an accredited laboratory to analyze and report the results. For urine testing, the laboratory used must be accredited by the Substance Abuse and Mental Health Services Administration [SAMHSA]. For oral fluid testing, the laboratory used must be accredited by SAMHSA or meet the *General Requirements for the Competence of Testing and Calibration Laboratories*, ISO/IEC 17025.

[21] The RegDoc establishes threshold values, or cut-off levels, for the amount of a substance that must be found in a sample to constitute a positive test result for both alcohol testing and drug testing. The positive results from laboratory tests are sent to a medical review officer who reviews, interprets and verifies the laboratory tests results for each drug class as specified in the RegDoc. When faced with a positive test result, the medical review officer must provide the

worker an opportunity to explain any alternative reasons for such result. The medical review officer will only report verified positive test results to Employers.

[22] It should be noted that the pre-placement and random testing provisions of the RegDoc have not yet been implemented. The RegDoc went into effect on January 21, 2021. The November 2020 Meeting Minutes of the CNSC reflect that the Licensees would be required to implement pre-placement testing measures within six months (by July 22, 2021), and random testing measures within twelve months (by January 22, 2022). However, in early 2022, the Applicants successfully brought a motion for an injunction before the Court. Justice Gleeson granted the injunctive relief sought, staying the implementation of sections 5.1 (pre-placement testing) and 5.5 (random testing) of the RegDoc until the final disposition of this Application (see: *Power Workers 2022* at paras 5-8).

[23] As a result, the testing mechanism contemplated under the impugned sections of the RegDoc has yet to be administered. Courts are encouraged to proceed with caution when considering the constitutionality of a provision or legislative scheme in the absence of a factual matrix (*MacKay v Manitoba*, [1989] 2 SCR 357 at 366 [*MacKay*]; *Ernst v Alberta Energy Regulator*, 2017 SCC 1 at para 22 [*Ernst*]).

III. Issues and Standard of Review

[24] Before setting out the issues before me, I note that in the Notice of Constitutional Question, the Applicants assert that the pre-placement and random testing provisions of the RegDoc are "invalid" under section 1 of the *Charter*. In the Notice of Application for Judicial

Review, the Applicants seek a declaration that sections 5.1 and 5.5 of the RegDoc are contrary to sections 7, 8, and 15 of the *Charter* and are of no force and effect. The Notice of Application also seeks an order quashing the CNSC's decision to adopt the provisions.

[25] Thus, this case is distinct from many of the administrative law cases challenging delegated legislation, in that the Applicants do not challenge the RegDoc as being *ultra vires* its enabling statute. In other words, they do not argue that the RegDoc is invalid because the CNSC exceeded the powers delegated to it by Parliament in the *Act*. Nor do the Applicants impugn the jurisdiction or *vires* of the *Act* writ large, to argue that the *Act* is contrary to the division of powers, the *Charter*, or section 35 of the *Constitution Act*.

[26] Instead, the Applicants submit that two specific elements of the RegDoc, namely the (i) pre-placement and (ii) random testing measures (sections 5.1 and 5.5), infringe several sections of the *Charter*. They contend that the CSNC's decision to adopt these measures was unreasonable. In other words, they say that while sections 5.1 and 5.5 must be struck, the remainder of the structure of the RegDoc may stand.

[27] The Applicants argue that the RegDoc's two impugned sections should fall for two reasons. First, they contend that its pre-placement and random testing requirements violate sections 7, 8, and 15 of the *Charter*, and are not justified under section 1. Second, they posit, in the alternative, that CNSC's decision to adopt the RegDoc was unreasonable on administrative law grounds.

[28] In determining the applicable standard of review in this case, it is important to understand how the issues were framed. In making their case, the Applicants pivoted between challenging the elements of the RegDoc as if they were seeking to invalidate provisions of a statute, and impugning the CNSC's decision to adopt a RegDoc that includes pre-placement and random testing requirements.

[29] On the one hand, for the purposes of their administrative law arguments, they dress the RegDoc in the garb of an administrative decision, attacking it for its unreasonableness. On the other, for the purposes of their constitutional arguments, they impugn it as a form of regulation or legislative measure that prescribes a limit on a *Charter* right.

[30] A similar blending of the classification of the RegDoc was also evident in the Applicants' written submissions. For instance, at paragraph 42 of their Factum, the Applicants state, "the RegDoc constitutes a "law" which prescribes a limit on *Charter* rights […] Non-statutory binding rules that establish obligations of general rather than specific application, and are sufficiently accessible and precise, qualify as "law" that prescribe a limit on a *Charter* right."

[31] Later, the Applicants also submit that the RegDoc purports to be a regulation and that the Commission improperly adopted it through the informal vehicle of a regulatory document, rather than having it go through the more rigorous procedure required by regulatory amendments, as further discussed in Section B (Step 2) below.

[32] However, at the outset of their Factum, at paragraph 1, the Applicants state they oppose the CNSC's decision to impose the RegDoc's requirements, and in terms of a remedy, request this Court quash the CNSC's decision to adopt the pre-placement and random testing elements of the RegDoc because those two elements are unconstitutional.

[33] In the alternative, the Applicants request that the Court remit the two "elements" of the RegDoc back to the CNSC for re-determination. During the hearing, when asked to delineate what exactly they were claiming violated *Charter* grounds, Counsel for the Applicants clarified that they were seeking a declaration of invalidity of sections 5.1 and 5.5 and for the Court to strike these impugned provisions from the RegDoc. Discussion of the remedy was mentioned at various points of the hearing. One such instance occurred at 02:43:00 to 02:45:00 of the audio recording of Day 1. Again, at no point did the Applicants request that the Court strike out the validity of the entire RegDoc.

[34] The Respondents agree with the Applicants that the constitutionality of the testing measures should be reviewed by adjudicating each *Charter* right and applying the framework in *R v Oakes*, 1986 CanLII 46 (SCC), 1 SCR 103 [*Oakes*] under section 1. The Parties are also in agreement that the Court ought not to apply the balancing framework for the review of discretionary administrative decisions set out in *Doré v Barreau du Québec*, 2012 SCC 12 at paras 37, 39 [*Doré*] (see also: *Loyola High School v Quebec (Attorney General)*, 2015 SCC 12 at paras 39-42 [*Loyola*]; *Law Society of British Columbia v Trinity Western University*, 2018 SCC 32 at para 111 [*Trinity Western*]). The Parties submitted in their written materials – and reiterated at the hearing – that the Court must not use the *Charter* values paradigm in analysing the

RegDoc, because the Applicants are not challenging the CSNC's underlying decision to adopt the entire RegDoc, rather only two sections of it.

[35] While the Parties agree on the method for *how* the Court should approach the *Charter* questions raised by the Applicants, namely under the *Oakes* approach, they split on the esoteric question of whether correctness, or no standard of review applies. They agree that reasonableness applies to the administrative law question of whether the CNSC's decision to adopt the RegDoc was reasonable.

[36] The Applicants rely on *Elementary Teachers Federation of Ontario v York Region District School Board*, 2022 ONCA 476 at paras 36-37 [*Elementary Teachers*] to argue that the correctness standard applies in their *Charter* arguments. In *Elementary Teachers,* the Ontario Court of Appeal held that an arbitrator's decision was subject to a correctness standard of review on the question of law of whether the grievor had a reasonable expectation of privacy in their workplace laptop (*Elementary Teachers* at para 37 citing to *R v Shepherd*, 2009 SCC 35 at para 20). *Elementary Teachers* has since been appealed and is now before the Supreme Court of Canada [SCC] (see: *York Region District School Board v Elementary Teachers' Federation of Ontario,* 2023 CanLII 19753 (SCC)).

[37] The Respondents, by contrast, contend that no standard of review applies to the issue of whether the testing requirements infringe the *Charter*, because the Applicants do not seek to review an administrative decision. The Respondents state in their written submissions that the application of a correctness standard is "fundamentally at odds with the *Oakes* test". They argue

that the Applicants seek to strike out provisions of the RegDoc, which in their view, is a policy "prescribed by law" that falls within the meaning of section 1 of the *Charter*. Relying on *Greater Vancouver Transportation Authority v Canadian Federation of Students British Columbia Component*, 2009 SCC 31 at paragraph 64 [*Greater Vancouver Transportation Authority*], they say the RegDoc qualifies as a "law" because it establishes a series of obligations that must be adhered to by all Licensees.

[38] I am not convinced by this distinction that the correctness standard is fundamentally at odds with the *Oakes* framework since, as recently noted by Justice Favel in *McCarthy v Whitefish Lake First Nation #128*, 2023 FC 220 at paragraph 54 [*Whitefish*], "[t]his distinction is more academic than practical, as "no standard of review" is the functional equivalent of a "correctness review"". Put simply, here the question is whether in its application, the RegDoc breaches the *Charter.*

[39] The Respondents also rely on *Reference re Marine Transportation Security Regulations*, 2009 FCA 234 [*Marine Reference*] and *Canada (Union of Correctional Officers) v Canada (Attorney General)*, 2019 FCA 212 [*Correctional Officers*]. These two Federal Court of Appeal [FCA] decisions dealt with *Charter* challenges to the validity of federal regulations.

[40] In *Marine Reference*, the AGC brought a reference to the Court under subsection 18.3(2) of the *Federal Courts Act*, RSC, 1985, c F-7 to determine their constitutional validity. As such, there was no administrative decision at play and the Court did not consider whether a standard of review was applicable.

[41] *Correctional Officers*, which was decided in 2019, involved a judicial review application to the Treasury Board's decision to adopt a standard for financial security screening procedures of correctional officers, and a directive by the Correctional Service of Canada implementing it. The applicants in *Correctional Officers* argued that the enhanced financial screening procedures infringed the section 8 *Charter* rights of employees at these correctional facilities.

[42] The FCA rejected the application judge's determination that the reasonableness standard applied in *Correctional Officers*, finding instead that the correctness standard applied. The Court went on to explain that *Doré* was not applicable because the application for judicial review "is more akin to a challenge of the constitutionality of a legislative or regulatory provision" (*Correctional Officers* at para 21):

> [21] […] the appellant is not challenging an individual administrative decision based on a provision of the 2014 Standard or the Commissioner's Directive that was interpreted by a decision maker. Instead, the appellant is challenging their adoption <u>in their entirety</u>. Thus, the Union is attacking head on the constitutionality of the 2014 Standard and the Commissioner's Directive themselves. It follows that the analytical framework described in *Doré* does not apply and that it is therefore inappropriate to apply the reasonableness standard. The appellant's application for judicial review is more akin to a challenge of the constitutionality of a legislative or regulatory provision. Such a challenge is typically subject to the correctness standard of review (*Dunsmuir*, at paragraph 58).
>
> [Emphasis in Original]

[43] In many respects, *Correctional Officers* is on point in that the Applicants here are not challenging a decision-maker's interpretation of the document in question. In both cases, they challenge the adoption of financial screening and drug testing (respectively) measures on *Charter* grounds.

[44] A few months after the release of *Correctional Officers*, the SCC released *Canada (Minister of Citizenship and Immigration) v Vavilov*, 2019 SCC 65 [*Vavilov*]. The decision in *Correctional Officers*, although decided by the FCA just before *Vavilov*, is still good law, having been cited by Chief Justice Crampton post-*Vavilov* in *Spencer v Canada (Health)*, 2021 FC 62 [*Spencer*].

[45] In *Spencer*, Chief Justice Crampton dismissed a challenge to the validity of certain federal quarantine measures affecting air travellers. The measures were part of the federal government's response to the COVID-19 global pandemic and were implemented by way of a series of Orders in Council. On appeal, the FCA held that the challenge was moot since the orders had been repealed (*Spencer v Canada (Attorney General)*, 2023 FCA 8).

[46] At paragraph 64 of *Spencer*, Chief Justice Crampton cites *Correctional Officers*, among other pre-*Vavilov* cases to find that "[t]he standard applicable to the Court's review of the issues that have been raised with respect to the *Charter*, the *Constitution Act, 1867* and the *Canadian Bill of Rights* is correctness" (see also: *Taseko Mines Limited v Canada (Environment)*, 2017 FC 1100 at paras 49 and 54, affd 2019 FCA 320 at paras 19 and 22).

[47] I will follow this approach, as suggested by the FCA at paragraph 21 of *Correctional Officers*, and followed by Chief Justice Crampton in *Spencer*. I find this approach to be consistent with my reading of *Vavilov* where the SCC confirmed at paragraphs 55-57, that the standard of correctness continues to be applied in reviewing constitutional matters.

[48] This is also consistent with subsequent binding case law issued by the FCA (*Innovative Medicines Canada v Canada (Attorney General)*, 2022 FCA 210 [*Innovative Medicines*] and *Portnov v Canada*, 2021 FCA 171 [*Portnov*]). In both decisions, the FCA found that the adoption of delegated legislation should be reviewed against the reasonableness standard unless an exception under *Vavilov* applies (see *Portnov* at para 10 and *Innovative Medicines* at para 27). These cases depart from the approach that had been set out in *Katz Group Canada Inc v Ontario (Health and Long-Term Care)*, 2013 SCC 64 [*Katz*], that the Court must find the regulation is “irrelevant,” “extraneous,” or “completely unrelated” to the statutory purpose of the enabling statute (*Katz* at para 28). *Katz* was published several years before *Vavilov*. The FCA confirmed that *Vavilov* is the most appropriate lens to consider the validity of regulations (*Innovative Medicines* at para 26, *Portnov* at paras 22-28).

[49] I note that both *Portnov* and *Innovative Medicines* are distinct from this case. They both considered the *vires* of the regulations in question in light of their enabling statute. In both decisions, the FCA determined that no exceptions to the presumption of reasonableness under the *Vavilov* framework applied (*Portnov* at para 17; *Innovative Medicines* at para 45). Here, on the other hand, the validity of the RegDoc is being challenged on the basis of certain elements violating sections 7, 8 and 15 of the *Charter*.

[50] *Vavilov* established that the standard of reasonableness is generally applicable when reviewing administrative decisions (*Vavilov* at paras 16, 23-25). However, there are two exceptions to this presumption. First, if the legislature specifies a standard of review or creates a

statutory appeal mechanism that suggests an appellate standard should be used (*Vavilov* at paras 17, 33-35).

[51] The second exception arises where the rule of law requires the application of the correctness standard for certain categories of legal questions, namely constitutional questions, general questions of law that are significant to the legal system as a whole, and questions concerning the jurisdictional boundaries between two or more administrative bodies (*Vavilov* at paras 17, 53).

[52] At paragraphs 54-56 of *Vavilov*, the SCC describes the issues that fall under the constitutional law category as including legal questions on the division of powers between Parliament and the provinces, the relationship between the legislature and other branches of the state, the extent of Aboriginal and treaty rights under section 35 of the *Constitution Act, 1982,* interpretations of the administrative decision-maker's enabling statute, and "other constitutional matters that require a final and determinate answer from the courts."

[53] The exception to the presumption of reasonableness carved out in *Vavilov* for constitutional questions follows long-standing jurisprudence confirming the certainty and rigour required in the examination of constitutional questions. As held by the FCA in *Guérin v Canada (Attorney General)*, 2019 FCA 272 at paragraph 23:

> Regarding whether the Regulations and Directives violate section 7 of the Charter, I am of the opinion that the standard of correctness must apply. <u>It is settled law that constitutional questions must be examined rigorously and without deference in the context of judicial review</u>: *Alberta (Information and Privacy Commissioner) v. Alberta Teachers' Association*, 2011 SCC 61, [2011] 3 S.C.R.

> 654, at paragraph 30*; Dunsmuir v. New Brunswick*, 2008 SCC 9, [2008] 1 S.C.R. 190, at paragraph 58 [Dunsmuir]; *Tapambwa v. Canada (Citizenship and Immigration)*, 2019 FCA 34, [2019] F.C.J. No. 186 at para. 30; *Begum v. Canada (Citizenship and Immigration)*, 2018 FCA 181, [2018] F.C.J. No. 1007, at para. 36, leave to appeal to the SCC denied, 38439 (April 18, 2019), [2018] S.C.C.A. No. 506 [*Begum*]; *Canada (Attorney General) v. Association of Justice Counsel*, 2016 FCA 92, [2016] F.C.J. No. 304, at para. 23.
>
> [Emphasis added]

[54] Similarly, in *Air Canada Pilots Association v Air Canada*, 2023 FC 138 [*Pilots Association*], this Court recently considered whether a regulatory exemption under two subsections of the *Canadian Human Rights Benefit Regulations*, SOR/80-68 infringed subsection 15(1) of the *Charter*. Justice Furlanetto held at paragraph 20, relying on paragraphs 55-57 of *Vavilov*: “The standard of review for the substantive issue is correctness. The compatibility of subsections 3(b) and 5(b) of the Regulations with the *Charter* is a constitutional question that falls within an exception to the presumption of reasonableness.”

[55] In this case, the *Charter* challenges advanced by the Applicants are characterized as “attacking head on the constitutionality” of the RegDoc (see: *Correctional Officers* at para 21). In my view, the approach used in *Correctional Officers*, and recently followed by this Court in *Spencer* and *Pilots Association*, is the more appropriate approach to adjudicate the *Charter* questions in this case; and I find it to be consistent with *Vavilov*, falling within the exception to the presumption of reasonableness of “other constitutional matters that require a final and determinate answer from the courts” (*Vavilov* at para 55).

IV. Analysis

[56] The nuclear industry is unique. All Parties concur that safety is the most important priority, and that public interest in nuclear safety is high. A nuclear incident can have devastating and long lasting impacts on the community and the environment. It is within this unique context of the highly regulated nuclear industry that I find the pre-placement and random testing provisions of the RegDoc are constitutional and do not breach sections 8, 15 or 7 of the *Charter*, as will be explained next.

A. *Applicability of the Charter*

[57] The *Charter* binds the conduct of state actors and does not limit private or non-governmental activity (*RWDSU v Dolphin Delivery Ltd*., 1986 CanLII 5 (SCC), [1986] 2 SCR 573). For instance, a search or seizure carried out by a private citizen does not trigger section 8 scrutiny unless the private citizen was acting as an agent of the state or was exercising statutory delegation of governmental powers (*R v Buhay*, 2003 SCC 30 at para 31).

[58] Subsection 32(1) of the *Charter* defines the scope of its application in the following terms:

32 (1) This Charter applies	**32 (1)** La présente charte s'applique :
(a) to the Parliament and government of Canada in respect of all matters within the authority of Parliament including all matters relating to the Yukon Territory and Northwest Territories; and	**a)** au Parlement et au gouvernement du Canada, pour tous les domaines relevant du Parlement, y compris ceux qui concernent le territoire du Yukon et les territoires du Nord-Ouest;
(b) to the legislature and government of each province in respect of all matters within the authority of the legislature of each province.	**b)** à la législature et au gouvernement de chaque province, pour tous les domaines relevant de cette législature.

[59] In *Eldridge v British Columbia (Attorney General)*, 1997 CanLII 327 (SCC), [1997] 3 SCR 624, Justice La Forest, writing for a unanimous court, summarized the applicable principles for the interpretation of section 32:

> . . . the *Charter* may be found to apply to an entity on one of two bases. First, it may be determined that the entity is itself "government" for the purposes of s. 32. This involves an inquiry into whether the entity whose actions have given rise to the alleged *Charter* breach can, either by its very nature or in virtue of the degree of governmental control exercised over it, properly be characterized as "government" within the meaning of s. 32(1). In such cases, all of the activities of the entity will be subject to the *Charter*, regardless of whether the activity in which it is engaged could, if performed by a non-governmental actor, correctly be described as "private". Second, an entity may be found to attract *Charter* scrutiny with respect to a particular activity that can be ascribed to government. This demands an investigation not into the nature of the entity whose activity is impugned but rather into the nature of the activity itself. In such cases, in other words, one must scrutinize the quality of the act at issue, rather than the quality of the actor. If the act is truly "governmental" in nature — for example, the implementation of a specific statutory scheme or a government program — the entity performing it will be subject to review under the *Charter* only in respect of that act, and not its other, private activities.

[60] In *Greater Vancouver Transportation Authority*, Justice Deschamps reiterated that the *Charter* applies not only to Parliament, the legislatures, and government, but also to "all matters within the authority of those entities" (para 14).

[61] The Parties did not cite any decisions explicitly stating that the *Charter* applies to nuclear power workplaces, nor am I aware of any such jurisprudence. However, I note that in one somewhat analogous context in the early days of the *Charter*, the Ontario Labour Relations Board found at para 35 of *Electrical Power Systems Construction Council of Ontario v Ontario Hydro*, 1984 CanLII 1050 (ON LRB): "[t]here appears to be little doubt that the *Charter* would apply to actions of government officials in issuing regulations and granting or denying licences or benefits authorized under statutes."

[62] I further note that the SCC has held that bodies created by statute (like municipalities and school boards) are government entities with legislative powers and the *Charter* applies (*Godbout v Longueuil (City)*, 1997 CanLII 335 (SCC), [1997] 3 SCR 844 at paras 50, 51 118 [*Godbout*] and *Chamberlain v Surrey School District No. 36*, 2002 SCC 86). Likewise, the CNSC is an entity that was created by Parliament, is thus a "government entity", and accordingly, the *Charter* applies.

[63] More specifically, the CNSC is a federal regulator, mandated to oversee the production and use of nuclear power in Canada, operating in the public interest. It was established as an agent of the Crown pursuant to subsection 8(2) of the *Act*. The CNSC members and president are appointed by the Governor in Council (subsections 10(1) and (3) of the *Act*). Pursuant to section

19, the Governor in Council may issue “directives” to the Commission that are legally binding. Moreover, sections 12 and 72 of the *Act* define the role of the CNSC’s President as being its chief executive reporting to the Minister of National Resources.

[64] In short, as the CNSC is governmental in nature, it is subject to *Charter* review.

B. *The pre-placement and random testing provisions of the RegDoc do not infringe section 8 of the Charter*

[65] Section 8 of the *Charter* confers the right “to be secure against unreasonable search or seizure.” At its core, the purpose of section 8 is to shield against unjustified state intrusions on personal privacy (*R v Kang-Brown*, 2008 SCC 18 at para 8; *Hunter et al v Southam Inc.*, 1984 CanLII 33 (SCC), [1984] 2 SCR 145, at p 160 [*Hunter v Southam*]). Broadly speaking, section 8 protects a claimant’s reasonable expectation of privacy against unreasonable state intrusion (*R v Tessling*, 2004 SCC 67 at paras 18-16 [*Tessling*]).

[66] I begin my analysis with a brief discussion of the applicability of the section 8 case law to the unique nature of the case at bar. In the context of criminal law, the contemplation of unreasonable search or seizure protection calls for a highly fact-specific analysis into whether an accused’s personal right to privacy was infringed by the state. As a matter of standing under section 8, an accused may only invoke his or her own personal privacy rights and not those of a third party (see for instance: *R v Edwards*, 1996 CanLII 255 (SCC), [1996] 1 SCR 128 at paras 43, 45-47 [*Edwards*]; *R v Marakah*, 2017 SCC 59 at para 12).

[67] Section 8 has certainly been found to extend beyond the protection against unreasonable search and seizure in a criminal law context (see: *R v McKinlay Transport Ltd.*, 1990 CanLII 137 (SCC), [1990] 1 SCR 627 at 640-641 [*McKinlay Transport*]; *Comité paritaire de l'industrie de la chemise v Potash*, 1994 CanLII 92 (SCC), [1994] 2 SCR 406 at 408 [*Comité paritaire*]; *Thomson Newspapers Ltd. v Canada (Director of Investigation and Research, Restrictive Trade Practices Commission) (1990)*, 1990 CanLII 135 (SCC), 54 CCC (3d) 417 at 495-496 [*Thomson Newspapers*]).

[68] However, in each of these non-criminal law decisions, the SCC contemplated the particulars of a search or seizure event that had already transpired. In *McKinlay Transport*, the Court considered the constitutionality of provisions of the *Income Tax Act*, RSC 1985, c 1, after these provisions had been applied to two corporate taxpayers.

[69] The Court in *Comité paritaire*, similarly considered the inspection powers of an agency in a regulated industrial sector (textile manufacturing), after the inspectors had attempted to investigate the premises in question in accordance with their powers under the impugned legislation. In *Thomson Newspapers*, the Court considered whether section 17 of the *Combines Investigation Act* violated sections 7 and 8 of the *Charter* after it was used to serve the corporate appellant and several of its officers with orders to appear before the Restrictive Trade Practices Commission, to be examined under oath and to produce documents.

[70] Although non-criminal, *McKinlay Transport*, *Comité paritaire* and *Thomson Newspapers* each involved a “factual foundation” to consider the constitutionality of the search or seizure incident at issue (see also *MacKay* at page 361).

[71] Evidently, in this case, the implementation of the impugned provisions is stayed pending the final determination of this Application for Judicial Review (*Power Workers 2022* at para 6). I am thus being asked to adjudicate the constitutionality of a seizure to be authorized by the RegDoc, but which has not taken place for any particular worker, given the injunction issued in *Power Workers 2022*.

[72] The FCA decisions *Correctional Officers* and *Marine Reference* (above) are instructive on how to consider an inchoate search or seizure – namely one that is authorized by a particular statutory or regulatory regime, but which has not yet taken place. *Correctional Officers*, decided after *Goodwin v British Columbia (Superintendent of Motor Vehicles)*, 2015 SCC 46 [*Goodwin*], considered the constitutionality of a prospective search in a regulatory context.

[73] In *Marine Reference*, the Court considered a regulatory scheme that would apply to screen workers employed in security-sensitive positions in Canadian ports. The regulations at issue required workers to provide biographical information about themselves and their spouses to the Minister of Transport to determine whether the workers represented a security threat to Canada’s operations. At paragraph 28 of *Marine Reference*, Justice Evans, writing for the Court, emphasized three relevant considerations to frame the *Charter* challenges brought in a particular regulatory context:

> [28] First, as the party alleging *Charter* violations, ILWU [the Applicant] has the burden of proving a prima facie breach, even when the section of the *Charter* in question requires a contextual balancing of the right against competing interests, such as sections 7 (principles of fundamental justice) and 8 (unreasonable search). Second, when the issue is whether impugned state action has the effect of infringing a *Charter* right, ILWU, as the party alleging that it does, must adduce evidence to prove it, unless it is obvious. Third, it is important to distinguish an attack on the validity of the Regulations, such as that by ILWU, from an attack on an individual decision made under them. Regulations are not invalidated merely because they may be applied in an unconstitutional manner in individual cases.

[74] In the Court's section 8 *Charter* analysis, Justice Evans first assumed for the purposes of the reference, that the regulations would constitute a search (para 48). He went on to consider the second step for the section 8 analysis, that is, whether the search as authorized by the regulations was unreasonable. The Court balanced employees' interest in their personal privacy against the public interests served by the statutory scheme (*Marine Reference* at para 49). This balancing exercise compelled the court to take into account the following considerations:

(i) contextual factors; which take into account

(ii) prior authorization and post-decision review (ie. checks and balances to prevent abuses of power); and

(iii) degree of intrusion into privacy and pressing nature of the public interest (ie. fingerprints or photographs being less intrusive).

[75] In the more recent decision of *Correctional Officers*, the FCA ruled that a directive mandating correctional officers with specific security clearance levels to submit credit reports, did not infringe section 8 of the *Charter*. Since it was not disputed that the credit check was a search within the meaning of section 8, the Court's analysis was focused on whether the directive at issue would result in an unreasonable search of the applicants. Justice Boivin, writing for the

Court in *Correctional Officers*, outlined the steps of the section 8 analysis, after having considered both the approaches taken in *Marine Reference* and in *Goodwin*:

> [24] Since the respondent did not dispute at trial that the credit check was a search within the meaning of section 8 of the *Charter*, the Federal Court limited its analysis to the issue of whether that search was abusive (Federal Court decision at paragraphs 95–98; *Hunter v. Southam Inc*., 1984 CanLII 33 (SCC), [1984] 2 S.C.R. 145).
>
> [25] For that purpose, the Federal Court methodically applied the criteria set out by the Supreme Court of Canada in and the criteria described by our Court in the *Marine Reference*. In the present case, <u>the criteria in question can be described as follows: (i) the objective of the 2014 Standard and the Commissioner's Directive; (ii) the nature of those schemes; (iii) the mechanism for conducting the search, including the degree of intrusiveness; and (iv) the subsequent review and possible redress for overseeing the search.</u>
>
> [Full citations omitted; emphasis added]

[76] In both *Marine Reference* and *Correctional Officers*, the FCA considered whether the regulations were authorized by law and whether the law itself was reasonable. However, neither address whether the manner in which the search was carried out was reasonable, for the obvious reason that no search had yet been carried out.

[77] As a similar situation is also present here, given that the scheme exists but has not yet been exercised against any Safety-Critical Workers in light of this Court's injunction, I will apply the FCA's approach as guided by the SCC in *Goodwin*, since the Court has been asked to strike regulatory provisions that empower Licensees to authorize a seizure.

Step 1: The pre-placement and random testing provisions engage section 8

[78] The first step requires the claimant to show that state conduct amounts to a search or seizure within the construct of section 8 (*R v Jones*, 2017 SCC 60 at para 13 [*Jones*]), and determine whether section 8 is engaged, based on the claimant's reasonable expectation of privacy (*Goodwin* at paras 49-51).

[79] The word 'search' has been described as "an examination, by the agents of the state, of a person's person or property": Hogg, *Constitutional Law of Canada*, vol. 2 (Toronto: Carswell, 2021) at 48:4.

[80] The term 'seizure' was defined by Justice La Forest in *Thomson Newspapers* as "the taking of a thing from a person by a public authority without that person's consent." This definition was recently applied by the FCA in *Rémillard c Canada (Revenu national)*, 2022 CAF 63 at para 71.

[81] I reiterate that not every "examination" conducted by a state actor, nor every "taking" by the government, engages the section 8 protection (*Tessling* at para 18; *Goodwin* at para 51). Rather, a search or seizure only occurs when the state has interfered with a citizen's reasonably held expectation of privacy, taking into account the "totality of the circumstances of a particular case" (*Jones* at para 13 citing *Edwards* at para 31; *R v Wong*, 1990 CanLII 56 (SCC), [1990] 3 SCR 36, at 62).

[82] In this case, the Respondents concede that requiring Licensees to collect bodily samples – whether breath, urine or saliva – necessarily involves taking personal and informational data amounting to a “seizure.” That point conceded, their position is that under the RegDoc, the state interferes in a limited manner. Based on the totality of the circumstances, the Respondents argue that Safety-Critical Workers employed at a nuclear power plant have a significantly reduced expectation of privacy.

[83] The Applicants argue that Safety-Critical Workers do not have a diminished expectation of privacy, but on the contrary, have a heightened expectation of privacy based on (a) the subject matter of the search (b) their interest in the subject matter (c) their subjective expectation of privacy in the subject matter and (d) whether this subjective expectation of privacy was objectively reasonable, having regard to the totality of the circumstances. In support of their argument that they deserve a heightened expectation of privacy, the Applicants primarily rely on the SCC decisions in *Tessling* at paragraph 32, and *R v Spencer*, 2014 SCC 43 at paragraph 18 [*R v Spencer*] and the lower court decision in *Gillies (Litigation Guardian of) v Toronto District School Board*, 2015 ONSC 1038 (Sup. Ct.) at paragraphs 79-80 [*Gillies*].

[84] In particular, the Applicants note that the urine and/or oral fluids collected in the pre-placement and random process testing are bodily samples over which the Safety-Critical Workers have both a high interest and a subjective expectation of privacy. The Applicants argue that bodily samples and what they reveal about a person’s lifestyle constitute an individual’s “biographical core”, and there can be no doubt that an individual has a significant interest in that

information both on a subjective and objective basis (*R v Plant*, 1993 CanLII 70 (SCC), [1993] 3 SCR 281 at para 20).

[85] The Applicants highlight the comments of Justice Himel, at paragraph 96 of *Gillies*:

> [96] I do not accept the respondents' submission that, in light of the Supreme Court decision in *Jarvis*, the seizure of the students' breath sample would not attract the full panoply of *Charter* rights. First, the principal deposed in his affidavit that although the breathalyzer is not intended to be a precursor to student discipline, he noted the potential for discipline for student alcohol consumption. Second, <u>the seizure of a bodily sample interferes with a person's bodily integrity regardless of the context in which it is taken</u>. I am not persuaded that the Supreme Court intended to diminish the *Charter* scrutiny to be applied to the seizure of a bodily sample. In *Jarvis*, the impugned search at issue was at a person's residence and of a person's personal documents; the subject matter of the search in the present case interferes with a person's bodily integrity. That difference is paramount.
>
> [Emphasis added]

They contend that the Superior Court's decision in *Gillies* rejects the Respondents' position that a workplace attracts a diminished expectation of privacy for workers when the object of the seizure is bodily samples. There, Justice Himel found that the practice of mandatory, blanket breathalyzer testing of students at their school prom infringed their rights under section 8.

[86] The Applicants also argue that their situation is analogous to that of the teachers in the recent Ontario Court of Appeal decision in *Elementary Teachers* at para 56. In that case, the Court of Appeal held that two teachers' section 8 rights were breached when the school's principal read and documented the teachers' personal logs of concerns about the school, which were left open on a school laptop. The Applicants rely on that case to argue that employees have

a right to keep information about their personal choices private from their employer, as well as to expect that information to remain private in the workplace.

[87] The Applicants further contend that Safety-Critical Workers have a heightened expectation of privacy because they do not consent to the pre-placement and random testing. It is compulsory and could result in significant consequences for these impacted employees, including removal from their work duties and referral to a mandatory substance abuse evaluation. The Applicants argue that Safety-Critical Workers did not – and cannot – waive their reasonable expectation of privacy or their *Charter*-protected right against unreasonable searches by choosing to work at nuclear facilities. They assert that under the RegDoc, there is no true right of refusal, but rather only a spectrum of negative employment and reputational consequences.

[88] Finally, the Applicants reject the notion that a flexible approach must be adopted in the section 8 analysis for regulatory contexts because this approach would result in a more lenient standard in assessing reasonableness of the search, and effectively diminish rights under the *Charter*. The Applicants argue (relying on *Gillies* at para 94) that even in regulatory contexts, the "full panoply" of *Charter* rights apply.

[89] The Respondents, on the other hand, primarily rely on *Goodwin* at paragraph 51 to argue that the SCC has made clear that individuals who participate in highly regulated activities have a diminished expectation of privacy, even in relation to the seizure of bodily samples to determine a measure of alcohol and drug use. In that case, Mr. Goodwin was driving on a public highway and was asked to give a breath sample to determine whether he was driving while impaired. The

Respondents emphasize that the SCC considered driving on a public highway to be a "highly regulated context," resulting in a diminished expectation of privacy (*Goodwin* at para 51). They argue that the same standard should necessarily apply to the handling of safety-critical tasks in a nuclear facility, such that the impacted positions attract a diminished expectation of privacy.

[90] The Respondents highlight that context is important in establishing the reasonable expectation of privacy because a search and seizure arising from a regulatory context cannot be reviewed under the same standard as one arising from a criminal context. The Respondents urge this Court to apply, as *McKinlay Transport* requires, a "flexible and purposive approach to s. 8 of the *Charter*" and "draw a distinction between seizures in the criminal or quasi-criminal context to which the full rigours of the *Hunter v Southam* criteria will apply, and seizures in the administrative or regulatory context to which a lesser standard may apply depending upon the legislative scheme under review" (at page 647).

[91] In my view, a flexible approach, which takes its colour from context, does not diminish *Charter* rights for individuals. As Justice Wilson wrote on behalf of the *McKinlay Transport* majority at pp 644-645:

> In my opinion, flexibility is key to interpreting any constitutional document including the *Charter*. It would be wrong, I think for the courts to apply a rigid approach to a particular section of the *Charter* since that provision must be capable of application in a vast variety of legislative schemes.
>
> […]
>
> Since individuals have different expectations of privacy in different kinds contexts and with regard to different kinds of information and documents, it follows that the standard of review of what is "reasonable" in a given context must be flexible if it is to be realistic and meaningful.

[92] *McKinlay Transport* thus established that a flexible approach is not a mechanism to be used by the courts to limit *Charter* rights. Rather, it allows the courts to interpret *Charter* rights in a wide variety of contexts in a "realistic and meaningful" way. A flexible approach reflects differing expectations of privacy for different contexts.

[93] In this case, I agree with the Respondents that the Court should use a flexible approach to the section 8 analysis due to the highly regulated nature of the nuclear power workplace. As noted above, it is undisputed that obtaining bodily samples in the workplace constitutes a seizure within the meaning of section 8.

[94] With respect to the reasonable expectation of privacy, I disagree with the Applicants that the balance of contextual factors points to a heightened expectation of privacy for Safety-Critical Workers at nuclear facilities. In particular, the Applicants argued that the compulsory nature of the pre-placement and random testing provisions and lack of consent would result in a heightened expectation of privacy. However, if Safety-Critical Workers had a right of refusal or consented to the requirement, their section 8 rights would not be engaged at all because there would be no search or seizure in the first place. As held by the Ontario Court of Appeal in *R v Wills*, 1992 CanLII 2780 (ON CA), 7 OR (3d) 337 at paragraph 86: "[a] valid consent is a waiver of one's s. 8 rights. A 'consent search or seizure' is, in fact, no search or seizure at all for the purposes of s. 8."

[95] I also take issue with the Applicants' reliance on the *Gillies* decision. It is distinguishable from the case at bar. First, the Superior Court in *Gillies* applies a very specific test for section 8

that was established by the SCC to determine whether searches conducted by teachers or a principal in the school environment is reasonable (*Gillies* at para 129). As discussed above, the framework of analysis in *Goodwin*, *Marine Reference*, and *Correctional Officers* is more appropriate for the present case, given the regulatory framework within which those three cases arise.

[96] Second, I am not convinced by the Applicants’ attempt to draw a parallel between the negative employment and reputational consequences that could befall a Safety-Critical Worker subject to a pre-placement or random test, and the “disruptive, invasive and humiliating” experience of a student subject to a breathalyzer test at their high school prom (*Gillies* at para 132).

[97] When balancing the contextual factors to determine the strength of the privacy interests at stake, I find that the section 8 rights of Safety-Critical Workers are engaged. Although these workers have a diminished expectation of privacy when working at nuclear facilities, their residual privacy interest in the collection of their bodily samples is by no means eliminated.

[98] While the seizure of bodily samples does not automatically attract a high expectation of privacy, particularly for “relatively non-intrusive samples,” such as breath (*R v Grant*, 2009 SCC 32 at para 111; *Goodwin* at paras 51 and 65), and buccal – or mouth – swabs (*R v SAB*, 2003 SCC 60 at para 44 [*R v SAB*]), the taking of one’s biographical information without their consent falls squarely within the purview of section 8. This determination is supported by the SCC’s remarks in *Goodwin*:

> [50] It is undisputed before this Court that the roadside breath demand constitutes a seizure within the meaning of s. 8 of the *Charter*.
>
> [51] It is also undisputed before this Court that drivers of vehicles have some expectation of privacy in their breath, even if a diminished one. The factors identified by this Court as "helpful markers" in *Tessling*, at paras. 43-62, support this conclusion. The seizure occurs in a vehicle (*R. v. Grant*, 2009 SCC 32, [2009] 2 S.C.R. 353, at paras. 111 and 113); in the highly regulated context of driving on a public highway (*R. v. McKinlay Transport Ltd*., 1990 CanLII 137 (SCC), [1990] 1 S.C.R. 627, at pp. 647-48); and is relatively non-intrusive (*Grant*, at para. 111). <u>While these factors support a diminished expectation of privacy, they do not eliminate any residual privacy interest in one's breath. Thus the demand to breathe into a roadside screening device constitutes a seizure that infringes on an individual's reasonable expectation of privacy. The protection of s. 8 is engaged.</u>
>
> [Emphasis added]

Step 2: The pre-placement and random testing provisions in the RegDoc are authorized by law

[99] The Applicants argue that the pre-placement and random testing provisions are not authorized by law, because there is nothing specifically in the *Act*, nor a common law rule, that authorizes the search (*R v Caslake*, [1998] 1 SCR 51 at para 12 [*Caslake*]). The Applicants rely on *R v Shoker*, 2006 SCC 44 at para 22 [*Shoker*] to argue that searches must be authorized by law through specific statutory language and not general grants of regulatory power as was used by the CNSC in passing the RegDoc, because where Parliament has chosen to authorize the collection of bodily samples, it has used both clear authorizing language, and standard safeguards surrounding the collection of bodily samples.

[100] The Applicants also rely on *expressio unius est exclusio alterius*, a maxim meaning the express mention of an item excludes others. They submit as the basis of the *expressio unius* principle that paragraph 44(1)(h) of the *Act* specifically mentions the Commission's power to make regulations prescribing medical examinations or tests to nuclear energy workers to ensure their protection, but does not contain authorizing language with respect to pre-placement or random testing, or any standards and safeguards for such methods of testing.

[101] The Applicants further argue that the *Act* does not contain any provision, other than paragraph 44(1)(h), which mentions medical examinations or tests that would include pre-placement and random testing. The Applicants contend that this absence of a specific grant of authority in the *Act* demonstrates Parliament's intent to deny the CNSC the power to impose pre-placement and random testing provisions on nuclear workers.

[102] The Respondents counter that the pre-placement and random testing provisions of the RegDoc are authorized by law, because the RegDoc is a law. As noted above, they rely on *Greater Vancouver Transportation Authority* to submit that a RegDoc can constitute a "law" where it establishes a norm or standard of general application that has been enacted by a government entity pursuant to a rule-making authority that is sufficiently precise and accessible. The Respondents contend that the RegDoc is an instrument enacted by Canada's nuclear regulator under a broad statutory grant or power, and thus satisfies the "authorized by law" requirement for section 8 of the *Charter*.

[103] The Respondents further submit that jurisprudence emanating from a regulatory context is more applicable and persuasive than that arising from the criminal context. For example, they argue that the decisions in *Caslake* and *Shoker*, which authorize the collection of bodily samples within a law enforcement regime, are not applicable in the current case because the RegDoc is not punitive in nature. Instead, the Respondents invite the Court to follow the flexible approach required in a regulatory context, as described by the SCC in *Goodwin* at para 53:

> The analysis of a search or seizure under s. 8 is a contextual inquiry: *R. v. Rodgers*, 2006 SCC 15, [2006] 1 S.C.R. 554, at para. 26. It requires regard to the purpose for which the seizure occurs, and to the statutory provisions that set out the grounds, means and consequences of the seizure. A search or seizure can be valid for one purpose and not for another.

[104] I am not persuaded by the Applicants' position because it fails to consider the regulatory context in which the seizure is authorized. It is true that neither the *Act* nor its associated *Regulations* stipulate the collection of bodily samples for drug and alcohol testing, as do certain provisions of the *Criminal Code*, RSC 1985, c C-46. However, we must adopt a more flexible approach to the "authorized by law" requirement, as suggested by the SCC, when in a regulatory and not in a criminal, context. That encapsulates the present circumstances.

[105] Indeed, here the associated *Regulations*, the *General Nuclear Safety and Control Regulations*, SOR/2000-202, and the *Class 1 Regulations* [collectively the *Regulations*], require Licensees to maintain human performance programs that include ongoing attention to reducing the likelihood of human performance-caused safety events. These regulatory provisions and CNSC's broad powers to impose licensing requirements under subsection 24(2) of the *Act* constitute a sufficient statutory basis for this Court to find that the pre-placement and random

testing provisions of the RegDoc are authorized by law. These statutory provisions also reflect Parliament's intent to empower the CNSC to regulate and set standards in the nuclear industry as it sees fit.

[106] I find the Applicants' *expressio unius* argument to be unconvincing. In particular, I do not find compelling the suggestion that this Court should look to what has been excluded from the *Act* and its associated *Regulations* to understand Parliament's intent concerning drug and alcohol testing at nuclear facilities. Indeed by reviewing subsection 24(2) and paragraph 44(1)(h) of the *Act* (see Annex A to these Reasons for both provisions), there is nothing that indicates that Parliament intended to exclude the CNSC's broad regulatory powers from applying to medical examinations and testing of workers.

[107] I note that in the context in which this judicial review application arises, Parliament has given the CNSC a wide latitude to regulate Canada's nuclear industry in the public interest. To achieve this regulatory purpose, Parliament delegates a variety of tools to the CNSC to tailor specifications and requirements to Licencees governed by the *Act* and its *Regulations*. The CNSC acted pursuant to its broad powers when it decided to implement pre-placement and random testing to bolster the fitness for duty programs and ameliorate the safety conditions in these nuclear facilities. These powers are authorized by law under subsection 24(2) of the *Act*.

Step 3: The pre-placement and random testing provisions are reasonable

[108] Before I begin my analysis of the reasonableness of the pre-placement and random testing provisions using the framework set out in *Goodwin* and applied in *Correctional Officers,* I will briefly discuss the Applicants' reliance on arbitral jurisprudence.

[109] The Applicants rely on arbitral jurisprudence, in particular *Communications, Energy and Paperworkers Union of Canada, Local 30 v Irving Pulp & Paper Ltd*, 2013 SCC 34 [*Irving*] to argue that pre-placement and random testing is unreasonable. The Applicants submit that the well-established arbitral jurisprudence about pre-placement and random testing ought to weigh heavily on the section 8 analysis because that case considered the same balancing between individual privacy rights and employer interests as does section 8. The Applicants rely on the SCC's comments in *Irving* at paras 30-31 to argue that an employer's interest in safety will not justify breaching an employee's privacy rights without reasonable cause, even in an inherently dangerous workplace:

> [30] In a workplace that is dangerous, employers are generally entitled to test individual employees who occupy safety sensitive positions without having to show that alternative measures have been exhausted if there is "reasonable cause" to believe that the employee is impaired while on duty, where the employee has been directly involved in a workplace accident or significant incident, or where the employee is returning to work after treatment for substance abuse […]
>
> [31] But the dangerousness of a workplace — whether described as dangerous, inherently dangerous, or highly safety sensitive — is, while clearly and highly relevant, only the beginning of the inquiry. It has never been found to be an automatic justification for the unilateral imposition of unfettered random testing with disciplinary consequences. What has been additionally required is evidence of enhanced safety risks, such as evidence of a general problem with substance abuse in the workplace.

[110] While the SCC's analysis of the balancing of interests between the employer and employees in *Irving*, along with the other arbitral jurisprudence, is helpful, I do not feel it is authoritative for the section 8 analysis in this case. Indeed, one must consider how Justice Abella approached *Irving*, writing at paragraph 3 of that decision:

> The legal issue at the heart of this case is the interpretation of the management rights clause of a collective agreement. This is <u>a labour law issue</u> with clear precedents and a history of respectful recognition of the ability of collective bargaining to responsibly address the safety concerns of the workplace – and the public.
>
> [Emphasis added]

[111] The reality is that *Irving* and the arbitral jurisprudence focuses on the exercise of management rights and the application of the "KVP test," a test which was contained in the labour law decision *Re Lumber & Sawmill Workers' Union, Local 2537, and KVP Co. (1965),* 16 LAC 73. The KVP test ensures "that any rule or policy unilaterally imposed by an employer and not subsequently agreed to by the union, must be consistent with the collective agreement and be reasonable" (*Irving* at para 24). While the KVP test focuses on the relationship between the employer and the employees, and the terms of the collective agreement between them, a section 8 analysis is more contextual and requires the examination of the totality of circumstances.

[112] In any event, the circumstances in the present case are distinguishable from those in *Irving* in two significant ways. First, the subject matter under review is a measure enacted by a federal regulator, and not workplace requirements introduced by an employer. Second, the RegDoc does not mention disciplinary consequences, whereas the employer policy in *Irving* did.

Also notable is the fact that *Irving* does not preclude the implementation of pre-placement and random testing in workplaces (*Irving* at para 52):

> [52] This is not to say that an employer can never impose random testing in a dangerous workplace. If it represents a proportionate response in light of both legitimate safety concerns and privacy interests, it may well be justified.

[113] In keeping with the analysis set out by *Goodwin* as applied in *Correctional Officers*, my assessment of whether the seizure authorized by sections 5.1 and 5.5 of the RegDoc is reasonable, will be subject to the following criteria: (a) the purpose of the RegDoc and the provisions at issue; (b) the nature of the regulatory scheme; (c) the mechanism for obtaining the bodily samples, including the degree of intrusiveness; and (d) the subsequent review and possible redress for seizure, i.e. the availability of judicial oversight (see *Correctional Officers* at para 25). Each of these four criteria is discussed next.

(a) *The purpose of the RegDoc and the provisions at issue*

[114] I am satisfied that the purpose of the RegDoc and of its pre-placement and testing provisions, is to standardize and improve Licensees' fitness for duty programs relating to drug and alcohol testing.

[115] The Respondents submit that the pre-placement and random testing provisions of the RegDoc arose from a need for better fitness for duty provisions in light of lessons from nuclear disasters such as the one in Fukushima, Japan in 2011. This required looking abroad to align with international standards, including the recommendations and expectations of the International

Atomic Energy Agency [IAEA], as well as addressing domestic developments such as measures needed to respond to the introduction of the *Cannabis Act*, SC 2018, c 16.

[116] As mentioned by the 2021 Arbitral Decision in this matter, "[t]he RegDoc is the product of almost 10 years of study and consultation by the CNSC, in which the parties to this litigation have participated, and over the course of which this litigation has been anticipated": *Ontario Power Generation, Bruce Power, Power Workers' Union, Society of United Professionals, The Chalk River Nuclear Safety Officers Association and International Brotherhood of Electrical Workers, Local 37 v Canadian Nuclear Laboratories and New Brunswick Power*, 2021 CanLII 65284 (ON LA) at para 2 [Arbitral Decision].

[117] In the course of its research, the CNSC commissioned a number of key reports, which it relied on when developing the RegDoc. These reports include: (i) "*Review, Analysis and Synthesis of CNSC's Licensees' Fitness for Duty Programs*" by AIM Health Group in 2011 [AIM Report]; (ii) "*The Forensic Toxicology of Alcohol and Best Practices for Alcohol Testing in the Workplace*" by James Wigmore in 2014 [Wigmore Report]; (iii) "*State of Policies and Practices on Substance Use in Safety-sensitive Industries in Canada*" by the Canadian Centre on Substance Use and Addiction in 2017 [CC Report]; (iv) "*Urine Drug Testing Practices*" by Dr. Albert Fraser in 2014 [Fraser Report]; and (v) "*Recent Alcohol and Drug Workplace Policies in Canada: Considerations for the Nuclear Industry*" by Barbara Butler and Associates Inc. in 2012 [Butler Report].

[118] The findings in these five reports [Reports] point to an identified need for better methods of detection of drug and alcohol impairment at nuclear facilities, as well as to the efficacy of the testing methods proposed by the RegDoc.

[119] In particular, the AIM Report looked into deficiencies in the CNSC's existing fitness for duty programs and compared them with standards from the IAEA, the world's central intergovernmental forum for scientific and technical co-operation in the peaceful use of nuclear energy. Canada is a member of the IAEA, as one of its 175 member states. While the AIM Report found that CNSC's existing fitness for duty programs were compliant with IAEA standards, it also found the programs across the different nuclear facilities in Canada were inconsistent with each other. Page 24 of the AIM Report recommended the following specific areas of improvement within the domain of "substance use and abuse":

- Improve the policy of Licensees to include clear expectations on the number of hours of alcohol abstinence necessary prior to reporting to work or on-call;
- Define additional policy statements for off-duty expectations regarding use, possession or distribution of illegal substances;
- Drug and/or alcohol testing protocols need to be defined.

[120] The Wigmore Report noted that there were concerns with supervisory awareness programs for detecting impairment in the workplace, including a lack of scientific evidence to show that supervisors were able to detect impairment since some workers may not show outward signs of impairment but still exhibit symptoms of functional impairment.

[121] For its part, the CC Report indicated that the impact of legalization and regulation of cannabis in Canada could result in increased use in populations that typically did not use cannabis, particularly adults in the workforce.

[122] The Fraser Report discussed the efficacy of urine drug testing practices and how it could be used to detect impairment.

[123] The Butler Report addressed the deterring effects of random testing and recommended it as a more objective method of testing than reasonable cause testing (testing after referral based on judgment calls made by supervisors).

[124] According to the Respondents, these five Reports informed the development of the RegDoc to improve methods of detection of drug and alcohol impairment at nuclear facilities.

[125] The record, including the Reports, produced over the course of the decade leading up to the planned 2021 implementation of the RegDoc, shows that the pre-placement and random testing provisions were reasonably included in the RegDoc after years of research identified specific gaps in the existing fitness for duty programs, particularly with respect to reliable, consistent, and accurate methods to detect drug and/or alcohol impairment among workers at nuclear facilities. CNSC staff testified that the Commission had, as early as 2007, identified gaps and inconsistencies in the existing fitness for duty programs, particularly for drug use. As a result, CNSC staff researched drug and alcohol use, the risks posed to the nuclear industry, and what steps would reduce those risks.

[126] The bolstering of Licensees' fitness for duty programs relating to drug and alcohol testing is a compelling purpose in light of those gaps in protecting against the identified risks. This compelling purpose weighs in favour of the reasonableness of the seizure required by the pre-placement and random testing measures.

[127] I note that the purpose of the pre-placement and random testing provisions is also aligned with the defence-in-depth principle. As underscored by the Respondents, in the nuclear industry, one cannot "wait and see" given the severe consequences that often result from nuclear incidents. Thus fitness for duty programs must be built on a foundation that layers various measures to minimize risk and implement best practices to both prevent failure, and ensure safety. Contrary to the Applicants' submissions, pre-placement and random testing procedures neither undermine nor diminishes that principle. Rather, they represent additional measures to the other uncontested methods of detecting drug and alcohol impairment in the RegDoc. The additional measures contribute to the purpose of the scheme, namely to improve the fitness for duty programs relating to drug and alcohol testing.

[128] Under the defence-in-depth principle, the existence of multiple methods and layers of detection of drug and alcohol impairment is not a redundancy, but rather an intended outcome. In this unique case, the defence-in-depth principle helps to justify multiple methods of detection by pre-placement and random testing under the regime of the RegDoc; it does not controvert that principle or undermine the purpose of the scheme.

(b) *The nature of the regulatory scheme*

[129] In the context of a regulatory scheme, the SCC departed from the rigid framework of analysis in *Hunter v Southam* to assess the reasonableness of a search and/or seizure. As Justice La Forest held for the Court in *Comité paritaire*, "[i]n a context in which their occupations are extensively regulated by the state, the reasonable expectations of privacy employers may have…are considerably lower" (at page 420). He added at page 421:

> It is thus impossible, without further qualification, to apply the strict guarantees set out in *Hunter v. Southam Inc.*, *supra*, which were developed in a very different context. The underlying purpose of inspection is to ensure that a regulatory statute is being complied with. It is often accompanied by an information aspect designed to promote the interests of those on whose behalf the statute was enacted. The exercise of powers of inspection does not carry with it the stigmas normally associated with criminal investigations and their consequences are less draconian. While regulatory statutes incidentally provide for offences, they are enacted primarily to encourage compliance. It may be that in the course of inspections those responsible for enforcing a statute will uncover facts that point to a violation, but this possibility does not alter the underlying purpose behind the exercise of the powers of inspection.

[130] Furthermore, as held by Justice Karakatsanis writing for the majority at paragraph 60 of *Goodwin*, "[the SCC] has recognized in its s. 8 jurisprudence that the characterization of a search or seizure as either criminal or regulatory is relevant in assessing its reasonableness. Where an impugned law's purpose is regulatory and not criminal, it may be subject to less stringent standards." Likewise, in this case, the highly regulated nature of nuclear facilities is relevant for assessing the reasonableness of the seizure (see also *Comité paritaire* at page 418 and *Marine Reference* at para 50).

[131] The RegDoc's administrative law context differs from the criminal domain (*McKinlay Transport* at para 647; *Thomson Newspapers* at paras 495-496). The focus here is rather the broad public interest served by the RegDoc, namely nuclear safety (see *Marine Reference* at para 53). As the FCA held in *Correctional Officers* at para 29, where the impugned directive was administrative and not criminal in nature: "[t]he case law is uniformly clear: the resulting searches are thus considered less intrusive than those performed in a criminal investigation."

[132] In sum, considering the nature of this regulatory scheme, I find that the RegDoc's context supports the reasonableness of the searches under its pre-placement and random testing provisions.

(c) *The mechanism for obtaining the bodily samples, including the degree of intrusiveness*

[133] The SCC held in *Goodwin* at paras 64-67 that the two relevant factors to assess the reasonableness of the manner of a search are (i) the degree of intrusiveness on an individual's bodily integrity, and (ii) the reliability of the results. The Applicants argue that the manner in which the testing is carried out as proposed in the RegDoc is unreasonable, because the collection of bodily samples is highly intrusive, and the RegDoc's testing methodology is unreliable because it may show only past drug use rather than present impairment.

[134] The two testing methods (breath samples and buccal swabs) are prescribed by sections 6.1 and 6.2 of the RegDoc. Under the third – and arguably the most contentious – bodily sample method contained in the RegDoc, Licensees will be required to conduct urine testing in a

secure and private testing location, a measure intended to protect bodily integrity and reduce, as the Respondents assert, any affront to privacy and dignity of Safety-Critical Workers (*R v SAB* at para 44).

[135] The Respondents counter that the manner in which the testing is carried out is reasonable for two primary reasons. First, as mentioned above, while the collection of bodily samples can be intrusive, they urge this Court to use a flexible approach, one that considers other contextual factors, such as the narrow scope of the RegDoc, and the absence of disciplinary consequences that flow from a positive test result. Second, they emphasize that the testing methods contained in the RegDoc are highly reliable.

[136] As I have already addressed the intrusiveness of the collection of bodily samples as well as the need for a flexible approach and the consideration of contextual factors due to the regulatory context, I will focus on the reliability of the testing methodology of the RegDoc in my analysis of the reasonableness in the testing methodology.

[137] The Applicants argue that the alcohol and drug testing methods outlined in the RegDoc actually detect the amount of alcohol and/or drug that an individual has taken, which can only be used to determine whether an individual is intoxicated, but cannot be used to accurately measure the level of impairment of an intoxicated individual. They point to the Butler Report, which suggests that no alcohol and/or drug testing method can actually and directly measure an individual’s level of impairment from alcohol and/or drug use.

[138] A CNSC staff member testified that the testing methods outlined in the RegDoc were actually designed to measure recency of use, and recency is the most accurate indicator of impairment. Specifically, the Butler Report suggests that while alcohol and drug testing cannot measure impairment, it can accurately measure the concentration of a substance in a person's body and/or the recency of use of a substance, which are both strong indicators of impairment when examined in conjunction with studies available on the impact and duration of the effects of drugs on performance.

[139] The Butler Report also examines how different cut-off levels set out for testing affect the accuracy of measuring recent use. CNSC staff used this research to set the cut-off levels in the RegDoc to represent narrow windows on recent use to ensure the accuracy of test results. In other words, the cut-off levels in the RegDoc are set so that a positive test result would indicate very recent use and be a better signal for possible impairment. Therefore, there is a research-established link between the RegDoc's testing methods, including the proposed cut-off levels for a positive test result, and the detection of alcohol and drug impairment.

[140] Finally, turning back to the fundamental safety assurance objective of the impugned provisions, the testing methodology outlined in the RegDoc also embodies the nuclear safety principle of defence-in-depth and its multiple layers. First, it sets out a combination of testing methods for higher accuracy. For example, Licensees can opt for a combination of urine drug testing and oral fluid drug testing. Second, the RegDoc requires multiple steps of analysis before a positive result is reported, namely a laboratory screening, followed by examination, as well as confirmation from a medical review officer.

(d) *The subsequent review and possible redress for seizure (i.e. availability of judicial oversight)*

[141] The consequences arising from a regulatory scheme that enables a search or seizure generally (i.e., without prior authorization for each incident) are lessened if an individual subject to the regulatory scheme can challenge both the basis for, and the accuracy of, their test results (*Goodwin* at para 69). As such, the availability and adequacy of judicial oversight, or "procedural safeguards", are relevant measures in assessing the reasonableness of a search or seizure under section 8 (*Goodwin* at paras 71-72).

[142] The Applicants, through their argument of an absence of reasonable and probable grounds for the pre-placement and random testing measures, are effectively challenging the availability of judicial oversight. They argue that in the absence of prior judicial authorization, a search is presumptively unreasonable and the state bears the onus of rebutting that presumption, relying on *R v Spencer* at paragraph 68. The Applicants submit, given the absence of reasonable and probable grounds, that the presumption has not been rebutted and therefore the proposed pre-placement and random testing is unreasonable.

[143] The Applicants contend that random testing is, by definition, without grounds. They also assert that pre-placement testing arises from an individual's application for a Safety-Critical position, not because of reasonable and probable grounds to suspect that an individual might be impaired at work. The Applicants rely on pages 167 and 168 of *Hunter v Southam* to submit the SCC affirmed that the state's interest only prevails over the individual's right to privacy "at the point where credibly-based probability replaces suspicion".

[144] The applicants in *Marine Reference* also argued that the regulatory scheme in that case was "fatally flawed" because there was no prior authorization for the searches (i.e., security screenings). However, the FCA rejected those arguments at paras 57-59 of its decision:

> [55] ILWU argues that the scheme is fatally flawed because it lacks any adequate checks to prevent the abuse of the power to obtain and use information about an employee. In particular, prior independent authorization is not required, and an employee who has been refused a security clearance has no right of review by an independent decision-maker. Hence, any "search" under the Regulations is unreasonable.
>
> [56] Counsel relies on *Canada (Combines Investigation Acts, Director of Investigation and Research) v. Southam Inc.*, 1984 CanLII 33 (SCC), [1984] 2 S.C.R. 145 ("*Hunter*"), for the proposition that, even when undertaken as part of a regulatory scheme, a search will normally not be reasonable for the purpose of section 8 without prior authorization by an independent person capable of acting in a judicial manner.
>
> [57] I disagree. In my opinion, *Hunter* cannot be applied to the scheme under consideration here. For one thing, to require prior authorization before an employee completes a security clearance application would serve no purpose because all employees complete the same form. The complaint in this case is not to abuses in the way that forms are administered to different employees, but to the form itself.
>
> [58] Further, cases in which prior authorization has been required have invariably arisen in contexts where criminal and *quasi*-criminal offences are being investigated and where the expectation of privacy is highest. Here, in contrast, existing and future employees who wish to work in security-sensitive positions in marine transportation, a highly regulated activity giving rise to a much lower expectation of privacy, may be refused a security clearance, which may adversely affect their employment opportunities. See *Comité paritaire* at 419-20.
>
> [59] To the extent that ILWU argues that authorization is required before the information provided by an employee is checked a8nd verified by law enforcement and intelligence agencies, its argument is equally flawed. It would be impracticable to require prior authorization before the information provided by thousands of port employees across the country could be processed. Nor is it clear to me what purpose would be served by

> such an exercise, since it will often not be possible to identify potential security risks until background checks have been conducted.
>
> [Emphasis added]

[145] I agree with the FCA's approach in *Marine Reference* that the Court cannot take a rigid approach of requiring prior authorization in its assessment of the availability of judicial oversight. In *Correctional Officers*, the FCA found that correctional officers who were obligated to consent to credit checks, which constituted a search under section 8, were afforded judicial oversight because the scheme allowed them to explain any adverse information in their credit report and contest any decision to revoke their reliability status as a result of an adverse search result (*Correctional Officers* at para 32). The correctional officers also had recourse to the Federal Courts and the Human Rights Commission, which the FCA found to be "undeniably relevant in assessing the reasonableness of the search" (*Correctional Officers* at para 32).

[146] In *Goodwin* at para 71, the Court found "[t]he nature of the review required will of course vary with the circumstances, including the nature of the scheme. On the other hand, the availability of oversight is particularly important where, as here, a search or seizure occurs without prior authorization: *R v Tse*, 2012 SCC 16, [2012] 1 SCR 531, at para 84. While less exacting review may be sufficient in a regulatory context, the availability and adequacy of review is nonetheless relevant to reasonableness under s. 8."

[147] Here, under the "Drug-testing process" (section 6.2 of the RegDoc), Safety-Critical Workers are provided with the opportunity to explain any alternative reasons for the positive test result, and if a medical review officer finds a legitimate medical explanation for the positive test

result, it will not be considered “verified” or reported to the Employers. Thus, similar to the regulatory scheme in *Correctional Officers*, the RegDoc provides a procedure to contest the results of the search.

[148] I agree with the Respondents that the RegDoc does not result in any adverse disciplinary consequences if a Safety-Critical Worker receives a positive test. Under section 6.3 of the RegDoc, Safety-Critical Workers who receive a verified positive test result shall be removed from Safety-Critical duties and referred for a mandatory substance abuse evaluation. The removal from Safety-Critical duties does not result in the individual’s dismissal. Instead, the individual is referred to a substance abuse evaluation, which is a medical process designed for rehabilitation.

[149] Neither the removal from Safety-Critical duties, nor the referral to a substance abuse evaluation, are detrimental to Safety-Critical Workers. At least, that is all that I am prepared to conclude at this early stage, which is before the RegDoc has been applied to any particular case. Based on the record,the purported detrimental effects of a positive test to employment reside in the realm of the hypothetical, rather than on any tangible basis.

[150] Although the RegDoc does not outline an appeal mechanism for adverse consequences resulting from a positive test result once the administrative process is complete, such as a possibility of judicial review or of filing a complaint to a third-party, any administrative decision made by the Employers under the regulatory scheme of the RegDoc can eventually be subject to judicial review before the Federal Court.

[151] In conclusion, the pre-placement and random testing provisions of the RegDoc engage, but do not infringe, section 8 of the *Charter*. The Safety-Critical Workers have a diminished expectation of privacy due to the highly regulated nature of their workplace, and the testing provisions are reasonable when considering all the contextual factors at hand, including the regulatory context, the public interest in nuclear safety, the identified need to bolster fitness for duty programs, the reliability of the testing methodology, and the availability of judicial oversight.

C. *The pre-placement and random testing provisions of the RegDoc do not infringe section 7 of the Charter*

[152] Section 7 of the *Charter* guarantees the right to life, liberty and security of the person and the right not to be deprived thereof except in accordance with the principles of fundamental justice.

[153] There is a two-step test for applying section 7. The Court must first determine whether the impugned provisions deprive the claimant of life, liberty, or security of the person. If affirmed, the Court must then determine whether the deprivation is contrary to the principles of fundamental justice (*R v Beare*, [1988] 2 SCR 387 at 401).

[154] These steps are sequential. As noted by the SCC in *Blencoe v BC (Human Rights Commission)*, 2000 SCC 44 [*Blencoe*] at para 47, “if no interest in the respondent’s life, liberty or security of the person is implicated, the s. 7 analysis stops there” (see also: *R v Pontes*, [1995] 3 SCR 44 at para 47).

[155] The Applicants claim that the provisions deprive them of their security of the person interest. They argue that the absence of reasonable and probable cause to authorize each seizure renders the pre-placement and random testing provisions of the RegDoc in contravention of the principles of natural justice. Specifically, the Applicants submit that the impugned provisions are: arbitrary because the testing is without reasonable and probable grounds; overbroad because it captures employees who are not suspected of being impaired; and disproportionate given all the existing measures in place in nuclear facilities, as well as the non-contested measures already contained in the RegDoc that sufficiently monitor impairment.

[156] The Respondents dispute these assertions. They rely on *Wakeling v United States of America*, 2014 SCC 72 at paras 49-50 [*Wakeling*] to submit that the arguments raised by the Applicants under their section 7 challenge can and should be dealt with under the section 8 analysis. In any event, the Respondents argue that the pre-placement and random testing provisions of the RegDoc are not arbitrary, overbroad or grossly disproportionate, and that any interference with the bodily integrity of Safety-Critical Workers resulting from the testing, is in accordance with the principles of fundamental justice.

[157] At the outset, I am of the view that the Applicants' concerns are more appropriately framed for consideration under the section 8 *Charter* analysis and not section 7. I agree with the Respondents' submission that a section 7 analysis in this case is redundant since the taking of bodily samples ought only be considered under section 8 (*Wakeling* at paras 49-50; *R v Rodgers*, 2006 SCC 15 at paras 23-24; *Ontario (Attorney General) v Bogaerts*, 2019 ONCA 876 at para 54

[*Bogaerts*]). Nonetheless, I will respond to the Applicants' section 7 claim for the sake of completeness.

[158] The Applicants argue the impugned provisions engage the "security of the person" interest. In particular, they argue that pre-placement and random testing provisions lead to a measure of psychological harm by compromising Safety-Critical Workers' bodily integrity. In support of their argument that security of the person is engaged, the Applicants rely on two decisions, *Jackson v Joyceville Penitentiary (TD)*, [1990] 3 FC 55 [*Jackson*], and *Cruikshanks v Stephen*, 1992 CanLII 1929 (BC CA) [*Cruikshanks*]. Both decisions involved a prison inmate contesting the requirement to submit to a urinalysis test.

[159] However, the facts and issues in both *Jackson* and *Cruikshanks* are highly distinguishable from the RegDoc's testing for several reasons.

[160] In *Jackson*, Justice MacKay found that the design of the impugned regulation was at risk of improper use by prison staff. The primary concern was that inmates could be subjected to a demand for a urine sample, or punished for refusing to provide a sample, at the whim of prison staff, and that the test could conceivably be used as a tool to coerce inmates to do certain acts or as a form of punishment outside of the disciplinary system mandated by statute. At para 49 of *Jackson*, the Court characterized the section 7 *Charter* issue before it as follows:

> Section 41.1 in so far as it permits a member to require an inmate, who is considered to have ingested an intoxicant, to provide a specimen of the inmate's urine for analysis to detect the presence of an intoxicant in the body of the inmate, when coupled with disciplinary proceedings for failure to obey a lawful order if the requirement not be met, contravenes section 7 of the Charter by

> depriving the inmate of the right to liberty and security of the person in a manner that does not accord with the principles of fundamental justice.
>
> (see also para 91)

[161] It was in this context that the Court found the deprivation of the inmate's security of the person and liberty interests (*Jackson* at para 96):

> To require an inmate to provide a specimen of urine for purposes of testing for trace elements of intoxicants, as section 41.1 provides, is in my view, an interference with bodily integrity. Urinalysis may reveal health or other conditions beyond the indications sought for traces of unauthorized intoxicants. In many cases requiring a specimen for testing aside from health reasons might lead to a measure of psychological stress, particularly where, as here, the procedure for collecting the sample involves direct observation by another. The requirement deprives the inmate concerned of security of his or her person. To require this or risk punishment for failure to comply with an order, as practice under standing orders for disciplinary proceedings here provides, is also an interference with the liberty of the person.

[162] The Applicants' reliance on *Cruikshanks* is also misplaced due to different circumstances. In *Cruikshank*, the Court of Appeal for British Columbia did not consider the section 7 *Charter* rights of the inmate:

> [123] We are agreed as we assume was the learned judge in the court below, that <u>in the particular circumstance of this case</u> the requirement as a condition of mandatory supervision to furnish urinalysis samples on demand by a supervisor or peace officer without reasons or probable grounds, was not authorized by any law or regulation <u>and constituted a breach of *Charter* s.8.</u>
>
> [Emphasis added]

[163] There is well-established case law setting out the test for demonstrating an interference with the security of the person interest. It was recently summarized by the Ontario Court of Appeal in *Bogaerts* as follows:

> [52] To demonstrate an interference with security of the person, an applicant must show either (1) interference with bodily integrity and autonomy, including deprivation of control over one's body: *Carter v. Canada (Attorney General)*, 2015 SCC 5, [2015] 1 S.C.R. 331, at paras. 66-67, or (2) serious state-imposed psychological stress: *Blencoe v. British Columbia (Human Rights Commission)*, 2000 SCC 44, [2000] 2 S.C.R. 307, at paras. 81-86; Hamish Stewart, *Fundamental Justice:* Section 7 *of the* Canadian Charter of Rights and Freedoms, 2nd ed. (Toronto: Irwin Law, 2019), at pp. 95-106.

[164] The Applicants here have not demonstrated either prong of the security of the person interest test. The choice to work in a Safety-Critical position at a nuclear power plant is not one of the "basic choices going to the core of what it means to enjoy individual dignity and independence protected by s. 7" (*Blencoe* at para 49). Section 7 does not protect property or other predominantly economic interests, including the right to practice a particular profession. The adverse effect of not working one's preferred position at a nuclear power plant is not protected under the scope of section 7 (*Marine Reference* at para 47, citing *Mussani v College of Physicians and Surgeons of Ontario* (2004), 74 OR (3d) 1, at paras 41-43).

[165] I note that the Applicants provided no authority to support the notion that section 7 guarantees the right to have one's choice of employment. The closest analogy occurred only on one occasion, when a minority of the SCC judges (Justice La Forest writing, supported by two other) held that the right to choose to establish one's home vis-à-vis a job fell within section 7 liberty interests. The other six *Godbout* judges struck down the municipal resolution requiring its

employees to reside within its boundaries, as invalid, because it violated section 5 of the *Quebec Charter of Rights and Freedoms*, RSQC, C-12.

[166] The facts and context in *Godbout* are thus also very different from those under review. In the 25 years since the SCC decided *Godbout*, suffice it to say that the threshold to demonstrate a section 7 breach on the basis of employment is significant and requires more than the non-invasive taking of saliva, urine or breath samples to check for evidence of drugs or alcohol as a measure to protect the broader public.

[167] Ultimately, if the Safety-Critical Workers fundamentally object to being tested on the basis of security of their person, they can apply for the other 90% of positions in nuclear facilities not classified as "safety-critical" or work in a less safety sensitive industry.

[168] Since the Applicants have not demonstrated that their section 7 interests are implicated, "the s. 7 analysis stops there" (*Blencoe* at para 47).

D. *The pre-placement and random testing provisions of the RegDoc do not infringe section 15 of the Charter*

[169] Subsection 15(1) of the *Charter* safeguards every individual's right to the equal protection and benefit of the law, without discrimination based on, among other grounds, race, national or ethnic origin, colour, religion, sex, age or mental or physical disability.

[170] Subsection 15(1) of the *Charter* requires the claimant to show (i) that the impugned law draws a distinction or has a disproportionate impact on the basis of an enumerated or analogous ground; and (ii) that the law has the effect of reinforcing, perpetuating, or exacerbating disadvantage (*R v Sharma*, 2022 SCC 39 at para 28 [*Sharma*]).

[171] The first step of the subsection 15(1) test requires the claimant to demonstrate either that the law draws a distinction on the basis of an enumerated or analogous ground, or that the law has a disproportionate impact on a group identified by an enumerated or analogous ground. This is a question of "whether the impugned law created or contributed to a *disproportionate impact* on the claimant group based on a protected ground" (*Sharma* at para 31; Emphasis in original).

[172] The Applicants' claim fails on the first step of the section 15 test for two reasons. First, the RegDoc applies to a job category of workers at nuclear power facilities. This is not a "protected group" for the purposes of section 15. Moreover, the Applicants do not properly establish individuals experiencing 'drug dependency' as an enumerated or analogous ground of persons living with a disability. The RegDoc does not draw a distinction, either on its face or through an adverse impact on that ground. The Applicants have not adduced any evidence to show that the RegDoc may result in a situation wherein certain workers affected by it are members of a disadvantaged group, or may experience disadvantage.

[173] The Applicants rely on human rights case law to argue that "drug dependency" should be recognized as an analogous ground worthy of protection under section 15 of the *Charter*. They

rely on *British Columbia (Public Service Employee Relations Commission) v BCGSEU*, [1999] 3 SCR 3 [*BCGSEU*] to argue that this Court should use a human rights analysis to establish discrimination under subsection 15(1). The SCC found there to be "little reason for adopting a different approach when the claim is brought under human rights legislation which, while it may have a different legal orientation, is aimed at the same general wrong as s. 15(1) of the *Charter*" (*BCGSEU* at para 48).

[174] Under a human rights analysis, the Applicants submit that drug dependency is recognized as a protected ground and can give rise to *prima facie* discrimination if three factors are present: (i) the worker has a drug dependency, (ii) they have experienced an adverse impact, and (iii) the drug dependency was a factor in that adverse impact (*Entrop v Imperial Oil Limited*, 2000 CanLII 16800 (Ont CA) at para 92 [*Entrop*] and *Canada (Human Rights Commission) v Toronto-Dominion Bank*, [1998] 4 FC 205 (CA) at para 28 [*TD Bank*]).

[175] It would not be appropriate to apply a human rights analysis instead of a *Charter* section 15 analysis to determine whether the RegDoc provisions draw a distinction on an analogous ground, especially given that the Applicants have not brought any evidence to support that there are drug dependencies amongst Safety-Critical Workers.

[176] The clear and authoritative criteria established by the SCC to recognize an analogous ground under section 15, holds that an analogous ground cannot be found without compelling reasons. Analogous grounds are similar to the enumerated grounds insofar as they identify a

basis for stereotypical decision-making or a group that has historically suffered discrimination. They describe personal characteristics that are either immutable or constructively immutable.

[177] The analysis for determining an analogous ground involves "considering whether differential treatment of those defined by that characteristic or combination of traits has the potential to violate human dignity in the sense underlying s. 15(1)" *(Corbiere v Canada (Minister of Indian and Northern Affairs)*, [1999] 2 SCR 203 at paras 59-60 [*Corbiere*]). Once a ground has been found to be analogous, it will always be considered a ground in the future (*Corbiere* at para 13):

> [13] What then are the criteria by which we identify a ground of distinction as analogous? The obvious answer is that we look for grounds of distinction that are analogous or like the grounds enumerated in s. 15 — race, national or ethnic origin, colour, religion, sex, age, or mental or physical disability. It seems to us that what these grounds have in common is the fact that they often serve as the basis for stereotypical decisions made not on the basis of merit but on the basis of a personal characteristic that is immutable or changeable only at unacceptable cost to personal identity. This suggests that the thrust of identification of analogous grounds at the second stage of the *Law* analysis is to reveal grounds based on characteristics that we cannot change or that the government has no legitimate interest in expecting us to change to receive equal treatment under the law. To put it another way, s. 15 targets the denial of equal treatment on grounds that are actually immutable, like race, or constructively immutable, like religion. Other factors identified in the cases as associated with the enumerated and analogous grounds, like the fact that the decision adversely impacts on a discrete and insular minority or a group that has been historically discriminated against, may be seen to flow from the central concept of immutable or constructively immutable personal characteristics, which too often have served as illegitimate and demeaning proxies for merit-based decision making.

[178] As noted above, while I find that the RegDoc makes a distinction between the job categories of workers at nuclear power facilities, it does not do so on an enumerated ground. The SCC has rejected claimants' attempts to recognize occupational status as an analogous ground (see: *Delisle v Canada (Deputy Attorney General)*, [1999] 2 SCR 989 at para 44; *Baier v Alberta*, 2007 SCC 31 at para 65).

[179] The SCC has also rejected the analogous ground of "substance orientation." In *R v Malmo-Levine; R v Caine*, 2003 SCC 74 at para 185, the Court held:

> [185] A taste for marihuana is not a "personal characteristic" in the sense required to trigger s. 15 protection: *Andrews v. Law Society of British Columbia*, [1989] 1 S.C.R. 143. As Malmo-Levine argues elsewhere, it is a lifestyle choice. It bears no analogy with the personal characteristics listed in s. 15, namely race, national or ethnic origin, colour, religion, sex, age, or mental or physical disability. It would trivialize this list to say that "pot" smoking is analogous to gender or religion as a "deeply personal characteristic that is either unchangeable or changeable only at unacceptable personal costs": *Egan v. Canada*, [1995] 2 S.C.R. 513, at para. 5; *Vriend*, *supra*, at para. 90. Malmo-Levine's equality claim therefore fails at the first hurdle of the requirements set out in *Law v. Canada (Minister of Employment and Immigration)*, [1999] 1 S.C.R. 497. The true focus of s. 15 is "to remedy or prevent discrimination against groups subject to stereotyping, historical disadvantage and political and social prejudice in Canadian society": *Swain*, *supra*, at p. 992, *per* Lamer C.J.; and *Rodriguez*, *supra*, at p. 616. To uphold Malmo-Levine's argument for recreational choice (or lifestyle protection) on the basis of s. 15 of the Charter would simply be to create a parody of a noble purpose.

[180] An identified protected ground is a threshold question for the section 15 analysis. If there is no enumerated or analogous ground identified, there is no need to consider whether the law creates or contributes to a distinction. The section 15 challenge fails on the first step of the section 15 test.

[181] For the edification of the Safety-Critical Workers challenging the pre-placement and random testing provisions of the RegDoc, I will note a few deficiencies in their section 15 had a full analysis been merited. In particular, the Applicants did not advance any evidence, statistical or otherwise, as was done in *Fraser*, about the demographic make-up of Safety-Critical Workers, to support their claim that a disproportionate number of these Workers have drug dependencies and would be affected by the impugned provisions of the RegDoc. At the hearing, Counsel to the Applicants, relying on paragraph 57 of *Fraser v Canada (Attorney General)*, 2020 SCC 28, suggested that I take judicial notice of the existence of drug dependencies among Safety-Critical Workers. I am not prepared to do so.

[182] The Applicants also failed to explain how the impugned provisions would result in an arbitrary disadvantage for Safety-Critical Workers with drug dependencies, lacking evidence beyond a mere "web of instinct" (*Kahkewistahaw First Nation v Taypotat*, 2015 SCC 30 at para 34). Lastly, the Applicants did not demonstrate that the provisions are arbitrary, prejudicial or stereotyping (*Sharma* at para 53).

[183] Another deficiency of the section 15 arguments (beyond what I have found to be a neutral policy on both its face and in its effects) is that since the RegDoc has not been implemented, there are no concrete situations that can be addressed. No worker has yet been impacted by the implementation of the RegDoc, due to the injunction that was issued before its intended implementation date. Thus, any actual impact or potential discrimination is purely hypothetical.

[184] Indeed, this observation is applicable to the entire *Charter* analysis. The harm alleged by the Applicants as a result of potential section 8, 7 or 15 breaches is hypothetical at this point in time. It could be that the ensuing Employers' policies, implementing pre-placement and random testing at nuclear facilities in accordance with the licensing requirements of the RegDoc, could infringe workers' *Charter* rights under sections 8, 7 and 15. However, these policies have not been enacted and this Court cannot work in the realm of the hypothetical when the RegDoc and its effects are neutral on their face (*Ernst* at para 22; *Ozcevik v Canada (Revenue Agency)*, 2021 FC 13 at para 30).

[185] In light of my findings with respect to sections 8, 15 and 7 of the *Charter*, I decline to address the Parties' arguments with respect to section 1 of the *Charter*.

[186] Finally, before moving on to the Applicant's administrative law arguments, I turn back to the earlier discussion on standard of review, and the *Doré*/*Loyola* approach that I found to be inapplicable to this Application. However, even if I had applied the *Doré*/*Loyola* framework and its proportionality analysis to determine whether the CNSC's decision to adopt specific provisions in the RegDoc has an adverse effect on the rights of employees and candidates in the nuclear industry, I would have arrived at the same outcome as I did under the correctness standard. This is because the measures contained in sections 5.1 and 5.5 of the RegDoc pass *Doré* muster, because they support a proportionate balancing between, on the one hand, their objective of bolstering fitness for duty standards in order to protect the public, and on the other hand, the *Charter* rights and values of Safety-Critical Workers under sections 7, 8 and 15.

[187] After all, as argued by Professor Richard Stacey in his recent article on *Doré*, the *Oakes* framework and *Doré* approach are “merely different heuristics, or modes of reasoning” to determine whether the limit to a *Charter* right is justified, and thus both have a common underlying culture of justification (Richard Stacey, “Public Law’s Cerberus: A Three-Headed Approach to Charter Rights-Limiting Administrative Decisions” (2023) 1-36 Can J Law Jurisprud).

E. *The impugned RegDoc provisions are reasonable under administrative law*

[188] Having disposed of the constitutional arguments, I now turn to my analysis of the second issue. The administrative law issues raised by the Applicants with respect to the two RegDoc provisions are separate from the *Charter* challenges, and were raised in the alternative, in the event that the Court were to find no *Charter* breaches. That has occurred, such that I will now address these alternate arguments.

[189] Specifically, the Applicants argue from an administrative law perspective that if this Court should find the pre-placement and random testing provisions of the RegDoc constitutional, these aspects are nonetheless unreasonable because (i) there was no statutory basis for the Commission to adopt the two impugned testing provisions; and (ii) the Commission did not provide adequate reasons to justify the inclusion of the provisions in the RegDoc, particularly when addressing stakeholder concerns about the *Charter* raised during the consultation phase.

[190] I agree with the Parties that the administrative law questions at issue are reviewable on a standard of reasonableness, meaning the rationale for the RegDoc’s inclusion of pre-placement

and random testing provisions must be rational, logical and justified under the relevant law and facts (*Vavilov* at paras 102, 105).

[191] To ensure nuclear safety, Parliament created and empowered the CNSC, a highly specialized administrative body. Its expertise commands a high level of deference from reviewing courts with respect to the decisions of the Commission, as emphasized in *Citizens Against Radioactive Neighbourhoods v BWXT Nuclear Energy Inc,* 2022 FC 849 at para 42:

> [60] Where, as here, the issues at play involve detailed factual findings and discretionary decisions within the heartland of the tribunal's expertise, the reasonableness standard requires that considerable deference be given to the tribunal's determinations. This is particularly so when the issues under review concern nuclear safety and the tribunal is the nuclear safety regulator. In short, the CNSC is much better placed than a reviewing court to factually assess and determine what types of possible accidents are likely to occur at a nuclear power plant and how to conduct the assessment of the environmental impacts of potential accidents. It is therefore inappropriate for a reviewing court to second-guess these determinations through a detailed re-examination of the evidence as the appellants would have us do in the instant case.
>
> See also: *Greenpeace Canada v Canada (Attorney General),* 2016 FCA 114 at para 60

[192] It is within the unique context of the highly specialized CNSC, that I find the Commission's decision to adopt the pre-placement and random testing provisions of the RegDoc was reasonable, intelligible and justified.

(1) There is a statutory basis for the random testing provisions to be in the RegDoc

[193] The Applicants argue that the RegDoc does not have a statutory basis. First, they rely on their submissions with respect to section 8 of the *Charter* to submit that the pre-placement and

random testing provisions of the RegDoc are *ultra vires*, because they were not authorized by law, and thus were unlawful and unreasonable. Second, the Applicants argue that the Commission fettered its discretion by adopting the contested provisions using its broad licencing authority. Third, the Applicants contend that the mechanism used by the Commission to adopt the RegDoc unreasonably denied them participatory rights.

[194] The Respondents maintain that the RegDoc was authorized by law, and lawfully adopted using the Commission's broad licensing authority. The Respondents argue that the Commission had multiple tools at its disposal to implement the pre-placement and random testing provisions of the RegDoc, and that it was reasonable for the Commission to choose regulatory documents for flexibility and adaptability. The Respondents submit that this decision attracts a high level of deference, because of the unique context of, and CNSC's expertise in, the nuclear industry. The Respondents contend that the Applicants were not denied participatory rights since they were consulted during the development process of the RegDoc, and had the opportunity to submit comments and share concerns.

[195] As discussed earlier under the section 8 *Charter* analysis for the "authorized by law" requirement, the RegDoc indeed has a statutory basis: under the *Act*, the CNSC had the authority and the discretion to choose the instrument under which to implement pre-placement and random testing provisions. It chose the regulatory document as the instrument due to its flexibility and adaptability. This was a reasonable decision, informed by changing circumstances such as guidance coming from the IAEA after the nuclear accident in Fukushima, evolving international

practices, the legalization of cannabis in Canada, evolving research on the accuracy and efficacy of drug and alcohol testing, and divergent stakeholder demands.

[196] The purpose of the RegDoc further justifies the instrument chosen. CNSC staff testified that the purpose of the RegDoc is to bolster fitness for duty programs by adding more reliable methods to detect impairment, including pre-placement and random testing. This purpose does not fall directly within the scope of subparagraph 44(1)(h)(iii) of the *Act* (the regulation-making power), which is geared towards the "protection of nuclear energy workers".

[197] For example, as explained by the Respondents at the hearing, dosimetry tests, which measure the level of radiation a person is exposed to, would fall under the regulation-making power of subparagraph 44(1)(h)(iii) since dosimetry tests are a type of medical test prescribed for the protection of nuclear energy workers by ensuring they are not exposed to radiation levels that would threaten their health. By contrast, the purpose of the pre-placement and random testing measures of the RegDoc aims to protect the broader community interests and public safety.

[198] Considering these competing demands, CNSC was justified in using the broader powers under subsection 24(5) of the *Act* to add mandatory requirements to the licence. The RegDoc was always intended to be a licensing requirement, and never purported to be a non-binding policy or a guideline. Therefore, the CNSC did not fetter its discretion in passing mandatory pre-placement and random testing requirements through a regulatory document.

[199] With respect to participatory rights, the CNSC conducted broad outreach over the course of the decade during which the RegDoc was developed. The Commission provided multiple opportunities for the public – including the Applicants – to comment at various stages of the development of the RegDoc.

[200] The other mechanisms under the *Act*, which the Applicants argue the CNSC should have proceeded under – namely, the formal licence amendment process under section 25 and the regulation-making authority under section 44 – would not likely have provided the Applicants with any significant additional participatory rights beyond opportunities they received to participate in the RegDoc's development process. Pursuant to the formal licence amendment process and the regulation-making authority under subsections 39(1) and 40(1) of the *Act*, the Applicants would have been given the opportunity to appear before the Commission in a hearing, as occurred with the RegDoc.

[201] Although regulatory documents are not specifically discussed in the *Act*, they do form part of the legislative framework. They are a lawful mechanism under which to implement licence requirements, and provide for considerable stakeholder input, as occurred in the case under review.

[202] For all the reasons outlined above, the CNSC reasonably chose to use the RegDoc as the mechanism by which to include pre-placement and random testing provisions as a condition of the Employers' licences. The RegDoc and the decade-long process that led to its publication, in

which the Parties had opportunities to be heard during that lengthy consultation and development phase, all properly formed part of the CNSC's licensing basis.

(2) The Commission provided adequate reasons for the RegDoc

[203] The Applicants argue that the rationale provided by the CNSC for the inclusion of the pre-placement and random testing provisions in the RegDoc, does not meet the *Vavilov* standards of "an internally coherent and rational chain of analysis" (*Vavilov* at para 85). The Applicants submit that the RegDoc does not provide an adequate basis to explain the rationale for what amounts to such a significant new requirement for impacted Safety-Critical Workers. The Applicants further submit there is no concise set of documents to show that adequate reasons were provided, and that the thousands of pages of documents that form the Certified Tribunal Record [CTR] constitute a "data dump". They point out that this term was in fact used by a Commission member at the August 2017 public meeting.

[204] The Applicants argue that even if this Court gives deference to the institutional setting in which the RegDoc was adopted, there are fundamental gaps in the development of the pre-placement and random testing provisions that make the inclusion of these provisions in the RegDoc unjustifiable, unintelligible and unreasonable. In particular, the Applicants raise the Commission's lack of responsiveness to stakeholder concerns with *Charter* breaches.

[205] The Applicants submit that the Commission undertook no analysis of the Unions' concerns flowing from the *Charter* and from arbitral jurisprudence, despite their awareness and recognition of the impact of the impugned provisions on *Charter* rights as voiced during the

public meeting in August 2017. They also argue that the record shows that CNSC staff dealt with the core constitutional and legal concerns only in a cursory fashion. The Applicants point out that they are not making a procedural fairness argument based on the lack of reasons provided by the CNSC, but rather submit that the inadequacy of the reasons provided gives rise to the fatal flaw of the decision to include the impugned provisions in the RegDoc (*Vavilov* at para 133).

[206] The Respondents counter that the extensive CTR reveals an internally coherent and rational chain of analysis in accordance with *Vavilov*, and that the CNSC adequately addressed stakeholder concerns with respect to *Charter* rights. They rely on *Sketchley v Canada (Attorney General)*, 2005 FCA 404 at para 37 and *Gupta v Canada (Attorney General)*, 2016 FC 1089 at para 17, to submit that when a decision-maker can adopt recommendations from a body which assists it in its duties, those recommendations form a part of the decision and thus formal reasons are not required.

[207] In addition, the Respondents argue that the Commission is not a quasi-judicial tribunal, but can have a quasi-judicial role, and carry out functions such as providing punishments when it acts as a court of record under sections 20 and 48 of the *Act*. However, the creation of regulatory documents, such as the RegDoc, which serve to create new licensee requirements relating to pre-placement and random testing, falls squarely within the Commission's regulatory and administrative role, which does not require it to issue formal reasons.

[208] The SCC addressed the sufficiency of reasons at para 103 of *Vavilov*:

> [103] While, as we indicated earlier (at paras. 89-96), formal reasons should be read in light of the record and with due

> sensitivity to the administrative regime in which they were given, a decision will be unreasonable if the reasons for it, read holistically, fail to reveal a rational chain of analysis or if they reveal that the decision was based on an irrational chain of analysis: see *Wright v. Nova Scotia (Human Rights Commission)*, 2017 NSSC 11, 23 Admin. L.R. (6th) 110; *Southam*, at para. 56. A decision will also be unreasonable where the conclusion reached cannot follow from the analysis undertaken (see *Sangmo v. Canada (Minister of Citizenship and Immigration)*, 2016 FC 17, at para. 21 (CanLII)) or if the reasons read in conjunction with the record do not make it possible to understand the decision maker's reasoning on a critical point.

[209] I find that the documents in the CTR provide a rational chain of analysis to justify the inclusion of the pre-placement and random testing provisions in the RegDoc. As discussed above, the inclusion of these provisions was in response to an identified need to bolster fitness for duty programs, particularly with respect to the detection of drug and alcohol impairment.

[210] While the Applicants argue that "the reasons in conjunction with the record do not make it possible to understand the decision maker's reasons on a critical point" – that point being responsiveness to concerns about the *Charter* – I find that both the record before me and the regulatory scheme of the RegDoc show that the CNSC not only considered stakeholder concerns about *Charter* rights, but also addressed these concerns by modifying the RegDoc after considering the stakeholder feedback.

[211] Specifically, CNSC staff created "Comments Tables" to collect all the comments provided in the public feedback process from stakeholders, which included feedback from many of the Applicants and Employers, in addition to the responses to the feedback in the form of comments from CNSC staff. The Comments Tables were published on the CNSC's website for

public consultation during the development phase of the RegDoc. They form part of the reasons for the Commission's decision and show that CNSC staff reasonably considered and addressed *Charter* rights.

[212] In their responses to stakeholder comments, CNSC staff explained how the RegDoc balanced privacy interests with the CNSC's mandate to prevent unreasonable risk in various ways, including the environment, to public health and safety, and to national security, arising from the development production and use of nuclear energy.

[213] Furthermore, the statutory scheme of the final version of the RegDoc shows changes from earlier versions as being directly responsive to stakeholder concerns. The modifications made in response to public feedback include the narrowing of the categories of workers affected by the pre-placement and random testing provisions, the inclusion of the duty to accommodate, and the consideration of the *Canadian Human Rights Act*, RSC, 1985, c H-6.

[214] The flaws that the Applicants point to in the CNSC's reasons are "merely superficial or peripheral to the merits of the decision" (*Vavilov* at para 100). They have pointed to missing documents in the CTR, even though CNSC staff testified in cross-examination that these documents were sent to the Commission by staff. They also point to contradictory statements made by the Employers about the efficacy of testing methods and the sufficiency of existing impairment detection methods at the time – statements which were made over the course of the decade-long development of the RegDoc. None of these alleged flaws, in my opinion, are enough to show that the CNSC's decision to implement the RegDoc was based on an irrational

chain of analysis given the totality of the evidence before the Court, including the Reports discussed above.

V. Costs

[215] The Parties have jointly submitted that costs be awarded in a lump sum of $20,000 to either the collective group of Applicants or Respondents who prevail in this judicial review. Accordingly, the Applicants shall pay an inclusive lump sum of $20,000 to the Respondents.

VI. Conclusion

[216] For the reasons outlined above, I find the pre-placement and random testing provisions, sections 5.1 and 5.5 respectively, of the RegDoc pass constitutional muster, in that they do not breach sections 8, 15 or 7 of the *Charter*. I also find that the CNSC's decision to adopt the pre-placement and random testing provisions was reasonable from an administrative law perspective. The Application for Judicial Review is accordingly dismissed. Costs are issued to the Respondents in the amount of $20,000.

JUDGMENT in T-1222-21

THIS COURT'S JUDGMENT is that:

1. The pre-placement and random testing provisions of the RegDoc (sections 5.1 and 5.5 respectively) do not infringe sections 8, 15 or 7 of the *Charter*.
2. The CNSC's decision to adopt sections 5.1 and 5.5 of the RegDoc was reasonable.
3. The Application for Judicial Review is dismissed.
4. The Applicants shall pay an inclusive lump sum of $20,000 in costs to the Respondents.

Publishing history
August 2018   Version 1.0

Preface

The Canadian Nuclear Safety Commission (CNSC) is the federal organization responsible for regulating the use of nuclear energy and materials in Canada. It regulates to protect health, safety, security and the environment, and to implement Canada's international commitments on the peaceful use of nuclear energy. The CNSC also disseminates objective scientific, technical, and regulatory information to the public.

Regulatory document REGDOC-3.5.3, *Regulatory Fundamentals*, outlines the CNSC's regulatory philosophy and approach to applying the Nuclear Safety and Control Act. It provides information for licensees, applicants and the public, and contains neither guidance nor requirements. It replaces P-299, *Regulatory Fundamentals* (2005) and INFO-0795, *Licensing Basis - Objective and Definitions* (2010).

This regulatory document is part of the CNSC's processes and practices series of regulatory documents, which also covers information on licensing processes, compliance, and enforcement. The full list of regulatory documents is included at the end of this document, and can also be found on the CNSC's website.

Table of Contents

Regulatory Fundamentals

1. Introduction

1.1 Purpose

This regulatory document is intended for information only and does not contain any requirements for CNSC licensees. It describes the CNSC's regulatory approach and philosophy, and outlines how the CNSC applies the *Nuclear Safety and Control Act* (NSCA) and regulations made under the authority of the NSCA in its regulatory oversight. The information in this regulatory document will be of interest to anyone seeking to learn more about the CNSC and how it regulates nuclear activity in Canada.

1.2 Scope

This document describes the CNSC's regulatory activities.

2. About the CNSC

Regulation is a key instrument used by government to enable economic activity and to protect health, safety, security and the environment in Canada. The Government of Canada has determined that the use of nuclear substances and nuclear energy offers benefits, and that the associated risks must not be at an unreasonable level. These two facts drive the need for Canadian legislation and a regulatory body to oversee nuclear activities in Canada.

The NSCA came into force on May 31, 2000. It establishes the Canadian Nuclear Safety Commission (CNSC), its objects, and the framework under which it can effectively and independently meet those objects. The CNSC was established in 2000 under the NSCA and reports to Parliament through the Minister of Natural Resources. The CNSC replaced the former Atomic Energy Control Board, which was founded in 1946.

The CNSC is the sole authority in Canada to regulate the development, production and use of nuclear energy, and the production, possession and use of nuclear substances, prescribed equipment and prescribed information in order to prevent unreasonable risk. The CNSC's mandate also requires it to disseminate objective scientific, technical and regulatory information to the public.

Parliament has also given the CNSC the authority to conduct environmental assessments under the *Canadian Environmental Assessment Act, 2012*.

The CNSC has also been delegated authority to implement Canada's agreement with the International Atomic Energy Agency on nuclear safeguards verification. For more information, see the *Agreement Between the Government of Canada and the International Atomic Energy Agency for the Application of Safeguards in Connection with the Treaty on the Non-Proliferation of Nuclear Weapons* [1] and the *Protocol Additional to the Agreement between Canada and the International Atomic Energy Agency for the Application of Safeguards in Connection with the Treaty on the Non-Proliferation of Nuclear Weapons*[2].

2.1 The Commission

The Commission[1] is an independent, quasi-judicial tribunal and a court of record, with the powers, rights, and privileges necessary to carry out its duties and enforce its orders. It has a central role in CNSC operations, and operates at arm's length from the government with no ties to the nuclear industry.

The Commission has up to seven permanent members, who are appointed by the Governor in Council for terms of up to five years. One member is designated as President of the Commission and Chief Executive Officer of the CNSC.

Subject to the approval of the Governor in Council[2], the Commission may make and amend regulations as it deems necessary for attaining the objects of the NSCA. The Commission is also empowered to grant licences to conduct nuclear activities. Commission decisions are science- and safety-based; they may not be overturned by the Government of Canada, and they are reviewable only by the Federal Court of Canada. These measures help ensure the independence of the Commission.

The Governor in Council may issue directives to the CNSC. Any such directive may only be of general application on broad policy matters with respect to the objects of the Commission, and not in respect of a particular case before the Commission.

To maintain its adjudicative distance from CNSC staff, the Commission communicates with staff only through the Commission Secretariat and through formal proceedings. This separation serves to maintain the Commission's independence.

2.2 CNSC staff

The Commission employs the staff it considers necessary for the purposes of the NSCA.

The CNSC has highly skilled scientific, technical, professional and administrative personnel who carry out the work necessary to fulfill the Commission's mandate. CNSC staff perform several functions such as:

- conducting expert research and analysis
- verifying licensee compliance with regulatory requirements
- conducting activities to enforce licensee compliance, when necessary
- preparing material, known as Commission member documents (CMDs), for the Commission and appearing before the Commission at proceedings to answer questions
- carrying out a wide range of internal activities that enable the success of the CNSC's core operational work

---

[1] In this document, the term "Commission" refers to the appointed members forming the Commission.
[2] In Canada, the Governor in Council is the Governor General acting on the advice of Cabinet.

The Commission may also enter into contracts for services to receive advice and assistance in the exercise or performance of any of its powers, duties or functions under the NSCA.

2.3 What the CNSC regulates

The CNSC regulates the conduct of activities related to the use, production and distribution of nuclear energy and substances as defined by section 26 of the NSCA. This includes activities related to:

- uranium mines and mills
- uranium fuel fabrication and processing
- nuclear power plants
- nuclear substance processing
- industrial and medical applications
- nuclear research and educational activities
- transportation of nuclear substances
- nuclear security and safeguards
- import and export activities
- waste management facilities

3. The CNSC's Regulatory Framework

The CNSC's regulatory framework (see figure 1) consists of the *Nuclear Safety and Control Act* (NSCA) and other laws passed by Parliament that govern the regulation of Canada's nuclear industry, as well as regulations, licences and documents that the CNSC uses to regulate the industry.

Figure 1: Key elements of the CNSC's regulatory framework

The regulatory framework also includes guidance, which is used to inform the applicant or licensees on how to meet requirements, elaborate further on requirements, or provide best practices. While the CNSC sets requirements and provides guidance on how to meet requirements, an applicant or licensee may put forward a case to demonstrate that the intent of a requirement is addressed by other means. Such a case must be demonstrated with supportable evidence. CNSC staff consider guidance when evaluating the adequacy of any case submitted. This does not mean that the requirement is waived; rather, it is an indication that the regulatory framework provides flexibility for licensees to propose alternative means of achieving the intent of the requirement. The Commission is always the final authority as to whether the requirement has been met.

CNSC requirements and guidance take into account international regulatory best practices and modern codes and standards, and align with the International Atomic Energy Agency's Safety Fundamentals and Safety Requirements. The CNSC cooperates with other organizations and jurisdictions to foster the development and application of a consistent, effective regulatory framework in Canada and for international nuclear regulators. The CNSC welcomes stakeholder feedback on its regulatory framework at any time.

Further information on the CNSC's regulatory framework can be found on the CNSC's Regulatory framework overview Web page.

3.1 The *Nuclear Safety and Control Act*

The NSCA establishes the CNSC's mandate to regulate the development, production, and use of nuclear energy and the production, possession and use of nuclear substances, prescribed equipment and prescribed information in Canada.

The mandate of the CNSC is informed by the objects of the Commission, set out in section 9 of the NSCA, which are:

> (a) to regulate the development, production and use of nuclear energy and the production, possession and use of nuclear substances, prescribed equipment and prescribed information in order to
>
> (i) prevent unreasonable risk, to the environment and to the health and safety of persons, associated with that development, production, possession or use,
> (ii) prevent unreasonable risk to national security associated with that development, production, possession or use, and
> (iii) achieve conformity with measures of control and international obligations to which Canada has agreed; and
>
> (b) to disseminate objective scientific, technical and regulatory information to the public concerning the activities of the Commission and the effects, on the environment and on the health and safety of persons, of the development, production, possession and use referred to in paragraph (a).

When making licensing decisions, the Commission is guided by section 24, paragraph 4 of the NSCA, which states:

> No licence shall be issued, renewed, amended or replaced — and no authorization to transfer one given — unless, in the opinion of the Commission, the applicant or, in the case of an application for an authorization to transfer the licence, the transferee

(a) is qualified to carry on the activity that the licence will authorize the licensee to carry on; and
(b) will, in carrying on that activity, make adequate provision for the protection of the environment, the health and safety of persons and the maintenance of national security and measures required to implement international obligations to which Canada has agreed.

3.2 Regulations made under the *Nuclear Safety and Control Act*

The regulations made under the NSCA provide further legislative authority with respect to topic-specific considerations, using a combination of prescriptive and performance-based approaches. Prescriptive approaches tell licensees exactly what they need to do to meet requirements, whereas performance-based approaches set specific performance measures that licensees must meet with respect to particular aspects of their licensed activities.

There are 13 regulations under the NSCA, including the *General Nuclear Safety and Control Regulations* and the *Radiation Protection Regulations*. Regulations under the NSCA describe the general application of requirements for nuclear activity in Canada, and also provide requirements for Class I and Class II nuclear facilities, uranium mines and mills, and the use of nuclear substances. The Canadian Nuclear Safety Commission By-laws and the *Canadian Nuclear Safety Commission Rules of Procedure* define the management and conduct of the Commission's affairs.

More information about all regulations under the NSCA can be found on the List of regulations on the CNSC website.

3.3 Licences and certificates

3.3.1 Licences

Section 26 of the NSCA describes activities that no person shall conduct except in accordance with a licence. The NSCA gives the Commission the power to grant licences for these activities.

All applicable licence conditions are reflected in the respective licence, including those that require the licensee to ensure that qualified personnel carry out the licensed activities, and that adequate provision is made for the protection of the environment, the health and safety of persons, and the maintenance of Canada's domestic and international obligations.

For more information on licensing, see section 6.1 of this document.

3.3.2 Certificates

The CNSC also issues certificates for people to carry out prescribed duties and for the use of prescribed equipment, and for the packaging and transport of nuclear substances. In each case, the certificate sets out applicable regulatory requirements. See section 5.4 for more information on certification.

3.4 CNSC regulatory documents and industry standards

In addition to the NSCA and the regulations made under it, the CNSC has developed regulatory documents, which are a key part of its regulatory framework for nuclear activities in Canada. They provide additional clarity to licensees and applicants by explaining how to meet the requirements set out in the NSCA and the regulations made under it. Regulatory documents are organized into three key categories: regulated facilities and activities, safety and control areas, and other areas of regulatory engagement.

The CNSC maintains an efficient and streamlined regulatory framework by making appropriate use of industry standards. These include, but are not limited to, standards created by independent, third-party standard-setting organizations such as the CSA Group, the American Society of Mechanical Engineers, the International Commission on Radiological Protection and the Institute of Electrical and Electronics Engineers. Industry or international standards may be referenced in CNSC regulatory documents.

More information about the CNSC's regulatory documents and CSA Group nuclear standards can be found on the CNSC's Regulatory documents Web page.

3.5 Safety and control areas

Safety and control areas (SCAs) are the technical topics that CNSC staff use to assess, review, verify and report on regulatory requirements and performance across all regulated facilities and activities. By providing a common language and architecture, SCAs improve understanding and communication within the CNSC, as well as between the CNSC and licensees, the Commission and other stakeholders. The CNSC's 14 SCAs are organized in three functional areas: management, facility and equipment, and core control processes.

SCAs do not constrain the CNSC in its conduct of regulatory oversight activities. Additional topics may be added as needed to provide satisfactory assurance of compliance.

Appendix B provides a table that lists the SCAs and their respective specific areas.

3.6 Role of consultation in the regulatory framework

Consultation with the public, licensees and other stakeholders is an integral component of developing the CNSC's regulatory framework. Regulations and regulatory documents published by the CNSC are generally subject to a formal public consultation process. Meetings and workshops may be organized to engage stakeholders and solicit feedback on the development of regulatory policies, requirements and guidance, and on what regulatory instruments are appropriate.

When proposing changes to the regulatory framework, the CNSC uses a variety of means to actively seek input from licensees, the public, non-governmental organizations, all levels of government, and international stakeholders. All input gained from these activities is considered when the CNSC develops and maintains its regulatory instruments. The CNSC uses discussion papers to solicit early feedback from stakeholders about the development of new or amended regulations, and when it is considering new areas of oversight or exercising its existing regulatory authority in a new manner.

The CNSC communicates openly and transparently with stakeholders, while respecting Canada's access to information and privacy laws. It consults stakeholders when establishing priorities, developing policies and planning programs and services. The CNSC also cooperates with other jurisdictions to increase efficiency and effectiveness; for example, entering into formal arrangements where appropriate.

4. Public and Aboriginal engagement

4.1 Commission proceedings

Commission proceedings include public hearings and public meetings. At public hearings, the Commission hears information pertaining to the making of licensing and certification decisions. Public meetings are used to brief the Commission about significant developments that affect the nuclear regulatory process, or to ask the Commission to make administrative decisions or deal with administrative issues.

Interested parties can be heard in the public hearing process. With respect to public meetings, interested parties are invited to observe, but do not usually participate. Hearings and meetings can also be viewed online as webcasts.

4.2 Dissemination of objective scientific, technical and regulatory information

As part of its mandate to disseminate objective scientific, technical, and regulatory information, the CNSC informs the public about the development, production, possession, transport and use of nuclear substances on an ongoing basis. This is accomplished through various means, including:

- regulatory documents, decisions, reports, and plans posted to the CNSC website
- public Commission hearings and meetings
- live webcasts during Commission hearings and meetings
- social media platforms (YouTube, Facebook, Twitter and LinkedIn) and online resources (available on the CNSC website) that provide technical and scientific information in plain language
- public information sessions
- public consultation on, and publication of, regulations and regulatory documents
- sessions across Canada, to familiarize people with the CNSC and its role, and how they can participate in CNSC regulatory processes

In addition, the CNSC encourages its experts to share their knowledge, and it publishes scientific and technical paper abstracts, as well as journal articles authored by CNSC staff on its website. Staff also attend national fairs and conferences that specifically target youth, municipalities, and the medical community. This ongoing dialogue is important for increasing public understanding and trust in the CNSC.s role of protecting Canadians, their health, and the environment.

4.3 Aboriginal consultation and engagement

The CNSC seeks opportunities to work with Indigenous Peoples to understand any concerns they may have about the nuclear sector, and to ensure the safe and effective regulation of nuclear energy and materials.

As an agent of the Crown, the CNSC is responsible for fulfilling its legal duty to consult, and where appropriate, accommodate Indigenous Peoples when its decisions may have an adverse impact on potential or established Aboriginal and/or treaty rights pursuant to section 35 of the *Constitution Act, 1982*.

The CNSC's approach to Aboriginal consultation includes commitments to uphold the honour of the Crown through information sharing, relationship building and promoting reconciliation, as well as to meeting its common-law duty to consult. The CNSC supports a coordinated, whole-of-government approach to improve the efficiency and effectiveness of the consultation process.

The CNSC cannot delegate its obligation, but can assign procedural aspects of the consultation process to licensees. In many cases, licensees are best positioned to collect information and propose any appropriate additional measures. The information collected and measures proposed by licensees to avoid, mitigate or offset adverse impacts is used by the CNSC in meeting its obligations and in its efforts toward reconciliation.

For further information on the CNSC's approach to Indigenous consultation and engagement, see REGDOC-3.2.2, *Aboriginal Engagement* [3].

5. The CNSC's Regulatory Approach

As discussed earlier in this document, the CNSC regulates to prevent unreasonable risk to the environment, the health and safety of persons, and national security. To this end, the CNSC has established a licensing and compliance system to ensure that all persons who use or possess nuclear substances and radiation devices do so in accordance with a licence, and that regulated parties have safety and security provisions in place that ensure compliance with regulatory requirements.

This section addresses the major elements that comprise the CNSC's regulatory approach.

5.1 Regulatory philosophy

The CNSC's regulatory philosophy is based on the following:

- Licensees are directly responsible for managing regulated activities in a manner that protects health, safety, security and the environment, and that conforms with Canada's domestic and international obligations on the peaceful use of nuclear energy.
- The CNSC is accountable to Parliament and to Canadians for assuring that these responsibilities are properly discharged.

The CNSC therefore ensures that regulated parties are informed about requirements and provided with guidance on how to meet them, and then verifies that all regulatory requirements are and continue to be met.

5.2 Continuous improvement

The CNSC is committed to continuous improvement of both its internal operations and its regulation of the Canadian nuclear industry. The CNSC therefore requires licensees to strive to further reduce the risks associated with their licensed activities on an ongoing basis. It assesses how licensees manage risk during both normal operations and in response to potential accident conditions applying concepts such as the ALARA[3] principle and defence in depth (see section 4.3,). In its assessments, the CNSC considers how licensees continuously evaluate, manage, and further reduce uncertainties with respect to hazards and safety issues. This also includes assessing how licensees consider additional safety and mitigation options as techniques and technologies evolve.

5.3 Defence in depth

CNSC requirements necessitate the implementation of defence in depth (DiD) in the design, construction and operation of nuclear facilities or the undertaking of nuclear activities. With DiD, more than one level of defence (i.e., protective measure) is in place for a given safety objective, so that the objective will still be achieved even if one of the protective measures fails.

To achieve this, multiple independent level of defence must be put into place to the extent practicable, taking organizational, behavioural, and engineered safety and security elements into account, such that no potential human or mechanical failure relies exclusively on a single level of defence.

DiD applies to a wide range of facilities and activities. Appendix A illustrates how the different levels are defined for nuclear power plants.

5.3.1 Emergency preparedness

With regard to emergency preparedness and response, the CNSC has multiple emergency-related roles that translate to reducing risk in the event of an emergency. The CNSC regulates licensees' onsite emergency plans at nuclear facilities, ensures that applicants provide support to and have arrangements in place with offsite authorities (such as municipal and provincial governments), and is also part of the whole-of-government approach to federal nuclear emergency planning.

In the unlikely event of a nuclear emergency, the CNSC's role is to monitor and evaluate the actions of any nuclear operators involved, provide technical advice and regulatory directives when required, and inform the government and the public of its assessment of the situation. The CNSC's emergency preparedness program ensures well-coordinated, suitable responses to emergencies by integrating with nuclear operators; municipal, provincial and federal government agencies; first responders; and international organizations. The program is regularly tested through exercises that involve simulated incidents in coordination with licensees and government agencies.

---

[3]A principle of radiation protection that holds that exposures to radiation are kept as low as reasonably achievable (ALARA) , social and economic factors taken into account. Section 4 of the *Radiation rotection Regulations* stipulates licensee requirements with respect to ALARA. A similar principle, best available technology and techniques economically achievable (BATEA), may also be applied to releases of hazardous substances.

5.4 Graded approach

The graded approach is a systematic method or process by which elements such as the level of analysis, the depth of documentation and the scope of actions necessary to comply with requirements are commensurate with:

- the relative risks to health, safety, security, the environment and the implementation of international obligations to which Canada has agreed
- the particular characteristics of a nuclear facility or licensed activity

The CNSC applies the graded approach to licensing and compliance activities.

This approach is driven primarily by assessment of the risk associated with the activities being regulated, and the performance history of the licensee.

The degree of oversight is also informed by:

- the complexity and potential harm posed by the licensed activity
- technical assessments of submissions
- relevant research
- information supplied by parties to Commission proceedings
- international activities that advance knowledge in nuclear and environmental safety
- cooperation with other regulatory bodies

When applying the risk-informed approach, the following principles are adhered to:

- the meeting of regulatory requirements
- the maintenance of sufficient safety margins
- the maintenance of defence in depth

If a licensee cannot achieve the required level of safety, it will not be permitted in any case to continue conducting its licensed activities.

5.5 Protection of the environment

Environmental protection is a shared federal–provincial responsibility. The CNSC cooperates with other jurisdictions and departments and, where appropriate, enters into formal arrangements to protect the environment more effectively and to coordinate regulatory oversight.

The CNSC's environmental protection mandate includes design objectives and best practices to minimize or eliminate the release of nuclear or hazardous substances to the environment. Environmental protection measures are commensurate with the level of risk associated with the activity. The CNSC determines whether a licensee or applicant will make adequate provision to protect the environment against unreasonable risk, and verifies compliance with associated regulatory requirements.

For further information on environmental protection, see REGDOC-2.9.1, *Environmental Principles, Assessments and Protection Measures* [4].

5.6 Protection of the health and safety of persons

The CNSC sets dose limits that are within the protective health limits and establishes regulations that set requirements to prevent unreasonable risk to the health and safety of persons. These limits are described in the *Radiation Protection Regulations* and are consistent with the recommendations of the International Commission on Radiological Protection (ICRP).

The *Radiation Protection Regulations* also require every licensee to implement a radiation protection program that takes into consideration the ALARA principle.

In addition to radiological hazards, regulating to prevent unreasonable risk to the health and safety of persons addresses conventional health and safety hazards.

5.7 Protection of national security

To prevent risk to national security, the CNSC works closely with nuclear facility operators, law enforcement and intelligence agencies, international organizations, and other governmental departments to ensure that nuclear substances and facilities are adequately protected. Nuclear security in Canada is aided by the *Nuclear Security Regulations* under the *Nuclear Safety and Control Act*. These regulations set out detailed security requirements for licensed nuclear facilities and other regulated activities.

5.8 International obligations

The CNSC participates in international fora to provide global nuclear leadership and to benefit from international experience and best practices. It also participates in undertakings implemented by the International Atomic Energy Agency (IAEA) (for example, IAEA peer reviews), the ICRP and other international organizations, as well as in activities under certain treaties such as the *Convention on Nuclear Safety* [5].

These international activities help inform the CNSC's decision-making processes to:

- understand and compare various ways of evaluating and mitigating risks
- share research and operational experience

5.9 Nuclear non-proliferation

The CNSC is responsible for implementing Canada's nuclear non-proliferation commitments and government policy:

- to assure Canadians and the international community that Canada's nuclear exports do not contribute to the development of nuclear weapons or other nuclear explosive devices
- to promote a more effective and comprehensive international nuclear non-proliferation regime

The international *Treaty on the Non-Proliferation of Nuclear Weapons* [6] (NPT) is the cornerstone of Canada's efforts to promote its objectives of international disarmament, non-proliferation, and the peaceful use of nuclear energy. NPT commitments to which Canada has agreed include:

- to not receive, manufacture, or acquire nuclear weapons or other nuclear explosive devices

- to accept IAEA safeguards on all nuclear material for peaceful use in Canada
- to ensure that Canada's nuclear material exports are subject to IAEA oversight

The CNSC implements these commitments through the NSCA and corresponding regulations, including the *Nuclear Non-proliferation Import and Export Control Regulations*.

5.10 Safeguards

The term "safeguards" refers to the measures taken by the IAEA, in accordance with the NPT, to verify that nuclear material is not diverted from peaceful uses to the development of nuclear weapons. The safeguards agreements between the Government of Canada and the IAEA give the IAEA the right and obligation to monitor Canada's nuclear-related activities, and to verify nuclear material inventories and flows in Canada.

Through its regulatory oversight, the CNSC ensures that all applicable licensees have safeguards programs in place to allow for:

- monitoring and reporting on nuclear material and activities
- providing IAEA safeguards inspectors with access to areas where nuclear material is stored, and to certain specified nuclear-related manufacturing and research activities
- providing operational and design information for nuclear facilities to the IAEA

Where required by the safeguards agreements, the CNSC compiles licensee information and submits it to the IAEA on behalf of the Government of Canada. The CNSC also cooperates with the IAEA in developing new safeguards approaches for Canadian facilities, and contributes to efforts to strengthen IAEA safeguards internationally.

6. Licensing and Certification

The Commission makes independent, objective and risk-informed decisions, taking into consideration all of the information provided by applicants, stakeholders, Indigenous peoples, and staff. CNSC staff make recommendations to the Commission based on thorough assessment of factual evidence. The Commission recognizes the role of professional judgment, particularly in areas where no objective standards exist.

6.1 Licensing

The licensing process consists of submission of a licence application, an assessment of the application by CNSC staff, and a decision by the Commission. The CNSC considers both the complexity of the nuclear activity and the regulatory approach determined to be the most appropriate, given the relative risks.

6.1.1 Licensing basis

The licensing basis sets the boundary conditions for a regulated activity, and establishes the basis for the CNSC's compliance program for that regulated activity.

All licensees are required to conduct their activities in accordance with the licensing basis, which is defined as a set of requirements and documents for a regulated activity comprising the following:

1. The regulatory requirements set out in the applicable laws and regulations
2. The conditions and safety and control measures described in the licence, and the documents directly referenced in that licence
3. The safety and control measures described in the licence application and the documents needed to support that licence application

Documents needed to support the licence application are those documents that demonstrate that the applicant is qualified to carry out the licensed activity, and that appropriate provisions are in place to protect worker and public health and safety, to protect the environment, and to maintain national security and measures required to implement international obligations to which Canada has agreed. Examples are detailed documents supporting the design, safety analyses and all aspects of operation to which the licensee makes reference, documents describing conduct of operations, and documents describing conduct of maintenance.

6.1.2 Licence conditions handbook

The CNSC's licensing regime includes the licence conditions handbook (LCH), which is a companion piece to interpret a licence. The general purpose of the LCH is, for each licence condition, to clarify the regulatory requirements and other relevant parts of the licensing basis.

The LCH, which should be read in conjunction with the licence, provides compliance verification criteria that the licensee must follow to comply with licence conditions, operational limits and information on delegation of authority and applicable versions of documents referenced in the licence. The LCH also provides non-mandatory recommendations and guidance on how to comply with licence conditions and criteria.

6.2 Certification

Certification applies to persons carrying out prescribed duties and the use of prescribed equipment, and to the packaging and transport of nuclear substances.

6.2.1 Certification of persons

Positions identified in regulations or a licence must hold a CNSC certification. The purpose of personnel certification is to regulate personnel who are assigned to positions that have a direct impact on the safe operation of a facility, or on the health and safety of workers, the public or the environment.

The CNSC's regulatory framework defines CNSC requirements and expectations for certification processes, including the qualifications, training, and examinations necessary to become certified, and the work experience, training and testing necessary to maintain a certification.

6.2.2 Certification of prescribed equipment

Certification of equipment is an attestation from the CNSC that prescribed equipment[4] is safe for use by qualified personnel. No prescribed equipment – barring exemptions such as smoke detectors and other equipment with a very small amount of a nuclear substance – can be used in Canada unless it is certified model or used in accordance with a CNSC licence.

6.2.3 Certification of transport packaging

The CNSC issues licences and certificates for packaging and transport of nuclear substances, as stipulated in the *Packaging and Transport of Nuclear Substances Regulations, 2015* (PTNSR 2015). These regulations are based on the IAEA's *Regulations for the Safe Transport of Radioactive Material* (2012 Edition) (IAEA Regulations).

The CNSC's REGDOC-2.14.1, *Information Incorporated by Reference in Canada's Packaging and Transport of Nuclear Substances Regulations, 2015*,[7] helps the regulated community comply with the PTNSR 2015. REGDOC-2.14.1 links provisions in the regulations to relevant content in the IAEA Regulations, the *Nuclear Safety and Control Act* (NSCA), other CNSC regulations, and other related information.

The CNSC regulates all aspects of the packaging and transport of nuclear substances, including the design, production, use, inspection, maintenance and repair of packages. In addition, the PTNSR 2015 require certain types of package design to be certified by the CNSC before being used in Canada. The PTNSR 2015 also provide for the certification of special form radioactive material confirming that the sealed source containing the radioactive material is designed to be strong enough to maintain leak tightness under the conditions of use and wear for which the sealed source was designed.

---

[4]Prescribed equipment is defined as the equipment prescribed by section 20 of the *General Nuclear Safety and Control Regulations*.

Note 1: Section 20 of the *General Nuclear Safety and Control Regulations* states that each of the following items is prescribed equipment for the purposes of the *Nuclear Safety and Control Act* (NSCA):

(a) a package, special form radioactive material, low dispersible radioactive material, fissile-excepted radioactive material, radioactive material that has a basic radionuclide value that is not listed in the IAEA Regulations and an instrument or article that has an alternative activity limit for an exempt consignment, as those terms are defined in subsection 1(1) of the *Packaging and Transport of Nuclear Substances Regulations, 2015*;
(b) a radiation device and a sealed source, as defined in section 1 of the *Nuclear Substances and Radiation Devices Regulations*;
(c) Class II prescribed equipment, as defined in section 1 of the *Class II Nuclear Facilities and Prescribed Equipment Regulations*; and
(d) equipment that is capable of being used in the design, production, operation or maintenance of a nuclear weapon or nuclear explosive device.

Note 2: All controlled nuclear equipment is prescribed equipment for the purposes of the NSCA, with respect to the import and export of that equipment.

6.3 Pre-licensing and pre-certification engagement

The CNSC provides applicants with the option to engage in pre-licensing or pre-certification activities to facilitate discussion between stakeholders, the CNSC and any other relevant government bodies prior to submitting a licence or certificate application. These interactions may facilitate understanding of regulatory processes and requirements, while also allowing for early identification and resolution of potential regulatory or technical issues. Pre-licensing and pre-certification activities can only inform a licensing or certification process; they do not result in issuance of a licence or certificate under the NSCA, and in no way fetter the Commission's decision-making authority.

Pre-licensing engagement can vary in complexity from process-related questions to technical assessments that provide feedback to a potential applicant. An example of a pre-licensing technical assessment is a CNSC review of a proposed facility design to identify problems and means for their resolution.

Pre-licensing and pre-certification activities may also allow potential regulatory or technical issues to be identified early on, and improve an applicant's understanding of the CNSC's regulatory processes and requirements.

6.4 Application assessment by CNSC staff

When the CNSC receives a licence application, staff evaluate it to determine if the proposed safety and control measures described in the application, and the documents needed to support the application, are adequate meet applicable requirements.

Documents needed to support the licence application are those documents that demonstrate that the applicant is qualified to carry out the licensed activity, and that appropriate provisions will be made to protect worker and public health and safety, to protect the environment, and to maintain national security and measures required to implement international obligations to which Canada has agreed. Examples include detailed documents supporting the design, safety analyses and all aspects of operation to which the applicant makes reference; documents describing conduct of operations; and documents describing conduct of maintenance.

Regulatory documents and industry standards may be referenced in the information supplied by an applicant in support of its licence application, and are used by CNSC staff to evaluate the application. These regulatory documents and standards become part of the licensing basis when referenced in the licence application or its supporting documentation, or when directly referenced in a licence.

Information submitted in support of an application must demonstrate that proposed safety and control measures will meet or exceed CNSC expectations. All submissions are expected to be supported by appropriate analytical, experimental or other suitable evidence. When deciding whether to renew an existing licence, the Commission also considers past performance by verifying compliance history.

Technical assessments are conducted to support licensing, compliance, regulatory decision making and development of regulatory positions. CNSC staff perform these assessments based on the best available science (such as technical knowledge and analytical methods), taking operating experience into consideration. Technical assessments determine whether submitted documents and supporting evidence presented to the CNSC by any stakeholder have a sound technical basis, measured against the CNSC regulatory framework. These assessments address the completeness (coverage and adequacy), comprehensiveness (depth), and the validity of the rationale and technical justification provided in submissions, and are also used to verify licensee compliance with regulatory requirements.

If CNSC staff conclude that an application is not complete or satisfactory, the applicant will be asked to submit additional information. Normally, applications do not proceed to a decision until staff are satisfied with the application.

6.5 Licensing and certification decisions

Licensing decisions include the issuance, refusal, amendment, renewal, suspension, revocation, replacement or transfer of a licence. Certification and decertification are determined by way of certification decisions. The CNSC's independence and transparency in decision making are supported by fair, open, transparent and predictable regulatory processes. Commission hearings provide stakeholders with the opportunity to be heard, and the Commission takes stakeholder input into consideration in its decision-making processes, In addition, the Commission recognizes the role of professional judgment, particularly in areas where no objective standards exist.

The Commission is the overall decision-making authority for all licensing matters. For decisions related to some low-risk facilities or activities, the Commission delegates its decision-making authority to certain CNSC staff members called designated officers (DOs). For more risk-significant facilities and activities, decisions are made by the Commission.

CNSC staff make recommendations to the Commission, and the Commission considers those recommendations along with input from external stakeholders (including the applicant or licensee) in its decision making. The Commission or the DO issues the licence or certificate, adding conditions as appropriate.

If the Commission deems it to be in the public interest to do so, then licensing decisions involve public hearings before the Commission. Commission proceedings are open to the public and are webcast live on the CNSC website.

7. Compliance

Once a license is issued, CNSC staff continue oversight through a compliance program. Compliance is defined as conformity by regulated persons or organizations with the requirements of the *Nuclear Safety and Control Act* (NSCA), the regulations made under the NSCA, licences, certificates, decisions, and orders made by the CNSC.

The licensee bears the primary responsibility for safety at all times, including compliance with regulatory requirements. The CNSC undertakes necessary and reasonable measures to ensure compliance. These measures include influencing compliance awareness, verification and enforcement (see sections 7.2 to 7.4 for more information on compliance verification and enforcement).

The CNSC holds information sessions and communicates with licensees regularly, in order to increase licensees' awareness of their responsibilities and to promote compliance.

7.1 Planning of compliance verification activities

The CNSC's compliance planning process ensures that compliance activities are carried out in a systematic and risk-informed manner. Annual compliance work plans outline the scope, scheduling, resourcing and timeframe for the activities to be undertaken for the next compliance cycle for a particular licence or class of licence.

The CNSC has developed a set of compliance verification activities that are based on the ongoing review of previous compliance findings and operational information. Once approved by the CNSC, any changes proposed by the licensee during the course of the given year are evaluated and documented using a risk-informed approach. Progress reviews are conducted periodically to monitor execution of the plan.

7.2 Compliance verification

The CNSC inspects and reviews operational activities and documentation to verify licensee compliance with requirements. The frequency, scope, type and depth of these inspections and reviews are risk-informed. Where there may be overlap in regulatory oversight with other regulatory bodies, the CNSC coordinates its verification activities to optimize efficiency and reduce administrative burden on licensees.

To evaluate licensee compliance, the CNSC conducts both field verification activities and desktop reviews.

Field verification activities include inspections and other surveillance and monitoring activities. Inspection is the process by which the CNSC inspectors gather data from the site of a licensed activity and analyze the data, for the purpose of confirming that workers, activities, facilities, and equipment are in compliance with the given licensing basis.

CNSC inspections are led by designated inspectors and are planned, controlled, coordinated, consistent and transparent (open to formal scrutiny). Conducted in alignment with the SCAs, the objectives of inspections are defined and communicated to licensees. Licensees are also made aware of inspection criteria, and of the standards of performance and methodologies being used.

Desktop reviews generally entail consideration of documents and reports, such as quarterly technical reports, annual compliance reports, special reports, and documentation related to design, safety analysis, programs and procedures. Licensees are required to provide information to the CNSC through baseline reporting (scheduled) and event reporting. They are also expected to notify the CNSC of changes to operating processes, procedures or programs, or to submit written requests of such changes. In all cases, the CNSC assesses this information to ensure that operations remain within the licensing basis.

Where a deficiency or deviation is either self-identified by the licensee or detected by CNSC staff, the regulated party is expected to address or correct the situation promptly. If necessary, the CNSC may also take enforcement action to compel compliance with regulatory requirements.

7.3 Enforcement

The purpose of enforcement is to compel licensees or regulated persons back into compliance where non-compliance is detected. The CNSC does not take enforcement action to punish, but rather to encourage compliance, to maintain continued safety, and to deter further non-compliance.

The CNSC uses a graded approach to enforcement. Regulated parties typically identify and self-correct non-compliances on an ongoing basis; however, where enforcement is indicated, the appropriate enforcement action for the given situation is determined, taking into account such considerations as:

- the risk significance of the non-compliance with respect to health, safety, security, the environment and international obligations
- the circumstances that lead to the non-compliance (including acts of willfulness)
- the compliance history of the regulated party
- operational and legal constraints (for example, the *Directive to the Canadian Nuclear Safety Commission Regarding the Health of Canadians*)
- industry-specific considerations

Enforcement actions include informal discussion, orders, administrative monetary penalties and legal prosecution. Any enforcement action can be used independently or in combination with others, resulting in a wide range of options for the CNSC.

7.4 Compliance reporting

CNSC staff report to the Commission, the public, licensees, the Government of Canada, the International Atomic Energy Agency, and other interested parties on the results of compliance verification and enforcement activities. Compliance reports document the safety performance of regulated activities, and are based on the CNSC's independent evaluation of compliance and licensee performance.

Appendix A: Levels of Defence in Depth for Nuclear Power Plants

Defence in depth is a principle implemented primarily through a combination of multiple consecutive and independent levels of protection. For nuclear power plants, defence in depth consists of different levels of equipment and procedures to maintain the effectiveness of physical barriers placed between radioactive materials and workers, the public, or the environment. Table A shows an example of the objectives and implementation of each level in a defence-in-depth regime for a nuclear power plant.

Table A: Objectives and implementation of defence in depth for nuclear power plants

Level	Objective	Implementation
1	Normal operation: To prevent deviations from normal operation, and to prevent failures of structures, systems and components (SSCs) important to safety.	• Conservative design • High-quality materials, manufacturing and construction (e.g. appropriate design codes and materials, design procedures, equipment qualification, control of component fabrication and plant construction, operational experience) • A suitable site was chosen for the plant with consideration of all external hazards (e.g. earthquakes, aircraft crashes, blast waves, fire, flooding) in the design • Qualification of personnel and training to increase competence • Strong safety culture • Operation and maintenance of SSC in accordance with the safety case
2	Operational occurrences: To detect and intercept deviations from normal operation, to prevent AOOs from escalating to accident conditions and to return the plant to a state of normal operation.	• Inherent and engineered design features to minimize or exclude uncontrolled transients to the extent possible • Monitoring systems to identify deviations from normal operation • Operator training to respond to reactor transients
3	Design basis accidents: To minimize the consequences of accidents and prevent escalation to beyond design basis accidents.	• Inherent safety features • Fail-safe design • Engineered design features, procedures that minimize design basis accident (DBA) consequences • Redundancy, diversity, segregation, physical separation, safety system train/channel independence, single-point failure protection • Instrumentation suitable for accident conditions • Operator training for postulated accident response

4	Beyond design basis accidents: To ensure that radioactive releases caused by beyond design basis accidents, including severe accidents, are kept as low as practicable.	• Beyond design basis accidents guidance to manage accidents and mitigate their consequences as far as practicable • Robust containment design with features to address containment challenges (e.g. hydrogen combustion, overpressure protection, core concrete interactions, molten core spreading and cooling) • Complementary design features to prevent accident progression and to mitigate the consequences • Features to mitigate radiological releases (e.g. filtered vents)
5	Mitigation of radiological consequences: To mitigate the radiological consequences of potential releases of radioactive materials that may result from accident conditions.	• Emergency support facilities • Onsite and offsite emergency response plans and provisions • Plant staff training on emergency preparedness and response

Appendix B: Safety and Control Area Framework

The CNSC's regulatory requirements and expectations for the safety performance of programs are organized into a framework made up of 3 functional areas and 14 safety and control areas (SCAs), which are subdivided into specific areas. Table B outlines each functional area and their respective SCAs and specific areas.

Table B: Key elements of the CNSC's Safety and Control Area Framework

Functional area	Safety and control area	Specific area
Management	1. Management system	Management system
		Organization
		Performance assessment, improvement and management review
		Operating experience (OPEX)
		Change management
		Safety culture
		Configuration management
		Records management
		Management of contractors
		Business continuity
	2. Human performance management	Human performance program
		Personnel training
		Personnel certification
		Initial certification examinations and requalification tests
		Work organization and job design
		Fitness for duty
	3. Operating performance	Conduct of licensed activities
		Procedures
		Reporting and trending
		Outage management performance
		Safe operating envelope
		Severe accident management and recovery
		Accident management and recovery

Functional area	Safety and control area	Specific area
Facility and equipment	4. Safety analysis	Deterministic safety analysis
		Hazard analysis
		Probabilistic safety assessment
		Criticality safety
		Severe accident analysis
		Management of safety issues (including R&D programs)
	5. Physical design	Design governance
		Site characterization
		Facility design
		Structure design
		System design
		Component design
	6. Fitness for service	Equipment fitness for service / equipment performance
		Maintenance
		Structural integrity
		Aging management
		Chemistry control
		Periodic inspection and testing
Core control processes	7. Radiation protection	Application of ALARA
		Worker dose control
		Radiation protection program performance
		Radiological hazard control
		Estimated dose to public
	8. Conventional health and safety	Performance
		Practices
		Awareness
	9. Environmental protection	Effluent and emissions control (releases)
		Environmental management system (EMS)

Functional area	Safety and control area	Specific area
		Assessment and monitoring
		Protection of the public
		Environmental risk assessment
	10. Emergency management and fire protection	Conventional emergency preparedness and response
		Nuclear emergency preparedness and response
		Fire emergency preparedness and response
	11. Waste management	Waste characterization
		Waste minimization
		Waste management practices
		Decommissioning plans
	12. Security	Facilities and equipment
		Response arrangements
		Security practices
		Drills and exercises
	13. Safeguards and non-proliferation	Nuclear material accountancy and control
		Access and assistance to the IAEA
		Operational and design information
		Safeguards equipment, containment and surveillance
		Import and export
	14. Packaging and transport	Package design and maintenance
		Packaging and transport
		Registration for use

Glossary

For definitions of terms used in this document, see REGDOC-3.6, *Glossary of CNSC Terminology*.

REGDOC-3.6 includes terms and definitions used in the *Nuclear Safety and Control Act* and the regulations made under it, as well as in CNSC regulatory documents and other publications. REGDOC-3.6 is provided for reference and information.

CNSC Regulatory Document Series

Facilities and activities within the nuclear sector in Canada are regulated by the Canadian Nuclear Safety Commission (CNSC). In addition to the *Nuclear Safety and Control Act* and associated regulations, these facilities and activities may also be required to comply with other regulatory instruments such as regulatory documents or standards.

Effective April 2013, the CNSC's catalogue of existing and planned regulatory documents has been organized under three key categories and twenty-six series, as set out below. Regulatory documents produced by the CNSC fall under one of the following series:

1.0 Regulated facilities and activities

Series 1.1 Reactor facilities
1.2 Class IB facilities
1.3 Uranium mines and mills
1.4 Class II facilities
1.5 Certification of prescribed equipment
1.6 Nuclear substances and radiation devices

2.0 Safety and control areas

Series 2.1 Management system
2.2 Human performance management
2.3 Operating performance
2.4 Safety analysis
2.5 Physical design
2.6 Fitness for service
2.7 Radiation protection
2.8 Conventional health and safety
2.9 Environmental protection
2.10 Emergency management and fire protection
2.11 Waste management
2.12 Security
2.13 Safeguards and non-proliferation
2.14 Packaging and transport

3.0 Other regulatory areas

Series 3.1 Reporting requirements
3.2 Public and Aboriginal engagement
3.3 Financial guarantees
3.4 Commission proceedings
3.5 CNSC processes and practices
3.6 Glossary of CNSC terminology

Note: The regulatory document series may be adjusted periodically by the CNSC. Each regulatory document series listed above may contain multiple regulatory documents. For the latest list of regulatory documents, visit the CNSC's website.

FEDERAL COURT

SOLICITORS OF RECORD

DOCKET:	T-1222-21
STYLE OF CAUSE:	POWER WORKERS' UNION, SOCIETY OF UNITED PROFESSIONALS, THE CHALK RIVER NUCLEAR SAFETY OFFICERS ASSOCIATION, INTERNATIONAL BROTHERHOOD OF ELECTRICAL WORKERS LOCAL, 37, CHRIS DAMANT, PAUL CATAHNO, SCOTT LAMPMAN, GREG MACLEOD, MATTHEW STEWART AND THOMAS SHIELDS v ATTORNEY GENERAL OF CANADA, ONTARIO POWER GENERATION, BRUCE POWER, NEW BRUNSWICK POWER CORPORATION AND, CANADIAN NUCLEAR LABORATORIES
PLACE OF HEARING:	TORONTO, ONTARIO (HYBRID HEARING)
DATE OF HEARING:	DECEMBER 6-8, 2022
REASONS FOR JUDGMENT AND JUDGMENT:	DINER J.
DATED:	JUNE 6, 2023

APPEARANCES:

Revision History

Rev. No.	Date	Details of Rev.	Authored By	Reviewed By	Approved By
0.3	2023/07/17	Issued as “Approved for Use”	B. Scott	S. Brewer S. Faught A. Coulas	S. Faught on behalf of S. Brewer
0.3D1	2023/07/13	Issued for “Review and Comment” The following minor changes were made: · 7.1.2.2 - added item 4) to advise the CNSC Event Reporting and Response Lead (or Licensing Lead) of the intent to submit a combined report when providing verbal report. · Updated List of Regulatory Agencies in Appendix A to include Emergency Measure Organization – MB and MB Dept of Labour and Immigration	B. Scott	S. Brewer S. Faught A. Coulas	
0.2	2023/03/10	Issued as “Approved for Use”	B. Scott	S. Brewer	S. Brewer
0.2D0.1	2023/02/20	Issued for “Review and Comment” The following minor changes were made to address comments from CNSC staff’s review: · 3.1.1 - updated to clarify that the more stringent reporting requirement will apply when requirements in the licence/LCH differ from those in the NSCA or Regulations · 3.1.2.1 - added ‘REGDOC-3.1.2 or REGDOC 3.1.3, as applicable’ · 3.1.3 - added ‘secret and top secret’ to confidential reports · 7.1.3.2 - corrected reference email	B. Scott	C. Gallagher A. Dash B. Scott	

Rev. No.	Date	Details of Rev.	Authored By	Reviewed By	Approved By
		· 7.2.2 - added 2nd method for upgrading proactive notification · 9 - corrected reference to REGDOC-3.1.3 · Fixed minor grammatical errors The following minor changes were made as part of IM quality check: · 3 - renamed to ‘Pre-requisites’ · 5 - renamed to ‘Roles and Responsibilities’ · Corrections to several references in section 9			
0.1	2022/12/19	Issued as “Approved for Use.	B. Scott	S. Brewer	S. Brewer
0.1D0.3	2022/08/19	Issued for “Review and Comment” The following minor updates were made: · 3.1.2.1 - Last section clarified · 3.1.3.2 - Added comment that Event Reporting and Response Lead should be advised if a combined report is being submitted · 3.1.5.1 & 7.2.1 - Removed notification provision · 3.1.5.2 & 7.2.2 - Clarified what to do when Proactive Notification is upgraded to a Reportable Event · 3.1.9.1 - Added references to the ACMR templates and Standard · 5.1.5.5 - Added Correspondence Coordinators/Administrative Staff · 7.4.1 & 7.4.2 - Clarified steps for including CNL Legal Department · Appendix C – Updated to align with new template	B. Scott	S. Brewer C. Gallagher A. Dash	

Rev. No.	Date	Details of Rev.	Authored By	Reviewed By	Approved By
		· Updated revision numbering from Revision 1 to 0.1 as per new approval workflow			
0.1D0.2	2022/05/17	Reviewed for CNSC comments and Additions due to actions from a root cause analysis ***Approval not complete as additional items were identified to be added.**	B. Scott	S. Cotnam	
0.1D0.1	2021/12/02	Issued for “Review and Comment” Minor changes made. Updated to new template. The following updates were made and comments from CNSC (*) were addressed: · Added reference to REGDOC-3.1.3 for applicable sites · 3.1.2.1 - Added a reference ([8]) regarding exemption from reporting false/ spurious alarms to Duty Officer under certain circumstances for high-security sites; · (*) 3.1.3.1 & 7.1.3.1 - As per REGDOC-3.1.2, added a statement about no requirement for a written preliminary report if an emergency has previously been reported to a Duty Officer; · 3.1.3.2 - Moved “Combined Reports” out of Section 3.1.1 to a new section · (*) 3.1.3.3 - “Extension in Submission of a Report” removed, updated 3.1.3.3 to deal with extra time needed · 3.1.5.1 - added clarification on DO calls when ambulance or police called to site · 3.1.5.2 – added	N. Walters B. Scott	S. Karivelil S. Cotnam N. Walters V. Mihaylov	

Rev. No.	Date	Details of Rev.	Authored By	Reviewed By	Approved By
		requirements for upgrading a proactive notification to a reportable event · 5.1.3 – Replaced MST with DST, and removed reference to FLM · 5.1.4 - Added responsibility to notify CNL Legal, CNO, and CRO for specific events · (*) 6.1 – Flowchart updated to better reflect process and to include ‘Events that could trigger Stakeholder interest’ · 3.1.9.3 & 7 .4 - New sections dealing with ensuring involvement of CNL Legal for certain events. · 7.1.1 - Added a statement to select either “Notification” or “Yes for Reportable” when processing an ImpAct, but not both. · Added 7.2.2 Process for Upgrading a Proactive Notification to a Reportable Event · Updated “Project Officer (or Designated Point of Contact) to Event Reporting and Response Lead (or Licensing Lead) · Updated generic use of ‘Notification’ to ‘Communication’ or other similar term to differentiate from ‘Proactive Notifications’ · Strengthened Appendix A · Added Appendix C, Proactive Notification Template

Table of Contents

1. Scope and Applicability

The requirements of this procedure constitute a standard for consistent reporting to regulatory agencies and are applicable to all sites operated by CNL.

This procedure describes the requirements, the process, and the responsibilities for reporting by Canadian Nuclear Laboratories (CNL) to the Canadian Nuclear Safety Commission (CNSC) as required by the *Nuclear Safety and Control Act* (NSCA) [1] and the associated regulations, and to other regulatory agencies, as per the applicable legislation.

The document applies to the CNL employees who are Designated Representatives of the Licensee (DROL) and are responsible for reporting to the CNSC, and in general to the CNL staff responsible for reporting to regulatory agencies.

Appendix A includes an alphabetic list of regulatory agencies, other than the CNSC, to which CNL reports, the type of arrangement, and the Functional Support Area or department responsible.

Any questions regarding the content or the application of this document can be directed to CNL Regulatory Affairs via email: RegAff@cnl.ca (>>RegAff).

2. Purpose

The purpose of this procedure is to ensure a consistent manner of reporting to regulators for all licensed CNL sites.

The information provided in the reports is used by the regulatory agencies in responding to emergencies, monitoring ongoing events, confirming licensing basis, studying potential safety problems, assessing trends and patterns, monitoring performance, and identifying precursors of more significant events.

3. Pre-requisites

To ensure compliance and coherence of this document with the relevant legislation and CNSC regulatory documents, the procedure follows the same convention in formulation of requirements, i.e., the word "shall" is used to express a mandatory requirement to be satisfied by the licensee, "should" is used to express guidance or that which is advised, "may" is used to express an option or that which is advised or permissible within the limits of this document, and "can" is used to express possibility or capability.

3.1 Requirements for Reporting to the CNSC

3.1.1 Determination of Reportability and Reporting Timelines

The reporting requirements applicable to CNL are specified in the NSCA [1] and the pertinent regulations. The CNSC's regulatory documents' series "3.1 Reporting Requirements" sets out the framework for event and compliance monitoring reporting by the licensees. As identified in their associated Licence Conditions Handbook (LCH), either REGDOC-3.1.2, *Reporting Requirements - Volume I: Non-Power Reactor Class I Nuclear Facilities and Uranium Mines and Mills* [2] or REGDOC-3.1.3, *Reporting Requirements for Waste Nuclear Substance Licensees,* *Class II Nuclear Facilities and Users of Prescribed Equipment, Nuclear Substances and Radiation Devices* [3] will be applicable to the various CNL sites. Appendix A of these regulatory documents provides a list of situations and events that require a report or a notification to CNSC staff, the applicable reporting provisions, and the required reporting timelines.

The criteria for determination of the reportability of situations/events and the relevant reporting timelines for submission of verbal and written reports can be found in the licenses, LCHs, the NSCA [1] and the pertinent regulations, and the applicable regulatory documents from the series "3.1 Reporting Requirements". With respect to reporting requirements, should the requirements found in the pertinent applicable licence/LCH differ from the standard terms stated in legislative documents (NSCA and regulations), those with the more stringent reporting requirements shall be considered as most applicable.

When documented in ActionWay, non-compliances with regulatory requirements identified as a result of CNSC inspections shall not be flagged as reportable (see *Improvement Action (ImpAct) Corrective Action Program* [4] for further information).

3.1.2 Requirements for Preliminary Reporting to CNSC Staff

The purpose of the preliminary reporting is to provide CNSC staff with timely initial information on reportable occurrences or situations/events of regulatory interest, thus allowing them to respond to emergencies, monitor ongoing events, and identify precursors of more significant events.

After determining or becoming aware that an event is reportable, the responsible CNL DROL shall immediately report verbally, and file a preliminary written report to the CNSC, as applicable; that is, after steps to mitigate the consequences (as applicable) have been taken.

Preliminary reports should contain enough information so that CNSC staff have an understanding of the effects of the event on the health, safety and security of Canadians and the environment.

All reasonable efforts to obtain timely information that has been reviewed for accuracy should be made, when filing a report to the CNSC. For reports of situations or events that have not attained stability and predictability, timeliness of informing CNSC staff of the situation or event should be prioritized over the availability of data or information. Under the *Packaging and Transport of Nuclear Substances Regulations (PTNSR 2015)* [5], dangerous occurrences, as defined in section 35, are reported after the obligations listed in subsection 36(1) have been met.

3.1.2.1 Immediate Verbal Report to CNSC Duty Officer

As described in CNSC REGDOC-3.1.2 Section 2 item #8 [2], the DROL shall immediately report any of the following events to the CNSC Duty Officer:

- situations or events that trigger actions under emergency response programs, this includes but is not limited to:
  - activation of the Emergency Operations Centre (EOC) in error, or due to false alarms,

- when ambulance or police services have been called to site.[1]

- events that could trigger stakeholder interest such as a spill, a release, or an injury, or
- events that fall under the reporting requirements of the *General Nuclear Safety and Control Regulations* (GNSCR) [6], subsection 29(1).

Note: A direct verbal communication with the CNSC Duty Officer has to be ensured, i.e, the DROL has to speak to a person and make sure that the message has been acknowledged; leaving only a voicemail is not sufficient.

REGDOC-2.10.1, *Nuclear Emergency Preparedness and Response* [7] establishes the requirements for reporting to CNSC of activation of the emergency response organization.

Important:

- All alarms resulting in activation of CNL's EOC, including false alarms, are to be reported to the CNSC Duty Officer;
- As per the agreement with CNSC [8], rapidly identifiable false or spurious alarms that occur at CNLs four high security sites (Chalk River Laboratories, Whiteshell Laboratories, Douglas Point and Gentilly-1) whereby they would not require substantive or further mitigation measures and which do not result in activation of CNL's EOC are not immediately reportable to the CNSC Duty Officer. This includes spurious fire alarms and the response to such;
- Fire alarms at all other CNL sites are reported as per the requirements applicable to that site (i.e., REGDOC-3.1.2 [2] or REGDOC-3.1.3 [3]).

See section 7.1.2.1 for details on the Duty Officer reporting process.

3.1.2.2 Immediate Verbal Report to CNSC Event Reporting and Response Lead (or Licensing Lead)

Initial information for reportable occurrences, which do not fall under the criteria for reporting directly to the CNSC Duty Officer (see 3.1.2.1 above), shall be verbally communicated by a DROL to the CNSC Event Reporting and Response Lead (for CRL) or relevant CNSC Licensing Lead (for other sites) via a phone line or in person, as practical.

Note: Leaving only a voicemail is not sufficient. The DROL has to make sure that the message has been acknowledged and understood by the CNSC representative, either via direct verbal communication or from a received email response confirming the details.

See section 7.1.2.2 for details on the reporting process.

[1] If an ambulance or police service (off-site response) was called to site for a non-occupational event and not in the conduct of a licensed activity, the Duty Officer is to be called to report the off-site response, however, this is not considered a reportable event. The DROL will follow-up with the CNSC Event Reporting and Licensing Lead (for CRL) or Licensing Lead (for other sites) with a proactive notification.

3.1.3 Requirements for Follow-up Written Reports

All written reports (preliminary, combined, and full) shall be submitted using the form *Unplanned Event Report* [9], and filed electronically with CNSC staff. Any additional or supporting information shall be also submitted electronically (e.g., air/water monitoring data).

Note: Although REGDOC-3.1.2 [2] and REGDOC-3.1.3 [3] permit written reports to be filed by fax or regular mail, the current arrangement between CNL and CNSC [10] is that all written submissions are to be filed electronically, no hard copy submissions required (with the exception of confidential information). Confidential reports (including secret and top secret) are submitted as a hardcopy via courier service.

3.1.3.1 Preliminary Report

Written preliminary reports (form *Unplanned Event Report* [9]) shall be submitted to CNSC staff within the required timeframes stated in Appendix A of REGDOC-3.1.2 [2], or per the guidance from REGDOC-3.1.3 [3], or in the applicable regulations after the immediate verbal report to a duty officer or CNSC Event Reporting and Response Lead (or Licensing Lead). The report shall capture the information reported during the initial verbal communication.

Note: If an emergency is reported to the CNSC duty officer, a written preliminary report is not required. For all other reports to the duty officer, a preliminary written and full report (or combined report) is still required.

A cover letter is not required for a preliminary report. The form [9] shall be filed with CNSC staff as a pdf email attachment.

See section 7.1.3.1 for details on the Preliminary Report process.

3.1.3.2 Combined Report

A combined report, i.e., a report that serves as preliminary and full at the same time, can be submitted instead of a preliminary report, where no additional information or investigation beyond the preliminary report can reasonably be expected. It is recommended that a combined report be issued within five days of reporting the event. If there is an ongoing investigations (i.e., a fact finding investigation is not complete) or the exact cause is still unknown, a combined report cannot be issued.

Where a combined report is going to be submitted, it must be communicated to the CNSC Event Reporting & Response Lead (or Licensing Lead) at the time of the verbal report so as not to miss the deadline for submitting preliminary reports.

A cover letter for regulatory close-out is required for combined reports, as they serve as preliminary and full at the same time, and the form [9] shall be enclosed with this letter. The letter shall include:

- the reason(s) why the preliminary report is submitted as combined; and
- a statement that CNL considers that the correspondence with the enclosed reporting form completes the reporting requirements for the event.

The cover letter and the form shall be submitted to CNSC staff as separate pdf email attachments.

See section 7.1.3.2 for details on the Combined Report process.

3.1.3.3 Full Report

Written full report (form *Unplanned Event Report* [9]) shall be submitted to CNSC staff within the timeframe required by the licence, LCH, or applicable regulations, after the preliminary report.

For full reports the form shall be enclosed with a cover letter for regulatory close-out, which shall include:

- a statement that CNL considers that the correspondence with the enclosed reporting form completes the reporting requirement for the event.

The cover letter and the form shall be submitted to CNSC staff as separate pdf email attachments.

Note: Failure to submit a full report within the required timeframe constitutes a separate reportable event.

See section 7.1.3.3 for details on the Full Report process.

In the event that complete detailed information cannot be obtained within the specified reporting timeframe (due to an increase in the significance level of the event, or when an investigation will extend beyond the specified reporting timeframe), the final report shall be submitted as per the identified timeframe. It shall be noted in the report the reason for the incomplete detailed information (e.g., the investigation is ongoing), and a date included for when an updated (revised) report will be issued. This shall be captured in a REG-action (REG-C) within the event ImpAct, and details provided in a Regulatory Commitments Summary table (see Appendix A of [14]).

It is recommended that CNL should notify CNSC staff prior to the full report due date, to advise that the full report is incomplete, and a revised report will be forthcoming.

See section 3.1.4.1 on requirements for Revised Reports section 7.1.3.4 for details on the Revised Report process.

3.1.4 Requirements for Other Written Submissions

3.1.4.1 Revised Report

A revised report shall be submitted during the following circumstances:

- complete detailed information cannot be obtained within the specified reporting timeframe for the Full Report,
- additional information on the event becomes subsequently available, or

- when the original report has been found to contain a considerable amount of incorrect technical information.

The revised report shall contain all the information needed to replace/supersede the original report (i.e. it should not consist of only the amendments to the original report).

See section 7.1.3.4 for details on the Revised Report process.

3.1.4.2 Request for Retraction of Unplanned Event Report

In general, requests for retraction are submitted for events that were reported in error and were subsequently determined not to be reportable. When the retraction of a preliminary, combined, or full report is required, written justification shall be provided to CNSC staff along with a request for retraction.

See section 7.1.4.1 for details on the process.

3.1.5 Requirements for Notifications & Communications

3.1.5.1 Proactive Notification for Unplanned Occurrences

Occurrences that may not initially appear to fall under any reporting provision, but are relevant to the safety of operation, significant as an operating experience, or that may have an impact on the reputation of CNL or the nuclear industry, should be considered as potentially reportable or of regulatory interest. Such items require a proactive notification (verbal, followed by email) to the CNSC Event Reporting and Response Lead (or Licensing Lead), prior to determining their actual reportability.

Proactive notifications of eligible items must be provided in timely fashion. The proactive notification shall be submitted as soon as the ImpAct documenting the occurrence has been raised in the ActionWay system.

Additional guidance:

- It is strongly recommended that occurrences that fall into ‘grey area’ are considered for proactive notification. Subsequently these occurrences may or may not be determined as items reportable to the CNSC.
- If an event has been determined to fall under a reporting provision within REGDOC-3.1.2 [2], or REGDOC-3.1.3 [3], then it cannot be sent as a proactive notification.
- The decision for proactive notification has to be made independently of possible consideration for ‘public disclosure’.
- For Duty Officer calls when a request for an ambulance or police service to attend a site for a non-occupation injury that occurred during the conduct of non-licensed activities (i.e., personal medical issue, while not conducting a licensed activity), a written proactive notification will be provided to the CNSC Event Reporting and Response Lead (or Licensing Lead) as this is not considered a reportable event.

3.1.5.2 Upgrade of Proactive Notification to a Reportable Event

Should additional information related to a proactive notification result in the event being deemed reportable, or a request received from the regulator requesting the event be deemed reportable, then the requirements (see section 3.1.1) and process for a Reportable Event must be followed (see section 7.1). For instance, if the event originally should have been a call to the CNSC Duty Officer, then a call must be placed to the Duty Officer to identify the proactive notification is now being considered as a reportable event.

Note: The timeline for reportable events begins as soon as the event has been ungraded from proactive notification to a reportable event.

3.1.5.3 Communications to CNSC Staff on Planned Events

In accordance with the NSCA [1] and the regulations, CNL is required to provide formal notice to CNSC of specific planned events, such as: removal or reinstatement of certified personnel, planned disposal of records, or intent to conduct security exercise.

When documented in ActionWay, such occurrences shall not be flagged as reportable or for notification (see *Improvement Action (ImpAct) Corrective Action Program* [4] for further information).

These formal notices shall be electronically submitted as formal email or as a pdf email attachment; no specific CNL forms are to be used.

3.1.5.4 Public Disclosure

CNL public communications are governed by public information programs, which address the activities of public interest at the different CNL sites. The public information programs are prepared in accordance with the CNSC REGDOC-3.2.1.*, Public Information and Disclosure* [11]. The programs outline the commitment to provide open and transparent access to information on unplanned situations and events.

The public information programs, pertinent to the different CNL sites are described in the following documents:

- *Public Information Program for Canadian Nuclear Laboratories* (CNL) [12] for Chalk River Laboratories, Whiteshell Laboratories, Prototype Reactor sites and Heavy Water Plant sites, and
- *PHAI Phase 2 Public Information Program* [13], for the Historic Waste Program (HWP).

Information on unplanned occurrences from all CNL sites, shall be forwarded to CNL Corporate Communications for further consideration.

Examples of occurrences which may qualify for public disclosure include: events with off-site effects, impact of natural events (e.g., earthquake, flood), significant industrial accidents, protest group actions, etc.

CNSC staff shall be formally notified by CNL Corporate Communications when announcements under the public disclosure protocol are made.

3.1.5.5 Communications to Atomic Energy of Canada Limited

Atomic Energy of Canada Limited (AECL) is the federal Crown Corporation responsible for the long-term contractual arrangement for the management and operation of CNL under a government-owned, contractor-operated model.

AECL shall receive formal notice by email of the following:

- unplanned situations or events of ImpAct significance levels 1 and 2;
- Event Initial Reports (EIR);
- announcements made under a public disclosure protocol;
- security events; and
- any other situation or event at the discretion of the CNL Chief Regulatory Officer (CRO).

The information shall be communicated to the AECL Chief Security Officer (CSO) by the CNL CRO, CSO, or designate(s) thereof.

3.1.6 Requirements for Integrated/Harmonised Reporting

CNSC staff shall be copied on correspondence regarding events that are reportable to other regulatory agencies (e.g., Environment and Climate Change Canada, Employment and Social Development Canada, etc).

3.1.7 Requirements under the CNL ImpAct Process

The *Improvement Action (ImpAct) Corrective Action Program* [4] shall be used to document all unplanned situations and events.

Note: Timely reporting is a responsibility of the DROLs (section 5.3). The reporting timeline depends solely on the applicable regulatory provisions (section 3.1.1) and shall not be affected by the schedule of the ImpAct process.

3.1.8 Requirements for Formal Correspondence to CNSC

The requirements of the CNL procedure *Managing Regulatory Communications and Commitments* [14] shall be followed for correspondence and other aspects of the reporting process as applicable.

Prior to sending out, any correspondence materials (e.g., letters, enclosures, supporting materials) shall be submitted for review to Regulatory Affairs, licensing managers or designates. For complex technical matters, the correspondence shall be submitted to the relevant SME for review as well. Correspondence that contains information of potential public interest shall be submitted for review to Corporate Communications.

3.1.9 Other Requirements for Reporting to the CNSC

3.1.9.1 Requirements for Annual Compliance Monitoring Report

An Annual Compliance Monitoring Report (ACMR) for the previous calendar year shall be filed with the CNSC every year, as scheduled in the applicable licences/LCHs for the different CNL sites, and shall include:

- Information that can be made available to the public without restrictions; any classified, protected, proprietary, or personal information shall be submitted to the CNSC separately in accordance with the CNSC's *Guidance Document on Confidential Filings* [15] and CNL's *Protection of Information* procedure [16];
- Sufficient details to provide CNSC staff with information to verify that the regulatory requirements are met and that operations have been conducted safely;
- Information on each of the 14 areas in the CNSC's Safety and Control Area (SCA) framework and other matters of regulatory interest; if a particular SCA is not relevant or does not apply to a particular CNL site, a statement to that effect shall be included in the report.

Each ACMR is intended to exist as a stand-alone document to provide the site-specific information. Information related to company-wide functional support areas and their associated SCAs are identified in the CNL ACMR. If information from any previous ACMRs is needed for completeness, this information shall be repeated to the appropriate level of detail.

Appendix B of REGDOC-3.1.2 [2] or REGDOC-3.1.3 [3] provides a sample structure as guidance for the preparation of an ACMR, based on the CNSC's SCA framework. This sample structure has been included in the ACMR templates: *Site Annual Compliance Monitoring Report Template* [17] for use at each site, and the *CNL Annual Compliance Monitoring Report Template* [18] for details on CNL site-wide SCAs. For additional information on completing the ACMRs, see *Preparation and Content of CNL Annual Compliance Monitoring Reports* [19].

Additional compliance monitoring reports shall be submitted (e.g., quarterly, monthly, or according to a licensee-specific schedule) if required by the site specific licence/LCH.

3.1.9.2 Annual Report of Radiation Detections in Packaging and Transport

Any nuclear substance referred to in paragraph 2(2)(o) of the PTNSR 2015 [5], must be characterized at the earliest possible time to determine the extent to which it is subject to the PTNSR 2015 and the Nuclear Substances and Radiation Devices Regulations [20].

Where such characterizations have been performed, an annual report containing a summary of radiation detections for the calendar year before the date of the report shall be filed with the CNSC by April 30.

3.1.9.3 Guidelines for Involving CNL Legal Department

There are times when events may require that CNL's Legal Department be advised in order to provide assistance. Should the DROL become aware of any of the following events, they shall immediately reach out to the CRO, CNO, and the Legal Department for further assistance and guidance:

- Any unplanned event with a Significance Level 1 or 2;
- An unplanned event with a high probability of triggering an Administrative Monetary Penalty by either the CNSC (as outlined in the *Administrative Monetary Penalties Regulations* [21]) or another Regulator;

Note: these events include, but are not limited to repeat, CNL-wide events that resulted in significant releases to the environment (i.e., multiple action level & regulatory limit exceedance); repeat events that caused significant injuries and near misses; exposure of persons to radiation in excess of the applicable radiation dose limits; or repeat events that fall within GNSCR 29(1) [6] that wasn't in itself a Significance Level 1 Event.

- A request by CNSC for an EIR to be tabled and/or discussed before the Commission;
- A request from CNSC at the Director-General level identifying dissatisfaction and/or concern regarding an event that occurred at CNL;
- Any Order or GNSCR 12(2) [6] request issued by CNSC as a result of an event or CNL reporting.

See section 7.4.1 and 7.4.2 for details on the process to involve CNL Legal Department.

3.2 Requirements for Reporting to Regulatory Agencies other than the CNSC

Formal notifications or reports to regulatory agencies other than the CNSC shall be submitted electronically. No specialized CNL forms shall be used; the information shall be laid out and formatted on a case-by-case basis.

Where applicable, any specific requirements from regulatory agencies for formatting and/or submission method shall be followed (e.g., Environment and Climate Change Canada requirements for reporting through their on-line reporting system). The Functional Support Manager should confirm with the regulatory agency (via direct contact or website) the requirements for submission.

Under the direction of the signing authority, before the communication is sent out it shall be submitted for review to CNL Regulatory Affairs staff, along with all pertinent materials, i.e., attachments and enclosures.

The list shown in Appendix A includes regulatory agencies and responsible authorities at provincial, federal, and international level, to which CNL has obligations to report.

4. Definitions and Acronyms

This document relies primarily on word meaning as found in common dictionaries. The current *Glossary of Controlled Terms and Acronyms* [22] contains specific meanings for those words that require further clarification.

4.1 Definitions

Can	*Can* is used to express possibility or capability.
Certified	Certified by the CNSC under paragraph 21(l)(i) of the NSCA [1] or by a designated officer authorized under paragraph 37(2)(b) of the NSCA.
Dangerous Occurrence	List of situations that can be considered as 'dangerous occurrence' is provided in section 35 of PTNSR 2015 [5].
Designated Representative of the Licensee	A DROL is a CNL staff member who is designated and authorized to communicate with, and make commitments to, CNSC staff on behalf of CNL for their organizational unit, facility, project, or program within their financial authority to do so. DROL is also a CNL staff member who is designated and authorized to make and submit unplanned situation or event reports to CNSC staff. The members of this group are identified in *Site Licences, Certificates, Permits, Building/Facility Contacts, & Licence Representatives* [23].
Event/Occurrence/ Situation	Any unwanted, unintentional sequence of occurrences that result in or could potentially result in consequences to operation and safety. These terms are used interchangeably to avoid duplication in sentences. They are given the same meaning.
Licensing Manager	Manager in charge of ensuring compliance with Licence, LCH, NSCA [1], and all other applicable regulations for a particular CNL site, business line, facility, project, or program.
May	*May* is used to express an option or that which is advised or permissible within the limits of this document.
Prescribed	Prescribed by regulation of the CNSC.
Proactive Notification	A notification refers to the obligation to inform the CNSC (or other regulatory agency) of events or situations where no further reporting is required. If further reporting is necessary, the licensee should submit a preliminary report instead.

Report	1) Initial or follow-up, verbal or written communication with the CNSC (or other regulatory agency) with regards to reportable situations, events, or dangerous occurrences. 2) Scheduled written submission to CNSC (or other regulatory agency) in response to the applicable regulatory requirements.
Shall	*Shall* is used to express a requirement to be satisfied by the licensee.
Should	*Should* is used to express guidance or that which is advised.

4.2 Acronyms

ACMR	Annual Compliance Monitoring Report
CNO	Chief Nuclear Officer
CNLRPD	Canadian Nuclear Laboratories Regulatory Program Division (Division within CNSC Directorate of Nuclear Cycle and Facilities Regulation)
CNSC	Canadian Nuclear Safety Commission
CRO	Chief Regulatory Officer
DROL	Designated Representative of the Licensee
DST	Dedicated Screening Team
EIR	Event Initial Report
EOC	Emergency Operations Centre
GNSCR	General Nuclear Safety and Control Regulations
HWP	Historic Waste Program (Port Hope, Port Granby)
LCH	Licence Conditions Handbook
MRM	Management Review Meeting
NSCA	Nuclear Safety and Control Act
PTNSR	Packaging and Transport Nuclear Safety Regulations
SCA	Safety and Control Area
SME	Subject Matter Expert

5. Roles and Responsibilities

5.1 Employees

Responsibilities of all CNL employees include:

- Verbally notifying their line management (and DROL if applicable) on discovery of any unplanned situation or event;
- Initiating an ImpAct (as per *Improvement Action (ImpAct) Corrective Action Program* [4]) for the situation or event, and follow the ImpAct process.

5.2 Dedicated Screening Team and Management Review Meeting

The Dedicated Screening Team (DST) responsibilities, under the ImpAct process, are to review ImpAct submissions daily for all CNL ImpActs

The Management Review Meeting (MRM) members are responsible for reviewing and confirming the reportability of the ImpAct submissions. The MRM chair will inform the appropriate DROL of any MRM recommendations, including on the reportability of a situation or event.

5.3 Designated Representatives of the Licensee or CNLs Representative for the Regulatory Body

Note: for the purposes of this document, CNLs Representative for other Regulatory Bodies shall be referred to as DROLs.

The responsibilities of the DROLs include:

- Maintaining expertise on reportability of situations/events particular to their organizational unit;
- Proactively providing an early notification to the relevant CNSC Event Reporting and Response Lead (or Licensing Lead) of potentially reportable situations or events;
- Determining the reportability[2] of the occurrence, and when applicable identify it as reportable in the ImpAct system;
- Ensuring that the CRO, CNO and CNL's Legal Department are advised for any Significance Level 1 or 2 event, any event with a high probability of triggering an Administrative Monetary Penalty, or on receipt of a GNSCR 12(2) [6] letter (see 3.1.9.3)
- Ensuring that the Managers, Supervisors and the Subject Matter Experts (SME) within their organization are capable of recognizing reportable occurrences;
- Consulting with SMEs (including Functional Support Area/SCA DROL and Facility DROL), manager of Regulatory Affairs, or Licensing Managers, as necessary, to determine the reportability of a situation or event;

---

[2] DROLs shall not consult with CNSC staff to determine the reportability of a situation or event.

- Reporting to, or notifying CNSC staff or other regulatory bodies of situations or events as per the applicable requirements;
- Ensuring the appropriate context, the quality, and the technical correctness of the unplanned event reports;
- Reviewing attachments and enclosures to ensure that they are complete, are of the highest quality, are technically correct, and that they sufficiently address the issues, requests, regulatory requirements etc., and/or that they satisfactorily state and explain the proposed actions to be undertaken by CNL;
- Ensuring that all written materials have been reviewed by staff of the Regulatory Affairs branch, and the relevant Licensing Managers, prior to submission to the CNSC;
- Ensuring that staff within their organizations to whom this procedure applies know and comply with the requirements it sets for the reporting process;
- Initiating and authorizing cause analysis for situations or events, as appropriate; and
- Participating and contributing to the development of ACMRs, and any other scheduled reporting submissions as required by the applicable licence/LCH.

5.4 Chief Regulatory Officer

The CRO has the authority as described in the Management System Manual [24] and:

- Acts as an authorized representative of CNL in dealings with the CNSC (Commission).
- Appoints DROLs for specific SCAs.
- Acts as an authorized representative of CNL in dealings with AECL.

5.5 Regulatory Affairs Manager

Regulatory Affairs Manager and designates are responsibilities for:

- Maintaining and updating this procedure;
- Ensuring all DROLs are trained and updated on reporting requirements;
- Providing assistance and guidance to DROLs on the reportability of events and on consideration for early notification of potentially reportable situations;
- Reviewing for quality and content the drafts of submission letters and preliminary, full, and combined reports;
- Reporting events that are CRL site-wide (e.g., site-wide power outage, flood, fire, stay-in);
- Managing/supervising the development of the CNL/CRL ACMRs, and support any other scheduled reporting submissions as required by the applicable licence/LCH.

5.6 Licensing Managers

Site/Projects Licensing Managers and designates are responsible for:

- Providing assistance and guidance to DROLs on the reportability of events;

- Providing focused training to licensing staff and/or DROLs on reporting requirements related to their site;
- Reviewing for quality and content the drafts of the preliminary, full, combined reports, and submission letters;
- Managing/supervising the development of ACMRs, and support any other scheduled reporting submissions as required by the applicable licence/LCH.

5.7 Corporate Communications

Corporate Communications staff are responsible for:

- Reviewing content of reports and submission letters, as per the DROLs' request;
- Evaluating and appropriately disclosing to the public information about unplanned situations and events; and
- Informing CNSC on public disclosures.

5.8 Subject Matter Experts

The responsibilities of SME in response to DROLs' requests, include:

- Assisting DROLs in the determination of reportability;
- Reviewing the technical correctness of event reports; and
- Assisting DROLs in the completion of the ACMRs and any other scheduled reporting submissions as required by the applicable licence/LCH.

5.9 Correspondence Coordinator/Administrative Staff

When dealing with correspondence to and from a regulator, the Correspondence Coordinators or DROL's administrative staff assigned as Correspondence Coordinator are responsible for filing regulatory correspondence in ATOM, and for providing a link to the author/DROL for future reference, as per [14].

5.10 Responsibilities in Reporting to Regulatory Agencies other than the CNSC

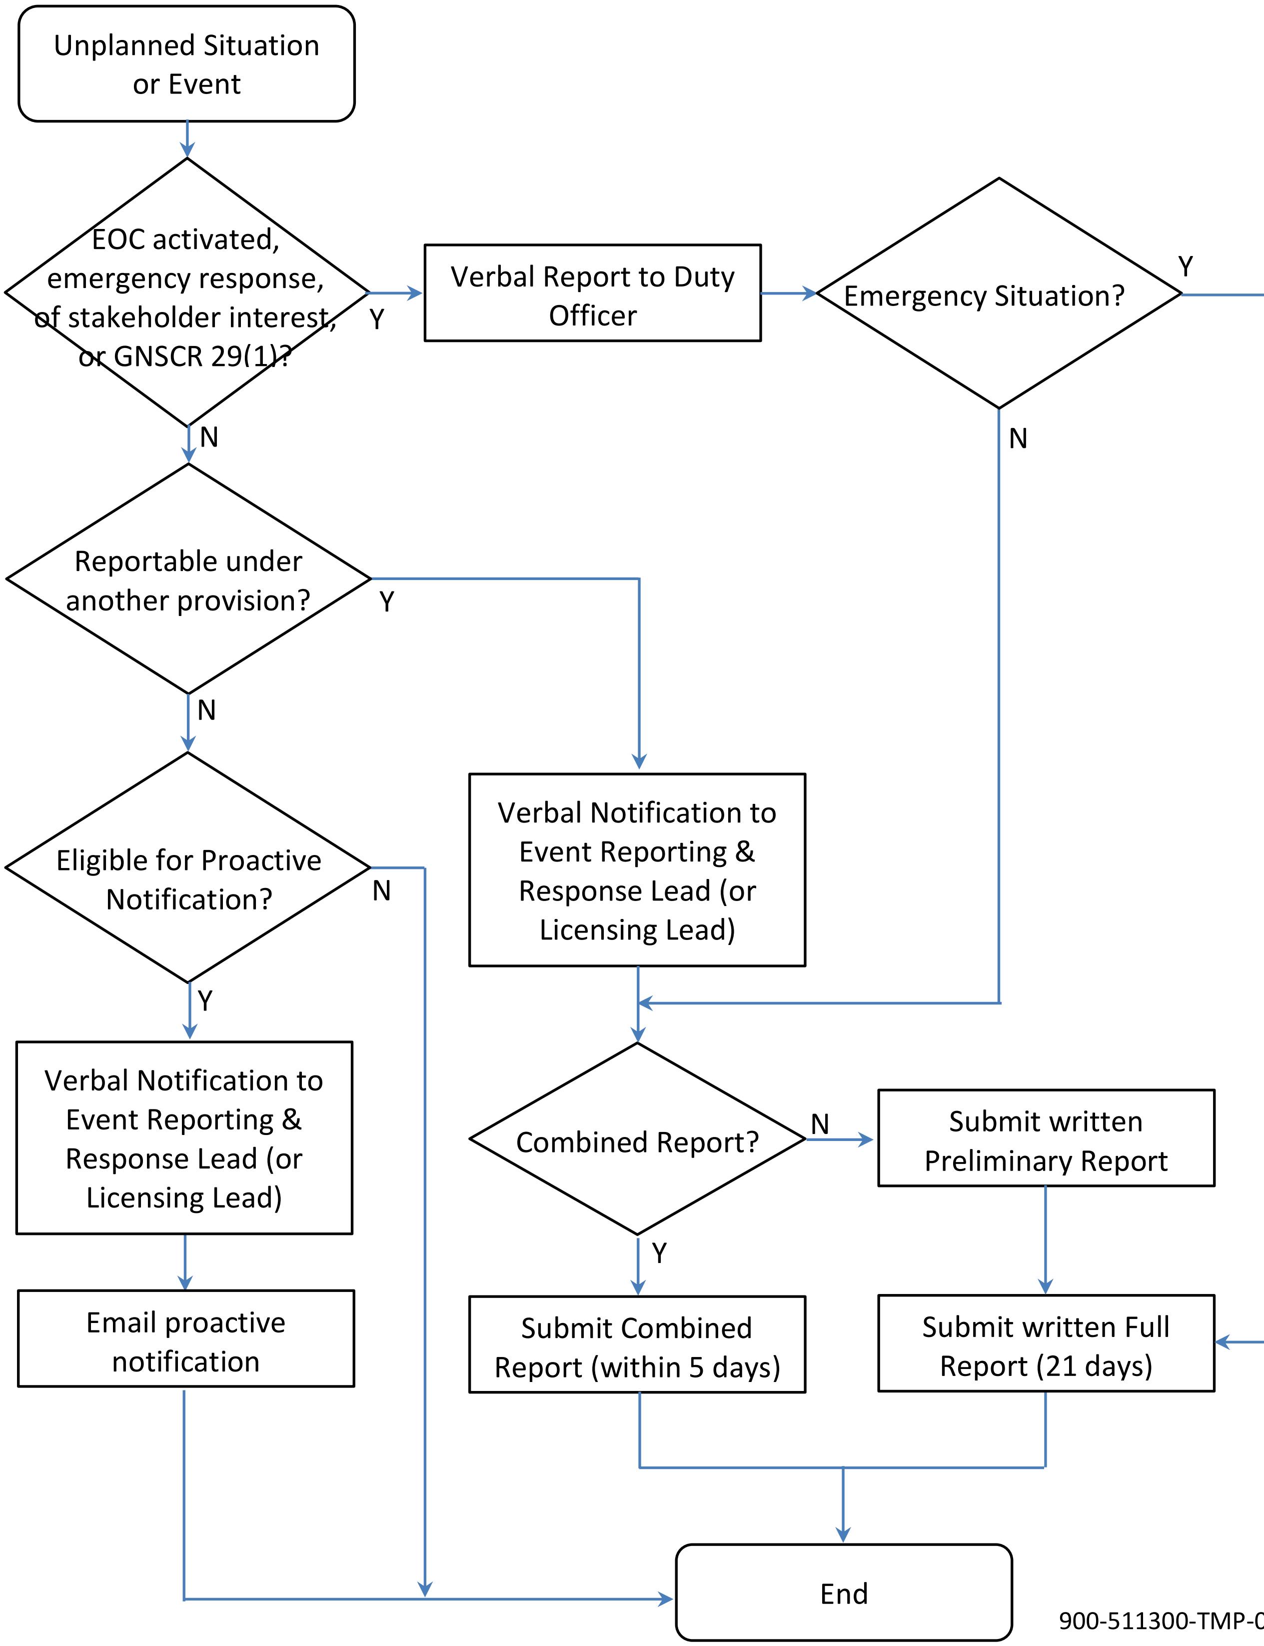
Reporting to other regulatory agencies is carried out by the designated CNL representatives as per the requirements of the different CNL compliance programs, and as per the information in Appendix A of this procedure.

5.11 Signing Authority

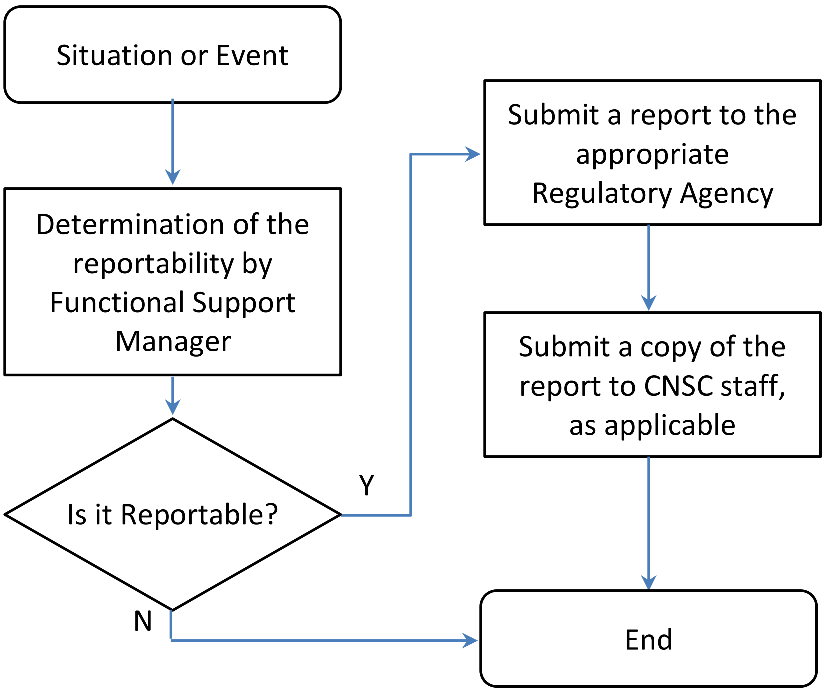
The relevant signing authority is responsible for ensuring that the reports and pertinent materials are reviewed, and sent for final review and comments to CNL Regulatory Affairs staff prior to submission to the regulatory agency.

6. Flowchart

6.1 Flowchart for Reporting to the CNSC



6.2 Flowchart for Reporting to Other Agencies



7. Process

Canadian Nuclear Laboratories reports to Regulatory Agencies in accordance with the requirements stated in section 3 of this procedure.

7.1 Process for Reporting to the CNSC

This section details the process of capturing and documenting unplanned situations and events at CNL, the determination of their reportability, and the preparation and submission of the relevant reports.

The effective date of filing of any report is the date it is received by the CNSC staff.

The DROLs are to ensure that as per section 8 of this procedure, copies of all report submissions are filed in ATOM and either a reference is provided or copy of the correspondence is attached to the originating ImpAct.

7.1.1 ImpAct Process

The reporting process utilizes ActionWay to create ImpActs, and comprises the actions as detailed below.

All Employees

1) Initiate an ImpAct as per the *Improvement Action (ImpAct) Corrective Action Program* [4] when an unplanned situation or event occurs or is discovered, and notify supervision.

2) Verbally notify the appropriate DROL on discovery or occurrence of a situation or event that could be reportable.

DROL

3) Determine reportability and declare a situation or event reportable accordingly. Consider if the event qualifies for proactive notification (see requirements in section 3.1.5.1).

   Note: Ensure that the ImpAct indicates either YES for "Notification to Regulator", when a proactive notification is submitted, or YES for "Is it Reportable?", when the event is recognized as reportable.

4) Solicit assistance from the Regulatory Affairs Manager, Licensing Managers, and SMEs (including SCA DROLs and Facility DROLs), as needed.
5) As appropriate, submit to CNSC staff a notification, verbal and written reports for the unplanned event, within the prescribed timeframe. (See the following sections for detailed information on submitting verbal and written reports for events and notifications.)
6) Initiate and authorize cause analysis effort, as appropriate.
7) Submit information for events of potential public interest to CNL Corporate Communications.

DST

8) Review that the ImpAct has sufficient information with regard to reportability and the significance level.

MRM

9) Confirm the reportability and the ImpAct significance level.
10) IF proactive notification to the relevant CNSC Event Reporting and Response Lead (or Licensing Lead) has not been made

    THEN consider independently from the DROLs' decision whether the event qualifies for proactive notification under section 3.1.5.1.

11) Provide the DROLs with recommendations according to the conclusions of the MRM.

7.1.2 Preliminary Reporting

7.1.2.1 Verbal Report to CNSC Duty Officer

In accordance with the requirements stated in section 3.1.2.1, situations and events of high significance are reported through the CNSC Duty Officer.

The CNSC Duty Officer emergency telephone lines 1-844-879-0805 and 613-995-0479 are available 24 hours a day, 7 days a week. Information on how to report nuclear incidents is available online at: http://nuclearsafety.gc.ca/eng/contact-us/report-a-nuclear-incident.cfm.

DROL

1) Contact the CNSC Duty Officer via telephone at 1-844-879-0805 or 613-995-0479.

2) Report the situation/event and ensure that the information has been properly understood by the CNSC Duty Officer in direct verbal contact using three-way communication. (**Note**: leaving only a voicemail is not sufficient).

7.1.2.2 Verbal Report to CNSC Event Reporting and Response Lead (or Licensing Lead)

For all unplanned situations and events which fall outside of the requirements identified in section 3.1.2.1, the initial report is communicated verbally to the CNSC Event Reporting and Response Lead (or Licensing Lead) within the timeline determined by the applicable requirements outlined in section 3.1.2.2.

DROL

1) Contact the appropriate CNSC Event Reporting and Response Lead (or Licensing Lead) via telephone.
2) IF neither the CNSC Event Reporting and Response Lead (or Licensing Lead) nor their backup contact are available

   THEN contact the relevant CNSC Director, CNL Regulatory Program Division (CNLRPD) or designate.

   Note: the message has to be acknowledged by a CNSC representative within a reasonable time, leaving a voicemail is not sufficient.
3) Communicate verbally the preliminary report. As this is an initial report, it typically includes only readily available or provisional information on the situation or the event being reported.
4) IF it has been determined that the report can be submitted as a combined report

   THEN advise the CNSC Event Reporting and Response Lead (or Licensing Lead) of the intent to submit the report as a combined Report. This is to ensure the CNSC Event Reporting and Response Lead (or Licensing Lead) is not anticipating a written preliminary report the following day.
5) Ensure that the information has been properly understood by the CNSC Event Reporting and Response Lead (or Licensing Lead), using three-way communication.

7.1.3 Preparation and Submission of Written Reports

7.1.3.1 Preliminary Report

The requirements for a written preliminary report are detailed in section 3.1.3.1.

A written preliminary report is followed by a full report.

The process of preparation and submission of a written preliminary report entails the steps shown below.

DROL

1) Prepare a draft for a written preliminary report using the form *Unplanned Event Report* [9].

   Note: If an emergency is reported to the CNSC duty officer, a written preliminary report is not required, only a full report, as per [2].

2) Ensure that all fields in the form are filled out. Enter "Nothing to Report" when there is nothing to report under a specific item, or "N/A" (not applicable) when an item is not applicable to the selected type of report.
3) If any regulatory actions have been identified in the preliminary report, ensure that they are dated, and the person responsible for each action is identified (by role or job title only).
4) For any actions identified in the previous step, ensure that they are captured in ActionWay as REG-I actions under the source ImpAct, as per the requirements of procedure *Managing Regulatory Communications and Commitments* [14].
5) Raise a REG-R action for the submission of the full report in ActionWay under the source ImpAct, as per the requirements of procedure *Managing Regulatory Communications and Commitments* [14].
6) Submit for review to Licensing Managers or designates, and on as-needed basis to Corporate Communications and SMEs.

Licensing Managers, SMEs, and Corporate Communications

7) Review the submitted report and return to DROL with any comments or corrections.

DROL

8) Revise the reviewed report and submit the final, signature ready version to Regulatory Affairs for review.

Regulatory Affairs

9) Review the submitted report and return to DROL with any comments.

Correspondence Coordinator

10) Code the email and provide the correspondence number to the author.
11) File the final email and report in ATOM, as per the requirements of procedure *Managing Regulatory Communications and Commitments* [14].

DROL

12) Ensure that the appropriate report type (preliminary) is selected in the completed form *Unplanned Event Report* [9], and that the form is signed and submitted to the CNSC Event Reporting and Response Lead (or Licensing Lead) within the prescribed timeframe via email as separate pdf enclosure, and copied to the Director, CNLRPD.
13) Ensure that the submission is filed in ATOM, and a link or copy of the preliminary report is attached to the originating reportable ImpAct.

14) Confirm that any commitments or actions made in the preliminary report are entered into ActionWay as Regulatory Actions, including target completion date, responsible manager, and closure criteria.
15) Ensure that a REG-R action for the submission of the full report is raised under the original ImpAct.

7.1.3.2 Combined Report

The requirements for written combined reports are detailed in section 3.1.3.2.

The submission of a combined report (enclosed with a formal letter for regulatory close-out) concludes the reporting process and no full report is required to follow.

The process of preparation and submission of a written combined report entails the steps shown below.

DROL

1) Prepare a draft for written combined report using the form *Unplanned Event Report* [9].
2) Ensure that all fields in the form are filled out. Enter “Nothing to Report” when there is nothing to report under specific item, or “N/A” (not applicable) when an item is not applicable to the selected type of report.
3) For any regulatory actions identified in the report, ensure that they are dated, and the person responsible for each action is identified (by role or job title only).
4) For all actions identified in the previous step, raise REG-I actions in ActionWay under the source ImpAct, as per the requirements of procedure *Managing Regulatory Communications and Commitments* [14].
5) Prepare a cover letter for regulatory close-out including the following:
    - the reason(s) why the preliminary report is submitted as combined;
    - a statement that CNL considers that the correspondence with the enclosed reporting form completes the reporting requirement for the event.
6) Submit the completed form *Unplanned Event Report* [9] and cover letter for review to Licensing Managers or designates, and on as-needed basis to Corporate Communications and SMEs.

Licensing Managers, SMEs, and Corporate Communications

7) Review the submitted report and cover letter, and return to DROL with any comments or corrections.

DROL

8) Revise the reviewed report and cover letter, and submit the final, signature ready versions to Regulatory Affairs for review.

Regulatory Affairs

9) Review the submitted report and return to DROL with any comments.

Regulatory Affairs

10) Review the submitted report and correspondence, including attachments and enclosures.

Correspondence Coordinator

11) Code the cover letter and provide the file number to the author.

12) File the final letter and report in ATOM, as per the requirements of procedure *Managing Regulatory Communications and Commitments* [14].

DROL

13) Ensure that the appropriate report type (combined) is selected in the completed form *Unplanned Event Report* [9], and that the form and the cover letter, is signed and submitted to the CNSC Event Reporting and Response Lead (or Licensing Lead) within the prescribed timeframe via email as separate pdf enclosure, and copied to the Director, CNLRPD.

Note: All correspondence must be addressed to the appropriate contact person as per details provide from the Regulator or the most recent CNSC Points of Contact list on the Regulatory Affairs – Correspondence SharePoint site or the Regulatory Affairs/Licensing – CNL Distribution List page on myCNL. This page also provides a CNL distribution list of personnel for mandatory distribution of all letters and formal emails sent to a regulator.

CNSC has specifically identified the distribution list to ensure all pertinent CNSC staff have been included in the correspondence. It is imperative that the following contacts are also included for all CNSC correspondence:

- Monitoring Officer CNLRPD (fname.lname@cnsc-ccsn.gc.ca)
- forms-formulaires@cnsc-ccsn.gc.ca,
- >CR Licensing; and
- >CR CNSC Site Officer (cnlrpdsiteoffice-bureauregionaldedprlnc@cnsc-ccsn.gc.ca

14) Ensure that the submission is filed in ATOM, and a link or copy of the combined report is attached to the originating reportable ImpAct.

15) Confirm that any commitments or actions made in the combined report are entered into ActionWay as Regulatory Actions, including target completion date, responsible manager, and closure criteria.

7.1.3.3 Full Reports

The full report is a written report, submitted to CNSC staff after the submission of a written preliminary report, within the timeframe required by the applicable regulatory requirement (21 calendar days in most cases). The DROL determines the submission timeline as per the requirements of section 3.1.1. A delay in submission of a full report to CNSC staff constitutes a separate reportable event**.**

Note: If a Root Cause Analysis or an Apparent Cause Analysis was conducted in support of a full report, these apparent cause or root cause analyses must not be declared in the cover letter or referenced in the report. The CNO and the CRO shall be contacted if a formal request to submit an apparent cause or root cause analysis is received from CNSC staff.

The process of preparation and submission of a full report entails the steps shown below.

DROL

1) Prepare draft full report using the form *Unplanned Event Report* [9].
2) Ensure that all fields in the form are filled out. Enter "Nothing to Report" when there is nothing to report under specific item, or "N/A" (not applicable) when an item is not applicable to full report.
3) For all regulatory actions identified in the report, ensure that they are dated, and the responsibility for each action is identified (by role or job title only).
4) For all actions identified in the previous step, raise REG-I actions in ActionWay under the source ImpAct, as per the requirements of procedure *Managing Regulatory Communications and Commitments* [14].
5) IF complete detailed information cannot be obtained within the specified reporting timeframe,

   THEN the final report is still to be submitted and note in the report:

   - the reason for the incomplete detailed information (e.g., the investigation is ongoing, and
   - a date for when an updated (revised) report will be issued.
6) Prepare a cover letter:

   IF the full report is complete and it is not anticipated there will be a revised report,

   THEN prepare a cover letter for regulatory close-out which includes:

   - a statement that CNL considers that the correspondence with the enclosed reporting form completes the reporting requirement for the event.

   IF the full report is incomplete and there will be a revised report,

   THEN prepare a cover letter which includes:

   - a statement that CNL is submitting the full report, but as there is incomplete detailed information, a revised report will be forthcoming, and
   - an action commitment table

   AND ensure that a REG-C action for the submission of the revised report is raised under the original ImpAct.

7) Submit the cover letter and the completed *Unplanned Event Report* [9] form for review to Licensing Managers, or designates, and on as-needed basis to Corporate Communications and SMEs.

Licensing Managers, SMEs, and Corporate Communications

8) Review the submitted report and cover letter, and return to DROL with any comments or corrections.

DROL

9) Revise the reviewed report and cover letter, and submit the final, signature ready versions to Regulatory Affairs for review.

Regulatory Affairs

10) Review the submitted report and cover letter, including attachments and enclosures, and return to DROL with any comments.

Correspondence Coordinator

11) Code the cover letter and provide the file number to the author.

12) File the final letter and report in ATOM, as per the requirements of procedure *Managing Regulatory Communications and Commitments* [14].

DROL

13) Confirm that 'full report' is selected in the completed form *Unplanned Event Report* [9], and ensure that the form and the cover letter are signed and submitted to the CNSC Event Reporting and Response Lead (or Licensing Lead) within the prescribed timeframe via email as separate pdf attachments, and copied to the Director, CNLRPD.

14) Confirm that any commitments or actions made in the full report are entered into ActionWay, including their projected completion date, responsible manager, and closure criteria.

15) IF the full report is incomplete and there will be a revised report.

    THEN ensure that a REG-C action for the submission of the revised report is raised under the original ImpAct.

16) Ensure that the submission is filed in ATOM, and a link or copy of the full report is attached to the originating reportable ImpAct.

7.1.3.4 Revised Report

The process shown below is followed for the submission of a revised report.

DROL

1) Prepare draft for the revised report using the form *Unplanned Event Report* [9].

2) Update the Revision number to show this is a revised report to the original submitted report.

3) Ensure that all fields in the form are filled out. Enter “Nothing to Report” when there is nothing to report under specific item, or “N/A” (not applicable) when an item is not applicable to the selected type of report.

4) Prepare a cover letter for regulatory close-out which:

   - indicates that the revised submission (include report revision #) has become the official report for the event and it supersedes the previous submission; and
   - IF the revised submission is for an incomplete full report

     THEN includes a statement that CNL considers that the correspondence with the enclosed reporting form completes the reporting requirement for the event.

5) Submit the cover letter and the completed *Unplanned Event Report* [9] form for review to Licensing Managers, or designates, and on as-needed basis to SMEs and Corporate Communications.

Licensing Managers, SMEs, and Corporate Communications

6) Review the submitted report and cover letter, and return to DROL with any comments or corrections.

DROL

7) Revise the reviewed report and cover letter, and submit the final, signature ready versions to Regulatory Affairs for review.

Regulatory Affairs

8) Review the report correspondence, including attachments and enclosures, and return to DROL with any comments.

Correspondence Coordinator

9) Code the regulatory close-out cover letter and provide the file number to the author.

10) File the letter and the report in ATOM, as per the requirements of procedure *Managing Regulatory Communications and Commitments* [14].

DROL

1) Ensure that any regulatory actions identified in the report are dated, and the responsibility for each action is identified (by job title only).

2) Ensure that the completed form *Unplanned Event Report* [9], with the full report checkbox checked, the revision number has been updated, and the cover letter are signed and submitted to the CNSC Event Reporting and Response Lead (or Licensing Lead) via email as separate pdf attachments, and copied to the Director, CNLRPD.

3) Ensure that any new commitments or actions made in the revised full report are entered into ActionWay, including their projected completion date, responsible manager, and

closure criteria. Close any unnecessary actions previously assigned in ActionWay with a justification that a revised report has been submitted.

4) Ensure that the submission is filed in ATOM, and a link or copy of the revised report is attached to the originating reportable ImpAct.

7.1.4 Preparation of Other Written Submissions

7.1.4.1 Request for Retraction of a Preliminary or Full Report

If further investigation concludes that a situation or event that has been reported does not meet the requirements of a reportable event, the DROL may request the retraction of the preliminary, combined, or full report.

If CNSC staff grants the request for the retraction, the information on the situation or event that has already been submitted to CNSC staff will remain a part of the CNSC records.

The steps in the process are shown below.

DROL

1) Prepare a formal written request for retraction indicating the following:
    - the title, the identifying file number, and the date of the submission of the report to which the request pertains; and
    - the description of the grounds for the request for retraction and the reasons why the event is no longer considered reportable.
2) Submit for review to Regulatory Affairs.

Regulatory Affairs

3) Review the report correspondence, including attachments and enclosures, and return to DROL with any comments.

DROL

4) Submit request for retraction to the relevant CNSC Event Reporting and Response Lead (or Licensing Lead).
5) IF CNSC staff rejects the request for retraction of the report

   THEN follow the regular reporting process in accordance with this procedure[3].

7.1.5 Additional Guidance for Reporting to the CNSC

Appendix B provides general guidance on information on the content of an *Unplanned Event Report* [9], use form [9] for the actual report.

[3] Note: The reporting timeline for full reports resumes from the original timeline of the event report.

Guidelines for reviewing event reports and for the use of appropriate language are provided in Appendix D.

7.2 Proactive Notifications

7.2.1 Process for Submission of Proactive Notification for Unplanned Events

A proactive notification is sent if is it determined than an event that may not initially appear to fall under any reporting provision (see section 3.1.1), but is relevant to the safety of operation, significant as an operating experience, or that may have an impact on the reputation of CNL or the nuclear industry.

The process below is followed for events that fall under the requirements of section 3.1.5.1.

DROL

1) Contact the appropriate CNSC Event Reporting and Response Lead (or Licensing Lead) via telephone.
2) IF neither the CNSC Event Reporting and Response Lead (or Licensing Lead) nor their backup contact are available

   THEN contact the relevant CNSC Director, CNLRPD or designate.

   Note: the message must be acknowledged by a CNSC representative within a reasonable time, leaving a voicemail is not sufficient.
3) Communicate verbally that CNSC is being provided notification of an event that does not appear to be reportable but is of regulatory interest.
4) Ensure that the information has been properly understood by the CNSC Event Reporting and Response Lead (or Licensing Lead), using three-way communication.
5) IF, after discussion with the CNSC Event Reporting and Response Lead (or Licensing Lead), it is felt that the event is reportable

   THEN follow the process for submission of a reportable event (7.1)
6) Prepare a draft proactive notification using the template in Appendix C.
7) Ensure that any actions identified in the report are dated, and the responsibility for each action is identified (by role or job title only).
8) Follow the steps under section 7.1.1 to indicate in the relevant ImpAct that notification has been provided.
9) Ensure that the actions identified in the previous step are captured in ActionWay as under the source ImpAct, as per the requirements of procedure *Managing Regulatory Communications and Commitments* [14].
10) Submit the completed form *Proactive Notification* Template (Appendix C) for review to Regulatory Affairs.

Regulatory Affairs

11) Review the submitted proactive notification, and return to DROL with any comments.

Correspondence Coordinator

12) Code the email and provide the correspondence number to the author.
13) File the final email in ATOM, as per the requirements of procedure *Managing Regulatory Communications and Commitments* [14].

DROL

14) Copy the information from the *Proactive Notification* template into an email and submit to the CNSC Event Reporting and Response Lead (or Licensing Lead) and copying the Director, CNLRPD.
15) Ensure that the submission is filed in ATOM, and a link is attached to the originating reportable ImpAct.

7.2.2 Process for Upgrading a Proactive Notification to a Reportable Event

An event that was previously identified and submitted to CNSC staff as a Proactive Notification can be upgraded to a Reportable Event in 2 ways:

- CNL staff determine, through investigation or other information, that the event is now considered reportable as per the requirements in section 3.1.1, or
- CNL receives comments back from CNSC staff regarding a Proactive Notification and have requested it be deemed reportable.

In either case, the process for upgrading a Proactive Notification to a Reportable Event is the same as when a Reportable Event had been identified (i.e. if the event would have initially required a call to the Duty Officer, then the DROL must place a call to the Duty Officer advising the Proactive Notification is being upgraded to a Reportable Event).

DROL

IF the event falls under the criteria for reporting directly to the CNSC Duty Officer, (see section 3.1.2.1)

THEN follow the process starting in section 7.1.2.1.

IF the event does not require reporting to the CNSC Duty Officer (see section 3.1.2.2),

THEN follow the process starting in section 7.1.2.2.

7.3 Process for Reporting to other Regulatory Agencies

Correspondence with other regulatory agencies is carried out as shown below.

Functional Support Manager (equivalent to DROL)

1) Prepare the draft of the correspondence.

2) Submit the correspondence and all additional materials for review to Licensing Managers, or designates, and on as-needed basis to Corporate Communications and SMEs.

Licensing Managers, SMEs, and Corporate Communications

3) Review the submitted report and return to DROL with any comments or corrections.

Functional Support Manager

4) Revise the reviewed correspondence and submit the final, signature ready version to Regulatory Affairs for review.

Regulatory Affairs

5) Review the submitted correspondence, including attachments and enclosures, and return to Functional Support Manager with any comments.

Correspondence Coordinator

6) Code cover letter, provide the file number to the author, and file the final letter in ATOM.

Functional Support Manager

7) Ensure that any regulatory actions identified in the correspondence are dated, and the responsibilities are identified (by job title only).

8) Ensure that any commitments or actions made in the correspondence are entered into ActionWay, including their projected completion date, responsible manager, and closure criteria.

7.4 Process for Other Requirements when reporting to CNSC

7.4.1 Significance Level 1 or 2 Events or Event that has a high probability of triggering an Administrative Monetary Penalty

See section 3.1.9.3 for examples of events that could trigger an Administrative Monetary Penalty.

DROL

1) Ensure an ImpAct has been raised as per the *Improvement Action (ImpAct) Corrective Action Program* [4].

2) Immediately schedule a meeting with the CNO, CRO and CNL's Legal Department to discuss path forward

3) Further procedures will be identified as part of the meetings and/or discussions with CNO, CRO, and CNL's Legal Department

7.4.2 Events requiring an Event Initial Report, an Order, or GNSCR 12(2) request

See section 3.1.9.3 for examples of events that could trigger an EIR, an order, or a GNSCR 12(2) letter.

An Order or GNSCR 12(2) letter are regulatory tools issued by CNSC to compel a licensee to do something, while an EIR is a request by the CNSC to appear before the Commission to discuss an event. All of these will be sent to the licensee by the CNSC, either the CNO or DROL.

Addressee (CNO, CRO or DROL)

1) Acknowledge receipt of correspondence from the regulator.
2) Ensure that correspondence has been saved in ATOM as per [14]
3) Ensure an ImpAct has been raised as per the *Improvement Action (ImpAct) Corrective Action Program* [4].
4) Further procedures will be identified as part of the meetings and/or discussions with CNO, CRO, and CNL's Legal Department.

8. Documented Information

Creation, Capture and Use of Information Assets [25] provides current information on the storage, preservation, turnover and retention requirement for records.

All letters and emails submitting preliminary and full reports shall be filed in the correspondence module of ATOM, as per *Managing Regulatory Communications and Commitments* [14].

Appendix A Regulatory Agencies other than the Canadian Nuclear Safety Commission

Regulatory Agency	Type of Arrangement	Functional Support Area or Department
Federal		
Department of Fisheries and Oceans	Reporting requirements: - Environmental Acts and Regulations, includes unplanned, emergency, and scheduled reporting.	Environmental Protection
Environment and Climate Change Canada	Reporting requirements: - Environmental Acts and Regulations (such as CEPA, SARA, CEAA 2012, Migratory Birds, Federal Halocarbons, etc) includes unplanned, emergency, and scheduled reporting. - Asbestos Containing Products Regulations	Environmental Protection
Employment and Social Development Canada	Reporting requirements: - Canada Labour Code Part II; - Employer Annual Hazardous Occurrence Report; - Workplace Committee Report; - Hazardous Occurrence Investigation Record; - Assurance of Voluntary Compliance. - Hours of Work issues (under the Canada Labour Code)	Occupational Health and Safety and Human Resources
Global Affairs Canada	Dual-Use material permitting	Supply Chain and Transportation of Dangerous Goods
Government Employees Compensation Regulations	Reporting requirements: - Employer’s Report of Injury/Disease.	Occupational Health and Safety
Impact Assessment Agency	Came into effect in 2019 August.	Environmental Protection
International Atomic Energy Agency (IAEA)	Safeguards Reporting through arrangements with CNSC, as required.	Nuclear Materials and Safeguards

Regulatory Agency	Type of Arrangement	Functional Support Area or Department
Natural Resources of Canada (NRCan)	NRCan (and can be via AECL) requests CNL, through formal correspondence to Vice-President and General Manager of Decommissioning and Waste Management, to provide updated data for the inventory of radioactive waste in CNL. This information is used for the preparation of the Inventory of Radioactive Waste in Canada report published by NRCan.	Waste Management
Treasury Board	Notification of revocation of a security clearance; Government of Canada Security Policy.	Security
Transport Canada	Transportation events, reported as required.	Transportation of Dangerous Goods
Provincial		
Emergency Management Ontario	Reporting requirement during an emergency.	Emergency Preparedness
Sécurité Civile du Quebec	Reporting requirement during an emergency.	Emergency Preparedness
Emergency Measures Organization - Manitoba	Reporting requirement during an emergency.	Emergency Preparedness
Province of Ontario, Police of Jurisdiction	Reporting requirements of business firearm licence: - Immediate reporting of firearms discharge other than scheduled range practice to Police of Jurisdiction and the Chief Firearms Office for the Province of Ontario. - Notification of any employee handling firearms weapons devices or ammunition covered by the Firearms Act that has been charged or convicted of an offence referred to in section 5 of the Firearms Act, treated for mental illness, or has exhibited violent behaviour that may make them ineligible for a licence. - Notification within 24 hours if an employee licensed under the act is suspended from firearms carrying duties.	Security

Regulatory Agency	Type of Arrangement	Functional Support Area or Department
	- Notification of any employee handling firearms weapons devices or ammunition covered by the Firearms Act that has terminated employment.	
Chief Firearms Officer – Manitoba (CNSC is prime regulator as of Fall 2020)	Reporting requirements of business firearm licence: - Immediate reporting to a Peace Office and the Chief Firearms Office of Manitoba of any firearms discharge that causes injury to a person or damage to property. - Notification of any new employee hired by the business who handles or would handle firearms, weapons, devices or ammunition covered by the Firearms Act. - Notification of any employee who ceases to be employed by the business in the capacity, or at all, of handling firearms, weapons, devices or ammunition covered by the Firearms Act. - Immediate reporting to a Peace Officer and the Chief Firearms Office of Manitoba of any theft or loss of firearms, weapons, devices or ammunition covered by the Firearms Act.	Security
Ministry of Transportation, Ontario	Reporting requirements: - Changes to Licences of CNL fleet of Ontario licenced vehicles	Infrastructure and Transportation of Dangerous Goods
Ministry of Environment, Conservation & Parks – Ontario	Protection of Ontario's air, land, water, species at risk and their habitats, enforce compliance with environmental laws Reporting requirements: - Spills on non-federal lands	Environmental Protection
Ministry of Labour Ontario	Reporting requirements: - Occupational Health & Safety Act and associated Regulations; - Workplace Safety & Insurance Act.	Occupational Health and Safety
Workplace Safety and Insurance Board (WSIB) – Ontario	Reporting requirements: - Worker's Compensation Act (Ontario)	Health Centre

Regulatory Agency	Type of Arrangement	Functional Support Area or Department
Worker's Compensation Board of Manitoba	Reporting requirements: - Worker's Compensation Act (Manitoba)	Health Centre
Ontario Energy Board	Electricity Wholesaler Licence – *expires 2027 Dec 14*	Infrastructure
Technical Standards and Safety Authority (Boilers and pressure vessels division)	Authorized Inspection Agency Services Agreement between Technical Standards and Safety Authority and CNL (Revised Agreement, effective 2022 April 01).	Engineering - Pressure Boundary
Technical Standards and Safety Authority (Elevating devices division)	Authorized Inspection Agreement between Technical Standards and Safety Authority and CNL for inspection and licensing of elevators.	Infrastructure
Manitoba Department of Labour and Immigration	Reporting requirements: - The Steam and Pressure Plants Act (Manitoba), C.C.S.M. c. S210	Engineering - Pressure Boundary

Appendix B General Content of Event Report

#	Required Information
1	***Report Details:*** - ImpAct number and title - Type of report – preliminary/combined/full - Reference to the preliminary report or notification (in full reports) - Date and the time of the initial verbal report - Name and signature of the Designated Representative of the Licensee - Name of CNSC staff member contacted for the situation/event - Reporting provision (from NSCA, the Regulations, licence/LCH)
2	***Details on event circumstances:*** - Date and time of the onset - Indication if the situation is ongoing - Date and time of discovery - Event duration (known or estimated) - Location, where the situation or event occurred - The effective dose and equivalent dose of radiation received by any person as a result of the situation or event, including the measured or estimated doses to the public - Any problem with a radiation device, if applicable - Action Levels reached
3	***Consequences of the event:*** - Effects on the health, safety and security of persons or the environment, any releases of radioactive and/or hazardous substances to the environment - Effects on the maintenance of security - International obligations that have resulted or may result from the situation or event, If applicable - Qualifications of the workers, including trainees, for any situation or event which involved an exposure device - Information on the nuclear substance and the name, model, and serial number of the radiation device involved, where applicable - Names of persons involved and the details of the packaging and packages, for dangerous occurrences under PTNSR 2015
4	***Actions:*** - Immediate actions resulting from the event - Further actions taken or proposed to be taken to correct or prevent recurrence of the event, including the delivery date and the responsibility (by title).

#	Required Information
	- Whether an Extent-of-Condition evaluation will be performed.

Appendix C Proactive Notification Template

Proactive Notification **(Information for Item of Regulatory Interest)**	
ImpAct Title	/Impact title as it appears in ActionWay/
ImpAct Number	/Impact ID number as in ActionWay/
Date of Occurrence	/YYYY-MM-DD/
Summary of Occurrence	/Short description of the occurrence/
Actions Taken by Licensee	/Bulleted list of actions taken/

- *Populate the above table and submit in MS-Word format to Regulatory Affairs for review after it has been reviewed by management and Subject Matter Experts (email to: >>RegAff).*
- *The 'Summary of Occurrence' should include brief description of the occurrence; should avoid irrelevant information. All acronyms must be developed at first use.*
- *The 'Actions Taken by Licensee' should be described clearly, with clear objectives. The actions that are complete should be identified.*
- *After the Regulatory Affairs review is complete, include the above table in an email to CNSC staff.*
- *Set security designation of the email as appropriate (Unrestricted or Protected-Sensitive).*
- *Address as appropriate (refer to the information on CNSC contacts and the CNL Distribution List for Regulatory Correspondence available at the Regulatory Affairs intranet site).*
- *Definition of Proactive Notification is available in procedure 900-514300-MCP-006, CNL Reporting to Regulatory Agencies.*
- *For reportable events use the form 900-514300-FM-002, Unplanned Event Report.*

Appendix D Language Used in Unplanned Event Reports

a) Is the title appropriate?
  1) Could the title shock the reader or cause undue alarm?
b) Is the language clear and concise?
  1) The full report is to state facts only.
  2) There shall not be any slang used in the report.
c) Is the language free of editorial opinions?
  1) There shall not be any language that is speculative or tentative.
    i) e.g., speculative language: I think, Could be, Assumedly, Seems to.
      a) Use →At this time the root cause is linked to…
    ii) e.g., tentative language: I would like to, By any chance, hope, supposedly, probably, sometimes.
  2) There shall not be any language that is emotional. Value statements shall not be added to the language.
    i) e.g., emotional language:
      a) Words like "always, only, very" should be avoided.
      b) e.g., This branch always hands in their reports late.
      Use →The report was handed in late.
      c) e.g., The data showed that only 5% of the liquid contained heavy water.
      Use →The data showed that 5% of the liquid contained heavy water.
      d) e.g., The RP signage was very hard to see.
      Use →The RP signage was hard to see due to boxes placed in front of it.
d) There shall not be any inflammatory statements regarding individual staff or programs/policies.
  1) e.g., Employee X has been repeatedly asked not to do this.
  2) e.g., We have asked for this piece of equipment to be fixed but no one ever listens.
  3) e.g., This problem seems to arise every other month.
  4) e.g., That department does not cooperate with other departments.
  5) e.g., This problem arises due to the silos that exist on site.
  6) e.g., This issue has been brought to the attention of management but they have yet to act on it.
e) The language used shall not be shocking or causing any undue fear.
f) The title or text shall not admit or imply guilt.
  1) e.g., Use "non-compliance" or "non-conformance" as appropriate instead of "violation".

The report shall present the information as facts and not add value statements. The information provided in the report shall be accurate and truthful.

Effective date: 2022/10/24

Mandatory Review by Date: 2025/10/24

Revision History

Rev. No.	Date	Details of Revision	Prepared By	Reviewed By	Approved By
5	2022/10/07	Issued as “Approved for Use”.	M. Karam	A. Bakewell	D. Garrick
5D1	2022/08/12	Issued for “Review and Comment”. Minor Changes. General updates to formatting and alignment to a new template. Minor editorial changes: • Addition of the first paragraph in Section 1 to align with the latest version of the template. • The order of the first and second paragraph in Section 1 (of Rev 4) is switched to align the content with the added paragraph in the above bullet. • The complete definition of “safety analysis” from reference [1] is added in the fourth paragraph. • Moved the bullets and last two paragraphs from Section 2 (Purpose) to Section 5 (Functional Programs) to align with the description in the new template. • Rearranged the references in chronological order to align with the after mentioned text move in the above bullet. References [8], [9] and [7] are rearranged to be [7], [8] and [9], respectively. • Added “Chief Safety & Licensing Officer” as the Safety Analysis Functional Support Manager in Section 4.1. This is done to align with CNL Management System Manual which states that the Chief Safety & Licensing Officer responsibilities are described in PDD for Safety Analysis. • Rephrasing the wording of the six bullet in Section 4.2 to clarify the meaning. • Added a new reference [12] for the Safety Review Committee in Section 5.1.1 and rearranged existing references [12] and [13] to [13] and [14], respectively.	M. Karam	A. Dash D. Garrick Y. Dube R.Kingsbury	

Rev. No.	Date	Details of Revision	Prepared By	Reviewed By	Approved By
		• Added the following text to Section 5.1.1 to clarify requirements for planning small vs complex projects as follows: "The level of documentation is commensurate to the level of work. For simple projects, no documentation may be required apart from discussion and confirmation from the stakeholders. For more complex projects with multiple deliverables, a detailed plan may be prepared". • Wording for the first two bullets in Section 5.1.2 is updated for clarity of the meaning. • Added "including Design Extension Conditions (DEC)' to the last bullet in Section 5.1.2. • Replaced "key phenomena" with "postulated initiating events, hazards" in the second paragraph of Section 5.1.3. • Replaced Operations with Nuclear Facilities in the third and fourth bullets in Section 5.1.4. • Added a new internal interface group "Nuclear Criticality Safety" in Section 6.1. • Corrected the name of IAEA in the table in Section 6.2 from International Atomic Energy Association to International Atomic Energy Agency.			
4	2021/07/22	Issued as "Approved for Use". Minor Changes. General updates to formatting and alignment to a new template. Minor editorial changes: • Table in Section 6.1: replaced Operations with Nuclear Facilities. Removed Change Control Committee meetings and added TOE. Changed HSSE&Q to HSSE. • Table in Section 6.2: changed primary interface contact with CNSC to Manager of Canadian Nuclear Laboratories Regulatory Affairs Branch. Changed primary interface contact with	M. Karam		D. Garrick

Rev. No.	Date	Details of Revision	Prepared By	Reviewed By	Approved By
		International Groups to Office of Safety and Licensing. • Update to references [1], [8], [12] & [13].			
3	2020/07/30	Issued as "Approved for Use". Minor Changes. Updated to incorporate minor editorial changes.	M. Karam		D. Garrick
2	2019/09/19	Issued as "Approved for Use".	M. Karam		D. Garrick
2D1	2019/08/22	Issued for "Review and Comment". Minor editorial changes.	M .Karam	A. Coulas D. Cram J. DeRuiter Y. Dube D. Garrick G. Hamilton V. Mihaylov N. Mantifel S. Mistry J. Slade	
1	2018/11/30	Issued as "Approved for Use". Replaced "Manager, Safety Analysis" by "Designated Safety Analysis Manager". Added reference to 900-508120-MCP-003 for verification activities. Added Configuration Management to the internal interfaces table.	M. Karam		D. Garrick
1D1	2018/09/20	Issued for "Review and Comment". Minor editorial changes. Minor change to Section 1 to align with the PDD. Replaced sub-section numbering by table caption as per latest template. Updated requirements to latest CRL LCH.	M. Karam	S. Brewer A. Coulas Y. Dube D. Garrick G. Hamilton S. Karivelil N. Mantifel S. Mistry S. Sanders J. Slade	
0	2017/02/03	Issued as "Approved for Use". Cancels and Supersedes: 145-508770-OV-001, Safety Engineering and Licensing		D. Garrick	D. Garrick
D2	2017/01/10	Issued for "limited Review and Comment".		A. Coulas J. West	
D1	2016/12/15/31	Issued for "Review and Comment".	A. Writer	A. Bellil A. Caron S. Celovsky D. Garrick G. Hamilton S. Karivelil H. Khartabil K. Lundie N. Mantifel S. Mistry B. Orbanski R. Ponnan K. Schruder	

Table of Contents

1. Scope and Applicability

This Company-wide Interpretation document applies to all activities unique to the Safety Analysis Functional Support Area (FSA), performed by Canadian Nuclear Laboratories (CNL) across all sites.

The Safety Analysis FSA processes apply to all safety analysis activities involving CNL structures, systems and components (SSCs), and all management, supervision and staff across all CNL sites.

The Safety Analysis FSA develops and controls the suite of nuclear safety analysis documents required to support the execution of safety analysis at CNL.

As defined by Canadian Nuclear Safety Commission (CNSC) [1], safety analysis is a systematic evaluation of the potential hazards that is associated with the conduct of a proposed activity or facility and that considers the effectiveness of preventive measures and strategies in reducing the effects of such hazards or with respect to deterministic safety analysis, analysis by means of appropriate analytical tools that confirms the design basis for the items important to safety and ensures that the overall nuclear facility design is capable of meeting specified acceptance criteria. The relevant hazards, include radiological, nuclear criticality, fire, and chemical. However, with respect to compliance with the Nuclear Safety and Control Act (NSCA) and the pertinent regulations, the CNSC requirements are limited to consideration of the effects of all relevant hazards to radiological safety, and prevention of nuclear criticality accidents, or chemical hazards directly associated with CNSC licensed radioactive material.

Assessment of non-radiological hazards is included in the scope of other FSAs, such as Occupational Safety & Health [2] and Fire Protection [3] with aspects relevant to nuclear safety taken into account in Safety Analysis. The assessment of Nuclear Criticality Safety is governed by the Nuclear Criticality Safety FSA [4] and the results are an input to the safety case. Radiological hazards related to protection of workers and the public from ionizing radiation, is covered under the Radiation Protection FSA [5].

Any questions regarding the content or application of this document should be directed to the Functional Support Manager for Safety Analysis as identified in the *Functional Authorities* controlled list [6].

2. Purpose

The purpose of this document is to define how to conduct and maintain nuclear safety analysis to permit the successful completion of safe engineering design in support of new build, facility modification, facility operation, research and product development, decommissioning and disposal.

3. Definitions and Acronyms

This document relies primarily on word meaning as found in common dictionaries. The current *Glossary of Controlled Terms and Acronyms* [7] and the *Glossary of CNSC Terminology* [1] contain specific meanings for those words that require further clarification.

4. Roles and Responsibilities

4.1 Safety Analysis Functional Support Manager

The Chief Safety & Licensing Officer is the Safety Analysis Functional Support Manager (FSM) and is responsible for:

- The preparation and maintenance of the safety and licensing basis for all facilities at CNL.
- Ensuring the quality of all safety analysis and the compliance with all policies, procedures, regulations and site licensing requirements.
- Ensuring the oversight of any safety analysis being conducted at CNL following the Safety Analysis FSA processes.
- Delegation of the Safety Analysis Authority (Safety Analysis FSA) [8].

4.2 Safety Analysis FSM Designate

A Safety Analysis FSM Designate is a person to whom the accountability for Safety Analysis activities have been delegated by the CNL Safety Analysis FSM, and is responsible for:

- Managing and supervising the execution of safety analysis work.
- Ensuring compliance with all policies, procedures, regulations and site licensing requirements.
- Ensuring the use of qualified personnel and appropriate procedures.
- Reviewing safety analysis FSA processes and procedures.
- Approving safety analyses.
- Providing safety analysis to support response to emergency events.
- The overall responsibility for technical work executed within Safety Analysis FSA.
- Providing advice / guidance to CNL personnel on nuclear safety matters.

4.3 Technical Lead

A Technical Lead (demonstrated technical competencies in a subject matter area) is responsible for:

- Providing guidance and mentorship to Analysts / Engineers conducting safety analyses.
- Ensuring compliance with company procedures.
- Reviewing safety analyses.

4.4 Safety Analyst / Engineer / Subject Matter Expert

A Safety Analyst / Engineer / Subject Matter Expert (SME) undertakes work related to nuclear safety. A Safety Analyst / Engineer / SME is responsible for:

- Performing work in accordance with Safety Analysis processes and procedures.
- Providing advice and guidance to CNL personnel on nuclear safety matters as required.

5. Functional Programs

The objectives of safety analysis include:

- Confirming that the design of the nuclear facility meets its nuclear safety requirements.
- Characterizing the events that are applicable to the site and facility design; deriving or confirming operational limits and conditions (OLCs).
- Analyzing and evaluating event sequences that result from the failure of SSCs.
- Confirming the range of conditions and events taken into account in the design basis.
- Demonstrating that the management of the anticipated operational occurrences (AOOs) and design basis accidents (DBAs) is possible by automatic response of either the control systems or safety systems in combination with prescribed operator actions.
- Confirming that the results of a safety analyses are within design basis limits and radiological dose acceptance criteria.

The Safety Analysis FSA also manages requirements and processes and provides advice to all safety analysts to ensure that safety analysis activities are performed in a manner that considers protection of workers, the public, and the environment, and are in compliance with applicable regulatory and licence requirements. The Safety Analysis FSA documents the requirements for planning, performing and documenting safety analyses for the full lifecycle of nuclear facilities from design through to decommissioning or disposal.

The Safety Analysis FSA requirements are listed in the Program Requirements Document [9].

5.1 Process Description

The Safety Analysis FSA supports the execution of complex technical safety analyses and independent routine hazard assessment activities. It includes activities such as:

- Hazard analysis
  - Identification of hazards using systematic processes.
  - Risk ranking and classification of hazards.
- Safety analysis
  - Radiological consequence assessment of accidents/hazards/postulated initiating events.
  - Analytical modelling of event sequences such as, atmospheric dispersion, thermal hydraulic, reactor physics, etc.
  - Probabilistic modeling of event sequences, such as fault tree analysis (FTA), event tree analysis (ETA), reliability analysis, etc.
  - Uncertainty analysis of safety analyses.
- Safety assurance
  - Specification of safety analysis processes and procedures.
  - Verification and validation of safety analyses.
  - Verification and validation that the design meets the safety requirements.

Activities are executed in accordance with the procedures and instructions that can be found in the *Safety Analysis* procedure [10], the *Safety Analysis for Decommissioning and Waste Management* standard [11], and the procedural documents referenced within.

All safety analysis activities are performed using:

- Systematic analysis methodology with justified assumptions and inputs.
- Verified and validated computer codes.
- Accounted for uncertainties in the safety analysis models and inputs.
- Traceable and reproducible degrees of conservatism commensurate with the severity of the analyzed event and associated uncertainties.
- Accepted review process.

The safety analysis processes allow for development, maintenance, oversight and effectiveness reviews of all work related to nuclear safety. These ensure all analysis is compliant with the requirements of the Safety Analysis FSA.

5.1.1 Define Safety Analysis Plan

Prior to executing safety analysis, the scope, purpose, requirements, acceptance criteria and a suitable methodology are defined and documented in conjunction with stakeholders. This includes the operating organization and relevant safety and licensing organization. The level of documentation is commensurate to the level of work. For simple projects, no documentation may be required apart from discussion and confirmation from the stakeholders. For more complex projects with multiple deliverables, a detailed plan may be prepared. The plan is developed by determining if an independent safety review is required, identifying deliverables, determining required Safety Review Committee (SRC) [12] and CNSC involvement, outlining relevant quality and verification activities.

A consistent graded approach can be used in determining the scope and detail of safety analysis consistent with the risk associated with the activity. CNL safety analysis covers a wide range of facilities and projects and hence a wide range of risks and hazards. A higher level of rigour is applied for complex analyses, if there are large uncertainties, or if margins to acceptance criteria are expected to be small. Less rigour can be applied to addressing each of the requirements for safety analysis when the scope, hazards, consequences, and risk are reduced.

5.1.2 Identify and Classify Hazards and Events

A systematic process, based on regulatory requirements, operational experience, engineering judgement, and design review is used to define events, event sequences and event combinations that can potentially challenge the safety or control functions of the nuclear facility. These events include credible SSC failures or malfunctions, operator errors, as well as common-cause internally and externally initiated events.

Hazards are identified and classified prior to the execution of safety analysis and can include:

- Radiological hazards related to production, possessing, processing, storing and disposing of nuclear substances at the facility.

- Chemical hazards associated with the nuclear substances.
- Facility hazards that could affect the safety of nuclear substances and thus present an increased radiological risk.
- Potential accident sequences caused by process deviations or other events internal to the facility and credible external events, including natural phenomena.
- Consequence and the frequency of occurrence of each potential accident sequence, and the methodology used to determine the consequences and frequency.
- Each item relied on for safety, the characteristics of its preventive, mitigating, or other safety function, and the assumptions and conditions under which the item is relied upon to support compliance with the performance requirements.
- Common-cause failures initiated by internal and/or external events.
- Classify the events selected for analysis into: AOOs, DBAs and beyond design basis accidents (BDBAs) including Design Extension Conditions (DEC).

5.1.3 Execute Safety Analysis and Assess Results

Work is executed by following the developed plan and in accordance with procedures and instructions that can be found in the Safety Analysis documentation [10] and [11], and the procedural documents referenced within.

The scenarios, postulated initiating events, hazards and event sequences are analyzed. The results of each safety analysis are assessed for parameters directly related to acceptance criteria and margins are assessed relative to the uncertainties. The safety assessment needs to clearly identify any requirements for a change in design or operations, including identification of OLCs as appropriate. The execution of safety analysis can also include confirmation that the defence in depth of the facility or site meets expectations.

Where there is uncertainty regarding an event sequence or safety case, the uncertainty are addressed through means, such as sensitivity analysis, additional assessment and justification of assumptions and key parameters, or in the case of long term assessments, natural analogues can be used to demonstrate system robustness.

5.1.4 Execute Design and Operational Support Activities

Depending on the reason for the analysis, additional activities could be identified in the analysis plan and carried out after completion of the initial analysis, sometimes as an input to further analysis. This can include specification of OLCs, confirmation or recommendation of safety measures, redefinition of events to be analyzed, determination of failure event sequences, and specification of automatic response of either the control systems or safety systems.

Design and operational support includes activities such as:

- Interfacing with Design (can be CNL Engineering or an external contractor) during definition phase for design requirements, component requirements, pressure boundary, etc., to specify safety requirements.

- Providing support to Design with document reviews, formal and informal communications, etc., to confirm safety requirements.
- Interface with Nuclear Facilities to specify safety requirements, such as OLCs, trip and alarm (T&A) set points, etc.
- Providing support to Nuclear Facilities with document reviews, formal and informal communications, etc., to confirm safety requirements.
- Defining safety envelope for new and modified operations, such as job reviews, experimental/infrequently performed operations approvals, conditional release request (CRR), technical operability evaluation (TOE), operational decision making (ODM), etc.

5.1.5 Verify, Approve and Release Results

After events have been analyzed, the results are verified against the acceptance criteria of initial classification and grouping. Should the results of an analysis be less consequential than initially postulated, or likelihood of occurrence change upon development of the event sequence, the initial classification and grouping can be examined/revised.

Verification activities are carried out in accordance with the *Design and Development Review and Design Verification* procedure [13] and include:

- Independent review of technical work, analysis methods and calculations.
- Review of both technical and process documentation for safety-related activities.

All work conducted in accordance with the Safety Analysis FSA processes is subject to management review and approval. Where required by provincial legislation, formal documents produced may require signing and sealing by a professional engineer. Any such endorsement is carried out in accordance with the *Preparation of Design Document* procedure [14].

6. Interfaces

6.1 Internal Interfaces

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Design Engineering	Design drawings, technical notes, safety requirements, Independent Safety Assessments	Visits, meetings, phone calls, e-mails	Chief Engineer Director, Engineering Services Design Authority
Configuration Management	Engineering Change Control (ECC)	ECC process	Designated Engineering Manager for CM
Nuclear Criticality Safety	Criticality hazard identification (CHI) study	Meetings, documentation of CHI study	Nuclear Criticality Safety Program Manager

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Nuclear Facilities	TOE and ODM support License amendment support Safety Analysis Report (SAR) Development and update	Visits, meetings, phone calls, e-mails	Facility Authorities Facility Managers
Science & Technology	Safety analysis documentation in support of new Research & Development facilities and modification to existing Research & Development facilities	Visits, meetings, phone calls, e-mails	Facility Authorities Facility Managers
Regulatory Affairs	Safety analysis documentation in support of submissions to CNSC, license renewals / extensions	Visits, meetings, phone calls, e-mails	Manager, Regulatory Affairs
Environmental Remediation Management	Independent verification of safety analyses conducted by Environmental Remediation Management (ERM)	Visits, meetings, phone calls, e-mails	Director, ERM Safety, Licensing & Engineering Manager, ERM Safety & Licensing
Health, Safety, Security and Environment (HSSE) FSAs	Information pertinent to Safety Analysis activities that have an effect on HSSE FSAs. Information pertinent to HSSE FSAs that have an effect on Safety Analysis activities.	Visits, meetings, phone calls, e-mails Document review and comment	FSM from Functions in HSSE Lead area

6.2 External Interfaces

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Canadian Nuclear Safety Commission (CNSC)	Licensing and regulatory compliance issues	Annual meetings, Quarterly meetings	Manager of Canadian Nuclear Laboratories Regulatory Affairs Branch
Canadian Standards Association (CSA)	Information exchange and collaboration	Nuclear Standards Steering Committee and Technical Committees	Nuclear Technical Committee Secretariat
International Groups: • CANDU Owners Group (COG) • International Atomic Energy Agency (IAEA)	Information exchange and collaboration	Working groups, Peer reviews	Office of Safety and Licensing

Revision History

Rev. No.	Date	Details of Revision	Prepared By	Reviewed By	Approved By
6.1	2024/03/13	Issued as “Approve for Use”	M. Karam	A. Bakewell	D. Garrick
6.1D1	2024/03/07	Issued for “Review and Comment”. Minor Changes. Revised in response to CNSC Staff comments received in 145-NOCN-23-0055-L (e-Doc-7179596), and aligned with CNL's disposition to the comments as documented in 145-CNNO-24-0003-L (e-Doc 7210661) and accepted by the CNSC staff in 145-NOCN-24-0009-L (e-Doc 7214133). Minor changes are as follows: • Sentences are added to Sections 3.2.1 and 3.2.2 to clarify the area of applicability of REGDOC-2.11.1 (Volume III) and REGDOC-2.4.4, respectively. • Added Section 1.2 (Scope) of REGDOC-2.11.1 Volume III to Table 4. • A note is added to Table 12 to clarify the applicability of REGDOC-2.4.4 vs. REGDOC-2.11.1 (Volume III). • Added two missing clauses (4.3.1 Identification of postulated initiating events) from REGDOC-2.4.4 into Table 5.	M. Karam	A. Bakewell	
6	2023/10/30	Issued as “Approved for Use”.	C. Popistas	A. Bakewell	D. Garrick
6D1	2023/10/09	Issued for “Review and Comment”. Major changes: General updates to formatting and alignment to a new template, including addition of Table 12. Included REGDOC-2.4.4 requirements (Section 3.1.3). Included CSA N292.0, N292.2, N292.3 and N292.6 requirements (Section 3.2).	C. Popistas	A. Bakewell M. Karam S. Melnyk S. Mackie T. Pehkonen	D. Garrick

Rev. No.	Date	Details of Revision	Prepared By	Reviewed By	Approved By
		Also, the following were included: • *Deterministic Safety Analysis*, REGDOC 2.4.1. • *Safety Assessment for Facilities and Activities*, IAEA GSR Part 4. • *Safety Analysis and Licensing Documentation for Nuclear Fuel Cycle Facilities*, IAEA SRS No. 102. • *Procedures for Conducting Probabilistic Safety Assessment for Non-reactor Nuclear Facilities*, IAEA TECDOC-1267. • *Safety of Nuclear Fuel Cycling Facilities*, IAEA SSR-4.			
5	2022/11/02	Issued as “Approved for Use”.	M. Karam	A. Bakewell	D. Garrick
5D1	2022/09/02	Issued for “Review and Comment”. Minor Changes. General updates to formatting and alignment to a new template. Minor changes: • Section 1 is updated to align with the latest version of the new template. • The second paragraph in Section 3 is deleted to align with new template. • Last three bullets are added to Section 4 to identify requirements from REGDOC-2.11.1 Volume I, Volume III and REGDOC-2.11.2, respectively • Table 2 changes: • document 900-508770-FID-005 is voided, removed from Table 2 and replaced by the applicable suite of safety analysis documents • document 900-508770-FID-007 is canceled and	M. Karam	A. Bakewell	D. Garrick

Rev. No.	Date	Details of Revision	Prepared By	Reviewed By	Approved By
		superseded by 900-508770-MCP-004 (added to Table 2) • document 900-508770-MCP-002 is added to Table 2 • document 900-508770-LST-001 is added to Table 2 • Two rows (3 and 4) are added to Table 2 to list clauses for Safety Analysis Program in the CRL LCH • Added the last two rows in Table 3 to list clauses for Safety Analysis Program in the WL LCH • Table is updated to provide the applicable clauses from the LCHs for G-1, NPD and DP Waste Facilities • Added a new table (Table 5) to include applicable clauses from REGDOC-2.11.1 Volume I and Volume III and REGDOC-2.11.2 as they fall under Safety Analysis scope. These REGDOCs are listed in the LCHs of various CNL sites • Added a new table (Table 6) to include applicable clauses from CSA N294-19 as they fall under Safety Analysis scope. These CSA N294-19 is listed in the LCHs of various CNL sites • Added a new table (Table 7) to include an applicable clause from the Site Operating Company Agreement (SOCA) • Section 6 (References) is deleted to align with the new template			
4	2021/06/21	Issued as “Approved for Use”. Minor Changes. Updated to include applicable requirements from CSA N286-12 (R2017) and editorial changes.	M. Karam		D. Garrick
3	2020/09/25	Issued as “Approved for Use”. Minor Changes. Updated to include applicable	M. Karam		D. Garrick

Table of Contents

1. Scope and Applicability

This Company-wide Document applies to all activities unique to the Safety Analysis Functional Support Area (FSA), performed by Canadian Nuclear Laboratories' (CNL) employees, contractors, and sub-contractors, as well as third parties engaged through external partnerships or collaborations that perform work for and/or on behalf of CNL.

2. Purpose

This document identifies the requirements for conducting safety analysis activities at CNL in order to demonstrate conformance to all applicable laws, regulations, company policies and procedures.

The following is a mapping of requirement source documents to the Management System documentation that implements those requirements. It reflects the current operational implementation of the requirements. Given the diverse nature of the CNL business and the dynamic nature of the regulatory environment and the complexity of the regulations, the mapping is not intended to be complete for every possible requirement.

3. Requirements and Flowdown

The specific requirements to be addressed by the Safety Analysis FSA originate from the relevant acts and regulations, and licences that CNL holds. The process for implementation of requirements for the Safety Analysis FSA requirements is described in the relevant Management System Documents, as provided in the follow-on tables.

3.2 Regulatory Documents

3.2.1 REGDOC-2.11.1 (Volume I and III) and REGDOC-2.11.2

REGDOC-2.11.1 (Volume III) applies to Class IB waste management facilities for the development of a safety case and supporting safety assessment for the post-closure phase of disposal facilities. For the pre-closure phase, only REGDOC-2.4.4 applies, and REGDOC-2.4.4 does not apply to post-closure.

Table 4: Waste Management, Volume I: Management of Radioactive Waste -REGDOC-2.11.1, Waste Management, Volume III: Assessing the Long-Term Safety of Radioactive Waste Management-REGDOC-2.11.1 and Decommissioning-REGDOC-2.11.2

Source, Section and Title	Description	Implementing Document(s)
REGDOC 2.11.1 Volume III Section 1.2 Scope	This regulatory document addresses the development of a safety case and supporting safety assessment for the post-closure phase of disposal facilities, which includes locations or sites, for all classes of radioactive waste. This document also applies to long-term radioactive waste management facilities, locations or sites where there is no intention to retrieve the waste.	900-508770-STD-001, *Safety Analysis for Environmental Remediation Management*
REGDOC 2.11.1 Volume III Section 7.9 Institutional Controls	The licensee or applicant shall identify the role that institutional controls play in disposal facility safety, and how that role is taken into account in the safety case and its supporting safety assessment. The presence of institutional controls should not be used to justify a reduction in the level of design of the containment and isolation system. While long-term safety of the disposal facility should not be dependent on institutional controls, these should be used to the extent practicable to confirm that the disposal system is performing as designed. Given the uncertainties associated with future human activities and the evolution and stability of societies, licensees or applicants should limit reliance on institutional control as a safety feature to a few hundred years. For uranium mine and mill waste, the large volume of the waste and the longevity of some of the radionuclides might necessitate longer periods of institutional control as a means of providing safety. Reliance on such	900-508770-STD-001, *Safety Analysis for Environmental Remediation Management*

Source, Section and Title	Description	Implementing Document(s)
	longer-term institutional control (beyond a few hundred years) should be justified in the safety case through an optimization process taking into account technical and socio-economic factors. REGDOC 2.11.1, Waste Management, Volume I: Management of Radioactive Waste, provides guidance on institutional control	
REGDOC 2.11.1 Volume I Section 10.1 General Requirements	The licensee shall develop, implement and maintain a safety case for the entire lifecycle of the radioactive waste storage facility in accordance with applicable regulations.	900-508770-MCP-001, *Safety Analysis*
REGDOC 2.11.1 Volume I Section 11.1 General Requirements	The licensee shall develop, implement and maintain a safety case for the entire lifecycle of the radioactive waste disposal facility, and a post-closure safety assessment, in accordance with applicable regulations. The licensee shall ensure that each of the stages in the lifecycle of a disposal facility is supported, as necessary, by evaluations of the site, design, construction, operation and closure of the facility, and of the performance and safety of the disposal system. Each of these stages shall be supported as necessary by an iterative evaluation of the disposal system. The licensee shall ensure the safety of the facility by means of multiple safety functions including the use of multiple barriers and controls; for example, the host environment, engineered barriers, and operating the facility within the limits and conditions derived from the safety assessments. The licensee shall site, design, construct, commission, operate and close the disposal facility: in such a way that safety is ensured by passive means to the fullest extent possible so as to minimize the need for actions to be taken after closure of the facility. The licensee shall identify SSCs important to safety. For radioactive waste disposal facilities, REGDOC-2.11.1, Waste Management, Volume III: Safety Case for Disposal of Radioactive Waste, provides requirements and guidance for licensees and applicants	900-508770-MCP-001, *Safety Analysis* 900-508770-STD-001, *Safety Analysis for Environmental Remediation Management*
REGDOC 2.11.1 Volume I Section 8.6 Disposal	The licensee shall dispose of radioactive waste safely, in a manner that provides for the protection of people, the environment and national security, and that is in accordance with regulatory requirements. The licensee shall carry out disposal activities in accordance with its documented procedures. The licensee shall consider the impact	900-508770-STD-001, *Safety Analysis for Environmental Remediation Management*

Source, Section and Title	Description	Implementing Document(s)
	of any modification to these activities on the safety of the disposed waste. For additional criteria for the disposal of radioactive waste, refer to section 11, Radioactive Waste Disposal Facility.	
REGDOC 2.11.2 Decommissioning; Section 7.2 Safety Assessment for Decommissioning	The licensee shall perform a safety assessment to identify any radiological or non-radiological hazards to workers, the environment and the public from both routine decommissioning activities and credible potential accidents during decommissioning. The safety assessment should support the activities listed in the DDP. The safety assessment should be conducted in accordance with a graded approach. The safety assessment may be a stand-alone document or may be included in the DDP. The results of the safety assessment should be used to: support the development of the decommissioning plan and selection of the decommissioning strategy specify the program for maintenance, surveillance and inspection specify the procedures to be put in place for all decommissioning activities significant to safety for responding to accidents or any identified risks specify the necessary competencies for the staff involved in the decommissioning of the facility, location or site make decisions using an integrated, risk-informed approach. The safety assessment should be updated as necessary in light of revised regulatory requirements, advances in decommissioning technology, changes in site characteristics, modifications to the design or operations, effects of aging, and operational experience and lessons learned. For a nuclear facility with a Class I or uranium mines and mills licence, the licensee shall ensure that the safety assessment: identifies hazards to workers, the public and the environment from planned decommissioning activities, accidents and natural events that may arise during decommissioning and potential initiating events describes the relative importance of the hazards and identifies the methods for mitigating their risks determines the safety functions necessary throughout decommissioning, and ensures that the related SSCs are suitable and will deliver these safety functions demonstrates adequate defence	900-508770-MCP-002, *Hazard Identification/Analysis for Decommissioning Facilities in Support of Safety Assessment* 900-508770-STD-001, *Safety Analysis for Environmental Remediation Management*

Source, Section and Title	Description	Implementing Document(s)
	in depth and defines limits, controls and conditions for managing hazards demonstrates that adequate measures have been taken to prevent accident conditions and whether any consequences can be mitigated if accidents do occur determines the site characteristics related to the safety of the facility demonstrates that adequate measures have been taken to control hazards to an acceptable level, both in the present and in the long term, and to optimize protection and safety in decommissioning considers the combined and additive effects of hazards demonstrates that interdependencies between planned decommissioning actions are taken into account, and that any negative impacts of one action on another, as well as the possible generation of additional hazards, are properly taken into account Class II nuclear facilities and nuclear substances and radiation devices licensees may consult the above list for guidance, in accordance with a graded approach. For in situ decommissioning resulting in a disposal facility, location or site, a post-closure safety case (see section 5.1) shall be provided, in addition to the decommissioning safety assessment.	

3.2.2 REGDOC 2.4.4

REGDOC 2.4.4 describes the requirements for Safety Analysis for Class 1B nuclear facilities. The intent of this regulatory document is to clarify requirements and provides guidance for applicants and licensees on how to demonstrate the safety of a Class IB nuclear facility to the regulator. Table 5 depicts the implementation of the new standard within the Safety Analysis program, including actions that will be taken to ensure that requirements will be fully implemented. As indicated in Table 12, the REGDOC 2.4.4 is currently identified as a guidance document within numerous CNL licenses. Once it is fully implemented, it is proposed to become a Compliance Verification Criteria [See Footnote 3].

REGDOC-2.4.4 applies to the safety analysis of all Class IB facilities. This includes, waste management facilities for the pre-closure phase of disposal facilities. For the post-closure phase, REGDOC-2.11.1 (Volume III) applies instead of REGDOC-2.4.4.

Table 5: REGDOC-2.4.4, Safety Analysis for Class IB Nuclear Facilities

REGDOC-2.4.4 Clause Number	Clause Description	Implementing Document(s)
2 Safety Objectives	As stated in paragraphs 5(f) and 6(c) of the Class I Nuclear Facilities Regulations: "An application for a licence to construct a Class I nuclear facility shall contain the following information... (f) a preliminary safety analysis report demonstrating the adequacy of the design of the nuclear facility;" "An application for a licence to operate a Class I nuclear facility shall contain the following information... (c) a final safety analysis report demonstrating the adequacy of the design of the nuclear facility;	Preparing a Safety Analysis Report, 900-508770-MCP-001387
2.1 Defence in depth	The licensee shall address the concept of defence in depth when developing a safety analysis for a nuclear facility	Safety Analysis, 900-508770-MCP-001 Preparing a Safety Analysis Report, 900-508770-MCP-001387
2.2 Safety analysis objectives Requirements	The licensee shall maintain adequate capability to perform or procure a safety analysis	Safety Analysis, 900-508770-PDD-001 Procurement and Contracting, 900-505210-STD-001166
2.2 Safety analysis objectives Requirements	The licensee shall establish a process to assess and update the safety analysis	Scoping Review of a Safety Analysis Report, 900-508770-MCP-001460 Preparing a Safety Analysis Report, 900-508770-MCP-001387
2.2 Safety analysis objectives Requirements	The licensee shall systematically review the safety analysis results to ensure that they remain valid and continue to meet the safety goals, objectives and acceptance criteria	Scoping Review of a Safety Analysis Report, 900-508770-MCP-001460
3 Safety Analysis Program Requirements	The licensee shall develop, implement, conduct and maintain a safety analysis program for the nuclear facility	Safety Analysis, 900-508770-PRD-001 Safety Analysis, 900-508770-PDD-001 Safety Analysis, 900-508770-GDI-001 (A complete list of the Safety Analysis Program documentation is included in the Governing Document Index).
3 Safety Analysis Program Requirements	In support of the program, the licensee shall establish one or more internal safety committees to advise the organization's management on safety issues related to the commissioning, operation and modification of the facility. The licensee shall ensure that the committee has the necessary breadth of knowledge and experience to provide appropriate advice. The	Independent Technical and Readiness Reviews, 900-514300-MCP-002.

REGDOC-2.4.4 Clause Number	Clause Description	Implementing Document(s)
	members shall, to the extent necessary, be independent of the operations management raising the safety issue.	
3 Safety Analysis Program Requirements	The licensee shall provide these statements (safety, health and environmental policies) in the licence application as a declaration of the organization's objectives and the public commitment of corporate management	CNL Health and Safety Policy Committee, 900-510400-TOR-002. Environment, 900-509200-POL-001. "Application for Renewal of the Nuclear Research and Test Establishment Operating Licence for the Chalk River Laboratories – 2018", CRL-CNNO-17-0005-L, 22438143, Revision 0, 2017 March 30. "Application for Renewal of the Nuclear Research and Test Establishment Decommissioning Licence for the Whiteshell Laboratories", WLD-CNNO-18-0033-L, 43924589, Revision 0, 2018 November 15. Licence submission for Prototype Reactor Waste Facilities, "Request to Separate the Waste Facility Decommissioning Licence, WFDL-W4-332.01/2034 to Three Separate Licences for Douglas Point, Gentilly-1, and Nuclear Power Demonstration Waste Facilities", 140-CNNO-18-0003-L, 40540388, Revision 0, 2018 July 11.
3 Safety Analysis Program Requirements	The licensee shall also specify and put in place organizational structures, standards and management arrangements capable of meeting the organization's objectives and public commitments.	CNL Management System Manual, 900-514100-MAN-001
3 Safety Analysis Program Requirements	The licensee shall demonstrate that the safety analysis program is governed by the licensee's management system and is consistent with the applicable requirements of CSA N286-12, Management System Requirements for Nuclear Facilities	CNL Management System Manual, 900-514100-MAN-001 Safety Analysis, 900-508770-PRD-001
4. Safety Analysis Requirements	The licensee shall perform a safety analysis for normal operation, and for internal and external events that deviate from normal operation and belong to a category of credible	Preparing a Safety Analysis Report, 900-508770-MCP-001387

REGDOC-2.4.4 Clause Number	Clause Description	Implementing Document(s)
	abnormal events	
4.1 Safety Analysis Requirements	The licensee shall classify events into one of the facility states: anticipated operational occurrence (AOO), design-basis accident (DBA), beyond-design-basis accident (BDBA) and specific ranges within BDBA referred to as design extension conditions (DEC), or equivalent classification scheme	Preparing a Safety Analysis Report, 900-508770-MCP-001387 Safety Analysis for Environmental Remediation Management, 900-508770-STD-001
4.1 Safety Analysis Requirements	The licensee shall ensure that the safety analysis examines the following facility states: Normal operational modes (including maintenance and shutdown), AOO, DBA, DEC.	Preparing a Safety Analysis Report, 900-508770-MCP-001387 Safety Analysis for Environmental Remediation Management, 900-508770-STD-001
4.2 Safety analysis assumptions Requirements	The licensee shall not credit systems that are not qualified to operate in a post-accident environment.	Preparing a Safety Analysis Report, 900-508770-MCP-001387
4.2 Safety analysis assumptions Requirements	To credit operator action, the licensee shall demonstrate that the following are in place: • clear, well-defined, validated and readily available operating procedures that identify the necessary actions • instrumentation at the control location to provide clear and unambiguous indications of the need for operator action • a credible, protected and accessible path for the operator to safely carry out the actions required in the procedures • training for any person who may be expected to perform the operator actions	Safety Analysis, 900-508770-MCP-001
4.2 Safety analysis assumptions Requirements	The licensee shall set operator action times. The licensee shall add additional time to include, as appropriate, dressing in protective equipment; accessing remote equipment; and transporting, connecting and operating temporary equipment	Safety Analysis, 900-508770-MCP-001
4.2 Safety analysis assumptions Requirements	The SAR shall justify the operator action time	Safety Analysis, 900-508770-MCP-001
4.3 Postulated initiating events Guidance	The safety analysis and design for the nuclear facility shall consider not only the facility itself, but also the	Safety Analysis, 900-508770-PDD-001. Preparing a Safety Analysis Report, 900-

REGDOC-2.4.4 Clause Number	Clause Description	Implementing Document(s)
	interfaces with other facilities and installations that may affect its safety	508770-MCP-001387
4.3.1 Identification of postulated initiating events	The licensee shall identify PIEs (both internally and externally initiated) that could lead to: • radiation exposure to workers or to the public • a release of significant amounts of nuclear substances • a release of hazardous substances (such as hazardous chemicals) associated with the nuclear substances	Safety Analysis, 900-508770-PDD-001. Preparing a Safety Analysis Report, 900-508770-MCP-001387 Hazard Identification and Analysis, 900-508770-STD-002.
4.3.1 Identification of postulated initiating events	The licensee shall describe the methods used to identify the PIEs	Safety Analysis, 900-508770-PDD-001. Preparing a Safety Analysis Report, 900-508770-MCP-001387 Determining Bounding Accident Scenarios, 900-508770-FID-017 Hazard Identification and Analysis, 900-508770-STD-002
4.3.1 Identification of postulated initiating events	The licensee shall document and maintain the resulting list of PIEs.	Safety Analysis, 900-508770-PDD-001. Preparing a Safety Analysis Report, 900-508770-MCP-001387 Safety Analysis, 900-508770-MCP-001. Hazard Identification and Analysis, 900-508770-STD-002. Determining Bounding Accident Scenarios, 900-508770-FID-017
4.3.1 Identification of postulated initiating events	With input from technical specialists and experts in safety analysis, the licensee shall conduct a review of the list of PIEs, initially, to determine that the list is comprehensive and that the events include: • all credible failures of the facility's SSCs • all credible human errors thatcould occur in any of theoperating conditions of thefacility	Safety Analysis, 900-508770-PDD-001 Safety Analysis, 900-508770-MCP-001 Preparing a Safety Analysis Report, 900-508770-MCP-001387 Hazard Identification and Analysis, 900-508770-STD-002
4.3.1 Identification of postulated initiating events	the licensee shall conduct areview of the list of PIEsregularly, to confirm therelevance of the current listand revise it as necessary,given that relevant PIEs maychange as the facility goesthrough different phases of itslifecycle (for example, as aresult	Safety Analysis, 900-508770-PDD-001 Safety Analysis, 900-508770-MCP-001 Hazard Identification and Analysis, 900-508770-STD-002 Safety Requirements Derivation and Verification in Support of Engineering Change Control, 900-508770-FID-002

REGDOC-2.4.4 Clause Number	**Clause Description**	**Implementing Document(s)**
	of aging effects)	Scoping Review of a Safety AnalysisReport, 900-508770-MCP-001460
4.3.2 Classification of postulated initiating events Requirements	During the safety assessment, the licensee shall classify PIEs and event sequences upon identification, for the purpose of demonstrating that the acceptance criteria and the safety goals are met.	Safety Analysis, 900-508770-PDD-001 Preparing a Safety Analysis Report, 900-508770-MCP-001387. Determining Bounding Accident Scenarios, 900-508770-FID-017
4.4.1 Assessment of consequences Requirements	The licensee shall perform a deterministic safety analysis (that is, an assessment of the consequences) to identify the physical process occurring in the nuclear facility during an event and to assess the consequences.	Safety Analysis, 900-508770-PDD-001 Safety Analysis, 900-508770-MCP-001 Hazard Identification and Analysis, 900-508770-STD-002 Dose Calculations Pertaining to Respirable Radiation Sources, 900-508770-FID-008 Dose Calculations Pertaining to External Gamma Radiation Sources, 900-508770-FID-009 Dose Calculations Pertaining to Skin Exposure, 900-508770-FID-015 Dose Calculations for Ground Level Releases from Facilities at CRL, 900-508770-FID-016 Recommended Inputs for the Calculation of On-Site and Off-Site Doses Following Hypothetical Accidental Atmospheric Radioactive Releases, 900-508770-FID-018
4.4.1 Assessment of consequences Requirements	The licensee shall justify the assumptions and the actions of qualified mitigating measures (such as safety systems and operator actions) used in the deterministic analysis.	Safety Analysis, 900-508770-MCP-001.
4.4.1 Assessment of consequences Requirements	When the deterministic analysis is quantitative, the licensee shall develop models of the physical processes to calculate the consequences of the event.	Dose Calculations Pertaining to Respirable Radiation Sources, 900-508770-FID-008 Dose Calculations Pertaining to External Gamma Radiation Sources, 900-508770-FID-009 Dose Calculations Pertaining to Skin Exposure, 900-508770-FID-015 Dose Calculations for Ground Level Releases from Facilities at CRL, 900-508770-FID-016 Recommended Inputs for the Calculation of On-Site and Off-Site Doses Following Hypothetical Accidental Atmospheric Radioactive Releases, 900-508770-FID-

REGDOC-2.4.4 Clause Number	Clause Description	Implementing Document(s)
		018
4.4.1 Assessment of consequences Requirements	The licensee shall validate the computational tools used to calculate the consequences.	Safety Analysis, 900-508770-MCP-001 Preparing a Safety Analysis Report, 900-508770-MCP-001387 Use of Analytical, Scientific and Design Computer Programs, 900-514200-MCP-022
4.4.2 Assessment of likelihood Requirements	The licensee shall perform an assessment of likelihood to establish the likelihood of PIEs or event sequences to occur.	Safety Analysis, 900-508770-MCP-001 Hazard Identification and Analysis, 900-508770-STD-002 CAFTA ™ Processing for Event Tree and Fault Tree Analysis Tasks, 900-508770-FID-010. Determining Bounding Accident Scenarios, 900-508770-FID-017 Reliability Analysis, 900-508770-FID-019
4.5 Identification of structures, systems and components important to safety Requirements	The licensee shall use a safety assessment, or an equivalent methodology, to identify event sequences that may lead to an AOO, DBA, DEC or BDBA.	Safety Analysis, 900-508770-MCP-001 Hazard Identification and Analysis, 900-508770-STD-002. Preparing a Safety Analysis Report, 900-508770-MCP-001387 Determining Bounding Accident Scenarios, 900-508770-FID-017
4.5 Identification of structures, systems and components important to safety Requirements	For each event sequence, the licensee shall identify the safety functions, the corresponding SSCs important to safety, and the administrative safety requirements that are used to implement the defence-in-depth concept.	Safety Analysis, 900-508770-PDD-001 Safety Analysis, 900-508770-MCP-001 Hazard Identification and Analysis, 900-508770-STD-002 Identifying Structures, Systems and Components Important to Safety, 900-508770-FID-006
4.5 Identification of structures, systems and components important to safety Requirements	To be consistent with the safety analysis results, the licensee shall ensure that: • SSCs important to safety are designed to withstand the effects of extreme loadings and environmental conditions (such as extremes of temperature, humidity, pressure and radiation levels) that may be encountered in operational states and in accident conditions. • the required intervals for periodic testing and inspection of SSCs important to safety are defined. • the codes and standards applicable to SSCs important to safety are identified, and their use is justified. • the necessary levels of availability and reliability of SSCs important to	Safety Analysis, 900-508770-MCP-001 Design Authority and Design Engineering, 900-508120-PDD-001 Fitness for Service, 900-508230-PDD-001. Codes, Regulations, Standards, and other Documents, 900-514100-LST-002. Reliability Analysis, 900-508770-FID-019.

REGDOC-2.4.4 Clause Number	Clause Description	Implementing Document(s)
	safety, as established in the safety analysis, are attained.	
4.5 Identification of structures, systems and components important to safety Requirements	In protecting against potential hazards, the licensee shall ensure that the following hierarchy of design and administrative measures is used to the extent practicable: 1. selection of the process (to eliminate the hazard) 2. passive design features 3. active design features 4. administrative controls	Identifying Structures, Systems and Components Important to Safety, 900-508770-FID-006
4.6 Operational limits and conditions Requirements	The licensee shall derive the OLCs from the safety analysis. The licensee shall document the OLCs before starting operation of the facility.	Preparation of Operational Limits and Conditions, 900-508770-FID-003. Preparing a Safety Analysis Report, 900-508770-MCP-001387
4.7 Acceptance criteria Requirements	The licensee shall establish explicit criteria for the level of safety to be achieved to demonstrate that the licensee is making adequate provision for the protection of the environment and the health and safety of persons.	Safety Analysis, 900-508770-MCP-001. Preparing a Safety Analysis Report, 900-508770-MCP-001387.
4.7 Acceptance criteria Requirements	The licensee shall set limits on the radiological consequences and associated chemical consequences for workers and the public of direct exposures to radiation or discharges of radionuclides to the environment. These limits shall: • be set equal to, or below: • the provisions of the Radiation Protection Regulations, when applicable and as far as practicable; otherwise • criteria established by national or international standards as triggers for protective measures during radiological or chemical emergencies (for example, for sheltering or for distribution of iodine pills) • apply to the consequences of operational states and the possible consequences of AOO and DBA at the facility • apply at the site boundaries of the licensed facility when offsite consequences to the public are	Safety Analysis, 900-508770-MCP-001 Recommended Inputs for the Calculation of On-Site and Off-Site Doses Following Hypothetical Accidental Atmospheric Radioactive Releases, 900-508770-FID-018 **Note** The CNL Safety Analysis program does not yet include a requirement to establish limits on the chemical consequences associated with radiological discharges to the environment, in terms of “acceptance criteria for offsite consequences to the public of pertinent accidents”. **Action REG-23-5623** Develop a guidance document for identifying postulated initiating events (PIEs) that can lead to a release of hazardous chemicals and analyzing risks from associated accidents for class 1B facilities, and describing them in Safety Analysis Reports, as per REGDOC 2.4.4. It should consider standards such as the Canadian Environmental Emergency

REGDOC-2.4.4 Clause Number	Clause Description	Implementing Document(s)
	considered	Regulations and the associated Technical Guidelines. It will provide guidance for establishing limits on the chemical consequences associated with radiological discharges to the environment, in terms of "acceptance criteria for offsite consequences to the public of pertinent accidents". It will provide guidance for identifying Systems Structures and Components important to safety that prevent or mitigate the release of hazardous chemicals associated with the release of nuclear substances. To be completed by 2025 April 30.
4.7 Acceptance criteria Requirements	For new designs, the licensee shall consider targets that are below these limits.	Safety Analysis, 900-508770-PDD-001 Safety Analysis, 900-508770-MCP-001
4.7 Acceptance criteria Requirements	The licensee shall establish derived acceptance criteria to demonstrate that the barriers to prevent the release of nuclear or associated hazardous substances are effective; that is, the barriers: • avoid the potential for consequential failures resulting from an initiating event • maintain SSCs important to safety in a configuration that prevents releases of nuclear or associated hazardous substances to the environment or in the facility • prevent consequences that extend beyond the site boundaries of the licensed facility • are consistent with the design requirements for the facility's SSCs	Safety Analysis, 900-508770-PDD-001 Safety Analysis, 900-508770-MCP-001 Hazard Identification and Analysis, 900-508770-STD-002 Identifying Structures, Systems and Components Important to Safety, 900-508770-FID-006
4.8 Safety goals Requirements	The licensee shall demonstrate that the offsite consequences, as calculated at the site boundaries of the licensed facility, of a BDBA included in the DEC do not exceed criteria established as a trigger for temporary evacuation, for long-term relocation of the local population.	Preparing a Safety Analysis Report, 900-508770-MCP-001387 **Note:** The CNL Safety Analysis Program includes a requirement for analyzing DEC, but does not yet include all of the requirements and guidelines for how to conduct the analysis, as provided in REGDOC-2.4.4. **Action REG-23-5623:** Develop a guidance document for assessing Design Extension

REGDOC-2.4.4 Clause Number	Clause Description	Implementing Document(s)
		Conditions for class 1B facilities, and describing them in Safety Analysis Reports, as per REGDOC 2.4.4. It will provide guidance for assessing the offsite consequences against the criteria for triggering temporary evacuation and long-term relocation of the local population. It will include examples of naturally occurring events (consistent with the guidance of Appendix C in REGDOC-2.4.4). Extended loss of AC power shall be assessed. To be completed by 2025 April 30.
4.8 Safety goals Requirements	In addressing the concept of defence in depth, the licensee shall include events from BDBAs in the DEC. As a minimum, the licensee shall include the following events in the DEC: • an extended loss of AC power (ELAP) • PIEs and event sequences, including those that are specific or unique to the facility, that belong to a category of credible abnormal events	Safety Analysis, 900-508770-PDD-001 Safety Analysis, 900-508770-MCP-001 Preparing a Safety Analysis Report, 900-508770-MCP-001387 Hazard Identification and Analysis, 900-508770-STD-002. Determining Bounding Accident Scenarios, 900-508770-FID-017 **Note:** The CNL Safety Analysis Program includes a requirement for analyzing DEC, but does not yet include all of the requirements and guidelines for how to conduct the analysis, as provided in REGDOC-2.4.4. **REG-23-5623:** Develop a guidance document for assessing Design Extension Conditions for class 1B facilities, and describing them in Safety Analysis Reports, as per REGDOC 2.4.4. It will provide guidance for assessing the offsite consequences against the criteria for triggering temporary evacuation and long-term relocation of the local population. It will include examples of naturally occurring events (consistent with the guidance of Appendix C in REGDOC-2.4.4). Extended loss of AC power shall be assessed. To be completed by 2025 April 30.
4.8 Safety goals Requirements	For naturally occurring PIEs (for example, seismic events, flooding and severe weather), when selection of credible abnormal events is not practical, the licensee shall include in the DEC events that are more severe	Safety Analysis, 900-508770-PDD-001 Preparing a Safety Analysis Report, 900-508770-MCP-001387 Safety Analysis for Environmental Remediation Management, 900-508770-STD-001

5.2 Content of safety analysis documents and records Requirements	The licensee shall report the safety analysis results in sufficient detail to permit review by CNSC staff	Preparing a Safety Analysis Report, 900-508770-MCP-001387
5.2 Content of safety analysis documents and records Requirements	The licensee shall ensure that the content of the safety analysis documents and records for a facility includes, as a minimum, the SAR and the OLCs	Preparing a Safety Analysis Report, 900-508770-MCP-001387
5.2 Content of safety analysis documents and records Requirements	The SAR shall contain a representative summary of the safety analysis documents and records.	Preparing a Safety Analysis Report, 900-508770-MCP-001387
5.2 Content of safety analysis documents and records	The SAR shall: • describe the site characteristics • identify nuclear and associated	Preparing a Safety Analysis Report, 900-508770-MCP-001387 Hazard Identification and Analysis, 900-

REGDOC-2.4.4 Clause Number	**Clause Description**	**Implementing Document(s)**
Requirements	hazardous substances and their locations • identify applicable acceptance criteria for offsite consequences to the public of pertinent accidents (some examples of pertinent accidents are radiological, nuclear criticality, fire and chemical accidents, including explosions) • identify SSCs that prevent or mitigate release of nuclear or associated hazardous substances, or prevent accidental exposure to high radiation fields (to the extent appropriate for the facility, in accordance with a graded approach) • classify SSCs in accordance with their importance to safety • identify operating and emergency procedures and actions that prevent or mitigate release of nuclear or associated hazardous substances • identify the safety analysis assumptions (some examples are boundary conditions, facility configuration, and time for operator actions); many of these assumptions may be documented in the operational limits and conditions • identify credible initiating events that may affect the licensee's control of nuclear or associated hazardous substances, including: o internal events (for example, component failures, human error, fire or flood) o external events (for example, earthquake, fire, flood or extreme weather) • group together all initiating events that have similar characteristics and identify bounding events for analysis • provide the results of the analysis of the consequences of the analyzed events • include uncertainty and sensitivity analysis results, when applicable • compare the results to acceptance criteria	508770-STD-002. **Note** The CNL Safety Analysis program does not yet include a requirement to establish limits on the chemical consequences associated with radiological discharges to the environment, in terms of "acceptance criteria for offsite consequences to the public of pertinent accidents". **Action REG-23-5623**: Develop a guidance document for identifying postulated initiating events (PIEs) that can lead to a release of hazardous chemicals and analyzing risks from associated accidents for class 1B facilities, and describing them in Safety Analysis Reports, as per REGDOC 2.4.4. It should consider standards such as the Canadian Environmental Emergency Regulations and the associated Technical Guidelines. It will provide guidance for establishing limits on the chemical consequences associated with radiological discharges to the environment, in terms of "acceptance criteria for offsite consequences to the public of pertinent accidents". It will provide guidance for identifying Systems Structures and Components important to safety that prevent or mitigate the release of hazardous chemicals associated with the release of nuclear substances. To be completed by 2025 April 30.

REGDOC-2.4.4 Clause Number	Clause Description	Implementing Document(s)
	• provide results and conclusions • be independently reviewed as per the management system of the licensee • provide references to detailed analyses that support the safety analysis results	
5.3 Documenting and recording postulated initiating events and design-basis accidents Requirements	The licensee shall describe the facility's behaviour following a PIE and compare it to the analysis acceptance criteria.	Safety Analysis, 900-508770-PDD-001. Safety Analysis, 900-508770-MCP-001 Preparing a Safety Analysis Report, 900-508770-MCP-001387 Determining Bounding Accident Scenarios, 900-508770-FID-017
5.4 Maintaining safety analysis documents and records Requirements	The licensee shall perform an ongoing site evaluation. If the ongoing site evaluation identifies new information about the site characteristics (that is, changing the results of the identification and classification of PIEs), then safety precautions (such as engineering controls and emergency arrangements) may need to be reviewed and revised	Safety Analysis, 900-508770-MCP-001. Hazard Identification and Analysis, 900-508770-STD-002. Safety Analysis for Environmental Remediation Management, 900-508770-STD-001

3.2.3 REGDOC-2.4.1

REGDOC 2.4.1 Deterministic Safety Analysis, sets out the requirements of the Canadian Nuclear Safety Commission (CNSC) for deterministic safety analysis for nuclear power plants (in part I) and small reactor facilities (in part II). It sets-out the requirements and technical criteria for the selection of events to be analyzed, acceptance criteria, deterministic safety analysis methods, and safety analysis documentation, review and update, and quality control.

REGDOC 2.4.1 is identified as a compliance verification criteria in the Chalk River Laboratories License Condition Handbook, which also clarifies the scope and applicability. As such, the implementing documents for REGDOC 2.4.1 are identified in the CRL LCH section of this PRD.

3.3 Standards

3.3.1 CSA N286

3.3.2 CSA N292.0

CSA N292.0-19 provides General principles for the management of radioactive waste and irradiated fuel. The CSA N292 series of documents represents the principles for the management of radioactive waste and irradiated fuel. As indicated in Table 12, these standards are identified as being applicable to some of CNL's licenses, and are identified as a Compliance Verification Criteria (CVC) or Guidance Document (G) in the Waste Management Safety Control Area (SCA) in those Licenses. As such, they are mapped to CNL implementing documents in more detail in the Waste Management Program Requirements Document. However, the requirements pertaining to Safety Analysis are included in this PRD as well. The latest Version (CSA N292.0-19) is used to map implementing documents in Table 7.

Table 7: CSA N292.0-19 Requirements

Section and Title	Description	Implementing Document(s)
4.1.3 Safety measures	The safety measures implemented shall be commensurate with the nature and level of the hazards and the degree of risk associated with the radioactive waste and inventory.	900-508770-STD-001 *Safety Analysis for Environmental Remediation* *Management* 900-580770-MCP-001387 *Preparing a Safety Analysis Report*
4.1.6 Non-radiological hazards	Consideration shall be given to industrial health and safety and environmental protection with respect to non-radiological hazards associated with the waste.	900-508770-STD-001 *Safety Analysis for Environmental Remediation* *Management* 900-580770-MCP-001387 *Preparing a Safety Analysis Report*
4.5.9.1 Safety concerns	Management of radioactive waste shall reflect fundamental safety concerns related to Criticality; radiation exposure;	900-508770-STD-001 *Safety Analysis for Environmental Remediation* *Management* 900-508770-MCP-001, *Safety Analysis*

	heat control; and containment and retrievability[1].	
4.8.3.1 System implementation	A radioactive waste classification system that is based on the safety case shall be implemented.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*
4.10.1.1 Safety	Safety requirements for the management of radioactive waste and irradiated fuel shall provide for protection of the environment and the health and safety of workers and the public.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001, *Safety Analysis*
4.10.1.3 Safety	All reasonable efforts shall be made to prevent accidents.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001, *Safety Analysis* 900-509770-STD-002, *Hazard Identification and Analysis*
4.10.1.4 Safety	Detailed analysis shall identify precursors for postulated accidents and measures for their prevention.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001, *Safety Analysis* 900-509770-STD-002, *Hazard Identification and Analysis*
4.10.2.1 Nuclear Safety Requirements	Radioactive waste management system performance under normal operating conditions shall be assessed to maintain waste containment for the duration of facility operation.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*
4.10.2.2 Nuclear Safety Requirements	The radioactive waste management system performance expected during credible	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*

[1] Note: Retrievability and aging management to be discussed in future revisions of safety documents

Section and Title	Description	Implementing Document(s)
	abnormal events shall be assessed for the following events: -seismic activity (i.e., design basis earthquake for that location); -severe meteorological conditions (e.g., extreme temperatures, tornadoes, hurricane-force winds, lightning strikes, or extreme rainfall leading to foundation instability); -fires (at the waste management facility, adjacent facilities, or surrounding area, including forest fires); -flooding; -missile impacts as a result of vehicle collisions, aircraft crashes, pressure-boundary failures, or explosion-driven debris; and -equipment failure or operator error.	900-508770-MCP-001, *Safety Analysis*
4.10.6.1.1 Design	A safety assessment shall be performed as part of the design process of the waste management facility.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001 *Safety Analysis*
4.10.6.1.2 Design	The time frame for safety assessments shall be clearly justified, delineated, and commensurate with the hazard of the waste.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001 *Safety Analysis*
4.10.6.2 Assessment prior to transition	In order to determine if a transition is feasible, a safety assessment for the proposed transition shall be conducted	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*
4.10.6.2.2 Transition within the same facility	The safety assessment shall include a review of the current facility programs to demonstrate that the programs remain valid for	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*

Section and Title	Description	Implementing Document(s)
	the new state, or that further updates or new operational programs are implemented.	
4.10.6.2.3 Transition to another facility	The safety assessment shall consider the -condition of the waste package that is moved to another facility; -condition of the receiving facility; -WAC of the receiving facility; -transportation requirements; and -programs in place at the receiving facility.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*
4.10.6.3 Assessment objectives and considerations	The anticipated radiation exposure to workers, the public, and the environment arising from both normal conditions and credible abnormal events shall be considered in the safety assessment.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-509770-STD-002, *Hazard Identification and Analysis*
4.10.6.3.2 Assessment objectives and considerations	The safety assessment shall demonstrate that -containment, shielding, and heat removal is maintained for the duration of facility operation;	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001, *Safety Analysis*
4.10.6.3.3 Assessment objective and considerations	The safety assessment shall, at a minimum, consider the following: -the radioactive waste or irradiated fuel and its characteristics, including decay products and potential for gas generation; -seismic activity and any subsequent effects; severe meteorological conditions; **Note:** *Severe meteorological conditions can include, but are not limited to, the following: extreme temperatures;* *-extreme winds (e.g., hurricane-force winds) and tornadoes;* *-lightning strikes;* *-drought and low water levels;* *-fog;*	900-508770-MCP-001, *Safety Analysis* 900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*

Section and Title	Description	Implementing Document(s)
	-hail; *-extreme winter conditions such as ice cover, frost, or heavy snowfall;* *-storm surge; and* *-extreme rainfall leading to foundation instability or external flooding.* -fires (e.g., forest fires) (at the facility, adjacent facilities, or utility supply services such as a heating or cooling plant); flooding; -missile impacts as a result of vehicle collisions; -aircraft crashes; -pressure-boundary failures; or -explosion-driven foreign material (e.g., shrapnel). -equipment failure or operator error; -loss of off-site power; and impact of maintenance activities.	
5.6.2 Gas generation potential	Where relevant, gas generation shall also be accounted for in the safety assessment.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-580770-MCP-001387 *Preparing a Safety Analysis Report*
7.1 Waste Management Facility	The design of the waste management facility shall consider relevant requirements for nuclear safety, radiological safety, industrial safety, security, and safeguards.	900-508770-MCP-001, *Safety Analysis* 900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*
7.2.1.1 Site selection for new facilities	Site selection for a new facility shall consider: -the site-related factors likely to affect safety performance;	900-508770-MCP-001, *Safety Analysis* 900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*
7.2.2 Site characterization	Waste management facility sites shall be characterized at a level of detail sufficient to support a general understanding of the current site characteristics and how the site is anticipated to	900-508770-MCP-001, *Safety Analysis* 900-580770-MCP-001387 *Preparing a Safety Analysis Report* 900-508770-STD-001

Section and Title	Description	Implementing Document(s)
	evolve over the duration of the facility life cycle. The focus of the site characterization shall be on features, events, and processes that could have an impact on safety.	*Safety Analysis for Environmental Remediation Management*
7.26.1. Operational Limits	Waste management facilities should be operated in accordance with a set of operational limits and conditions derived from safety assessments.	900-508770-FID-014, *Preparation of a Facility Authorization Document* 900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*

3.3.3 CSA N292.2

CSA N292.2-13 provides the requirements for Interim dry storage of irradiated fuel. The CSA N292 series of documents represents the principles for the management of radioactive waste and irradiated fuel. As indicated in Table 12, these standards are identified as being applicable to some of CNL's licenses and are identified as a Compliance Verification Criteria (CVC) or Guidance Document (G) in the Waste Management Safety Control Area (SCA) in those Licenses. As such, they are mapped to CNL implementing documents in more detail in the Waste Management Program Requirements Document. However, the requirements pertaining to Safety Analysis are included in this PRD as well. The latest Version (CSA N292.2-13) is used to map implementing documents in Table 8.

Table 8: CSA N292.2-13 Requirements

Section and Title	Description	Implementing Document(s)
5.2.1.2 Environment, Health and Safety	Safety requirements for the dry storage of irradiated fuel shall ensure the protection of the environment, and the health and safety of workers and the public. Requirements may be grouped under the areas of a) nuclear safety; b) radiation safety; c) occupational health and safety; and d) environmental protection.	900-509200-POL-001 *Environment Policy* 900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001 *Safety Analysis*
5.3.1 Normal operating conditions	The dry storage system safety analysis shall demonstrate that	900-508770-STD-001

Section and Title	Description	Implementing Document(s)
	under normal operating conditions, a) fuel is maintained in a dry state; b) the container is not over-pressurized; c) decay heat is dissipated preventing degradation of the fuel assembly and containment barriers; d) nuclear criticality is prevented; e) the structural integrity of the storage structures is maintained; f) adequate shielding is maintained; g) the integrity of the fuel is maintained to facilitate retrieval for duration of storage; and h) containment is provided for the duration of the facility operation.	*Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001 *Safety Analysis*
5.3.2.1 Abnormal operating conditions	The design and operating requirements for dry storage systems shall address credible abnormal events that might lead to abnormal operating conditions.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001 *Safety Analysis* 900-509770-STD-002, *Hazard Identification and Analysis*
6.1.2 Specific requirements for the interim dry storage of irradiated fuel	Site selection for a dry storage facility shall consider the site-related factors likely to affect safety performance during construction, commissioning, operation, and decommissioning. Seismic risk shall be considered as per Clause 6.2.3.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001387 *Preparing a Safety Analysis Report* 900-508770-MCP-001 *Safety Analysis*
6.3.1.7 Dry storage system design	SSCs important to safety that are credited to withstand design basis events shall be qualified accordingly.	900-508770-MCP-001, *Safety Analysis* 900-508770-MCP-001 *Safety Analysis* 900-508770-MCP-004 *Consequence of Failure*

Section and Title	Description	Implementing Document(s)
6.3.4.2.1. Design requirements	The design of the fuel handling facility shall consider relevant requirements for nuclear safety, radiological safety, and industrial safety.	900-580770-MCP-001387 *Preparing a Safety Analysis Report*
6.3.4.2.6 Design requirements	An emergency electrical power supply and distribution system shall be provided for essential equipment and services where loss of power could result in a safety hazard.	900-580770-MCP-001387 *Preparing a Safety Analysis Report* 900-508770-MCP-001 *Safety Analysis*
6.3.5.2.6 Design requirements	Loads on irradiated fuel from any source during transfer shall be considered. Abnormal operating conditions shall be postulated and analyzed in the safety analysis	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001, *Safety Analysis* 900-509770-STD-002, *Hazard Identification and Analysis*
6.5.4.1 Modification control	Before making changes to the dry storage system or associated procedures, consideration should be given to whether the safety analysis will be valid for the modifications in question.	900-508770-MCP-001 *Safety Analysis* 900-508770-FID-002 *Safety Requirements Derivation and Verification in Support of Engineering Change Control*

3.3.4 CSA N292.3

CSA N292.3-14 provides the requirements for the Management of low and intermediate level radioactive waste. The CSA N292 series of documents represents the principles for the management of radioactive waste and irradiated fuel. As indicated in Table 12, these standards are identified as being applicable to some of CNL's licenses, and are identified as a Compliance Verification Criteria (CVC) or Guidance Document (G) in the Waste Management Safety Control Area (SCA) in those Licenses. As such, they are mapped to CNL implementing documents in more detail in the Waste Management Program Requirements Document. However, the requirements pertaining to Safety Analysis are included in this PRD as well.

No nuclear safety analysis program requirements identified.

3.3.5 CSA N292.6

CSA N292.6-18 provides the requirements for Long-term management of radioactive waste and irradiated fuel. The CSA N292 series of documents represents the principles for the management of radioactive waste and irradiated fuel. As indicated in Table 12, these standards are identified as being applicable to some of CNL's licenses, and are identified as a Compliance Verification Criteria (CVC) or Guidance Document (G) in the Waste Management Safety Control Area (SCA) in those Licenses. As such, they are mapped to CNL implementing documents in more detail in the Waste Management Program Requirements Document. However, the requirements pertaining to Safety Analysis are included in this PRD as well. The latest Version (CSA N292.6-18) is used to map implementing documents in Table 9.

Table 9: CSA N292.6-18 Requirements

Section and Title	Description	Implementing Document(s)
5.1.3 Waste characterization	The detail and depth of characterization or re-characterization shall be commensurate with the potential for future radiological, physical, and chemical changes and their consequences as identified in the safety assessment	900-508770-MCP-001 *Safety Analysis*
7.1.2 Site characterization	The facility site shall be characterized at a level of detail sufficient to support a general understanding of the current site characteristics and how the site is anticipated to evolve over the duration of the facility life cycle. The focus of the site characterization shall be on features, events, and processes that could have an impact on safety.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-580770-MCP-001387 *Preparing a Safety Analysis Report*
7.2.1 Design selection	Facility design selections shall be based upon radioactive material characteristics; ability of the system to fulfill basic design functions such as receipt, handling, storage, inspection, monitoring, and retrieval of waste packages; ability of the system to fulfill functions of radiological protection, containment, and isolation over the required performance period; and safety assessment results that model the system's performance over the period of potential hazard considering changes in the waste form, SSCs, barriers, and environmental and social conditions.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001 *Safety Analysis*
8.1 Design	A safety assessment shall be performed as part of the design	900-508770-STD-001

Section and Title	Description	Implementing Document(s)
	process of the long-term storage facility.	*Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001 *Safety Analysis*
8.2.1 General	In order to determine if a transition is feasible, a safety assessment for the proposed transition shall be conducted.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*
8.2.2 Transition within the same facility	The safety assessment shall include a review of the current facility programs to demonstrate that the programs remain valid for the new state or that further updates or new operational programs are implemented.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*
8.2.3 Transition to another facility	The safety assessment shall consider the condition of the radioactive material and waste package to be moved to another facility; condition of the receiving facility; waste acceptance criteria of the receiving facility; transportation requirements; and programs in place at the receiving facility.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*
8.3.1 Assessment objective and considerations	The anticipated radiation exposure to workers, the public, and the environment arising from both normal conditions and credible abnormal events shall be considered in the safety assessment.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001 *Safety Analysis*
8.3.3	The safety assessment shall demonstrate that containment, shielding, and heat removal is maintained for the duration of facility operation;	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001 *Safety Analysis*

Section and Title	Description	Implementing Document(s)
8.3.4	The safety assessment shall, at a minimum, consider the following: the radioactive material and its characteristics, including decay products and potential for gas generation; seismic activity and any subsequent effects; severe meteorological conditions; **Note:** *Severe meteorological conditions can include, but are not limited to, the following: extreme temperatures;* *extreme winds (e.g., hurricane-force winds) and tornadoes;* *lightning strikes;* *drought and low water levels;* *fog;* *hail;* *extreme winter conditions such as ice cover, frost, or heavy snowfall;* *storm surge; and* *extreme rainfall leading to foundation instability or external flooding.* fires (at the long-term storage facility, adjacent facilities, or utility supply services such as a heating or cooling plant); flooding; missile impacts as a result of vehicle collisions; aircraft crashes; pressure-boundary failures, where applicable; or explosion-driven foreign material (e.g., shrapnel). equipment failure or operator error; loss of off-site power; and impact of maintenance activities.	900-508770-STD-001 *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-001 *Safety Analysis*

3.3.6 CSA N294

CSA N294-19 provides the requirements for Decommissioning of Facilities containing nuclear substances. As indicated in Table 12, this standards is identified as being applicable to some of CNL's licenses. As such, it is mapped to CNL implementing documents in more detail in the Clean-up Program Requirements Document. However, the requirements pertaining to Safety Analysis are included in this PRD as well.

Table 10: Decommissioning of Facilities Containing Nuclear Substances, CSA N294-19

Source, Section and Title	Description	Implementing Document(s)
5.6 Hazard assessment	A hazard assessment commensurate with the tasks to be performed shall be completed prior to decommissioning	900-508770-STD-002, *Hazard Identification and Analysis* 900-508770-MCP-002, *Hazard Identification/Analysis for Decommissioning Facilities in Support of Safety Assessment* 900-508770-STD-001, *Safety Analysis for Environmental Remediation Management*
7.1.1	Preparation for decommissioning shall include c) a safety assessment for decommissioning	900-508770-STD-001, *Safety Analysis for Environmental Remediation Management* 900-508770-MCP-002, *Hazard Identification/Analysis for Decommissioning Facilities in Support of Safety Assessment*
7.5.1 General	An assessment of the state of the facility shall be performed to provide baseline information for condition of the building and SSC, and evaluation of the hazards to be controlled during decommissioning. A thorough survey shall be performed and supplemented by a review of existing records, as applicable. Relevant information should be archived and should be made available to the staff who will perform the decommissioning	900-508770-MCP-002, *Hazard Identification/Analysis for Decommissioning Facilities in Support of Safety Assessment* 900-508770-STD-001, *Safety Analysis for Environmental Remediation Management* 900-508770-FID-006, *Identifying Structures, Systems and Components Important to Safety*
7.5.2.1	The following hazards shall be investigated and assessed: a) radiological hazards	900-508770-MCP-002, *Hazard Identification/Analysis for Decommissioning Facilities in Support of Safety Assessment* 900-508770-STD-001, *Safety Analysis for Environmental Remediation Management* 900-508770-FID-006, *Identifying Structures, Systems and Components Important to Safety*

Source, Section and Title	Description	Implementing Document(s)
7.6.4 Safety assessment of the facilities undergoing decommissioning	A safety assessment shall be performed to identify potential hazards to workers, the public, and the environment, from both routine decommissioning activities and credible accidents during decommissioning. The level of the safety assessment should be commensurate with the type and complexity of the facility, and the maturity of the proposed decommissioning activities. The assessment shall describe the relative importance of the potential hazards and identify the methods for mitigating the risks associated with such hazards. If fissile material is involved, a criticality safety assessment and the planned actions involving fissile material shall be included. The assessment shall also address the residual risks to the public, if any, after decommissioning is completed. The safety assessment may be a stand-alone document or may be included in the DDP. In-situ decommissioning may result in a waste disposal site. In such a case, an applicant shall	900-508770-MCP-002, *Hazard Identification/Analysis for Decommissioning Facilities in Support of Safety Assessment* 900-508770-STD-001 *Safety Analysis for Environmental Remediation Management*[2] 900-508770-MCP-001680, *Recommended Input for RESRAD- OFFSITE Analysis* 900-508550-PDD-001, *Nuclear Criticality Safety*

[2] Implementation document (900-508770-STD-001) was updated to Revision 2, in May 2023, to cover the applicable requirements for post-closure safety assessment of a disposal facility

A1.4 Waste Management	1.4.4.7 CNL shall engage with the Regulatory Authority to determine the requirements for long-term Historic LLW management and disposal. 1.4.4.7.1 The safety basis and engineering design will be prepared as necessary to proceed through the licensing process. 1.4.4.7.2 CNL's recommendation will be included in the Proposed Annual Program of Work and Budget	900-508770-PDD-001, *Safety Analysis* 900-508770-MCP-001, *Safety Analysis*

3.5 Guidance Documents

Table 12 illustrates the publications that have been identified as Guidance Documents in CNL's licenses. Guidance documents are intended to provide non-mandatory information on how to comply with licence conditions. This section describes the Guidance Documents and their application.

3.5.1 IAEA GSR Part 4

Safety Assessment for Facilities and Activities, IAEA GSR Part 4, is a guidance document for: Gentilly-1 Waste Facility, Whiteshell Laboratories, Douglas Point Waste Facility and for the NPD Waste Facility.

The objective of General Safety Requirements Part 4, Safety Assessment for Facilities and Activities is to establish the generally applicable requirements that should be fulfilled in safety analysis for facilities and activities, with special attention paid to deterministic and probabilistic approaches, defence in depth, quantitative analyses and the application of a graded approach. The publication also addresses the independent verification, maintenance, and use of the safety analysis that should be carried out by the originators and users of the safety analysis. This publication is intended to provide a consistent and coherent basis for safety analysis across all facilities and activities, to facilitate the transfer of good practices between organizations conducting safety assessments and regulators, enhancing the confidence with regulators that an adequate level of safety has been achieved for facilities and activities.

Requirements for these areas have been specified in the Canadian regulatory framework, including REGDOCs 2.4.4 and 2.4.1, which have been mapped to CNL Safety Analysis program implementing documents in this PRD. However, GSR Part 4 can be applied as a Guidance Document where additional clarity is needed.

IAEA GSR-4 includes 24 general requirements, and information on how apply those requirements, and makes extensive use of mandatory language (e.g. shall, must). However, it should be applied as a guidance document that is intended to provide non-mandatory information on how to comply with licence conditions where additional clarity is desired, where the application of GSR-4 would not conflict with licence condition requirements.

3.5.2 IAEA SRS No. 102

The Safety Analysis and Licensing Documentation for Nuclear Fuel Cycle Facilities, IAEA SRS No. 102 is identified as a guidance document for CRL and the NPD Waste Facility.

The objective of Safety Report Series 102, Safety Analysis and Licensing Documentations for Nuclear Fuel Cycle Facilities, is to provide information on methods and practices, based on the IAEA safety standards and current international good practice, for performing safety analysis and preparing licensing documentation for nuclear fuel cycle facilities. It provides a systematic methodology covering the establishment of acceptance criteria, hazard identification, and identification of postulated initiating events, analysis of accident sequences and consequences, and the use of a graded approach. Information is also provided on application of the results of the safety analysis, including safety classification of Structures Systems and Components, derivation of Operating Limits and Controls, and the content of Safety Analysis Reports. The approaches provided in this publication can be applied to different types of nuclear fuel cycle facility with use of a graded approach that is commensurate with the potential hazards and risks posed by the facility.

Requirements for these areas are specified in the Canadian regulatory framework, including REGDOCs 2.4.4 and 2.4.1, which have been mapped to CNL Safety Analysis program implementing documents in this PRD. IAEA SRS 102 can be applied as a Guidance Document where additional clarity is needed. When it is applied as an alternate method that deviates from the CNL Safety Analysis implementing documents, 900-508770-MCP-003 Assigning a Delegation of Safety Analysis Authority, describes the provisions for assessing the proposed deviation.

3.5.3 IAEA TECDOC-1267

The Procedures for conducting Probabilistic Safety Assessment (PSA) for non-reactor nuclear facilities, IAEA TECDOC-1267, is a guidance document identified for application to the Whiteshell Laboratories.

This publication is intended as guidance for conducting probabilistic safety assessment (PSA) for non-reactor nuclear facilities. The main emphasis is on the general procedural steps for conducting a PSA for a non-reactor nuclear facility, rather than the details of the corresponding methods. The report is intended to assist technical experts performing or managing PSAs, and aims to promote a standardized framework, terminology, and form of documentation for PSAs.

3.5.4 IAEA SSR-4

The Safety of Nuclear Fuel Cycling Facilities, IAEA SSR-4, is a guidance document identified for application the Whiteshell Laboratories and for the Douglas Point Waste Facility.

The objective Specific Safety Requirements 4, Safety of Nuclear Fuel Cycle Facilities, is to establish a basis for safety and safety analysis for all stages in the lifetime of a nuclear fuel cycle facility by establishing specific requirements for site evaluation, design, construction, commissioning, operation and preparation for decommissioning that should be satisfied to ensure safety.

IAEA SSR-4 includes 75 specific requirements, and makes extensive use of mandatory language (e.g. shall, must). However, it should be applied as a guidance document that is intended to provide non-mandatory information on how to comply with licence conditions where additional clarity is desired, where the application of SSR-4 does not conflict with licence condition requirements.

Revision History

Rev. No.	Date	Details of Rev.	Authored By	Reviewed By	Approved By
5.3	2024/04/26	Issued as "Approved for Use". "Review and Comment" not required. Minor revision to 6.1 to include Nuclear Cyber Security as an internal interface.	M. Gogulapati	Y. Dube J. Slade	J. Slade
5.2	2023/12/13	Issued as "Approved for Use". "Review and Comment" not required. Minor revision to section 6.2: • Added external interface with ITSM. • Rephrased "interface activity/purpose" for TSSA to match the one for ITSM.	M. Gogulapati	A. Dash J. Slade	J. Slade
5.1	2023/06/19	Issued as "Approved for Use". "Review and Comment" not required. Minor revision: • Added 4.1 and 4.2. • 4.3: added that the CNL Design Authority is also the FSM. • Moved "Electrical Safety Authority" external interface to "Electrical Safety" internal interface. • Changed "Technical Standards and Safety Authority" external interface to design registration only. Added "Pressure Boundary" to internal interface for requirements interpretation. • Minor editorial changes.	M. Gogulapati	A. Dash J. Slade	J. Slade
5	2022/05/04	Issued as "Approved for Use". "Review and Comment" not required. Minor revision: • Aligned purpose to 900-514100-MCP-001. • Replaced "Designated Engineering Manager" by "Delegated Design Authority". • Updated references.	M. Gogulapati	A. Dash J. Slade	J. Slade
4	2021/05/04	Issued as "Approved for Use". Minor editorial changes.	M. Gogulapati	C. Ball	J. Slade

Rev. No.	Date	Details of Rev.	Authored By	Reviewed By	Approved By
		Replaced Contract & Contractor Management (900-505210-MCP-005) with Oversight of Engineering Agencies (900-508120-MCP-006) No formal R&C required.			
3	2020/06/15	Issued as “Approved for Use”. Minor editorial changes. No formal R&C required.	M. Gogulapati		J. Slade
2	2019/09/16	Issued as “Approved for Use”. Minor editorial changes. No formal R&C required.	M. Gogulapati		J. Slade
1	2018/11/30	Issued as “Approved for Use”	J. Bailey		J. Slade
1D1	2018/09/13	Issued for “Review and Comment”. Minor editorial changes. Minor changes to Section 1 and 2 to align with 900-508120-PRD-001. Moved all definitions and acronyms to the Glossary of Controlled Terms and Acronyms on myCNL. Added responsibilities for Designated Engineering Manager and Customer Representative. Added introduction to Section 5. Formalized reference to Design Engineering MCPs. Internal Interfaces table.	J. Bailey	E. Ballachey D. Campbell A. Caron C. Charbonneau A. Coulas J. deRuiter Y. Table of Contents

Section **Page**

1. Scope and Applicability

This Company-wide Interpretation document applies to all activities unique to the Design Authority and Design Engineering functional support area (FSA), performed by Canadian Nuclear Laboratories (CNL) across all sites.

The Design Authority and Design Engineering FSA maintains and controls the design basis of CNL within approved safety margins and regulatory requirements. It establishes the requirements for CNL design work.

Any questions regarding the content or application of this document should be directed to the Functional Support Manager for Design Authority and Design Engineering as identified in the *Functional Authorities* controlled list [1].

2. Purpose

The Design Authority and Design Engineering FSA manages the organizational responsibility to ensure the technical integrity of designs and design processes, establishing the requirements for CNL design work.

Design Authority and Design Engineering FSA ensures that design is planned, executed, verified, and documented according to applicable codes, standards, regulatory, and design customer requirements.

The Design Authority and Design Engineering FSA controls the design basis of CNL within approved safety margins and regulatory requirements.

3. Definitions and Acronyms

This document relies primarily on word meaning as found in common dictionaries. The current *Glossary of Controlled Terms and Acronyms* [2] contains specific meanings for those words that require further clarification.

There are no definitions or acronyms applicable to this document.

4. Roles and Responsibilities

4.1 Responsible Executive

The responsibilities for the Responsible Executive are as defined in *CNL Management System Manual* [3].

4.2 Functional Support Manager

The responsibilities for the Functional Support Manager are as defined in *CNL Management System Manual* [3].

4.3 CNL Design Authority

The CNL Design Authority is ultimately responsible for the design and engineering decisions made by CNL for all CNL activities, facilities and practices. The CNL Design Authority holds Professional Engineers Ontario (PEO) accountability for the design process. This role is assigned to the Chief Engineer through their accountability statement. The CNL Design Authority is also the Functional Support Manager for Design Authority and Design Engineering FSA.

The CNL Design Authority is responsible for:

- Evaluating the technical competency of the Delegated Design Authorities (DDAs) and delegating qualified individuals as DDAs.
- Ensuring an appropriate design basis is maintained for approved designs.
- Providing oversight of execution of the design work by the DDAs.
- Maintaining PEO status in good standing.
- Maintaining knowledge and understanding of key regulatory, licensing and quality requirements for a nuclear operating site.

4.4 Delegated Design Authority

A DDA is a person to whom accountability for specific engineering activities has been delegated by the CNL Design Authority. A DDA is responsible for:

- Assigning competent staff to perform engineering activities, such as Lead, Designer, Design Planner, and Design Reviewer.
- Providing oversight of execution of the design work by the staff under their supervision.
- Approving procedures used in their organization to execute design activities.
- Reviewing and approving informal and formal Design Grading and design planning documents.
- Ensuring that documentation has been prepared and evaluated by qualified staff according to established procedures.
- Validating that review and verification have been adequately documented.
- Resolving disputes arising during the review and comment process and the design and development process.

- Approving technical documents and drawings and their release.
- Acting as approval authority for changes to the design configuration of CNL facilities with regard to nuclear safety, performance, functionality, constructability, operability, and maintainability within the scope of their delegation.
- Maintaining knowledge and understanding of CNL processes, projects, and programs.
- Maintaining knowledge and understanding of key regulatory, licensing, and quality requirements for a nuclear operating site.

4.5 Lead

The Lead is a CNL employee who is the single point of contact for a project. The Lead is responsible for ensuring that the following activities are performed:

- Identification of input information relevant to the design work.
- Monitoring and communication of progress to the customer.
- Identification and communication of potential changes to the customer.
- Recommendation for review activities.
- Following the change control process.

The Lead is also responsible for:

- Having knowledge of technical and operational aspects of any structures, systems, and components (SSCs) being modified or created.
- Maintaining knowledge of the requirements of the Design Authority and Design Engineering FSA.

4.6 Designer / Design Planner

A Designer / Design Planner is responsible for:

- Gathering design inputs.
- Defining design requirements.
- Preparing design plans.
- Ensuring configuration management.
- Providing technical consultation and guidance for the work performed by other designers.
- Executing design/drafting activities as required.
- Maintaining knowledge and understanding of codes and standards and practical experience in area being reviewed.
- Maintaining knowledge and understanding of key regulatory, licensing, and quality requirements for a nuclear operating site.

4.7 Design Reviewer

A Design Reviewer is responsible for:

- Reviewing design outputs.
- Ensuring verification of design deliverables as required.
- Maintaining knowledge and understanding of codes and standards and practical experience in area being reviewed.
- Maintaining knowledge and understanding of key regulatory, licensing, and quality requirements for a nuclear operating site.

5. Functional Programs

5.1 General Concepts

The following concepts support the proper implementation of the Design Engineering processes and are understood before embarking on design work.

Graded Approach

Design engineering activities implement the consistent use of a graded approach depending on the safety significance and on the nature of the design work to be performed, as per paragraph 4.1.3 of CSA N286, *Management system requirements for nuclear facilities* [4]. The graded approach is applied when choosing the degree of rigor for design engineering activities during the design planning phase [5].

Design Records

Design records provide documented evidence of compliance with applicable codes, standards, regulatory, and customer requirements. Design records are retained for the lifetime of the SSC or facility, and include documents that do any of the following:

- Specify design requirements and the critical characteristics of the design.
- Identify the sources of design inputs.
- Demonstrate the capability for safe operation, and are valuable in facilitating troubleshooting and determining the causes of accidents, malfunctions, or unplanned events.
- Contain technical information needed for fabrication, construction, installation, operation, and decommissioning; and provide the information needed to facilitate maintenance, rework, repair, replacement, or modification.
- Substantiate the technical adequacy of the design.
- Provide baseline data for pre-service and periodic in-service inspections.
- Are required to support the facility licensing requirements.

Delegation of Design Authority

The concept of delegation of Design Authority from the Chief Engineer to staff members of CNL is the foundation for the deployment of the Design Authority and Design Engineering FSA throughout all sites at CNL. Delegations of Design Authority are granted based on consistent high standards, appropriate training to function safely and effectively, and understanding of duties and responsibilities. Delegation of Design Authority is performed in accordance with *Assigning a Delegation of Design Authority* [6].

5.2 Design Initiation

The design initiation phase may include requests for changes to an approved design configuration, requests for engineering assistance, requests for commercial proposals, definition of initial design requirements, and assignment of the planning work to appropriate individuals. The design work requests are assessed for the complexity, priority, risk involvement, and interfaces. Design initiation is described in more detail in *Design Planning* [5].

5.3 Design Planning

The following activities are undertaken during the design planning phase in accordance with *Design Planning* [5]:

- Developing the problem statement.
- Preparing Risk Assessments.
- Performing walk downs (as required).
- Reviewing existing documents and drawings.
- Identifying codes and standards.
- Identifying customer requested design completion activities.
- Obtaining budget and schedule constraints from customer.
- Securing additional planning resources (SMEs, Safety Analysis, etc.)
- Reviewing Operational Experience.
- Considering procurement risks.
- Gathering customer inputs and design inputs.
- Identifying assumptions.
- Performing Design Grading of work.
- Verifying design inputs and requirements (as per the ISO 9001:2015 requirement).
- Defining deliverables and specifying their configuration management and revision control requirements.
- Identifying verification requirements (what, who, when, how, and acceptance criteria).
- Defining design milestones (as required).
- Defining design completion activities.
- Defining resource competencies required to complete design.
- Preparing cost and schedule estimate and giving an estimate class.
- Producing, reviewing, and approving Design Plan.

Design inputs may not be fully defined at that time and may extend into the design phase.

The design planning phase ends when approved design planning documentation is turned over to the design responsible organization.

5.4 Design

The design requirements and design concepts are translated into design output documents that satisfy the customer and design requirements. Design Guides and Drawing Office Manuals support the production of design outputs. Content and preparation, as well as signing and sealing, of design documents is controlled through *Production and Acceptance of Design Documents* [7]. Formal design documents may be revised as required to provide current information. Revisions are controlled and subjected to review, verification and approval.

5.5 Design Review and Verification

Verification measures are applied at defined stages during the design phase in accordance with *Production and Acceptance of Design Documents* [7] and *Execution of Design Review and Verification* [8]. These verification measures evaluate the adequacy of a design or technical design decisions and confirm that the design satisfies the defined design requirements, as defined in the design verification requirements set out during the planning phase. Results of design review and design verification are documented.

The method, nature and extent of design verification required for design work is determined based on the safety significance (nuclear safety, industrial safety) of the work, complexity of the design used, degree of standardization of the product and process, state of the art, and use of previously issued designs. These factors are all considered in the Design Grading during the design planning phase.

5.6 Design Completion

Depending on the complexity of the design work or as identified during the planning stage, the designer prepares a statement to document completion of the design work, in accordance with *Production and Acceptance of Design Documents* [7]. For large, complex designs, a Design Completion Assurance Certificate may be required confirming that the design meets all design and technical requirements and satisfies all regulatory and compliance requirements, as outlined during the design planning process [5].

5.7 Design Changes

Design changes are controlled by the responsible designer during all stages of design development and implementation of permanent or temporary changes to facility equipment, SSC, processes, and controlled computer software. Design changes during initial design process are controlled in accordance with *Production and Acceptance of Design Documents* [7] and *Execution of Design Review and Verification* [8].

Changes occurring outside of the design process are controlled through *Configuration Management* [9].

5.8 Outsourced Design Work

Outsourced design work is managed through *Oversight of Engineering Agencies* [10]. However, the Design Authority and Design Engineering FSA covers the review of outsourced design work in accordance with *Production and Acceptance of Design Documents* [7] and *Execution of Design Review and Verification* [8].

6. Interfaces

6.1 Internal Interfaces

Functions/Lines Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Business Lines	Customers of design services	Email, telephone, meetings, and design planning forms	Customer Representative
HSSE	Identification of requirements	Email, telephone, meetings	Employees
Quality	Identification of requirements	Email, telephone, meetings	Employees
Business Management	SME advisory role	Email, telephone, meetings	SMEs
Safety Analysis	SME and service supplier for nuclear safety related design	Email, telephone, meetings, document preparation and review, and design forms	Safety Analyst/Engineer

Functions/Lines Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Nuclear Cyber Security	Identification of requirements and SME advisory role	Email, telephone meetings, document preparation and review, and design forms	Nuclear Cyber Security Specialist
Safety Review Committee	Review and Confirmation of Category 1 Changes	Memos and meetings	General Manager, Directors, and Managers
Electrical Safety	Interpretations on jurisdictional requirements for electrical systems	Email, telephone, meetings	Electrical Safety Functional Support Manager and SMEs
Pressure Boundary	Interpretations on jurisdictional requirements for pressure retaining systems	Email, telephone, meetings	Pressure Boundary Functional Support Manager and Specialists

6.2 External Interfaces

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Canadian Nuclear Safety Commission (CNSC)	Licensing and regulatory compliance issues	Annual meetings, Quarterly meetings	Managers
Canadian Standards Association (CSA)	Information exchange and collaboration	Nuclear Standards Steering Committee and Technical Committees	General Manager, Engineering, Chief Engineer, and Management

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Technical Standards and Safety Authority (TSSA)	Design Registration submission to Authorized Inspection Agency (AIA)	Email, online submission	Engineering Management, DDAs
Inspection and Technical Services Manitoba (ITSM)	Design Registration submission to AIA	Email, online submission	Engineering Management, DDAs
International Groups: • CANDU Owners Group (COG) • International Atomic Energy Association (IAEA)	Information exchange and collaboration	Working groups, Peer reviews	General Manager, Engineering, Chief Engineer, and Management

Revision History

Rev. No.	Date	Details of Rev.	Prepared By	Reviewed By	Approved By
5.1	2023/10/12	Issued as "Approved for Use". "Review and Comment" not required. Minor revision: • Updated to latest PRD template: removed former section 3, Definitions and Acronyms; added section 4. • Updated LCH for Chalk River to latest version; moved to National Building Code of Canada, 2020; added National Fire Code of Canada, 2020. • Updated LCH for Nuclear Power Demonstration to latest version; moved to National Building Code of Canada, 2020. • Updated LCH for Whiteshell and Port Hope to latest version; no changes in requirements. • Added implementing documents to Table 7 LCH for Port Hope. • Added tables for ASME NQA-1, CSA N286.6-98 (R2003), and CSA N299-16 series. • Updated Engineers Act (Quebec): no changes in requirements. • Added list of guidance documents.	M. Gogulapati	J. Slade S. Toelly	J. Slade
5	2022/05/05	Issued as "Approved for Use". "Review and Comment" not required. Minor revision: Added requirements to Table 1 SOCA to align with Requirement Management database. Updated Table 5 NPD and Table 6 Douglas Point to new licences (no changes in requirements). Added new Table 8 REGDOC-2.6.3 Clause 4.4.2 to align with Requirement Management database.	M. Gogulapati	J. Slade S. Toelly	J. Slade

Rev. No.	Date	Details of Rev.	Prepared By	Reviewed By	Approved By
		Updated implementing documents.			
4	2021/05/06	Issued as "Approved for Use" Minor editorial changes. Updated the version of N285 and CSA B51 as per current LCH. Removed N286-12, 7.11.1 and moved to appropriate PRD (CM). No formal R&C required.	M. Gogulapati	C. Ball	J. Slade
3	2020/06/15	Issued as "Approved for Use" Minor editorial changes. Included requirement from Pressure Boundary PRD. No formal R&C required.	M. Gogulapati	S. Deighton J. deRuiter J. Slade	J. Slade
2	2019/09/16	Issued as "Approved for Use" Minor editorial changes such as template, updating references.	M. Gogulapati		J. Slade
1	2018/11/30	Issued as "Approved for Use"	J. Bailey		J. Slade
1D1	2016/03/31	Issued for "Review and Comment". Aligned Scope and Applicability, and Purpose sections with PDD. Replaced sub-section numbering by table caption as per latest template. Removed some requirements not applicable to the program. Updated to latest version of all Licence Conditions Handbooks and N286. Updated implementing documents. Added specific wording for provincial Engineering Acts requirements. Removed source requirement documents from the reference section.	J. Bailey	C. Ball E. Ballachey M. Burger D. Campbell A. Caron C. Charbonneau A. Coulas J. deRuiter Y. Dube A. Eyvindson D. Garrick G. Hamilton J. Heal D. Hill N. Mantifel J. Mitock D. Murphy R. Ponnan S. Sanders U. Senaratne J. Slade K. Summers D. Trylinski

Table of Contents

Section **Page**

1. Scope and Applicability

This company-wide document applies to all activities unique to the Design Authority and Design Engineering Functional Support Area, performed by Canadian Nuclear Laboratories' employees, contractors, and sub-contractors, as well as third parties engaged through external partnerships or collaborations that perform work for and/or on behalf of CNL.

2. Purpose

The following is a mapping of requirement source documents to the Management System documentation that implements those requirements. It reflects the current operational implementation of the requirements. Given the diverse nature of the CNL business, the dynamic nature of the regulatory environment, and the complexity of the regulations, the mapping is not intended to be complete for every possible requirement.

3. Requirements and Flowdown

Various procedures control the design engineering work conducted at CNL. The following list presents the requirement source documents for the Design Authority and Design Engineering FSA.

- *Agreement for the Management and Operation of Certain Properties and Assets that are the Responsibilities of Atomic Energy of Canada Limited*, SOC Agreement (SOCA), 2015. Table 1
- *Chalk River Laboratories Nuclear Research and Test Establishment Operating Licence NRTEOL-01.00/2028*, Licence Conditions Handbook, NRTEOL-LCH-01.00/2028 Revision 3/CRL-508760-HBK-002 Revision 3, Canadian Nuclear Safety Commission, February 14, 2023. Table 2
- *Whiteshell Laboratories Nuclear Research and Test Establishment Decommissioning Licence NRTEDL-W5-08.00/2024*, Licence Conditions Handbook, NRTEDL-LCH-08.00/2024 Revision 1/WLD-508760-LCH-002 Revision 1, Canadian Nuclear Safety Commission, April 3, 2023. Table 3
- *Prototype Waste Facilities – Waste Facility Decommissioning License, Gentilly-1 Waste Facility, WFDL-W4-331.00/2034*, Licence Conditions Handbook, WFDL-LCH-W4-331.00/2034 Revision 1/61-00580-HBK-001, Revision 0, Canadian Nuclear Safety Commission, July 15, 2019. Table 4
- *Nuclear Power Demonstration Waste Facility Prototype Waste Facilities – Waste Facility Decommissioning Licence WFDL-W4-342.00/2034*, Licence Conditions Handbook, WFDL-LCH-W4-342.00/2034 Revision 2/64-508760-HBK-001, Revision 2, Canadian Nuclear Safety Commission, August 15, 2023. Table 5
- *Prototype Waste Facilities – Waste Facility Decommissioning Licence Douglas Point Facility WFDL-W4-332.03/2030*, Licence Conditions Handbook, WFDL-LCH-W4-332.03/2030 Revision 1/22-508760-HBK-002, Revision 0, Canadian Nuclear Safety Commission, June 11, 2021. Table 6

- *Port Hope Area Initiative Waste Management Project – Waste Nuclear Substance Licence WNSL-W1-2310.00/2032*, Licence Condition Handbook, LCH-WNSL-W1-2310.00/2032 Revision 0, Canadian Nuclear Safety Commission, January 1, 2023. Table 7
- *Fitness for Service: Aging Management*, REGDOC-2.6.3, Canadian Nuclear Safety Commission, March 2014. Table 8
- *Management system requirements for nuclear facilities*, N286-12 (R2022), Canadian Standards Association, June 2012. Table 9
- *Quality management systems - Requirements*, CAN/CSA-ISO 9001:16 (ISO 9001:2015, IDT), Canadian Standards Association, February 2016. Table 10
- *Quality Assurance Requirements for Nuclear Facility Applications*, ASME NQA-1-2015, American Society of Mechanical Engineers, February 20, 2015. Table 11
- *Decommissioning Quality Assurance for Nuclear Power Plants*, N286.6-98 (R2003), Canadian Standards Association, September 1998. Table 12
- *Quality assurance program requirements for the supply of items and services for nuclear power plants,* N299-16 series, Canadian Standards Association, September 2016. Table 13: CSA N299-16 series, Quality assurance program requirements for the supply of items and services for nuclear power plants.

- *Boiler, pressure vessel, and pressure piping code*, B51-14 (with no updates), Canadian Standards Association, January 2014. Table 16

- *Boiler, pressure vessel, and pressure piping code*, CSA B51-19 (with no updates), Canadian Standards Association, March 2019. Table 17
- *Professional Engineers Act (Ontario)*, R.S.O. 1990, c. P.28. Table 18
- *The Engineering and Geoscientific Professions Act (Manitoba)*, C.C.S.M. c. E120. Table 19
- *Engineers Act (Quebec)*, CQLR c. I-9. Table 20
- *Engineering and Geoscience Professions Act (New Brunswick)*, BILL 18. Table 21

The following list presents the guidance documents for the Design Authority and Design Engineering FSA not listed in the below tables.

- *General Design Considerations: Human Factors*, REGDOC-2.5.1, Canadian Nuclear Safety Commission, March 2019.
- *Design of Reactor Facilities: Nuclear Power Plants*, REGDOC-2.5.2, Canadian Nuclear Safety Commission, May 2014.
- *Design of Rooms Where Unsealed Nuclear Substances Used*, REGDOC-2.5.6, Canadian Nuclear Safety Commission, May 2023.

Table 1: Site Operating Company Agreement (SOCA).

Site Operating Company Agreement (SOCA)		
Section and Title	**Description**	**Implementing Document(s)**
SCHEDULE A - SOC STATEMENT OF WORK		
1. DECOMMISSIONING AND WASTE MANAGEMENT (DWM) 1.4 Waste Management (WM)	1.4.3.5 CNL shall be responsible for all technical and design aspects of the project under the PHAI program. 1.4.3.6 CNL shall ensure the design, construction and commissioning and operations of the PHAI are consistent with the requirements of the environmental assessment and any other Permits, Licences, Approvals and Agreements, and that projects meet necessary and appropriate Quality Assurance (QA) standards.	900-508120-PDD-001, *Design Authority and Design Engineering*
1. DECOMMISSIONING AND WASTE MANAGEMENT (DWM) 1.4 Waste Management (WM)	1.4.4.7 CNL shall engage with the Regulatory Authority to determine the requirements for long-term Historic LLW management and disposal.	900-508120-PDD-001, *Design Authority and Design Engineering*

Site Operating Company Agreement (SOCA)		
Section and Title	**Description**	**Implementing Document(s)**
	1.4.4.7.1 The safety basis and engineering design will be prepared as necessary to proceed through the licensing process. 1.4.4.7.2 CNL's recommendation will be included in the Proposed Annual Program of Work and Budget.	
4 PROJECT, DESIGN, AND CONSTRUCTION MANAGEMENT	4.5 CNL shall perform project, design and construction management, including: design and risk analysis, value engineering, configuration management and control, conceptual designs, preliminary designs, material testing, and surveying in support of architectural and engineering designs; final designs and construction drawings; and as-built drawings pursuant to construction inspections, surveying, and material-testing services for all of CNL's activities that support AECL and other customer needs.	900-508120-PDD-001, *Design Authority and Design Engineering*

	maintained and operating practices aimed at slowing down potential degradation of the structure or component	

Table 9: CSA N286-12, Management system requirements for nuclear facilities.

Management system requirements for nuclear power plants		
Section and Title	**Description**	**Implementing Document(s)**
4 Generic requirements for the management system		
4.8.3 Independent verification of work	[As it relates to design work] Work activities throughout the life of the nuclear facility shall be independently verified by workers who did not perform the work to confirm that it meets requirements. The extent and timing of the verification shall be based on the potential impact of the work.	900-508120-MCP-001, *Design Planning* 900-508120-MCP-003, *Execution of Design Review and Verification*
6.3.1 General (same as 7.3.1, 8.3.1, 9.3.1)	The design process shall be established and controlled.	900-508120-PDD-001, *Design Authority and Design Engineering* 900-508120-MCP-005, *Assigning a Delegation of Design Authority*
6.3.2 Inputs (same as 7.3.2, 8.3.2, 9.3.2)	Design inputs shall be established. The factors to be considered in determining the design inputs should include (a) functional requirements; (b) location and interfacing requirements; (c) performance requirements; (d) operational requirements; (e) environment considerations;	900-508120-MCP-001, *Design Planning* 900-508120-MCP-024, *Incorporation of Human Factors Engineering into Designs*

Management system requirements for nuclear power plants		
Section and Title	**Description**	**Implementing Document(s)**
	(f) safety considerations; (g) codes and standards, and jurisdictional requirements; (h) contractual and customer consideration; (i) supply and logistics considerations; (j) stakeholder impact considerations; (k) human factor considerations; (l) experience from previous designs; (m) design requirements for each specific engineering discipline; (n) fabrication considerations; (o) installation considerations; (p) commissioning considerations; (q) in-service considerations; (r) research, technical studies, data, and reports; (s) decommissioning requirements; and (t) economic considerations.	
6.3.3 Requirements (same as 7.3.3, 8.3.3, 9.3.3)	Design requirements shall be defined in sufficient detail to provide reference for making decisions, verifying designs, and evaluating design changes.	900-508120-MCP-001, *Design Planning*
6.3.4 Design (same as 7.3.5, 8.3.4, 9.3.4)	The design shall be carried out based on the design requirements. Calculations, analyses, and studies shall be controlled in such a manner that they are available to subsequent users of the design.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
6.3.5 Documents (same as 7.3.6, 8.3.5, 9.3.5)	Design documents shall be created so the design can be related to the design requirements and used by organizations responsible for construction, commissioning, operation, and decommissioning. The following shall be included in the design documents:	900-508120-MCP-001, *Design Planning* 900-508120-MCP-002, *Production and Acceptance of Design Documents*

Management system requirements for nuclear power plants		
Section and Title	**Description**	**Implementing Document(s)**
	(a) design requirements; (b) inputs, assumptions, methods, modelling, test and development work, and results; (c) jurisdictional requirements, applicable codes and standards, and other classification criteria; (d) purchasing, installation, and construction requirements; (e) design drawings; (f) characteristics of the design that need to be confirmed; and (g) system or equipment operating and maintenance requirements.	
7.3.4 Tools	Design tools shall be appropriate for the application and controlled.	900-508120-MCP-002, *Production and Acceptance of Design Documents*

Table 10: CAN/CSA-ISO 9001:16 (ISO 9001:2015, IDT), Quality management system - Requirements.

Quality management system-requirements		
Section and Title	**Description**	**Implementing Document(s)**
8.3 Design and development of products and services		
8.3.1 General	The organization shall establish, implement and maintain a design and development process that is appropriate to ensure the subsequent provision of products and services.	900-508120-PDD-001, *Design Authority and Design Engineering*
8.3.2 Design and development planning	In determining the stages and controls for design and development, the organization shall consider:	900-508120-MCP-001, *Design Planning* 900-508120-MCP-002, *Production and*

Quality management system-requirements		
Section and Title	**Description**	**Implementing Document(s)**
	a) the nature, duration and complexity of the design and development activities; b) the required process stages, including applicable design and development reviews; c) the required design and development verification and validation activities; d) the responsibilities and authorities involved in the design and development process; e) the internal and external resource needs for the design and development of products and services; f) the need to control interfaces between persons involved in the design and development process; g) the need for involvement of customers and users in the design and development process; h) the requirements for subsequent provision of products and services; i) the level of control expected for the design and development process by customers and other relevant interested parties; j) the documented information needed to demonstrate that design and development requirements have been met.	*Acceptance of Design Documents*
8.3.3 Design and development inputs	The organization shall determine the requirements essential for the specific types of products and services to be designed and developed. The organization shall consider:	900-508120-MCP-001, *Design Planning* 900-508120-MCP-002, *Production and Acceptance of Design Documents*

Quality management system-requirements		
Section and Title	**Description**	**Implementing Document(s)**
	a) functional and performance requirements; b) information derived from previous similar design and development activities; c) statutory and regulatory requirements; d) standards or codes of practice that the organization has committed to implement; e) potential consequences of failure due to the nature of the products and services. Inputs shall be adequate for design and development purposes, complete and unambiguous. Conflicting design and development inputs shall be resolved. The organization shall retain documented information on design and development inputs.	
8.3.4 Design and development controls	The organization shall apply controls to the design and development process to ensure that: a) the results to be achieved are defined; b) reviews are conducted to evaluate the ability of the results of design and development to meet requirements; c) verification activities are conducted to ensure that the design and development outputs meet the input requirements; d) validation activities are conducted to ensure that the resulting products and services meet the requirements for the specified application or intended use; e) any necessary actions are taken on problems determined during the reviews, or verification and validation activities;	900-508120-MCP-001, *Design Planning* 900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508120-MCP-003, *Execution of Design Review and Verification*

Quality management system-requirements		
Section and Title	**Description**	**Implementing Document(s)**
	f) documented information of these activities is retained. NOTE Design and development reviews, verification and validation have distinct purposes. They can be conducted separately or in any combination, as is suitable for the products and services of the organization.	
8.3.5 Design and development outputs	The organization shall ensure that design and development outputs: a) meet the input requirements; b) are adequate for the subsequent processes for the provision of products and services; c) include or reference monitoring and measuring requirements, as appropriate, and acceptance criteria; d) specify the characteristics of the products and services that are essential for their intended purpose and their safe and proper provision. The organization shall retain documented information on design and development outputs.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
8.3.6 Design and development changes	The organization shall identify, review and control changes made during, or subsequent to, the design and development of products and services, to the extent necessary to ensure that there is no adverse impact on conformity to requirements. The organization shall retain documented information on: a) design and development changes; b) the results of reviews;	900-508120-MCP-001, *Design Planning* 900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508120-MCP-003, *Execution of Design Review and Verification*

Quality management system-requirements		
Section and Title	**Description**	**Implementing Document(s)**
	c) the authorization of the changes; d) the actions taken to prevent adverse impacts.	
8.5 Production and service provision		
8.5.1 Control of production and service provision	The organization shall implement production and service provision under controlled conditions. Controlled conditions shall include, as applicable: a) the availability of documented information that defines: 1) the characteristics of the products to be produced, the services to be provided, or the activities to be performed; 2) the results to be achieved; b) the availability and use of suitable monitoring and measuring resources; c) the implementation of monitoring and measurement activities at appropriate stages to verify that criteria for control of processes or outputs, and acceptance criteria for products and services, have been met; d) the use of suitable infrastructure and environment for the operation of processes; e) the appointment of competent persons, including any required qualification; f) the validation, and periodic revalidation, of the ability to achieve planned results for the processes for production and service provision, where the resulting	900-508120-MCP-001, *Design Planning* 900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508120-MCP-003, *Execution of Design Review and Verification* 900-508120-MCP-024, *Incorporation of Human Factors Engineering into Designs*

Quality management system-requirements		
Section and Title	**Description**	**Implementing Document(s)**
	output cannot be verified by subsequent monitoring or measurement; g) the implementation of actions to prevent human error; h) the implementation of release, delivery, and post-delivery activities.	

Table 11: ASME NQA-1-2015, Quality Assurance Requirements for Nuclear Facility Applications.

Quality Assurance Requirements for Nuclear Facility Applications		
Section and Title	**Description**	**Implementing Document(s)**
All applicable sections	Included when applicable in review of codes and standards during design planning and design execution.	900-508120-MCP-001, *Design Planning* 900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508120-MCP-003, *Execution of Design Review and Verification*

Table 12: CSA N286.6-98 (R2003), Decommissioning Quality Assurance for Nuclear Power Plants.

Decommissioning Quality Assurance for Nuclear Power Plants		
Section and Title	**Description**	**Implementing Document(s)**
3 Basic Requirements		
3.8 Work Planning and Control	Decommissioning activities shall be identified, planned, sequenced, resourced, assigned, defined, controlled, and verified.	900-508120-MCP-001, *Design Planning*
3.10 Verification	Work requiring specific independent in-field inspection, to confirm that results meet requirements, shall be identified. The extent of inspection may vary depending upon the complexity of the work and the potential impact on safety.	900-508120-MCP-003, *Execution of Design Review and Verification*
3.14 Document Control	3.14.1 The identification, review, approval, issue, distribution, and revision of all documents shall be controlled. 3.14.2 Documents, including changes and revisions, shall be reviewed for adequacy and approved for release by authorized personnel. 3.14.3 The individuals or organizations responsible for preparing, revising, reviewing, approving, and issuing documents shall be identified. 3.14.4 Modifications to documents relating to items or services shall, prior to implementation, undergo the same reviews and approvals as the original documents. Such reviews and approvals shall be carried out by persons having access to pertinent background information and having adequate understanding of the requirements and intent of the original documents.	900-508120-MCP-002, *Production and Acceptance of Design Documents*

Decommissioning Quality Assurance for Nuclear Power Plants		
Section and Title	**Description**	**Implementing Document(s)**
	3.14.5 Documents, including changes and revisions, shall be distributed for use at the location where the prescribed activity is performed or where the document is required for reference. 3.14.6 Obsolete documents shall be identified as such and promptly removed from use. 3.14.7 Information that permits the identification of any changes and revisions to documents shall be maintained"	
3.15 Records	3.15.1 Essential records shall be identified, maintained, stored, and routinely inspected to ensure their preservation and protection from loss, deterioration, or destruction. Essential records are the records essential to decommissioning, including those records that are necessary to provide evidence that items, services, and activities meet specified requirements. 3.15.2 Essential records shall be complete, valid, legible, retrievable, and traceable to the items and activities to which they refer. 3.15.3 Retention periods for records shall be defined.	900-508120-MCP-002, *Production and Acceptance of Design Documents*

DIVISION II PRACTICE OF ENGINEERING	1.1. The practice of engineering consists, regardless of life cycle phase of works, in engaging in scientific analysis, design, execution, alteration, operation or advisory activities applied to structures and materials as well as to processes and systems that extract, use, exchange, transform, transport or store energy, information or matter in order to produce a reliable, safe and durable environment. The practice of engineering also consists in coordinating the work of persons who participate in the carrying out of engineering works. Respect for the environment and for life, the protection of property, heritage preservation and economic efficiency are part of the practice of engineering to the extent that they are related to the engineer's professional activities. [See Section 2 and 3 of DIVISION II of the Act for a description of the professional activities in the practice of engineering which are reserved to engineers]	Accountability Statements 900-508120-MCP-005, *Assigning a Delegation of Design Authority* 900-508120-MCP-002, *Production and Acceptance of Design Documents*

Table of Contents

1. Scope and Applicability

The Pressure Boundary Program applies to design, procurement, fabrication, installation, examination, testing, repair, replacement, modification, construction, and maintenance of pressure retaining systems and components performed by Canadian Nuclear Laboratories (CNL) at the Chalk River Laboratories (CRL), Deep River facilities controlled by CRL, and Whiteshell Laboratories (WL).

The Sites, Facilities, and Buildings that fall under the auspices of the Pressure Boundary Program are federally regulated. As such, provincial legislation does not apply to activities conducted on pressure retaining systems and components at these locations. The Canadian Nuclear Safety Commission (CNSC) identifies applicable codes and standards through the licences issued to permit the conduct of licensed activities. At this time, the CNSC have included specific pressure boundary requirements in the site licences for both CRL and WL. To ensure compliance with these defined requirements, the Pressure Boundary Program has been implemented at each of these sites. The *CRL Nuclear Pressure Boundary Quality Assurance* plan [1], *CRL CSA B51 Pressure Boundary Quality Control Manual* [2], and the *WL Pressure Boundary Quality Assurance Plan* [3] detail the specific scope, as permitted by the Certificates of Authorization issued to each laboratory, and describe the controls, authority, and responsibilities applicable to each laboratory.

Specific programs have not been developed to support activities conducted on pressure retaining systems and components at any other location.

The Pressure Boundary Program does not include the design, fabrication, modification, or repair of Class 1, 1C, 2, 2C, 3, or 3C pressure vessels, or overpressure protection devices as classified in accordance with CSA N285.0 *General requirements for pressure-retaining systems and components in CANDU nuclear power plants* [4] [5]. The program does not include qualification of material organizations or the qualification of unqualified source material. Qualified suppliers are to be contracted for specific scopes of work.

Any questions regarding the content or application of this document should be directed to the Functional Support Manager for Pressure Boundary as identified in *Functional Authorities* [6].

2. Purpose

The purpose of the Pressure Boundary Program is to assure that pressure-retaining systems and components are designed, constructed, and operated in full compliance with statutory and legislative requirements, while promoting and supporting performance excellence with a strong safety culture. The ultimate objective of the Pressure Boundary Program and its governing codes and standards is “no pressure boundary failures”.

3. Definitions and Acronyms

This document relies primarily on word meaning as found in common dictionaries. The current *Glossary of Controlled Terms and Acronyms* [7] contains specific meanings for those words that require further clarification.

Definitions of terms used in nuclear applications follow the hierarchy below:

- *Licence Conditions Handbook for Chalk River Laboratories* (LCH for CRL) [8]
- *Licence Conditions Handbook for Whiteshell Laboratories* (LCH for WL) [9]
- *General requirements for pressure-retaining systems and components in CANDU nuclear power plants* (CSA N285.0) [4] [5]
- *Glossary*, Section III - Article NCA-9000, Boiler and Pressure Vessel Code (ASME NCA-9000) [10]
- *Definitions*, Section III - Article NCA-4120, Boiler and Pressure Vessel Code (ASME NCA-4120) [11]
- *Quality Assurance Requirements for Nuclear Facility Applications* (ASME NQA-1) [12]

Definitions of terms used in non-nuclear applications follow the hierarchy below:

- *LCH for CRL* [8]
- *LCH for WL* [9]
- *Boiler, pressure vessel, and pressure piping code* (CSA B51) [13] [14]
- ASME codes of construction (ASME B31) [15] [16] [17]

4. Roles and Responsibilities

4.1 Functional Support Manager

The Pressure Boundary Functional Support Manager is responsible for:

- Assessing the applicability of laws, statutes, regulations, guidelines, codes, and standards for the program.
- Implementing regulatory, legal, codes, and standards requirements applicable to the program at all CNL Canadian sites considering specific work environment and activities.
- Defining performance measures for CRL and WL sites.
- Developing and maintaining Quality Assurance Plans for CRL and WL sites.

4.2 Classifier

The Classifier role may be performed by the Designer or by the Owner of the system or component. The Classifier is responsible for:

- Determining the classification of systems and components.
- Obtaining regulatory acceptance of classifications.

4.3 Designer

The Designer is responsible for:

- Determining if design registration is required.
- Registering designs with the Authorized Inspection Agency (AIA).
- Completing reconciliation statement when required.

4.4 Buyer

The Buyer is responsible for:

- Processing requisitions for items and services.
- Confirming suppliers are qualified.
- Awarding purchase orders.

4.5 Shipper or Receiver

The Shipper or Receiver is responsible for:

- Controlling materials to ensure traceability and preservation.
- Ensuring materials and items requiring inspection are segregated.

4.6 Supplier or Manufacturer

The Supplier or Manufacturer is responsible for:

- Controlling materials to ensure traceability and preservation.
- Ensuring Quality Assurance (QA) accepted material is used in fabrication.

4.7 Welding Professional

The Welding Professional is responsible for:

- Preparing, certifying, and registering Welding Procedure Specifications and maintaining Procedure Qualification Records.

4.8 Welder

The Welder is responsible for:

- Controlling materials to ensure traceability and preservation.
- Ensuring QA accepted material is used and welding is performed in accordance with registered Welding Procedure Specifications.

4.9 Quality Control Inspector

The Quality Control Inspector is responsible for:

- Controlling materials to ensure traceability and preservation.
- Ensuring QA accepted material was used.
- Conducting inspections, including non-destructive examination and incoming inspection.
- Initiating non-conformance reports for items found not complying with the specified requirements.

4.10 Planner or Assessor

The Planner or Assessor is responsible for:

- Coordinating hold and witness point inspections with the Jurisdictional Liaison.
- Planning maintenance, fabrication, installation, and inspection activities.
- Preparing, reviewing, and controlling maintenance documentation such as route sheets and/or other process control documents.
- Initiating inspection requests for pressure boundary items including customer supplied material.
- Closing out completed maintenance documentation.
- Controlling fabrication and installation activities.
- Controlling materials to ensure traceability and preservation.

4.11 Jurisdictional Liaison

The Jurisdictional Liaison is responsible for:

- Coordinating Authorized Inspector (AI) / Authorized Nuclear Inspector (ANI) visits to site.
- Providing AI/ANI with documentation.

4.12 Installer

The Installer is responsible for:

- Controlling materials to ensure traceability and preservation.
- Ensuring QA accepted material is used and process control documents are adhered to.

4.13 Authorized Inspector / Authorized Nuclear Inspector

The AI/ANI represents the AIA at CNL sites. The AI/ANI is responsible for:

- Ensuring QA accepted material was used.
- Verifying material traceability.
- Verifying installations and fabrications meet specified requirements, and witnessing post-maintenance pressure tests.

4.14 Owner

At CNL, the duties of the Owner are assigned to the Chief Engineer (also known as the Design Authority). The Owner is responsible for:

- Executing the owner's duties for CNL sites as defined by Site Licence Conditions and applicable codes and standards related to the Pressure Boundary Function.
- Formally delegating review and documentation of the review of Design Reports.
- Documenting a pressure boundary quality assurance program.
- Obtaining written agreement with an AIA.

5. Functional Programs

DESIGN (Classifier, Designer)

- Engage Engineering Safety & Licensing to conduct a consequence of failure analysis
- Determine system classification
- Produce design documentation (reports, forms, drawings, specifications)
- Register design with the AIA

↓

PROCUREMENT (Buyer)

- Produce and release purchase order to qualified suppliers
- Maintain procurement records

↓

LOGISTICS, SHIPPING, RECEIVING (Shipper or Receiver)

- Receive materials or items, with Certificate of Compliance
- Identify and control materials
- Generate Receipt Travellers

↓

FABRICATION (Supplier, Manufacturer, Welder, Welding Professional)

- Fabricate traceable item
- Generate welding procedure specifications
- Generate process control documents such as manufacturing inspection and test plans
- Certify procedure qualification records

↓

INSPECTION (Quality Control Inspector, Jurisdictional Liaison, AI/ANI)

- Conduct incoming material inspections
- Generate the receiving inspection report
- Perform non-destructive examinations
- Witness in-service testing
- Perform in-process inspections
- Calibrate measuring and test equipment

↓

PLANNING (Planner, Assessor, Jurisdictional Liaison)

- Prepare process control documents such as route sheet or job cards.
- Select materials or components
- Produce data reports
- Schedule work, including periodic inspections and replacements
- Engage the AI/ANI: AI/ANI reviews route sheet for acceptance and identification for any hold, or witness, or verification points

↓

INSTALLATION (Installer, Jurisdictional Liaison, AI/ANI)

- Install item
- Generate maintenance record and data report
- Complete required tests and inspections

Figure 1: Pressure Boundary process.

5.1 Chalk River Laboratories

CRL operates under the *Nuclear Research and Test Establishment Operating Licence, Chalk River Laboratories* [18] issued by the CNSC. The licence states that CNL will implement and maintain a pressure boundary program. The licence is supported by the *LCH for CRL* [8].

The Pressure Boundary Program at CRL complies with the requirements of CSA N285.0 [5], which defines the technical requirements for the design, procurement, fabrication, installation, modification, repair, replacement, testing, examination, and inspection of pressure-retaining and containment systems, including their components and supports.

Where indicated by CSA N285.0 [5] and its applicable referenced publications, CNL has the following:

- Registered designs and procedures (by AIA).
- Inspections (by AIA).
- Documents describing the classification, registration, and reconciliation processes and the associated controls.

CNL also obtains AIA acceptance for implementation of the CRL's programs and procedures for:

- Calibration, repair, and maintenance of overpressure protection devices.
- Repair and maintenance of mechanical joints.
- Periodic inspection of boilers and pressure vessels designed according to CSA B51 [14].

Where CSA N285.0 [5] requires items to be submitted to CNSC for approval before implementation, CNL:

1. Documents the item in sufficient detail to ensure it is safe to proceed.
2. Submits the item to the AIA for assessment and acceptance, if required by CSA N285.0 [5] or its referenced publications.

CNL may implement the item and notifies CNSC staff if the AIA has given its acceptance.

CNL has in place a formal agreement with an AIA acceptable to the CNSC to provide services for the pressure boundaries of the nuclear facility as defined by CSA N285.0 [5] and its applicable referenced publications. The Technical Standard and Safety Authority (TSSA) is the Provincial Boiler & Pressure Vessel authority in Ontario and the recognized and accepted inspection agency to CRL site.

The *CRL Nuclear Pressure Boundary Quality Assurance* plan [1] and the *CRL CSA B51 Pressure Boundary Quality Control Manual* [2] presents the details of the pressure boundary quality assurance program implemented at CRL.

5.2 Whiteshell Laboratories

WL operates under the *Nuclear Research and Test Establishment Decommissioning Licence (NRTEDL), Whiteshell Laboratories* [19]. The licence states that CNL will implement and maintain a pressure boundary program. The licence is supported by the *LCH for WL* [9].

The LCH further defines and clarifies the requirements and allowances for the pressure boundary program at WL to design, manufacture, fabricate, procure, install, modify, repair, test, examine, inspect, or otherwise perform work related to vessels, boilers, systems, piping, fittings, parts, components, and supports according to the specifications in CSA N285.0 [4], CSA B51 [13], or other codes and standards approved or prescribed by the CNSC.

Where indicated by these standards, CNL obtains regulatory approvals for the following work:

- Registered designs.
- Accepted overpressure protection reports.
- Approval of applicable standards and code classification.
- Registered welding and brazing procedures.
- Qualified welders, welding operators, brazers, and examination personnel.
- Accepted quality assurance programs.
- Accepted plans and procedures (certificates of authorization).

WL classifies as Class 6 systems or sections of systems that contain tritium or other radioactive substances, if the consequence of failure limit of 20 mSv effective acute whole body dose is not exceeded. WL carries out the activities listed above in accordance with CSA B51 [13], or other codes and standards approved or prescribed by the CNSC, for pressure boundary systems and components that do not contain nuclear substances, do not adversely impact a nuclear safety system, or do not cause an unreasonable risk involving nuclear substances at WL.

Whiteshell Laboratories:

- Operates vessels, boilers, systems, piping, fittings, parts, components, and supports safely and keeps them in a safe condition.
- Complies with operating limits specified in certificates, orders, designs, overpressure protection reports, and applicable codes and standards.
- Has any certified boiler or vessel that is in operation or use, inspected and certified by an AI according to an accepted schedule.
- Inspects and performs material surveillance according to accepted schedules, plans, and procedures.
- Ensures that vessels, boilers, systems, piping, fittings, parts, components, and supports have markings as specified in the applicable standards.
- Keeps proper records of regulatory approvals and other documents required as set out in the *LCH for WL* [9] and the standards applicable to the work or equipment.

WL reports to the CNSC and to the Manitoba Department of Labour and Immigration when WL learns of any failure of a pressure boundary that has caused injury, death, or property damage. The Inspection and Technical Services Manitoba (ITSM) is the Provincial Boiler & Pressure

Vessel regulatory authority in Manitoba (*The Steam and Pressure Plants Act* [20]) and the recognized and accepted inspection agency to WL site and provides AIA services to WL. This requirement is in addition to any reporting requirements of the *Nuclear Safety and Control Act* [21] and its associated Regulations.

The *WL Pressure Boundary Quality Assurance Plan* [3] presents the details of the pressure boundary quality assurance program implemented at WL.

6. Interfaces

6.1 Internal Interfaces

Functions/Lines Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Lines of Business (Owners of system or component)	• Determines the classification of systems and components • Obtains regulatory acceptance of classifications • Determines if design registration is required • Provides concurrence to non-conformance dispositions	• Meetings, email, phone, change requests	• Designer
Design Engineering	• Registers designs with the AIA • Assesses the as-built configuration of systems and components and reconciles differences with the registered design	• Meetings, email, phone, change requests	• Designer
Procurement	• Processes requisitions • Confirms suppliers are qualified • Awards purchase orders	• Purchase Orders	• Buyer
Logistics	• Controls materials to ensure traceability and preservation • Ensures materials and items requiring inspection are segregated	• Receipt Traveller	• Warehouse Supervisor
Quality	• Incoming inspection • Non-destructive examination • In-service testing • Calibrating measuring and test equipment • Initiates non-conformance reports for items found not complying with the specified requirements • Coordinates AI/ANI visits to site • Provides AI/ANI with documentation	• Process control documents such as route sheets • Inspection Record • ImpAct	• Quality Control Inspector • Jurisdictional Liaison

Functions/Lines Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Fitness for Service	• Controls materials to ensure traceability and preservation • Ensures QA accepted material is used and work control documents are adhered to • Coordinates hold and witness point inspections with the Jurisdictional Liaison • Plans fabrication and installation activities • Prepares, reviews, and controls maintenance documentation such as route sheets or other process control documents • Initiates inspection requests for pressure boundary items including customer supplied material • Closes out completed maintenance documentation • Controls fabrication and installation activities	• Work control package, documentation, email	• Planner, Assessor, Installer
Quality Audit & Support	• Carries out audits to determine the adequacy and effectiveness of the pressure boundary quality assurance programs	• Audit plan • Audit report	• Pressure Boundary Functional Support Manager
Pressure Boundary Working Group	• Provides oversight to existing processes identified in the pressure boundary programs as required under CRL and WL's site licences	• Working group meetings	• Pressure Boundary Functional Support Manager
Manufacturing Services	• Controls materials to ensure traceability and preservation • Ensures QA accepted material is used in fabrication • Fabricates traceable item • Generates welding procedure specifications • Generates Manufacturing Inspection and Test Plans • Certifies Procedure Qualification Records	• Manufacturing Inspection and Test Plans • Work request	• Manufacturing Assessor or Planner • Welding Professional

6.2 External Interfaces

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Canadian Standards Association (CSA) N285.0	• Information exchange and collaboration • Prepare and maintain CSA Nuclear Standards for pressure-retaining systems and components	• Nuclear Standards Steering Committee, Technical Committees	• General Manager, Engineering • Chief Engineer • Pressure Boundary Functional Support Manager
AI/ANI from Authorized Inspection Agency	• Ensures QA accepted material was used • Verifies material traceability • Witnesses post-maintenance pressure tests • Provides concurrence to non-conformance dispositions	• Inspection and witness testing • Email, phone • ImpAct	• Jurisdictional Liaison • Planner/Assessor • Pressure Boundary Functional Support Manager
Technical Standards and Safety Authority (TSSA)	• Jurisdictional requirements for pressure retaining systems within Ontario	• Procedure on Design Registration • Procedure on AIA Agreement • Audit plan • Audit report • Meetings, email, phone	• Pressure Boundary Functional Support Manager • Manager, Process, Mechanical & HVAC • CRL Jurisdictional Liaison
Inspection and Technical Services Manitoba (ITSM)	• Jurisdictional requirements for pressure retaining systems within Manitoba	• Procedure on Design Registration • Procedure on AIA Agreement • Audit plan • Audit report • Meetings, email, phone	• Pressure Boundary Functional Support Manager • Manager WL Engineering
CANDU Owners Group (COG)	• Information exchange and collaboration • Develop unified positions on generic pressure boundary issues	• Workshops, peer groups	• Pressure Boundary Functional Support Manager
Canadian Nuclear Safety Commission (CNSC)	• Unplanned event reporting • Compliance with licence	• Procedure on Reporting of Unplanned Events and Situations to the CNSC • Procedure on External audit	• Pressure Boundary Functional Support Manager

Groups Interfaced With	Interface Activity/Purpose (Type of Information Exchanged)	Interface Mechanism	Primary Interface Contact(s)
Supplier Manufacturer Fabricator	• Procurement of Components and/or Services	• Purchase Order • Technical Specification • Technical Scope of Work	• Procurement

Table of Contents

1. Scope and Applicability

This company-wide document applies to all activities unique to the Pressure Boundary Functional Support Area, performed at the Chalk River Laboratories (CRL), Deep River facilities controlled by CNL, and Whiteshell Laboratories (WL), by Canadian Nuclear Laboratories' employees, contractors, and sub-contractors, as well as third parties engaged through external partnerships or collaborations that perform work for and/or on behalf of CNL.

The Sites, Facilities, and Buildings that fall under the auspices of the Pressure Boundary Function are federally regulated. As such, provincial legislation typically does not apply to activities conducted on pressure retaining systems and components at these locations. Where specific provincial requirements are implemented, these are identified in the site-specific Quality Assurance Plans, and accepted by the Jurisdictional Authority for the Province. The Canadian Nuclear Safety Commission (CNSC) identifies applicable codes and standards through the licences issued to permit the conduct of licensed activities. At this time, the CNSC have included specific Pressure Boundary requirements in the site licences for both CRL and WL. To ensure compliance with these defined requirements, the Pressure Boundary Function has been implemented at each of these sites.

2. Purpose

The following is a mapping of requirement source documents to the Management System documentation that implements those requirements. It reflects the current operational implementation of the requirements. Given the diverse nature of the CNL business, the dynamic nature of the regulatory environment, and the complexity of the regulations, the mapping is not intended to be complete for every possible requirement.

3. Requirements and Flowdown

This section describes the requirements to ensure that the Pressure Boundary Function is planned, implemented, and maintained.

CSA standard N285.0 and its applicable referenced publications, as well as other codes and standards approved or prescribed by the CNSC, specify the technical requirements for the design, procurement, fabrication, installation, modification, repair, replacement, testing, examination and inspection of, and other work related to, pressure-retaining systems, components, and supports over the service life of a Canada Deuterium Uranium (CANDU) nuclear power plant. Figure 1 presents the hierarchy and interrelation between these standards.

The following list presents the requirement source documents for Pressure Boundary.

- *Chalk River Laboratories Nuclear Research and Test Establishment Operating Licence NRTEOL-01.00/2028*, Licence Conditions Handbook, NRTEOL-LCH-01.00/2028 Revision 3/CRL-508760-HBK-002 Revision 3, Canadian Nuclear Safety Commission, February 14, 2023. Table 1

- *Whiteshell Laboratories Nuclear Research and Test Establishment Decommissioning Licence NRTEDL-W5-08.00/2024,* Licence Conditions Handbook, NRTEDL-LCH-08.00/2024 Revision 1/WLD-508760-LCH-002 Revision 1, Canadian Nuclear Safety Commission, April 3, 2023. Table 2
- *Canada Labour Code*, R.S.C., 1985, c. L-2. Table 3
- *Canada Occupational Health and Safety Regulations*, SOR/86-304. Table 4
- *The Steam and Pressure Plants Act (Manitoba)*, C.C.S.M. c. S210. Table 5
- *General requirements for pressure-retaining systems and components in CANDU nuclear power plants*, N285.0-08 (with no updates), Canadian Standards Association, June 2008. Table 6
- *General requirements for pressure-retaining systems and components in CANDU nuclear power plants*, N285.0-17 (with no updates), Canadian Standards Association, July 2017. Table 7
- *ASME Boiler and Pressure Vessel Code*, American Society of Mechanical Engineers, 2015. Table 8
- *Quality Assurance Requirements for Nuclear Facility Applications,* NQA-1-2015, American Society of Mechanical Engineers, February 20, 2015. Table 9
- *Boiler, pressure vessel, and pressure piping code*, CSA B51-14 (with no updates), Canadian Standards Association, January 2014. Table 10
- *Boiler, pressure vessel, and pressure piping code*, CSA B51-19 (with no updates), Canadian Standards Association, March 2019. Table 11
- *Authorized Inspection Agency Services Agreement between Technical Standards and Safety Authority and Canadian Nuclear Laboratories Ltd.*, CRL-508140-141-000, 56842344. Table 12

The following list presents the guidance documents for Pressure Boundary not listed in the below tables.

- *Commentary on CSA N285.0-17, General requirements for pressure-retaining systems and components in CANDU nuclear power plants*, N285.0.1-2018, Canadian Standards Association, August 2018.
- *Commentary on CSA N285.0-12, General requirements for pressure-retaining systems and components in CANDU nuclear power plants*, N285.0.1-2016, Canadian Standards Association, November 2016.

Pressure Boundary work conducted at CRL and WL is controlled by various procedures, all of which are captured in the following quality assurance plans:

- *CRL Nuclear Pressure Boundary Quality Assurance*, CRL-508140-QAP-001, 51654825.
- *CRL CSA B51 Pressure Boundary Quality Control Manual*, CRL-508140-QAP-003, 50275773.
- *WL Pressure Boundary Quality Assurance Plan*, WL-508140-QAP-001, 55257059.

The quality assurance plans describe the controls, processes, special processes, test equipment, tools, and skills/certification of personnel required to meet the quality requirements. The quality assurance plans are used to ensure that all pressure boundary work is compliant with the requirements of *CSA N285.0, General Requirements for Pressure Retaining Systems and Components in CANDU Nuclear Power Plants* and/or *CSA B51, Boiler, Pressure Vessel, and Pressure Piping code* standards, including construction requirements for pressure boundary work at CNL**.**

5.2 – Pressure Boundary Program Compliance Verification Criteria	a) Subject to (b) and (c) below, the licensee shall design, manufacture, fabricate, procure, install, modify, repair, test, examine, inspect, or otherwise perform work related to vessels, boilers, systems, piping, fittings, parts, components, and supports according to the specifications in CSA standards N285.0-08, B51-14 or other codes and standards approved or prescribed by the Commission. Where indicated by these standards, the licensee shall obtain the following regulatory approvals for this work: i) Registered designs; ii) Accepted overpressure protection reports; iii) Approval of applicable standards and code classification; iv) Registered welding and brazing procedures; v) Qualified welders, welding operators, brazers, and examination personnel; vi) Accepted quality assurance programs; and vii) Accepted plans and procedures (certificate(s) of authorization).	WL-508140-QAP-001, *WL Pressure Boundary Quality Assurance Plan*
5.2 – Pressure Boundary Program Compliance Verification Criteria	b) CNL may classify as Class 6 systems or sections of systems that contain tritium or other radioactive substances, if the consequence of failure limit of 20 mSv effective acute whole body dose is not exceeded.	WLD-508140-PRO-001, *Whiteshell Laboratories Code Classification and Design Registration of Pressure-Retaining Systems / Components*

Licence Conditions Handbook for Whiteshell Laboratories		
Section and Title	**Description**	**Implementing Document(s)**
5.2 – Pressure Boundary Program Compliance Verification Criteria	c) CNL shall carry out the activities listed in a) above in accordance with B51-14, or other codes and standards approved or prescribed by the Commission, for pressure boundary systems and components that do not contain nuclear substances, do not adversely impact a nuclear safety system, or do not cause an unreasonable risk involving nuclear substances at WL.	WL-508140-QAP-001, *WL Pressure Boundary Quality Assurance Plan*
5.2 – Pressure Boundary Program Compliance Verification Criteria	d) CNL shall operate vessels, boilers, systems, piping, fittings, parts, components, and supports safely and keep them in a safe condition. The licensee shall: i) follow accepted plans and procedures to test, maintain, or alter overpressure protection devices; ii) comply with operating limits specified in certificates, orders, designs, overpressure protection reports, and applicable codes and standards; iii) inspect and perform material surveillance according to accepted schedules, plans and procedures; iv) have any certified boiler or vessel that is in operation or use inspected and certified by an authorized inspector according to an accepted schedule; and v) ensure that vessels, boilers, systems, piping, fittings, parts, components and supports have markings, as specified in the applicable standards.	WL-508140-QAP-001, *WL Pressure Boundary Quality Assurance Plan*
5.2 – Pressure Boundary Program Compliance Verification Criteria	e) CNL shall keep proper records of regulatory approvals and other documents required as set out in a) through d), and the standards applicable to the work or equipment.	WL-508140-QAP-001, *WL Pressure Boundary Quality Assurance Plan*
5.2 – Pressure Boundary Program Compliance Verification Criteria	f) In addition to any reporting requirements of the *Nuclear Safety and Control Act* and its associated Regulations, CNL shall report promptly to the Commission and to the Manitoba Department of Labour and Immigration when the licensee learns of any failure of a pressure boundary that has caused injury, death or property damage.	900-514300-MCP-006, *CNL Reporting to Regulatory Agencies*

Application		
Part V 5.2	This Part does not apply to: a) a heating boiler that has a wetted heating surface of 3 m^2 or less; b) a pressure vessel that has a capacity of 40 L or less; c) a pressure vessel that is installed for use at a pressure of one atmosphere of pressure or less; d) a pressure vessel that has an internal diameter of 152 mm or less; e) a pressure vessel that has an internal diameter of 610 mm or less and that is used to store hot water; f) a pressure vessel that has an internal diameter of 610 mm or less connected to a water pumping system and that contains compressed air which serves as a cushion; g) a hydropneumatic tank that has an internal diameter of 610 mm or less; h) an interprovincial or international pipeline; or i) a refrigeration plant that has a capacity of 18 kW or less.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components* WLD-508140-PRO-001, *Whiteshell Laboratories Code Classification and Design Registration of Pressure-Retaining Systems / Components*
Fabrication and Installation Standards		
Part V 5.3	Every boiler, pressure vessel and pressure piping system used in a work place shall, if feasible, meet the standards relating to design, construction, testing, stamping, nameplates, fabrication inspection and installation set out	CRL-508140-QAP-001, CRL Nuclear Pressure Boundary Quality Assurance

Canada Occupational Health and Safety Regulations		
Section and Title	**Description**	**Implementing Document(s)**
	in clauses 4.15 to 4.18 and 5.1 to 9.1 of Part I of the Boiler Code.	CRL-508140-QAP-003, *CRL CSA B51 Pressure Boundary Quality Control Manual* WL-508140-QAP-001, *WL Pressure Boundary Quality Assurance Plan*
Part V 5.4	1. Every boiler and pressure vessel shall have at least one safety valve or other equivalent fitting to maintain pressure at or below the maximum allowable working pressure of the boiler or pressure vessel. 2. When two or more boilers or pressure vessels are connected and are used at a common operating pressure, they shall each be fitted with at least one safety valve or other equivalent fitting to maintain pressure at or below the maximum allowable working pressure of the boiler or pressure vessel that has the lowest maximum allowable working pressure.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
Use, Operation, Repair, Alteration, and Maintenance		
Part V 5.5	1. An employer shall ensure that a qualified person, charged with the operation of a boiler, is in attendance and readily available at all times while the boiler is in operation and other employees are normally present in the same building as a boiler. 2. The attendance referred to in subsection (1) is not required if a) the boiler is equipped with a fail-safe device and an automated warning device that will ensure the safe operation of the boiler and its shutdown if required, and that are installed in such a manner that they i) cannot be rendered inoperative, and ii) can be tested under operating conditions; and b) the boiler is rated below 2,000 kW in the case of a high pressure boiler, and below 3,000 kW in the case of a low pressure boiler, which includes a low pressure hot water boiler, a low pressure organic fluid boiler and a low pressure steam boiler. 3. When a boiler is shut down by a device referred to in paragraph (2)(a), the boiler shall not be restarted unless it has been examined by a qualified person and the cause of the shutdown rectified.	4172-508000-COP-003, *Powerhouse Operational Control*

Inspections		
Part V 5.10	1. No person shall use a boiler, pressure vessel or pressure piping system unless it has been inspected by an inspector in accordance with subsection (2) and it has been certified by the inspector as safe for its intended use as stated in the declaration referred to in subparagraph 5.18(2)(b)(v). 2. The inspector shall a) inspect every boiler, pressure vessel and pressure piping system i) after it is installed and before it is used for the first time, ii) after any welding, alteration or repair is carried out on it, and iii) in accordance with section 5.11, 5.12 or 5.16; and b) make a record of each inspection in accordance with section 5.18. 3. A person who operates, repairs or maintains a boiler, pressure vessel or pressure piping system or any part of it may not inspect the boiler, pressure vessel or pressure piping system for the purposes of subsection (2). 	ii) where ultrasonic thickness measurements are performed annually by an NDT technician, at least once every three years. 5. Pressure vessels, other than buried pressure vessels, that have a corrosion rate exceeding 0.1 mm of metal loss per year shall be inspected a) externally, at least once every year; and b) internally, i) at least once every two years, or ii) if ultrasonic thickness measurements are performed annually by an NDT technician on representative sections of the pressure vessel, at least once every three years. 6. Pressure vessels, other than buried pressure vessels, that have a corrosion not exceeding 0.1 mm of metal loss per year shall be inspected a) externally, at least once every year; and b) internally, i) at least once every four years, or ii) if ultrasonic thickness measurements are performed annually by an NDT technician on representative sections of the pressure vessel, at least once every six years. 7. Air receivers shall be inspected a) externally, at least once every year; and b) internally, at least once every five years. 8. If the known corrosion rate of a pressure vessel is zero, internal inspection is not necessary provided that complete external inspections, including nondestructive thickness measurements performed by an NDT technician, are made at least once every two years on the pressure vessel and the following conditions are met: a) the non-corrosive nature of the service conditions, including the effect of trace components, has been established by at least five continuous years of comparable service experience with the fluid being handled; b) the periodic external inspection indicates that the condition of the pressure vessel does not warrant any further investigation; c) the operating temperature and pressure of the pressure vessel does not exceed the lower limits	

Canada Occupational Health and Safety Regulations		
Section and Title	**Description**	**Implementing Document(s)**
	for the creep rupture range of the vessel metal; and d) the pressure vessel is protected against inadvertent contamination, and there is no evidence of contamination. 9. If a pressure vessel is used to store anhydrous ammonia, the internal inspection frequency referred to in paragraph (5)(b) may be replaced by an internal inspection conducted at least once every five years if, at the same time, a hydrostatic test at a pressure equal to one and one-half times the maximum allowable working pressure is conducted.	
Part V 5.12	Every boiler, pressure vessel and pressure piping system in use at a work place shall be inspected by an inspector more frequently than it is provided for in section 5.11, if it is necessary to ensure that the boiler, pressure vessel or pressure piping system is safe for its intended use. 		Canadian Nuclear Laboratories Ltd.
Buried Pressure Vessels		
Part V 5.16	1. The installation of a buried pressure vessel shall meet the requirements set out in Appendix A to Part I of the Boiler Code. 2. Notice of the proposed backfilling shall be given to the Head of Compliance and Enforcement before backfilling is done over a pressure vessel. 3. If test plates are used as an indication of corrosion of a buried pressure vessel, the test plates and, subject to subsection (4), the pressure vessel shall be completely uncovered and inspected by an inspector at least once every three years. 4. If, on an inspection referred to in subsection (3), the test plates show no corrosion, the buried pressure vessel may be completely uncovered and inspected at intervals exceeding three years if the employer, immediately after the inspection, notifies the Head of Compliance and Enforcement in writing of the condition of the test plates and of the proposed inspection schedule for the pressure vessel. 5. Every buried pressure vessel shall be completely uncovered and inspected at least once every 15 years.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
Records and Reports		
Part V 5.17	The employer shall keep a record of every boiler, pressure vessel and pressure piping system to which this Part applies and that is under the employer's control.	900-508130-MCP-004, *Equipment Entity List Management* CRL-508230-PRO-707, *Asset Tagging and Equipment File Management*
Part V 5.18	1. A report of each inspection carried out under sections 5.10 to 5.16 shall be completed by the inspector who carried out the inspection. 2. Every report referred to in subsection (1) a) shall be signed by the inspector who carried out the inspection; and b) shall include i) the date of the inspection, ii) the identification and location of the boiler, pressure vessel or pressure piping system that was inspected,	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* CRL-508140-QAP-003, *CRL CSA B51 Pressure Boundary Quality Control Manual* WL-508140-QAP-001, *WL Pressure Boundary Quality Assurance Plan* CRL-508140-141-000, *Authorized Inspection Agency*

5.1 General Requirements		
5.1.1	Unless otherwise stated in the Act, licence conditions, or regulatory documents, the licensee shall classify systems in accordance with Clause 5 of this Standard. See Figure 1 for guidance on the classification of process systems.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.1.2	The licensee shall classify pressure-retaining systems and sections of pressure-retaining systems having a design pressure greater than 103 kPag (15 psig) and storage tanks having a design pressure greater than or equal to atmospheric pressure.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
5.1.3	The licensee shall classify containment systems, sections of containment systems, and containment components that have a design pressure greater than 35 kPag (5 psig).	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.1.4	Components and supports assume the classification of the system of which they are a part. This Standard specifies requirements for components that are designated as one of the following: Classes 1, 1C, 2, 2C, 3, 3C, 4, 6, and Class Exempt that require registration. This Standard provides requirements for components designated with one of these classifications to ensure the structural integrity and quality of the individual items of the plant.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.1.5	Instrument lines assume the classification of the systems they are attached to except as noted in Clause 5.2.4.1.2.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.1.6	Radioactivity concentrations used for classification purposes shall be based on the expected equilibrium tritium concentration. Concentrations of other radionuclides may be disregarded where their energy- weighted activity concentration is less than 10% of that of the tritium content. Higher than normal concentrations of short duration shall be considered acceptable. For systems used only intermittently, the concentrations during operation shall be the basis for classification.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.1.8	The classification approval form or the system classification list shall identify the ASME BPVC Code Cases that will be used in the design, fabrication, and installation of component(s) and supports. The alternative rules of Annex K may be used. When used, the alternative rule Clause number need not be included on the classification approval form or the system classification list but shall be recorded on the data report form.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.2 Process Systems		
5.2.1	Systems and sections of systems, and systems connected thereto, that contain fluid that directly transports heat from nuclear fuel, and whose failure would cause a loss of coolant accident as defined in the safety report, shall be classified as Class 1.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
5.2.2	Sections of systems not classified as Class 1 that penetrate the containment structure and form part of the containment boundary shall be classified as Class 2 unless otherwise classified as permitted by Clause 5.3.1.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.2.3	Systems and sections of systems not classified as Class 1 or 2 and that contain radioactive substances with a tritium concentration exceeding 74 GBq/kg (2Ci/kg) shall be classified as Class 3.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.2.4.1.1	Systems and sections of systems that do not contain radioactive substances or that contain radioactive substances with a tritium concentration not exceeding 74 GBq/kg (2 Ci/kg) shall be classified as Class 6.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.2.4.1.2	Sections of systems and instrument lines that otherwise would be classified as Class 1, 2, or 3 and that contain only piping and components of nominal size equal to or smaller than NPS 3/4 may be classified as Class 6, except as follows: a) this Clause does not apply to vessels; and b) instrument lines NPS 3/4 and smaller connected to Class 1 or 2 systems or sections of systems associated with the control of systems whose function is to cool the fuel shall be the same class as the system to which they are attached.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.2.4.1.3	A system or a vessel that would otherwise be classified as Class 3 may be classified as Class 6, provided that the classification can be justified through a consequence of failure analysis that demonstrates in the event of a release the effective acute body dose received does not exceed 20 mSv.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.2.4.2.1	Systems and sections of systems that would otherwise be classified as Class 6 may be exempted from classification, provided that all of the following conditions are met: a) the system does not contain radionuclides or other nuclear substances that are present as a consequence of operation of a CANDU nuclear power plant; b) the system has no nuclear substances deliberately added, stored, or used; and	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	c) failure of the pressure boundary would not reduce the ability of a system to perform its design safety function. **Note:** Safety analysis, environmental qualification programs, or seismic qualification may be used to address the requirements of this Clause.	
5.2.4.2.2	Storage tanks that have a design pressure less than or equal to 103 kPag (15 psig) and would otherwise be classified as Class 6, as well as their related supports, shall be exempt from classification.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.2.4.2.3	Systems and sections of systems that are exempt from classification shall be entered into the system classification list as Class Exempt.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.3 Special Safety Systems		
5.3.1 Containment Systems and Components		
5.3.1.1	Components that form part of the containment boundary or containment isolation barriers shall be classified as Class 4, except as otherwise specified in Clauses 5.3.1.2 and 5.3.1.3. **Note:** Class 4 components refers to metallic containment components only.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.3.1.2	Components that are part of a system that penetrates the containment structure and forms part of the containment boundary, unless otherwise classified as Class 1 or as permitted by Clause 5.3.1.3, shall be classified as Class 2.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.3.1.3	Closed systems and sections of closed systems that penetrate the containment structure may be classified as Class 6, provided that all of the following are met: a) the design pressure of the closed system is greater than the design pressure of the containment boundary; b) the closed system is i) pressure tested regularly; or ii) operated at a pressure greater than the design pressure of the containment boundary and monitored for leaks; and c) other requirements for the system do not necessitate a higher classification.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
5.3.1.4	Sections of pressure-suppression, pressure-reduction, pressure-relief, or containment auxiliary systems that do not form part of the containment boundary shall be classified in accordance with Clause 5.2.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.3.2 Emergency Core Cooling Systems		
5.3.2.1	Emergency core cooling systems shall be classified as Class 1, except for those sections of the emergency core cooling systems that meet any one of the following requirements: a) during normal operation of the plant, are continuously pressurized at or above the operating pressure expected to occur after initiation of the emergency core cooling system and whose integrity is monitored continuously; b) are continuously pressurized during normal operation of the plant and are tested in accordance with a defined schedule at or above the system operating pressure expected to occur after the initiation of the emergency core cooling system; c) are pressurized only during testing of the system; or d) are pressurized only after the initiation of the long-term low pressure circulation stage of the emergency core cooling system and cannot normally be isolated for testing.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.3.2.2	Sections of the emergency core cooling systems not classified as Class 1 shall be classified in accordance with Clause 5.2.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.3.3 Shutdown Systems		
5.3.3.1	Pressure-retaining sections of shutdown systems shall be classified as Class 1, except those pressure-retaining sections of the shutdown systems that meet any one of the following conditions: a) are normally at their maximum pressure and whose integrity is monitored continuously; b) are pressurized only during testing of the shutdown system; or c) a pressure boundary failure would not prevent the safe operation of the shutdown system.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
5.3.3.2	Sections of the shutdown system not classified as Class 1 shall be classified in accordance with Clause 5.2.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.4 Class 1C, 2C and 3C components	Components that would otherwise be classified as Class 1, 2, or 3, but to which the requirements of Annex E apply, shall be classified as Class 1C, 2C, or 3C, respectively.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.5 Adjoining Systems or Sections of Systems		
5.5.1	A system may have sections with different classifications, provided that the boundaries of such sections are designated on the system flowsheet. All items within the boundaries of a section shall have the same or equivalent classification.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.5.2	Adjoining systems or sections that have different classifications shall be separated by a) a valve that is normally closed or closes automatically in the event of a failure; or b) a restriction that limits the flow between sections in the event of a failure, to ensure conditions are kept within the classification criteria for each section.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.5.3	The licensee shall ensure that the valve or restriction specified in Clause 5.5.2 is located in the section having the higher classification.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.5.4	For process systems, no valve or restriction is required where the adjoining section contains only component(s) of nominal size equal to or smaller than NPS 3/4.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
5.5.5	Component(s) consisting of multiple compartments (e.g., heat exchangers) can have compartments with different classifications. The licensee shall include and account for the difference in service conditions between compartments of different classifications listed in the design specifications.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
6 Registration		
6.1 Designs to be Registered		
6.1.1 General Requirements		
6.1.1.1	The design of components, fittings, and supports that have been classified as Class 1, 1C, 2, 2C, 3, 3C, or 4 shall be registered. Annex B outlines procedures that are commonly used for registration and a sample statutory declaration form in Figure B.1.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.1.2	The design of component(s) that have been classified as Class 6 shall be registered in accordance with the requirements of CSA B51. Clause 6.2.2 specifies the Class 6 components and fittings that are exempt from registration.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.1.3	The design of systems and sections of systems that meet the requirements of Clause 5.2.4.2.1 shall be registered in accordance with CSA B51, except that the items listed in Clause 6.2.3.1 are exempt from registration.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.1.4	Regulatory approval of the classification shall be obtained before the design registration of a new piping system.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.1.5	The design of a component, fitting, or support shall be registered in accordance with Clauses 6.1.3 to 6.1.8.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.2 Subassemblies	The design of piping subassemblies shall not be registered separately but shall be included in the registration for the piping system.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.3 Small vessels	The design of vessels that have an internal diameter not exceeding 150 mm (6 in), or a capacity not exceeding 42.5 L (1.50 ft^3), shall be registered as Category H fittings. See Clause 6.1.6.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.4 Supports		
6.1.4.1	The design of all Class 1, 1C, 2, 2C, 3, 3C, or 4 supports, except standard supports that have been registered by the certificate holder, shall be registered.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
6.1.4.2	The design of supports for Class 1, 1C, 2, 2C, 3, 3C, or 4 shall be registered as follows: a) Supports shall be registered separately, except as permitted by Clause 6.1.4.3. b) The registration of components shall include any integral supports, except that integral supports that are attached in the field may be registered separately. c) Intervening elements shall not be registered, but design criteria and supporting evaluations shall be included in the design documentation of the support.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.4.3	All standard supports (as defined in Clause 7.5.1.2) that are of the same class may be included in a single application for registration, provided that copies of the appropriate standard drawings, including load capacity data sheets, accompany the application.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.4.4	The application for registration of supports shall include a) a list of documents submitted; b) a certified design specification* (see Clause 7.5 and Annex C), except where not required for standard supports; c) the general arrangements and applicable shop drawings necessary to provide evidence of conformance to this Standard (see Table 1); and d) a design report, load capacity data sheet, or design report summary that is certified when required by the ASME *BPVC*, Section III, NCA-3550. * The design specification for the support may be included in the design specification of the component.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.5 Pumps	Class 1, 1C, 2, 2C, 3, and 3C pumps shall be registered	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.6 Fittings	Standard* and non-standard fittings shall be designated as Category A to H, as follows: **A** - piping fittings that include couplings, tees, elbows, Ys, plugs, unions, nipples, pipe caps, and reducers;	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	B - flanges; **C** - line valves; **D** - expansion joints, flexible connections, and hose assemblies of all types; **E** - strainers, filters, separators, and steam traps; **F** - measuring devices that include pressure gauges, level gauges, sight glasses, level or pressure transmitters, and instruments; **G** - safety devices that include safety valves, relief valves, safety relief valves, and rupture disks; and **H** - pressure-retaining fittings that do not fall into Categories A to G. **A standard fitting is a fitting that complies with the ASME* BPVC *or another standard acceptable to the authorized inspection agency.*	
6.1.7 Instrument lines	Instrument lines shall be registered as part of the system, and the connection of instrument lines shall be indicated on the system flowsheets.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.8 Containment components	For registration of airlocks, bulkheads, and doors, a separate application for registration shall be made for each different type. For seal plates, flexible bellows, and containment penetration assemblies, a separate application for registration shall be made for each category or for each family of items.	Not Applicable – CANDU specific
6.1.9 Plant modifications	Modifications to a registered design during fabrication and that affect the boundary shall not be implemented until they have been accepted by the authorized inspection agency, except as permitted by Annex H.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.1.10 Design change after registration	The licensee shall retain records of approval by the authorized inspection agency of the updates of the registration for any design modification made after the original registration, except as permitted by Clause 14. The request to update the registration shall include the certified revisions or addenda to the design report and all referenced documents, whether or not they were revised.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
6.1.11 Welding and Brazing Procedures		
6.1.11.1	Prior to welding or brazing being performed inside Canada, unless otherwise permitted by this Standard, welding and brazing procedures for Class 1, 1C, 2, 2C, 3, 3C, and 4 components shall be qualified in accordance with the requirements of the ASME *BPVC*, Section III, Division 1, and registered by the authorized inspection agency. For Class 6 components requiring registration, welding and brazing procedures shall be qualified and registered in accordance with CSA B51. The licensee shall retain records of the welding and brazing procedure registration by the authorized inspection agency.	CRL-508241-OP-001, *Qualifying Welding Procedure Specifications* CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
6.1.11.2	Prior to welding or brazing being performed outside of Canada, the welding or brazing procedures shall be reviewed and accepted by the licensee. The licensee shall retain records of the acceptance.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
6.2 Registration Exemptions		
6.2.1 General	The licensee shall ensure that all systems or sections of systems that are exempt from registration are constructed to standards deemed by the licensee to be suitable for the service conditions.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.2.2 Class 6 Components and Fittings Exempt from Registration	Rotating or reciprocating mechanical devices, including pumps, compressors, turbines, generators, engines, and hydraulic or pneumatic cylinders where the primary design considerations or stresses, or both, are derived from the functional requirements of the device, are exempt from registration (see Clause 6.1.1.2). This includes piping internal to equipment or mounted upon equipment that carries fluid from one chamber to another on the same foundation.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
6.2.3 Items Exempt from Registration		
6.2.3.1	The following items are exempt from registration (see Clause 6.1.1.3): a) pressure-retaining systems that have a design pressure less than or equal to 103 kPag (15 psig) including their supports; b) containment systems that have a design pressure less than or equal to 35 kPag (5 psig) including their supports;	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	c) piping systems containing liquids not more hazardous than water, with a design pressure not exceeding 1.72 MPag (250 psig) and a design temperature not exceeding 65 °C (150 °F); d) hot water heating and chilled water cooling piping systems designed for pressures not exceeding 1.103 MPag (160 psig) and temperatures between –29 °C and 121 °C (-20 °F and 250 °F); e) hydraulic piping systems which drive hydraulic actuation devices (mechanical actuators, motors, cylinders, etc.) designed for temperatures not exceeding 65 °C (150 °F); f) oil piping systems designed for a temperature 28 °C (50 °F) lower than the flashpoint of the oil and a design pressure not exceeding 0.689 MPag (100 psig); g) compressed air piping systems that are outside containment and contain components NPS 3/4 or smaller; h) pressure-retaining enclosures for gas-filled high-voltage switchgear and control gear; i) stand-alone components and piping systems having a volume not exceeding 42.5 L (1.50 ft^3) and a design pressure not exceeding 4120 kPag (600 psig) and not containing a lethal substance (gas, vapour, or liquid); and j) refrigeration systems having a 125 kW and under prime mover nameplate rating covered by i) CSA C22.2 No. 63; ii) CSA C22.2 No. 92; iii) CSA C22.2 No. 117; iv) CSA C22.2 No. 120; v) CSA C22.2 No. 128; and vi) CSA C22.2 No. 236 when tested and certified by an approved testing laboratory.	
6.2.3.2	Storage tanks that meet the requirements of Clause 5.2.4.2.2, as well as their related supports, shall be exempt from registration.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
7 Design		
7.1.1 Class 1	Class 1 components shall be designed to comply with the requirements of the ASME *BPVC*, Section III, Division 1, NB-3000.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.1.2 Class 2	Class 2 components shall be designed to comply with the requirements of the ASME *BPVC*, Section III, Division 1, NC-3000.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.1.3 Class 3	Class 3 components shall be designed to comply with the requirements of the ASME *BPVC*, Section III, Division 1, ND-3000.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.1.4 Classes 1C, 2C, and 3C	In addition to the requirements of Clause 7, Class 1C, 2C, and 3C components shall be designed to comply with the requirements of Annex E.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.1.5 Class 4	Class 4 components shall be designed to comply with the requirements of the ASME *BPVC*, Section III, Division 1, NE-3000. Design requirements for specific containment boundary components are provided in Annex F.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.1.6 Class 6 or Class Exempt	Class 6 or Class Exempt components, that are required to be registered, shall be designed to comply with the requirements of CSA B51.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
7.1.7 Periodic inspection	Items shall be inspected periodically in accordance with CSA N285.4, N285.5, and N285.7 and shall be designed to allow access as required for such inspections.	NRU-508230-PRO-001, *Periodic Inspection*
7.1.8 Seismic requirements	When the system classification list or the design specification states that the effect of seismic loadings is to be considered, the licensee shall meet the system requirements of the CSA N289 series of Standards.	900-508120-MCP-003, *Execution of Design Review and Verification* 120-508120-OI-029, *Design for Earthquakes (Seismic Qualifications at CRL)*
7.1.9 Threaded fasteners with metallic inserts qualified by testing	Threaded fasteners and helical coil or other metallic inserts may be used for Class 1, 1C, 2, 2C, 3, 3C, and 4 components, provided that documents are available that give the results of the testing to destruction of representative quantities of full-size fastener/insert assemblies. The strength of such assemblies as shown in the test results shall be equal to or shall exceed the minimum specified strength of the fastener when threaded directly into the base material. The licensee shall retain records to demonstrate that the test report that qualifies each specific application was approved by the authorized inspection agency.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.1.10 Threaded fasteners with metallic inserts qualified by analysis	Threaded fasteners with helical coil or other metallic inserts for Class 1, 1C, 2, 2C, 3, 3C and 4 items shall satisfy the following: a) Class 1, 1C, 2, 2C, 3, 3C and 4 items shall be designed to comply with the corresponding requirements of the ASME BPVC, Section III, Division 1, NB-3000, NC-3000, ND-3000, NE-3000 and NF-3000. The helical coil or other metallic inserts shall be considered to be part of the female thread. b) For Class 1, 1C, 2, 2C and 4 items, the interface between the threaded fastener and the insert and the interface between the insert and the base material threaded hole shall meet the special stress limits for pure shear specified in ASME BPVC, Section III, Division 1, NB-3227.2 (a) for all axial loading experienced as a result of design loadings, test loadings or any service loadings except those for which Level D limits are designated. For axial loads induced by Level D service loadings the allowable shear stress requirements for bolted joints specified in ASME	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	BVPC, Section III, Appendix F, paragraph F-1335.2 (a) shall apply. c) For Class 3 and 3C items, the maximum allowable stress, S, for the helical coil or other metallic insert shall be larger than the maximum allowable stress for the tapped hole material. The engagement length between the helical coil, or other metallic insert, and both the tapped hole and the threaded fastener shall meet the minimum engagement length with the tapped hole as specified in ASME BPVC, Section III, Division 1, ND-3362 (b). d) For items having a combination of fasteners, with and without helical coil inserts, the design analysis shall consider the effect of potential stiffness differences between threaded fastener assemblies on load distribution and cyclic loading analysis.	
7.2 Plant design documents	The licensee shall ensure that the following documents are prepared and retained: a) system design documents for all systems that are required to comply with this Standard; b) a system classification list (see Clauses 5.1.7 and 7.3.3); and c) an overpressure protection report (see Clause 7.6.7), which may be a compilation of overpressure protection reports for different systems.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
7.3 System Design Documents		
7.3.1 System Records	For Class 1, 2, and 3 systems, the licensee shall retain records of the following: a) design requirements, shall consist of requirements for i) functionality; ii) performance; iii) safety, as well as regulatory requirements (e.g., pipe whip restraints), including applicable codes and standards and their effective dates; iv) seismic qualification; v) overpressure protection; vi) reliability and maintainability;	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	vii) configuration and interfacing (e.g., plant and equipment layout, space limits, clearances, and restraints); viii) environmental conditions; ix) fluid chemistry; x) materials; and xi) relevant special conditions or restrictions that influence the design (e.g., testing, commissioning, maintenance, and inspection requirements); b) conceptual design description, which consists of i) a functional and configurational description of the system; ii) schematic diagrams and/or general arrangement drawings; and iii) the classification of the system; c) loading categories, for which the designer shall consider all postulated service conditions for the system, including commissioning, scenarios, incidents, or events described and categorized according to the ASME *BPVC*, Section III, Division 1, NCA-2142, as follows: i) design loadings — as defined in the ASME *BPVC*, Section III, Division 1, NCA-2142; ii) Level A service loadings — Level A service conditions are those that are planned and occur frequently or routinely during normal operation. For process systems, this includes start-up, operation within the design power range (including full-power steady state), and controlled shutdown operations. For a safety system, this includes the system's designed operating mode after initiation by an abnormal plant condition and its normal standby condition; iii) Level B service loadings — Level B service conditions are any planned or unplanned deviations from Level A conditions anticipated to occur frequently enough that design shall include the capability to withstand the accumulated effect of these conditions without operational impairment;	

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	iv) Level C service loadings — Level C service conditions are unplanned but anticipated events. These conditions combined shall not result in more than 25 lifetime cycles, except that for seismic loadings the requirements of CSA CAN3-N289.3 shall be met. Design basis earthquakes shall be included in this level. The structural integrity of the system shall be preserved but local permanent deformation is acceptable*; **In this context, "acceptable" means from the safety point of view only.* v) Level D service loadings — Level D service conditions are unplanned but anticipated events that do not occur more than twice in the life of the system. The structural integrity of the system shall be preserved but gross deformation requiring shutdown for repair is acceptable; and **Note:** *As identified in the ASME BPVC, Section III, Division 1, NCA-2142, Level C and D events can require inspection, repair, or replacement of the damaged piping and items.* vi) test loadings (including testing of pressure relief devices); d) required loads, which are the loads that shall be taken into account in the design of the components for the system, shall include i) internal and external pressures; ii) impact loads, including rapidly changing or fluctuating pressures; iii) weight of the piping and components and normal contents under operating or test conditions, including pressure due to static and dynamic head of liquids; iv) superimposed loads, due to other components, operating equipment, insulation, shielding, corrosion/erosion-resistant linings, temporary maintenance flasks, and equipment; v) wind loads, snow loads, vibrations, and earthquake loads, when specified;	

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	vi) reactions of supporting lugs, rings, saddles, plinths, or other types of supports; vii) temperature effects; and viii) cyclic loads; e) load combinations, for which a load combination table shall be provided to indicate how loading data are to be combined for each of the service load conditions to be evaluated; f) acceptance criteria, which consist of the design, service, and test limits for each of the conditions listed in Item (c), for the materials employed, defined for stress limits, deformation limits, or alternative service limits as required by the ASME *BPVC*, Section III, Division 1, NCA-2142 and NCA-2143, except that for seismic loadings the acceptance criteria of CSA N289.3 shall apply; and g) flowsheets, design drawings, calculations, material requirements, and installation specifications for each system.	
7.3.2 System flowsheets	The licensee shall produce and retain a system flowsheet. The flowsheet shall show the schematic arrangement of all components in the system and shall contain the information listed below or reference the document where the information is to be found: a) design and operating pressures and temperatures; b) system fluids; c) system boundaries and, when more than one classification is specified, section boundaries; d) the containment boundary and containment penetrations; e) the seismic category and level boundaries; f) settings of pressure relief devices; g) the effective date or issue of applicable codes and standards for the design of the system; h) the test temperature and test pressure; and i) specifications for materials.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
7.3.3 System classification List	The system classification list shall identify all systems and their classification. The licensee shall include the following information for each item on the list:	900-508140-FID-001, *Classification and Design Registration of*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	a) system identification (title and reference number); b) a system flowsheet drawing number and revision number; c) system classification for each system; d) applicable codes and standards and their effective dates; e) the seismic level and category; f) reference to the classification approval form, where applicable; and g) the design pressure and temperature. When modifications are made to any system throughout the life of the plant, the system classification list shall be updated to reflect these changes. To ensure configuration control, the system classification list shall be updated no later than three years after the modification has been implemented.	*Pressure-Retaining Systems / Components*
7.4 Design Documents for Components and Non-Standard Fittings		
7.4.1 General requirements	A component and non-standard fitting that is not defined as part of a system shall meet the same requirements for design documentation as the component or a non-standard fitting that is part of a system.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
7.4.2 Design documents	For Class 1, 1C, 2, 2C, 3, 3C, and 4 components and non-standard fittings, the licensee shall have the following design documents: a) a component and/or non-standard fitting design specification certified by a registered engineer in accordance with the requirements of ASME *BPVC*, Section III, NCA-3250; b) a design report that meets the requirements of the ASME *BPVC*, Section III, NCA-3550, and is certified, when required by the ASME *BPVC*, Section III, Division 1, NCA-3550, by a registered engineer competent in the design field applicable to the component. The design report shall be submitted to the licensee or the licensee's designee for review and documentation of review in accordance with the ASME *BPVC*, Section III, NCA-3260;	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	c) a record of the registration of the component and/or non-standard fitting design with the authorized inspection agency; and d) a record of the review of the certificate holder's drawings and documentation determining their compliance with the registered design documents. Annex C outlines the design documentation that is commonly used.	
7.4.3 Piping system design reports	The licensee shall retain records of the following: a) The design report for Class 1, 2, and 3 piping systems shall demonstrate that the design and service limits and other acceptance criteria are satisfied. The piping system design report(s) shall document the design and stress analysis of the Class 1, 2, and 3 piping systems. Each report shall include sufficient information to be able to regenerate the computer/analysis model on which the analysis is based. In addition, the licensee shall retain the design reports and all documentation of the loadings applied to adjacent components and supports. b) In the case of piping system connected to a component, the design report shall include confirmation that the reaction loads are within the allowable limits for the component. The piping system design report shall also include the support assessment. Annex C outlines the design documentation that is commonly used.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components*
7.5 Supports for Class 1, 1C, 2, 2C, 3, 3C, and 4 Components		
7.5.1 General Requirements		
7..5.1.1	The licensee shall ensure that the following documents are prepared and retained: a) a review of the building structure and all structural elements in the support load path, as required by the ASME *BPVC*, Section III, NCA-3200; and b) a review of the jurisdictional boundaries between the component, attachments, intervening elements, component supports, and the building structure, that are consistent with	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	the boundary descriptions given in the ASME *BPVC*, Section III, Division 1, NF-1000. Supports for Class 1, 1C, 2, 2C, 3, 3C, and 4 components shall comply with the requirements of Clause 7.5., except where requirements specific to a support are given in Annex E.	
7.5.1.2	Supports or elements of supports, excluding intervening elements, shall be categorized as one of the types listed below: a) plate- and shell-type support — a support that is fabricated from plate and shell elements subjected to a biaxial stress field (e.g., pipe anchors, vessel skirts, saddles); b) linear-type support — a support that acts under a single component of direct stress or is subjected to shear stress (e.g., tension and compression struts, beams and columns subjected to uniaxial bending, trusses, frames, rings, arches, and cables); or c) standard support — a support that consists of one or more items usually referred to as “catalogue items” and is generally mass-produced (e.g., pipe hangers, snubbers).	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components*
7.5.2 Specific Requirements		
7.5.2.1	The licensee shall retain objective evidence to demonstrate that integral attachments have been designed to comply with the design requirements for the component to which they are attached.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components*
7.5.2.2	The licensee shall retain objective evidence to demonstrate that supports (intervening elements excepted) have been designed to comply with the requirements of the ASME *BPVC*, Section III, Division 1, NF-3000. The appropriate design rules shall be those rules consistent with the required class of the component on which the supports are installed.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components*
7.5.2.3	The licensee shall retain objective evidence to demonstrate that for standard supports, a general arrangement drawing of the design and the	900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	certificate holder's load-capacity data sheets have been prepared.	CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components*
7.5.2.4	The licensee shall retain objective evidence to demonstrate that by analysis or test, the intervening elements are capable of withstanding the loads imposed in supporting the component.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.5.2.5	For other than standard supports, the licensee shall retain a record of the following: a) a certified design specification; b) a design report that meets the requirements of the ASME *BPVC*, Section III, NCA-3550, and is certified, when required by the ASME *BPVC*, Section III, NCA-3550, by a registered engineer competent in the design field applicable to the support. The design report shall be submitted to the licensee or the licensee's designee for review and documentation of review in accordance with the ASME *BPVC*, Section III, NCA-3260; and c) a general arrangement drawing of the design.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components*
7.5.2.6	The licensee or agent shall append or reference in the piping system design report the design documents required for supports by the ASME *BPVC*, Section III, NCA-3550.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components*
7.6 Overpressure Protection		
7.6.1 General Requirements		
7.6.1.1	Overpressure protection of Class 1, 2, 3, and 4 components shall comply with the requirements of Clause 7.6 and the following articles from the ASME *BPVC*, Section III, Division 1: a) for Class 1 systems, NB-7000; b) for Class 2 systems, NC-7000; c) for Class 3 systems, ND-7000; and d) for Class 4 components, NE-7000.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components*
7.6.1.2	Overpressure protection of Class 6 piping and components shall comply with the applicable design documents of CSA B51.	900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
7.6.1.3	When shutdown systems are part of an integrated overpressure protection system that is designed to protect the heat transport system with the reactor at power, the requirements of Clause 7.6.2 shall apply.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.1.4	Shutdown system action can make no contribution to overpressure protection in situations where the reactor is initially at zero power and remains at zero power. The requirements of Clause 7.6.2 do not apply to such situations.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.2 Heat Transport Systems		
7.6.2.1	Where there are two shutdown systems, each of the systems, along with any pressure-relief device, shall be capable of preventing failure of the heat transport system due to overpressure. The credit allowed for the action of overpressure-relief devices shall be in accordance with Clause 7.6.2.3(d) and (e), provided that the overpressure-relief devices comply with Clause 7.6.1.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.2.2	For qualification of the heat transport overpressure protection system, service limits for events leading to overpressure shall be as specified in Clause 7.3.1 and the ASME *BPVC*, Section III, NCA-2140. The service limits to be applied shall be determined in terms of frequency of an event and the operation of one shutdown system (see Table 2), and the applicable regulatory documents.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.2.3	The qualification of the heat transport system shall consider the following: a) For some events, control system action, including the reactor regulation system by itself, is capable of protecting the heat transport system from overpressure. However, credit for these actions shall not be counted in the overpressure assessment. b) The first trip parameter shall be credited if it is heat transport system high-pressure; otherwise, the second trip parameter of each shutdown system shall be credited. c) When only one trip parameter is available on the first shutdown system to trip and it is not high pressure, only the first trip parameter of the other shutdown system shall be credited (i.e., the service limits given for the first	900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	shutdown system in Table 2 shall be met by the first parameter of the other shutdown system). In a case where only one trip parameter is installed in the other shutdown system, this trip parameter may be credited, subjected to the regulatory authority's review and acceptance. d) When power-actuated pressure-relief valves are installed and are connected to instrumentation associated with one of the shutdown systems, these pressure-relief valves shall only be credited to overpressure protection for the heat transport system when it is assumed that the shutdown system in question trips. When the other shutdown system operates, qualification shall be performed with and without these pressure-relief valves functioning as designed. e) When pressure-relief devices are installed but are not connected to either shutdown system, the pressure-relief devices may be credited for overpressure protection purposes where either shutdown system operates, provided that each pressure-relief device is independent of any other (e.g., equipped with its own instrumentation and power supplies, etc.) so that no single failure would result in the disablement of more than one relief valve and its instrumentation is designed to the same safety standards used for shutdown system instrumentation.	
7.6.2.4	The licensee shall prepare a system-specific overpressure protection report that covers all postulated events with specified service limits up to and including Level C as specified in Table 2. Level D events may be reported in the station safety report, provided that they are cross-referenced in the overpressure protection report.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.3 Application		
7.6.3.1	Overpressure protection shall be provided for items that might be isolated from the overpressure protection provided for the system, including isolatable volumes within components and fittings (e.g., gate interspace of valves).	900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
7.6.3.2	Pressure relief devices are not required for small isolatable volumes, for such lower-probability events as loss of coolant accidents (LOCAs), or for main feedwater line or main steam line breaks, provided that all of the following conditions are met: a) only piping shall be involved; b) piping shall meet the following requirements, as applicable: i) for Class 1 piping, the maximum primary membrane plus bending stress intensity shall not exceed the lesser of 3.0 *Sm* or 2.0 *Sy*, or the internal pressure shall not exceed twice the maximum allowable working pressure; and ii) for Class 2 and 3 piping, the maximum primary membrane plus bending stress shall not exceed the lesser of 3.0 *Sh* or 2.0 *Sy*, or the internal pressure shall not exceed twice the maximum allowable working pressure; c) the volume involved shall be less than 42.5 L (1.5 ft^3); d) the containment boundary integrity shall be maintained; e) there shall be no impairment of fuel cooling; f) compliance with Items (a) to (e) shall be demonstrated in the overpressure protection report; and g) piping shall be inspected, as necessary, after the event.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.3.3	Instruments and instrumentation shall be excluded from consideration as isolatable items.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.3.4	The effects of external pressure shall be considered on all components and fittings installed within the containment boundary.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.3.5	Pressure relief shall be provided wherever a component or fitting is not designed to withstand maximum external pressure conditions.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.3.6	Overpressure protection shall not be required for isolatable components that are vented, provided that venting that is capable of preventing overpressure is always available where the components are isolated.	900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
7.6.4 Conditions		
7.6.4.1	The complete range of operating modes, as defined in the design specification, shall be considered when determining the overpressure protection required.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.4.2	When steady-state analysis does not adequately represent the system, the licensee shall perform transient analysis of the overpressure protection.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.5 Methods		
7.6.5.1	The licensee shall select an overpressure protection method with performance characteristics that are compatible with the design specification.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.5.2	Control system action may be used to reduce the requirement for overpressure protective action only to the extent that the frequency of occurrence of overpressure is reduced.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.5.3	For systems that require overpressure protection, where more than one relief path is available, key interlocked pairs of valves (where the key interlock prevents closure of more than one of the valves at any one time) may be used on the two paths, provided that the valves and piping systems are designed to ensure that overpressure protection for either of the paths meets the requirements for all operating conditions. The interlock key for each pair of valves shall be unique so that the key from any other key interlock will not fit, and shall be of a type that is not commonly available or easily reproduced. The licensee shall have no spare keys for key interlocks.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.6 Provisions		
7.6.6.1	Overpressure protection for a single failure event shall comply with the requirements of the ASME *BPVC*, Section III, Division 1 (see Clause 7.6.1.1 of this Standard).	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.6.2	A single device for the dual functions of control and overpressure protection shall not be used.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
7.6.6.3	The licensee shall ensure that pressure relief devices are designed, constructed, and installed in a manner that facilitates periodic testing.	900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
7.6.7 Overpressure protection report	The following requirements shall apply: a) The report shall cover all components classified as Class 1, 1C, 2, 2C, 3, 3C, or 4. The impact of other connected components of any class shall be considered in the overpressure protection report. The report shall describe the overpressure protection methods to be used and their adequacy in meeting the requirements of this Standard. Annex C outlines the design documentation that is commonly used. b) An individual overpressure protection report may be prepared for each system, or a single report may be prepared for the plant or sections of the plant. c) The final report for a system shall contain the following information: i) system identification: (1) system name and reference number; a Canadian Registration Number (CRN) for system and pressure relief devices (where known); (2) major function of the system; (3) reference system flowsheet and revision number; and (4) list of reference design documents; ii) system description: (1) brief written description; (2) identification of system fluids; and (3) identification of isolatable items; iii) overpressure protection methods: (1) description of method; (2) extent of system that is protected; (3) protection devices, including type, number, set pressure, blowdown, and capacity; and (4) testability of pressure relief devices; iv) overpressure protection description: (1) relieving capacity requirements (minimum and maximum); (2) type of fluid being discharged; (3) effect of variation in operating time; and	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components* CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components*

	(4) inlet and discharge line characteristics; and v) isolatable items: (1) list of components and fittings; (2) overpressure protection method and description; (3) protection devices, including type, number, set pressure, blowdown, and capacity; and (4) method of testing.	
7.7 Reconciliation Statements for New Construction		
7.7 General requirements	The licensee shall retain records to demonstrate that any differences between the registered design and the as-built components have been evaluated and reconciled in accordance with Annex H. The licensee shall complete actions as specified in Annex H for any differences affecting the basis for classification or overpressure protection, and for reconciliation statements, design registration, and registration updates.	CRL-508140-PRO-004, *Certification of Design Documents for Nuclear Pressure Retaining Systems and Components* 900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
7.8 Instruments and Instrument Lines		
7.8.1 Instruments		
7.8.1.1	The design of sensing elements of instruments is outside the scope of this Standard, except that when an instrument is included in the design of a component, the system designer shall ensure that the pressure boundary of the sensing element is rated for the design conditions of the component.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
7.8.1.2	The licensee shall ensure that instruments that are included in the design of a piping system and that have an inlet larger than NPS 3/4 and a pressure boundary that is subject to flow shall meet all requirements associated with the class of the system.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
7.8.1.3	The pressure boundary portion of instruments in Class 1, 1C, 2, 2C, 3, 3C, or 4 components that have an inlet of NPS 3/4 or smaller shall be registered as a Category F fitting. The registration may be in accordance with the requirements of CSA B51. The	900-508120-MCP-002, *Production and Acceptance of Design Documents*

Section and Title	**Description**	**Implementing Document(s)**
	licensee shall ensure that the following requirements are met: a) the design shall be such that the instrument is rated for the design conditions of the component; and b) the material for instruments to be welded to the components shall be compatible with the pressure boundary materials.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
7.8.2 Instrument lines	Instrument lines shall meet the following requirements: a) Class 1 instrument lines shall be designed in accordance with the ASME *BPVC*, Section III, Division 1, NB-3600. Class 2 instrument lines shall be designed in accordance with the ASME *BPVC*, Section III, Division 1, NC-3600. Class 3 instrument lines shall be designed in accordance with the ASME BPVC, Section III, Division 1, ND-3600. Class 6 instrument lines shall be designed in accordance with CSA B51; b) Instrument isolating valves shall meet the design requirements for the class of the piping system to which they are attached; and c) valves located downstream of the first isolating valve on Class 1, 2, or 3 instrument lines that have an inlet of NPS 3/4 or smaller shall be registered as a Category C fitting. The registration may be in accordance with the requirements of CSA B51.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
8 Materials		
8.1 General Requirements		
8.1.1 Material for Class 1 components	Material for components classified as Class 1 shall comply with the requirements of the ASME *BPVC*, Section III, Division 1, NB-2000, or the CSA N285.6 Series.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
8.1.2 Material for Class 2 components	Material for components classified as Class 2 shall comply with the requirements of the ASME *BPVC*, Section III, Division 1, NC-2000, or the CSA N285.6 Series.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
8.1.3 Material for Class 3 components	Material for components classified as Class 3 shall comply with the requirements of the ASME *BPVC*, Section III, Division 1, ND-2000, or the CSA N285.6 Series.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
8.1.4 Material for Class 1C, 2C, and 3C components	Materials for components classified as Class 1C, 2C, or 3C shall comply with the specific requirements given in Annex E of this Standard, CSA N285.6 Series, and as appropriate the requirements of the ASME *BPVC*, Section III, Division 1, NB-2000, NC-2000, or ND-2000, respectively.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
8.1.5 Material for Class 4 Components		
8.1.5.1 Metallic materials	Metallic materials for components classified as Class 4 shall comply with the ASME *BPVC*, Section III, Division 1, NE-2000, or the CSA N285.6 Series.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
8.1.5.2 Non-metallic materials	Non-metallic materials shall be qualified for the service conditions and the required service life. Both normal plant conditions and the environmental conditions during and following a postulated accident (e.g., pressure, temperature, humidity, radiation, expected service life) shall be considered. The qualification method (e.g., tests) shall be documented.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
8.1.6 Materials for Class 6 components	Materials for components classified as Class 6 or Class Exempt that are required to be registered shall be in accordance with the requirements of CSA B51.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
8.2 Identification	Material for components classified as Class 1, 1C, 2, 2C, 3, 3C, and 4 shall be identified in accordance with the ASME *BPVC*, Section III, NCA-3856.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
8.3 Supports		
8.3.1 Class 1, 1C, 2, 2C, 3, 3C, and 4 supports	Material used for Class 1, 1C, 2, 2C, 3, 3C, and 4 supports (intervening elements excepted) shall comply with the requirements of the ASME *BPVC*, Section III, Division 1, NF-2000, or the CSA N285.6 Series.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
8.3.2 Integral attachments	Material used for integral attachments shall be compatible with the material requirements for the component(s) to which the attachments are fastened.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
9 Fabrication & Installation		
9.1 General requirements	Fabrication and installation shall be carried out under a quality assurance program in accordance with Clause 10 and shall include preparation of the following documentation: a) fabrication and installation documents, instructions, and procedures that include verification; b) records to demonstrate the completion of all required tests, inspections, examinations, and treatments, including the qualification of the personnel and procedures used; c) records to demonstrate the acceptance of the inspection and test plan by the authorized inspector; d) permanent and non-permanent records for the applicable period of time (see Clause 12); and e) records showing actual stamping of the nameplate (e.g., a photocopy, photograph, or rubbing).	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
9.2 Specific Requirements		
9.2.1 Class 1 components and non-standard fittings	The licensee shall have Class 1 components and non-standard fittings fabricated and installed to comply with the requirements of the ASME *BPVC*, Section III, Division 1, NB-4000.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering*

	this Standard. Annex G contains guidelines that may be used for in-service plugging by fusion welding of Class 1, 2, and 3 heat-exchanger tube or tubesheet holes with a one-inch maximum diameter.	
9.3.2	The licensee shall retain records in accordance with Clause 12 to demonstrate that the welding or brazing procedure performed outside Canada on any Class 1, 1C, 2, 2C, 3, 3C, or 4 component meets the requirements of the ASME *BPVC*, Section III, Division 1, NB-, NC-, ND-, NE-, or NF-4300.	900-511300-STD-003, *Creation, Capture and Use of Information Assets* 900-511300-STD-004, *Retention, Preservation and Disposition of Information Assets*
9.3.3	The licensee shall retain records in accordance with Clause 12 to demonstrate that, for welding or brazing performed on any Class 1, 1C, 2, 2C, 3, 3C, and 4 component, the welders, brazers, or welding operators are qualified for the process as required by the ASME *BPVC*, Section IX, and that they possess current, valid qualification documentation accepted or issued by the authorized inspection agency. Annex G of this Standard contains guidelines that may be used for in-service plugging by fusion welding of Class 1, 2, and 3 heat-exchanger tube or tubesheet holes with a one-inch maximum diameter.	CRL-508241-OP-002, *Required Qualifications for CRL Welders*
9.4 Support for Class 1, 1C, 2, 2C, 3, 3C, and 4 Components		
9.4.1	The licensee shall have supports fabricated and installed to comply with the requirements of the ASME *BPVC*, Section III, Division 1, NF-4000.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents* 172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
9.4.2	The licensee shall have integral attachments fabricated and installed to comply with the fabrication and installation requirements for the component to which they are attached.	900-508120-PDD-001 and 900-508120-PRD-001, *Design Authority and Design Engineering* 900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
		172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
10 General Requirements for Quality Assurance		
10.1 Applicability		
10..1.1	Class 1, 1C, 2, 2C, 3, 3C, 4 components and their supports shall be subject to the quality assurance requirements of Clause 10.	CRL-508140-QAP-001*, CRL Nuclear Pressure Boundary Quality Assurance*
10.1.2	Class 6 or Class Exempt components that are required to be registered shall be subject to the quality requirements of CSA B51.	CRL-508140-QAP-003, *CRL CSA B51 Pressure Boundary Quality Control Manual*
10.2 Construction of Class 1, 1C, 2, 2C, 3, 3C, and 4 components and their supports	Construction, or any limited scope of construction related activities, of Class 1, 1C, 2, 2C, 3, 3C, and 4 components and their supports shall be carried out under a quality assurance program that satisfies the requirements of ASME BPVC, Section III, Article NCA-4000.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-514200-PDD-001, *Quality*
10.3 Repair, replacement, and modification of Class 1, 1C, 2, 2C, 3, 3C, and 4 components and their supports		
10.3.1	Repair, replacement, or modification of Class 1, 1C, 2, 2C, 3, 3C, and 4 components and their supports shall be carried out under a quality assurance (QA) program that satisfies the requirements of ASME BPVC, Section III, Article NCA-4000.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-514200-PDD-001, *Quality*
10.3.2	A QA program that meets the requirements of NBBI NB23 may be used by the licensee for repair, replacement, and modification work not requiring registration updates when approved by the regulatory authority.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-514200-PDD-001, *Quality*
10.4 Refurbishing of Class 1, 1C, 2, 2C, 3, 3C, and 4 items	Refurbishing activities shall be performed and controlled in accordance with a quality assurance program acceptable to the licensee.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-514200-PDD-001, *Quality*
10.5 Servicing of Class 1, 2, and 3 pressure-relief valves	A QA program for servicing of Class 1, 2, and 3 pressure-relief valves shall be based on the NBBI NB23, Part 3, Section 1, with the following exceptions:	Not Applicable

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	a) a certificate of authorization or other method of acceptance issued by an authorized inspection agency (AIA) may be used instead of a National Board certificate of authorization; and b) National Board stamps are not required.	
10.6 Class 1, 1C, 2, 2C, 3, 3C, and 4 material	The manufacture or supply of materials (including welding consumables) for use in Class 1, 1C, 2, 2C, 3, 3C, or 4 components and their supports shall meet one of the following requirements: a) activities shall be carried out under a quality program that satisfies the requirements of the ASME BPVC, Section III, NCA-3800; or b) activities shall be carried out under a quality program that satisfies the requirements of CAN/CSA- ISO 9001, and the following additional requirements of the ASME BPVC, Section III: i) sources of material, source material, and services — NCA-3855.2; ii) identification marking, and material control — NCA-3856; iii) audits — NCA-3859.1(e); iv) certification requirements — NCA-3860; v) where utilization of unqualified source material is involved, the requirements of NCA-3855.5 shall also apply; vi) where welding repair is involved, the requirements of NCA-3857.3 shall also apply; and vii) scope and applicability — NCA-3851.2(a)(1), (2), (3), (5), and (6).	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-514200-PDD-001, *Quality*
10.7 QA programs acceptable for use		
10.7.1	QA programs that are deemed to meet the requirements listed in Clauses 10.1, 10.2, 10.3, 10.4, 10.5, or 10.6 a), and any additional N285 scope requirements may be used when surveyed and conclusions are confirmed and recorded in writing by an AIA in Canada (this may be by issuance of a certificate).	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-514200-PDD-001, *Quality*
10.7.2	ASME BPVC, Section III, NCA QA programs certified by ASME may be used.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-514200-PDD-001, *Quality*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
10.7.3	The holder of a valid QA program (as described in Clause 10.7.1 or 10.7.2) and when included in its scope of activities, may evaluate and qualify a supplier to the requirements listed in Clause 10.6 b). This qualification is limited to the furnishing of source material, material or subcontracted services to the organization that performed the evaluation.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-514200-PDD-001, *Quality*
10.7.4	A QA program for servicing pressure relief valves accredited by the National Board may be used.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-514200-PDD-001, *Quality*
11 Examination and Pressure Testing		
11.1 Examination requirements		
11.1.1	The licensee shall have documentation to demonstrate that Class 1 components have been examined in accordance with the requirements of the ASME *BPVC*, Section III, Division 1, NB-5000. The effective date shall be established in accordance with Clause 4.3. Examination procedures and techniques for repairs and replacements may be in accordance with a later edition of the ASME *BPVC*, Section III, Division 1, NB-5000.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001*, Classification and Design Registration of Pressure Retaining Systems / Components* CW-505000-REQ-212, *Control of Special Processes* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.1.2	The licensee shall have documentation to demonstrate that Class 2 components have been examined in accordance with the requirements of the ASME *BPVC*, Section III, Division 1, NC-5000. The effective date shall be established in accordance with Clause 4.3. Examination procedures and techniques for repairs and replacements may be in accordance with a later edition of the ASME *BPVC*, Section III, Division 1, NC-5000.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001*, Classification and Design Registration of Pressure Retaining Systems / Components* CW-505000-REQ-212, *Control of Special Processes* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.1.3	The licensee shall have documentation to demonstrate that Class 3 components have been examined in accordance with the requirements of the ASME *BPVC*, Section III, Division 1, ND-5000. The effective date shall be established in accordance with Clause 4.3. Examination procedures and techniques	900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	for repairs and replacements may be in accordance with a later edition of the ASME *BPVC*, Section III, Division 1, ND-5000.	900-508140-FID-001, *Classification and Design Registration of Pressure Retaining Systems / Components* CW-505000-REQ-212, *Control of Special Processes* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.1.4	When specific examination requirements are given in Annex E, they shall apply in lieu of the requirements of Clause 11.1.	CW-505000-REQ-212, *Control of Special Processes*
11.1.5	The licensee shall have documentation to demonstrate that Class 4 components have been examined in accordance with the requirements of the ASME *BPVC*, Section III, Division I, NE-5000. For repairs and replacements to Class 4 component(s), the licensee shall have documentation to demonstrate that examination is in accordance with the requirements of the original design. For repairs and replacements, newer procedures and techniques may be used.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001, *Classification and Design Registration of Pressure Retaining Systems / Components* CW-505000-REQ-212, *Control of Special Processes* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.1.6	The licensee shall have documentation to demonstrate that supports have been examined in accordance with the requirements of the ASME *BPVC*, Section III, Division 1, NF-5000. The effective date shall be established in accordance with Clause 4.3. Examination procedures and techniques for repairs and replacements may be in accordance with a later edition of the ASME *BPVC*, Section III, Division 1, NF-5000.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001, *Classification and Design Registration of Pressure Retaining Systems / Components* CW-505000-REQ-212, *Control of Special Processes* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.1.7	The licensee shall have documentation to demonstrate that integral attachments have been examined in accordance with the examination requirements for the component to which they are attached.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508140-FID-001, *Classification and Design Registration of Pressure Retaining Systems / Components* CW-505000-REQ-212, *Control of Special Processes*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
		CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.1.8	The licensee shall have documentation to demonstrate that for examinations performed on any pressure-retaining component, the persons performing the non-destructive examinations were, at the time of the examinations, qualified in accordance with Clause 11.3, and possessed current, valid qualification documentation.	900-514200-STD-006, *Requirements to Perform Non-Destructive Testing at CNL* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.2 Examination Methods		
11.2.1	The licensee shall have documentation to demonstrate that all non-destructive examination procedures performed on Class 1, 1C, 2, 2C, 3, 3C, and 4 components comply with Clause 11.1.	CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.2.2	The licensee shall have documentation to demonstrate that procedures for non-destructive examination on Class 1, 1C, 2, 2C, 3, 3C, and 4 components have been demonstrated to and accepted by the authorized inspection agency. For special applications, the licensee shall have documentation to demonstrate that methods of examination were agreeable to the regulatory authority. For special examinations carried out by organizations other than the licensee, the licensee shall have documentation to demonstrate that methods of examination were accepted by the licensee.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* CW-505000-REQ-212, *Control of Special Processes*
11.3 Examination Personnel		
11.3.1	The licensee shall have documentation to demonstrate that persons performing non-destructive examinations on Class 1, 1C, 2, 2C, 3, 3C, and 4 pressure-retaining component(s) were, at the time of the examinations, qualified in accordance with the following standards: a) In Canada: i) radiography, ultrasonic, magnetic particle, liquid penetrant, and eddy current methods — CAN/CGSB-48.9712/ISO 9712; and ii) other methods — standards acceptable to the licensee and the authorized inspection agency; or	900-514200-STD-006, *Requirements to Perform Non-Destructive Testing at CNL*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	b) Outside Canada: all methods — standards acceptable to the licensee and the authorized inspection agency.	
11.3.2	Certification and re-certification of non-destructive examination personnel shall be in accordance with the requirements of the standards listed in Clause 11.3.1 and of the authorized inspection agency.	900-514200-STD-006, *Requirements to Perform Non-Destructive Testing at CNL*
11.3.3	The licensee shall have documentation of the persons who performed the non-destructive examination, the effective and expiry dates of their certification, and the level of their qualification.	900-514200-STD-006, *Requirements to Perform Non-Destructive Testing at CNL*
11.4 Pressure Testing of Components		
11.4.1	The licensee shall have documentation to demonstrate that all new components have been subjected to a pressure test in accordance with Clause 11.4.	CRL-508140-QAP-001, CRL Nuclear Pressure Boundary Quality Assurance CRL-508140-QAP-003, *CRL CSA B51 Pressure Boundary Quality Control Manual* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.4.2	A pneumatic pressure test may be used only when a hydrostatic pressure test is not practicable because of service conditions, and provided that precautions have been taken for the protection of personnel.	900-514200-MCP-026, Pressure Test Verification Procedure
11.4.3	The licensee shall retain the data report to demonstrate that a pressure test has been performed to the satisfaction of an inspector, who has countersigned the data report (See Table 1).	CRL-508140-QAP-001, CRL Nuclear Pressure Boundary Quality Assurance CRL-508140-QAP-003, *CRL CSA B51 Pressure Boundary Quality Control Manual* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.4.4	The licensee shall have documentation to demonstrate that Class 1 component(s) have been tested in accordance with the requirements of the ASME *BPVC*, Section III, Division 1, NB-6000.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
11.4.5	The licensee shall have documentation to demonstrate that Class 2 component(s) have been tested in accordance with the requirements of the ASME *BPVC*, Section III, Division 1, NC-6000.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.4.6	The licensee shall have documentation to demonstrate that Class 3 components have been tested in accordance with the requirements of the ASME *BPVC*, Section III, Division 1, ND-6000.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.4.7	The licensee shall have documentation to demonstrate that in addition to the requirements of Clause 11.4.4, 11.4.5, and 11.4.6, component(s) classified as Classes 1C, 2C, and 3C have been tested in accordance with the requirements of Annex E.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.4.8	The licensee shall have documentation to demonstrate that components classified as Class 4 have been tested in accordance with the requirements of the ASME *BPVC*, Section III, Division I, NE-6000.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
11.4.9	The licensee shall have documentation to demonstrate that Class 6 components have been tested in accordance with the requirements of CSA B51.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508140-QAP-003, *CRL CSA B51 Pressure Boundary Quality Control Manual*
12 Documentation		
12.1 General	The licensee shall document all activities on components and their supports for which requirements are given in this Standard, and shall retain records as specified in Clause 12. Annex C outlines a system of design documentation that has been used in some facilities.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* CRL-508140-QAP-003, *CRL CSA B51 Pressure Boundary Quality Control Manual*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
		900-511300-STD-003, *Creation, Capture and Use of Information Assets* 900-511300-STD-004, *Retention, Preservation and Disposition of Information Assets*
12.2 Records, Identification, and Reports		
12.2.1	Records shall include permanent and non-permanent records. Records pertaining to Class 1, 1C, 2, 2C, 3, 3C, and 4 components and supports listed in Table 3 are classified as permanent. The licensee shall retain records of all registered items requiring data reports in accordance with Table 1, including their CRNs.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-511300-STD-003, *Creation, Capture and Use of Information Assets* 900-511300-STD-004, *Retention, Preservation and Disposition of Information Assets*
12.2.2	Certified overpressure protection reports for Class 1, 2, and 3 systems and Class 4 components, where required by this Standard, are classified as permanent records.	CRL-508140-QAP-001, CRL Nuclear Pressure Boundary Quality Assurance
12.2.3	The certified material test report or the certificate of compliance for Class 1, 1C, 2, 2C, 3, 3C, and 4 materials are classified as permanent records. The certified material test report shall contain the product specification for the material and all records specified therein as well as the information required by the ASME *BPVC*, Section III, Division 1, NCA-3800.	CRL-508140-QAP-001, CRL Nuclear Pressure Boundary Quality Assurance 900-511300-STD-003, *Creation, Capture and Use of Information Assets* 900-511300-STD-004, *Retention, Preservation and Disposition of Information Assets*
12.2.4	The certificate holder shall assemble all permanent records listed in Table 3 for a given component or fitting into a history docket.	CRL-508140-QAP-001, CRL Nuclear Pressure Boundary Quality Assurance 900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508120-MCP-003, *Execution of Design Review and Verification*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
12.2.5	The certificate holder other than the licensee shall forward the appropriate history docket to the licensee or to a designated agent upon completion of the component or fitting.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508120-MCP-003, *Execution of Design Review and Verification*
12.2.6	History docket for any component or fitting specified in Clause 12.2.4 shall be retained by the licensee until that that component or fitting is removed from service or the whole plant is decommissioned. Except for final radiographs designated by the licensee for CSA N285.4, CSA N285.5, and CSA N285.7 periodic inspection applications, radiographs shall remain in the history docket for 10 years after the in-service date. **Note:** Fabrication radiographs can be valuable in assessing flaws found as part of a fitness-for-service evaluation after a “beyond design” excursion or for a life extension evaluation. The licensee might want to designate certain radiographs for permanent retention for such purposes.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-511300-STD-003, *Creation, Capture and Use of Information Assets* 900-511300-STD-004*, Retention, Preservation and Disposition of Information Assets*
12.2.7	Non-permanent records consist of all those records not classified as permanent and that are required to verify compliance with this Standard.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-511300-STD-003, *Creation, Capture and Use of Information Assets* 900-511300-STD-004, *Retention, Preservation and Disposition of Information Assets*
12.2.8	The certificate holder or licensee shall retain non-permanent records in accordance with the ASME BPVC, Section III, Table NCA-4134.17-2. Non-permanent records not covered by Table NCA-4134.17-2 shall be retained for a minimum period of five years.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-511300-STD-003, *Creation, Capture and Use of Information Assets*

Section and Title	**Description**	**Implementing Document(s)**
		900-511300-STD-004, *Retention, Preservation and Disposition of Information Assets*
12.2.9	Partial shipments, or shipments other than to the licensee, shall be accompanied by documentation by the certificate holder sufficient to prove identification and acceptance. Duplicates of such documents shall be placed in the history docket.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-508120-MCP-003, *Execution of Design Review and Verification*
12.3 Identification		
12.3.1	Each Class 1, 1C, 2, 2C, 3, 3C, or 4 component (except a piping system), fitting*, part, piping subassembly, and support shall be identified by the certificate holder in accordance with the ASME *BPVC*, Section III, Division 1, NCA-8000, and all other applicable identification requirements of the ASME BPVC, Section III, Division 1, except an ASME code symbol stamp is not required for CSA N285.0 certificate holders. * Excluding Category A or B standard fittings (see Clause 6.1.6).	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
12.3.2	Identification shall be in a conspicuous location where it can be easily read. Duplicates may be used.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
12.3.3	When the size and configuration of a component does not permit the installation of a nameplate, identification shall be provided by a marking applied directly to the component or by other means acceptable to the authorized inspection agency.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
12.3.4	The nameplate shall be attached directly to the component or to a bracket attached to the component.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*

Section and Title	**Description**	**Implementing Document(s)**
		900-508120-MCP-002, *Production and Acceptance of Design Documents*
12.3.5	The attachment shall not affect the integrity of the component.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
12.3.6	Class 6 component(s) shall be identified in accordance with the requirements of CSA B51.	CRL-508140-QAP-003, *CRL CSA B51 Pressure Boundary Quality Control Manual* CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
12.4 Data Report for Fabrication Activities and Report for Repair, Replacement, or Modification		
12.4.1 General Requirements		
12.4.1.1	The certificate holder shall complete and submit a data report for each component and for tubular products welded with filler metal in accordance with the requirements of Clause 12.4.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 900-514200-MCP-004*, Incoming Inspection*
12.4.1.2	Data reports shall be on forms of the type shown in Figures 3 to 8 and 12. Reports for repairs, replacements, or modifications shall be of the type shown in Figures 9 and 10. Variations of these forms may be used, provided that the applicable essential data and sign-off areas are included.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
12.4.1.3	The data report shall be signed by the certificate holder after all inspections, examinations, and tests required by this Standard have been completed. It shall then be countersigned by the inspector required by Table 1, who shall ensure that a) the shop is qualified for the work to be performed;	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	b) the design drawings are registered; c) the quality assurance program has been accepted as required by Clause 10; d) the welding procedures are registered; e) the welders and welding operators are qualified; f) non-destructive examination procedures are qualified; g) persons performing non-destructive examinations are qualified and certified; h) materials comply with requirements; i) he pressure boundary integrity dimensions are within drawing tolerances; j) the heat treatment operation has been performed in accordance with specified requirements; k) all required examinations and tests have been performed; l) work is in compliance with the quality assurance program; m) the pressure tests required by this Standard have been completed; and n) the reconciliation statements for differences between the registered designs and the as-built item(s) have been certified by the designer.	CRL-508140-141-000, *Authorized Inspection Agency Services Agreement Between Technical Standards and Safety Authority and Canadian Nuclear Laboratories Ltd.*
12.4.1.4	When the data report required by Clause 12.4.1.3 cannot be issued because the design has not been finalized, and fabrication has proceeded on a piping system, piping subsystem, vessel, pump, support, or fitting under a provisional registration number, the item shall be accompanied by a partial data report that will define the status of the fabrication should the item be shipped to another certificate holder or to the nuclear power plant.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
12.4.1.5	The certificate holder other than the licensee shall submit completed original data reports to the licensee as part of the history docket, and shall submit a copy to the authorized inspection agency for vessels and piping systems.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
12.4.1.6	The certificate holder other than the licensee shall submit a completed data report, a certificate of conformance, or a certificate of compliance to the licensee as required by Table 1 for supports or	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	separately registered integral attachments. Supports of the same design may be covered by a single data report or certificate of conformance. Note: A data report or certificate of conformance is not required for non-welded supports that are furnished as material.	CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
12.4.1.8	The certificate holder shall complete and submit data report for Class 6 components in accordance with the requirements of CSA B51.	CRL-508140-QAP-003, *CRL CSA B51 Pressure Boundary Quality Control Manual* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
12.4.1.9	The licensee shall have documentation to demonstrate that employees or agents designated as licensee's verifiers are qualified by training and experience in accordance with criteria that is deemed suitable by the licensee. The extent of the training program shall be based on trainee education, experience, and the type of product to be inspected and shall include instruction on the responsibilities of the licensee's verifier. Annex D provides sample training criteria for the qualification of a licensee's verifier. The licensee's verifier shall be independent of the organization whose work is being verified, and shall have no responsibility relating to cost control or expediting of delivery that might influence the responsibility for quality.	Not Applicable
12.4.1.10	The licensee shall maintain records of the qualified licensee's verifiers and have their duties and performance evaluated. Such records shall include an annual attestation of continued inspection proficiency based on experience and training. Figure D.2 provides a sample of an attestation of proficiency statement for a licensee's verifier. For licensee's verifiers not employed by the licensee, the evaluation of the duties and performance may be performed by outside agencies or by the licensee.	No Applicable
12.4.1.11	The monitoring of employees of the licensee shall be under the licensee's internal auditing program.	900-514200-MCP-002, *Quality Audits*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
12.4.2 Piping System Installations for Class 1, 1C, 2, 2C, 3, 3C, or 4		
12.4.2.1	The certificate holder shall complete a data report for each piping system, except that a group of piping systems having a common final pressure test may be included in a single data report.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
12.4.2.2	The certificate holder shall sign the data report only after final design registration has been obtained for the component(s) therein.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
12.4.3 Piping subassemblies for Class 1, 1C, 2, 2C, 3, 3C, or 4	The certificate holder shall complete a partial data report for each piping subassembly	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
12.4.4 Vessels for Class 1, 1C, 2, 2C, 3, 3C, or 4	The certificate holder shall complete a data report for each vessel.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
12.4.5 Modifications for Class 1, 1C, 2, 2C, 3, 3C, or 4	The certificate holder shall complete a data report for each modified component.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
12.4.6 Pressure Relief Devices for Class 1, 1C, 2, 2C, 3, 3C, or 4		
12.4.6.1	The certificate holder shall complete a data report for each pressure relief device.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
12.4.6.2	Pressure relief devices that are of the same design and size, have an inlet connection not larger than NPS 2, and do not exceed 25 in quantity may be included in a single data report. The certificate holder shall identify each device in the data report by an individual serial number.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
12.4.7 Pumps and Valves for Class 1, 1C, 2, 2C, 3, 3C, or 4		
12.4.7.1	The certificate holder shall complete a data report for each pump and valve having an inlet connection larger than NPS 4.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
12.4.7.2	Pump and valves that are of the same design and size, have an inlet connection not larger than NPS 4, and that are released as one shipment not exceeding 25 in quantity may be included in a single data report. The certificate holder shall identify each pump and valve in the data report by an individual serial number.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
12.4.7.3	The data report shall be signed by the certificate holder after all inspections, examinations, and tests required by this Standard have been completed and countersigned by the inspector required by Table 1.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
12.4.8 Fittings for Class 1, 1C, 2, 2C, 3, 3C, or 4		
12.4.8.1	Fittings of the same design and size released as a single shipment may be included in a single data report, certified material test report (CMTR), or a certificate of compliance, as applicable.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
12.4.8.2	Fittings shall be identified by individual serial numbers listed in the data report or by a group identification mark.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
12.4.8.3	The data report shall be signed by the certificate holder after all inspections, examinations, and tests required by this Standard have been completed and countersigned by the inspector designated in Table 1.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
12.4.9 Parts for Class 1, 1C, 2, 2C, 3, 3C, or 4	A data report for a part shall be the same as that used for the component for which the part is to be used.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
13 In-Service Requirements		
13.1 General requirements	Components covered by this Standard shall be subject to inspections in accordance with CSA N285.4, CSA N285.5, and CSA N285.7.	NRU-508230-PRO-001, *Periodic Inspection*
13.2 Inaugural or baseline inspections	When the pressure boundary of a component that is subject to periodic inspection is repaired, replaced, or otherwise changed, it shall receive, before being put into service, an inaugural or baseline inspection as required by CSA N285.4, CSA-N285.5, and CSA N285.7.	NRU-508230-PRO-001, *Periodic Inspection*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
13.3 Class 1, 2, and 3 pressure relief devices	Testing programs of Class 1, 2, and 3 pressure relief devices shall meet the applicable requirements of the ASME OM Code, Appendix I, when those devices are required to protect systems or portions of systems that perform any of the following: a) shutting down a reactor to the safe shutdown condition; b) maintaining the safe shutdown condition; or c) mitigating the consequences of an accident. The licensee shall have documentation to demonstrate acceptance of the testing program by the regulatory authority. Class 6 pressure relief devices may be included in this program.	CRL-508140-QAP-002, *Repair or Service of Pressure Relief Valves to ASME Section VIII - Division 1 and CSA B51/B52 at Chalk River Laboratories*
13.4 Class 6 pressure relief devices	The licensee shall document that the inspection and testing of pressure relief devices in Class 6 systems and Class Exempt systems that require registration have been carried out in accordance with an approved program.	CRL-508140-QAP-002, *Repair or Service of Pressure Relief Valves to ASME Section VIII - Division 1 and CSA B51/B52 at Chalk River Laboratories*
14 Repairs, Replacements, and Modifications		
14.1 General	Clause 14 shall apply to all Class 1, 1C, 2, 2C, 3, 3C, 4, and 6 components and supports registered in accordance with Clause 6, unless otherwise specified.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
14.2 Repairs		
14.2.1	When repairs are made due to failure of an item or where an item does not comply with the requirements of this Standard, the licensee shall prepare a report on the failure or defect and submit it to the regulatory authority.	900-514300-MCP-006, *CNL Reporting to Regulatory Agencies*
14.2.2	The effective date used in the repair of an item for the design code of construction for the repaired item shall be the effective date for the original item or later.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-508140-FID-001, *Classification and Design Registration of Pressure Retaining Systems / Components*
14.2.3	The licensee shall have documentation to demonstrate that the authorized inspector accepted the repair procedure before the repair was undertaken	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
14.2.4	For repairs that result in a variation from the original design, but the item remains in compliance with the applicable codes and standards, the licensee shall have documentation to demonstrate that the authorized inspection agency accepted the design variation before the repair was undertaken.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* 900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
14.2.5	The licensee shall have documentation to demonstrate that the authorized inspector has been notified before commencing repairs that involve welding of the pressure boundary.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process*
14.2.6	Repairs carried out by the licensee on the pressure boundary that include welding shall comply with Clauses 6.1.11 and 9.3.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508241-OP-001, *Qualifying Welding Procedure Specifications*
14.2.7	Inspection, examination, and testing of repairs carried out by the licensee shall comply with Clauses 11 and 14.6.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process*
14.2.8	Documentation, in the form of both permanent and non-permanent records, shall be maintained by the licensee as required by Clause 12.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement*
14.2.9	The effective date for the standards covering materials, including welding and brazing consumables that are used in a repair shall be the effective date of the standard used in the design and construction of the component. However, if the licensee has demonstrated to the authorized inspector that a material manufactured to a more recent standard is functionally, chemically, and metallurgically compatible with the system or component, such a material may be used.	900-508140-FID-001, *Classification and Design Registration of Pressure Retaining Systems / Components* 172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process*
14.3 Replacement Items		
14.3.1	A replacement item may be purchased to the original design specification or to a different design	900-508140-FID-001, *Classification and Design Registration of*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	specification, provided that the design requirements for the original item are met. The effect on an existing components of the difference between the original item and the replacement item shall be reconciled with the original design reports. If these differences cannot be reconciled, updated design documentation shall be submitted to the authorized inspection agency in accordance with this Standard.	*Pressure-Retaining Systems / Components*
14.3.2	The classification of the replacement item shall be the same or a higher class than that required by the original design specification.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
14.3.3	For Class 1, 1C, 2, 2C, 3, 3C, and 4 items, the effective date for the design code of construction for the replacement item shall be the effective date for the original item or later.	900-508140-FID-001*, Classification and Design Registration of Pressure Retaining Systems / Components*
14.3.4	The replacement item shall be functionally, chemically, and metallurgically compatible with the components in which it is to be installed.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
14.3.5	The replacement item shall not have experienced any significant deterioration in storage that might adversely affect its structural integrity or operability.	900-505210-MCP-008*, Materials Management* CRL-508230-PRO-608, *Material Control for ASME Section III and Environmentally Qualified Work*
14.3.6	The licensee shall have documentation to demonstrate that the procedure for installing a replacement item was accepted by the authorized inspection agency before installation commenced.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement*
14.3.7	The licensee shall have documentation to demonstrate that the authorized inspector was notified before the installation of replacement items involving welding of the pressure boundary.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
14.3.8	Replacements carried out by the licensee on the pressure boundary that include welding shall comply with Clauses 6.1.11 and 9.3.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* CRL-508241-OP-001, *Qualifying Welding Procedure Specifications*
14.3.9	Replacement items that are the same as or similar to the ones being replaced and that meet the criteria of Clauses 14.3.1 to 14.3.8 shall be deemed acceptable for installation without further approval from the regulatory authority.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement* 900-508130-MCP-001, *Engineering Change Control*
14.3.10	When a replacement is made due to the failure of an item or when an item does not comply with the requirements of this Standard, the licensee shall prepare a report of the failure or defect and submit it to the regulatory authority.	900-514300-MCP-006, *CNL Reporting to Regulatory Agencies*
14.3.11	Examination and pressure testing of replacement items carried out by the licensee shall comply with Clauses 11 and 14.6.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process*
14.3.12	Documentation, in the form of both permanent and non-permanent records, shall be maintained by the licensee as required by Clause 12. The licensee shall have documentation that traces the replacement item to its certified design specification and this documentation shall be available to the authorized inspection agency for review.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement*
14.3.13	Replacement items shall be purchased, shipped, handled, and stored in accordance with the licensee's instructions and procedures to prevent damage, deterioration, or loss. These procedures shall ensure that the necessary identification, traceability, and records are maintained by the licensee as specified by this Standard.	*900-505210-MCP-008, Materials Management* CRL-508230-PRO-608, *Material Control for ASME Section III and Environmentally Qualified Work*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
14.3.14	The licensee shall identify items with limited shelf life and shall implement procedures to control their storage. The licensee shall quarantine and dispose of items that cease to conform to the requirements of this Standard.	*900-505210-MCP-008, Materials Management* CRL-508230-PRO-608, *Material Control for ASME Section III and Environmentally Qualified Work*
14.3.15	Annex I defines an alternative process to qualify Category A to F replacement fittings manufactured without welding. The licensee shall obtain approval from the regulatory authority to apply this process.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
14.4 Refurbishing of Items		
14.4.1	The licensee shall retain a record of the item identification and date of refurbishment for each refurbished item or group of items, in accordance with Clause 12	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
14.4.2	Refurbishing activities are not subject to AIA involvement.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance*
14.5 Modifications		
14.5 Addition of a self-contained system		
14.5.1.1	A new self-contained Class 1, 2, 3, or 6 system shall comply with the requirements of this Standard.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
14.5.1.2	The effective dates for the standards that apply to the modification shall be the dates listed in Clause 2 or as otherwise agreed upon by the regulatory authority.	900-508140-FID-001*, Classification and Design Registration of Pressure Retaining Systems / Components*
14.5.2 Existing Components		
14.5.2.2	A modification to the pressure boundary of an existing component shall comply with the requirements of this Standard.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components* 900-508120-MCP-002, *Production and Acceptance of Design Documents*
14.5.2.3	The effective dates for the standards that apply to the modification shall be the dates listed in Clause 2 or as otherwise agreed upon by the regulatory authority.	900-508140-FID-001*, Classification and Design Registration of Pressure Retaining Systems / Components*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
14.5.2.4	Licensees that have regulatory authority approval of their classification process shall obtain regulatory approval of the classification of the modification prior to the implementation of the modification when a) the modification changes the existing classification to a lower classification; or b) the modification involves penetration of the containment structure or a part of the containment boundary. Licensees not having regulatory authority approval of their classification process shall obtain regulatory approval of the classification of the modification prior to the implementation of the modification. The format of this submission may be an updated system classification list or a classification approval form, as specified in Clause 5.1.7.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
14.5.2.5	The licensee shall retain records to demonstrate that any differences between the following have been evaluated and reconciled in accordance with Annex H: a) the existing design and proposed modified design for existing components; or b) the registered or reconciled design of a modification and the as-built modification. The licensee shall complete actions as specified in Annex H for any differences affecting the basis for classification or overpressure protection and for reconciliation statements, design registration, and registration updates.	900-508140-FID-001, *Classification and Design Registration of Pressure-Retaining Systems / Components*
14.5.2.6	The licensee shall have documentation to demonstrate that the procedure for the installation of modifications was accepted by the authorized inspection agency before installation commenced.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement*
14.5.2.7	The licensee shall have documentation to demonstrate that the examination and testing of modifications complies with Clause 11, except for pressure testing, which shall have documentation demonstrating compliance with Clause 14.6.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
		CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
14.5.2.8	Permanent records required by Clause 12.2.1 shall be included in the history docket.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
14.5.3 Temporary Modifications		
14.5.3.2	Temporary modifications shall comply with the requirements of Clauses 5.1.7 and 14.5.2 and Annex H, with the following exceptions: a) For recurring temporary modifications, the following shall be required only for the first occurrence of the modification: i) the classification approval (see Clauses 14.5.2.4 and H.2); ii) the overpressure protection report update (see Clause H.3); and iii) the registration update (see Clause H.4). b) For non-recurring temporary modifications, i) the registration need not be updated when the materials used in the temporary modification are different from those specified in the original design, provided that (1) the materials used for the temporary modification are evaluated to be equivalent to the original materials; and (2) all other requirements of Clause H.4 are met; ii) the overpressure protection shall be evaluated and documented but the overpressure protection report or calculations need not be updated; and iii) the system classification list need not be updated. Section and Title	**Description**	**Implementing Document(s)**
14.6 Pressure Testing		
14.6.1 General Requirements		
14.6.1.1	For replacement items and items used in a piping system modification, the licensee shall have a pressure test performed in accordance with the requirements of the design and fabrication standards. The licensee may substitute the piping system pressure test for the item pressure test, provided that the requirements of the design standards are met.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement*
14.6.1.2	Where a modification consists of increasing the design pressure or temperature of a component, the licensee shall pressure test the component in accordance with the design and fabrication standard.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement*
14.6.1.3	When a new self-contained system is added, the licensee shall pressure test prior to operation in accordance with Clause 11.4.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement*
14.6.1.4	The licensee shall pressure test the tie-in joints involving welding or brazing of items in accordance with Clause 14.6.2 or 14.6.3, as applicable.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement*
14.6.1.5	After welding or brazing on a pressure-retaining boundary, the licensee shall perform a pressure test in accordance with	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	a) Clause 14.6.2 for Class 1, 1C, 2, 2C, 3, 3C, or 4 items; or b) Clause 14.6.2 or 14.6.3 for Class 6 items.	CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement*
14.6.1.6	The licensee shall take into account the fracture toughness of the ferritic materials all of the components of the piping system when determining the minimum metal temperature during pressure testing of the piping systems.	900-508120-MCP-002, *Production of Production and Acceptance of Design Documents*
14.6.2 Piping System Pressure Testing		
14.6.2.1	Where a pressure test is required by Clause 14.6.1, unless the welds or repairs are exempted by Clause 14.6.2.2, the piping system shall be filled with fluid and pressurized so that all welding or brazing repairs and tie-in welds are tested in accordance with Clause 14.6.2.	172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 172-508230-PRO-002, *Pressure Boundary Mechanical Joint Replacement*
14.6.2.2	The following are exempt from the pressure test: a) seal welds; b) heat exchanger tube plugging and sleeving; c) piping system, pump, and valve welding, where the welded cavity does not exceed 50% of the pressure-boundary minimum design thickness in the repair location; d) pressure vessel welding, where the welded cavity does not exceed 10% of the minimum design wall thickness; e) component connections, piping systems, and associated valves that are NPS 1/2 and smaller; f) tube-to-tubesheet welds, where such welds are made on the cladding; g) capped drains and vents isolated from a piping system by a valve; and h) leakage collection lines (to the first isolation valve from the expected leakage site).	900-508120-MCP-002, *Production and Acceptance of Design Documents*
14.6.2.3	Following a welded or brazed repair, replacement, or modification, the test pressure, temperature, and testing medium for a system pressure test shall	900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	comply with the requirements specified in the design specification of the piping system. The design specification shall be the one used for the original installation of that part of the piping system containing the item on which the repair, replacement, or modification was performed.	900-514200-MCP-026, Pressure Test Verification Procedure
14.6.2.4	The licensee shall perform a visual examination on the repaired areas, installation welds, or brazed joints to detect leakage at the pressure specified in the piping system design specification in effect at the time of the original installation. Areas requiring visual examination shall be accessible and free of any coating, insulation, or covering. Examination may be by direct visual means or may use visual aids (e.g., a mirror, telescope, borescope, or closed-circuit television).	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-025, *Visual Examination*
14.6.2.5	Where a piping system cannot be isolated to perform the pressure test, an operational pressure test in accordance with Clause 14.6.3 may be performed in lieu of the system pressure test, provided that the additional NDE of Clause 14.6.2.7 is carried out on welds that have not been tested in accordance with Clause 14.6.1.1. Where an operational pressure test is performed in lieu of the pressure test for Class 1, 1C, 2, 2C, 3, 3C, or 4 items, the exemptions of Clause 14.6.3.2 shall not apply.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, Pressure Test Verification Procedure
14.6.2.6	Where the replacement item or the area of the repair is isolatable within a portion of a piping system, only that portion shall require a pressure test.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, Pressure Test Verification Procedure
14.6.2.7	Where the licensee carries out pressure testing at a reduced pressure, as permitted by Clause 14.6.2.5, and in addition to those examinations required by Clause 11, the licensee shall perform the following: a) For butt welds of Class 1 or 1C component(s), the licensee shall perform an additional volumetric examination using a method different from the volumetric method required by the design and fabrication standards, in accordance with the ASME *BPVC*, Section III, Division 1, NB-5000. For other types of welds, the licensee shall perform a surface liquid penetrant (PT) or magnetic particle (MT) examination.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* 900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 900-514200-MCP-026, *Pressure Test Verification Procedure*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	b) For butt welds smaller than or equal to NPS 2-1/2 in Class 1 or 1C component(s) (excluding feeders), the licensee may perform the following in lieu of the second volumetric examination described in Item (a): i) for pipe sizes NPS 3/4 and smaller, a visual inspection of the root pass; or ii) for pipe sizes greater than NPS 3/4 and smaller than or equal to NPS 2-1/2, a visual inspection of the root and fill passes. Welds made in accordance with Item (b) shall be performed using gas tungsten arc welding (GTAW) only and welders shall be qualified on pipe coupons of the same diameter or a smaller diameter than the production pipe size being welded. c) For all welds of Class 2 or 2C component(s), the licensee shall perform a surface PT or MT examination. d) For butt welds of Class 3 or 3C components, the licensee shall perform a volumetric examination. For other types of welds, the licensee shall perform a surface PT or MT examination. The examinations outlined in Items (a) to (d) shall meet the applicable acceptance criteria of the design and fabrication standards. Examinations carried out to fulfill the requirements of the inaugural inspection for a periodic inspection program may be credited towards the requirements specified in this Clause.	
14.6.2.8	Any item within the pressure test boundary that the licensee considers unsuitable for exposure to the test pressure (e.g., instrumentation, pressure-relief devices) may be isolated, or removed prior to the application of pressure.	900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 900-514200-MCP-026, Pressure Test Verification Procedure
14.7.3 Operational Pressure Testing		
14.6.3.1	Where an operational pressure test is required by Clause 14.6.1 or 14.6.2, unless the welds or the repairs are exempted by Clause 14.6.3.2, the piping system shall be filled with the process fluid and pressurized using the process equipment so that all	900-514200-MCP-026, *Pressure Test Verification Procedure*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	welding or brazing repairs and tie-in welds are tested in accordance with Clause 14.6.3.	
14.6.3.2	The following are exempt from operational pressure tests: a) seal welds; b) heat exchanger tube plugging and sleeving; c) piping system, pump, and valve welding, where the repair weld does not penetrate the pressure boundary; d) pressure vessel welding, where the welded cavity does not exceed 33% of the minimum design wall thickness; e) component connections, piping system, and associated valves that are NPS 1 and smaller; f) tube-to-tubesheet welds; g) capped drains and vents isolated from the piping system by a valve; and h) leakage collection systems.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
14.6.3.3	The licensee shall perform a visual examination to detect leakage from repaired areas, installation welds, or brazed joints. This examination shall be performed after the piping system has been in operation for at least 10 min. Areas requiring visual examination shall be accessible and free of insulation. With prior agreement of the authorized inspection agency, for repaired areas, installation welds, or brazed joints that are insulated prior to the test, leakage detection shall be performed after the piping system has been in operation for at least 4 h. The surrounding area shall be examined for evidence of leakage. With prior agreement of the authorized inspection agency, repaired areas, installation welds or brazed joints that are inaccessible for examination may be examined using indirect methods to detect leakage.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-025, *Visual Examination*
14.6.3.4	When conducting an operational pressure test, the piping system pressure and temperature shall be determined by normal system instrumentation, test instrumentation, or through confirmation that the system is operating at its operating conditions. Records of the test shall be maintained in accordance with Clause 12.	900-514200-MCP-026, *Pressure Test Verification Procedure* 900-514200-QAP-001, *Calibration Program* 900-514200-MCP-013, *Calibration* 900-508230-MCP-002, *Preventive Maintenance*

Section and Title	**Description**	**Implementing Document(s)**
		CRL-508230-PRO-609, *Route Sheet for ASME Section III Work*
14.6.3.5	Where the repaired areas, tie-in welds, or brazed joints of the installed item are isolatable within a portion of a piping system, only that portion shall require a pressure test.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*
14.6.4 Alternative requirements for pressure testing	The alternative requirements for pressure testing specified in Clause 14.7 may be used in place of Clauses 14.6.1 to 14.6.3.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*
14.7 Alternative pressure testing of Class 1, 2, 3, and 6 systems after repairs, replacements, and modifications		
14.7.1 Requirements		
14.7.1.1 General		
14.7.1.1.1	As an alternative to the requirements of Clauses 14.6.1 to 14.6.3, Clause 14.7 may be used for the pressure testing of a repair, replacement, or modification to the pressure boundary of an existing Class 1, 2, 3, or 6 system.	CRL-508140-QAP-001, *CRL Nuclear Pressure Boundary Quality Assurance* CRL-508140-QAP-003, *CRL CSA B51 Pressure Boundary Quality Control Manual* 900-508120-MCP-002, *Production and Acceptance of Design Documents* CRL-508230-PRO-609, *Route Sheet for ASME Section III Work* 172-508230-PRO-001, *CRL Site Infrastructure Work Planning Process* 900-514200-MCP-026, *Pressure Test Verification Procedure*
14.7.1.1.2	For replacement items and items used in a system modification, the licensee shall have documentation to demonstrate that the item has been pressure-tested in accordance with Clause 11.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
14.7.1.1.3	Where a modification to an existing system involves an increase of the design pressure or temperature of a system or component, the licensee shall have documentation to demonstrate that the system has been pressure-tested in accordance with Clause 11 using the revised design requirements.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*
14.7.1.1.4	When a new self-contained system is added, the licensee shall have documentation to demonstrate that the system has been pressure-tested in accordance with Clause 11 prior to operation	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*
14.7.1.1.5	The licensee shall have documentation to demonstrate that the tie-in joints involving welding or brazing of an item have been pressure-tested in accordance with Clauses 14.7.1.2 and 14.7.2.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*
14.7.1.1.6	The licensee shall have documentation to demonstrate that repairs involving welding or brazing have been pressure-tested in accordance with Clauses 14.7.1.2 and 14.7.2.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*
14.7.1.1.7	For Class 1, 2, and 3 systems, the following items are exempt from the system pressure test: a) seal welds; b) heat exchanger tube plugging and sleeving; c) piping, pump, and valve welding, where the welded cavity does not exceed 50% of the pressure- boundary minimum design thickness in the repair location; d) pressure vessel welding, where the welded cavity does not exceed 10% of the minimum design wall thickness; e) component connections, piping, and associated valves that are NPS 1/2 and smaller; f) tube-to-tube sheet welds, where such welds are made on the cladding; g) capped drains and vents isolated from a system by a valve; and h) leakage collection lines (to the first isolation valve from the expected leakage site).	900-508120-MCP-002, *Production and Acceptance of Design Documents*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
14.1.1.1.8	For Class 6 systems, the following items are exempt from operational pressure tests: a) seal welds; b) heat exchanger tube plugging and sleeving; c) piping system, pump, and valve welding, where the repair weld does not penetrate the pressure boundary; d) pressure vessel welding, where the welded cavity does not exceed 33% of the minimum design wall thickness; e) component connections, piping system, and associated valves that are NPS 1 and smaller; f) tube-to-tube sheet joints involving welding or brazing; g) capped drains and vents isolated from the system by a valve; and h) leakage collection systems.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
14.7.1.2 Pressure-testing requirements for tie-in joints involving welding or brazing and repairs involving welding or brazing		
14.7.1.2.1	When pressure testing is performed in accordance with Clause 14.7.2.2, the licensee shall have documentation to demonstrate that tie-in joints involving welding or brazing or repairs involving welding or brazing of an item meet the requirements of Clauses 11.1 and 11.2.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
14.7.1.2.2	When operational pressure testing is performed in accordance with Clause 14.7.2.3, the licensee shall have documentation to demonstrate that the following requirements have been addressed: a) Tie-in joints involving welding or brazing or repairs involving welding or brazing of an item shall meet the requirements of Clauses 11.1 and 11.2. b) An engineering evaluation shall be performed on tie-in joints involving welding or brazing or repairs involving welding or brazing. The engineering evaluation shall postulate a flaw at the limit of the ability of the detection technique to be used. The analysis contained in the documentation shall demonstrate that the postulated flaw or any detected indication will not exceed an allowable flaw size within an inspection period as defined by the licensee.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
	c) The evaluation shall be accepted by the licensee. **Note:** An acceptable approach that may be used for determining allowable flaw size is to use ASME BPVC, Section XI, IWB-3600. Other approaches acceptable to the regulatory authority may be used.	
14.7.1.2.3	Parts and piping subassemblies used in the repair of a system shall be pressure-tested in accordance with Clause 14.7.2.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*
14.7.1.3 Fuel Channel repair or replacement	The licensee shall have documentation to demonstrate that the repair or replacement of a fuel channel involving a new end fitting and/or pressure tube or complete replacement of the fuel channel assembly has been tested in accordance with Clause 14.7.2.2 and inspected for leaks in accordance with Clause 14.7.2.4 prior to, or as part of, returning to service.	Not Applicable
14.7.2 Pressure Testing		
14.7.2.1 General	The licensee shall take into account the fracture toughness of the ferritic materials in the system when determining the minimum metal temperature for pressure testing of systems containing ferritic steel components.	900-508120-MCP-002, *Production and Acceptance of Design Documents*
14.7.2.2 Pressure Testing		
14.7.2.2.1	For Class 1, 2, 3, and 6 systems, a pressure test at normal ambient temperature shall be conducted at not less than 1.1 times the lowest design pressure of any pressure-retaining item in the system.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*
14.7.2.2.2	The requirements for measurement, maintenance of records, and conducting the pressure test shall be in accordance with Clause 11.4.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*

General requirements for pressure retaining systems and components in CANDU nuclear power plants (Chalk River Laboratories)		
Section and Title	**Description**	**Implementing Document(s)**
14.7.2.3 Operational Pressure Testing		
14.7.2.3.1	For Class 1, 2, 3, and 6 systems, an operational pressure test to check for leakage may be conducted in lieu of the pressure test specified in Clause 14.7.2.2, provided that the requirements of Clause 14.7.1.2 are met.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*
14.7.2.3.2	The operational pressure test shall be conducted at normal operating pressure and temperature prior to, or as part of, returning to service.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-026, *Pressure Test Verification Procedure*
14.7.2.4 Inspection Requirements		
14.7.2.4.1	The licensee shall perform a visual inspection to detect leakage from joints involving welding or brazing or repairs involving welding or brazing that require pressure testing. This inspection shall be performed after the system has been operating at normal pressures and temperature for at least 10 min.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-025, *Visual Examination*
14.7.2.4.2	With prior agreement of the authorized inspection agency, joints involving welding or brazing or repairs involving welding or brazing that require pressure testing and are insulated prior to the pressure test shall be examined for leakage after the system has been in operation for at least 4 h. The surrounding area shall be inspected for evidence of leakage.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-025, *Visual Examination*
14.7.2.4.3	With prior agreement of the authorized inspection agency, joints involving welding or brazing or repairs involving welding or brazing that require pressure testing and are inaccessible for inspection may be examined using indirect methods to detect leakage.	900-508120-MCP-002, *Production and Acceptance of Design Documents* 900-514200-MCP-025, *Visual Examination*
15 Pressure Boundary Program Document		
15	The licensee shall have a pressure boundary program document(s) that indicates how the requirements of this Standard are addressed by the licensee’s processes and procedures for a nuclear facility. The pressure boundary program document shall be submitted to the regulatory authority. Annex J outlines a suggested format for this document.	900-508140-PRD-001, *Pressure Boundary*

Table of Contents

1. SCOPE

This procedure describes the requirements, responsibilities, and processes for the classification, registration, deviation submission, and reconciliation of pressure-retaining systems and components at the Whiteshell Laboratories (WL) site.

This procedure is applicable to both nuclear and non-nuclear pressure-retaining systems and components. WL Site does not have any Class 1, 1C, 2, 2C and 4 nuclear pressure boundary system as classified in Section 5 of CSA N285.0-17 with Update No.1[1] [1]. Class 3 and 3C are kept under this procedure for future flexibility. WL is not qualified to do any activities on nuclear pressure retaining system/ components per the WL Pressure Boundary Quality Assurance Manual [9].

2. PURPOSE

This procedure describes the processes followed to perform code classifications, design registrations, deviation submissions and reconciliations in compliance with CSA N285.0-17 with Update No.1 [1] and CSA B51-14[2] [2].

3. DEFINITIONS

3.1 Terms

Note: See CSA N285.0 [1], Section 3, for other applicable definitions and abbreviations.

Classification Approval Form (CAF)	A form to record the code class of a system or component, see WL-508140-FM-002, *Whiteshell Laboratories Classification Approval Form.* [3].
Classification States	• ***Exempt From Classification*** – A system and/or section of system that would otherwise be classified as Class 6 may be exempted from classification provided certain conditions are met. The applicable conditions are listed in Section 5.2.4.2.1 of CSA N285.0 [1]. • ***Not Requiring Classification*** – A system or component that does not require classification, as determined by the classification process in Section 6 (by completing WL-508140-FM-001, *Whiteshell Laboratories Code Classification Selection [4]*). • ***Not Classified*** – A system or component that has not been evaluated through the classification process.

[1] CSA N285.0-17 with Update No.1 will henceforth be referred to as CSA N285.0 [1] in this procedure.

[2] CSA B51-14 will henceforth be referred to as CSA B51 [2] in this procedure.

	• ***Classified*** – A system or component that has been evaluated through the classification process.
Classification Submission Package	Package for submission to the CNSC requesting code class approval (see Section 4.1.1).
Code Classification Selection (CCS) Form	A form that provides guidance to determine classification of a system or component.
Consequence of Failure (CoF)	A document which shows the dose that plant personnel and/or the public may receive as a result of failure of the system or component.
Facility Authority	The manager accountable to the Owner through the established line organization for the safe operation, maintenance and use of a facility in compliance with all applicable licences, permits, laws and regulations, policies and procedures.
Legacy Pressure Boundary System	An existing system that was constructed and in operation prior to 1996 January 01, that does not require registration.
Modification	A physical change to the system pressure boundary (excluding repair and replacement) or a change in the system design conditions affecting the pressure boundary (definition from CSA N285.0 [1], Section 14.5.2.1).
Nuclear Facility	As defined in the Nuclear Safety and Control Act (1997, c.9) and associated regulations.
Reconciliation Statement	A form which demonstrates that any difference between the registered design and the as-built system or components or fittings have been appropriately reviewed and reconciled.
Statutory Declaration Form	A form used for the registration of fittings with the ITSM (see Appendix H for a sample form).
System Classification List	A document that identifies all pressure-retaining systems in a facility/plant as well as their respective code classifications (see Section 4.1.3).
ATOM	CNL’s corporate document control and information management system.

3.2 Abbreviations

AI	Authorized Inspector
ASI	AECL Subject Index
CAF	Classification Approval Form
CNL	Canadian Nuclear Laboratories
CCS	Code Classification Selection Form
CNSC	Canadian Nuclear Safety Commission
CoF	Consequences of Failure
CRN	Canadian Registration Number
CSA	Canadian Standards Association
DRS	Design Registration Submission
MLI	Manitoba Labour & Immigration
ITSM	Inspection And Technical Services Manitoba
ML&EC	Manager WL Licensing and Environmental Compliance
NSQ	No Seismic Qualification
SCL	System Classification List
WL	Whiteshell Laboratories
WLE	Whiteshell Laboratories Engineering
WLR	Whiteshell Laboratories Records

4. REQUIREMENTS

4.1 Classification

a) CSA N285.0 [1] documents the various code classifications, describes how to determine the proper code class of a system/component (using Section 5 of CSA N285.0 [1]), and defines when a Consequence of Failure (CoF) is required.
b) Classification is typically performed on a system-by-system basis, which includes all of the components shown on the system flow sheet for the system; however, if required, a component may also be classified separately.
c) Approved classified systems or components being changed to a lower code classification require CNSC approval except when changing from Class 6 to “exempt from classification”.
d) CNSC approval and/or acceptance is not required prior to execution of further work by CNL for systems and components that satisfy the following:
   1) Classified as Class 6,
   2) Exempt from classification, or
   3) Do not require classification.

For all other systems and components, CNSC approval of the classification shall be obtained before registering the design.

4.1.1 Classification Submission Package

Whiteshell Laboratories Code Classification Selection (CCS) form [4] shall be used to select code classification; however, the CCS is not part of the classification submission package. The code classification submission package shall include the following:

- Cover letter to the CNSC (see Appendix E for sample),
- Classification Approval Form CAF [3],
- Consequence of Failure (CoF) statement (if required), and
- Flowsheet and/or component drawing (see Appendix G for a guideline on the information to be included in the drawing).

At WL only systems that contain nuclear substances, adversely impact a safety system or cause unreasonable risk involving nuclear substances require formal submission to the CNSC.

4.1.2 Consequence of Failure (CoF)

The code classification shall be based on Section 5 of CSA N285.0 [1] as well as the CoF statement, as required. The CoF may be directly written under Item 7 on the CAF [3], or it may be prepared as a separate document. In this case the document is to be listed under Item 7 and included in the Classification Submission Package.

4.1.3 System Classification List (SCL)

a) The SCL shall be updated throughout the life of WL site no later than 3 years after a modification has been implemented to comply with clause 7.3.3 of CSA N285.0 [1].
b) All systems, sections of systems, or components that undergo the classification process are entered on the SCL, including items determined to be “exempt from classification”, or “not requiring classification”. CSA N285.0 [1] (Clause 7.3.3) provides the required information for each system.
c) It is expected that there will be one SCL for each Nuclear Facility and one SCL for the rest of the WL site.

4.1.4 Use of an Item with Lower Classification than that Required by Code

CNSC approval is required if an item has a lower classification (For WL Class 3 highest, Class 6 lowest) than that required by the code. Such an approval process may be initiated during the request for classification approval. The justification for lower classification shall be provided on Item 4 of the CAF [3], or in a separate document. For example, such a justification may be based on low consequence of failure, previous operating experience, and/or unavailability of higher class component.

The SCL shall state the required code classification under the “Class” column, unless otherwise instructed by the CNSC.

4.1.5 Classification Exceptions

Systems or components that are not Class 3, 3C or 6 must also be included in the SCL. This includes the following:

a) Some Class 6 systems inside Nuclear Facilities can be "exempt from classification" based on Clause 5.2.4.2.1 of CSA N285.0 [1]. Include the justification for the classification exemption in the system description on the CCS [4], or on a separate page.
b) Systems and components may be deemed "not requiring classification", as determined using the CCS form [4].

4.1.6 Modifications to Classified Systems and Components

If a system or component is modified after the code class approval, a new Classification Submission Package must be approved by the CNSC prior to implementation of the modification if the following applies:

a) The modification changes the existing classification to a less stringent classification (except the change from Class 6 to "exempt from classification" or "not requiring classification").
b) The modification involves penetration of the containment structure or a part of the containment boundary (there are no reactor containment structures on the WL site).

After the new classification has been approved by the CNSC, this information shall be shown in the next revision of the SCL.

4.2 Design Registration

Nuclear systems, components and supports design documents submitted for registration shall be stamped and/or certified by a Professional Engineer as required by CSA N285.0 [1]. Final (or provisional) design registration shall be obtained before component fabrication or system installation has started. Final design registration must be obtained before the pressure test.

4.2.1 Repairs and Replacements for Classified System

Repairs and replacements to registered nuclear systems are carried out in accordance with CSA N285.0 [1] requirements.

Repairs and replacements to classified but unregistered systems (legacy pressure boundary systems) are performed according to the requirements of CSA N285.0 [1] and CSA B51 [2] for the approved classification [9], [10], [11]. Repairs and replacements to these systems do not require registration.

Repairs and replacements to systems exempt from classification and not requiring classification are performed to the requirements of CSA N285.0 [1], CSA B51 [2]and Manitoba Steam and Pressure Plant Act [8].

4.2.2 Design Registration Submission (DRS) Package

When a system is to be registered with the ITSM, a Design Registration Submission package shall be prepared that includes the following documentation:

a) A **Design Registration Submission** document. The document should be assembled using the CNL formal document template and WL-508140-FM-003, Whiteshell Laboratories Design Registration Submission Data Form [5].
b) **Approved CAF** [3] from the CNSC for Class 3, 3C and 6 systems (required before ITSM will begin registration process). Code Classification Selection (CCS) forms [4] are used for “exempt from classification” and “not requiring classification” systems or components.
c) A **cover letter** that clearly identifies the system name and building number, invoicing information, and the requirement to return two sets of stamped drawings and technical notes to the sender. A sample cover letter is included in Appendix C.
d) **Two copies of all drawings**, including reference drawings.
e) **Two copies of other documentation** required by code.
f) A **Statutory Declaration Form** (obtain latest version from ITSM website) notarized by a Commissioner of Oaths shall be included in registration submissions for all fitting designs.
g) **Piping Design Registration Application Form** required by ITSM.

4.2.3 Reconciliation of Design Changes after Construction for Classified Systems

Prior to pressure testing, any differences between the registered design and the as-built system or components must be reviewed and reconciled by WL Engineering and accepted by the Authorized (Nuclear) Inspector. This is achieved by the following:

a) Obtaining Design Engineering approval of all Field Change Requests during installation,
b) Completing one reconciliation statement to cover the scope of all field changes associated with the job and certified by a Professional Engineer for Class 3 and 3C systems/components.
c) Obtaining ITSM and CNSC acceptance of updated design documentation as required (Section 7.7 of CSA N285.0 [1] dictates classification, registration and submission requirements, depending on class of system and nature of differences), and
d) Submitting to the Authorized Inspector (as part of the associated installation route sheet or manufacturing inspection and test plan) the completed reconciliation statement, prior to pressure testing.

One form, WL-508140-FM-004, Whiteshell Laboratories Reconciliation Statement [6], is used to satisfy the requirements of CSA N285.0 [1], Figure H.1. For system modifications controlled by 900-508130-MCP-001, Engineering Change Control [7], an additional field verification activity is conducted by the Engineering and Operations Representatives during the post-construction field walk down.

4.3 Deviations from the Code for Classified System

ITSM and CNSC acceptance is required for all pressure boundary system and/or item designs that do not fully comply with the codes and standards mandated in the nuclear operating site licence. Such “code deviations” may be allowed for items which are not in full compliance with the Manitoba Steam and Pressure Plant Act [8] on a case-by-case basis.

Deviations apply to pressure boundary items that are registered, or registerable, with ITSM. The deviation shall not detrimentally affect the safe use of the system/component or the health or safety of any person. They are typically encountered for using a non-registered component in a registered system, or using a special system arrangement that is not permitted in CSA B51 [2] for a defined period of time. Code deviation requests may also be submitted for use of commercial grade items in pressure boundary systems.

4.3.1 Code Deviation Application

All deviations from the requirements of the applicable Codes and Standards shall be submitted by the Design Representative to the Provincial Regulator (ITSM) for acceptance. The code deviation application shall include the following:

a) Complete description of the item or process involved, including installation instructions,
b) Full description of the circumstances and reasons that require the deviation,
c) Assessment of every safety risk associated with the deviation, based on safety engineering principles and recognized industry standards,
d) Description of the measures that are proposed to make the installation equivalent in safety to the level of safety intended by the requirements in the regulation, standard, or code,
e) Signature of the applicant (the qualified individual, for example a Professional Engineer, who is knowledgeable in the design aspects and specifics of the installation.

On receiving ITSM acceptance, one copy of all related correspondence shall be forwarded to WL Records for filing in the appropriate Registration file.

4.3.2 Code Deviation Submission to CNSC (Classified Systems Only)

Once the ITSM has accepted the code deviation, CNSC acceptance is required prior to installation. The CNSC submission includes evidence of the ITSM acceptance of the deviation (e.g., letter from the ITSM as well as relevant drawing) and a cover letter addressed to the CNSC Project Officer responsible for Whiteshell Laboratories that satisfies the following:

a) Includes design job number, preparer’s contact information,
b) Copies to WL Records for filing and tracking.
c) Appendix J includes a sample letter to the CNSC that may be adapted for this application.

4.4 Code Effective Date

The design of new and modifications to existing pressure-retaining systems and components shall meet the requirements of CSA N285.0 [1], which is interpreted as the following:

a) Repairs and replacements to existing pressure-retaining systems and components shall meet the requirements of the latest applicable codes and standards unless there is a reason to maintain a code effective date for that system (allowances are further defined in CSA N285.0 [1], Section 4).
b) The design, fabrication and installation of new systems shall be to the editions of standards listed in CSA N285.0 [1].

Decision/reason for maintaining the code effective date for repairs and replacements shall be approved by the WL Engineering Manager and filed in the design job file.

Design of pressure-retaining systems and components issued for construction (release for construction drawings) require a reconciliation statement at the end of construction if the work is not started prior to next code revision or addenda that comes into effect to disposition the design code change.

The design of new and modifications to existing pressure-retaining systems and components issued for construction (release for construction drawings) require a new design review if the work is not started within 5 years of the approval date on the drawing.

5. RESPONSIBILITIES

5.1 WL Engineering Manager

The WL Engineering Manager is responsible for the following:

- Ensuring this procedure is approved in accordance with CNL’s quality program requirements
- Ensuring any required acceptances are obtained from the CNSC prior to releasing the procedure for use.
- Approving code effective date exceptions, as defined in Section 4.4.
- Reviewing/approving design documentation as required by this procedure.

The Manager, WL Engineering, may also fill the role of “Facility Authority” within the scope of this procedure (e.g., approving code variances as plant owner’s designee).

5.2 WLE Professional Engineer

The WLE Professional Engineer is responsible for the following:

- Reviewing/approving/stamping design documentation as required by this procedure.

5.3 Designer/Engineer/Preparer

The Design Engineering Staff, or designated preparer, is responsible for the following:

- Compiling the necessary design documentation and correspondence in accordance with this procedure and applicable codes and standards.
- Obtaining applicable internal and external reviews, approvals and acceptances.
- Updating the necessary design documentation as required at the end of the design job.
- Arranging for the SCL revision.

5.4 Facility Authority

- The Facility Authority for a nuclear facility is responsible for reviewing and approving documentation and correspondence as required by this procedure.

5.5 Safety and Licensing Operations Specialist

The designated individual is responsible for the following:

- Preparing the Consequence of Failure, including obtaining the associated reviews.

5.6 WL Records

WL records office along with WL Doc Control is responsible for assigning file numbers for ITSM correspondence as well as tracking and filing ITSM documentation required by this procedure.

5.7 WL Licensing Coordinator

The WL Licensing Coordinator along with Manager WL Licensing and End State are responsible for ensuring that CNSC correspondence required by this procedure is numbered, formatted, released and tracked, in accordance with applicable procedures and bulletins from Regulatory Affairs.

6. PROCESS

6.1 Classification

This section provides the instructions for activities pertaining to system classification. Refer to Section 4.1 for the associated documentation requirements.

Designer/Engineer/ Preparer

1. If classification is required, obtain a CCS [4] number from Document Control and identify any items that are likely "*exempt from classification*" or "*not requiring classification*".
2. Locate or prepare/update the system flowsheet and component drawings (see Appendix G for drawing information requirements).
3. As required, make a request to Safety and Licensing Operations Specialist to prepare a Consequence of Failure statement (not required for Class 1 systems) or other supporting safety/licensing information.

Safety & Licensing Operations Specialist	4. When asked, prepare Consequence of Failure (CoF) or other supporting safety/licensing information. The CoF is to be reviewed by the Facility Authority for the Nuclear Facility. 5. Send approved CoF to Designer/Engineer/Preparer.
Designer/Engineer/ Preparer	6. For systems, sections of systems, or components that are Class 3, 3C or 6 prepare the CAF [3] (see Appendix D). 7. Forward the CAF [3] and/or CCS [4] and the system flowsheet (or component drawings) to the WL Engineering Manager for review.
WL Engineering. Manager	8. Review and approve the CCS [4], and CAF [3] when applicable (see Appendix D for CAF [3] instructions).
Designer/Engineer/ Preparer	9. Implement any required actions including updating documentation when specific corrections, follow-up actions, or changes are required as a result of the review and comment process. 10. Obtain the “originator’s” written approval on the CAF [3] (see Appendix D for CAF [3] instructions). The originator’s name shall be Facility Authority for a Nuclear Facility or just the WL Engineering Manager for WL Site (or when no Facility Authority exists). 11. Ensure the CCS [4] and associated documentation is filed in ATOM. 12. For systems, sections of systems, and/or components that are Class 3 or 3C, prepare a classification submission package and cover letter and obtain necessary internal approvals in accordance with Section 4.1.1. 13. Provide the classification submission package to the Manager, Licensing, and End State for submission to the CNSC (see Section 6.5). 14. Upon receiving CNSC’s acceptance, ensure the Classification Submission Package and the CNSC-accepted CAF [3] are filed in ATOM. 15. In discussion with the WL Engineering Manager, arrange for the System Classification List (SCL) to be revised.

6.1.1 Modifications to Classified Systems or Components

If a modification to an existing system changes the approved code classification, as described in Section 4.1.6, then a new Classification Submission Package is required (follow instructions in Section 6.1).

6.2 Registration

Designer/Engineer/ Preparer

1. Determine whether the new system/component or modification to an existing system/component requires registration, using Appendix A as a guideline.

   Appendix B *provides principles for legacy pressure boundary systems that require registration of modifications*.

2. If registration is required, complete the steps in Section 6.2.1.

6.2.1 Design Registration Submission Package Preparation

Designer/Engineer/ Preparer

Section 4.2.2 defines the content requirements for DRS packages.

3. If a Design Registration Submission (DRS) for the item already exists, update the last DRS issued (if more than one DRS exists for an item, choose one DRS number).
4. If no DRS exists, obtain a new DRS number from Document Control
5. Obtain peer review of the complete DRS package, which includes the DRS document, design documents/drawings, reference/supporting drawings and documents, CAF/CCS, and the cover letter.

WL Engineering. Branch Manager

6. Review the DRS package and when satisfied, approve the DRS document.

Designer/Engineer/ Preparer

7. Deliver the registration package to WL Records (see Section 6.5) for submission to the ITSM and subsequent tracking.

6.2.2 Return and Distribution of ITSM Stamped Drawings and Documents

Designer/Engineer/ Preparer

8. On receipt of approved documents from the ITSM, revise drawing CRN block to include the CRN obtained from ITSM before uploading into VAULT.

6.3 Reconciliations

Designer/Engineer/ Preparer	9. Complete the appropriate form to be used for the reconciliation, as per Section 4.2.3. 10. Submit completed form to WL Engineering Professional Engineer for review and approval.
WLE Professional Engineer	11. Review and approve the reconciliation form.
Designer/Engineer/ Preparer	12. Submit approved reconciliation form to ITSM, following the instructions in Section 6.5 for corresponding with the ITSM.

6.3.1 Replacements and Repairs

See Section 4.2.1 for requirements pertaining to registration of repairs and replacements.

6.4 Code Deviation

See Section 4.3.1 for requirements pertaining to application for deviation approval.

Designer/Engineer/ Preparer	13. Prepare application for the ITSM requesting approval for the deviation. 14. Prepare additional information, as described in Section 4.3.1.
Designer/Engineer/ Preparer	15. Submit application for deviation package to WL Engineering Professional Engineer for review and signature. 16. Complete any necessary testing with the AI present to formally witness the test.
WLE Professional Engineer	17. Review and sign application for deviation package and supporting documentation, as described in Section 4.3.1.
Designer/Engineer/ Preparer	18. Submit application for the deviation to ITSM as per instructions for Design Registration Submission (Section 6.2.1).
Designer/Engineer/ Preparer	19. Upon receiving ITSM acceptance, prepare CNSC submission package, with the contents defined in Section 4.3.2. 20. Submit package to Manager, Licensing, and End State for transmittal to CNSC for acceptance as per Section 6.5.1.
CNSC	21. Review and accept/reject the deviation.
Designer/Engineer/ Preparer	22. Confirm responses are filed in ATOM.

Note: Any deviation implemented shall be reported to CNSC within 60 days of its installation.

6.5 Correspondence

6.5.1 CNSC Correspondence

The ML&EC coordinates with the Preparer and WL Engineering Manager to submit correspondence packages to the CNSC.

Designer/Engineer/ Preparer	23. Provide package, draft cover letter and Design job file number to the Manager, Licensing, and End State.
WL Licensing Coordinator	24. Obtain a correspondence file number from ATOM. Ensure that the letter is in the proper template and that the appropriate CNSC and CNL people are copied on the correspondence.
	25. Consult with Regulatory Affairs to have the letter and package reviewed prior to submission to the CNSC.
	26. Send the letter and package to the CNSC, file the correspondence in ATOM and forward copies to the Preparer.
	27. Arrange to associate the letter and package with the Design job file number in ATOM.
Designer/Engineer/ Preparer	Upon receiving the CNSC's response, provide the original copy to Manager, Licensing, and End State for filing in ATOM.

6.5.2 ITSM Correspondence

Designer/Engineer/ Preparer	28. Provide Design Registration Submission package to WL Records.
WL Records	29. Submit the complete registration package to the ITSM and maintain log of submitted and returned packages.
	30. Upon receipt of the returned registered package (should be one copy of the stamped drawings/documents), file the package in ATOM, associated with the Design job file number.
	31. Distribute as per the list provided by the Preparer, and mail one hard copy to the customer or the designated customer representative.
Designer/Engineer/ Preparer	32. If the documents/drawings are returned to the Designer/Engineer instead of WL Records, bring the documents/drawings to WL Records for initial processing.

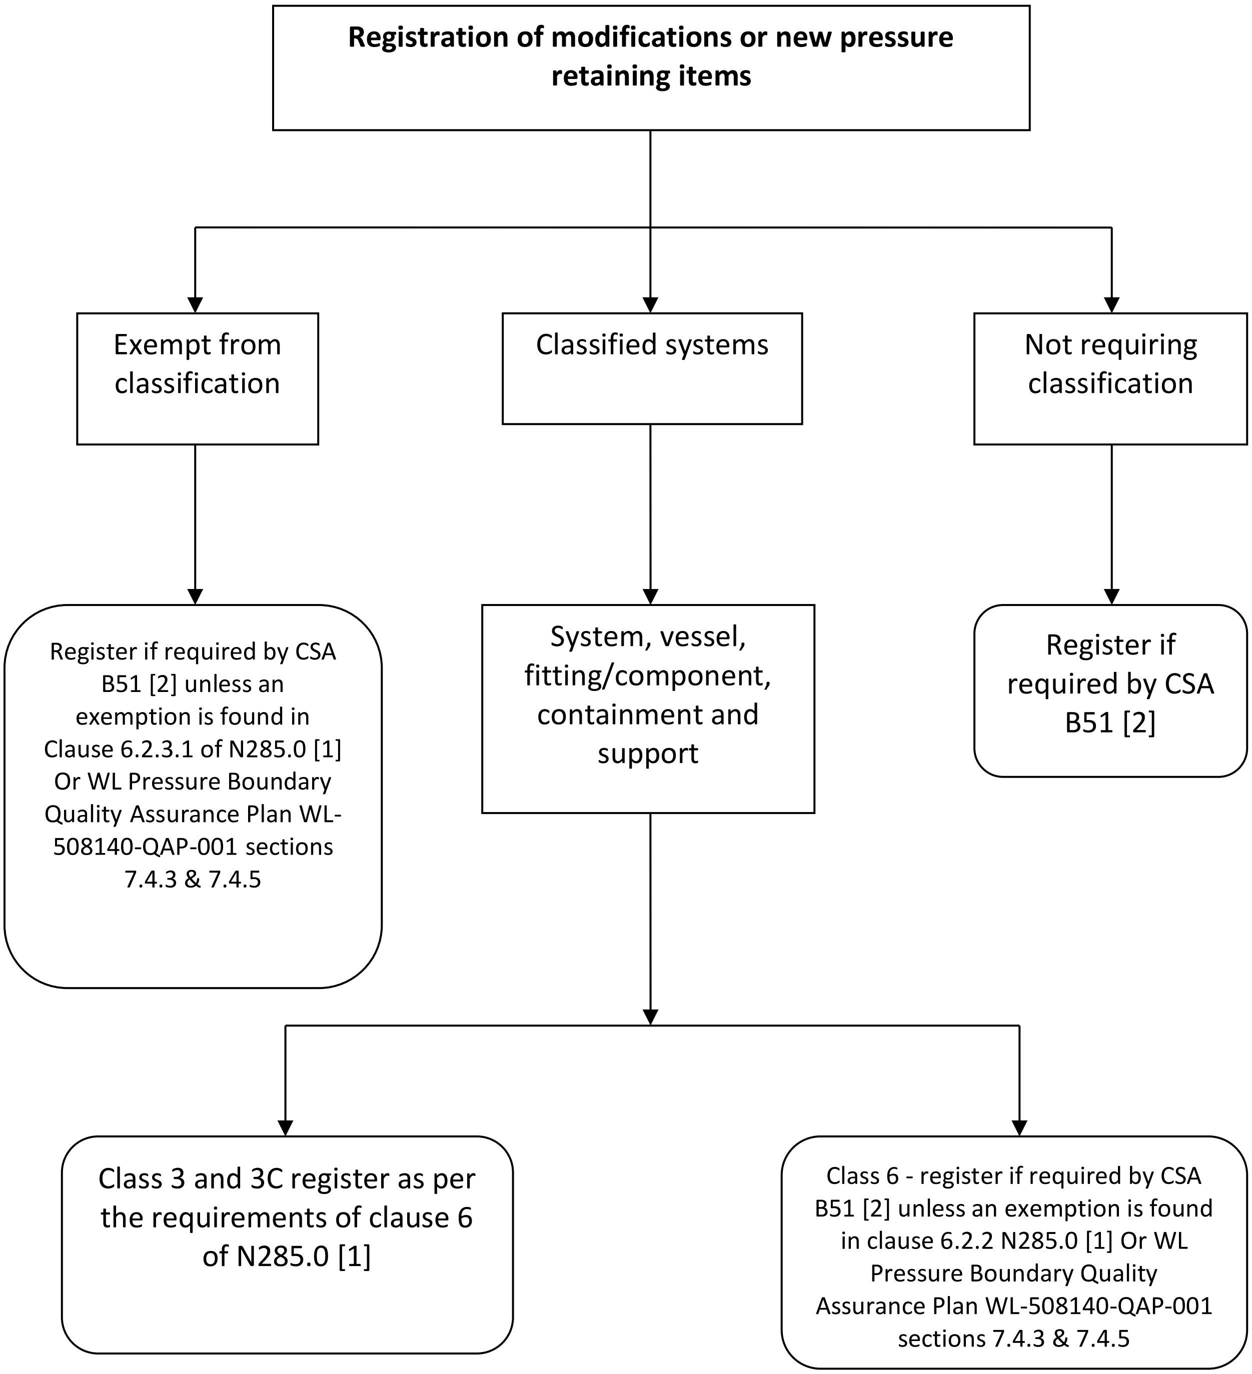
Appendix A Registration Guidelines



Appendix B Legacy Pressure Boundary System Registration Principles

Definition:

Refers to piping systems constructed and operating prior to 1996 January 1 that do not require registration per agreement with the Provincial Regulator for CSA B51 (Manitoba Department of Labour), approved 1995 December 15. WL Legacy Pressure Boundary System List, WL-508120-016-000-0001 [12] contains the list of Legacy pressure boundary system. General Principles:

- Only modifications are registered per QAP requirements [9]
- The design registration of the modification must satisfy its classification.
  - The modification is classified as per Section 6.1.
- An analysis of the modification includes as much of the existing system as required to enable analysis of the modification.
- If a modification to a system does not require registration as per N285.0 [1]/CSA B51 [2]/ Manitoba Steam and Pressure Plant Act [8] then the modification to a legacy pressure boundary system would not require registration.

(Follow most recent bulletin from Regulatory Affairs)

Appendix F System Classification List Information

Item	Action
Title	Enter the name of the system from the CAF.
Drawing Number	Enter the flow sheet/drawing number from the CAF.
Pressure (MPa(g))	Enter operating and design pressure in MPa(g) from the flow sheet.
Temperature (C)	Enter operating and design temperature in C from the flow sheet.
Working Fluid	Enter the fluid in the system from the flow sheet.
Class	Enter the CNSC approved code class from the CAF, or enter "*exempt from classification*", or "*not requiring classification*".
Reference	Enter the CoF number from the CAF.
Code Effective Date	Enter the design code and code effective date from the flow sheet.
CRN	Enter the Canadian Registration Number received from ITSM.
Seismic Qualification	Enter level and category from the flow sheet if seismic qualification is required; otherwise enter "no seismic qualification" (NSQ).
CNSC Acceptance	Enter the date of CNSC acceptance.

Appendix G System Flowsheet and Component Drawings

As per clause 7.3.2 of CSA N285.0 [1], the system Flowsheet shall show the schematic arrangement of all pressure-retaining components in the system and shall contain the information listed below or reference the document where the information is to be found:

a) Design and operating pressure and temperatures;
b) System fluids;
c) System boundaries and, when more than one classification is specified, section boundaries;
d) The containment boundary and containment penetrations;
e) The seismic category and level boundaries;
f) Settings of overpressure protection devices;
g) The effective date or issue of applicable codes and standards for the design of the system;
h) The test temperature and test pressure; and
i) Specifications for pressure-retaining piping materials.

Authorized Inspector -Inspection & Technical Services.

STATEMENT OF POLICY AND AUTHORITY

The provisions of this document, and the management system enabling documents specified herein, are mandatory and are implemented for pressure boundary activities in the facilities at the Whiteshell Laboratories (WL) site, as defined in Section 1 scope. The management and personnel of WL are committed to implementing and maintaining this Quality Assurance (QA) Program and associated procedures in the facilities.

This document describes the WL Quality Control Program for the manufacture, design, construction, examination, installation, repair, alteration/modification, replacement, and inspection of pressure retaining components (boilers, pressure vessels, fittings, and piping systems) as detailed in the scope herein. All repairs or alterations carried out by WL shall meet the requirements of the National Board Inspection Code, CSA B51, CSA B52, ASME BPV codes, sec I/Sec IV/Sec VIII, ASME B31.1/31.3/31.9 piping standards and Inspection & Technical Services (ITS) as applicable.

The Program described in this document, is supplementary to 900-514200-PDD-001, Quality Assurance and structured as per Appendix 10 of The American Society of Mechanical Engineers (ASME) Section VIII, Division 1.

Any disagreement in the implementation of this written document shall be referred for resolution to the higher authority (as applicable) as identified below, without negating Canadian Standards Association (CSA) B51, CSA B52, Applicable ASME Codes , NBIC, The Manitoba Steam and Pressure Plants Act, Chapter S210 and this Manual's requirements.

TITLE	NAME	SIGNATURE	DATE

Pressure Boundary Functional Support Manager	Jason DeRuiter		2021-08-05

TABLE OF CONTENTS

SECTION **PAGE**

1. QUALITY CONTROL PROGRAM SCOPE

This Quality Assurance Plan (QAP) document describes the Quality Control Program at Whiteshell Laboratories (WL), Pinawa for the manufacture, design, construction, examination, installation, repair, alteration/modification, replacement in the shop and field, and inspection of boilers, pressure vessels, and piping systems that must meet requirements of Statutes and Regulations of the Province of Manitoba. Applicable codes for this quality control programs are

- CSA Standard B51 - Boiler, Pressure Vessel and Pressure Piping Code
- CSA Standard B52 - Mechanical Refrigeration Code
- ASME Boiler and Pressure Vessel Code - Section I, Section IV, and Section VIII
- ASME B31.1 - Power Piping
- ASME B31.3 - Process Piping
- ASME B31.9 - Building Services Piping
- The Manitoba Steam and Pressure Plants Act, Chapter S210
- National Board Inspection Code –NBIC

This QAP is prepared as per the requirements of ASME BPVC VIII DIV 1, mandatory appendix 10, Quality control system. A cross reference table is included in Appendix A of this QAP outlines how this document meets the requirement of ASME BPVC VIII DIV 1, mandatory appendix 10.

This Quality Control Program does not cover any activities on Class 1, 1C, 2, 2C, 3, 3C, and 4 nuclear pressure retaining systems or components as classified in CSA N285.

For systems that are exempt from registration the Engineer of Record shall determine the applicable requirements from this manual that shall be applied to the work.

2. AUTHORITY AND RESPONSIBILITY

2.1 Scope

This section is applicable to employees at WL involved in this CSA B51 Quality Control Program.

2.2 Purpose

The purpose of this Section is to define the authority and responsibility of personnel involved in this Quality Control Program.

2.3 Authority

1. The overall responsibility for development and implementation of the Pressure Boundary Program and this QAP is with the Canadian Nuclear Laboratories (CNL) Pressure Boundary Functional Support Manager. He/she has the authority and is provided with the organizational freedom to ensure that all activities covered under the scope of this manual carried out by WL shall meet the requirements of the Provincial Regulatory Authority as applicable.
2. The WL Pressure Boundary Manager (WL Engineering Manager), as delegated by the Pressure Boundary Functional Support Manager, has the authority to enforce the requirements of this Quality Program.

3. The WL Pressure Boundary Subject Matter Expert (SME) is delegated to act on behalf of the WL Pressure Boundary Manager and has the authority to enforce the implementation of the requirements of the Quality Control Program described in this Quality Control Manual, Design and Construction of Pressure Retaining Components and Systems to CSA Standard B51. The WL Pressure Boundary SME has the authority to stop work on, or the operation of, any pressure retaining vessel, component, or system not in compliance with the requirements of the Quality Control Program or with the applicable Code and/or Regulatory requirements.
4. The Quality Control Representative (QCR) has the authority and organizational freedom to stop work not in compliance with requirements of this Quality Program.

2.4 Responsibilities

It is the responsibility of all WL employees to comply with the requirements, policies, and procedures contained and referenced in this Manual.

2.4.1 WL Engineering Branch

The WL Engineering Branch is responsible for the design, alteration and repair of pressurized components and systems to meet the applicable codes and provincial regulations.

2.4.2 WL Work Control Department

The WL Work Control Department is responsible for the fabrication, construction, maintenance and testing of pressurized components and systems in accordance with applicable codes and provincial regulations.

2.4.3 Customer Representatives

The Customer Representative is the interface within or between WL and an off-site organization. The Design Representative, QCR, Purchasing Agent or Requisitioner can all function as the Customer Representative.

2.4.4 Design Representatives

Personnel from WL Engineering or designates are responsible for the performance of the duties of the "Design Representative" in this Quality Control Program. The Design Representative reports to the WL Engineering Manager.

2.4.5 WL Engineering Manager

The WL Engineering Manager has overall responsibility for providing design and engineering services to the site, and is also responsible for ensuring that requirements of this Quality Control Program are applied within WL Engineering. The WL Engineering Manager reports to the Senior Project Manager, Engineering.

2.4.6 Facility Authority/ Landlord

The Facility Authorities and Landlords are accountable through the line organization for health, safety and environmental protection of Nuclear and Non-Nuclear facilities respectively. Facility Authorities and Landlords are listed in the Whiteshell Laboratories Procedure WL-508200-PRO-212 [1], Responsibility for Facilities and the Safety of Operations at the Whiteshell Laboratories.

2.4.7 Instrumentation Group

Personnel from The WL Work Control Instrumentation group are responsible for the performance of the duties of the "Instrumentation Group" in this Quality Program. The Lead Hand of the Instrumentation Group is responsible for ensuring that requirements of this Quality Control Program are applied within the Instrumentation Group, WL Work Control.

2.4.8 Job Contact

The WL Work Control Trades Supervisor or Trades Leadhand or Trades Foreman is responsible for the performance of the duties of the "Job Contact" in this Quality Program. The Job Contact reports to the Manager, WL Work Control, who reports to the Senior Project Manager, Engineering.

2.4.9 Work Control Manager

The Work Control Manager has been delegated the responsibility for ensuring that WL Work Control personnel conform to this Quality Assurance Plan (QAP). The Work Control Manager is also responsible for determining Relief Valve (RV) servicing frequencies, and conducting an annual records review of RVs to verify proficiency and compliance with this QAP. The Preventative Maintenance coordinator, with approval from the Manager, WL Work Control, selects the personnel from WL Work Control to carry out this task. The Work Control Manager reports to the Senior Project Manager, Engineering.

2.4.10 WL Preventative Maintenance Coordinator

The Preventative Maintenance Coordinator is responsible for updating the Relief Valve Servicing Due Dates into the CMMS.

The Preventative Maintenance Coordinator shall issue the Scheduled Maintenance Request/Service Request, generated by the CMMS for each pressure vessel/RV as the scheduled Servicing Due Date is reached.

2.4.11 WL Procurement Group

Contracts Officers from WL Procurement are responsible for the performance of the duties of "Purchasing" in this Quality Program. The WL Procurement Manager reports to the Director of WL Business Operations.

2.4.12 WL Pressure Boundary Manager

The WL Pressure Boundary Manager (WL Engineering Manager) is responsible for the overall management of the WL pressure boundary program, ensuring the organization has a valid Certificate of Authorization issued by the Inspection and Technical Services (ITS) for the scope of work being performed and maintaining a list of controlled manual holders.

2.4.13 WL Pressure Boundary Subject Matter Expert

The WL Pressure Boundary SME is responsible for developing, implementing, and maintaining the Quality Control Program for the design registration, construction, alteration, repair, examination, and inspection of pressure retaining components and systems which must meet the requirements of the Steam and Pressure Plant Act, Chapter S210, of the Continuing Statutes of Manitoba.

The WL Pressure Boundary SME is responsible for the preparation, revision, distribution and implementation of this QAP. The WL Pressure Boundary SME provides pressure boundary-related advice to the WL Pressure

Boundary Manager. The WL Pressure Boundary SME shall be a member of the WL Engineering Branch and have the appropriate qualifications deemed acceptable by the WL Engineering Manager. The WL Pressure Boundary SME shall be designated by the WL Pressure Boundary Manager.

2.4.14 Quality Assurance Specialist

The QA Specialist is responsible for assisting the Managers from various WL departments in developing, implementing and periodically updating their quality programs. The QA Specialist, when requested, monitors the effectiveness and adequacy of the Program, reports findings to the Branch Managers, ensures corrective actions are conducted and become incorporated into the Program.

2.4.15 Quality Control Representative

The Quality Assurance/Quality Control (QA/QC) Representative from the WL Licensing and Quality Management Branch are responsible for performance of the duties of the “Quality Control Representative” in this quality program. The QCR is responsible for ensuring all specified examinations and inspections are completed. The QCR has the responsibility and organizational freedom to identify quality related problems, stop work not in compliance with specified requirements, and to recommend and verify corrective actions that do not contravene the QC program and/or Code requirements. The QCR also controls nonconforming material or components until a solution has been established. The QCR will report functionally to the WL Pressure Boundary SME and consult with the Quality Assurance Specialist on QA matters.

2.4.16 Site Authority

The Head of the WL Closure Project is the WL Site Licence Holder with oversight responsibility for activities that impact the requirements and conditions defined by the WL Licence Condition Handbook, NRTEDL-LCH-08.00/2024 [2]. Facilities at WL are also under the management authority of the Head of the WL Closure Project.

2.4.17 Stores

Stores personnel are responsible for performance of the duties of “Stores” in this Quality Program. Stores personnel report to the Section Head, Property & Material Management, who reports to the Director of Business Operations.

2.4.18 Records

The WL Records is responsible for performing the duties of “Records” in this Quality Program. The WL Records staff report to the Manager, WL Licensing and Quality Management. WL Records staff are responsible for ensuring records and reports used within this program are retrievable and stored.

3. ORGANIZATION

3.1 Scope

This Section describes the organizations involved in this Quality Control Program and their interface relationship at the time of revising this QAP.

3.2 Purpose

The purpose of this Section is to define the organizational structure applicable to this Quality Control Program. Figure 1 illustrates the organizational structure.

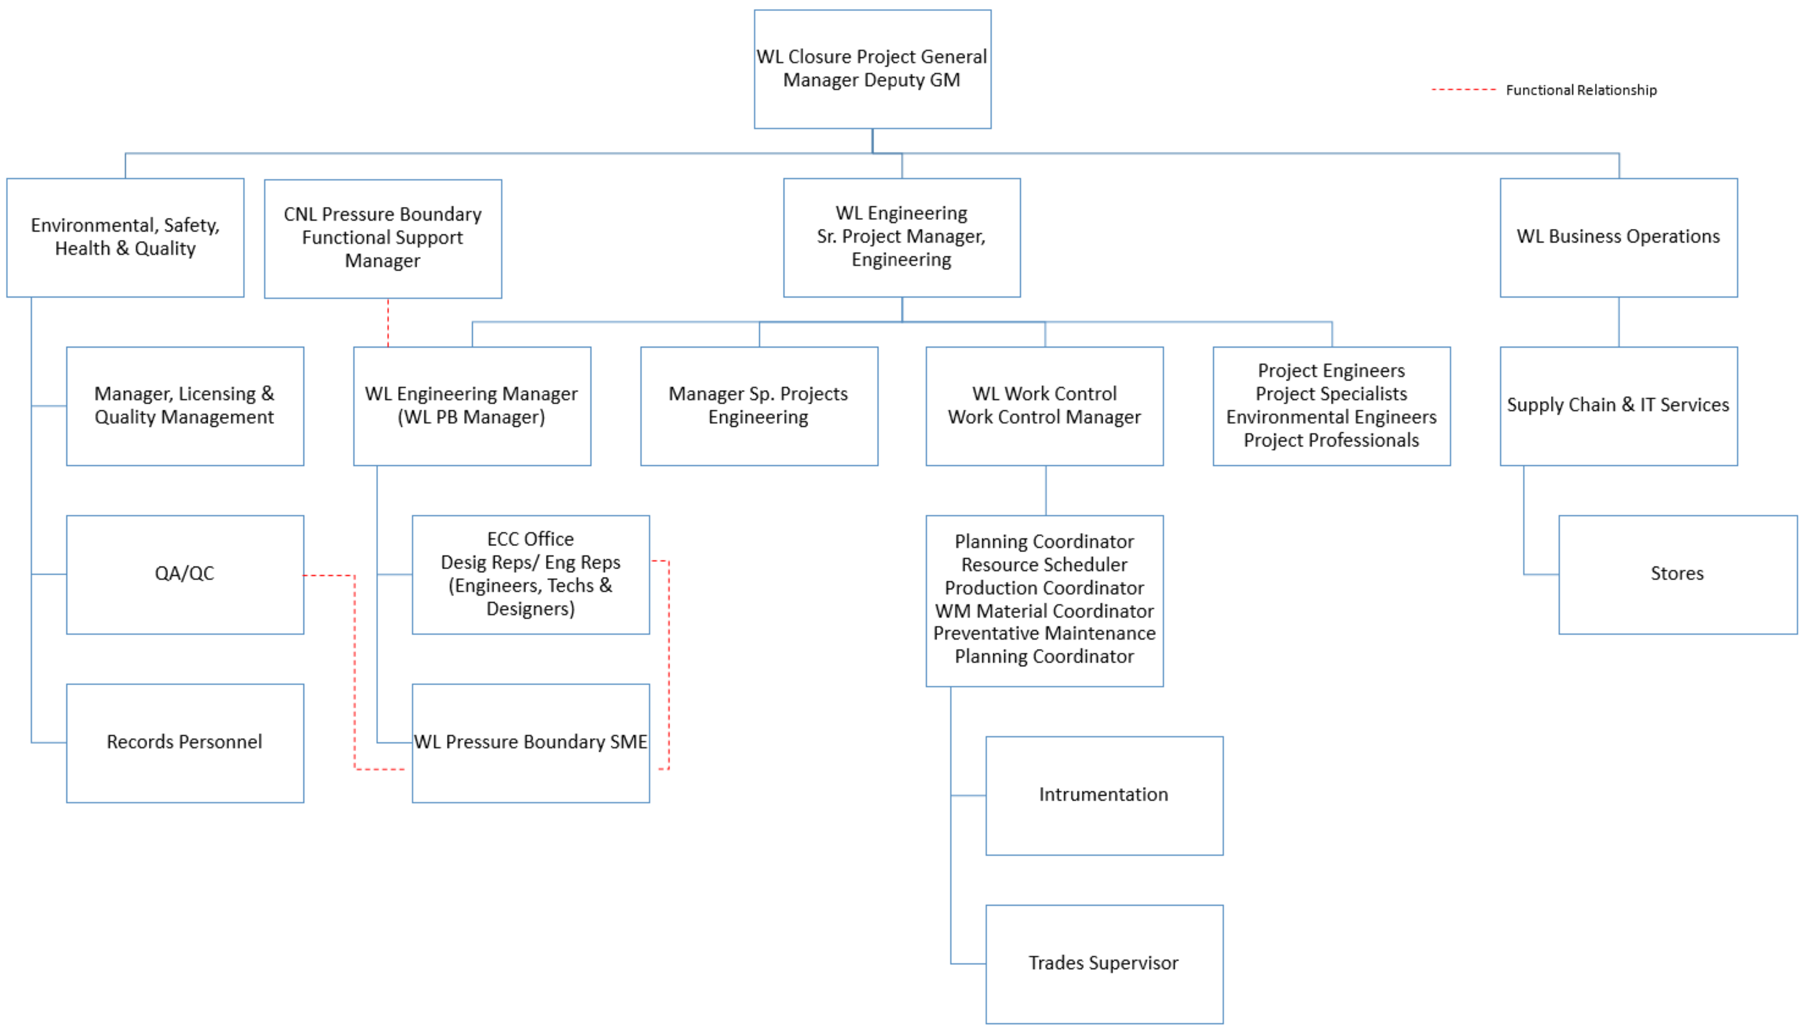

Figure 1 – WL Organizational Structure

4. ABBREVIATIONS, DEFINITIONS AND REFERENCES

4.1 Scope

This Section identifies abbreviations and definitions used at Whiteshell Laboratories for the design, construction, material control, installation, modification, and quality control and inspection activities of pressure retaining components and systems.

4.2 General

In addition to the following abbreviations and definitions, definitions described in other sections of this Plan, as well as in CNL's list of Acronyms and Abbreviations, and in CSA Standard B51, shall also apply.

4.3 Abbreviations

AECL	Atomic Energy of Canada Limited
AI	Authorized Inspector appointed by the Manitoba Labour and Immigration
ANSI	American National Standards Institute
ASME	American Society of Mechanical Engineers
ASTM	American Society for Testing and Materials
BPS	Brazing Procedure Specification
CMMS	Computerized Maintenance Management System
CNL	Canadian Nuclear Laboratories
CNSC	Canadian Nuclear Safety Commission
CRL	Chalk River Laboratories,
CRN	Canadian Registration Number
CSA	Canadian Standards Association
D&WM	Decommissioning and Waste Management
EDRMS	Electronic Document and Records Management System
ImpAct	Improvement Action
IRR	Inspection Request/Report
ITP	Inspection & Test Plan
ITS	Inspection & Technical Services
M&T	Measuring & Test
MAWP	Maximum Allowable Working Pressure
MITP	Manufacturing Inspection & Test Plan
MLI	Manitoba Labour and Immigration

MP&WM	Maintenance Planning & Work Management
NCR	Non-conformance Report
NDE	Non-Destructive Examination
NDT	Non-Destructive Testing
NIST	National Institute of Standards & Technology
NRC	National Research Council
PITP	Piping Inspection & Test Plan
PQR	Procedure Qualification Record
QA	Quality Assurance
QAM	Quality Assurance Manual
QC	Quality Control
QCR	Quality Control Representative
QOI	Quality Operating Instruction
QPS	Quality Program Selection
RV	Relief Valve
SIF	Supplementary Information Form
SME	Subject Matter Expert
WL	Whiteshell Laboratories
WMC	Work Management Coordinator
WPS	Welding Procedure Specification

4.4 Definitions

Act	The Steam and Pressure Plants Act, Province of Manitoba
Alteration	Any change in the item described on the original Manufacturer's Data Report which requires a change of design calculations or otherwise affects the pressure containing capability of the boiler or pressure vessel. Non-physical changes such as an increase in the maximum allowable working pressure (MAWP) (internal or external) or design temperature of a boiler or pressure vessel are also considered alterations, as are reductions, e.g., in minimum temperature, such that additional mechanical tests are required, shall also be considered an alteration.
Authorized Inspector	An Inspector authorized by the Regulatory Authority to perform inspections required under the Act.

Bill of Materials	A list of materials and fittings to be used in the construction of a pressure retaining system.
BPS	Brazing Procedure Specification; it identifies acceptable ranges of variables to be followed when brazing with a specific process, and is intended to provide direction to the brazer.
Calibration recall	A system for indicating in advance the next calibration due date for each piece of measuring and test equipment requiring calibration.
Calibration interval	The maximum allowable elapsed time between calibrations of a piece of measuring and test equipment which requires periodic calibration.
Code	The latest edition of CSA Standards B51 and B52 and their referenced Codes, e.g., ASME Section VIII Division 1 and ASME B31 Standards, as applicable.
Code Material	Material which must comply with requirements of ASME, ASTM, ANSI, or other applicable referenced Codes.
Component	An item, such as a vessel, boiler, heat exchanger, or a fitting manufactured at WL to meet Code requirements.
Construction	The activities of erection, installation, fabrication, assembly, alteration, and repair of items at the facility or plant.
Customer	For the purpose of this Manual, the term “customer” means purchaser of a product or service provided by WL.
Design	Includes calculations, analyses, drawings, and specifications to ensure the design meets Code and Regulatory requirements.
Design Documentation	Records of the design preparation, including design input, design output, engineering calculations and analyses, etc.
Design Input	Requirements, information, and data, e.g., performance and functional requirements, applicable Codes and standards, safety and environmental conditions, customer’s, Regulatory Authority’s , contractual, and other design group’s or discipline’s requirements to be used as a design basis for design work.
Design Output	May include drawings, specifications, technical notes, etc.
Fittings	An appurtenance attached to a boiler, pressure vessel, or piping, including such items as valves, gauges, and controlling devices, and which may include other pressure retaining components installed in a piping system within the scope of the Act.
Item	Item may be a component, part, fitting, or material.

Material	Item that conforms to a specification permitted by the Code or that is in the as- supplied condition.
Measuring and test equipment	A device used to measure, gauge, test, or otherwise examine items to determine their compliance with specifications.
Non-conformance	A deficiency in characteristic, documentation, system or procedure which renders an item or service unacceptable or indeterminate, or not meeting specified requirements.
Non-conformance Report (NCR)	A standardized form that is filled out when documenting a non-conformance.
Nonconforming Material	Materials, items or components deviating from specified requirements.
Piping System	Piping system as covered by this Manual applies to all piping and pressure retaining parts of piping manufactured in accordance with the Code. Piping includes pipes, fittings, flanges, and relief devices.
Registered Professional Engineer	A person who is licensed to practice under the "Engineering and Geoscientific Professions Act of Manitoba". The Engineer shall be qualified to assume responsibility for the engineering content of the design work done under his/her direction.
PQR	Procedure Qualification Record; it lists the actual conditions under which a test specimen was made and the results of tests performed on the specimen to qualify the process.
Purchase Request	The form used to initiate the purchase of goods and services
Purchase Document	Means any purchase order attachment such as specifications, drawings, or customer supplied documents.
Reference measurement standard	An instrument or device used in a calibration system as a primary standard or reference, its accuracy traceable to the National Institute of Standards and Technology (NIST), or to the National Research Council of Canada (NRC).
Registration File	File in records for pressure retaining components containing design registration, CRN etc.

Regulatory Authority	The body responsible for administering and enforcing the Act governing the design, fabrication, installation, repair, and alteration of boilers, pressure vessels, fittings and piping. In the Province of Manitoba, the Regulatory Authority is: Inspection and Technical Services, Municipal Relations 500-401 York Avenue Winnipeg, Manitoba R3C 0P8, Telephone (204)-945-3373
Reject	An item rejected for a CSA B51 application. Depending on the nature of the rejection it may be returned to the Supplier or dispositioned for use with non-CSA B51 jobs.
Repair	Processing a nonconforming item so it can function reliably and safely although the item still does not conform to the originally specified requirements. Note: for pressure-retaining components or systems, specifically, repair as defined in CSA B51 is to “restore a boiler or pressure vessel to a safe and satisfactory working condition”.
Request for Quotation	The form used to request quotation on goods and services.
Rework	Reprocessing a nonconforming item to conform to meet specified requirements. “Rework” to pressure retaining components or systems includes the correction of defects in weld/braze material, identified non-destructively during construction of the pressure retaining component or system. A rework procedure will be required if the original weld/braze procedure specification cannot be used.
Scrap	Designates material or items which cannot be used for their originally intended purpose.
Servicing Due Date	The date an RV must be withdrawn from its operating environment for servicing.
Servicing Frequency	The period of time for which the calibration of the set pressure of an RV is valid.
Transfer measurement standard	An instrument or device in a calibration system used to transfer measurements from the reference measurement standard to a lower echelon “working standard”, or directly to the measuring or test equipment being calibrated
Use-As-Is	An item not meeting specified requirements but still capable of performing satisfactorily without affecting fit, form, or function, can be “Used-As-Is”.
Working Standard	An instrument or device used in a calibration system to transfer measurements directly to the measuring and test equipment. Calibration of working standards is traceable to national standards via transfer measurement standards.

WPS	Welding Procedure Specification; identifies acceptable ranges of variables to be followed when welding with a specific process, and is intended to provide direction to the welder.

5. MANUAL REVISION AND CONTROL

5.1 Scope

This section describes the revision control of this Quality Control Plan including forms.

5.2 Quality Assurance Plan Revisions

The WL Pressure Boundary SME is responsible for preparation, revision, and distribution of the QAP, as well as for the review of applicable Codes and Standards and other internal or external changes affecting the Quality Program. This includes any process changes, organizational changes and any site license conditions affecting the Program. Once updated, the revised QAP is then submitted by the WL Pressure Boundary SME to the Inspection & Technical Services (ITS) for review and acceptance.

The WL Pressure Boundary SME reviews any new revision or addenda of the Codes and Standards, referenced in the QAP, within six months of their issue and incorporates any relevant changes in the QAP and the Program, the cycle followed for incorporation of the revisions in the QAP is as detailed in this Section. Formal revision of the QAP is done every 5 years.

Significant revisions are itemized in the Revision History associated with this document. Minor editorial changes and corrections that do not change the intent or meaning will not be marked. Only the most recent revision shall be indicated. Editorial type changes and corrections are not indicated. Revisions to any of the forms will be reflected in the Sample Forms in Section 20.

5.3 Quality Assurance Plan Control

The Pressure Boundary SME and WL Pressure Boundary Manage (WL Engineering Manager) are responsible for the development and implementation of the Pressure Boundary Program and this QAP.

After a review by the appropriate personnel, the QAP is approved by the WL Pressure Boundary Manager. Then, the QAP needs to be accepted by the CNL Pressure Boundary Functional Support Manager. Once accepted, the QAP is sent by the Pressure Boundary SME for acceptance to the Authorized Inspector of the Inspection & Technical Services (ITS). After their acceptance, the QAP shall be submitted to the CNSC as far in advance of planned implementation as practicable, but not less than 30 days prior to planned implementation. The QAP is then implemented at WL. Authorized Inspector's acceptance is indicated by his/her signature with date on the cover page.

The controlled document is approved and issued for use via a transmittal sheet through the Electronic Document and Records Management System (EDRMS) and the published revision is to be considered the official version of the QAP.

Uncontrolled copies of the QAP may be distributed (internally or externally) on request or for audit purposes. These are strictly for information purpose only.

5.4 Quality Assurance Plan Training

Training requirements for the WL Pressure Boundary quality program are prescribed in WL Training Plan WL-508140-TPL-001 [3]. This training plan identifies the training required by position within the organization to perform work on pressurized systems and to administer this quality program. It identifies who must be trained on the contents of this QAP, and other position specific training as identified by line management for each position.

6. DRAWINGS, DESIGN CALCULATIONS, AND SPECIFICATION CONTROL

6.1 Scope

This Section of the QAP applies to the design of pressure retaining components and systems that must meet requirements of CSA Standard B51.

6.2 Purpose

To describe the activities performed by the Design Representative when processing a design, to ensure that:

1. The latest technical data and correct design input are used in the preparation of design documentation and design output to assure Code compliance;
2. The latest and authorized design output documents are used for construction, installation and examination and testing purposes, and
3. Design documentation and design changes are controlled systematically.

6.3 Responsibilities

1. The Design Representative is responsible for performing design activities in conformance to applicable WL Engineering Design procedures. The Design Representative shall also ensure that the design is complete, current, and adequate to achieve the design objectives and comply with applicable regulatory, jurisdictional, and Code requirements. The design Representative is responsible for preparing construction drawings and obsolete drawings after decommissioning as per the WL Engineering Drawing Office Manual WLD-01150-MAN-001 [35].
2. The Registered Professional Engineer who applies his/her Seal to a design document has responsibility for the engineering content of the document and/or design.

6.4 Procedure

6.4.1 General Requirements

Procedures outlining the design process from receipt of a customer request through the close out phase of a design job shall conform to 900-508120-PRD-001 [4], Design Authority & Design Engineering and WLD-511300-PRO-002 [5], Construction Document & Record Control.

6.4.2 Design and Construction Criteria

1. Pressure retaining vessels, components, piping system and sub-assemblies shall meet requirements of CSA Standard B51, this Quality Control Program/Manual, and the applicable Code as specified below:
   a. Pressure vessels and boilers shall be designed and constructed in accordance with Section I, Section

IV, or Section VIII, Division 1 or 2, of the ASME Boiler and Pressure Vessel Code, as appropriate.

b. Pressure piping systems, sub-assemblies and portions thereof, shall be designed and constructed in accordance with the applicable ASME B31 Piping Code.

2. When service conditions, such as pressure and temperature, of an existing installation require re-evaluation, the review of the new service conditions must be performed by the Design Representative to determine the impact of these new conditions on design, construction, examination, and inspection.
3. For pressure vessels and boilers, the Design Representative shall summarize the design, material, examination, testing, and Code requirements on the drawings using a Pressure Vessel Specification Table (See Section 20 for a typical example).
4. The Registered Professional Engineer shall approve a design by applying his/her Seal to the design documents and ensure that every technical detail required for successful completion of the project, including parts list (with QA requirement), welding instructions, construction standards, examination, testing, quality control and code requirements are included.
5. When registration of the design is required with the Regulatory Authority, no Fabrication shall commence unless design registration is complete or prior approval has been received from the Authorized Inspector.

6.4.3 Deviations from the Code

1. All deviations from the requirements of the applicable codes and Standards shall be submitted by the Design Representative to the Regulatory Authority for approval.
2. One copy of all related correspondence shall be forwarded to WL Records staff for filing in the appropriate Registration File.

6.4.4 Release of Design Output

Procedures for releasing approved design output shall conform to applicable procedures listed in WLD-508120-GDI-001 [6], WL Engineering Governing Documentation Index and 900-508120-GDl-001 [7], Governing Documentation Index Design Authority & Design Engineering.

6.4.5 Design by External Suppliers

1. For pressure vessels and systems designed off-site, the Design Representative shall specify all applicable regulatory, design, and documentation requirements.
2. Supplier-generated designs for pressure retaining components or vessels from an external supplier may be reviewed by the Design Representative. Designs found not to be in compliance with the Code or Design Representative's requirements shall be returned to the Supplier for amendments/corrections prior to the start of any manufacturing activities.

6.4.6 Design or Manufacture for External Customers

For pressure retaining components or systems to be designed or manufactured for external customers, a representative from the Branch supplying the component or service shall contact the Design Representative and a QCR so that competent persons can be assigned to review any engineering documents/specifications submitted by an external customer, prior to any detailed design or construction, for adequacy and Code conformance. Customer documents found not to be in compliance with the Code shall be returned to the customer for amendment prior to the start of design or manufacturing activities. Design, construction or repair of such components and systems shall be performed in accordance with this Quality Program.

6.4.7 Change Control

1. The method used to control changes to approved engineering documents shall meet applicable requirements as specified in Engineering Change Control, 900-508130-MCP-001 [8].
2. A change in design may be initiated as the result of a proposed modification or alteration in the original design or existing pressure component/system, or due to a repair to be performed during manufacturing, construction or service of the component/system.
3. The Design Representative shall submit the revised design to the Regulatory Authority for prior approval/registration using the procedure described in Section 7 of this QAP. Revised Design documents may be issued for use only after obtaining approval from the Regulatory Authority.

7. DESIGN REGISTRATION

7.1 Scope

This section of the QAP applies to registration of designs of pressure retaining components and systems with the Regulatory Authority.

7.2 Purpose

To outline the procedures to follow and to define responsibilities when design registration is required for pressure retaining components or systems which must meet requirements of CSA Standard B51 and/or the Regulatory Authority.

7.3 Responsibilities

7.3.1 Design

1. The Design Representative is responsible for registration of the design of pressure retaining components and piping systems at WL. The design is registered in accordance with requirements of the applicable Code and/or Regulatory Authority.
2. WL Records staff is responsible for:
   a. Retaining the registered design and related documents, and
   b. Preparing and retaining the Registration File as outlined in Section 16.

7.4 Procedure

7.4.1 General

The design, construction, repair, alteration, and operation of pressure retaining systems and components are subject to the provisions of the Steam and Pressure Plants Act of Manitoba, and other applicable provincial regulations.

7.4.2 Design Registration

1. Where registration is required, the design of pressure vessels, boilers, piping or components to be manufactured in accordance with the Code shall be submitted to the Regulatory Authority for approval and registration in accordance with the requirements of the Regulatory Authority.
2. When a design is found defective by the Regulatory Authority in any detail, the Design Representative shall revise it to the satisfaction of the Regulatory Authority and re submit it for registration.
3. When the Regulatory Authority has approved the design and assigned it a Canadian Registration Number (CRN), a stamped copy of the design documents shall be returned to WL Engineering.
4. As standard procedure, a "Hold Point" shall be designated on ITP/MITP's for the Authorized Inspector to witness pressure testing of components and systems. A copy of the applicable ITP/MITP shall be forwarded to the Regulatory Authority for approval only when specifically requested by the Regulatory Authority. The Regulatory Authority may designate Hold Points on the ITP/MITP for additional activities to be verified or inspected by the Authorized Inspector.
5. Upon receipt of the registered and approved design from the Regulatory Authority, the Design documents shall be filed in the appropriate Registration File by WL Records staff.

7.4.3 Registration of Existing Piping Systems

Existing piping systems, which fall under CSA B51 requirements and were constructed and operating prior to 1996 January 01, will not require registration.

7.4.4 Design Registration for Alteration and Repairs

Unless permitted in Section 7.4.5.2 changes to registered pressure retaining components and systems which require alteration of the design shall require approval or re registration by the Regulatory Authority. Details for procedures to follow for alteration and repair are included in Section 11, Alteration and Repair.

7.4.5 Systems Exempt from Design Registration

By prior agreement with OFC, ITS, several specific systems at WL do not require CSA B51 design registration as per agreements contained in TN-49W82-2 [9], WL Pressure Vessel and System Compliance. Several system at WL are also exempt from registration due to CSA N285 Annex F clause. General descriptions of these systems are given below.

7.4.5.1 System Exemptions

1. Experimental facilities tubing systems which will otherwise be constructed to the applicable requirements of this Quality Control Program.
2. Experimental "Black Box" sections or components that do not fall within the scope of CSA B51. As examples, this would include items such as non-code materials evaluations or components that are designed for destructive failure evaluations.
3. Water, or water and glycol heating system pressures not exceeding 1.103 MPa (160 psig) and temperatures not exceeding 120°C (250°F). These systems shall otherwise be constructed to the applicable requirements of this Quality Program.
4. Compressed air systems up to and including ¾" diameter tubing connected together by means other

than welding or brazing. These systems shall otherwise be constructed to the applicable requirements of this Quality Program.

5. Pneumatic control systems, including control systems for experimental loops and facilities, as well as on heating, ventilation and air conditioning systems.
6. Systems will be registered on a loop or facility basis, as opposed to an individual system basis.

7.4.5.1.1 System Exemptions Based on CSA N285.0-08

1. Systems containing liquids not more hazardous than water, with a design pressure not exceeding 1.72 MPag (250 psig) and a design temperature not exceeding 65 C (150 F).
2. Chilled water cooling system pressures not exceeding 1.103 MPa (160 psig) and temperatures higher than -29^{o} C (-20^{o} F). These systems shall otherwise be constructed to the applicable requirements of this Quality Program

7.4.5.1.2 Fitting Exemptions

1. Exemption from Registration Requirements for Categories A, B, C and G category Fittings as per Safety Bulletin OFC ITSM 18-001 [10].
   a. Piping components complying with the standards and specifications listed in ASME B31 Pressure Piping Codes, as identified in Category A, B and C below:
      - **Category A**- Pipe fittings, including couplings, tees, elbows, wyes, plugs, unions, nipples, pipe caps, and reducers complying with a standard listed in Table 126.1 of ASME B31.1, Table 326.1 of ASME B31.3, Table 526.1 of ASME B31.5, or Table 926.1 of ASME B31.9
      - **Category B**- Flanges complying with a standard listed in Table 126.1 of ASME B31.1, Table 326.1 of ASME B31.3, Table 526.1 of ASME B31.5, or Table 926.1 of ASME B31.9
      - **Category C**- Valves complying with a standard listed in Table 126.1 of ASME B31.1, Table 326.1 of ASME B31.3, Table 526.1 of ASME B31.5, or Table 926.1 of ASME B31.9

   b. Certified pressure relief devices complying with ASME Boiler and Pressure Vessel Codes, as identified in Category G below:
      - **Category G**- Pressure-relief devices marked with an ASME or NB stamp.

   c. CGA fittings for pressure regulator applications.

7.4.5.2 Minor In-Service Repairs and/or Alterations to Piping Systems

Minor Modifications are defined as:

> “small piping changes only (re-routing or adding lines, addition/replacement of valves and other equipment, addition or replacement of instrumentation, addition or replacement of pumps, etc.)”

Minor in service repairs and/or alterations to piping systems do not require individual approval by the Regulatory Authority, provided the following conditions are met:

1. The design of such modifications/alterations is reviewed by the Design Representative to ensure Code compliance.
2. Minor repairs and alterations are performed in accordance with the applicable requirements of this Quality Program.

7.4.5.3 Exemptions Listed By the Inspection & Technical Services

ITS lists systems that do not require registration, specifically piping systems under 17 ft^3 in volume. Design and construction of systems under 17 ft^3 in volume are to be performed in accordance with the applicable requirements of this Quality Program.

See the Inspection and Technical Services website [11] for the latest information and requirements for systems under 17 ft^3.

8. MATERIAL CONTROL

8.1 Scope

This Section of the QAP applies to the procurement, receipt, storage, and handling of material used for fabrication, alteration and repair of boilers, pressure vessels, fittings, or piping systems which must meet requirements of CSA Standard B51.

8.2 Purpose

To document standard procedures followed for procurement, receipt, storage, and handling of Code materials.

8.3 Procedure

8.3.1 General Requirements

Requirements for procurement and control of material to be used for general construction of components are specified in WL Operating Procedure WL-508238-OP-003 [12], Obtaining and Controlling Material. The same requirements, as may be modified in the following Sections, shall be followed for control of material used for the construction of pressure retaining components and systems.

8.3.2 Material Requirements

1. The Design Representative is responsible for producing a Bill of Materials and Technical Specifications for material or fittings to be used in the construction of pressure retaining components or systems. Specifications for material shall include all applicable quality program, examination and inspection, dimensional and identification, documentation, and regulatory requirements.
2. Material selected and specified by the Design Representative shall be limited to those permitted by the applicable Codes mentioned in this QAP. The Bill of Materials shall specify the applicable ASME or ASTM Standard or Specification for the material.
3. Where required (See Section 7.4.5.1.2 for Fitting Exemptions) only pressure retaining components and fittings with a Canadian Registration Number (CRN) from the Province of Manitoba, or the Regulatory Authority in the Province of installation shall be used for construction of piping systems.
4. In the case where a Canadian Registration Number (CRN) number for Manitoba is required and not available then the Design Representative shall prepare and submit an application for exemption to Regulatory Authority. The application should include the CRN for any other Province/Territories in Canada if available, description of component and system it is being used on.
5. The Design Representative must approve any deviations from the Bill of Materials before such material is used.

6. Material Test Reports, traceable to the material and meeting requirements of the specification, shall be provided when required by applicable ASME Codes.

8.3.3 Procurement

8.3.3.1 General Procedure

General requirements for control of material procurement are defined in WL Operating Procedure WL-508238-OP-003 [12], Obtaining and Controlling Material. The procedure covers the following points:

1. Requisitioning of WL Stores Stock material,
2. Procurement of Non-Stores Stock material,
3. Responsibilities and
4. Material Control.

8.3.3.2 Stores Stock Material

Stores are responsible for re-ordering stock material. An automated procurement system generates the orders either directly or through blanket order contracts set up by the WL Purchasing Group. The Supply Chain Program Requirements Document, 900-505210-PRD-001 [13] and all applicable procurement procedures shall be followed. When required Quality Program Selection (QPS) Form [14], Supplementary Information Form (SIF) [15] and revisions to same, are either prepared or reviewed by the Design Representative.

8.3.4 Receiving Inspection

1. When material is delivered, it shall be received and handled by Stores.
2. Stores shall assign a traceability receipt number to the order received. They shall then raise a Quality Control Work Request (QCWR) identified with the same traceability receipt number, and forward it, along with a copy of the Receipt Traveler, to WL Quality Control to initiate receiving inspection of the material.
3. The QCR shall assign an additional traceability Inspection Request Report (IRR) number to the order, and perform receiving inspection to requirements of the Purchase Order, and in accordance with WL-508244-OP-003 [13], General Procedure for Receiving Inspection.
4. The QCR shall verify documentation, including Material Test Reports and Certificate of Compliance, and identification and markings on materials. The QCR shall perform any other inspection required by the Purchase Order or referenced Code Specification.
5. The QCR shall indicate acceptable material by affixing an Accept tag and/or QA Accepted label to the material, and/or container. The receipt number and the IRR number and where applicable the heat number shall be marked on the QA Accepted Tag.

8.3.5 Nonconforming Material

Nonconforming material shall be dealt with as described in Section 10 of this QAP.

8.3.6 Storage of Material

Following acceptance by Receiving Inspection, code material purchased for a specific job shall be stored in a designated storage area, or shall be released to direct control of the Job Contact, Planning Coordinator or Foreman in accordance with the WL Operating Procedure WL-508238-OP-003 [12], Obtaining and Controlling Material. Code material purchased for in-field stock shall be traceable, properly identified.

8.3.7 Inspection Records

The QCR shall maintain a listing of Inspection Request Reports and Material Test Reports pertaining to receiving inspection of material and fittings in accordance with WL Operating Procedure WL-508244-OP-003 [13], General Procedure for Receiving Inspection.

8.3.8 Material Control during Construction

Material to be used during construction of pressure retaining components and systems shall be identified and controlled in accordance with WL Operating Procedure WL-508238-OP-003[16], Obtaining and Controlling Material.

9. EXAMINATION AND INSPECTION PROGRAM

9.1 Scope

This Section of the QAP applies to the examination and inspection program and work planning process associated with the manufacture, installation, repair, replacement, and modifications of pressure retaining components in the shop and the field to the requirements of CSA B51.

9.2 Purpose

To describe the procedures used to ensure that examinations, inspections, and tests of pressure retaining components and systems are performed to the requirements of the applicable Codes and Standards.

9.3 Responsibilities

1. The Design Representative shall specify the extent and acceptance criteria for examination and inspection required on pressure retaining components and systems.
2. When required the QCR is responsible for the preparation of an Inspection and Test Plan (ITP) for the job. He/she shall ensure that the ITP describes all examinations and tests required by design documents and customer documents, when applicable. The Work Control Manager and QA Specialist shall review all revisions of ITP and approve the ITP prior to release to the field.
3. The Design representative is responsible for submitting the ITP to the Authorized Inspector when required.
4. The Job Contact or delegate is responsible for the construction of pressure retaining components and systems per design requirements. He/she shall ensure compliance with requirements of this Quality Control Program.
5. The QCR is responsible for performing examinations and tests specified in design documents and the ITP, and for reporting acceptance or rejection of tests.

9.4 Procedure

9.4.1 Construction Activities

General procedures for inspection and testing during construction activities are described in various procedures for Quality Control. These procedures are supplemented by requirements in the following paragraphs for Inspection and Test Plans, pressure testing, non-destructive testing, and initial service testing.

9.4.2 Inspection and Test Plans

1. Construction operations, examinations, and inspections are planned prior to the start of work and the results of examinations are documented. These actions are normally accomplished through the issue of an ITP for a job on a registered system. Preparation of ITP is done using Operating Procedure WL-508238-OP-001 [16], Preparation of Inspection & Test Plans.
2. The approved ITP and applicable drawings are stored into the Red file (WLD-511300-PRO-002 [5], Construction Documents & Record Control). Under control of the Job Contact, the Red file follows the work through the construction, examination, and inspection operations. Final ITP signoff to be done by Work Control Manager, QCR & Job Contact.
3. The Regulatory Authority may enter “Hold Point” on the ITP or drawing (See Section 7 Design Registration). Construction shall not proceed past such points without Authorized Inspector (AI) approval.
4. The Job Contact or Work Control Manager shall notify the QCR when the component or system is ready for AI “Hold Point” inspection or pressure testing. The QCR shall ensure the component or system is ready for “Hold Point” inspection prior to notifying the AI, and shall be present during the inspection.
5. The Design Representative and/or QCR shall notify the AI at least 48 hours in advance for “Hold Point” inspection or pressure testing.
6. Where required by code or for registered systems, pressure testing of repaired or altered components and systems shall be witnessed and accepted by the QCR and test records shall be maintained for AI verification. When required, the AI will witness pressure testing of repaired pressure vessels.

9.4.3 Non-Destructive Testing

Procedures for non-destructive testing of pressure retaining components and systems are referenced in Section 13 Non-Destructive Examination, in this QAP.

9.4.4 Pressure Testing

9.4.4.1 Hydrostatic Testing

Hydrostatic Testing shall be performed in accordance to the requirements provided in the applicable codes:

- ASME B31.1
- ASME B31.3
- ASME B31.9
- ASME Section I
- ASME Section IV

- ASME Section VIII, Division 1
- NFC

A dial indication pressure gauge shall be directly connected in an upright position to the component (preferably at the highest point). If the indicating gauge is not readily visible to the operator controlling the pressure being applied, an additional indicating gauge shall be provided that is visible to the operator throughout the duration of the test. Gauges used in testing shall be graduated over a range not less than 1 ½ or more than 4 times the test pressure. All test gauges shall be calibrated by qualified personnel against a standard dead weight tester, a calibrated master gauge, or a mercury column at least once every three months (or before testing when gauges are not in regular use). The calibration of the test gauge shall be traceable to the National Institute of Standards and Technology or to the National Research Council of Canada.

Suitable precautions shall be taken during testing to minimize the possibility of injury to personnel. These precautions shall include:

1. Pressurized equipment shall not be left unattended during testing,
2. Pressurized components shall be properly vented of all air and gases,
3. No heat shall be applied to pressurized components during testing,
4. Testing shall not be done in direct sunlight,
5. Isolation of the testing equipment from testing personnel (by distance, barriers, testing pit, etc.) shall be established by the Design Representative, and incorporated during testing and
6. Warning signs shall be posted at the exclusion zone and shall remain in position for the duration of the test.

Where required by the applicable codes listed above or for registered systems, a Hydrostatic Test Report shall be completed by the QCR and retained as a Quality Record (See Section 20, Sample Forms List). When required, the AI will be notified prior to pressure testing by the QCR.

9.4.4.2 Pneumatic Testing

Pneumatic Testing shall be performed in accordance to the requirements provided in the applicable codes:

- ASME B31.1
- ASME B31.3
- ASME B31.9
- ASME Section VIII, Division I

A dial-indicating pressure gauge shall be directly connected in an upright position to the component (preferably at the highest point). If the indicating gauge is not readily visible to the operator controlling the pressure being applied, an additional indicating gauge shall be provided that is visible to the operator throughout the duration of the test. Gauges used in testing shall be graduated over a range not less than 1 ½ or more than 4 times the test pressure. All test gauges shall be calibrated by qualified personnel against a standard dead weight tester, a calibrated master gauge, or a mercury column at least once every three months (or before testing when gauges are not in regular use). The calibration of the test gauge shall be traceable to the National Institute of Standards and Technology or to the National Research Council of Canada.

Suitable precautions shall be taken during testing to minimize the possibility of injury to personnel. These precautions shall include:

- Isolation of the testing equipment from testing personnel (by distance, barriers, testing pit, etc.) shall be established by the Design Representative, and incorporated during testing,
- Warning signs shall be posted at the exclusion zone and shall remain in position for the duration of the test,
- Testing shall not be done in direct sunlight,
- The application of pressure during the test shall be as outlined in the applicable Code,
- Pressurized equipment shall not be left unattended during testing,
- No heat shall be applied to pressurized components during testing and
- The test equipment must allow for a controlled release of pressure upon completion of testing.

Where required by the applicable codes listed above or for registered systems, a Pneumatic Test Report shall be completed by the QCR and retained as a Quality Record (See Section 20, Sample Forms List). When required, the AI will be notified prior to pressure testing by the QCR.

All pneumatic testing must be performed using a written procedure that is acceptable to the Authorized Inspector.

9.4.4.3 Initial Service Testing

Initial Service Testing shall be performed in accordance to the requirements provided in the applicable codes:

- ASME B31.1
- ASME B31.3
- ASME B31.9
- NFC

A dial-indication pressure gauge is not required for initial service testing. The QCR must be assured that the system is at normal operating pressure.

Where the applicable codes listed above allow, an initial service may be completed in lieu of a hydrostatic or pneumatic test. Where required by the applicable codes or for registered systems, the initial service test shall be recorded on a Hydrostatic/Pneumatic Test Report form by the QCR and retained as Quality Record. (See Section 20, Sample Forms List).

9.4.5 Inspection Stamps

1. Two styles of inspection stamps are in use, in both the acceptance and rejection form. These are rubber sets for marking on paper, and metal blunt-nosed low-stress sets. The procedure for controlling inspection stamps is described in Operating Procedure WL-508244-OP-010 [17], Managing Quality Control Stamps at Whiteshell Laboratories.
2. Each QCR who performs non-destructive examination shall be assigned a set of stamps.

9.4.6 Pressure Vessel Name Plate

1. A Name Plate (See Section 20) shall be attached to all registered pressure vessels constructed.

Appropriate Name-plate data shall be provided to the Job Contact by the Design Representative. The Job Contact shall enter the data and affix the Name Plate to the vessel.

2. Name Plate data shall be verified by the QCR.

10. CORRECTION OF NON-CONFORMANCES

10.1 Scope

1. This section covers material not conforming to specification, policy, procedures or design requirements. It establishes the responsibilities of personnel engaged in the detection, identification, segregation, and disposition of nonconforming material.
2. This section applies to material and work performed on material from receipt of the order to completion of work. This section also applies to work carried out on material returned by the customer.

10.2 Purpose

To provide control of items from the time of identification of the non-conformance until the non-conformance has been resolved; to provide assurance that the specifications and design requirements are met and nonconformities are fully investigated, properly dispositioned, and recorded.

10.3 Procedure

10.3.1 General Requirements

Requirements for control of non-conformances for construction of any components are specified in WL Operating Procedure WL-508238-OP-005 [18], Control of Non-conformances. This procedure covers non-conformances detected during receiving inspection, in process, and final inspection.

1. Nonconforming material is identified by a “HOLD” tag (optional for “Rework” items). Rejected or scrapped material is identified by a “REJECT” tag and/or reject stamp. Only a QCR is allowed to authorize the removal of either a “REJECT” or “HOLD” tag.
2. The QCR controls quarantine areas for storage of nonconforming items. When conditions such as size or contamination risk exist, segregation by means of a “HOLD” Tag may be used in lieu of storage in the quarantine area.
3. General rules for distribution and dispositioning of Non-conformance Reports (NCR) are addressed in WL Operating Procedure WL-508238-OP-005 [18], Control of Non-conformances
4. The Branch responsible for performing the repair is responsible for preparing repair instructions. Repair instructions may also be suggested by other functional groups. In any case, repair instructions shall be included as part of the disposition on the NCR, or as a separate attachment to the NCR. The Work Control Manager or Design Representative shall approve the repair procedure.
5. The Design representative is responsible to ensure the inspector is notified for concurrence (where Authorized Inspector involvement is required)

10.4 Record Management

Upon completion of the non-conformance, the QCR enters the NCR information into Improvement Action (ImpAct). The purpose is to document any non-conformances as outlined in 900-514000-MCP-004 [19], Improvement Action (Impact) Corrective Action Program. The entry of this data provides an electronic record of the NCR and allows trending of the non-conformances. When this step is completed the QCR forwards the completed NCR to WL Records for archival.

11. ALTERATION AND REPAIR

11.1 Scope

This section applies to alteration or repair of pressure retaining components and systems which must meet requirements of CSA Standard B51.

11.2 Purpose

To provide a documented system for the control of alterations or repairs of pressure retaining components and systems, and to provide assurance to the Regulatory Authority that the alteration or repair is performed in a safe manner in compliance with CSA B51 requirements.

11.3 Procedure

1. Unless stated otherwise, other requirements of this QAP, for example, Material Control, Design Calculations, Change Control, etc., shall apply equally to Alteration and Repair procedures.
2. Alteration or repair shall not be performed without the approval of a Design Representative.
3. Any change to the original registered design initiated due to alteration or repair shall be approved by and registered with the Regulatory Authority in accordance with change control procedures, (See Section 6 of this QAP).
4. Pressure Vessels and Boilers:
    a. When an alteration or repair is to be performed on a pressure vessel or boiler, the Design Representative shall complete the Alteration or Repair Record Form, Pressure Vessels (See Section 20, Sample Forms List). The Design Representative shall submit the form to the Regulatory Authority for approval prior to its execution.
5. Pressure Piping:
    a. With the exception of Section 11.3.2, for alteration or repair to registered pressure piping systems, the Design Representative shall complete the Alteration or Repair Record Form, Piping Systems (See Section 20 Sample Forms List). When required by the AI, the Design Representative shall obtain approval from the Regulatory Authority prior to its execution.
6. Pressure Fittings:
    a. With the exception of Section 11.3.2, for alteration or repair to registered pressure fittings, the Design Representative shall complete the Alteration or Repair Record Form, Fittings (See Section 20 Sample Forms List). When required by the AI, the Design Representative shall obtain approval from the Regulatory Authority prior to its execution.
7. The Design Representative shall maintain a record of alteration or repair for future reference by the

Regulatory Authority.

8. An Inspection and Test Plan (Traveler) is required to be developed and presented to the Authorized Inspector for review and designation of hold points prior to the commencement of work.
9. The Design Representative is responsible the hydrostatic testing of a repair or alteration and shall be performed in accordance with the requirements contained within the NBIC.
10. Authorized Inspector is to be notified in advance of any pressure testing to be performed.

11.3.1 Weld/Braze Repairs

1. Refer also to Section 12 - Welding/Brazing Control for more specific weld/braze repair requirements.
2. For weld/braze repairs, the Work Control Manager shall, when required, prepare and qualify appropriate repair and welding/brazing procedures with the Regulatory Authority. Approval by the Design Representative for such procedures is required prior to submission to the Regulatory Authority.
3. As a minimum requirement, weld/braze repair shall be subjected to the same non-destructive examination as the original weld/brazed joint. Examination and test records of repairs shall be maintained for AI verification.

11.3.2 Minor In - Service and/or Alteration to Piping Systems

Minor Modifications are defined as:

“small piping changes only (rerouting or adding lines, addition/replacement of valves and other equipment, addition or replacement of instrumentation, addition or replacement of pumps, etc.). No work will be undertaken involving repairs or alteration to registered boilers or pressure vessels without first obtaining approval from the Inspection & Technical Services (ITS).

As stated in Section 7, Design Registration, Minor in-service repairs and/or alterations to piping systems do not require individual approval by the Regulatory Authority provided the following conditions are met:

1. Minor repairs and alterations meet the original design conditions
2. Minor repairs and alterations are performed in accordance with the applicable requirements of this Quality Program.

12. WELDING/ BRAZING CONTROL

12.1 Scope

This section applies to welding and brazing processes for pressure retaining components and systems.

12.2 Purpose

The purpose of this procedure is to ensure that welding and brazing processes meet the requirements of Section IX of the ASME Boiler and Pressure Vessel Code and the applicable Code of Construction of the ASME Code.

12.3 Procedure

Welding/brazing shall conform to the requirements of Section IX of the ASME Boiler and Pressure Vessel Code and to additional requirements of the applicable Code of Construction of the ASME Code.

12.3.1 Welding/Brazing Procedure Specifications and Procedure Qualification Records for In-House Welders

The WL Work Control Manager:

1. Shall develop a generic WPS/BPS, for each specific process.
2. Shall arrange and conduct welding/brazing procedure qualification tests in the presence of the AI. Welding/brazing processes, base materials, and consumables shall be in accordance with the requirements of ASME Section IX.
3. Shall arrange the required tests and examinations of the weld/braze.
4. Shall record the results of tests and examinations in the PQR.
5. Shall certify the PQR and submit it to the AI for approval and registration.
6. Shall file the registered PQR in the appropriate Records file.
7. Shall maintain a current list of WPSs/BPSs and PQRs (to be located in the WL Records Vault).

12.3.2 Qualifications of In-House Welders/Brazers

The Work Control Manager:

1. Shall develop a generic WPS/BPS, for each specific process.
2. Shall arrange and conduct welder/brazer qualification tests by third party company possessing a Certificate of Authorization to perform welder/brazer performance testing. Welding/brazing processes, base materials, and consumable shall conform to the requirements of ASME Section IX. Welder/brazer qualification tests shall be performed in accordance with a registered WPS/BPS and production welds shall not be used when welder testing is required.
3. Shall arrange the required tests and examinations of welder/brazer specimens.
4. Shall record the results of tests and examinations in the welder/brazer qualification record.
5. Shall submit the welder/brazer qualification record to the AI for approval and registration.
6. Shall file the registered welder/brazer qualification record in the appropriate records file.
7. Shall issue an identification stamp to each welder/brazer qualified.
8. Shall maintain a current list of welder/brazer qualification records and shall ensure a record is kept of the processes used by each welder/brazer to maintain their qualified status.
9. Shall submit the documentation to the Jurisdiction for issuance of the welder’s license on behalf of the welder and to ensure the license is restricted to this QCP
10. Shall have the pressure welders/brazers re-qualified as per the Manitoba Steam and Pressure Plants Act S210 by third party company possessing a Certificate of Authorization to perform welder/brazer performance testing upon expiry. The welder/brazer shall also be requalified, in accordance with ASME Section IX QW-322.1 and QB-322 when one of the following conditions occurs:
    a. The welder/brazer has not performed the process for a period of six months.

b. There is a specific reason to question the ability of the welder/brazer to perform the process to meet the specification.

11. Authorized Inspector has the right to require re-qualification of the welder

12.3.3 Qualification of Contract Welders

1. All Contract Welding Companies shall have a quality control program and qualified welding procedures certified and registered with ITS. The Contract Welder shall provide copies of these documents to the Work Control Manager.
2. The Work Control Manager is responsible for verifying that the contract welder has valid licenses for the weld procedures he/she has been hired to perform.
3. The Contractor shall provide a copy of the welder's license and a copy of the Weld Procedure Specification and the PQRs. These copies will be placed in the PITP/MITP.

12.3.4 Performance of Welding/Brazing Work by In-House Welders

1. The Design Representative will specify joint configuration and when and if applicable, weld process, and acceptable consumables for each weld on the drawings.
2. The QCR shall prepare a job-specific WPS for each welding job, and the Work Control Manager shall approve it. The job-specific WPS shall be supported by, and be referenced to, an existing PQR.
3. All changes to essential, supplementary essential or nonessential variables of WPSs/BPSs shall be controlled by revision number and date.
4. The Work Control Manager shall control the issue and distribution of WPSs/BPSs.
5. The Work Control Manager shall ensure the welder/brazer and the WPS/BPS used in production are within their range of qualification.
6. The welder/brazer shall ensure:
   a. He/she is licensed for the specific process to be used.
   b. The specified WPS/BPS and materials are used.
   c. Consumables are ordered with correct SFA and AWS designation, stored and traceability is maintained in accordance with WL Working Procedure WLCS-01913-WP-2203 [20], Control of Brazing/Welding Consumables and that for low-hydrogen electrodes, maximum time exposure from the oven or sealed package shall be not greater than four hours. The welder/brazer is also responsible for the issue and return of welding material.
   d. Work is identified by the welder/brazer identification symbol in accordance with the requirements of the WL Working Procedure WLCS-01913-WP-2202 [21], Control of Brazing/Welding Processes.

12.3.5 Performance of Welding/Brazing Work by Contract Welders

1. The Design Representative in consultation with the QCR and Work Control Manager will specify joint configuration, weld process, and acceptable consumables for each weld on the drawings.

7. The Work Control Manager shall ensure that the Contract Welder has the required qualifications for the requested welds.
8. Consumables used by the Contract Welder shall be controlled by the Pipefitters Lead Hand in accordance with WLCS-01913-WP-2203 [20], Control of Brazing/Welding Consumables.

9. The Job Contact shall ensure;
    a. Contract welders have proper supervision
    b. The specified WPS/BPS and materials are used.
    c. Work is identified by the welder/brazer identification symbol in accordance with the requirements of WLCS-01913-WP-2202 [21], Control of Brazing/Welding Processes.

12.3.6 Weld/Braze Repairs to Base Material or Components

1. When a base material or component is found to be defective, repair shall be carried out in accordance with Section 10, Correction of Non-conformances.
2. The Work Control Manager shall prepare a repair procedure for weld/braze repairs to base materials or components. The procedure shall include, where required by the applicable ASME Code of Construction, the method of removal of defects, thermal preheat and post-weld heat treatment, the proposed WPS/BPS, examination requirements, and other precautions to be taken. The weld procedure shall be approved by a Design Engineer.
3. If required, the Design Representative shall obtain Regulatory Authority approval before performing the repair (See Section 11 of this QAP).
4. The type and extent of examination shall, at least, be the same as for the original material and the applicable Section of the ASME Code.

12.3.7 Rework of the Welds/Brazed Joints

The following condition constitutes a “Rework” to pressure retaining components or systems: “the correction of defects in weld/braze material, identified non-destructively during construction. A rework procedure will be required if the original weld/braze procedure specification cannot be used.”

12.3.8 Tack Welds

Tack welds, and joining of brackets and other attachments to pressure retaining materials shall be carried out by qualified welders. Tack welds shall be visually examined by QC for defects based on the acceptance criteria specified on the design drawings. Tack welds found to be acceptable shall be properly prepared by grinding the welds at both ends (start and stop) and incorporated into the final weld. Besides grinding, other suitable means of weld preparation may be utilized. Rejected tack welds shall be removed. The Work Control Manager shall assign an appropriate and qualified WPS for such welds.

13. NON-DESTRUCTIVE EXAMINATION

13.1 Scope

This section applies to Non-Destructive Examinations (NDE) of pressure retaining components & systems which must meet requirements of CSA Standard B51.

13.2 Purpose

To describe the system in use for control of non-destructive examination of pressure retaining components and systems.

13.3 Responsibilities

1. The Design Representative shall specify the extent and acceptance criteria for examinations required on pressure retaining components and systems. For pressure retaining components and systems manufactured to an external customer's design documents, the applicable Customer Representative shall ensure that examination & test methods and their extent and acceptance criteria are specified in the design documents.
2. When NDE is to be conducted by a contractor under a Purchase Order, the Requisitioner, normally the QCR, shall furnish Purchasing with a Purchasing/Quotation Requisition, identification/ traceability requirement and applicable Technical Specifications for the NDE.
3. The QCR is responsible for performing and/or overseeing the required non-destructive examinations. The QCR is also responsible for making the all NDE results, including film and interpretation sheets available for review and acceptance by the Authorized Inspector upon request by the AI.
4. The authorized Inspector has the right to require re-qualification of the NDE personnel and procedures if necessary.
5. The Work Control Manager is responsible for appointing the NDE examiner who is a contracted, permanent or non-permanent staff with required qualifications below.

13.4 Personnel Qualifications

1. Personnel performing NDE shall be certified to Non-Destructive Testing (NDT) Level I, NDT Level II, or NDT Level III requirements as per Standard CAN/CGSB 48.9712 [22], Nondestructive Testing Qualification and Certification of Personnel. Contract, permanent or non-permanent staff shall meet these requirements.
2. NDE personnel qualification records shall be maintained by the Quality Control Representative.

13.5 Procedures

13.5.1 NDE Procedures

1. NDE procedures shall meet the requirements of ASME Code Section V, and other ASME Code Sections as applicable. Applicable operating procedures are listed below:
   - WL-508244-OP-008 [23] Magnetic Particle Examination
   - WL-508244-OP-009 [24] Liquid Penetrant Examination
   - WL-508244-OP-006 [25] General Procedure for Visual Examination of Welds
2. Visual inspection of welds shall be performed in accordance with requirements of the applicable ASME Code Section and WL-508244-OP-006 [25], General Procedure for Visual Examination of Welds.
3. Specific NDE techniques required by Code shall be filed in WL Records by the QCR for use.

14. HEAT TREATMENT

14.1 Scope

This section applies to heat treatment of materials requiring conformance to CSA Standard B51.

14.2 Purpose

This procedure establishes controls to ensure that heat treatment operations carried out on material, components, and assemblies meet the requirements of the applicable ASME Code.

14.3 Responsibility

The Work Control Manager shall ensure that heat treatment is carried out as required by Design specifications/drawings, and that heat treatment records are generated and verified.

14.4 Procedure

14.4.1 General

1. Technical specifications or drawings, approved by the Design Representative, shall furnish the technical requirements for heat treatment. The specifications shall meet requirements of applicable Codes and jurisdictions.
2. Heat treatment records shall be generated showing results of the heat treatment operation, for example, thermal cycle chart and chronological time and temperature log. The records shall be traceable to the heat treated item and the job specification/drawing, and shall be signed and dated by the Operator.
3. The QCR shall verify heat treatment records to ensure compliance with the specifications. The records shall be made available to the AI for reviews, when required.

14.4.2 WL Heat Treatment

1. When heat treating is to be conducted by WL personnel, the Work Control Manager is responsible for preparing a heat treatment procedure to meet the requirements of the job specification and the applicable Section of the ASME code, and indicating quality control requirements on the ITPs.
2. The Instrumentation Group is responsible for maintenance and calibration on a scheduled basis of furnace controls and recording instrumentation which is used in heat treatment operations.

14.4.3 Contractor Heat Treatment

1. When heat treatment is to be conducted by a contractor under a Purchase Order, the Requisitioner, normally the Job Contact or the Work Control Manager, shall furnish Purchasing with a Purchasing/Quotation Requisition, identification/ traceability requirement and applicable Technical Specifications for the heat treatment.
2. The Design Representative shall approve the Purchase/Quotation and Technical Specifications prior to issue of the order. The contractors shall provide calibration certificates for all heat treatment instrumentation for acceptance by the design representative.
3. The Work Control Manager or Design Representative shall accept the contractor’s heat treatment procedure prior to the start of heat treatment.
4. The contractor’s heat treatment procedure shall include instructions for proper placement of thermocouples.

14.4.4 Records

Records pertaining to heat treatment shall be maintained in the Job File for the part that was heat treated.

15. CALIBRATION OF MEASURING AND TEST EQUIPMENT

15.1 Scope

This section applies to measuring and test equipment used for pressure retaining components and systems.

15.2 Purpose

The purpose of this section is to document a system used to ensure the accuracy of measuring and test equipment.

15.3 Application

Specifically, this procedure applies to:

1. Reference Measurement Standards, e.g., ring gauges, gauge blocks
2. Dead weight testers,
3. Test pressure gauges,
4. Final point inspection measuring and test equipment (QC tools),
5. WL Work Control Branch measuring and testing - equipment,
6. Non-destructive testing equipment, and
7. Torque Wrenches.

15.4 Responsibilities

Both the Quality Control of the WL Licensing and Quality Management Branch and the Instrumentation Group of the WL Work Control branch have measuring and test equipment that is used in the inspection, manufacturing, or monitoring the operation of pressure vessels and pressure retaining components. These groups have different responsibilities but, must calibrate their equipment to a similar quality level.

15.4.1 Quality Control Representative

The QCR shall perform the following activities in accordance with WL-508237-OP-001 [26], Quality Control Calibration Procedure.

1. Develop and maintain a calibration recall system encompassing M&T equipment requiring periodic calibration.
2. Develop and maintain written instructions for calibration of measuring and test equipment.
3. Perform and report calibrations as required. This responsibility includes retrieval of the specific piece of measuring and test equipment that has been called up for calibration.
4. Maintain quality records showing calibration reports traceable to the measuring and test equipment, and, ultimately, to a reference measurement standard.
5. M&T equipment are typically replaced rather than repaired. In the case that M&T equipment was repaired the QCR Shall maintain a “Repairs Log Book” that will list the status of all M&T equipment

which has been sent out for repair.

15.4.2 Instrumentation Group

The Instrumentation Group shall perform the following activities in accordance with the WLCS-108700-MAN-004 [27], WL Instrumentation Services Calibration Procedures Manual:

1. Compile and maintain a current listing of, and identify measuring and test (M&T) equipment, included in the WLCS-108700-MAN-004[27], WL Instrumentation Services Calibration Procedures Manual.
2. Assign and maintain a calibration accuracy, frequency, and schedule, and maintain a retrieval system encompassing measuring and test equipment requiring periodic calibration.
3. Develop and maintain written instructions for calibration of measuring and test equipment.
4. Perform and report calibrations as required, and on schedule. This responsibility includes retrieval of the specific piece of measuring and test equipment that has been called up for calibration.
5. Maintain quality records showing calibration reports traceable to measuring and test equipment, and, ultimately, to a reference measurement standard.
6. Test pressure gauges used for pressure testing of pressure retaining components and systems shall be calibrated in accordance with WLCS-108700-MAN-004 [27], WL Instrumentation Services Calibration Procedures Manual.

15.4.3 Work Control Manager

The Work Control Manager shall:

1. Be responsible for promptly locating any M&T equipment in his control.
2. Ensure that all M&T equipment that has been returned by the QCR or the Instrumentation Group as "Not Calibrated" will be kept out of service until it is repaired or discarded as appropriate. The QCR or the Instrumentation Group shall be duly notified of the action taken.
3. Ensure that all M&T equipment, after repair, is returned to the QCR or the Instrumentation Group for recalibration.
4. Compile and maintain a current listing of M&T equipment included in the Calibration Recall System. All such equipment shall be identified by a unique serial number.
5. Be responsible for determining what M&T equipment requires testing.

15.5 Personnel Qualifications

15.5.1 Quality Control Representative

Quality Control Representatives (QCR) performing calibrations of non-destructive testing equipment shall be qualified to NDT Level I, Level II, or Level III requirements for those non-destructive testing methods governed by the Canadian General Standards Board. For testing methods outside the jurisdiction of the Canadian General Standard Board, personnel qualifications will be justified by experience and skill.

15.5.2 Instrumentation Group Personnel

Instrumentation Group personnel who perform calibrations of measuring and test equipment shall be certified as journeyman industrial instrument mechanics, or instrumentation technologists. WL Work Control Branch shall maintain records detailing training periods, examinations, and certifications.

15.6 Procedure

1. The calibration of measuring and test equipment shall be traceable to a National Standard such as NRC or NIST.
2. Procedures for calibration of measuring and test equipment are detailed in the Quality Control Calibration Procedure, WL-508237-OP-001 [26], and the Whiteshell Instrumentation Services Calibration Procedures Manual, WLCS-108700-MAN-004 [27]. The same requirements, with exceptions listed below, shall be followed for calibration of measuring and test equipment used in the fabrication, alteration, or repair of pressure retaining components fabricated to requirements of this QAP.
    a. Unless the measuring and test equipment has been calibrated within the pre-set calibration interval specified in WL-508237-OP-001 [26], Quality Control Calibration Procedure or WLCS-108700-MAN-004 [27], WL Instrumentation Services Calibration Procedures Manual, it shall be calibrated prior to the next use.
    b. Where the QCR is required to perform final point inspection of components or parts fabricated or repaired to requirements of this Manual, then any precision measuring and test equipment used in the inspection, whether included in Section 15.3 or otherwise, shall be in a calibrated state at the time of inspection.

16. RECORDS RETENTION

16.1 Scope

This section applies to essential records related to the design, construction, examination, and inspection of pressure retaining components and systems which must meet the requirements of CSA Standard B51.

16.2 Records Management Procedures

Procedures describing methods for retention of essential records are included in Manuals and Procedures specific to functional units involved in design, construction, examination, and inspection of pressure retaining components and systems.

16.3 File Retention Period

All files are to be retained for 10 years after the expiry date of the licence to abandon the WL site in accordance with 900-511300-FID-002, Process to Create, Capture and Use Information [28], and 900-511300-STD-003, Standard Format and Presentation of CNL Documents [29].

16.4 Engineering Records

Methods used to control design documents are described in WLD-511300-PRO-001 [30], WL Engineering Records Management.

16.4.1 Registration Files

The Registration File for pressure retaining components or systems shall contain all design registration documents used for registering the system or component.

16.4.2 Engineering Job Files

Documents contained in the Engineering Job Files are documents generated during the design process. They include but are not limited to: Design drawings, Informal document files, Formal document files.

16.5 Construction Records

Methods used to control construction documents are described in WLD -511300-PRO-002 [31], Construction Document and Record Control.

16.5.1 Construction Job Files

Documents contained in the Construction Job Files are documents generated during the construction process. They include but are not limited to Work Request and Job Index Files.

16.5.2 Registered WPS and/or BPS and PQR

Registered Welding and/or Brazing Procedure Specifications are classified as permanent records while Procedure Qualification Records are considered non-permanent records.

16.5.3 Welder's and Brazer's Qualification Records

Records of Welder and Brazer Qualification shall be retained as non-permanent records.

16.5.4 Inspection Records

Methods used to control issue and retention of Inspection records are defined in WL-508244-OP-005 [32], Documentation Control Procedure for Quality Control Records.

17. CONTROL OF PRESSURE RELIEF VALVES

RV repair and servicing will be outsourced to a vendor that is National Board certified and/or ITS authorized. WL Operating Procedure WL-508238-OP-002 [33], Control of Pressure Relief Valve will be used to control the repairing, testing, servicing and purchasing of pressure relief valves at CNL-WL.

18. REGULATORY AUTHORITY

18.1 Scope

This section applies to Regulatory interface activities for design, construction, examination, and in service inspection of boilers, pressure vessels, piping systems, and pressure retaining components and systems.

18.2 Purpose

This section describes the interface with the Regulatory Authority.

18.3 Regulatory Authority Interfaces

1. As a condition of the WL Site Licence issued by the Canadian Nuclear Safety Commission (CNSC), it is a Company obligation to assist the Authorized Inspector (AI) in the performance of their duties.
2. Requirements additional to those specified in applicable Codes and this QAP may be imposed by the Regulatory Authority.
3. The AI shall have full access to all specifications, calculations, drawings, procedural records, test results, or any other documents, and to all parts of the shop that concern the construction of pressure retaining components and systems.
4. At the discretion of the AI, re-qualification of equipment, procedures, and personnel for welding/brazing and non-destructive examinations may be required when a specific reason exists as to the validity of such qualifications.
5. The Regulatory Authority has jurisdiction over the following activities addressed in this QAP:
    a. Design Registration (see Section 7),
    b. Approval of alterations and repairs (see Section 11),
    c. Designation of “Hold Points” during construction (see Section 7),
    d. Witnessing of weld/braze procedure qualification tests and registration of Welding/Brazing Procedures (see Section 12),
    e. Witnessing and acceptance of welder/brazer performance qualification tests (see Section 12) and
    f. “Hold Point” inspections (see Section 18.6).

18.4 Contact Persons

1. The Design Representative is the contact person for matters dealing with design and in-service inspection of pressure retaining components and systems.
2. The Work Control Manager is the contact person for matters dealing with qualification of welding/brazing procedures, procedure qualification tests, and welder/brazer qualifications.
3. The QCR and/or Design Representative can act as the contact person for notifying the Authorized Inspector for “Hold Point” or final inspection of components.

18.5 Responsibilities

18.5.1 WL Work Control Manager

The Work Control Manager shall:

1. Ensure welders/brazers and welding/brazing procedure specifications to be used in construction of pressure retaining components or systems are qualified as required by Section 12, Welding/Brazing Control,
2. Ensure that an Inspection & Test Plan (PITP or MITP) is prepared in accordance with Section 9, Examination & Inspection Program,
3. Ensure completion of construction and acceptance of the item and
4. Sign the Manufacturer’s Data Report for Pressure Vessel.

18.5.2 The Design Representative

The Design Representative shall prepare the Manufacturer's Data Report for Pressure Vessel in readiness for Work Control Manager signature and AI review.

18.5.3 The Quality Control Representative

The QCR responsibilities are specified elsewhere, as follows:

1. Section 2 - Authority and Responsibility
2. Section 8 - Material Control
3. Section 9 - Examination & Inspection Program
4. Section 10 - Correction of Non-conformances
5. Section 12 - Welding/Brazing Control
6. Section 13 - Non-Destructive Examination
7. Section 15 - Calibration of Measuring and Test Equipment
8. Section 18 - Regulatory Authority

18.6 Procedure

18.6.1 Construction of Components - WL Actions

1. Construction personnel shall proceed with procurement of materials and construction of pressure retaining components and systems in accordance with "For Construction" drawings and specifications, an approved PITP or MITP, and this Quality Control Plan.
2. The Work Control Manager or Job Contact shall notify the QCR when the vessel or component is ready for AI "Hold Point" or final inspection.
3. The Quality Control Representative(QCR) interfaces with the AI for "Hold Point" and ensures the following:
   a. Design documents have been registered with the Regulatory Authority.
   b. The ITP, including required design drawings and documents, are with the component, and all operations and tests preceding the "Hold Point" have been completed and the item is ready for AI inspection.
   c. The vessel nameplate is in place and is correctly identified (see Paragraph 18.6.2.1 below).
   d. The pressure gauge to be used for a pressure test is the correct range and is in a calibrated state.
   e. The Manufacturer's Data Report for Pressure Vessel is available for AI review and signature (see paragraph 18.6.2.2 below).
   f. Welder/brazer and welding/brazing procedure qualification records are available to the AI.
   g. NDE procedures and personnel qualification records are available to the AI.
4. The Design Representative and/or QCR shall notify the AI at least 48 hours in advance for "Hold Point" inspection or final inspection. A QCR shall be present at the time of AI inspection. Subject to prior approval by the Regulatory Authority, AI inspection may involve only witnessing of pressure testing of components or systems, (as per Section 9 of this QAP).

18.6.2 AI Acceptance of Construction

18.6.2.1 Nameplate/Identification

1. Identification shall be by Nameplate stamping (See Section 20, Sample Forms List), or marking directly on the item. The Design Representative shall specify Nameplate data on the design documents in accordance with applicable Code requirements. The nameplate stamping shall include the Canadian Registration Number (CRN).
2. The completed component shall be marked by Construction personnel as required by the applicable design documents and to the satisfaction of the AI. Markings shall be legible and permanent.
3. The QCR shall verify that nameplate marking data is complete and correct.
4. The Nameplate for registered vessels will be stamped by the AI after inspection and approval.

18.6.2.2 Manufacturer's Data Report

1. When the item has been satisfactorily constructed, examined, and accepted, the Design Representative shall complete, and the Work Control Manager shall sign the appropriate Manufacturer's Data report for Pressure Vessel (see Section 20, Sample Forms List). The AI will countersign the same Report.
2. The AI and/or the Jurisdiction of the Province of installation shall be provided with one copy of the signed Manufacturer's Data Report for Pressure Vessel. A copy of the same Report shall also be filed in the Construction Job Files.

18.6.2.3 Alteration and Repair Record

The Work Control Manager and the AI shall complete and sign applicable Alteration and Repair Records (see Section 20, Sample Forms List). Copies of these reports shall be filed in WL Records.

BOILERS AND PRESSURE VESSELS REPAIR & ALTERATION REPORT

OWNER EQUIP NO.: ________________

REPAIR ☐ **and/or** **ALTERATION** ☐ **Partial** ☐ **Final** ☐

1. Name and Address of Organization doing Repair/Alteration ____________________

____________________ Manitoba Quality Control Program #: ____________________

Location of Installation ____________________

2. Name of Owner ____________________ Address ____________________

3. Boiler/Pressure Vessel Description ____________________ CRN ____________________

Manufacturer's Name ____________________ National Board # : ____________________ Serial No. ____________________

4. **Design Conditions**:
a) Vessel/Shellside/Boiler: Max Allowable Working Press. __________ Min/Max Design Temp ______/__________
b) Jacket/Tubeside: Max Allowable Working Press. __________ Min/Max Design Temp ______/__________

5. Description of defects (location and types of deterioration that resulted in the repair/alteration).____________________

6. **ASME Code Edition and Addenda** used for work: ASME Sect. _______ Year _____ Addenda ____________

7. **Repair/Alter. Description of Work.** Step by step description of repair/alteration method, attach additional sheets as needed.

Note 1: Repair/Alteration Procedure to be accepted by the Mechanical & Engineering Design Engineer prior to start of work.

Mechanical and Engineering District Boiler/Pressure Vessel Inspector may grant a temporary approval of the above repair/alteration in an emergency condition. This shall be used only when the pressure vessel or boiler or pressure piping is required in the continued operation of the heating or processing plant. Dept. of Labour Design Engineer approval shall be acquired within two business days.

DOL Inspector ____
NAME (Please Print) SIGNATURE DATE

8. **Material** – List any material used in repair/alteration and any base material welded on:

Item	Material Spec.	Thick/ Sch	Diam	Item	Material Spec.	Thick/ Sch	Diam

1. Scope and Applicability

This Company-wide Interpretation document applies to all activities unique to the Fitness for Service Function, performed by Canadian Nuclear Laboratories (CNL) across all sites. The main programs of this Functional Support Area (FSA) include Maintenance, Reliability, and Aging Management.

Maintenance applies to CNL maintained sites and facilities. Implementation of Maintenance elements is commensurate with the importance to safety, design function and required performance.

The applicability of Reliability and Aging management are best described by each specific programs and can be found in their respective management control procedure and standard.

Implementation of Fitness for Service involves the integration of key elements of Maintenance, Reliability, and Aging Management with each other and with interfacing groups and processes, such as Asset Management, Configuration Management, and Maintenance and Work Management.

This FSA excludes Informational Technology assets and systems.

2. Purpose

Fitness for Service:

- Ensures maintenance is carried out adequately and effectively.
- Decreases the likelihood, or impact of system, equipment, or component failures on nuclear safety, the health and safety of workers, public, security, environment, equipment, and property.
- Ensures safety-related systems function reliably in accordance with the relevant design and performance criteria, including any safety goals of the Facility and Canadian Nuclear Safety Commission.
- Enables evaluation of equipment, development, and implementation of long-term equipment improvement plans, monitoring of equipment performance and condition, and adjustment of preventive maintenance tasks and frequencies based on equipment performance.

3. Definitions and Acronyms

This document relies primarily on word meaning as found in common dictionaries. The current *Glossary of Controlled Terms and Acronyms* [1] and the Glossary of CNSC Terminology [2] contain specific meanings for those words that require further clarification.

3.1 Definitions

Aging	The gradual change of the characteristics of a structure, system or component over time or with use. Note: One or more mechanisms may drive physical aging. Physical aging is due to physical, mechanical, thermal, electrical, chemical, irradiation and/or biological processes (aging mechanisms). Non-physical aging means becoming out of date (obsolete) due to the evolution of knowledge and technology and associated changes in codes and standards. [2]
Aging Management (AM)	Engineering, operations, inspection and maintenance actions to control, within acceptable limits, the effects of physical aging and obsolescence of structures, systems and components. [2]
Condition Monitoring	Continuous or periodic inspections, measurements or trending of the performance or physical characteristics of structures, systems and components, to indicate current or future performance and the potential for failure. [2]
Corrective maintenance	Actions that restore, by repair, overhaul or replacement, the capability of a failed structure, system or component to function within acceptance criteria. Corrective maintenance does not necessarily result in a significant extension of the expected useful life of a functional structure, system or component. Contrasted with preventive maintenance. [3]
Failure	The inability or interruption of ability of a structure, system or component to function within acceptance criteria. Also called fault. [2]
Fitness for Service	A safety and control area (SCA) that covers activities that impact the physical condition of structures, systems and components to ensure that they remain effective over time. This includes programs that ensure all equipment is available to perform its intended design function when called upon to do so. This SCA is one of the 14 within the CNSC SCA Framework. [2]
Periodic maintenance	Form of preventive maintenance consisting of servicing, parts replacement, surveillance, or testing at predetermined intervals of calendar time, operating time or number of cycles. Also termed time based maintenance. [3]

Planned maintenance	Form of preventive maintenance consisting of refurbishment or replacement that is scheduled and performed prior to unacceptable degradation of a structure, system or component. [3]
Predictive maintenance	Form of preventive maintenance performed continuously or at intervals governed by observed condition to monitor, diagnose or trend a structure, system or component's condition indicators; results indicate present and future functional ability or the nature of and schedule for planned maintenance. Also termed condition based maintenance. [3]
Preventive maintenance (PM)	Actions that detect, preclude or mitigate degradation of a functional structure, system or component to sustain or extend its useful life by controlling degradation and failures to an acceptable level. Preventive maintenance may be periodic maintenance, planned maintenance or predictive maintenance. Contrasted with corrective maintenance. [3] Also called preventative maintenance. [2]
Reliability-centred maintenance (RCM)	A process for specifying applicable preventive maintenance requirements for safety related systems and equipment in order to prevent potential failures or to control the failure modes optimally. RCM utilizes a decision logic tree to identify the maintenance requirements according to the safety consequences and operational consequences of each failure and the degradation mechanism responsible for the failures. [3]
Obsolescence	With respect to structures, systems and components, the process of becoming out of date in comparison with current knowledge, standards and technology. [2]
Preventive Maintenance Technical Basis (PMTB)	A documented justification of a component's Preventive Maintenance (PM) strategy which ties PM tasks to a component's dominant failure mechanisms.
Reliability	The ability of a structure, system or component to perform, in accordance with its defined specifications, its required function under given conditions for a defined time period or upon demand. [2]
Availability	The fraction of time that a component or system is able to function. Availability can also mean the probability that a component or system will be able to function at any given time. [2]

Run to Failure (RTF)	A maintenance strategy whereby Structures, Systems, and Components (SSCs) are run until breakdown ensues. An RTF strategy is selected when the breakdown condition is readily evident to operating staff, when replacement items or spare parts are readily available, and when safety, operational, or economic impacts of failure are acceptable.
Structures, Systems and, Components (SSCs)	A general term encompassing all of the elements of a facility or activity that contribute to protection and safety. Structures are the passive elements: buildings, vessels, shielding, etc. A system comprises several components, assembled in such a way as to perform a specific (active) function. A component is a discrete element of a system. Some examples are wires, transistors, integrated circuits, motors, relays, solenoids, pipes, fittings, pumps, tanks and valves. [2]
System Health Report (SHR)	The System Health Report is used to document and communicate the overall condition (health) of the system based on inputs from monitoring activities and key performance indicators. The evaluation covers issues affecting the system related to aging, obsolescence, maintenance, configuration, spare parts availability, as well as design or procedural deficiencies. Short-term and long-term corrective actions and recommendations should be specified and justified, including development of strategies for major component overhauls or replacement. The System Health Report also details significant action taken, current to the time the report is prepared, and the results of the action, if available.
System Performance Monitoring Plan (SPMP)	The SPMP will identify key system functional requirements, degradation mechanisms, methods, and frequencies to monitor degradation and system performance indicators.

3.2 Acronyms

AM	Aging Management
CM	Corrective Maintenance
CMMS	Computerized Maintenance Management System
DfM	Design for Maintainability
PM	Preventive Maintenance
PMTB	Preventive Maintenance Technical Basis
RCM	Reliability-Centered Maintenance

RTF	Run to Failure
SHR	System Health Report
SHT	System Health Team
SPMP	System Performance Monitoring Plan
WP&C	Work Planning & Control

4. Roles and Responsibilities

The roles described are functional titles that may be fulfilled by different positions within line organizations. Some of those roles maybe fulfilled by the same person.

4.1 Functional Support Manager

The Functional Support Manager (FSM) is responsible for:

- Establishing and maintaining effective Fitness for Service programs for CNL maintained facilities that meet the requirements as described in *Fitness for Service* Program Requirement Document [4].
- Planning, resourcing, and overseeing the development of Fitness for Service documentation, and training of the Fitness for Service processes and related documents.
- Approving and releasing company-wide Fitness for Service process documents.
- Supporting facilities in the implementation of the Fitness for Service programs.
- Establishing performance indicators to determine the effectiveness of the program and performing routine self-assessments to ensure adequacy and effectiveness of Fitness for Service processes and procedures.
- Reporting to the Responsible Executive on the process performance and any non-compliance issues.
- Benchmarking with external organizations to promote incorporate of industry best practices.

4.2 Maintenance Technical Representatives
