Summary

Wheeler River Project

The Wheeler River Project (Wheeler or the Project) is a proposed uranium mine and processing plant in northern Saskatchewan, Canada. It is located in a relatively undisturbed area of the boreal forest about 4 km off of Highway 914 and approximately 35 km north-northeast of the Key Lake uranium operation.

Wheeler is a joint venture project owned by Denison Mines Corp. (Denison) and JCU (Canada) Exploration Company Ltd. (JCU). Denison owns 90% of Wheeler and is the operator, while JCU owns 10%. Denison is a uranium exploration and development company with interests focused in the Athabasca Basin region of northern Saskatchewan, Canada with a head office in Toronto, Ontario and technical office in Saskatoon, Saskatchewan. Historically Denison has had over 50 years of uranium mining experience in Saskatchewan, Elliot Lake, Ontario, and in the United States. Today, the company is part owner (22.5%) of the McClean Lake Joint Venture which includes the operating McClean Lake uranium mill in northern Saskatchewan.

To advance the Project, Denison is applying an innovative approach to uranium mining in Canada called in situ recovery (ISR). The use of ISR mining at Wheeler means that there will be no need for a large open pit mining operation or multiple shafts to access underground mine workings; no workers will be underground as the ISR process is conducted from surface facilities. While this mining method has been used extensively on an international basis and currently accounts for more than 50% of global uranium production, it has not previously been used in Canada for uranium mining. Denison has done significant research on international uranium ISR operations to understand best practices and incorporate lessons learned into the design of Wheeler. In order to implement ISR at Wheeler, Denison will apply existing technologies to eliminate the typical challenges experienced at some international uranium ISR operations.

ISR mining at Wheeler will involve injecting a mining solution into the uranium deposit through a series of cased drill holes (about 4 to 8 inches in diameter) called injection wells (Figure A). The mining solution proposed for Wheeler is a low pH or acidic mining solution. As the mining solution passes from the injection wells through the uranium deposit it dissolves the uranium and leaves virtually all other minerals in the host rock in place. Once dissolved, the uranium rich mining solution is recovered and pumped back up to surface through another set of cased drill holes called recovery wells. The combination of injection and recovery wells is called a wellfield. Denison anticipates the wellfield will have the general arrangement of one recovery well in the centre surrounded by 6-8 injection wells with about 10 m spacing between wells. With these configuration options, the final wellfield may include approximately 310 wells over a 90 m x 900 m area.

Criticism of international ISR operations largely involves the containment of mining solution and the interaction of the mining solution with groundwater. At Wheeler, in order to contain the solution within the uranium deposit and maximize recovery as well as prevent interaction of the mining solution with surrounding groundwater, Denison will create an isolated mining chamber using conventional ground freezing technology. Ground freezing will establish an impermeable barrier above and on all sides of the mining chamber, with the existing impermeable basement rock acting as a bottom barrier. The approximate dimensions of the mining chamber are 100 m wide x 30 m high x 1,300 m long and it will be located approximately 400 m below the surface (Figure B).

Once on surface, the uranium rich mining solution recovered from the wellfield will be pumped to the on-site processing plant. Inside the processing plant a relatively simple precipitation process will be used to separate the uranium from the mining solution. Once the uranium is removed, the mining solution is refortified with reagents and returned to the wellfield for re-injection and further mining. The process is a closed loop system with potentially no need for treated effluent discharge to the environment. The uranium will be dried, packaged and trucked off site, destined for eventual use in a nuclear power plant.

Once sold and refined off-site, the uranium will be used as fuel for nuclear power plants. Denison estimates that the uranium produced from Wheeler can be used to power 1 million modern homes for approximately 160 years with minimal greenhouse gas emissions. This highlights the importance of the Project at a time when reducing global greenhouse gas emissions are of the utmost importance in the battle against climate change.

In addition to ISR mining and uranium processing, the Project will also require construction, operation, and decommissioning of a number of supporting components. This includes a short (7 km) access road from Highway 914 to the site, an accommodation complex, operations centre, airstrip, a 5 km long road from the site to the airstrip, site roads, a lined pad for storage of impurities from the processing plant and mineralized drill cuttings from wellfield development, water treatment ponds, potable, sewage, and waste water treatment plants. Power will be supplied to Wheeler by connecting into the existing provincial power line along Highway 914 with emergency generators available as a back-up power supply.

The main phases of the Project are construction, operation, decommissioning and post-decommissioning. The Project is subject to both a federal and provincial environmental impact assessment and various licences and permits will also be needed. Following receipt of regulatory approvals, construction would last for approximately two years and may start as early as 2022. Production activities commence following commissioning of the facilities and would last up to 20 years with a production rate of up to 12 M lbs U₃O₈ per year. Decommissioning is expected to last for five years. The five main decommissioning activities include: mining chamber remediation, decontamination, asset removal, demolition and disposal, and reclamation. Closure of the entire Project will be completed in accordance with all provincial and federal regulations and guidance documents with the fundamental considerations being to ensure physical and chemical stability of the site in order to protect human health and the environment. A five-year post-decommissioning phase will serve to monitor Wheeler and confirm that it is acceptable for either direct release back to the Crown with no future use restrictions or acceptance into the provincial Institutional Control Program for decommissioned sites.

Existing Environment

The Project is located in the Wheeler River Upland Landscape Area of the Athabasca Plain Ecoregion. Exploration activity has occurred in the area over the past 40 years. There are recreational, industrial and traditional land use leases nearby; however, the nearest permanent residences are about 150 km away. The Slush Lake Reserve registered to the English River First Nation, which has no permanent residents, is located approximately 15 km west of Wheeler.

Denison initiated a comprehensive biophysical environmental data collection program in 2016 to characterize the existing or baseline conditions. A robust dataset of atmospheric, hydrogeological, aquatic, and terrestrial data has been collected for the Wheeler site, local and regional study areas and targeted data collection is ongoing. The biophysical environment data collection program to date has focused on defining existing conditions for: air quality (radon and dust), groundwater quality, groundwater levels, surface water quality, lake levels, lake bathymetry, stream flow, sediment quality, aquatic habitats, benthic invertebrates (communities and chemistry), plankton, fish (communities, spawning habitat, and tissue chemistry), amphibians, birds, small mammals, semi-aquatic furbearers, large mammals, ecosite mapping, vegetation (communities and chemistry), soil quality, and wildlife habitat.

Wheeler is located in the Treaty 10 area and the local and regional area surrounding the proposed Project has been claimed by four distinct Indigenous communities as partially or entirely falling within their traditional territories, where traditional land use activities have been historically or are currently practiced. These groups consist of the English River First Nation and the Kineepik, Sipishik and A La Baie Métis locals of the communities of Pinehouse, Beauval and Ile a la Crosse, respectively. Traditional land use activities practiced within the local and regional area of the Project consist of subsistence hunting and fishing, seasonal harvesting of native plants for food and medicinal purposes. During the open water season the rivers and lakes in the area serve as transportation routes to and from areas for harvest of plants and game as well as preferred campsites and cabins. During the winter months the frozen lakes, river banks and muskegs are used as transportation routes to cabins, trap lines and preferred hunting areas. Heritage resource surveys completed at Wheeler to date identified one artifact and the Project has been redesigned to avoid the location of the artifact find.

Overall, Denison believes the baseline biophysical and human environments in the Project areas have been adequately characterized to support the completion of an environmental impact assessment and support future environmental monitoring programs.

Potential Effects

ISR mining, as proposed for the Project, results in a uranium mining and uranium processing Project with no tailings, a relatively small surface disturbance footprint, minimal volumes of clean waste rock (all in the form of drill cuttings), minimal volumes of waste rock (mineralized drill cuttings from wellfield development), minimal generation of other contaminated wastes, near zero carbon emissions and limited (if any) water treatment and discharge. Wheeler will be designed to contain all hazardous materials and careful consideration will be taken to ensure contaminated areas are kept separate from non-contaminated areas. Through Project design, implementation of best management practices, and application of other mitigation measures, Denison will strive to minimize interactions of the Project with the biophysical and human environments throughout all phases of the Project.

The main potential Project effects on the biophysical environment are expected to be: changes in air quality from various emission sources including the processing plant; changes in air quality if radon and radon progeny degas from the uranium rich mining solution; potential changes in groundwater quality from mining solution excursions or the potential discharge of treated effluent to groundwater; changes in water quality, sediment quality, and possibly other aquatic components from the potential discharge of treated effluent to a surface water body; direct loss of wildlife habitat; and indirect effects on wildlife through sensory disturbance. However, Denison anticipates that none of these potential effects will be significant and overall the Project does not pose any long-term risks to the biophysical environment.

The Project's potential effect on the socio-economic component of the human environment is expected to be positive. Wheeler will employ approximately 300 people during two years of construction and about 100 to 150 people during operations. Business opportunities will be available for supplies and services. Any potential effects on traditional land use activities will be limited to the site and local study areas and these effects will be short term and limited to the construction and operating phase of the Project. After decommissioning is completed, access to the site and the ability to practice traditional activities such as fishing and hunting will be fully restored. No effects on traditional land use are expected to occur in the regional study area. Potential effects on workers from a conventional health and safety standpoint will be similar to other mining and industrial sites and Denison expects these effects can be mitigated through management and development of a strong safety culture. Potential effects on workers from radiological exposures will be minimized through Project design measures and closely monitored and managed through implementation of a Radiation Safety Management Program.

In the EIA, Denison will demonstrate that the Project can be constructed, operated, and decommissioned with no significant adverse effects on the biophysical and human environments. Potential effects of the Project will be rigorously and transparently assessed and presented in the EIA. This includes the completion of a human health and ecological risk assessment to demonstrate

the overall low impacts of the Project. The EIA will also outline details of an effective monitoring program. Monitoring will be required to provide proof that the Project is operating legally and within the bounds of its licence obligations.

Engagement

Denison recognizes the importance of engaging with local and Indigenous communities, residents, businesses, organizations, land users and the various regulatory authorities, collectively referred to as 'Stakeholders.' Since 2016 Denison had been engaging with Stakeholders in an ongoing effort to build positive relationships with all parties. Broadly speaking, Denison has categorized the stakeholders into three categories:

- Indigenous communities
- Regulatory authorities
- The general public

Denison has engaged with Stakeholders to provide Project updates and collect input that has been incorporated into the Project's design. This approach is expected to continue. Further, Indigenous Knowledge has been integrated into the baseline data collection programs to ensure appropriate scientific data is collected in key areas to allow for a robust assessment of potential Project interactions as part of the environmental impact assessment.

Denison and several local Indigenous and non-Indigenous communities have executed mutual Memorandums of Understanding (MOU) regarding the Project. These non-binding MOUs formalize the signing parties' intent to work together in a spirit of mutual respect and cooperation to collectively identify practical means by which to avoid, mitigate, or otherwise address potential impacts of the Project upon the exercise of Indigenous rights, Treaty rights, and interests. In addition, the MOUs outline the signing parties' intent to work together to ensure that benefits will flow from the Wheeler River project, provide a process for continued Project engagement and information-sharing about the project, and establish a relationship to identify business, employment and training opportunities for the parties with respect to the Project.

Denison is proud of the relationships it has established with all Stakeholders, and looks forward to continuing to build upon those relationships through an ongoing engagement program as Wheeler advances.

Sommaire

Projet Wheeler River

Le projet Wheeler River (Wheeler ou, le Projet) comprend une mine d'uranium et une usine de traitement proposées dans le nord de la Saskatchewan, au Canada. Il se situe dans une zone relativement peu perturbée de la forêt boréale, à environ 4km de l'autoroute 914 et à environ 35km au nord-nord-est du site d'exploitation d'uranium de Key Lake.

Wheeler est un projet de coentreprise appartenant à Denison Mines Corp. (Denison) et à JCU (Canada) Exploration Company Ltd. (JCU). Denison détient 90% de Wheeler et en est opérateur, tandis que JCU en détient 10%. Denison est une compagnie d'exploration et de développement d'uranium dont les intérêts sont concentrés dans la région du Bassin Athabasca dans le nord de la Saskatchewan au Canada, avec son bureau primaire à Toronto, Ontario et un bureau technique à Saskatoon, Saskatchewan. Denison a plus de 50 ans d'expérience historique dans l'extraction d'uranium en Saskatchewan, à Elliot Lake en Ontario, et aux États-Unis. Présentement, la compagnie est propriétaire (22.5%) de la coentreprise McClean Lake qui comprend l'usine de traitement d'uranium au nord de la Saskatchewan.

Pour faire avancer le projet, Denison applique une nouvelle méthode à l'extraction de l'uranium au Canada qui appelée récupération in situ (RIS). L'utilisation de l'exploitation minière de RIS à Wheeler signifie qu'il ne sera plus nécessaire de recourir à une grande exploitation à ciel ouvert ou aux infrastructures pour accéder les travaux d'une mine souterraine; il n'aura aucun ouvrier sous terre puisque le processus de RIS est mené à partir d'installations de surface. Bien que cette méthode d'exploitation minière ait été largement utilisée à l'échelle internationale et représente présentement plus de 50% de la production mondiale d'uranium, elle n'était auparavant pas utilisée au Canada pour l'extraction d'uranium. Denison a effectué d'importantes recherches sur les opérations internationales de RIS pour l'uranium afin de bien comprendre les meilleures pratiques et d'intégrer les leçons apprises à la conception de Wheeler. Afin de mettre en œuvre la RIS à Wheeler, Denison utilisera les technologies existantes pour éliminer les défis typiques rencontrés à quelques opérations internationales de RIS d'uranium.

L'exploitation par RIS à Wheeler impliquera l'injection d'une solution d'exploitation minière dans le gisement d'uranium à travers une série de trous de forage tubés (d'un diamètre de 4 à 8 pouces) appelés puits d'injection (Figure B). La solution minière proposée pour Wheeler est une solution à pH bas ou acide. Lorsque la solution minière passe des puits d'injection à travers le gisement d'uranium, elle dissout l'uranium et laisse pratiquement tous les autres minéraux dans la roche hôte.

Une fois dissoute, la solution minière, riche en uranium, est récupérée et remontée à la surface par un autre ensemble de trous de forage tubés appelés puits de récupération. La combinaison des puits d'injection et de récupération s'appelle un champ de captage. Denison prévoit que le champ

de captage aura la configuration générale d'un puits de récupération au centre entouré de 6 à 8 puits d'injection espacés d'environ 10 m. Avec ces options de configuration, le champ de captage final pourra inclure environ 310 puits sur une aire de 90m x 900m.

Enison Mines

Projet Wheeler River
Proposition Technique et Description de Projet

Figure A: Aperçu du Processus de Récupération In-Situ (RIS)

Mai 2019

Les critiques des opérations internationales de RIS concernent largement le confinement de la solution minière et l'interaction entre la solution minière avec les eaux souterraines. À Wheeler, afin de contenir la solution dans le gisement d'uranium, et d'optimiser la récupération ainsi que d'empêcher l'interaction de la solution minière avec les eaux souterraines environnantes, Denison créera une chambre d'extraction isolée utilisant la technologie conventionnelle de congélation du sol. La congélation du sol établira une barrière imperméable au-dessus et de tous les côtés de la chambre d'extraction, avec le roc de base servant de barrière inférieure. La chambre d'extraction minière se situera à environ 400 m sous la surface (Figure B) et les dimensions approximatives mesurent 100 m de large x 30 m de haut x 1,300 m de long.

Une fois à la surface, la solution minière riche en uranium récupérée du champ de captage sera pompée vers l'usine de traitement sur site. À l'intérieur de l'usine, un processus de précipitation relativement simple sera utilisé pour séparer l'uranium de la solution minière. Une fois que l'uranium est extrait, la solution minière est reconditionnée avec des réactifs et renvoyée au champ de captage pour être réinjectée et extraite. Le processus suit un système en boucle fermée qui ne nécessite, potentiellement, aucun rejet d'effluent traité dans l'environnement. L'uranium sera séché, emballé et acheminé par camion hors site, destiné à être utilisé dans une centrale nucléaire.

Une fois vendu et raffiné hors site, l'uranium sera utilisé comme combustible pour les centrales nucléaires. Denison estime que l'uranium produit par Wheeler peut servir à alimenter 1 million de foyers modernes pendant environ 160 ans avec des émissions minimales de gaz à effet de serre. Cela souligne l'importance du projet à un moment où la réduction des émissions mondiales de gaz à effet de serre revêt une importance capitale dans la lutte contre le changement climatique.

En plus des activités d'extraction (RIS) et de traitement d'uranium, le projet nécessitera également la construction, l'exploitation, et le déclasséement d'un certain nombre de composantes de support. Cela comprend un court chemin d'accès (7 km) allant de l'autoroute 914 jusqu'au site, un complexe d'hébergement, un centre d'opérations, une piste d'atterrissage, une route de 5 km allant du site à la piste d'atterrissage, des routes de chantier, une plateforme couverte de doublure pour le stockage de résidus de l'usine de traitement et des déblais de forage minéralisés provenant de la mise en valeur des champs de captage, des bassins de traitement d'eau, et des usines de traitement (eau potable et eaux usées). L'électricité sera fournie à Wheeler par une connexion à la ligne électrique provinciale existante le long de l'autoroute 914 avec des génératrices de secours disponibles comme source d'alimentation secondaire.

Les phases principales du projet sont la construction, l'exploitation, le déclasséement, et le post-déclasséement. Le projet est assujéti à une évaluation des impacts sur l'environnement au niveau fédéral ainsi que provincial, et divers permis et licences seront également nécessaires. Après avoir reçu les approbations réglementaires, la construction durerait environ deux ans et pourrait commencer dès 2022. Les activités de production débutent suivant la mise en service des installations et dureraient jusqu'à 20 ans, avec un taux de production pouvant atteindre 12M lb U_3O_8 par an. Le déclasséement devrait durer cinq ans. Les cinq principales activités de déclasséement sont les suivantes : assainissement de la chambre d'extraction, décontamination, élimination des actifs, démolition et élimination, et réhabilitation. La clôture de l'ensemble du projet sera effectuée conformément à tous les règlements et directives provinciaux et fédéraux, les considérations fondamentales étant d'assurer la stabilité physique et chimique du site afin de protéger la santé humaine ainsi que l'environnement. Suivant le déclasséement, une phase de cinq ans servira à surveiller Wheeler et à confirmer qu'il est acceptable de le restituer soit directement à la Couronne sans restrictions d'utilisation futures, ou au programme provincial de contrôle des établissements pour les sites déclassés.

Environnement Existant

Le projet est situé dans la région paysagère des hautes terres de la rivière Wheeler de l'écorégion de la plaine Athabasca. Des activités d'exploration ont eu lieu dans la région au cours des 40 dernières années. Il y a des utilisations récréatives, industrielles et traditionnelles des terres à proximité; cependant, les résidences permanentes les plus proches sont à environ 150 km du site. La réserve de Slush Lake, appartenant aux Premières Nations d'English River, qui n'a pas de résidents permanents, est située à environ 15 km à l'ouest de Wheeler.

Denison a lancé un programme complet de collecte de données biophysiques sur l'environnement en 2016 afin de caractériser les conditions existantes ou de base. Un ensemble de données robustes de données atmosphériques, hydrogéologiques, aquatiques, et terrestre a été collecté pour le site Wheeler; les zones d'étude locales et régionales et une collecte de données plus spécifiques est toujours en cours. À ce jour, le programme de collecte de données sur l'environnement biophysique s'est concentré sur la définition des conditions existantes pour : la qualité de l'air (radon et particules), la qualité des eaux souterraines, le niveau des eaux souterraines, la qualité des eaux de surface, les niveaux des lacs, la bathymétrie des lacs, le débit des cours d'eau, la qualité des sédiments, les habitats aquatiques, les invertébrés benthiques (communautés et chimie), plancton, poissons (communautés, habitat de frai, chimie des tissus), amphibiens, oiseaux, petits mammifères, animaux à fourrure semi-aquatiques, grands mammifères, cartographie d'éco-sites, végétation (communautés et chimie), qualité du sol, et habitat faunique.

Wheeler est situé dans la zone du Traité 10 et quatre communautés d'autochtones distincts ont prétendu que la zone locale et régionale entourant le projet proposé appartenait en tout ou en partie à leurs territoires traditionnels, ou des activités traditionnelles d'utilisation des terres ont anciennement été ou sont présentement pratiquées. Ces groupes comprennent la Première Nation English River et les habitants de Kineepik, Sipishik, et À La Baie Métis des communautés de Pinehouse, Beauval, et Île à la Crosse respectivement. Les activités traditionnelles d'utilisation des terres pratiquées dans la zone locale et régionale du projet comprennent la chasse et la pêche de subsistance, et la récolte saisonnière de plantes indigènes à des fins alimentaire et médicinales. Pendant la saison des eaux libres, les rivières et les lacs de la région servent de voies de transport pour la récolte de plantes et de gibier, ainsi que pour les sites de campings et chalets préférés. Pendant les mois d'hiver, les lacs gelés, berges des rivières, et muskegs sont utilisés comme voies de transport vers les cabanes, les lignes de piégeage, et les zones de chasse préférés. Les enquêtes sur les ressources patrimoniales réalisées à Wheeler à ce jour ont permis d'identifier un artefact et le projet a été repensé afin d'éviter l'emplacement de la découverte de l'artefact.

En tout, Denison estime que les facteurs biophysiques et humains de l'environnement dans la zone du projet ont été correctement caractérisés pour appuyer la réalisation d'une évaluation de l'impact sur l'environnement ainsi que les programmes de suivi environnemental à venir.

Effets Potentiels

L'exploitation minière RIS, telle que proposée pour le projet, aboutit à un projet d'extraction et de traitement d'uranium sans résidus, avec une empreinte de perturbation de surface relativement petite, des volumes minimaux de stériles propres (tous sous la forme de déblais de forage), des volumes minimaux de stériles (déblais de forage minéralisés provenant du développement du champ de captage), volumes minimaux d'autres déchets contaminés, près de zéro émissions de gaz à effet de serre, et un traitement et rejet minimal d'eau (le cas échéant). Wheeler sera conçu pour contenir toutes les matières dangereuses et un soin particulier sera pris pour s'assurer que les zones contaminées sont séparées des zones non contaminées. Par la conception du projet, la mise en œuvre des meilleures pratiques de gestion et l'application d'autres mesures d'atténuation, Denison s'efforcera de minimiser les interactions du projet avec les environnements biophysiques et humains au cours de toutes les phases du projet.

Les principaux effets potentiels du projet sur l'environnement biophysique devraient être les suivants : modifications de la qualité de l'air provenant de diverses sources d'émission, y compris l'usine de traitement; des changements dans la qualité de l'air si le radon et les descendants du radon proviennent de la solution minière riche en uranium; les changements potentiels dans la qualité des eaux souterraines résultants d'excursions de solutions minières ou le rejet potentiel d'effluent traités dans les eaux souterraines; les changements dans la qualité de l'eau, la qualité des sédiments et éventuellement d'autres composantes aquatiques dus au rejet potentiel d'effluents traités dans un plan d'eau de surface; perte directe d'habitat faunique; et, effets indirects sur la faune par des perturbations sensorielles. Cependant, Denison prévoit qu'aucun de ces effets potentiels seront significatifs et que en tout, le projet ne pose aucun risque à long terme pour l'environnement biophysique.

L'effet potentiel du projet sur la composante socio-économique de l'environnement humain est prévu d'être positif. Wheeler emploiera environ 300 personnes pendant deux ans de construction et entre 100-150 personnes durant les opérations. Des opportunités seront disponibles pour les fournisseurs de services et de matériaux. Tous les effets potentiels sur les activités d'utilisation traditionnelle des terres seront limités au site et aux zones d'étude locales. Ils seront de courte durée et limités à la phase de construction et d'exploitation du projet. Une fois que le déclassement est terminé, l'accès au site et la possibilité de pratiquer des activités traditionnelles telles que la pêche et la chasse seront entièrement rétablis. Aucun effet sur l'utilisation traditionnelle des terres ne devrait se produire dans la zone d'étude régionale. Les effets potentiels sur les travailleurs du point de vue santé et sécurité seront similaires à ceux d'autres sites miniers et industriels, et Denison s'attend à ce que ces effets puissent être atténués grâce à la gestion et au développement d'une forte culture de sécurité. Les effets potentiels des expositions radiologiques sur les travailleurs seront minimisés grâce aux mesures de conception du projet, suivis de près et gérés par la mise en œuvre d'un Programme de Gestion de la Protection contre la Radiation.

Dans le cadre de l'évaluation des impacts environnementaux (EIE), Denison démontrera que le projet peut être construit, exploiter, et déclasser sans aucun effet négatif important sur les environnements biophysique et humain. Les effets potentiels du projet seront évalués et présentés de manière rigoureuse et transparente dans l'EIE. Cela comprend la réalisation d'une Évaluation des Risques pour la Santé Humaine et l'Environnement afin de démontrer les faibles impacts du projet au complet. L'EIE indiquera également les détails d'un programme de suivi efficace. La surveillance sera nécessaire pour fournir la preuve que le projet fonctionne légalement et dans les limites de ses obligations en matière de licence.

Engagement

Denison reconnaît l'importance de s'impliquer avec les communautés locales et autochtones, les résidents, les entreprises, les organisations, les utilisateurs des terres, et les diverses autorités de réglementation, ci-après dénommés « Parties Prenantes ». Depuis 2016, Denison engageait les parties prenantes dans leur effort continu d'établir des relations positives avec toutes les parties. De manière générale, Denison a classé les parties prenantes en trois catégories :

- Communautés autochtones
- Autorités réglementaires
- Public général

Denison s'est engagé auprès des parties prenantes pour fournir des mises à jour du projet et collecter des informations qui ont été intégrés à la conception du projet. Cette approche est prévue de se poursuivre. De plus, le savoir autochtone a été intégré dans les programmes de collecte de données de base afin de garantir la collecte de données scientifiques appropriées dans des domaines clés, afin de permettre une évaluation robuste des interactions potentielles du projet dans le cadre de l'évaluation de l'impact sur l'environnement. Denison est fière des relations établies avec les communautés et réjouit de pouvoir continuer à améliorer ces relations et ces avantages pour les communautés par moyen du programme en cours de participation des parties prenantes à mesure que Wheeler avance.

Denison et plusieurs communautés locales autochtones et non-autochtone ont conclu des accords de principe ou des protocoles d'entente mutuels. Ces protocoles d'entente non-contraignant formalisent l'intention des signataires de travailler ensemble dans un esprit de respect mutuel et de coopération pour identifier collectivement des moyens pratiques permettant d'éviter, d'atténuer, ou adresser des impacts potentiels du projet sur l'exercice des droits autochtones, droits issus de traités, et domaines d'intérêt mutuels. De plus, les accords de principe et protocoles d'entente décrivent l'intention des signataires de travailler ensemble pour assurer que les avantages découleront du projet Wheeler River, fourniront un processus permettant de poursuivre l'engagement du projet et le partage d'informations sur celui-ci, et établiront une relation en vue de définir des opportunités d'affaires d'emploi et de formation pour les parties liées au projet.

Denison est fier de la relation établie avec toutes les parties prenantes, et se réjouit de continuer à développer ces relations par moyen d'un programme d'engagement en cours à mesure que le projet Wheeler avance.

1 Introduction

The Wheeler River Project (Wheeler or the Project) is a proposed uranium mine and processing plant in northern Saskatchewan, Canada (Figure 1.1).

Wheeler is a joint venture project owned by Denison Mines Corp. (Denison) and JCU (Canada) Exploration Company Ltd. (JCU). Denison owns 90% of Wheeler and is the operator, while JCU owns 10%. The Wheeler property contains a number of areas of mineralization, including but not limited to the Phoenix and Gryphon deposits.

Athabasca Basin, Canada
Date: Dec. 2018

Figure 1.1: Wheeler River Location in Canada

Wheeler is located in Saskatchewan's Athabasca Basin about 4 km west of Highway 914. It is located mid-way between Cameco Corporation's Key Lake Mill and McArthur River Mine (Figure 1.2) and is 600 km north of Saskatoon.

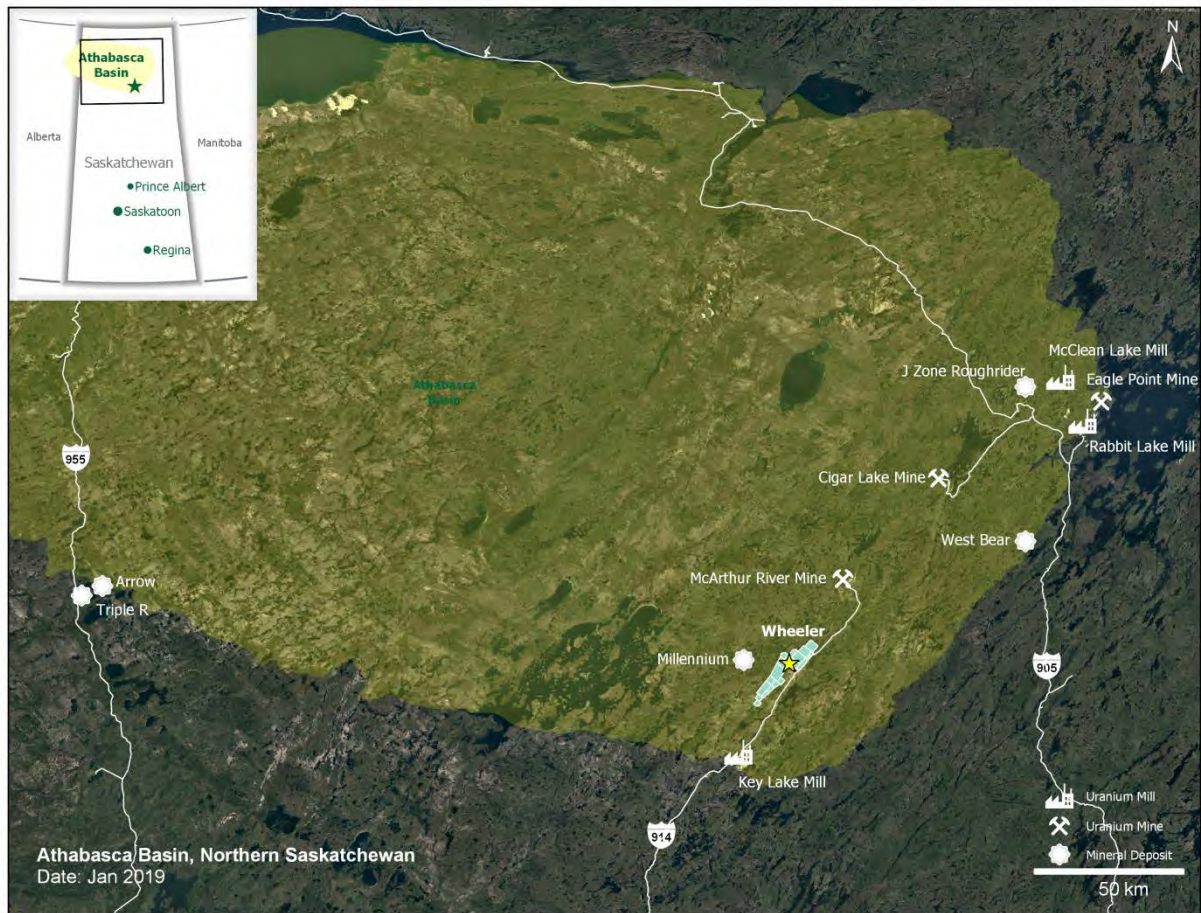

Figure 1.2: Wheeler River Location in the Athabasca Basin

1.1 Project Proponent

Denison is a publicly traded uranium exploration and development company with interests focused in the Athabasca Basin region of northern Saskatchewan, Canada. The company trades on the Toronto Stock Exchange and New York Stock Exchange, and headquartered in Toronto, Ontario with offices in Saskatoon, Saskatchewan and Vancouver, British Columbia.

Historically, Denison (and its predecessor companies) has had over 50 years of uranium mining experience in Elliot Lake, Ontario, Saskatchewan, and in the United States. Today, the company is part owner (22.5%) of the McClean Lake Joint Venture which includes the operating McClean Lake uranium mill in northern Saskatchewan. In addition, Denison provides expert mine decommissioning and environmental services through its Denison Environmental Services division and serves as the manager of Uranium Participation Corporation, a publicly traded company that invests in uranium oxide and uranium hexafluoride.

The company's history of uranium mining, unique expertise in the specialized sectors of uranium mine decommissioning and exploration, as well as its active involvement in the uranium sales and marketing business through its management of Uranium Participation Corporation, have uniquely prepared Denison to be a qualified proponent to develop and operate Wheeler.

As exemplified under our current licences with the Canadian Nuclear Safety Commission (CNSC) at our Elliot Lake and McClean Lake uranium facilities, Denison is committed to the operation of its facilities in a manner that prioritizes safety, environmental protection, and sustainable development.

The proponent is Denison Mines Corp.

1.2 Project Needs and Benefit

Mining of uranium is the first step in the nuclear fuel cycle, which ultimately concludes with the furnishing of nuclear fuel assemblies to nuclear power plants around the world for the generation of low carbon and low-cost electricity. Accordingly, uranium mining is an essential component in the global battle against climate change and the shift towards the generation of low carbon electricity.

The United Nations estimates that the world's population will grow from approximately 7.5 billion in 2017 to over 9.7 billion in 2050 (United Nations 2017) which is expected to substantially increase global electricity demand. Economic development in non-OECD countries is rapidly shifting global electricity demand and generating more interest in new nuclear plant investments (Massachusetts Institute of Technology 2018). According to the International Atomic Energy Agency (IAEA 2018), high-case projections for nuclear generating capacity suggest that current global capacity could increase from 392 GWe in 2017 to 748 GWe in 2050. At present, there are approximately 450 operable reactors worldwide with an additional 50 to 60 under construction (Canadian Nuclear Association 2017). In addition, momentum is building in regards to the future potential associated

with the development of small modular nuclear reactors, which could bring reliable and low-cost energy to remote communities around the world, and ultimately create significant additional demand for nuclear fuel.

Hand-in-hand with the rising demand for reliable and low-cost energy is the discussion surrounding greenhouse gas emissions and climate change. Despite numerous environmental initiatives and on-going research, global climate change continues at an alarming rate. In 2017, global atmospheric concentration of carbon dioxide (CO₂) rose by 1.4% which is the largest annual rise ever recorded (World Nuclear Association 2018). One of the most influential energy sources available to combat the rise of CO₂ emissions is nuclear power (Figure 1.3). If all the world's coal and natural gas plants were replaced with low carbon nuclear, CO₂ emissions would be reduced by over 22% (Canadian Nuclear Association 2017).

Source: The Canadian Nuclear Association 2017

Figure 1.3: Global CO₂ Emissions since 1990 and CO₂ Emissions by Energy Source

A recent report by the United Nations Intergovernmental Panel on Climate Change that examined 89 climate change mitigation scenarios concluded that achieving the 1.5°C target from the Paris Agreement will require global greenhouse gas emissions to start being reduced immediately, and an increase in nuclear power generation of approximately 2.5 times by 2050 (World Nuclear Association 2018). Without a significant contribution from nuclear energy, as the global power mix shifts to respond to climate change initiatives, the cost to achieve meaningful decarbonisation targets will steadily rise or targets will simply go unmet. Nuclear is critical to global climate change objectives because of its unique combination of low carbon emissions, large scale, and reliability.

In terms of scale, the uranium expected to be produced from Wheeler would be sufficient to power 1 million homes for approximately 160 years (assuming 200 tonnes U_3O_8 fuels a 1,000 MWe plant for one year). Alternatively, the uranium produced from Wheeler could provide fuel to meet all of the projected Canadian nuclear utilities' base requirements from 2019 to 2035 including New Brunswick Power, Ontario Power Generation and Bruce Power.

Canada is uniquely positioned to support global climate change initiatives. Canada is the second largest producer and exporter of uranium in the world, with approximately 88% of the uranium produced in Canada destined for export to support global nuclear power use (Natural Resources Canada 2018). At present, Canada's current uranium production comes from uranium mines operated in northern Saskatchewan. Canada has a rich history of involvement with nuclear power and the technological advances that have been made within the industry since the early 1940s. According to Natural Resources Canada, 15% of the country's electricity was provided by nuclear power in 2016 (Natural Resources Canada 2018). Given the integral role it plays in our economy, the nuclear power industry has been and will continue to be a growth vehicle for economic and employment opportunity, an aid to the rapidly increasing electricity demand, and a key contributor in the battle against the environmental impacts associated with greenhouse gas emissions. The mining and processing of uranium as part of the Project will support the projected future growth in nuclear power both domestically and internationally.

Nuclear in Canada is a \$6 billion industry that directly and indirectly supports a total of 60,000 jobs throughout the country (Canadian Nuclear Association 2017) (Figure 1.4).

Source: The Canadian Nuclear Association Factbook 2017

Figure 1.4: Jobs Supported by the Nuclear Industry in Canada

With refurbishment plans in place for 10 of the 19 nuclear reactors in Canada (primarily located at the Ontario Power Generation and Bruce Power nuclear facilities in Ontario) there is a distinct opportunity to add further employment opportunities within the industry and throughout the nuclear fuel cycle. Government research and studies suggest that the economic benefits of refurbishing only 4 of the 10 reactors (located at the Ontario Power Generation facility in Darlington, Ontario) would be almost \$90 billion (Canadian Nuclear Association 2017). At its peak, the refurbishment of Bruce Power’s nuclear facility will create 22,000 direct and indirect jobs annually and will secure the organization’s future for decades creating demand for reliable and safe uranium production for many years to come (Bruce Power and Ontario Power Generation 2018).

While Canada’s nuclear facilities are mainly concentrated in Ontario, the majority of uranium production in Canada comes from northern Saskatchewan, which is home to the world’s largest and highest-grade uranium deposits – some with concentrations more than 100 times the global average (Natural Resources Canada 2018). Wheeler is located in the Athabasca Basin in northern Saskatchewan where established uranium mining and milling operations are a major employer of the province’s northern and Indigenous peoples. The advancement of Wheeler will not only contribute economically to Canada’s nuclear energy industry, but is also expected to provide additional employment and business opportunities to Indigenous and northern communities in Saskatchewan.

The world and Canada need uranium and Wheeler can provide this critical component in the nuclear fuel cycle while making a meaningful contribution to the Canadian economy and Saskatchewan’s northern and Indigenous communities.

1.3 Regulatory Context

This document was written to meet the requirements and guidance for both a federal Project Description under the *Canadian Environmental Assessment Act 2012* (CEAA 2012; *Prescribed Information for the Description of a Designated Project Regulations* and Canadian Environmental Assessment Agency 2015a) and a provincial Technical Proposal (Government of Saskatchewan 2014a) under Saskatchewan's *Environmental Assessment Act*.

Denison anticipates that the provincial and federal environmental assessment processes for Wheeler will be conducted in parallel; the Saskatchewan Environmental Assessment & Stewardship Branch and the CNSC will cooperate in conducting a coordinated provincial-federal EA that will follow the spirit of the Canada-Saskatchewan Agreement on Environmental Assessment Cooperation (2005) to the extent possible. The agreement allows for cooperation in the assessment of projects that require regulation by both levels of government. The cooperation agreement allows for the production of a single environmental impact assessment (EIA) that meets the requirements of both levels of government, so that each level of government can make an independent decision.

Please see Appendix A for the table of concordance with the *Prescribed Information for the Description of a Designated Project Regulations*.

1.3.1 Environmental Assessment Requirements

1.3.1.1 Federal

The proposed Project will include the construction, operation and decommissioning of a uranium mine, processing plant and supporting facilities on a site that is not within the boundaries of an existing licensed uranium mine or mill. As such, Wheeler is a designated project as set out in section 31 of the *Regulations Designating Physical Activities* and is therefore subject to a federal environmental assessment.

The CNSC will be the federal responsible authority for Wheeler's environmental assessment.

Applicable federal Acts and regulations applicable to Wheeler include but are not limited to:

- *Fisheries Act*
 - *Metal and Diamond Mining Effluent Regulations*
- *Canadian Environmental Assessment Act*
 - *Regulations Designating Physical Activities*
 - *Prescribed Information for the Description of a Designated Project Regulations*
- *Species at Risk Act*
- *Nuclear Safety and Control Act*
 - *General Nuclear Safety and Control Regulations*

- *Uranium Mines and Mills Regulations*
- *Packaging and Transport of Nuclear Substances Regulations*
- *Radiation Protection Regulations*
- *Migratory Birds Convention Act*
- *Transportation of Dangerous Goods Act*
 - *Transportation of Dangerous Goods Regulations*
- *Canadian Environmental Protection Act*
 - *Environmental Emergency Regulations*
- *Canadian Wildlife Act*
- *Navigation Protection Act*

Denison acknowledges Bill C-69 that proposes a number of changes to the current environmental assessment process. Section 182 of the bill outlines that EIAs for CNSC designated projects started under *CEAA (2012)* will continue under *CEAA (2012)*.

Accordingly, this project description has been prepared to comply with the requirements of *CEAA (2012)*.

1.3.1.2 Provincial

Environmental Assessment in Saskatchewan is regulated by the *Environmental Assessment Act* and its application hinges on whether a project is a development, or not, based upon the criteria in Section 2(d):

2(d) “development” means any project, operation or activity or any alteration or expansion of any project, operation or activity which is likely to:

- (i) have an effect on any unique, rare or endangered feature of the environment;
- (ii) substantially utilize any provincial resource and in so doing pre-empt the use, or potential use, of that resource for any other purpose;
- (iii) cause the emission of any pollutants or create by-products, residual or waste products which require handling and disposal in a manner that is not regulated by any other Act or regulation;
- (iv) cause widespread public concern because of potential environmental changes;
- (v) involve a new technology that is concerned with resource utilization and that may induce significant environmental change; or
- (vi) have a significant impact on the environment or necessitate a further development which is likely to have a significant impact on the environment.

The likely applicable Section 2(d) triggers are Sections 2(d) (iv) and (v); a potential for public concern, and a new technology application in Saskatchewan (in situ recovery for uranium), respectively.

Accordingly, Denison is self-declaring that Wheeler is a development under the *Environmental Assessment Act*; Denison is not seeking a ministerial determination on whether the Project is a development.

Denison will be submitting the Project's draft Terms of Reference to the province under a separate cover.

Denison will conduct, prepare and submit an environmental impact statement (EIS) to Saskatchewan Ministry of Environment's Environmental Assessment and Stewardship branch that meets the requirements outlined in the Saskatchewan Environmental Assessment Act. Ultimately the Project will require issuance of a ministerial approval under section 15 of the Saskatchewan *Environmental Assessment Act* before proceeding to licensing and permitting.

Relevant provincial Acts and associated regulations applicable to Wheeler include but are not limited to:

- *Environmental Assessment Act*
- *Environmental Management and Protection Act*
 - *Mineral Industry Environmental Protection Regulations*
 - *Hazardous Substances and Waste Dangerous Goods Regulations*
 - *The Waterworks and Sewage Works Regulations*
 - *Environmental Management and Protection (Saskatchewan Environmental Code Adoption) Regulations*
- *Wildlife Act*
 - *Wildlife Regulations*
- *Wildlife Habitat Protection Act*
 - *Wildlife Habitat Lands Disposition and Alteration Regulations*
- *Fisheries Act (Saskatchewan)*
 - *Fisheries Regulations*
- *Forest Resource Management Act*
 - *Forest Resources Management (Saskatchewan Environmental Code Adoption) Regulations*
 - *Forest Resources Management Regulations*
- *Natural Resources Act*
- *Prairie and Forest Fire Act*
- *Heritage Property Act*

- *Provincial Lands Act*
 - *Provincial Lands Regulations*
- *Saskatchewan Employment Act*
 - *Mines Regulations*
 - *Occupational Health and Safety Regulations*
- *Radiation Health and Safety Act*
 - *Radiation Health and Safety Regulations*
- *Reclaimed Industrial Site Act*
 - *Reclaimed Industrial Sites Regulations*
- *Water Security Agency Act*
- *Dangerous Goods Transportation Act*
 - *Dangerous Goods Transportation Regulations*
- *Mineral Resources Act*
- *Crown Minerals Act*
- *Public Health Act*
 - *Plumbing Regulations*
- *Boiler and Pressure Vessel Act*
 - *Regulations Respecting the Design, Construction, Installation and Use of Boilers and Pressure Vessels*
- *Electrical Inspection Act*
 - *Electrical Inspection Regulations*
- *Gas Inspection Act*
 - *Gas Inspection Regulations*
 - *Gas Licensing Regulations*

1.3.2 Guidelines, Policies, Standards

In addition to regulatory requirements from federal and provincial Acts and regulations, Denison will apply a number of other guidelines, policies and standards to the Project. The following list provides examples of guides, policies and standards Denison will use in completing the Wheeler EIA and is not exhaustive:

- Canadian Environmental Assessment Agency:
 - Technical Guidance for Assessing Physical and Cultural Heritage or any Structure, Site, or Thing that is of Historical, Archaeological, Paleontological, or Architectural Significance under CEAA (2012)

- Addressing “Purpose of” and “Alternative Means” under the CEAA (2012)
- Determining Whether a Designated Project is Likely to Cause Significant Adverse Environmental Effects under the CEAA (2012)
- Considering Aboriginal traditional knowledge in environmental assessments conducted under CEAA (2012) (CEAA 2015b)
- Federal Policy on Wetland Conservation
- Various CNSC regulatory documents (REGDOCS), for example:
 - 2.9.1 Environmental Principles, Assessments and Protection Measures (CNSC 2017)
 - 3.1.2 Reporting Requirements, Volume I: Non-power reactor class I facilities and uranium mines and mills
 - 3.2.2 Aboriginal Engagement (CNSC 2016a)
- CNSC’s generic guidelines for the preparation of an environmental impact statement (CNSC 2016b)
- Various CSA Standards, for example:
 - N288.4-10 Environmental monitoring programs at Class I nuclear facilities and uranium mines and mills
 - N288.7-15 Groundwater protection programs at Class I nuclear facilities and uranium mines and mills
 - N286-12 Management System Requirements for Nuclear Facilities
 - N288.5-11 Effluent Monitoring Programs at Class I nuclear facilities and uranium mines and mills
 - N288.6-12 Environmental risk assessments at class I nuclear facilities and uranium mines and mills
 - N294-09 Decommissioning of facilities containing nuclear substances
- Guidelines for Northern Mine Decommissioning and Reclamation, November 2008, Version 6, Saskatchewan Ministry of Environment
- The Saskatchewan Environmental Code and attendant standards

1.3.3 Licensing and Permitting

The following permits, approvals, and licences are anticipated at different stages of the Project:

- Provincial environmental assessment approval
- Federal environmental assessment approval
- CNSC licences to:
 - Prepare site and construct

- Operate
 - Decommission
 - Abandon (release from licensing)
- Surface lease agreement
- Heritage Conservation Branch approval
- Forest Product Permit
- Aquatic Habitat Protection Permit
- Approval to Construct Highways Approach
- Approval to Construct and Operate Pollutant Control Facilities
- Environmental Protection Plan for Industrial Sources
- Approval to Construct Hazardous Substances and Waste Dangerous Goods Facility and Store Hazardous Substances and Waste Dangerous Goods
- Permit to Operate Waterworks
- Permit to Operate Sewage Works
- Approval to Decommission Pollutant Control Facilities
- Release from Decommissioning and Reclamation
- Provincial Acceptance of Decommissioned and Reclaimed Site into Institutional Control Program

1.4 Regional Studies

EIAs have been completed or are underway for nearby projects related to uranium mining and milling as well as a provincial highway extension. This includes Cameco Corporation's original EIAs and any subsequent expansion EIAs for mining and milling of uranium at Key Lake Operation and mining of uranium at McArthur River Operation. An EIA was initiated and subsequently halted by Cameco for the proposed Millennium Project, a proposed uranium mine located between Key Lake and Wheeler. Saskatchewan Ministry of Highways has initiated the provincial environmental assessment process for extending Highway 914 from McArthur River Operation to Cigar Lake mine and constructing a by-pass at the Key Lake Operation.

Other regional studies include:

- Eastern Athabasca Regional Environmental Monitoring Program;
- Canadian Nuclear Safety Commission's Independent Environmental Monitoring Programs; and
- Saskatchewan Boreal Watershed Initiative (Government of Saskatchewan 2017a) which includes a summary of available air quality, aquatic ecosystems, terrestrial ecosystems and Indigenous Knowledge.

1.5 Engagement

Denison recognizes the importance of engaging with local and Indigenous communities, residents, businesses, organizations, land users and the various regulatory authorities, collectively referred to as ‘Stakeholders.’ Since 2016 Denison had been engaging with Stakeholders in ongoing efforts to build positive relationships with all parties.

Denison has engaged with the following Stakeholders in regards to Wheeler:

- English River First Nation
- Hamlet of Patuanak
- Kineepik Métis Local Inc.
- Pinehouse village
- Sipisishik Métis Local 37
- Beauval village
- A La Baie Métis Local 21 Inc.
- Ile a la Crosse village
- Recreational lease holders
- Northern Saskatchewan Environmental Quality Committee
- Canadian Nuclear Safety Commission staff in the Environmental Assessment division and the Uranium Mines and Mills division
- Saskatchewan Ministry of Environment staff with the Environmental Assessment and Stewardship branch and the Uranium and Northern Operations branch.

Details of Denison’s engagement with Stakeholders, including engagement results to date, influence of engagement on the Project design, and the plan for ongoing engagement activities are provided in sections 7 and 8 below.

Engagement initiated by Denison in 2016 is part of an ongoing commitment by Denison to actively engage all Stakeholders throughout the Project development phases.

Denison’s early engagement initiatives with local Indigenous communities have allowed for the integration of Indigenous Knowledge with the Project development process, environmental baseline studies completed, and socio-economic initiatives directly related to the Project. Some of the key activities demonstrating this integration are presented in the Project timeline shown in Figure 1.5.

Denison’s ongoing Stakeholder engagement program reflects the results of feedback received to date from previous engagement sessions and is intended to be flexible and adaptive.

Denison will visit local Stakeholders, as appropriate, and will provide Project updates as Wheeler is advanced. It is currently envisioned that community meetings will be held at least once per year in a number of local communities, and more frequently if desired by any of these communities.

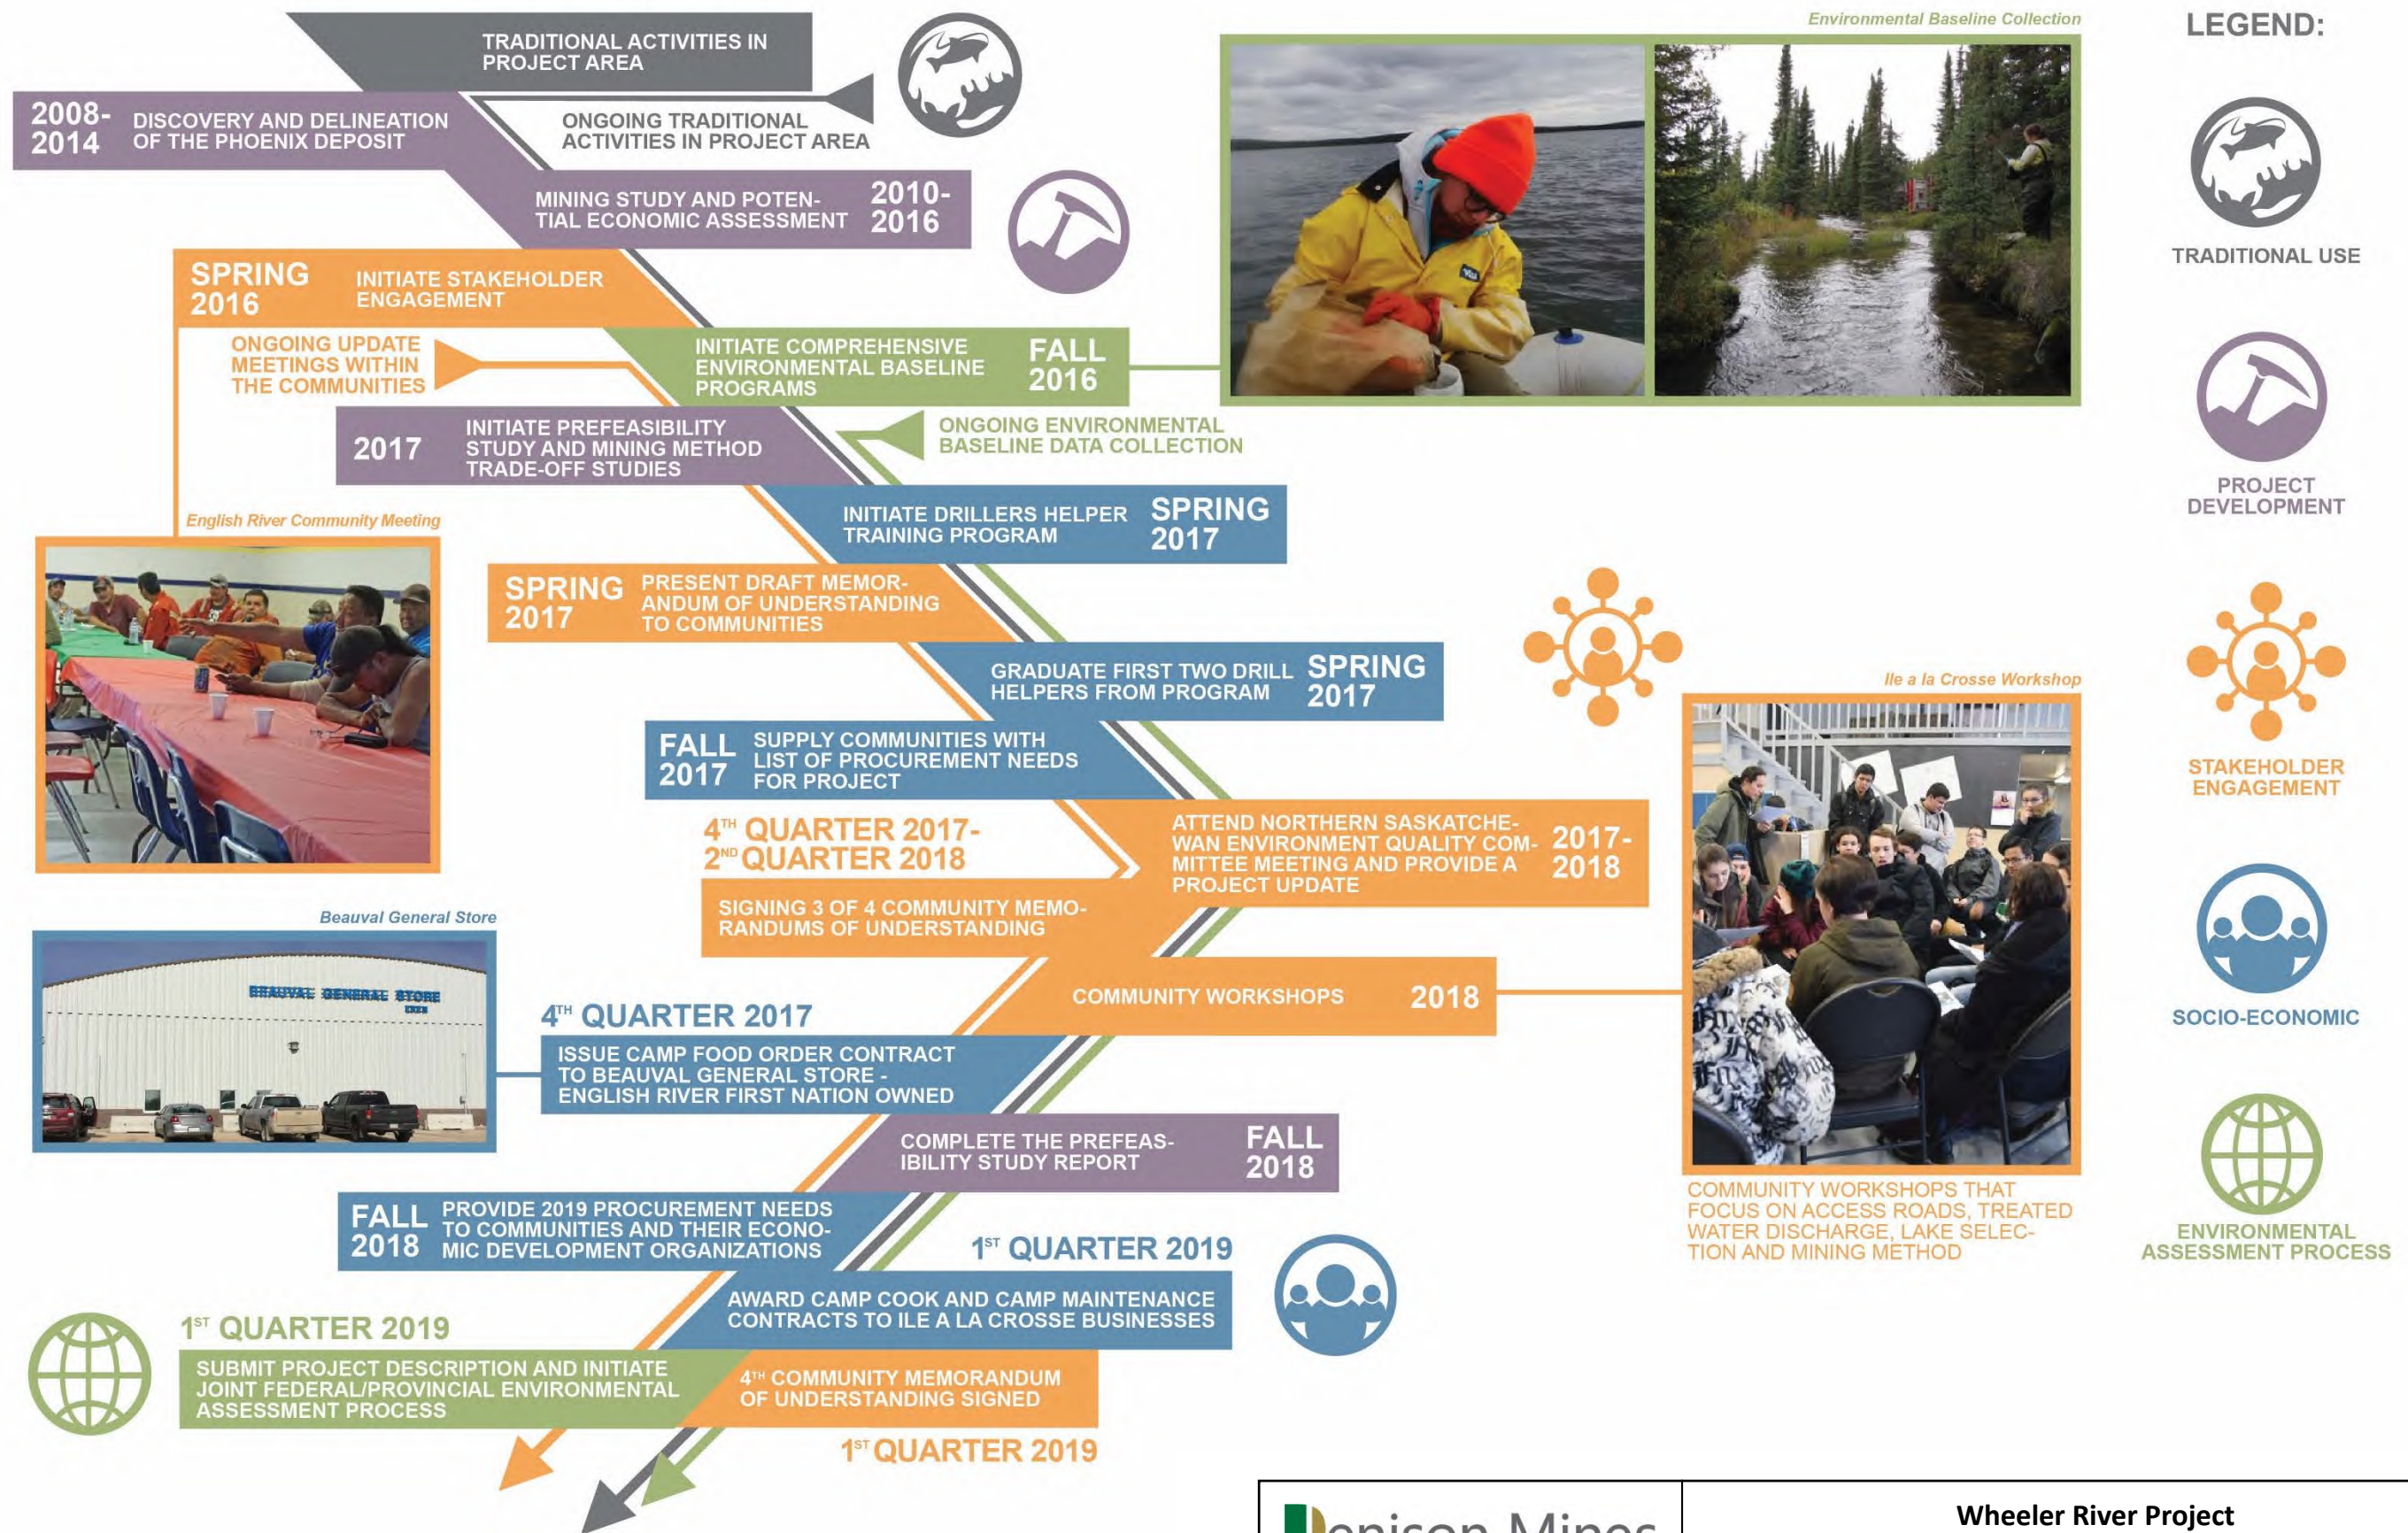

Denison is also committed to meeting with the leadership of these communities, in addition to other stakeholder organizations, as and when requested as part of the Company's standing commitment to respond to any enquires regarding the Project.

As the Project advances Denison is committed to continue to utilize local community radio stations, social media, and print media that may reach northern audiences.

In order to formalize Denison's commitment to its local Indigenous communities (and their associated non-Indigenous communities), Memorandums of Understanding (MOU) have been signed between Denison and:

- English River First Nation;
- Kineepik Métis Local and the community of Pinehouse;
- A La Baie Métis Local 21 and the community of Ile a la Crosse; and
- Sipisishik Métis Local 37 and the community of Beauval.

These non-binding MOUs formalize the signing parties' intent to work together in a spirit of mutual respect and cooperation to collectively identify practical means by which to avoid, mitigate, or otherwise address potential impacts of the Project upon the exercise of the indigenous rights, treaty rights, and interests. In addition, the MOUs outline the signing parties' intent to work together to ensure benefits will flow from the Project, provide a process for continued Project engagement and information-sharing about the project, and establish a relationship to identify business, employment and training opportunities for the parties with respect to the Project.

Figure 1.5: Project Timeline

May 2019

2 Project Information

2.1 Project Overview

2.1.1 Deposit & Geology

Several areas of uranium mineralization amenable to in situ recovery (ISR) have been defined at Wheeler with the most prominent area being the Phoenix deposit. Phoenix is the highest-grade undeveloped uranium deposit in the world. It is geologically situated at or immediately above the unconformity between the Athabasca Basin sandstone and older basement rocks, approximately 400 metres below surface. To date, these zones have been estimated to contain a total of 70.2 million pounds U_3O_8 of indicated mineral resources based on 166,400 tonnes of ore at an average grade of 19.14% U_3O_8 . There are additional zones of mineralization at Wheeler that have not been fully defined from exploration activities.

2.1.2 Selection of In Situ Recovery Mining Method

After completion of the 2016 Wheeler Preliminary Economic Assessment (Denison 2016) Denison initiated a detailed review of the development plan for the Phoenix deposit, which had originally been designed as an underground mine using a jet boring system as the extraction technology.

The 2016 Preliminary Economic Assessment identified disadvantages associated with the jet boring system mining method – including technical risks, comparatively high operating and capital costs, and long pre-production construction timelines. Accordingly, Denison initiated an extensive review process, seeking suitable alternative mining methods for the Phoenix deposit. A total of 32 different mining methods were initially identified and screened. The final two preferred technologies were advanced into a more rigorous evaluation process at the prefeasibility (PFS) level of assessment. Ultimately, In Situ Recovery (ISR) mining was selected as the preferred mining method due to its significant economic, environmental, and technical advantages.

ISR mining is also known as solution mining or in situ leaching – as the mining method uses an engineered fluid or solution to dissolve uranium from the host rock without physically removing the host rock for processing on surface. There are no underground or open pit workings required in an ISR operation; no heavy equipment is needed and people do not work underground. The process utilizes a series of injection wells to inject mining solution into the uranium deposit and another series of wells (recovery wells) to return the uranium rich solution back to surface for processing. There is minimal surface disturbance, minimal waste rock generated and no tailings are produced.

2.1.3 Experience and Lessons Learned from International In Situ Recovery Operations

Globally, ISR mining is considered to be the lowest-cost and industry leading method for uranium extraction. The method was first used in the 1960's and now accounts for over 50% of the world's annual uranium production, with use in Kazakhstan (the world's largest and lowest cost producer of

uranium), the United States, China, Russia, and Australia, among others. ISR mining is amenable to uranium deposits in certain sedimentary formations and is well known in the industry for having comparatively minimal surface impact, high production flexibility, and low operating and capital costs relative to open pit or conventional underground mining methods. There has been continuous development and improvement of ISR mining techniques in recent years, particularly in the two decades since the International Atomic Energy Agency published the *Manual of Acid In-Situ Leach Uranium Mining Technology* (IAEA 2001).

The general benefits of ISR include:

- *No tailings* – as the dissolution of the uranium contained in the host rock occurs “in-situ”, there is no processing of the host rock on surface and thus there is no waste / tailings generated by the ISR mining method;
- *Minimal surface disturbance* – In addition to having relatively modest needs for buildings and structures on site, ISR mining does not involve the sinking of shafts or the development of a large open pit. The surface impact associated with an ISR wellfield is limited to a series of cased injection, recovery and monitoring wells with a diameter of approximately 4-8 inches;
- *Established safety practices and procedures* – with over 50% of global uranium production coming from ISR mining in multiple countries, the mining method has become well known within the uranium mining industry and has allowed for the establishment of a wealth of safety practices and procedures to ensure health and safety of workers;
- *Minimal environmental impacts* - Amongst other additional comparative benefits, ISR mining operations are known for low noise levels, minimal dust and air emissions, low water consumption levels, minimal treated effluent discharge volumes, and minimal waste rock generation; and
- *Economic advantages* – ISR mining operations often have comparatively low capital and operating costs, as well as shorter timelines to first production and greater flexibility to allow production to be scaled to meet market demands.

In evaluating the application of ISR technology to the Athabasca Basin, Denison initiated a detailed review of the experience from international ISR operations over the last 50 years. Information is publicly available from ISR activities in the following countries:

- Australia (5 sites)
- USA (49 sites)
- Kazakhstan (17 sites)
- Bulgaria (19 sites)
- China (3 sites)
- Czech Republic (2 sites)
- Hungary (1 sites)

- Mongolia (3 site)
- Niger (1 site)
- Pakistan (1 site)
- Russia (2 sites)
- Ukraine (3 sites)
- Uzbekistan (3 sites)

Other countries such as Germany also have experience with ISR operations but have less extensive publicly available records to date.

While each operation is unique based on site-specific characteristics, the two general challenges to international ISR operations are: 1) potential groundwater impacts during operations and 2) remediation of the mining zones after mining is complete.

2.1.3.1 Potential Impacts to Groundwater

Traditional ISR operations rely on natural barriers (aquitards) or artificial pumping to create a drawdown of the regional groundwater to help contain the mining solution and minimize loss of the mining solutions to the regional groundwater. Containment of the mining solution in this way may create downstream problems including:

1. Loss of the mining solutions to the environment (known as excursions) may occur. Depending on the site-specific characteristics, these excursions will have varying levels of impact on the groundwater. In some instances, the excursions are allowed to continue while in other cases operations are required to implement mitigation strategies such as drilling additional pumping wells, reversal of wellfield flows and increase in draw down rates of the regional groundwater to capture the excursion.
2. Artificial drawdown of the aquifer brings excess water into the ISR process plant known as a bleed. Depending on site specific characteristics the bleed is either treated and discharged or directly discharged. In either case, it results with handling additional volumes of groundwater, an increased demand on energy and stress on the regional groundwater system.

In order to eliminate potential excursion to the regional groundwater Denison will engineer and create an artificial freeze wall to encapsulate the uranium deposit and create an isolated mining chamber (details in Section 2.3.1.3). The freeze wall will prevent the mining solution from travelling into the regional groundwater system and at the same time prevent the regional groundwater from entering the mining chamber area and diluting the mining solution.

2.1.3.2 Remediation After Operations

The second major challenge to international ISR operations is the remediation of the site after mining is complete. Remediation efforts in international operations vary significantly depending on

site specific characteristics as well as the time period in which the operation occurred. In general, more recent operations have increased efforts towards remediation. Similar to many legacy mining sites, some historical ISR operations were operated with limited environmental considerations and as a result have led to contamination of the regional groundwater system.

In some operations, conditions surrounding the wellfield support a natural attenuation approach to remediation. In this context as groundwater travels outside the mining area it naturally improves. No active treatment outside the wellfield area is completed. Natural attenuation is typically completed in areas where the pre-mining environment showed poor background groundwater quality, limited or no use of groundwater for agriculture or human consumption, and/or areas with geochemical characteristics capable of naturally neutralizing the groundwater.

In some operations active treatment of the wellfield is completed. This can be completed by injecting reagents into the mined-out wellfield to neutralize the impacted groundwater, flushing the wellfield with clean water (in the same manner as mining was completed) with treatment and discharge of the collected groundwater or a variety of other options.

Denison's inclusion of a freeze wall (details Section 2.3.1.3) will mitigate many of the remediation challenges encountered at international operations. The freeze wall will allow for a controlled remediation process to occur unaffected by the regional groundwater. The depth to the deposit (400 metres below surface), the existing poor quality pre-mining groundwater chemistry, and limited volume of groundwater disturbance due to the isolation of the mining chamber will eliminate any impacts on regional groundwater use. Remediation of the contained mining chamber will be completed using active treatment and containment will continue until conditions inside the chamber demonstrate acceptable geochemical conditions.

Denison has extensively researched best practices and challenges experienced in international operations. The design of the Wheeler ISR project has specifically targeted the elimination of the major challenges seen at international operations which is expected to result with the Wheeler being one of the most environmentally friendly mining projects in the world.

2.1.4 Objective and Overview of Wheeler In Situ Recovery

The objective of the Project is to construct, operate, and decommission an ISR uranium mine and processing plant.

The mining solution proposed at Wheeler will be similar to the leaching solution currently used in conventional Saskatchewan uranium mills and will consist of water and reagents such as sulphuric acid mixed to a consistent and relatively dilute concentration. The low pH or acidic mining solution oxidizes and dissolves the uranium as it travels through the uranium deposit. The process involves injecting the mining solution into the uranium deposit through a series of cased (contained) drill holes called injection wells. Following sufficient contact between the mining solution and the uranium deposit, the uranium is dissolved into the mining solution. The uranium rich mining

solution is then pumped back to surface via a similar series of cased recovery wells. This process is shown graphically in Figure 2.1 and details are provided in Section 2.3.1. Once on surface, the uranium rich mining solution will be piped to the processing plant for chemical separation of the uranium from the mining solution.

At Wheeler the uranium deposit is confined to a relatively small area (approximately 900 m x 90 m) and has proved readily leachable in laboratory testing. As a result, infrastructure disturbance (e.g., number of wells, extent of surface piping systems) are expected to be significantly reduced when compared to conventional low-grade ISR operations or conventional open pit operations.

In conventional ISR operations, containment of the mining solution is typically achieved by naturally impermeable bounding layers in the geological strata (i.e., aquitards) and/or by creating an artificial drawdown (via pumping) of the water table towards the uranium deposit. At Wheeler, there is a natural impermeable layer below the deposit, in the form of competent basement rock, but the deposit is otherwise hydraulically connected to the regional groundwater system in the overlying sandstone formation that is consistent throughout the Athabasca Basin. Given the depth and small spatial extents of the uranium deposit, extraction could be done without an upper bounding layer of containment; however, doing so will require significant engineering controls between the injection and recovery wells to facilitate the necessary containment of the mining solution.

In order to simplify these controls and associated costs as well as to maintain proper concentrations of the mining solution and constant contact of the mining solution with the uranium deposit, an artificial freeze wall will be created to serve as an impermeable layer above and around the uranium deposit (details are provided in Section 2.3.1.3). When combined with the low permeability basement rock underneath the uranium deposit, the dome-shaped freeze wall will isolate the uranium deposit, creating the mining chamber (Figure 2.2). Within the mining chamber, the mining solution can then circulate from the injection wells through the deposit to the recovery wells without interacting with the surrounding groundwater. The freeze wall will also facilitate controlled restoration of the mining chamber during the decommissioning phase.

ISOMETRIC SECTIONAL VIEW

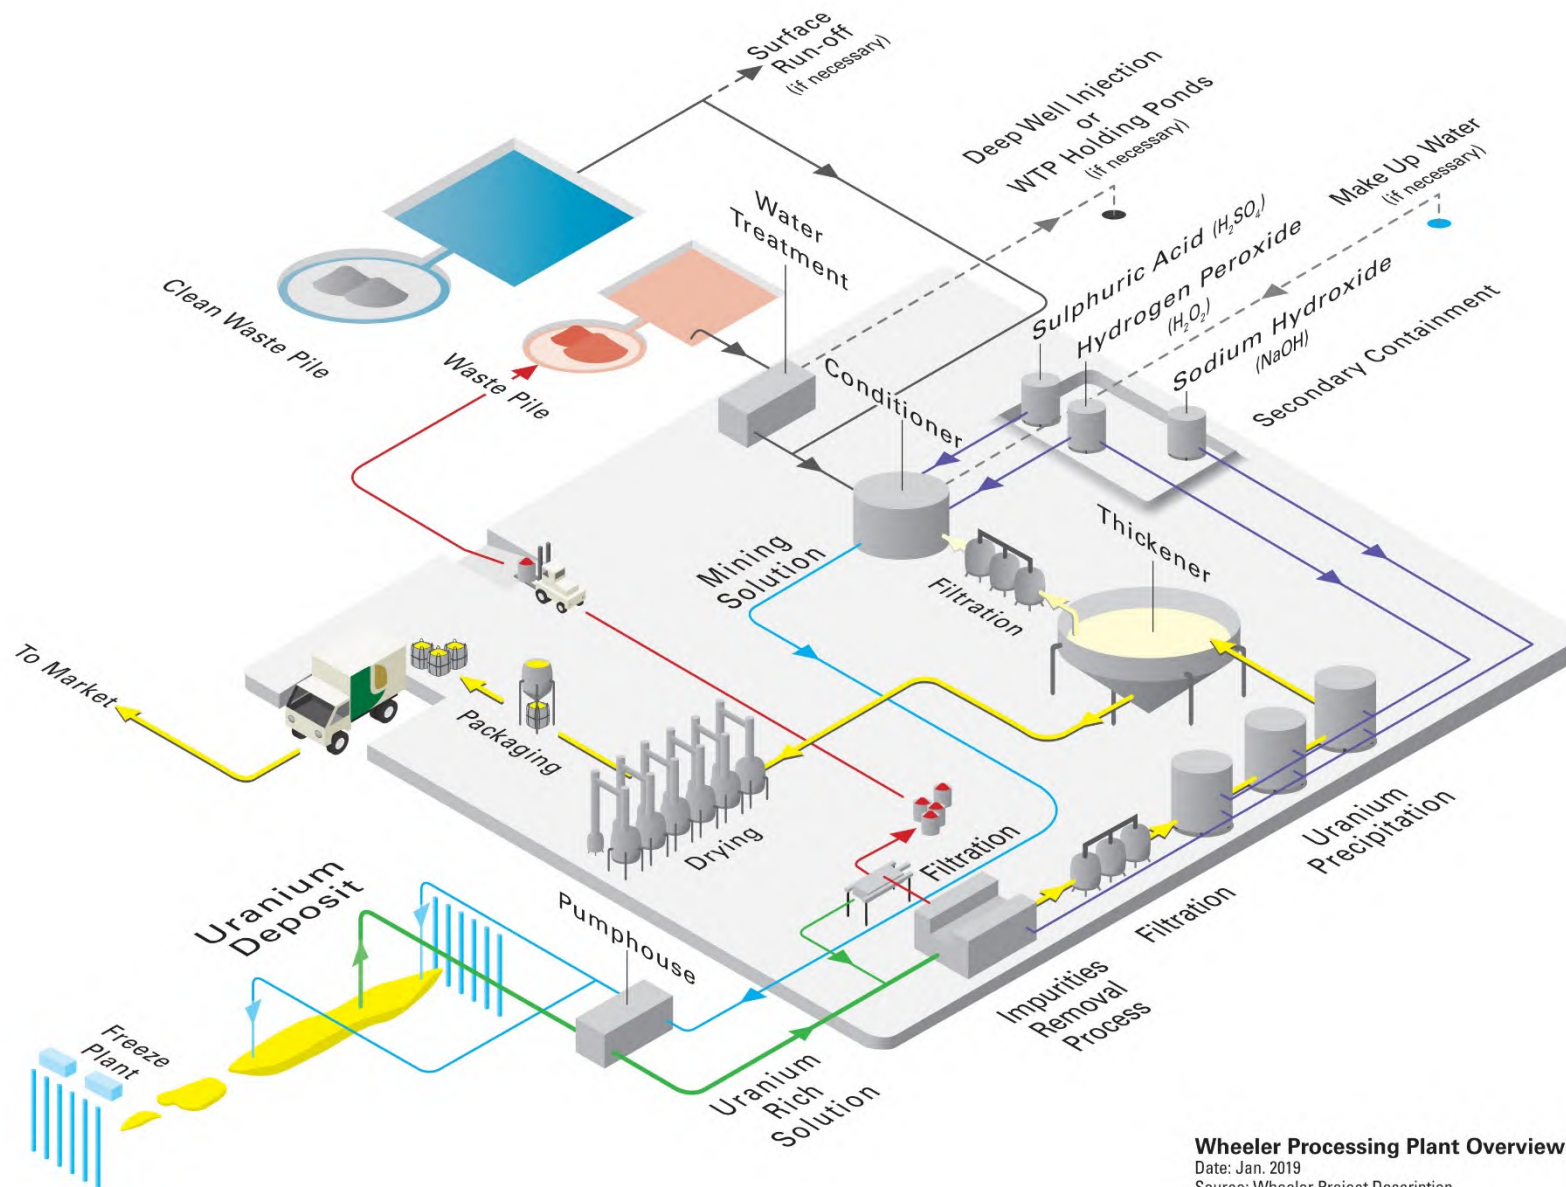

Schematic does not represent detailed engineering of the ISR well field and its components. Schematic not drawn to scale.

As part of the Project evaluation process, Denison completed numerous metallurgical test programs to simulate the ISR mining process, in accordance with industry standards – including leach tests, agitation leach tests, column tests, and post-mining restoration tests. The test results have been used to inform the design of the processing plant.

The processing plant design will be relatively simple for a variety of reasons. The first is that the ISR mining method eliminates the need for treatment of ore through conventional milling circuits like crushing, grinding and leaching. Secondly, as a result of the high uranium concentration and low levels of impurities in the uranium deposit and the uranium rich mining solution, Denison has demonstrated through test work that direct precipitation of the uranium is viable and may eliminate the need for ion exchange or solvent extraction circuits. However, to be conservative and allow for operational flexibility, future design work may evaluate use of additional processing circuits to improve performance. Finally, since the ISR process produces no tailings there is no need for tailings preparation circuits and a tailings management facility.

The processing of the uranium rich mining solution will consist of an impurities (mainly iron) precipitation circuit followed by the uranium precipitation, drying and packaging circuits (Figure 2.3). Details are provided in Section 2.3.2. The processing plant will be designed as a closed loop system, meaning that once the uranium is precipitated, the mining solution is reformed with reagents and returned to the wellfield for re-injection and further mining.

Wheeler Processing Plant Overview

 Source: Wheeler Project Description

2.2 Site History

2.2.1 Property Description

The Wheeler River exploration property is host to the Phoenix uranium deposit discovered in 2008 and Gryphon deposit discovered in 2014 (Figure 2.4) plus additional zones of mineralization and other prospective exploration targets.

Access to the property and deposits is by road, helicopter, or fixed wing aircraft from Saskatoon. Vehicle access to the property is by Highway 914. Access to Highway 914 north of Key Lake Operation is controlled by a gatehouse operated by Cameco. An older access road, the Fox Lake Road, between Key Lake Operation and McArthur River Operation provides access to most of the northwestern side of the property. The Fox Lake Road was decommissioned in 1999 and has been unmaintained since with the removal of all bridges and culverts in 2017. Gravel and sand roads and drill trails provide access by either four-wheel-drive or all-terrain vehicles to the rest of the property.

2.2.2 Land Tenure

The property consists of 19 mineral claims totalling 11,720 ha with an aggregate annual requirement of \$293,000 in either work or cash to maintain title to the mineral claims. In Saskatchewan, a mineral claim does not grant the holder the right to mine minerals. A mineral claim (Crown disposition) grants the right or privilege to explore or prospect for any Crown mineral or any other right to or interest in any Crown mineral or any Crown mineral lands. Based on previous work submitted and approved by the province of Saskatchewan, Denison has secured the title of the Wheeler River property until 2035. Denison continues to explore on the Wheeler River property and the right to explore on the property are reviewed on a project basis annually by the Saskatchewan Ministry of Environment.

A Saskatchewan mineral claim (Crown disposition) in good standing can be converted to a lease (Crown Lease) upon application. Leases have a term of 10 years and are renewable. A lease gives the holder the exclusive right to explore for, mine, work, recover, procure, remove, carry away, and dispose of any Crown minerals within the lease lands which are nonetheless owned by the province. Denison current has not converted any mineral claims to mineral leases. A surface lease agreement will be developed with the province following the successful completion of the environmental impact assessment process. It is anticipated that a small portion of the 11,720 ha mineral lease area will be converted to a surface lease.

Any uranium produced from the Wheeler River property is subject to uranium mining royalties in Saskatchewan, in accordance with Part III of the *Crown Mineral Royalty Regulations*. There is a 10% Net Profits Interest associated with the property held by the Wheeler River Joint Venture in approximate proportion to the ownership interests of each participant. There are no other back-in rights or third-party royalties applicable to this property.

There are no known environmental liabilities associated with the property, and there are no other known significant factors and risks that may affect access, title, or the right or ability to perform work on the property. All necessary permits for surface exploration on the property are in place and current. There are no known authorizations relating to a water lot in the Project area.

2.2.3 Exploration History

The Wheeler River property was staked on July 6, 1977. Excluding the years 1990 to 1994, exploration activities (such as airborne and ground geophysical surveys, geochemical surveys, prospecting, and diamond drilling) have been carried out on the property from 1978 to present. In November 2004, Denison became operator of the property and in 2005 carried out property-wide airborne geophysical surveys. The Phoenix deposit was discovered by diamond drilling in 2008, with subsequent delineation completed over the next six years from 2008 to 2014.

2.2.3.1 Current Site Conditions

Exploration field operations are currently conducted from Denison's on-site camp facilities, which are located approximately 3 km southwest of the Phoenix deposit (Figure 2.4). The camp provides accommodations for up to 40 field staff using ATCO trailer units and tent facilities (Figure 2.5). Fuel and miscellaneous supplies are stored in existing warehouse and tank facilities at the camp. Drill core from exploration activities is also stored on site. The exploration site currently generates its own power by diesel generator.

Denison maintains portions of the site roads necessary to gain access to the camp facilities (Figure 1.1) and complete field activities. This maintenance includes installation of temporary water crossings (bridges) and general road maintenance to ensure safe travel by either four-wheel drive vehicle or ATV. In addition, several gravel and sand roads as well as drill trails provide access by either four-wheel-drive or all-terrain vehicles to the rest of the property. These roads are maintained only as necessary.

Figure 2.5: Denison's Wheeler River Project Exploration Camp

Outside of the Phoenix drilling area (Figure 2.6) and Wheeler exploration camp facility, various surface disturbances have occurred since commencement of exploration activity in 1978. Several ground geophysical survey grid lines transect the property uniformly with an approximate additional 750 exploration pads that were cleared to accommodate diamond drill hole exploration programs. As a result of exploration drilling activities, several portions of the property have been previously disturbed with the removal of vegetation to allow for access trails and drilling areas.

Figure 2.6: Phoenix Deposit Aerial View

2.3 Project Components

The following section describes the anticipated Project components.

An overview of all proposed Project components is provided in Figure 2.7 and the proposed site layout is available in Figure 2.8.

2.3.1 In Situ Recovery of Uranium

2.3.1.1 Mining Solution

Test work completed to date indicates that the uranium at Wheeler is amenable to the same type of leach solution that is used to leach other Athabasca Basin uranium ores in mills: an acidic or low pH solution.

The Wheeler ISR mining solution will initially be created by adding certain reagents (e.g., sulphuric acid (H_2SO_4) and sodium chlorate (NaClO_3)) to fresh water. The fresh water will be sourced from either a shallow groundwater well or a nearby lake. The liquids will be mixed to achieve the optimal pH of the mining solution which is a pH between 1.0 to 2.0.

The mining solution will be pumped underground to the uranium deposit via an injection well and recovered as uranium rich mining solution through a series of recovery wells (Figure 2.1). Once uranium rich mining solution is recovered, it will be pumped from the pumphouses into the processing plant where uranium will be removed from the uranium rich solution. The mining solution will be reformed (Section 2.3.2) with reagents as required and pumped back into the mining chamber via an injection well (Figure 2.3). In this way, it is expected that the mining solution will be reused over and over again throughout the mining process. A small volume of make-up water will be added to the mining solution during operations to replace moisture removed during the yellowcake precipitation and drying processes. This make-up water will be preferentially sourced from site runoff where possible; although the EIA will include options for obtaining make-up water from either a shallow groundwater well or a nearby lake.

lenison Mines

Wheeler River Project
Provincial Technical Proposal and Federal Project Description

Figure 2.7: Overview of Proposed Project Components

May 2019

2.3.1.2 Wellfield

The ISR wellfield is a group of wells, installed and completed in an area of uranium mineralized. The Wheeler wellfield will consist of a combination of injection and recovery wells, potentially in the general arrangement of one recovery well in the centre surrounded by 6-8 injection wells. At surface, the spacing between the recovery well and each injection well is anticipated to be roughly 10 metres apart (Figure 2.1), with certain areas requiring closer spacing (approximately 5 meters) or further spacing (approximately 15 metres).

With these configuration options, the final wellfield for Phoenix is expected to include approximately 310 wells over a 90 m x 900 m area.

A variety of alternative arrangements or patterns of injection and recovery wells may be used; however, and may include other vertical or horizontal arrangements. The final details of the wellfield design (e.g., pattern on surface, distance between wells, orientation of wells, number of pumphouses, etc.) will be developed as Project engineering advances. A schematic of the conceptual wellfield and surface features is provided in Figure 2.2.

Well Design and Installation

There is no material difference in the design of an injection and a recovery well – both can be used to move mining solution in either direction depending on how pumps direct flow in or out of the ground. Pumping pressures between injection and recovery wells are expected to vary considerably depending on distance and stage of mining.

Injection and recovery wells at Wheeler may be about 4 to 8 inches in diameter at surface, however, other diameters may be used in some instances. Figure 2.9 shows photographs of a typical ISR well at surface and a standard type of well cover.

Figure 2.10 provides an overview of Denison's current conceptual well installation sequence based on prefeasibility level engineering. Specific details may change as the Project advances into feasibility and detailed engineering design stages.

Figure 2.9: Typical In Situ Recovery Well at Surface

Source: Confidential uranium in situ recovery operation in the USA

Schematic represents injection and recovery well installation concept at the prefeasibility stage. Details of well design, installation, and dimensions may be refined. Schematic not drawn to scale.

Pumphouses

Based on the current designs for the Project, approximately three pumphouses will be needed. A pumphouse is a small building or container on surface where pipes from injection and recovery wells are operated and flows of mining solution are monitored. See photos in Figure 2.11 for examples of components inside an operating ISR pumphouse in the USA.

Figure 2.11: Inside a Typical In Situ Recovery Pumphouse

Source: Confidential uranium in situ recovery operation in the USA

Pumphouses will distribute the mining solution to the injection wells, as well as collect the uranium rich mining solution from the recovery wells. Each pumphouse will be connected to two production trunk lines. One of the trunk lines will be used for receiving mining solution from the processing plant, and the other will be used for returning uranium rich mining solution back to the processing plant (Figure 2.1 and Figure 2.8). Each pumphouse will include a manifold, valves, flow meters, pressure meters, and instrumentation, as required, to fully operate, monitor and control

the process. Pumphouse control monitoring systems enable operators to individually adjust each recovery or injection well as well as allow for sampling. Operators can also use the master control system in the processing plant to remotely control pumphouse production lines.

Ventilation in the pumphouses will be designed with the ALARA principle (as low as reasonably achievable) in mind to provide sufficient worker protection from potential radon and radon progeny exposure. Monitoring systems will be in place to ensure these mitigation measures are meeting design specifications.

Wellfield Piping System

Pipelines will transport the mining solution to and from the processing plant. The flow rates and pressures of the individual well lines will be monitored in the pumphouses. This data will be transmitted to the processing plant for remote monitoring through a master control system. Through the master control system, operators will be capable of controlling pumphouse production lines remotely.

Double-walled high-density polyethylene (HDPE), or equivalent, piping will be used in the wellfields and will be designed and selected to meet design operating and environmental conditions.

The lines from the processing plant, pumphouses, and individual well lines will be freeze protected and secured to minimize pipe movement.

Monitoring Wells

Groundwater monitoring wells will be installed at various depths and locations in and around the wellfield. The monitoring wells will allow for both groundwater sample collection and measurement of groundwater level.

Mechanical Integrity Testing

After an injection, recovery, or monitoring well has been completed, and before it is made operational, a mechanical integrity testing of the well casing will be completed to ensure the installation has been successful and the well is functioning as designed. Well casings that fail integrity tests will be repaired before the well is placed into service.

2.3.1.3 Freeze Wall

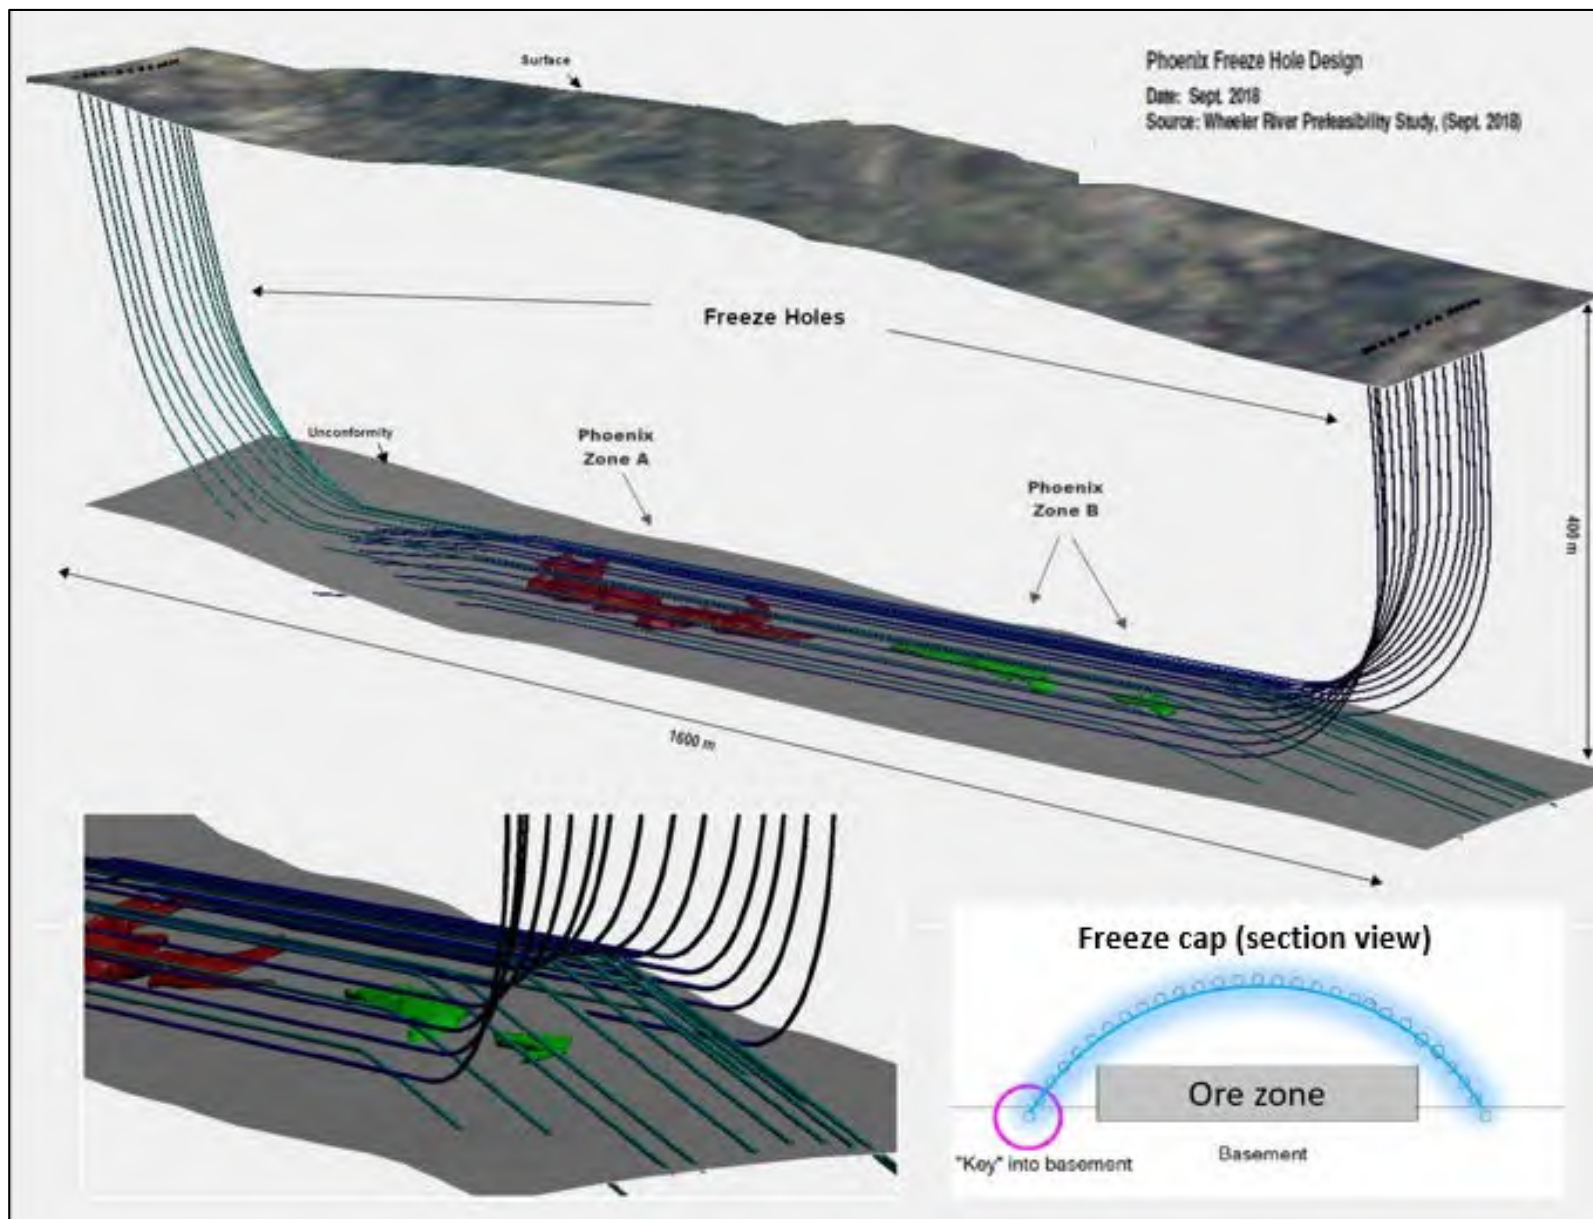

In typical ISR operations, containment is normally achieved through naturally impermeable geological layers (aquitards) or by artificially creating a drawdown of the water table by pumping.

At Wheeler, the very low permeability basement rock below the uranium deposit serves as a natural aquitard; however, the sandstone hosting the uranium deposit is permeable and groundwater can flow across the deposit. To achieve containment at Wheeler, the entire uranium deposit will be isolated from the surrounding sandstone by creating a freeze wall above and on all sides of the uranium deposit – encapsulating the uranium deposit (Figure 2.2).

Ground freezing technology is well established throughout the world. Its use in a mining environment was pioneered in Saskatchewan's potash mining industry and later adapted for use in Saskatchewan's uranium industry. Ground freezing to control and eliminate groundwater from entering the mining areas is a fundamental component of two existing Athabasca Basin underground uranium mines.

The freeze wall will be established by drilling parallel cased holes from surface, starting at both ends of the deposit and travelling horizontally along the long axis of the uranium deposit anchoring into the impermeable basement rock on the opposite end of the deposit. This process is illustrated in Figure 2.12 and is expected to be achievable using existing directional drilling techniques. Once the drill holes have installed, a low temperature brine solution will be circulated through the cased holes to remove heat from the ground, ultimately freezing the natural groundwater and establishing an impermeable, frozen wall to encapsulate the uranium deposit. While the freeze wall is expected to be several metres thick, it will be developed around the uranium deposit, to ensure the uranium deposit itself does not freeze.

The area under the freeze wall is referred to as the mining chamber. The approximate dimensions of the mining chamber are: 100 m wide x 30 m high x 1,300 m long. The volume of the mining chamber is approximately 1.8 million m³. The mining chamber is similar in shape to London, England's Paddington train station. The volume contained within the mining chamber is approximately the same volume contained in Roger's Centre in Toronto, Ontario as shown in Figure 2.13.

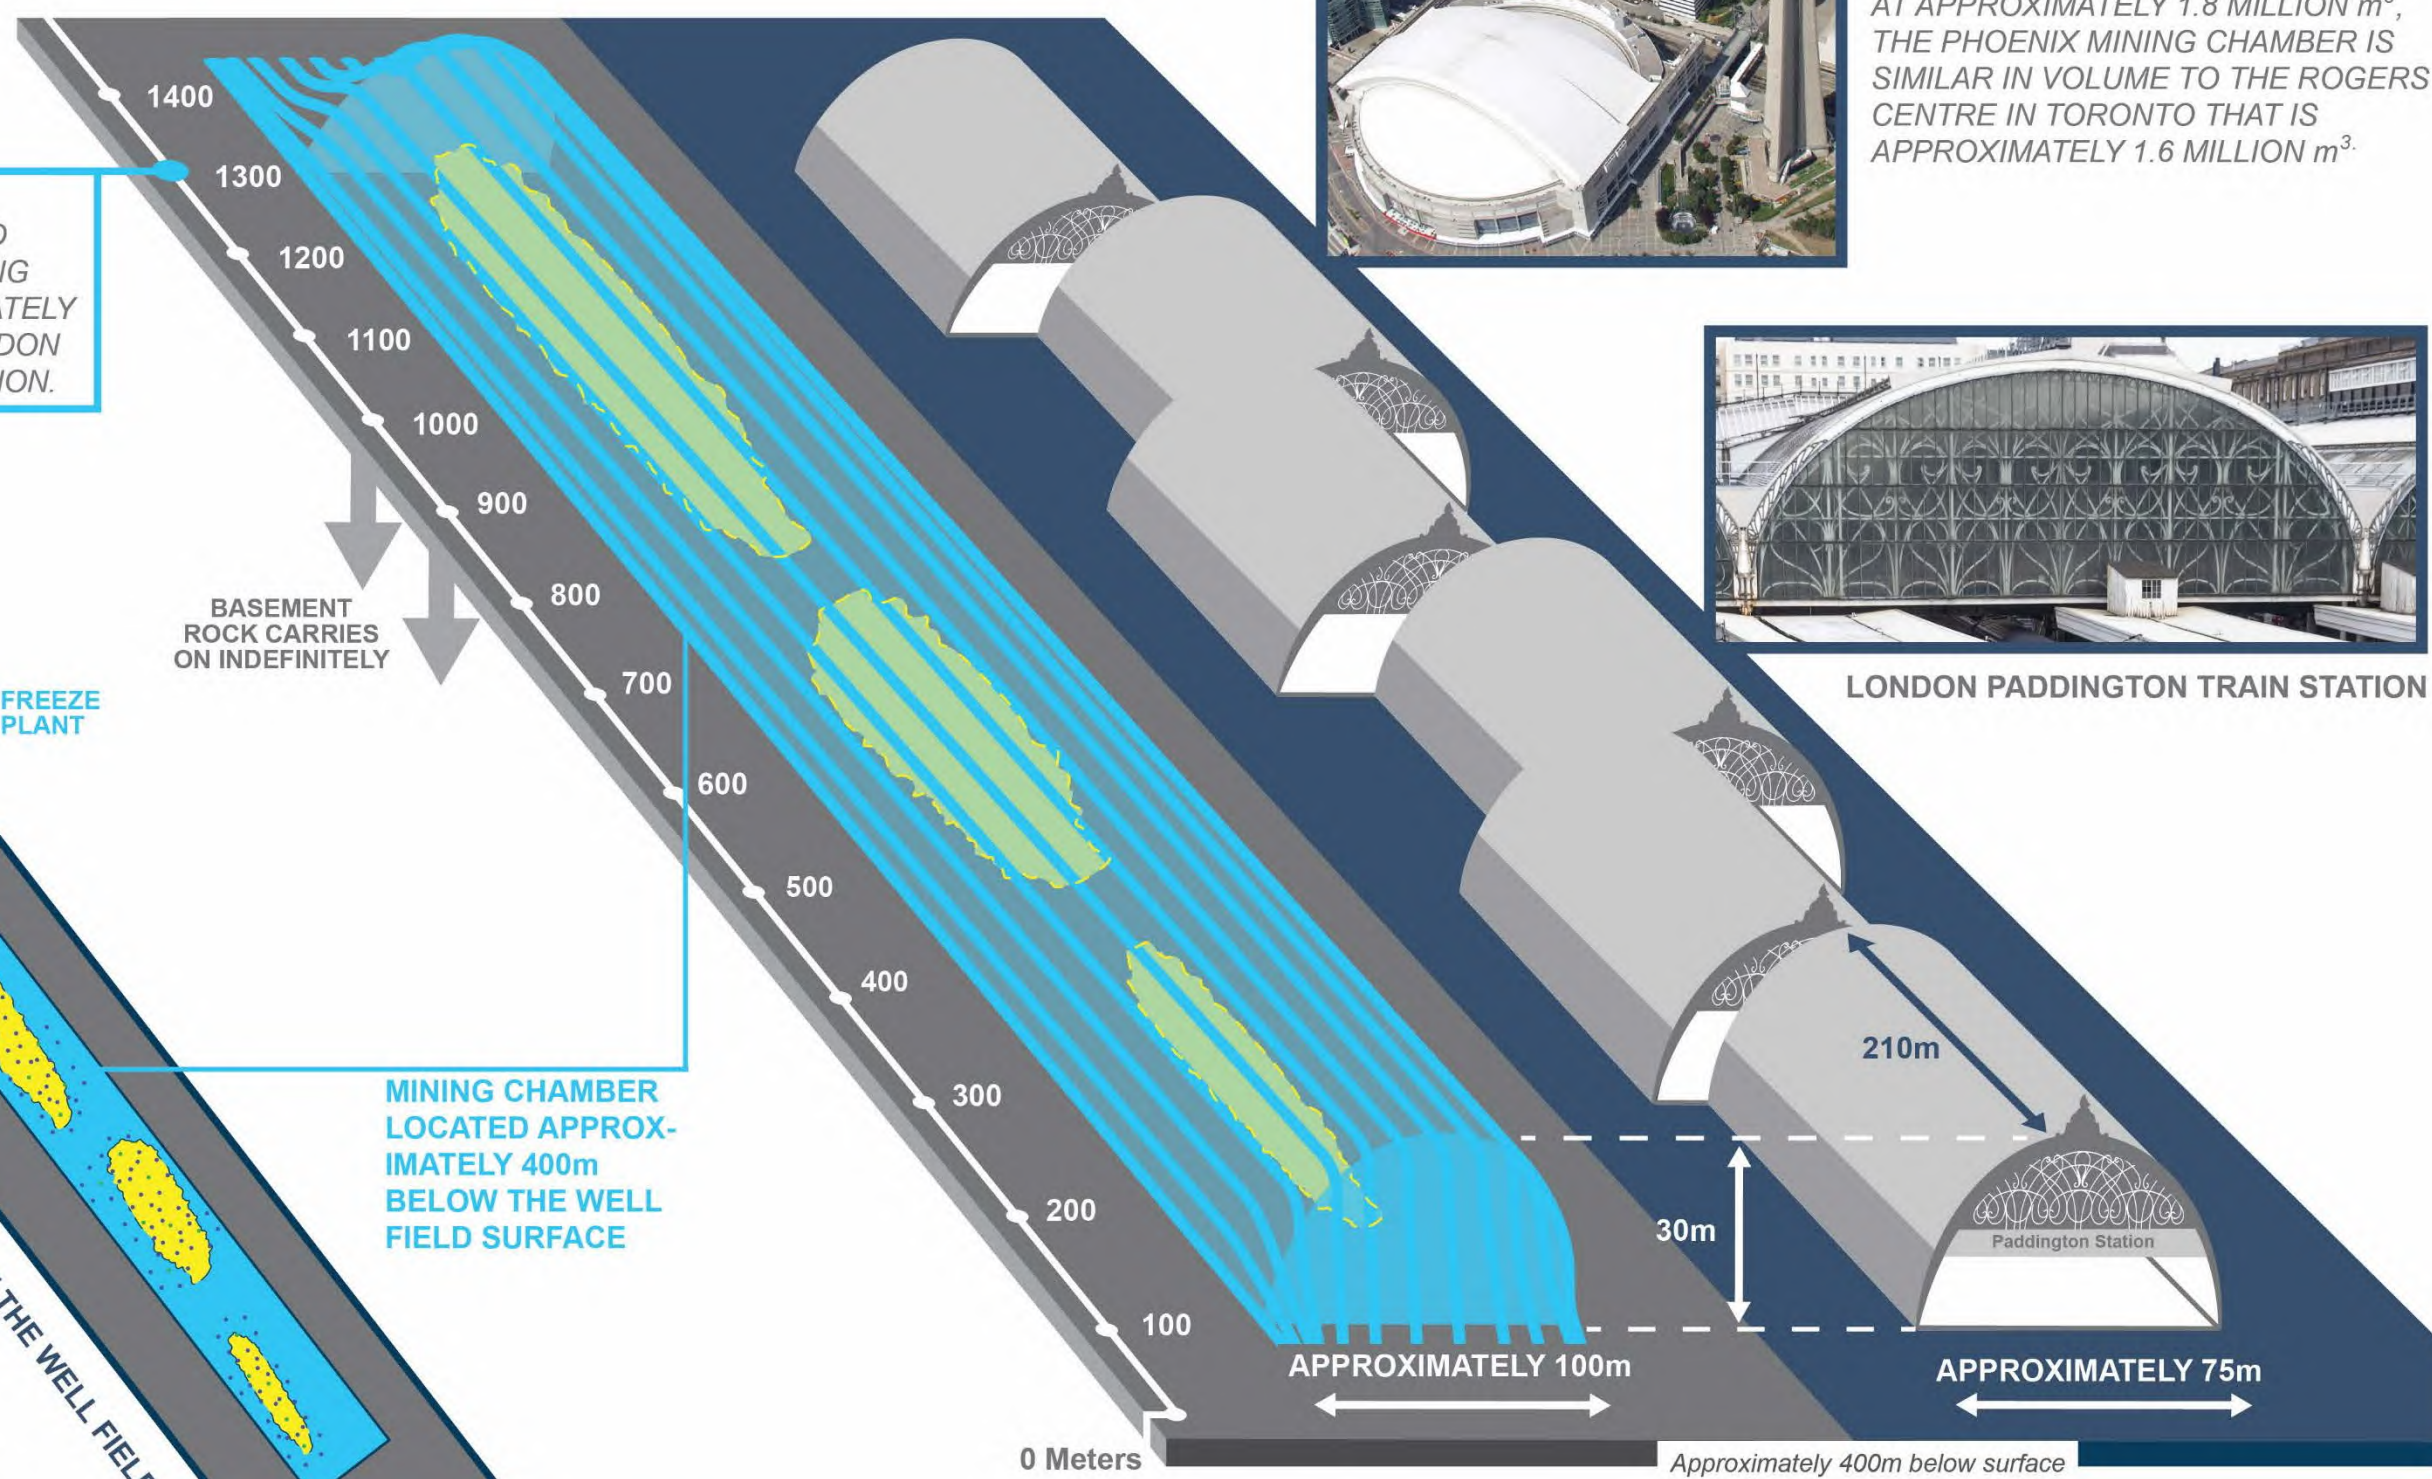

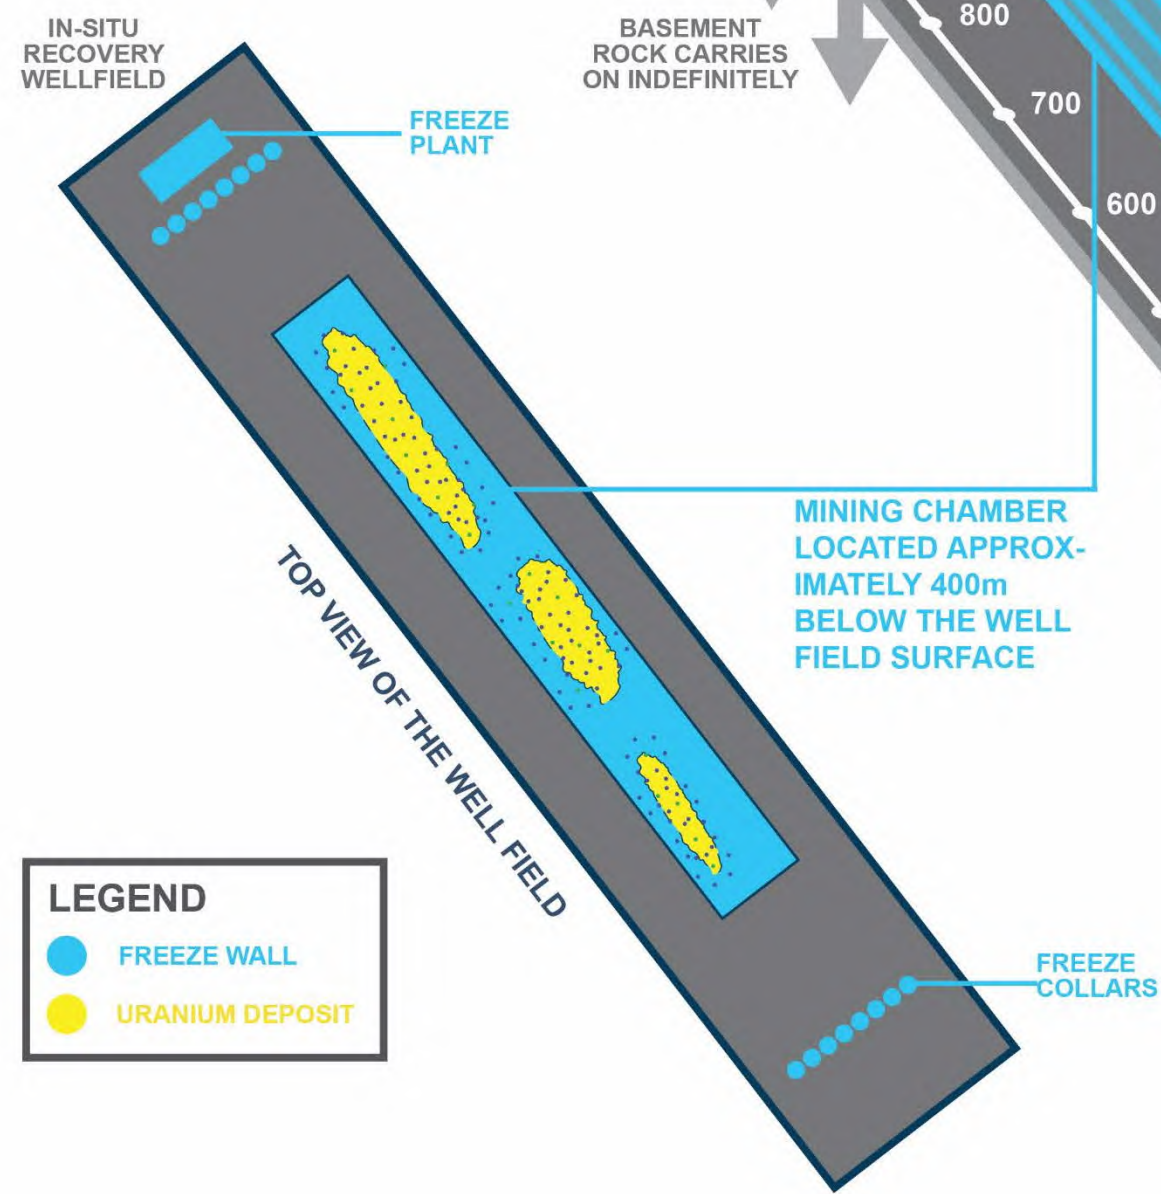

MINING CHAMBER
 AT 1300m IN LENGTH AND
 30m IN WIDTH, THE MINING
 CHAMBER IS APPROXIMATELY
 6X AS LONG AS THE LONDON
 PADDINGTON TRAIN STATION.

ROGERS CENTRE
 AT APPROXIMATELY 1.8 MILLION m³,
 THE PHOENIX MINING CHAMBER IS
 SIMILAR IN VOLUME TO THE ROGERS
 CENTRE IN TORONTO THAT IS
 APPROXIMATELY 1.6 MILLION m³.

LONDON PADDINGTON TRAIN STATION

LEGEND

- FREEZE WALL
- URANIUM DEPOSIT

Freeze Plant

Two freeze plants will be required on surface; one at each end of the deposit where the freeze holes are collared (Figure 2.8). The two freeze plants will be constructed on surface based on a modular design for easy installation and operation. The design for each freeze plant includes:

- Six modular freeze plant skids;
- One electrical/control skid;
- Six evaporative condenser skids; and
- One insulated brine tank.

Freeze Wall Timeline

Modelling predicts the freeze wall will require 14 months to be established. The freeze wall will be in place throughout the operations phase.

After decommissioning once the freeze wall is no longer needed and refrigeration is turned off, it will take a minimum of 2 to 3 years for the freeze wall to thaw depending on how long the freeze wall was active and actual ground conditions encountered.

2.3.2 Processing Plant

Refer to Figure 2.3 for an overview of the conceptual design of the processing plant.

The processing plant will house the tanks and equipment to fully process uranium rich mining solution recovered from the ISR wellfield into yellowcake and reformat the mining solution for continued use in the ISR wellfield. The processing plant will also contain filtration systems, bulk chemical storage, process solution storage tanks, and a control room.

The processing plant will be designed with expert consideration of potential environmental and health and safety effects to mitigate interactions to the extent possible. For instance, the floor will be graded as required and sumps will be installed to collect any spills. Ventilation in the processing plant will be designed with the ALARA principle in mind to provide sufficient worker protection and monitoring systems will be in place to ensure worker health and safety. Dust control and good housekeeping practices throughout the processing plant will also form a critical component of the Radiation Protection Management Plan developed for the Project. The processing plant exhaust, mainly from drying and packaging areas, will be directed through a stack and released outside of the building. The stack height will be designed based on results of air dispersion modelling to be an appropriate height for optimal dispersion. Bulk storage tanks for the processing chemicals, such as sulfuric and/or hydrochloric acid, sodium hydroxide, and hydrogen peroxide, will be located outside the processing plant. The storage tanks will sit inside appropriately designed and sized concrete secondary containment basins. The secondary containment basin for each applicable chemical system will be physically separated from the containment basins for other chemical systems.

The plant is anticipated to be approximately 50,000 ft² (4,600 m²) in size, which is about half the size of a CFL football field. The building will be constructed adjacent to the wellfield to minimize piping distances (Figure 2.8).

The uranium bearing solution will be pumped from the wellfield pumphouse(s) to the processing plant and pumped through the following circuits:

- *pH adjustment (not shown in Figure 2.3)* – The pH of the incoming uranium rich mining solution will be monitored and adjusted as required to ensure the uranium is fully dissolved.
- *Impurities Removal Process* – Uranium rich mining solution will be pumped to an impurities removal circuit where the pH of the solution will be adjusted to allow the precipitation of iron hydroxides and other metals. Once the impurities have precipitated out of the uranium rich mining solution, the solution is routed to the yellowcake precipitation circuit. Precipitated impurities removed at this step will be placed into totes and stored on the lined waste pad (Figure 2.8) until final disposal.
- *Uranium Precipitation* – Uranium is recovered from the uranium rich mining solution following the impurities removal process. Reagents are added to the uranium rich mining solution in a series of agitation tanks to precipitate dissolved uranium. If required, there is additional pH adjustment. The solution moves to a thickener that provides time for growth of the uranium oxide crystals. The precipitated uranium will accumulate at the bottom of the thickener and the mining solution, now depleted of uranium, will rise to the top. The mining solution is cleaned through a series of sand filters prior to reformation and re-injection into the wellfield. The precipitated uranium product accumulated at the bottom of the thickener is withdrawn at the underflow of the thickener and pumped through a filter press (*not shown in Figure 2.3*), where excess liquid is removed and circulated back to the thickener.
- *Yellowcake Dewatering/Drying and Packaging* – Entrained solids particles exiting the filter press will be collected for drying and packaged. Fresh water is sprayed on the surface of the cake to reduce the entrainment of contaminants in the dryer. Any remaining moisture is evaporated in the dryer. Any water collected from the drying process will be condensed and reused in the plant for reagents preparation. Once the moisture is removed from the yellowcake product, the yellowcake is packaged into 400 L steel drums via gravity. Denison will evaluate the use of either low temperature dryers or calciners for drying in the processing plant.
- *Mining solution reformation* – The ISR process circulates the mining solution through the uranium deposit over and over, and it is expected that contaminants may accumulate in the continuously recycled solution. Accordingly, it may be required to remove (or ‘bleed’) a portion of the mining solution to prevent accumulation of contaminants. The bleed solution will be routed to the water treatment plant where the contaminants will be removed from the system and any produced cleaned water will be re-used as process make-up water when possible. This bleed volume in addition to moisture losses in the drying process must be replaced. Reagents will be added to any makeup water (sourced from either surface runoff or fresh water from

groundwater or a lake) and will then be mixed with the recycled mining solution and re-injected into the mining chamber.

The ISR wellfield and processing plant will be designed to efficiently recover uranium and to reduce operating costs by recycling and re-using most of the solutions inside each circuit. Any excess treated water from the WTP will be released to a surface water body or injected into groundwater via deep well injection once acceptable water quality is achieved.

2.3.2.1 Production Capacity

The anticipated production capacity of Wheeler is up to 12 Mlbs/year with a mine life of up to 20 years. This is above the current known reserves at Wheeler and is intended to provide a conservative basis for assessing Project effects in the EIA and operational flexibility.

2.3.3 Roads

Mainland access to the site will be from Highway 914. A seven-kilometer (7 km) section of road will be constructed from the highway to the Wheeler site and a five kilometer (5 km) long road will also be constructed from the Wheeler site to the airstrip (Figure 2.7); the total road length is twelve kilometers (12 km). Additional site roads will include a service loop to the camp and a short service road to the runoff pond and the potential treated effluent discharge point.

Many of the proposed roads will be developed along previously disturbed areas, including roads currently used for exploration activities, thereby minimizing terrestrial habitat disturbance.

Denison anticipates the need for installation of two water crossings along the road from the Wheeler site to the airstrip. The crossings will be designed, constructed and maintained to avoid causing harm to fish and fish habitat.

During the PFS process (Denison 2018), an assessment was completed to evaluate access road alignment options from the highway into the Wheeler site. Several routes were analyzed for key factors including: length, cut and fill quantities, distance from cabins, distance from waterbodies and distance from any water crossings. As outlined in Section 8.2.1.2, a workshop was completed with communities to obtain input from local Indigenous and non-Indigenous communities into the access road routing options. After the engagement process and using community input, the preferred route was selected and incorporated into the current Project design.

2.3.4 Supporting Infrastructure

2.3.4.1 Air Strip and Terminal

As a proposed fly in-fly out operation, Wheeler will require an airstrip to bring personnel to and from the site.

A 1,600 m long airstrip is proposed to be positioned in a natural and relatively flat valley to the NE of the Wheeler site (Figure 2.7). The magnetic headings are 03/21, which is similar to both the

Collins Bay airport and Key Lake airstrip. The runway has been designed to accommodate the aircraft presently used by existing mining operations in northern Saskatchewan to transport personnel into and out of site. An airstrip terminal building and two double-walled Jet A fuel tanks, to provide site service to aircraft as required, will be constructed near the airstrip. The approach line to the airstrip from the SW clears the Wheeler surface facilities by 500 m.

2.3.4.2 Accommodations Facility

Located to the southeast of the wellfield, the proposed accommodations facility is anticipated to be a turnkey building manufactured offsite and assembled and commissioned on-site. The building's design will be sized to accommodate a peak load of about 100-150 individuals during operations; however, due to its modularized design, additional modules can be easily installed should additional beds be required in the future.

The facility will include a central services complex with:

- Kitchen with food preparation area and serving area;
- Dining room;
- Camp office;
- Commissary;
- Recreation area; and
- Exercise facilities.

2.3.4.3 Operations Centre

The operations complex is planned to be a standalone, multi-functional building that will serve the administrative, technical, and maintenance needs of the site.

At the PFS stage, the building is proposed to be a two-story pre-engineered structure with total usable space of 38,000 ft²: 27,000 ft² on the first floor and 11,000 ft² on the second floor.

The first floor will house the two-story shops, dry space, and warehouses. The shops will include three full-sized maintenance bays, with one being equipped as a welding bay. Areas of the operations centre will be designed to have containment and sumps as required. Men's and women's change areas (dries) will be provided, with contamination control and suitable wash spaces for each, including laundry facilities. The warehouse has two receiving doors adjacent to the shops. Office spaces will also be provided in these areas for warehouse and procurement staff as well as maintenance supervisors.

The second floor will have administrative space with offices, a boardroom, meeting rooms, lunchroom, and washrooms.

Additional facilities include:

- Medical or nursing station with waiting area;

- Parking space for emergency response vehicles;
- Space for storage of mine rescue/emergency response gear and supplies;
- Laboratory facilities;
- Training room; and
- Mechanical and electrical services rooms.

2.3.4.4 Security Houses and Truck Scales

Access to the property will be controlled by both a north and south security gate (Figure 2.8).

The main, south gate security house will be staffed as required and be equipped with an 80-tonne weigh scale that is hard-wired into the shack. The security and truck scale buildings are planned to be modular, pre-fabricated units that will be manufactured off-site and shipped to site for installation and commissioning. The south gate facilities will have appropriate power and communications capability.

The north gate will be a simple locked gate.

2.3.4.5 Wash Bay and Scanning Facility

A wash bay will be available to clean items, equipment and vehicles that may have been in contact with potential contaminants. Contaminated water from wash bay will be collected in a sump tank and routed to the water treatment plant for treatment and discharge.

Radiological clearance scanning required for any items, equipment and vehicles leaving the site will be conducted in the same building.

2.3.5 Power Needs and Power Supply

Operation of an ISR uranium mine does not require substantial inputs of energy compared to traditional mining methods.

In an effort to further improve Wheeler's energy efficiency, Denison will assess using state of art technology for battery-powered light vehicles and mobile equipment. Similarly, Denison will evaluate the viability of using an AC powered dual rotary drill for ISR wellfield development rather than a traditional diesel-powered unit. Site infrastructure anticipated to draw power from the provincial power grid, includes the camp buildings, operations buildings, the ISR precipitation plant, and the freeze plants.

Primary Power Supply

Electrical service to Wheeler will be provided via an approximate 5 km extension tap from the existing 138 kV overhead transmission line that runs along Highway 914. Optimization of the precise line route will be completed as the Project advances and will likely follow the access road alignment.

Power transmission to the site (e.g., assessment, obtaining necessary permits, and construction) will be led by SaskPower and is not considered as part of this Project (refer to Section 2.6).

Back-up Power Supply

Based on historical data provided by SaskPower, the outage rate of the existing line is approximately six outages per year. To provide electrical service during times of utility outages, emergency diesel generator will be installed in strategic locations to service the site and maintain essential functions.

The generators will be used to maintain power to the processing plant and the accommodations facility, as well as to maintain other essential services as required.

2.3.6 Water Management and Treatment

As part of Denison's approach to sustainable mining at Wheeler, Denison intends to recycle process water to the greatest extent possible, thereby reducing the demand for a fresh water supply. The proposed recycling process design incorporates a closed-loop system within which only limited make-up water is estimated to be required to supplement ISR mining and on-site processing. As a result of the focus on water recycle, the volume of treated effluent requiring discharge is expected to be low.

2.3.6.1 Site Runoff

Water will be collected from the waste pond (which collected runoff from the waste pad) and the processing plant terrace and then directed to the water treatment plant. Runoff for the small clean waste rock pile may be collected into a settling pond to remove total suspended solids if necessary. Other site runoff collection needs will be examined and identified as part of the EIA.

2.3.6.2 Fresh Water Supply and Distribution

A fresh water distribution system will be designed to provide fresh water to the fire water system (fresh water tank, two electric fire water pumps, and a back-up diesel fire water pump for on-site fire suppression needs), the potable WTP, the processing plant, wash bay and temporary batch plant (required during construction phase). Fresh water will be sourced from either a shallow groundwater well or an intake from a nearby surface water body. Estimated fresh water consumption rates are provided in Table 2.1 below.

Table 2.1: Estimated Fresh Water Consumption Rates

| Consumer | Flow Rate (L/day) |
|--|-------------------|
| Processing Plant | 2,000 |
| Wash Bay | 6,000 |
| Potable WTP | 30,000 |
| Temporary Batch Plant (during construction only) | 5,000 |

2.3.6.3 Potable Water Treatment Plant and Distribution

Raw water for the potable WTP will be sourced from either groundwater or a nearby surface water body.

Potable water will be generated on site by a pre-fabricated modularized (40 ft shipping container) potable WTP comprised of a treatment plant, a 2,000 L storage tank, and a bottle filling station. Potable water will be piped to the camp, the operations centre, and the processing plant to provide water for safety showers and eyewash stations. Other locations, such as the airstrip terminal, gate houses and satellite lunch trailers (during construction) will receive bottled water as required.

Ultrafiltration or reverse osmosis with UV filtration are proposed for filtration. Chlorination will be needed prior to distribution. The modular plant will be capable of all necessary processes and will contain required HVAC and lighting. The potable WTP will be placed on a concrete pad and will generate 1.4 m³/hr (33 m³) of potable water per day based on 300 L per person per day. Raw water will be pumped to the potable WTP via pipeline from the fire water storage tank and fresh water distribution system.

2.3.6.4 Sewage Treatment Plant

Domestic waste water and sewage will be generated at the camp, processing plant, and the operations centre. Domestic waste was assumed to be generated at the rate of 300 L per person per day. Sewage will either be collected in septic tanks and transported by a vacuum truck or piped directly to the on-site sewage treatment plant. The sewage treatment plant will be a modular facility comprised of two heated and insulated units (likely containers), a holding tank, ancillary filtration, ancillary treatment process equipment, and sludge handling system. Denison may investigate options to dispose of treated sewage underground or through a septic field. Alternatively, the sewage treatment plant will generate effluent suitable for discharge to local surface water. Treated effluent will first be discharged to surface testing ponds where the water quality will be checked to ensure it meets regulatory limits. Reject solids from the treatment process will be collected, dewatered, and stored on the waste pad on site prior to permanent disposal.

2.3.6.5 Water Treatment Plant

The Wheeler WTP will be designed to treat any contaminated water removed from the ISR process (e.g., backwash of sand filters, bleed solution), runoff collected from the waste pad, and any other contact water such as water from the wash bay and process sumps. The WTP will be located inside of the processing plant.

Contaminants will be removed from the system. It is Denison's intent to incorporate treated water back into the mining water balance as make-up water in the processing plant, to the extent possible. Any excess treated water from the WTP will be pumped to appropriately-sized holding

ponds. The holding ponds will be sized to hold effluent for a period of 24 hours for testing before discharge to the environment.

Treated water in the ponds will be monitored prior to release to a surface water body or injected into groundwater via deep well injection. All treated effluent released to surface water will meet federal and provincial regulatory discharge limits. The treated effluent discharge line will be heated and have secondary containment in place.

Details on the proposed treated effluent discharge location, the pipeline, the type of release point, and modelled results of any changes in the aquatic environment will be presented in the EIA.

2.3.7 Waste Management

2.3.7.1 Incinerator

Denison plans to operate an incinerator to incinerate any food waste. This is a best practice to avoid attracting wildlife into the site. It is expected that selection of an appropriate incinerator will have design components to mitigate emissions to air. Correct operation and regular maintenance of the incinerator will be important to achieve the design parameters for minimizing emissions to air and procedures will be in place to achieve this.

2.3.7.2 Landfill

Denison plans to construct, operate, monitor and decommission a domestic landfill on site. A waste management plan will be developed for the Project which will detail how each type of waste generated on site will be managed. In general, only inert non-hazardous wastes such as wood and plastics will be suitable for disposal in the on-site landfill.

2.3.7.3 Waste Pad and Pond

During operations, the waste pad is expected to contain:

- Mineralized drill cuttings from wellfield development;
- solid impurities (mainly iron and/or radium) removed from the uranium rich mining solution during the impurities removal step in the processing plant; and
- dewatered reject solids from the sewage and water treatment processes.

The waste pad will be double lined, with leak detection capabilities and an associated monitoring program to ensure containment. An adjacent pond will be used to collect runoff from the pad and water in the waste pond will be piped to the water treatment plant for treatment. As part of the EIA, Denison will identify options for either on-site disposal of these wastes or off-site disposal at an approved facility.

2.3.7.4 Clean Waste Rock Pad and Pond

Clean waste rock will be generated from the sandstone cuttings from drilling activities. This includes the drilling of the injection and recovery wells to create the ISR wellfield and the drilling of

freeze holes to create the freeze wall. It is estimated that a total of 7,100 m³ of clean waste rock will be generated.

Clean waste rock will be stored on an unlined pad and can be used for road or concrete construction. A pond may be constructed beside the pad to collect runoff if required.

2.3.7.5 Hazardous Substance Storage and Use

Fuel Storage and Dispensing Facility

Since the site's primary power supply will be from the provincial electrical grid, Wheeler fuel consumption at Wheeler may be limited to back-up power supply, auxiliary vehicles (i.e. ATVs and snowmobiles), miscellaneous equipment (i.e. portable pumps), and freight and personnel transportation to site. This will reduce Project fuel consumption and minimize greenhouse gas emissions.

Tanker trucks will deliver diesel and gasoline to the site on an as-needed basis. Fuels will be stored in approved, above-ground, 25,000 L double-walled storage tank(s) equipped with secondary containment in accordance with provincial regulations and standards. Fuel storage and distribution infrastructure will be constructed in accordance with applicable legislation requirements (e.g., *Hazardous Substances and Waste Dangerous Goods Regulations*). Stationary and mobile equipment will be fueled with a fuel-dispensing truck.

Propane Facility

Propane may be used as a primary or backup means to support the camp kitchen, the incinerator, and to heat the buildings. The propane facility will be sized to meet the needs of the site activities and will feature a storage tank (assumed to be 30,000 uswg), vaporizers, a propane bottle fill station, and a propane bottle weigh station. Propane will be delivered to site on an as needed basis.

Other Hazardous Substances

Sulfuric acid, hydrogen peroxide, sodium hydroxide, barium chloride and flocculants are the main chemicals anticipated to be used in the processing plant and in mining. Bulk storage tanks for the processing chemicals, such as sulfuric and/or hydrochloric acid, sodium hydroxide, and hydrogen peroxide, will be located outside the processing plant. The storage tanks will sit inside appropriately designed and sized concrete secondary containment basins. The secondary containment basin for each applicable chemical system will be physically separated from the containment basins for other chemical systems.

The various lubricants and coolants required for regular maintenance of equipment will be stored on site.

Each one of these materials will be stored, handled, recycled or disposed of in an appropriate manner and meet the requirements of the *Hazardous Substances and Waste Dangerous Goods Regulations*.

No fuels, oils or other hazardous substances will be stored within 100 m of any water body and no equipment maintenance or re-fuelling will be conducted within 100 m of a water body. Denison will maintain an up to date record of the various hazardous substances on site and will maintain Material Safety Data Sheets and appropriate procedures for spill management, handling and clean up in an accessible location.

2.4 Project Activities and Schedule

The following sections describe the main activities to be performed in each Project phase and the proposed schedule for Project development.

2.4.1 Pre-Development and Construction

2.4.1.1 Pilot Demonstration Well Pattern

In order to obtain essential data for detailed engineering, licensing and the environmental assessment, Denison may elect to operate a pilot demonstration well pattern. A separate proposal will be submitted to the appropriate regulatory agencies for review and approval. The pilot demonstration may include well development, circulation of mining solution over a small spatial area and subsequent recovery of the mining solution. Permeability enhancement of the uranium deposit may be included as part of the scope. Monitoring wells will be in place and monitoring will be conducted to ensure the well pattern functions as proposed. It is not anticipated that the pilot demonstration will incorporate the use of a freeze wall.

2.4.1.2 Pre-Development Phase

Following receipt of environmental approvals, the preparatory phase will include initiation of licensing activities, organization of the Project execution team, preparation of key Project documents, and procurement of equipment, materials, and labour. These activities will be initiated during the last stages of the feasibility study should results continue to support advancement of the Project.

2.4.1.3 Construction Phase

Following receipt of licensing approvals, construction activities on site will commence. Construction of Wheeler infrastructure can be divided into several key areas as outlined below.

Site Preparation: Clearing and leveling of the surface facilities will be contracted out to a suitable contractor. The initial earthworks construction will focus on preparing roads into the site, specifically to the ISR plant and the two ends of the wellfield where the freeze wall drilling will occur. These two sites will remain the focus of levelling and grading activities. All of this work will be supported by temporary camps and utilities (and/or the existing exploration camp and utilities) while permanent facilities are established. Temporary security checkpoints will be established early in the site preparation phase.

Wellfield and Freeze Hole Drilling: Denison has been drilling on the property since 2004; this experience and knowledge will be applied to the drilling of the freeze and wellfield holes. Suitably qualified and experienced contractors will be overseen by Denison personnel to complete drilling activities.

Ground freezing requires the establishment of a pattern of freeze wells drilled across the uranium deposit and of refrigeration units and corresponding electrical and mechanical services to each. Freeze well drilling will be initiated as early as possible. The ground freezing units will arrive at site and be physically installed and operating when the appropriate tie-ins to the site power distribution system is completed.

Processing Plant Construction: While the processing plant is likely the most complex construction activity for the Project, it is relatively simple when compared to other full-service uranium mills, as there are a limited number of vessels and minimal piping. Furthermore, due to the degree of isolation of the plant from other site facilities, construction of this facility can be prioritized with minimal impact to other facilities. Most of the equipment and materials inside the plant are small in size, enabling the shipment of tanks and other vessels pre-assembled. Processing plant construction will begin immediately following earthworks at the site. After foundations are completed, the building can start constructed. A short commissioning period begins post-construction prior to first uranium production.

Other Surface Infrastructure: Other surface infrastructure includes camp buildings, the operations centre, the airstrip terminal building, and various other smaller infrastructure. With the exception of the operations centre and processing plant, all other buildings are expected to be pre-fabricated buildings to reduce the costs of construction on site.

The operations center is planned to be completed ahead of commissioning. This will allow the operations team to conduct activities in a suitable building and will create a permanent maintenance facility before operations commence. The permanent camp is completed in a similar time frame, along with basic services such as permanent communications and fire systems.

A temporary batch plant will be used during the construction phase. Concrete will be required for construction of foundations and containment walls in select surface infrastructure.

Electrical infrastructure: A powerline will be constructed from the existing provincial power line adjacent to Highway 914 into site to the main substation. Distribution around site will be completed as required to support the various operations.

Other: The balance of the infrastructure items, such as storage areas, incinerator, and security gates, are planned to be completed at about the time of commissioning and will complete the construction at Wheeler.

Commissioning of the facilities is expected to be supported by engineering and/or supplies vendors along with the assistance of the construction teams. This will ensure constructed facilities adhere to the designs and specifications set forth.

Project and construction management during the capital development phase of the Project will be managed by a small dedicated Project management team. During the construction phase, Denison will provide general and administrative services to operate the site and support the contractors in construction (i.e. room and board, flights, general supplies, freight haulage, etc.). It is expected that a mix of employees, contractors, and engineering service providers will support site construction efforts.

Wheeler construction milestones are summarized in Table 2.2.

Table 2.2: Wheeler Conceptual Development Schedule

| Project Activity | Schedule |
|---|-----------|
| Environmental Impact Assessment and Licensing | 2019-2022 |
| Feasibility Engineering | 2019-2021 |
| Detailed Engineering | 2021-2022 |
| Construction | 2022-2024 |
| Operation | 2024-2044 |
| Decommissioning (does not include progressive decommissioning during operations) | 2044-2049 |
| Post-decommissioning | 2049-2054 |
| Release from licence and transfer back to Crown land or into Provincial Institutional Control Program | 2055 |

2.4.2 Operation

Operation of Wheeler is planned to last up to 20 years. Denison anticipates operating the site with employees and a limited number of external contractors.

The operation phase is generally focused on operating the Project components presented in Section 2.3. As such, the operational activities for Wheeler include but are not limited to:

- Operation of the ISR wellfield;
- Operation of the ISR processing plant and production of uranium concentrate at a production rate of up to 12 Mlbs U₃O₈/year;
- Maintenance activities at the wellfield, processing plant, roads, airstrip and other site facilities;
- Water withdrawal from groundwater or surface water body for potable use, fire suppression system and make-up water in the processing plant;
- Water treatment of potable water, sewage, and waste water;

- Waste management;
- Environmental monitoring as outlined in the Environmental Management System;
- Package and transport of nuclear substances;
- Reporting to regulators;
- Engagement with local Indigenous and non-Indigenous communities; and
- Systems for maintaining site security.

2.4.3 Decommissioning

The five main decommissioning activities include:

- Mining chamber remediation;
- Decontamination;
- Asset removal;
- Demolition and disposal; and
- Reclamation.

Progressive decommissioning will be completed throughout the life of the Project whenever feasible and reported to the regulatory agencies as part of the annual reporting requirements throughout operations. Progressive decommissioning activities will focus on the decontamination, demolition, and disposal of unused buildings and infrastructure, as well as the removal of unused equipment and machinery. Reclamation of inactive areas will take place when these areas become available.

Closure of the entire Project will be completed in accordance with all provincial and federal regulations and guidance documents with the fundamental considerations being to ensure physical and chemical stability of the site in order to protect human health and the environment.

2.4.3.1 Mining Chamber Remediation

Mining chamber remediation will be initiated once mining is completed. The objective will be to restore the water within the confines of the freeze wall (i.e. within the mining chamber) to reach an acceptable decommissioning objective. Details on groundwater quality decommissioning objectives for the mining chamber will be developed as part of the EIA.

To complete mining chamber remediation, water will be injected into the mining chamber via injection wells and then recovered through the recovery wells. Produced water would be processed through the processing plant until non-economic uranium concentrations are observed. Non-economic produced waters will be treated and mixed with fresh water for continued circulation in the mining chamber. This will continue until recovered water reaches acceptable groundwater quality decommissioning objectives.

During groundwater restoration, reagents may be added to the injected water to accelerate groundwater quality recovery.

After remediation has been completed, the freeze wall will be turned off and allowed to thaw. This will allow the eventual re-establishment of the pre-operational groundwater flow regime in the former mining chamber area.

2.4.3.2 Decontamination

Surface facilities and injection, recovery, and monitoring wells will be systematically surveyed and decontaminated as necessary. Surplus chemicals and other hazardous materials will be removed and stored in designated temporary storage facilities. Sumps will be cleaned. All hazardous materials will be disposed of at approved off-site facilities. All radiologically contaminated material will be disposed of on-site in accordance with licence conditions.

Empty tanks will be removed from the sites and sold as scrap or reused. Otherwise, they will be transported to an approved waste management facility. Fuel tanks will be managed by a contractor licenced to handle these types of tanks. Any remaining fuel and tanks will be removed by the contractor from the site. As much waste as possible will be hauled off-site and disposed of at appropriate licenced facilities.

2.4.3.3 Asset Removal

Salvageable machinery, equipment, and other materials will be dismantled, decontaminated, and taken off-site for resale or recycling. Remaining items will either be managed at a facility licenced to manage radioactive wastes or disposed of in an approved facility on-site.

2.4.3.4 Demolition and Disposal

All permanent structures that cannot be removed from the property as an asset will require demolition. Most process equipment and non-supporting structures will be removed from buildings prior to demolition and the buildings will be demolished.

During demolition, dust control will be required. An initial wash may be necessary, in addition to the wetting of demolition debris as structures are disturbed during demolition. The requirement and duration of misting will be determined on a case-by-case basis.

A review prior to the start of demolition will identify areas requiring additional procedures. Where possible, dust generating materials will be removed prior to demolition. Appropriate personal protective equipment and personnel decontamination procedures will be employed.

Valuable recyclable materials will be separated and processed for transport and sale concurrent with demolition. Excavators equipped with grapples will sort the recyclable products from the non-recyclables. Shears will be used to size recyclables for shipping and sale. Cleaning procedures of recyclables will be integrated into demolition, as necessary.

Concrete foundations will be left in place. Any portions of concrete foundations remaining above grade will be levelled and rebar will be cut-off at grade. Large slabs will be perforated on a 2 m grid to permit drainage. Concrete slabs will be covered with 0.5 m of development rock or locally stockpiled till.

The demolition process will produce:

- Saleable recyclable materials (steel, stainless steel, copper, steel sections, and sheet metal);
- Hazardous materials, including contaminated material that cannot be decontaminated;
- Roofing materials and insulation;
- Wood;
- Concrete; and
- Contaminated soils.

Saleable recyclable materials will also be transported off-site as scrap or recycled.

Hazardous materials will be handled and disposed of in accordance with the appropriate regulations and good practice. Where possible, chemicals will be mixed to produce a neutral solution and disposed of in an approved manner at site. Hazardous materials, such as spent chemicals (that cannot be managed on-site), waste oil, and sludges, will be disposed of off-site at licenced facilities.

Non-hazardous waste materials, such as roofing materials, insulation, wood, co-mingled concrete, and light steel (i.e. hand railings), may be disposed of on-site or off-site in a licensed landfill. Soil testing will be conducted in any areas of known contamination and/or potential spills, including areas around chemical, fuel, and explosive storage areas. Testing will be conducted according to industry standard procedures and compared to provincial and federal soil standards.

2.4.3.5 Reclamation

An overview of the reclamation activities that will be completed for the main Project components is provided below. The main Project components that will require reclamation at closure include:

- ISR wellfield and infrastructure;
- Transportation corridors and laydown areas;
- Ancillary infrastructure;
- Waste pad; and
- Water storage ponds.

Closure of the ISR wellfield and associated infrastructure will require the following activities:

- Decommissioning of all injection and recovery wells, following acceptable wellfield restoration;
- Removal, decontamination, and disposal of all surface piping;
- Decontamination and removal of the pumphouses;

- Decontamination, removal, and/or disposal of the processing plant;
- Allowing the freeze wall to thaw and decommissioning of all freeze pipes and freeze plant; and
- Placement of all waste in an approved long-term licenced facility.

Prior to reclamation, the existing wellfield will be used to circulate neutralizing solution and clean water through the mining chamber. The tanks in the processing plant may be repurposed and used for the closure water treatment process.

Transportation corridors will be graded and scarified to promote natural revegetation. Access roads required for post-closure monitoring will be left as is and maintained to permit access. Access to the site will be restricted by gates and/or berms. Laydown areas will be scarified, covered with 0.5 to 1.0 m of stockpiled overburden, and vegetated with native self-sustaining species.

Reclamation of remaining infrastructure components involves the decommissioning and removal of components such as power transmission lines and electrical infrastructure, water pipelines, and water treatment plants. Ponds and lined settling ponds will be decommissioned once they are no longer required for water management. Any contaminated liners will be removed and hauled to an approved landfill. The footprints of ancillary infrastructure will be scarified and vegetated with native self-sustaining species as required.

2.4.4 Post-Decommissioning

The post-decommissioning period will extend from the end of physical decommissioning until transfer of the site into the provincial Institutional Control Program (Government of Saskatchewan 2009) or direct release of the land back to the Crown, is expected to last five years.

Following decommissioning, physical, chemical, and biological monitoring of the site will be conducted to ensure that the site is chemically and physically stable. The monitoring programs will be designed and conducted in accordance with the provincial and federal regulations and licence conditions.

The following is a summary of the anticipated monitoring programs:

- Groundwater quality;
- Physical stability;
- Biological; and
- Surface water quality.

The monitoring programs will be conducted until the site-specific decommissioning and reclamation objectives for the Project are met. Monitoring reports will be developed and submitted to both the provincial and federal regulators, in accordance with licence conditions.

2.5 Project Alternatives

Denison first initiated evaluation of the production potential from Wheeler in 2010. Since that time the Project has undergone significant design and review stages and has naturally evolved into the current state. During this time, several key alternatives and options were evaluated including:

1. Mining methods: Historical work evaluated a total of 32 mining methods to extract uranium from the deposit. Methods were evaluated through an increasingly rigorous process and considered factors such as: safety, environment, production rates, capital costs, operating costs, schedule, operational flexibility, risk, etc. In addition, specific workshops were held in local Indigenous and non-Indigenous communities to capture community input into the selection of a preferred mining method. After several years of study, the ISR mining approach was selected as the best option across the majority of factors.
2. Mineral Processing: In conjunction with the above assessments, historical work evaluated the construction of an on-site conventional mill to process run of mine ore from an underground mine. Factors such as: safety, environment, production rates, capital costs, operating costs, schedule were considered. Ultimately the decision to avoid construction of a conventional mill and tailings facility was made.

Following the selection of ISR as the mining method, further processing alternatives were evaluated including the use of a toll mill to process the uranium rich mining solution, ion exchange technology (common to international ISR operations) and direct precipitation. Direct precipitation on site scored the highest in all evaluation categories.

3. Site Access Road Routing: The Wheeler site is approximately 4 km from the existing highway 914. An assessment of several routes was completed and considered factors such as: safety, environment (total disturbance), capital costs and risk. In addition, specific workshops were held in the Indigenous and non-Indigenous communities to capture community input into the final route selection.
4. Treated Effluent Discharge Location: After completion of baseline data collection a preliminary evaluation of potential surface water bodies was completed to assess the suitability of the surrounding areas to receive treated effluent from the site. Preliminary modelling identified five surface waterbodies that would likely be able to receive treated effluent without significant adverse environmental impacts. More detailed assessments of these waterbodies were completed and factors such as safety, environment, capital cost, operating costs and risk were considered. In addition, specific workshops were held in Indigenous and non-Indigenous communities to capture community input into the final location selection.
5. Site Infrastructure Layouts: Throughout the design process, several iterations of the site infrastructure and placements were considered. This process is on-going with factors such as safety, environmental disturbance, schedule, capital costs and risk being considered.

2.6 Ancillary Projects

SaskPower will secure permits for and construct the ~5 km powerline extension from along Highway 914 into Wheeler. It is anticipated that the powerline extension will be adjacent to the access road.

Saskatchewan Ministry of Highways has initiated the provincial environmental assessment process for Highway 914 extension and the Key Lake by-pass. As outlined in the project's Terms of Reference (Saskatchewan Ministry of Highways 2016) the Key Lake bypass component includes construction and operation of an approximate 5 km all-weather road by-pass to route traffic around Cameco's Key Lake uranium mill site. The Key Lake by-pass component of the Ministry of Highway's proposed project is considered an ancillary project for Wheeler.

2.7 Socio-Economics

Approximately 300 workers are expected to be required during the two-year construction period. Each component of construction will require workers with different types of skills and training depending on the task (e.g. road construction, wellfield drilling, erection of buildings, connection to services, etc.). During operations, about 150 people will be employed to operate the ISR wellfield and processing plant, as well as provide various supporting activities such as security, camp operations, operation of the water treatment, sewage and potable water plants, environmental monitoring, and maintenance of roads, equipment, and buildings.

The need for goods and services during construction, operations and decommissioning will generate business opportunities throughout the life of Wheeler. Examples of anticipated goods and services may include: catering, housekeeping, food, freight, and bulk materials such as fuel, propane, and reagents.

Employment and procurement opportunities pursued by those from nearby communities will be preferred as outlined in the MOUs executed with nearby communities and Indigenous groups (Section 8). In accordance with the intent of the MOUs, Denison has established an internal procurement approach, which requires the procurement of all goods and services for the Project to first consider businesses based in the communities prior to looking elsewhere in northern Saskatchewan, southern Saskatchewan and/or outside of Saskatchewan.

As a result of Denison's early engagement initiatives, a number of programs and actions focused on producing socio-economic benefits for local Indigenous and non-Indigenous communities have been initiated. Examples of some of the successes to date are described in Section 8.2.1. It is Denison's intent to leverage its early work and existing relationships with local Indigenous and non-Indigenous communities in order to expand upon its existing socio-economic commitments. This will allow Denison to meet or exceed the socio-economic commitments that will be outlined in the Project's Saskatchewan Surface Lease Agreement and the Human Resource Development Agreement to be negotiated between Denison and the province following the successful completion of the environmental impact assessment process.

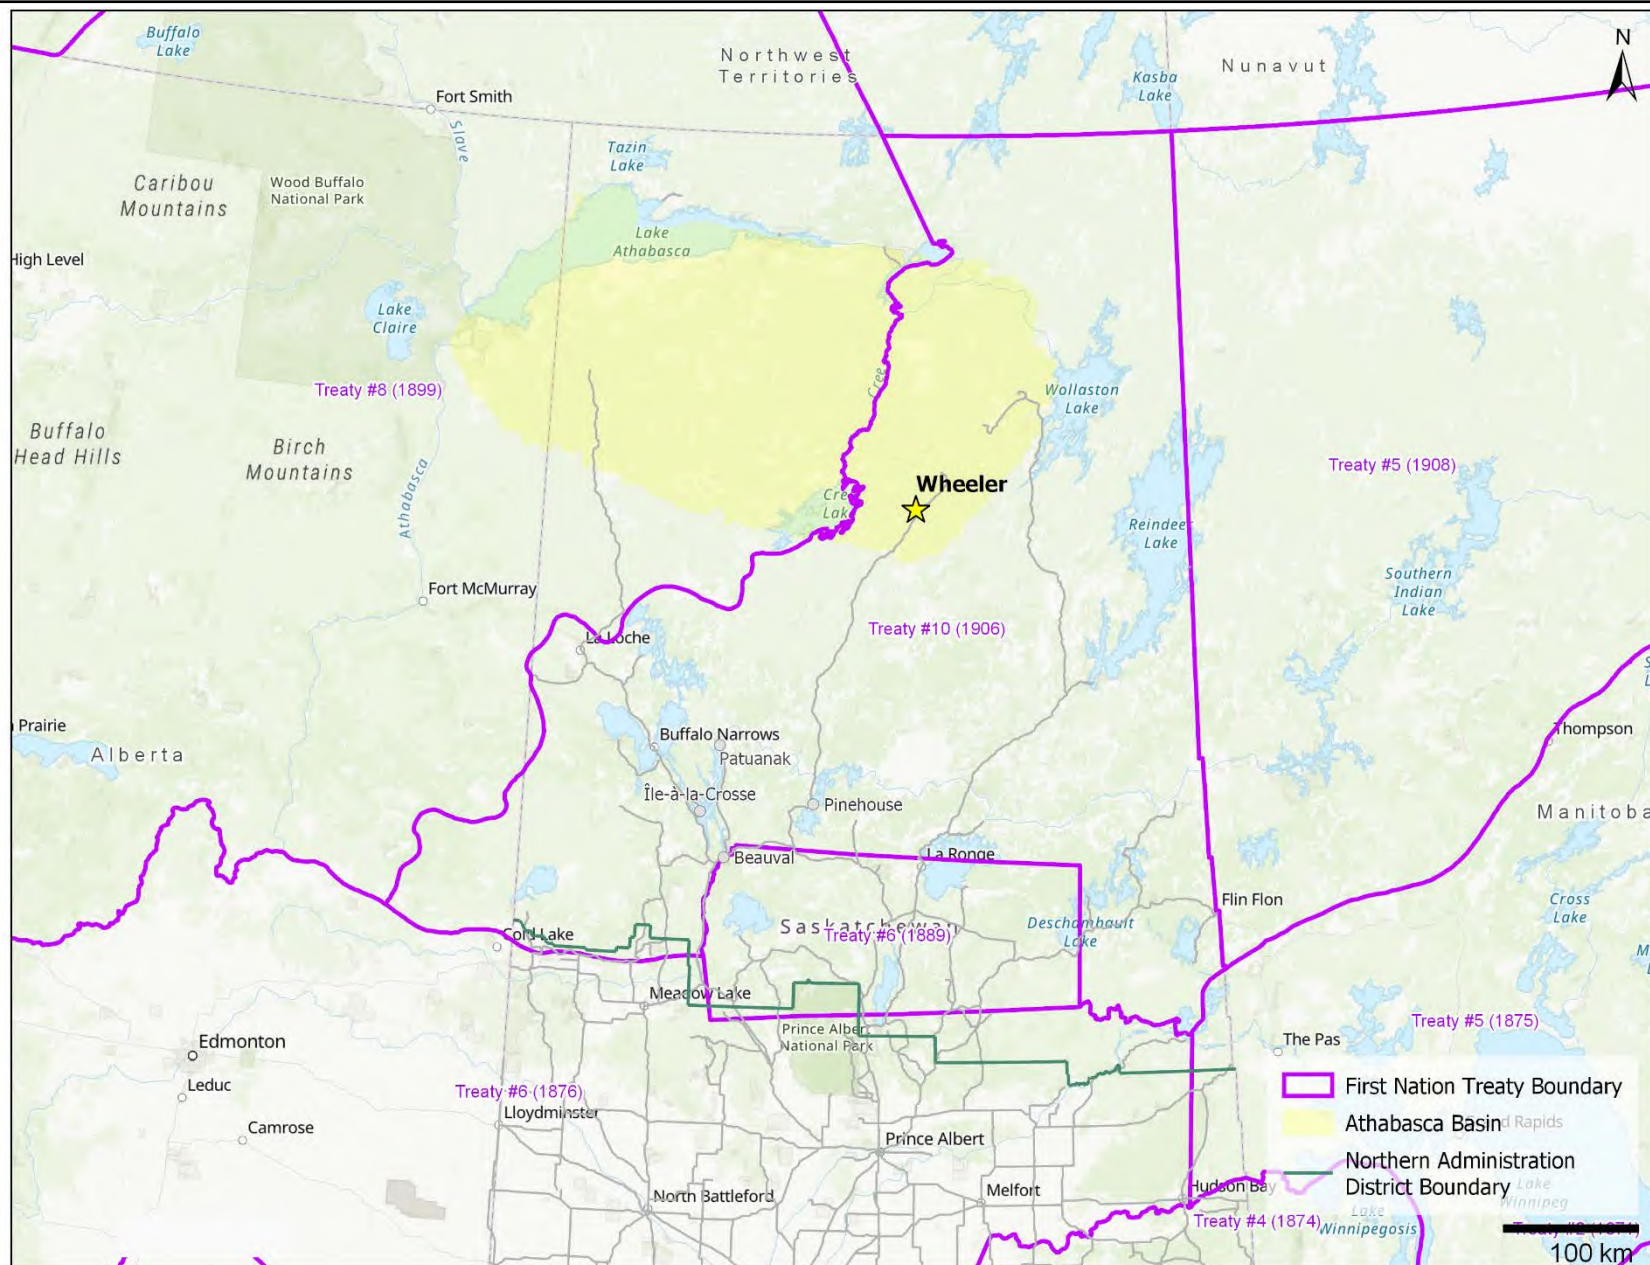

3 Project Location

The property straddles the boundaries of NTS map sheets 74H-5, 6, 11, and 12. The approximate UTM coordinates of the property are 477,000E and 6,374,000N (NAD83, Zone 13). Wheeler is located within Treaty 10 territory (Figure 3.1).

Wheeler is located in Saskatchewan's Northern Administration District (NAD) as defined in the province's Northern Municipalities Act, but its creation dates back to The Northern Administration Act, 1948, which provided for the administration and development of the northern part of Saskatchewan. The NAD includes approximately half of Saskatchewan's land area, but less than four per cent of the province's population. The NAD's population of roughly 37,000 lives in approximately 45 communities, which include municipalities, First Nations reserves, settlements, and sometimes a combination of each.

There are a number of leases near Wheeler including recreational, traditional land use, and industrial surface leases. Figure 3.2 shows the location of recreational and traditional land use leases issued by the Province of Saskatchewan; it is assumed there are seasonally used cabins on these properties and this will be confirmed as part of the EIA. There are potentially eleven (11) cabins within 22 km of Wheeler (Figure 3.2).

Other nearby surface leases are for industrial sites such as power transmission and mineral exploration (Figure 3.3 and Table 3.1). Industrial surface leases are in place for the Key Lake Operation (a uranium mill) and the McArthur River Operation (an underground uranium mine); milling and mining activities at these sites are currently suspended.

Notes:

¹ Land dispositions from Crown Resource Lands provided by Government of Saskatchewan, Ministry of Environment, Fish, Wildlife and Lands Branch

As a remote site, there are no communities in relatively close proximity to Wheeler (Figure 3.4). Calculated using a straight line, the closest communities are approximately 150 km away in the northern settlement of Wollaston Lake and the neighbouring reserve of Lac La Hache (Table 3.2 and Figure 3.4). Travelling by existing roads the closest community to the Project is Pinehouse which is approximately 260 km away (Table 3.2).

The communities and associated Indigenous groups of Patuanak, Pinehouse, Ile a la Crosse, and Beauval were identified as key through the community selection process; additional details are provided in Section 7 and Section 8.

The federal lands close to Wheeler are First Nation Reserves, most of which do not have permanent residences. Figure 3.5 shows the location of reserve land within 150 km of Wheeler and Table 3.3 provides the details about the reserve lands. The closest national park to Wheeler is Prince Albert National Park which is 357 km south.

Note: Communities shown in bold font have been the focus of Denison's local Indigenous and non-Indigenous engagement program

Denison screened the area around Wheeler to check for environmentally sensitive areas. As shown in Figure 3.6, crown land subdivision, ecological reserves, representative areas, special management areas, wildlife refuges and wind turbine avoidance zones are not located near the Project area. In addition to the information provided on Figure 3.6, there are no game preserve, national wildlife areas, migratory bird sanctuaries, conservation easements, Fish and Wildlife development fund lands, Ramsar wetlands, or wildlife habitat protection areas in the area shown.

In terms of management areas, Wheeler is near the centre of the woodland caribou SK1 administrative unit, fur block 18, and the provincial wildlife management zone 75 (Figure 3.7).

4 Federal Involvement

No federal funding or support has been provided to the Project.

Federal lands will not be used for the purpose of carrying out the Project.

5 Existing Environment

5.1 Physiography and Terrain

The property is characterized by a relatively flat till plain with elevations ranging from 477 to 490 metres above sea level (masl). Throughout the area, there is a distinctive north-easterly trend to landforms resulting from the passage of Pleistocene glacial ice from the northeast to the southwest. The topography and vegetation at the property are typical of the taiga forested land common to the Athabasca Basin area of northern Saskatchewan.

The regional area is covered with overburden from 0 to 130 m in thickness; the overburden in the immediate area of the Wheeler uranium deposit is 22 to 30 m in thickness. The terrain is gently rolling and characterized by forested sand and dunes. Vegetation is dominated by black spruce and jack pine, with occasional small stands of white birch occurring in more productive and well-drained areas. Lowlands are generally well drained but can contain some muskeg and poorly drained bog areas with vegetation varying from wet, open, non-treed vistas to variable density stands of primarily black spruce as well as tamarack depending on moisture and soil conditions. Lichen growth is common in this boreal landscape mostly associated with mature coniferous stands and bogs.

5.1.1 Geology

The Property is partially covered by lakes and muskeg which overlies a complex succession of glacial overburden deposits. These include eskers and outwash sand plains, well-developed drumlins, till plains and glaciofluvial plain deposits (Campbell 2007). Glacial overburden is comprised of medium to coarse grained sand and gravel till outwash. The quaternary deposits vary in thickness from zero to approximately 120 metres with the orientation of the drumlins reflecting a southwesterly ice flow. Local outcrops of consolidated paleoproterozoic sandstone of the Athabasca formation also occur in select areas on the Property.

The glacial overburden is underlain by relatively undeformed paleoproterozoic Athabasca Group sandstone that unconformably overlie the crystalline basement rocks and have a considerable range of thickness from 170 metres over the quartzite ridge to at least 560 metres on the western side of the property. The unconformity varies dramatically across the property. From elevations of 160 to 230 metres above sea level along the Property's southeastern edge, the unconformity rises gently to a pronounced north-easterly trending ridge up to 350 metres above sea level, coincident with the subcrop of a quartzite unit in the crystalline basement. The unconformity surface drops steeply westward to as low as 30 metres below sea level. A schematic cross-section of the general property geology is shown in Figure 5.1.

Basement rocks on the Wheeler property are located within the Wollaston Domain of the Trans Hudson-Orogeny and comprise metasedimentary and granitoid gneisses. The metasedimentary rocks belong to the Paleoproterozoic Wollaston Supergroup and include graphitic and non-graphitic

pelitic and semipelitic gneisses, felsic and quartz feldspathic gneisses, meta-quartzite and rare calc-silicate gneisses. These metasediments are interpreted to belong to the Daly Lake Group, (Yeo and Delaney, 2007). Pegmatitic segregations and intrusions are common in all units. Garnet, cordierite and sillimanite occur in the pelitic units indicating an upper amphibolite grade of metamorphism. A “Paleoweathered Zone”, generally between three to ten metres thick, is superimposed on the crystalline rocks and occurs immediately below the unconformity.

The Wheeler exploration property is host to the Phoenix uranium deposit discovered in 2008 and Gryphon deposit discovered in 2014 (Figure 2.4) plus additional zones of mineralization and other prospective exploration targets. The details below are focused on the Phoenix deposit although other areas of mineralization suitable for ISR mining at Wheeler are anticipated to be geologically similar.

The quartzite ridge, an interpreted impermeable and structural barrier forming the footwall to the mineralization, dominates the basement geology at the Phoenix deposit. The quartzite unit exhibits variable dips from 45° to 75° to the southeast, averaging 50°, and with an undulating, but generally 055° azimuth. Immediately overlying the quartzite is a garnetiferous pelite, which varies from seven metres to 60 metres in thickness. Overlying the garnetiferous pelite is a graphitic pelite. The graphitic pelite is approximately 5 metres wide in the southwest, increases to approximately 70 m in the central portion of the deposit area and is 50 metres wide at the northeast extremity.

Mineralization at Phoenix generally occurs at the Athabasca unconformity in contact with the underlying basement rocks at depths ranging from 390 to 420 metres. It is interpreted to be structurally controlled by the northeast southwest trending (055° azimuth) WS Fault which dips 55° to the southeast on the east side of the quartzite ridge.

A detailed schematic of the geology at the Phoenix deposit is shown in Figure 5.2. The grades and thickness of the deposit vary along the major structure where typically higher grades and thicker portions of the deposit are associated with larger offsets along the structure where the sandstone contact has been displaced allowing for greater structural disruption and permeability of the deposit area. In general, the deposit is comprised of an exceptionally high-grade core, related to the major structure, and is surrounded by a lower grade shell away from the structure. Both the core and the shell are variably structured and are characterised by sandy clays with portions of the deposit containing ‘islands’ of less permeable though high grade ore within the more permeable and structured areas. The Phoenix deposit appears to be amenable to ISR as it is situated within relatively porous and permeable structured sandstones and underlain by less porous and competent basement rocks.

Wheeler River Property**

May 2019

5.2 Hydrogeology

Shallow groundwater monitoring wells have been installed in the overburden and upper sandstone in a regional area north of the Phoenix deposit to establish baseline conditions. Monitoring has been ongoing since 2018 and results to date are typical for the Athabasca Basin and the water contains low concentrations of total dissolved solids. The water table in this area is located about 2 to 10 meters below surface.

Baseline groundwater quality samples have been collected from the Athabasca Sandstone in the site study area above the uranium deposit. Results from samples collected from between 280 to 363 m below surface show the groundwater quality has low concentrations of total dissolved solids and nutrients and a relatively neutral pH (between 6.0 and 7.0). Conductivity was 71 $\mu\text{S}/\text{cm}$. When compared to Canadian Water Quality Guidelines for the Protection of Aquatic Life (CCME 2017), results exceeded the prescribed criteria for dissolved aluminum, dissolved iron, dissolved copper, dissolved lead, and uranium. Radium-226 was 1.9 Bq/L, exceeding the Saskatchewan Environmental Quality Guideline (SEQG) of 0.11 Bq/L for surface water (Government of Saskatchewan 2017b), while the concentration of lead-210 was 0.80 Bq/L.

Baseline groundwater quality samples have also been collected from sandstone in an area immediately above the uranium deposit (352 to 395 m below surface), providing information on the water quality closer to the uranium deposit. The results from the groundwater sampling indicate a neutral pH (6.9 to 7.5), as anion chemistry was dominated by bicarbonate alkalinity and sulphate, whereas chloride was comparatively low. Cation chemistry was shown to be dominated by sodium, calcium, iron, and aluminum. Conductivity was 216 $\mu\text{S}/\text{cm}$. Dissolved iron concentrations were higher than expected given the pH of the samples, as iron hydroxides have low solubility at neutral pH, and under oxidizing conditions, iron is expected to precipitate. The iron results indicate it is likely that iron is out of equilibrium with surface conditions due to the change in redox conditions (to more oxidizing) produced by removal of the water from depth. When compared to Canadian Water Quality Guidelines for the Protection of Aquatic Life (CCME 2017), results exceeded the prescribed criteria for aluminum, dissolved iron, dissolved arsenic, dissolved copper, dissolved lead, and dissolved uranium. Radium-226 was 7.2 Bq/L, exceeding the SEQG of 0.11 Bq/L for surface water (Government of Saskatchewan 2017b), while the concentration of lead-210 was 2.1 Bq/L.

An extensive groundwater quality sampling program will be completed in 2019 to further characterize the baseline hydrogeological conditions in and around the proposed wellfield, as well as at the broader regional area. Collection of groundwater quality and water level data will be ongoing at key locations.

5.3 Atmospheric and Acoustic Environment

5.3.1 Radon

Atmospheric or passive radon monitoring commenced in September 2016 to establish baseline radon levels in the Project area. Passive radon detectors were deployed at 10 select locations in duplicate. On a quarterly basis, each deployed detector is exchanged with a new replacement detector, and each collected detector is sent to an accredited laboratory for analysis.

While there is currently no Canadian regulation that prescribes a radon threshold value in outdoor environments, Health Canada has developed a guideline for radon in indoor air for dwellings of 200 Bq/m³. This guideline provides Canadians with guidance pertaining to when remedial action should be taken to reduce radon levels. Results to date demonstrate that baseline atmospheric radon levels within the Project area are low, with the average radon concentration not exceeding 10 +/- 3 Bq/m³ at any location. Baseline radon monitoring will continue as required.

5.3.2 Dustfall

Dustfall monitoring stations were established at six (6) locations around the site in the fall of 2018. Data from these stations is not yet available.

5.3.3 Noise

Noise baseline studies are scheduled to be completed in 2019. It is reasonable to assume the baseline noise levels will be quite low in the Project area since it is located in a relatively isolated area of the boreal forest.

5.3.4 Climate and Meteorology

Regional climate and meteorological data is available from the nearby weather station at Key Lake; the station is approximately 32 km away from Wheeler. Temperature and precipitation data from 1981 to 2010 is provided in Figure 5.3. An on-site metrological station has not yet been established.

Figure 5.3: Historical Temperature and Precipitation near Wheeler

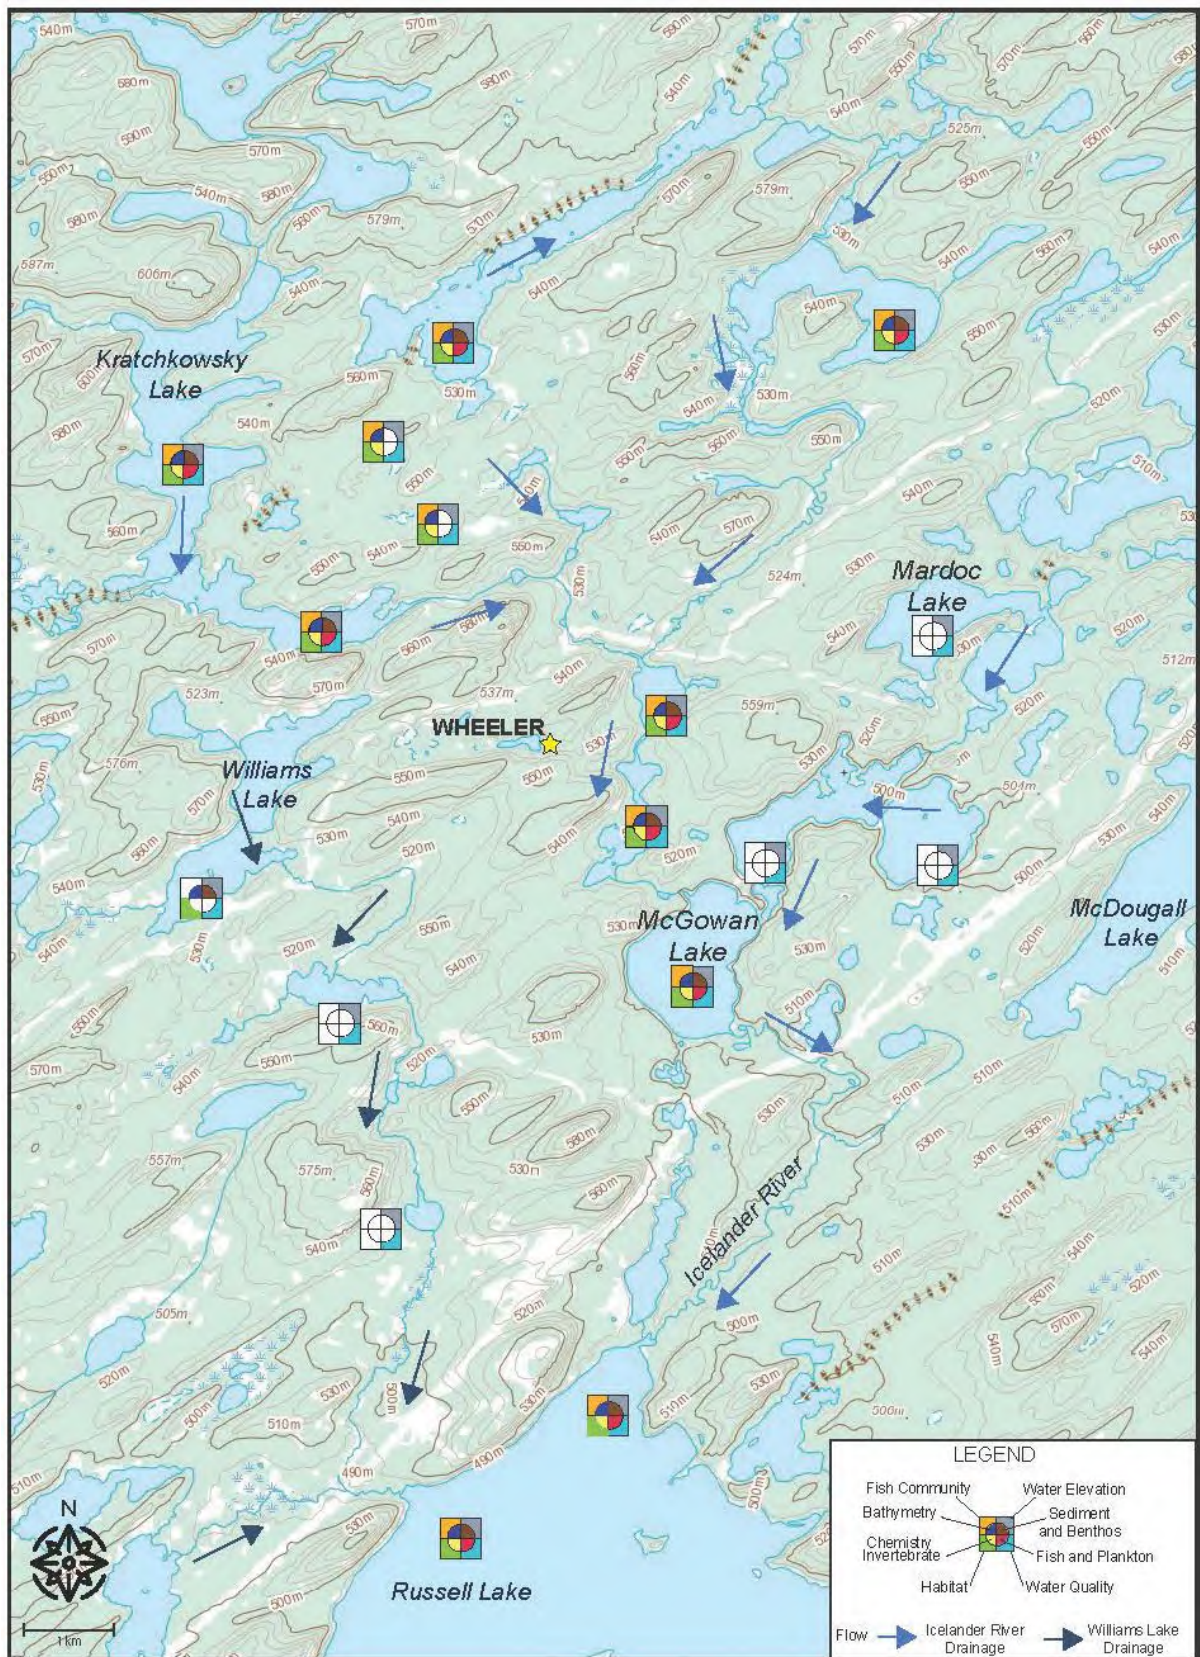

The climate is typical of the continental sub-arctic region of northern Saskatchewan, with temperatures ranging from +32°C in summer to -45°C in winter. Winters are long and cold, with mean monthly temperatures below freezing for seven months of the year. Winter snow pack averages 70 cm to 90 cm. Freezing of surrounding lakes, in most years, begins in November and break-up occurs around the middle of May. The average frost-free period is approximately 90 days.

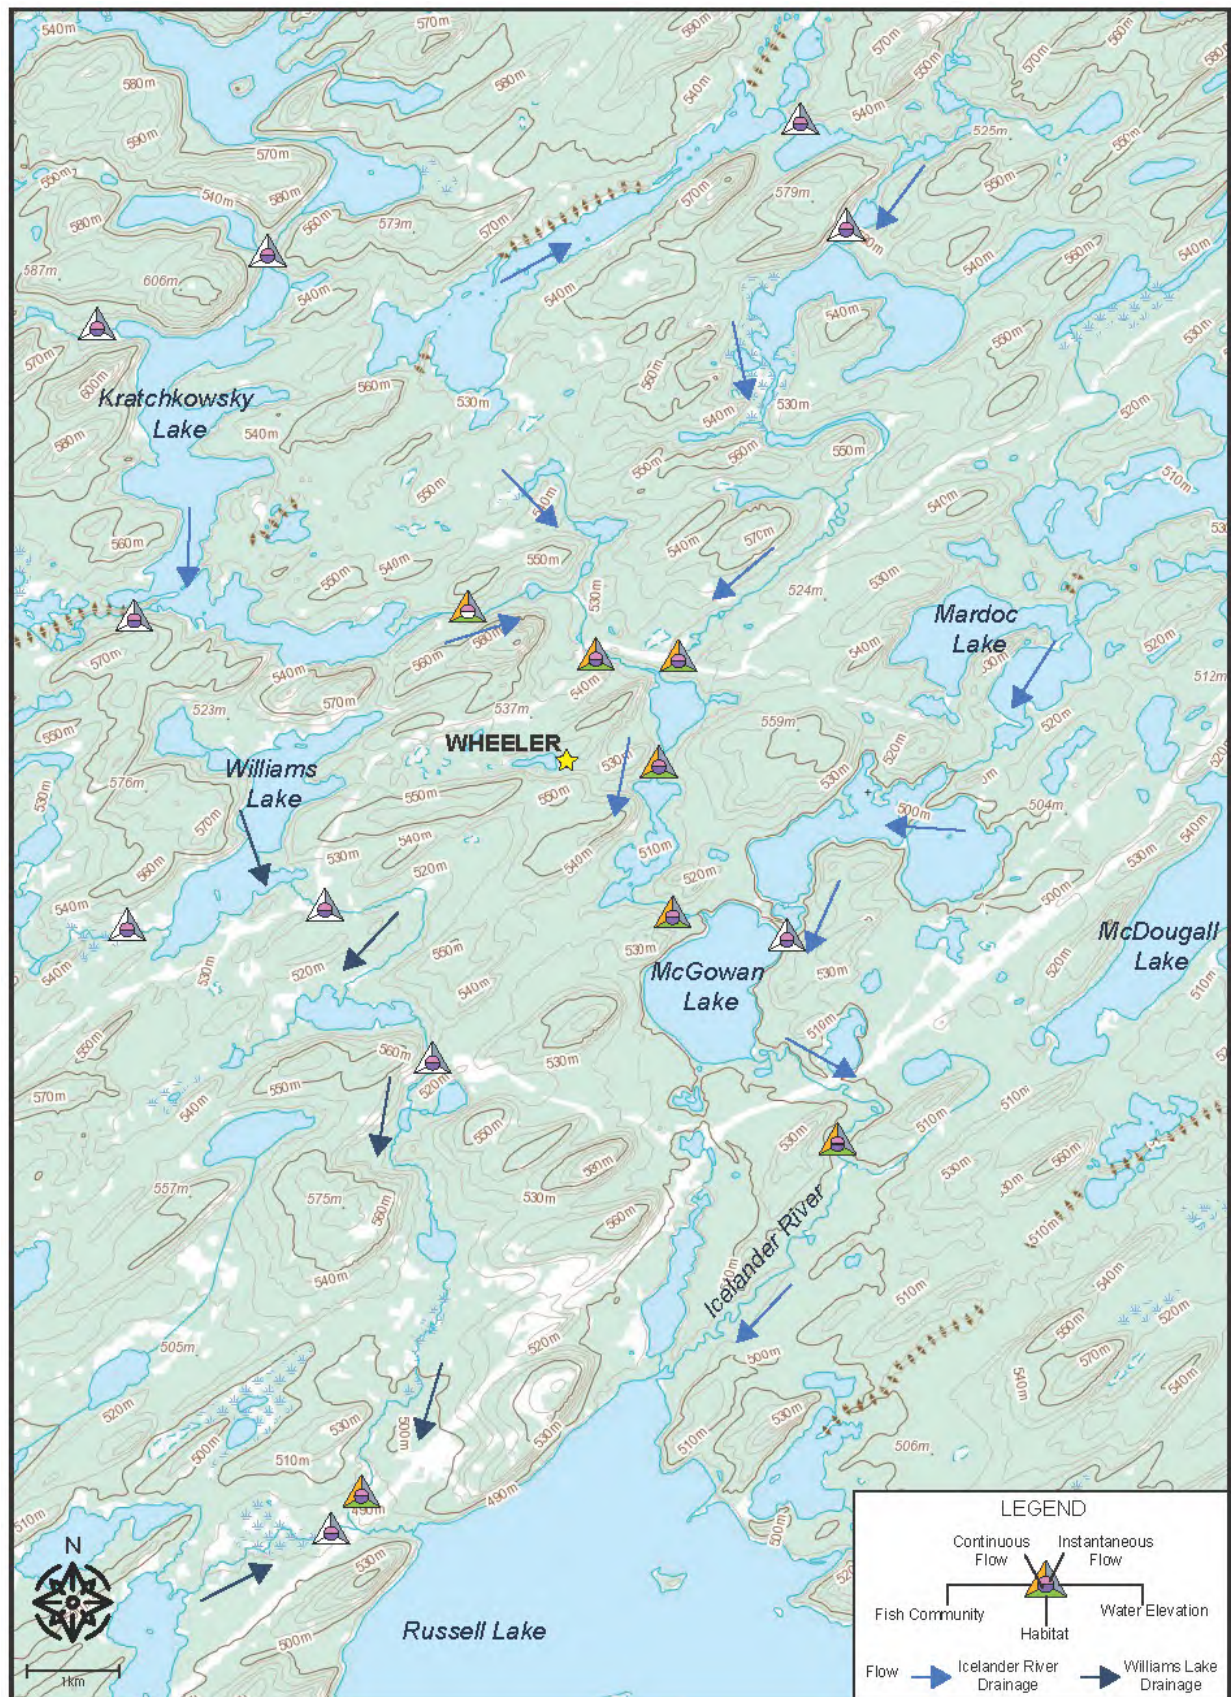

Average annual total precipitation for the region is approximately 480 mm, of which 67% falls as rain, with more than half occurring from June to September. Snow may occur in all months but rarely falls in July or August. The prevailing wind direction is from the north-west/west with a mean speed of 12 km/hr.

5.4 Aquatic Environment

Aquatic environment baseline field surveys completed between 2012 and 2018 focused on hydrology, water quality, limnology, sediment quality, aquatic habitat, bathymetry, plankton community, benthic invertebrate community and tissue chemistry, and fish community, spawning, and tissue chemistry.

A summary of data collected in lakes and ponds is provided in Figure 5.4 and a summary of data collected from streams is provided in Figure 5.5.

5.4.1 Hydrology

The Project area is located within two distinct sub-drainage areas that drain into Russell Lake, the Wheeler River, and ultimately into Wollaston Lake (via the Geikie River). Extending north and east of the Project area, the Iceland River drainage area drains approximately 371 km², while the Williams Lake drainage area is located south of the Project area and drains approximately 78 km² (Figure 5.6).

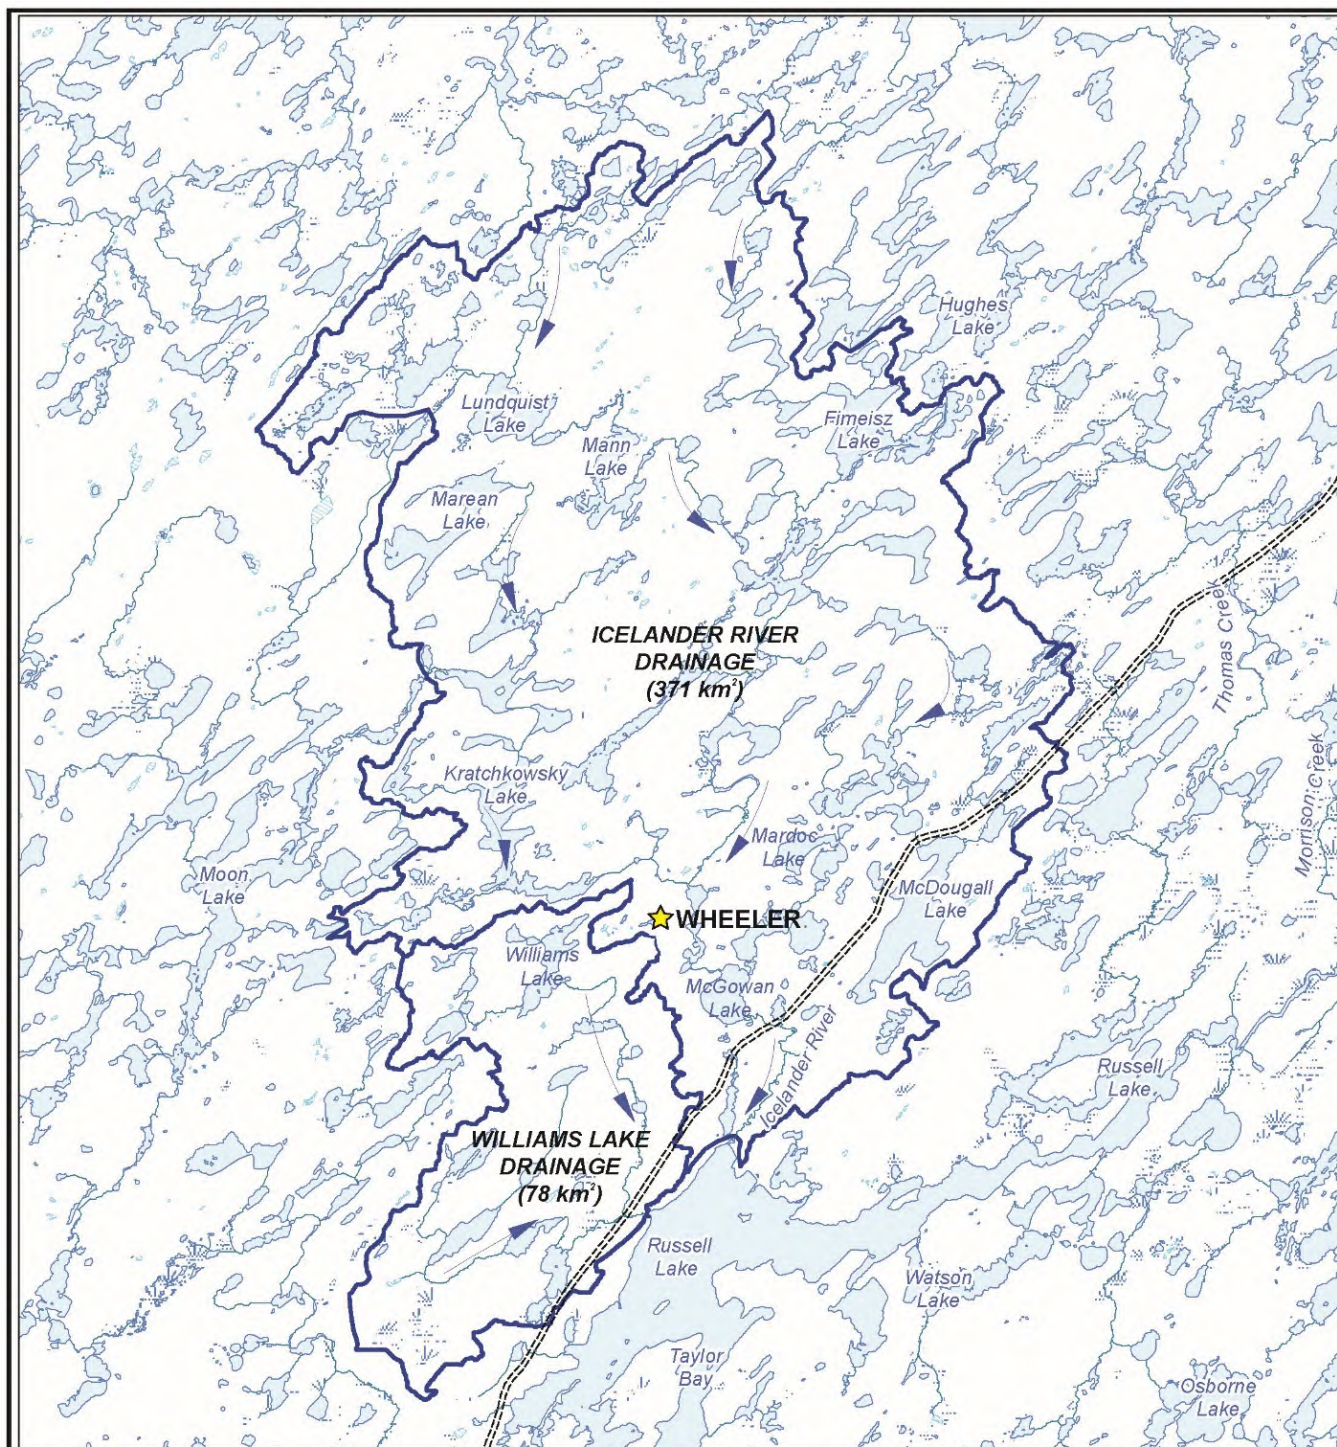

Hydrological baseline studies included manual streamflow measurements, staff gauge and elevation surveys, detailed bathymetric surveys, and continuous water level recording using dataloggers to develop rating curves at select stream locations within the Project area.

The hydrological characteristics of lakes and streams in the Project area were surveyed between 2011 and 2014. Water elevation survey locations were established at nine stream stations and eleven lake stations. Manual flow measurements were performed at each of the nine stream stations, and automated stream elevation instruments (level data loggers) were installed at all stream stations. Rating curves were established for each station based on the manual stream discharge measurements to permit estimation of hydrographic profiles for each location.

Four field programs were completed from fall 2016 to summer 2018 to capture seasonal flow conditions in spring, summer and fall. One winter field program was completed between March 15 and 19, 2018, to assess ice cover in the area and to gain a better understanding of winter baseflow conditions. Continuous monitoring equipment has been installed in seven stream stations and one lake station for continued hydrological data collection.

Project area lake and pond surface water elevations ranged from 520.86 masl at an unnamed headwater lake, to 488.26 masl at Russell Lake. In the Iceland River drainage area, water level elevations at the stream stations ranged from 520.73 masl at the most upstream station, to 492.71 masl at the most downstream station. Stream flow measurements were recorded at 2.34 cm/s at the most downstream location of the Iceland River drainage area.

In the Williams Lake drainage area, water levels at stream stations ranged from 518.33 masl at the most upstream station, to 488.55 masl at the most downstream station. Stream flow measurements recorded during this time were recorded at 0.64 cm/s at the most downstream location of the Williams Lake drainage area.

Wheeler River Project
Provincial Technical Proposal and Federal Project Description

Figure 5.6: Drainage Areas around Wheeler

May 2019

5.4.2 Surface Water Quality and Limnology

Baseline surface water quality was assessed at seventeen (17) lentic locations and eleven (11) lotic stations within the Project area. Water quality data were compiled for the years 2012, 2014, 2016, 2017, and 2018 by measuring physical and chemical constituents obtained in situ, as well as by accredited laboratory analyses. Surface waters within the Project area were found to be comparable to other lakes in the region, which are classified as being soft with typically low levels of alkalinity, nutrients (nitrate and phosphorus), total dissolved solids, and total suspended solids. The pH of surface waters within the study area are slightly acidic to neutral.

In general, the concentrations of metals and metalloids were similar throughout the study area. Radionuclide concentrations were low, with the majority of measurements lower than their respective laboratory detection limits. For parameters with Saskatchewan Surface Water Quality Objectives (SSWQO) or Canadian Water Quality Guidelines (CWQG), most were below their respective guideline limits. Aluminum, cadmium, and lead concentrations exceeded guideline values at some locations; however, this appears to be a natural occurrence as demonstrated in surface water throughout the Project area. Elevated concentrations of iron and mercury were measured near the lake bottom in lakes that exhibited thermal stratification at the time they were sampled.

Radionuclide concentrations measured in surface water are low within the study area, and generally below the laboratory detection limits of 0.02 Bq/L for lead-210, 0.005 Bq/L for polonium-210, 0.005 Bq/L for radium-226, and 0.01 Bq/L for thorium-228, thorium-230, and thorium-232.

Limnology profiles were recorded at the deepest location in each lake, measuring conductivity, pH, temperature, and dissolved oxygen. Thermal stratification of the water column was infrequently observed in the Project area lakes.

5.4.3 Sediment Quality

Sediment samples were collected from the depositional areas of selected lakes for analysis of metals, radionuclides, total organic carbon, and particle size during the 2016 field study. Lake sediments within the Project area were found to be generally silty-clay or sandy-silt with total organic carbon present at approximately 16%. For parameters with prescribed sediment quality guidelines, all constituent concentrations were found to be at, or below, their respective threshold values.

5.4.4 Benthic Invertebrate Community and Tissue Chemistry

Benthic invertebrate community samples were collected at select lakes in September 2016. Benthic invertebrates were identified to family and consideration was also given to functional feeding group. Results were analyzed for abundance, relative abundance, and community metrics such as

density, richness, Simpson's Diversity Index, Simpson's Evenness Index, and Bray-Curtis dissimilarity index. Thirty-eight (38) major taxonomic groups (families) present in Project area waterbodies.

Total invertebrate density ranged from 671 to over 10,000 individuals per m². A total of 78 taxa were identified in the study area and mean invertebrate richness ranged from 7 to 24 taxa per sample. Simpson's Diversity Index values suggested that the benthic communities were relatively diverse at all locations; mean Simpson's Diversity Index values ranged from 0.65 to 0.85. Simpson's Evenness Index values ranged from 0.18 to 0.4 and overall few taxa comprised a large proportion of total invertebrate density at any given sampling location.

Thirty-eight major taxonomic groups (Families) were present in the study area. Chironomids were the most prevalent, comprising between 16 to 85% of the total benthic invertebrate density at each location. Furthermore, chironomids were the most numerically dominant taxon at all but two locations where Chydoridae family of water fleas (Cladocera) were the most numerically dominant. Other major taxonomic groups with respect to total benthic invertebrate density were detritus worms (Naididae), pill clams (Pisidiidae), water fleas from the families Holopedidae and Macrothricidae, phantom midges (Chaoboridae), seed shrimps (Ostracoda) and cyclopoid copepods.

Benthic macroinvertebrates from the following functional feeding groups were present at all locations sampled in the study area: scrapers, shredders, collector-gatherers, collector-filterers, and predators.

Benthic invertebrates (dragonfly nymphs and caddisfly larvae) were collected from selected Project area lakes, including Russell Lake and Kratchkowsky Lake, and analyzed for metals and radionuclides. The results of the analyses identified that radionuclide levels were generally below the laboratory method detection limit, with the exception of Po-210 and Ra-226. While metal concentrations observed in benthic invertebrate tissues collected from Project area lakes were generally consistent across all locations, cobalt and nickel concentrations were observed to be more variable. Benthic invertebrate tissues collected from Russell Lake had higher concentrations of some metals, including aluminum, cobalt, and uranium, than other lakes in the Project area.

5.4.5 Plankton Community

Lake phytoplankton and zooplankton samples were collected in September 2016 at six locations.

The biovolume of phytoplankton ranged from 0.69 to 14.0 mm³/m³ water at the locations sampled. In total, 55 phytoplankton taxa were identified from seven classes and at least six classes were identified in each of the waterbodies sampled. Diatoms (Bacillariophyceae) were dominant at all locations, representing approximately 25% to 90% of the total biovolume at each location.

The biovolume for zooplankton ranged from approximately 10 to 2,211 mm³/m³ water at lakes sampled. A total of 32 taxa belonging to 10 classes were identified. Branchiopods (Branchiopoda)

were dominant at all locations representing approximately 33% to 94% of zooplankton biovolume at each location.

At all locations, chlorophyll-a concentrations were below the laboratory method detection limit ($< 0.60 \mu\text{g/L}$). This is a reflection of the typically low primary productivity of oligotrophic lakes in the Project study area.

5.4.6 Fish Community, Spawning, and Fish Tissue Chemistry

Baseline field surveys were conducted to assess aquatic habitats throughout seasonal fluctuations in fish movements and spawning activities. Fish community surveys were undertaken in various habitat types in selected Project area waterbodies to characterize fish species presence and community diversity. A total of 13 species of fish were collected within the Project area during baseline surveys in September 2016 and May 2017. All waterbodies sampled, except one headwater pond, supported fish.

Eleven fish species were collected within study area lakes: lake chub, spottail shiner, longnose sucker, white sucker, lake whitefish, lake trout, northern pike, burbot, ninespine stickleback, yellow perch, and walleye.

Eleven fish species were also collected at stream sampling areas: lake chub, spottail shiner, longnose sucker, white sucker, arctic grayling, northern pike, burbot, ninespine stickleback, slimy sculpin, yellow perch and walleye.

Large-bodied fish spawning surveys were conducted in the fall of 2016 and spring of 2017 at selected lake and stream locations to determine the utilization of these areas for spawning. Fall spawning species present within the study area include lake whitefish and lake trout, and potential spawning habitats for these species were identified in several Project area lakes, including Kratchkowsky Lake. Spring spawning species present within the study area include walleye, northern pike, arctic grayling, white sucker, longnose sucker, and yellow perch. Spawning habitats for walleye and suckers were observed at most stream stations. Northern pike spawning habitats were present in nearly all study area lakes, as well as most stream stations. Burbot spawn during late winter in streams or lake shallows under ice. No specific spawning surveys targeted burbot, however potential spawning habitat occurs within the study area.

Tissue samples (muscle and bone) collected in 2016 and 2017 from northern pike and white sucker were submitted for chemical and radiological analyses. Northern pike represents a predator species whereas white sucker represents a forage species. Mercury concentrations in both northern pike and white sucker tissue were below the Health Canada (2007) standard of $0.5 \mu\text{g/g}$ wet weight for commercially sold fish. Selenium concentrations in both northern pike and white sucker tissue were below the British Columbia Ministry of Environment (2014) guideline of $4 \mu\text{g/g}$ dry weight and the United States Environmental Protection Agency (2016) criterion of $11.3 \mu\text{g/g}$ dry weight for fish muscle.

5.5 Terrestrial Environment

Terrestrial baseline studies were initiated in 2016 to characterize the existing environment in the Wheeler area.

5.5.1 Predictive Ecosite, Anthropogenic, and Fire Mapping

In order to develop baseline disturbance and vegetation cover/fire mapping, as well as provide an accurate characterization of the vegetation cover for future monitoring and/or impact assessment purposes, predictive ecosite mapping was obtained from the Saskatchewan Technical Branch and enhanced to increase accuracy for site, local and regional study areas.

The predictive ecosite mapping identified that there are 22 different ecosite classifications located throughout the Project area, with the most abundant being jack pine/blueberry/lichen (70%), waterbodies (13%), and jack pine/black spruce/feathermoss (5%). The results also identified that the broader regional study area was comprised of the same ecosite classifications, however differing slightly in their proportions (jack pine/blueberry/lichen (52%), waterbodies (21%), and jack pine/black spruce/feathermoss (13%)).

The results of the baseline anthropogenic map of the Project study area identified that the total amount of anthropogenic disturbance in the Project local study area is 2.9% (1.4 km²), and 1.5% (5.8 km²) identified in the broader regional study area.

Historical fire data was obtained from the Saskatchewan Ministry of Environment, Wildfire Management Branch to characterize the proportion of the Project and regional study areas which have been disturbed by past fires. The results of the fire mapping survey identified that 43% percent of the Project area landscape has burned within the last 30-50 years, and the remaining 57% of the landscape has forests aged 70 years and older.

5.5.2 Ecosite Characterization, Plant Structural Diversity, and Species Richness

Detailed vegetation and wildlife habitat characterization field surveys were undertaken in 2017 to describe and quantify the ecological and botanical conditions within recurring mapped ecosite types and regeneration forests. Sample site locations were widely distributed throughout the Project area. One hundred and ninety-four (194) species and/or genus of species were recorded during the vegetation field survey.

5.5.3 Vegetation and Soil Chemistry

The vegetation and soil sampling program was undertaken between August 2 and 7, 2017. Blueberry stems, leaves, fruit (currents year's growth), terrestrial lichen, and soil samples were collected to determine baseline conditions of physical properties, inorganic ions, metals, and radionuclides in vegetation (blueberry and lichen) and soil samples, as well as to support future monitoring, mitigation, and impact assessments.

Lichen and blueberry radionuclide levels were relatively consistent across the Project study area. Metal parameters were variable but relatively consistent, aside from elevated levels of aluminum, chromium, iron, lead, titanium, and vanadium observed at one location.

Radionuclide levels in soil were also variable but relatively consistent, with the exception of one sample site located northeast of Russell Lake where higher levels of lead-210 and polonium-210 were observed compared to other sample sites. Elevated levels of calcium, copper, lead, and manganese were also observed at this location compared to other sample sites.

5.5.4 Winter-Active Wildlife Identification and Abundance

Winter tracking surveys were completed to determine the presence of winter-active animals, determine the relative abundance of winter-active animals, enhance the Project specific area understanding of species-ecosite affiliations, and provide a robust baseline for potential follow-up and monitoring requirements. Winter tracking surveys were completed between January 25 and February 3, 2017, February 1 and 3, 2018 and March 2 and 12, 2018. Methodology was developed with guidance from the provincial snow track survey protocols (Government of Saskatchewan 2014b) and long-term monitoring techniques originating in Finland (Linden *et al.* 1996) and adopted by the Alberta Biodiversity Monitoring Program (Shank and Farr 1999). Tracks from the following species were observed in the Project area during the winter track count surveys:

- Snowshoe hare;
- Red squirrel;
- Grouse;
- Fisher;
- Moose;
- Microtine (voles and muskrats);
- Marten;
- Canada lynx;
- Otter;
- Ermine;
- Woodland caribou;
- Mink; and
- Red fox.

5.5.5 Ungulate Pellet Group/Browse Availability

Pellet group/browse availability transects were completed between June 9 and 20, 2017, and June 6 and 12, 2018 to collect baseline data on the presence and relative abundance of ungulates (moose and woodland caribou), carnivores, and game birds (grouse/ptarmigan species). The

transects were also used to determine the frequency of occurrence and abundance of terrestrial and arboreal lichen, as this species is vital to the woodland caribou population.

Pellets or scats of the following seven species were detected during the pellet group/browse availability surveys:

- Grouse/ptarmigan;
- Moose;
- Woodland caribou;
- Black bear;
- Red fox;
- Mink; and
- Martin.

The pellet group/browse availability surveys will provide baseline data to support future impact assessments and to allow for potential future follow-up and monitoring requirements.

Terrestrial lichen was observed in all ecosite/vegetation cover types sampled, except in areas where black spruce/balsam poplar/river alder swamp and willow shrubby rich fen covers were most prominent. Frequency of occurrence was the highest (greater than 99%) in areas covered by jack pine/blueberry/lichen.

Arboreal lichen occurred in 79% of ecosites/vegetation cover types surveyed throughout the Project area and were observed to be most abundant in areas covered by jack pine/blueberry/lichen.

5.5.6 Woodland Caribou Aerial Survey

In 2018, Denison submitted a permit application for an aerial survey to collect local-regional wildlife (most specifically woodland caribou and moose) data to present regional comparison values (occurrence/relative density) and habitat affiliations of species in the region, and provide context for results recorded in the Project area to date. The aerial survey permit application was denied by Saskatchewan Ministry of the Environment (SK MOE). SK MOE advised that a Project-specific aerial survey was unnecessary; SK MOE advised that in the EIA, Denison should assume presence of woodland caribou in the Project area and reference available regional data on distribution, density and movement. Although regional woodland caribou data is available in an interim, summarized form (i.e., McLoughlin et al. 2016), raw data is currently unavailable to Denison.

5.5.7 Small Mammal Identification, Abundance, and Tissue Chemistry

A small mammal trapping program was completed between September 24 and October 2, 2016 to determine the species composition and relative abundance of voles, mice, and shrews, as well as to collect specimens for baseline metal and radionuclide tissue analyses.

With an overall capture rate of 7.7 captures per 100 trap nights, a total of 197 individual small mammals from the following three species were captured during the program: red-backed voles, meadow voles, and dusky shrews.

The small mammal trap lines were stratified by three general areas: Gryphon deposit, Phoenix deposit, and a reference location. A total of 124 red-backed vole specimens were submitted for metals and radionuclide analysis. Samples collected at the Phoenix deposit indicated elevated levels of aluminum, titanium, uranium, and radium-226 in comparison to other sites surveyed.

5.5.8 Amphibian Nocturnal Call and Visual Identification Surveys

Amphibian surveys were completed to establish the presence/not-absence and relative abundance of amphibian species within the local and regional study areas. Amphibian auditory surveys were completed between June 16 and 20, 2017 and June 6 and 9, 2018. The provincial species detection protocol for amphibian auditory surveys (Government of Saskatchewan 2014c) was used to establish methodology for the amphibian nocturnal call survey.

Visual search surveys were completed between June 7 and 14, 2018. The provincial species detection protocol for amphibian visual surveys (Government of Saskatchewan 2014d) was used to establish methodology for the amphibian visual search surveys.

Wood frogs and boreal chorus frogs were detected.

5.5.9 Breeding Songbird Identification and Abundance

Breeding songbird point count surveys were undertaken in June 2017 to document the diversity and relative abundance of breeding songbirds within the Project study area, as well as to determine the presence of known or potential avian species at risk. The breeding songbird point count survey methodology was developed with guidance from the Saskatchewan Ministry of Environments species detection survey protocol for forest bird surveys (Government of Saskatchewan 2014e). Three hundred and nineteen indicated pairs were observed in the Project study area. The highest number of breeding songbird pairs were detected in jack pine/white birch/feathermoss cover. The following list provides the ten most common species detected:

- Ruby-crowned kinglet;
- Dark-eyed junco;
- Gray jay;
- Yellow-rumped warbler;
- Swainson's thrush;
- Hermit thrush;
- Lincoln sparrow;
- Chipping sparrow;

- Fox sparrow; and
- American robin.

5.5.10 Semi-Aquatic Furbearer Abundance

Semi-aquatic furbearer shoreline surveys were conducted along shorelines of select creeks, lakes, and ponds between September 29 and October 3, 2016 to provide quantitative data on the occurrence and relative abundance of semi-aquatic furbearing mammals (muskrat, mink, beaver, and otter) and to collect spatial data on the distribution within the Project and regional study areas. Signs of three target species, namely muskrat, beaver, and river otter, were observed during the survey.

5.5.11 Aerial Waterfowl and Raptor Identification and Abundance

The aerial waterfowl and raptor stick nest survey was completed across 33 survey sections containing 353 water bodies on June 15 and 16, 2017 to document the presence, diversity, and abundance of breeding waterfowl (including species at risk), as well as to identify the occurrence of active, inactive, and old raptor nests (i.e. bald eagle, osprey, and red-tailed hawk). The survey recorded 20 confirmed unique species and six species groups, for a total of 681 individual waterfowl/raptor(s). The ten most commonly observed species were:

- Ring-necked duck;
- Common merganser;
- Common loon;
- Mallard;
- White-headed gull;
- Bald eagle;
- Canada goose;
- Lesser scaup;
- Yellow legs spp; and
- Bufflehead.

A total of 24 active (currently occupied), inactive (not currently occupied), and old (dilapidated) nests were observed in the Project area during the survey. Eleven nests were active including four bald eagle nests, four osprey nests, one raven nest, one herring gull nest, and one common loon nest, as well as one mew gull colony of 12-15 nests.

5.6 Species at Risk and Sensitive Species

Wildlife resources in the regional area of the Project have been identified as being important due to their contributions to biodiversity, social and economic value, and importance to local culture. A

literature review of available wildlife information identified a number of past inventory and habitat mapping studies within the local and regional study areas, many of which contribute to understanding local animal behaviour, habitat use, and anthropogenic and biological influences.

5.6.1 Wildlife Species

The Saskatchewan Conservation Data Centre (SKCDC) were consulted to identify wildlife species that may occur in the Project area. A total of five amphibians, 219 birds, and 41 mammals potentially occur within the Project area. Of the list of vertebrates known, or with potential to occur in the Project area, thirteen sensitive or federally/provincially listed species at risk were observed. Five are listed as “threatened” or “special concern” under the Committee on the Status of Endangered Wildlife in Canada (COSEWIC), and four are listed as Schedule 1 under *Species at Risk Act* (SARA).

Table 5.1 presents the list of sensitive or federally/provincially listed species at risk observed within the Wheeler area, along with setback distances.

5.6.2 Aquatic Species

There are no observations of aquatic species (meaning wildlife that is a fish as defined in section 2 of the *Fisheries Act*) in the Project area with the status of threatened, endangered or special concern under SARA or COSEWIC.

Table 5.1: Vertebrate Sensitive or Species at Risk Observations in the Wheeler River Project Area

| Common Name | Scientific Name | Observation Source | Observation Type | Observations Per Type | Total Observations* | SK Status ¹ | COSEWIC Status ² | SARA Status ³ | SARGSS ⁴ | Setback Distance (high disturbance) ⁵ |

⁴ SARGSS: Saskatchewan Activity Restriction Guidelines for Sensitive Species (Government of Saskatchewan 2017c)

5.6.3 Plant Species

Rare vascular plant surveys were completed to identify rare vascular plant occurrence(s) within the Project local and regional study areas, as well as to provide a scientifically defensible baseline for potential follow-up/monitoring requirements. The rare plant survey was completed according to the Government of Saskatchewan (2017d) Rare Vascular Plant Survey Protocol. Alaskan clubmoss (*Diphasiastrum sitchense*), ranked as imperiled/ very rare (SK2), and three-seeded sedge (*Carex trisperma*), ranked as vulnerable/ rare to uncommon (SK3), were observed in the Project area.

5.7 Human Environment

5.7.1 Socio-Economic Context

The following is a summary of social and economic conditions, land use, communities, surface leases, disturbances, and existing infrastructure around the Project area.

The economy in northern Saskatchewan is dominated either directly or indirectly by natural resources. Economic activity is generated through commercial fishing, tourism, harvesting and sale of country foods such as mushrooms, wild rice and berries. The forestry industry is also a significant contributor to the region's economic base. That being said mineral exploration and the mining industry are by far the most dominant contributors to northern Saskatchewan's economy through direct employment, contracting of northern based businesses and the procurement of a multitude of supplies and services. The recent suspension of an operating uranium mine and mill in northern Saskatchewan resulted with layoffs of approximately 550 employees of which approximately half of those individuals were registered as northern residents.

As a remote site, there are no communities in relatively close proximity to Wheeler (Figure 3.4). Calculated using a straight line, the closest communities are approximately 150 km away in the northern settlement of Wollaston Lake and the neighbouring reserve of Lac La Hache (Table 3.2 and Figure 3.4). Travelling by existing roads the closest community to the Project is Pinehouse which is approximately 260 km away (Table 3.2).

A number of recreational leases are held, and it is assumed that cabins are used by both non-Indigenous and Indigenous people (Table 3.1). There are ten (10) recreational leases within 22 km of Wheeler. The federal lands within 150 km of Wheeler are reserve lands (Figure 3.5 and Table 3.3), none of which have permanent residences.

Ground access to Wheeler is along Highway 914; access to the highway north of Key Lake is controlled at the Cameco Key Lake gatehouse. Existing infrastructure in the area includes Highway 914, the provincial power line which is adjacent to the highway, infrastructure for Key Lake Operation, and infrastructure for McArthur River Operation (Figure 1.2). Existing disturbances are from exploration activities such as line cutting drilling and access routes.

Industrial leases in proximity to Wheeler are held for mineral exploration, power supply and road maintenance (Figure 3.2 and Table 3.1).

5.7.2 Heritage Resources

The Project footprints from the preliminary economic assessment stage were submitted to the Heritage Conservation Branch (HCB), Saskatchewan Ministry of Parks, Culture and Sport for heritage screening in 2017. It was identified that portions of the proposed infrastructure and access road options could impact hilly terrain and prominent uplands located within heritage sensitive areas. Accordingly, a Heritage Resource Impact Assessment requirement was attached to the Project, pursuant to Section 63 of *Heritage Property Act*.

A heritage resources baseline study was initiated on July 5, 2017 under Archaeological Resource Investigation, Permit 17-091. Heritage sensitive areas were assessed through a combination of pedestrian reconnaissance and visual inspection field programs, complimented by the excavation of 258 shovel probes and 5 shovel tests. The assessment identified an Artifact Find site (HiNi-6) of an unknown precontact cultural affiliation located on the western terrace of a lake adjacent to the Phoenix 2 access road option. The find was a large, grey quartzite secondary flake. At this stage in the Project design, the Phoenix 2 access road option is no longer being considered.

Upon completion of the Heritage Resources Impact Assessment, it was submitted to the HCB for review. The HCB determined that the new site was small, consisting of a single artifact so it was considered to have limited interpretative value. The HCB determined that the regulatory requirements were satisfactorily completed, and the office had no concerns regarding development occurring within the areas surveyed. An approval letter was issued to Denison by the HCB on December 14, 2017.

Denison recognizes that Project footprints (location, size) assessed in 2017 may change as the Project advances through the EIA and licensing phases. Additional heritage resource baseline studies will be undertaken, and approval will be received prior to executing future land disturbances, as required.

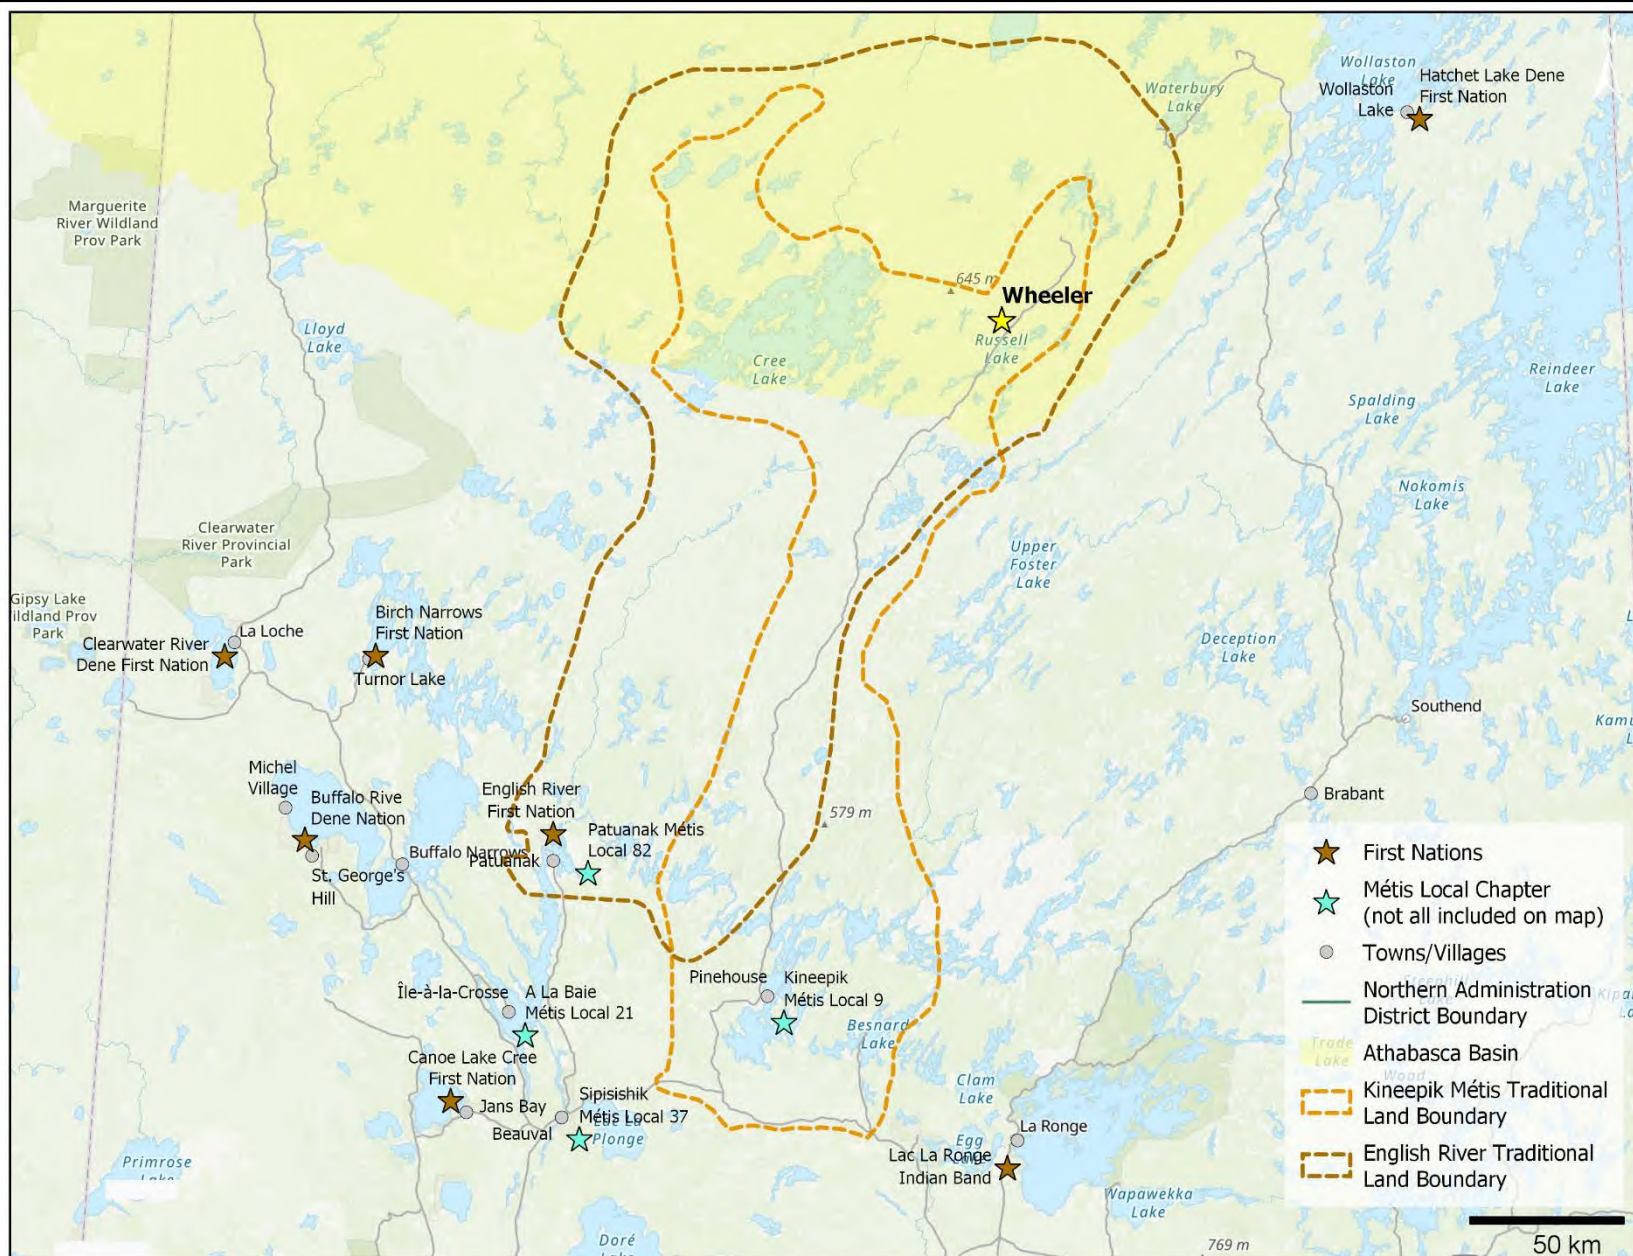

5.7.3 Current Traditional Land Use by Indigenous Communities

Wheeler is located in the Treaty 10 area (Figure 3.1) and the local and regional area surrounding the proposed Project has been claimed by four distinct Indigenous communities as partially or entirely falling within their traditional territories, where traditional land use activities have been historically or are currently practiced. These groups consist of the English River First Nation and the Kineepik, Sipishik and A La Baie Métis locals of the communities of Pinehouse, Beauval and Ile a la Crosse, respectively. Traditional territory boundaries from English River First Nation and Pinehouse Kineepik Métis are provided in Figure 5.7. These traditional land use maps were provided to Denison along with permission to use the maps.

The traditional activities practiced within the immediate and regional area of the Project consist of subsistence hunting and fishing. The immediate area also falls within the trapping block of N18, which is operated by a member of the English River First Nation (Figure 3.2 and Table 3.1).

Seasonal harvesting of native plants for food and medicinal purposes is also common throughout the regional area.

During the open water season the rivers and lakes in the area serve as transportation routes to and from areas of harvest of plants and game as well as preferred campsites and/or cabins. During the winter months the frozen lakes, river banks and muskegs are used as transportation routes to cabins, trap lines and/or preferred hunting areas.

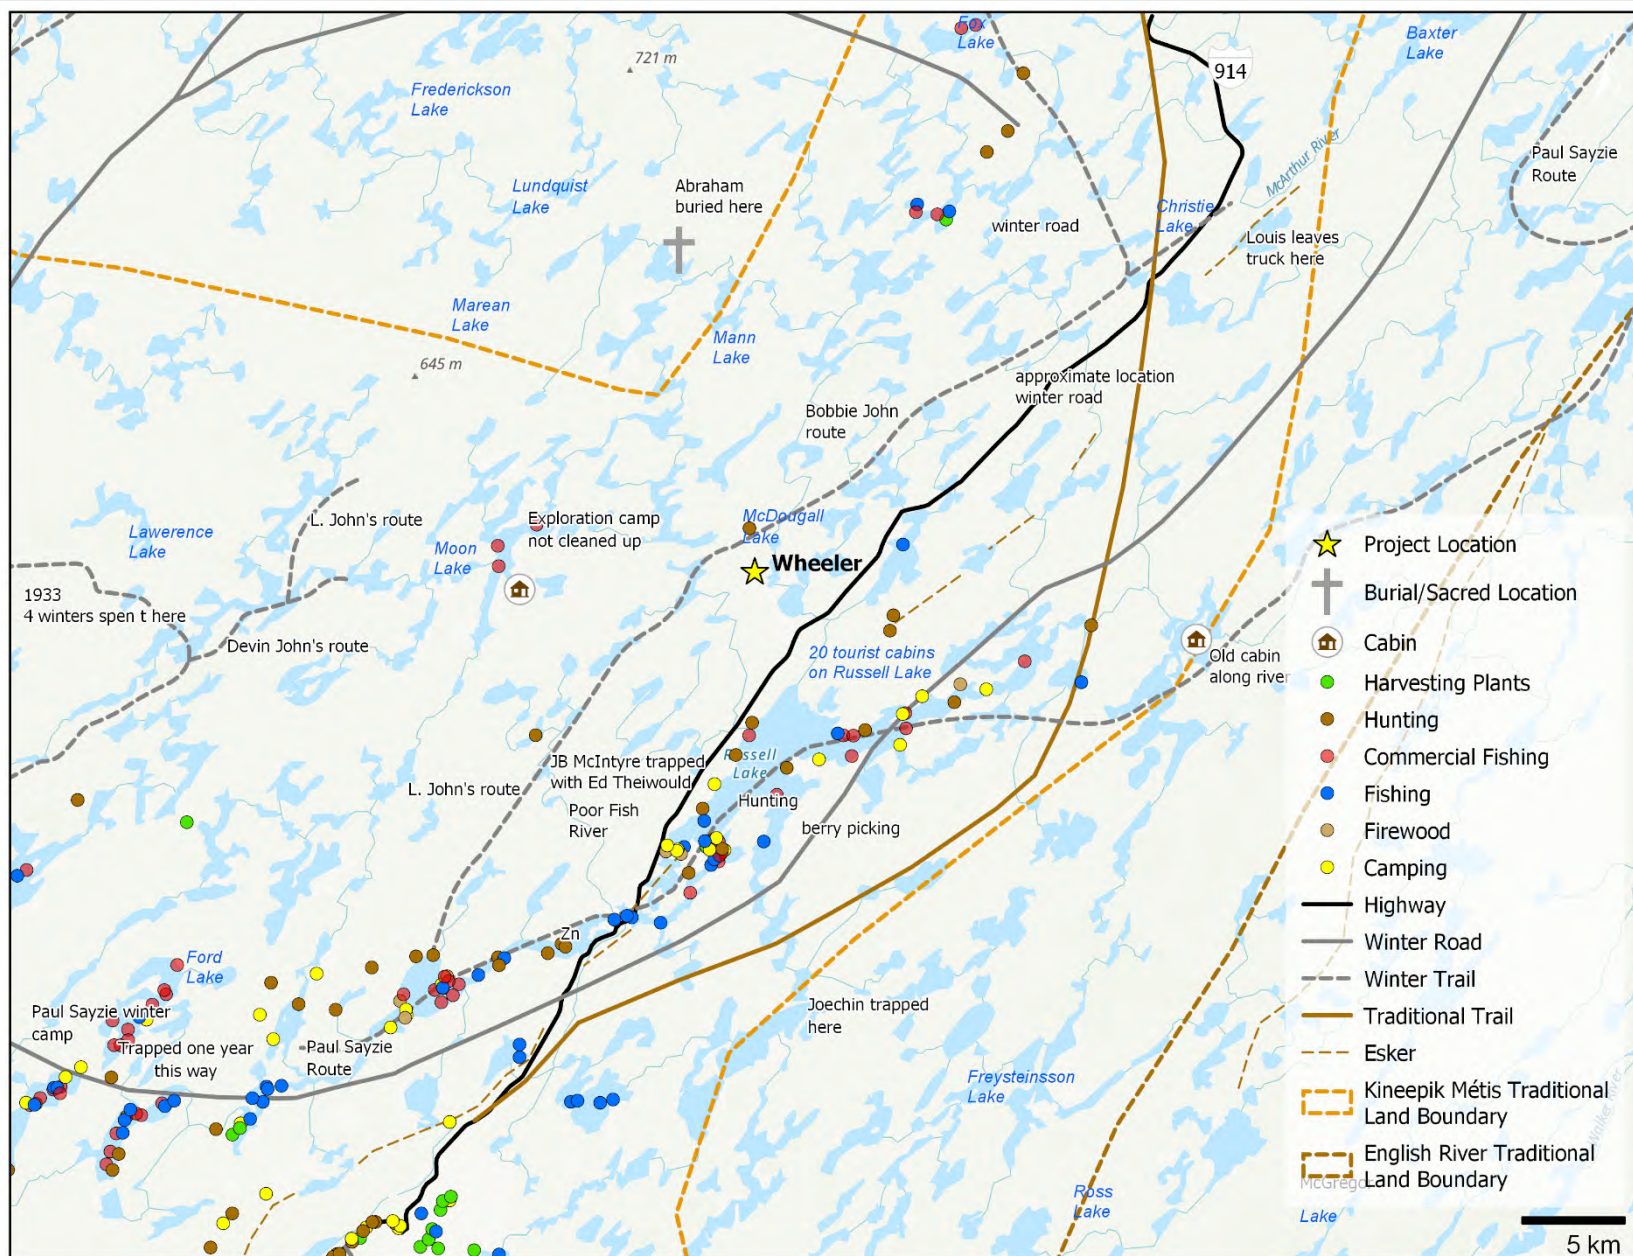

Note: Not all Indigenous traditional territories are included on the map

6 Environmental Effects

6.1 Overview of Potential Project Effects and Mitigation Measures

This section provides a brief description of changes that may be caused by the Wheeler Project and the proposed mitigations. It includes a high-level summary of potential effects during the construction, operation, decommissioning and post-decommissioning phases under normal operating conditions and potential accidents and malfunctions scenarios. General mitigation measures to minimize or eliminate potential effects are presented for the biophysical or human environment component discussed below. This evaluation is not comprehensive or final; potential effects of the Project at the site, local and regional assessment areas will be rigorously and transparently assessed and presented in the EIA following the general approach of:

- Identifying component- or activity-specific characteristics and site-specific environmental characteristics;
- Identifying both positive and negative interactions between those characteristics (Project-environment interactions) through Project pathways;
- Identifying robust mitigation measures; and
- Assessing the likelihood and significance of these interactions following application of the mitigation measures, the acceptability of these residual risks, if any, and the resulting potential effects they may have on biophysical and human environment valued components (VCs).

In addition to predictions made, monitoring programs will be developed based on results of the environmental assessment and implemented as part of the plan, do, check, act model (Section 6.3).

6.1.1 Biophysical Environment

6.1.1.1 Terrain and Geology

Changes in terrain are expected to be minor as both the footprint and volume of earthworks required for construction of the Project components are minimal. Earthworks are expected for construction of surface infrastructure such as roads, building, and the airstrip. Large volumes for cut and fill are not anticipated, and detailed designs will be tailored to minimize and balance the cut and fill needs of the Project footprint.

Due to the depth of the deposit (~400m below surface), low vertical profile of the deposit (~6-8 m on average) and the fact that the mining only removes uranium from the ground leaving virtually all other material in place, surface ground subsidence is not expected. Ground subsidence may be experienced directly above the deposit, but those effects will be localized and are expected to dissipate in a short distance. To be conservative the potential for any ground subsidence at surface during the post-decommissioning phase as a result of allowing the freeze wall to thaw will be evaluated in the EIA.

General mitigation measures to minimize or eliminate potential effects to terrain and geology:

- Design Project to minimize footprint, and incrementally reclaim where possible;
- Design Project to minimize cut and fill volumes for surface facilities;
- Include freeze wall to provide geotechnical stability during mining;
- Assess the potential for subsidence post-mining and monitor the geochemical and geotechnical conditions within the mine chamber during the decommissioning phase; and
- Evaluate options to backfill the mining area if subsidence during the post-decommissioning is identified.

6.1.1.2 Hydrogeology

Groundwater quality within the mining chamber is expected to change as a result of direct contact with the mining solution during operations. This effect will be localized and groundwater in the mining chamber will be remediated during decommissioning before the freeze wall is allowed to thaw.

Mining solution and uranium rich mining solution may enter groundwater outside of the mining chamber via accidents or malfunctions. Examples of types of accidents and malfunctions could be: well damage and release outside of the mining chamber, groundwater contamination from surface through spills at the pumphouses or leaks along the pipelines. However, all flows within the ISR mining system from the processing plant to the mining chamber are metered and monitored for pressure losses which will allow for early identification of leaks in wells and along pipelines throughout the entire closed circuit. Wells and pipelines will be designed with secondary containment (or equivalent protections) and leak detection monitors. The monitoring and safeguards put in place will allow for the stoppage of any leaks quickly by turning off wells or reversing flows at select wells within the wellfield, thereby minimizing any effects on groundwater quality. If required, Denison will be able to drill additional wells into any potentially contaminated areas for recovery of the mining solution back to surface. Denison will develop emergency response plans to prevent and clean-up surface spills. In addition, groundwater monitoring wells will be established at key locations within and outside of the wellfield to monitor for any changes in groundwater quality.

Groundwater quality may be changed by discharge of treated effluent into the groundwater environment. Options and potential effects associated with potential discharge of treated effluent into groundwater via deep well injection will be thoroughly examined in the EIA.

Groundwater quality may also be changed by accidents and malfunctions related to: spills or leaks from waste pads and ponds, spills of hazardous substances including reagents and fuels, leaks from water treatment plant ponds, and leaching from the landfill. During normal operating conditions, Denison expects these interactions will be fully mitigated through appropriate Project design (e.g., waste pad will be double lined with leak detection capabilities; hazardous substances stored

in approved storage areas with secondary containment as required) and implementation of management plans (e.g. material sorting for items destined for onsite landfill, hazardous waste handling and storage). Groundwater monitoring wells will be established near the processing plant terrace, landfill, and fuel and hazardous waste storage area to allow for detection of any changes in groundwater quality.

While the freeze wall is in place, groundwater flow will be changed at the site level (e.g., immediately surrounding the mining chamber) as groundwater within and outside of the freeze wall will not be able to interact. This will be reversed post-decommissioning once the mining chamber has been remediated and the freeze wall is allowed to thaw. Potential changes in site and local groundwater flow regime will be evaluated as part of the hydrogeological model in the EIA.

Given our understanding of the extent of the hydrogeological environment in the site, local and regional Project areas we do not expect any aspect of the Project will influence groundwater quantity. However, the influence of the wellfield and the in situ recovery mining method on groundwater quantity will be examined and assessed as part of the hydrogeological assessment in the EIA. The assessment will include the potential for localized drawdown in groundwater outside of the mining chamber. Groundwater withdrawal for the fresh water distribution system (fire water system, the potable WTP, the processing plant and the wash bay) will also be evaluated for any potential changes on groundwater quantity. Groundwater monitoring wells will be established at key locations within and outside of the wellfield to monitor any changes in groundwater levels.

General mitigation measures to minimize or eliminate potential effects to the hydrogeological environment:

- Establish freeze wall before mining operations to create the mining chamber, effectively isolating the area with mining solution (area inside the mining chamber) from the surrounding groundwater environment;
- Design injection and recovery wells to have secondary containment, or adequate containment (e.g. cementing the annulus of injection and recovery wells);
- Recognize option to drill additional wells in order to recover mining solution excursions;
- Design pipelines to have secondary containment or catchment;
- Have leak detection in place for wells and pipelines;
- Remediate groundwater in mining chamber as part of decommissioning;
- Have appropriately designed and monitored storage areas for waste, reagents, and hazardous substances; and
- Design processing plant to allow for collection of any spills.

6.1.1.3 Atmospheric and Acoustic Environment

There is potential for radon and radon progeny degassing from uranium rich mining solution in the wellfield components (i.e., injection and recovery wells, pumphouses, pipelines) and in the

processing plant. Ventilation will be designed to provide sufficient worker protection and monitoring systems will be in place to ensure worker health and safety. Discharge into atmosphere should provide sufficient dilution, although modelling for EIA will indicate if other mitigations are required.

The processing plant exhaust, mainly from drying and packaging areas, will be directed through a stack and released outside of the building. The stack height will be designed based on results of air dispersion modelling to be an appropriate height for optimal dispersion. If the modelling suggests the need, scrubbers will be installed to control atmospheric emissions. Best available technology, with respect to workplace cleanliness will be implemented inside the processing plant in order to reduce radiological exposures. Denison anticipates stack monitoring, ambient radon monitoring and high-volume air to confirm EIA predictions with respect to calculated source terms and dispersion modelling results.

Fugitive dust from access roads, the airstrip and the clean waste rock pile have potential to locally impact vegetation and soil and therefore wildlife habitat. This will be considered as a physical effect of clean dust in the terrestrial environment section of the EIA; elevated metal and radionuclides are not expected at either roads due to the mining method selected or the clean waste rock pile due to sorting of drill cuttings during wellfield development. The need for dust control will be evaluated based on results of modelling predictions results documented in the EIA. These predictions will be calibrated with dustfall or high-volume monitoring during operations and if necessary additional mitigations measures will be implemented.

Dust from material on the waste pad has the potential to contain metals and radionuclides. The pile will be managed to minimize dust and fugitive dust leaving the pad will be monitored. If necessary, dust control mitigation will be implemented. The current plan is to pack precipitate waste or impurities from the processing plant in tote bags that are then placed on the pad, providing an additional level of containment, eliminating dust from this source and reducing potential volumes of contaminated contact water. Options for disposal of the material on the waste pad (mineralized waste rock, precipitates, and water treatment plant solids) will be evaluated in the EIA.

By tying into the provincial power grid and the nearby Island Falls hydroelectric station, greenhouse gases (GHGs) emissions associated with the Project will be minimized. GHGs are expected from operation of back-up diesel generators, vehicles, drill rigs, and exhaust from propane use in the kitchen and camp for heating. Selection of high-quality, low emissions equipment and regular maintenance will help reduce emissions of GHGs. Denison will examine options to further reduce GHG emissions by using alternate emergency generators, electric vehicles, an electric drill rig for wellfield development, and electrical heat in buildings. Denison will assess greenhouse gas emissions and evaluate their significance in the EIA. This will include evaluating whether the Project is a large GHG emitter, or not. Emissions of NO_x, SO_x, and particulate matter will be evaluated in the EIA as a potential input into the human health and ecological risk assessment (HHERA).

Denison plans to operate an incinerator to dispose of food waste. It is expected that selection of an appropriate incinerator will have design components to mitigate emissions to air. Correct operation and regular maintenance of the incinerator will be important to achieve the design parameters and procedures will be in place to achieve this. If required, the exhaust from the incinerator will be examined as part to the air dispersion modelling.

Compared to traditional uranium mining operations in Canada, the Wheeler noise levels are expected to be low. The main sources of noise will be related to transport of people and goods to and from the site via air and land, drilling of holes for the freeze wall and wellfield, operation of the batch plant, operation of the processing plant, and operation of the pumphouses. Selection of high-quality, low sound emission equipment and regular maintenance will help reduce noise associated with Project activities. Denison will examine options to further reduce noise emissions by using electric vehicles and an electric drill rig for wellfield development. Sensory disturbances to wildlife will be examined as required in the terrestrial section of the EIA.

Overall, Denison anticipates that air emissions and noise from Project activities will dissipate very rapidly to background levels within a few hundred metres from the source.

General mitigation measures to minimize or eliminate potential effects to the atmospheric and acoustic environments:

- Implement a waste rock segregation plan;
- Provide dust control along roads and at the airstrip as required;
- Install scrubbers in stacks and incinerator, as necessary;
- Tie into provincial power grid and hydroelectric station at Island Falls as the main way to minimize GHG emissions;
- Evaluate electric vehicles, electric drill rigs and electric heating in buildings to further minimize greenhouse gas emissions;
- Select and purchase equipment to minimize emissions to air and noise generation;
- Follow operating procedures for equipment;
- Conduct regular maintenance of equipment;
- Develop methods for minimizing radon exposure from the venting of wells, pumphouses or anywhere that there is a potential for the degassing of radon in the system; and
- Evaluate options to reduce noise emissions by using electric vehicles and an electric drill rig for wellfield development.

6.1.1.4 Aquatic Environment

Changes in water quality will be examined through various pathways including: discharge of treated effluent, discharge from the clean waste rock pond, potential for contaminated groundwater to affect surface water bodies, construction and maintenance of water crossings, and any on land

activities near water bodies. Changes in water quality have the potential to affect other components of the aquatic environment including sediment, benthic invertebrates, plankton, and fish. The discharge of treated effluent to a surface water body is expected to be the main Project interaction with water, sediment, and aquatic biota.

The Project may be subject to the Metal and Diamond Mining Effluent Regulations (depending on the volume of treated effluent discharge) which outline requirements for effluent monitoring, effluent discharge limits, and biological effects monitoring program in the receiving environment. Details on expected treated effluent quality and volumes will be presented in the EIA. Based on the current Project design with a focus on water recycle in the processing plant and the minimal discharge volumes to surface water, downstream impacts are considered unlikely outside of the local study area. This includes water and sediment quality, changes in benthic invertebrate, plankton, and fish communities, and benthic invertebrate tissue chemistry and fish tissue chemistry. A thorough evaluation of the potential effects of treated effluent in the receiving environment will be completed as part of fate and transport modelling in the EIA. This is an exercise to predict water and sediment quality at locations downstream of the treated effluent discharge point. The results of the water and sediment modelling will be used to predict effects on benthic invertebrates, plankton, fish, semi-aquatic VCs, terrestrial VCs and humans as part of the HHERA.

Changes in certain components of the aquatic environment (e.g., surface water quality, benthic invertebrate communities, fish populations, etc.) may result from accidents and malfunctions related to spills or leaks from pipelines, processing plant, waste pads, ponds, and hazardous substance storage area. During normal operating conditions, Denison expects these interactions will be fully mitigated through integration of best available technology in the Project design (e.g., leak detection and secondary containment along pipelines; hazardous substances stored in approved storage areas with secondary containment as required) and implementation of various management programs, standard operating procedures and monitoring plans (e.g. material sorting for items destined for onsite landfill, hazardous waste handling and storage).

Potential changes in water quantity as measured by water level and flows will be examined through various pathways including: discharge of treated effluent, discharge from the clean waste rock pond, withdrawals for the fresh water distribution system (fire water system, the potable WTP, the processing plant and the wash bay), recharge of groundwater to surface water bodies, possible drawdown from mining activities, and construction and maintenance of water crossings. All interactions are anticipated to be minor as water intake and output volumes are low relative to the baseline flows in the Project drainage areas. Any changes in local drainage around the site due to infrastructure are expected to be minimal and have negligible effects on site and local study area flows and water levels. Flows are not expected to change at the proposed water crossings as the crossing types will be selected, designed and constructed to avoid causing harm to fish and fish habitat. All potential changes in water levels and flow will be examined as part of the hydrological assessment in the EIA.

Potential effects on fish and fish habitat from in-water works and activities near water are expected to be minor and may be managed by following the Department of Fisheries and Oceans Canada's (DFO's) measures to avoid and mitigate impacts to fish and fish habitat into Project planning and implementation. Two water crossings will be required along the road from the site to the airstrip. The crossing types will be selected and designed to avoid causing harm to fish and fish habitat. Installation of a water intake and a treated effluent discharge pipeline will require in-water works which will be done following best management practices and incorporate measures to avoid causing harm to fish and fish habitat. The water intake will be screened to prevent entrainment of fish and the treated effluent release point will be designed to reduce erosion. A 100 m buffer zone will be established along the shoreline of fish bearing water bodies for working near water, where possible, and best management practices such as erosion and sediment control measures will be implemented. Denison does not expect any Project activities will require a *Fisheries Act* Authorization from DFO. As such, Project review for effects to fish and fish habitat will be conducted by the CNSC as per the MOU between the CNSC and DFO (dated December 16, 2013).

General mitigation measures to minimize or eliminate potential effects to the aquatic environment:

- Minimize volume of treated effluent discharge to the environment by recycling mining solution in the processing plant;
- Design water treatment plant to produce treated effluent which meets or is lower than regulatory discharge requirements;
- Design water intake to avoid fish entrainment;
- Design treated effluent release point to reduce erosion;
- Design and monitor storage areas for waste and hazardous substances;
- Design pipelines to have secondary containment or catchment;
- Design surface facilities to allow for the collection of spills;
- Design and construct water crossings to avoid causing harm to fish and fish habitat;
- Follow best management practices for working in and near water; and
- Develop a robust emergency response plan to minimize the impacts of accidents and malfunctions.

6.1.1.5 Terrestrial Environment

Site preparation and construction will involve ground clearing for all facilities including the roads, processing plant area, wellfield, waste pads and ponds, water treatment plant ponds, and support building such as the camp and operations centre. Best management practices will be followed such as completing all site preparation activities outside of the breeding bird season (and or pre-clearing the area outside of breeding periods), maintaining set-backs from water and saving brush for reclamation. Some of the site and local study areas to be cleared have already been disturbed and/or cleared as a result of exploration activities which will help minimize new disturbance.

Construction and operation of the Project will result in a small loss of soil, vegetation and wildlife habitat in the site and local study areas. However, following decommissioning and reclamation, soil, vegetation and wildlife habitat are expected to recover to baseline conditions. During operations progressive reclamation activities will be completed where possible and the progress and success of these activities will be assessed annually.

Project interactions with wildlife may include direct effects (i.e., potential for wildlife-vehicle collisions) and indirect effects such as changes in movement in response to activity and noise. Woodland caribou are of particular interest due to their conservation status (COSEWIC and SARA status of threatened). Mitigation measures to reduce Project footprints, minimize habitat disturbance, and minimize noise will contribute to reducing potential effects of the Project on woodland caribou in the site, local and regional study areas. A Woodland Caribou Management Plan consistent with the management goals of SK-1 zone will be developed as part of the EIA and will assess the needs for habitat offsets.

Migratory birds are present in the Project area. The main potential interaction of the Project with migratory birds is expected to be site clearing activities (primarily during construction) with breeding times for migratory birds. The Project will be designed and planned to avoid disruption of migratory birds' nests and eggs.

The primary pathways for contaminants to interact with terrestrial wildlife includes release of treated effluent and release of contaminated dust. The potential for radiological and non-radiological contaminants to affect the health of terrestrial wildlife will be evaluated in the EIA as part of the HHERA.

Changes in certain components of the terrestrial environment such as soil quality and vegetation quality may result from accidents and malfunctions related to spills or leaks from pipelines, processing plant, waste pad, ponds, and hazardous substances. During normal operating conditions, Denison expects these interactions will be fully mitigated through appropriate Project design (e.g., leak detection and secondary containment along pipelines; hazardous substances stored in approved storage areas with secondary containment as required) and implementation of various management programs and plans (e.g. material sorting for items destined for onsite landfill, hazardous waste handling and storage, a site emergency response plan).

General mitigation measures to minimize or eliminate potential effects to the terrestrial environment:

- Design Project to minimize disturbance of terrestrial habitat;
- Stockpile brush when possible to use in reclamation;
- Complete ongoing decommissioning when possible;
- Design surface pipelines to have secondary containment or catchment;
- Have leak detection systems in place at key locations;

- Develop a caribou management plan and evaluate the need for caribou habitat offsets in the EIA; and
- Design and plan Project activities to avoid disruption of migratory birds' nests and eggs.

6.1.2 Human Environment

6.1.2.1 Worker Health and Safety

Worker health and safety will be evaluated for both conventional health and safety and radiological health and safety. Worker exposure to non-radiological and radiological elements will be evaluated as part of the HHERA in the EIA.

The main conventional health and safety concerns will be working with hazardous substances such as reagents used throughout the ISR mining and uranium extraction processes as well as fuels, lubricants and greases common to an industrial operation. Denison will have a comprehensive health and safety program in place that meets the requirements of both the federal and provincial governments in order to protect workers and to minimize the potential for conventional health and safety incidents.

With respect to radiation protection, there is the potential for worker exposure to radon and radon progeny degassing from uranium rich mining solution in the wellfield components and in the processing plant. Ventilation will be designed with the ALARA principle (as low as reasonably achievable) in mind to provide sufficient worker protection. Monitoring systems will be in place to ensure these mitigation measures are meeting design specifications. Dust control and good housekeeping practices throughout the plant will also form a critical component of the Radiation Protection Management Plan developed for the Project. Radiological exposures will stay under regulatory limits and keeping with the ALARA principal every effort will be made to maintain all exposures below all licenced action levels. The EIA will present an assessment of potential worker dose and quantify the likely range of doses.

The proposed location for the camp facilities was selected to be upwind of the processing plant, waste pile, and other main sources of contaminants to air.

General mitigation measures to minimize or eliminate potential effects to Worker Health and Safety:

- A radiation protection program derived from a robust radiation exposure assessment;
- An occupational health and safety program;
- Programs for any area deemed critical to safety or in the core CNSC safety assessment areas;
- Clear separation of clean and potentially contaminated areas on site for equipment and personnel;
- Appropriate monitoring and reporting;
- Design pumphouses and processing plant to have proper ventilation; and
- Design Project layout to have office and camp upwind of processing plant.

6.1.2.2 Traditional Land Use

The construction and operation phases of Wheeler may positively or negatively change access for any Indigenous or other resource users in the site and local study areas. There are no potential effects expected from the Project at the regional study area. Denison has integrated traditional knowledge provided by several Indigenous groups practicing traditional land use in the regional and local areas in the early design stages of the Project (refer to Section 8.2.1.2). This practice will continue throughout the EIA and all components of the Project will be assessed in an effort to limit or eliminate effects of the Project on traditional land use. One of the principle decommissioning and reclamation objectives will be to reclaim the site and local study areas to a self-sustaining natural environment capable of supporting pre-mining land use. Successfully meeting this decommissioning and reclamation objective will allow for traditional land use in the site, local and regional study area to continue throughout the post decommissioning and reclamation phase of the Project.

General mitigation measures to minimize or eliminate potential effects to Traditional Land Use:

- Continue engagement with Indigenous groups currently practicing traditional land use activities in the Project area throughout the EIA, feasibility and detailed design stages;
- Identify and incorporate any mitigation or accommodation measures obtained during engagement with Indigenous groups currently practicing traditional land use activities in the Project area;
- Implement Caribou and other Wildlife Management Plans, which will limit or eliminate harvesting of fish and game throughout the construction, operation and decommissioning and reclamation phases of the Project by Project staff;
- Ensure the design and construction of all water crossings over navigable waters are constructed in a manner that does not impede the use of these water courses as a means of transportation for traditional users;
- Ensure the implementation of monitoring programs for all three study areas and present the results of these monitoring programs to key Indigenous groups on regular intervals, demonstrating the environmental protection management plans being implemented are meeting their objectives;
- Design and implement a decommissioning and reclamation plan that incorporates best management practices; and
- Design Project with minimal footprint.

6.1.2.3 Heritage Resources

It is expected that effects on heritage resources will be mitigated through the completion of heritage resource impact assessments and avoidance of any known heritage resources. Procedures will be in place to appropriately respond to any unanticipated heritage resource encounters. These

unanticipated encounters would primarily be expected during site clearing and construction activities.

General mitigation measures to minimize or eliminate potential effects to heritage resources:

- Complete heritage surveys and avoid areas with known resources;
- Submit results of heritage resource impact assessments to Heritage Conservation Branch for review;
- Develop and implement a Heritage Resource Management Plan for the construction and operating phases of Wheeler in accordance with Saskatchewan's *Heritage Property Act*;
- Obtain Indigenous feedback on and incorporate feedback into the Heritage Resource Management Plan; and
- Design Project with minimal footprint.

6.1.2.4 Members of the Public

Exposure to non-radiological and radiological elements for members of the public will be evaluated as part of the HHERA in the EIA. Based on the Project design, Denison anticipated any effects on members of the public will be fully mitigated.

Releases to the environment will be controlled and monitored by the effluent, emissions and environmental monitoring program. Results of these monitoring and control activities will be used to validate results of the HHERA for dose and exposure to members of the public.

6.1.2.5 Socio-Economics

It is expected that the Project will provide a net positive socio-economic effect. This effect will be realized at national, provincial and local northern community levels. All of these socio-economic benefits will be assessed as part of the EIA.

Briefly, the Project will contribute to the national and provincial economies through taxes and royalties as well as through out of province employment generated through downstream processing and transportation requirements of the Wheeler final product. In addition, socially the Project will contribute a significant supply of GHG free energy, in a GHG friendly manner, supporting Canada and Saskatchewan's commitment to addressing global climate change.

The Project itself will generate significant employment and business opportunities throughout all four phases of the operation: construction, operation, decommissioning and post-decommissioning.

In line with Denison's MOUs, direct and indirect employment opportunities as well as business development opportunities will preferentially target individuals and businesses residing in and based in northern Saskatchewan, respectively. Denison is also committed to support education and training opportunities as well as community investment within local northern and Indigenous

communities. Progress on all of these commitments is currently being realized in northern and Indigenous communities and will continue throughout all phases of the Project. The existing commitments and future commitments will be evaluated as part of the EIA.

Denison is an equal opportunity employer and has established strong policies against harassment in the workplace and unlawful discrimination. Denison will continue to work with regulatory agencies, government and communities to reduce employment barriers for all people.

There is currently no tourism land use documented on the site or local study area. However, there is tourism use documented within the regional study area. There are no effects anticipated from the Project that would impact tourism in the regional study area. However, this will be assessed as part of the EIA under the socio-economic aspects of the Project.

General mitigation measures to minimize or eliminate potential negative effects and continue the growth of socio-economic benefits associated with the Project:

- Continue Denison's Indigenous and non-Indigenous engagement program;
- Continue to fulfill commitments outlined in Denison's existing MOUs with Indigenous groups and communities;
- Continue employment practices and efforts to reduce employment barriers for all people;
- Involve and inform representatives of the tourism industry active in the regional study area as part of the ongoing implementation of the engagement program;
- Ensure the implementation of monitoring programs for site, local and regional study areas and present the results of these monitoring programs to regulatory agencies, Indigenous groups and members of the public on regular intervals, demonstrating the environmental protection management plans being implemented are meeting their objectives; and
- Design Project with minimal footprint.

6.1.2.6 Indigenous Peoples

It is anticipated that Wheeler will have a net positive effect on the Indigenous peoples of northern Saskatchewan. Many of these effects have been discussed above, in Sections 6.1.2.1 through Section 6.1.2.5. However, Denison believes they have an additional obligation to the Indigenous peoples who assert claim of the site, local and regional study area as being part of their traditional territory.

The ongoing implementation of the Indigenous engagement program (Section 8.2) will help to identify programs that can be developed within the spirit of the objectives of Denison's existing MOUs with northern and Indigenous groups. These programs will be included as part of the socio-economic aspects of the Project's EIA.

Denison has already engaged with Indigenous peoples to obtain and incorporate feedback directly into the Project designs (refer to Section 8.2.1.2). Denison intends to continue this process to help

minimize impacts through design. Denison intends to continue to engage Indigenous groups on any of the Project's potential impacts to their potential or established Indigenous and/or treaty rights. Engagement efforts will continue as the Project advances and additional conversations will be held once potential Project effects are more thoroughly understood and assessed as part of the EIA process.

As part of ongoing engagement and the EIA process, Denison can review cultural programs in place at other mine sites and brainstorm with Indigenous groups to identify effective cultural support programs that could be implemented at Wheeler.

Examples of additional programs that could be assessed as part of the EIA are:

- Employ Elders at site throughout the construction, operation and decommissioning phases of the program to provide cultural support to Indigenous employees;
- Initiate cultural awareness training for employees periodically throughout the construction and operational phases of the Project; and
- Work with Saskatchewan's northern medical health office to initiate additional programs that may not be currently easily accessed in remote communities. These programs could be made available at site to the Project's work force to encourage wellness and healthy lifestyle choices.

6.1.3 Summary of Environmental Effects under CEAA 2012

This section provides a summary of information presented in Section 6.1.1 and Section 6.1.2 in order to clearly address the requirements of CEAA 2012, s. 5(1).

6.1.3.1 Fish and Fish Habitat

There is potential for contaminants in water to affect fish health and fish communities. The two main pathways for contaminants to enter fish bearing water bodies are anticipated to be 1) release of treated effluent and 2) spills or leaks of hazardous substances.

The volume of treated effluent (if any) is expected to be minimal with maximum water recycle in the processing plant. In addition, the quality of the effluent will meet or be lower than regulatory limits designed to protect the aquatic environment. This will be fully evaluated as part of the HHERA in the EIA.

Through Project design, best management practices, monitoring, and development of a robust emergency response plan, it is anticipated that the potential for accidents and malfunctions will be minimized.

Potential effects on fish and fish habitat from in-water works and activities near water are expected to be minor and can be mitigated by following the Department of Fisheries and Oceans Canada's (DFO's) measures to avoid and mitigate impacts to fish and fish habitat. The design and installation of any in-water Project components such as water crossings, a water intake, and a treated effluent discharge pipeline and release point will incorporate measures to avoid causing harm to fish and

fish habitat. Work near the shoreline of fish bearing water bodies will be avoided where possible and all work will follow best management practices such as erosion and sediment control.

Denison does not expect any Project activities will require a *Fisheries Act* Authorization from DFO. As such, Project review for effects to fish and fish habitat will be conducted by the CNSC as per the MOU between the CNSC and DFO (dated December 16, 2013).

Based on the above, no significant impacts to fish or fish habitat (as defined in subsection 2(1) of the *Fisheries Act*) are expected from Project activities.

6.1.3.2 Aquatic Species

There are no observations of aquatic species (meaning wildlife that is a fish as defined in section 2 of the *Fisheries Act*) in the Project area with the status of threatened, endangered or special concern under SARA or COSEWIC.

6.1.3.3 Migratory Birds

Migratory birds as defined in the Migratory Birds Convention Act are present in the Project area. The main potential interaction of the Project with migratory birds is expected to be site clearing activities (primarily during construction) with breeding times for migratory birds. The Project will be designed and executed to avoid disruption of migratory birds' nests and eggs. This may involve pre-clearing Project footprints outside of breeding periods.

6.1.3.4 Changes to the Environment on Federal Lands, in a Province other than Saskatchewan, or outside Canada

Denison does not anticipate any changes to the environment on federal lands, in a province other than Saskatchewan, or outside Canada as a result of construction, operation and decommissioning of Wheeler. Potential effects of the Project are expected to be limited to the VC-specific local study areas. No impacts outside of the province of Saskatchewan are expected.

The nearest federal land is 16 km away (Table 3.3 and Figure 3.5). This is reserve land registered to English River First Nation which currently and has no permanent residences.

Any potential changes to the environment on federal lands, outside of Saskatchewan or Canada will be fully evaluated in the EIA.

6.1.3.5 Effects on Indigenous People

Health and Socio-economic Conditions

Exposure to non-radiological and radiological elements for members of the public will be evaluated as part of the HHRA in the EIA. Based on the Project design, Denison anticipated any effects on members of the public will be fully mitigated.

Denison anticipates a net positive socio-economic effect on Indigenous peoples. In line with Denison's MOUs with Indigenous groups, direct and indirect employment opportunities as well as

business development opportunities will preferentially target individuals and businesses residing in and based in northern Saskatchewan, respectively. Denison is also committed to support education and training opportunities as well as community investment within local northern and Indigenous communities.

Physical and Cultural Heritage

Based on traditional knowledge shared with Denison to date, physical areas of cultural importance have not been identified in the Project local study area. Protection of cultural heritage will be incorporated into potential initiatives such as cultural awareness training to employees and employing Elders at site throughout the construction, operation and decommissioning phases of the Project to provide cultural support to Indigenous employees.

Current use of lands and resources for traditional purposes:

Denison has integrated Indigenous knowledge provided by several Indigenous groups practicing traditional land use in the regional area in the early design stages of the Project (refer to Section 8.2.1.2). This practice will continue throughout the EIA and all components of the Project will be assessed in an effort to limit or eliminate effects of the Project on traditional land use.

Traditional land users in the Project area could be affected by restricted access to the site for hunting and fishing during construction and operation; however, following decommissioning, access to the site and resources harvesting will be fully restored. Denison intends to continue to engage Indigenous groups on any of the Project's potential impacts to their potential or established Indigenous and/or treaty rights. Denison will also identify and incorporate any mitigation or accommodation measures obtained from engagement activities. Engagement efforts will continue as the Project advances and additional conversations will be held once potential Project effects are more thoroughly understood and assessed as part of the EIA process.

Any structure, site or thing that is of historical, archaeological, paleontological or architectural significance:

Based on knowledge of the existing environment, Project effects on any structure, site or thing that is of historical, archaeological, paleontological or architectural significance are not expected.

Denison is committed to completing heritage surveys for all Project footprints and avoiding areas with known resources. Denison will also develop and implement a Heritage Resource Management Plan which will outline steps to be taken should an unexpected artifact be encountered. Denison is committed to obtaining Indigenous feedback on and participation with the Heritage Resource Management Plan.

6.1.4 Conclusions

The selection of ISR results in a uranium mining and milling Project with no tailings, a relatively small footprint, minimal volumes of clean waste rock, minimal volumes of waste rock, minimal

generation of other contaminated wastes, and limited water treatment and discharge. Wheeler will be designed to contain potential contaminants and careful consideration will be taken to ensure contaminated areas are kept separate from non-contaminated areas.

Groundwater quality will be a main focus in the EIA in order to fully describe the potential range of effects of any leaks or spills of mining solution to the area outside of the mining chamber. Planning for mining chamber restoration at the end of operations provides confidence that protection of groundwater quality will be a primary focus for decommissioning. Denison anticipates that air emissions and noise from Project activities will dissipate very rapidly to background levels within a few hundred metres from the source. Aquatic effects are expected to be low as the Project will minimize volumes of treated effluent through water recycling in the processing plant. Effects on fish and fish habitat are expected to be avoided and mitigated and it is anticipated that a *Fisheries Act* Authorization will not be required. Disturbance of terrestrial habitat will be minimized to the extent possible; progressive reclamation will be practiced throughout operations and a robust decommissioning and reclamation plan will be implemented following the operations phase of the Project. Potential Project effects on woodland caribou will be carefully considered in the EIA. A Caribou Management Plan will be developed and the need for any caribou habitat offsets will be presented in the EIA. Worker health and safety is of the utmost importance and effects on members of the public are not expected. Any effects on traditional land use will be limited to the site and local study areas and these effects will be short term limited to the construction and operating phase of the Project. No effects on traditional land use will occur in the regional study area. Wheeler is expected to provide a net positive effect on socio-economics throughout all levels of the Canadian economy with the most significant positive impact being realized by the Project's local Indigenous and non-Indigenous communities through direct employment and business opportunities. Wheeler can be decommissioned and reclaimed to meet decommissioning objectives resulting in a site that is safe and stable where traditional land use activities may be freely conducted. The site is expected to be accepted into the provincial Institutional Control Program or possibly released back into the Crown land inventory within five years following final decommissioning and reclamation.

In the EIA Denison will demonstrate that the Wheeler Project can be constructed, operated, and decommissioned with no significant adverse effects on the biophysical and human environments. An HHERA will be performed as part of the EIA to demonstrate the overall low impacts of the Project. The preliminary EIA results will be provided for discussion and feedback with local Indigenous and non-Indigenous communities as part of Denison's ongoing engagement activities.

6.2 Cumulative Effects

For the purposes of a cumulative effects assessment, the Project's net environmental effects (i.e. after mitigation) are assessed in combination with the environmental effects of past activities, existing projects and projects or activities that can be reasonably predicted to occur in the region. A

cumulative effects assessment is required in both the federal and provincial environmental assessment processes. Denison commits to including an assessment of how other developments or activities in the area may impact the proposed development, its potential impacts on Valued Components (VCs), and whether they contribute to any cumulative environmental impacts. This will take the form of a cumulative environmental effects assessment as part of the description of Project impacts and mitigations that describes the net cumulative impact of the Project. The assessment would also include an assessment of potential impacts due to reasonable emergency or upset conditions.

Potential cumulative impacts will be identified in the assessment of potential Project impacts during baseline environmental work, subsequent analysis and pathways modelling. This will include an examination of any potential cumulative effects identified in the consultation and engagement processes. The potential impacts will be assessed against proposed mitigations to determine if there is any residual risk. Should the residual risk remain high, different mitigations may be necessary.

Wheeler lies within the eastern Athabasca Basin between two existing uranium operations; Cameco's McArthur River mine, and the Key Lake mill and tailings management facility where ore from the McArthur River mine is processed. The Project would also utilize the existing Highway 914, which includes the haul road between McArthur River and Key Lake. There are considerable amounts of information available for use in a cumulative effects assessment, including, but not limited to:

1. Existing site baseline and monitoring data, including any modelling;
2. Baseline and project information from previous EIAs;
3. Government monitoring information;
4. Monitoring data available from uranium projects in the area (i.e. annual monitoring reports; Environmental Performance Reports);
5. Regional monitoring studies, such as the Northern Mines Monitoring Secretariat program with the Northern Saskatchewan Environmental Quality Committee;
6. Eastern Athabasca Regional Monitoring Program;
7. Community monitoring programs in the Athabasca funded by the companies; and
8. State of the Environment reports and CNSC independent third-party reviews of environmental performance at existing uranium operations.

This information combined with the Project specific baseline and pathways modelling should allow for a sufficient cumulative effects assessment. The main areas with potential to generate cumulative effects are due to:

1. Any effluent discharge, as Wheeler will share a watershed with the Key Lake Operation, and possibly Millennium project;

2. Overlap of air emissions with other projects;
3. Vehicle traffic to and from the site. This will include shipments of supplies, construction materials, reagents and fuel to the site, and shipments of uranium and recyclables from the site to the south;
4. Habitat disturbance for operations and ancillary facilities, including any access road. This may have an impact on caribou habitat that will have to be assessed through the site's Caribou Management Plan;
5. Emergency or upset conditions;
6. Requirements for employees from northern communities in competition with other operations;
7. Traditional use and harvesting; and
8. Requirements for services from northern businesses.

At Wheeler, the potential for the development of the Gryphon deposit is a reasonably foreseeable project, and it would be included as part of the cumulative effects assessment.

Cameco's proposed Millennium uranium mining project, although currently withdrawn from the federal regulatory process, is the only project that might reasonably be expected to proceed during the life of the Wheeler Project. While that is the only project currently identified, any project subsequently identified during the environmental assessment process with a reasonable chance of affecting the cumulative effects assessment would be added. Other projects that have potential for consideration for inclusion include UEX's West Bear cobalt/nickel deposit, but there are few details at this time.

Although largely covered in other sections of the EIS, the cumulative effects assessment will also require an examination of any potential to impact traditional Indigenous use of lands and resources, or on communities in a cumulative sense. There is an expectation of meaningful public and Indigenous participation in environmental assessments, and that the discussion of cumulative effects is included in consultations as part of the Wheeler engagement program with feedback recorded and included in the environmental assessment.

6.3 Monitoring

An effective monitoring program is important in a modern mining operation as it provides the proof that the Project is operating legally and within the bounds of its permissions. Both the federal and provincial regulators require comprehensive monitoring programs and reporting. While the focus here is on the federal requirements due to the broader scope of those requirements, the provincial requirements are no less important.

The CNSC has defined several safety and control areas, and all of these require monitoring and reporting as part of the ongoing performance assessment, improvement and management review within the respective management systems. The CNSC's safety and control areas are:

- Management
 - Management systems
 - Human performance management
 - Operational performance
- Facilities and Equipment
 - Safety analysis
 - Physical design
 - Fitness for service
- Core Controls and Processes
 - Radiation Protection
 - Human health and safety
 - Environmental Protection
 - Emergency management and fire protection
 - Waste management
 - Security
- Safeguards and Non-proliferation
- Packaging and Transport

All these areas will require a structured program that demonstrates effective management and control, usually within an ISO/CSA plan-do-check-act style system (PDCA). While all the safety and control areas will have monitoring, the environmental program is further described here as an example.

Environmental monitoring is performed to demonstrate the Project's environmental and safety performance, and to provide the necessary feedback to manage that performance in the areas of:

- Gaseous and liquid discharges;
- The transport of nuclear and hazardous substances within the environment;
- Public exposure and dose;
- Exposure and effects on terrestrial and aquatic biota; and
- Any changes in habitat and effects on species that rely on that habitat.

Through the baseline program and environmental risk assessment, predictions on the Project's performance will be made in the above areas and monitoring is essential in tracking and managing

that performance. Denison will incorporate the results of the EIA predictions into the Environmental Management System (EMS), including the effluent and environmental monitoring plans (CNSC 2017). The EIA predictions for physical disturbances and releases, and the associated environmental responses and potential effects, will be measured and tested using site-specific monitoring data during construction, operation, decommissioning and post-decommissioning phases. As such, a comprehensive monitoring program will be required as part of the Project's ISO/CSA 14001-2015 compliant EMS, providing the necessary feedback to:

1. Demonstrate compliance with applicable laws and permit conditions;
2. Inform the required follow-up program(s), especially within the EMS;
3. Demonstrate continual improvement;
4. Provide process feedback to operations and to management;
5. Provide warning of process changes or upsets;
6. Provide data for maintaining up to date site models; and
7. Information to Indigenous groups, regulatory agencies, and the public.

The EMS will be based on the ISO/CSA PDCA methodology with monitoring playing a critical role in the check process, providing the necessary information for management to act, if necessary, to implement changes in performance. The Canadian Standards Association, as a natural offshoot of its ISO/CSA EMS requirements (e.g. ISO 14001-2015) has been working with the nuclear industry in Canada and have issued standards for Environmental Risk Assessment (CSA N288.6), which lead directly to effluent monitoring (CSA N288.5), environmental monitoring (CSA N288.4), and supplementary studies. The CSA standards are specifically referenced within the CNSC's REGDOC 2.9.1 (CNSC 2017) as functioning parts of the overall EMS.

For radiation, the offsite monitoring is included in the environmental monitoring program while the on-site worker radiation safety program and monitoring activities are subject to a stand-alone Radiation Safety Management program with its own management plan, structure and reporting.

While there are discharge limits for mining in the Saskatchewan Mineral Industry Environmental Protection Regulations, 1996, and the federal Metal and Diamond Mining Effluent Regulations (MDMER), the expectation of the federal regulator will be that a modern uranium mine will have effluent concentrations protective of the environment and well below the values in the above regulations. The MDMER in addition to defining discharge limits also defines a biological effects monitoring program to ensure that discharges remain with limits that are protective of the environment.

Monitoring for potential impacts on traditional use or northern communities may be done through several mechanisms such as surface leases conditions, licence conditions, commitments in the EIA, agreements directly with potentially affected parties, etc. This monitoring would become part of the Project's monitoring and reporting program.

Monitoring is not done in isolation by the company as both the federal and provincial governments will undertake inspections of the operations, including side-by-side sampling to verify compliance. The CNSC will also periodically contract independent third-party consultants to undertake an assessment of an operation's environmental performance. In addition, there are other independent groups that provide monitoring such as the Northern Saskatchewan Environmental Quality Committee (NSEQC), which is composed of members from communities across northern Saskatchewan who meet to review monitoring data and tour the operations to monitor performance, providing feedback and recommendations to regulators and proponents.

7 Stakeholder Engagement

Denison recognizes the importance of engaging with local and Indigenous communities, residents, businesses, organizations, land users and the various regulatory authorities, collectively referred to as 'Stakeholders.' Since 2016 Denison had been engaging with Stakeholders in ongoing efforts to build positive relationships with all parties. Broadly speaking, Denison has categorized the Stakeholders into three categories:

- Regulatory agencies;
- The general public; and
- Indigenous communities.

Further details regarding engagement with specific Indigenous communities can be found in Section 8.

In accordance with Denison's Environmental and Social Management System, a Stakeholder engagement program has been developed to capture all Stakeholder groups within the categories identified above. The design and considerations associated with stakeholder engagement activities for the Project are in compliance with provincial (Government of Saskatchewan 2014f), federal (CNSC 2016a; Canadian Environmental Assessment Agency 2015a) and international guidance (International Finance Corporation 2012) for stakeholder engagement.

Denison is committed to operating Wheeler in a fully sustainable manner, giving consideration to not only maintaining high standards of safety, and environmental compliance, but also financial discipline.

Generally speaking, stakeholder engagement is an exercise of building and maintaining relationships with groups, communities and individuals who are potentially affected by, interested in and/or may be in a position to influence the direction of the Project throughout its entire life cycle. To that end, the following six key principles of stakeholder engagement apply:

1. Provide meaningful, relevant information in a culturally appropriate format and language that is easily understandable by each specific stakeholder group.
2. Conduct all stakeholder engagement in a manner that respects local traditions, culture, timeframes, and the decision-making processes of each stakeholder group.
3. Conduct stakeholder engagement in a variety of ways, venues and make every effort to identify and include all stakeholders.
4. Where relevant, complete stakeholder engagement activities in advance of final decisions, allowing for the consideration and inclusion of comments and recommendations received to be incorporated into Project decisions.
5. Provide frequent feedback, including the results of meetings, incoming suggestions, requests and key recommendations.

6. Provide frequent monitoring and evaluation of the effectiveness of the Plans during and after each engagement session and adjust the engagement program as required and/or suggested by the participating stakeholders in order to improve follow up engagement sessions.

7.1 Engagement with Regulatory Agencies

The Project will undergo a joint provincial- federal environmental assessment process which will be led by Saskatchewan Ministry of Environment's Environmental Assessment and Stewardship branch and the CNSC. The CNSC will be the federal responsible authority for Wheeler's environmental assessment under CEAA 2012. Wheeler will be subject to a number of provincial and federal acts and regulations (Section 1.3.1) and Denison anticipates involvement of other federal and provincial departments once the Wheeler EIS has been submitted and is under review.

With respect to the schedule for engagement with regulatory agencies Denison believes that engagement will largely be initiated in conjunction with the initiation of Wheeler's environmental impact assessment process. In an effort to be proactive and in accordance with existing guidance documents, engagement with CNSC staff and SK MOE staff was initiated during the completion of the prefeasibility engineering and early collection of the environmental baseline data (Table 7.1). The purpose of the engagement meetings in early 2018 was to provide the regulatory agencies with an update on Wheeler with respect to: the technical/engineering aspects, the environmental baseline collection programs, the Indigenous engagement activities and how the selection of these communities were made, as well as an update on the socio-economic activities resulting from these early engagement activities. The more recent meetings in late 2018 were intended to serve as pre-engagement meetings i.e., prior to submission of this document. Denison provided a Project overview, sought guidance and addressed questions before submission of the Technical Proposal and Project Description.

7.2 Engagement with General Public

Members of the public may have an interest in the development of Wheeler. Denison has identified nearby cabin owners, commercial lodges and the villages of Patuanak, Pinehouse, Ile a la Crosse and Beauval as potentially interested in the Project.

Non-Indigenous people who reside near or within one of the four local communities (Patuanak, Pinehouse, Ile a la Crosse and Beauval) were included and invited to participate in the engagement sessions scheduled in those communities along with their Indigenous neighbours (Table 7.1). In addition, Denison has engaged with mayors, council and economic development entities in the local communities (Table 7.1).

As part of Denison's early engagement activities, one of the existing recreational cabin owners located within the Project area requested an update on the status of the Project via a telephone call to a Denison representative. The cabin owner indicated that he has a positive existing relationship with Denison employees given the proximity of his cabin to the existing Wheeler exploration camp and was hopeful that this relationship could continue.

Table 7.1 Summary of In-Person Stakeholder Engagement (Excluding Indigenous Communities)

| Group | Organization or Individual | Date | Summary of Engagement |
|---------------------|--|-------------------|--|
| Regulatory Agencies | Canadian Nuclear Safety Commission, Uranium Mines and Mills Division | February 14, 2018 | Introduced Denison and the Wheeler River Project; provided an overview of the Project from the Preliminary Economic Assessment and scope for the Prefeasibility Study which is underway; discussion and Q&A. |
| | Saskatchewan Ministry of Environment, Mining Industry and Audit Environmental Protection Branch | March 1, 2018 | Introduced Denison and the Wheeler River Project; provided an overview of the Project from the Preliminary Economic Assessment and scope for the Prefeasibility Study which is underway; discussion and Q&A. |
| | Canadian Nuclear Safety Commission, Uranium Mines and Mills Division and Environmental Assessment Division | April 25, 2018 | Introduced Denison and the Wheeler River Project; provided an overview of the Project from the Preliminary Economic Assessment and scope for the Prefeasibility Study which is underway; discussion and Q&A. |
| | Canadian Nuclear Safety Commission, Uranium Mines and Mills Division and Environmental Assessment Division | November 13, 2018 | Denison provided a Project update including an overview of the Prefeasibility Study and the Project scope for the Project Description. Answered any questions about the Project. Denison advised on plans to submit a Project Description in 2019 and the group discussed plans for regulatory process moving forward. |
| | Saskatchewan Ministry of Environment, Environmental Assessment Branch and Uranium and Northern Operations branch | November 21, 2018 | Denison provided a Project update including an overview of the Prefeasibility Study and the Project scope for the Technical Proposal. Denison advised on plans to submit a Technical Proposal in 2019 and the group discussed plans for regulatory process moving forward. |
| | Saskatchewan Ministry of Environment, Uranium and Northern Operations | December 3, 2018 | Denison provided a Project update including an overview of the Prefeasibility Study and the Project scope for the Technical Proposal. Denison advised on plans to submit a Technical Proposal in 2019 and the group discussed plans for regulatory process moving forward. |

| Group | Organization or Individual | Date | Summary of Engagement |
|----------------|--|-------------------|---|
| General Public | Local community members (Patuanak) | July 27, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were given to those in attendance. The presentations were followed by a Question and Answer session. |
| | Mayor, Councillors, community members and the leadership team of Pinehouse Business North (Pinehouse Lake) | September 7, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. This session was followed by a presentation to Denison from Pinehouse Business North focused on their current capacity. |
| | Mayor, Councillors, Co-management board, Métis local community members (Beauval) | December 6, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. |
| | Mayor, Councilors, Co-management Board, Métis Honorable Member of the Legislature (Athabasca riding) and other local community members (Ile a la Crosse) | December 7, 2016 | Following a coffee and snacks, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. |
| | Local community members (Pinehouse) | January 16, 2018 | Held a community workshop in Pinehouse. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | Local community members (Beauval) | January 18, 2018 | Held a community workshop in Beauval. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |

| Group | Organization or Individual | Date | Summary of Engagement |
|----------------|---|-------------------|---|
| General Public | Local community members (Patuanak) | May 3, 2018 | Denison representatives traveled to Patuanak to provide a Project update. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | Local community members (Ile a la Crosse) | January 17, 2018 | Held a community workshop in Ile a La Crosse. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | Mayor, Business Development Corporation (Ile a la Crosse) | January 18, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission |
| | Business Develop Corporation (English River First Nation) | January 31, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission; discuss future opportunities |
| | Business Development Corporation (Pinehouse) | February 1, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission |
| | Mayor (Beauval) | February 1, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission |
| | Northern Saskatchewan Environmental Quality Committee | November 28, 2018 | General overview of the Project, including the ISR methodology. |

Note: Since 2016, additional engagement has been completed via letters, emails, and phone calls.

7.3 Planned Engagement Activities with Regulatory Agencies and the General Public

Denison is committed to continued engagement via various methods of engagement for all groups including regulatory agencies and the general public. Denison is also prepared to engage with any representative of these groups on an as-needed basis should any specific requests to do so be received. Denison will ensure the CNSC and the SK MOE are kept up-to-date on scheduling and the scope of future engagement activities so they have the opportunity to be included in the planning and ultimately participate when desired.

It is anticipated interest from these groups will largely be expressed as part of the formal environmental impact assessment process once this process has been initiated.

Records of these engagements will continue to be documented and meeting notes will be created to maintain a record of the discussions, questions, concerns and answers provided. All of these written records will be added to the Stakeholder engagement section of the Wheeler EIS.

7.4 Socio-Economics

The early engagement activities completed to date have developed the foundations of genuine relationships between Denison and the Indigenous and non-Indigenous groups local to the Project. These relationships have precipitated follow up meetings and discussions with the economic development divisions of these groups and communities who are expressing a strong interest in continuing an open dialogue with Denison in order to afford them access to socio-economic opportunities associated with the Project. Denison has committed to continue to support these discussions.

8 Engagement with Indigenous Communities

Denison is committed to continuing meaningful engagement with Indigenous communities potentially affected by the Project, and to maintaining relationships with these communities throughout all phases of the Project. The approach to engagement has considered relevant guidance, specifically CNSC's REGDOC-3.2.2 Aboriginal Engagement (CNSC 2016a), the Government of Saskatchewan's guidelines for Consultation with First Nations and Métis in Saskatchewan Environmental Impact Assessment (2014f), the Canadian Environmental Assessment Agency's reference guide on considering Aboriginal traditional knowledge in environmental assessments (2015b) and the IFC Performance Standards on Environmental and Social Sustainability (2012).

The following information outlines the list of Indigenous communities identified for engagement activities, including the rationale for inclusion / exclusion; a summary of the activities conducted to date; and an outline of planned activities and associated milestones. Indigenous engagement activities will be adapted, modified and reported on at various points during the associated regulatory process for the Project.

General Guiding Principles

Indigenous peoples' have a unique and important relationship with the environment, and importantly, Indigenous and Treaty Rights which must be fully respected during the process of project development, construction, operation and decommissioning. To this end, Denison's objectives with respect to Indigenous engagement associated with the Project are as follows:

- Build and maintain authentic relationships built on trust and transparency;
- Create a respectful dialogue process that promotes communication between Denison and Indigenous communities, in a timely and accurate fashion; and
- Understand how the proposed development of the Project may adversely impact Indigenous' peoples ability to exercise collective Indigenous and/or treaty rights.

8.1 Identified Communities and Supporting Criteria

The Northern Administration District (NAD) of Saskatchewan (northern Saskatchewan) includes approximately half of Saskatchewan's land area, but less than four per cent of the province's population. Northern Saskatchewan is approximately 250,000 square kilometres, or about 44% of Saskatchewan's area and is home to about 38,000 people (Statistics Canada 2017) living in approximately 45 communities which include incorporated municipalities (such as towns, villages, hamlets and settlements – most of which self-identify as Métis communities), First Nation reserves, and unincorporated areas. More than 80% of people who live in northern Saskatchewan self-identify as Indigenous. Within the NAD, the communities are roughly divided between three regions: the Athabasca Basin region, the North Central region, and the West Side region

(Figure 8.1). The NAD, while sparsely populated, celebrates a diversity amongst Indigenous communities that requires a unique approach to engagement activities.

Consistent with the history associated with other uranium mining projects located within the NAD, Denison recognizes that all of the communities within the NAD typically have an interest in uranium activities, but that an approach based on appropriate criteria to determine those included in the Program is required.

It is important to note that, as a remote site, there are no communities in relatively close proximity to Wheeler. Calculated using a straight line, the closest communities are approximately 150 km from the site (Table 3.2). Travelling by existing roads, the closest community to the Project is approximately 260 km away.

The following criteria have been used to appropriately evaluate the significant number of communities located in the NAD to those Indigenous communities that will be engaged by Denison.

- Treaty 10 signatory (Treaty in which the Project is located);
- Potential or established Indigenous and/or treaty rights within the Project area;
- Geographic proximity of community and / or reserve land to the Project site;
- Known traditional territory in and around the Project site, including travel routes;
- History of relationship with operating companies, the CNSC, and the Province, in relation to other projects located near the Project (McArthur River, Key Lake, Millennium); and
- The potential for collective exercising of Indigenous and/or treaty rights in proximity to the Project

The results of the initial assessment against the above criteria determined that English River First Nation, the Kineepik Métis Local 9, the Sipisishik Métis Local 37, and the A La Baie Métis Local 21 would form part of Denison's initial focus for Indigenous engagement activities (Table 8.1). Upon further evaluation and identified through various engagement activities, Denison also recognizes that the Patuanak Métis Local 82 should be included as part of the Indigenous engagement program.

It is also important to note that the communities of Ile a la Crosse, Beauval, and Pinehouse, and most of the community-members residing in these communities self-identify as Métis communities and members. Denison recognizes and follows the Métis Nation of Saskatchewan's approach to formal consultation, which occurs with the elected Métis representation; however, it is noted that there is often overlap in engagement activities when, for example, community meetings occur. More often than not, the elected officials of Métis locals are also elected members of the municipality and therefore represent both their Indigenous community as well as their municipality, and rarely acknowledge a separation between the two entities.

The following outlines the criteria used to support the inclusion of the above Indigenous communities into the Program.

Table 8.1: Indigenous Communities

| Indigenous Stakeholder Group | Brief Description |
|------------------------------|---|
| English River First Nation | <ul style="list-style-type: none"> • Treaty 10 signatory • Potential or established Indigenous and/or treaty rights within the Project area • Geographic proximity of community and / or reserve land to the Project site (Slush Lake reserve approximately 16 km away; Barkwell Bay reserve 39 km away; community of Patuanak 229 km away); • Known traditional territory in and around the Project site, including travel routes (see Figure 5.7 and Figure 5.8); • History of relationship with operating companies, the CNSC and the Province in relation to other projects located near the Project (McArthur River, Key Lake, Millennium); • The potential for collective exercising of Indigenous and/or treaty rights in proximity to the Project |
| Kineepik Métis Local 9 | <ul style="list-style-type: none"> • Potential or established Indigenous Rights within the Project area • Geographic proximity of community and / or reserve land to the Project site (233 km away); • Known traditional territory in and around the Project site, including travel routes (see Figure 5.7 and Figure 5.8); • History of relationship with operating companies, the CNSC and the Province in relation to other projects located near the Project (McArthur River, Key Lake, Millennium); • The potential for collective exercising of Indigenous rights in proximity to the Project |
| Sipisishik Métis Local 37 | <ul style="list-style-type: none"> • Potential or established Indigenous Rights within the Project area • Known traditional territory in and around the Project site, including travel routes; • Familial ties through the ERFN Membership and La Plonge reserve (immediately adjacent to Beauval) • The potential for collective exercising of Indigenous rights in proximity to the Project |
| A La Baie Métis Local 21 | <ul style="list-style-type: none"> • Potential or established Indigenous Rights within the Project area • Known traditional territory in and around the Project site, including travel routes; • Familial ties through the ERFN Membership • the provision of 'script' to Métis residents during the signing of Treaty 10 • The potential for collective exercising of Indigenous rights in proximity to the Project |
| Patuanak Métis 82 | <ul style="list-style-type: none"> • Potential or established Indigenous Rights within the Project area • Known traditional territory in and around the Project site, including travel routes; • Familial ties through the ERFN Membership and Wapachewunak 192D reserve (immediately adjacent to Patuanak) • The potential for collective exercising of Indigenous rights in proximity to the Project |

Indigenous Organizations

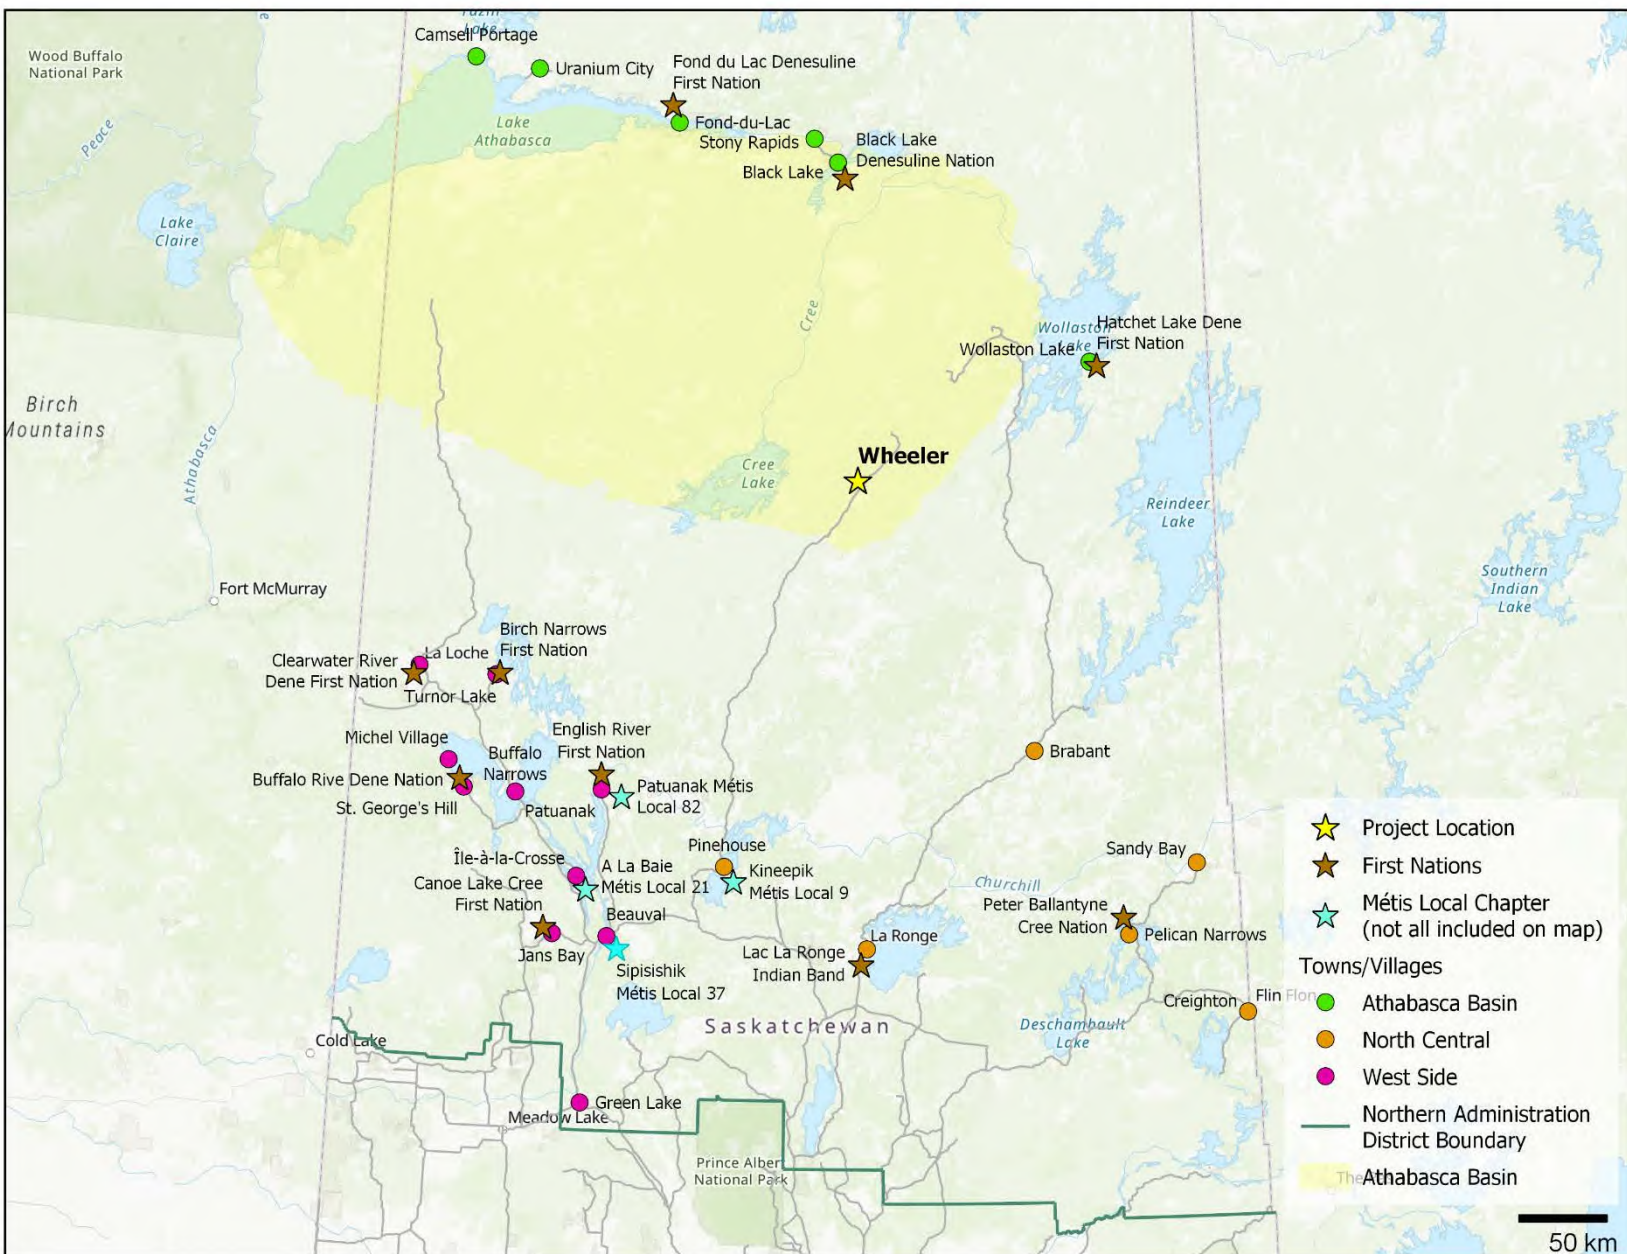

Indigenous organizations can provide a single point of contact for Denison to share information more broadly to a wide variety of Indigenous communities and their leadership regarding Project information, company information, etc. These organizations can also provide specific information regarding their members, interests their members may have, opportunities for Denison to work collaboratively together on various initiatives, etc.

As such, Denison has identified three Indigenous organizations to be included in the Program. The following outlines the criteria for their inclusion:

Ya'thi Nene Land and Resource Office: The Ya'thi Nene Lands and Resources Office (YTNLRO) was created as a not-for-profit organization to be the single point of contact between industry, government and the local Athabasca communities of Hatchet Lake First Nation, Black Lake First Nation, Fond du Lac First Nation, Camsell Portage, Stony Rapids, Uranium City and Wollaston Post. Hatchet Lake First Nation is a Treaty 10 signatory. Denison has evaluated the information currently available online (<http://yathinene.ca/#open-map>) which suggests that there are limited contemporary traditional land use activities near the Project location, relative to the high concentration of traditional land use activities in the Athabasca Region. However, Denison recognizes that these communities may have an interest in the Project and therefore, Denison intends to engage with the YTNLRO in order to better understand contemporary traditional land use activities that are currently being undertaken in the Project area by the member Indigenous communities of the YTNLRO.

Métis Northern Region I: The Project is located within Métis Region I in Saskatchewan. The Métis in Saskatchewan are currently structured with a President, an Executive, Regional Presidents, and Local Presidents. As noted on the Métis Nation of Saskatchewan's (MNS) website, the MNS identifies that 'consultations must be with the Métis government structures that are elected and supported by the Métis people.' As a result, since the Regional Presidents are elected (in addition to the Local Presidents), Denison will engage with the MNS Regional President I regarding the Project.

Métis Northern Region II: While the Project is not located within Métis Region II, a number of key Métis communities with whom Denison is engaging, are located in Northern Region II. The Métis in Saskatchewan are currently structured with a President, an Executive, Regional Presidents, and Local Presidents. As noted on the Métis Nation of Saskatchewan's (MNS) website, the MNS identifies that 'consultations must be with the Métis government structures that are elected and supported by the Métis people.' As a result, since the Regional Presidents are elected (in addition to the Local Presidents), Denison will engage with the MNS Regional President II regarding the Project.

8.2 Summary of Indigenous Engagement Activities to Date

Since the spring of 2016, Denison has completed over 20 in-person engagement events (Table 8.2) involving the leadership and general public of the communities of Patuanak, Pinehouse, Ile a la Crosse and Beauval, involving representatives of English River First Nation, the Kineepik, the A La Baie, and the Sipisishik Métis Locals and non-Indigenous residents of these communities as well.

In all cases, Denison's reception by the Indigenous leadership as well as the general populations at each of the communities visited was positive. This early and frequent engagement fostered the development of a positive, mutually respectful relationship between Denison and the community leadership and members at large, and as a result, Denison was complimented by the communities for their decision to come to the communities at the very early stages of the proposed project. In addition, it allowed the Denison team to solicit feedback on aspects of the project engineering early enough in the design phase of the project such that this feedback could be integrated into the designs (Section 8.2.1.2).

Table 8.2 Summary of In-Person Indigenous Engagement Activities

| Indigenous Community | Organization or Individual | Date | Summary of Engagement |
|----------------------------|---|-------------------|---|
| English River First Nation | Chief | July 6, 2016 | Denison introduced their leadership team to leadership of English River First Nation and requested permission to visit the community and provide an introductory presentation to the community |
| | English River First Nation Members | July 27, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were given |
| | High School Students and Teachers | November 17, 2016 | Denison staff hosted a booth at the English River First Nation job fair, providing advice to high school students on the career opportunities in the mining and exploration industries. |
| | Lands and Resources Manager | November 30, 2016 | Discussed the upcoming schedule of the Wheeler River Project as well as the best way of obtaining and incorporating English River First Nation Traditional Knowledge into the Project's 2017 environmental baseline data collection. |
| | Lands and Resources Manager | March 3, 2017 | Obtained and discussed the English River First Nation Traditional Knowledge map of their Traditional Territory |
| | Chief of English River First Nation, English River First Nation Members | May 3, 2018 | Denison representatives traveled to Patuanak to provide a Project update. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | Land & Resources Officer, Elder | January 31, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission; discuss future opportunities |

| Indigenous Community | Organization or Individual | Date | Summary of Engagement |
|--------------------------------|---|-------------------|---|
| Pinehouse Kineepik Métis Local | Local President, community councillors, local community members, and Business Development Corporation | September 7, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. This session was followed by a presentation to Denison from Pinehouse Business North focused on their current capabilities. |
| | Local President, Community Councillor | November 29, 2016 | Discussed upcoming activities at the Wheeler project and how best to obtain and incorporate community Indigenous Knowledge into the 2017 environmental baseline data collection. In addition, spoke about potential training and employment opportunities with Denison's exploration activities. |
| | Local President, Community representatives, Business Development Corporation | September 6, 2017 | Provide the community Leadership with an update on the development of the Wheeler River project |
| | Local President, Community Representative | November 3, 2017 | Discussions regarding maintaining the strong relationship developed to date between Pinehouse and Denison. |
| | Local community members | January 16, 2018 | Held a community workshop in Pinehouse. The workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | Local President | February 1, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission |

| Indigenous Community | Organization or Individual | Date | Summary of Engagement |
|------------------------------|--|------------------|---|
| Beauval Sipishik Métis Local | Local President and representatives, local community members | December 6, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. |
| | Local community members | January 18, 2018 | Held a community workshop in Beauval. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| A La Baie Métis Local | Local representatives, and local community members | December 7, 2016 | Following a coffee and snacks, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. |
| | Local community members | January 17, 2018 | Held a community workshop in Ile a La Crosse. The workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | High School Students and Teachers | May, 2018 | Denison Geologists hosted a booth at the high school job fair, providing advice to high school students on the career opportunities in the mining and exploration industries. |

Note: Since 2016, additional engagement has been completed via letters, emails, and phone calls.

Early and frequent engagement also fostered the development of a positive, mutually respectful relationship between Denison and the community leadership and members at large. It has allowed the Denison team to solicit feedback on aspects of the Project engineering early enough in the design phase of the Project such that this feedback could be integrated into the designs.

Some examples of successes achieved with Indigenous communities as a result of Denison's commitment to early and effective engagement are listed below in Section 8.2.1.

8.2.1 Achievements

8.2.1.1 Memorandums of Understanding

In order to formalize Denison's commitment to its local Indigenous communities (and their associated non-indigenous communities), Memorandums of Understanding (MOU) have been signed between Denison and:

- English River First Nation;
- Kineepik Métis Local and the community of Pinehouse;
- A La Baie Métis Local 21 and the community of Ile a la Crosse; and
- Sipsisishik Métis Local 37 and the community of Beauval.

These non-binding MOUs formalize the signing parties' intent to work together in a spirit of mutual respect to cooperate in order to collectively identify practical means by which to avoid, mitigate, or otherwise address potential impacts of the Project upon the exercise of the indigenous rights, treaty rights, and interests. In addition, the MOUs formalize the signing parties' intent to work together regarding the benefits that will flow from the Project, provide a process for continued Project engagement and information-sharing about the project and establishes a relationship to identify business, employment and training opportunities for the parties with respect to the Project.

8.2.1.2 Integration of Indigenous Knowledge

Indigenous knowledge (IK) has been incorporated into the early design stages of the Project.

English River First Nation provided their IK map to Denison along with the permission to use it. Denison provided the map to consultants responsible for the collection of the baseline data prior to the development and initiation of these studies in 2016. This allowed Denison's consultants to incorporate English River First Nation IK data into the early designs of their field programs. More recent IK data has been received from Pinehouse Kineepik Métis Local 9, and this IK, along with that from English River First Nation, will be incorporated into the design of all subsequent baseline programs, the selection of VCs and ultimately, the Environmental Impact Statement. In addition, Indigenous field support staff worked closely with consultants during baseline field programs whenever possible, which, in Denison's experience, also provides a valuable Indigenous worldview when undertaking the supporting activities for the eventual EIS preparation.

Knowledge from Indigenous community members was also included in the Project design and influenced the selection of access road alignments, mining method, and proposed treated effluent discharge location. Engineering options developed as part of the prefeasibility study were taken to the Indigenous communities and discussed in focussed workshops. Project design options under the following three topics were discussed:

- Preferred access road routing to the site from Highway 914. Three different options analyzed in the prefeasibility engineering studies were presented.
- Preferred surface water course, to be used for the discharge of treated effluent associated with the proposed Project: six options that were shortlisted as a result of the hydrological and biological data collection were presented.
- Two mining methods under consideration for the Project were presented.

Participants at these workshops consisted of general members of the public (divided into groups of Elders and youth) as well as high school students who were specifically invited to the workshops through each school's administration.

Each group was led through a series of slides explaining the options within all three of the topic areas. Participants were then asked to identify the pros and cons of each of the options within the three topics. The participants were specifically asked to consider these pros and cons from their perspective and backgrounds. In all three topics discussed at the workshop, the options identified by the Indigenous communities as carrying the highest number of pros were ultimately chosen as the preferred options to advance through the Project's Prefeasibility Study (Denison 2018).

Denison's work to collect and integrate IK into the Project design will continue as the Project design is refined through feasibility and detailed design stages and as the regulatory process advances. Updates on any new and continued integration of IK will be included in updates to the IER and the environmental impact statement (EIS).

8.2.2 Summary of Questions and Feedback from Indigenous Engagement

All questions and answers provided during the community engagement sessions as well as one set of written questions provided to Denison by two residents of Beauval have been recorded and captured by Denison (Table 8.3). The themes arising out of many of the engagement sessions generally followed two main areas: economic development opportunities for northerners and environmental protection associated with the eventual operation of the Project.

Table 8.3: Summary of Project Questions and Feedback from Indigenous Groups

| Date | Type of Meeting | Question or Feedback | Denison Response |
|-----------------------------------|-------------------|---|--|
| English River First Nation | | | |
| 27-Jul-16 | Community Meeting | Band Asking for a monetary agreement based on percentage | Denison recorded the request |
| | | Request to see results of environmental studies | The environmental work is just starting; our consultants have been mandated to maximize northern employment. |
| | | Request for employment, including drilling and environmental disciplines. Insistence on hiring now. | We share benefits between communities and look for opportunities to hire northerners. |
| | | How much money have you and your investors made so far? | We have made none; our investors may have made some, but likely very little. We, and they, are investing for the future. |
| | | Specific questions from Marius Paul regarding safety, cleanup, funding, taxes, health & safety, emergency cleanup, tailings, long-term contamination, weapons, environmental impact, pollution, worker mortality, | Written answers would be provided to all questions given that they were provided in writing as well as verbally. |
| | | | The government does not allow Canadian uranium to be used for nuclear weapons. |
| | | Concern about ongoing access to the Wheeler River; and protection of whitefish spawning and moose/caribou calving areas. Some changes to the landscape take time to manifest. | Denison recorded the concern. |
| | | Will the project be sold to another company? | Denison plans to stay with the project throughout production as the Operator. |
| | | Noted that a road will be required between McArthur River and Cigar lake to transport the ore. The province will come to the people for approval, but Province is likely to do it anyway. | This road is key for the Gryphon deposit. Without that road the Gryphon project may not be viable. |
| | | We need an agreement that benefits us ahead of the mine or the government. | We understand. As a small example, Denison has switched its grocery supplier from La Ronge to the ERFN store at Beauval Forks. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|-----------|--------------------|---|---|
| 03-May-18 | Community Workshop | The Chief outlined some historical and cultural considerations. Insisting that ERFN is the only community that should benefit. Denison does not need to speak with any other communities about the project. You don't need MOUs with anyone but us. | We have your traditional land use map posted at camp and are using it to help steer the project. |
| | | People want to work. What types of jobs will be available? What can Denison do to help build capacity in elementary and middle school students? | Our hiring priorities are from here. |
| | | | Initially, environmental or geological technicians. For technical positions, they need math and science skills. For management positions, the same plus experience. |
| | | | We're open to scholarship programs. |
| | | Would like a resident elder at site. | Denison noted the request. |
| | | Concern about additional impact to Russell Lake; there are already many cabins on that lake. | The cumulative effect will be considered in the environmental assessment. |
| | | If you sell or merge, what happens to the contracts? | The buyer would take over the contracts previously established. |
| | | Questions about the ISR mining method | The mining method was explained and the environmental protection measures that come with Denison's planned application of the method. |
| | | Could you power the mine using solar and wind? ERFN has considered power generation as an economic development opportunity. | Would probably need grid power for the base load; solar and wind could be supplemental sources. If ERFN chose to generate, we would be open to buying power. |
| | | Is there cell service at the site? | With a booster, or on a high hill coverage from the Key Lake cell tower can be obtained. |
| | | We want more ERFN people being trained in the drill helper program. | Denison noted the comment. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|--|--------------------|---|--|
| Kineepik Métis Local / Pinehouse Lake | | | |
| 07-Sep-16 | Community Meeting | What are environmental baseline studies are being completed? | Local and regional data is being collected. Denison is also hoping to use existing data from Cameco's Millennium project and the provincial government. Cumulative Effects Monitoring is part of the monitoring that is needed as well. |
| | | We as a community want to start to understand the science involved so we can create local capacity – our area will always have commodities and mining and require services. | Denison is happy to work with the community to help them develop capacity. |
| | | How do current markets affect your decisions? | They are very important to our decisions. We expect prices to be better by 2025 when we start production. |
| | | What is Denison's market cap? | About \$370 million. If the price was \$55/lb, our market cap could be as high as \$1.5 billion. |
| | | Where does your revenue come from? | Some from toll milling Cigar Lake ore at McClean Lake., and some from our environmental services division. A little from managing Uranium Participation Corp. We have a 25% interest in GoviEx Uranium, and 12% in Skyharbour Resources. |
| 16-Jan-18 | Community Workshop | What is a shareholder and how do I become one? | Denison explained to process of how to purchase shares in a public company. Noting there is risk of losing money as well. |
| | | Discussion on price and markets. | |
| | | How would you get Gryphon ore to surface? Technical questions about ground conditions and mining method. | Skipped as rock up a conventional mine shaft, not pumped as slurry. |
| | | | Gryphon Ore is in hard basement rock; no freezing necessary the ground conditions are very good. |
| | | Cost of ISR vs. jet boring | ISR is much cheaper; too deep for jet boring from surface. ISR only works on some ore bodies. You can't use it on the Gryphon deposit as we understand the technology today. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|-----------------------------------|----------------------|--|---|
| | | How do you treat tailings | There are no tailings produced with ISR. |
| | | Need for independent water sampling program alongside of the company’s sampling program. | Governments require independent sampling for the State of the Environment Report every five years. Environment Canada requires independent Environmental Effects Monitoring every three years. |
| | | We never get this independent information | Part of the MOU process is to establish what information the community wants, so as to allow Denison to provide it to the community. |
| | | Can you prove there is no long-range impact – that cumulative effects are zero. | Through the environmental assessment process, we expect to prove that the Project will be below guidelines and that there is no cumulative effect in the regional assessment area. Cumulative Effects Monitoring is usually the government’s responsibility; however, we will need to address the issue of potential cumulative effects as part of the environmental assessment. We do not believe the project will negatively affect tourism activities in the region. |
| | | At what point is tourism affected? | |
| A La Baie Métis / Ile a la Crosse | | | |
| 07-Dec-16 | Community Engagement | Why hire drillers from BC when there are drillers in La Ronge? | Hy-Tech hires locally and has a shop in Saskatoon. Local companies sometimes do not bid on the job. It’s sometimes a financial decision. |
| | | Requested copy of feasibility study | It will be public when it is completed. |
| | | Will you present to schools on future jobs? | Denison would be happy to do so. |
| | | How are you financed? | We seek investors from global capital markets; we get a portion of revenue from McClean Lake mill and our environmental services division. |
| | | How much are you investing in the north? | We’re in the early stages and trying to invest as much as we can in the north. |
| | | How can this project be feasible given recent shutdowns? | We are planning for production when prices rise again. The world is moving towards more nuclear energy. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|------|-----------------|---|---|
| | | We are developing a goods and services database of northern businesses. | We're encouraged to hear that and would welcome the opportunity to receive a copy. |
| | | Is this consultation? | Formal consultations will start when the project description is written, and the environmental assessment starts. We are trying to be proactive. |
| | | Can we see the EA before it goes to government? | The process will be interactive with the communities, so you will have opportunities to see it and make comments during that process. |
| | | We would like Sakitawak Development Corporation to be involved in mine development and operation. | Hopefully we can work something out as we go forward. |
| | | We would like to have northerners work with your human resources people on hiring. | So far we only need drillers. We can train driller helpers. Environmental sampling is part-time. We are at early stages of developing the project. |
| | | One attendee spoke of his changed attitude to uranium mining and nuclear power – He is now in full support of the industry stating he has seen a lot of jobs go to northerners as a result of the uranium mines in northern Saskatchewan. | Denison thanked him for his support. |
| | | Any Impact Management Agreement should be made with the whole north, not just specific communities. It puts the others at a disadvantage. | That's the next stage of discussions. While it could be much easier for the company, it is also a challenging proposition. |
| | | We need a north-wide fund to draw from. | |
| | | Are there still investment possibilities for First Nations, development corporations or individuals? | We already have two other partners, but the door is never closed for investment. |
| | | Why not process ore at the closer Key Lake mill? | Our share of the ore is expected to go to McClean Lake, which we part-own. Cameco may take their 30% to Key Lake. Each company can decide what to do with their portion of the ore. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|-----------|--------------------|---|---|
| 17-Jan-18 | Community Workshop | Concern that this is engagement, not duty to consult. | Denison was in the community to gather input from the members to help inform the project design and continue to build a relationship with the communities. |
| | | What will be left behind at the site after the mine is closed? | Probably there will be a decommissioned landfill at site but not much more than that. Almost everything is taken off site. |
| | | Concern that the Métis Nation (Region) was not formally invited to be part of the MOU. Students need to understand what a MOU is. | The MOU names the La Baie Métis Local and the community and has been discussed with representatives of the Local. The MOU is a commitment to talk and work together for mutual support in the areas of environmental sustainability, education, employment and training, business opportunities and community investment. |
| | | Concern about who the agreements will be with. | |
| | | Again, white people telling us what they want to do. Would like to hear from the Serpent River First Nation (Elliot Lake). | This is a dialogue; we want your input. Denison is considering having local community liaison people added to the team as the project advances. |
| | | The students need to know this information. | Denison agrees, that is why we invited them to be a part of this workshop and why they are here. |
| | | Are the jobs transferable to the community? | Most, if not all, of the trades needed are transferable across the country. Other more specific mining jobs are strictly mining-related. It's a risk you take depending on what training you select. |
| | | Any news on the McArthur - Cigar Lake road? | We have met with the province. If the road is not built, the Gryphon component of the project is unlikely to go ahead. |
| | | When will you sign a surface lease agreement? | After the environmental assessment is successfully completed. Before construction begins. |
| | | Northerners can supply a lot of goods and services. Look at Sakitawak Development Corp. | We agree. One of the components of the MOU is to help identify these opportunities. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|---------------------------------|-------------------|---|---|
| | | Should work with local people on culture and climate change. | Denison is happy to do that. We have English River's Traditional Territory map. and have asked for similar information if available from Pinehouse, Ile a la Crosse and Beauval. |
| Sipishik Métis / Beauval | | | |
| 06-Dec-16 | Community Meeting | | Currently these are supplied from La Ronge. |
| | | Our local post plant could produce core boxes | We are in communication with KCDC on the topic of career development. |
| | | What jobs are and will be available? | Drillers are the main employment opportunity at this stage of the project. Geologists and environmental specialists are also going to be needed. At the feasibility stage, also need additional safety people. There are only about 10-12 people on site at this stage. Workers to build roads, power lines etc. will be needed once construction starts. |
| | | Do you have a HR department? | Yes |
| | | Need for a more sophisticated human resource development strategy to attract high school students into some of the careers in mining. | Denison noted the comment. |
| | | There's still a trust gap between development and peoples' relationship to the land. It's time to build environmental monitoring liaisons to help build trust. | Denison noted the comment. |
| | | To help develop opportunities, Beauval has Northwest Communities (NWC), Primrose Lake Economic development Corp (PLEDCO), the resources of the Gabriel Dumont Institute (GDIO) for apprenticeship training. | Denison noted the comment and welcomed the opportunity to work with these groups as the project advanced. |
| | | What is the potential for you to invest in our communities? | The next stage of discussion is to explore those options as the project moves forward. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|-----------|--------------------|--|--|
| 18-Jan-18 | Community Workshop | Could we invest in, say, heavy equipment? | |
| | | We need to plan properly to get a piece of the action. | We will keep you informed as to what we're doing in order to help you prepare. |
| | | Questions about hiring drillers, community response and logistics of accessing site. | Hired 2 driller helper trainees. One from Cole Bay and one from Pinehouse. Hy-Tech Drilling is the company running the training program. |
| | | Preference to avoid spawning areas and general stress to fish and animals when choosing a discharge point. Preference to discharge into swift-flowing water at a point that allows flow through the entire river system. Preference not to discharge directly to Russell Lake. | Denison noted comments. |
| | | Questions about the ISR technique and directional drilling. Glad to hear of closed-loop system, no waste water and no tailings. | Comments were noted by Denison. |
| | | Concern that ore bodies may be under lakes | Denison indicated that both orebodies are under land approximately 500 metres below surface. |
| | | How many employees will be needed for the ISR mining method. | Denison indicated about 100 to 150. |

8.3 Planned Indigenous Engagement Activities

The Indigenous engagement activities initiated by Denison in 2016 are part of an ongoing commitment by Denison to actively engage both Indigenous and non-Indigenous communities throughout all phases of the Project. In addition, Denison's ongoing engagement program honours the commitments outlined in the MOUs.

The ongoing engagement schedule is also a product of the results of the previous engagement sessions. Denison has agreed to visit the Indigenous communities and provide project updates as the development activities advance. It is currently envisioned that community meetings will be held at least once per year with the Patuanak Métis, the Kineepik Métis, the A la Baie Métis Local 21 Sipishik Métis Local 37, English River First Nation, along with their associated municipal communities. Denison will meet more frequently if desired and warranted.

Denison is also committed to meeting with the leadership of each of these Indigenous communities as and when they make a request to do so. In addition, Denison has a standing commitment to respond to any enquires to meet and/or make presentations on the Project to informal or formalized groups.

As the project advances, Denison will continue to utilize local community radio stations, social media as well as print media that may reach appropriate Indigenous audiences.

In accordance with current guidance documents and illustrated in Table 8.4, Denison will undertake engagement activities during the Project's stages as outlined below.

Table 8.4: General Engagement Schedule

| Project Evolution | Indigenous Groups Engaged | Coordination to include Federal and Provincial Governments | Rationale |
|---|---|---|---|
| Prefeasibility engineering and environmental baseline collection | Indigenous communities potentially affected and interested in the Project | Denison will contact federal and provincial governments to coordinate attendance at engagement events wherever possible | Allows for Indigenous communities to be engaged at earliest stage of the Project, allows for adjustments to baseline collection if needed |
| Initiation of environmental impact assessment – submission of Project Description | Indigenous communities potentially affected and interested in the Project | | Allows continued engagement |
| Throughout completion of environmental impact assessment | Indigenous communities potentially affected and interested in the Project | | Allows continued engagement throughout entire process |

Detailed schedules and work plans for engagements will be developed in consultation with the various Indigenous groups at the appropriate stage of the Project's evolution. As referred to above in Table 8.4, some engagements will be mandatory requirements of the EIA process and as such, the scheduling of those sessions may be determined by the regulatory schedule. Denison and individual Indigenous communities will work together to propose an appropriate schedule for follow-up discussions. In general, it has been agreed between each of the Indigenous communities and Denison to attempt to hold update meetings every quarter or half year with leadership representatives and an open invitation for each group to request a meeting with Denison as and when desired.

Denison will include the CNSC and the Province of Saskatchewan in the planning and participation within ongoing engagement activities. Denison's Community Social Responsibility Manager will contact the CNSC Project Officer once formal and specific engagement plans have been developed for the various stages of the Project.

It is expected that a more formalized schedule will be developed as part of the EA process.

8.3.1 Ongoing Engagement – Specific Topics for Upcoming Engagement

In addition to Project updates, a number of specific topics will be the focus of ongoing engagement as Denison prepares the EIS. The anticipated topics for the foreseeable future are:

- Contemporary traditional land use activities occurring in proximity to the Project and potential impacts of taking up the land associated with the surface lease during construction and operation.
- Identification of both biophysical and human environment VCs.
- Traditional / contemporary local names for features such as lakes and other geographic areas or features.

Other topics will likely arise as outcomes of the engagement activities with Indigenous communities present themselves and as the Project advances.

Wheeler River Project

Notice of Commencement of an Environmental Assessment

Wheeler River Project

The Canadian Nuclear Safety Commission (CNSC) has received a project description from Denison Mines Corp. for the Wheeler River Project, a proposed new uranium mining and processing operation. The proposed project is located in the Athabasca Basin in northern Saskatchewan, approximately 600 km north of the city of Saskatoon, 4 km west of Highway

914 and midway between Cameco Corporation's Key Lake Mill and McArthur River Mine. The proposed Wheeler River Mine would produce up to 5400 tonnes of U_3O_8 annually for 20 years.

The proposed project includes underground and surface facilities to support the mining and processing of uranium ore using the In Situ Recovery (ISR) mining method. The main components include: an ISR wellfield; two freeze plants on the surface to establish a frozen isolated mining chamber underground; an on-site plant to process the mining solution recovered from the ISR wellfield; surface facilities to support the short and long term storage of waste rock; water handling infrastructure and a water treatment plant and additional infrastructure to support mining activities.

The CNSC has determined that the project requires a federal environmental assessment (EA) pursuant to the *Canadian Environmental Assessment Act, 2012 (CEAA 2012)*. An EA under CEAA 2012 is a planning and decision-making tool. Its objectives are to minimize or avoid adverse environmental effects before they occur, incorporate environmental factors into decision making, and identify the elements of a follow-up monitoring program. The project will also require a provincial environmental assessment (EA) under the Saskatchewan *Environmental Assessment Act*.

The availability of PFP funding for this project will be announced at a later date.

For further information on this EA, please contact:

Marcelle Phaneuf, Environmental Assessment Officer

Saskatoon, SK. S7K 0E9
Email: pbennett@denisonmines.com

Subject: Changes to Federal Legislation and Implications for the Wheeler River Project

Dear Ms. Bennett,

The purpose of this letter is to inform your organization of recent changes to federal legislation, particularly transition provisions relevant to the Wheeler River Project (the Project), and next steps.

On August 28, 2019, the *Impact Assessment Act* (IAA) came into force, repealing the *Canadian Environmental Assessment Act, 2012* (CEAA 2012). The IAA contains transitional provisions for EAs of designated projects commenced under CEAA 2012 and for which the Canadian Nuclear Safety Commission (CNSC) is the Responsible Authority.

The Wheeler River Project has been subject to an EA commenced under CEAA 2012, since May 31st, 2019. As per the transition provision described in subsection 182 of the IAA: “*Any environmental assessment of a designated project by the Canadian Nuclear Safety Commission or the National Energy Board commenced under the 2012 Act, in respect of which a decision statement has not been issued under section 54 of the 2012 Act before the day on which this Act comes into force, is continued under the 2012 Act as if that Act had not been repealed.*”

As outlined in subsection 182, given that the Project was commenced under CEAA 2012 and a decision statement has not yet been issued, and therefore will continue and be completed under its current process.

The “Assessment Type” on the project-specific page of the Public Registry website, Reference Number: [80178](#), has been updated to indicate “Environmental Assessment under CEAA 2012”. In addition, this letter will be posted on the Public Registry website as the official record of notification.

If you have any questions, do not hesitate to contact Marcelle Phaneuf, Environmental Assessment Officer responsible for the Project, by phone 613-947-3209 or email *Marcelle.Phaneuf@canada.ca*.

Sincerely,

<Personal Information Redacted>

Candida Cianci
Director, Environmental Assessment Division
Canadian Nuclear Safety Commission

c.c.: P. Fundarek (CNSC); C. Cattryse (CNSC); S. Akhter (CNSC); M. Phaneuf (CNSC)

Disclaimer

This document is not a legal authority, nor does it provide legal advice or direction; it provides information only, and must not be used as a substitute for the *Canadian Environmental Assessment Act, 2012* (CEAA 2012) or its regulations. In the event of a discrepancy, the CEAA 2012 and its regulations prevail. Portions of the CEAA 2012 have been paraphrased in this document, but will not be relied upon for legal purposes.

[Top of page](#)

Part 1 – Background

1. Introduction

The purpose of this document is to provide information to proponents on the requirements for the preparation of an environmental impact statement (EIS) for a designated project to be assessed pursuant to the *Canadian Environmental Assessment Act, 2012* (CEAA 2012). This document specifies the nature, scope and extent of the information required. Part 1 of this document provides guidance and general instruction on the preparation of the EIS, and Part 2 outlines the information that must be included in the EIS.

Section 5 of the CEAA 2012 requires an assessment of the proposed project's potential environmental effects:

5. (1) For the purposes of this Act, the environmental effects that are to be taken into account in relation to an act or thing, a physical activity, a designated project or a project are:

- (a) a change that may be caused to the following components of the environment that are within the legislative authority of Parliament:

- (i) fish and fish habitat as defined in subsection 2(1) of the *Fisheries Act*

- (ii) aquatic species as defined in subsection 2(1) of the *Species at Risk Act*

- (iii) migratory birds as defined in subsection 2(1) of the *Migratory Birds Convention Act, 1994*

- (iv) any other component of the environment that is set out in Schedule 2

- (b) a change that may be caused to the environment that would occur
 - (i) on federal lands
 - (ii) in a province other than the one in which the act or thing is done or where the physical activity, the designated project or the project is being carried out
 - (iii) outside Canada
- (c) with respect to Aboriginal peoples, an effect occurring in Canada of any change that may be caused to the environment on
 - (i) health and socio-economic conditions
 - (ii) physical and cultural heritage
 - (iii) the current use of lands and resources for traditional purposes
 - (iv) any structure, site or thing that is of historical, archaeological paleontological or architectural significance

5. (2) However, if the carrying out of the physical activity, the designated project or the project requires a federal authority to exercise a power or perform a duty or function conferred on it under any Act of Parliament other than this Act, the following environmental effects are also to be taken into account:

- (a) a change, other than those referred to in paragraphs (1)(a) and (b), that may be caused to the environment and that is directly linked or necessarily incidental to a federal authority's exercise of a power or performance of a duty or function that would permit the carrying out, in whole or in part, of the physical activity, the designated project or the project
- (b) an effect, other than those referred to in paragraph (1)(c), of any change referred to in paragraph (a) on
 - (i) health and socio-economic conditions
 - (ii) physical and cultural heritage

- (iii) any structure, site or thing that is of historical, archaeological, paleontological or architectural significance

The Canadian Nuclear Safety Commission (CNSC) uses the proponent's EIS and other information received during the environmental assessment (EA) process to prepare an EA report that will inform the issuance of a decision statement by the Commission. Therefore, the EIS must include a full description of the changes the project will cause to the environment that may result in potential effects on areas of federal jurisdiction (i.e., section 5 of the CEAA 2012), including changes that are directly linked or necessarily incidental to any federal decisions that would permit the project to be carried out. The EIS should also include a list of key mitigation measures that the proponent proposes to undertake in order to avoid or minimize any adverse environmental effects of the project. It is the proponent's responsibility to provide sufficient data and analyses of potential changes to the environment.

[Top of page](#)

2. Guiding principles

2.1 Government of Canada's interim measures

On January 27, 2016, the Minister of Environment and Climate Change Canada and the Minister of Natural Resources Canada announced an interim approach that includes principles and plans for major projects. These principles are the first part of a broader strategy to review and restore confidence in Canada's EA processes.

In particular, the Government of Canada has introduced a principle under which direct and upstream greenhouse gas emissions linked to the projects under review will be assessed. The proponent is expected to take the

necessary steps to provide sufficient information and evidence, in accordance with this principle. For more information on assessing greenhouse gas emissions, refer to section 5.1 (Part 2).

2.2 Environmental assessment as a planning tool

An environment assessment (EA) is a planning tool used to ensure that projects are considered in a careful and precautionary manner in order to avoid or mitigate possible environmental effects and to encourage decision makers to take actions that promote sustainable development.

2.3 Public participation

One of the purposes of the EA identified in the CEAA 2012 is to ensure opportunities for meaningful public participation during an EA. The CNSC ensures that the public is provided with opportunities to participate in the EA. Meaningful public participation is best achieved when all parties have a clear understanding of the proposed project as early as possible in the review process. The proponent is required to provide current information about the project to the public and especially to the communities likely to be most affected by the project.

2.4 Engagement with Indigenous groups

A key objective of the CEAA 2012 is to promote communication and cooperation with Indigenous peoples, which include the First Nations, Inuit and Métis. The proponent is expected to engage with Indigenous groups that may be affected by the project as early as possible in the project planning process. The proponent will provide Indigenous groups with opportunities to learn about the project and its potential effects, communicate their concerns about the project's potential effects and discuss measures to mitigate those effects. The proponent is strongly

encouraged to work with Indigenous groups to establish an engagement approach that is reasonable to both parties. The proponent will make reasonable efforts to consider traditional Indigenous knowledge in the assessment of environmental impacts. For more information on considering Indigenous traditional knowledge, refer to section 3.3.2 (Part 1).

Information gathered through the EA process and associated engagement by the proponent with Indigenous groups will be used to inform decisions under the CEAA 2012. In providing information to the CNSC, the proponent will ensure that any confidential information shared with them by Indigenous groups is treated in the appropriate manner. This information will also contribute to the Crown's understanding of any potential adverse impacts of the project on potential or established Indigenous or treaty rights and the effectiveness of measures proposed to avoid or minimize those impacts, and will assist the Crown in meeting its duty-to-consult obligations.

The proponent is encouraged to consult the following resources:

- REGDOC-3.2.2, *Indigenous Engagement* (CNSC)
- Aboriginal and Treaty Rights Information System (Indigenous and Northern Affairs Canada)

2.5 Application of the precautionary approach

In documenting the analyses included in the EIS, the proponent will demonstrate that all aspects of the project have been examined and planned in a careful and precautionary manner in order to avoid significant adverse environmental effects.

A document by Canada's Privy Council Office, *A Framework for the Application of Precaution in Science-based Decision Making About Risk*, sets out guiding principles for the application of precaution to science-based decision making.

[Top of page](#)

3. Preparation and presentation of the EIS

3.1 Guidance

The proponent is encouraged to consult the CNSC's [REGDOC-2.9.1, Environmental Protection: Environmental Policy, Assessments and Protection Measures](#) for additional guidance on the preparation of the EIS. The proponent may also consider consulting the relevant EA policy and guidance documents provided on the [Impact Assessment Agency of Canada's website](#).

The proponent is further encouraged to consult with the CNSC and, if applicable, other federal authorities, during the planning and development of the EIS and supporting documentation.

3.2 Study strategy and methodology

The proponent is expected to respect the intent of these guidelines and to consider the effects that are likely to arise from the project (including situations not explicitly identified in these guidelines), the technically and economically feasible mitigation measures that will be applied, and the significance of any residual effects. Except where specified by the CNSC, the proponent has the discretion to select the most appropriate methods to compile and present data, information and analysis in the EIS, as long as the methods are transparent, justifiable and replicable.

These guidelines may include matters that the proponent does not deem relevant or significant to the project. If such matters are omitted from the EIS, the proponent will clearly indicate this and provide a justification so that the CNSC, federal authorities, Indigenous groups, the public and any other interested party have an opportunity to comment on this decision. If the CNSC disagrees with the proponent's decision, the proponent will be required to provide the specified information.

The proponent must explain and justify the methods used to predict the impacts the project will have on each valued component (VC). VCs include biophysical and socioeconomic components, the interactions among them and their relationships within the environment. The information presented must be substantiated; in particular, the proponent must describe how the VCs were identified and what methods were used to predict and assess the project's potential adverse environmental effects on these components. The value of a component not only relates to its role in the ecosystem, but also to the value that humans place on it. The culture and way of life of the people using the area affected by the project may be considered VCs themselves. The EIS will also explain and justify methods used to identify mitigation measures and follow-up program elements.

The EIS will document how scientific, engineering, traditional and local knowledge were used to reach conclusions. Assumptions will be clearly identified and justified. All data, models and studies will be documented such that the analyses are transparent and reproducible. All data collection methods will be specified. The uncertainty, reliability and sensitivity of models used to reach conclusions must be indicated. The sections in the EIS regarding the existing environment and the potential adverse environmental effects predictions and assessment must be prepared, using best available information and methods, to the highest standards in the relevant subject area. All conclusions must be substantiated.

The EIS will identify all significant gaps in knowledge and understanding related to key conclusions, and the steps to be taken by the proponent to address these gaps. Where the conclusions drawn from scientific, engineering and technical knowledge are inconsistent with the conclusions drawn from traditional and local knowledge, the EIS will contain a balanced presentation of the issues and a statement of the proponent's conclusions.

3.3 Use of information

3.3.1 Federal coordination of information or knowledge

Section 20 of the CEAA 2012 requires that every federal authority with specialist or expert information, or knowledge with respect to a project subject to an EA, make that information or knowledge available to the CNSC. The CNSC will coordinate the involvement of federal departments and other jurisdictions with expert and specialist knowledge specific to the EA and notify the proponent.

3.3.2 Community knowledge and Indigenous traditional knowledge

Subsection 19(3) of the CEAA 2012 states, “the environmental assessment of a designated project may take into account community knowledge and Aboriginal traditional knowledge”.

The proponent will consider the community and Indigenous traditional knowledge to which it has access or that is acquired through Indigenous and public engagement activities, in keeping with appropriate ethical standards and obligations of confidentiality. Agreement should be obtained from Indigenous groups regarding the use, management and protection of their existing traditional knowledge during and after the EA.

Where community and Indigenous traditional knowledge has been considered by the proponent, the EIS will document the following:

- the traditional knowledge gathered
- how the traditional knowledge was gathered (e.g., interviews with key community leaders and elders, collaborative field research, Indigenous traditional knowledge studies, etc.)
- the source of the traditional knowledge
- how the proponent considered the traditional knowledge gathered in the assessment, including both methodology (e.g., identifying VCs, establishing spatial and temporal boundaries, defining significance criteria) and analysis (e.g., baseline characterization, effects prediction, development of mitigation measures)

3.3.3 Existing information

In preparing the EIS, the proponent is encouraged to make use of existing information relevant to the project. When relying on existing information to meet the requirements of the EIS guidelines, the proponent will either include the information directly in the EIS or clearly direct readers to it (i.e., by cross-referencing). When relying on existing information, the proponent will also comment on how the data was applied to the project, separate factual lines of evidence from inference and state any limitations on the inferences or conclusions that can be drawn from the existing information.

3.3.4 Confidential information

In implementing the CEAA 2012, the CNSC is committed to promoting public participation in the EAs of projects and providing access to the information on which EAs are based. All documents prepared or submitted by the proponent or any other stakeholder in relation to the EA are posted or referenced on the [Canadian Impact Assessment Registry](#) (formerly the

Canadian Environmental Assessment Registry) and/or the CNSC's website and made available to the public upon request. For this reason, the EIS should not contain information that:

- is sensitive or confidential (i.e., financial, commercial, scientific, technical, personal, cultural) under the *Privacy Act* and the *Access to Information Act*, is treated consistently as confidential, and the person affected has not consented to the disclosure
- may cause harm to a person or harm to the environment through its disclosure

If the EIS contains information that should be treated as confidential or protected under the *Privacy Act* and the *Access to Information Act*, the proponent should identify that information and request that the CNSC treat it accordingly.

Part 2 – Content of the Environmental Impact Statement

Part 2 of this document provides specific instructions for the content of each section in the EIS. The EIS as a whole must reflect the guiding principles in Part 1 of this document.

[Top of page](#)

1. Presentation and Organization

To help identify the documents submitted, the title page of the EIS and related documents contains the following information:

- project name and location
- title of the document, including the term “environmental impact statement”

- subtitle of the document
- proponent name and contact information
- date

The EIS will be written in clear, precise language. A glossary of technical terms and a list of acronyms and abbreviations will be included. It will include charts, diagrams, tables, maps and photographs where appropriate to clarify the text. Perspective drawings that clearly convey the various components of the project will also be provided. Wherever possible, maps will be presented in common scales and datum to allow for comparison and overlay of mapped features.

For brevity and to avoid repetition, cross-referencing within the EIS is preferred. The EIS may make reference to information that has already been presented in other sections of the document, rather than repeating it.

Detailed studies (including all relevant and supporting data and methodologies) will be provided in separate appendices and will be referenced by appendix, section and page in the text of the main document. The EIS will explain how information is organized in the document. This will include a list of all tables, figures and photographs referenced in the text. A complete list of supporting literature and references will also be provided. A table of concordance which cross-references the information presented in the EIS with the information requirements set out in the EIS guidelines will be provided. The proponent will provide copies of the EIS and its summary for distribution, as directed by the CNSC, including paper and electronic versions in unlocked, searchable PDF format.

[Top of page](#)

2. Executive Summary

For efficiency, the proponent may consider preparing a summary of the EIS in both official languages (English and French) to be provided to the CNSC at the same time as the EIS. The proponent is also encouraged to consider making the executive summary available in the language(s) spoken by Indigenous communities in close proximity to the project (e.g., Cree, Dene).

The summary, provided as a separate document, will include:

- a concise description of all key project components and related activities
- a summary of the consultation held with Indigenous groups, the public and government agencies, including a summary of the issues raised and the proponent's responses
- an overview of the key environmental effects of the project and proposed technically- and economically-feasible mitigation measures
- the proponent's conclusions on the residual environmental effects of the project after taking mitigation measures into account and the significance of those effects
- sufficient details for the reader to learn about and understand the project, its potential environmental effects, mitigation measures, the significance of the residual effects and the follow-up program

[Top of page](#)

3. Introduction and Overview

3.1 About the proponent

In the EIS, the proponent will:

- provide contact information (e.g., name, address, phone, fax, email)

- identify itself and provide the name of the legal entity or entities that would develop, manage and operate the project
- describe corporate and management structures
- identify key personnel, contractors and/or sub-contractors responsible for preparing the EIS

3.2 Project overview

The EIS will describe the project, key project components and associated activities, scheduling details, the timing of each phase of the project and other key features. If the project is part of a larger sequence of projects, the EIS will outline the larger context.

The overview identifies the key project components rather than providing a detailed description which is presented in a different section of the EIS.

3.3 Project location

The EIS will contain a description of the geographical setting in which the project will take place. This description should include those aspects of the project and its setting that are key to understanding the project's potential adverse environmental effects, including:

- geographical maps of the project location (at an appropriate scale) that includes project components, boundaries of the proposed project site with Universal Transverse Mercator (UTM) coordinates, the lease boundary, site study area, local study area, regional study area, the major existing infrastructure, adjacent land uses and any important environmental features
- current land use in the area
- the distance of the project facilities and components to any federal lands

- the environmental significance and value of the geographical setting in which the project will take place and the surrounding area
- environmentally sensitive areas, such as national, provincial and regional parks, ecological reserves, wetlands, estuaries and habitats of federally (Schedule 1 of *Species at Risk Act* (SARA)) or provincially listed species at risk and other sensitive areas
- a description of local and Indigenous communities
- traditional Indigenous territories, treaty lands, and Indian reserve lands and Métis harvesting regions and/or settlements

3.4 Regulatory framework and the role of government

The EIS should identify:

- the environmental and other regulatory approvals and legislation, including the CEAA 2012, that are applicable to the project at the federal, provincial, regional and municipal levels
- government policies, resource management plans, planning or study initiatives pertinent to the project and/or EA and their implications
- any treaty or self-government agreements with Indigenous groups that are pertinent to the project and/or EA
- any relevant land use plans, land zoning or community plans
- regional, provincial and/or national objectives, standards or guidelines that have been used by the proponent to assist in the evaluation of any predicted environmental effects

[Top of page](#)

4. Project description

4.1 Purpose of the project

The EIS will describe the purpose of the project by providing the rationale for the project. It explains the background, the problems or opportunities that the project is intended to satisfy and the stated objectives from the proponent's perspective. If the objectives of the project are related to broader private or public sector policies, plans or programs, this information should also be included.

4.2 Alternative means of carrying out the project

The EIS shall identify and describe alternative means to carry out the project that are, from the perspective of the applicant, technically and economically feasible. The alternative means identified by the proponent include options for locations, development and implementation methods, routes, designs, technologies and mitigation measures. Alternative means may also be related to the construction, operation, expansion, decommissioning and abandonment of a physical work.

The approach and level of effort applied to addressing alternative means is established on a project-by-project basis, taking into consideration:

- the characteristics of the project
- the environmental effects associated with the potential alternative means
- the health or status of VCs that may be impacted by the alternative means
- the potential for mitigation and the extent to which mitigation measures may address potential environmental effects
- the level of concern expressed by the public and Indigenous groups

The EIS should also describe the environmental effects of each of the alternative means. It should list the criteria used to identify an alternative means as unacceptable and explain how these criteria are applied, as

should the criteria used to examine the environmental effects of each remaining alternative means to identify the preferred alternative.

The proponent will complete the following procedural steps for addressing alternative means:

- Identify and describe in sufficient detail the alternative means to carry out the project:
 - develop criteria to determine the technical and economic feasibility of the alternative means
 - identify those alternative means that are technically and economically feasible
- Identify the effects of each technically and economically feasible alternative means:
 - identify those elements of each alternative means that could produce effects in sufficient detail to allow a comparison with the effects of the project
 - the effects referred to above include both environmental effects and potential adverse impacts on potential or established Indigenous and treaty rights and related interests
- Describe the methodology used for the analysis of alternative means and the conclusion reached (i.e., preferred means)

For further information regarding “purpose of” and “alternative means”, please consult the Impact Assessment Agency’s operational policy statement, *Addressing “Purpose of” and “Alternative Means” under the CEAA 2012* (see bibliography).

The CNSC recognizes that projects may be in the early planning stages when the EIS is being prepared. Proponents are strongly encouraged to conduct an environmental effects analysis where they have not made final decisions about the placement of project infrastructure or the technologies to be used, or if several options exist for various project components.

4.3 Scope of project

The scope of the project for the purpose of the EA includes all the phases, components, activities and federal decisions proposed by the proponent as described in the project description that has been determined to meet the requirements of the *Prescribed Information for the Description of a Designated Project Regulations*. The CNSC's Commission may also determine that other components and/or activities in relation to the project are to be included in the project scope.

The proponent will consider all phases, components, activities and federal decisions identified in the scope of project as part of the effects assessment.

4.3.1 Project components

The EIS will describe the project by presenting the project components, associated and ancillary works, and other characteristics that will assist in understanding the environmental effects.

4.3.2 Project activities

The EIS will include descriptions of each phase associated with the proposed project.

This will include descriptions of the activities to be carried out during each phase, the location of each activity, expected outputs and an indication of the activity's magnitude and scale.

Although a complete list of project activities should be provided, the emphasis will be on activities with the greatest potential to have environmental effects. Sufficient information will be included to predict environmental effects and address concerns identified by the public and

Indigenous groups. Highlight activities that involve periods of increased environmental disturbance or the release of materials into the environment.

The EIS will include a summary of the changes that have been made to the project since originally proposed, including the benefits of these changes to the environment, Indigenous peoples, and the public.

The EIS will include a schedule including time of year, frequency, and duration for all project activities.

[Top of page](#)

5. Scope of the environmental assessment

5.1 Factors to be considered

Scoping establishes the EA's parameters and focuses the assessment on relevant issues and concerns. The EA of the designated project must take into account the following factors, as listed in subsection 19(1) of the CEAA 2012:

- a. the section 5 environmental effects of the designated project (such as changes to fish and fish habitat, aquatic species, migratory birds), including the environmental effects of malfunctions or accidents that may occur in connection with the designated project, and any cumulative environmental effects likely to result from the designated project in combination with other physical activities that have been or will be carried out
- b. the significance of those environmental effects
- c. comments from the public that are received in accordance with the CEAA 2012

- d. mitigation measures that are technically and economically feasible and that would mitigate any significant adverse environmental effects of the designated project
- e. the requirements of the follow-up program in respect of the designated project
- f. the purpose of the designated project
- g. alternative means of carrying out the designated project that are technically and economically feasible and the environmental effects of any such alternative means
- h. any changes to the designated project that may be caused by the environment
- i. the results of any relevant study conducted by a committee established under section 73 or 74 of the CEEA 2012
- j. any other matter relevant to the EA that the CNSC requires to be taken into account, in accordance with the *Nuclear Safety and Control Act*

Pursuant to subsection 19(2) of the CEEA 2012, the scope of the factors to be taken into account under paragraphs 19(1)(a), (b), (d), (e), (g), (h) and (j) is determined by the CNSC, as the responsible authority.

In conjunction with subsections 4.1 and 4.4 of REGDOC-2.9.1, *Environmental Protection: Environmental Policy, Assessments and Protection Measures*, the CNSC requires an environmental risk assessment (ERA) and a human health risk assessment (HHRA) as part of the EIS. An ERA is a systematic process that identifies, quantifies and characterizes the risk posed by nuclear or hazardous substances and physical stressors in the environment. The ERA:

- identifies facility- or activity-specific characteristics and site-specific environmental characteristics
- identifies interactions between those characteristics
- assesses the likelihood and significance of these interactions and the resulting potential effects on the environment and the public

An HHRA is completed as a sub-element of an ERA for both nuclear and hazardous substances.

To implement the Government of Canada's interim measure with respect to upstream greenhouse gas emissions, the CNSC may require consideration of these types of emissions in the scope of the EA. On March 19, 2016, a definition of upstream greenhouse gas (GHG) emissions was published by Environment Canada and Climate Change in the *Canada Gazette*. The proposed definition of upstream includes "all industrial activities from the point of resource extraction to the project under review." The processes to be considered as upstream activities will vary by type of resource and nature of the project being assessed. In general, upstream activities include extraction, processing, handling and transportation.

Where a reliable and feasible methodology exists for calculating upstream GHG emissions linked to the project, the proponent will be required to provide sufficient information to estimate these types of emissions. This information should be presented by individual pollutant and summarized in carbon dioxide equivalent units per year. If upstream GHG emissions are not considered in the assessment, the proponent will provide a rationale in the EIS.

5.2 Scope of factors

5.2.1 Valued components to be examined

Valued components (VCs) refer to environmental biophysical or human features that may be impacted by a project. The value of a component relates not only to its role in the ecosystem, but also to the value people place on it. For example, it may have scientific, social, cultural, economic, historical, archaeological or aesthetic importance.

The EIS identifies the VCs linked to section 5 of the CEAA 2012, including those identified in section 9.2 (Part 2), that may be affected by changes in the environment, as well as species at risk and their critical habitat as per the requirement outlined in section 79 of the SARA.

Under section 73 of the SARA, the Minister of Environment and Climate Change Canada may grant permits authorizing an activity affecting a listed wildlife species or any part of its residence or critical habitat that would otherwise be prohibited. Where the proponent determines that a listed wildlife species or any part of its residence or critical habitat would be affected by the project activities, it should consult directly with the Canadian Wildlife Service as early as possible in the process.

The final list of VCs to be presented in the EIS will be completed according to the evolution and design of the project and reflect the knowledge about the environment acquired through public consultation and Indigenous engagement. The EIS will describe the methods used to predict and assess the potential adverse environmental effects the project would have on these components.

The VCs will be described in sufficient detail to allow the reviewer to understand their importance and to assess the potential for environmental effects arising from the project activities. The EIS will provide a rationale for selecting specific VCs and for excluding any VCs or information specified in these guidelines. Challenges with particular exclusions may arise, so it is important to document the information and criteria used to make each determination. Examples of justification include primary data collection, computer modelling, literature references, public consultation, expert input or professional judgement. The EIS will identify those VCs, processes and interactions that were raised as concerns during any workshop or meeting held by the proponent, or that the proponent considers will likely be affected by the project. In doing so, the EIS will indicate to whom these

concerns are important and why, including environmental, Indigenous, social, economic, recreational and aesthetic considerations. If comments are received on a component that has not been included as a VC, the comments will be summarized, and the rationale for excluding the VC will be provided.

5.2.2 Spatial and temporal boundaries

The spatial and temporal boundaries used in the EA may vary depending on the VC and will be considered separately for each one. The proponent is encouraged to consult with the CNSC, federal and provincial government departments and agencies, local government and Indigenous groups. It is also encouraged to take into account public comments when defining the spatial boundaries used in the EIS.

The EIS will describe the spatial boundaries, including local and regional study areas, for each VC to be used to assess the potential adverse environmental effects of the project and provide a rationale for each boundary. Spatial boundaries are defined by taking into account the following criteria. This list is not exhaustive:

- a. the physical extent of the proposed project, including any off-site facilities or activities
- b. the extent of aquatic and terrestrial ecosystems potentially affected by the project
- c. the extent of potential effects arising from noise, light and atmospheric emissions
- d. the extent to which traditional land use or treaty rights could potentially be affected by the project
- e. current land and resource use for residential, commercial, industrial, recreational, cultural and aesthetic purposes by communities whose areas include the physical extent of the project

- f. the size, nature and location of past, present and reasonably foreseeable projects and activities which could interact with items (b), (c), (d) and (e)
- g. community and Indigenous traditional knowledge, and ecological and technical considerations

The following geographic study areas should serve as the basis for developing project- and effect-specific study areas:

Site study area: The site study area is the project's footprint. In other words, it is where project activities would be undertaken, and it includes the project's proposed facilities, buildings and infrastructure.

Local study area: The local study area is defined as the area that exists outside the site study area boundary, where measurable changes to the environment may be anticipated as a result of the proposed activities at any phase of the project, either through normal activities or from possible accidents or malfunctions. The boundaries must change if appropriate following an assessment of the spatial extent of potential effects. The geographic boundary depends on the factor being considered (e.g., a local study area defined for the aquatic environment will differ from that defined for the atmospheric environment).

Regional study area: The regional study area is defined as the area within which the potential effects of this project may interact with the effects of other projects, resulting in potentially cumulative effects. The geographic boundary for the regional study areas is also specific to the factor being considered.

Within these study areas, the boundary of concern will extend to a depth that will include the full extent of the surface water and groundwater.

The EA's temporal boundaries will span all phases of the project determined to be within the scope of the project, as specified in section 4.3. If impacts are predicted after project decommissioning, this should be taken into consideration when defining boundaries. At a minimum, the assessment is expected to include the period of time during which the maximum impact is predicted to occur. Community and Indigenous traditional knowledge should factor into decisions about temporal boundaries. If the temporal boundaries do not span all phases of the project, the EIS will identify the boundaries used and provide a rationale.

[Top of page](#)

6. Public and stakeholder consultation

In accordance with CNSC's REGDOC-3.2.1, *Public Information and Disclosure*, the EIS will describe the ongoing and proposed participation activities that the proponent will undertake or that it has already undertaken on the project. It will describe the efforts made to distribute project information, and describe the information and materials that were distributed during the public consultation process. The EIS will indicate the methods used, where the consultation was held, the persons and organizations consulted, the concerns voiced and the extent to which this information was incorporated into the project design and EIS. The EIS will provide a summary of the key project issues raised and their potential environmental effects, as well as describe any outstanding issues and ways to address them.

[Top of page](#)

7. Indigenous engagement

In accordance with the CNSC's REGDOC-3.2.2, *Indigenous Engagement*, the EIS will describe the proponent's engagement activities with potentially affected Indigenous groups.

The EIS will include, and the proponent should consider engaging with potentially affected Indigenous groups to obtain their views on the following, to be included in the EIS:

- the objectives of Indigenous engagement activities and the methods used
- each Indigenous group's potential or established rights, including geographical extent, nature, frequency, timing, maps and data sets (e.g., fish catch numbers), when this information is provided by a group to the proponent or available through public records
- comments, specific issues and concerns raised by Indigenous groups and how the key concerns were addressed
- the potential adverse impacts of the project on potential or established Indigenous or treaty rights
- the effects of changes to the environment on Indigenous peoples (health and socio-economic conditions; physical and cultural heritage, including any structure, site or thing that is of historical, archaeological, paleontological or architectural significance; and current use of lands and resources for traditional purposes), pursuant to paragraph 5(1)(c) of the CEEA 2012
- VCs suggested by Indigenous groups for inclusion in the EIS, whether they were included and the rationale for any exclusions
- measures identified to mitigate or accommodate potential adverse impacts of the project on the potential or established Indigenous or treaty rights and effects of changes to the environment for Indigenous peoples, including suggestions made by Indigenous groups

One suggested format for providing this information is a table to track the key issues raised by each Indigenous group, including concerns raised about the project, proposed mitigation options and where appropriate, a reference to the proponent's analysis in the EIS.

[Top of page](#)

8. Description of the environment

8.1 Baseline environment

The EIS will include a description of the environment, including the components of the existing environment and environmental processes, their interrelations and interactions, and the variability in these components, processes and interactions over time scales appropriate to the EIS. In characterizing the environmental effects of the project, the proponent will consider the current baseline environment and environmental trends within the project area. The description of the existing baseline and environmental trends should consider past projects and activities carried out by the proponent and/or others in the project area.

Based on the scope of the project, the EIS will present sufficiently detailed baseline information to determine the effects the project could have on the VCs and analyze those effects. If other VCs are identified while conducting the EA, the baseline condition for these components will also be described in the EIS. The baseline description should include results from studies done prior to any physical disruption of the environment due to initial project activities (e.g., site preparation). To determine the appropriate spatial boundaries to describe the baseline information, refer to

section 5.2.2 (Part 2) of these guidelines. As a minimum, the EIS will include a description of the following biophysical and human (health/socio-economic) environmental components.

8.2 Atmospheric environment

The atmospheric environment includes the climate conditions at the site and in the local and regional study areas. It includes the seasonal variations in weather conditions in the study areas to allow the assessment of effects on the facility or activity.

The applicant or licensee should provide a description of the existing ambient air quality in the study areas, with emphasis on characterizing radiological and non-radiological analytes.

The description should include meteorological information, such as air temperature, relative humidity, precipitation, wind speed and direction, atmospheric pressure and solar radiation. It should also include the occurrence of weather phenomena (e.g., lightning, temperature inversions, fog). Special consideration should be given to analyzing extreme and rare meteorological phenomena (e.g., tornadoes). Uncertainties should be described and taken into account when discussing the reliability of the information presented.

The description should also include current ambient daytime and nighttime noise levels at the site and local study areas, and include information about its source(s), geographic extent and temporal variations. The description should provide ambient noise levels for other areas that could be affected by the facility or activity. Some examples are:

- increased traffic along transportation corridors to and from the site during construction

- receptors at residences and sensitive sites (such as hospitals, schools, daycare facilities, seniors' residences and places of worship)

The applicant or licensee should describe the influence of regional topography or other features that could affect weather conditions in the study areas.

The baseline information should be sufficient to support the use of an atmospheric dispersion model to conduct a site-specific ERA and to support an assessment of environmental effects on the project (e.g., tornadoes).

8.3 Surface water environment

The surface water environment includes all surface water features and hydrology that affect surface water at the site or in the local and regional study areas. The applicant or licensee should include delineation of drainage basins at appropriate scales.

When documenting the water quality of all surface water, the applicant or licensee should demonstrate the use of appropriate sampling and analytical protocols for the range of analytical parameters that could potentially be influenced by the facility or activity. This information should be presented using tables, maps and figures to provide an understanding of surface water characteristics and conditions at the site and in the local and regional study areas.

The applicant or licensee should describe hydrological regimes within the drainage basin, including seasonal fluctuations and the year-to-year variability of all surface waters. The applicant or licensee should assess the normal flow, flooding and drought properties of water bodies, as well as the interactions between surface water and groundwater flow systems. The

applicant or licensee should describe all water sources used for drinking water in the area, including source water intakes for drinking water treatment facilities.

The baseline information should be sufficient to support the use of an aquatic dispersion model to conduct a site-specific ERA and to support an assessment of the effects (e.g., flooding) of the environment for the facility or activity.

The applicant or licensee should document the sediment quality of all water bodies to be affected by the facility or activity and demonstrate the use of appropriate sampling and analytical protocols for the range of analytical parameters with the potential to be influenced by the facility or activity. This information should provide an appropriate understanding of sediment characteristics and conditions on the site and in the local and regional study areas.

The study design should be fully described, including the allocation of samples in space and time, measurement methods and results.

The applicant or licensee should include an assessment of any limitations or gaps in the quality and extent of baseline data and methods, as well as the method(s) by which they have been addressed.

8.4 Aquatic environment

The aquatic environment includes the aquatic and wetland species at the site and within the local and regional study areas, including the flora and fauna and their habitats.

The applicant or licensee should seek information from relevant authorities (e.g., Environment and Climate Change Canada, Fisheries and Oceans Canada and provincial or territorial authorities) on aquatic and wetland

species and habitat for the local and regional study areas. The applicant or licensee should also undertake independent studies to gather the necessary information.

The applicant or licensee should include a description of the food chain and food web dynamics as a habitat component, as this relates to fish populations, and the potential effects (e.g., impingement and entrainment) the facility or activity will have.

The applicant or licensee should provide detailed habitat mapping that demonstrates habitat usage by fish within the study areas. This information should include depth profiles, substrate mapping, water temperature profiles and a description of known and potential habitat usage (e.g., spawning, nursery, rearing, feeding and migration) by fish in the study areas.

The applicant or licensee should identify any biological species that have natural conservation status – in other words, that are deemed rare, vulnerable, endangered, threatened or uncommon at a federal, provincial or municipal level – and their critical habitats, if any are identified.

The applicant or licensee should provide baseline characterization of radionuclide and hazardous substance levels in aquatic biota to support human and ecological risk assessments.

The applicant or licensee should fully describe the study design, including the allocation of samples in space and time, measurement methods and results.

The applicant or licensee should include an assessment of any limitations or gaps in the quality and extent of baseline data and methods, as well as the method(s) by which they have been addressed.

8.5 Geological and hydrogeological environment

The geological and hydrogeological environment includes the bedrock and overburden geology at both the local and regional scales.

8.5.1 Geology

The applicant or licensee should characterize the geomorphology, topography, quaternary geology and soil characteristics, structural geology, petrology, geochemistry, economic geology and hydrogeology. The applicant or licensee should also describe the geomechanical properties that apply to the region and at the site that will be disturbed.

The applicant or licensee should provide the geotechnical properties of the overburden, including shear strength and liquefaction potential, to allow for the assessment of slope stability and the bearing capacity of foundations under both static and dynamic conditions.

The description of the structural geology should include regional, local and site-specific documentation of fractures and faults. It should include a description of primary geological features and deformation fabrics, both at the site and in the local and regional study areas.

If applicable, the applicant or licensee should describe the coastal geomorphology and include the characteristics of any lakefront, ocean bluff or shoreline, and both near-shore and offshore zones.

The baseline characterization should be sufficient to assess the effects of the environment on the facility or activity (e.g., seismic effects).

The applicant or licensee should present a geological model that incorporates all overburden and bedrock information. If extrapolation is required to derive the stratigraphy, the applicant or licensee should explicitly discuss the uncertainties and the need for additional field investigations to reduce those uncertainties.

The applicant or licensee should describe the geotechnical and geophysical hazards, including consideration of subsidence, uplift, seismicity (and active faulting), and it should consider the potential for movement at the ground surface (including co-seismic rupture) and earthquake ground motions. A seismic hazard assessment should be provided. Where appropriate, narrative descriptions should be supplemented by geological maps, figures, cross-sections, borehole logs and photographs (with specific location information).

8.5.2 Hydrogeology

The applicant or licensee should describe the hydrogeology at the site and in the local and regional study areas. The description should characterize the physical and geochemical properties of all overburden and bedrock hydrogeological units (from the ground surface to the uppermost basement unit, which is site dependent).

Units may be characterized as aquifers or aquitards, and unit descriptions should include their geochemical characteristics, vertical and lateral permeabilities, transport mechanism (diffusion versus advection) and the directions of groundwater flow.

The applicant or licensee should identify the groundwater recharge and discharge areas, and describe in detail groundwater interactions with surface waters.

The applicant or licensee should present a conceptual and numerical hydrogeological model that discusses the hydrostratigraphy and groundwater flow systems.

The applicant or licensee should provide a description of baseline groundwater quality at the site and in the local study area. The applicant or licensee should also describe local and regional potable groundwater supplies, including their current use and potential for future use.

8.6 Terrestrial environment

The terrestrial environment includes flora and fauna, their habitats, any wildlife corridors and the soil.

The applicant or licensee should describe the terrestrial species at the site and within the local and regional study areas, including flora, fauna and their habitat. The applicant or licensee should identify all biological species at risk (i.e., endangered, threatened, special concern, extirpated at a federal, provincial or municipal level) known to occur in the area or where the site is within range of the species.

The applicant or licensee should describe the presence and importance of wildlife habitat within the study areas, including critical habitats for any listed species. The applicant or licensee should also describe any wildlife corridors and physical barriers to movement.

The applicant or licensee should identify all protected and conservation areas established by federal, provincial and municipal jurisdictions (e.g., wilderness areas, parks, sites of historical or ecological significance, nature reserves, federal migratory bird sanctuaries and wildlife management areas).

The applicant or licensee should describe the existing soil quality (including hazardous and radiological substance concentrations) for all study areas, as well as any additional soil quality parameters potentially relevant for modelling purposes (such as the transport and bioavailability of contaminants of potential concern).

The applicant or licensee should provide baseline a characterization of radionuclide and hazardous substance levels in vegetation and other non-human biota to support human and ecological risk assessments. The

characterization should also take into consideration the baseline conditions of other applicable environmental components (e.g., the atmospheric environment).

The applicant or licensee should undertake independent studies to gather the necessary information, as appropriate. The applicant or licensee should describe field studies in terms of representativeness of the target populations where possible. The applicant or licensee should fully describe the design of the study, including the allocation of samples in space and time, measurement methods and results.

The applicant or licensee should include an assessment of any limitations or gaps in the quality and extent of baseline data and methods, and the method(s) by which they were addressed.

8.7 Ambient radioactivity

Ambient radioactivity arises from sources, their activity levels and their origin, for all applicable environmental media (including air, soil, food, water, aquatic sediments and plant or animal tissue).

The applicant or licensee should describe the ambient radiological conditions at the site and in the local and regional study areas. The applicant or licensee should include information about the existing conditions, including an inventory of sources, their activity levels and their origin (natural or anthropogenic), for all applicable environmental media.

The applicant or licensee should fully describe the design of the study, including the allocation of samples in space and time, measurement methods and results.

The description should include an assessment of any limitations or gaps in the quality and extent of the baseline data and methods, as well as the method(s) by which they have been addressed.

8.8 Human health

The potential effects of the facility or activity on human health include both radiological sources and non-radiological contaminants.

The applicant or licensee should describe the current health profiles of the communities likely to be affected by the facility or activity, including information on the population health of the communities in the local and regional study areas.

The applicant or licensee should provide, to the extent available, information about the current consumption of locally grown harvests and country foods, and the quality by food type, amounts consumed and parts consumed (whole body or specific organs).

The applicant should characterize the socio-economic environment, including:

- the rural and urban settings likely to be affected by the project
- any federal lands and lands located outside the province or Canada that may be affected by the project
- the current use of land in the study area, with a description of hunting, recreational and commercial fishing, trapping, gathering, outdoor recreation, use of seasonal cabins, outfitters
- current use of all waterways and water bodies that will be directly affected by the project, including recreational uses, where available
- location of and proximity to any permanent, seasonal or temporary residences or camps
- health ¹ and socio-economic conditions, covering the functioning and health of the socio-economic environment and encompassing a broad range of matters that affect communities in the study area in a way that recognizes interrelationships, system functions and vulnerabilities

- physical and cultural heritage, including structures, sites or things of historical, archaeological, paleontological or architectural significance

8.9 Indigenous land and resource use

Indigenous land and resource use includes lands, waters and resources of specific value, traditional activities and lifestyle, and traditional dietary habits.

Traditional land use may include areas where traditional activities are being carried out, such as establishing seasonal camps, camping, travel on traditional routes, gathering of country foods and medicines (hunting, fishing, trapping, planting and harvesting). Traditional land use also includes spiritual sites of significance to Indigenous people.

The applicant or licensee should identify the lands, water and resources of specific social, economic, archaeological, cultural or spiritual value to Indigenous people, including established and asserted Indigenous or treaty rights, that may be affected by the facility or activity.

The applicant or licensee should describe Indigenous land and resource use at the site and in the local and regional study areas. The applicant or licensee should identify traditional activities, including activities for food, social, ceremonial and other cultural purposes, in relation to such lands, waters and resources with a focus on the current use of lands, waters and resources for traditional purposes.

The applicant or licensee should describe the traditional dietary habits and dependence on country foods and harvesting for other purposes, including harvesting of plants for medicinal purposes. The analysis should focus on identifying the potential adverse effects of the facility or activity that impact the ability of future generations of Indigenous people to pursue traditional activities or lifestyle.

9. Effects assessment

9.1 Predicted changes to the physical environment

The assessment will include a consideration of the predicted changes to the environment that result from the project being carried out or from of any powers, duties or functions to be exercised by the federal government in relation to the project. These predicted changes to the environment are to be considered in relation to each phase of the project (i.e., construction, operation, decommissioning) and are to be described in terms of magnitude, geographic extent, duration and frequency, and whether the environmental changes are reversible or irreversible.

As changes to various parts of the physical environment may be inter-related in an ecosystem, the EIS will explain and describe the connections between the changes described.

9.2 Predicted effects on valued components

Based on the predicted changes to the environment identified in section 9.1 (Part 2), the proponent is to assess the environmental effects of the project on the VCs identified as per section 5.2.1 (Part 2).

Based on the predicted changes to the environment identified in section 9.1 (Part 2), additional VCs are to be selected based on the following:

- If there is potential for the project to result in environmental changes on federal lands, in another province or in another country, VCs of importance not already identified are to be listed in this section.
- If federal decisions about the project will lead to environmental changes, these environmental changes are to be considered stand-

alone VCs.

All interconnections between VCs and between changes to multiple VCs will be described.

The proponent will use the information in appendix C of the CNSC's REGDOC-2.9.1, *Environmental Protection: Environmental Policy, Assessments and Protection Measures* and CEAA 2012 guidance documents listed on the Impact Assessment Agency's website for guidance on assessing the environmental effects of the project (refer to the bibliography for titles and web pages).

9.3 Mitigation measures

Every EA conducted under the CEAA 2012 will consider measures that are technically and economically feasible and that would mitigate any significant adverse environmental effects of the project. Measures that are technically and economically feasible include application of best industry practices, pollution prevention principles such as best available technology and techniques economically achievable, and radiation protection principles, such as keeping radiation exposure and doses as low as reasonably achievable (ALARA). Under the CEAA 2012, mitigation includes measures to eliminate, reduce or control the adverse environmental effects of a project, as well as restitution for damages to the environment through replacement, restoration, compensation or other means.

Each measure will be specific, achievable, measurable and verifiable, and described in a manner that avoids ambiguity in intent, interpretation and implementation. Mitigation measures may be considered for inclusion as conditions in the EA decision statement and/or in other compliance and enforcement mechanisms provided by other authorities' permitting or licensing processes.

As a first step, the proponent is encouraged to use an approach based on the avoidance and reduction of the effect(s) at the source. Such an approach may include the modification of the design of the project or relocation of project components.

The EIS will describe the standard mitigation practices, policies and commitments that constitute technically and economically feasible mitigation measures and that will be applied as part of standard practice regardless of location (including the measures directed at mitigating adverse socio-economic effects). The EIS will then describe the project's environmental protection plan and its environmental management system, through which the proponent will deliver this plan. The plan will provide an overall perspective on how potentially adverse effects would be minimized and managed over time. The EIS will further discuss the mechanisms the proponent would use to require its contractors and sub-contractors to comply with these commitments and policies and with auditing and enforcement programs.

The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the proponent intends to implement them and the environmental outcome the mitigation is designed to address. The EIS will describe mitigation measures in relation to species and/or critical habitat listed under the SARA. These mitigation measures will be consistent with any SARA permit, applicable recovery strategy and/or action plan.

The EIS will specify the actions, works, minimal disturbance footprint techniques, best available technology, corrective measures or additions planned during the project's various phases to eliminate or reduce the significance of potential adverse effects. The impact statement will also present an assessment of the effectiveness of the proposed technically and

economically feasible mitigation measures. The basis used to determine whether the mitigation measure reduces the significance of a potential adverse effect will be made explicit. The proponent is also encouraged to identify mitigation measures for effects that are adverse although not significant.

The EIS will indicate what other technically and economically feasible mitigation measures were considered, and explain why they were rejected. Trade-offs between cost savings and effectiveness of the various forms of mitigation will be justified. The EIS will identify who is responsible for the implementation of these measures and the system of accountability.

For proposed mitigation measures for which there is little experience or that have questionable effectiveness, the potential environmental risks and effects – should those measures not be effective –will be clearly and concisely described. In addition, the EIS will identify the extent to which technological innovations will help mitigate environmental effects. Where possible, it will provide detailed information on the nature of these measures, their implementation and management, and how they are integrated into the follow-up program.

The EIS will document specific suggestions raised by Indigenous groups for mitigating the effects of changes to the environment on Indigenous peoples (section 5(1)(c) of CEAA 2012). For the mitigation measures intended to address the effects of changes to the environment for Indigenous peoples, the proponent must discuss the residual effects with the Indigenous groups prior to submitting the EIS.

Adaptive management is not considered a mitigation measure, but if the follow-up program indicates that corrective action is required, the proposed approach for managing the action should be identified.

9.4 Other effects to consider

9.4.1 Accidents and malfunctions

The applicant should provide an assessment of potential health and environmental effects resulting from postulated radiological and conventional malfunctions or accidents. The EIS should also include any mitigation measures, such as monitoring, contingency, clean-up or restoration work in the surrounding environment that would be required during or immediately following the postulated malfunction and accident scenarios.

The EIS should provide a description of postulated malfunction and accident sequences leading to a radiological or non-radiological release considering, as appropriate, internal events, external events and human-induced events, including their frequency, an explanation of how these events were identified and any modeling that was performed.

The applicant can use a bounding approach or use facility- or activity-specific information (e.g., design, operation, projected environmental releases) in the assessment of radiological accidents and malfunctions. If a bounding approach is used, the applicant should provide a detailed rationale for the selection of each bounding scenario.

The EIS should include the source, quantity, mechanism, pathway, rate, form and characteristics of contaminants and other materials (physical and chemical) likely to be released to the surrounding environment during the postulated malfunctions and accidents.

Note: Malfunctions and accidents are reviewed in depth under the NSCA for licensing purposes (for example, under REGDOC-2.4.1, *Deterministic Safety Analysis*; REGDOC-2.4.2, *Probabilistic Safety Assessments for Nuclear Power Plants* and REGDOC-1.1.1, *Site Evaluation and Site Preparation for New Reactor Facilities*). These scenarios should be taken into consideration by the applicant when designing environmental protection measures.

If applicable, the applicant should use operating experience (OPEX) to identify any past abnormal operations, accidents and spills to the extent that they are relevant to the current assessment for the purposes of identifying malfunction and accident scenarios to be assessed.

9.4.2 Effects of the environment on the project

The EIS shall take into account how the environment could adversely affect the project and how this in turn could result in effects on the project (e.g., extreme environmental conditions resulting in malfunctions and accidental events). These events will be considered in different probability patterns (e.g., 5-year flood vs. 100-year flood).

Examples include local conditions, natural hazards (e.g., severe and/or extreme weather conditions), external events (e.g., flooding, drought, ice jams, landslides, avalanches, erosion, subsidence, fire, outflow conditions, geotechnical hazards, seismic events) and biophysical hazards (e.g., algae).

The applicant shall also take into account any potential effects of climate change on the project, including an assessment of whether the project might be sensitive to changes in climate conditions during its lifecycle.

The EIS will provide details of planning, design and construction strategies intended to minimize the potential environmental effects of the environment on the project.

9.4.3 Cumulative effects

The applicant shall assess any residual adverse environmental effects of the project in combination with other past, present or reasonably foreseeable projects and/or activities within the study area.

The applicant should explain the approach and methods used to identify and assess cumulative effects. The approach and methods should be consistent with *Assessing Cumulative Environmental Effects under the*

10. Conclusion on significance of residual effects

The applicant shall assess the significance of any residual effects that persist, taking into consideration the proposed mitigation measures. These residual effects are identified during the ERA or a characterization of the environmental effects.

In the EIS, the applicant should include a detailed analysis of the significance of each residual effect. The applicant should clearly explain the method and definitions used to describe the level of the residual adverse effect (e.g., low, medium, high) for each of the criteria assessed. The applicant should also describe any cumulative environmental effects that are likely to result from the designated project in combination with other physical activities that have been or will be carried on. It should also describe how these levels were combined to reach an overall conclusion on the significance of the adverse effects for each VC.

Some specific criteria to be assessed are:

- magnitude of the effect
- spatial extent of the effect
- duration and frequency of the effect
- degree to which the effect can be reversed or mitigated
- ecological importance

The method used to describe the level of the adverse effect should be transparent and reproducible.

The EIS should identify additional criteria used to assign significance ratings to any predicted adverse effects. It should contain clear and sufficient information to enable the CNSC and the public to understand and review the applicant's judgment of the significance of effects. The applicant should define the terms used to describe the level of significance. In assessing significance against the criteria, the EIS should, where possible, employ relevant existing regulatory documents, environmental standards, guidelines or objectives such as prescribed maximum levels of emissions or discharges of specific hazardous substances into the environment or maximum acceptable levels of specific hazardous substances in the environment.

[Top of page](#)

11. Follow-up program

The EIS shall include a framework or preliminary program upon which EA follow-up actions will be managed throughout the life of the project.

The applicant should design the follow-up program to verify the accuracy of the EA predictions and to determine the effectiveness of the measures implemented to mitigate the potential adverse environmental effects of the project. The applicant should also design the follow-up program to incorporate pre-project information that would provide the baseline data; compliance data, such as established environmental quality criteria; regulatory documents, standards or guidelines; and real-time data consisting of observed data gathered in the field. The applicant should describe the compliance reporting methods to be used, including reporting frequency, methods and format.

Where applicable, the proponent will describe how the follow-up program relates to the project's environmental protection plan and environmental management system.

Environmental assessment effects predictions, assumptions and mitigation actions that are to be tested in the follow-up program must be converted into field-testable monitoring objectives. The monitoring design must include a statistical evaluation of the adequacy of existing baseline data to provide a benchmark for testing project effects, and the need for any additional pre-construction or pre-operational monitoring to establish a firmer project baseline.

The proponent will propose a schedule for the follow-up program. The schedule should indicate the timing, frequency and duration of effect monitoring. This schedule would be developed after the statistical evaluation of the length of time needed to detect effects given estimated baseline variability, probable environmental effect size and desired level of statistical confidence in the results (type 1 and type 2 errors).

The description of the follow-up program must include any contingency procedures or plans or other adaptive management provisions as a means of addressing unforeseen effects or correcting exceedances, as required, to comply with benchmarks, regulatory standards or guidelines.

The follow-up program will describe roles and responsibilities for the program and its review process, by both peers and the public.

The EIS should provide discussion on the follow-up program's requirements, and include:

- objectives and structure of the follow-up program and the VCs targeted by the program
- tabular summary and explanatory text of the main components of the program including:

- a description of each monitoring activity under that component
- which of the two generic program objectives the activity is relevant to (e.g., verify EA predictions, determine effectiveness of mitigation measures)
- the specific statement from the EA that goes along with that generic objective and will be the focus for that activity (e.g., program objective: verify predicted effects; environmental assessment effect: no potential adverse effects)
- the specific monitoring objective for that activity
- planned schedule
- roles and responsibilities to be played by the proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the program results
- possible involvement of independent researchers
- program funding sources
- information management and reporting (reporting frequency, methods and format)
- possible opportunities for the proponent to include the participation of the public and Indigenous groups, during the development and implementation of the program

The follow-up program plan should be sufficiently described in the EIS to allow independent judgment as to the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures.

Wheeler River Project – Comments Invited on Denison Mines Corp.'s Project Description

The Canadian Nuclear Safety Commission (CNSC) is seeking comments from the public and Indigenous groups on the project description for the proposed Wheeler River Project. The project involves a new uranium

mining and processing operation located in the Athabasca Basin in northern Saskatchewan, approximately 600 km north of the city of Saskatoon, SK, 4 km west of Highway 914 and midway between Cameco Corporation's Key Lake Mill and McArthur River Mine.

The CNSC has reviewed the project description and determined that it was written in accordance with the *Prescribed Information for the Description of a Designated Project Regulations* (CEAA 2012). Detailed information about the project will be available in the Environmental Impact Statement which will be submitted by Denison Mines Corp. at a later stage of the EA process (refer to Next Steps below).

Comments on the project description should be based on local, regional or traditional knowledge of the site or surrounding environment, or should provide any other relevant information that may help with the conduct of the environmental assessment (EA). All comments received will be considered public.

Written comments must be submitted by **June 30, 2019** to:

Marcelle Phaneuf, Environmental Assessment Officer

Canadian Nuclear Safety Commission

P.O. Box 1046 Station B

280 Slater Street

Ottawa ON K1P 5S9

Telephone: 613-947-3209 or 1-800-668-5284

Fax: 613-995-5086

Email: cnscc.ea-ee.ccsn@canada.ca

Next Steps

Following receipt of comments on the project description, CNSC staff will consider all submissions received and make recommendations to inform the Commission's decision on the scope of the factors to be considered in the EA. In addition, CNSC staff will respond to all comments received from members of the public and Indigenous groups. The comments and responses will be populated in a table and publically posted to the Canadian Environmental Assessment Registry. Effort will be made to collate common issues together.

Following the Commission's decision on the scope of the EA, the proponent, Denison Mines Corp., will then be required to provide to the CNSC an Environmental Impact Statement (EIS) for review. An EIS is a report written by a proponent that presents the technical studies and findings of an EA. The CNSC's *Generic Guidelines for the Preparation of an Environmental Impact Statement pursuant to the Canadian Environmental Assessment Act, 2012* (PDF, 733Kb) provide general instructions on the preparation and information requirements that must be included in the EIS in order to comply with CEAA 2012 requirements.

Participation Opportunities

We'd also like to seek your views on the EA participation opportunities for this project.

As part of the EA process, Indigenous groups and members of the public will have the opportunity, through formal comment periods, to review and comment on the following documents:

- the project description
- the draft Environmental Impact Statement

Indigenous groups and members of the public will also be given the opportunity to submit comments to the Commission for an eventual EA/Licensing hearing as a Commission Member Document (written intervention and/or oral presentation).

In addition, throughout the EA process, CNSC staff will engage with members of the public through more informal engagement opportunities such as open houses, town halls, workshops, webinars, and providing status updates to our project distribution list. As part of standard practice, CNSC staff will focus its efforts in key communities within the regional project area that would provide the greatest opportunity for access by a large number of participants and where possible, capitalize on existing events/festivals in the communities to further extend our reach.

We would like to hear your views and suggestions on in-person engagement opportunities that would be meaningful for you. The feedback received will inform the planning of future activities.

Anyone interested in receiving regular project updates is invited to sign up for the project update e-mail list by sending a request to cnsceae.ccsn@canada.ca.

Ottawa, ON K1P 5S9

Subject: Wheeler River Uranium Project
Notification of temporary suspension of Environmental Assessment

Dear Ms. Cianci:

On March 20, 2020 Denison Mines Corp. (“Denison” or the “Company”) will be announcing the suspension of activities relating to the Environmental Assessment (“EA”) for the Wheeler River Uranium Project. An advanced copy of the Press Release is attached for your reference. The decision to suspend the EA is motivated by the significant social and economic disruption that has emerged as a result of the COVID-19 pandemic, and the Company’s commitment to ensure employee safety, support public health efforts to limit transmission of COVID-19, and exercise prudent financial discipline. The suspension includes a hold on all technical assessments and project focused engagement activities with Indigenous and non-Indigenous interested parties.

Accordingly, Denison hereby requests that the cost recovery fees associated with the Regulatory Activity Plan, payable to the Canadian Nuclear Safety Commission (“CNSC”), be put on hold until the CNSC receives further notice from Denison. Given the timing of this notification, Denison understands that the fee structure can be re-evaluated prior to the start of the upcoming fiscal year (April 2020) and that we can expect an updated fee estimate for the 2020-2021 fiscal year.

To the extent possible, Denison will provide the CNSC with advanced notice on the re-commencement of EA activities as well as an updated expected submission date for the draft Environmental Impact Statement, once established. It is important for the Company to maintain open lines of communication with the CNSC, as it is our intent to advance the EA process once global circumstances allow. In keeping with Denison’s effort to be transparent throughout the EA process, Denison will also be notifying certain Indigenous and non-Indigenous groups regarding our recent decisions.

If you have any questions, please do not hesitate to contact me by phone at 306-652-8201 ext. [REDACTED] or by email at [REDACTED]. Alternatively, you can contact Janna Switzer by phone at 306-652-8201 ext. [REDACTED] or by email at [REDACTED].

Regards,

David Bronkhorst
Vice President, Operations

Cree – Page xxv

Summary

Wheeler River Project

The Wheeler River Project (Wheeler or the Project) is a proposed uranium mine and processing plant in northern Saskatchewan, Canada. It is located in a relatively undisturbed area of the boreal forest about 4 km off of Highway 914 and approximately 35 km north-northeast of the Key Lake uranium operation.

Wheeler is a joint venture project owned by Denison Mines Corp. (Denison) and JCU (Canada) Exploration Company Ltd. (JCU). Denison owns 90% of Wheeler and is the operator, while JCU owns 10%. Denison is a uranium exploration and development company with interests focused in the Athabasca Basin region of northern Saskatchewan, Canada with a head office in Toronto, Ontario and technical office in Saskatoon, Saskatchewan. Historically Denison has had over 50 years of uranium mining experience in Saskatchewan, Elliot Lake, Ontario, and in the United States. Today, the company is part owner (22.5%) of the McClean Lake Joint Venture which includes the operating McClean Lake uranium mill in northern Saskatchewan.

To advance the Project, Denison is applying an innovative approach to uranium mining in Canada called in situ recovery (ISR). The use of ISR mining at Wheeler means that there will be no need for a large open pit mining operation or multiple shafts to access underground mine workings; no workers will be underground as the ISR process is conducted from surface facilities. While this mining method has been used extensively on an international basis and currently accounts for more than 50% of global uranium production, it has not previously been used in Canada for uranium mining. Denison has done significant research on international uranium ISR operations to understand best practices and incorporate lessons learned into the design of Wheeler. In order to implement ISR at Wheeler, Denison will apply existing technologies to eliminate the typical challenges experienced at some international uranium ISR operations.

ISR mining at Wheeler will involve injecting a mining solution into the uranium deposit through a series of cased drill holes (about 4 to 8 inches in diameter) called injection wells (Figure A). The mining solution proposed for Wheeler is a low pH or acidic mining solution. As the mining solution passes from the injection wells through the uranium deposit it dissolves the uranium and leaves virtually all other minerals in the host rock in place. Once dissolved, the uranium rich mining solution is recovered and pumped back up to surface through another set of cased drill holes called recovery wells. The combination of injection and recovery wells is called a wellfield. Denison anticipates the wellfield will have the general arrangement of one recovery well in the centre surrounded by 6-8 injection wells with about 10 m spacing between wells. With these configuration options, the final wellfield may include approximately 310 wells over a 90 m x 900 m area.

Denison Mines

**Wheeler River Project
Technical Proposal and Project Description**

Figure A: Overview of the In-situ Recovery Process

Revised - December, 2020

Criticism of international ISR operations largely involves the containment of mining solution and the interaction of the mining solution with groundwater. At Wheeler, in order to contain the solution within the uranium deposit and maximize recovery as well as prevent interaction of the mining solution with surrounding groundwater, Denison will create an impermeable wall using conventional ground freezing technology. The freeze wall will encompass the deposit located at 400 m depth and the overlying sandstone from the basement rock to surface with the existing impermeable basement rock acting as a bottom barrier beneath the deposit. The approximate area of the freeze containment is 90 m wide x 900 m long.

Once on surface, the uranium rich mining solution recovered from the wellfield will be pumped to the on-site processing plant. Inside the processing plant a relatively simple precipitation process will be used to separate the uranium from the mining solution. Once the uranium is removed, the mining solution is reformed with reagents and returned to the wellfield for re-injection and further mining. The process is a closed loop system with potentially no need for treated effluent discharge to the environment. The uranium will be dried, packaged and trucked off site, destined for eventual use in a nuclear power plant.

Once sold and refined off-site, the uranium will be used as fuel for nuclear power plants. Denison estimates that the uranium produced from Wheeler can be used to power 1 million modern homes for approximately 160 years with minimal greenhouse gas emissions. This highlights the importance of the Project at a time when reducing global greenhouse gas emissions are of the utmost importance in the battle against climate change.

In addition to ISR mining and uranium processing, the Project will also require construction, operation, and decommissioning of a number of supporting components. This includes a short (7 km) access road from Highway 914 to the site, an accommodation complex, operations centre, airstrip, a 5 km long road from the site to the airstrip, site roads, a lined pad for storage of impurities from the processing plant and mineralized drill cuttings from wellfield development, water treatment ponds, potable, sewage, and waste water treatment plants. Power will be supplied to Wheeler by connecting into the existing provincial power line along Highway 914 with emergency generators available as a back-up power supply.

The main phases of the Project are construction, operation, decommissioning and post-decommissioning. The Project is subject to both a federal and provincial environmental impact assessment and various licences and permits will also be needed. Following receipt of regulatory approvals, construction would last for approximately two years and may start as early as 2022. Production activities commence following commissioning of the facilities and would last up to 20 years with a production rate of up to 12 M lbs U₃O₈ per year. Decommissioning is expected to last for five years. The five main decommissioning activities include: remediation, decontamination, asset removal, demolition and disposal, and reclamation. Closure of the entire Project will be completed in accordance with all provincial and federal regulations and guidance documents with the fundamental considerations being to ensure physical and chemical stability of the site in order to protect human health and the environment. A five-year post-decommissioning phase will serve to monitor Wheeler and confirm that it is acceptable for either direct release back to the Crown with no future use restrictions or acceptance into the provincial Institutional Control Program for decommissioned sites.

Existing Environment

The Project is located in the Wheeler River Upland Landscape Area of the Athabasca Plain Ecoregion. Exploration activity has occurred in the area over the past 40 years. There are recreational, industrial and traditional land use leases nearby; however, the nearest permanent residences are about 150 km away. The Slush Lake Reserve registered to the English River First Nation, which has no permanent residents, is located approximately 15 km west of Wheeler.

Denison initiated a comprehensive biophysical environmental data collection program in 2016 to characterize the existing or baseline conditions. A robust dataset of atmospheric, hydrogeological, aquatic, and terrestrial data has been collected for the Wheeler site, local and regional study areas and targeted data collection is ongoing. The biophysical environment data collection program to date has focused on defining existing conditions for: air quality (radon and dust), groundwater quality, groundwater levels, surface water quality, lake levels, lake bathymetry, stream flow, sediment quality, aquatic habitats, benthic invertebrates (communities and chemistry), plankton, fish (communities, spawning habitat, and tissue chemistry), amphibians, birds, small mammals, semi-aquatic furbearers, large mammals, ecosite mapping, vegetation (communities and chemistry), soil quality, and wildlife habitat.

Wheeler is located in the Treaty 10 area and the local and regional area surrounding the proposed Project has been claimed by four distinct Indigenous communities as partially or entirely falling within their traditional territories, where traditional land use activities have been historically or are currently practiced. These groups consist of the English River First Nation and the Kineepik, Sipishik and A La Baie Métis locals of the communities of Pinehouse, Beauval and Ile a la Crosse, respectively. Traditional land use activities practiced within the local and regional area of the Project consist of subsistence hunting and fishing, seasonal harvesting of native plants for food and medicinal purposes. During the open water season the rivers and lakes in the area serve as transportation routes to and from areas for harvest of plants and game as well as preferred campsites and cabins. During the winter months the frozen lakes, river banks and muskegs are used as transportation routes to cabins, trap lines and preferred hunting areas. Heritage resource surveys completed at Wheeler to date identified one artifact and the Project has been redesigned to avoid the location of the artifact find.

Overall, Denison believes the baseline biophysical and human environments in the Project areas have been adequately characterized to support the completion of an environmental impact assessment and support future environmental monitoring programs.

Potential Effects

ISR mining, as proposed for the Project, results in a uranium mining and uranium processing Project with no tailings, a relatively small surface disturbance footprint, minimal volumes of clean waste rock (all in the form of drill cuttings), minimal volumes of waste rock (mineralized drill cuttings from wellfield development), minimal generation of other contaminated wastes, near zero carbon emissions and limited (if any) water treatment and discharge. Wheeler will be designed to contain all hazardous materials and careful consideration will be taken to ensure contaminated areas are kept separate from non-contaminated areas. Through Project design, implementation of best management practices, and application of other mitigation measures, Denison will strive to minimize interactions of the Project with the biophysical and human environments throughout all phases of the Project.

The main potential Project effects on the biophysical environment are expected to be: changes in air quality from various emission sources including the processing plant; changes in air quality if radon and radon progeny degas from the uranium rich mining solution; potential changes in groundwater quality from mining solution excursions or the potential discharge of treated effluent to groundwater; changes in water quality, sediment quality, and possibly other aquatic components from the potential discharge of treated effluent to a surface water body; direct loss of wildlife habitat; and indirect effects on wildlife through sensory disturbance. However, Denison anticipates that none of these potential effects will be significant and overall the Project does not pose any long-term risks to the biophysical environment.

The Project's potential effect on the socio-economic component of the human environment is expected to be positive. Wheeler will employ approximately 300 people during two years of construction and about 100 to 150 people during operations. Business opportunities will be available for supplies and services. Any potential effects on traditional land use activities will be limited to the site and local study areas and these effects will be short term and limited to the construction and operating phase of the Project. After decommissioning is completed, access to the site and the ability to practice traditional activities such as fishing and hunting will be fully restored. No effects on traditional land use are expected to occur in the regional study area. Potential effects on workers from a conventional health and safety standpoint will be similar to other mining and industrial sites and Denison expects these effects can be mitigated through management and development of a strong safety culture. Potential effects on workers from radiological exposures will be minimized through Project design measures and closely monitored and managed through implementation of a Radiation Safety Management Program.

In the EIA, Denison will demonstrate that the Project can be constructed, operated, and decommissioned with no significant adverse effects on the biophysical and human environments. Potential effects of the Project will be rigorously and transparently assessed and presented in the EIA. This includes the completion of a human health and ecological risk assessment to demonstrate

the overall low impacts of the Project. The EIA will also outline details of an effective monitoring program. Monitoring will be required to provide proof that the Project is operating legally and within the bounds of its licence obligations.

Engagement

Denison recognizes the importance of engaging with local and Indigenous communities, residents, businesses, organizations, land users and the various regulatory authorities, collectively referred to as 'Stakeholders.' Since 2016 Denison had been engaging with Stakeholders in an ongoing effort to build positive relationships with all parties. Broadly speaking, Denison has categorized the stakeholders into three categories:

- Indigenous communities
- Regulatory authorities
- The general public

Denison has engaged with Stakeholders to provide Project updates and collect input that has been incorporated into the Project's design. This approach is expected to continue. Further, Indigenous Knowledge has been integrated into the baseline data collection programs to ensure appropriate scientific data is collected in key areas to allow for a robust assessment of potential Project interactions as part of the environmental impact assessment.

Denison and several local Indigenous and non-Indigenous communities have executed mutual Memorandums of Understanding (MOU) regarding the Project. These non-binding MOUs formalize the signing parties' intent to work together in a spirit of mutual respect and cooperation to collectively identify practical means by which to avoid, mitigate, or otherwise address potential impacts of the Project upon the exercise of Indigenous rights, Treaty rights, and interests. In addition, the MOUs outline the signing parties' intent to work together to ensure that benefits will flow from the Wheeler River project, provide a process for continued Project engagement and information-sharing about the project, and establish a relationship to identify business, employment and training opportunities for the parties with respect to the Project.

Denison is proud of the relationships it has established with all Stakeholders, and looks forward to continuing to build upon those relationships through an ongoing engagement program as Wheeler advances.

Sommaire

Projet Wheeler River

Le projet Wheeler River (Wheeler ou, le Projet) comprend une mine d'uranium et une usine de traitement proposées dans le nord de la Saskatchewan, au Canada. Il se situe dans une zone relativement peu perturbée de la forêt boréale, à environ 4km de l'autoroute 914 et à environ 35km au nord-nord-est du site d'exploitation d'uranium de Key Lake.

Wheeler est un projet de coentreprise appartenant à Denison Mines Corp. (Denison) et à JCU (Canada) Exploration Company Ltd. (JCU). Denison détient 90% de Wheeler et en est opérateur, tandis que JCU en détient 10%. Denison est une compagnie d'exploration et de développement d'uranium dont les intérêts sont concentrés dans la région du Bassin Athabasca dans le nord de la Saskatchewan au Canada, avec son bureau primaire à Toronto, Ontario et un bureau technique à Saskatoon, Saskatchewan. Denison a plus de 50 ans d'expérience historique dans l'extraction d'uranium en Saskatchewan, à Elliot Lake en Ontario, et aux États-Unis. Présentement, la compagnie est propriétaire (22.5%) de la coentreprise McClean Lake qui comprend l'usine de traitement d'uranium au nord de la Saskatchewan.

Pour faire avancer le projet, Denison applique une nouvelle méthode à l'extraction de l'uranium au Canada qui appelée récupération in situ (RIS). L'utilisation de l'exploitation minière de RIS à Wheeler signifie qu'il ne sera plus nécessaire de recourir à une grande exploitation à ciel ouvert ou aux infrastructures pour accéder les travaux d'une mine souterraine; il n'aura aucun ouvrier sous terre puisque le processus de RIS est mené à partir d'installations de surface. Bien que cette méthode d'exploitation minière soit largement utilisée à l'échelle internationale et représente présentement plus de 50% de la production mondiale d'uranium, elle n'était auparavant pas utilisée au Canada pour l'extraction d'uranium. Denison a effectué d'importantes recherches sur les opérations internationales de RIS pour l'uranium afin de bien comprendre les meilleures pratiques et d'intégrer les leçons apprises à la conception de Wheeler. Afin de mettre en œuvre la RIS à Wheeler, Denison utilisera les technologies existantes pour éliminer les défis typiques rencontrés à quelques opérations internationales de RIS d'uranium.

L'exploitation par RIS à Wheeler impliquera l'injection d'une solution d'exploitation minière dans le gisement d'uranium à travers une série de trous de forage tubés (d'un diamètre de 4 à 8 pouces) appelés puits d'injection. La solution minière proposée pour Wheeler est une solution à pH bas ou acide. Lorsque la solution minière passe des puits d'injection à travers le gisement d'uranium, elle dissout l'uranium et laisse pratiquement tous les autres minéraux dans la roche hôte.

Une fois dissoute, la solution minière, riche en uranium, est récupérée et remontée à la surface par un autre ensemble de trous de forage tubés appelés puits de récupération. La combinaison des puits d'injection et de récupération s'appelle un champ de captage. Denison prévoit que le champ de captage aura la configuration générale d'un puits de récupération au centre entouré de 6 à 8

puits d'injection espacés d'environ 10 m. Avec ces options de configuration, le champ de captage final pourra inclure environ 310 puits sur une aire de 90m x 900m.

Enison Mines

Project Wheeler River
Proposition Technique et Description de Project

Figure A: Aperçu du Processus de Récupération In-Situ (RIS)

Révisé - Décembre, 2020

Les critiques des opérations internationales de RIS concernent largement le confinement de la solution minière et l'interaction entre la solution minière avec les eaux souterraines. À Wheeler, afin de contenir la solution dans le gisement d'uranium, et d'optimiser la récupération ainsi que d'empêcher l'interaction de la solution minière avec les eaux souterraines environnantes, Denison créera une barrière imperméable utilisant la technologie conventionnelle de congélation du sol. La barrière de gel imperméable entourera le gisement situé à 400 m sous terre; ainsi que le grès situé au dessus du gisement et s'étendra depuis le roc de base jusqu'à la surface. Le roc de base imperméable servira de barrière en dessous du gisement. La surface approximative du confinement par le gel sera de 90 m de large par 900 m de long.

Une fois à la surface, la solution minière riche en uranium récupérée du champ de captage sera pompée vers l'usine de traitement sur site. À l'intérieur de l'usine, un processus de précipitation relativement simple sera utilisé pour séparer l'uranium de la solution minière. Une fois que l'uranium est extrait, la solution minière est reconditionnée avec des réactifs et renvoyée au champ de captage pour être réinjectée et extraite. Le processus suit un système en boucle fermée qui ne nécessite, potentiellement, aucun rejet d'effluent traité dans l'environnement. L'uranium sera séché, emballé et acheminé par camion hors site, destiné à être utilisé dans une centrale nucléaire.

Une fois vendu et raffiné hors site, l'uranium sera utilisé comme combustible pour les centrales nucléaires. Denison estime que l'uranium produit par Wheeler peut servir à alimenter 1 million de foyers modernes pendant environ 160 ans avec des émissions minimales de gaz à effet de serre. Cela souligne l'importance du projet à un moment où la réduction des émissions mondiales de gaz à effet de serre revêt une importance capitale dans la lutte contre le changement climatique.

En plus des activités d'extraction (RIS) et de traitement d'uranium, le projet nécessitera également la construction, l'exploitation, et le déclasséement d'un certain nombre de composantes de support. Cela comprend un court chemin d'accès (7 km) allant de l'autoroute 914 jusqu'au site, un complexe d'hébergement, un centre d'opérations, une piste d'atterrissage, une route de 5 km allant du site à la piste d'atterrissage, des routes de chantier, une plateforme couverte de doublure pour le stockage de résidus de l'usine de traitement et des déblais de forage minéralisés provenant de la mise en valeur des champs de captage, des bassins de traitement d'eau, et des usines de traitement (eau potable et eaux usées). L'électricité sera fournie à Wheeler par une connexion à la ligne électrique provinciale existante le long de l'autoroute 914 avec des génératrices de secours disponibles comme source d'alimentation secondaire.

Les phases principales du projet sont la construction, l'exploitation, le déclasséement, et le post-déclasséement. Le projet est assujéti à une évaluation des impacts sur l'environnement au niveau fédéral ainsi que provincial, et divers permis et licences seront également nécessaires. Après avoir reçu les approbations réglementaires, la construction durerait environ deux ans et pourrait commencer dès 2022. Les activités de production débutent suivant la mise en service des installations et dureraient jusqu'à 20 ans, avec un taux de production pouvant atteindre 12M lb U_3O_8 par an. Le déclasséement devrait durer cinq ans. Les cinq principales activités de déclasséement sont les suivantes: décontamination, élimination des actifs, démolition et élimination, et réhabilitation. La clôture de l'ensemble du projet sera effectuée conformément à tous les règlements et directives provinciaux et fédéraux, les considérations fondamentales étant d'assurer la stabilité physique et chimique du site afin de protéger la santé humaine ainsi que l'environnement. Suivant le déclasséement, une phase de cinq ans servira à surveiller Wheeler et à confirmer qu'il est acceptable de le restituer soit directement à la Couronne sans restrictions d'utilisation futures, ou au programme provincial de contrôle des établissements pour les sites déclassés.

Environnement Existant

Le projet est situé dans la région paysagère des hautes terres de la rivière Wheeler de l'écorégion de la plaine Athabasca. Des activités d'exploration ont eu lieu dans la région au cours des 40 dernières années. Il y a des utilisations récréatives, industrielles et traditionnelles des terres à proximité; cependant, les résidences permanentes les plus proches sont à environ 150 km du site. La réserve de Slush Lake, appartenant aux Premières Nations d'English River, qui n'a pas de résidents permanents, est située à environ 15 km à l'ouest de Wheeler.

Denison a lancé un programme complet de collecte de données biophysiques sur l'environnement en 2016 afin de caractériser les conditions existantes ou de base. Un ensemble de données robustes de données atmosphériques, hydrogéologiques, aquatiques, et terrestre a été collecté pour le site Wheeler; les zones d'étude locales et régionales et une collecte de données plus spécifiques est toujours en cours. À ce jour, le programme de collecte de données sur l'environnement biophysique s'est concentré sur la définition des conditions existantes pour : la qualité de l'air (radon et particules), la qualité des eaux souterraines, le niveau des eaux souterraines, la qualité des eaux de surface, les niveaux des lacs, la bathymétrie des lacs, le débit des cours d'eau, la qualité des sédiments, les habitats aquatiques, les invertébrés benthiques (communautés et chimie), plancton, poissons (communautés, habitat de frai, chimie des tissus), amphibiens, oiseaux, petits mammifères, animaux à fourrure semi-aquatiques, grands mammifères, cartographie d'éco-sites, végétation (communautés et chimie), qualité du sol, et habitat faunique.

Wheeler est situé dans la zone du Traité 10 et quatre communautés d'autochtones distincts ont prétendu que la zone locale et régionale entourant le projet proposé appartenait en tout ou en partie à leurs territoires traditionnels, ou des activités traditionnelles d'utilisation des terres ont anciennement été ou sont présentement pratiquées. Ces groupes comprennent la Première Nation English River et les habitants de Kineepik, Sipishik, et À La Baie Métis des communautés de Pinehouse, Beauval, et Île à la Crosse respectivement. Les activités traditionnelles d'utilisation des terres pratiquées dans la zone locale et régionale du projet comprennent la chasse et la pêche de subsistance, et la récolte saisonnière de plantes indigènes à des fins alimentaire et médicinales. Pendant la saison des eaux libres, les rivières et les lacs de la région servent de voies de transport pour la récolte de plantes et de gibier, ainsi que pour les sites de campings et chalets préférés. Pendant les mois d'hiver, les lacs gelés, berges des rivières, et muskegs sont utilisés comme voies de transport vers les cabanes, les lignes de piégeage, et les zones de chasse préférés. Les enquêtes sur les ressources patrimoniales réalisées à Wheeler à ce jour ont permis d'identifier un artefact et le projet a été repensé afin d'éviter l'emplacement de la découverte de l'artefact.

En tout, Denison estime que les facteurs biophysiques et humains de l'environnement dans la zone du projet ont été correctement caractérisés pour appuyer la réalisation d'une évaluation de l'impact sur l'environnement ainsi que les programmes de suivi environnemental à venir.

Effets Potentiels

L'exploitation minière RIS, telle que proposée pour le projet, aboutit à un projet d'extraction et de traitement d'uranium sans résidus, avec une empreinte de perturbation de surface relativement petite, des volumes minimaux de stériles propres (tous sous la forme de déblais de forage), des volumes minimaux de stériles (déblais de forage minéralisés provenant du développement du champ de captage), volumes minimaux d'autres déchets contaminés, près de zéro émissions de gaz à effet de serre, et un traitement et rejet minimal d'eau (le cas échéant). Wheeler sera conçu pour contenir toutes les matières dangereuses et un soin particulier sera pris pour s'assurer que les zones contaminées soient séparées des zones non contaminées. Par la conception du projet, la mise en œuvre des meilleures pratiques de gestion et l'application d'autres mesures d'atténuation, Denison s'efforcera de minimiser les interactions du projet avec les environnements biophysiques et humains au cours de toutes les phases du projet.

Les principaux effets potentiels du projet sur l'environnement biophysique devraient être les suivants : modifications de la qualité de l'air provenant de diverses sources d'émission, y compris l'usine de traitement; des changements dans la qualité de l'air si le radon et les descendants du radon proviennent de la solution minière riche en uranium; les changements potentiels dans la qualité des eaux souterraines résultants d'excursions de solutions minières ou le rejet potentiel d'effluent traités dans les eaux souterraines; les changements dans la qualité de l'eau, la qualité des sédiments et éventuellement d'autres composantes aquatiques dus au rejet potentiel d'effluents traités dans un plan d'eau de surface; perte directe d'habitat faunique; et, effets indirects sur la faune par des perturbations sensorielles. Cependant, Denison prévoit qu'aucun de ces effets potentiels seront significatifs et que en tout, le projet ne pose aucun risque à long terme pour l'environnement biophysique.

L'effet potentiel du projet sur la composante socio-économique de l'environnement humain est prévu d'être positif. Wheeler emploiera environ 300 personnes pendant deux ans de construction et entre 100-150 personnes durant les opérations. Des opportunités seront disponibles pour les fournisseurs de services et de matériaux. Tous les effets potentiels sur les activités d'utilisation traditionnelle des terres seront limités au site et aux zones d'étude locales. Ils seront de courte durée et limités à la phase de construction et d'exploitation du projet. Une fois que le déclassement est terminé, l'accès au site et la possibilité de pratiquer des activités traditionnelles telles que la pêche et la chasse seront entièrement rétablis. Aucun effet sur l'utilisation traditionnelle des terres ne devrait se produire dans la zone d'étude régionale. Les effets potentiels sur les travailleurs du point de vue santé et sécurité seront similaires à ceux d'autres sites miniers et industriels, et Denison s'attend à ce que ces effets puissent être atténués grâce à la gestion et au développement d'une forte culture de sécurité. Les effets potentiels des expositions radiologiques sur les travailleurs seront minimisés grâce aux mesures de conception du projet, suivis de près et gérés par la mise en œuvre d'un Programme de Gestion de la Protection contre la Radiation.

Dans le cadre de l'évaluation des impacts environnementaux (EIE), Denison démontrera que le projet peut être construit, exploiter, et déclasser sans aucun effet négatif important sur les environnements biophysique et humain. Les effets potentiels du projet seront évalués et présentés de manière rigoureuse et transparente dans l'EIE. Cela comprend la réalisation d'une Évaluation des Risques pour la Santé Humaine et l'Environnement afin de démontrer les faibles impacts du projet au complet. L'EIE indiquera également les détails d'un programme de suivi efficace. La surveillance sera nécessaire pour fournir la preuve que le projet fonctionne légalement et dans les limites de ses obligations en matière de licence.

Engagement

Denison reconnaît l'importance de s'impliquer avec les communautés locales et autochtones, les résidents, les entreprises, les organisations, les utilisateurs des terres, et les diverses autorités de réglementation, ci-après dénommés « Parties Prenantes ». Depuis 2016, Denison engageait les parties prenantes dans leur effort continu d'établir des relations positives avec toutes les parties. De manière générale, Denison a classé les parties prenantes en trois catégories :

- Communautés autochtones
- Autorités réglementaires
- Public général

Denison s'est engagé auprès des parties prenantes pour fournir des mises à jour du projet et collecter des informations qui ont été intégrés à la conception du projet. Cette approche est prévue de se poursuivre. De plus, le savoir autochtone a été intégré dans les programmes de collecte de données de base afin de garantir la collecte de données scientifiques appropriées dans des domaines clés, afin de permettre une évaluation robuste des interactions potentielles du projet dans le cadre de l'évaluation de l'impact sur l'environnement. Denison est fière des relations établies avec les communautés et réjouit de pouvoir continuer à améliorer ces relations et ces avantages pour les communautés par moyen du programme en cours de participation des parties prenantes à mesure que Wheeler avance.

Denison et plusieurs communautés locales autochtones et non-autochtone ont conclu des accords de principe ou des protocoles d'entente mutuels. Ces protocoles d'entente non-contraignant formalisent l'intention des signataires de travailler ensemble dans un esprit de respect mutuel et de coopération pour identifier collectivement des moyens pratiques permettant d'éviter, d'atténuer, ou adresser des impacts potentiels du projet sur l'exercice des droits autochtones, droits issus de traités, et domaines d'intérêt mutuels. De plus, les accords de principe et protocoles d'entente décrivent l'intention des signataires de travailler ensemble pour assurer que les avantages découleront du projet Wheeler River, fourniront un processus permettant de poursuivre l'engagement du projet et le partage d'informations sur celui-ci, et établiront une relation en vue de définir des opportunités d'affaires d'emploi et de formation pour les parties liées au projet.

Denison est fier de la relation établie avec toutes les parties prenantes, et se réjouit de continuer à développer ces relations par moyen d'un programme d'engagement en cours à mesure que le projet Wheeler avance.

1 Introduction

The Wheeler River Project (Wheeler or the Project) is a proposed uranium mine and processing plant in northern Saskatchewan, Canada (Figure 1.1).

Wheeler is a joint venture project owned by Denison Mines Corp. (Denison) and JCU (Canada) Exploration Company Ltd. (JCU). Denison owns 90% of Wheeler and is the operator, while JCU owns 10%. The Wheeler property contains a number of areas of mineralization, including but not limited to the Phoenix and Gryphon deposits.

Athabasca Basin, Canada
Date: Dec. 2018

Figure 1.1: Wheeler River Location in Canada

Wheeler is located in Saskatchewan's Athabasca Basin about 4 km west of Highway 914. It is located mid-way between Cameco Corporation's Key Lake Mill and McArthur River Mine (Figure 1.2) and is 600 km north of Saskatoon.

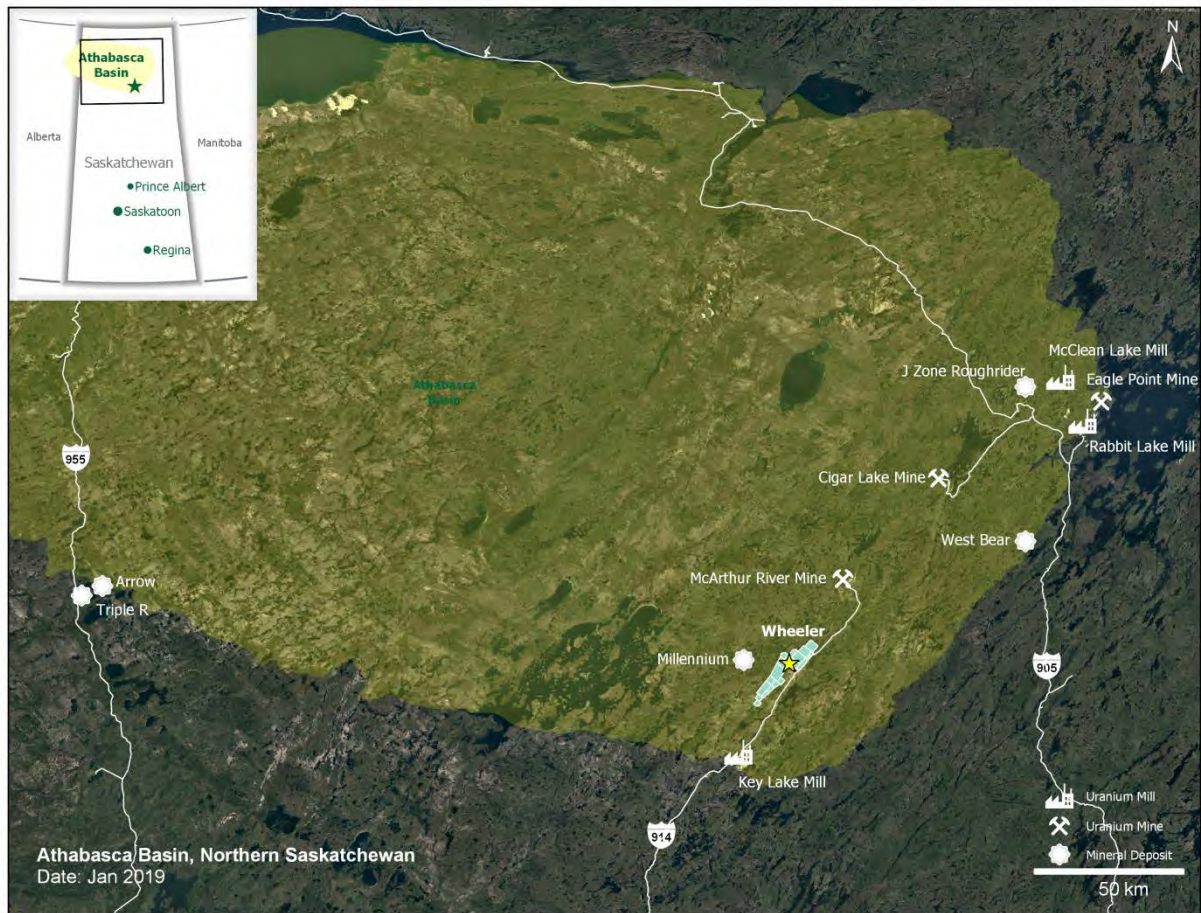

Figure 1.2: Wheeler River Location in the Athabasca Basin

1.1 Project Proponent

Denison is a publicly traded uranium exploration and development company with interests focused in the Athabasca Basin region of northern Saskatchewan, Canada. The company trades on the Toronto Stock Exchange and New York Stock Exchange, and headquartered in Toronto, Ontario with offices in Saskatoon, Saskatchewan and Vancouver, British Columbia.

Historically, Denison (and its predecessor companies) has had over 50 years of uranium mining experience in Elliot Lake, Ontario, Saskatchewan, and in the United States. Today, the company is part owner (22.5%) of the McClean Lake Joint Venture which includes the operating McClean Lake uranium mill in northern Saskatchewan. In addition, Denison provides expert mine decommissioning and environmental services through its Denison Environmental Services division and serves as the manager of Uranium Participation Corporation, a publicly traded company that invests in uranium oxide and uranium hexafluoride.

The company's history of uranium mining, unique expertise in the specialized sectors of uranium mine decommissioning and exploration, as well as its active involvement in the uranium sales and marketing business through its management of Uranium Participation Corporation, have uniquely prepared Denison to be a qualified proponent to develop and operate Wheeler.

As exemplified under our current licences with the Canadian Nuclear Safety Commission (CNSC) at our Elliot Lake and McClean Lake uranium facilities, Denison is committed to the operation of its facilities in a manner that prioritizes safety, environmental protection, and sustainable development.

The proponent is Denison Mines Corp.

1.2 Project Needs and Benefit

Mining of uranium is the first step in the nuclear fuel cycle, which ultimately concludes with the furnishing of nuclear fuel assemblies to nuclear power plants around the world for the generation of low carbon and low-cost electricity. Accordingly, uranium mining is an essential component in the global battle against climate change and the shift towards the generation of low carbon electricity.

The United Nations estimates that the world's population will grow from approximately 7.5 billion in 2017 to over 9.7 billion in 2050 (United Nations 2017) which is expected to substantially increase global electricity demand. Economic development in non-OECD countries is rapidly shifting global electricity demand and generating more interest in new nuclear plant investments (Massachusetts Institute of Technology 2018). According to the International Atomic Energy Agency (IAEA 2018), high-case projections for nuclear generating capacity suggest that current global capacity could increase from 392 GWe in 2017 to 748 GWe in 2050. At present, there are approximately 450 operable reactors worldwide with an additional 50 to 60 under construction (Canadian Nuclear Association 2017). In addition, momentum is building in regards to the future potential associated

with the development of small modular nuclear reactors, which could bring reliable and low-cost energy to remote communities around the world, and ultimately create significant additional demand for nuclear fuel.

Hand-in-hand with the rising demand for reliable and low-cost energy is the discussion surrounding greenhouse gas emissions and climate change. Despite numerous environmental initiatives and on-going research, global climate change continues at an alarming rate. In 2017, global atmospheric concentration of carbon dioxide (CO₂) rose by 1.4% which is the largest annual rise ever recorded (World Nuclear Association 2018). One of the most influential energy sources available to combat the rise of CO₂ emissions is nuclear power (Figure 1.3). If all the world's coal and natural gas plants were replaced with low carbon nuclear, CO₂ emissions would be reduced by over 22% (Canadian Nuclear Association 2017).

Source: The Canadian Nuclear Association 2017

Figure 1.3: Global CO₂ Emissions since 1990 and CO₂ Emissions by Energy Source

A recent report by the United Nations Intergovernmental Panel on Climate Change that examined 89 climate change mitigation scenarios concluded that achieving the 1.5°C target from the Paris Agreement will require global greenhouse gas emissions to start being reduced immediately, and an increase in nuclear power generation of approximately 2.5 times by 2050 (World Nuclear Association 2018). Without a significant contribution from nuclear energy, as the global power mix shifts to respond to climate change initiatives, the cost to achieve meaningful decarbonisation targets will steadily rise or targets will simply go unmet. Nuclear is critical to global climate change objectives because of its unique combination of low carbon emissions, large scale, and reliability.

In terms of scale, the uranium expected to be produced from Wheeler would be sufficient to power 1 million homes for approximately 160 years (assuming 200 tonnes U_3O_8 fuels a 1,000 MWe plant for one year). Alternatively, the uranium produced from Wheeler could provide fuel to meet all of the projected Canadian nuclear utilities' base requirements from 2019 to 2035 including New Brunswick Power, Ontario Power Generation and Bruce Power.

Canada is uniquely positioned to support global climate change initiatives. Canada is the second largest producer and exporter of uranium in the world, with approximately 88% of the uranium produced in Canada destined for export to support global nuclear power use (Natural Resources Canada 2018). At present, Canada's current uranium production comes from uranium mines operated in northern Saskatchewan. Canada has a rich history of involvement with nuclear power and the technological advances that have been made within the industry since the early 1940s. According to Natural Resources Canada, 15% of the country's electricity was provided by nuclear power in 2016 (Natural Resources Canada 2018). Given the integral role it plays in our economy, the nuclear power industry has been and will continue to be a growth vehicle for economic and employment opportunity, an aid to the rapidly increasing electricity demand, and a key contributor in the battle against the environmental impacts associated with greenhouse gas emissions. The mining and processing of uranium as part of the Project will support the projected future growth in nuclear power both domestically and internationally.

Nuclear in Canada is a \$6 billion industry that directly and indirectly supports a total of 60,000 jobs throughout the country (Canadian Nuclear Association 2017) (Figure 1.4).

Source: The Canadian Nuclear Association Factbook 2017

Figure 1.4: Jobs Supported by the Nuclear Industry in Canada

With refurbishment plans in place for 10 of the 19 nuclear reactors in Canada (primarily located at the Ontario Power Generation and Bruce Power nuclear facilities in Ontario) there is a distinct opportunity to add further employment opportunities within the industry and throughout the nuclear fuel cycle. Government research and studies suggest that the economic benefits of refurbishing only 4 of the 10 reactors (located at the Ontario Power Generation facility in Darlington, Ontario) would be almost \$90 billion (Canadian Nuclear Association 2017). At its peak, the refurbishment of Bruce Power’s nuclear facility will create 22,000 direct and indirect jobs annually and will secure the organization’s future for decades creating demand for reliable and safe uranium production for many years to come (Bruce Power and Ontario Power Generation 2018).

While Canada’s nuclear facilities are mainly concentrated in Ontario, the majority of uranium production in Canada comes from northern Saskatchewan, which is home to the world’s largest and highest-grade uranium deposits – some with concentrations more than 100 times the global average (Natural Resources Canada 2018). Wheeler is located in the Athabasca Basin in northern Saskatchewan where established uranium mining and milling operations are a major employer of the province’s northern and Indigenous peoples. The advancement of Wheeler will not only contribute economically to Canada’s nuclear energy industry, but is also expected to provide additional employment and business opportunities to Indigenous and northern communities in Saskatchewan.

The world and Canada need uranium and Wheeler can provide this critical component in the nuclear fuel cycle while making a meaningful contribution to the Canadian economy and Saskatchewan’s northern and Indigenous communities.

1.3 Regulatory Context

This document was written to meet the requirements and guidance for both a federal Project Description under the *Canadian Environmental Assessment Act 2012* (CEAA 2012; *Prescribed Information for the Description of a Designated Project Regulations* and Canadian Environmental Assessment Agency 2015a) and a provincial Technical Proposal (Government of Saskatchewan 2014a) under Saskatchewan's *Environmental Assessment Act*.

Denison anticipates that the provincial and federal environmental assessment processes for Wheeler will be conducted in parallel; the Saskatchewan Environmental Assessment & Stewardship Branch and the CNSC will cooperate in conducting a coordinated provincial-federal EA that will follow the spirit of the Canada-Saskatchewan Agreement on Environmental Assessment Cooperation (2005) to the extent possible. The agreement allows for cooperation in the assessment of projects that require regulation by both levels of government. The cooperation agreement allows for the production of a single environmental impact assessment (EIA) that meets the requirements of both levels of government, so that each level of government can make an independent decision.

Please see Appendix A for the table of concordance with the *Prescribed Information for the Description of a Designated Project Regulations*.

1.3.1 Environmental Assessment Requirements

1.3.1.1 Federal

The proposed Project will include the construction, operation and decommissioning of a uranium mine, processing plant and supporting facilities on a site that is not within the boundaries of an existing licensed uranium mine or mill. As such, Wheeler is a designated project as set out in section 31 of the *Regulations Designating Physical Activities* and is therefore subject to a federal environmental assessment.

The CNSC will be the federal responsible authority for Wheeler's environmental assessment.

Applicable federal Acts and regulations applicable to Wheeler include but are not limited to:

- *Fisheries Act*
 - *Metal and Diamond Mining Effluent Regulations*
- *Canadian Environmental Assessment Act*
 - *Regulations Designating Physical Activities*
 - *Prescribed Information for the Description of a Designated Project Regulations*
- *Species at Risk Act*
- *Nuclear Safety and Control Act*
 - *General Nuclear Safety and Control Regulations*

- *Uranium Mines and Mills Regulations*
- *Packaging and Transport of Nuclear Substances Regulations*
- *Radiation Protection Regulations*
- *Migratory Birds Convention Act*
- *Transportation of Dangerous Goods Act*
 - *Transportation of Dangerous Goods Regulations*
- *Canadian Environmental Protection Act*
 - *Environmental Emergency Regulations*
- *Canadian Wildlife Act*
- *Navigation Protection Act*

Denison acknowledges Bill C-69 that proposes a number of changes to the current environmental assessment process. Section 182 of the bill outlines that EIAs for CNSC designated projects started under *CEAA (2012)* will continue under *CEAA (2012)*.

Accordingly, this project description has been prepared to comply with the requirements of *CEAA (2012)*.

1.3.1.2 Provincial

Environmental Assessment in Saskatchewan is regulated by the *Environmental Assessment Act* and its application hinges on whether a project is a development, or not, based upon the criteria in Section 2(d):

2(d) “development” means any project, operation or activity or any alteration or expansion of any project, operation or activity which is likely to:

- (i) have an effect on any unique, rare or endangered feature of the environment;
- (ii) substantially utilize any provincial resource and in so doing pre-empt the use, or potential use, of that resource for any other purpose;
- (iii) cause the emission of any pollutants or create by-products, residual or waste products which require handling and disposal in a manner that is not regulated by any other Act or regulation;
- (iv) cause widespread public concern because of potential environmental changes;
- (v) involve a new technology that is concerned with resource utilization and that may induce significant environmental change; or
- (vi) have a significant impact on the environment or necessitate a further development which is likely to have a significant impact on the environment.

The likely applicable Section 2(d) triggers are Sections 2(d) (iv) and (v); a potential for public concern, and a new technology application in Saskatchewan (in situ recovery for uranium), respectively.

Accordingly, Denison is self-declaring that Wheeler is a development under the *Environmental Assessment Act*; Denison is not seeking a ministerial determination on whether the Project is a development.

Denison will be submitting the Project's draft Terms of Reference to the province under a separate cover.

Denison will conduct, prepare and submit an environmental impact statement (EIS) to Saskatchewan Ministry of Environment's Environmental Assessment and Stewardship branch that meets the requirements outlined in the Saskatchewan Environmental Assessment Act. Ultimately the Project will require issuance of a ministerial approval under section 15 of the Saskatchewan *Environmental Assessment Act* before proceeding to licensing and permitting.

Relevant provincial Acts and associated regulations applicable to Wheeler include but are not limited to:

- *Environmental Assessment Act*
- *Environmental Management and Protection Act*
 - *Mineral Industry Environmental Protection Regulations*
 - *Hazardous Substances and Waste Dangerous Goods Regulations*
 - *The Waterworks and Sewage Works Regulations*
 - *Environmental Management and Protection (Saskatchewan Environmental Code Adoption) Regulations*
- *Wildlife Act*
 - *Wildlife Regulations*
- *Wildlife Habitat Protection Act*
 - *Wildlife Habitat Lands Disposition and Alteration Regulations*
- *Fisheries Act (Saskatchewan)*
 - *Fisheries Regulations*
- *Forest Resource Management Act*
 - *Forest Resources Management (Saskatchewan Environmental Code Adoption) Regulations*
 - *Forest Resources Management Regulations*
- *Natural Resources Act*
- *Prairie and Forest Fire Act*
- *Heritage Property Act*

- *Provincial Lands Act*
 - *Provincial Lands Regulations*
- *Saskatchewan Employment Act*
 - *Mines Regulations*
 - *Occupational Health and Safety Regulations*
- *Radiation Health and Safety Act*
 - *Radiation Health and Safety Regulations*
- *Reclaimed Industrial Site Act*
 - *Reclaimed Industrial Sites Regulations*
- *Water Security Agency Act*
- *Dangerous Goods Transportation Act*
 - *Dangerous Goods Transportation Regulations*
- *Mineral Resources Act*
- *Crown Minerals Act*
- *Public Health Act*
 - *Plumbing Regulations*
- *Boiler and Pressure Vessel Act*
 - *Regulations Respecting the Design, Construction, Installation and Use of Boilers and Pressure Vessels*
- *Electrical Inspection Act*
 - *Electrical Inspection Regulations*
- *Gas Inspection Act*
 - *Gas Inspection Regulations*
 - *Gas Licensing Regulations*

1.3.2 Guidelines, Policies, Standards

In addition to regulatory requirements from federal and provincial Acts and regulations, Denison will apply a number of other guidelines, policies and standards to the Project. The following list provides examples of guides, policies and standards Denison will use in completing the Wheeler EIA and is not exhaustive:

- Canadian Environmental Assessment Agency:
 - Technical Guidance for Assessing Physical and Cultural Heritage or any Structure, Site, or Thing that is of Historical, Archaeological, Paleontological, or Architectural Significance under CEAA (2012)

- Addressing “Purpose of” and “Alternative Means” under the CEAA (2012)
- Determining Whether a Designated Project is Likely to Cause Significant Adverse Environmental Effects under the CEAA (2012)
- Considering Aboriginal traditional knowledge in environmental assessments conducted under CEAA (2012) (CEAA 2015b)
- Federal Policy on Wetland Conservation
- Various CNSC regulatory documents (REGDOCS), for example:
 - 2.9.1 Environmental Principles, Assessments and Protection Measures (CNSC 2017)
 - 3.1.2 Reporting Requirements, Volume I: Non-power reactor class I facilities and uranium mines and mills
 - 3.2.2 Aboriginal Engagement (CNSC 2016a)
- CNSC’s generic guidelines for the preparation of an environmental impact statement (CNSC 2016b)
- Various CSA Standards, for example:
 - N288.4-10 Environmental monitoring programs at Class I nuclear facilities and uranium mines and mills
 - N288.7-15 Groundwater protection programs at Class I nuclear facilities and uranium mines and mills
 - N286-12 Management System Requirements for Nuclear Facilities
 - N288.5-11 Effluent Monitoring Programs at Class I nuclear facilities and uranium mines and mills
 - N288.6-12 Environmental risk assessments at class I nuclear facilities and uranium mines and mills
 - N294-09 Decommissioning of facilities containing nuclear substances
- Guidelines for Northern Mine Decommissioning and Reclamation, November 2008, Version 6, Saskatchewan Ministry of Environment
- The Saskatchewan Environmental Code and attendant standards

1.3.3 Licensing and Permitting

The following permits, approvals, and licences are anticipated at different stages of the Project:

- Provincial environmental assessment approval
- Federal environmental assessment approval
- CNSC licences to:
 - Prepare site and construct

- Operate
 - Decommission
 - Abandon (release from licensing)
- Surface lease agreement
- Heritage Conservation Branch approval
- Forest Product Permit
- Aquatic Habitat Protection Permit
- Approval to Construct Highways Approach
- Approval to Construct and Operate Pollutant Control Facilities
- Environmental Protection Plan for Industrial Sources
- Approval to Construct Hazardous Substances and Waste Dangerous Goods Facility and Store Hazardous Substances and Waste Dangerous Goods
- Permit to Operate Waterworks
- Permit to Operate Sewage Works
- Approval to Decommission Pollutant Control Facilities
- Release from Decommissioning and Reclamation
- Provincial Acceptance of Decommissioned and Reclaimed Site into Institutional Control Program

1.4 Regional Studies

EIAs have been completed or are underway for nearby projects related to uranium mining and milling as well as a provincial highway extension. This includes Cameco Corporation's original EIAs and any subsequent expansion EIAs for mining and milling of uranium at Key Lake Operation and mining of uranium at McArthur River Operation. An EIA was initiated and subsequently halted by Cameco for the proposed Millennium Project, a proposed uranium mine located between Key Lake and Wheeler. Saskatchewan Ministry of Highways has initiated the provincial environmental assessment process for extending Highway 914 from McArthur River Operation to Cigar Lake mine and constructing a by-pass at the Key Lake Operation.

Other regional studies include:

- Eastern Athabasca Regional Environmental Monitoring Program;
- Canadian Nuclear Safety Commission's Independent Environmental Monitoring Programs; and
- Saskatchewan Boreal Watershed Initiative (Government of Saskatchewan 2017a) which includes a summary of available air quality, aquatic ecosystems, terrestrial ecosystems and Indigenous Knowledge.

1.5 Engagement

Denison recognizes the importance of engaging with local and Indigenous communities, residents, businesses, organizations, land users and the various regulatory authorities, collectively referred to as ‘Stakeholders.’ Since 2016 Denison had been engaging with Stakeholders in ongoing efforts to build positive relationships with all parties.

Denison has engaged with the following Stakeholders in regards to Wheeler:

- English River First Nation
- Hamlet of Patuanak
- Kineepik Métis Local Inc.
- Pinehouse village
- Sipisishik Métis Local 37
- Beauval village
- A La Baie Métis Local 21 Inc.
- Ile a la Crosse village
- Recreational lease holders
- Northern Saskatchewan Environmental Quality Committee
- Canadian Nuclear Safety Commission staff in the Environmental Assessment division and the Uranium Mines and Mills division
- Saskatchewan Ministry of Environment staff with the Environmental Assessment and Stewardship branch and the Uranium and Northern Operations branch.

Details of Denison’s engagement with Stakeholders, including engagement results to date, influence of engagement on the Project design, and the plan for ongoing engagement activities are provided in sections 7 and 8 below.

Engagement initiated by Denison in 2016 is part of an ongoing commitment by Denison to actively engage all Stakeholders throughout the Project development phases.

Denison’s early engagement initiatives with local Indigenous communities have allowed for the integration of Indigenous Knowledge with the Project development process, environmental baseline studies completed, and socio-economic initiatives directly related to the Project. Some of the key activities demonstrating this integration are presented in the Project timeline shown in Figure 1.5.

Denison’s ongoing Stakeholder engagement program reflects the results of feedback received to date from previous engagement sessions and is intended to be flexible and adaptive.

Denison will visit local Stakeholders, as appropriate, and will provide Project updates as Wheeler is advanced. It is currently envisioned that community meetings will be held at least once per year in a number of local communities, and more frequently if desired by any of these communities.

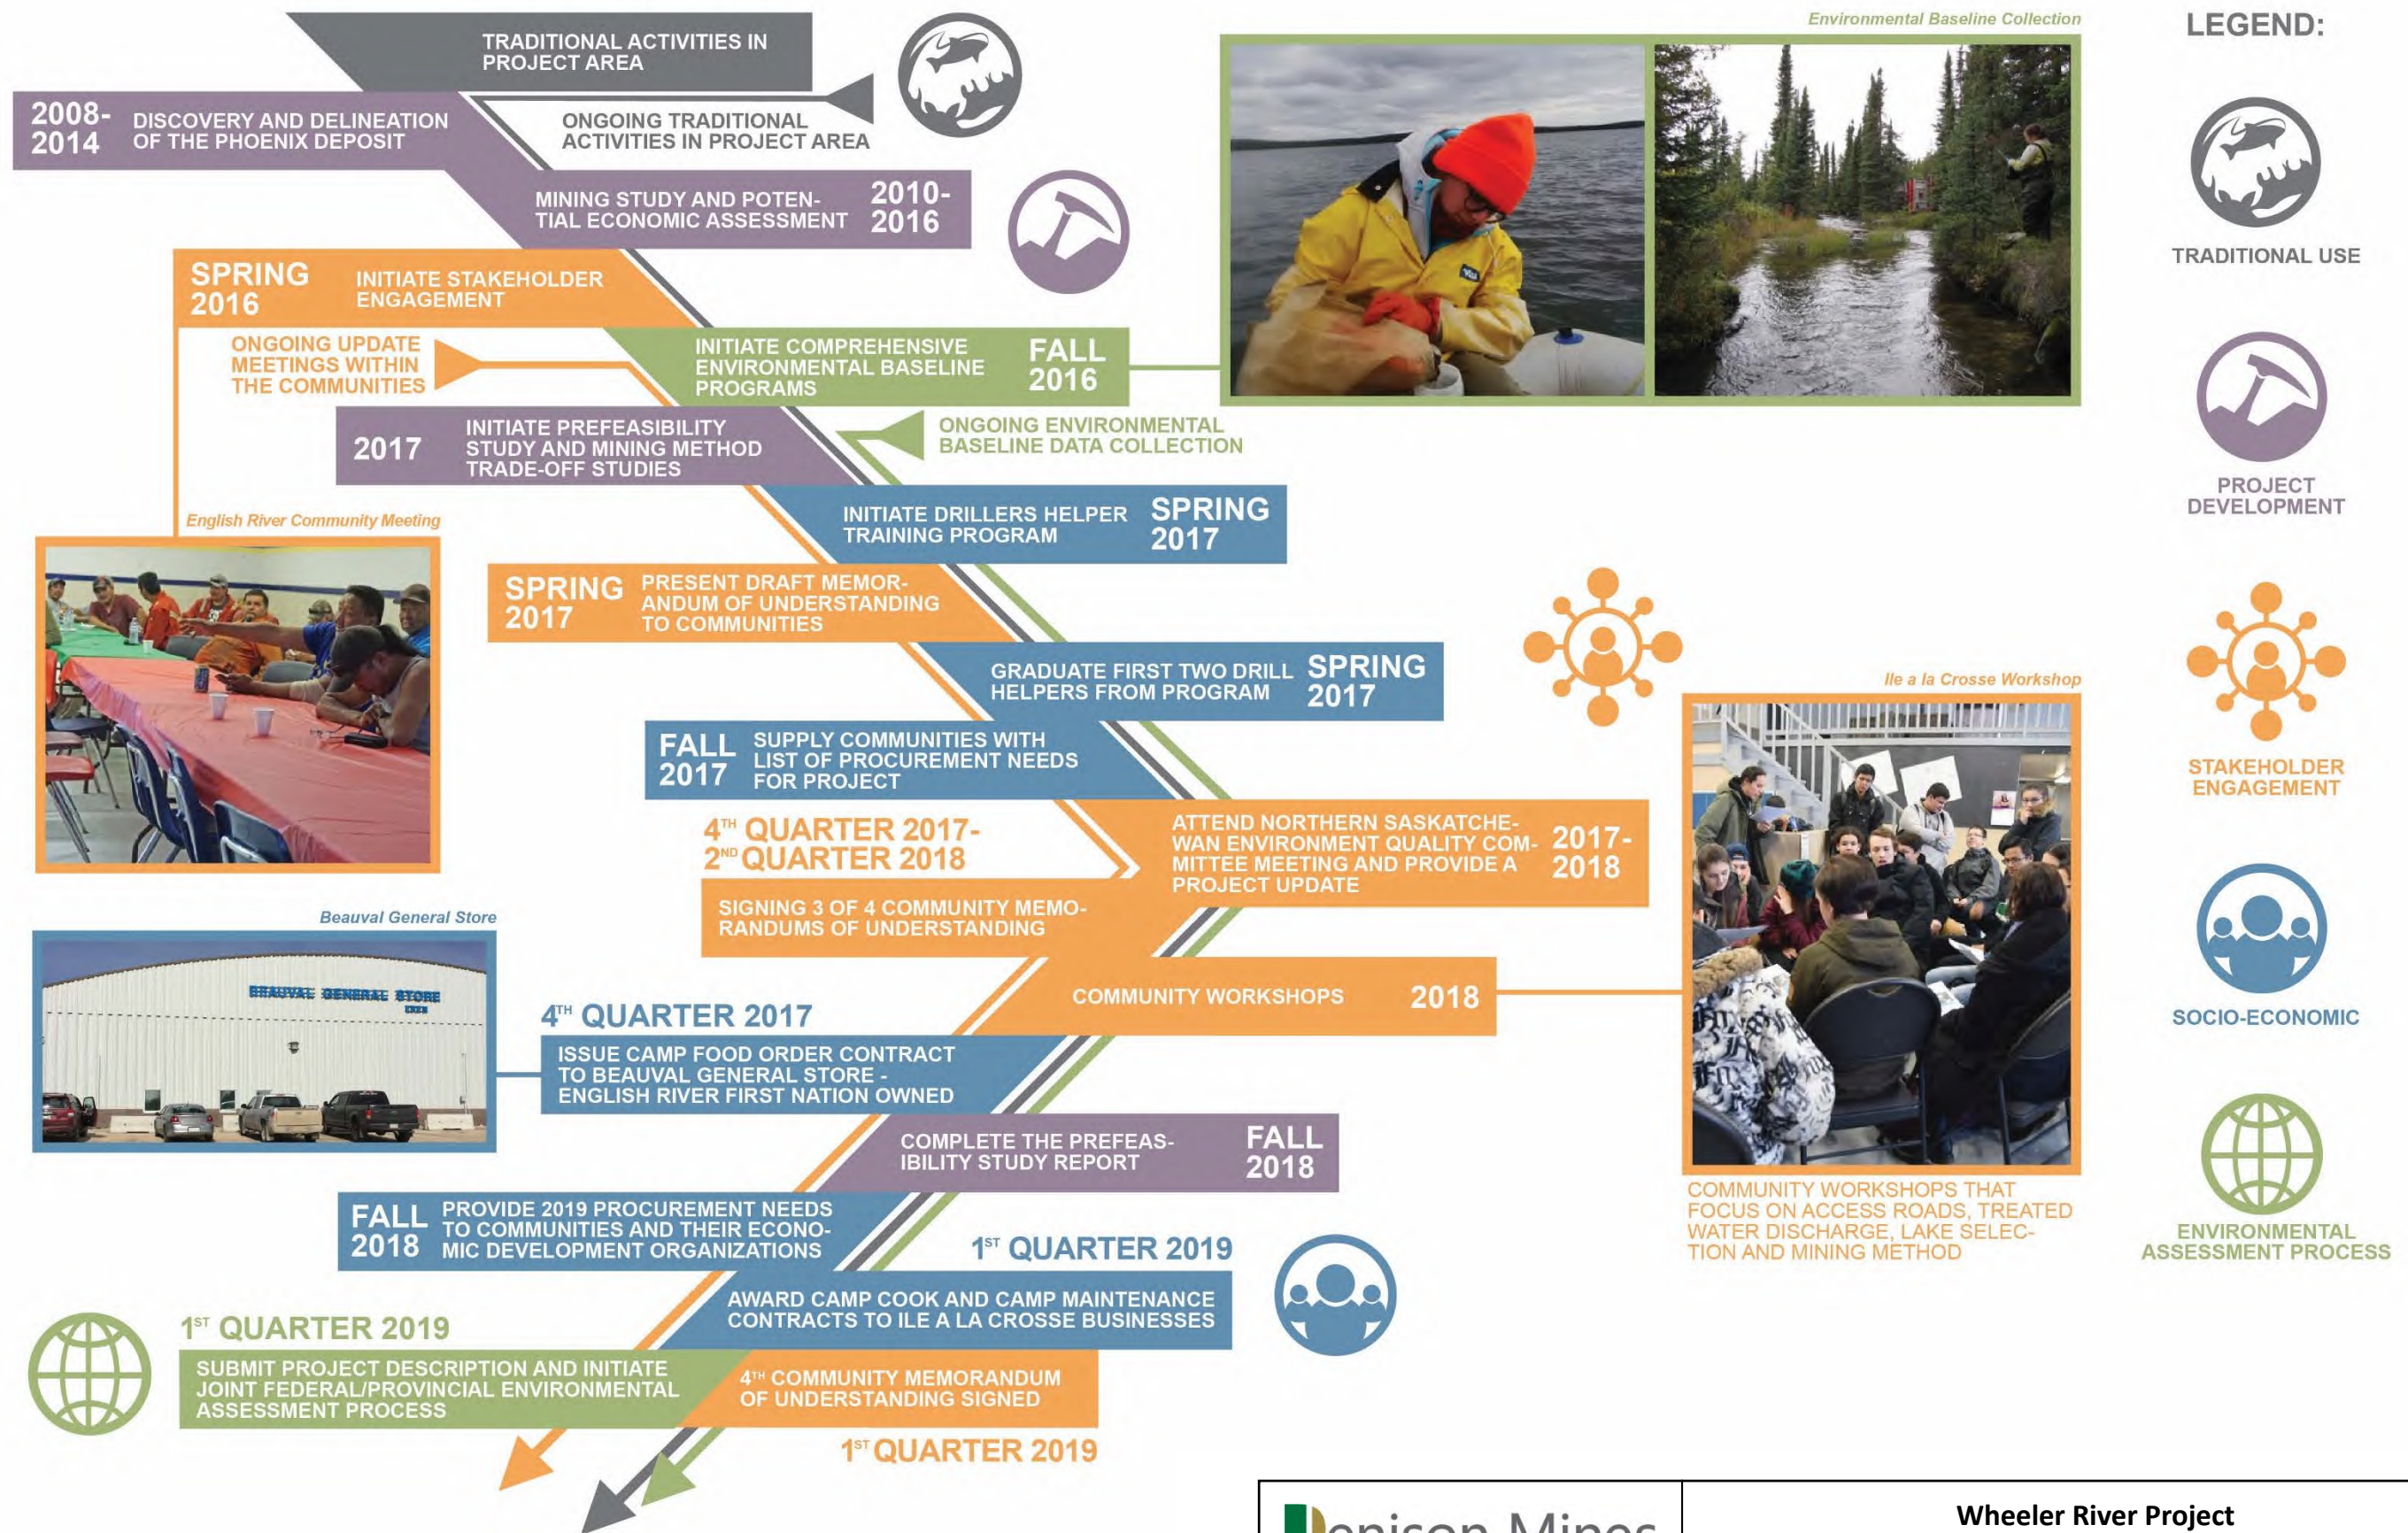

Denison is also committed to meeting with the leadership of these communities, in addition to other stakeholder organizations, as and when requested as part of the Company's standing commitment to respond to any enquires regarding the Project.

As the Project advances Denison is committed to continue to utilize local community radio stations, social media, and print media that may reach northern audiences.

In order to formalize Denison's commitment to its local Indigenous communities (and their associated non-Indigenous communities), Memorandums of Understanding (MOU) have been signed between Denison and:

- English River First Nation;
- Kineepik Métis Local and the community of Pinehouse;
- A La Baie Métis Local 21 and the community of Ile a la Crosse; and
- Sipisishik Métis Local 37 and the community of Beauval.

These non-binding MOUs formalize the signing parties' intent to work together in a spirit of mutual respect and cooperation to collectively identify practical means by which to avoid, mitigate, or otherwise address potential impacts of the Project upon the exercise of the indigenous rights, treaty rights, and interests. In addition, the MOUs outline the signing parties' intent to work together to ensure benefits will flow from the Project, provide a process for continued Project engagement and information-sharing about the project, and establish a relationship to identify business, employment and training opportunities for the parties with respect to the Project.

Figure 1.5: Project Timeline

May 2019

2 Project Information

2.1 Project Overview

2.1.1 Deposit & Geology

Several areas of uranium mineralization amenable to in situ recovery (ISR) have been defined at Wheeler with the most prominent area being the Phoenix deposit. Phoenix is the highest-grade undeveloped uranium deposit in the world. It is geologically situated at or immediately above the unconformity between the Athabasca Basin sandstone and older basement rocks, approximately 400 metres below surface. To date, these zones have been estimated to contain a total of 70.2 million pounds U_3O_8 of indicated mineral resources based on 166,400 tonnes of ore at an average grade of 19.14% U_3O_8 . There are additional zones of mineralization at Wheeler that have not been fully defined from exploration activities.

2.1.2 Selection of In Situ Recovery Mining Method

After completion of the 2016 Wheeler Preliminary Economic Assessment (Denison 2016) Denison initiated a detailed review of the development plan for the Phoenix deposit, which had originally been designed as an underground mine using a jet boring system as the extraction technology.

The 2016 Preliminary Economic Assessment identified disadvantages associated with the jet boring system mining method – including technical risks, comparatively high operating and capital costs, and long pre-production construction timelines. Accordingly, Denison initiated an extensive review process, seeking suitable alternative mining methods for the Phoenix deposit. A total of 32 different mining methods were initially identified and screened. The final two preferred technologies were advanced into a more rigorous evaluation process at the prefeasibility (PFS) level of assessment. Ultimately, In Situ Recovery (ISR) mining was selected as the preferred mining method due to its significant economic, environmental, and technical advantages.

ISR mining is also known as solution mining or in situ leaching – as the mining method uses an engineered fluid or solution to dissolve uranium from the host rock without physically removing the host rock for processing on surface. There are no underground or open pit workings required in an ISR operation; no heavy equipment is needed and people do not work underground. The process utilizes a series of injection wells to inject mining solution into the uranium deposit and another series of wells (recovery wells) to return the uranium rich solution back to surface for processing. There is minimal surface disturbance, minimal waste rock generated and no tailings are produced.

2.1.3 Experience and Lessons Learned from International In Situ Recovery Operations

Globally, ISR mining is considered to be the lowest-cost and industry leading method for uranium extraction. The method was first used in the 1960's and now accounts for over 50% of the world's annual uranium production, with use in Kazakhstan (the world's largest and lowest cost producer of

uranium), the United States, China, Russia, and Australia, among others. ISR mining is amenable to uranium deposits in certain sedimentary formations and is well known in the industry for having comparatively minimal surface impact, high production flexibility, and low operating and capital costs relative to open pit or conventional underground mining methods. There has been continuous development and improvement of ISR mining techniques in recent years, particularly in the two decades since the International Atomic Energy Agency published the *Manual of Acid In-Situ Leach Uranium Mining Technology* (IAEA 2001).

The general benefits of ISR include:

- *No tailings* – as the dissolution of the uranium contained in the host rock occurs “in-situ”, there is no processing of the host rock on surface and thus there is no waste / tailings generated by the ISR mining method;
- *Minimal surface disturbance* – In addition to having relatively modest needs for buildings and structures on site, ISR mining does not involve the sinking of shafts or the development of a large open pit. The surface impact associated with an ISR wellfield is limited to a series of cased injection, recovery and monitoring wells with a diameter of approximately 4-8 inches;
- *Established safety practices and procedures* – with over 50% of global uranium production coming from ISR mining in multiple countries, the mining method has become well known within the uranium mining industry and has allowed for the establishment of a wealth of safety practices and procedures to ensure health and safety of workers;
- *Minimal environmental impacts* - Amongst other additional comparative benefits, ISR mining operations are known for low noise levels, minimal dust and air emissions, low water consumption levels, minimal treated effluent discharge volumes, and minimal waste rock generation; and
- *Economic advantages* – ISR mining operations often have comparatively low capital and operating costs, as well as shorter timelines to first production and greater flexibility to allow production to be scaled to meet market demands.

In evaluating the application of ISR technology to the Athabasca Basin, Denison initiated a detailed review of the experience from international ISR operations over the last 50 years. Information is publicly available from ISR activities in the following countries:

- Australia (5 sites)
- USA (49 sites)
- Kazakhstan (17 sites)
- Bulgaria (19 sites)
- China (3 sites)
- Czech Republic (2 sites)
- Hungary (1 sites)

- Mongolia (3 site)
- Niger (1 site)
- Pakistan (1 site)
- Russia (2 sites)
- Ukraine (3 sites)
- Uzbekistan (3 sites)

Other countries such as Germany also have experience with ISR operations but have less extensive publicly available records to date.

While each operation is unique based on site-specific characteristics, the two general challenges to international ISR operations are: 1) potential groundwater impacts during operations and 2) remediation of the mining zones after mining is complete.

2.1.3.1 Potential Impacts to Groundwater

Traditional ISR operations rely on natural barriers (aquitards) or artificial pumping to create a drawdown of the regional groundwater to help contain the mining solution and minimize loss of the mining solutions to the regional groundwater. Containment of the mining solution in this way may create downstream problems including:

1. Loss of the mining solutions to the environment (known as excursions) may occur. Depending on the site-specific characteristics, these excursions will have varying levels of impact on the groundwater. In some instances, the excursions are allowed to continue while in other cases operations are required to implement mitigation strategies such as drilling additional pumping wells, reversal of wellfield flows and increase in draw down rates of the regional groundwater to capture the excursion.
2. Artificial drawdown of the aquifer brings excess water into the ISR process plant known as a bleed. Depending on site specific characteristics the bleed is either treated and discharged or directly discharged. In either case, it results with handling additional volumes of groundwater, an increased demand on energy and stress on the regional groundwater system.

In order to eliminate potential excursion to the regional groundwater Denison will engineer and create an artificial freeze wall to encompass the uranium deposit and isolate the mining horizon from the basement rock to surface (details in Section 2.3.1.3). The freeze wall will prevent the mining solution from travelling into the regional groundwater system and at the same time prevent the regional groundwater from entering the mining horizon and diluting the mining solution.

2.1.3.2 Remediation After Operations

The second major challenge to international ISR operations is the remediation of the site after mining is complete. Remediation efforts in international operations vary significantly depending on

site specific characteristics as well as the time period in which the operation occurred. In general, more recent operations have increased efforts towards remediation. Similar to many legacy mining sites, some historical ISR operations were operated with limited environmental considerations and as a result have led to contamination of the regional groundwater system.

In some operations, conditions surrounding the wellfield support a natural attenuation approach to remediation. In this context as groundwater travels outside the mining area it naturally improves. No active treatment outside the wellfield area is completed. Natural attenuation is typically completed in areas where the pre-mining environment showed poor background groundwater quality, limited or no use of groundwater for agriculture or human consumption, and/or areas with geochemical characteristics capable of naturally neutralizing the groundwater.

In some operations active treatment of the wellfield is completed. This can be completed by injecting reagents into the mined-out wellfield to neutralize the impacted groundwater, flushing the wellfield with clean water (in the same manner as mining was completed) with treatment and discharge of the collected groundwater or a variety of other options.

Denison's inclusion of a freeze wall (details Section 2.3.1.3) will mitigate many of the remediation challenges encountered at international operations. The freeze wall will allow for a controlled remediation process to occur unaffected by the regional groundwater. The depth to the deposit (400 metres below surface), the existing poor quality pre-mining groundwater chemistry, and limited volume of groundwater disturbance due to the isolation of the mining horizon will eliminate any impacts on regional groundwater use. Remediation of the contained mining horizon will be completed using active treatment and containment will continue until conditions inside the wall demonstrate acceptable geochemical conditions.

Denison has extensively researched best practices and challenges experienced in international operations. The design of the Wheeler ISR project has specifically targeted the elimination of the major challenges seen at international operations which is expected to result with the Wheeler being one of the most environmentally friendly mining projects in the world.

2.1.4 Objective and Overview of Wheeler In Situ Recovery

The objective of the Project is to construct, operate, and decommission an ISR uranium mine and processing plant.

The mining solution proposed at Wheeler will be similar to the leaching solution currently used in conventional Saskatchewan uranium mills and will consist of water and reagents such as sulphuric acid mixed to a consistent and relatively dilute concentration. The low pH or acidic mining solution oxidizes and dissolves the uranium as it travels through the uranium deposit. The process involves injecting the mining solution into the uranium deposit through a series of cased (contained) drill holes called injection wells. Following sufficient contact between the mining solution and the uranium deposit, the uranium is dissolved into the mining solution. The uranium rich mining

solution is then pumped back to surface via a similar series of cased recovery wells. This process is shown graphically in Figure 2.1 and details are provided in Section 2.3.1. Once on surface, the uranium rich mining solution will be piped to the processing plant for chemical separation of the uranium from the mining solution.

At Wheeler the uranium deposit is confined to a relatively small area (approximately 900 m x 90 m) and has proved readily leachable in laboratory testing. As a result, infrastructure disturbance (e.g., number of wells, extent of surface piping systems) are expected to be significantly reduced when compared to conventional low-grade ISR operations or conventional open pit operations.

In conventional ISR operations, containment of the mining solution is typically achieved by naturally impermeable bounding layers in the geological strata (i.e., aquitards) and/or by creating an artificial drawdown (via pumping) of the water table towards the uranium deposit. At Wheeler, there is a natural impermeable layer below the deposit, in the form of competent basement rock, but the deposit is otherwise hydraulically connected to the regional groundwater system in the overlying sandstone formation that is consistent throughout the Athabasca Basin. Given the depth and small spatial extents of the uranium deposit, the natural vertical hydraulic gradient can act as an upper layer of containment to contain the mining solution during the active mining process.

In order to simplify these controls and associated costs as well as to maintain proper concentrations of the mining solution and constant contact of the mining solution with the uranium deposit, an artificial freeze wall will be created to serve as an impermeable layer around the uranium deposit (details are provided in Section 2.3.1.3). When combined with the low permeability basement rock underneath the uranium deposit, the freeze wall will isolate the uranium deposit (Figure 2.1). Within the mining horizon the mining solution can move from the injection wells through the deposit to the recovery wells without interacting with the surrounding regional groundwater. The freeze wall will also facilitate controlled restoration of the mining horizon during the decommissioning phase.

|---|---|--------------------------------|
| | Wheeler River Project Technical Proposal and Project Description | |
| Figure 2.1: Overview of the In-situ Recovery Process | | Revised - December 2020 |

As part of the Project evaluation process, Denison completed numerous metallurgical test programs to simulate the ISR mining process, in accordance with industry standards – including leach tests, agitation leach tests, column tests, and post-mining restoration tests. The test results have been used to inform the design of the processing plant.

The processing plant design will be relatively simple for a variety of reasons. The first is that the ISR mining method eliminates the need for treatment of ore through conventional milling circuits like crushing, grinding and leaching. Secondly, as a result of the high uranium concentration and low levels of impurities in the uranium deposit and the uranium rich mining solution, Denison has demonstrated through test work that direct precipitation of the uranium is viable and may eliminate the need for ion exchange or solvent extraction circuits. However, to be conservative and allow for operational flexibility, future design work may evaluate use of additional processing circuits to improve performance. Finally, since the ISR process produces no tailings there is no need for tailings preparation circuits and a tailings management facility.

The processing of the uranium rich mining solution will consist of an impurities (mainly iron) precipitation circuit followed by the uranium precipitation, drying and packaging circuits (**Figure 2.2**). Details are provided in Section 2.3.2. The processing plant will be designed as a closed loop system, meaning that once the uranium is precipitated, the mining solution is refortified with reagents and returned to the wellfield for re-injection and further mining.

Wheeler Processing Plant Overview

2.2 Site History

2.2.1 Property Description

The Wheeler River exploration property is host to the Phoenix uranium deposit discovered in 2008 and Gryphon deposit discovered in 2014 (Figure 2.3) plus additional zones of mineralization and other prospective exploration targets.

Access to the property and deposits is by road, helicopter, or fixed wing aircraft from Saskatoon. Vehicle access to the property is by Highway 914. Access to Highway 914 north of Key Lake Operation is controlled by a gatehouse operated by Cameco. An older access road, the Fox Lake Road, between Key Lake Operation and McArthur River Operation provides access to most of the northwestern side of the property. The Fox Lake Road was decommissioned in 1999 and has been unmaintained since with the removal of all bridges and culverts in 2017. Gravel and sand roads and drill trails provide access by either four-wheel-drive or all-terrain vehicles to the rest of the property.

Lenison Mines

Wheeler River Project
Provincial Technical Proposal and Federal Project Description

Figure 2.3: Location of Wheeler River Property and Phoenix Deposit

May 2019

2.2.2 Land Tenure

The property consists of 19 mineral claims totalling 11,720 ha with an aggregate annual requirement of \$293,000 in either work or cash to maintain title to the mineral claims. In Saskatchewan, a mineral claim does not grant the holder the right to mine minerals. A mineral claim (Crown disposition) grants the right or privilege to explore or prospect for any Crown mineral or any other right to or interest in any Crown mineral or any Crown mineral lands. Based on previous work submitted and approved by the province of Saskatchewan, Denison has secured the title of the Wheeler River property until 2035. Denison continues to explore on the Wheeler River property and the right to explore on the property are reviewed on a project basis annually by the Saskatchewan Ministry of Environment.

A Saskatchewan mineral claim (Crown disposition) in good standing can be converted to a lease (Crown Lease) upon application. Leases have a term of 10 years and are renewable. A lease gives the holder the exclusive right to explore for, mine, work, recover, procure, remove, carry away, and dispose of any Crown minerals within the lease lands which are nonetheless owned by the province. Denison current has not converted any mineral claims to mineral leases. A surface lease agreement will be developed with the province following the successful completion of the environmental impact assessment process. It is anticipated that a small portion of the 11,720 ha mineral lease area will be converted to a surface lease.

Any uranium produced from the Wheeler River property is subject to uranium mining royalties in Saskatchewan, in accordance with Part III of the *Crown Mineral Royalty Regulations*. There is a 10% Net Profits Interest associated with the property held by the Wheeler River Joint Venture in approximate proportion to the ownership interests of each participant. There are no other back-in rights or third-party royalties applicable to this property.

There are no known environmental liabilities associated with the property, and there are no other known significant factors and risks that may affect access, title, or the right or ability to perform work on the property. All necessary permits for surface exploration on the property are in place and current. There are no known authorizations relating to a water lot in the Project area.

2.2.3 Exploration History

The Wheeler River property was staked on July 6, 1977. Excluding the years 1990 to 1994, exploration activities (such as airborne and ground geophysical surveys, geochemical surveys, prospecting, and diamond drilling) have been carried out on the property from 1978 to present. In November 2004, Denison became operator of the property and in 2005 carried out property-wide airborne geophysical surveys. The Phoenix deposit was discovered by diamond drilling in 2008, with subsequent delineation completed over the next six years from 2008 to 2014.

2.2.3.1 Current Site Conditions

Exploration field operations are currently conducted from Denison's on-site camp facilities, which are located approximately 3 km southwest of the Phoenix deposit (Figure 2.3). The camp provides accommodations for up to 40 field staff using ATCO trailer units and tent facilities (Figure 2.4). Fuel and miscellaneous supplies are stored in existing warehouse and tank facilities at the camp. Drill core from exploration activities is also stored on site. The exploration site currently generates its own power by diesel generator.

Denison maintains portions of the site roads necessary to gain access to the camp facilities (Figure 1.1) and complete field activities. This maintenance includes installation of temporary water crossings (bridges) and general road maintenance to ensure safe travel by either four-wheel drive vehicle or ATV. In addition, several gravel and sand roads as well as drill trails provide access by either four-wheel-drive or all-terrain vehicles to the rest of the property. These roads are maintained only as necessary.

Figure 2.4: Denison's Wheeler River Project Exploration Camp

Outside of the Phoenix drilling area (Figure 2.5) and Wheeler exploration camp facility, various surface disturbances have occurred since commencement of exploration activity in 1978. Several ground geophysical survey grid lines transect the property uniformly with an approximate additional 750 exploration pads that were cleared to accommodate diamond drill hole exploration programs. As a result of exploration drilling activities, several portions of the property have been previously disturbed with the removal of vegetation to allow for access trails and drilling areas.

Figure 2.5: Phoenix Deposit Aerial View

2.3 Project Components

The following section describes the anticipated Project components.

An overview of all proposed Project components is provided in Figure 2.6 and the proposed site layout is available in Figure 2.7.

2.3.1 In Situ Recovery of Uranium

2.3.1.1 Mining Solution

Test work completed to date indicates that the uranium at Wheeler is amenable to the same type of leach solution that is used to leach other Athabasca Basin uranium ores in mills: an acidic or low pH solution.

The Wheeler ISR mining solution will initially be created by adding certain reagents (e.g., sulphuric acid (H_2SO_4) and sodium chlorate (NaClO_3)) to fresh water. The fresh water will be sourced from either a shallow groundwater well or a nearby lake. The liquids will be mixed to achieve the optimal pH of the mining solution which is a pH between 1.0 to 2.0.

The mining solution will be pumped underground to the uranium deposit via an injection well and recovered as uranium rich mining solution through a series of recovery wells (Figure 2.1). Once uranium rich mining solution is recovered, it will be pumped from the pumphouses into the processing plant where uranium will be removed from the uranium rich solution. The mining solution will be refortified (Section 2.3.2) with reagents as required and pumped back into the mining horizon via an injection well (**Error! Reference source not found.**). In this way, it is expected that the mining solution will be reused over and over again throughout the mining process. A small volume of make-up water will be added to the mining solution during operations to replace moisture removed during the yellowcake precipitation and drying processes. This make-up water will be preferentially sourced from site runoff where possible; although the EIA will include options for obtaining make-up water from either a shallow groundwater well or a nearby lake.

2.3.1.2 Wellfield

The ISR wellfield is a group of wells, installed and completed in an area of uranium mineralized. The Wheeler wellfield will consist of a combination of injection and recovery wells, potentially in the general arrangement of one recovery well in the centre surrounded by 6-8 injection wells. At surface, the spacing between the recovery well and each injection well is anticipated to be roughly 10 metres apart (Figure 2.1), with certain areas requiring closer spacing (approximately 5 meters) or further spacing (approximately 15 metres).

With these configuration options, the final wellfield for Phoenix is expected to include approximately 310 wells over a 90 m x 900 m area.

A variety of alternative arrangements or patterns of injection and recovery wells may be used; however, and may include other vertical or horizontal arrangements. The final details of the wellfield design (e.g., pattern on surface, distance between wells, orientation of wells, number of pumphouses, etc.) will be developed as Project engineering advances.

Well Design and Installation

There is no material difference in the design of an injection and a recovery well – both can be used to move mining solution in either direction depending on how pumps direct flow in or out of the ground. Pumping pressures between injection and recovery wells are expected to vary considerably depending on distance and stage of mining.

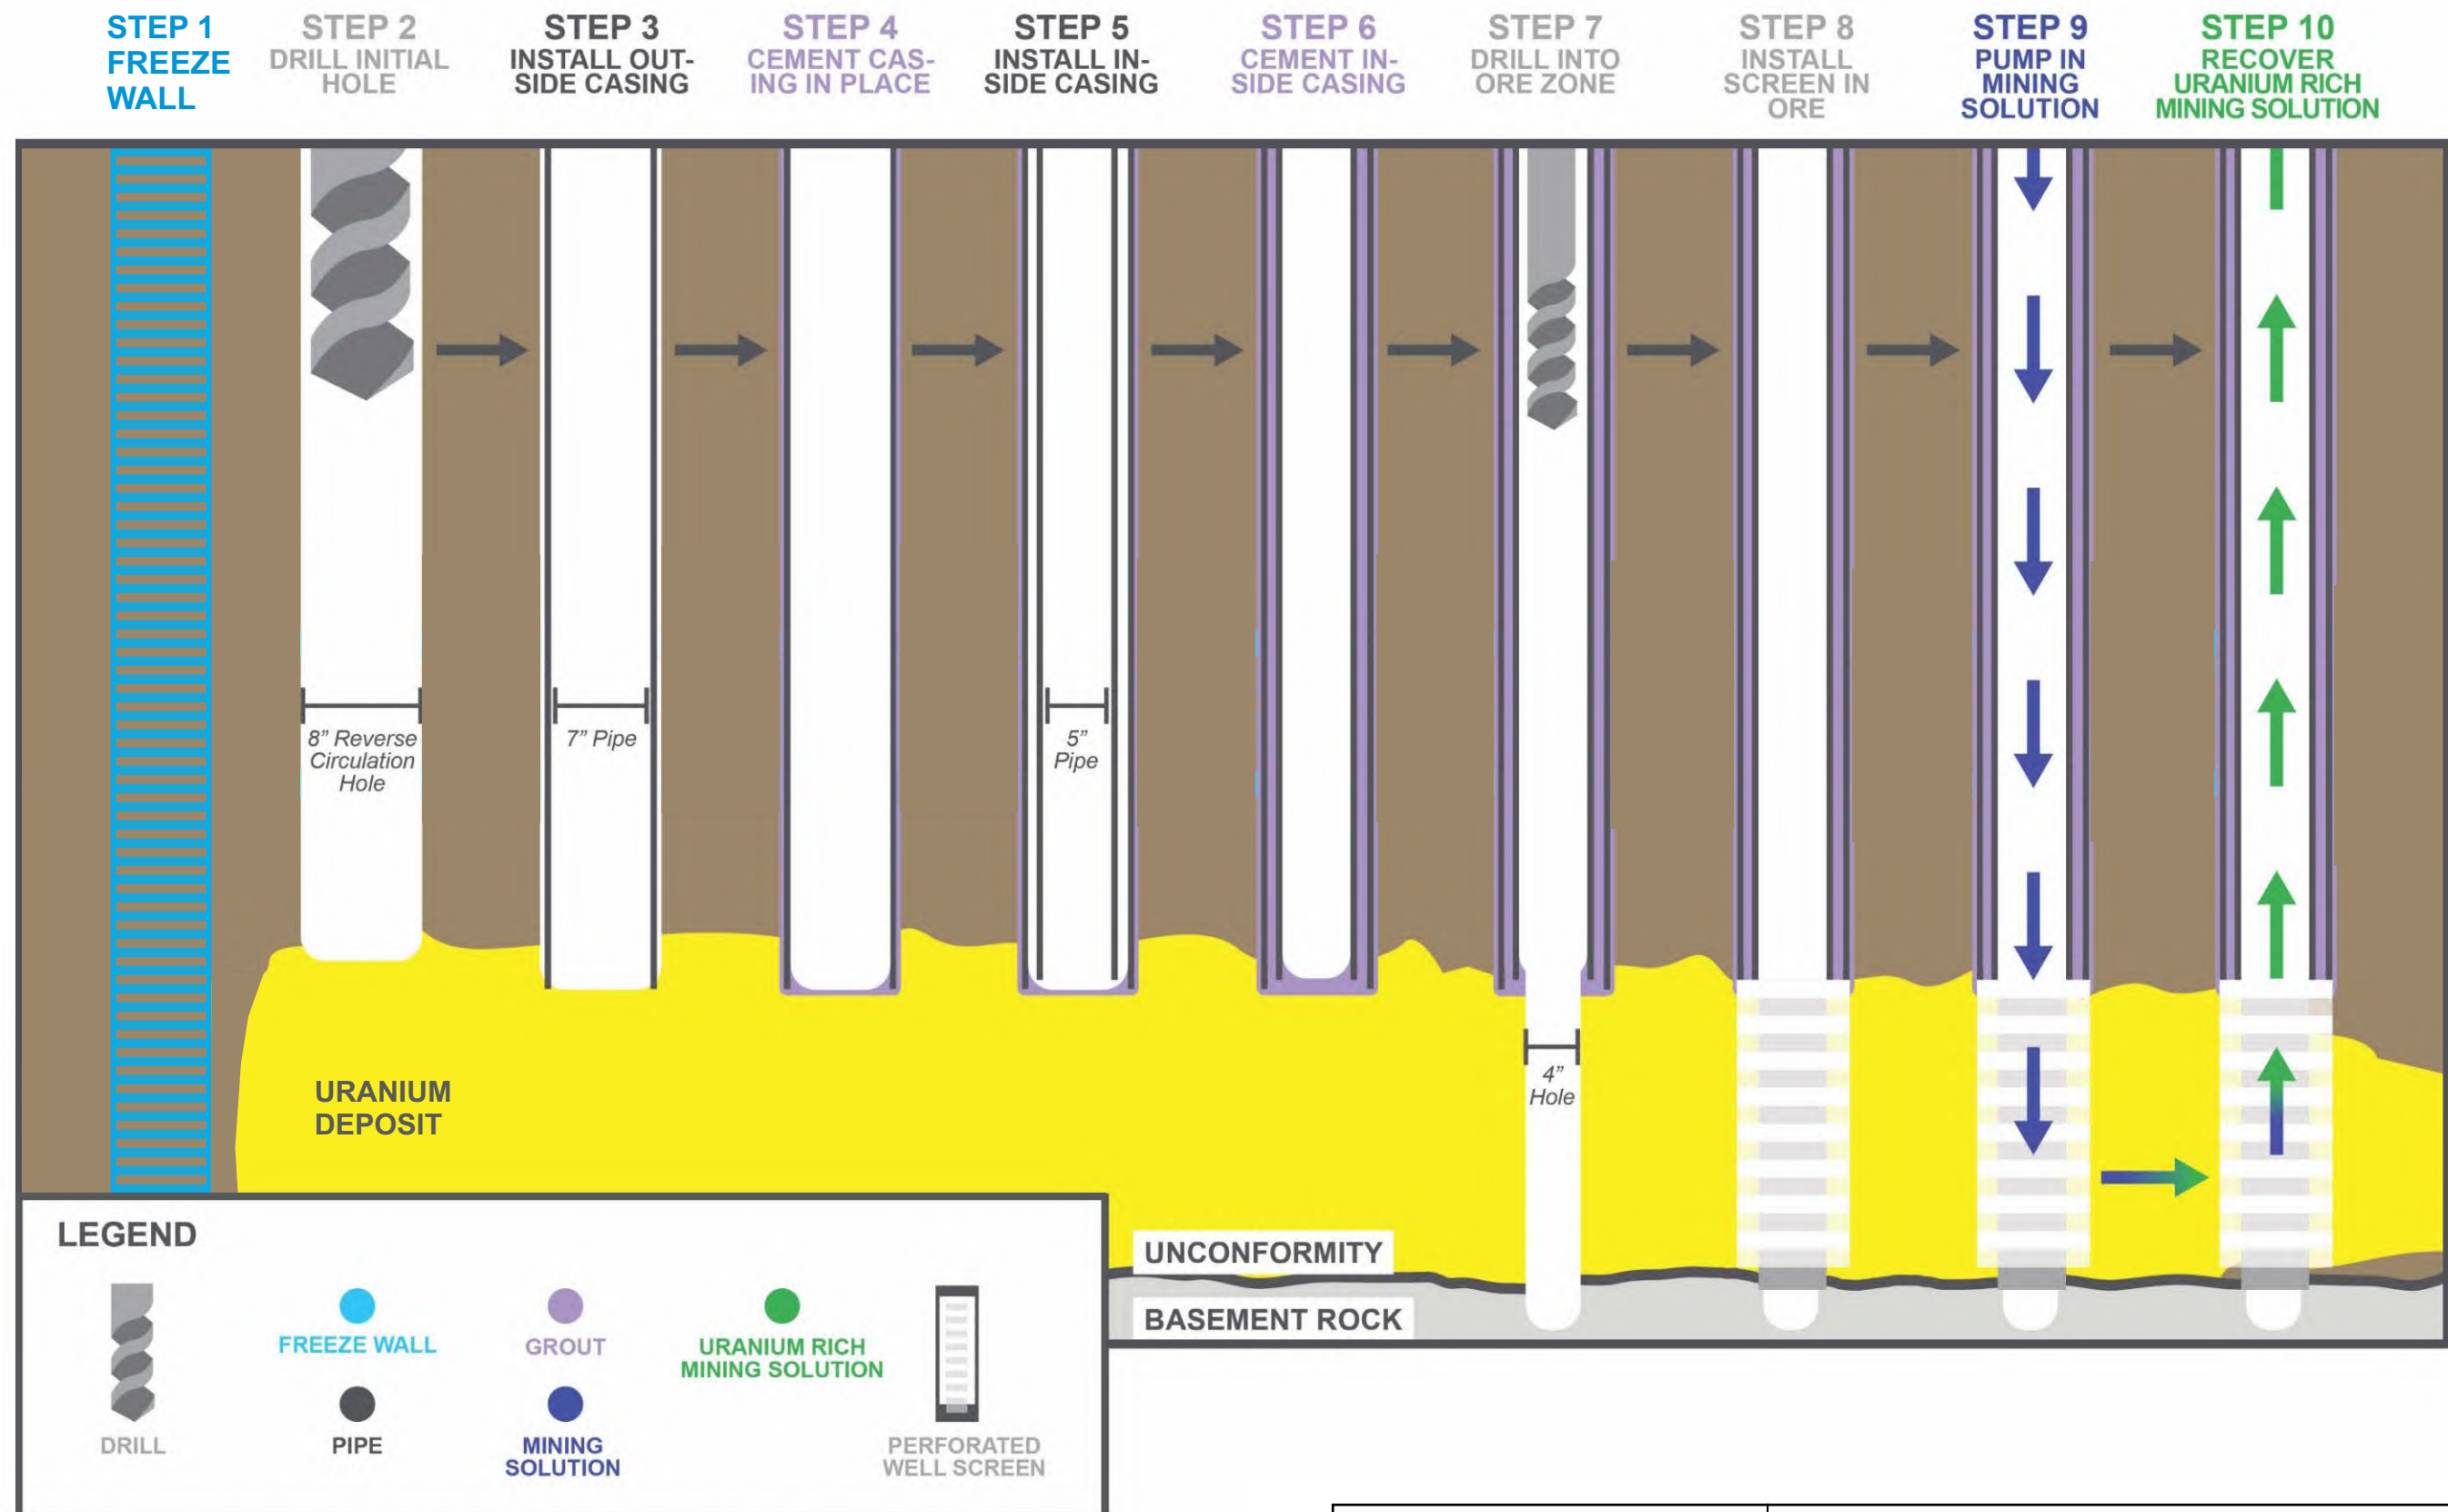

Injection and recovery wells at Wheeler may be about 4 to 8 inches in diameter at surface, however, other diameters may be used in some instances. Figure 2.8 shows photographs of a typical ISR well at surface and a standard type of well cover.

Figure 2.9 provides an overview of Denison's current conceptual well installation sequence based on prefeasibility level engineering. Specific details may change as the Project advances into feasibility and detailed engineering design stages.

Figure 2.8: Typical In Situ Recovery Well at Surface

Lenison Mines

Wheeler River Project
Provincial Technical Proposal and Federal Project Description

Figure 2.9: Proposed Well Installation Sequence

Revised: December 2020

Pumphouses

Based on the current designs for the Project, approximately three pumphouses will be needed. A pumphouse is a small building or container on surface where pipes from injection and recovery wells are operated and flows of mining solution are monitored. See photos in Figure 2.10 for examples of components inside an operating ISR pumphouse in the USA.

Figure 2.10: Inside a Typical In Situ Recovery Pumphouse

Source: Confidential uranium in situ recovery operation in the USA

Pumphouses will distribute the mining solution to the injection wells, as well as collect the uranium rich mining solution from the recovery wells. Each pumphouse will be connected to two production trunk lines. One of the trunk lines will be used for receiving mining solution from the processing plant, and the other will be used for returning uranium rich mining solution back to the processing plant (Figure 2.1 and Figure 2.7). Each pumphouse will include a manifold, valves, flow meters, pressure meters, and instrumentation, as required, to fully operate, monitor and control

the process. Pumphouse control monitoring systems enable operators to individually adjust each recovery or injection well as well as allow for sampling. Operators can also use the master control system in the processing plant to remotely control pumphouse production lines.

Ventilation in the pumphouses will be designed with the ALARA principle (as low as reasonably achievable) in mind to provide sufficient worker protection from potential radon and radon progeny exposure. Monitoring systems will be in place to ensure these mitigation measures are meeting design specifications.

Wellfield Piping System

Pipelines will transport the mining solution to and from the processing plant. The flow rates and pressures of the individual well lines will be monitored in the pumphouses. This data will be transmitted to the processing plant for remote monitoring through a master control system. Through the master control system, operators will be capable of controlling pumphouse production lines remotely.

Double-walled high-density polyethylene (HDPE), or equivalent, piping will be used in the wellfields and will be designed and selected to meet design operating and environmental conditions.

The lines from the processing plant, pumphouses, and individual well lines will be freeze protected and secured to minimize pipe movement.

Monitoring Wells

Groundwater monitoring wells will be installed at various depths and locations in and around the wellfield. The monitoring wells will allow for both groundwater sample collection and measurement of groundwater level.

Mechanical Integrity Testing

After an injection, recovery, or monitoring well has been completed, and before it is made operational, a mechanical integrity testing of the well casing will be completed to ensure the installation has been successful and the well is functioning as designed. Well casings that fail integrity tests will be repaired before the well is placed into service.

2.3.1.3 Freeze Wall

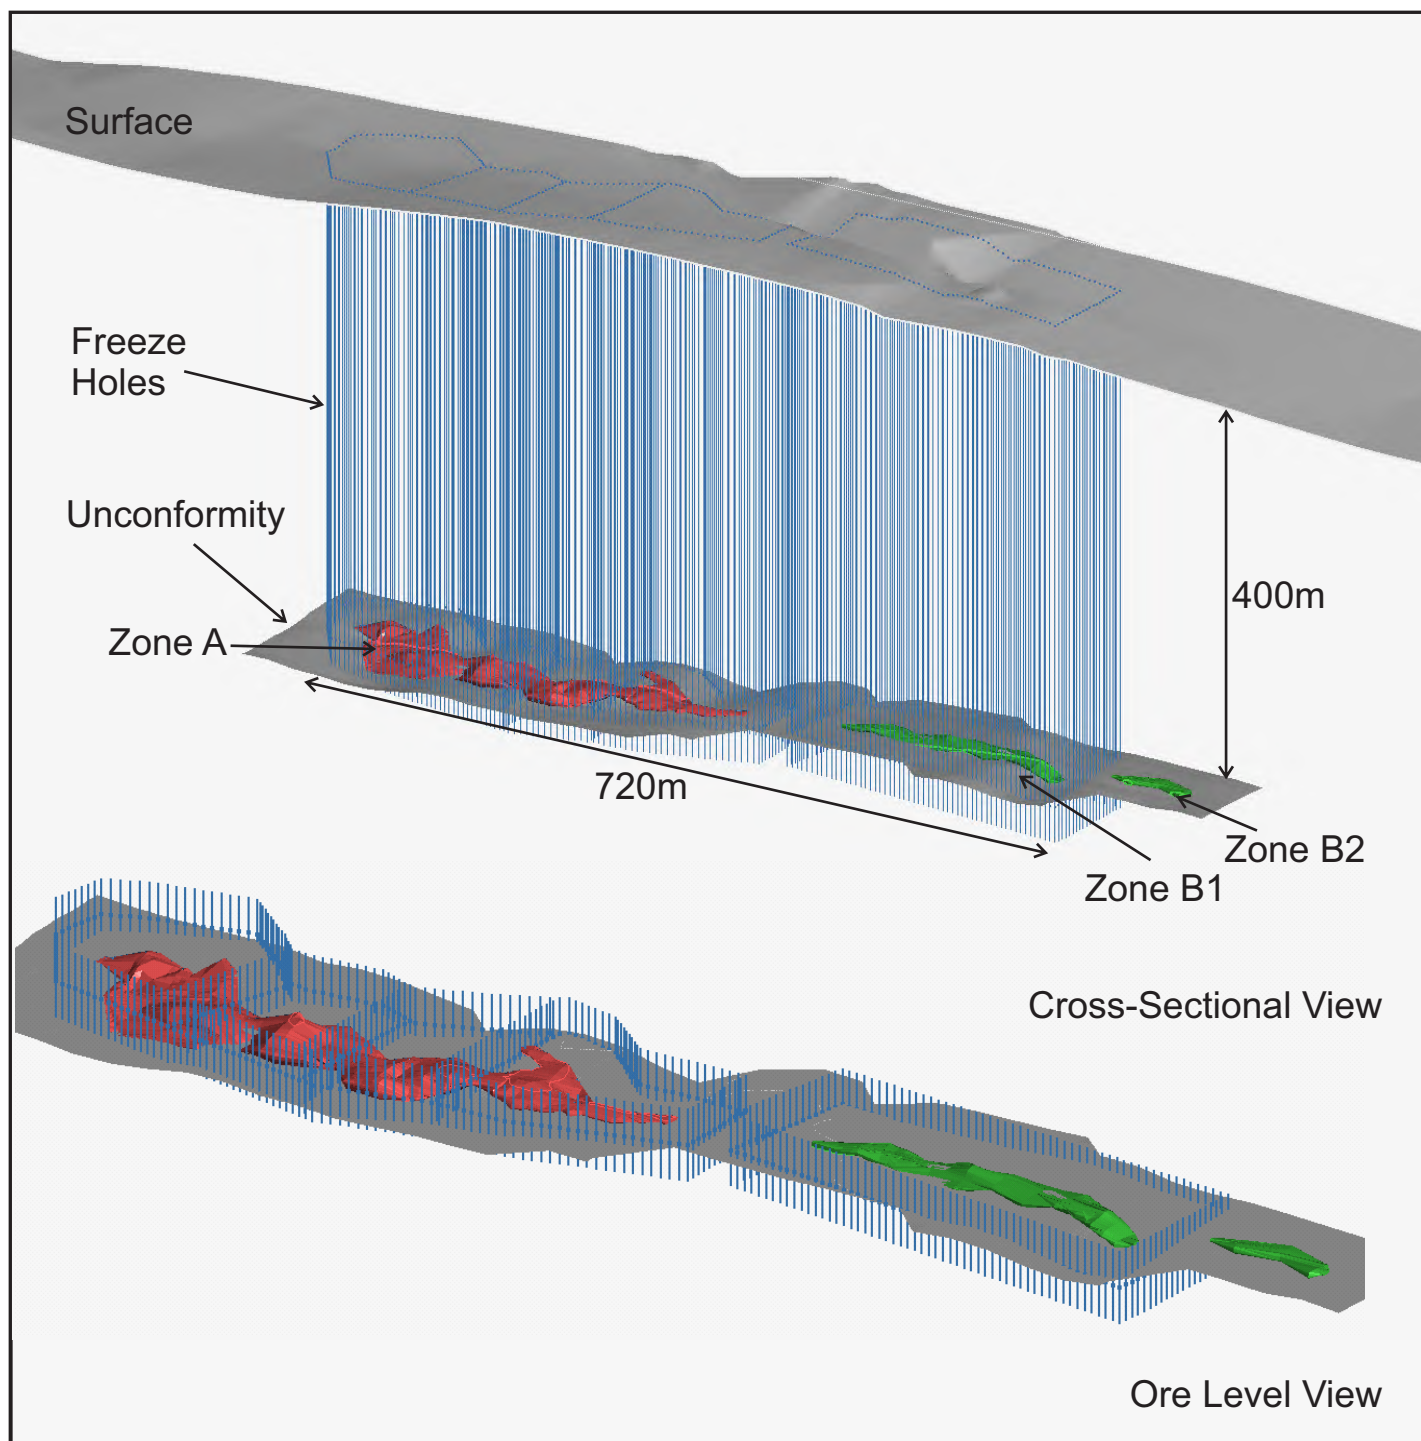

In typical ISR operations, containment is normally achieved through naturally impermeable geological layers (aquitards) or by artificially creating a drawdown of the water table by pumping.

At Wheeler, the very low permeability basement rock below the uranium deposit serves as a natural aquitard; however, the sandstone hosting the uranium deposit is permeable and groundwater can flow horizontally through the deposit. To achieve containment at Wheeler, the uranium deposit will be surrounded by an engineered freeze wall from the basement rock to surface, isolating the uranium from regional groundwater movement.

Ground freezing technology is well established throughout the world. Its use in a mining environment was pioneered in Saskatchewan's potash mining industry and later adapted for use in Saskatchewan's uranium industry. Ground freezing to control and eliminate groundwater from entering the mining areas is a fundamental component of two existing Athabasca Basin underground uranium mines.

The freeze wall will be established by drilling parallel cased holes from surface, anchoring into the impermeable basement rock. The freeze wall will be constructed to surround the entire mining horizon. This process is illustrated in Figure 2.11 and is expected to be achievable using existing commonly used drilling techniques. Once the drill holes have been installed, a low temperature brine solution will be circulated through the cased holes to remove heat from the ground, ultimately freezing the natural groundwater and establishing an impermeable, frozen wall to encompass the uranium deposit. While the freeze wall is expected to be several metres thick, it will be developed around the uranium deposit, to ensure the uranium deposit itself does not freeze.

The area within the freeze wall will allow for full containment of mining fluids and protect the regional groundwater.

Freeze Plant

A freeze plant will be required on surface; near the deposit where the freeze holes are collared (Figure 2.7). The freeze plant will be constructed on surface based on a modular design for easy installation and operation. The design for the freeze plant includes:

- Several modular freeze plant skids;
- Electrical/control skids;
- Evaporative condenser skids; and
- One insulated brine tank.

Freeze Wall Timeline

Modelling predicts the freeze wall will require 14 months to be established. The freeze wall will be in place throughout the operations phase. The freeze wall will be designed to allow for phased mining of the deposit and facilitate discovery and implementation of continuous improvement initiatives.

After decommissioning once the freeze wall is no longer needed and refrigeration is turned off, it will take a minimum of 1 year for the freeze wall to thaw depending on how long the freeze wall was active and actual ground conditions encountered.

2.3.2 Processing Plant

Refer to **Figure 2.2.** for an overview of the conceptual design of the processing plant.

The processing plant will house the tanks and equipment to fully process uranium rich mining solution recovered from the ISR wellfield into yellowcake and refortify the mining solution for continued use in the ISR wellfield. The processing plant will also contain filtration systems, bulk chemical storage, process solution storage tanks, and a control room.

The processing plant will be designed with expert consideration of potential environmental and health and safety effects to mitigate interactions to the extent possible. For instance, the floor will be graded as required and sumps will be installed to collect any spills. Ventilation in the processing plant will be designed with the ALARA principle in mind to provide sufficient worker protection and monitoring systems will be in place to ensure worker health and safety. Dust control and good housekeeping practices throughout the processing plant will also form a critical component of the Radiation Protection Management Plan developed for the Project. The processing plant exhaust, mainly from drying and packaging areas, will be directed through a stack and released outside of the building. The stack height will be designed based on results of air dispersion modelling to be an appropriate height for optimal dispersion. Bulk storage tanks for the processing chemicals, such as sulfuric and/or hydrochloric acid, sodium hydroxide, and hydrogen peroxide, will be located outside the processing plant. The storage tanks will sit inside appropriately designed and sized concrete

secondary containment basins. The secondary containment basin for each applicable chemical system will be physically separated from the containment basins for other chemical systems.

The plant is anticipated to be approximately 50,000 ft² (4,600 m²) in size, which is about half the size of a CFL football field. The building will be constructed adjacent to the wellfield to minimize piping distances (Figure 2.7).

The uranium bearing solution will be pumped from the wellfield pumphouse(s) to the processing plant and pumped through the following circuits:

- *pH adjustment (not shown in Figure 2.2)* – The pH of the incoming uranium rich mining solution will be monitored and adjusted as required to ensure the uranium is fully dissolved.
- *Impurities Removal Process* – Uranium rich mining solution will be pumped to an impurities removal circuit where the pH of the solution will be adjusted to allow the precipitation of iron hydroxides and other metals. Once the impurities have precipitated out of the uranium rich mining solution, the solution is routed to the yellowcake precipitation circuit. Precipitated impurities removed at this step will be placed into totes and stored on the lined waste pad (Figure 2.7) until final disposal.
- *Uranium Precipitation* – Uranium is recovered from the uranium rich mining solution following the impurities removal process. Reagents are added to the uranium rich mining solution in a series of agitation tanks to precipitate dissolved uranium. If required, there is additional pH adjustment. The solution moves to a thickener that provides time for growth of the uranium oxide crystals. The precipitated uranium will accumulate at the bottom of the thickener and the mining solution, now depleted of uranium, will rise to the top. The mining solution is cleaned through a series of sand filters prior to refortification and re-injection into the wellfield. The precipitated uranium product accumulated at the bottom of the thickener is withdrawn at the underflow of the thickener and pumped through a filter press (*not shown in Figure 2.2.*), where excess liquid is removed and circulated back to the thickener.
- *Yellowcake Dewatering/Drying and Packaging* – Entrained solids particles exiting the filter press will be collected for drying and packaged. Fresh water is sprayed on the surface of the cake to reduce the entrainment of contaminants in the dryer. Any remaining moisture is evaporated in the dryer. Any water collected from the drying process will be condensed and reused in the plant for reagents preparation. Once the moisture is removed from the yellowcake product, the yellowcake is packaged into 400 L steel drums via gravity. Denison will evaluate the use of either low temperature dryers or calciners for drying in the processing plant.
- *Mining solution refortification* – The ISR process circulates the mining solution through the uranium deposit over and over, and it is expected that contaminants may accumulate in the continuously recycled solution. Accordingly, it may be required to remove (or ‘bleed’) a portion of the mining solution to prevent accumulation of contaminants. The bleed solution will be routed to the water treatment plant where the contaminants will be removed from the system

and any produced cleaned water will be re-used as process make-up water when possible. This bleed volume in addition to moisture losses in the drying process must be replaced. Reagents will be added to any makeup water (sourced from either surface runoff or fresh water from groundwater or a lake) and will then be mixed with the recycled mining solution and re-injected into the mining horizon.

The ISR wellfield and processing plant will be designed to efficiently recover uranium and to reduce operating costs by recycling and re-using most of the solutions inside each circuit. Any excess treated water from the WTP will be released to a surface water body or injected into groundwater via deep well injection once acceptable water quality is achieved.

2.3.2.1 Production Capacity

The anticipated production capacity of Wheeler is up to 12 Mlbs/year with a mine life of up to 20 years. This is above the current known reserves at Wheeler and is intended to provide a conservative basis for assessing Project effects in the EIA and operational flexibility.

2.3.3 Roads

Mainland access to the site will be from Highway 914. A seven-kilometer (7 km) section of road will be constructed from the highway to the Wheeler site and a five kilometer (5 km) long road will also be constructed from the Wheeler site to the airstrip (Figure 2.6); the total road length is twelve kilometers (12 km). Additional site roads will include a service loop to the camp and a short service road to the runoff pond and the potential treated effluent discharge point.

Many of the proposed roads will be developed along previously disturbed areas, including roads currently used for exploration activities, thereby minimizing terrestrial habitat disturbance.

Denison anticipates the need for installation of two water crossings along the road from the Wheeler site to the airstrip. The crossings will be designed, constructed and maintained to avoid causing harm to fish and fish habitat.

During the PFS process (Denison 2018), an assessment was completed to evaluate access road alignment options from the highway into the Wheeler site. Several routes were analyzed for key factors including: length, cut and fill quantities, distance from cabins, distance from waterbodies and distance from any water crossings. As outlined in Section 8.2.1.2, a workshop was completed with communities to obtain input from local Indigenous and non-Indigenous communities into the access road routing options. After the engagement process and using community input, the preferred route was selected and incorporated into the current Project design.

2.3.4 Supporting Infrastructure

2.3.4.1 Air Strip and Terminal

As a proposed fly in-fly out operation, Wheeler will require an airstrip to bring personnel to and from the site.

A 1,600 m long airstrip is proposed to be positioned in a natural and relatively flat valley to the NE of the Wheeler site (Figure 2.6). The magnetic headings are 03/21, which is similar to both the Collins Bay airport and Key Lake airstrip. The runway has been designed to accommodate the aircraft presently used by existing mining operations in northern Saskatchewan to transport personnel into and out of site. An airstrip terminal building and two double-walled Jet A fuel tanks, to provide site service to aircraft as required, will be constructed near the airstrip. The approach line to the airstrip from the SW clears the Wheeler surface facilities by 500 m.

2.3.4.2 Accommodations Facility

Located to the southeast of the wellfield, the proposed accommodations facility is anticipated to be a turnkey building manufactured offsite and assembled and commissioned on-site. The building's design will be sized to accommodate a peak load of about 100-150 individuals during operations; however, due to its modularized design, additional modules can be easily installed should additional beds be required in the future.

The facility will include a central services complex with:

- Kitchen with food preparation area and serving area;
- Dining room;
- Camp office;
- Commissary;
- Recreation area; and
- Exercise facilities.

2.3.4.3 Operations Centre

The operations complex is planned to be a standalone, multi-functional building that will serve the administrative, technical, and maintenance needs of the site.

At the PFS stage, the building is proposed to be a two-story pre-engineered structure with total usable space of 38,000 ft²: 27,000 ft² on the first floor and 11,000 ft² on the second floor.

The first floor will house the two-story shops, dry space, and warehouses. The shops will include three full-sized maintenance bays, with one being equipped as a welding bay. Areas of the operations centre will be designed to have containment and sumps as required. Men's and women's change areas (dries) will be provided, with contamination control and suitable wash spaces for each, including laundry facilities. The warehouse has two receiving doors adjacent to the shops. Office spaces will also be provided in these areas for warehouse and procurement staff as well as maintenance supervisors.

The second floor will have administrative space with offices, a boardroom, meeting rooms, lunchroom, and washrooms.

Additional facilities include:

- Medical or nursing station with waiting area;
- Parking space for emergency response vehicles;
- Space for storage of mine rescue/emergency response gear and supplies;
- Laboratory facilities;
- Training room; and
- Mechanical and electrical services rooms.

2.3.4.4 Security Houses and Truck Scales

Access to the property will be controlled by both a north and south security gate (Figure 2.7).

The main, south gate security house will be staffed as required and be equipped with an 80-tonne weigh scale that is hard-wired into the shack. The security and truck scale buildings are planned to be modular, pre-fabricated units that will be manufactured off-site and shipped to site for installation and commissioning. The south gate facilities will have appropriate power and communications capability.

The north gate will be a simple locked gate.

2.3.4.5 Wash Bay and Scanning Facility

A wash bay will be available to clean items, equipment and vehicles that may have been in contact with potential contaminants. Contaminated water from wash bay will be collected in a sump tank and routed to the water treatment plant for treatment and discharge.

Radiological clearance scanning required for any items, equipment and vehicles leaving the site will be conducted in the same building.

2.3.5 Power Needs and Power Supply

Operation of an ISR uranium mine does not require substantial inputs of energy compared to traditional mining methods.

In an effort to further improve Wheeler's energy efficiency, Denison will assess using state of art technology for battery-powered light vehicles and mobile equipment. Similarly, Denison will evaluate the viability of using an AC powered dual rotary drill for ISR wellfield development rather than a traditional diesel-powered unit. Site infrastructure anticipated to draw power from the provincial power grid, includes the camp buildings, operations buildings, the ISR precipitation plant, and the freeze plants.

Primary Power Supply

Electrical service to Wheeler will be provided via an approximate 5 km extension tap from the existing 138 kV overhead transmission line that runs along Highway 914. Optimization of the precise line route will be completed as the Project advances and will likely follow the access road alignment.

Power transmission to the site (e.g., assessment, obtaining necessary permits, and construction) will be led by SaskPower and is not considered as part of this Project (refer to Section 2.6).

Back-up Power Supply

Based on historical data provided by SaskPower, the outage rate of the existing line is approximately six outages per year. To provide electrical service during times of utility outages, emergency diesel generator will be installed in strategic locations to service the site and maintain essential functions.

The generators will be used to maintain power to the processing plant and the accommodations facility, as well as to maintain other essential services as required.

2.3.6 Water Management and Treatment

As part of Denison's approach to sustainable mining at Wheeler, Denison intends to recycle process water to the greatest extent possible, thereby reducing the demand for a fresh water supply. The proposed recycling process design incorporates a closed-loop system within which only limited make-up water is estimated to be required to supplement ISR mining and on-site processing. As a result of the focus on water recycle, the volume of treated effluent requiring discharge is expected to be low.

2.3.6.1 Site Runoff

Water will be collected from the waste pond (which collected runoff from the waste pad) and the processing plant terrace and then directed to the water treatment plant. Runoff for the small clean waste rock pile may be collected into a settling pond to remove total suspended solids if necessary. Other site runoff collection needs will be examined and identified as part of the EIA.

2.3.6.2 Fresh Water Supply and Distribution

A fresh water distribution system will be designed to provide fresh water to the fire water system (fresh water tank, two electric fire water pumps, and a back-up diesel fire water pump for on-site fire suppression needs), the potable WTP, the processing plant, wash bay and temporary batch plant (required during construction phase). Fresh water will be sourced from either a shallow groundwater well or an intake from a nearby surface water body. Estimated fresh water consumption rates are provided in Table 2.1 below.

Table 2.1: Estimated Fresh Water Consumption Rates

| Consumer | Flow Rate (L/day) |
|--|-------------------|
| Processing Plant | 2,000 |
| Wash Bay | 6,000 |
| Potable WTP | 30,000 |
| Temporary Batch Plant (during construction only) | 5,000 |

2.3.6.3 Potable Water Treatment Plant and Distribution

Raw water for the potable WTP will be sourced from either groundwater or a nearby surface water body.

Potable water will be generated on site by a pre-fabricated modularized (40 ft shipping container) potable WTP comprised of a treatment plant, a 2,000 L storage tank, and a bottle filling station. Potable water will be piped to the camp, the operations centre, and the processing plant to provide water for safety showers and eyewash stations. Other locations, such as the airstrip terminal, gate houses and satellite lunch trailers (during construction) will receive bottled water as required.

Ultrafiltration or reverse osmosis with UV filtration are proposed for filtration. Chlorination will be needed prior to distribution. The modular plant will be capable of all necessary processes and will contain required HVAC and lighting. The potable WTP will be placed on a concrete pad and will generate 1.4 m³/hr (33 m³) of potable water per day based on 300 L per person per day. Raw water will be pumped to the potable WTP via pipeline from the fire water storage tank and fresh water distribution system.

2.3.6.4 Sewage Treatment Plant

Domestic waste water and sewage will be generated at the camp, processing plant, and the operations centre. Domestic waste was assumed to be generated at the rate of 300 L per person per day. Sewage will either be collected in septic tanks and transported by a vacuum truck or piped directly to the on-site sewage treatment plant. The sewage treatment plant will be a modular facility comprised of two heated and insulated units (likely containers), a holding tank, ancillary filtration, ancillary treatment process equipment, and sludge handling system. Denison may investigate options to dispose of treated sewage underground or through a septic field. Alternatively, the sewage treatment plant will generate effluent suitable for discharge to local surface water. Treated effluent will first be discharged to surface testing ponds where the water quality will be checked to ensure it meets regulatory limits. Reject solids from the treatment process will be collected, dewatered, and stored on the waste pad on site prior to permanent disposal.

2.3.6.5 Water Treatment Plant

The Wheeler WTP will be designed to treat any contaminated water removed from the ISR process (e.g., backwash of sand filters, bleed solution), runoff collected from the waste pad, and any other contact water such as water from the wash bay and process sumps. The WTP will be located inside of the processing plant.

Contaminants will be removed from the system. It is Denison's intent to incorporate treated water back into the mining water balance as make-up water in the processing plant, to the extent possible. Any excess treated water from the WTP will be pumped to appropriately-sized holding

ponds. The holding ponds will be sized to hold effluent for a period of 24 hours for testing before discharge to the environment.

Treated water in the ponds will be monitored prior to release to a surface water body or injected into groundwater via deep well injection. All treated effluent released to surface water will meet federal and provincial regulatory discharge limits. The treated effluent discharge line will be heated and have secondary containment in place.

Details on the proposed treated effluent discharge location, the pipeline, the type of release point, and modelled results of any changes in the aquatic environment will be presented in the EIA.

2.3.7 Waste Management

2.3.7.1 Incinerator

Denison plans to operate an incinerator to incinerate any food waste. This is a best practice to avoid attracting wildlife into the site. It is expected that selection of an appropriate incinerator will have design components to mitigate emissions to air. Correct operation and regular maintenance of the incinerator will be important to achieve the design parameters for minimizing emissions to air and procedures will be in place to achieve this.

2.3.7.2 Landfill

Denison plans to construct, operate, monitor and decommission a domestic landfill on site. A waste management plan will be developed for the Project which will detail how each type of waste generated on site will be managed. In general, only inert non-hazardous wastes such as wood and plastics will be suitable for disposal in the on-site landfill.

2.3.7.3 Waste Pad and Pond

During operations, the waste pad is expected to contain:

- Mineralized drill cuttings from wellfield development;
- solid impurities (mainly iron and/or radium) removed from the uranium rich mining solution during the impurities removal step in the processing plant; and
- dewatered reject solids from the sewage and water treatment processes.

The waste pad will be double lined, with leak detection capabilities and an associated monitoring program to ensure containment. An adjacent pond will be used to collect runoff from the pad and water in the waste pond will be piped to the water treatment plant for treatment. As part of the EIA, Denison will identify options for either on-site disposal of these wastes or off-site disposal at an approved facility.

2.3.7.4 Clean Waste Rock Pad and Pond

Clean waste rock will be generated from the sandstone cuttings from drilling activities. This includes the drilling of the injection and recovery wells to create the ISR wellfield and the drilling of

freeze holes to create the freeze wall. It is estimated that a total of 7,100 m³ of clean waste rock will be generated.

Clean waste rock will be stored on an unlined pad and can be used for road or concrete construction. A pond may be constructed beside the pad to collect runoff if required.

2.3.7.5 Hazardous Substance Storage and Use

Fuel Storage and Dispensing Facility

Since the site's primary power supply will be from the provincial electrical grid, Wheeler fuel consumption at Wheeler may be limited to back-up power supply, auxiliary vehicles (i.e. ATVs and snowmobiles), miscellaneous equipment (i.e. portable pumps), and freight and personnel transportation to site. This will reduce Project fuel consumption and minimize greenhouse gas emissions.

Tanker trucks will deliver diesel and gasoline to the site on an as-needed basis. Fuels will be stored in approved, above-ground, 25,000 L double-walled storage tank(s) equipped with secondary containment in accordance with provincial regulations and standards. Fuel storage and distribution infrastructure will be constructed in accordance with applicable legislation requirements (e.g., *Hazardous Substances and Waste Dangerous Goods Regulations*). Stationary and mobile equipment will be fueled with a fuel-dispensing truck.

Propane Facility

Propane may be used as a primary or backup means to support the camp kitchen, the incinerator, and to heat the buildings. The propane facility will be sized to meet the needs of the site activities and will feature a storage tank (assumed to be 30,000 uswg), vaporizers, a propane bottle fill station, and a propane bottle weigh station. Propane will be delivered to site on an as needed basis.

Other Hazardous Substances

Sulfuric acid, hydrogen peroxide, sodium hydroxide, barium chloride and flocculants are the main chemicals anticipated to be used in the processing plant and in mining. Bulk storage tanks for the processing chemicals, such as sulfuric and/or hydrochloric acid, sodium hydroxide, and hydrogen peroxide, will be located outside the processing plant. The storage tanks will sit inside appropriately designed and sized concrete secondary containment basins. The secondary containment basin for each applicable chemical system will be physically separated from the containment basins for other chemical systems.

The various lubricants and coolants required for regular maintenance of equipment will be stored on site.

Each one of these materials will be stored, handled, recycled or disposed of in an appropriate manner and meet the requirements of the *Hazardous Substances and Waste Dangerous Goods Regulations*.

No fuels, oils or other hazardous substances will be stored within 100 m of any water body and no equipment maintenance or re-fuelling will be conducted within 100 m of a water body. Denison will maintain an up to date record of the various hazardous substances on site and will maintain Material Safety Data Sheets and appropriate procedures for spill management, handling and clean up in an accessible location.

2.4 Project Activities and Schedule

The following sections describe the main activities to be performed in each Project phase and the proposed schedule for Project development.

2.4.1 Pre-Development and Construction

2.4.1.1 Pilot Demonstration Well Pattern

In order to obtain essential data for detailed engineering, licensing and the environmental assessment, Denison may elect to operate a pilot demonstration well pattern. A separate proposal will be submitted to the appropriate regulatory agencies for review and approval. The pilot demonstration may include well development, circulation of mining solution over a small spatial area and subsequent recovery of the mining solution. Permeability enhancement of the uranium deposit may be included as part of the scope. Monitoring wells will be in place and monitoring will be conducted to ensure the well pattern functions as proposed. It is not anticipated that the pilot demonstration will incorporate the use of a freeze wall.

2.4.1.2 Pre-Development Phase

Following receipt of environmental approvals, the preparatory phase will include initiation of licensing activities, organization of the Project execution team, preparation of key Project documents, and procurement of equipment, materials, and labour. These activities will be initiated during the last stages of the feasibility study should results continue to support advancement of the Project.

2.4.1.3 Construction Phase

Following receipt of licensing approvals, construction activities on site will commence. Construction of Wheeler infrastructure can be divided into several key areas as outlined below.

Site Preparation: Clearing and leveling of the surface facilities will be contracted out to a suitable contractor. The initial earthworks construction will focus on preparing roads into the site, specifically to the ISR plant and the two ends of the wellfield where the freeze wall drilling will occur. These two sites will remain the focus of levelling and grading activities. All of this work will be supported by temporary camps and utilities (and/or the existing exploration camp and utilities) while permanent facilities are established. Temporary security checkpoints will be established early in the site preparation phase.

Wellfield and Freeze Hole Drilling: Denison has been drilling on the property since 2004; this experience and knowledge will be applied to the drilling of the freeze and wellfield holes. Suitably qualified and experienced contractors will be overseen by Denison personnel to complete drilling activities.

Ground freezing requires the establishment of a pattern of freeze wells drilled across the uranium deposit and of refrigeration units and corresponding electrical and mechanical services to each. Freeze well drilling will be initiated as early as possible. The ground freezing units will arrive at site and be physically installed and operating when the appropriate tie-ins to the site power distribution system is completed.

Processing Plant Construction: While the processing plant is likely the most complex construction activity for the Project, it is relatively simple when compared to other full-service uranium mills, as there are a limited number of vessels and minimal piping. Furthermore, due to the degree of isolation of the plant from other site facilities, construction of this facility can be prioritized with minimal impact to other facilities. Most of the equipment and materials inside the plant are small in size, enabling the shipment of tanks and other vessels pre-assembled. Processing plant construction will begin immediately following earthworks at the site. After foundations are completed, the building can start constructed. A short commissioning period begins post-construction prior to first uranium production.

Other Surface Infrastructure: Other surface infrastructure includes camp buildings, the operations centre, the airstrip terminal building, and various other smaller infrastructure. With the exception of the operations centre and processing plant, all other buildings are expected to be pre-fabricated buildings to reduce the costs of construction on site.

The operations center is planned to be completed ahead of commissioning. This will allow the operations team to conduct activities in a suitable building and will create a permanent maintenance facility before operations commence. The permanent camp is completed in a similar time frame, along with basic services such as permanent communications and fire systems.

A temporary batch plant will be used during the construction phase. Concrete will be required for construction of foundations and containment walls in select surface infrastructure.

Electrical infrastructure: A powerline will be constructed from the existing provincial power line adjacent to Highway 914 into site to the main substation. Distribution around site will be completed as required to support the various operations.

Other: The balance of the infrastructure items, such as storage areas, incinerator, and security gates, are planned to be completed at about the time of commissioning and will complete the construction at Wheeler.

Commissioning of the facilities is expected to be supported by engineering and/or supplies vendors along with the assistance of the construction teams. This will ensure constructed facilities adhere to the designs and specifications set forth.

Project and construction management during the capital development phase of the Project will be managed by a small dedicated Project management team. During the construction phase, Denison will provide general and administrative services to operate the site and support the contractors in construction (i.e. room and board, flights, general supplies, freight haulage, etc.). It is expected that a mix of employees, contractors, and engineering service providers will support site construction efforts.

Wheeler construction milestones are summarized in Table 2.2.

Table 2.2: Wheeler Conceptual Development Schedule

| Project Activity | Schedule* |
|---|-----------|
| Environmental Impact Assessment and Licensing | 2019-2022 |
| Feasibility Engineering | 2019-2021 |
| Detailed Engineering | 2021-2022 |
| Construction | 2022-2024 |
| Operation | 2024-2044 |
| Decommissioning (does not include progressive decommissioning during operations) | 2044-2049 |
| Post-decommissioning | 2049-2054 |
| Release from licence and transfer back to Crown land or into Provincial Institutional Control Program | 2055 |

*2020 Update: Note on COVID 19 - Given recent social, financial and market disruptions, Denison suspended certain activities at Wheeler River, including the Environmental Assessment program, which is on the critical path to achieving the project development schedule outlined in the PFS. On November 9th, Denison announced its decision to restart the EA, effective January 2021. However, uncertainty associated with the temporary suspension remains and the Company is not yet able to estimate the impact to the project development schedule outlined in the PFS, and users are cautioned that the estimates provided therein regarding the start of pre-production activities in 2021 and first production in 2024 should not be relied upon.

2.4.2 Operation

Operation of Wheeler is planned to last up to 20 years. Denison anticipates operating the site with employees and a limited number of external contractors.

The operation phase is generally focused on operating the Project components presented in Section 2.3. As such, the operational activities for Wheeler include but are not limited to:

- Operation of the ISR wellfield;
- Operation of the ISR processing plant and production of uranium concentrate at a production rate of up to 12 Mlbs U₃O₈/year;
- Maintenance activities at the wellfield, processing plant, roads, airstrip and other site facilities;

- Water withdrawal from groundwater or surface water body for potable use, fire suppression system and make-up water in the processing plant;
- Water treatment of potable water, sewage, and waste water;
- Waste management;
- Environmental monitoring as outlined in the Environmental Management System;
- Package and transport of nuclear substances;
- Reporting to regulators;
- Engagement with local Indigenous and non-Indigenous communities; and
- Systems for maintaining site security.

2.4.3 Decommissioning

The five main decommissioning activities include:

- Mining horizon remediation;
- Decontamination;
- Asset removal;
- Demolition and disposal; and
- Reclamation.

Progressive decommissioning will be completed throughout the life of the Project whenever feasible and reported to the regulatory agencies as part of the annual reporting requirements throughout operations. Progressive decommissioning activities will focus on the decontamination, demolition, and disposal of unused buildings and infrastructure, as well as the removal of unused equipment and machinery. Reclamation of inactive areas will take place when these areas become available.

Closure of the entire Project will be completed in accordance with all provincial and federal regulations and guidance documents with the fundamental considerations being to ensure physical and chemical stability of the site in order to protect human health and the environment.

2.4.3.1 Mining Horizon Remediation

Mining horizon remediation will be initiated once mining is completed. The objective will be to restore the water within the confines of the freeze wall to reach an acceptable decommissioning objective. Details on groundwater quality decommissioning objectives for the mining horizon will be developed as part of the EIA.

To complete mining horizon remediation, water will be injected into the mining horizon via injection wells and then recovered through the recovery wells. Produced water would be processed through the processing plant until non-economic uranium concentrations are observed. Non-economic produced waters will be treated and mixed with fresh water for continued circulation in

the mining horizon. This will continue until recovered water reaches acceptable groundwater quality decommissioning objectives.

During groundwater restoration, reagents may be added to the injected water to accelerate groundwater quality recovery.

After remediation has been completed, the freeze wall will be turned off and allowed to thaw. This will allow the eventual re-establishment of the pre-operational groundwater flow regime in the former mining horizon.

2.4.3.2 Decontamination

Surface facilities and injection, recovery, and monitoring wells will be systematically surveyed and decontaminated as necessary. Surplus chemicals and other hazardous materials will be removed and stored in designated temporary storage facilities. Sumps will be cleaned. All hazardous materials will be disposed of at approved off-site facilities. All radiologically contaminated material will be disposed of on-site in accordance with licence conditions.

Empty tanks will be removed from the sites and sold as scrap or reused. Otherwise, they will be transported to an approved waste management facility. Fuel tanks will be managed by a contractor licenced to handle these types of tanks. Any remaining fuel and tanks will be removed by the contractor from the site. As much waste as possible will be hauled off-site and disposed of at appropriate licenced facilities.

2.4.3.3 Asset Removal

Salvageable machinery, equipment, and other materials will be dismantled, decontaminated, and taken off-site for resale or recycling. Remaining items will either be managed at a facility licenced to manage radioactive wastes or disposed of in an approved facility on-site.

2.4.3.4 Demolition and Disposal

All permanent structures that cannot be removed from the property as an asset will require demolition. Most process equipment and non-supporting structures will be removed from buildings prior to demolition and the buildings will be demolished.

During demolition, dust control will be required. An initial wash may be necessary, in addition to the wetting of demolition debris as structures are disturbed during demolition. The requirement and duration of misting will be determined on a case-by-case basis.

A review prior to the start of demolition will identify areas requiring additional procedures. Where possible, dust generating materials will be removed prior to demolition. Appropriate personal protective equipment and personnel decontamination procedures will be employed.

Valuable recyclable materials will be separated and processed for transport and sale concurrent with demolition. Excavators equipped with grapples will sort the recyclable products from the non-

recyclables. Shears will be used to size recyclables for shipping and sale. Cleaning procedures of recyclables will be integrated into demolition, as necessary.

Concrete foundations will be left in place. Any portions of concrete foundations remaining above grade will be levelled and rebar will be cut-off at grade. Large slabs will be perforated on a 2 m grid to permit drainage. Concrete slabs will be covered with 0.5 m of development rock or locally stockpiled till.

The demolition process will produce:

- Saleable recyclable materials (steel, stainless steel, copper, steel sections, and sheet metal);
- Hazardous materials, including contaminated material that cannot be decontaminated;
- Roofing materials and insulation;
- Wood;
- Concrete; and
- Contaminated soils.

Saleable recyclable materials will also be transported off-site as scrap or recycled.

Hazardous materials will be handled and disposed of in accordance with the appropriate regulations and good practice. Where possible, chemicals will be mixed to produce a neutral solution and disposed of in an approved manner at site. Hazardous materials, such as spent chemicals (that cannot be managed on-site), waste oil, and sludges, will be disposed of off-site at licenced facilities.

Non-hazardous waste materials, such as roofing materials, insulation, wood, co-mingled concrete, and light steel (i.e. hand railings), may be disposed of on-site or off-site in a licensed landfill. Soil testing will be conducted in any areas of known contamination and/or potential spills, including areas around chemical, fuel, and explosive storage areas. Testing will be conducted according to industry standard procedures and compared to provincial and federal soil standards.

2.4.3.5 Reclamation

An overview of the reclamation activities that will be completed for the main Project components is provided below. The main Project components that will require reclamation at closure include:

- ISR wellfield and infrastructure;
- Transportation corridors and laydown areas;
- Ancillary infrastructure;
- Waste pad; and
- Water storage ponds.

Closure of the ISR wellfield and associated infrastructure will require the following activities:

- Decommissioning of all injection and recovery wells, following acceptable wellfield restoration;

- Removal, decontamination, and disposal of all surface piping;
- Decontamination and removal of the pumphouses;
- Decontamination, removal, and/or disposal of the processing plant;
- Allowing the freeze wall to thaw and decommissioning of all freeze pipes and freeze plant; and
- Placement of all waste in an approved long-term licenced facility.

Prior to reclamation, the existing wellfield will be used to circulate neutralizing solution and clean water through the mining horizon. The tanks in the processing plant may be repurposed and used for the closure water treatment process.

Transportation corridors will be graded and scarified to promote natural revegetation. Access roads required for post-closure monitoring will be left as is and maintained to permit access. Access to the site will be restricted by gates and/or berms. Laydown areas will be scarified, covered with 0.5 to 1.0 m of stockpiled overburden, and vegetated with native self-sustaining species.

Reclamation of remaining infrastructure components involves the decommissioning and removal of components such as power transmission lines and electrical infrastructure, water pipelines, and water treatment plants. Ponds and lined settling ponds will be decommissioned once they are no longer required for water management. Any contaminated liners will be removed and hauled to an approved landfill. The footprints of ancillary infrastructure will be scarified and vegetated with native self-sustaining species as required.

2.4.4 Post-Decommissioning

The post-decommissioning period will extend from the end of physical decommissioning until transfer of the site into the provincial Institutional Control Program (Government of Saskatchewan 2009) or direct release of the land back to the Crown, is expected to last five years.

Following decommissioning, physical, chemical, and biological monitoring of the site will be conducted to ensure that the site is chemically and physically stable. The monitoring programs will be designed and conducted in accordance with the provincial and federal regulations and licence conditions.

The following is a summary of the anticipated monitoring programs:

- Groundwater quality;
- Physical stability;
- Biological; and
- Surface water quality.

The monitoring programs will be conducted until the site-specific decommissioning and reclamation objectives for the Project are met. Monitoring reports will be developed and submitted to both the provincial and federal regulators, in accordance with licence conditions.

2.5 Project Alternatives

Denison first initiated evaluation of the production potential from Wheeler in 2010. Since that time the Project has undergone significant design and review stages and has naturally evolved into the current state. During this time, several key alternatives and options were evaluated including:

1. Mining methods: Historical work evaluated a total of 32 mining methods to extract uranium from the deposit. Methods were evaluated through an increasingly rigorous process and considered factors such as: safety, environment, production rates, capital costs, operating costs, schedule, operational flexibility, risk, etc. In addition, specific workshops were held in local Indigenous and non-Indigenous communities to capture community input into the selection of a preferred mining method. After several years of study, the ISR mining approach was selected as the best option across the majority of factors.
2. Mineral Processing: In conjunction with the above assessments, historical work evaluated the construction of an on-site conventional mill to process run of mine ore from an underground mine. Factors such as: safety, environment, production rates, capital costs, operating costs, schedule were considered. Ultimately the decision to avoid construction of a conventional mill and tailings facility was made.

Following the selection of ISR as the mining method, further processing alternatives were evaluated including the use of a toll mill to process the uranium rich mining solution, ion exchange technology (common to international ISR operations) and direct precipitation. Direct precipitation on site scored the highest in all evaluation categories.

3. Site Access Road Routing: The Wheeler site is approximately 4 km from the existing highway 914. An assessment of several routes was completed and considered factors such as: safety, environment (total disturbance), capital costs and risk. In addition, specific workshops were held in the Indigenous and non-Indigenous communities to capture community input into the final route selection.
4. Treated Effluent Discharge Location: After completion of baseline data collection a preliminary evaluation of potential surface water bodies was completed to assess the suitability of the surrounding areas to receive treated effluent from the site. Preliminary modelling identified five surface waterbodies that would likely be able to receive treated effluent without significant adverse environmental impacts. More detailed assessments of these waterbodies were completed and factors such as safety, environment, capital cost, operating costs and risk were considered. In addition, specific workshops were held in Indigenous and non-Indigenous communities to capture community input into the final location selection.
5. Site Infrastructure Layouts: Throughout the design process, several iterations of the site infrastructure and placements were considered. This process is on-going with factors such as safety, environmental disturbance, schedule, capital costs and risk being considered.

2.6 Ancillary Projects

SaskPower will secure permits for and construct the ~5 km powerline extension from along Highway 914 into Wheeler. It is anticipated that the powerline extension will be adjacent to the access road.

Saskatchewan Ministry of Highways has initiated the provincial environmental assessment process for Highway 914 extension and the Key Lake by-pass. As outlined in the project's Terms of Reference (Saskatchewan Ministry of Highways 2016) the Key Lake bypass component includes construction and operation of an approximate 5 km all-weather road by-pass to route traffic around Cameco's Key Lake uranium mill site. The Key Lake by-pass component of the Ministry of Highway's proposed project is considered an ancillary project for Wheeler.

2.7 Socio-Economics

Approximately 300 workers are expected to be required during the two-year construction period. Each component of construction will require workers with different types of skills and training depending on the task (e.g. road construction, wellfield drilling, erection of buildings, connection to services, etc.). During operations, about 150 people will be employed to operate the ISR wellfield and processing plant, as well as provide various supporting activities such as security, camp operations, operation of the water treatment, sewage and potable water plants, environmental monitoring, and maintenance of roads, equipment, and buildings.

The need for goods and services during construction, operations and decommissioning will generate business opportunities throughout the life of Wheeler. Examples of anticipated goods and services may include: catering, housekeeping, food, freight, and bulk materials such as fuel, propane, and reagents.

Employment and procurement opportunities pursued by those from nearby communities will be preferred as outlined in the MOUs executed with nearby communities and Indigenous groups (Section 8). In accordance with the intent of the MOUs, Denison has established an internal procurement approach, which requires the procurement of all goods and services for the Project to first consider businesses based in the communities prior to looking elsewhere in northern Saskatchewan, southern Saskatchewan and/or outside of Saskatchewan.

As a result of Denison's early engagement initiatives, a number of programs and actions focused on producing socio-economic benefits for local Indigenous and non-Indigenous communities have been initiated. Examples of some of the successes to date are described in Section 8.2.1. It is Denison's intent to leverage its early work and existing relationships with local Indigenous and non-Indigenous communities in order to expand upon its existing socio-economic commitments. This will allow Denison to meet or exceed the socio-economic commitments that will be outlined in the Project's Saskatchewan Surface Lease Agreement and the Human Resource Development Agreement to be negotiated between Denison and the province following the successful completion of the environmental impact assessment process.

3 Project Location

The property straddles the boundaries of NTS map sheets 74H-5, 6, 11, and 12. The approximate UTM coordinates of the property are 477,000E and 6,374,000N (NAD83, Zone 13). Wheeler is located within Treaty 10 territory (Figure 3.1).

Wheeler is located in Saskatchewan's Northern Administration District (NAD) as defined in the province's Northern Municipalities Act, but its creation dates back to The Northern Administration Act, 1948, which provided for the administration and development of the northern part of Saskatchewan. The NAD includes approximately half of Saskatchewan's land area, but less than four per cent of the province's population. The NAD's population of roughly 37,000 lives in approximately 45 communities, which include municipalities, First Nations reserves, settlements, and sometimes a combination of each.

There are a number of leases near Wheeler including recreational, traditional land use, and industrial surface leases. Figure 3.2 shows the location of recreational and traditional land use leases issued by the Province of Saskatchewan; it is assumed there are seasonally used cabins on these properties and this will be confirmed as part of the EIA. There are potentially eleven (11) cabins within 22 km of Wheeler (Figure 3.2).

Other nearby surface leases are for industrial sites such as power transmission and mineral exploration (Figure 3.3 and Table 3.1). Industrial surface leases are in place for the Key Lake Operation (a uranium mill) and the McArthur River Operation (an underground uranium mine); milling and mining activities at these sites are currently suspended.

Notes:

¹ Land dispositions from Crown Resource Lands provided by Government of Saskatchewan, Ministry of Environment, Fish, Wildlife and Lands Branch

As a remote site, there are no communities in relatively close proximity to Wheeler (Figure 3.4). Calculated using a straight line, the closest communities are approximately 150 km away in the northern settlement of Wollaston Lake and the neighbouring reserve of Lac La Hache (Table 3.2 and Figure 3.4). Travelling by existing roads the closest community to the Project is Pinehouse which is approximately 260 km away (Table 3.2).

The communities and associated Indigenous groups of Patuanak, Pinehouse, Ile a la Crosse, and Beauval were identified as key through the community selection process; additional details are provided in Section 7 and Section 8.

Denison screened the area around Wheeler to check for environmentally sensitive areas. As shown in Figure 3.6, crown land subdivision, ecological reserves, representative areas, special management areas, wildlife refuges and wind turbine avoidance zones are not located near the Project area. In addition to the information provided on Figure 3.6, there are no game preserve, national wildlife areas, migratory bird sanctuaries, conservation easements, Fish and Wildlife development fund lands, Ramsar wetlands, or wildlife habitat protection areas in the area shown.

In terms of management areas, Wheeler is near the centre of the woodland caribou SK1 administrative unit, fur block 18, and the provincial wildlife management zone 75 (Figure 3.7).

4 Federal Involvement

No federal funding or support has been provided to the Project.

Federal lands will not be used for the purpose of carrying out the Project.

5 Existing Environment

5.1 Physiography and Terrain

The property is characterized by a relatively flat till plain with elevations ranging from 477 to 490 metres above sea level (masl). Throughout the area, there is a distinctive north-easterly trend to landforms resulting from the passage of Pleistocene glacial ice from the northeast to the southwest. The topography and vegetation at the property are typical of the taiga forested land common to the Athabasca Basin area of northern Saskatchewan.

The regional area is covered with overburden from 0 to 130 m in thickness; the overburden in the immediate area of the Wheeler uranium deposit is 22 to 30 m in thickness. The terrain is gently rolling and characterized by forested sand and dunes. Vegetation is dominated by black spruce and jack pine, with occasional small stands of white birch occurring in more productive and well-drained areas. Lowlands are generally well drained but can contain some muskeg and poorly drained bog areas with vegetation varying from wet, open, non-treed vistas to variable density stands of primarily black spruce as well as tamarack depending on moisture and soil conditions. Lichen growth is common in this boreal landscape mostly associated with mature coniferous stands and bogs.

5.1.1 Geology

The Property is partially covered by lakes and muskeg which overlies a complex succession of glacial overburden deposits. These include eskers and outwash sand plains, well-developed drumlins, till plains and glaciofluvial plain deposits (Campbell 2007). Glacial overburden is comprised of medium to coarse grained sand and gravel till outwash. The quaternary deposits vary in thickness from zero to approximately 120 metres with the orientation of the drumlins reflecting a southwesterly ice flow. Local outcrops of consolidated paleoproterozoic sandstone of the Athabasca formation also occur in select areas on the Property.

The glacial overburden is underlain by relatively undeformed paleoproterozoic Athabasca Group sandstone that unconformably overlie the crystalline basement rocks and have a considerable range of thickness from 170 metres over the quartzite ridge to at least 560 metres on the western side of the property. The unconformity varies dramatically across the property. From elevations of 160 to 230 metres above sea level along the Property's southeastern edge, the unconformity rises gently to a pronounced north-easterly trending ridge up to 350 metres above sea level, coincident with the subcrop of a quartzite unit in the crystalline basement. The unconformity surface drops steeply westward to as low as 30 metres below sea level. A schematic cross-section of the general property geology is shown in Figure 5.1.

Basement rocks on the Wheeler property are located within the Wollaston Domain of the Trans Hudson-Orogeny and comprise metasedimentary and granitoid gneisses. The metasedimentary rocks belong to the Paleoproterozoic Wollaston Supergroup and include graphitic and non-graphitic

pelitic and semipelitic gneisses, felsic and quartz feldspathic gneisses, meta-quartzite and rare calc-silicate gneisses. These metasediments are interpreted to belong to the Daly Lake Group, (Yeo and Delaney, 2007). Pegmatitic segregations and intrusions are common in all units. Garnet, cordierite and sillimanite occur in the pelitic units indicating an upper amphibolite grade of metamorphism. A “Paleoweathered Zone”, generally between three to ten metres thick, is superimposed on the crystalline rocks and occurs immediately below the unconformity.

The Wheeler exploration property is host to the Phoenix uranium deposit discovered in 2008 and Gryphon deposit discovered in 2014 (Figure 2.3) plus additional zones of mineralization and other prospective exploration targets. The details below are focused on the Phoenix deposit although other areas of mineralization suitable for ISR mining at Wheeler are anticipated to be geologically similar.

The quartzite ridge, an interpreted impermeable and structural barrier forming the footwall to the mineralization, dominates the basement geology at the Phoenix deposit. The quartzite unit exhibits variable dips from 45° to 75° to the southeast, averaging 50°, and with an undulating, but generally 055° azimuth. Immediately overlying the quartzite is a garnetiferous pelite, which varies from seven metres to 60 metres in thickness. Overlying the garnetiferous pelite is a graphitic pelite. The graphitic pelite is approximately 5 metres wide in the southwest, increases to approximately 70 m in the central portion of the deposit area and is 50 metres wide at the northeast extremity.

Mineralization at Phoenix generally occurs at the Athabasca unconformity in contact with the underlying basement rocks at depths ranging from 390 to 420 metres. It is interpreted to be structurally controlled by the northeast southwest trending (055° azimuth) WS Fault which dips 55° to the southeast on the east side of the quartzite ridge.

A detailed schematic of the geology at the Phoenix deposit is shown in Figure 5.2. The grades and thickness of the deposit vary along the major structure where typically higher grades and thicker portions of the deposit are associated with larger offsets along the structure where the sandstone contact has been displaced allowing for greater structural disruption and permeability of the deposit area. In general, the deposit is comprised of an exceptionally high-grade core, related to the major structure, and is surrounded by a lower grade shell away from the structure. Both the core and the shell are variably structured and are characterised by sandy clays with portions of the deposit containing ‘islands’ of less permeable though high grade ore within the more permeable and structured areas. The Phoenix deposit appears to be amenable to ISR as it is situated within relatively porous and permeable structured sandstones and underlain by less porous and competent basement rocks.

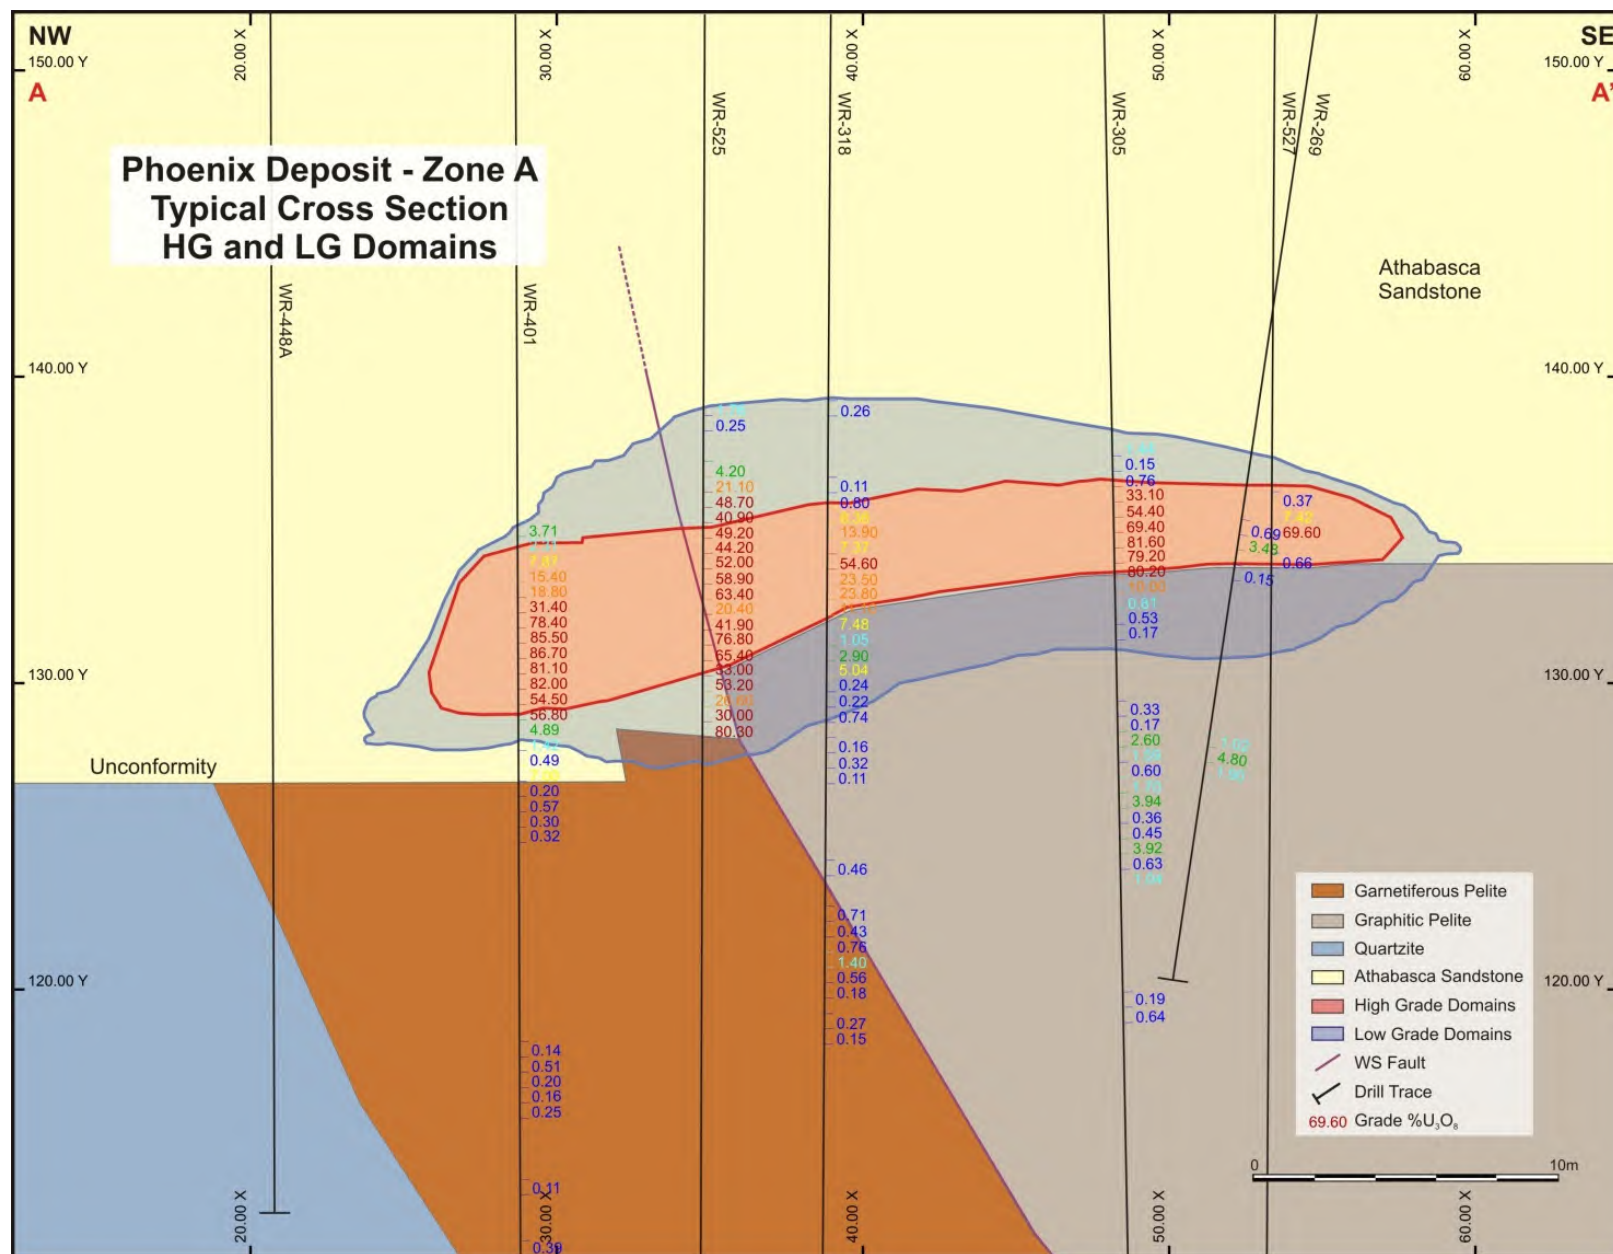

Wheeler River Property Geological Cross Section

Wheeler River Project
Provincial Technical Proposal and Federal Project Description

**Figure 5.1: Schematic Cross Section of the
Wheeler River Property**

May 2019

5.2 Hydrogeology

Shallow groundwater monitoring wells have been installed in the overburden and upper sandstone in a regional area north of the Phoenix deposit to establish baseline conditions. Monitoring has been ongoing since 2018 and results to date are typical for the Athabasca Basin and the water contains low concentrations of total dissolved solids. The water table in this area is located about 2 to 10 meters below surface.

Baseline groundwater quality samples have been collected from the Athabasca Sandstone in the site study area above the uranium deposit. Results from samples collected from between 280 to 363 m below surface show the groundwater quality has low concentrations of total dissolved solids and nutrients and a relatively neutral pH (between 6.0 and 7.0). Conductivity was 71 $\mu\text{S}/\text{cm}$. When compared to Canadian Water Quality Guidelines for the Protection of Aquatic Life (CCME 2017), results exceeded the prescribed criteria for dissolved aluminum, dissolved iron, dissolved copper, dissolved lead, and uranium. Radium-226 was 1.9 Bq/L, exceeding the Saskatchewan Environmental Quality Guideline (SEQG) of 0.11 Bq/L for surface water (Government of Saskatchewan 2017b), while the concentration of lead-210 was 0.80 Bq/L.

Baseline groundwater quality samples have also been collected from sandstone in an area immediately above the uranium deposit (352 to 395 m below surface), providing information on the water quality closer to the uranium deposit. The results from the groundwater sampling indicate a neutral pH (6.9 to 7.5), as anion chemistry was dominated by bicarbonate alkalinity and sulphate, whereas chloride was comparatively low. Cation chemistry was shown to be dominated by sodium, calcium, iron, and aluminum. Conductivity was 216 $\mu\text{S}/\text{cm}$. Dissolved iron concentrations were higher than expected given the pH of the samples, as iron hydroxides have low solubility at neutral pH, and under oxidizing conditions, iron is expected to precipitate. The iron results indicate it is likely that iron is out of equilibrium with surface conditions due to the change in redox conditions (to more oxidizing) produced by removal of the water from depth. When compared to Canadian Water Quality Guidelines for the Protection of Aquatic Life (CCME 2017), results exceeded the prescribed criteria for aluminum, dissolved iron, dissolved arsenic, dissolved copper, dissolved lead, and dissolved uranium. Radium-226 was 7.2 Bq/L, exceeding the SEQG of 0.11 Bq/L for surface water (Government of Saskatchewan 2017b), while the concentration of lead-210 was 2.1 Bq/L.

An extensive groundwater quality sampling program will be completed in 2019 to further characterize the baseline hydrogeological conditions in and around the proposed wellfield, as well as at the broader regional area. Collection of groundwater quality and water level data will be ongoing at key locations.

5.3 Atmospheric and Acoustic Environment

5.3.1 Radon

Atmospheric or passive radon monitoring commenced in September 2016 to establish baseline radon levels in the Project area. Passive radon detectors were deployed at 10 select locations in duplicate. On a quarterly basis, each deployed detector is exchanged with a new replacement detector, and each collected detector is sent to an accredited laboratory for analysis.

While there is currently no Canadian regulation that prescribes a radon threshold value in outdoor environments, Health Canada has developed a guideline for radon in indoor air for dwellings of 200 Bq/m³. This guideline provides Canadians with guidance pertaining to when remedial action should be taken to reduce radon levels. Results to date demonstrate that baseline atmospheric radon levels within the Project area are low, with the average radon concentration not exceeding 10 +/- 3 Bq/m³ at any location. Baseline radon monitoring will continue as required.

5.3.2 Dustfall

Dustfall monitoring stations were established at six (6) locations around the site in the fall of 2018. Data from these stations is not yet available.

5.3.3 Noise

Noise baseline studies are scheduled to be completed in 2019. It is reasonable to assume the baseline noise levels will be quite low in the Project area since it is located in a relatively isolated area of the boreal forest.

5.3.4 Climate and Meteorology

Regional climate and meteorological data is available from the nearby weather station at Key Lake; the station is approximately 32 km away from Wheeler. Temperature and precipitation data from 1981 to 2010 is provided in Figure 5.3. An on-site metrological station has not yet been established.

Figure 5.3: Historical Temperature and Precipitation near Wheeler

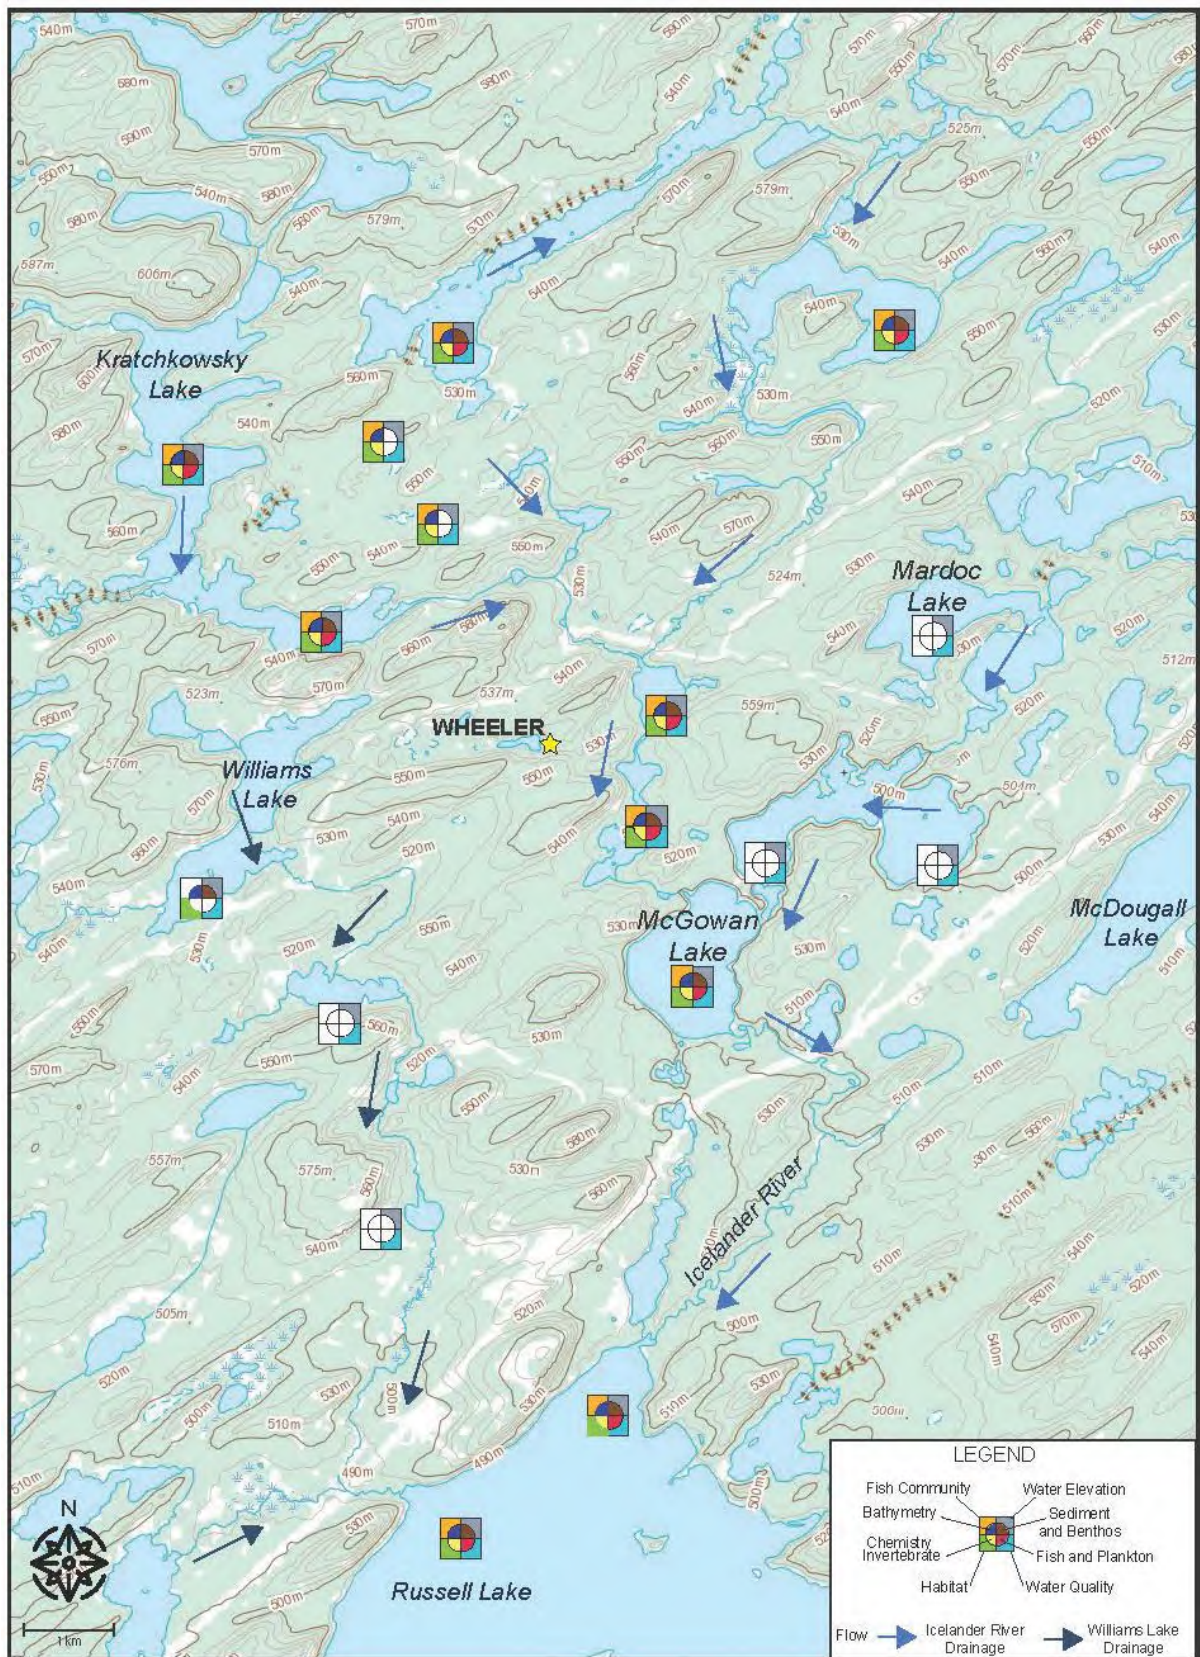

The climate is typical of the continental sub-arctic region of northern Saskatchewan, with temperatures ranging from +32°C in summer to -45°C in winter. Winters are long and cold, with mean monthly temperatures below freezing for seven months of the year. Winter snow pack averages 70 cm to 90 cm. Freezing of surrounding lakes, in most years, begins in November and break-up occurs around the middle of May. The average frost-free period is approximately 90 days.

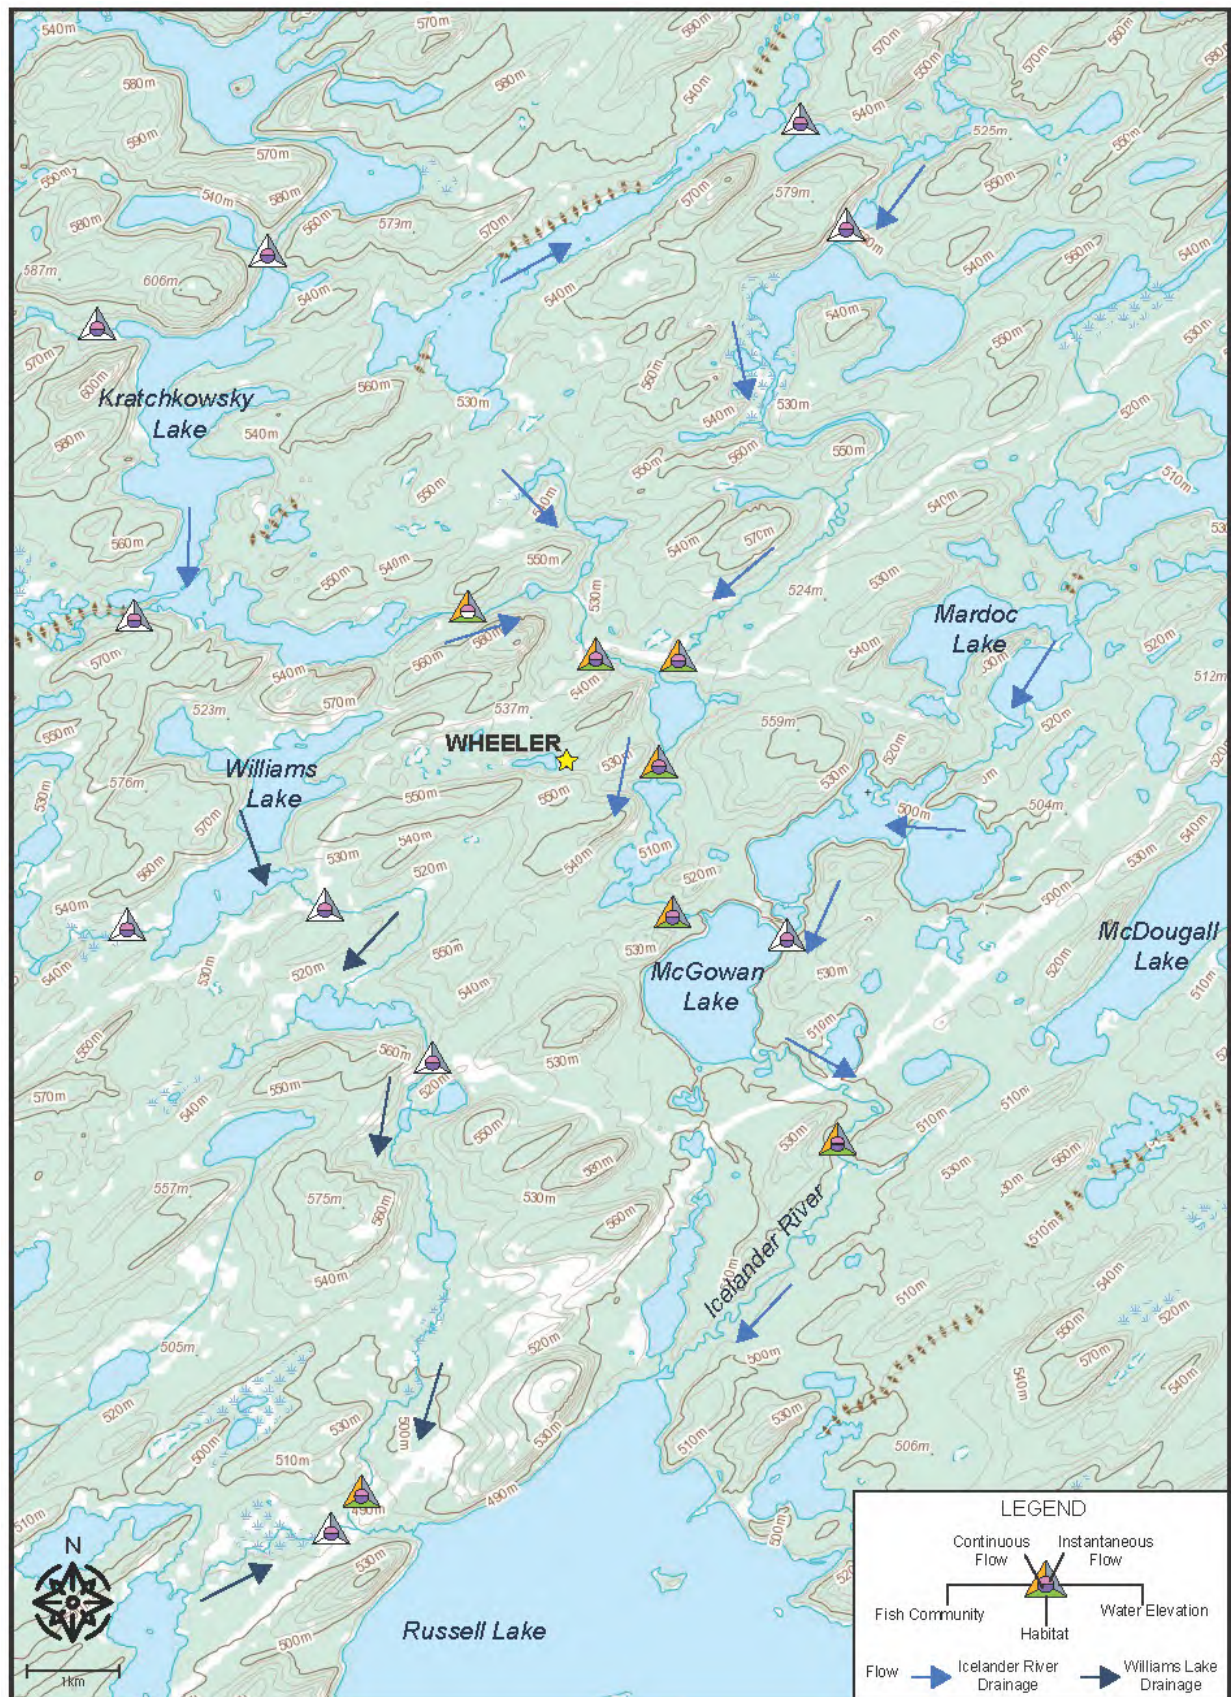

Average annual total precipitation for the region is approximately 480 mm, of which 67% falls as rain, with more than half occurring from June to September. Snow may occur in all months but rarely falls in July or August. The prevailing wind direction is from the north-west/west with a mean speed of 12 km/hr.

5.4 Aquatic Environment

Aquatic environment baseline field surveys completed between 2012 and 2018 focused on hydrology, water quality, limnology, sediment quality, aquatic habitat, bathymetry, plankton community, benthic invertebrate community and tissue chemistry, and fish community, spawning, and tissue chemistry.

A summary of data collected in lakes and ponds is provided in Figure 5.4 and a summary of data collected from streams is provided in Figure 5.5.

5.4.1 Hydrology

The Project area is located within two distinct sub-drainage areas that drain into Russell Lake, the Wheeler River, and ultimately into Wollaston Lake (via the Geikie River). Extending north and east of the Project area, the Iceland River drainage area drains approximately 371 km², while the Williams Lake drainage area is located south of the Project area and drains approximately 78 km² (Figure 5.6).

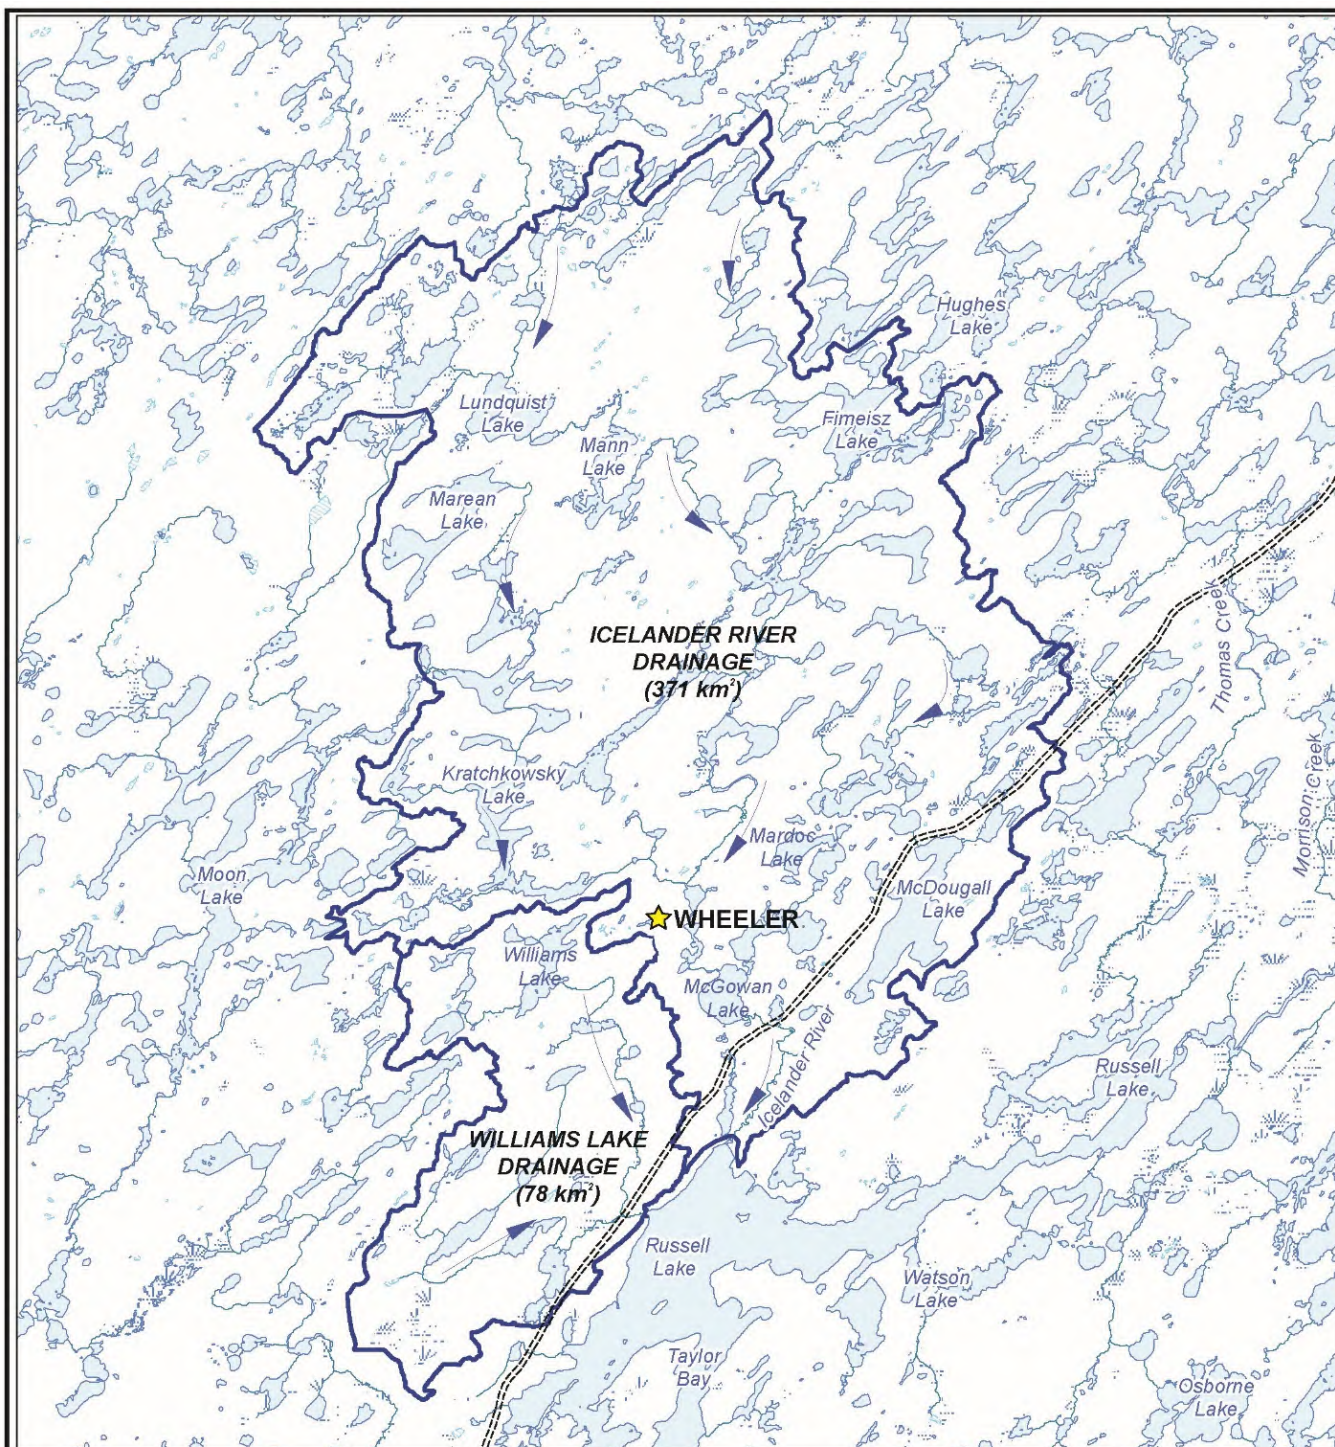

Hydrological baseline studies included manual streamflow measurements, staff gauge and elevation surveys, detailed bathymetric surveys, and continuous water level recording using dataloggers to develop rating curves at select stream locations within the Project area.

The hydrological characteristics of lakes and streams in the Project area were surveyed between 2011 and 2014. Water elevation survey locations were established at nine stream stations and eleven lake stations. Manual flow measurements were performed at each of the nine stream stations, and automated stream elevation instruments (level data loggers) were installed at all stream stations. Rating curves were established for each station based on the manual stream discharge measurements to permit estimation of hydrographic profiles for each location.

Four field programs were completed from fall 2016 to summer 2018 to capture seasonal flow conditions in spring, summer and fall. One winter field program was completed between March 15 and 19, 2018, to assess ice cover in the area and to gain a better understanding of winter baseflow conditions. Continuous monitoring equipment has been installed in seven stream stations and one lake station for continued hydrological data collection.

Project area lake and pond surface water elevations ranged from 520.86 masl at an unnamed headwater lake, to 488.26 masl at Russell Lake. In the Iceland River drainage area, water level elevations at the stream stations ranged from 520.73 masl at the most upstream station, to 492.71 masl at the most downstream station. Stream flow measurements were recorded at 2.34 cm/s at the most downstream location of the Iceland River drainage area.

In the Williams Lake drainage area, water levels at stream stations ranged from 518.33 masl at the most upstream station, to 488.55 masl at the most downstream station. Stream flow measurements recorded during this time were recorded at 0.64 cm/s at the most downstream location of the Williams Lake drainage area.

May 2019

5.4.2 Surface Water Quality and Limnology

Baseline surface water quality was assessed at seventeen (17) lentic locations and eleven (11) lotic stations within the Project area. Water quality data were compiled for the years 2012, 2014, 2016, 2017, and 2018 by measuring physical and chemical constituents obtained in situ, as well as by accredited laboratory analyses. Surface waters within the Project area were found to be comparable to other lakes in the region, which are classified as being soft with typically low levels of alkalinity, nutrients (nitrate and phosphorus), total dissolved solids, and total suspended solids. The pH of surface waters within the study area are slightly acidic to neutral.

In general, the concentrations of metals and metalloids were similar throughout the study area. Radionuclide concentrations were low, with the majority of measurements lower than their respective laboratory detection limits. For parameters with Saskatchewan Surface Water Quality Objectives (SSWQO) or Canadian Water Quality Guidelines (CWQG), most were below their respective guideline limits. Aluminum, cadmium, and lead concentrations exceeded guideline values at some locations; however, this appears to be a natural occurrence as demonstrated in surface water throughout the Project area. Elevated concentrations of iron and mercury were measured near the lake bottom in lakes that exhibited thermal stratification at the time they were sampled.

Radionuclide concentrations measured in surface water are low within the study area, and generally below the laboratory detection limits of 0.02 Bq/L for lead-210, 0.005 Bq/L for polonium-210, 0.005 Bq/L for radium-226, and 0.01 Bq/L for thorium-228, thorium-230, and thorium-232.

Limnology profiles were recorded at the deepest location in each lake, measuring conductivity, pH, temperature, and dissolved oxygen. Thermal stratification of the water column was infrequently observed in the Project area lakes.

5.4.3 Sediment Quality

Sediment samples were collected from the depositional areas of selected lakes for analysis of metals, radionuclides, total organic carbon, and particle size during the 2016 field study. Lake sediments within the Project area were found to be generally silty-clay or sandy-silt with total organic carbon present at approximately 16%. For parameters with prescribed sediment quality guidelines, all constituent concentrations were found to be at, or below, their respective threshold values.

5.4.4 Benthic Invertebrate Community and Tissue Chemistry

Benthic invertebrate community samples were collected at select lakes in September 2016. Benthic invertebrates were identified to family and consideration was also given to functional feeding group. Results were analyzed for abundance, relative abundance, and community metrics such as

density, richness, Simpson's Diversity Index, Simpson's Evenness Index, and Bray-Curtis dissimilarity index. Thirty-eight (38) major taxonomic groups (families) present in Project area waterbodies.

Total invertebrate density ranged from 671 to over 10,000 individuals per m². A total of 78 taxa were identified in the study area and mean invertebrate richness ranged from 7 to 24 taxa per sample. Simpson's Diversity Index values suggested that the benthic communities were relatively diverse at all locations; mean Simpson's Diversity Index values ranged from 0.65 to 0.85. Simpson's Evenness Index values ranged from 0.18 to 0.4 and overall few taxa comprised a large proportion of total invertebrate density at any given sampling location.

Thirty-eight major taxonomic groups (Families) were present in the study area. Chironomids were the most prevalent, comprising between 16 to 85% of the total benthic invertebrate density at each location. Furthermore, chironomids were the most numerically dominant taxon at all but two locations where Chydoridae family of water fleas (Cladocera) were the most numerically dominant. Other major taxonomic groups with respect to total benthic invertebrate density were detritus worms (Naididae), pill clams (Pisidiidae), water fleas from the families Holopedidae and Macrothricidae, phantom midges (Chaoboridae), seed shrimps (Ostracoda) and cyclopoid copepods.

Benthic macroinvertebrates from the following functional feeding groups were present at all locations sampled in the study area: scrapers, shredders, collector-gatherers, collector-filterers, and predators.

Benthic invertebrates (dragonfly nymphs and caddisfly larvae) were collected from selected Project area lakes, including Russell Lake and Kratchkowsky Lake, and analyzed for metals and radionuclides. The results of the analyses identified that radionuclide levels were generally below the laboratory method detection limit, with the exception of Po-210 and Ra-226. While metal concentrations observed in benthic invertebrate tissues collected from Project area lakes were generally consistent across all locations, cobalt and nickel concentrations were observed to be more variable. Benthic invertebrate tissues collected from Russell Lake had higher concentrations of some metals, including aluminum, cobalt, and uranium, than other lakes in the Project area.

5.4.5 Plankton Community

Lake phytoplankton and zooplankton samples were collected in September 2016 at six locations.

The biovolume of phytoplankton ranged from 0.69 to 14.0 mm³/m³ water at the locations sampled. In total, 55 phytoplankton taxa were identified from seven classes and at least six classes were identified in each of the waterbodies sampled. Diatoms (Bacillariophyceae) were dominant at all locations, representing approximately 25% to 90% of the total biovolume at each location.

The biovolume for zooplankton ranged from approximately 10 to 2,211 mm³/m³ water at lakes sampled. A total of 32 taxa belonging to 10 classes were identified. Branchiopods (Branchiopoda)

were dominant at all locations representing approximately 33% to 94% of zooplankton biovolume at each location.

At all locations, chlorophyll-a concentrations were below the laboratory method detection limit ($< 0.60 \mu\text{g/L}$). This is a reflection of the typically low primary productivity of oligotrophic lakes in the Project study area.

5.4.6 Fish Community, Spawning, and Fish Tissue Chemistry

Baseline field surveys were conducted to assess aquatic habitats throughout seasonal fluctuations in fish movements and spawning activities. Fish community surveys were undertaken in various habitat types in selected Project area waterbodies to characterize fish species presence and community diversity. A total of 13 species of fish were collected within the Project area during baseline surveys in September 2016 and May 2017. All waterbodies sampled, except one headwater pond, supported fish.

Eleven fish species were collected within study area lakes: lake chub, spottail shiner, longnose sucker, white sucker, lake whitefish, lake trout, northern pike, burbot, ninespine stickleback, yellow perch, and walleye.

Eleven fish species were also collected at stream sampling areas: lake chub, spottail shiner, longnose sucker, white sucker, arctic grayling, northern pike, burbot, ninespine stickleback, slimy sculpin, yellow perch and walleye.

Large-bodied fish spawning surveys were conducted in the fall of 2016 and spring of 2017 at selected lake and stream locations to determine the utilization of these areas for spawning. Fall spawning species present within the study area include lake whitefish and lake trout, and potential spawning habitats for these species were identified in several Project area lakes, including Kratchkowsky Lake. Spring spawning species present within the study area include walleye, northern pike, arctic grayling, white sucker, longnose sucker, and yellow perch. Spawning habitats for walleye and suckers were observed at most stream stations. Northern pike spawning habitats were present in nearly all study area lakes, as well as most stream stations. Burbot spawn during late winter in streams or lake shallows under ice. No specific spawning surveys targeted burbot, however potential spawning habitat occurs within the study area.

Tissue samples (muscle and bone) collected in 2016 and 2017 from northern pike and white sucker were submitted for chemical and radiological analyses. Northern pike represents a predator species whereas white sucker represents a forage species. Mercury concentrations in both northern pike and white sucker tissue were below the Health Canada (2007) standard of $0.5 \mu\text{g/g}$ wet weight for commercially sold fish. Selenium concentrations in both northern pike and white sucker tissue were below the British Columbia Ministry of Environment (2014) guideline of $4 \mu\text{g/g}$ dry weight and the United States Environmental Protection Agency (2016) criterion of $11.3 \mu\text{g/g}$ dry weight for fish muscle.

5.5 Terrestrial Environment

Terrestrial baseline studies were initiated in 2016 to characterize the existing environment in the Wheeler area.

5.5.1 Predictive Ecosite, Anthropogenic, and Fire Mapping

In order to develop baseline disturbance and vegetation cover/fire mapping, as well as provide an accurate characterization of the vegetation cover for future monitoring and/or impact assessment purposes, predictive ecosite mapping was obtained from the Saskatchewan Technical Branch and enhanced to increase accuracy for site, local and regional study areas.

The predictive ecosite mapping identified that there are 22 different ecosite classifications located throughout the Project area, with the most abundant being jack pine/blueberry/lichen (70%), waterbodies (13%), and jack pine/black spruce/feathermoss (5%). The results also identified that the broader regional study area was comprised of the same ecosite classifications, however differing slightly in their proportions (jack pine/blueberry/lichen (52%), waterbodies (21%), and jack pine/black spruce/feathermoss (13%)).

The results of the baseline anthropogenic map of the Project study area identified that the total amount of anthropogenic disturbance in the Project local study area is 2.9% (1.4 km²), and 1.5% (5.8 km²) identified in the broader regional study area.

Historical fire data was obtained from the Saskatchewan Ministry of Environment, Wildfire Management Branch to characterize the proportion of the Project and regional study areas which have been disturbed by past fires. The results of the fire mapping survey identified that 43% percent of the Project area landscape has burned within the last 30-50 years, and the remaining 57% of the landscape has forests aged 70 years and older.

5.5.2 Ecosite Characterization, Plant Structural Diversity, and Species Richness

Detailed vegetation and wildlife habitat characterization field surveys were undertaken in 2017 to describe and quantify the ecological and botanical conditions within recurring mapped ecosite types and regeneration forests. Sample site locations were widely distributed throughout the Project area. One hundred and ninety-four (194) species and/or genus of species were recorded during the vegetation field survey.

5.5.3 Vegetation and Soil Chemistry

The vegetation and soil sampling program was undertaken between August 2 and 7, 2017. Blueberry stems, leaves, fruit (currents year's growth), terrestrial lichen, and soil samples were collected to determine baseline conditions of physical properties, inorganic ions, metals, and radionuclides in vegetation (blueberry and lichen) and soil samples, as well as to support future monitoring, mitigation, and impact assessments.

Lichen and blueberry radionuclide levels were relatively consistent across the Project study area. Metal parameters were variable but relatively consistent, aside from elevated levels of aluminum, chromium, iron, lead, titanium, and vanadium observed at one location.

Radionuclide levels in soil were also variable but relatively consistent, with the exception of one sample site located northeast of Russell Lake where higher levels of lead-210 and polonium-210 were observed compared to other sample sites. Elevated levels of calcium, copper, lead, and manganese were also observed at this location compared to other sample sites.

5.5.4 Winter-Active Wildlife Identification and Abundance

Winter tracking surveys were completed to determine the presence of winter-active animals, determine the relative abundance of winter-active animals, enhance the Project specific area understanding of species-ecosite affiliations, and provide a robust baseline for potential follow-up and monitoring requirements. Winter tracking surveys were completed between January 25 and February 3, 2017, February 1 and 3, 2018 and March 2 and 12, 2018. Methodology was developed with guidance from the provincial snow track survey protocols (Government of Saskatchewan 2014b) and long-term monitoring techniques originating in Finland (Linden *et al.* 1996) and adopted by the Alberta Biodiversity Monitoring Program (Shank and Farr 1999). Tracks from the following species were observed in the Project area during the winter track count surveys:

- Snowshoe hare;
- Red squirrel;
- Grouse;
- Fisher;
- Moose;
- Microtine (voles and muskrats);
- Marten;
- Canada lynx;
- Otter;
- Ermine;
- Woodland caribou;
- Mink; and
- Red fox.

5.5.5 Ungulate Pellet Group/Browse Availability

Pellet group/browse availability transects were completed between June 9 and 20, 2017, and June 6 and 12, 2018 to collect baseline data on the presence and relative abundance of ungulates (moose and woodland caribou), carnivores, and game birds (grouse/ptarmigan species). The

transects were also used to determine the frequency of occurrence and abundance of terrestrial and arboreal lichen, as this species is vital to the woodland caribou population.

Pellets or scats of the following seven species were detected during the pellet group/browse availability surveys:

- Grouse/ptarmigan;
- Moose;
- Woodland caribou;
- Black bear;
- Red fox;
- Mink; and
- Martin.

The pellet group/browse availability surveys will provide baseline data to support future impact assessments and to allow for potential future follow-up and monitoring requirements.

Terrestrial lichen was observed in all ecosite/vegetation cover types sampled, except in areas where black spruce/balsam poplar/river alder swamp and willow shrubby rich fen covers were most prominent. Frequency of occurrence was the highest (greater than 99%) in areas covered by jack pine/blueberry/lichen.

Arboreal lichen occurred in 79% of ecosites/vegetation cover types surveyed throughout the Project area and were observed to be most abundant in areas covered by jack pine/blueberry/lichen.

5.5.6 Woodland Caribou Aerial Survey

In 2018, Denison submitted a permit application for an aerial survey to collect local-regional wildlife (most specifically woodland caribou and moose) data to present regional comparison values (occurrence/relative density) and habitat affiliations of species in the region, and provide context for results recorded in the Project area to date. The aerial survey permit application was denied by Saskatchewan Ministry of the Environment (SK MOE). SK MOE advised that a Project-specific aerial survey was unnecessary; SK MOE advised that in the EIA, Denison should assume presence of woodland caribou in the Project area and reference available regional data on distribution, density and movement. Although regional woodland caribou data is available in an interim, summarized form (i.e., McLoughlin et al. 2016), raw data is currently unavailable to Denison.

5.5.7 Small Mammal Identification, Abundance, and Tissue Chemistry

A small mammal trapping program was completed between September 24 and October 2, 2016 to determine the species composition and relative abundance of voles, mice, and shrews, as well as to collect specimens for baseline metal and radionuclide tissue analyses.

With an overall capture rate of 7.7 captures per 100 trap nights, a total of 197 individual small mammals from the following three species were captured during the program: red-backed voles, meadow voles, and dusky shrews.

The small mammal trap lines were stratified by three general areas: Gryphon deposit, Phoenix deposit, and a reference location. A total of 124 red-backed vole specimens were submitted for metals and radionuclide analysis. Samples collected at the Phoenix deposit indicated elevated levels of aluminum, titanium, uranium, and radium-226 in comparison to other sites surveyed.

5.5.8 Amphibian Nocturnal Call and Visual Identification Surveys

Amphibian surveys were completed to establish the presence/not-absence and relative abundance of amphibian species within the local and regional study areas. Amphibian auditory surveys were completed between June 16 and 20, 2017 and June 6 and 9, 2018. The provincial species detection protocol for amphibian auditory surveys (Government of Saskatchewan 2014c) was used to establish methodology for the amphibian nocturnal call survey.

Visual search surveys were completed between June 7 and 14, 2018. The provincial species detection protocol for amphibian visual surveys (Government of Saskatchewan 2014d) was used to establish methodology for the amphibian visual search surveys.

Wood frogs and boreal chorus frogs were detected.

5.5.9 Breeding Songbird Identification and Abundance

Breeding songbird point count surveys were undertaken in June 2017 to document the diversity and relative abundance of breeding songbirds within the Project study area, as well as to determine the presence of known or potential avian species at risk. The breeding songbird point count survey methodology was developed with guidance from the Saskatchewan Ministry of Environments species detection survey protocol for forest bird surveys (Government of Saskatchewan 2014e). Three hundred and nineteen indicated pairs were observed in the Project study area. The highest number of breeding songbird pairs were detected in jack pine/white birch/feathermoss cover. The following list provides the ten most common species detected:

- Ruby-crowned kinglet;
- Dark-eyed junco;
- Gray jay;
- Yellow-rumped warbler;
- Swainson's thrush;
- Hermit thrush;
- Lincoln sparrow;
- Chipping sparrow;

- Fox sparrow; and
- American robin.

5.5.10 Semi-Aquatic Furbearer Abundance

Semi-aquatic furbearer shoreline surveys were conducted along shorelines of select creeks, lakes, and ponds between September 29 and October 3, 2016 to provide quantitative data on the occurrence and relative abundance of semi-aquatic furbearing mammals (muskrat, mink, beaver, and otter) and to collect spatial data on the distribution within the Project and regional study areas. Signs of three target species, namely muskrat, beaver, and river otter, were observed during the survey.

5.5.11 Aerial Waterfowl and Raptor Identification and Abundance

The aerial waterfowl and raptor stick nest survey was completed across 33 survey sections containing 353 water bodies on June 15 and 16, 2017 to document the presence, diversity, and abundance of breeding waterfowl (including species at risk), as well as to identify the occurrence of active, inactive, and old raptor nests (i.e. bald eagle, osprey, and red-tailed hawk). The survey recorded 20 confirmed unique species and six species groups, for a total of 681 individual waterfowl/raptor(s). The ten most commonly observed species were:

- Ring-necked duck;
- Common merganser;
- Common loon;
- Mallard;
- White-headed gull;
- Bald eagle;
- Canada goose;
- Lesser scaup;
- Yellow legs spp; and
- Bufflehead.

A total of 24 active (currently occupied), inactive (not currently occupied), and old (dilapidated) nests were observed in the Project area during the survey. Eleven nests were active including four bald eagle nests, four osprey nests, one raven nest, one herring gull nest, and one common loon nest, as well as one mew gull colony of 12-15 nests.

5.6 Species at Risk and Sensitive Species

Wildlife resources in the regional area of the Project have been identified as being important due to their contributions to biodiversity, social and economic value, and importance to local culture. A

literature review of available wildlife information identified a number of past inventory and habitat mapping studies within the local and regional study areas, many of which contribute to understanding local animal behaviour, habitat use, and anthropogenic and biological influences.

5.6.1 Wildlife Species

The Saskatchewan Conservation Data Centre (SKCDC) were consulted to identify wildlife species that may occur in the Project area. A total of five amphibians, 219 birds, and 41 mammals potentially occur within the Project area. Of the list of vertebrates known, or with potential to occur in the Project area, thirteen sensitive or federally/provincially listed species at risk were observed. Five are listed as “threatened” or “special concern” under the Committee on the Status of Endangered Wildlife in Canada (COSEWIC), and four are listed as Schedule 1 under *Species at Risk Act* (SARA).

Table 5.1 presents the list of sensitive or federally/provincially listed species at risk observed within the Wheeler area, along with setback distances.

5.6.2 Aquatic Species

There are no observations of aquatic species (meaning wildlife that is a fish as defined in section 2 of the *Fisheries Act*) in the Project area with the status of threatened, endangered or special concern under SARA or COSEWIC.

Table 5.1: Vertebrate Sensitive or Species at Risk Observations in the Wheeler River Project Area

| Common Name | Scientific Name | Observation Source | Observation Type | Observations Per Type | Total Observations* | SK Status ¹ | COSEWIC Status ² | SARA Status ³ | SARGSS ⁴ | Setback Distance (high disturbance) ⁵ |

* Species detections included visual/auditory observations, scat/pellet groups, winter tracking trails and general sign during 2017 and 2018 surveys

¹ SKCDC Rankings:

2 = Imperiled/Very rare

3 = Vulnerable/Rare to uncommon

4 = Apparently Secure

5 = Secure/Common

M = for a migratory species, rank applies to the transient (migrant) population

B = for a migratory species, applies to the breeding population in the province

N = for a migratory species, applies to the non-breeding population in the province

U = status is uncertain in Saskatchewan because of limited or conflicting information (unrankable)

³ Species at Risk Act (SARA) and its registry of protected species go to: <http://www.sararegistry.gc.ca>

⁴ SARGSS: Saskatchewan Activity Restriction Guidelines for Sensitive Species (Government of Saskatchewan 2017c)

5.6.3 Plant Species

Rare vascular plant surveys were completed to identify rare vascular plant occurrence(s) within the Project local and regional study areas, as well as to provide a scientifically defensible baseline for potential follow-up/monitoring requirements. The rare plant survey was completed according to the Government of Saskatchewan (2017d) Rare Vascular Plant Survey Protocol. Alaskan clubmoss (*Diphasiastrum sitchense*), ranked as imperiled/ very rare (SK2), and three-seeded sedge (*Carex trisperma*), ranked as vulnerable/ rare to uncommon (SK3), were observed in the Project area.

5.7 Human Environment

5.7.1 Socio-Economic Context

The following is a summary of social and economic conditions, land use, communities, surface leases, disturbances, and existing infrastructure around the Project area.

The economy in northern Saskatchewan is dominated either directly or indirectly by natural resources. Economic activity is generated through commercial fishing, tourism, harvesting and sale of country foods such as mushrooms, wild rice and berries. The forestry industry is also a significant contributor to the region's economic base. That being said mineral exploration and the mining industry are by far the most dominant contributors to northern Saskatchewan's economy through direct employment, contracting of northern based businesses and the procurement of a multitude of supplies and services. The recent suspension of an operating uranium mine and mill in northern Saskatchewan resulted with layoffs of approximately 550 employees of which approximately half of those individuals were registered as northern residents.

As a remote site, there are no communities in relatively close proximity to Wheeler (Figure 3.4). Calculated using a straight line, the closest communities are approximately 150 km away in the northern settlement of Wollaston Lake and the neighbouring reserve of Lac La Hache (Table 3.2 and Figure 3.4). Travelling by existing roads the closest community to the Project is Pinehouse which is approximately 260 km away (Table 3.2).

A number of recreational leases are held, and it is assumed that cabins are used by both non-Indigenous and Indigenous people (Table 3.1). There are ten (10) recreational leases within 22 km of Wheeler. The federal lands within 150 km of Wheeler are reserve lands (Figure 3.5 and Table 3.3), none of which have permanent residences.

Ground access to Wheeler is along Highway 914; access to the highway north of Key Lake is controlled at the Cameco Key Lake gatehouse. Existing infrastructure in the area includes Highway 914, the provincial power line which is adjacent to the highway, infrastructure for Key Lake Operation, and infrastructure for McArthur River Operation (Figure 1.2). Existing disturbances are from exploration activities such as line cutting drilling and access routes.

Industrial leases in proximity to Wheeler are held for mineral exploration, power supply and road maintenance (Figure 3.2 and Table 3.1).

5.7.2 Heritage Resources

The Project footprints from the preliminary economic assessment stage were submitted to the Heritage Conservation Branch (HCB), Saskatchewan Ministry of Parks, Culture and Sport for heritage screening in 2017. It was identified that portions of the proposed infrastructure and access road options could impact hilly terrain and prominent uplands located within heritage sensitive areas. Accordingly, a Heritage Resource Impact Assessment requirement was attached to the Project, pursuant to Section 63 of *Heritage Property Act*.

A heritage resources baseline study was initiated on July 5, 2017 under Archaeological Resource Investigation, Permit 17-091. Heritage sensitive areas were assessed through a combination of pedestrian reconnaissance and visual inspection field programs, complimented by the excavation of 258 shovel probes and 5 shovel tests. The assessment identified an Artifact Find site (HiNi-6) of an unknown precontact cultural affiliation located on the western terrace of a lake adjacent to the Phoenix 2 access road option. The find was a large, grey quartzite secondary flake. At this stage in the Project design, the Phoenix 2 access road option is no longer being considered.

Upon completion of the Heritage Resources Impact Assessment, it was submitted to the HCB for review. The HCB determined that the new site was small, consisting of a single artifact so it was considered to have limited interpretative value. The HCB determined that the regulatory requirements were satisfactorily completed, and the office had no concerns regarding development occurring within the areas surveyed. An approval letter was issued to Denison by the HCB on December 14, 2017.

Denison recognizes that Project footprints (location, size) assessed in 2017 may change as the Project advances through the EIA and licensing phases. Additional heritage resource baseline studies will be undertaken, and approval will be received prior to executing future land disturbances, as required.

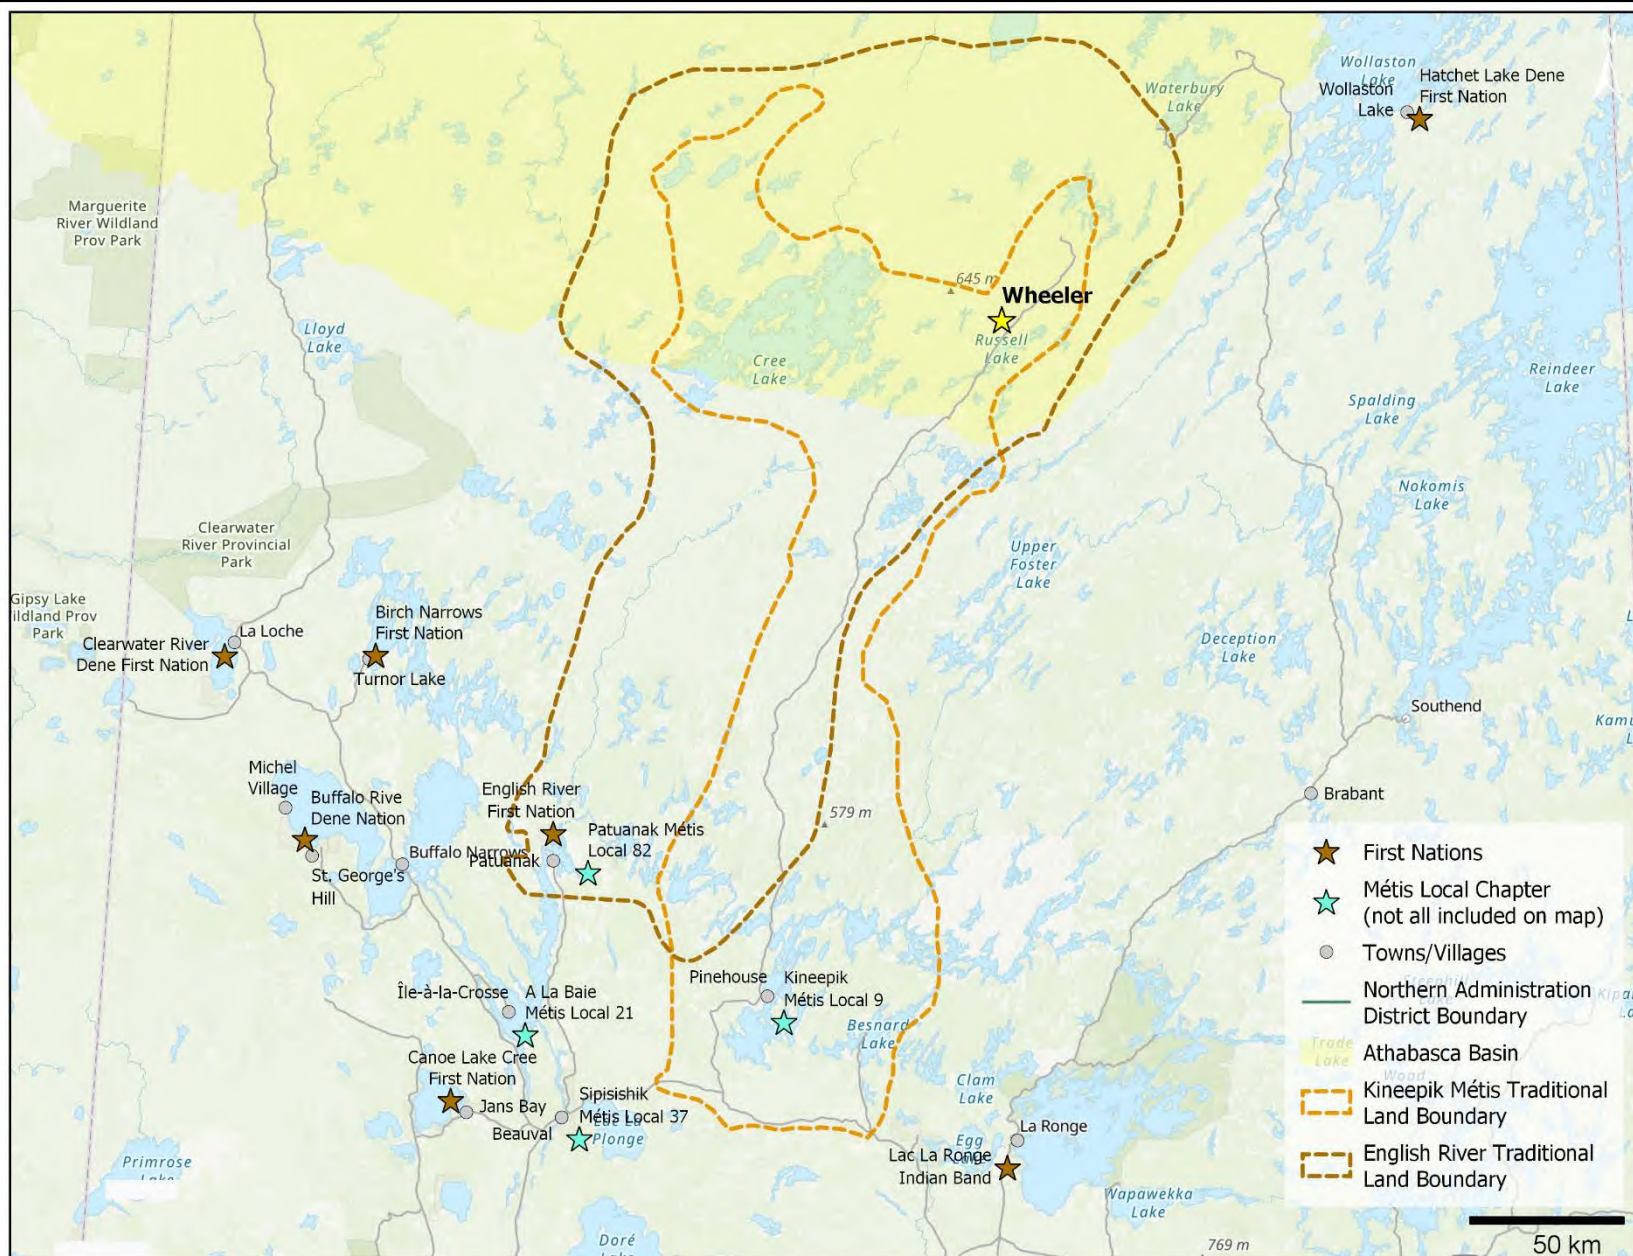

5.7.3 Current Traditional Land Use by Indigenous Communities

Wheeler is located in the Treaty 10 area (Figure 3.1) and the local and regional area surrounding the proposed Project has been claimed by four distinct Indigenous communities as partially or entirely falling within their traditional territories, where traditional land use activities have been historically or are currently practiced. These groups consist of the English River First Nation and the Kineepik, Sipishik and A La Baie Métis locals of the communities of Pinehouse, Beauval and Ile a la Crosse, respectively. Traditional territory boundaries from English River First Nation and Pinehouse Kineepik Métis are provided in Figure 5.7. These traditional land use maps were provided to Denison along with permission to use the maps.

The traditional activities practiced within the immediate and regional area of the Project consist of subsistence hunting and fishing. The immediate area also falls within the trapping block of N18, which is operated by a member of the English River First Nation (Figure 3.2 and Table 3.1).

Seasonal harvesting of native plants for food and medicinal purposes is also common throughout the regional area.

During the open water season the rivers and lakes in the area serve as transportation routes to and from areas of harvest of plants and game as well as preferred campsites and/or cabins. During the winter months the frozen lakes, river banks and muskegs are used as transportation routes to cabins, trap lines and/or preferred hunting areas.

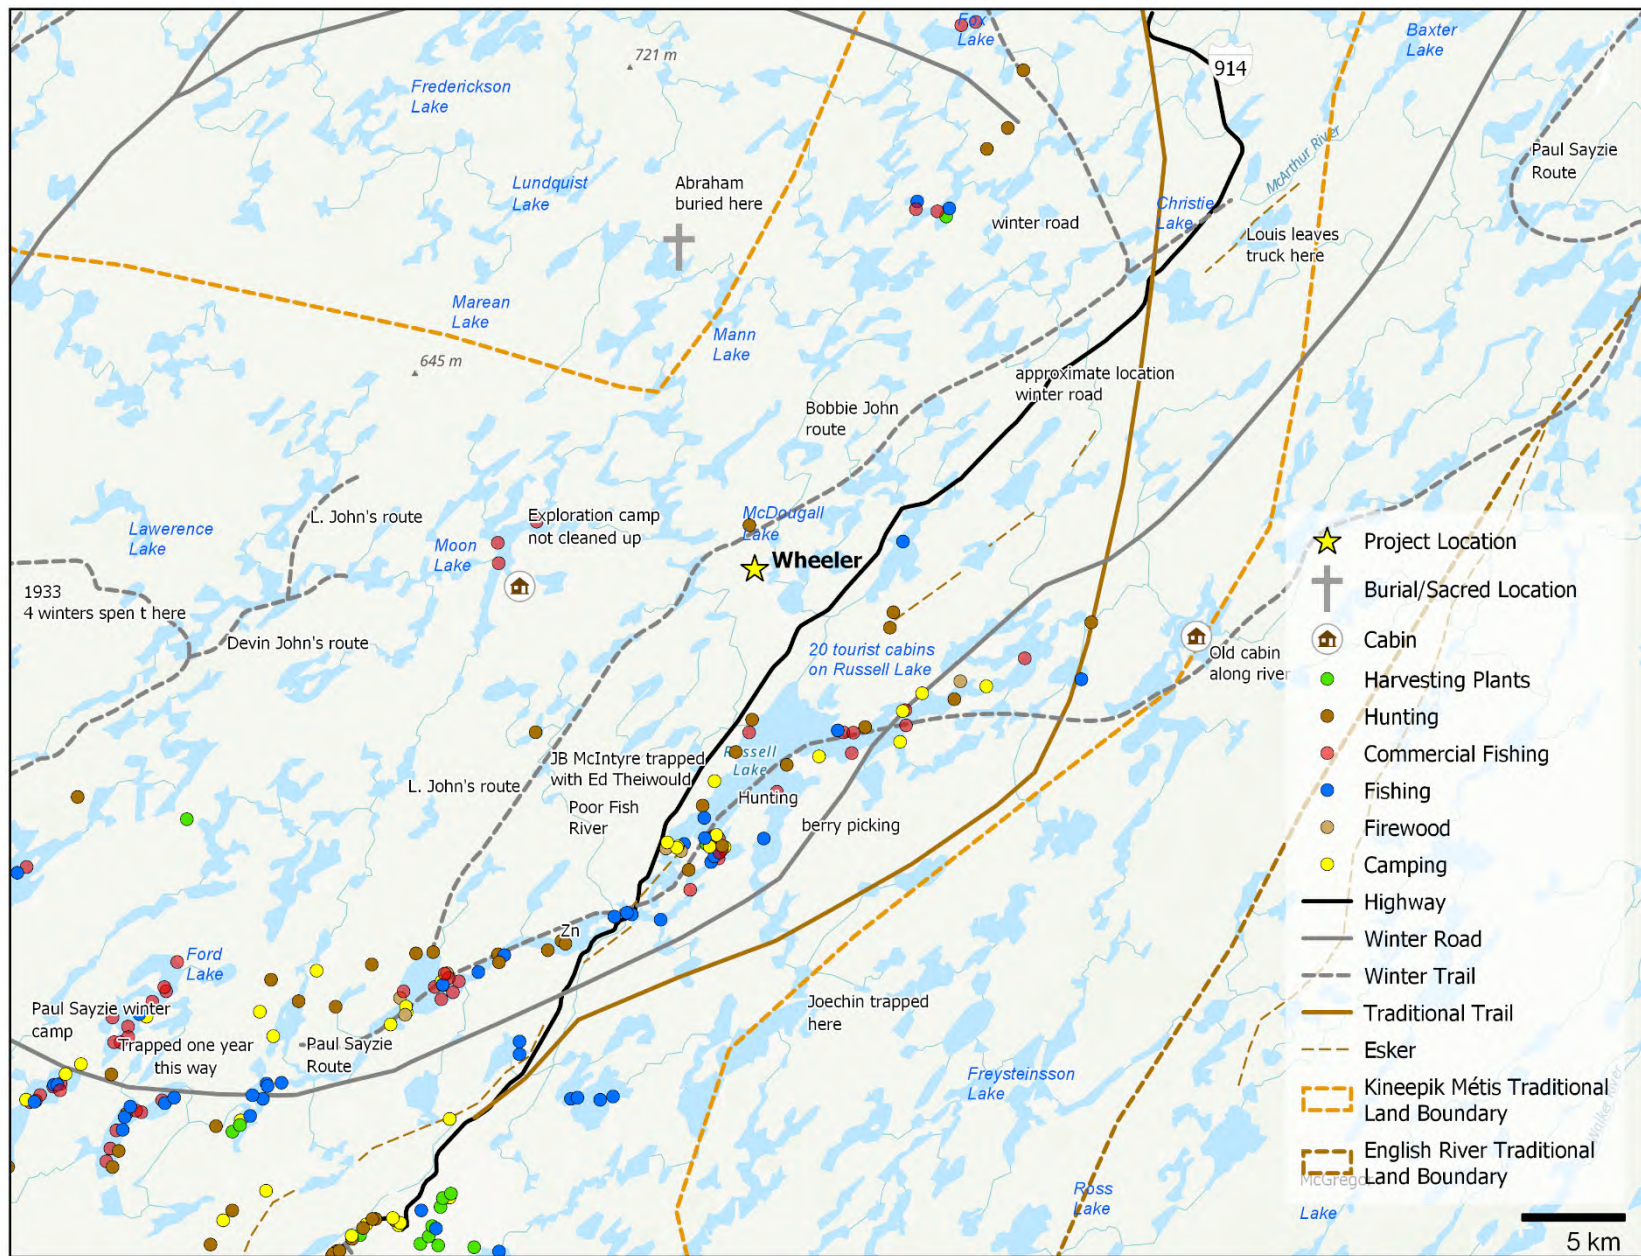

Note: Not all Indigenous traditional territories are included on the map

6 Environmental Effects

6.1 Overview of Potential Project Effects and Mitigation Measures

This section provides a brief description of changes that may be caused by the Wheeler Project and the proposed mitigations. It includes a high-level summary of potential effects during the construction, operation, decommissioning and post-decommissioning phases under normal operating conditions and potential accidents and malfunctions scenarios. General mitigation measures to minimize or eliminate potential effects are presented for the biophysical or human environment component discussed below. This evaluation is not comprehensive or final; potential effects of the Project at the site, local and regional assessment areas will be rigorously and transparently assessed and presented in the EIA following the general approach of:

- Identifying component- or activity-specific characteristics and site-specific environmental characteristics;
- Identifying both positive and negative interactions between those characteristics (Project-environment interactions) through Project pathways;
- Identifying robust mitigation measures; and
- Assessing the likelihood and significance of these interactions following application of the mitigation measures, the acceptability of these residual risks, if any, and the resulting potential effects they may have on biophysical and human environment valued components (VCs).

In addition to predictions made, monitoring programs will be developed based on results of the environmental assessment and implemented as part of the plan, do, check, act model (Section 6.3).

6.1.1 Biophysical Environment

6.1.1.1 Terrain and Geology

Changes in terrain are expected to be minor as both the footprint and volume of earthworks required for construction of the Project components are minimal. Earthworks are expected for construction of surface infrastructure such as roads, building, and the airstrip. Large volumes for cut and fill are not anticipated, and detailed designs will be tailored to minimize and balance the cut and fill needs of the Project footprint.

Due to the depth of the deposit (~400m below surface), low vertical profile of the deposit (~6-8 m on average) and the fact that the mining only removes uranium from the ground leaving virtually all other material in place, surface ground subsidence is not expected. Ground subsidence may be experienced directly above the deposit, but those effects will be localized and are expected to dissipate in a short distance. To be conservative the potential for any ground subsidence at surface during the post-decommissioning phase as a result of allowing the freeze wall to thaw will be evaluated in the EIA.

General mitigation measures to minimize or eliminate potential effects to terrain and geology:

- Design Project to minimize footprint, and incrementally reclaim where possible;
- Design Project to minimize cut and fill volumes for surface facilities;
- Include freeze wall to provide geotechnical stability during mining;
- Assess the potential for subsidence post-mining and monitor the geochemical and geotechnical conditions within the mine horizon during the decommissioning phase; and
- Evaluate options to backfill the mining area if subsidence during the post-decommissioning is identified.

6.1.1.2 Hydrogeology

Groundwater quality within the mining horizon is expected to change as a result of direct contact with the mining solution during operations. This effect will be localized and groundwater in the mining horizon will be remediated during decommissioning before the freeze wall is allowed to thaw.

Mining solution and uranium rich mining solution may enter groundwater above the mining horizon via accidents and malfunctions. Examples of types of accidents and malfunctions could be: well damage and release above the mining horizon, groundwater contamination from surface through spills at the pumphouses or leaks along the pipelines. However, all flows within the ISR mining system from the processing plant to the mining horizon are contained by the freeze wall and additionally metered and monitored for pressure losses which will allow for early identification of leaks in wells and along pipelines throughout the entire closed circuit. Wells and pipelines will be designed with secondary containment (or equivalent protections) and leak detection monitors. The monitoring and safeguards put in place will allow for the stoppage of any leaks quickly by turning off wells or reversing flows at select wells within the wellfield, thereby minimizing any effects on groundwater quality above the mining horizon. If required, Denison will be able to drill additional wells into any potentially contaminated areas for recovery of the mining solution back to surface. Denison will develop emergency response plans to prevent and clean-up surface spills. In addition, groundwater monitoring wells will be established at key locations within and outside of the wellfield to monitor for any changes in groundwater quality.

Groundwater quality may be changed by discharge of treated effluent into the groundwater environment. Options and potential effects associated with potential discharge of treated effluent into groundwater via deep well injection will be thoroughly examined in the EIA.

Groundwater quality may also be changed by accidents and malfunctions related to: spills or leaks from waste pads and ponds, spills of hazardous substances including reagents and fuels, leaks from water treatment plant ponds, and leaching from the landfill. During normal operating conditions, Denison expects these interactions will be fully mitigated through appropriate Project design (e.g., waste pad will be double lined with leak detection capabilities; hazardous substances stored

in approved storage areas with secondary containment as required) and implementation of management plans (e.g. material sorting for items destined for onsite landfill, hazardous waste handling and storage). Groundwater monitoring wells will be established near the processing plant terrace, landfill, and fuel and hazardous waste storage area to allow for detection of any changes in groundwater quality.

While the freeze wall is in place, groundwater flow will be changed at the site level (e.g., immediately surrounding the mining freeze wall) as groundwater within and outside of the freeze wall will not be able to interact. This will be reversed post-decommissioning once the mining horizon has been remediated and the freeze wall is allowed to thaw. Potential changes in site and local groundwater flow regime will be evaluated as part of the hydrogeological model in the EIA.

Given our understanding of the extent of the hydrogeological environment in the site, local and regional Project areas we do not expect any aspect of the Project will influence groundwater quantity. However, the influence of the wellfield and the in situ recovery mining method on groundwater quantity will be examined and assessed as part of the hydrogeological assessment in the EIA. The assessment will include the potential for localized drawdown in groundwater outside of the mining horizon. Groundwater withdrawal for the fresh water distribution system (fire water system, the potable WTP, the processing plant and the wash bay) will also be evaluated for any potential changes on groundwater quantity. Groundwater monitoring wells will be established at key locations within and outside of the wellfield to monitor any changes in groundwater levels.

General mitigation measures to minimize or eliminate potential effects to the hydrogeological environment:

- Establish freeze wall before mining operations to effectively isolating the area with mining solution (area inside the mining horizon) from the surrounding groundwater environment;
- Design injection and recovery wells to have secondary containment, or adequate containment (e.g. cementing the annulus of injection and recovery wells);
- Recognize option to drill additional wells in order to recover mining solution excursions;
- Design pipelines to have secondary containment or catchment;
- Have leak detection in place for wells and pipelines;
- Remediate groundwater in mining horizon as part of decommissioning;
- Have appropriately designed and monitored storage areas for waste, reagents, and hazardous substances; and
- Design processing plant to allow for collection of any spills.

6.1.1.3 Atmospheric and Acoustic Environment

There is potential for radon and radon progeny degassing from uranium rich mining solution in the wellfield components (i.e., injection and recovery wells, pumphouses, pipelines) and in the processing plant. Ventilation will be designed to provide sufficient worker protection and

monitoring systems will be in place to ensure worker health and safety. Discharge into atmosphere should provide sufficient dilution, although modelling for EIA will indicate if other mitigations are required.

The processing plant exhaust, mainly from drying and packaging areas, will be directed through a stack and released outside of the building. The stack height will be designed based on results of air dispersion modelling to be an appropriate height for optimal dispersion. If the modelling suggests the need, scrubbers will be installed to control atmospheric emissions. Best available technology, with respect to workplace cleanliness will be implemented inside the processing plant in order to reduce radiological exposures. Denison anticipates stack monitoring, ambient radon monitoring and high-volume air to confirm EIA predictions with respect to calculated source terms and dispersion modelling results.

Fugitive dust from access roads, the airstrip and the clean waste rock pile have potential to locally impact vegetation and soil and therefore wildlife habitat. This will be considered as a physical effect of clean dust in the terrestrial environment section of the EIA; elevated metal and radionuclides are not expected at either roads due to the mining method selected or the clean waste rock pile due to sorting of drill cuttings during wellfield development. The need for dust control will be evaluated based on results of modelling predictions results documented in the EIA. These predictions will be calibrated with dustfall or high-volume monitoring during operations and if necessary additional mitigations measures will be implemented.

Dust from material on the waste pad has the potential to contain metals and radionuclides. The pile will be managed to minimize dust and fugitive dust leaving the pad will be monitored. If necessary, dust control mitigation will be implemented. The current plan is to pack precipitate waste or impurities from the processing plant in tote bags that are then placed on the pad, providing an additional level of containment, eliminating dust from this source and reducing potential volumes of contaminated contact water. Options for disposal of the material on the waste pad (mineralized waste rock, precipitates, and water treatment plant solids) will be evaluated in the EIA.

By tying into the provincial power grid and the nearby Island Falls hydroelectric station, greenhouse gases (GHGs) emissions associated with the Project will be minimized. GHGs are expected from operation of back-up diesel generators, vehicles, drill rigs, and exhaust from propane use in the kitchen and camp for heating. Selection of high-quality, low emissions equipment and regular maintenance will help reduce emissions of GHGs. Denison will examine options to further reduce GHG emissions by using alternate emergency generators, electric vehicles, an electric drill rig for wellfield development, and electrical heat in buildings. Denison will assess greenhouse gas emissions and evaluate their significance in the EIA. This will include evaluating whether the Project is a large GHG emitter, or not. Emissions of NO_x, SO_x, and particulate matter will be evaluated in the EIA as a potential input into the human health and ecological risk assessment (HHERA).

Denison plans to operate an incinerator to dispose of food waste. It is expected that selection of an appropriate incinerator will have design components to mitigate emissions to air. Correct operation and regular maintenance of the incinerator will be important to achieve the design parameters and procedures will be in place to achieve this. If required, the exhaust from the incinerator will be examined as part to the air dispersion modelling.

Compared to traditional uranium mining operations in Canada, the Wheeler noise levels are expected to be low. The main sources of noise will be related to transport of people and goods to and from the site via air and land, drilling of holes for the freeze wall and wellfield, operation of the batch plant, operation of the processing plant, and operation of the pumphouses. Selection of high-quality, low sound emission equipment and regular maintenance will help reduce noise associated with Project activities. Denison will examine options to further reduce noise emissions by using electric vehicles and an electric drill rig for wellfield development. Sensory disturbances to wildlife will be examined as required in the terrestrial section of the EIA.

Overall, Denison anticipates that air emissions and noise from Project activities will dissipate very rapidly to background levels within a few hundred metres from the source.

General mitigation measures to minimize or eliminate potential effects to the atmospheric and acoustic environments:

- Implement a waste rock segregation plan;
- Provide dust control along roads and at the airstrip as required;
- Install scrubbers in stacks and incinerator, as necessary;
- Tie into provincial power grid and hydroelectric station at Island Falls as the main way to minimize GHG emissions;
- Evaluate electric vehicles, electric drill rigs and electric heating in buildings to further minimize greenhouse gas emissions;
- Select and purchase equipment to minimize emissions to air and noise generation;
- Follow operating procedures for equipment;
- Conduct regular maintenance of equipment;
- Develop methods for minimizing radon exposure from the venting of wells, pumphouses or anywhere that there is a potential for the degassing of radon in the system; and
- Evaluate options to reduce noise emissions by using electric vehicles and an electric drill rig for wellfield development.

6.1.1.4 Aquatic Environment

Changes in water quality will be examined through various pathways including: discharge of treated effluent, discharge from the clean waste rock pond, potential for contaminated groundwater to affect surface water bodies, construction and maintenance of water crossings, and any on land

activities near water bodies. Changes in water quality have the potential to affect other components of the aquatic environment including sediment, benthic invertebrates, plankton, and fish. The discharge of treated effluent to a surface water body is expected to be the main Project interaction with water, sediment, and aquatic biota.

The Project may be subject to the Metal and Diamond Mining Effluent Regulations (depending on the volume of treated effluent discharge) which outline requirements for effluent monitoring, effluent discharge limits, and biological effects monitoring program in the receiving environment. Details on expected treated effluent quality and volumes will be presented in the EIA. Based on the current Project design with a focus on water recycle in the processing plant and the minimal discharge volumes to surface water, downstream impacts are considered unlikely outside of the local study area. This includes water and sediment quality, changes in benthic invertebrate, plankton, and fish communities, and benthic invertebrate tissue chemistry and fish tissue chemistry. A thorough evaluation of the potential effects of treated effluent in the receiving environment will be completed as part of fate and transport modelling in the EIA. This is an exercise to predict water and sediment quality at locations downstream of the treated effluent discharge point. The results of the water and sediment modelling will be used to predict effects on benthic invertebrates, plankton, fish, semi-aquatic VCs, terrestrial VCs and humans as part of the HHERA.

Changes in certain components of the aquatic environment (e.g., surface water quality, benthic invertebrate communities, fish populations, etc.) may result from accidents and malfunctions related to spills or leaks from pipelines, processing plant, waste pads, ponds, and hazardous substance storage area. During normal operating conditions, Denison expects these interactions will be fully mitigated through integration of best available technology in the Project design (e.g., leak detection and secondary containment along pipelines; hazardous substances stored in approved storage areas with secondary containment as required) and implementation of various management programs, standard operating procedures and monitoring plans (e.g. material sorting for items destined for onsite landfill, hazardous waste handling and storage).

Potential changes in water quantity as measured by water level and flows will be examined through various pathways including: discharge of treated effluent, discharge from the clean waste rock pond, withdrawals for the fresh water distribution system (fire water system, the potable WTP, the processing plant and the wash bay), recharge of groundwater to surface water bodies, possible drawdown from mining activities, and construction and maintenance of water crossings. All interactions are anticipated to be minor as water intake and output volumes are low relative to the baseline flows in the Project drainage areas. Any changes in local drainage around the site due to infrastructure are expected to be minimal and have negligible effects on site and local study area flows and water levels. Flows are not expected to change at the proposed water crossings as the crossing types will be selected, designed and constructed to avoid causing harm to fish and fish habitat. All potential changes in water levels and flow will be examined as part of the hydrological assessment in the EIA.

Potential effects on fish and fish habitat from in-water works and activities near water are expected to be minor and may be managed by following the Department of Fisheries and Oceans Canada's (DFO's) measures to avoid and mitigate impacts to fish and fish habitat into Project planning and implementation. Two water crossings will be required along the road from the site to the airstrip. The crossing types will be selected and designed to avoid causing harm to fish and fish habitat. Installation of a water intake and a treated effluent discharge pipeline will require in-water works which will be done following best management practices and incorporate measures to avoid causing harm to fish and fish habitat. The water intake will be screened to prevent entrainment of fish and the treated effluent release point will be designed to reduce erosion. A 100 m buffer zone will be established along the shoreline of fish bearing water bodies for working near water, where possible, and best management practices such as erosion and sediment control measures will be implemented. Denison does not expect any Project activities will require a *Fisheries Act* Authorization from DFO. As such, Project review for effects to fish and fish habitat will be conducted by the CNSC as per the MOU between the CNSC and DFO (dated December 16, 2013).

General mitigation measures to minimize or eliminate potential effects to the aquatic environment:

- Minimize volume of treated effluent discharge to the environment by recycling mining solution in the processing plant;
- Design water treatment plant to produce treated effluent which meets or is lower than regulatory discharge requirements;
- Design water intake to avoid fish entrainment;
- Design treated effluent release point to reduce erosion;
- Design and monitor storage areas for waste and hazardous substances;
- Design pipelines to have secondary containment or catchment;
- Design surface facilities to allow for the collection of spills;
- Design and construct water crossings to avoid causing harm to fish and fish habitat;
- Follow best management practices for working in and near water; and
- Develop a robust emergency response plan to minimize the impacts of accidents and malfunctions.

6.1.1.5 Terrestrial Environment

Site preparation and construction will involve ground clearing for all facilities including the roads, processing plant area, wellfield, waste pads and ponds, water treatment plant ponds, and support building such as the camp and operations centre. Best management practices will be followed such as completing all site preparation activities outside of the breeding bird season (and or pre-clearing the area outside of breeding periods), maintaining set-backs from water and saving brush for reclamation. Some of the site and local study areas to be cleared have already been disturbed and/or cleared as a result of exploration activities which will help minimize new disturbance.

Construction and operation of the Project will result in a small loss of soil, vegetation and wildlife habitat in the site and local study areas. However, following decommissioning and reclamation, soil, vegetation and wildlife habitat are expected to recover to baseline conditions. During operations progressive reclamation activities will be completed where possible and the progress and success of these activities will be assessed annually.

Project interactions with wildlife may include direct effects (i.e., potential for wildlife-vehicle collisions) and indirect effects such as changes in movement in response to activity and noise. Woodland caribou are of particular interest due to their conservation status (COSEWIC and SARA status of threatened). Mitigation measures to reduce Project footprints, minimize habitat disturbance, and minimize noise will contribute to reducing potential effects of the Project on woodland caribou in the site, local and regional study areas. A Woodland Caribou Management Plan consistent with the management goals of SK-1 zone will be developed as part of the EIA and will assess the needs for habitat offsets.

Migratory birds are present in the Project area. The main potential interaction of the Project with migratory birds is expected to be site clearing activities (primarily during construction) with breeding times for migratory birds. The Project will be designed and planned to avoid disruption of migratory birds' nests and eggs.

The primary pathways for contaminants to interact with terrestrial wildlife includes release of treated effluent and release of contaminated dust. The potential for radiological and non-radiological contaminants to affect the health of terrestrial wildlife will be evaluated in the EIA as part of the HHERA.

Changes in certain components of the terrestrial environment such as soil quality and vegetation quality may result from accidents and malfunctions related to spills or leaks from pipelines, processing plant, waste pad, ponds, and hazardous substances. During normal operating conditions, Denison expects these interactions will be fully mitigated through appropriate Project design (e.g., leak detection and secondary containment along pipelines; hazardous substances stored in approved storage areas with secondary containment as required) and implementation of various management programs and plans (e.g. material sorting for items destined for onsite landfill, hazardous waste handling and storage, a site emergency response plan).

General mitigation measures to minimize or eliminate potential effects to the terrestrial environment:

- Design Project to minimize disturbance of terrestrial habitat;
- Stockpile brush when possible to use in reclamation;
- Complete ongoing decommissioning when possible;
- Design surface pipelines to have secondary containment or catchment;
- Have leak detection systems in place at key locations;

- Develop a caribou management plan and evaluate the need for caribou habitat offsets in the EIA; and
- Design and plan Project activities to avoid disruption of migratory birds' nests and eggs.

6.1.2 Human Environment

6.1.2.1 Worker Health and Safety

Worker health and safety will be evaluated for both conventional health and safety and radiological health and safety. Worker exposure to non-radiological and radiological elements will be evaluated as part of the HHERA in the EIA.

The main conventional health and safety concerns will be working with hazardous substances such as reagents used throughout the ISR mining and uranium extraction processes as well as fuels, lubricants and greases common to an industrial operation. Denison will have a comprehensive health and safety program in place that meets the requirements of both the federal and provincial governments in order to protect workers and to minimize the potential for conventional health and safety incidents.

With respect to radiation protection, there is the potential for worker exposure to radon and radon progeny degassing from uranium rich mining solution in the wellfield components and in the processing plant. Ventilation will be designed with the ALARA principle (as low as reasonably achievable) in mind to provide sufficient worker protection. Monitoring systems will be in place to ensure these mitigation measures are meeting design specifications. Dust control and good housekeeping practices throughout the plant will also form a critical component of the Radiation Protection Management Plan developed for the Project. Radiological exposures will stay under regulatory limits and keeping with the ALARA principal every effort will be made to maintain all exposures below all licenced action levels. The EIA will present an assessment of potential worker dose and quantify the likely range of doses.

The proposed location for the camp facilities was selected to be upwind of the processing plant, waste pile, and other main sources of contaminants to air.

General mitigation measures to minimize or eliminate potential effects to Worker Health and Safety:

- A radiation protection program derived from a robust radiation exposure assessment;
- An occupational health and safety program;
- Programs for any area deemed critical to safety or in the core CNSC safety assessment areas;
- Clear separation of clean and potentially contaminated areas on site for equipment and personnel;
- Appropriate monitoring and reporting;
- Design pumphouses and processing plant to have proper ventilation; and
- Design Project layout to have office and camp upwind of processing plant.

6.1.2.2 Traditional Land Use

The construction and operation phases of Wheeler may positively or negatively change access for any Indigenous or other resource users in the site and local study areas. There are no potential effects expected from the Project at the regional study area. Denison has integrated traditional knowledge provided by several Indigenous groups practicing traditional land use in the regional and local areas in the early design stages of the Project (refer to Section 8.2.1.2). This practice will continue throughout the EIA and all components of the Project will be assessed in an effort to limit or eliminate effects of the Project on traditional land use. One of the principle decommissioning and reclamation objectives will be to reclaim the site and local study areas to a self-sustaining natural environment capable of supporting pre-mining land use. Successfully meeting this decommissioning and reclamation objective will allow for traditional land use in the site, local and regional study area to continue throughout the post decommissioning and reclamation phase of the Project.

General mitigation measures to minimize or eliminate potential effects to Traditional Land Use:

- Continue engagement with Indigenous groups currently practicing traditional land use activities in the Project area throughout the EIA, feasibility and detailed design stages;
- Identify and incorporate any mitigation or accommodation measures obtained during engagement with Indigenous groups currently practicing traditional land use activities in the Project area;
- Implement Caribou and other Wildlife Management Plans, which will limit or eliminate harvesting of fish and game throughout the construction, operation and decommissioning and reclamation phases of the Project by Project staff;
- Ensure the design and construction of all water crossings over navigable waters are constructed in a manner that does not impede the use of these water courses as a means of transportation for traditional users;
- Ensure the implementation of monitoring programs for all three study areas and present the results of these monitoring programs to key Indigenous groups on regular intervals, demonstrating the environmental protection management plans being implemented are meeting their objectives;
- Design and implement a decommissioning and reclamation plan that incorporates best management practices; and
- Design Project with minimal footprint.

6.1.2.3 Heritage Resources

It is expected that effects on heritage resources will be mitigated through the completion of heritage resource impact assessments and avoidance of any known heritage resources. Procedures will be in place to appropriately respond to any unanticipated heritage resource encounters. These

unanticipated encounters would primarily be expected during site clearing and construction activities.

General mitigation measures to minimize or eliminate potential effects to heritage resources:

- Complete heritage surveys and avoid areas with known resources;
- Submit results of heritage resource impact assessments to Heritage Conservation Branch for review;
- Develop and implement a Heritage Resource Management Plan for the construction and operating phases of Wheeler in accordance with Saskatchewan's *Heritage Property Act*;
- Obtain Indigenous feedback on and incorporate feedback into the Heritage Resource Management Plan; and
- Design Project with minimal footprint.

6.1.2.4 Members of the Public

Exposure to non-radiological and radiological elements for members of the public will be evaluated as part of the HHERA in the EIA. Based on the Project design, Denison anticipated any effects on members of the public will be fully mitigated.

Releases to the environment will be controlled and monitored by the effluent, emissions and environmental monitoring program. Results of these monitoring and control activities will be used to validate results of the HHERA for dose and exposure to members of the public.

6.1.2.5 Socio-Economics

It is expected that the Project will provide a net positive socio-economic effect. This effect will be realized at national, provincial and local northern community levels. All of these socio-economic benefits will be assessed as part of the EIA.

Briefly, the Project will contribute to the national and provincial economies through taxes and royalties as well as through out of province employment generated through downstream processing and transportation requirements of the Wheeler final product. In addition, socially the Project will contribute a significant supply of GHG free energy, in a GHG friendly manner, supporting Canada and Saskatchewan's commitment to addressing global climate change.

The Project itself will generate significant employment and business opportunities throughout all four phases of the operation: construction, operation, decommissioning and post-decommissioning.

In line with Denison's MOUs, direct and indirect employment opportunities as well as business development opportunities will preferentially target individuals and businesses residing in and based in northern Saskatchewan, respectively. Denison is also committed to support education and training opportunities as well as community investment within local northern and Indigenous

communities. Progress on all of these commitments is currently being realized in northern and Indigenous communities and will continue throughout all phases of the Project. The existing commitments and future commitments will be evaluated as part of the EIA.

Denison is an equal opportunity employer and has established strong policies against harassment in the workplace and unlawful discrimination. Denison will continue to work with regulatory agencies, government and communities to reduce employment barriers for all people.

There is currently no tourism land use documented on the site or local study area. However, there is tourism use documented within the regional study area. There are no effects anticipated from the Project that would impact tourism in the regional study area. However, this will be assessed as part of the EIA under the socio-economic aspects of the Project.

General mitigation measures to minimize or eliminate potential negative effects and continue the growth of socio-economic benefits associated with the Project:

- Continue Denison's Indigenous and non-Indigenous engagement program;
- Continue to fulfill commitments outlined in Denison's existing MOUs with Indigenous groups and communities;
- Continue employment practices and efforts to reduce employment barriers for all people;
- Involve and inform representatives of the tourism industry active in the regional study area as part of the ongoing implementation of the engagement program;
- Ensure the implementation of monitoring programs for site, local and regional study areas and present the results of these monitoring programs to regulatory agencies, Indigenous groups and members of the public on regular intervals, demonstrating the environmental protection management plans being implemented are meeting their objectives; and
- Design Project with minimal footprint.

6.1.2.6 Indigenous Peoples

It is anticipated that Wheeler will have a net positive effect on the Indigenous peoples of northern Saskatchewan. Many of these effects have been discussed above, in Sections 6.1.2.1 through Section 6.1.2.5. However, Denison believes they have an additional obligation to the Indigenous peoples who assert claim of the site, local and regional study area as being part of their traditional territory.

The ongoing implementation of the Indigenous engagement program (Section 8.2) will help to identify programs that can be developed within the spirit of the objectives of Denison's existing MOUs with northern and Indigenous groups. These programs will be included as part of the socio-economic aspects of the Project's EIA.

Denison has already engaged with Indigenous peoples to obtain and incorporate feedback directly into the Project designs (refer to Section 8.2.1.2). Denison intends to continue this process to help

minimize impacts through design. Denison intends to continue to engage Indigenous groups on any of the Project's potential impacts to their potential or established Indigenous and/or treaty rights. Engagement efforts will continue as the Project advances and additional conversations will be held once potential Project effects are more thoroughly understood and assessed as part of the EIA process.

As part of ongoing engagement and the EIA process, Denison can review cultural programs in place at other mine sites and brainstorm with Indigenous groups to identify effective cultural support programs that could be implemented at Wheeler.

Examples of additional programs that could be assessed as part of the EIA are:

- Employ Elders at site throughout the construction, operation and decommissioning phases of the program to provide cultural support to Indigenous employees;
- Initiate cultural awareness training for employees periodically throughout the construction and operational phases of the Project; and
- Work with Saskatchewan's northern medical health office to initiate additional programs that may not be currently easily accessed in remote communities. These programs could be made available at site to the Project's work force to encourage wellness and healthy lifestyle choices.

6.1.3 Summary of Environmental Effects under CEAA 2012

This section provides a summary of information presented in Section 6.1.1 and Section 6.1.2 in order to clearly address the requirements of CEAA 2012, s. 5(1).

6.1.4 Fish and Fish Habitat

There is potential for contaminants in water to affect fish health and fish communities. The two main pathways for contaminants to enter fish bearing water bodies are anticipated to be 1) release of treated effluent and 2) spills or leaks of hazardous substances.

The volume of treated effluent (if any) is expected to be minimal with maximum water recycle in the processing plant. In addition, the quality of the effluent will meet or be lower than regulatory limits designed to protect the aquatic environment. This will be fully evaluated as part of the HHERA in the EIA.

Through Project design, best management practices, monitoring, and development of a robust emergency response plan, it is anticipated that the potential for accidents and malfunctions will be minimized.

Potential effects on fish and fish habitat from in-water works and activities near water are expected to be minor and can be mitigated by following the Department of Fisheries and Oceans Canada's (DFO's) measures to avoid and mitigate impacts to fish and fish habitat. The design and installation of any in-water Project components such as water crossings, a water intake, and a treated effluent

discharge pipeline and release point will incorporate measures to avoid causing harm to fish and fish habitat. Work near the shoreline of fish bearing water bodies will be avoided where possible and all work will follow best management practices such as erosion and sediment control.

Denison does not expect any Project activities will require a *Fisheries Act* Authorization from DFO. As such, Project review for effects to fish and fish habitat will be conducted by the CNSC as per the MOU between the CNSC and DFO (dated December 16, 2013).

Based on the above, no significant impacts to fish or fish habitat (as defined in subsection 2(1) of the *Fisheries Act*) are expected from Project activities.

6.1.5 Aquatic Species

There are no observations of aquatic species (meaning wildlife that is a fish as defined in section 2 of the *Fisheries Act*) in the Project area with the status of threatened, endangered or special concern under SARA or COSEWIC.

6.1.6 Migratory Birds

Migratory birds as defined in the Migratory Birds Convention Act are present in the Project area. The main potential interaction of the Project with migratory birds is expected to be site clearing activities (primarily during construction) with breeding times for migratory birds. The Project will be designed and executed to avoid disruption of migratory birds' nests and eggs. This may involve pre-clearing Project footprints outside of breeding periods.

6.1.7 Changes to the Environment on Federal Lands, in a Province other than Saskatchewan, or outside Canada

Denison does not anticipate any changes to the environment on federal lands, in a province other than Saskatchewan, or outside Canada as a result of construction, operation and decommissioning of Wheeler. Potential effects of the Project are expected to be limited to the VC-specific local study areas. No impacts outside of the province of Saskatchewan are expected.

The nearest federal land is 16 km away (Table 3.3 and Figure 3.5). This is reserve land registered to English River First Nation which currently and has no permanent residences.

Any potential changes to the environment on federal lands, outside of Saskatchewan or Canada will be fully evaluated in the EIA.

6.1.8 Effects on Indigenous People

Health and Socio-economic Conditions

Exposure to non-radiological and radiological elements for members of the public will be evaluated as part of the HHRA in the EIA. Based on the Project design, Denison anticipated any effects on members of the public will be fully mitigated.

Denison anticipates a net positive socio-economic effect on Indigenous peoples. In line with Denison's MOUs with Indigenous groups, direct and indirect employment opportunities as well as business development opportunities will preferentially target individuals and businesses residing in and based in northern Saskatchewan, respectively. Denison is also committed to support education and training opportunities as well as community investment within local northern and Indigenous communities.

Physical and Cultural Heritage

Based on traditional knowledge shared with Denison to date, physical areas of cultural importance have not been identified in the Project local study area. Protection of cultural heritage will be incorporated into potential initiatives such as cultural awareness training to employees and employing Elders at site throughout the construction, operation and decommissioning phases of the Project to provide cultural support to Indigenous employees.

Current use of lands and resources for traditional purposes:

Denison has integrated Indigenous knowledge provided by several Indigenous groups practicing traditional land use in the regional area in the early design stages of the Project (refer to Section 8.2.1.2). This practice will continue throughout the EIA and all components of the Project will be assessed in an effort to limit or eliminate effects of the Project on traditional land use.

Traditional land users in the Project area could be affected by restricted access to the site for hunting and fishing during construction and operation; however, following decommissioning, access to the site and resources harvesting will be fully restored. Denison intends to continue to engage Indigenous groups on any of the Project's potential impacts to their potential or established Indigenous and/or treaty rights. Denison will also identify and incorporate any mitigation or accommodation measures obtained from engagement activities. Engagement efforts will continue as the Project advances and additional conversations will be held once potential Project effects are more thoroughly understood and assessed as part of the EIA process.

Any structure, site or thing that is of historical, archaeological, paleontological or architectural significance:

Based on knowledge of the existing environment, Project effects on any structure, site or thing that is of historical, archaeological, paleontological or architectural significance are not expected.

Denison is committed to completing heritage surveys for all Project footprints and avoiding areas with known resources. Denison will also develop and implement a Heritage Resource Management Plan which will outline steps to be taken should an unexpected artifact be encountered. Denison is committed to obtaining Indigenous feedback on and participation with the Heritage Resource Management Plan.

6.1.9 Conclusions

The selection of ISR results in a uranium mining and milling Project with no tailings, a relatively small footprint, minimal volumes of clean waste rock, minimal volumes of waste rock, minimal generation of other contaminated wastes, and limited water treatment and discharge. Wheeler will be designed to contain potential contaminants and careful consideration will be taken to ensure contaminated areas are kept separate from non-contaminated areas.

Groundwater quality will be a main focus in the EIA in order to fully describe the potential range of effects of any leaks or spills of mining solution to the area outside of the freeze wall. Planning for mining horizon restoration at the end of operations provides confidence that protection of groundwater quality will be a primary focus for decommissioning. Denison anticipates that air emissions and noise from Project activities will dissipate very rapidly to background levels within a few hundred metres from the source. Aquatic effects are expected to be low as the Project will minimize volumes of treated effluent through water recycling in the processing plant. Effects on fish and fish habitat are expected to be avoided and mitigated and it is anticipated that a *Fisheries Act* Authorization will not be required. Disturbance of terrestrial habitat will be minimized to the extent possible; progressive reclamation will be practiced throughout operations and a robust decommissioning and reclamation plan will be implemented following the operations phase of the Project. Potential Project effects on woodland caribou will be carefully considered in the EIA. A Caribou Management Plan will be developed and the need for any caribou habitat offsets will be presented in the EIA. Worker health and safety is of the utmost importance and effects on members of the public are not expected. Any effects on traditional land use will be limited to the site and local study areas and these effects will be short term limited to the construction and operating phase of the Project. No effects on traditional land use will occur in the regional study area. Wheeler is expected to provide a net positive effect on socio-economics throughout all levels of the Canadian economy with the most significant positive impact being realized by the Project's local Indigenous and non-Indigenous communities through direct employment and business opportunities. Wheeler can be decommissioned and reclaimed to meet decommissioning objectives resulting in a site that is safe and stable where traditional land use activities may be freely conducted. The site is expected to be accepted into the provincial Institutional Control Program or possibly released back into the Crown land inventory within five years following final decommissioning and reclamation.

In the EIA Denison will demonstrate that the Wheeler Project can be constructed, operated, and decommissioned with no significant adverse effects on the biophysical and human environments. An HHRA will be performed as part of the EIA to demonstrate the overall low impacts of the Project. The preliminary EIA results will be provided for discussion and feedback with local Indigenous and non-Indigenous communities as part of Denison's ongoing engagement activities.

6.2 Cumulative Effects

For the purposes of a cumulative effects assessment, the Project's net environmental effects (i.e. after mitigation) are assessed in combination with the environmental effects of past activities, existing projects and projects or activities that can be reasonably predicted to occur in the region. A cumulative effects assessment is required in both the federal and provincial environmental assessment processes. Denison commits to including an assessment of how other developments or activities in the area may impact the proposed development, its potential impacts on Valued Components (VCs), and whether they contribute to any cumulative environmental impacts. This will take the form of a cumulative environmental effects assessment as part of the description of Project impacts and mitigations that describes the net cumulative impact of the Project. The assessment would also include an assessment of potential impacts due to reasonable emergency or upset conditions.

Potential cumulative impacts will be identified in the assessment of potential Project impacts during baseline environmental work, subsequent analysis and pathways modelling. This will include an examination of any potential cumulative effects identified in the consultation and engagement processes. The potential impacts will be assessed against proposed mitigations to determine if there is any residual risk. Should the residual risk remain high, different mitigations may be necessary.

Wheeler lies within the eastern Athabasca Basin between two existing uranium operations; Cameco's McArthur River mine, and the Key Lake mill and tailings management facility where ore from the McArthur River mine is processed. The Project would also utilize the existing Highway 914, which includes the haul road between McArthur River and Key Lake. There are considerable amounts of information available for use in a cumulative effects assessment, including, but not limited to:

1. Existing site baseline and monitoring data, including any modelling;
2. Baseline and project information from previous EIAs;
3. Government monitoring information;
4. Monitoring data available from uranium projects in the area (i.e. annual monitoring reports; Environmental Performance Reports);
5. Regional monitoring studies, such as the Northern Mines Monitoring Secretariat program with the Northern Saskatchewan Environmental Quality Committee;
6. Eastern Athabasca Regional Monitoring Program;
7. Community monitoring programs in the Athabasca funded by the companies; and
8. State of the Environment reports and CNSC independent third-party reviews of environmental performance at existing uranium operations.

This information combined with the Project specific baseline and pathways modelling should allow for a sufficient cumulative effects assessment. The main areas with potential to generate cumulative effects are due to:

1. Any effluent discharge, as Wheeler will share a watershed with the Key Lake Operation, and possibly Millennium project;
2. Overlap of air emissions with other projects;
3. Vehicle traffic to and from the site. This will include shipments of supplies, construction materials, reagents and fuel to the site, and shipments of uranium and recyclables from the site to the south;
4. Habitat disturbance for operations and ancillary facilities, including any access road. This may have an impact on caribou habitat that will have to be assessed through the site's Caribou Management Plan;
5. Emergency or upset conditions;
6. Requirements for employees from northern communities in competition with other operations;
7. Traditional use and harvesting; and
8. Requirements for services from northern businesses.

At Wheeler, the potential for the development of the Gryphon deposit is a reasonably foreseeable project, and it would be included as part of the cumulative effects assessment.

Cameco's proposed Millennium uranium mining project, although currently withdrawn from the federal regulatory process, is the only project that might reasonably be expected to proceed during the life of the Wheeler Project. While that is the only project currently identified, any project subsequently identified during the environmental assessment process with a reasonable chance of affecting the cumulative effects assessment would be added. Other projects that have potential for consideration for inclusion include UEX's West Bear cobalt/nickel deposit, but there are few details at this time.

Although largely covered in other sections of the EIS, the cumulative effects assessment will also require an examination of any potential to impact traditional Indigenous use of lands and resources, or on communities in a cumulative sense. There is an expectation of meaningful public and Indigenous participation in environmental assessments, and that the discussion of cumulative effects is included in consultations as part of the Wheeler engagement program with feedback recorded and included in the environmental assessment.

6.3 Monitoring

An effective monitoring program is important in a modern mining operation as it provides the proof that the Project is operating legally and within the bounds of its permissions. Both the federal and provincial regulators require comprehensive monitoring programs and reporting. While the focus

here is on the federal requirements due to the broader scope of those requirements, the provincial requirements are no less important.

The CNSC has defined several safety and control areas, and all of these require monitoring and reporting as part of the ongoing performance assessment, improvement and management review within the respective management systems. The CNSC's safety and control areas are:

- Management
 - Management systems
 - Human performance management
 - Operational performance
- Facilities and Equipment
 - Safety analysis
 - Physical design
 - Fitness for service
- Core Controls and Processes
 - Radiation Protection
 - Human health and safety
 - Environmental Protection
 - Emergency management and fire protection
 - Waste management
 - Security
- Safeguards and Non-proliferation
- Packaging and Transport

All these areas will require a structured program that demonstrates effective management and control, usually within an ISO/CSA plan-do-check-act style system (PDCA). While all the safety and control areas will have monitoring, the environmental program is further described here as an example.

Environmental monitoring is performed to demonstrate the Project's environmental and safety performance, and to provide the necessary feedback to manage that performance in the areas of:

- Gaseous and liquid discharges;
- The transport of nuclear and hazardous substances within the environment;
- Public exposure and dose;
- Exposure and effects on terrestrial and aquatic biota; and
- Any changes in habitat and effects on species that rely on that habitat.

Through the baseline program and environmental risk assessment, predictions on the Project's performance will be made in the above areas and monitoring is essential in tracking and managing

that performance. Denison will incorporate the results of the EIA predictions into the Environmental Management System (EMS), including the effluent and environmental monitoring plans (CNSC 2017). The EIA predictions for physical disturbances and releases, and the associated environmental responses and potential effects, will be measured and tested using site-specific monitoring data during construction, operation, decommissioning and post-decommissioning phases. As such, a comprehensive monitoring program will be required as part of the Project's ISO/CSA 14001-2015 compliant EMS, providing the necessary feedback to:

1. Demonstrate compliance with applicable laws and permit conditions;
2. Inform the required follow-up program(s), especially within the EMS;
3. Demonstrate continual improvement;
4. Provide process feedback to operations and to management;
5. Provide warning of process changes or upsets;
6. Provide data for maintaining up to date site models; and
7. Information to Indigenous groups, regulatory agencies, and the public.

The EMS will be based on the ISO/CSA PDCA methodology with monitoring playing a critical role in the check process, providing the necessary information for management to act, if necessary, to implement changes in performance. The Canadian Standards Association, as a natural offshoot of its ISO/CSA EMS requirements (e.g. ISO 14001-2015) has been working with the nuclear industry in Canada and have issued standards for Environmental Risk Assessment (CSA N288.6), which lead directly to effluent monitoring (CSA N288.5), environmental monitoring (CSA N288.4), and supplementary studies. The CSA standards are specifically referenced within the CNSC's REGDOC 2.9.1 (CNSC 2017) as functioning parts of the overall EMS.

For radiation, the offsite monitoring is included in the environmental monitoring program while the on-site worker radiation safety program and monitoring activities are subject to a stand-alone Radiation Safety Management program with its own management plan, structure and reporting.

While there are discharge limits for mining in the Saskatchewan Mineral Industry Environmental Protection Regulations, 1996, and the federal Metal and Diamond Mining Effluent Regulations (MDMER), the expectation of the federal regulator will be that a modern uranium mine will have effluent concentrations protective of the environment and well below the values in the above regulations. The MDMER in addition to defining discharge limits also defines a biological effects monitoring program to ensure that discharges remain with limits that are protective of the environment.

Monitoring for potential impacts on traditional use or northern communities may be done through several mechanisms such as surface leases conditions, licence conditions, commitments in the EIA, agreements directly with potentially affected parties, etc. This monitoring would become part of the Project's monitoring and reporting program.

Monitoring is not done in isolation by the company as both the federal and provincial governments will undertake inspections of the operations, including side-by-side sampling to verify compliance. The CNSC will also periodically contract independent third-party consultants to undertake an assessment of an operation's environmental performance. In addition, there are other independent groups that provide monitoring such as the Northern Saskatchewan Environmental Quality Committee (NSEQC), which is composed of members from communities across northern Saskatchewan who meet to review monitoring data and tour the operations to monitor performance, providing feedback and recommendations to regulators and proponents.

7 Stakeholder Engagement

Denison recognizes the importance of engaging with local and Indigenous communities, residents, businesses, organizations, land users and the various regulatory authorities, collectively referred to as 'Stakeholders.' Since 2016 Denison had been engaging with Stakeholders in ongoing efforts to build positive relationships with all parties. Broadly speaking, Denison has categorized the Stakeholders into three categories:

- Regulatory agencies;
- The general public; and
- Indigenous communities.

Further details regarding engagement with specific Indigenous communities can be found in Section 8.

In accordance with Denison's Environmental and Social Management System, a Stakeholder engagement program has been developed to capture all Stakeholder groups within the categories identified above. The design and considerations associated with stakeholder engagement activities for the Project are in compliance with provincial (Government of Saskatchewan 2014f), federal (CNSC 2016a; Canadian Environmental Assessment Agency 2015a) and international guidance (International Finance Corporation 2012) for stakeholder engagement.

Denison is committed to operating Wheeler in a fully sustainable manner, giving consideration to not only maintaining high standards of safety, and environmental compliance, but also financial discipline.

Generally speaking, stakeholder engagement is an exercise of building and maintaining relationships with groups, communities and individuals who are potentially affected by, interested in and/or may be in a position to influence the direction of the Project throughout its entire life cycle. To that end, the following six key principles of stakeholder engagement apply:

1. Provide meaningful, relevant information in a culturally appropriate format and language that is easily understandable by each specific stakeholder group.
2. Conduct all stakeholder engagement in a manner that respects local traditions, culture, timeframes, and the decision-making processes of each stakeholder group.
3. Conduct stakeholder engagement in a variety of ways, venues and make every effort to identify and include all stakeholders.
4. Where relevant, complete stakeholder engagement activities in advance of final decisions, allowing for the consideration and inclusion of comments and recommendations received to be incorporated into Project decisions.
5. Provide frequent feedback, including the results of meetings, incoming suggestions, requests and key recommendations.

6. Provide frequent monitoring and evaluation of the effectiveness of the Plans during and after each engagement session and adjust the engagement program as required and/or suggested by the participating stakeholders in order to improve follow up engagement sessions.

7.1 Engagement with Regulatory Agencies

The Project will undergo a joint provincial- federal environmental assessment process which will be led by Saskatchewan Ministry of Environment's Environmental Assessment and Stewardship branch and the CNSC. The CNSC will be the federal responsible authority for Wheeler's environmental assessment under CEAA 2012. Wheeler will be subject to a number of provincial and federal acts and regulations (Section 1.3.1) and Denison anticipates involvement of other federal and provincial departments once the Wheeler EIS has been submitted and is under review.

With respect to the schedule for engagement with regulatory agencies Denison believes that engagement will largely be initiated in conjunction with the initiation of Wheeler's environmental impact assessment process. In an effort to be proactive and in accordance with existing guidance documents, engagement with CNSC staff and SK MOE staff was initiated during the completion of the prefeasibility engineering and early collection of the environmental baseline data (Table 7.1). The purpose of the engagement meetings in early 2018 was to provide the regulatory agencies with an update on Wheeler with respect to: the technical/engineering aspects, the environmental baseline collection programs, the Indigenous engagement activities and how the selection of these communities were made, as well as an update on the socio-economic activities resulting from these early engagement activities. The more recent meetings in late 2018 were intended to serve as pre-engagement meetings i.e., prior to submission of this document. Denison provided a Project overview, sought guidance and addressed questions before submission of the Technical Proposal and Project Description.

7.2 Engagement with General Public

Members of the public may have an interest in the development of Wheeler. Denison has identified nearby cabin owners, commercial lodges and the villages of Patuanak, Pinehouse, Ile a la Crosse and Beauval as potentially interested in the Project.

Non-Indigenous people who reside near or within one of the four local communities (Patuanak, Pinehouse, Ile a la Crosse and Beauval) were included and invited to participate in the engagement sessions scheduled in those communities along with their Indigenous neighbours (Table 7.1). In addition, Denison has engaged with mayors, council and economic development entities in the local communities (Table 7.1).

As part of Denison's early engagement activities, one of the existing recreational cabin owners located within the Project area requested an update on the status of the Project via a telephone call to a Denison representative. The cabin owner indicated that he has a positive existing relationship with Denison employees given the proximity of his cabin to the existing Wheeler exploration camp and was hopeful that this relationship could continue.

Table 7.1 Summary of In-Person Stakeholder Engagement (Excluding Indigenous Communities)

| Group | Organization or Individual | Date | Summary of Engagement |
|---------------------|--|-------------------|--|
| Regulatory Agencies | Canadian Nuclear Safety Commission, Uranium Mines and Mills Division | February 14, 2018 | Introduced Denison and the Wheeler River Project; provided an overview of the Project from the Preliminary Economic Assessment and scope for the Prefeasibility Study which is underway; discussion and Q&A. |
| | Saskatchewan Ministry of Environment, Mining Industry and Audit Environmental Protection Branch | March 1, 2018 | Introduced Denison and the Wheeler River Project; provided an overview of the Project from the Preliminary Economic Assessment and scope for the Prefeasibility Study which is underway; discussion and Q&A. |
| | Canadian Nuclear Safety Commission, Uranium Mines and Mills Division and Environmental Assessment Division | April 25, 2018 | Introduced Denison and the Wheeler River Project; provided an overview of the Project from the Preliminary Economic Assessment and scope for the Prefeasibility Study which is underway; discussion and Q&A. |
| | Canadian Nuclear Safety Commission, Uranium Mines and Mills Division and Environmental Assessment Division | November 13, 2018 | Denison provided a Project update including an overview of the Prefeasibility Study and the Project scope for the Project Description. Answered any questions about the Project. Denison advised on plans to submit a Project Description in 2019 and the group discussed plans for regulatory process moving forward. |
| | Saskatchewan Ministry of Environment, Environmental Assessment Branch and Uranium and Northern Operations branch | November 21, 2018 | Denison provided a Project update including an overview of the Prefeasibility Study and the Project scope for the Technical Proposal. Denison advised on plans to submit a Technical Proposal in 2019 and the group discussed plans for regulatory process moving forward. |
| | Saskatchewan Ministry of Environment, Uranium and Northern Operations | December 3, 2018 | Denison provided a Project update including an overview of the Prefeasibility Study and the Project scope for the Technical Proposal. Denison advised on plans to submit a Technical Proposal in 2019 and the group discussed plans for regulatory process moving forward. |

| Group | Organization or Individual | Date | Summary of Engagement |
|----------------|--|-------------------|---|
| General Public | Local community members (Patuanak) | July 27, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were given to those in attendance. The presentations were followed by a Question and Answer session. |
| | Mayor, Councillors, community members and the leadership team of Pinehouse Business North (Pinehouse Lake) | September 7, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. This session was followed by a presentation to Denison from Pinehouse Business North focused on their current capacity. |
| | Mayor, Councillors, Co-management board, Métis local community members (Beauval) | December 6, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. |
| | Mayor, Councilors, Co-management Board, Métis Honorable Member of the Legislature (Athabasca riding) and other local community members (Ile a la Crosse) | December 7, 2016 | Following a coffee and snacks, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. |
| | Local community members (Pinehouse) | January 16, 2018 | Held a community workshop in Pinehouse. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | Local community members (Beauval) | January 18, 2018 | Held a community workshop in Beauval. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |

| Group | Organization or Individual | Date | Summary of Engagement |
|----------------|---|-------------------|---|
| General Public | Local community members (Patuanak) | May 3, 2018 | Denison representatives traveled to Patuanak to provide a Project update. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | Local community members (Ile a la Crosse) | January 17, 2018 | Held a community workshop in Ile a La Crosse. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | Mayor, Business Development Corporation (Ile a la Crosse) | January 18, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission |
| | Business Develop Corporation (English River First Nation) | January 31, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission; discuss future opportunities |
| | Business Development Corporation (Pinehouse) | February 1, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission |
| | Mayor (Beauval) | February 1, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission |
| | Northern Saskatchewan Environmental Quality Committee | November 28, 2018 | General overview of the Project, including the ISR methodology. |

Note: Since 2016, additional engagement has been completed via letters, emails, and phone calls.

7.3 Planned Engagement Activities with Regulatory Agencies and the General Public

Denison is committed to continued engagement via various methods of engagement for all groups including regulatory agencies and the general public. Denison is also prepared to engage with any representative of these groups on an as-needed basis should any specific requests to do so be received. Denison will ensure the CNSC and the SK MOE are kept up-to-date on scheduling and the scope of future engagement activities so they have the opportunity to be included in the planning and ultimately participate when desired.

It is anticipated interest from these groups will largely be expressed as part of the formal environmental impact assessment process once this process has been initiated.

Records of these engagements will continue to be documented and meeting notes will be created to maintain a record of the discussions, questions, concerns and answers provided. All of these written records will be added to the Stakeholder engagement section of the Wheeler EIS.

7.4 Socio-Economics

The early engagement activities completed to date have developed the foundations of genuine relationships between Denison and the Indigenous and non-Indigenous groups local to the Project. These relationships have precipitated follow up meetings and discussions with the economic development divisions of these groups and communities who are expressing a strong interest in continuing an open dialogue with Denison in order to afford them access to socio-economic opportunities associated with the Project. Denison has committed to continue to support these discussions.

8 Engagement with Indigenous Communities

Denison is committed to continuing meaningful engagement with Indigenous communities potentially affected by the Project, and to maintaining relationships with these communities throughout all phases of the Project. The approach to engagement has considered relevant guidance, specifically CNSC's REGDOC-3.2.2 Aboriginal Engagement (CNSC 2016a), the Government of Saskatchewan's guidelines for Consultation with First Nations and Métis in Saskatchewan Environmental Impact Assessment (2014f), the Canadian Environmental Assessment Agency's reference guide on considering Aboriginal traditional knowledge in environmental assessments (2015b) and the IFC Performance Standards on Environmental and Social Sustainability (2012).

The following information outlines the list of Indigenous communities identified for engagement activities, including the rationale for inclusion / exclusion; a summary of the activities conducted to date; and an outline of planned activities and associated milestones. Indigenous engagement activities will be adapted, modified and reported on at various points during the associated regulatory process for the Project.

General Guiding Principles

Indigenous peoples' have a unique and important relationship with the environment, and importantly, Indigenous and Treaty Rights which must be fully respected during the process of project development, construction, operation and decommissioning. To this end, Denison's objectives with respect to Indigenous engagement associated with the Project are as follows:

- Build and maintain authentic relationships built on trust and transparency;
- Create a respectful dialogue process that promotes communication between Denison and Indigenous communities, in a timely and accurate fashion; and
- Understand how the proposed development of the Project may adversely impact Indigenous' peoples ability to exercise collective Indigenous and /or Treaty rights.

8.1 Identified Communities and Supporting Criteria

The Northern Administration District (NAD) of Saskatchewan (northern Saskatchewan) includes approximately half of Saskatchewan's land area, but less than four per cent of the province's population. Northern Saskatchewan is approximately 250,000 square kilometres, or about 44% of Saskatchewan's area and is home to about 38,000 people (Statistics Canada 2017) living in approximately 45 communities which include incorporated municipalities (such as towns, villages, hamlets and settlements – most of which self-identify as Métis communities), First Nation reserves, and unincorporated areas. More than 80% of people who live in northern Saskatchewan self-identify as Indigenous. Within the NAD, the communities are roughly divided between three regions: the Athabasca Basin region, the North Central region, and the West Side region

(Figure 8.1). The NAD, while sparsely populated, celebrates a diversity amongst Indigenous communities that requires a unique approach to engagement activities.

Consistent with the history associated with other uranium mining projects located within the NAD, Denison recognizes that all of the communities within the NAD typically have an interest in uranium activities, but that an approach based on appropriate criteria to determine those included in the Program is required.

It is important to note that, as a remote site, there are no communities in relatively close proximity to Wheeler. Calculated using a straight line, the closest communities are approximately 150 km from the site (Table 3.2). Travelling by existing roads, the closest community to the Project is approximately 260 km away.

The following criteria have been used to appropriately evaluate the significant number of communities located in the NAD to those Indigenous communities that will be engaged by Denison.

- Treaty 10 signatory (Treaty in which the Project is located);
- Potential or established Indigenous and /or Treaty Rights within the Project area;
- Geographic proximity of community and / or reserve land to the Project site;
- Known traditional territory in and around the Project site, including travel routes;
- History of relationship with operating companies, the CNSC, and the Province, in relation to other projects located near the Project (McArthur River, Key Lake, Millennium); and
- The potential for collective exercising of Indigenous and /or Treaty rights in proximity to the Project

The results of the initial assessment against the above criteria determined that English River First Nation, the Kineepik Métis Local 9, the Sipisishik Métis Local 37, and the A La Baie Métis Local 21 would form part of Denison's initial focus for Indigenous engagement activities (Table 8.1). Upon further evaluation and identified through various engagement activities, Denison also recognizes that the Patuanak Métis Local 82 should be included as part of the Indigenous engagement program.

It is also important to note that the communities of Ile a la Crosse, Beauval, and Pinehouse, and most of the community-members residing in these communities self-identify as Métis communities and members. Denison recognizes and follows the Métis Nation of Saskatchewan's approach to formal consultation, which occurs with the elected Métis representation; however, it is noted that there is often overlap in engagement activities when, for example, community meetings occur. More often than not, the elected officials of Métis locals are also elected members of the municipality and therefore represent both their Indigenous community as well as their municipality, and rarely acknowledge a separation between the two entities.

The following outlines the criteria used to support the inclusion of the above Indigenous communities into the Program.

Table 8.1: Indigenous Communities

| Indigenous Stakeholder Group | Brief Description |
|------------------------------|---|
| English River First Nation | <ul style="list-style-type: none"> • Treaty 10 signatory • Potential or established Indigenous and /or Treaty rights within the Project area • Geographic proximity of community and / or reserve land to the Project site (Slush Lake reserve approximately 16 km away; Barkwell Bay reserve 39 km away; community of Patuanak 229 km away); • Known traditional territory in and around the Project site, including travel routes (see Figure 5.7 and Figure 5.8); • History of relationship with operating companies, the CNSC and the Province in relation to other projects located near the Project (McArthur River, Key Lake, Millennium); • The potential for collective exercising of Indigenous and /or Treaty rights in proximity to the Project |
| Kineepik Métis Local 9 | <ul style="list-style-type: none"> • Potential or established Indigenous Rights within the Project area • Geographic proximity of community and / or reserve land to the Project site (233 km away); • Known traditional territory in and around the Project site, including travel routes (see Figure 5.7 and Figure 5.8); • History of relationship with operating companies, the CNSC and the Province in relation to other projects located near the Project (McArthur River, Key Lake, Millennium); • The potential for collective exercising of Indigenous rights in proximity to the Project |
| Sipisishik Métis Local 37 | <ul style="list-style-type: none"> • Potential or established Indigenous Rights within the Project area • Known traditional territory in and around the Project site, including travel routes; • Familial ties through the ERFN Membership and La Plonge reserve (immediately adjacent to Beauval) • The potential for collective exercising of Indigenous rights in proximity to the Project |
| A La Baie Métis Local 21 | <ul style="list-style-type: none"> • Potential or established Indigenous Rights within the Project area • Known traditional territory in and around the Project site, including travel routes; • Familial ties through the ERFN Membership • the provision of 'script' to Métis residents during the signing of Treaty 10 • The potential for collective exercising of Indigenous rights in proximity to the Project |
| Patuanak Métis 82 | <ul style="list-style-type: none"> • Potential or established Indigenous Rights within the Project area • Known traditional territory in and around the Project site, including travel routes; • Familial ties through the ERFN Membership and Wapachewunak 192D reserve (immediately adjacent to Patuanak) • The potential for collective exercising of Indigenous rights in proximity to the Project |

Indigenous Organizations

Indigenous organizations can provide a single point of contact for Denison to share information more broadly to a wide variety of Indigenous communities and their leadership regarding Project information, company information, etc. These organizations can also provide specific information regarding their members, interests their members may have, opportunities for Denison to work collaboratively together on various initiatives, etc.

As such, Denison has identified three Indigenous organizations to be included in the Program. The following outlines the criteria for their inclusion:

Ya'thi Nene Land and Resource Office: The Ya'thi Nene Lands and Resources Office (YTNLRO) was created as a not-for-profit organization to be the single point of contact between industry, government and the local Athabasca communities of Hatchet Lake First Nation, Black Lake First Nation, Fond du Lac First Nation, Camsell Portage, Stony Rapids, Uranium City and Wollaston Post. Hatchet Lake First Nation is a Treaty 10 signatory. Denison has evaluated the information currently available online (<http://yathinene.ca/#open-map>) which suggests that there are limited contemporary traditional land use activities near the Project location, relative to the high concentration of traditional land use activities in the Athabasca Region. However, Denison recognizes that these communities may have an interest in the Project and therefore, Denison intends to engage with the YTNLRO in order to better understand contemporary traditional land use activities that are currently being undertaken in the Project area by the member Indigenous communities of the YTNLRO.

Métis Northern Region I: The Project is located within Métis Region I in Saskatchewan. The Métis in Saskatchewan are currently structured with a President, an Executive, Regional Presidents, and Local Presidents. As noted on the Métis Nation of Saskatchewan's (MNS) website, the MNS identifies that 'consultations must be with the Métis government structures that are elected and supported by the Métis people.' As a result, since the Regional Presidents are elected (in addition to the Local Presidents), Denison will engage with the MNS Regional President I regarding the Project.

Métis Northern Region II: While the Project is not located within Métis Region II, a number of key Métis communities with whom Denison is engaging, are located in Northern Region II. The Métis in Saskatchewan are currently structured with a President, an Executive, Regional Presidents, and Local Presidents. As noted on the Métis Nation of Saskatchewan's (MNS) website, the MNS identifies that 'consultations must be with the Métis government structures that are elected and supported by the Métis people.' As a result, since the Regional Presidents are elected (in addition to the Local Presidents), Denison will engage with the MNS Regional President II regarding the Project.

8.2 Summary of Indigenous Engagement Activities to Date

Since the spring of 2016, Denison has completed over 20 in-person engagement events (Table 8.2) involving the leadership and general public of the communities of Patuanak, Pinehouse, Ile a la Crosse and Beauval, involving representatives of English River First Nation, the Kineepik, the A La Baie, and the Sipisishik Métis Locals and non-Indigenous residents of these communities as well.

In all cases, Denison's reception by the Indigenous leadership as well as the general populations at each of the communities visited was positive. This early and frequent engagement fostered the development of a positive, mutually respectful relationship between Denison and the community leadership and members at large, and as a result, Denison was complimented by the communities for their decision to come to the communities at the very early stages of the proposed project. In addition, it allowed the Denison team to solicit feedback on aspects of the project engineering early enough in the design phase of the project such that this feedback could be integrated into the designs (Section 8.2.1.2).

Table 8.2 Summary of In-Person Indigenous Engagement Activities

| Indigenous Community | Organization or Individual | Date | Summary of Engagement |
|----------------------------|---|-------------------|---|
| English River First Nation | Chief | July 6, 2016 | Denison introduced their leadership team to leadership of English River First Nation and requested permission to visit the community and provide an introductory presentation to the community |
| | English River First Nation Members | July 27, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were given |
| | High School Students and Teachers | November 17, 2016 | Denison staff hosted a booth at the English River First Nation job fair, providing advice to high school students on the career opportunities in the mining and exploration industries. |
| | Lands and Resources Manager | November 30, 2016 | Discussed the upcoming schedule of the Wheeler River Project as well as the best way of obtaining and incorporating English River First Nation Traditional Knowledge into the Project's 2017 environmental baseline data collection. |
| | Lands and Resources Manager | March 3, 2017 | Obtained and discussed the English River First Nation Traditional Knowledge map of their Traditional Territory |
| | Chief of English River First Nation, English River First Nation Members | May 3, 2018 | Denison representatives traveled to Patuanak to provide a Project update. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | Land & Resources Officer, Elder | January 31, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission; discuss future opportunities |

| Indigenous Community | Organization or Individual | Date | Summary of Engagement |
|--------------------------------|---|-------------------|---|
| Pinehouse Kineepik Métis Local | Local President, community councillors, local community members, and Business Development Corporation | September 7, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. This session was followed by a presentation to Denison from Pinehouse Business North focused on their current capabilities. |
| | Local President, Community Councillor | November 29, 2016 | Discussed upcoming activities at the Wheeler project and how best to obtain and incorporate community Indigenous Knowledge into the 2017 environmental baseline data collection. In addition, spoke about potential training and employment opportunities with Denison's exploration activities. |
| | Local President, Community representatives, Business Development Corporation | September 6, 2017 | Provide the community Leadership with an update on the development of the Wheeler River project |
| | Local President, Community Representative | November 3, 2017 | Discussions regarding maintaining the strong relationship developed to date between Pinehouse and Denison. |
| | Local community members | January 16, 2018 | Held a community workshop in Pinehouse. The workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | Local President | February 1, 2019 | Provide an update to leadership regarding: the finalization of the Project Description for submission to the CNSC and the Province of Saskatchewan to initiate the environmental assessment of the Wheeler River Project; provide an overview of the details of the pending environmental assessment submission |

| Indigenous Community | Organization or Individual | Date | Summary of Engagement |
|------------------------------|--|------------------|---|
| Beauval Sipishik Métis Local | Local President and representatives, local community members | December 6, 2016 | Following a community meal, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. |
| | Local community members | January 18, 2018 | Held a community workshop in Beauval. A workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| A La Baie Métis Local | Local representatives, and local community members | December 7, 2016 | Following a coffee and snacks, introductory presentations on Denison Mines, the company and its Wheeler River Project were provided to those in attendance. These presentations were followed by a Question and Answer session. |
| | Local community members | January 17, 2018 | Held a community workshop in Ile a La Crosse. The workshop was completed with participants at the meeting to help identify (1) the most effective mine access route from the existing public highway to the project, (2) the pros and/or cons with respect to which lake would be the most appropriate lake to select in terms of discharging treated effluent once the mine was operational and, (3) the pros and/or cons the community saw with respect to the mining methods under evaluation at the time. |
| | High School Students and Teachers | May, 2018 | Denison Geologists hosted a booth at the high school job fair, providing advice to high school students on the career opportunities in the mining and exploration industries. |

Note: Since 2016, additional engagement has been completed via letters, emails, and phone calls.

Early and frequent engagement also fostered the development of a positive, mutually respectful relationship between Denison and the community leadership and members at large. It has allowed the Denison team to solicit feedback on aspects of the Project engineering early enough in the design phase of the Project such that this feedback could be integrated into the designs.

Some examples of successes achieved with Indigenous communities as a result of Denison's commitment to early and effective engagement are listed below in Section 8.2.1.

8.2.1 Achievements

8.2.1.1 Memorandums of Understanding

In order to formalize Denison's commitment to its local Indigenous communities (and their associated non-indigenous communities), Memorandums of Understanding (MOU) have been signed between Denison and:

- English River First Nation;
- Kineepik Métis Local and the community of Pinehouse;
- A La Baie Métis Local 21 and the community of Ile a la Crosse; and
- Sipsisishik Métis Local 37 and the community of Beauval.

These non-binding MOUs formalize the signing parties' intent to work together in a spirit of mutual respect to cooperate in order to collectively identify practical means by which to avoid, mitigate, or otherwise address potential impacts of the Project upon the exercise of the indigenous rights, treaty rights, and interests. In addition, the MOUs formalize the signing parties' intent to work together regarding the benefits that will flow from the Project, provide a process for continued Project engagement and information-sharing about the project and establishes a relationship to identify business, employment and training opportunities for the parties with respect to the Project.

8.2.1.2 Integration of Indigenous Knowledge

Indigenous knowledge (IK) has been incorporated into the early design stages of the Project.

English River First Nation provided their IK map to Denison along with the permission to use it. Denison provided the map to consultants responsible for the collection of the baseline data prior to the development and initiation of these studies in 2016. This allowed Denison's consultants to incorporate English River First Nation IK data into the early designs of their field programs. More recent IK data has been received from Pinehouse Kineepik Métis Local 9, and this IK, along with that from English River First Nation, will be incorporated into the design of all subsequent baseline programs, the selection of VCs and ultimately, the Environmental Impact Statement. In addition, Indigenous field support staff worked closely with consultants during baseline field programs whenever possible, which, in Denison's experience, also provides a valuable Indigenous worldview when undertaking the supporting activities for the eventual EIS preparation.

Knowledge from Indigenous community members was also included in the Project design and influenced the selection of access road alignments, mining method, and proposed treated effluent discharge location. Engineering options developed as part of the prefeasibility study were taken to the Indigenous communities and discussed in focussed workshops. Project design options under the following three topics were discussed:

- Preferred access road routing to the site from Highway 914. Three different options analyzed in the prefeasibility engineering studies were presented.
- Preferred surface water course, to be used for the discharge of treated effluent associated with the proposed Project: six options that were shortlisted as a result of the hydrological and biological data collection were presented.
- Two mining methods under consideration for the Project were presented.

Participants at these workshops consisted of general members of the public (divided into groups of Elders and youth) as well as high school students who were specifically invited to the workshops through each school's administration.

Each group was led through a series of slides explaining the options within all three of the topic areas. Participants were then asked to identify the pros and cons of each of the options within the three topics. The participants were specifically asked to consider these pros and cons from their perspective and backgrounds. In all three topics discussed at the workshop, the options identified by the Indigenous communities as carrying the highest number of pros were ultimately chosen as the preferred options to advance through the Project's Prefeasibility Study (Denison 2018).

Denison's work to collect and integrate IK into the Project design will continue as the Project design is refined through feasibility and detailed design stages and as the regulatory process advances. Updates on any new and continued integration of IK will be included in updates to the IER and the environmental impact statement (EIS).

8.2.2 Summary of Questions and Feedback from Indigenous Engagement

All questions and answers provided during the community engagement sessions as well as one set of written questions provided to Denison by two residents of Beauval have been recorded and captured by Denison (Table 8.3). The themes arising out of many of the engagement sessions generally followed two main areas: economic development opportunities for northerners and environmental protection associated with the eventual operation of the Project.

Table 8.3: Summary of Project Questions and Feedback from Indigenous Groups

| Date | Type of Meeting | Question or Feedback | Denison Response |
|-----------------------------------|-------------------|---|--|
| English River First Nation | | | |
| 27-Jul-16 | Community Meeting | Band Asking for a monetary agreement based on percentage | Denison recorded the request |
| | | Request to see results of environmental studies | The environmental work is just starting; our consultants have been mandated to maximize northern employment. |
| | | Request for employment, including drilling and environmental disciplines. Insistence on hiring now. | We share benefits between communities and look for opportunities to hire northerners. |
| | | How much money have you and your investors made so far? | We have made none; our investors may have made some, but likely very little. We, and they, are investing for the future. |
| | | Specific questions from Marius Paul regarding safety, cleanup, funding, taxes, health & safety, emergency cleanup, tailings, long-term contamination, weapons, environmental impact, pollution, worker mortality, | Written answers would be provided to all questions given that they were provided in writing as well as verbally. |
| | | | The government does not allow Canadian uranium to be used for nuclear weapons. |
| | | Concern about ongoing access to the Wheeler River; and protection of whitefish spawning and moose/caribou calving areas. Some changes to the landscape take time to manifest. | Denison recorded the concern. |
| | | Will the project be sold to another company? | Denison plans to stay with the project throughout production as the Operator. |
| | | Noted that a road will be required between McArthur River and Cigar lake to transport the ore. The province will come to the people for approval, but Province is likely to do it anyway. | This road is key for the Gryphon deposit. Without that road the Gryphon project may not be viable. |
| | | We need an agreement that benefits us ahead of the mine or the government. | We understand. As a small example, Denison has switched its grocery supplier from La Ronge to the ERFN store at Beauval Forks. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|-----------|--------------------|---|---|
| 03-May-18 | Community Workshop | The Chief outlined some historical and cultural considerations. Insisting that ERFN is the only community that should benefit. Denison does not need to speak with any other communities about the project. You don't need MOUs with anyone but us. | We have your traditional land use map posted at camp and are using it to help steer the project. |
| | | People want to work. What types of jobs will be available? What can Denison do to help build capacity in elementary and middle school students? | Our hiring priorities are from here. |
| | | | Initially, environmental or geological technicians. For technical positions, they need math and science skills. For management positions, the same plus experience. |
| | | | We're open to scholarship programs. |
| | | Would like a resident elder at site. | Denison noted the request. |
| | | Concern about additional impact to Russell Lake; there are already many cabins on that lake. | The cumulative effect will be considered in the environmental assessment. |
| | | If you sell or merge, what happens to the contracts? | The buyer would take over the contracts previously established. |
| | | Questions about the ISR mining method | The mining method was explained and the environmental protection measures that come with Denison's planned application of the method. |
| | | Could you power the mine using solar and wind? ERFN has considered power generation as an economic development opportunity. | Would probably need grid power for the base load; solar and wind could be supplemental sources. If ERFN chose to generate, we would be open to buying power. |
| | | Is there cell service at the site? | With a booster, or on a high hill coverage from the Key Lake cell tower can be obtained. |
| | | We want more ERFN people being trained in the drill helper program. | Denison noted the comment. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|--|--------------------|---|--|
| Kineepik Métis Local / Pinehouse Lake | | | |
| 07-Sep-16 | Community Meeting | What are environmental baseline studies are being completed? | Local and regional data is being collected. Denison is also hoping to use existing data from Cameco's Millennium project and the provincial government. Cumulative Effects Monitoring is part of the monitoring that is needed as well. |
| | | We as a community want to start to understand the science involved so we can create local capacity – our area will always have commodities and mining and require services. | Denison is happy to work with the community to help them develop capacity. |
| | | How do current markets affect your decisions? | They are very important to our decisions. We expect prices to be better by 2025 when we start production. |
| | | What is Denison's market cap? | About \$370 million. If the price was \$55/lb, our market cap could be as high as \$1.5 billion. |
| | | Where does your revenue come from? | Some from toll milling Cigar Lake ore at McClean Lake., and some from our environmental services division. A little from managing Uranium Participation Corp. We have a 25% interest in GoviEx Uranium, and 12% in Skyharbour Resources. |
| 16-Jan-18 | Community Workshop | What is a shareholder and how do I become one? | Denison explained to process of how to purchase shares in a public company. Noting there is risk of losing money as well. |
| | | Discussion on price and markets. | |
| | | How would you get Gryphon ore to surface? Technical questions about ground conditions and mining method. | Skipped as rock up a conventional mine shaft, not pumped as slurry. |
| | | | Gryphon Ore is in hard basement rock; no freezing necessary the ground conditions are very good. |
| | | Cost of ISR vs. jet boring | ISR is much cheaper; too deep for jet boring from surface. ISR only works on some ore bodies. You can't use it on the Gryphon deposit as we understand the technology today. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|-----------------------------------|----------------------|--|---|
| | | How do you treat tailings | There are no tailings produced with ISR. |
| | | Need for independent water sampling program alongside of the company’s sampling program. | Governments require independent sampling for the State of the Environment Report every five years. Environment Canada requires independent Environmental Effects Monitoring every three years. |
| | | We never get this independent information | Part of the MOU process is to establish what information the community wants, so as to allow Denison to provide it to the community. |
| | | Can you prove there is no long-range impact – that cumulative effects are zero. | Through the environmental assessment process, we expect to prove that the Project will be below guidelines and that there is no cumulative effect in the regional assessment area. Cumulative Effects Monitoring is usually the government’s responsibility; however, we will need to address the issue of potential cumulative effects as part of the environmental assessment. We do not believe the project will negatively affect tourism activities in the region. |
| | | At what point is tourism affected? | |
| A La Baie Métis / Ile a la Crosse | | | |
| 07-Dec-16 | Community Engagement | Why hire drillers from BC when there are drillers in La Ronge? | Hy-Tech hires locally and has a shop in Saskatoon. Local companies sometimes do not bid on the job. It’s sometimes a financial decision. |
| | | Requested copy of feasibility study | It will be public when it is completed. |
| | | Will you present to schools on future jobs? | Denison would be happy to do so. |
| | | How are you financed? | We seek investors from global capital markets; we get a portion of revenue from McClean Lake mill and our environmental services division. |
| | | How much are you investing in the north? | We’re in the early stages and trying to invest as much as we can in the north. |
| | | How can this project be feasible given recent shutdowns? | We are planning for production when prices rise again. The world is moving towards more nuclear energy. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|------|-----------------|---|---|
| | | We are developing a goods and services database of northern businesses. | We're encouraged to hear that and would welcome the opportunity to receive a copy. |
| | | Is this consultation? | Formal consultations will start when the project description is written, and the environmental assessment starts. We are trying to be proactive. |
| | | Can we see the EA before it goes to government? | The process will be interactive with the communities, so you will have opportunities to see it and make comments during that process. |
| | | We would like Sakitawak Development Corporation to be involved in mine development and operation. | Hopefully we can work something out as we go forward. |
| | | We would like to have northerners work with your human resources people on hiring. | So far we only need drillers. We can train driller helpers. Environmental sampling is part-time. We are at early stages of developing the project. |
| | | One attendee spoke of his changed attitude to uranium mining and nuclear power – He is now in full support of the industry stating he has seen a lot of jobs go to northerners as a result of the uranium mines in northern Saskatchewan. | Denison thanked him for his support. |
| | | Any Impact Management Agreement should be made with the whole north, not just specific communities. It puts the others at a disadvantage. | That's the next stage of discussions. While it could be much easier for the company, it is also a challenging proposition. |
| | | We need a north-wide fund to draw from. | |
| | | Are there still investment possibilities for First Nations, development corporations or individuals? | We already have two other partners, but the door is never closed for investment. |
| | | Why not process ore at the closer Key Lake mill? | Our share of the ore is expected to go to McClean Lake, which we part-own. Cameco may take their 30% to Key Lake. Each company can decide what to do with their portion of the ore. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|-----------|--------------------|---|---|
| 17-Jan-18 | Community Workshop | Concern that this is engagement, not duty to consult. | Denison was in the community to gather input from the members to help inform the project design and continue to build a relationship with the communities. |
| | | What will be left behind at the site after the mine is closed? | Probably there will be a decommissioned landfill at site but not much more than that. Almost everything is taken off site. |
| | | Concern that the Métis Nation (Region) was not formally invited to be part of the MOU. Students need to understand what a MOU is. | The MOU names the La Baie Métis Local and the community and has been discussed with representatives of the Local. The MOU is a commitment to talk and work together for mutual support in the areas of environmental sustainability, education, employment and training, business opportunities and community investment. |
| | | Concern about who the agreements will be with. | |
| | | Again, white people telling us what they want to do. Would like to hear from the Serpent River First Nation (Elliot Lake). | This is a dialogue; we want your input. Denison is considering having local community liaison people added to the team as the project advances. |
| | | The students need to know this information. | Denison agrees, that is why we invited them to be a part of this workshop and why they are here. |
| | | Are the jobs transferable to the community? | Most, if not all, of the trades needed are transferable across the country. Other more specific mining jobs are strictly mining-related. It's a risk you take depending on what training you select. |
| | | Any news on the McArthur - Cigar Lake road? | We have met with the province. If the road is not built, the Gryphon component of the project is unlikely to go ahead. |
| | | When will you sign a surface lease agreement? | After the environmental assessment is successfully completed. Before construction begins. |
| | | Northerners can supply a lot of goods and services. Look at Sakitawak Development Corp. | We agree. One of the components of the MOU is to help identify these opportunities. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|---------------------------------|-------------------|---|---|
| | | Should work with local people on culture and climate change. | Denison is happy to do that. We have English River's Traditional Territory map. and have asked for similar information if available from Pinehouse, Ile a la Crosse and Beauval. |
| Sipishik Métis / Beauval | | | |
| 06-Dec-16 | Community Meeting | | Currently these are supplied from La Ronge. |
| | | Our local post plant could produce core boxes | We are in communication with KCDC on the topic of career development. |
| | | What jobs are and will be available? | Drillers are the main employment opportunity at this stage of the project. Geologists and environmental specialists are also going to be needed. At the feasibility stage, also need additional safety people. There are only about 10-12 people on site at this stage. Workers to build roads, power lines etc. will be needed once construction starts. |
| | | Do you have a HR department? | Yes |
| | | Need for a more sophisticated human resource development strategy to attract high school students into some of the careers in mining. | Denison noted the comment. |
| | | There's still a trust gap between development and peoples' relationship to the land. It's time to build environmental monitoring liaisons to help build trust. | Denison noted the comment. |
| | | To help develop opportunities, Beauval has Northwest Communities (NWC), Primrose Lake Economic development Corp (PLEDCO), the resources of the Gabriel Dumont Institute (GDIO) for apprenticeship training. | Denison noted the comment and welcomed the opportunity to work with these groups as the project advanced. |
| | | What is the potential for you to invest in our communities? | The next stage of discussion is to explore those options as the project moves forward. |

| Date | Type of Meeting | Question or Feedback | Denison Response |
|-----------|--------------------|--|--|
| 18-Jan-18 | Community Workshop | Could we invest in, say, heavy equipment? | |
| | | We need to plan properly to get a piece of the action. | We will keep you informed as to what we're doing in order to help you prepare. |
| | | Questions about hiring drillers, community response and logistics of accessing site. | Hired 2 driller helper trainees. One from Cole Bay and one from Pinehouse. Hy-Tech Drilling is the company running the training program. |
| | | Preference to avoid spawning areas and general stress to fish and animals when choosing a discharge point. Preference to discharge into swift-flowing water at a point that allows flow through the entire river system. Preference not to discharge directly to Russell Lake. | Denison noted comments. |
| | | Questions about the ISR technique and directional drilling. Glad to hear of closed-loop system, no waste water and no tailings. | Comments were noted by Denison. |
| | | Concern that ore bodies may be under lakes | Denison indicated that both orebodies are under land approximately 500 metres below surface. |
| | | How many employees will be needed for the ISR mining method. | Denison indicated about 100 to 150. |

8.3 Planned Indigenous Engagement Activities

The Indigenous engagement activities initiated by Denison in 2016 are part of an ongoing commitment by Denison to actively engage both Indigenous and non-Indigenous throughout all phases of the Project. In addition, Denison's ongoing engagement program honours the commitments outlined in the MOUs.

The ongoing engagement schedule is also a product of the results of the previous engagement sessions. Denison has agreed to visit the Indigenous communities and provide project updates as the development activities advance. It is currently envisioned that community meetings will be held at least once per year with the Patuanak Métis, the Kineepik Métis, the A la Baie Métis Local 21 Sipishik Métis Local 37, English River First Nation, along with their associated municipal communities. Denison will meet more frequently if desired and warranted.

Denison is also committed to meeting with the leadership of each of these Indigenous communities as and when they make a request to do so. In addition, Denison has a standing commitment to respond to any enquires to meet and/or make presentations on the Project to informal or formalized groups.

As the project advances, Denison will continue to utilize local community radio stations, social media as well as print media that may reach appropriate Indigenous audiences.

In accordance with current guidance documents and illustrated in Table 8.4, Denison will undertake engagement activities during the Project's stages as outlined below.

Table 8.4: General Engagement Schedule

| Project Evolution | Indigenous Groups Engaged | Coordination to include Federal and Provincial Governments | Rationale |
|---|---|---|---|
| Prefeasibility engineering and environmental baseline collection | Indigenous communities potentially affected and interested in the Project | Denison will contact federal and provincial governments to coordinate attendance at engagement events wherever possible | Allows for Indigenous communities to be engaged at earliest stage of the Project, allows for adjustments to baseline collection if needed |
| Initiation of environmental impact assessment – submission of Project Description | Indigenous communities potentially affected and interested in the Project | | Allows continued engagement |
| Throughout completion of environmental impact assessment | Indigenous communities potentially affected and interested in the Project | | Allows continued engagement throughout entire process |

Detailed schedules and work plans for engagements will be developed in consultation with the various Indigenous groups at the appropriate stage of the Project's evolution. As referred to above in Table 8.4, some engagements will be mandatory requirements of the EIA process and as such, the scheduling of those sessions may be determined by the regulatory schedule. Denison and individual Indigenous communities will work together to propose an appropriate schedule for follow-up discussions. In general, it has been agreed between each of the Indigenous communities and Denison to attempt to hold update meetings every quarter or half year with leadership representatives and an open invitation for each group to request a meeting with Denison as and when desired.

Denison will include the CNSC and the Province of Saskatchewan in the planning and participation within ongoing engagement activities. Denison's Community Social Responsibility Manager will contact the CNSC Project Officer once formal and specific engagement plans have been developed for the various stages of the Project.

It is expected that a more formalized schedule will be developed as part of the EA process.

8.3.1 Ongoing Engagement – Specific Topics for Upcoming Engagement

In addition to Project updates, a number of specific topics will be the focus of ongoing engagement as Denison prepares the EIS. The anticipated topics for the foreseeable future are:

- Contemporary traditional land use activities occurring in proximity to the Project and potential impacts of taking up the land associated with the surface lease during construction and operation.
- Identification of both biophysical and human environment VCs.
- Traditional / contemporary local names for features such as lakes and other geographic areas or features.

Other topics will likely arise as outcomes of the engagement activities with Indigenous communities present themselves and as the Project advances.

Regulations

Table of Concordance with Prescribed Information for the Description of a Designated Project Regulations

| Section in <i>Prescribed Information for the Description of a Designated Project Regulations</i> | | Wheeler Technical Proposal and Project Description Document Section |
|--|---|---|
| General Information | 1 The project's name, nature and proposed location. | Section 1 Introduction |
| | 2 The proponent's name and contact information and the name and contact information of their primary representative for the purpose of the description of the project. | Section 1.1 Project Proponent |
| | 3 A description of and the results of any consultations undertaken with any jurisdictions and other parties including Aboriginal peoples and the public. | Summary in Section 1.5 Engagement |
| | | Details in Section 7 Stakeholder Engagement and Section 8 Engagement with Indigenous Communities |
| | 4 The environmental assessment and regulatory requirements of other jurisdictions. | Section 1.3.1.2 Provincial |
| | 4.1 A description of any environmental study that is being or has been conducted of the region where the project is to be carried out. | Section 1.4 Regional Studies |
| Project Information | 5 A description of the project's context and objectives. | Section 2.1.4 Objective and Overview of Wheeler In Situ Recovery |
| | | In addition, context on the Project components and activities is provided in Section 2, context on the Project's location is in Section 3, and context on the existing biophysical and human environment is provided in Section 5 |
| | 6 The provisions in the schedule to the Regulations Designating Physical Activities describing the project in whole or in part. | Section 1.3.1.1 Federal |
| | 7 A description of the physical works that are related to the project including their purpose, size and capacity. | Section 2.3 Project Components |
| | 8 The anticipated production capacity of the project and a description of the production processes to be used, the associated infrastructure and any permanent or temporary structures. | Section 2.3 Project Components and Section 2.4 Project Activities and Schedule |
| | 9 A description of all activities to be performed in relation to the project. | Section 2.3 Project Components and 2.4 Project Activities and Schedule |
| | 10 A description of any waste that is likely to be generated during any phase of the project and of a plan to manage that waste. | Section 2.3 Project Components and Section 2.4 Project Activities and Schedule |

| Section in <i>Prescribed Information for the Description of a Designated Project Regulations</i> | | Wheeler Technical Proposal and Project Description Document Section |
|--|--|---|
| | 11 A description of the anticipated phases of and the schedule for the project's construction, operation, decommissioning and abandonment. | Section 2.4 Project Activities and Schedule |
| Project Location Information | 12 A description of the project's location, including (a) its geographic coordinates; | Section 3 Project Location |
| | (b) site maps produced at an appropriate scale in order to determine the project's overall location and the spatial relationship of the project components; | Section 2 Project Information, including Figure 2.6 and Figure 2.7 |
| | | Section 3 Project Location, including Figure 3.1, Figure 3.2, Figure 3.3, Figure 3.4, Figure 3.5, Figure 3.6 and Figure 3.7 |
| | (c) the legal description of land to be used for the project, including the title, deed or document and any authorization relating to a water lot; | Section 2.2.2 Land Tenure |
| | (d) the project's proximity to any permanent, seasonal or temporary residences; | Section 3 Project Location, including Table 3.1, Table 3.2, Figure 3.2 and Figure 3.4 |
| | (e) the project's proximity to reserves, traditional territories as well as lands and resources currently used for traditional purposes by Aboriginal peoples; and | Section 3 Project Location, including Table 3.3, Table 3.2, Figure 3.2, Figure 3.4 and Figure 3.5 |
| | | Section 5.7.3 Current Traditional Land Use by Indigenous , including Figure 5.7 and Figure 5.8 |
| | (f) the project's proximity to any federal lands. | Section 3 Project Location, including Table 3.3 and Figure 3.5 |
| Federal Involvement | 13 A description of any financial support that federal authorities are, or may be, providing to the project. | Section 4 Federal Involvement Federal Involvement |
| | 14 A description of any federal land that may be used for the purpose of carrying out the project. | Section 4 Federal Involvement Federal Involvement |
| | 15 A list of the permits, licences or other authorizations that may be required under any Act of Parliament to carry out the project. | Section 1.3.3 Licensing and Permitting |
| Environmental Effects | 16 A description of the physical and biological setting. | Section 5 Existing Environment |
| | 17 A description of any changes that may be caused, as a result of carrying out the project, to (a) fish and fish habitat as defined in subsection 2(1) of the Fisheries Act; | Section 6.1.4 Fish and Fish Habitat (see 6.1.1.4 Aquatic Environment for supporting information) |

PRESS RELEASE**DENISON ANNOUNCES DECISION TO RESUME FORMAL ENVIRONMENTAL ASSESSMENT PROCESS FOR WHEELER RIVER**

Toronto, ON – Nov 9, 2020. Denison Mines Corp. (“Denison” or the “Company”) (DML: TSX, DNN NYSE American) is pleased to announce its decision to restart the formal Environmental Assessment (“EA”) process for the 90% owned Wheeler River Uranium Project (“Wheeler River” or the “Project”) effective January 2021. The decision to resume the EA process marks the end of the temporary suspension announced in March 2020 amidst the significant social and economic disruption that emerged as a result of the COVID-19 pandemic (see Denison’s news release from March 20, 2020).

David Cates, Denison's President & CEO, commented, *“In the coming days, formal notifications will be submitted to the Canadian Nuclear Safety Commission (‘CNSC’) and the Saskatchewan Ministry of Environment (‘MOE’) to restart the EA process. These notifications will inform the regulators of Denison’s intention to resume various activities designed to meet the regulatory requirements for an Environmental Impact Statement (‘EIS’) supporting the advancement of Wheeler River as Canada’s first In-Situ Recovery (‘ISR’) uranium mine.*

With over \$29 million in cash on the balance sheet at the end of October, Denison is well funded to resume the Wheeler River EA process and is currently finalizing its plans for the resumption of the EA as part of the Company’s 2021 budgeting process. A key milestone for the EA process in 2021 is expected to be the resumption of community engagement activities, adapted to reflect COVID-19 protocols and best practices, to facilitate information sharing with interested parties. Additionally, advancing the EA process will involve the completion of third-party technical studies and assessments, ahead of the preparation and submission of a draft EIS, which is currently targeted for early 2022.”

Background on the Environmental Assessment Process

The EA is an important planning and decision-making tool that involves predicting potential environmental effects throughout the project lifecycle (construction, operation, decommissioning and post-decommissioning) at the site, and within the local and regional assessment areas. The EA process is part of the critical path for the advancement of Wheeler River to a future development decision. Denison initiated the EA for Wheeler River in 2019 with the submission of a Project Description and Technical Proposal (together referred to as the “Project Description”) to the CNSC and MOE. The Project Description was accepted in the second quarter of 2019, formally initiating the EA process for the Project in accordance with the requirements of both the Canadian Environmental Assessment Act, 2012 and the Saskatchewan Environmental Assessment Act. In late December 2019, Denison received a Record of Decision from the CNSC on the scope of the factors to be taken into account for the Wheeler River EA, which indicate that the EA will follow the CNSC's generic guidelines.

The Wheeler River EA will draw on the knowledge and expertise of various technical experts in the fields of hydrogeology, aquatics, hydrology, terrestrial ecology, socio economics, and atmospheric and acoustic sciences. The expert knowledge collected through this process will be used to evaluate the potential project effects on the environment and, where applicable, develop mitigation criteria for the life of the operation. Denison considers this process to be iterative – involving repeated and ongoing interaction with project design, as the Company advances towards a future feasibility study and further detailed engineering. This integrated approach ensures the Project will meet regulatory requirements, protect people and the environment, and maintain operational efficiency.

Impact on the Company's Outlook for 2020

The Company previously announced plans for 2020 in its annual Management Discussion & Analysis ("MD&A") for the year ended December 31, 2019 (the "Initial 2020 Outlook"). Those plans identified discretionary work related to the advancement of the Wheeler River EA with a total cost of approximately \$7.0 million. As updated in the Company's MD&A for the quarters ended March 30, 2020 and June 30, 2020, the Company's Outlook for 2020 was adapted in response to the COVID-19 pandemic and the decision to temporarily suspend the Wheeler River EA ("Updated 2020 Outlook"). While the Company's internal environmental and technical teams continued to advance certain scopes of work related to the EA during 2020 (see Denison's news release dated October 28, 2020), the Updated 2020 Outlook did not include the discretionary EA work identified in the Initial 2020 Outlook.

Now, in support of the planned resumption of the EA in 2021, the Company has approved certain discretionary scopes of work for the remainder of 2020 – each of which is designed to best position Denison to resume the EA process. The Company's latest Outlook for 2020 ("Latest 2020 Outlook") is outlined in its MD&A for the period ended September 30, 2020 and reflects these additional discretionary scopes of work as part of the \$700,000 of additional evaluation expenditures outlined for Wheeler River in 2020.

The future scope and cost associated with the resumption of the EA and the associated activities for 2021 are still to be determined, and are expected to be included in the Company's future disclosure of its overall business plans for 2021, which is expected to follow the completion of the Company's annual budgeting process.

About Wheeler River

Wheeler River is the largest undeveloped uranium project in the infrastructure rich eastern portion of the Athabasca Basin region, in northern Saskatchewan – including combined Indicated Mineral Resources of 132.1 million pounds U_3O_8 (1,809,000 tonnes at an average grade of 3.3% U_3O_8), plus combined Inferred Mineral Resources of 3.0 million pounds U_3O_8 (82,000 tonnes at an average grade of 1.7% U_3O_8). The project is host to the high-grade Phoenix and Gryphon uranium deposits, discovered by Denison in 2008 and 2014, respectively, and is a joint venture between Denison (90% and operator) and JCU (Canada) Exploration Company Limited (10%).

A PFS was completed for Wheeler River in late 2018, considering the potential economic merit of developing the Phoenix deposit as an ISR operation and the Gryphon deposit as a conventional underground mining operation. Taken together, the project is estimated to have mine production of 109.4 million pounds U_3O_8 over a 14-year mine life, with a base case pre-tax NPV of \$1.31 billion (8% discount rate), Internal Rate of Return ("IRR") of 38.7%, and initial pre-production capital expenditures of \$322.5 million. The Phoenix ISR operation is estimated to have a stand-alone base case pre-tax NPV of \$930.4 million (8% discount rate), IRR of 43.3%, initial pre-production capital expenditures of \$322.5 million, and industry leading average operating costs of US\$3.33/lb U_3O_8 . The PFS is prepared on a project (100% ownership) and pre-tax basis, as each of the partners to the Wheeler River Joint Venture are subject to different tax and other obligations.

Further details regarding the PFS, including additional scientific and technical information, as well as after-tax results attributable to Denison's ownership interest, are described in greater detail in the NI 43-101 Technical Report titled "Pre-feasibility Study for the Wheeler River Uranium Project, Saskatchewan, Canada" dated October 30, 2018 with an effective date of September 24, 2018. A copy of this report is available on Denison's website and under its profile on SEDAR at www.sedar.com and on EDGAR at www.sec.gov/edgar.shtml.

Denison suspended certain activities at Wheeler River during 2020, including the formal EA process, which is on the critical path to achieving the project development schedule outlined in the PFS. The Company is not currently able to estimate the impact to the project development schedule outlined in the PFS, and users are cautioned against relying on the estimates provided therein regarding the start of pre-production activities in 2021 and first production in 2024.

About Denison

Denison is a uranium exploration and development company with interests focused in the Athabasca Basin region of northern Saskatchewan, Canada. In addition to the Wheeler River project, Denison's Athabasca Basin exploration portfolio consists of numerous projects covering over 250,000 hectares. Denison's interests in the Athabasca Basin also include a 22.5% ownership interest in the McClean Lake joint venture ("MLJV"), which includes several uranium deposits and the McClean Lake uranium mill, which is currently processing ore from the Cigar Lake mine under a toll milling agreement, plus a 25.17% interest in the Midwest and Midwest A deposits, and a 66.71% interest in the J Zone and Huskie deposits on the Waterbury Lake property. Each of Midwest, Midwest A, J Zone and Huskie are located within 20 kilometres of the McClean Lake mill.

Denison is engaged in mine decommissioning and environmental services through its Closed Mines group (formerly Denison Environmental Services), which manages Denison's Elliot Lake reclamation projects and provides post-closure mine care and maintenance services to a variety of industry and government clients.

Denison is also the manager of Uranium Participation Corp., a publicly traded company which invests in uranium oxide and uranium hexafluoride.

Qualified Persons

The technical information contained in this release related to mineral resource estimates has been reviewed and approved by Mr. Andrew Yackulic, P. Geo, Denison's Director, Exploration, who is a Qualified Person in accordance with the requirements of NI 43-101.

The balance of the technical information contained in this release has been reviewed and approved by Mr. David Bronkhorst, P.Eng, Denison's Vice President, Operations, who is a Qualified Person in accordance with the requirements of NI 43-101.

Cautionary Statement Regarding Forward-Looking Statements

Certain information contained in this news release constitutes 'forward-looking information', within the meaning of the applicable United States and Canadian legislation concerning the business, operations and financial performance and condition of Denison.

Generally, these forward-looking statements can be identified by the use of forward-looking terminology such as 'plans', 'expects', 'budget', 'scheduled', 'estimates', 'forecasts', 'intends', 'anticipates', or 'believes', or the negatives and/or variations of such words and phrases, or state that certain actions, events or results 'may', 'could', 'would', 'might' or 'will be taken', 'occur', 'be achieved' or 'has the potential to'.

In particular, this news release contains forward-looking information pertaining to the following: the planned resumption of the EA process, including regulatory notices and procedures, and anticipated scope, objectives and timing; the duration and scope of impacts of the COVID-19 pandemic and affiliated operational adjustments; the results of the PFS and expectations with respect thereto; development and expansion plans and objectives, including plans for a feasibility study; and expectations regarding its joint venture ownership interests and the continuity of its agreements with its partners.

Forward looking statements are based on the opinions and estimates of management as of the date such statements are made, and they are subject to known and unknown risks, uncertainties and other factors that may cause the actual results, level of activity, performance or achievements of Denison to be materially different from those expressed or implied by such forward-looking statements. For example, Denison may be unable to resume or, once resumed, decide or otherwise be required to discontinue the EA or other testing, evaluation and development work at Wheeler River if it is unable to maintain or otherwise secure the necessary resources (such as testing facilities, capital funding, regulatory approvals, etc.) or operations are otherwise affected by COVID-19 and its potentially far-reaching impacts. Denison believes that the expectations reflected in this forward-looking information are reasonable but no assurance can be given that these expectations will prove to be accurate and results may differ materially from those anticipated in this forward-looking information. For a discussion in respect of risks and other factors that could influence forward-looking events,

please refer to the factors discussed in Denison's Annual Information Form dated March 13, 2020 or subsequent quarterly financial reports under the heading 'Risk Factors'. These factors are not, and should not be construed as being exhaustive.

Accordingly, readers should not place undue reliance on forward-looking statements. The forward-looking information contained in this news release is expressly qualified by this cautionary statement. Any forward-looking information and the assumptions made with respect thereto speaks only as of the date of this news release. Denison does not undertake any obligation to publicly update or revise any forward-looking information after the date of this news release to conform such information to actual results or to changes in Denison's expectations except as otherwise required by applicable legislation.

Cautionary Note to United States Investors Concerning Estimates of Measured, Indicated and Inferred Mineral Resources and Probable Mineral Reserves: This press release may use the terms 'measured', 'indicated' and 'inferred' mineral resources. United States investors are advised that while such terms have been prepared in accordance with the definition standards on mineral reserves of the Canadian Institute of Mining, Metallurgy and Petroleum referred to in Canadian National Instrument 43-101 Mineral Disclosure Standards ('NI 43-101') and are recognized and required by Canadian regulations, these terms are not defined under Industry Guide 7 under the United States Securities Act and, until recently, have not been permitted to be used in reports and registration statements filed with the United States Securities and Exchange Commission ('SEC'). 'Inferred mineral resources' have a great amount of uncertainty as to their existence, and as to their economic and legal feasibility. It cannot be assumed that all or any part of an inferred mineral resource will ever be upgraded to a higher category. Under Canadian rules, estimates of inferred mineral resources may not form the basis of feasibility or other economic studies. United States investors are cautioned not to assume that all or any part of measured or indicated mineral resources will ever be converted into mineral reserves. United States investors are also cautioned not to assume that all or any part of an inferred mineral resource exists, or is economically or legally mineable. In addition, the terms "mineral reserve", "proven mineral reserve" and "probable mineral reserve" for the purposes of NI 43-101 differ from the definitions and allowable usage in Industry Guide 7. Effective February 2019, the SEC adopted amendments to its disclosure rules to modernize the mineral property disclosure requirements for issuers whose securities are registered with the SEC under the Exchange Act and as a result, the SEC now recognizes estimates of "measured mineral resources", "indicated mineral resources" and "inferred mineral resources". In addition, the SEC has amended its definitions of "proven mineral reserves" and "probable mineral reserves" to be "substantially similar" to the corresponding definitions under the CIM Standards, as required under NI 43-101. However, information regarding mineral resources or mineral reserves in Denison's disclosure may not be comparable to similar information made public by United States companies

[Canada.ca](#) › [Canadian Nuclear Safety Commission](#) › [The Commission](#)

› [Participant Funding Program](#) › [Participant Funding Program opportunities](#)

Participant funding to review the draft environmental impact statement for Denison Mines Corp.'s Wheeler River project

This participant funding offering is open from **January 10 to March 14, 2022**.

Participant funding notice

The Canadian Nuclear Safety Commission (CNSC) is offering participant funding to assist Indigenous peoples, members of the public, and stakeholders in the review of the draft environmental impact statement (EIS) for the Wheeler River project proposed by Denison Mines Corp. (Denison).

Denison is proposing to develop an *in situ* recovery uranium mining and processing operation located in the Athabasca Basin in northern Saskatchewan, approximately 600 km north of the city of Saskatoon, 4 km west of Highway 914 and midway between Cameco Corporation's Key Lake Mill and McArthur River Mine. The proposed Wheeler River mine would produce up to 5,400 tonnes of U₃O₈ annually for 20 years. Under the *Nuclear Safety and Control Act*, Denison's proposal requires CNSC approval.

Before the Commission can make a licensing decision on this proposal, an environmental assessment (EA) conducted under the *Canadian Environmental Assessment Act, 2012*, is required, along with an EA decision affirming that the proposed activities will not cause significant adverse environmental effects.

For further details on Denison's proposal and the EA process, please see [Canadian Impact Assessment Registry project #80178](#). The dates and location of associated CNSC public Commission hearings will be announced at a later date in a notice of public hearing.

Up to **\$250,000** in participant funding will be disbursed among all eligible applicants for the provision of new, distinctive and valuable information on Denison's upcoming draft EIS and related documentation. It is anticipated that the draft EIS will be submitted in late June 2022. Please note that this first phase of funding is intended to assist in the review of the draft EIS. A second phase of funding to assist with participation in the remainder of the regulatory process, including the review of the EA report and related Commission member documents, will be announced at a later date.

To apply for participant funding, interested parties must complete and submit a [participant funding application form](#). Certain [terms and conditions](#) apply. An application form can be submitted by:

- email: pfp@cnsccsn.gc.ca
- mail: Canadian Nuclear Safety Commission
c/o Participant Funding Program Administrator
P.O. Box 1046, Station B
280 Slater Street
Ottawa, ON, Canada K1P 5S9
- fax: 613-995-5086

The deadline for submitting a participant funding application is March 14, 2022.

A funding review committee that is independent of the CNSC will consider all applications for funding and make recommendations on the allocation of funds.

For information on how to participate, view the [Wheeler River project](#) and [Participant Funding Program](#) sections of the CNSC website.

For questions about this specific funding opportunity, contact:

Adam Zenobi

Participant Funding Program Administrator

Webinar: NexGen Rook I and Denison Wheeler River Projects – CNSC Regulatory Review Process Overview

Join us on September 13, 2022, for a webinar on the CNSC regulatory review process for the proposed NexGen Rook I and Denison Wheeler River projects.

The CNSC's regulatory framework consists of laws passed by Parliament that govern the regulation of Canada's nuclear industry, and regulations, licences and documents used by the CNSC to regulate the industry.

The purpose of this webinar is to:

- present an overview of the CNSC's regulatory review process for licensing and environmental assessment
- provide an update on the progress and status of the proposed Rook I and Wheeler River projects

Public Notice - Conformity Review for the Wheeler River Project EIS Submission

October 24, 2022: On October 21, 2022, Denison Mines Ltd. submitted a draft environmental impact statement (EIS) for the proposed Wheeler River Project to the Canadian Nuclear Safety Commission (CNSC). CNSC staff are currently conducting a 30-day conformity review to ensure that sufficient information has been submitted in accordance with the CNSC *Generic*

Guidelines for the Preparation of an Environmental Impact Statement. If the draft EIS is deemed sufficient, a technical review will commence, along with a 90-day public comment period.

Ms. Janna Switzer
Environment Manager
Denison Mines Corp.
jswitzer@denisonmines.com

Subject: Outcome of CNSC Staff Conformity Review of the October 21, 2022 Draft Environmental Impact Statement for the Proposed Wheeler River Project

Dear Ms. Switzer:

On October 21, 2022, Denison Mines Corp. (Denison) submitted a draft Environmental Impact Statement (EIS) for the Wheeler River Project, proposed for the Athabasca Basin region of Northern Saskatchewan [1]. CNSC staff have conducted a conformity review of this submission, along with the supporting information submitted by Denison on November 9, 2022 [2], to form a conclusion on whether the required information has been provided, in order to proceed with the EIS technical review.

The scope of the conformity review was to evaluate this submission against CNSC staff's [*Generic Guidelines for the Preparation of an Environmental Impact Statement pursuant to the Canadian Environmental Assessment Act, 2012*](#).

Review Results:

CNSC staff have found the submission to contain the required information, to proceed with the technical review of the draft EIS.

Next Steps:

On November 21, 2022 or shortly thereafter, CNSC staff will post the draft EIS, the Executive Summary, and all Technical Support Documents on the Canadian Impact Assessment Registry (CIAR) page for the [*Wheeler River Project \(Reference number: 80178\)*](#). The Federal-Indigenous-Review-Team (FIRT) will then begin a 120-day technical review of the draft EIS submission and at the same time, or shortly thereafter, a 90-day public comment period will commence.

Near the end of the technical review period, CNSC staff will then compile the FIRT Information Request (IR) Table. This will be sent back to Denison for response no later than March 21, 2023.

A compiled table of comments from First Nations, Métis and the public will also be shared with Denison before the end of April, 2023. Submissions will be posted to the CIAR as they are received, throughout this comment period.

Should you have any questions, please do not hesitate to contact me directly by phone at 343-540-6213 or by email at jessica.way@cnsccsn.gc.ca.

Sincerely,

Jessica Way

Wheeler River Project

Public Notice - Public Comment Period on Denison's Draft Environmental Impact Statement for the Proposed Wheeler River Project

The Canadian Nuclear Safety Commission (CNSC) is seeking comments during a 90-day public comment period on the [draft environmental impact statement](#) (EIS), for the proposed Wheeler River Project submitted by the proponent, Denison Mines Corp. At the same time, the CNSC, with the support of the federal-Indigenous Review Team, will begin an EIS technical review.

For the purposes of the public comment period, the draft EIS and supporting documents can be accessed by visiting All Records for the project page. The EIS can also be found under Key Documents, located on the main page of the Canadian Impact Assessment Registry for the Wheeler River Project.

The draft EIS provides an analysis of the project's potential environmental effects and measures to mitigate those potential impacts. The public comment period gives Indigenous nations and communities, members of the public, and government departments and agencies an opportunity to submit their views in writing to the CNSC on the adequacy of the information presented in the EIS, as measured against the Generic Guidelines for the Preparation of an Environmental Impact Statement pursuant to the Canadian Environmental Assessment Act, 2012 (the Guidelines), and on the technical merit of the information presented. The Guidelines provide direction to the proponent and identify the information that is required in the EIS.

Written comments must be submitted by **February 18, 2023** to:

Jes Way

Environmental Assessment Officer

Email: wheelerriver@cnsccsn.gc.ca

All comments on the draft EIS will be posted on the Canadian Impact Assessment Registry in the language in which they were received.

Public Notice - CNSC Completes Initial Review of Denison's Draft Environmental Impact Statement for the Proposed Wheeler River Project

The Federal Indigenous Review Team (FIRT) has completed a technical review of Denison Mines Corp.'s draft environmental impact statement (EIS) submission and has found that the information provided does not fully address the regulatory requirements for the environmental assessment (EA). The technical review resulted in 238 information requests (IRs), found in Annex 1, as well as 49 Advice to Proponent comments, found in Annex 2.

The following documents have been posted:

- Letter from CNSC staff to Denison with outcome of draft EIS review
- Annex 1 - FIRT - Information Requirements for the Wheeler River Environmental Impact Statement
- Annex 2 - FIRT - Advice to the Proponent for the Wheeler River Environmental Impact Statement

CNSC staff expects Denison to submit complete responses to all IRs and Advice to Proponent comments, along with a revised EIS and supporting documentation. Denison's responses may be reviewed several times to ensure the responses meet requirements. Once the draft EIS meets regulatory requirements, CNSC staff will proceed with developing an EA report.

Document reference number: 80

Date modified: 2023-03-28

e-Doc: 6991467

March 20, 2023

Ms. Janna Switzer
Director, HSE Regulatory Compliance
Denison Mines Corp.
jswitzer@denisonmines.com

Subject: Results of the Federal-Indigenous Review Team technical review of the October 21st, 2022 Draft Environmental Impact Statement Submission for the proposed Wheeler River Project

Dear Mrs. Switzer,

On October 21, 2022, Denison Mines Corp. (Denison) submitted a draft Environmental Impact Statement (EIS), Executive Summary, as well as Technical Support Documents (in the form of Appendices) for the proposed Wheeler River Project [1]. On November 18, 2022, CNSC staff found the submission [1] to contain the required information to proceed with the Federal-Indigenous Review Team (FIRT) technical review of the draft EIS [2].

Outcome of the EIS Technical Review

The FIRT has completed the technical review of the submission and has found that the information provided does not fully address the regulatory requirements for the environmental assessment (EA). The technical review of the submission [1] has resulted in 238 information requests (IRs) [3], found in Annex 1 attached, as well as 49 advice to proponent comments [4], found in Annex 2, also attached. Comments in the advice to proponent table contain additional guidance and advice that Denison should take into consideration when responding to IRs and when revising the draft EIS.

Expectations and Next Steps

On March 21, 2023 or shortly thereafter, CNSC staff will post information request tables and advice to proponent comments on the Canadian Impact Assessment Registry for the [Wheeler River Project](#) (Reference number: 80178).

CNSC staff expect Denison to submit complete responses to all IRs and advice to proponent comments and to re-submit a revised EIS. CNSC staff also request that Denison provide a document revision history with the revised EIS, in order for reviewers to locate the changes that have been made to revised documents. It is expected that Denison clearly indicate how the revised EIS incorporated changes that take into account the responses to the IRs. CNSC staff as well as members of the FIRT are available and willing to meet with Denison to discuss the path forward and to clarify expectations for the IR responses.

Commitments Report

At this time, CNSC staff are also formally requesting that Denison submit, as part of its revised EIS documentation, a Commitments Report in order to capture all the mitigation measures, follow-up program measures and commitments that have been referenced in the EA documentation in a single location for completeness and traceability. This report should include a listing of all commitments made by Denison based on all of the documentation submitted to date including:

- the EIS
- correspondence with the public and Indigenous Nations and communities
- responses to IRs
- additional commitments Denison has made in any documentation to members of the public and Indigenous Nations and communities and to whom these commitments apply

These commitments should be triaged based on whether they are within the scope of regulatory requirements or beyond (e.g., good governance, social responsibility), and indicate how each of these commitments will be tracked into Denison programs, for example, environmental monitoring programs.

It would be helpful if Denison could organize this information in tabular format providing the following information:

- details of the commitment
- which phase(s) of the project will the commitment be carried out (e.g., all phases)
- where the commitment is referenced (which document, table, etc. and where it can be found)
- how this commitment will be tracked (project EA follow-up program, site-wide programs, etc.)

This report would remain an evergreen document that would continue to be updated, during the remainder of the regulatory review process, as well as if the project is approved, after the public hearings and Commission decisions, to capture any additional commitments made by Denison staff during public hearings and any actions directed by the Commission to Denison.

Should you have any questions, please do not hesitate to contact me, directly by phone at 343-540-6213 or by email at Jessica.Way@cnsccsn.gc.ca.

Sincerely,

Jessica Way
Environmental Assessment Officer
Environmental Assessment Division

Federal Indigenous Review Team (FIRT) - Information Requirements for the Wheeler River Environmental Impact Statement

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|---|---|--|--|---|------------------|
| IR-01 | English River First Nation (ERFN) | Current use of lands and resources for traditional purposes | General | <p>Context: Denison has not gone far enough in terms of learning from and incorporating information from ERFN provided in the <i>Traditional Knowledge Study and Health and Socio-Economic Study Report</i>. It appears Denison put a disproportionate amount of reliance on the views and interests of one ERFN land user. While we applaud the efforts of Denison to seek feedback from ERFN land users directly and to work closely with such land users, ERFN’s rights and interests in the region of the Project (and the potential of the Project to adversely impact such rights and interests) extend well beyond that of just one land user.</p> <p>Rationale: It is important for the proponent and regulators to understand that while the rights and interests of individual ERFN members are important to consider, the Elders and elected leaders of ERFN represent the collective rights and interests of ERFN as a Nation. The results of the scoping study indicated that ERFN holds firmly established rights to the area where the planned project is located. Numerous studies conducted over several decades have examined ERFN's relationship and connection to land use and occupancy of the region where the proposed mine is located from traditional land use, subsistence harvesting, ecological, and sociocultural and economic perspective.</p> | <p>The draft EIS should be revised to reflect the totality of ERFN TK and land use information.</p> <p>Denison and CNSC must continue to work with ERFN to ensure that impacts on ERFN rights are appropriately and fully considered, mitigated, and accommodated.</p> | |
| IR-02 | Canadian Nuclear Safety Commission (CNSC) | Mitigation Measures | General Appendix 16-C | <p>Context: Denison’s 2019 Wheeler River Terms of Reference states: “The EIA will also discuss the monitoring programs required to demonstrate regulatory compliance and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders.”</p> <p>The CNSC’s Generic Guidelines for the Preparation of an Environmental Impact Statement (EIS), also state: “The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the proponent intends to implement them and the environmental outcome the mitigation is designed to address.</p> <p>Rationale: The EIS and the Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information. It is not clear which monitoring programs will be</p> | <p>CNSC staff expect Denison to provide a comprehensive list of commitments along with the next version of the EIS, including any commitments made to Indigenous Nations and communities and other stakeholders (As committed in the Wheeler River Terms of reference, and as noted in the November 28th, 2022 email from CNSC staff to Denison: <i>Future Submission of a Commitments Table for Wheeler River EIS</i>).</p> | |

¹ Unless otherwise stated, the section noted refers to the draft EIS.
² Where IR contents note “See also related IR(s)”, responses from Denison may be similar or provided in a single detailed response, but it was preferred to keep original IRs distinct.

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|--|--|--|--|---|------------------|
| | | | | employed to demonstrate regulatory compliance, and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders. | | |
| IR-03 | CNSC | Site preparation | Section 1.3.2 Temporal Boundaries Appendix 10-A (ERA) | Context: The EIS and TSD-ERA provide assessment on the project timeframe, including construction, operation, and decommissioning phases. Rational: The site preparation phase is not included in the timeframe (EIS and TSD-ERA). As per REGDOC 2.9.1, the sub-section 4.1.1 Complexity of the environmental risk assessment requirements states that “The applicant or licensee shall identify facility characteristics and activities that may interact with the environment during the relevant phase of the facility or activity’s lifecycle (for example, site preparation, construction, operation, and decommissioning.” | Please provide an assessment of those facility characteristics and activities that may interact with the environment during the site preparation phase, along with an assessment of their potential effects, in order to reflect the entire lifecycle or provide a rationale for its exclusion. | |
| IR-04 | Environment and Climate Change Canada (ECCC) | Fish and fish habitat | Section 2, Project Description Section: Glossary | Context: The Proponent defines ‘clean waste rock’ as “Waste rock generated as sandstone cuttings and core from drilling activities associated with well and freeze hole development that does not have uranium containing materials”. ECCC notes that the use of the term “Clean Waste Rock” could be misunderstood to mean that the waste rock is devoid of any contaminant. Even when the waste rock referred to as “clean waste rock” does not contain uranium materials, it could contain other metals or contaminants that could have adverse environmental effects. It is also not clear whether the “clean waste rock” is characterized for Acid Rock Drainage/Metal Leaching (ARD/ML) given that some portion of the basement rock is to be drilled out to anchor the freeze walls and may have ARD/ML potential. Rationale: The current definition of ‘clean waste rock’ in the draft EIS could lead to inappropriate handling and disposal if it is assumed to be devoid of any metals or other contaminants that might negatively affect the environment. | Provide a clear and more detailed definition of the term ‘clean waste rock’. | |
| IR-05 | CNSC | Change to an environmental component due to hazardous contaminants | Section 2.2.1.2 | Context: Water volumes for mud/diamond drilling is listed as minimal as the mud will be re-used. The mud is identified as a mixture of water, clay, and environmentally friendly polymers that clean out the cuttings and help to keep the drilling bit cool. Rationale: Although the mud for drilling will be re-used, there could be environmental impacts should there be an accident while drilling. | Please identify the components of the environmentally friendly polymers for the drilling mud and potential environmental impacts should the mud not be recovered. | |
| IR-06 | CNSC | Geology and groundwater | Section 2.2.1.4, Wellfield for In Situ Recovery Mining | Context: This Section of the EIS indicates that a tracer test was completed in 2021 and a feasibility field test was initiated in 2022. No information from these tests is included in the EIS and no reporting | 1. Please provide a summary of the results of field tests (i.e., tracer tests, wellfield leach tests, and remediation trials) in the EIS, or provide a technical supporting | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-----------------------|---|--|--|------------------|
| | | | | <p>timelines are provided.</p> <p>Rationale: Guidance from the IAEA (2001) and best practices highlighted by regulatory regimes in other countries such as the United States (IAEA, 2016) and Australia (Geoscience Australia, 2010) indicates that single and multi-well trial (feasibility) testing for mining and remediation techniques should be carried out before a licence for full-scale operations can be granted. This is part of the requirement for proponents to demonstrate to government authorities that all potential risks have been considered during the life of operation and post-remediation of the mine.</p> <p>Additionally, Section 8.5.2 of the Generic EIS Guidelines states: “Units may be characterized as aquifers or aquitards, and unit descriptions should include their geochemical characteristics, vertical and lateral permeabilities, transport mechanism (diffusion versus advection) and the directions of groundwater flow”,</p> <p>And that “The applicant or licensee should present a conceptual and numerical hydrogeological model that discusses the hydrostratigraphy and groundwater flow systems”.</p> <p>Outcomes from the tracer test inform model parameters such as effective porosity (see IR-78), dispersion, and dispersivity (see IR-96). The wellfield leach tests and remediation trails ultimately inform environmental monitoring during site activities, and the source term for the groundwater model. This source term represents the contaminants which flow through the desilicified zone into Whitefish Lake, which represents a source of contamination considered in the ERA.</p> <p>References: [1] International Atomic Energy Agency (IAEA). 2001. Manual of Acid in Site Leach Uranium Mining Technology. IAEA-TECDOC-1239. Vienna. 283 p. [2] International Atomic Energy Agency (IAEA). 2016. In Situ Leach Uranium Mining: An Overview of Operations. IAEA Nuclear Energy Series No. NF-T-1.4. Vienna. 76 p. [3] Commonwealth of Australia (Geoscience Australia). 2010. Australia’s in situ recovery uranium mining best practice guide. ISBN 978-1-921672-95-8. Canberra. 33 p.</p> | <p>document with this information, and ensure the documentation is appropriately referenced in the EIS.</p> <p>2. Please indicate how outcomes from these field tests inform the design of In Situ Recovery. This information should include:</p> <ul style="list-style-type: none">• feasibility of meeting remediation targets.• groundwater flow conditions and validation of flow models.• mobilization of contaminants (e.g., Al, Se or V).• potential for free gas evolution/two-phase flow.• identifying composition of lixiviant and production solutions.• success despite presence of >2% carbonate minerals (siderite, FeCO3) in the ore zone (see Table 4-3 of Appendix 7-A).• site-specific data to parameterize, validate, and refine solute transport models (hydraulic conductivity, effective porosity, dispersivity, diffusion, etc.). <p>3. Please provide further information of proposed operations including % recovery, uranium concentrations, optimal liquid/solid ratios, anticipated reagent consumption, etc.</p> | |
| IR-07 | ECCC | Fish and fish habitat | Section 2.2.1.4.2, Wellfield Operation Section 2.2.1.4.2.2, Secondary Containment of | <p>Context: The description in Sections 2.2.1.4.2 and 2.2.1.4.2.2 refer to the differential rates of injection and withdrawal, which implies that more solution will be withdrawn through the recovery well than volume of mining solution injected. According to the description of the site, a freeze wall will create a barrier between the uranium deposit to be mined and outside the isolated area to prevent inflow of</p> | <p>Clarify where the extra groundwater will come from to sustain this differential rate of injection and withdrawals during operation and if this extra water has been accounted for in the model and the amount of water that ends up in the receiving environment.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|--|--|------------------|
| | | | Mining Solution – Pumping | <p>groundwater from the sandstone outside the freeze wall. Secondly, it was indicated that the basement rock below the uranium deposit will prevent infusion of groundwater from below.</p> <p>The Proponent stated that inward hydraulic gradient will be created by recovering more solution than is being injected. In general, the wellfield will operate to draw a minimum of 1% more solution out of the wellfield compared to solutions injected in. This will help avoid increased subsurface pressures from injection pressure build up within the deposit.</p> <p>Rationale: It is not clear where the extra groundwater will come from that will sustain this differential rate of injection and withdrawals as the freeze wall and bedrock basement will isolate the injection well from groundwater.</p> <p>If it is assumed that there is limited amount of groundwater present in the sandstone layer above the uranium deposit, that amount of groundwater in the sandstone layer is finite and will be exhausted at some point. Therefore, it is not clear where the extra groundwater will come from. If the extra volume of water is not accounted for in the modelling, that would ultimately affect the volume of water that ends up in the receiving environment and likewise the amount of contaminants contained.</p> | | |
| IR-08 | ECCC | Change to an environmental component due to radiological contaminants | Section 2.2.1.4.2.2 Project Description | <p>Context: This section describes how an inward hydraulic gradient will be created within the mining area as a secondary containment method for control of mining solution. While the process is described, there is no information on contingency measures in place for pump failure or system maintenance solutions. There is also no information on how quickly the hydraulic gradient, and therefore secondary containment, would be compromised if any pumps stopped working. It is also unclear how primary containment (i.e., well design) failure, such as physical/mechanical issues compromising casings, would affect the creation of the hydraulic gradient and secondary containment as well.</p> <p>Rationale: It is important to have contingency planning in place in the event that there are any issues with the hydraulic gradient and secondary containment system for control of the acidic mining solution.</p> <p>There is no information in this section on how the hydraulic gradient (i.e., secondary containment) would be maintained if a well or pump (i.e., Primary containment) experienced problems.</p> | Provide further information regarding how the inward hydraulic gradient system functions, with particular focus on how the hydraulic gradient and secondary containment will be maintained if any wells or pumps were compromised. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|---|---|------------------|
| IR-09 | CNSC | Geology and Groundwater | Section 2.2.1.4.2.2 | <p>Context: This section indicates that mining solution within the mining area can primarily be controlled by maintaining an inward hydraulic gradient. The inward hydraulic gradient will be created by recovering more solution than is being injected.</p> <p>Rationale: If, for some reason, the recovered solution is much more than that being injected, an excessive drawdown could be created. If, by accident, mining solution is leaking into the upper sandstone aquifer through crack in injection/recovery well casing at the same time, it would be challenging to remediate the upper sandstone aquifer in dry conditions (due to excessive drawdown).</p> | Please clarify if any measure will be implemented to avoid excessive drawdown and develop contingency measures to address such accident. | |
| IR-10 | ECCC | Fish and fish habitat | Section 2.2.1.4.2.3, Tertiary Containment of Mining Solution - Freeze Wall | <p>Context: The Proponent stated that as a tertiary means of containment for the mining area, the uranium deposit is proposed to be surrounded by a freeze wall that extends from the surface to the basement rock, isolating the mining area from regional groundwater. Current plans are for the freeze wall to be a minimum of 10 m thick, be installed 25 m away from the uranium deposit, and extend 30 m into the basement rock (Figure 2.2-6).</p> <p>As explained in Section 2.2.1.4.2.2, mining solution will be injected into the ore zone under pressure and will likely react, not just with the uranium in the ore zone, but also the binding or cementing material in the sandstone. This means that some portion of the sandstone above the uranium layer and perhaps some portions of the freeze wall will dissolve, thereby creating more void than just the thickness of the uranium layer or horizon. The void may affect the integrity of the freeze wall as containment.</p> <p>Rationale: It is not clear how the Proponent will monitor the freeze wall to verify whether portions of the freeze wall are being dissolved in the mining process and how it plans to verify the integrity of the freeze wall as a containment for the mining solution. In addition, if the dissolution reaction of the uranium ore is exothermic, then the heat generated may also affect the integrity of the freeze wall.</p> | <p>1. Explain how the integrity of the freeze wall will be maintained as a means of containment that prevents migration of the mining solution out of the ore zone into the receiving environment.</p> <p>2. Demonstrate that the mining solution injected under pressure will not compromise the integrity of the freeze wall as a containment.</p> <p>3. Demonstrate how both exothermic and chemical reactions of the mining solution used to dissolve the uranium ore will not compromise the integrity of the freeze wall as a containment.</p> <p>Technical Discussion Required: Yes. ECCC would like to better understand the chemical constituents that compose the mining solution and the chemical reactions that it will cause.</p> | |
| IR-11 | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.2.3 Project Description | <p>Context: It is unclear how much contact water may be produced during the drilling of the mine well field during the construction phase of the proposed Project. Figure 2.2-14 indicates that no water will be produced during the drilling process in the construction phase. In Section 2.2.1.2 both mud rotary drilling and diamond drilling are proposed for the creation of wells. Both processes require water, however only mud rotary drilling produces liquid mud that is then reused in the drilling process.</p> <p>Rationale: It is unclear if the liquid mud produced during drilling can be reused indefinitely with further water additions, or if this</p> | Provide further information on potential wastewater produced during the construction phase from drilling processes, and if proposed infrastructure can contain any water produced. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|--|------------------|
| | | | | eventually becomes the clean sand grain cutting and how it will be disposed of (i.e., liquid or solid waste). If the mud produced from drilling is classified as liquid waste and disposed of as contact water, it is not clear if this is accounted for in the site water management plan and water balance during the construction phase. Contact water from well drilling during the construction phase has not been quantified or accounted for in Figure 2.2-1, and therefore it is unclear if proposed infrastructure during the construction phase has the capacity to contain this waste stream in addition to the waste streams currently outlined in Figure 2.2-1. | | |
| IR-12 | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.2.3, Project Description | <p>Context: There is not enough information provided within the draft EIS and site water infrastructure designs to determine if the infrastructure will sufficiently contain mine site contact and non-contact water runoff. It is unclear how water management will occur during all proposed Project stages at the Project airstrip, which is located away from the main Project site. No information has been provided regarding water that may come into contact with fuels and oils from machinery on the air strip, how and where that contaminated water will be treated, and how surface runoff around the airstrip will be managed. Additionally, it is unclear if contaminants from heavy machinery on roads have been considered during runoff collection plans throughout the mine Project site. Water management at the airstrip and roads can have impacts on surface water quality and sediment quality and contaminants (e.g., Hydrocarbons) from these sources should be considered in overall site water management plans.</p> <p>In Section 2.2.3.1 a site drainage plan for contact and non-contact water has been provided in Figure 2.2-17, and water balances have been provided for the different Project phases in Figures 2.2-14 to 2.2-16. In Section 2.2.3.4 a volume of 30,000m3 for the process water pond is provided, and it is stated that the process water pond has the capacity to contain Probable Maximum Precipitation (PMP) event estimated to be 483.3mm while allowing for 1.0m of freeboard. However, there are no estimates on the total volume of water that may be drained from the overall site infrastructure (i.e., the well field, processing areas, etc.) during a 24-hr PMP event. Additionally, in Figure 2.2.17 culvert locations are provided, however there is no further information on culvert designs, flow ratings and capacity for PMP events.</p> <p>Rationale: In order to be able to understand site water management and flood risk potential, more information needs to be provided regarding the site water infrastructure designs and capture volumes during PMP events. This information will aid ECCC in understanding how contact and non-contact water will be conveyed throughout the</p> | <p>1. Provide information on how contact and non-contact water from the site airstrip will be managed. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</p> <p>2. Provide further information on how potential contaminants in runoff from roads have been considered in the site water management. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</p> <p>3. Provide estimated volumes of water to be drained from overall site infrastructure (such as the mine terrace, airstrip, camp area etc.), during a 24-hr PMP event.</p> <p>4. Provide additional information on culvert designs and conveyance capacity for PMP events.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------------|----------------------------|---|--|---|------------------|
| | | | | site. Runoff from roads and the site airstrip will contain contaminants from vehicles, heavy machinery, aircrafts and de-icing practices. Additional information on the runoff collection systems and expected contaminant concentrations for the site airstrip and roads is needed to determine if the receiving environment and aquatic and terrestrial receptors are protected. | | |
| IR-13 | ECCC CNSC | Fish and fish habitat | Section 2.2.4, Waste Management Section 2.2.7.7, Borrow Area Section 2.3.1.3 Site Preparation and Earthworks | <p>Context: The Proponent indicates that a borrow area is planned for an area northeast of the processing plant. The borrow material or overburden will be used during construction for roads, airstrip, pads, and in the batch plant for concrete production needs, during Operation for ongoing maintenance of various Project components and during decommissioning for fill and cover material. Suitable construction fill material will be sourced from the proposed borrow area and any suitable clean sandstone generated during freeze wall and well drilling (Section 2.2.7.7).</p> <p>It was also noted in Sections 2.2.1.3 and 2.2.14 that the freeze wall will be established by drilling over 300 vertical holes from surface to the basement rock. The freeze holes will extend 30 m into the basement rock and will produce waste rock from basement rock (Figure 2.2-6). However, there is no information whether the waste rock from basement rock would potentially be acid generating and/or metal leaching. This means that all the extra 30 m of basement rock should also be characterized for potential ARD/ML to determine use or appropriate disposal.</p> <p>Rationale: ECCC notes that the Proponent did not indicate whether the borrow material and the drill out part of the sandstone layers and basement rock will be tested for Acid rock drainage/metal leaching (ARD/ML) potential before they will be used during construction, operation and decommissioning. ARD/ML is an environmental hazard that will have an adverse effect on waterbodies frequented by fish.</p> <p>Potential acid generating and metal leaching waste rock could pose negative impacts on the environment if they are not managed adequately.</p> | <p>Please provide:</p> <p>1. Information on whether the waste rock from the basement rock is potentially acid generating and metal leaching;</p> <p>a. Confirm that any borrow material to be used for construction will be characterized for potential ARD/ML.</p> <p>b. Confirm that the part of waste rock recovered from the basement rock, will also be tested for potential ARD/ML.</p> <p>2. Criteria for segregating the potential acid generating and metal leaching waste rock, if it exists, from clean waste rock; and,</p> <p>3. A plan to manage the potential acid generating and metal leaching waste rock, if it exists.</p> | |
| IR-14 | CNSC | Wastes and Decommissioning | Section 2.3.3.1.3 Decontamination, Demolition, and Disposal (p. 2-82) Table 4.3-2: Key Issues and Concerns from English River First Nation (p. 4-33) | <p>Context: The EIS states “Concrete foundations will be left in place. Any portions of concrete foundations remaining above grade will be levelled and rebar will be cut-off at grade. Large slabs will be perforated on a 2-m grid to permit drainage. Concrete slabs will be covered with 0.5 m of development rock or locally stockpiled till.” (p. 2-82)</p> <p>Further, Denison notes that “Concern about responsible authority for restoring the environment, including contaminants when mining</p> | How has the proposal to leave these foundations in place been received by the Indigenous Nations and communities during engagement sessions? Have engagement activities influenced Denison’s planned decommissioning approach? Describe in additional detail how the comment from p. 4-33 has been addressed and how this has been received by those who expressed this concern? | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|---|---|---|------------------|
| | | | | <p>concludes. How long will it take to have the environment fully restored and, if Denison is no longer the operator, how will this be completed?” (p. 4-33). This comment status is noted as <i>Complete</i>.</p> <p>Rationale: Permanent structures will remain following decommissioning, according to the excerpt above. It’s unclear how engagement activities influenced Denison’s planned decommissioning approach, or how the comment above has been addressed or received.</p> | | |
| IR-15 | ECCC | Fish and fish habitat | Section 2.2.3.4 Project Description Section 8.1.3.4.2, Aquatic Environment | <p>Context: In Section 2.2.3.4 it is stated that the estimated PMP event for Project infrastructure planning is 483.3mm. In Section 8.1.3.4.2 it is stated that the PMP is 489.3 mm.</p> <p>Rationale: It is unclear which value is the correct PMP value and if Project infrastructure has been planned correctly.</p> | Provide the correct PMP value and verify that Project infrastructure has been designed utilizing the correct value. | |
| IR-16 | CNSC | Human health with respect to hazardous contaminants | Section 2.2.3.8 | <p>Context: The EIS and technical supporting documents do not provide sufficient justification for the selection of the proposed wastewater treatment systems for the industrial wastewater treatment plant or the domestic wastewater treatment plant.</p> <p>In addition, it is not clear how the upper bound of the industrial wastewater treatment plant effluent quality was obtained.</p> <p>Rationale: Draft REGDOC-2.9.2 formally documents the CNSC’s expectations to licensees for controlling releases to the environment. For proposed new facilities, these expectations include conducting a best available technology and techniques, economically achievable (BATEA) Assessment, and determining key parameters necessary to support the EIS. These include identifying:</p> <ul style="list-style-type: none">• environmental release targets to inform the design of wastewater treatment systems to constrain the quantity and concentration of contaminants and physical stressors released into the environment,• the best available technology and techniques through an options analysis; and• the anticipated influent characteristics, overall treatment efficiencies, and maximum predicted design release as the output of the assessment. <p>Consideration of the principle of pollution prevention and BATEA is also a requirement of REGDOC-2.9.1.</p> <p>CNSC staff have met with Denison to discuss the expectations in draft REGDOC-2.9.2.</p> | <p>Please provide a summary of the BATEA assessment to justify the selection of the wastewater treatment plant system.</p> <p>As part of the summary, please identify the anticipated environmental release targets used to inform the design, as well as the maximum predicted design release concentrations and loadings to the receiving environment. The maximum predicted design releases should be used in the ERA to demonstrate protection of people and the environment.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|---|---|------------------|
| IR-17 | CNSC | Human health with respect to hazardous contaminants | Section 2.2.3.8 | <p>Context: It is also acknowledged that Denison stated in meetings with CNSC staff that Denison intends to propose final release targets to the CNSC as part of the licence application submission.</p> <p>Rationale: It is not clear in the submission whether Denison has considered whether any applicable technology-based performance standards exist in Canada or internationally, and would be relevant as effluent discharge targets, in order to ensure principles of pollution prevention are applied. Consideration of this would help ensure that the proposed effluent discharge targets harmonize with existing federal, provincial/territorial, and/or municipal requirements. For example, there are release limits for radium-226, TSS, and pH outlined in the federal Metal and Diamond Mining Effluent Regulations, which have been demonstrated to be achievable in the uranium mine and mill industry.</p> <p>In addition, countries like the United States, where in-situ recovery has been conducted in the past, have specific technology-based limits. These are known as New Source Performance Standards and are identified in US Code of Federal Regulations (US CFR) 40, Chapter 1, Subchapter N, Part 440 - Ore Mining and Dressing Point Source Category. It is not clear whether these have been considered in Denison’s assessment. These should be considered when identifying suitable achievable technologies.</p> | Denison should harmonize their proposed Effluent Release Targets with the technology-based performance standards that exist in the Metal and Diamond Mining Effluent Regulations where applicable, or other suitable international regulations. | |
| IR-18 | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.2.3.9, Project Description Appendix 8-E | <p>Context: In Table 2.2-1 the upper bound Industrial Wastewater Treatment Plant (IWWTP) effluent quality final discharge targets for Constituents of Potential Concern (COPCs) are provided. General parameters (e.g., temperature, pH, etc.), and several Schedule 4 Substances with maximum authorized concentrations (lead, nickel, suspended solids, and un-ionized ammonia) under the Metal and Diamond Mining Effluent Regulations (MDMER) have not been provided in this table. There are several COPCs (aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese) for effluent characterization under Schedule 5 Section 4 of the MDMER that have not been provided in this table. Additionally, no information on water quality guidelines has been provided in this table.</p> <p>Furthermore, it is stated that the final effluent quality discharge target for uranium is 0.057 mg/L. However, the Canadian Council of Ministers of the Environment (CCME) water short term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe.</p> <p>Rationale: ECCC requests the Proponent include the general water</p> | <p>1. Update Table 2.2-1 and Appendix 8-E to include all general parameters required for environmental effects monitoring: pH, temperature, hardness, alkalinity, and conductivity.</p> <p>2. Update Table 2.2-1 and Appendix 8-E to include missing Schedule 4 Substances under the MDMER with maximum authorized concentrations: lead, nickel, suspended solids, and un-ionized ammonia.</p> <p>3. Update Table 2.2-1 and Appendix 8-E to include missing Schedule 5 Section 4 parameters required for effluent characterization under the MDMER: aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese.</p> <p>4. Include all acute and chronic water quality thresholds for each parameter in Table 2.2-1 and Appendix 8-E.</p> <p>5. Describe additional mitigation measures that can be considered to minimize impacts to aquatic biota from uranium concentrations in effluent.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|--|---|------------------|
| | | | | <p>quality parameters that influence water quality thresholds, parameters in Schedule 4 and Schedule 5 Section 4 of the MDMER, and their respective water quality guidelines for consideration and transparency.</p> <p>Discharges from the proposed Project will alter water quality in the immediate receiving area, and this may include some sublethal effects on aquatic biota, which must be minimized. It remains the Proponent’s responsibility to adhere to the MDMER to ensure that effluent at the end-of-pipe from all final discharge points be non-acutely lethal and meet requirements for prescribed deleterious substances under Schedule 4 of the regulations.</p> | | |
| IR-19 | ECCC | Change to an environmental component due to radiological contaminants | Section 2.2.4 Project Description | <p>Context: In this section, it is proposed that the IWWTP precipitate pond will have a single geosynthetic composite liner system, which is used for ponds/pads that only store non-radioactive materials.</p> <p>However, from Section 2.2.3.9 on industrial wastewater treatment, it is unclear if the precipitates from the stage three neutralization process that are pumped to the IWWTP precipitates pond will have any residual radioactivity.</p> <p>Rationale: For the protection of the surrounding environment, it is important that any ponds/pads that are expected to store radiological contaminants be designed to have proper controls (i.e., liners with monitoring systems) in place.</p> | <p>1. Confirm the characterization of the precipitates that are to be stored in the IWWTP precipitate pond.</p> <p>2. If radiological constituents are expected within those precipitates, update the draft EIS to ensure the proposed geosynthetic liner system for the IWWTP precipitate pond will be adequate to ensure the protection of the surrounding environment.</p> | |
| IR-20 | NRCan | Fish and fish habitat | Section 2.3.3.1.1 Appendix 7-C | <p>Context: The proponent's objective for mining area remediation is to restore the groundwater within the confines of the freeze wall to an acceptable remediation target (EIS, sec. 2.3.3.1.1). The proponent's acceptable decommissioning objectives for groundwater quality are provided in EIS Table 2.3-3 and in Table 3-5 of Appendix 7-C. These objectives were based on laboratory core flood tests performed by flushing samples of ore with groundwater and groundwater amended with sodium hydroxide or sodium bicarbonate. The composition of the remediated groundwater observed in the core flood tests serves as the source term for the post-decommissioning reactive transport modeling presented in section 4 of Appendix 7-C.</p> <p>Rationale: In NRCan's opinion, it is important for reviewers to be able to assess the level of remediation achieved in order to reach the proponent's decommissioning groundwater quality objectives. Therefore, the proponent should provide complete water quality data for the pregnant lixiviant that remains in the ore zone after the end of mining and prior to any remediation.</p> | NRCan requests that the proponent revise Table 3-5 of Appendix 7-C to show the water quality in lixiviant remaining in the ore zone at the end of mining, prior to remediation activities. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|---|--|---|------------------|
| IR-21 | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.3.3.1.3, Project Description | <p>Context: The decommissioning process for the wellfield and associated infrastructure is discussed, however there is no information provided on the potential risk for subsidence of the ground above the depleted uranium deposit. After the uranium has been dissolved and pumped to the surface, a cavity will be formed in the area where the uranium used to exist. This could destabilize the overlying substrates, causing the ground at the surface to sink in the future. There is currently no information regarding this risk, and how it may alter the overlying environment, surface water features, runoff, or existing nearby waterbodies.</p> <p>Rationale: From a surface water and sediment quality perspective, it is important to understand how potential subsidence in the future post-decommissioning may affect the existing environment. It is currently unclear if there is any risk to the aquatic environment if subsidence were to occur and alter existing waterbodies, create new surface water features, or if there will be any risk to the decommissioned onsite industrial landfill and industrial wastewater treatment plant precipitate pond.</p> | Provide further information on the potential risks from subsidence including the probability of occurrence, how it may affect surface water features, and if there exists any risk to the planned decommissioning of waste management infrastructure. | |
| IR-22 | NRCan | Fish and fish habitat | Section 2.10 Appendix 2-C, section 1.1.1.4 | <p>Context: With respect to the choice of In-Situ Recovery (ISR) mining solution, two alternatives were assessed: alkaline and acidic lixivants (Appendix 2-C, sec. 1.1.1.4). In the consideration of technical and economic feasibility of the alternatives (Table 2, Appendix 2-C), the proponent concludes that: Option 1 (alkaline) is not technically feasible based on the uranium deposit geochemistry. Option 2 (acidic) is technically and economically feasible based on the uranium deposit geochemistry and ability to dissolve uranium. Accordingly, the alkaline alternative was not carried forward into the Environmental Assessment (EIS, Table 2.10-1; Appendix 2-C, Table 3).</p> <p>While acidic ISR solutions are widely used internationally (e.g., Kazakhstan), in the United States, where the environmental regulatory regime is more strict, alkaline solutions have been used exclusively since 1970.</p> <p>Rationale: In NRCan's opinion, the proponent should provide a more thorough technical justification for adopting an acidic ISR lixiviant.</p> | In the Alternative Means Assessment (Appendix 2-C), NRCan requests that the proponent provides a more thorough technical justification for selecting an acidic ISR lixiviant rather than a less environmentally problematic alkaline leach used exclusively in the USA. | |
| IR-23 | CNSC | Alternative Means | Section 2.10.2 Alternative Means Appendix 2-A PD Engagement Tables | <p>Context: There are multiple rows in the Indigenous Tables for Appendix 2-A where comments and concerns raised by Indigenous Nations and communities and other members of the public were taken into consideration in the Alternative Means Assessment. However, it is unclear how these were considered.</p> <p>A few examples:</p> | Please explain how comments and concerns collected during Denison's engagement sessions were considered or influenced the alternative means assessment. Please include this information in the EIS and/or it's appendices. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|---|--|------------------|
| | | | Appendix 2-C Alternative Means Assessment (p. 3) | <ul style="list-style-type: none">16-EN-DesNd-101.1: Interested in any future business opportunities that may be available as Denison advances their Wheeler River Project.16-EN-ERFN-100.15: In that territory near the Wheeler River there are a lot of spawning and calving areas for moose, caribou; those creeks are for whitefish spawning. There’s lots of heavy muskeg there. A lot of us have been there, and we’d like to know there’ll still be access to the area.6-EN-ERFN-100.17: Today because of climate change, things are starting to happen that normally didn’t happen. Even the permafrost is now further down. In the Wheeler River area, where there’s some permafrost, have your environment guys seen a change? Will there be a change? These are some of the questions that need to be answered in order to come out with a positive spin. <p>Rationale: Appendix 2-C, Alternative Means assessment, states (p.3): “Engagement with Interested Parties naturally included alternatives means and the engagement input was included in the evaluation of alternative means. Refer to the references list below and <i>Appendix 2-A Engagement Database Summary – Project Description</i> for details of engagement information referenced in this alternative means assessment.”</p> <p>It is unclear in section 2.10.2 of the EIS, Appendix 2-A or Appendix 2C how the comments documented by Denison have been considered or influenced the alternative means assessment.</p> | | |
| IR-24 | CNSC | Alternative Means | Section 2.10.2 Alternative Means | <p>Context: While Appendix 2-C (Alternative Means Assessment) is detailed and includes all aspects of the Alternative means assessment that are required, the summary of the analysis and conclusions in Section 2.10.2 of the EIS lacks the level of detail required to understand the methodology used, and how Denison arrived at these conclusions.</p> <p>Rationale: As noted in the Agency’s Operational Policy Statement on Addressing “Purpose of” and “Alternative Means” under the CEAA 2012: “If a preferred means is selected, the analysis and the rationale for the choice should be explained from the perspective of the proponent, and be documented in the EIS in sufficient detail to provide context for public and technical comment periods during the project EA, and ultimately to allow the decision maker to understand the choice.”</p> | <p>Please summarize the analysis of the alternative means assessment within the body of the EIS, in sufficient detail that a reader of the EIS has adequate information to understand the methodology used, and how Denison arrived at these conclusions.</p> <p>*Note: In addition to the adding text to summarize, Table 6 in Appendix 2-C could be useful to understanding table 2.10.1 in the EIS.</p> | |
| IR-25 | CNSC | Current use of lands and resources for | Section 3, Sections 4, Section 5, | <p>Context: The EIS states that Denison is currently negotiating an agreement with MN-S and no traditional land use information is included throughout the EIS given no agreement was signed or</p> | <p>Please update the revised Draft EIS to reflect the integration of the Métis Use and Knowledge Study in the</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--------------------------------------|---|--|--|------------------|
| | | traditional purposes | Section 11 (and all other applicable once Métis Knowledge Use Study is completed) | <p>Traditional land use information was shared at the time the EIS was being drafted.</p> <p>As noted in the EIS Denison has committed that: “As information becomes available from the agreed-upon process between the Métis Nation – Saskatchewan and Denison, it will be incorporated into the final EIS.” (p. 11-36)</p> <p>Rationale: More information is required to better understand the issues and concerns, valued components, and current use of lands and resources for traditional purposes by MN-S near the project area.</p> <p>Requirements are detailed in CNSC’s Generic EIS Guidelines, section 8.9: Indigenous land and resource use.</p> | <p>Draft EIS where applicable, when this study is completed and provided to Denison.</p> <p>In addition, please include an updated Issues and Concerns table that includes relevant information from the MN-S as a result of engagement activities and relevant MN-S studies in the next version of the EIS, as appropriate.</p> <p>Should this information not be made available to Denison at the time of revising the draft EIS, the next version of the EIS and the response to this IR should provide a status update on discussions and engagement with MN-S and next steps.</p> | |
| IR-26 | CNSC | Precautionary principle and approach | Section 3.4.8 Lands Taken Up from an Indigenous Perspective (p. 3-14) | <p>Context: Denison states: “Discrepancies among IK and western scientific information provide an opportunity for Denison to take a precautionary approach. Examples of concrete actions to address uncertainty in cases where IK and LK have differing conclusions on predicted Project effects include addressing uncertainty through monitoring and follow-up programs and communicating results of those monitoring and follow-up programs to demonstrate they have been responsive to the IK shared.” (p. 3-14)</p> <p>Rationale: CNSC’s Generic Guidelines for the Preparation of an EIS state: “In documenting the analyses included in the EIS, the proponent will demonstrate that all aspects of the project have been examined and planned in a careful and precautionary manner in order to avoid significant adverse environmental effects.</p> <p>A document by Canada’s Privy Council Office, A Framework for the Application of Precaution in Science-based Decision Making About Risk, sets out guiding principles for the application of precaution to science-based decision making.” (Section 2.5)</p> | <p>Please clarify how the precautionary principle, and the Privy Council Office’s, A Framework for the Application of Precaution in Science-based Decision Making About Risk, sets out guiding principles for the application of precaution to science-based decision making has been considered and incorporated into the EA described in the EIS.</p> | |
| IR-27 | CNSC | Cumulative Effects Analysis | Section 3.4.8 | <p>Context: During an outreach and engagement trip by CNSC in October 2022, an abandoned exploration camp adjacent to the proposed Wheeler River site was observed. This site has not been identified within the EIS as part of the cumulative effects assessment. As noted in section 3.4.8, KML has also raised concerns with Denison related to abandoned camps and industrial waste left with no programs for clean-up.</p> <p>Rationale: Section 9.4.3 of CNSC’s Generic Guidelines for the Preparation of an EIS states that “The applicant shall assess any residual adverse environmental effects of the project in combination</p> | <p>Please specify why abandoned exploration camps and industrial waste aren’t taken into consideration when completing cumulative effects assessment.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|---|---|--|------------------|
| | | | | with other past, present or reasonably foreseeable projects and/or activities within the study area.” | | |
| IR-28 | CNSC | Current use of lands and resources for traditional purposes | Section 4, IER and engagement appendices, including: Appendix 2-A Appendix 6-B Appendix 7-B Appendix 8-A Appendix 9-A Appendix 10-B Appendix 11-A Appendix 12-A Appendix 13-A Appendix 14-B | <p>Context: The summary of issues tables do not appear to include all of the key issues identified by the Indigenous Nations and communities.</p> <p>For example, some Indigenous Nations and communities have shared concerns with respect to accident prevention and overall safety on the Key Lake road (Highway 914) due to increased traffic, impacts on treaty rights and section 35 rights due to cumulative impacts, and decommissioning, that were not captured in the issues and concerns and summary tables in Section 4.3.2 and in the IER.</p> <p>The tables in the engagement appendices include a column titled “Response (From Denison)”. The “Response” column does not include responses, but instead points the reader to where this comment or concern was considered. When navigating to the sections referenced, it is often unclear how this information was considered or influenced the assessment.</p> <p>Rationale: Additional detail is required in order to ensure the key issues are all identified and to understand the status of validation for each issue raised and the response provided.</p> | <p>1. Update the summary of issues and concerns tables to include all relevant issues and concerns raised by each of the Indigenous Nations and communities to date, including concerns raised in the Indigenous Knowledge studies provided, additional engagement, and Draft EIS comments.</p> <p>2. Please include a column in the issues and concerns tables to clearly articulate the specific mitigation/monitoring measures that Denison have committed to, or any other measures, in order to address the concerns raised by each Indigenous Nation and community during the engagement process to date.</p> <p>3. Denison must demonstrate that each Indigenous Nation and community has validated that the summary of issues and concerns table reflects their understanding or agreement, and/or a path forward to complete the validation throughout the EIS and the updated IER.</p> <p>Validation must be complete by the time the technical review is complete, prior to submission of a final EIS. Should Denison not be able to fully address issues, concerns or feedback raised by any Indigenous Nation or community, through mitigation and monitoring measures, this should be documented, and a rationale provided.</p> <p>3. Update the response column of the Engagement tables to describe how these were considered in the sections referenced. Consider renaming this column to reflect the nature of the content (i.e., how the information was considered).</p> | |
| IR-29 | CNSC | Current use of lands and resources for traditional purposes | Section 4.3.2 and IER | <p>Context: In this section, Denison includes the engagement with BNDN and includes a summary of issues and concerns table for the Nation. Within the history of interactions (Section 4.3.3.2.1).</p> <p>Rationale: Denison states that they have been providing information on the project to BNDN in 2019, 2021 and again in 2022 and that Denison and BNDN have not responded to date in order to advance further engagement and dialogue.</p> | Please ensure updated information of any additional engagement activities that Denison has completed with BNDN related to understanding their current and traditional land use and potential interests near the proposed project is provided. | |
| IR-30 | CNSC | Indigenous physical and cultural heritage | Section 4.3.2.1.3, Table 4.3.2 | <p>Context: Concerns were raised during engagement sessions that “Elders are not being consulted as most of the engagement has been through online means and without a translator”.</p> | How has Denison adapted engagement with Elders from the ERFN since receiving this comment on March 31, 2021? | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|---|---|---|------------------|
| | | | | Rationale: There’s no indication that a translator has been employed to engage with Elders since 2021 in the engagement Table 4.3.2. | | |
| IR-31 | CNSC | Indigenous Engagement | Section 4.4.2.1.3, Key Engagement Activities (p. 4-88) | Context and Rationale: Regarding the following: “An open house for the general public was planned to be hosted in 2022 on preliminary effects and mitigation, but due to concerns identified by MN-S about hosting a public open house in a community with a significant Métis population, this meeting was postponed by Denison. Denison looks forward to rescheduling the meeting in collaboration with the MN-S.” (p. 4-88) | Please provide an update on the evolution or progress of this engagement with local communities, following collaboration with MN-S (or otherwise). | |
| IR-32 | CNSC | Current use of lands and resources for traditional purposes | Section 5.3 Section 9.0 Terrestrial Environment | Context: Some sections of the EIS (such as Fish and Fish Habitat, Indigenous Lands and resource use) indicate that Indigenous and/or local knowledge was considered when defining the spatial boundaries. However, this is not included in other sections, such as Terrestrial Environment. Rationale: Section 5.2.2 of CNSC’s Generic EIS Guidelines require that spatial boundaries be defined by considering, but not limited to, the following criteria: Community and Indigenous traditional knowledge, ecological and technical considerations. | Please provide any additional details about how any comments or concerns raised were considered in defining the spatial boundaries with Indigenous Nations and communities with respect to spatial boundaries, for the Terrestrial Section and which specific Indigenous Nations and communities were engaged on these topics and how their input and knowledge was incorporated into the EIS. If already presented in the EIS text body, please indicate where this information can be found or link to Section 4 of the EIS or in the IER. | |
| IR-33 | CNSC | Residual Effect Characterization | Section 5.8.1, Definitions for Residual Effects Characterization and Significance Section 5.8.1.1, Residual Effects Characteristics Section 8, Table 8.3-9: Fish and Fish Habitat - Surface Water Quality | Context: Denison uses specific criteria (Residual Effect Characteristics: Direction, magnitude, geographic extent, duration, frequency, reversibility, context and likelihood) and associated ratings (e.g., adverse/positive, low/moderate/high) for the predicted effects assessment. However, it is unclear whether an aggregation method was used in order to determine whether impacts will be significant or not significant, depending on the combination of rating categories (i.e., weightings that were calculated, use of decision rules). For example, medium term and long term are both used to represent the same time category: “Effects are expected to last between 3 to 38 years (i.e., effects expected during Construction through to the end of post-Decommissioning).” (See table 8.4-13 on p. 8-200 compared to table 8.4-12 on p. 8-199 and table 8.5-9 on p. 8-246). Rationale: The Generic Guidelines state: “The method used to describe the level of the adverse effect should be transparent and reproducible.” In Table 8.3-11, duration was moderate, but again uses same rationale. There is no 'moderate' in Table 8.3-8, and by the same rationale, this should be medium-term to be consistent with definitions provided and summary Table 8.3-12. | If an aggregation method was used and ratings (e.g., High, medium, low) were weighted, what weightings were used, how were these calculated? Please also describe any decision rules that informed the determination of significance. If no aggregation was used, how did Denison ensure that results were consistent, given the varying rankings for each of the key criteria, and varying combination? Regarding inconsistencies in ratings, please use consistent terminology for same rating. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|---|------------------|
| | | | | It was noted that all three tables should be deemed medium-term based on definitions of ratings outlined in Table 8.3-8. Frequency was also showing up as "continuous" and "continuously" in these tables. | | |
| IR-34 | CNSC | Cumulative Effects Analysis | Section 5.9.2.2 (p. 5-41) | <p>Context: Denison identifies the Gryphon deposit as a project that is not reasonably foreseeable. The direct quote from the EIS indicates that the “Development of the Gryphon deposit as an underground mine was evaluated at the prefeasibility level in 2018 but has not advanced to feasibility study or EA. Denison has not announced an intent to proceed with the development of the Gryphon deposit.” (p. 5-41)</p> <p>Rationale: The guidance Assessing Cumulative Environmental Effects under the CEAA, 2012 defines <i>Reasonably Foreseeable</i> as a “physical activity [that] is expected to proceed, e.g. the proponent has publicly disclosed its intention to seek the necessary EA or other authorizations to proceed.”</p> <p>In a press release by Denison Mines (2018: Denison announces decision to advance Wheeler River Project following positive PFS results), Denison publicly disclosed intention to seek the necessary EA for Gryphon to proceed: “After careful consideration of the risks and opportunities associated with permitting and concurrent advancement of project engineering activities, the Company has decided to submit a PD and initiate the EA process in early 2019 for the Phoenix ISR operation, and to bring the Gryphon operation forward, at a later date, as required to achieve the PFS plan of Gryphon first production by 2030.”</p> <p>Further, Denison’s Wheeler River Webpage references a “start of pre-production activities for the Gryphon operation in 2026”</p> | Please update the cumulative effects assessment in the EIS to include the Gryphon deposit as a Present or Reasonably Foreseeable Project. | |
| IR-35 | CNSC | Change to an environmental component due to hazardous contaminants | Section 6, Chemicals of Potential Concern | <p>Context: The use of petroleum products (e.g., propane, gasoline, and diesel) at the Denison Mines Wheeler River site is associated with vehicles and periodic operational testing of emergency generators as well as stationary pumps for emergency power or fire water systems. Thus, the air emissions will contain acrolein.</p> <p>Rationale: This chemical of potential concern (COPC) poses potential risks to human health via inhalation, but acrolein appears to have been missed or deemed insignificant. However, its consideration in the assessment will provide information on the significance of the associated risk.</p> | Please consider acrolein in the assessment or provide a rationale for its exclusion. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|---|--|--|------------------|
| IR-36 | CNSC | Other | Section 6, Table 6.1-11 Baseline External Gamma Monitoring | <p>Context: For one of the exposures in the summary table for baseline external gamma monitoring (Table 6.1-11), the cell states "Destroyed in Field".</p> <p>Rationale: No rationale or indication as to why or how it was destroyed is provided.</p> | Please provide any additional info available as to how equipment was destroyed. | |
| IR-37 | CNSC | Air Quality | Section 6.1.1.1, CALPUFF model | <p>Context: "The Saskatchewan Ministry of Environment (SK MOE) has developed the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) to assist proponents in conducting air dispersion modelling assessments in a consistent manner. The guideline defines the recommended approach for dispersion modelling assessments in Saskatchewan, including model selection, emission source characterization, and the determination of compliance criteria to apply."</p> <p>Rationale: Saskatchewan air quality guideline requires consultation on use of CALPUFF model, where it states" The ministry acknowledges that there will be situations where specialized air dispersion models such as CALPUFF, CALQ3HCR and others may be applicable. The use of specialized models requires consultation with the ministry" OR "Pre-consultation with the ministry must be undertaken prior to the facility conducting specialized modelling (p. 3)." It is not clear if Denison Mines consulted with Saskatchewan MOE on use of CALPUFF model.</p> <p>Noted that Section 6.1.4.2 is again referring to Saskatchewan MOE guidance for justification, but no indication that they consulted with them (a requirement).</p> | Please confirm and provide a summary of the consultation with the Saskatchewan MOE on the use of CALPUFF model for the Wheeler River EIS as per provincial air quality guidelines. | |
| IR-38 | ECCC | Change to an environmental component due to hazardous contaminants | Section 6.1.4.1, Potential Interactions Between the Project and Valued Component / Key Indicators | <p>Context: In this section, the Proponent identifies primary interactions between Project activities and air quality valued components and their associated key indicators. These primary interactions may result in an adverse effect on the valued component. Among the primary interactions are the use of emergency generators in a backup role should there be an interruption of the provincial electrical grid. However, it is not evident what is the anticipated frequency and duration of interruption to grid power.</p> <p>Rationale: The Proponent states in the conservative operation scenario that while the site will be powered from the provincial grid at the operations stage, the back-up power generators were assumed to be operating under emergency conditions as a worst-case scenario. ECCC acknowledges the positive impact of extending the electrical grid to the Project site with resultant reduction in generator emissions. The impact of an interruption in grid power would be greatest during the winter months when energy use would be greatest and surface-</p> | Provide an evaluation of a worst-case scenario of grid power interruptions (i.e., average aggregate length of power outages) during the winter months for this section of the electrical power grid. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|--|------------------|
| | | | | based temperature inversions, which vertically trap emissions, would be strongest. | | |
| IR-39 | ECCC | Change to an environmental component due to hazardous contaminants | Section 6.1.4.2, Potential Project-Related Effects | <p>Context: In this section, the Proponent discusses the approach taken for air dispersion numerical modelling. Using their CALMET data set, the Proponent’s CALPUFF model runs indicated exceedances for 24-hour total suspended particulates, 24-hour particulate matter (PM10), 1-hour nitrogen dioxide, and 24-hour uranium concentrations. However, there is no mention of possible diurnal and seasonal occurrences of the exceedances.</p> <p>Rationale: Adequate assessment of the modelling results requires knowledge of the temporal characteristics for the exceedances. For example, wintertime exceedances may be due to strong temperature inversions, especially during the overnight to morning hours. These strong inversions are challenging for numerical models to capture. Exceedances during warmer months may be due to specific wind directions, which transport emissions directly to downwind receptors.</p> | Provide additional information on any diurnal and seasonal influences of the modelled exceedances. | |
| IR-40 | CNSC | Air Quality | Section 6.1.6.2.1, Air quality significance determination | <p>Context: Significance determination was not conducted for air quality due to interconnectedness with other assessment endpoints.</p> <p>Rationale: It is not clear where and how these air quality assessment endpoints were factored into the assessment.</p> | Please provide additional information to demonstrate where and how these air quality assessment endpoints were factored in. | |
| IR-41 | CNSC | Air Quality | Section 6.1.6.2.2, Background concentrations | <p>Context: The EIS states that "Conservative regional background concentrations from the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) and based on the La Loche monitoring station were used for particulate matter, NO2, SO2, and CO. The La Loche monitoring station is located near anthropogenic sources, while the Project is in a remote area removed from anthropogenic sources."</p> <p>Rationale: If La Loche monitoring station is located near anthropogenic sources and the project is not, use of this data is not a conservative or realistic representation of background.</p> <p>For a realistic approach, background data considered should be upper 95th percentile (or max if n<10) from an area representative of project location</p> <p>For a conservative approach, background data from an area located even further from anthropogenic sources (if this exists) should be used, or an upper limit of background less than upper 95th should be applied as the background.</p> <p>Upper limit of background is used to screen out COPCs or often subtracted from total to ascertain relative contribution / impact from</p> | Please provide additional rationale to justify the appropriateness of La Loche monitoring station concentrations as background for project location. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|--------------------|--|---|--|--|------------------|
| | | | | source, so using a higher upper limit may result in COPCs screening out or appear to have a lower relative contribution. If background was added to source, then approach used would be conservative. If this is the case, confirmation and reference to where this is discussed in methodology should be provided. | | |
| IR-42 | Health Canada (HC) | Physical stressors (noise and vibration) | Section 6.2.4.2.2, (p. 6-66) Section 6, Section 6.2.9, (p. 6-72) | <p>Nighttime noise impacts are not adequately considered for human receptors.</p> <p>Context: The EIS states in Section 6.2.9 that, “While the predicted sound levels were less than the guideline values, the increase from baseline was predicted to be noticeable” (p. 6-72). No information is provided on individual noise events occurring during the nighttime period.</p> <p>Rationale: While the increase from baseline is predicted to be noticeable, it is important to also consider that changes to the characteristics of the sound from baseline (e.g., a change in frequency, changes in sound modulation, increased impulsiveness or tonality, or a shift in noise from the daytime to being more at night) may cause noise to be even more noticeable. Consult ANSI S12.9-2005/Part 4, clause A.1.3 for further information.</p> <p>In particular, consideration should be given to potential impacts on sleep, where adverse impacts are reported to begin when sound levels inside bedrooms exceed 30 dBA for continuous noise sources and 45 dBA LAmax for discrete noise events (WHO, 1999).</p> | <p>1. Provide a description of the project- related nighttime noise sources that may impact human receptors as well as a qualitative discussion of the resulting potential impacts on perception considering not only changes in sound levels but also sound characteristics (e.g., tonality, impulsivity).</p> <p>2. Confirm whether individual nighttime noise events exceeding 45 dBA LAmax outdoors (or 30 dBA indoors) are expected to occur more than 15 times over the nighttime period at any nearby potentially noise-sensitive human receptor location(s). This may be of particular concern if some construction and/or operations activities occur during sleeping hours.</p> | |
| IR-43 | HC | Physical stressors (noise and vibration) | Section 6.2.5, (p. 6-66) Section 6.2.5, (p. 6-71) | <p>Mitigation measures for project-related noise were not identified for the Construction phase.</p> <p>Context: The mitigation measures provided in Section 6.2.5, including a complaint management system is also to be implemented as part of the EMS, are only proposed for the operations phase.</p> <p>However, construction activities are predicted to last more than one year. Construction noise will involve the use of equipment operating at the site, construction of surface facilities, drilling, and partial operation of the freeze plant. It will also include regular truck trips and air traffic for personnel changes.</p> <p>Rationale: It is unclear if listed mitigation measures also apply to the construction phase (or only to the operations phase).</p> | <p>1. Clarify whether mitigation measures and the proposed EMS apply to the Construction phase. If not, identify mitigation measures for noise impacts related to Construction phase activities, and consider applying the EMS to the Construction phase and implementing the community complaints and response procedure from the beginning of construction activities.</p> <p>2. Health Canada suggests that construction noise lasting longer than 1 year be assessed as operational noise, and that noise mitigation measures be applied also to the construction phase. Special consideration should be given to mitigation measures for construction noise that occurs at night, in order to minimize impacts on sleep (i.e., avoiding tonal or impulsive noise sources at night).</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends use of Appendix H of Health Canada (2017), which identifies additional construction</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|---|------------------|
| | | | | | noise mitigation measures that could also be considered to reduce project- related noise. | |
| IR-44 | HC | Physical stressors (noise and vibration) | Section 6.2.8, (p. 6-71) | <p>The noise complaints resolution and response procedure is not sufficiently described in the EIS.</p> <p>Context: Section 6.2.8 discusses Monitoring and Follow- up. The proponent indicates: “The EMS will also include a community complaints and response procedure” (p. 6-71).</p> <p>Rationale: Details have not been provided regarding how the complaints would be received, addressed or what the timelines will be for providing a response or resolution. It is important to provide information to potentially affected communities in advance of particularly noisy activities. Community consultation and advanced notification of noisy activities has been shown to reduce complaints (see Health Canada, 2017).</p> | <p>1. Provide the details of the noise complaints resolution and response procedure as per Health Canada (2017).</p> <p>2. Consider conducting community consultations and/or implementing an advanced community notification system to pro-actively reduce the probability noise-related impacts and complaints.</p> | |
| IR-45 | HC | Change to an environmental component due to hazardous contaminants | Section 6 Air Quality Technical Supporting Document Section 6.3.1 | <p>The carcinogenic risks of diesel exhaust from the project should be assessed.</p> <p>Context: Section 6.3.1 discusses modelled predictions of exceedances for Particulate Matter (PM). TSD p. 22 states: “concentrations of 24-hour PM2.5 are also elevated around the standby generators at the freeze plant, which emit fine particulate matter from combustion of diesel fuel”. However, diesel particulate matter is not evaluated for the whole project in the air quality model or the air quality assessment.</p> <p>Rationale: Health Canada has determined that diesel exhaust is carcinogenic in humans which is consistent with the conclusion of the International Agency for Research on Cancer (IARC), and that diesel exhaust is associated with significant population health impacts in Canada.</p> <p>To characterize the carcinogenic risk of diesel exhaust from a project, HC has published a report (2022)¹ which provides a quantitative assessment of the relationship between ambient PM2.5 exposure and lung cancer risk. Specifically, this report quantifies the increase in risk of lung cancer mortality (over the baseline rate in the Canadian population) due to PM2.5 exposure.</p> <p>This quantitative assessment is considered appropriate to characterize risks from diesel PM given the contribution of diesel exhaust to ambient PM2.5 in Canada, and that the carcinogenicity of diesel exhaust has generally been evaluated based on the respirable PM fraction^{1,2,3}.</p> | <p>1. Evaluate the carcinogenic risk of all potential diesel exhaust from the project based on the approach proposed by Health Canada (2022). Additional guidance ("Additional Lung Cancer Mortality from PM2.5: Recommended Approach and Sample Calculation") is provided as an appendix to this comment table.ⁱ</p> | |

| IR-46 | HC | Physical stressors (noise and vibration) | Appendix 6-A Table A-1 | <p>Low-frequency noise and associated potential human health effects were not assessed.</p> <p>Context: Some equipment that may emit low-frequency noise (LFN) have been listed in Table A-1: Assessment Scenarios and Sound Level Data (Section 6 Appendix A); however, no information describing potential impacts of this type of sound on nearby human receptors are presented.</p> <p>Rationale: Low frequency noise can be associated with the introduction of noticeable vibrations and rattles in nearby structures. Research indicates that annoyance related to noise is greater when low-frequency noise is present (ISO 1996-1:2003). As sound environments are usually characterized using A-weighted decibel levels (dBA) that reflect the frequencies most audible to the human ear, the impacts of low- frequency noise may need to be assessed separately.</p> | 1. Clarify whether any project-related activities (construction, operation and/or decommissioning) may produce LFN that could impact off-site human receptors. Evaluate LFN in the noise assessment, if and where applicable. See Appendix C of Health Canada (2017) for a discussion of LFN. | |
| IR-47 | ECCC | Air Quality | Appendix 6-A, A.1 | <p>Context and Rationale: Verification of the following calculation is required for assessing predicted emissions of dust from general construction. It appears the result of 0.70 ton/acre/month is incorrect and should instead be 0.314 ton/acre/month.</p> <p>Appendix 6-A, Appendix A, A.1 (p. A4) TSP Emission Factor for General Construction:</p> $EF\ (TSP) = 0.11\ \frac{\text{ton}}{\text{acre}} \div \frac{\text{month}}{\text{month}} \times 1.2\ \frac{\text{ton}}{\text{acre}} \div \frac{\text{month}}{\text{month}} + 0.42\ \frac{\text{ton}}{\text{acre}} \div \frac{\text{month}}{\text{month}}$ $= 0.70\ \frac{\text{ton}}{\text{acre}} \div \frac{\text{month}}{\text{month}}$ | Explain how the emission factor total suspended particulates (EF (TSP)) result was obtained or rectify if it is incorrect and update the draft EIS to reflect the correction. | |

|--------|------------|--|--|---|---|------------------|
| IR-48 | HC | Physical stressors (noise and vibration) | Appendix 6-E, Figure 6.2.3, p. 6-57 | <p>Noise-sensitive receptors are not included on noise contour maps.</p> <p>Context: Noise-sensitive receptors are identified in the acoustic model report in Section 6 Appendix 6-E but not presented on any maps in the atmospheric and acoustic sections of the main report (Figure 6.2-3).</p> <p>Rationale: The noise assessment typically includes a map illustrating modelled noise levels from the project at receptor locations in the study area.</p> <p>Certainty regarding the presence of human receptors in the regional study area is also recommended in order to assess cumulative impacts.</p> | 1. For more clarity, identify noise-sensitive receptors on Figure 6.2-3: Noise Assessment Study Area as well as on contour maps showing the baseline and predicted noise levels. | |
| IR-49 | HC | Physical stressors (noise and vibration) | Appendix 6-E, 4.0 Table A.1 | <p>The Noise Source Characterization is incomplete.</p> <p>Context: Section 3.0 of the Draft EIS Section 6 Appendix 6- E discusses Source Characterization. There is no detail regarding potential tonal or impulsive noise sources in Section 3.0.</p> <p>Rationale: The draft EIS should include a description of sound source characteristics (e.g., tonal, impulsive, highly impulsive) in order to properly inform the quantitative noise assessment and which assumptions/adjustments need to be applied and to properly evaluate impacts of project noise on health of affected receptors.</p> | 1. Identify any tonal, regularly impulsive, highly impulsive, or high-energy impulsive noises likely to be produced during project activities that could be audible at noise sensitive receptors. Furthermore, describe the timing (e.g., hours of night-time activities), frequency and duration of noise events, and their sound characteristics, including frequency spectrum. See Health Canada (2017) for details. | |
| IR-50 | HC | Physical stressors (noise and vibration) | Appendix 6-E, 4.0 Table A.1 | <p>The description of noise modelling does not document or justify the use of sound level adjustments.</p> <p>Context: ISO Standard 9613-2 has been used for the sound level modelling; however, it is unclear if all applicable adjustments have been considered as per ISO 1996-1:2016 (Table A.1).</p> <p>Rationale: When modelling techniques are used to estimate present (baseline) or future (construction and operational) sound levels, these techniques and any accompanying assumptions, including the use of sound level adjustments, it is important to provide appropriate documentation and justification.</p> <p>Note that in situations where more than one source characteristic adjustment is applicable (e.g., impulsive or tonal), only the higher of the adjustments is used. However, all time-of-day adjustments and the quiet rural area adjustment are to be added to the highest of the applicable source adjustments.</p> | 1. Clarify whether ISO-1996-1:2016 has been considered in the modelling to account for any applicable sound level adjustments. Adjustments should be considered when calculating Ln (night- time sound level) and Ldn (day-night sound level). In addition, if applicable, adjustments can be applied depending on the noise characteristic (impulsive, highly impulsive, etc.), and because the project location is considered to be in a quiet rural area. See: ISO 1996-1:2016 and Health Canada (2017) for details. | |

| IR-51 | CNSC | Geology and Groundwater | Section 7, Figure 7.8-1 Appendix 7-C | <p>Context: Figure 7.8-1 (p. 7-107, main EIS report) shows monitoring well cluster outside of the freeze wall.</p> <p>Rationale: It is not clear what the targeted hydro-stratigraphic units of each monitoring well cluster are. In addition, it is not clear how the establishment of the freeze wall and any leakage from the brine solution will be monitored. If there is any “window” within the freeze wall (i.e., the freeze wall is not continuous), is there any way to identify that?</p> | <p>Please clarify the targeted hydro-stratigraphic units of each monitoring well cluster in Figure 7.8-1 (p. 7-107, main EIS report).</p> <p>Please clarify how the establishment of a continuous freeze wall will be monitored.</p> | |
| IR-52 | ECCC | Fish and fish habitat | Section 7, Geology and Groundwater Appendix 7 | <p>Context: According to the Proponent, “an acidic or low pH mining solution will be used to leach uranium ores from the ground. Mining solution may be a mixture of sulphuric acid, hydrogen peroxide, ferric sulphate, and freshwater (from shallow groundwater well or surface waterbody) or recycled water.</p> <p>Wellfield will consist of a combination of injection and recovery wells, in the general the arrangement of one recovery well in the centre surrounded by four injection wells (5-spot pattern) with about 5 to 10 m between wells. The final wellfield is expected to include approximately 300 wells over an area measuring 90 m wide x 750 m long”.</p> <p>As the components/contaminants mentioned in the description of the hydrogeologic contaminant transport processes above may be transported to Whitesfish Lake through groundwater, the injection and recovery wells should be included in the model.</p> <p>Rationale: The hydrogeologic contaminant transport processes described above are an important part of the proposed Project and it is not clear why numerical modelling results and a sensitivity analysis for the above processes was not presented.</p> | <p>1. Explain why 3D hydrogeology and contaminant transport numerical modelling of the injection and extraction wells was not presented.</p> <p>2. Alternatively, provide simulation results and a sensitivity analysis for the injection and extraction of the acidic solution in the mining area.</p> | |
| IR-53 | CNSC | Geology and Groundwater | Section 7.3, Table 7.3.-2 Appendix 7-C | <p>Context: The field-based hydraulic conductivity values (referred to as K values hereafter) in Table 7.3-2 (p. 7-32, main EIS report) indicate that the K value ranges of upper and lower sandstone aquifers have a significant overlap with those of the intermediate sandstone aquitard.</p> <p>However, the calibrated K value in Table 2-2 (p. 2.7, Appendix 7-C)) for the intermediate sandstone aquitard is close to the lower end of the field-based K value range, while the calibrated K values for the upper and lower sandstone aquifers are close to the upper end of the field-based K value range.</p> <p>Rationale: It is not clear how representative the calibrated K values are of the field-based K values for each hydro-stratigraphic unit, and if the significant difference between the K values for the upper and</p> | <p>Please provide additional information to support the representativeness of the calibrated K values (for example, use graph to present the measured K values and the calibrated K values).</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|---|---|---|------------------|
| | | | | <p>lower sandstone aquifers and those for the intermediate sandstone aquitard is supported by the geological properties of the corresponding stratigraphy units.</p> <p>It is stated in the report (p. 7-36, main EIS report) that “Vertical fracture or fault zones that hydraulically connect the Local (upper) and Semi-Regional (lower) groundwater flow regimes are present throughout the Athabasca Basin”. But fractures and fault zones are not explicitly considered in the model. There is possibility that these features could increase the hydraulic connection between the upper and lower sandstone aquifer.</p> | | |
| IR-54 | CNSC | Geology and Groundwater | Section 7.3.1 | <p>Context: EIS states: “The most important associated topographic features in the region are the northwest to southeast trending drumlins and eskers....” This is not the trend shown on the provided maps, nor described elsewhere in the report, e.g., Section 7.3.2.1</p> <p>Rationale: Inaccurate information in the EIS</p> | Please update the EIS where required to accurately describe the topographical features. | |
| IR-55 | NRCan | Fish and fish habitat | Section 7.3.3.1; Appendix 7-A, sections 3.4, 3.5, 3.8, 4.2; Appendix 7-C, section 2.8 | <p>Context: According to the proponent's conceptual hydrogeological model (EIS, sec 7.3.3, Figure 7.3-7, Table 7.3-2; Appendix 7-A, sec. 3.4, Table 3-4), the horizontal hydraulic conductivity of the Intermediate Sandstone (Iss) aquitard is 8.4 E-09 m/s based on field measurements. The proponent further assumes a 10:1 anisotropy ratio for the unit (Appendix 7-A, sec. 3.5.1) such that its estimated vertical conductivity is 8.4 E- 10 m/s. Based on this information, structural geology and groundwater quality data, the proponent concludes that the connectivity between the Upper sandstone aquifer and the Intermediate Sandstone aquifer (sic) is limited (EIS sec. 7.3.3.3; Appendix 7-A, sec. 4.4). While acknowledging the paucity of conductivity data and the proponent's attempt to mitigate this by leveraging collateral information on fracture frequency and clay content (Appendix 7-A, sec. 3.3.1), NRCan considers that the hydraulic conductivity assigned to the Iss aquitard is unrealistically low and inconsistent with the following lines of evidence: a) The conductivity value for the Iss is based on the geometric mean of 18 field measurements, 12 of which are from the same borehole (WR-695) located in the Gryphon zone, beyond the domain of the numerical model (Appendix 7-A, Appendix C, Table C-1). If the conductivity data were weighted equally, with one value per borehole, the geometric mean would be approximately 1.5 E-07 m/s, or two orders of magnitude higher; b) The proponent notes that vertical fracture or fault zones that hydraulically connect Upper and Lower aquifer systems are present throughout the Athabasca Basin including in the Phoenix area (EIS, sec. 7.3.3.2.2; Appendix 7-A, sec.3.8.1); c) The proponent notes that groundwater chemistry data (major ions) corroborate the presence of structurally controlled vertical hydraulic</p> | In the "Parameter Uncertainty Assessment" for the numerical groundwater flow model (Appendix 7-C, sec. 2.8), NRCan requests that the proponent develop a calibrated numerical model with an alternate conceptualization of the Intermediate sandstone as a "leaky" aquitard with a horizontal hydraulic conductivity on the order of 1 E-07 m/s and a much lower anisotropy ratio. This should involve modifying the model lateral boundary conditions to allow for groundwater inflow/outflow across the entire thickness of the Athabasca Sandstone Group rather than just the Lower Sandstone aquifer. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|--|--|--|------------------|
| | | | | <p>connections between the Upper and Lower aquifer systems (EIS, sec. 7.3.3.2.2, sec. 7.3.3.3; Appendix 7-A, 4.3.3); d) Groundwater chemistry data (Appendix 7-A, sec. 4.2, Table 4-1) also indicate the presence of detectable levels of "bomb" tritium (indicating recharge waters < 50 years old) in the Lower Sandstone Aquifer (GWR-025, GWR-008, GWR-033) and in the Iss (GWR-009, GWR-034), outside the area of U mineralization. This is also evidence of vertical hydraulic connection through the Iss. In summary, whereas the proponent conceptualizes the Iss as a very low-permeability unit with localized vertical hydraulic connection (WS Shear), NRCan interprets the Iss as a "leaky" aquitard with pervasive fracture-controlled and much higher vertical hydraulic conductivity.</p> <p>Rationale: The significance of NRCan's alternative interpretation of the Iss hydrostratigraphic unit is that deep groundwaters, including mining-impacted waters, may represent a greater proportion of baseflow discharge to Whitefish Lake than the 1% currently estimated in the proponent's groundwater flow model (EIS, sec. 7.4.2.1, p.7-51; Appendix 7-C, sec. 2.6.3).</p> | | |
| IR-56 | CNSC | Geology and Groundwater | Section 7.3.3.2 | <p>Context: It is stated in Section 7.3.3.2 (p. 7-37, main EIS report) that “Exploration boreholes drilled in the Phoenix area, where left unplugged, have the potential to provide preferential flow paths between the Overburden and Upper and Lower Sandstone Aquifers. Exploration holes were reportedly grouted approximately 10 to 20 m above and below the ore zone, resulting in open holes remaining throughout the overlying materials. These portions of the open holes may act as open conduits for groundwater flow through the 400 m of Athabasca Group Sandstone.”</p> <p>Rationale: It is not clear why the exploration boreholes have not been decommissioned.</p> | Please clarify why the exploration boreholes have not been decommissioned and the timeline to decommission the boreholes according to appropriate guidelines/procedures. If it is not decommissioned before the ISR operation, what is the potential impact of the unplugged boreholes on the mining solution migration? | |
| IR-57 | NRCan | Fish and fish habitat | Section 7.3.3.2 Appendix 7-A, sections 3.1.2 and 3.7 Appendix 7-C, section 2.5.2 | <p>Context: The proponent's conceptual model of groundwater flow in the Local Study Area (EIS, sec 7.3.3, Figure 7.3-7) involves an unconfined Upper system hosted by overburden and the Upper sandstone aquifer, and a Lower confined system hosted by the Lower Sandstone Aquifer. The Intermediate Sandstone aquitard acts as a confining unit. Vertical heads gradients are directed downwards west of the Phoenix deposit and upwards beneath surface water receptors including Whitefish Lake (EIS, sec. 7.3.3.2).</p> <p>Using head data from nested monitoring wells (Appendix 7-A, sec. 3.1.2, Table 3-1) the proponent calculates upward gradients in cluster WR-607, between the Lower Sandstone aquifer and the Upper Sandstone aquifer. In cluster LA-5, an upward gradient is calculated between the Upper Sandstone and the overburden unit (Appendix 7-</p> | In section 2.5.2 of Appendix 7-C (Calibration Results), the proponent should demonstrate that the numerical groundwater flow model reproduces quantitatively or at least qualitatively the vertical head gradients calculated from observations in the nested monitoring well clusters (Appendix 7-A, Table 3-1). | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-----------------------|--|---|--|------------------|
| | | | | <p>A, Table 3-5). In areas west and south-west of the Phoenix deposit, groundwater is estimated to flow downward under a vertical gradient of approximately 0.015 m/m (Appendix 7-A, p.3-15).</p> <p>Rationale: In NRCan's opinion, the proponent's interpretation of vertical head gradients in the LSA is not fully accurate. For the "Up-Gradient" monitoring well cluster, the tabulated head data (Appendix 7-A, Table 3-1) and data logger hydrographs (Appendix 7-A, Appendix B) indicate a downward gradient (0.014 m/m) from the overburden unit to the Intermediate Sandstone and an upward gradient (0.056 m/m) from the Lower Sandstone to the Intermediate Sandstone. Head data from the "NW" monitoring well cluster indicate a similar pattern of downward (0.016 m/m) and upward (0.014 m/m) gradients converging in the Intermediate Sandstone. In the "Downgradient" and "SE" monitoring well clusters, head observations and data logger hydrographs indicate downward gradients from the shallow aquifer system but essentially equal heads in the Intermediate and Lower Sandstones. This more complex picture of groundwater flow systems in the LSA does not appear to have been captured in the proponent's conceptual model. Given the importance of the baseline hydrogeological regime for predicting the transport and fate of COPCs in the post-decommissioning period, the proponent needs to demonstrate that the numerical groundwater flow model accounts for observed vertical head gradients.</p> | | |
| IR-58 | ECCC | Fish and fish habitat | Section 7.3.2.4, Ore Deposit | <p>Context: The Proponent states that the Phoenix ore bodies are long and narrow (approximately 25 to 50 m wide) and are located within or near a graphitic pelite unit. Hydrothermal alteration associated with the ore zone is a discontinuous envelope of clay alteration and a sulphide-cemented rock zone that extends into the overlying sandstone and the underlying basement (Figure 7.3-3). This black, clay-rich zone is approximately 3 m thick on average and locally hydraulically isolates the ore zone from the overlying sandstones and underlying weathered basement rock.</p> <p>Rationale: As indicated by the Proponent, a 3 m black clay rich zone isolates the ore zone from the overlying sandstones and underlying weathered basement rock. It is, however, unclear whether this discontinuous clay layer will prevent downward migration of uranium-bearing solution into the Paleo-weathered basement rock or horizontal flow along the unconformity surface to escape into the environment. Escape of uranium-bearing solution into the environment will have a negative effect on the receiving environment.</p> | <p>1. Verify that there will be no downward migration of mining solution into the paleo- weathered basement rock or that there is no flow along the unconformity surface.</p> <p>2. If downward migration of the mining solution occurs, explain how it will be mitigated.</p> | |
| IR-59 | CNSC | Fish and fish habitat | Section 7.4 Assessment of Project-related | <p>Context: Figure 7.4-2: Simulated Change in Groundwater Discharge and Flow through Whitefish Lake Over the Life of the Project appears to be missing information.</p> | <p>Please update this Figure to ensure it is complete, and that features are properly indicated in the legend.</p> | |

| | | | Effects, Figure 7.4-2 (p. 7-56) | Rationale: Legend is included below the image, but the Legend box is blank. The green dotted line is not represented by anything in the legend. | | |
| IR-60 | NRCan | Fish and fish habitat | Section 7.4.2.1 Appendix 7-C, section 5.2.1, Appendix B | Context: In the discussion of the limitations of the numerical groundwater flow model (Appendix 7-C, sec. 5.2.1), the proponent invokes the well known modeling principles of "Occam's razor" and "Parsimony" which guided the parametrization of hydraulic conductivity in model layers. The proponent states that hydrogeologic property values were applied uniformly for, among other units, the Lower Sandstone aquifer beyond the immediate area of desilicified materials. However, in the layer parametrization for the Lower Sandstone aquifer (Appendix 7-C, Appendix B, Figure B-5), NRCan notes a large zone of enhanced conductivity (1 E-05 m/s) extending south from Kratchkowsky Lake, which contrasts with the value (2 E-07 m/s) assigned elsewhere outside the desilicified zone. NRCan also notes the extremely detailed parametrization of hydraulic conductivity in the clay cap overlying the ore zone where borehole control is dense (Appendix 7-C, Appendix B, Figure B-6). Rationale: In NRCan's opinion, these model features appear to violate the principle of "Parsimony" and require greater justification supported by field observations. | NRCan requests that the proponent provide justification based on field evidence for the multiple hydraulic conductivity zones assigned to the Lower Sandstone aquifer and the clay cap above the ore zone. | |
| IR-61 | CNSC | Geology and Groundwater | Section 7.4.2 | Context: There is no discussion of potential induced seismicity from mining processes. Rationale: Induced seismicity may lead to a loss of process as identified for natural seismicity. | Please provide information on the potential mining-induced seismicity. | |
| IR-62 | ECCC | Fish and fish habitat | Section 7.4.2, Potential Project-related Effects | Context: The Proponent indicates that the mining area includes: <ul style="list-style-type: none">the 'active mining area', which is the target ore zone;a zone extending between 11 and 13 m above the active mining area that represents the maximum vertical height over which the injected mining fluids will migrate upwards from the ore zone during active mining; anda zone extending 50 m vertically upwards from the active mining area (that incorporates the active mining area and the 11 to 13 m zone defined in the previous bullet) that was selected to account for potential upset conditions. Rationale: It is not clear to ECCC how the Proponent would be able to limit the mining solution migration within 11 & 13 m above active mining as the maximum vertical height over which the injected mining fluid will migrate. As the mining fluid will be injected under pressure into zones with possible presence of fractures, the pressure may also cause additional fractures and given that the solution is warm/hot will | 1. Explain plans to limit the upward migration of mining solution into the overlying layer to 11 and 13m above the ore zone. 2. Explain what impacts will occur if the mining solution migrates beyond the predicted height. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------------|-------------------------|--|---|--|------------------|
| | | | | possibly dissolve the other cementing material in the sandstone above, making it difficult to accurately predict where the solution will migrate to. | | |
| IR-63 | CNSC | Geology and groundwater | Section 7.4.2.1, Potential Effect #1: Groundwater Quantity – Construction to Decommissioning Appendix 7-C, Section 2.7, Groundwater Conditions During Mine Operations | <p>Context: The numerical groundwater model described was calibrated to observed water level and stream baseflow data. Table 7.4-3 in the EIS indicates that Denison recognizes the potential for freeze wall operation to impact groundwater quantity. To simulate this impact, the model was adapted to reduce recharge (to 50%) within the freeze wall area, reduce hydraulic conductivity associated with the vertical freeze walls, and simulate pumping within the freeze wall area. Recovery from pumping and effects on discharge to groundwater discharge to Whitefish Lake are discussed in the potential effects section.</p> <p>Rationale: Although this assessment considered drawdown of the water table and discharge to Whitefish Lake, the discussion did not address the potential effects of operating the freeze wall on the local and semi-regional groundwater regimes. What would the pathway be for groundwater to pass around the freeze wall? What is the basis for the parameters selected, e.g., 50% recharge and lower hydraulic conductivity for freeze well? These factors need to be considered when evaluating the potential impacts of freeze well operations on groundwater flow conditions and corresponding receptors.</p> | Please provide a more fulsome discussion on the impact of freeze wall operations on local and semi-regional groundwater regimes and potential receptors. Please provide the rationale for assumptions made for key model parameters (e.g., selection of 50% recharge, hydraulic conductivity value used to represent freeze wall). In addition, please discuss the potential pathways for groundwater flow around the freeze wall, complete with figures demonstrating these pathways. | |
| IR-64 | ECCC CNSC | Fish and fish habitat | Section: 7.4.2.2, Potential Effect #2: Terrain Morphology and Stability – Operation Appendix 7-A, Appendix K (p. 12) | <p>Context: The Proponent stated that the geological assessment predicted maximum vertical displacement in altered sandstone immediately above the mining area (17.5 cm). A very minor change in elevation at ground surface (of less than 7.5 cm) was predicted within a discrete and localized area overlying the ore body. The modelling work is considered to provide a worst-case bounding scenario. If subsidence were to occur over the lifetime of the Project, or in the years following mining, the extent of vertical displacement is not expected to exceed that predicted in the modelling, which is based on an assumed volume extraction.</p> <p>Rationale: ECCC notes that the thickness of the ore zone has an average thickness of 5 m with a range of 2 to 17 m, and is 25-50 m wide and that the overburden rock above the ore zone measures about 400 m. Therefore, it is not clear how the Proponent determined that the surface expression of a subsidence on the surface if it occurs will be limited to 7.5 cm and localized. A subsidence greater than 7.5 cm, implies that the void in the ore zone will be narrower, and will affect the amount of water migrating through the zone.</p> | <p>Explain:</p> <ul style="list-style-type: none">Will this be revisited with updated data based on extraction feasibility results?How will the surface expression of a subsidence will be limited to 7.5 cm and localized? <p>Suggestions for mitigation and follow-up measures: ECCC recommends that the Proponent consider implementing remediation measures immediately after mining to prevent subsidence from occurring in the first place.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|---|--|--|------------------|
| | | | | It was the recommendation of the consultant who conducted the work in Appendix K that more accurate material properties should be used for future modelling. | | |
| IR-65 | CNSC | Geology and Groundwater | Section 7.4.2.2 | <p>Context: It is stated the maximum subsidence is 7.5cm based on modeling with an assumed volume extraction. Has subsidence from dewatering/pumping and from lack of inflow of groundwater due to freeze wall been considered?</p> <p>Rationale: Surface facilities and wells may be impacted if there is unaccounted for subsidence.</p> | Please provide additional details for any dewatering/pumping induced subsidence. | |
| IR-66 | CNSC | Geology and Groundwater | Section 7, Table 7.5-1, Row 1, Column 6 | <p>Context: Column 6 in Table 7.5-1 indicates the mitigation measures for a valued component. For Row 1, Geology, there is no description of mitigation measures but only that contingency plans will be developed if based on monitoring.</p> <p>Rationale: Subsidence may impact wells and surface infrastructure.</p> | Please provide additional details on monitoring and contingency plans related to the geological environment (e.g., subsidence), including triggers for implementing such plans. | |
| IR-67 | CNSC | Geology and groundwater | Section 7.6.2.1 (Remediation Objectives) | <p>Context: Metallurgical testing, including batch reaction, coreflood testing and column tests are mentioned frequently throughout Sections 2 and 7 of the EIS. Outside of the composition of restored solutions from coreflood tests #2B and 3C, results from these various tests are not reported in the EIS or any associated Appendices.</p> <p>Rationale: The results from metallurgical testing are important to a number of items discussed in the EIS, including (but not limited to): evolution of hydrochemistry during remediation, source of salts in Lower Sandstone Aquifer porewaters, process plans, industrial wastewater treatment, estimating composition and volume of process precipitates, and composition of mining fluids and leachate. In particular, the EIS posits that mining area decommissioning objectives are achievable based on metallurgical testing and provides these objectives in Table 2.3-3. CNSC staff need to understand the specifics of this metallurgical testing, given its importance for the development and justification for mining and remediation activities. Denison must also provide information demonstrating that the proposed restoration actions and remediation targets are As Low As Reasonably Achievable (ALARA).</p> | <p>1. Please provide a summary of the results and the analysis of results of the metallurgical tests within the EIS, or provide the technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS. This should include sample information for cores (e.g., mineralogy, location, U content, depth), test conditions (e.g., duration, # of iterations, column length, flow rate, temperature, pressure, sample frequency, influent/effluent composition), as well as results and how they are pertinent to the development of ISR activities.</p> <p>2. Please provide further clarification/justification on how results from two singular coreflood tests (i.e., Coreflood #2B and Coreflood #3C) can justify large-scale remediation activities and targets following solution mining.</p> <p>3. Please provide material demonstrating that the proposed restoration actions and remediation targets are ALARA.</p> | |
| IR-68 | NRCan | Fish and fish habitat | Section 7.6.2.2.3 Appendix 7-C, sections 3.3, 4.1, 4.4.4 and 4.7 | <p>Context: Sources terms for the COPCs considered in 3D reactive transport modeling are given by the composition of "Restoration Solution #1", which the proponent believes is representative of groundwater quality in the ore zone after remediation at decommissioning (Appendix 7-C, sec. 3.3, Table 3-5; sec 4.0). The proponent considers COPC source terms as "initial conditions" for groundwater quality in the ore zone at the start of the model simulation period. During the simulation, no</p> | NRCan requests that the proponent's reactive transport prediction uncertainty analysis (Appendix 7-C, sec. 4.7) consider extended source release periods for additional COPCs. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------------|--|--|---|---|------------------|
| | | | | <p>additional mass of COPCs is transferred to groundwater in the ore zone.</p> <p>Rationale: In NRCan's opinion, this representation of COPC sources is not conservative as it fails to account for various long-term slow mass release processes. These processes could include redissolution of secondary phases formed during ISR mining (e.g., radium-bearing gypsum or barite, jarosite, alunite) and migration of unrecovered lixiviant or restored solution from low-permeability regions or stagnant zones that were not fully swept during mining or remediation. NRCan notes that scenario #2 in the proponent's transport prediction uncertainty analysis (Appendix 7-C, sec. 4.7) does consider an extended source release period for protons (desorption from chlorite). However, in NRCan's opinion, additional modeling scenarios should consider extended-release periods for other COPCs as well.</p> | | |
| IR-69 | NRCan | Fish and fish habitat | Section 7.6.2.2.3 Appendix 7-C, sections 3.1 and 3.2 | <p>Context: For hydrogeological and geochemical assessments in support of ISR projects, the proponent identifies two aspects of primary importance (Appendix 7-C, sec. 3.1). These are a) groundwater remediation (Appendix 7-C, sec. 3.1.1); and b) the assimilative capacity of host rocks downgradient from the ore zone (Appendix 7-C, sec. 3.1.2). According to the proponent, the objective of groundwater remediation at decommissioning is to achieve water quality in the mined zone that does not pose a risk to receptors at the point of exposure. Assimilative capacity refers to the ability of groundwater-rock reactions to naturally sequester or attenuate COPCs migrating from the ore zone during the post-decommissioning period.</p> <p>Rationale: However, in NRCan's opinion, the proponent has neglected to mention the most fundamental aspect for hydrogeological and geochemical assessments in support of ISR projects. That aspect is the choice of ISR lixiviant and its effects on the mineralogy and hydrogeochemistry of the ore zone during mining operations. The proponent provides information on the pre-mining mineralogy (Appendix 7-C, sec. 3.2.1) and hydrogeochemistry (Appendix 7-C, sec. 3.2.2) but no information on their expected changes as a result of ISR mining. This Information is important when considering source terms in reactive transport modeling.</p> | NRCan requests that the proponent provide a detailed description of the expected mineralogical and hydrogeochemical changes occurring within the ore and barrier zones as a result of the injection of acidic lixiviant. | |
| IR-70 | CNSC ECCC | Fish and fish habitat Geology and groundwater | Section 7.6.2.2.3, Evaluation of Geochemical Reactive Transport Appendix 7-C, Section 4.4.2, Sub-Domain | <p>Context: The EIS indicates that “changes to hydrogeological conditions within the mining area were considered during development of the 3D sub-domain model. Dissolution of ore within the active mining area is expected to enhance ... hydraulic conductivity”.</p> <p>In Section 4.7 (Prediction Uncertainty Analysis), predictive uncertainty scenarios are provided. For scenario 7, the hydraulic conductivity (K)</p> | Please provide a more fulsome discussion on the anticipated impacts of mining on permeability of the ore zone due to mining activities in the EIS or in an Appendix. The value used for scenario 7 of the prediction uncertainty analysis should be provided. The scientific rationale for the use of a K value only a factor of five greater than the value assumed for the ore zone in the 3D regional model should | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|--|--|--|------------------|
| | | | Model Hydrogeologic Parameters | <p>of the ore zone was increased even further than initial model assumptions. The value used is not indicated in the text.</p> <p>Rationale: A hydraulic conductivity (K) value of 5x10-6 m/s, which is a factor of five (5) greater than the value assumed for the ore zone, was applied in the base case numerical model to account for this impact. It is unclear from the information provided in Section 7 of the EIS or associated Appendices what the basis of this five-fold increase in K value for the ore zone, and how this was judged to be conservative, or to adequately represent anticipated conditions. This parameter is important as it impacts the rate at which contaminants flow from the ore zone following mining activities. Due to the dissolution of uranium, larger voids will likely be created, and the hydraulic conductivity may increase by more than a factor of 5 compared to pre-project material. Therefore, a variation of at least one or two orders of magnitude for hydraulic conductivity should be used in the sensitivity analysis. Having a representative, conservative value for hydraulic conductivity is essential for understanding groundwater as a pathway of contaminant transport to Whitefish Lake and potential impacts to aquatic life. The K value used in the predictive uncertainty analysis should be reported.</p> | be provided, alternatively, provide simulation results for a more conservative scenario. Specifically, this discussion should address the potential effects of mechanical permeability enhancement with tools, dissolution of ore, gas plugging, chemical plugging, plugging due to ion exchange, and mechanical plugging. | |
| IR-71 | CNSC | Geology and groundwater | Section 7.7.1, Climate Change Considerations | <p>Context: The report states that in a scenario of increased precipitation and decreased/constant evaporation, climate change may result in greater flows in the Wheeler River drainage system and increased recharge to groundwater, which would correspond to increased groundwater discharge to Whitefish Lake. Additionally, it is also stated that climate change was evaluated qualitatively.</p> <p>Rationale: It is not clear why the impacts of increased evapotranspiration associated with higher average temperatures were not considered, even though these are likely outcomes of temperature increases due to climate change in areas such as the Prairies (Climate trends and projections - Canada.ca). It is also not clear why climate change considerations were not assessed quantitatively.</p> | Please provide a discussion on potential effects of increased evapotranspiration, as well as decreased groundwater recharge for the study area. Provide justification for performing qualitative assessment of impacts of climate change rather than a quantitative one. | |
| IR-72 | CNSC | Geology and groundwater | Section 7.8.2, Groundwater Monitoring | <p>Context: Monitoring seems to consider COPCs from surface facilities, and excursion of pumped mine fluid in the Lower Sandstone Aquifer. There does not appear any discussion on how the proposed monitoring program considers potential excursions of brine from freeze wells.</p> <p>Rationale: It is unclear how potential excursions of brine from freeze wells will be monitored. Would this be through the fiber optic cables installed within the freeze well network? Or would it be achieved in the monitoring well clusters? If this is the case, how would an</p> | Please provide further information regarding how potential excursions of brine from freeze wells will be monitored as part of the proposed groundwater monitoring program. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|---|---|---|------------------|
| | | | | excursion of brine from a freeze well be differentiated from an excursion of mining solution? | | |
| IR-73 | CNSC | Geology and groundwater | Section 7.8.2.2, In Situ Recovery Mining Area Appendix 7-A, Appendix C | <p>Context: The EIS recommends that a follow-up study be carried out to supplement available data on hydraulic conductivity in the Desilicified Zone (DSZ).</p> <p>Rationale: Appendix C (Summary of Hydraulic Testing Data and Conductivity Values) of Appendix 7A indicates that only n = 6 hydraulic conductivity values are available for the DSZ, one of which appears unreliable due to a problem with packer sealing. This is relatively few values compared to the Intermediate and Lower Sandstones. Additionally, limited hydraulic head data from boreholes screened in the DSZ is available (GWR-037, GWR-012 and GWR-014; See Figures 16/17 in Appendix 7-A) – most information appears to originate from open core holes. The information presented in its current form is insufficient considering the importance of this zone as a preferential pathway for contaminants following remediation activities, and the heterogeneity of the unit due to intense hydrothermal alteration and fracturing. Further information regarding hydrogeological properties and groundwater flow would aid greatly in validating and refining the numerical groundwater model.</p> | As per the EIS recommendations, please provide additional information to supplement available data on hydraulic conductivity in the DSZ. Please provide the following information as part of the follow-up study: | |
| IR-74 | CNSC | Geology and Groundwater | Section 7.8.2.3 | <p>Context: It is stated in Section 7.8.2.3 (p. 7-113, main EIS report) that, at the Post-Decommissioning Stage, “Excursion are signaled by a change in water quality that is outside of that bounded by modelling predictions”, and “The model predictions spatiotemporally bound COPC concentrations in the subsurface that do not pose a risk to the receiving environment. Water quality that is outside of this bounding is defined as representing a material increase over a meaningful period compared to the predicted values either in rate of change or magnitude of change of COPC concentrations.”</p> <p>Rationale: It is not clear in which locations (e.g., is it in the mining area, or downstream of the mining area, or anywhere else?) the water quality is used to compare with the model predictions to determine if excursion occurs.</p> | Please clarify in which locations the water quality data is used to compare with the model predictions to determine if excursion occurs. | |
| IR-75 | CNSC | Geology and Groundwater | Appendix 7-A, Appendix K | <p>Context: The geomechanical study showed that the stability of the remnant ore zone and surrounding rock mass is highly sensitive to the magnitude of the material properties. To quantify this risk, the proponent conducted a sensitivity analysis to assess the influence that material properties have on the stability of key stratigraphic layers. The results of the sensitivity analyses suggest that small variations in the cohesion magnitude and angle of internal friction may significantly influence the stability of the altered sandstone, ore zone, and upper and lower clays.</p> | Please provide a plan to implement recommendations for further detailed geomechanical studies to reduce the uncertainties and risks in association with the stability and deformation analyses of ore zone rock matrix and its overlying rock mass formations and assess their impacts on the mine operation. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------------|--|--|--|--|------------------|
| | | | | Rationale: By considering the potential uncertainties and risks in association with the geomechanical study and the empirically derived rock mass strength parameters and the non-site specific physical parameters of different rock formations used for the modeling, the proponent’s consultant suggests to define a laboratory testing program to address data gaps in the current geotechnical data and increase confidence in the material properties, and use more accurate material properties to model the phased extraction of uranium-enriched rock and assess the associated risks for cavity collapse and failure in the steel casing. CNSC staff concurs with these suggestions. | | |
| IR-76 | CNSC | Geology and Groundwater | Appendix 7-A, Appendix K (p. 12) | Context: Based on the consultant’s report, the modeled vertical strain is approaching or exceeding the tensile and compressive yield limits for steel casing. Rationale: Failure of steel casing may result in process loss or alter groundwater flow and quality. | Please provide additional details on how casing integrity will be monitored and potential effects mitigated. | |
| IR-77 | CNSC | Geology and Groundwater | Appendix 7-A, Appendix K Results of a Geomechanical Study Investigating the Influence of Uranium Extraction on Mining-Cavity Stability for the Wheeler River Uranium Project (Revision 1) | Context: It is reported in the appendix K report, within Appendix 7-A, that both phase I scoping analysis and phase II detailed strip model were investigated by numerical modelling. The analysis discussed influence on host rock stability as a result of incremental increase in volumetric extraction and graded conservative treatment of material properties. Rationale: As critical components of a numerical geomechanical simulation, initial and boundary conditions are crucially important to the confidence and reliability of the modelling results. However, this information is absent from the current report. In-situ principal stresses largely affects the stability of the excavated host rock, and the vertical strain and surface subsidence. This information is also absent in current form. | Please provide details on the boundary and initial conditions applied on stress loading and strain for the numerical analysis. In particular, the in-situ principal stresses, which are critical to correct understanding of the excavation disturbance to the host rock, should be provided and justified as appropriate. | |
| IR-78 | CNSC ECCC | Fish and fish habitat Geology and groundwater | Appendix 7-A, Section 3.5.2, Porosity Appendix 7-C, Section 2.3.2.1, Porosity Values | Context: This section of the report outlines the estimated/assumed effective porosity values. The only reference provided is for permeameter testing on rock core samples (Scibek, 2019). Additionally, the report states that “As tracer test results to estimate effective porosity were unavailable at the time of modelling, effective porosity values for the sandstone bedrock and basement units were sourced from literature values”, where literature values are effective porosities from the Cigar Lake study (AECL, 1994), situated approximately 40 km NE of Wheeler River. No on-site Wheeler River field data was used to justify this value. Additionally,, in the Cigar Lake study, the authors reported that, because results from tracer tests and pumping tests were unavailable, “a practical approach was adopted, | 1. Please provide the reference for the data substantiating the assumed effective porosity values reported in Appendix 7-A, and used in the numerical model in Appendix 7-C. 2. Please provide information on how the site-specific effective porosity values from tracer tests or pumping tests, were considered in the numerical models. Section 2.2.1.4 of the EIS asserts that tracer tests were carried out in 2021 – this information should thus be available for improving/updating models. Alternatively, provide a sensitivity analysis for the effective porosity in the | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|--|---|--|------------------|
| | | | | <p>i.e., to use the porosity values obtained from laboratory measurements made on core samples, and to assume that those numbers were close to the average field kinematic (effective) porosity values”.</p> <p>Rationale: The source of reported effective porosity values is unclear from Section 3.5.2 in Appendix A (e.g. literature review, field work, laboratory work).</p> <p>In Section 2.3.2.1 of Appendix 7-C, there is a lack of clarity regarding the effective porosity data used in the numerical model. It appears that no site-specific data derived from tracer tests or pumping tests is used in the numerical model. Given the that effective porosity directly correlates to seepage velocity and by extension transport time and distribution of COPCs in groundwater, it is an important parameter. Given its relative importance for contaminant fate and transport, effective porosity should be based on field measurements, or at the very least accounted for in the sensitivity analysis.</p> | Desilicified Zone, or contaminant transport simulation results with more conservative effective porosity values. | |
| IR-79 | CNSC | Geology and groundwater | Appendix 7-A, Section 4, Groundwater Chemistry | <p>Context: Table 4-1 in Section 4 of Appendix 7-A provides groundwater monitoring results from sampling activities carried out at 26 monitoring wells in 2019, 2020, and 2021. The majority of these wells were only sampled once (n = 8) or twice (n = 17). In some cases (Lower Sandstone Aquifer/Intermediate Sandstone Aquitard), the variability of results between sampling events is quite high. Data for the Paleoweathered Zone is sparse.</p> <p>Rationale: Insufficient information is presented in the EIS and associated Appendices to concretely define baseline groundwater chemistry for the different hydrostratigraphic units. As defined in the CNSC’s Generic Guidelines for the Preparation of an EIS: “Based on the scope of the project, the EIS will present sufficiently detailed baseline information to determine the effects the project could have on the VCs and analyze those effects”. This is particularly important given certain features of the study area (i.e., presence of zones of thermal alteration/desilicification, as well as hydraulically active fractures/faults), and the need to adequately characterize baseline conditions in the Desilicified Zone downgradient from the proposed mining area. As an example, the US Nuclear Regulatory Commission (NRC) typically requires a minimum of four (4) quarterly samples from (i) surficial aquifers, (ii) production aquifers, (iii) overlying aquifers, and (iv) underlying aquifers to characterize preoperational groundwater quality (E. Striz, pers. comm.).</p> | Please provide the statistical basis (number of samples and variability) by which “baseline” is defined and the justification that the current information is sufficient to adequately characterize groundwater quality. In order to ensure sufficient baseline information is collected, further iterations of sample collection for groundwater monitoring wells in all defined hydrostratigraphic units may be required. In addition, groundwater quality downgradient from the proposed mining area should be further characterized to assess spatial influence of alteration and hydraulically active features, | |
| IR-80 | CNSC | Geology and groundwater | Appendix 7-A, Section 4.3.3, Hydrochemistry | <p>Context: This section provides data for groundwater samples collected during the Cigar Lake analogue study and Millennium Project for further regional context. The previous studies are heavily referenced</p> | Please provide additional clarity to and interpretation of Figure 26 in Appendix 7-A, including a revision to the Figure to allow for easier interpretation. This could include | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|---|--|---|------------------|
| | | | by Hydrostratigraphic Unit | <p>to support interpretations made for the conceptual site model.</p> <p>Rationale: The Piper Plots in Figure 26 are difficult to interpret (many overlapping circles with variegated colors), and Cigar Lake samples plot predominantly as Na/K-Cl/SO4 groundwater facies. Conversely, samples collected as part of the Phoenix Project (current), plot either as Ca-HCO3 or Ca-SO4/Cl groundwater facies. No explanation is provided for the observed hydrogeochemical differences between groundwater from the Phoenix project and the Cigar Lake analogue study/Millennium Project.</p> | clear identification of end members, as well as arrows indicating proposed evolution of groundwater chemistry. Further discussion should be provided describing observed differences between groundwater chemistry at the Phoenix project compared to Millennium/Cigar Lake. | |
| IR-81 | CNSC | Geology and groundwater | Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit | <p>Context: The report states in the description of hydrochemistry of the Lower Sandstone Aquifer that, “On the basis of groundwater chemistry and tritium values in that groundwater, the authors (of the Cigar Lake analogue study in 1994) concluded that the groundwater reflected a younger water component that had penetrated to depth along hydraulically active fractures/faults. The same conclusion is made here (in the Wheeler River EIS) for the Phoenix study area – meaning that fracture/fault conditions are such that some areas of the MFa are characterized by younger/recharge groundwaters”.</p> <p>Rationale: Tritium results for most wells in the Lower Sandstone Aquifer (MFa) reported in Table 4-1 of Appendix 7-A exhibit tritium concentrations <15 Bq/L for the 2020 sample, and 0.1 or <0.1 Bq/L for the 2021 sample. Tritium in modern precipitation typically varies from 1 – 3 Bq/L. Conclusions made in the text are not supported by data, especially given that tritium values are not reported in the EIS for local precipitation or surface water. This is important in reinforcing the assumption from the conceptual model that modern meteoric water circulates at depth in the Lower Sandstone Aquifer.</p> | Provide a further discussion on the interpretation of tritium in groundwater, rather than echoing conclusions from the Cigar Lake analogue study. Consideration should be given to the assertion that modern meteoric water circulates at depth in the Lower Sandstone Aquifer. Collection and analysis of stable isotope (e.g., δ2H, δ18O) samples is a cost-effective solution which would greatly improve understanding of groundwater hydrology and support the development of a conceptual model. | |
| IR-82 | CNSC | Geology and groundwater | Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit Appendix 7-C, Section 3.5 | <p>Context: A. In-field measurements of Oxidation-Reduction Potential (ORP) for three (3) out of twenty-six (26) groundwater samples are presented in Table 4-1 of Appendix 7-A. Although sparse, these values are also used to characterize redox conditions for representative groundwaters in Table 3-5 of Appendix 7-C.</p> <p>B. In Section 3.5.5 of Appendix 7-C it is stated that groundwaters in the PHREEQC model were allowed to equilibrate with atmospheric concentrations of oxygen, resulting in oxidizing subsurface conditions. In Section 3.7 of Appendix 7-C it states that input files for 3D reactive transport were generated based on outcomes for PHREEQC modelling. However, in reading Section 4 of Appendix 7-C, it is unclear whether this assumption (equilibration with atmospheric oxygen) was carried forward for the 3D model.</p> <p>C. As per p. 3.49 of Appendix 7-C, “A small amount of reactive pyrite</p> | <p>1. Provide further discussions and information (i.e., ORP measurements or analytical data for redox couples) on redox conditions at the Phoenix site. Particular focus should be given to the spatial heterogeneity of redox processes. Tools such as the reference provided [2] below provide an example of simplified framework for characterizing redox conditions in aquifers.</p> <p>2. Clarify assumptions regarding initial redox conditions for the 3D solute transport model.</p> <p>3. Provide the % reactive pyrite by weight assumed for models in the text. Justification for proportions used, such as analytical data, should also be provided.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|--|--|---|------------------|
| | | | | <p>was assumed for the first 500 m of transport away from the ore zone in the model, primarily in the desilicified sediments of the Lower Sandstone Aquifer, and deeper portion of the Intermediate Sandstone Aquitard”.</p> <p>Rationale: A. Given the importance of redox conditions for U mobilization and precipitation/dissolution of minerals (e.g., pyrite/metal oxyhydroxides) and the corresponding influence on contaminant transport from both a modelling and monitoring perspective, these should be further characterized. It should also be noted that the measurement of Oxidative-Reductive Potential (ORP) in natural waters can be complex and difficult due to the variability and disequilibrium of natural systems and issues inherent to electrode calibration (e.g., Schuring et al., 2000). Measurements of redox couples (e.g., As(III)/As(V); Fe(II)/Fe(III); S(-II)/S(VI)) are typically recommended to accurately characterize redox conditions in natural waters (Schuring et al., 2000).</p> <p>B. The assumptions regarding redox conditions for the 3D solute transport model should be clarified.</p> <p>C. The amount of pyrite (e.g., % by weight) assumed for the purposes of modelling should be clarified, given the potential role of pyrite as a reducing agent in limiting the transport of COPCs.</p> <p>Reference: [1] Schuring J.; Schulz, H. D.; Fischer, W.R.; Bottcher, J.; and Duijnisveld, M.H.W. 2000. Redox: Fundamentals, Processes and Applications. Springer: Berlin.</p> | <p>Reference: [2] Jurgens, B.C., McMahon, P.B., Chapelle, F.H., and Eberts, S.M., 2009, An Excel workbook for identifying redox processes in ground water: U.S. Geological Survey Open-File Report 2009–1004 8 p.</p> | |
| IR-83 | CNSC | Geology and Groundwater | Appendix 7-A, Section 7.4.2.2 and Appendix K | <p>Context: Leaching of uranium from the ore zone will generate voids within the ore zone, which could fail and collapse. Failure of the voids would cause displacement in overlying rocks, which will lead to the eventual ground subsidence. Based on the developed geological model, a geomechanical study was conducted to assess potential maximum vertical displacement in the overlying rock formations and predict the ground subsidence. While a layer of altered sandstone is modeled above the ore zone, the desilicified zone, a zone that is comprised of completely to partially unconsolidated sands and has very low rock quality, high fracture intensity, and high friability, and low strength in the area overlying and east of the Phoenix deposit, appears not to have been included in the model for geomechanical modeling. The evaluated displacement/deformation in the overlying rock formation and the resulted ground subsidence would not be conservative without including the desilicified zone.</p> <p>Rationale: Stability of the ore zone rock matrix and the potential</p> | <p>Please provide details whether and how the desilicified zone is considered in the geomechanical modeling of the detailed strip model. Such details should include figures and the linkage between the geomechanical model including the determination of strength parameters of the desilicified zone and the geological model including information on the core delineation of the desilicified zone.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|--|--|---|------------------|
| | | | | displacement/deformation in the overlying rock formations when voids in the extracted ore zone collapse are critical for protecting the overlying aquifers, preventing substantial ground subsidence, safeguarding casing integrity, and mitigating plug-off of the remaining ore as well as efficiently mining extraction. The deformed zone in the overlying rock formations will change in hydraulic conductivity that will impact on the assessment of potential effects on groundwater flow and contaminant transport in the zone. Therefore, the rock mass behavior including and above the ore zone should be adequately understood and the potential displacement/deformation should be assessed and quantified with adequately defined geological model. | | |
| IR-84 | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: It is stated in Section 2.5.2.4 (p. 2.35, Appendix 7-C) that “In addition to calibrating to water level elevations targets, the model was calibrated to estimates of groundwater discharge to Whitefish Lake. A match between simulated and observed flows helps to support that groundwater recharge rates are reasonable, and to provide validation for water budget assessments. Baseflow calibration targets were developed using point streamflow measurements collected upstream and downstream of Whitefish Lake. Figure 2-10 (p. 2.26, Appendix 7-C) shows the locations of the baseflow calibration targets, and Table 2-7 (p. 2.35, Appendix 7-C) illustrates the model-simulated groundwater discharge rates in relation to the estimated range of baseflow from stream measurements. The simulated baseflow to Whitefish Lake is in good agreement with the estimated representative baseflow”.</p> <p>Rationale: It is not clear in Figure 2-10 (p. 2.26, Appendix 7-C) where the point streamflow measurements were conducted upstream and downstream of Whitefish Lake. Additionally, it is not clear how the groundwater discharge to Whitefish Lake is simulated, since the model domain does not cover the whole Whitefish Lake.</p> | 1) Please clarify in Figure 2-10 where the point streamflow measurements were conducted upstream and downstream of Whitefish Lake. 2) Please clarify how the groundwater discharge to Whitefish Lake is simulated considering that the model domain does not cover the whole Whitefish Lake. | |
| IR-85 | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: Section 2.7.3 (Appendix 7-C) mentions Wells A, B and C, and Figure 2-17 (p. 2.43, Appendix 7-C) illustrates the predicted drawdown ranges at Well B and Well C.</p> <p>Rationale: It is not clear where Well A, Well B and Well C are located.</p> | Please provide the locations of Well A, Well B and Well C illustrated in a Figure. | |
| IR-86 | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: It is stated in Section 2.7.3 (p. 2.41, Appendix 7-C) that “Both the pumping demand and the recharge changes were incorporated into a transient simulation performed using the calibrated groundwater flow model. The model simulation was started at the beginning of mine construction, with initial conditions taken from the calibrated model. The simulation period was extended for 40 years to include the entire period of construction, operation, and decommissioning, and extending through 17 years post decommissioning”.</p> | Please clarify the parameters, boundary conditions and any other aspects as used in the transient model that are different from the calibrated model. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|--|--|--|------------------|
| | | | | Rationale: It is not clear what is the difference between the calibrated model and transient model in terms of parameters (such as the K values for the mining zone), boundary conditions, etc. | | |
| IR-87 | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: In Section 2.8 (p. 2.45, Appendix 7-C) Parameter uncertainty assessment, only parameters for certain zones (part of each specific hydro-stratigraphic unit as shown in Figure 2-19, p. 2.46, Appendix 7-C) related to the pathway from the ore zone toward Whitefish Lake were allowed to vary in order to find combinations of parameter values that met statistical calibration criteria. If each hydro-stratigraphic units within the whole model domain were treated as parameter zones that can have varied hydraulic conductivity values, a different combination of parameter values could be obtained that meet statistical calibration criteria too.</p> <p>Rationale: The parameter values for parameter zones between the mining area and Whitefish Lake is important in determining the hydraulic connection between the mining area and Whitefish Lake. Parameter values in other parameter zones could also be important. For example, if the K values for the intermediate sandstone aquitard are significantly larger than in the current calibration results, the interaction between the upper sandstone aquifer and the lower sandstone aquifer could be more active, and the mined-out zone could be more active hydraulically and groundwater in the minded-out zone could have a shorter residence time than in the current calibrated model.</p> <p>Additionally, it is noted that Figure 2.19 (p. 2.46, Appendix 7-C) illustrates the parameter zone for the intermediate sandstone aquitard. However, Figure 2.20 (p. 2.49, Appendix 7-C) did not include the intermediate sandstone aquitard in the results.</p> | It is recommended that the parameter zones in the Parameter uncertainty assessment include hydro-stratigraphic units in the whole model domain to investigate the possible combination of parameter values that could make the groundwater in the mined-out zone more active hydraulically. | |
| IR-88 | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: The conceptual hydrogeological model includes upper sandstone aquifer, intermediate sandstone aquitard, and lower sandstone aquifer. The desilicified zone above the ore zone have enhanced hydraulic conductivity. The boundary condition for the lower sandstone aquifer on the west (upstream) side was assigned to have specified head, which provide source of water for the lower sandstone aquifer.</p> <p>As a result of the conceptual model setup, the upper sandstone aquifer is hydraulically active and the groundwater residence time within the upper sandstone aquifer is relative short. In contrast, the lower sandstone aquifer (and the ore zone) is hydraulically inactive, and the groundwater residence time in the lower sandstone aquifer is relatively long (as shown in the particle tracking results in Figure 7.6-2</p> | It is recommended to conduct the following work to demonstrate if the mined-out zone is hydraulically active: <ol style="list-style-type: none">Determine the groundwater residence time in the lower sandstone aquifer and compare it with the simulated residence time in the numerical model.Conduct additional particle tracking to demonstrate where groundwater originating from the mined-out zone flow towards (forward tracking) and where groundwater flowing towards the mined-out zone originates from. This would help determine why groundwater in the mined-out zone is not hydraulically active. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|----------------------|--|--|---|------------------|
| | | | | <p>(p. 7-71, main EIS report), and the simulated plume for chloride in Figure 7.6-7(p. 7-86, main EIS report)).</p> <p>It is stated in Section 2.6.4 (Appendix 7-C) that “As noted above in section 2.6.3, it is estimated that 99% of the groundwater discharge to Whitefish Lake is derived from groundwater that has only flowed through shallow deposits (i.e., Overburden and Upper Sandstone Aquifers). Contribution of deep groundwater flow through the Desilicified Zone within the Intermediate Sandstone Aquitard is estimated to be < 1% of the groundwater discharging to Whitefish Lake”. This simulation result is reflective of the conceptual model.</p> <p>Section 7.3.3.3 (p. 7-42) states that “The Lower Sandstone Aquifer is characterized spatially by two types of groundwater. The first groundwater type is most like that observed in the Local Flow System. This reflects hydraulically active fractures and fault systems that allow fresh recharge water to penetrate and mix with deeper waters in the aquifer. The second type of groundwater is within the zone of thermal alteration around the ore zone”.</p> <p>The hydraulic connectivity of the ore zone with the upper sandstone aquifer has important implication on the groundwater restoration. The ore zone is not hydraulically active locally because it is enclosed by a clay zone before the mining operation. But if it is located within a hydraulically active area, or on a groundwater flow pathway that is hydraulically active, the mined-out zone (with much larger porosity and hydraulic conductivity) could become active hydraulically after mining operation is finished.</p> <p>Figure 7.6-7 (p. 7-86, main EIS report) shows that the chloride plume is most persistent within the mined-out mining area. This seems to indicate the mined-out zone is hydraulically inactive after the mining operation is finished.</p> <p>It is stated in Section 7.3.3.2 (p. 7-37, main EIS report) that “Exploration boreholes drilled in the Phoenix area, where left unplugged, have the potential to provide preferential flow paths between the Overburden and Upper and Lower Sandstone Aquifers. Exploration holes were reportedly grouted approximately 10 to 20 m above and below the ore zone, resulting in open holes remaining throughout the overlying materials. These portions of the open holes may act as open conduits for groundwater flow through the 400 m of Athabasca Group Sandstone.” So, there is possibility that the unplugged borehole could increase the hydraulic connection between the upper and lower sandstone aquifer.</p> <p>Rationale: It is important to understand if the larger area containing</p> | <p>3. Conduct sensitivity analysis to investigate the effect of higher K values for the intermediate sandstone aquitard and the K and porosity values of the mined-out zone on the plume migration.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-----------------------|---|---|---|------------------|
| | | | | <p>ore zone is hydraulically active. Additional confidence would be gained if there is any other evidence that support that the area containing the ore zone is not hydraulically active, and groundwater residence time in the lower sandstone aquifer surrounding the ore zone is comparable with the simulated results.</p> <p>Table 2-4 (p. 2.16, Appendix 7-C) shows the effective porosity (0.01-0.05) of the ore body. Figure B7 (p. B.8, Appendix 7-C) shows that the calibrated K values for the mined-out zone is 1x10-6 m/s. Section 3.5.2 (p. 3.24, Appendix 7-C) states that “The same average linear velocity was assumed for the mining area (source zone), following from the discussion in Section 4.4.2, where the hydraulic conductivity value in this zone following mining was set to 5x10-6 m/s, and a porosity of 0.2 is assumed for the ore zone (Table 4-2)”. It is not clear what the justification is for the selection of the porosity and K values for the mined-out area, and whether they are conservative. It is also not clear, what the potential impact on the groundwater flow and COPCs transport would be If the mined-out zones collapse.</p> | | |
| IR-89 | ECCC | Fish and fish habitat | Appendix 7-C, Numerical Modelling: Post- Decommissioning Evaluation, Section 2.3.1.4, Desilicified Zone | <p>Context: The Proponent states that a hydraulic conductivity value of 5x10-6 m/s was uniformly assigned to the model layers representing the Desilicified Zone. They additionally state that this value is consistent with packer and pumping tests screened in this unit that have interpreted hydraulic conductivity values ranging from 1x10-6 to 3x10-5 m/s (Appendix C), with a geomean of 6.0x10-6 m/s.</p> <p>Considering that the Desilicified Zone is of particular interest because it is the main pathway for the COPC to reach Whitefish lake, and that hydraulic conductivities are not entirely understood, ECCC recommends that a larger range of hydraulic conductivities be simulated to understand potential effects on fish and fish habitat.</p> <p>Rationale: The Desilicified Zone is a critical layer in the hydrogeological model as it represents a key potential pathway of contaminants to Whitefish Lake. The base case hydraulic conductivity value (5x10-6 m/s) is even lower than the geometric mean, not to mention the highest value found. When simulating geochemical processes and contaminant transport within this important pathway a more conservative approach should be employed. Modifying this parameter will affect travel times and distribution of COPC in the subsurface.</p> | <p>1. Provide an in-depth rationale for choosing a value of 5x10-6 m/s as the base case for the hydraulic conductivity, in both the PH REDox EQUilibrium (PHREEQC) and Finite-Element Ground Water Flow (FEFLOW) models.</p> <p>2. Provide a rationale for keeping the sensitivity analysis within one order of magnitude considering the lack of physical data on the Desilicified Zone. Alternatively, provide contaminant transport simulation results with more conservative hydraulic conductivity (e.g., more than 3x10-5 m/s) values in the Desilicified Zone.</p> <p>See also related: IR-96.</p> | |
| IR-90 | ECCC | Fish and fish habitat | Appendix 7-C, Section 2.4 and 2.6 | <p>Context: Hydraulic conductivities and hydraulic gradients play an important role in groundwater flow, geochemical modeling, and contaminant transport for the PHREEQC and FEFLOW models. Although there is an important vertical component to the</p> | <p>1. Explain if the vertical and lateral hydraulic gradients and hydraulic conductivities are assumed to be equivalent.</p> <p>2. Provide a rationale for not distinguishing between vertical and lateral hydraulic gradients.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|--|--|---|------------------|
| | | | | <p>contaminant transport, there is no distinction made between lateral and vertical hydraulic conductivities of hydraulic gradients.</p> <p>Rationale: According to the conceptual model, there is an important vertical aspect to the groundwater flow thus incorporating any vertical hydraulic gradient or hydraulic conductivity information into the calibration would increase confidence in the results.</p> <p>Providing a distinct value for vertical hydraulic conductivity will improve the accuracy of the model in regards to the transport of contaminants to Whitefish Lake through the Desilicified zone, which is important to understand potential impacts to aquatic life.</p> | <p>3. Alternatively, provide both lateral and vertical hydraulic gradient estimates and the implications on contaminant transport.</p> | |
| IR-91 | NRCan | Fish and fish habitat | Appendix 7-C, section 2.5.2 | <p>Context: The numerical model calibration quality plot (Appendix 7-C, sec. 2.5.2.1, Figure 2-13) contains a small error. The vertical (simulated heads) and horizontal (observed heads) axes do not have the same scales (499 to 521 masl versus 499 to 522 masl). Therefore, the line of ideal fit is offset.</p> <p>Rationale: As a result, NRCan notes that observed heads in the 510-512 masl range are underpredicted by the model. NRCan also notes that the calibration statistics (Appendix 7-C, sec.2.5.2.3) are highly leveraged by two data points from open boreholes south of Kratchkowsky Lake where simulated values are largely controlled by the nearby constant-head boundary in the Lower Sandstone aquifer (520 masl).</p> | <p>The proponent should correct the scales on the axes of Figure 2-13 in Appendix 7-C. The proponent should also comment on the effect on calibration of the clustering of most observation wells in the ore zone.</p> | |
| IR-92 | CNSC | Geology and groundwater | Appendix 7-C, Section 3.2.1, Mineralogical Composition | <p>Context: Table 3-2 summarizes the clay content of the Athabasca Group sandstones and the Paleoweathered Zone. Although minimum, maximum and median values are provided, the number of samples and variability of the dataset are not. Rationale for incorporating illite into reactive transport modelling and excluding kaolinite/dichlorite is provided in the text.</p> <p>From p. 3.29 in Appendix 7-C: “The illite content was based on the normative clay composition determined from site-specific corehole elemental analysis (median illite by mass is 7.68%; Table 3-2) and using portable infra-red mineral analysis indicating median illite content by mass is 13.1% (data not shown)”</p> <p>From p. 3.30 in Appendix 7-C: “Using the minor amount of illite compared to the more dominant chlorite is conservative in that not all sorptive capacity of the clays is accounted for in the simulated paleoweathered zone”. This conservative assumption appears contrary to assumptions for the desilicified zone (DSZ) and Athabasca Group sandstones “Illite was used to represent the total clay content,</p> | <p>1. Please provide in Table 3- the number of samples and variability of the datasets used to estimate the clay content of hydrostratigraphic units for the model. Include results from infrared mineral analysis in the text if the information is used to support assumptions for modelling.</p> <p>2. Please provide further information/discussion within the EIS relating to the assumptions of clay content in hydrostratigraphic units for modelling. Provide further justification and rationale as to why total clay content in the Athabasca Group sandstones and Desilicified Zone is assumed to be illite, and how this assumption is conservative. This discussion could include a comparison of the properties (cation exchange capacity, surface area) of illite vs. kaolinite vs. dichlorite for the anticipated range of subsurface conditions (pH, redox, U concentrations, etc.).</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|---|---|---|------------------|
| | | | | <p>which varies from 1.74% to 5.85% by mass in the hydrostratigraphic units within the Athabasca Group sandstones and Desilicified Zone”.</p> <p>Rationale: Information is missing in the EIS regarding the clay composition of hydrostratigraphic units. Results from infrared mineral analysis are not reported.</p> <p>The assumption for the solute transport model is that all clays in the downgradient DSZ are illite. However, clay content in the Read Formation (Lower Sandstone Aquifer) downgradient of the ore zone is low in illite (0.42%) compared to kaolinite (0.52%) and dichlorite (1.18%). A value of 3.9% illite clay by weight is used for the DSZ, but Table 3-2 indicates median content is 2.42% illite. It is not clear why illite was used to represent total clay content for the DSZ, as opposed to the conservative assumptions used for the Paleoweathered Zone, nor has any basis or justification been given.</p> | | |
| IR-93 | CNSC | Geology and Groundwater | Appendix 7-C, Table 3-10: Properties of Adsorbing Mineral Phases | <p>Context: In Appendix 7-C, section 3.5.6.2.2 Ion Exchange and Surface Complexation, the consideration of ion exchange and surface complexation and the corresponding parameters and chemical reaction are discussed.</p> <p>Rationale: The site density of sorbent Goethite was reported in Table 3-10 to be 1.6E3 mol/kg. Taking into account the specific surface area of 60 m2/g, this equals to 1600/6E4 mol/m2, or 0.0266 mol/m2, 1.6e4 sites/nm2.</p> <p>This value largely overestimates the site density of goethite, which is reported to be in the range of 2~6 sites/nm2. The reference used in the EIS report indicates the similar range of variation for this specific parameter.</p> <p>There are plenty of similar studies on SCM of iron oxides in literature. It is suggested to consult with more than one single study to enhance the reliability of model parameters.</p> <p>The overestimation of sorption site density will directly result in underestimation of the affected COPCs’ concentrations in pore fluid. This will result in underestimation of COPC transport plume in the affected underground space, and potentially the dissolved concentrations in the hydrogeological sink.</p> | Please provide additional evidence to justify the model parameter of site density for goethite, applied to the numerical model. If necessary, the reactive transport modelling should be re-run to update the contents presented in the EIS report. | |
| IR-94 | CNSC | Geology and Groundwater | Appendix 7-C, Numerical modelling: post-decommissioning evaluation, Section | <p>Context: It is reported in this section the assumed subsurface conditions that were applied in the geochemical site conceptual models. Critical phenomenon of pH tail was mentioned. Inclusion and exclusion of corresponding geochemical reactions were discussed briefly.</p> | Please provide additional evidence to justify the approach for excluding uraninite and pyrite from the analysis of remediated mining area. This may require the results from additional modelling. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------|---|---|--|------------------|
| | | | 3.5.5, Subsurface Conditions Incorporated | Rationale: It was reported that the residual reduced minerals of uraninite and pyrite were not included in the modelling of the remediated mining area. The argument was based on consideration of the upstream groundwater, passing through the mined zone, will not be oxidizing and groundwater conditions are expected to be similar to pre-mine conditions. However, this ignores the pH tail effect that releases proton H+ sorbed to solid surface during ISR flooding. By ignoring this process, there is a potential risk of underestimating the source terms for some key COPCs. Exclusion of uraninite and pyrite in remediated mining area modelling is contradictory to pH-tail effect. The justification is not sufficient in the current form. | | |
| IR-95 | CNSC | Geology and Groundwater | Appendix 7-C, Table 3-11 | <p>Context: The Table 3-11 reported the Solid-Phase Concentrations and Partitioning Constants for COPCs. Data were both measured and simulated.</p> <p>Rationale: It is unclear how the partition coefficients of various COPCs upon desilicified and paleoweathered rocks were obtained. It was not reported at what pH were these Kd analyzed. Sorption of chemicals on solid phase is known to be pH dependent. It is unclear whether pH influence was considered in the measurement and analysis of apparent partition coefficients.</p> <p>In addition, uptake of metals on clay is highly nonlinear, and always has a maximum capacity. Even with a very strong affinity towards specific metal ions, the sorption will be saturated at elevated concentrations. Therefore, assuming a linear correlation needs to be cautious of the concentration range of target COPC species, and the applicable sorption capacity of the clay mineral.</p> <p>In the current model, only the linear form of sorption is considered, although with discussion of Kd value selection. Additional rationale is needed to justify if the applied methodology is sufficient for assessment.</p> | Please justify the choice of applying a linear form partition coefficient for the modelling and assessment, and whether it provides a conservative approach to the assessment results. Clarity around the experimental conditions during the measurement of partitioning coefficient of various COPCs on the target rocks may help support this assumption. | |
| IR-96 | CNSC | Geology and groundwater | Appendix 7-C, Section 4.4.4, Sub-Domain Model Transport Boundary Conditions | <p>Context: From the text, “Transport parameters were specified for diffusion (1x10-9 m2/s), longitudinal dispersivity (10 m along the plume trajectory), and transverse dispersivity (5 m)”. The source of this information is not provided in Appendix 7-C. It is unclear if the values used are defaults in the modelling software, from literature, from small-scale laboratory tests, or are site-specific values determined through tracer tests.</p> <p>Rationale: The use of a calibrated flow model does not imply that the solute transport model is calibrated. The transport parameters (such as effective porosity, dispersivity and reactive transport parameters)</p> | <p>1. Please provide the source of the numerical value used for diffusion and longitudinal and transverse dispersivity, and provide justification if default values by the model code were used.</p> <p>2. Please provide a discussion on the influence of large-scale heterogeneity on dispersion and solute transport predictions in the modelling report.</p> <p>See also related: IR-89.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|---|---|------------------|
| | | | | <p>can only be calibrated by matching simulated and observed spatial and/or temporal distributions of a solute. Sensitivity analysis indicates that decreasing longitudinal and transverse dispersivities by a factor of two resulted in exceedances of groundwater criteria for both selenium (Se) and cobalt (Co). Given the clear influence of these values on contaminant transport, it is important that transfer parameter values are justified in the solute transport model. In addition, the influence of large-scale heterogeneity on dispersion and solute transport predictions should be discussed, to identify any uncertainty in the model predictions, and provide confidence that the applied model is adequately representing groundwater flow and solute transport.</p> <p>Further guidance on solute transport modelling can be found in BC MOE (2012) [1].</p> <p>Reference: [1] British Columbia Ministry of the Environment (BC MOE). 2012. Guidelines for Groundwater Modelling to Assess Impacts of Proposed Natural Resource Development Activities. Report no. 194001, 385 p.</p> | | |
| IR-97 | ECCC | Fish and fish habitat | Appendix 7-C, Figures 4-6, 4-7a, 4-7b, 4-8a, 4-8b, 4-9a, 4-9b | <p>Context: Appendix 7, Figures 4-6, 4-7a, 4-7b, 4-8a, 4-8b, 4-9a, 4-9b present contaminant transport simulations of chloride, selenium, cadmium, and uranium. All simulations use initial condition concentrations at t=0 (or end of mining operations. In the 3D FEFLOW contaminant transport model it is not clear why initial condition concentrations were chosen rather than a constant concentration boundary.</p> <p>It is also unclear if mining activities will cause mobilization of the contaminants beyond the end of operations.</p> <p>Rationale: The choice of boundary conditions may impact the predicted transport of contaminants that reach Whitefish Lake through groundwater, which may have impacts to aquatic life.</p> | <p>1. Explain and clarify if mining operations will mobilize contaminants beyond operations?</p> <p>2. Clarify if the source of contamination, (e.g., uranium, selenium) will cease after operations?</p> <p>3. For the 3D model please provide the rationale for using initial concentrations rather than constant concentration boundary conditions for contaminant concentrations.</p> | |
| IR-98 | CNSC | Change to an environmental component due to hazardous contaminants | Section 8, Aquatic Environment | <p>Context: It states in EIS in Section 8.3.7.1 (p. 8-151) that "Cameco's Key Lake Operation will overlap spatially and temporally with the Project".</p> <p>Rationale: It is not clear whether there is the possibility that planned Denison discharges would eventually flow into and influence a background reference lake used by Key Lake operation.</p> | Please provide supporting information to demonstrate whether discharges from the proposed operation will not eventually flow into a reference lake used by another existing operation. | |
| IR-99 | CNSC | Aquatic environment | Section 8, Water Quality, Table 8.2-13 | <p>Context: Table 8.2-13 shows the maximum concentration of hazardous and radiological COPC's in surface water throughout the local study area. However, the concentration for all constituents is stated as mg/L.</p> | Please use Bq/L when displaying concentration of radiological COPC's. If this was a typographical error in the table, please indicate as such and revise the table to indicate values are indeed in Bq/L. Please also review other | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|--|---|------------------|
| | | | | Rationale: It is unusual for radiological COPC's to be displayed in mg/L, radiological constituents are typically displayed in Bq/L | tables displaying concentrations of radiological constituents to ensure this error is not repeated in other tables. | |
| IR-100 | HC | Indigenous Peoples' health / Socio- economic conditions | Section 8, (p. 8-195) Section 8.5.3, Table 8.5-2, (p. 8-226) | <p>Mercury is excluded as a COPC in the assessment. Inadequate consideration of mercury and methylmercury in fish and other country foods, and use of incorrect Hg-related health guideline values can underestimate the risks to human health among country food consumers.</p> <p>Context: Section 8 states “Mercury has not been identified as a COPC for the Project as it is currently not present in the receiving environment (i.e., background condition) at detectable concentrations and will not be produced as part of the mine process; therefore, it will not be discharged to the aquatic environment.</p> <p>However, it is understood that potential nutrient enrichment-related effects are possible and can be linked to increases in mercury in the environment” (p. 8-195).</p> <p>Table 8.5-2 shows that there is mercury present in the tissues of Northern Pike and White Sucker sampled in the waterbodies within the local study area and in Russell Lake. These fish are regularly consumed by nearby communities according to the ERFN 2017 dietary survey.</p> <p>In Section 8.5.3, fish tissue concentrations are compared to Health Canada’s human health risk- based maximum permissible mercury concentration (0.5 µg/g wet weight), which is applicable to most species of commercially sold fish rather than country foods.</p> <p>Rationale: It is recommended that mercury be listed as a COPC considering it is in fact present in fish tissue under existing conditions, the significant consumption of fish by the local Indigenous communities, and its toxicological significance to human health.</p> <p>Further, the Health Canada provisional tolerable daily intake (pTDI) value of 0.2 µg/kg/bw/day (Health Canada, 2007) is a more appropriate reference level when evaluating consumption of mercury in fish by Indigenous people, as it allows for the consideration of food consumption patterns in the risk assessment that differ from the general population and is protective of the most sensitive sub-group (i.e., developing foetus).</p> <p>It is important to note that methylmercury, rather than inorganic mercury, is generally the predominant mercury species present in fish</p> | <p>1. Include mercury (including methylmercury) as a COPC in the assessment given the baseline presence of mercury in sampled fish, the potential increase of methylmercury in receiving waters due to nutrient enrichment resulting from the project, the significant fish consumption by the local population and that country foods, particularly fish, are an important source of dietary exposure to mercury.</p> <p>2. Assess health risks from fish consumption by calculating hazard quotients for baseline and predicted methylmercury levels in country foods using Health Canada’s pTDI for methylmercury (Health Canada, 2007).</p> <p>3. Clarify whether mercury data represented throughout the EIS represents total mercury, inorganic mercury or methylmercury.</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends including methylmercury in the list of COPCs to be monitored in fish throughout all project phases.</p> <p>See also related Advice to the Proponent: AD-31.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-----------------------|--|--|--|------------------|
| | | | | and is also the most toxicologically significant form. The assumption of 100% of mercury in fish and other country food items being present as methylmercury ensures that the potential health risks are not underestimated. It is unclear, however, if the mercury data presented throughout the EIS represent total mercury, inorganic mercury or methylmercury. | | |
| IR-101 | ECCC | Fish and fish habitat | Section 8.1.1.3, Section 8.2.1.3 Aquatic Environment | <p>Context: In Section 8.1.1.3 Spatial and Temporal Boundaries the Project Area, Local Study Area (LSA) and Regional Study Area (RSA) are established as they pertain to surface water quantity. The same is done in Section 8.2.1.3 for surface water quality. In Section 8.1.1.3 Figure 8.1-4, the locations of the Project Area, LSA, RSA and surface water features and monitoring stations are provided.</p> <p>However, the locations of wetlands located near the Project area and within the LSA and RSA have not been provided. The location of wetlands within or near the Project footprint, as well as the other wetlands existing within the LSA can be confirmed from Part II_S9 Terrestrial Environment, Section 9.2.3.3 Figure 9.2.-8, including the wetland classifications. There appears to be at least one shallow open water wetland and several bogs located within the Project Area. There is no consideration of wetlands or potential effects to wetland hydrology, surface water or sediment quality throughout the aquatic environment assessments. There is no baseline information regarding wetlands and their status as fish habitat and ecological function, or assessment of potential effects to flow rates, water levels, water quality, sediment quality, or biota.</p> <p>Rationale: There is currently not enough information provided for ECCC to provide advice on the potential risks of the proposed Project to wetland hydrology, surface water and sediment quality within the LSA. This pathway of effects is important to assess in terms of potential effects to wetland habitat availability and quality due to changes in flow rates, water levels, water quality, sediment transport, sediment quality and potential effects to terrestrial and aquatic receptors. It is necessary to evaluate if changes in groundwater and surface water runoff flows and routing will affect water levels and habitat availability within wetlands. Potential effects from COPCs and radionuclides to surface water and sediment, or potential effects to ecological receptors within wetlands have not been evaluated.</p> | <p>1. Provide baseline information regarding wetland characterization within the Project Area and LSA, including: locations, wetland type, size, water surface elevation, depth, water flow pathways, and the presence of wildlife receptors including presence of fish/fish habitat within the Aquatic Environment section of the draft EIS. If this information is available in annexes or baseline studies, summarize it within the main body of the Aquatic Environment section of the draft EIS with references to respective documents for review.</p> <p>2. Provide baseline information on wetland surface water and sediment quality characterization for wetlands within the Project footprint.</p> <p>3. Provide an assessment of potential effects to wetlands within the LSA and potential effects to ecological receptors during all phases of the proposed Project.</p> <p>4. Provide further information on mitigation measures and monitoring that would be applied for the protection of wetlands.</p> | |
| IR-102 | ECCC | Fish and fish habitat | Section 8.1.3.1 Appendix 8-C, including Appendix II, Table 1 (p. 2) | <p>Context: Only one measured-results dataset for baseline stream flow exists that is relevant to the Project data from the Water Survey of Canada (WSC) station for Wheeler River (06DA005), and the Proponent used constructed records. The Proponent states that data from 06DA005 was used to extend local hydrometric station records and calculate baseline water quantity metrics. However, this was done</p> | <p>1. Provide more information on the extension of Project hydrometric station data using WSC station 06DA005.</p> <p>2. Discuss the accuracy of any correlations/relationships and justify any deviations from simple unit area runoff relationships in the estimation of baseline water quantity</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-----------------------|---|---|--|------------------|
| | | | | <p>through a complex combination of daily data correlation or monthly unit area runoff relationship, with or without offset, where some stations were based off constructed records instead of the real long-term dataset at 06DA005 (see Section 8.1.3.1 and Appendix II of Appendix 8-C, Table 1, p.2 (PDF p. 569)). Appendix 8-C references previous reports in its own appendices, but no equations are shown and there is no description of the accuracy of the fit, or explanation for not referring back to the one dataset (WSC station). Subsequent statistics calculated from these constructed records (e.g., 7Q10 needed for SK water licenses) would be affected by this uncertainty.</p> <p>Rationale: Fish habitat can be altered by changes to depositional and erosional patterns in streams. Confidence in the Proponent’s estimate of baseline water quantity, and by extension Project effects to fish habitat, cannot be established without a complete description of the method applied, as well as a discussion of its accuracy.</p> | <p>values for the Project hydrometric stations. Constructing records from records that are themselves constructed is not recommended.</p> <p>3. If baseline water quantity metrics need to be revised, discuss (if any) resulting changes to the effects assessment.</p> | |
| IR-103 | ECCC | Fish and fish habitat | Section 8.1.3.4 Climate Change Influenced Extreme Events | <p>Context: The Proponent notes that Intensity duration frequency (IDF) curves are used to estimate the size of water management structures around a site and that the IDF curves are often specific to climate monitoring stations.</p> <p>The Proponent used the IDF_CC Tool 5.0 developed by the Institute for Catastrophic Loss Reduction (2021) which generates Intensity Duration Frequency (IDF) curves at ungauged locations in order to estimate future IDF curve values under influences of climate change. This tool generates sub-daily values at ungauged locations by interpolation and distance weighing from gauged locations.</p> <p>Rationale: IDF trends exhibit random behavior at some locations and correlated behavior at other locations. The choice of gauged locations will infer the statistics for the ungauged locations, including the IDF trends. Without identification of the gauged locations, it is not possible to assess if the modelled data is realistic or not. If the modelled data is not accurate the design of water management structures on the site may not be sufficient resulting in the potential for impacts to the Project from flooding or extreme weather events.</p> | <p>Provide the gauged stations used to generate the sub daily duration values found in Table 8.1-6: Baseline of Intensity Duration Frequency data.</p> <p>Technical Discussion Required: Yes</p> | |
| IR-104 | ECCC | Fish and fish habitat | Section 8.1.3.4.2 Probable Maximum Precipitation (PMP) Events Appendix 8C | <p>Context and Rationale: The Proponent notes: “The probable maximum precipitation (PMP) event is a design standard value for an extreme rainfall event. The PMP event does not have an estimated return period but is instead based on the theoretical maximum amount of water that a storm could produce based on the maximum persisting dew point.”</p> <p>The Proponent provides a PMP value of 489.3 mm, which is based on data and methodologies available in 1999, taken from the</p> | <p>1. Provide a revised PMP value (using up to date data) or justify the use of a PMP that is based on data and methodologies from 1999 as opposed to a more recent time series analysis.</p> <p>2. Describe the alternative methods for determining PMP values that were considered. Include descriptions of both “statistical” outcomes and “rational” outcomes as applicable.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|---|--|--|--|---|------------------|
| | | | | <p>Atmospheric Environment Branch Report (1999), Report Number AHSD-R99-01. The Proponent references Appendix 8C for details. Appendix 8C contains no supplementary information other than what is already provided in Section 8.1.3.4.2.</p> <p>The assumptions and methodologies presented in the report are the results of time series analyses available in 1999. As time series evolve so do the derived statistics. In order to assess potential flood risks and impacts to the Project from flooding, data that is current and representative of the changing climate is needed. The Proponent should explain why they've used data from 1999 rather than using up to date data, describe what alternative methods for determining PMP they have considered, and describe how they will support their use of 489.3 mm as a PMP, or describe how they will generate a refreshed PMP. The main factor that influences the statistical data output is the length of the time series hence the reason to keep the statistical data. The PMP values can be substantially (>10%) different if two decades of data is used in the statistical analysis.</p> | Technical Discussion Required: Yes | |
| IR-105 | Directorate of Fisheries and Oceans (DFO) | Fish and fish habitat | Section 8.1.4.1, Potential interactions between project and valued component/key indicators Surface Water Quantity Section 8.1.4.2.2, Surface Water Taking 8.3.4.1, Potential interactions between project and valued component/key indicators | <p>Context: Table 8.1-8 and Table 8.3-6 in the EIS indicates a potential for freeze wall operation to influence groundwater interactions and surface water quantity and as a result, impact fish and fish habitat. Section 8.1.4.2.2 references Section 7 Geology and Groundwater for details on potential impacts. In addition, IR-63 notes the groundwater model does not describe the pathway in which groundwater would pass around the freeze wall during operation and any resulting potential effects on groundwater discharge to Whitefish Lake.</p> <p>Rationale: As per IR-63, the groundwater model analysis is insufficient to make conclusions on the potential effects of the freeze wall on groundwater discharge into Whitefish Lake. DFO requires this information to fully understand if altered groundwater regimes will result in changes to Whitefish Lake water levels and any potential impacts to fish and fish habitat as a result of changing water levels.</p> | <p>1. Provide a more fulsome analysis of the potential impact of freeze wall operations on local and semi-regional groundwater regimes, and subsequently to fish and fish habitat within Whitefish Lake. The analysis should provide a rationale of how the scope of the groundwater model is relevant to and able to detect changes at the scale of fish and fish habitat.</p> <p>2. If impacts to fish and fish habitat in Whitefish Lake are predicted to occur due to changes in the groundwater regime, describe any mitigation measures that could be used to avoid these impacts.</p> <p>3. If impacts are predicted that cannot be avoided, characterize residual effects on fish and fish habitat.</p> | |
| IR-106 | CNSC | Change to an environmental component due to hazardous contaminants | Section 8.1.4.2.3, Surface Water Discharge | <p>Context: It is stated in this section under construction that all site contact water will be held in the Clean Waste Rock Pond.</p> <p>Rationale: It is unclear from this section what will happen to the contact water held in the Clean Waste Rock Pond, and whether it will be removed from site or released at a later time. What is the contingency plan if more contact water is produced during construction than the Clean Waste Rock Pond has capacity for.</p> | Please indicate what will happen to the contact water stored in the Clean Waste Rock Pond during construction activities, will it be released after the wastewater treatment plant is installed? Further, please describe the contingency plan if contact water produced exceeds estimates and will exceed the volume of the clean waste rock pond? | |
| IR-107 | CNSC ECCC | Aquatic environment | Section 8.2.3.3, Existing Surface Water Quality | <p>Context: Under the methodology and metrics section (8.2.3.1) it is stated baseline water quality was sampled in 2016, 2018, and 2019. Looking at the data in Appendix A of Appendix 8D it seems that some</p> | Please clarify what data quality objectives were used for the baseline characterization data. Please provide justification whether the number of datapoints collected | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|---|------------------|
| | | | | <p>waterbodies have little data available for baseline characterization. For example, Whitefish Lake only has 3 and 5 samples taken between its two sample stations, with sampling frequency seeming intermittent.</p> <p>Rationale: The amount of data available for baseline water quality characterization does not seem sufficient to adequately characterize the baseline and the variation it would experience. An effective baseline characterization is vital to ensure water quality is indeed not being affected by the project. In addition, it is not clear if data quality objectives were applied to determine baseline information was adequate.</p> <p>To meet CEAA 2012 requirements, and CNSC expectations outlined in REGDOC 2.9.1, Environmental Principles Assessments and Protection Measures, the applicant is required to complete a characterization of the baseline environment.</p> <p>As described in REGDOC 2.9.1 Appendix B.2, Characterization of the Baseline Environment for Environmental Assessment Under CEAA 2012, the “baseline information should be sufficient to support the use of an aquatic dispersion model to conduct the site-specific ERA and to support an assessment of the effects of the environment on the facility or activity”</p> <p>In addition, the “applicant or licensee should include an assessment of any limitations or gaps in the quality and extent of baseline data and methods, as well as the method(s) by which they have been addressed.”</p> | <p>with inconsistent frequency in baseline surface water characterization is sufficient to meet data quality objectives and to adequately characterize the baseline, and whether Denison is confident that the data collected is enough for a robust water quality baseline characterization.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends that additional water samples are collected and analyzed at a consistent frequency to ensure a robust baseline</p> | |
| IR-108 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.3.3 Aquatic Environment | <p>Context: Tables 8.2-2 and 8.2-3 provide summaries of the baseline surface water quality in the LSA. No justifications for the selection of water quality guidelines have been provided. COPCs that require calculations based on other parameters such as hardness, pH, or temperature to derive guidelines (i.e., ammonia, cobalt, zinc, etc.) should be indicated within the table, with a note specifying the parameter values used in the calculations, so that thresholds may be confirmed. No baseline data for un-ionized ammonia has been provided, which is a Schedule 4 substance requiring monitoring under the MDMER. For cobalt, manganese, and vanadium, Federal Environmental Quality Guidelines (FEQGs) and/or CCME Canadian Water Quality Guidelines (CWQGs) for the Protection of Aquatic Life have not been included. A guideline of 26 mg/L has been provided for molybdenum as a Saskatchewan Environmental Quality Guidelines (SEQG), however the actual SEQG is 31 mg/L and the CCME CWQG is 0.073 mg/L.</p> | <p>1. Update Tables 8.2-2 and 8.2-3 to include all COPCs that require effluent characterization and receiving environment monitoring under the MDMER.</p> <p>2. Update Tables 8.2-2 and 8.2-3 to include missing or corrected water quality guidance thresholds, and information on values used to derive thresholds for COPCs that are dependent on general parameters.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|---|------------------|
| | | | | Rationale: In order to assess potential changes to surface water quality from Project related activities, ECCC requires that data on all parameters that require MDMER effluent and receiving environment monitoring be provided for assessment, including accurate water quality guidelines where available. | | |
| IR-109 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.1.1 Aquatic Environment | <p>Context: In this section it is stated “Treated water from the IWWTP will be pumped to the three Effluent Monitoring and Release Ponds (each 3,300 m3). These ponds will be designed to hold effluent for 72 hours for testing before discharge to the environment” (p. 8-75). It is unclear what procedure will be followed if effluent in monitoring ponds does not meet discharge requirements following testing.</p> <p>Additionally, it is also stated that “Treated water in the Effluent Monitoring and Release Ponds will be monitored prior to release to a surface waterbody or injected into groundwater via deep well injection.” However, the MDMER pursuant to the Fisheries Act requires all mine effluent and seep. from the mine site that contain deleterious substances be discharged through a final discharge point.</p> <p>Rationale: In order to fully understand effluent management, more information is required regarding the procedure for managing effluent in monitoring ponds that does not meet discharge requirements. It is unclear how effluent that does not meet discharge requirements will be managed if it needs re-treatment and re-testing prior to discharge.</p> <p>ECCC reminds the Proponent that Project effluent from all final discharge points must meet federal legislation requirements.</p> | Provide further information regarding management of effluent in monitoring ponds that does not meet the requirements for discharge under the MDMER. | |
| IR-110 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.1.1 Aquatic Environment Appendix 8-E, Section 2.1 | <p>Context: It is stated that the diffuser at the final effluent discharge point will be located in approximately 3m of water. However, in Figure 8.2-5 displaying the location of the proposed diffuser and lake bathymetry, the diffuser location seems to be located in 2-2.5m of water. A similar image in Figure 1 Section 2.0 of Appendix 8-E also indicates that the diffuser seems to be located in 2-2.5m of water. Additionally, while thermal effects are unlikely, this cannot be confirmed until a more detailed diffuser design is provided for review.</p> <p>Rationale: The Proponent should confirm the location and depth of the proposed diffuser in order to confirm that modelling predictions for effluent discharged into the receiving environment are accurate.</p> | Provide confirmation of the diffuser depth and location. ECCC requests the opportunity to review the finalized diffuser design once it is available. | |
| IR-111 | CNSC | Fish and fish habitat | Section 8.2.4.2.2, Controlled Discharge | <p>Context: This section of the EIS indicated that the scenario was assessed using a conservative assumption of a continuous freshwater withdrawal rate of 40.5 m3/hr, and a continuous effluent discharge rate of 81.0 m3/hr.</p> | Please clarify where the other half of the total volume of effluent discharged is from in the water balance between water intake and effluent. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|---|--|---|------------------|
| | | | | Rationale: The withdrawal rate assessed is half of the effluent rate, it is unclear from the text where the other half of the volume of effluent is coming from, if not drawn from the lake. | | |
| IR-112 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.2.2, Aquatic Environment Appendix 8-E, Section 1.2.1 Appendix 10-A (ERA), Section 3.1 | <p>Context: This section of the EIS states that, “for the purpose of assessing the scenario of greatest potential effects, the Project was assessed as having a continuous freshwater withdrawal rate of 40.5 m³/hr and a continuous effluent discharge rate of 81.0 m³/hr.” (p. 8-21)</p> <p>However, several sentences later it is stated that, “The approach to assessing Project-related effects on the Surface Water Quality VC was conservative for the following reasons: The assessment was based on a continuous (year-round) discharge rate at an expected average effluent discharge of 0.0101 m³/s (or 36.5 m³/hr) throughout Construction, Operation, and Decommissioning...”</p> <p>This is a continuous theme throughout Section 8, Aquatic Environment, where the discharge rate for the surface water quality assessment changes between 36.5 m³/hr and 81.0 m³/hr. However, in Appendix 10-A (ERA) the 36.5 m³/hr discharge rate is the only value used for the near and far-field modelling.</p> <p>It should be made clear in the main body of the draft EIS that the average effluent discharge rate of 36.5 m³/hr has been used as the input for the near- and far-field modelling for effluent, surface water and sediment quality predictions. The maximum upper bound discharge rate is 81 m³/hr; however, modelling for effluent, surface water and sediment quality was not completed for this discharge rate.</p> <p>Rationale: It remains unclear throughout the draft EIS that all predictions of COPC concentrations in effluent, and receiving environment surface water and sediment are based upon the effluent discharge rate of 36.5 m³/hr, and not the maximum upper bound discharge rate of 81 m³/hr. All conclusions about risk to the environment and aquatic and terrestrial biota must make this clear. If the Proponent wishes to make conclusions based on the maximum upper bound discharge rate of 81 m³/hr, modelling needs to be conducted using this rate of discharge.</p> | <p>1. Confirm that the surface water quantity, quality, and aquatic biota risk assessments and modelling, were conducted using the discharge rate for 36.5 m³/hr within the draft EIS.</p> <p>2. Revise any statements or conclusions in the draft EIS to improve clarity about the usage of the maximum upper bound discharge rate of 81 m³/hr. Remove statements regarding use of the discharge rate of 81 m³/hr during modelling and risk assessments to the receiving environment as needed.</p> | |
| IR-113 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.2.3 and Section 8.4.7.6, Aquatic Environment | <p>Context: No quantitative assessment of climate change has been conducted. Representative concentration pathways (RPC) projections for climate change have not been integrated with near-and far-field modelling to assess impacts to surface water quality or sediment quality in the future.</p> <p>Rationale: Changes in air and water temperatures, precipitation, snow</p> | Provide a quantitative analysis of the potential impacts of predicted COPCs from mine effluent to surface water and sediment quality with climate change scenarios for the Project lifespan incorporated into modelling. Include modelling predictions regarding the influence of changes to air and water temperatures, precipitation, snow melt, | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------------|--|--|--|--|------------------|
| | | | | melt, ice formation, etc., due to climate change can all influence COPC concentrations in surface water and sediment. It is not possible to assess the potential impacts from climate change on predicted surface water and sediment COPC concentrations with the current information. | ice formation, etc., on COPC concentrations in surface water and sediment. | |
| IR-114 | ECCC CNSC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.2.3 and Section 8.2.4.2.4 | <p>Context: Tables 8.2-9, 8.2-10 and 8.2-13 demonstrate predicted maximum effluent concentrations of COPCs and maximum predicted receiving environment concentrations in the near- and far-field. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, TSS and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization.</p> <p>For zinc, it is unclear how guidelines have been calculated when CCME thresholds can only be derived with hardness values <250 mg/L. Additionally, water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations.</p> <p>Mercury has been identified as a COPC of interest to Indigenous groups for the proposed Project. Table 8.2-8 indicates that background concentrations of mercury in LA-5 are low, and predicted effluent concentrations are also low. However, no information has been provided on background methylmercury concentrations or expected atmospheric deposition of mercury from Project related emissions. Predicted effluent concentrations of 3915 mg/L of sulphate are quite high, and sulphate is known to increase mercury methylation rates in aquatic environments.</p> <p>Rationale: A review of all modelling results for all COPCs under the MDMER will assist ECCC in understanding the potential risks to the receiving environment. ECCC recommends the use of the most stringent guidelines for the protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds.</p> <p>Increased sulphate availability can lead to increased methylation rates of mercury and methylmercury in sediment and surface water. Methylmercury is a toxin that can bioaccumulate within the food chain and present risks to aquatic biota and wildlife consuming aquatic biota. Potential changes to methylmercury concentrations in</p> | <p>1. Update all tables to include all COPCs with required monitoring under the MDMER including acute and chronic thresholds.</p> <p>2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota.</p> <p>3. Provide baseline data on the concentrations of methylmercury in surface water, sediment and fish tissues (i.e., large-bodied sports fish and small-bodied forage fish) in the LSA and RSA receiving environment to establish a baseline prior to potential Project impacts.</p> <p>4. Provide an assessment of risk from methylmercury to ecological receptors due to changes in sulphate concentrations in effluent, and potential deposition of mercury from Project related atmospheric emissions in the receiving environment.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|---|---|--|------------------|
| | | | | <p>water quality, sediment and fish tissues should be assessed due to the proposed sulphate loadings in effluent.</p> <p>Additionally, in accordance with the MDMERs, Denison will be required to demonstrate that their effluent quality meets the limits in the MDMER. Denison is expected to provide the predicted effluent quality for lead, nickel, and un-ionized ammonia to demonstrate compliance with the MDMERs.</p> | | |
| IR-115 | ECCC | Fish and fish habitat | Section 8.2.4.2.3 Aquatic Environment Appendix 10-A (ERA), Section 3.1.1.1 | <p>Context: Table 8.2-8 demonstrates baseline concentrations of COPCs in LA-5 South Whitefish Lake, their respective water quality guidelines from applicable sources, and proposed Project thresholds. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, Total Suspended Solids (TSS) and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization. Water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations. The water quality objective selected for molybdenum is the 31 mg/L SEQG rather than the CCME guideline of 0.073 mg/L.</p> <p>Rationale: ECCC recommends the use of guidelines that will ensure the protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds.</p> | <p>1. Update Table 8.2-8 to include all COPCs with required monitoring under the MDMER.</p> <p>2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.</p> <p>3. Provide additional information to justify the use of the selected water quality guideline for molybdenum.</p> | |
| IR-116 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.2.5, Section 8.4.4.2.5 and Section 8.5.4.2.3 | <p>Context: Tables 8.2-14, 8.4-9 and 8.5-5 demonstrate predicted mass flux (in mg/s) of COPCs in groundwater during the future centuries scenario. The table does not provide any information on actual surface water concentrations of COPCs or accumulation in concentrations over time. It is not possible to determine what the COPC concentrations in surface water and sediment will be during the future centuries scenario with the current information.</p> <p>Additionally, only a subset of parameters have been provided in this table based on parameters that were elevated in effluent after treatment. Groundwater may have a variety of different COPCs with elevated concentrations as it will migrate directly from the ore body area and not receive treatment.</p> <p>Rationale: It is not possible for ECCC to assess the predicted concentrations of COPCs in surface water and sediment, and therefore</p> | <p>1. Provide the predicted water and sediment quality concentrations of COPCs in the receiving environment for the future centuries scenario.</p> <p>2. Include data for a greater suite of COPCs that were assessed as having potential to be at elevated concentrations in groundwater.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|---|--|---|------------------|
| | | | | risk to aquatic biota during the future centuries scenario with the provided information. | | |
| IR-117 | CNSC | Human health with respect to hazardous contaminants | Section 8.2.4, Table 8.2-9 | <p>Context: CNSC staff note that some of the effluent quality predictions in the EIS are quite high for a uranium mine and mill facility compared to the existing facilities.</p> <p>For example, the upper bound effluent quality of molybdenum is 2.5 mg/L. In 2021, the highest monthly mean concentration at the existing uranium mine and mill facilities is 0.213 mg/L.</p> <p>Also, the upper bound effluent quality of copper is 0.022 mg/L. In 2021, the highest monthly mean concentration at the existing uranium mine and mill facilities is 0.002 mg/L.</p> <p>Rationale: Surface water quality models should be based on the anticipated effluent quality. From discussions with Denison, it appears that the effluent quality predictions may change based on the results of more bench scale tests that are still being conducted and continued optimization of the design of the water treatment plant.</p> | <p>Please provide the anticipated effluent quality of the constituents of potential concern during normal operations.</p> <p>Once Denison has refined the effluent quality predictions, Denison is expected to update the inputs into the surface water quality model.</p> | |
| IR-118 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.6.1, Section 8.4.6.1 and Section 8.5.6.1, Aquatic Environment | <p>Context: It is unclear if Tables 8.2-16, 8.4-12, 8.5-7 and 8.5-8 take into consideration potential effects from groundwater seepages of COPCS to surface water and sediment quality in the future centuries scenario. No information regarding the future centuries scenario has been provided in the rationale summary for ratings.</p> <p>Rationale: Groundwater seepage of COPCs may have future impacts to surface water quality, sediment quality and aquatic receptors; however, the extent of residual effects is unclear without further information.</p> | Provide further information regarding how groundwater seep. of COPCs may have future impacts to surface water quality, sediment quality, and aquatic receptors, and any residual effects that may persist. | |
| IR-119 | CNSC | Fish and fish habitat | Section 8.3.1.2, Table 8.3-1, Sediment quality | <p>Context: Sediment quality isn't considered a key indicator for fish and fish habitat, but the accumulation of contaminants in sediment porewater without habitat alteration is similar to the key indicator 'change in surface water quality from baseline conditions' that is considered.</p> <p>Rationale: It is not clear whether sediment was just considered for physical disturbance, and why chemical changes are missing from key indicator list for fish and fish habitat.</p> | Please provide the rationale for exclusion of sediment quality from the key indicator list for fish and fish habitat. | |
| IR-120 | CNSC | Aquatic species | Section 8.3.3 and 8.5, Aquatic Environment | <p>Context: Although downstream impacts are not predicted by Denison it is important from an ecosystem perspective to establish baseline locations to monitor for potential cumulative effects to the aquatic environment due to the Key Lake and Wheeler River Operations to ensure the aquatic environment is being protected from cumulative impacts.</p> | <p>If Denison has not collected baseline aquatic studies in the far-field downstream receiving environment of Russell Lake, please provide a rationale for why.</p> <p>If a far-field Russell Lake location was sampled as part of baseline data collection, more information about the</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|--|--|------------------|
| | | | | <p>Denison should consider adding a far-field exposure location and collecting baseline aquatic ecosystem baseline data in Russell Lake including:</p> <ul style="list-style-type: none">• Water quality/chemistry• Sediment chemistry/quality• Benthic invertebrate chemistry /community• Large-bodied fish tissue/chemistry <p>Rationale: Russell Lake is identified as part of the RSA for the aquatic environment, but it appears that no detailed aquatic baseline data was completed in far-field location in Russell Lake. In addition, several Indigenous Nations and communities and local resource users have indicated that Russell Lake is an important body of water both culturally for traditional use and was once used as commercial fishery.</p> | <p>process and results with regards to sampling at Russell Lake should be included in the EIS. This information would be valuable to help determine potential cumulative effects downstream in the Russell Lake drainage system (due to the Key Lake Operation) which has been identified as a key concern and area of interest by several Indigenous Nations and communities.</p> | |
| IR-121 | CNSC | Fish and fish habitat | Section 8.3.3.1, Methodology and Metrics | <p>Context: In the description of methodology for fish communities and spawning surveys, there's no mention that could be found for an any evaluation of fish condition, other than sexual condition.</p> <p>Rationale: Exposure to other pre-existing stressors could result in abnormal conditions or deformation(s) in existing population, but the extent of existing conditions should be evaluated to ascertain whether the rate is increasing as a result of proposed activities once in operation.</p> | <p>Please provide reference to where fish condition is considered or provide a justification for its exclusion.</p> | |
| IR-122 | CNSC | Fish and fish habitat | Section 8.3.8, Monitoring and Follow-up | <p>Context: Section 8.3.8 of the EIS states: "Changes in fish communities/populations will be assessed through comparison of Construction, Operation, and Decommissioning results to pre-development."</p> <p>Rationale: Tracking changes in fish communities / populations in reference lakes over time should be conducted, as reference lakes can be used to differentiate natural temporal variation with potential project impacts.</p> | <p>Please include reference lakes, and if it is provided, please reference where in the EIS these are discussed. If there are no reference lakes, these should be included in the monitoring program.</p> | |
| IR-123 | ECCC | Change to an environmental component due to radiological contaminants | Section 8.4.3.2.3, Aquatic Environment Appendix 8-D, Table 3-5 | <p>Context: Table 8.4-3 provides a summary of the baseline concentrations of COPCs in sediments in the LSA. Sediment quality thresholds and justification for the selection of those thresholds have not been provided. Table 3-5 in Appendix 8-D does provide benchmarks but the selection of benchmarks is not discussed, and the most stringent guidelines are not used for some COPCs. Additionally, there is no data provided for sediment concentrations of mercury, which is a COPC that requires surface water quality monitoring and effluent characterization under the MDMER.</p> <p>Rationale: Further information should be provided regarding any</p> | <p>1. Provide sediment quality thresholds and justification for the selection of those thresholds for comparison against measured baseline COPC concentrations in the LSA.</p> <p>2. Provide data on baseline concentrations of mercury in sediment.</p> <p>3. Identify any COPCs with baseline concentrations that exceed sediment quality thresholds in the LSA.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|--|------------------|
| | | | | exceedances of sediment quality thresholds in baseline concentrations of COPCs, which should be recommended for further assessment of risk due to effluent discharges. | | |
| IR-124 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.4.4.2.3, Aquatic Environment | <p>Context: Table 8.4-7 provides maximum concentrations of surface water COPCs in sediment. The following COPCs, which are required to evaluate the risk from effluent to sediment quality, were not evaluated:</p> <ol style="list-style-type: none">1. COPCs that have monitoring requirements in receiving environment surface water and effluent under the MDMER,2. COPCs that exceed water quality guidelines in effluent, and,3. COPCs that have baseline concentrations that exceed sediment quality thresholds in the receiving environment. <p>Rationale: Due to the lack of information on COPCs with baseline concentrations that exceed sediment quality guidelines, and COPCs that require monitoring under the MDMER, a determination on risk to sediment quality and aquatic biota cannot be made.</p> | <ol style="list-style-type: none">1. Provide the information on baseline exceedances of COPCs in sediment.2. Provide an assessment of risk for any COPCs that have baseline exceedances of sediment quality thresholds in the receiving environment.3. Provide an assessment of risk from any COPCs that require monitoring in the receiving environment and effluent under the MDMER. Please include any COPCs in effluent that will exceed water quality guidelines. | |
| IR-125 | CNSC | Fish and fish habitat | Section 8.5, Aquatic Environment and Fish health | <p>Context: Indigenous Knowledge studies and information collected in relation to the Project clearly identified the importance of water quality and fish health to local Indigenous peoples and is discussed throughout the Draft EIS. For example:</p> <ul style="list-style-type: none">• “Russell is one lake where I commercially fish. How will this effluent impact the water quality, fish health? Will I be able to sell fish from here? If there is going to water” pollution, I just want to know” (19-LK-ERFNTrip-134.255) “• “How are you going to protect the water quality? We are concerned about mercury in fish, other animals, etc. Is there mercury or arsenic in the uranium solution?” (p. 8-53) <p>Rationale: Several Indigenous Nations and communities and local resources users have indicated Russell Lake is an important body of water both culturally for traditional use and was used as commercial fishery in the past and from an aquatic ecosystem perspective.</p> | <p>One of the many mitigation measures mentioned throughout the aquatic environment section states:</p> <p>“Denison will work with the associated communities to develop and implement the Project-specific monitoring programs and a framework to share the results for the purpose of assessing the performance of the water management system.” (p.10-32)</p> <p>Has Denison considered the collection of additional baseline fish tissue species that are of importance to Indigenous Nations and communities and local cabin owners from Russell Lake? Assuming the species would be walleye (commercially and recreationally) and lake white whitefish that is traditionally an important species consumed.</p> <p>Please provide more information on the engagement to date on the development of the Surface Water Management Program and Monitoring program that Denison is developing and engagement to date with interested Indigenous Nations and communities in the region on fish and fish health.</p> | |
| IR-126 | ECCC | Aquatic species | Section 8.5.3 Appendix 10-A (ERA), Section 5.3.1.1.8 | <p>Context: The Proponent has used the US Environmental Protection Agency (US EPA) guidelines for the assessment of selenium fish tissue concentrations in Section 8.5.3 of the draft EIS and in the</p> | Update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA (Appendix 10-A (ERA) in Section 10) as needed using ECCC’s FEQG. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|--|--|------------------|
| | | | | Environmental Risk Assessment (ERA) in Appendix 10-A (ERA) of Section 10. Rationale: ECCC’s Federal Environmental Quality Guidelines of 6.7 ug/g dry weight fish whole body tissue for selenium should be used, as it is more protective than the US EPA guidelines. | | |
| IR-127 | CNSC | Aquatic environment | Appendix 8-E, Section 1.2.1, Hydrological Inputs | Context: Within this section it states that the 7Q10 low flow rate used in the mixing assessment “was provided verbally to Ecometrix by NewFields Canada during a project meeting on 26 April 2022” Rationale: The statement that this value was provided verbally is not an infallible method of communicating data, as the value could have been misheard, misremembered, or recorded improperly. | Please verify that the 7Q10 value used in the assessment is the correct value determined by NewFields. | |
| IR-128 | CNSC | Current use of lands and resources for traditional purposes | Section 9 Various pages in section 11.1, Land and Indigenous Resource Use Section 12 Section 14 | Context: The increased road traffic (14-18 trucks per day during construction/operations) may have indirect impact on ungulates, furbearers and wood land caribou presence/absence for traditional and subsistence hunting have been raised to CNSC staff when meeting with Indigenous Nations and communities and are presented in the EIS. Rationale: The increased traffic and therefore dispersal of game (moose, woodland caribou) due to increased traffic has been raised as a concern with respect to increased mortality on wildlife and decreased ability to practice traditional rights. | How have the potential residual impacts with respect to increased traffic and noise (due to current and future operations) been communicated to Indigenous Nations and communities who use the road #914 for cultural and traditional activities (such as moose harvesting, berry picking and small game and birds)? Please provide any additional information on the engagement that has taken place to date with Indigenous Nations and communities with respect to concerns and potential impacts on current use of lands and resources due to increased road traffic, and any mitigation measures proposed by Indigenous Nations and communities to minimize the potential impacts. | |
| IR-129 | CNSC | Current use of lands and resources for traditional purposes | Section 9 Section 10 Section 11, including Section 11.1.4.3.1 (p. 11-46) Section 12 Section 16 | Context: ERFN indicated they are concerned about declining moose populations from an influx of hunters; more people may be accessing the area year after year, and worried populations may be affected by the Project (21-EN-ERFN-473.13). Further, the EIS highlights that: “Vehicle collisions are the most likely source of direct mortality for moose. Effective mitigation measures (e.g., breaks in snowbanks; speed limits; and exclusion fencing around contaminated waste pads and ponds) will be implemented to reduce moose mortality.” (p. 11-46) Rationale: The Technical Guidance for Assessing the Current Use of Lands and Resources for Traditional Purposes under CEAA 2012 notes: “The views of affected Aboriginal groups on mitigation be considered and included in the EIS. This could assist in ensuring that the environmental effects on the current use of land and resources for traditional purposes are at an acceptable level for the community.” | Please provide additional information on the discussions Denison has had with Indigenous Nations and communities on how to mitigate any residual project impacts on their traditional harvesting activities of large game such as moose. More information is required to determine if Denison has engaged directly with ERFN/KML and other Indigenous Nations who utilize the area to harvest moose to determine current baseline harvest numbers that provide subsistence, continued cultural identity and community well-being, as well as discussions on how the project could potentially impact moose populations and the harvesting of moose for traditional practices. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|---|--|------------------|
| | | | | <p>Sources for indirect moose mortality (e.g., increased hunter access, changes to health due to sensory disturbances, changes to predator-prey dynamics) may result in mortality outside the Wildlife LSA. The residual effect of change in moose mortality is likely to occur. Although mitigation measures are expected to reduce, but not fully eliminate, the residual effect on moose.</p> <p>The potential residual impact on the moose and other large game populations in the broader regional study area may potentially impact Indigenous treaty rights, culture, and community well-being if the harvesting of moose and large game declines due to increased traffic, noise, and vehicle mortality or increased outside hunting pressure.</p> | | |
| IR-130 | CNSC | Physical stressors (noise and vibration) on wildlife | Section 9, Terrestrial Environment | <p>Context: Sensory disturbances such as noise have been identified as stressors for selected wildlife (Ungulates, Furbearers, and Woodland Caribou), birds and amphibians in the project area. However, there is no consideration of impacts from vibrations on these species. Also, impacts of noise and vibration on reptiles have not been assessed in the project area.</p> <p>Rationale: While noise has been qualitatively assessed for selected wildlife, birds, and amphibians, there is no consideration of project-related vibrations as a sensory disturbance/physical stressor. Sensitive terrestrial species (specifically, herpetofauna, amphibians, invertebrates, and caribou) can be impacted by vibrations emanating from the operation of heavy machinery, blasting activities, and other anthropogenic activities at the project site.</p> <p>Also, impacts of physical stressors (noise and vibration) on reptiles were not assessed. These species should be included in this assessment due to their sensitivity to noise and vibrations.</p> | <p>Please provide a discussion of impacts of physical stressors (specifically vibrations) on wildlife, birds, and amphibians in the project area. Specific mitigation measures and/or monitoring for impacts from project-related vibrations should be considered, as appropriate.</p> <p>Also, include reptiles in the assessment of project-related noise and vibrations as sensory disturbance/physical stressor, or a justification for their exclusion.</p> | |
| IR-131 | CNSC | Migratory birds, Wildlife and Wildlife Habitat | Section 9, Terrestrial Environment | <p>Context and Rationale: As per the requirement outlined in Section 79 of the Species at Risk Act (SARA): <i>The person must identify the adverse effects of the project on the listed wildlife species and its critical habitat and, if the project is carried out, must ensure that measures are taken to avoid or lessen those effects and to monitor them. The measures must be taken in a way that is consistent with any applicable recovery strategy and action plans. This is accomplished by ensuring that the Proponent has identified, avoided, lessened and will monitor effects to species at risk.</i></p> <p>As per the CNSC’s Generic Guidelines for the Preparation of an EIS pursuant to the Canadian Environmental Assessment Act, 2012: “The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the proponent intends to</p> | <p>Identify all species at risk listed on Schedule 1 of the Species at Risk Act and their critical habitat that are likely to be affected by the Project and describe how they may be adversely affected by the Project. Describe what measures will be taken to avoid or lessen the effects of each Project activity and stage, and how these effects will be monitored to ensure they are avoided or minimized.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|---|---|------------------|
| | | | | <p><i>implement them and the environmental outcome the mitigation is designed to address. The EIS will describe mitigation measures in relation to species and/or critical habitat listed under the Species at Risk Act (SARA). These mitigation measures will be consistent with any SARA permit, applicable recovery strategy and/or action plan”.</i></p> <p>The draft EIS neither lists the adverse effects to all listed schedule 1 SARA species, nor outlines the measures that will be taken to avoid or lessen these effects. The Proponent references that additional species-specific mitigations will be detailed in environmental management plans but has not provided those plans for review.</p> | | |
| IR-132 | ECCC | Wildlife and Wildlife habitat | Section 9, Terrestrial Environment | Context and Rationale: ECCC has identified that three species at risk arthropods (yellow banded bumble bee, transverse lady beetle, and nine-spotted lady beetle) have ranges overlapping the Project area and these were not mentioned in the draft EIS. | <p>1. Conduct an effects assessment for arthropod species at risk.</p> <p>2. Explain what mitigation measures will be used to minimize potential effects.</p> | |
| IR-133 | ECCC | | Section 9, Terrestrial Environment | Context and Rationale: There is potential for some species at risk (e.g., myotis species, barn or bank swallows, common nighthawk) to be attracted to and use mine infrastructure (buildings, roads etc.) once constructed for nesting, roosting, or foraging. | For all Project phases, describe the mitigation measures and adaptive management to prevent and minimize effects on species at risk that may utilize mine infrastructure. | |
| | | | | <p>Details on mitigation measures and adaptive management with respect to attraction to Project components should be identified to assess residual and cumulative impacts to species at risk.</p> | | |
| IR-134 | ECCC | Wildlife and Wildlife habitat | Section 9, Terrestrial Environment | Context and Rationale: The draft EIS states in multiple places that vegetation clearing may occur year-round. | Provide important roosting dates for bat species at risk in the Project area. | |
| | | | | <p>In order to correspond with the timing of emergence from hibernation, tree clearing should not be conducted during the bat roosting period. If maternity roost trees are removed after pregnant females have established a roost area, there is a higher likelihood of abortion than there would be otherwise.</p> <p>Species-specific mitigations are required to protect bat SAR.</p> | | |
| IR-135 | ECCC | Migratory birds, Wildlife and Wildlife Habitat | Section 9, Terrestrial Environment | Context and Rationale: The mitigation measures for birds and wildlife presented in the draft EIS are very general. Additional detail is required for a complete assessment of residual and cumulative Project effects to birds and wildlife. | The following information should be included in the various plans and should be provided for review during the environmental assessment: | |
| | | | | <p>The Proponent has committed to providing a number of plans including, a Decommissioning Plan, a Spill Response Plan, a Waste Management Plan, a Surface Water Monitoring Plan, a Remediation and Closure Plan, a Radiation Protection Plan, a Soil and Vegetation Monitoring Plan, a Wildlife Monitoring Plan, and a Woodland Caribou</p> | <p>1. For all Project phases, describe the species-specific mitigation measures and responses to prevent and minimize effects on migratory birds or species at risk (SAR) birds and mammals that may utilize mine infrastructure.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|---|---|------------------|
| | | | | Management Plan. In order to assess potential affects to migratory birds and wildlife from Project related activities, ECCC requires details on species-specific mitigation measures, and monitoring plans. | <p>2. Explain how light pollution will be managed and what specific mitigation measures will be used to minimize effects to migratory birds and SAR birds and mammals.</p> <p>3. Provide details on what methods will be used for erosion control and how they will prevent sediment from entering waters frequented by migratory birds or SAR. Explain what actions will be taken if the erosion control measures are not successful.</p> <p>4. Provide details on noise and other sensory disturbance monitoring and mitigations if noise levels surpass thresholds.</p> <p>5. Describe time windows and species- specific mitigations related to maintenance activities such as vegetation management, road or building repair and stream crossing replacements.</p> | |
| IR-136 | CNSC | Soil Salvage Monitoring | Section 9.1.8.2 | <p>Context: The proponent plans to salvage and stockpile soil and organic matter/peat in order to use it in reclamation activities during decommissioning. Periodic monitoring of the stockpiles is proposed to be conducted to verify that soil and organic matter/peat are delineated, stripped, handled, and stockpiled as recommended, and to evaluate the stability of salvaged soil, e.g., in relation to potential erosion and/or degradation. It is unclear whether monitoring includes soil quality in terms of concentrations of COPCs.</p> <p>Rationale: It is expected that project-related activities (road and airport traffic, drilling) can result in open-source (i.e., fugitive) dust and process-source dust (incl. radionuclides), which can accumulate and result in changes in soil quality of the stockpiled soil and organic matter/peat as described in Sections 9.1.4.2.2 and 9.1.4.2.3).</p> | Please clarify if COPC concentrations monitoring is planned to be performed for stockpiled soil and organic matter/peat. | |
| IR-137 | ECCC | Migratory birds, Wildlife and Wildlife Habitat, Vegetation and Wetlands | <p>Section 9.2.1.3, Spatial and Temporal Boundaries for Vegetation and Ecosystems, Listed Plant Species and Wetlands</p> <p>Section 9.3.1.3.1, Spatial Boundaries for Ungulates, Furbearers and Woodland Caribou</p> | <p>Context and Rationale: The CNSC’s Generic Guidelines for the Preparation of an EIS Pursuant to the Canadian Environmental Assessment Act, 2012 states that: “The EIS will describe the spatial boundaries, including local and regional study areas, for each VC to be used to assess the potential adverse environmental effects of the Project and provide a rationale for each boundary.</p> <p>Spatial boundaries will be defined taking into account the appropriate scale and spatial extent of potential environmental effects, community knowledge and Indigenous knowledge, current or traditional land and resource use by Indigenous groups, ecological, technical, social and cultural considerations.”</p> | <p>Provide a biologically relevant rationale for the delineated study boundaries (LSA and RSA) for all different valued components. Include the following information:</p> <ul style="list-style-type: none">• Descriptions of how the RSA and LSA boundaries were derived for all VCs. <p>Specific to boreal caribou:</p> <p><u>Project Footprint:</u></p> <ul style="list-style-type: none">• Include a 500-m buffer of area of maximum physical disturbance to represent functional habitat loss for boreal caribou <p><u>LSA:</u></p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|----------------------|---|---|---|------------------|
| | | | 9.4.1.3.1, Spatial Boundaries for Raptors, Migratory Breeding Birds, and Bird Species at Risk | <p>The information provided in the EIS does not enable a biologically relevant assessment of the Project's effects.</p> <p>The Proponent did not provide rationale for the selection of study areas for individual vegetation, wildlife or migratory bird valued components (VC). Different VCs may have different spatial boundaries for the LSA and/or RSA. For wildlife and bird VCs, the LSA is defined as a 1.7-km buffer from the Project area, and the RSA is defined as a 6.6-km buffer around the LSA. There is no information on how the spatial boundaries were derived.</p> <p>Specific to Woodland Caribou, boreal population (hereafter referred to as boreal caribou):</p> <p><u>Project Footprint</u>: In a scientific assessment of critical habitat (Environment Canada, 2011) [1] ECCC demonstrated that the application of a 500-m buffer to mapped anthropogenic features best represents the combined effects of increased predation and avoidance on caribou population trends at the national scale. Adding a 500-m buffer to the Project footprint is required to represent functional habitat loss.</p> <p>The draft EIS does not appear to use a buffer for their Project area. The draft EIS (Section 9.3.1.3.1) states: “Project Area: the area within which the Project and all components/activities are located (i.e., the area of maximum physical disturbance). The Project Area covers 169.6 ha and is not VC-specific, but consistent throughout the EA.” (p. 9-168)</p> <p><u>LSA</u>: The defined LSA for boreal caribou has to consider avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance. This required information is not detailed in the draft EIS.</p> <p>Adverse effects of Projects including predator and prey access to undisturbed areas, reduction in connectivity, and sensory disturbance to individual boreal caribou can vary and extend several kilometers depending on Project activities and ecological context. At minimum, the LSA should capture the above- mentioned effects. For boreal caribou, the Project footprint should be defined as the immediate area to be cleared, plus a 500-m buffer to represent functional habitat loss. Following this guidance, the LSA should be defined as a buffer of the Project footprint with the 500-m buffer.</p> <p><u>RSA</u>: The Amended Recovery Strategy for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada states: <i>Mitigation of adverse effects from individual projects/activities will</i></p> | <ul style="list-style-type: none">• Include a description of how the LSA takes into account boreal caribou avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance to individuals. <p><u>RSA</u>:</p> <ul style="list-style-type: none">• Include a description of how the RSA used in the draft EIS is an accurate representation of the SK1 boreal caribou range; or• Re-do the assessment with the RSA at the scale of the range <p>See also related IRs: IR-154 and IR-156.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|----------------------|--|---|---|------------------|
| | | | | <p><i>require a coordinated approach and management of cumulative effects within and among ranges. A cumulative effects assessment is essential to position the proposed project/activity in the context of all current and future development activities. The cumulative effects assessment will:</i></p> <ul style="list-style-type: none">• <i>Assess the impact of all disturbances (anthropogenic and natural) at the range-scale;</i>• <i>Monitor habitat conditions, including the amount of current disturbed and undisturbed habitat, and amount of habitat being restored;</i>• <i>Account for planned disturbances; and</i>• <i>Assess the distribution of disturbance in large ranges for risk of range retraction in parts of the range.</i> <p>The proposed Project’s cumulative effects for boreal caribou are possible at the scale of the SK1 boreal caribou range. The RSA used for boreal caribou for this Project is only 40,173.6 ha, compared to the SK1 range, which is 18,034,870 ha. As such, it is too small to capture cumulative effects to this species and does not follow the Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada (Environment Canada, 2011) or the Amended Recovery Strategy for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada.</p> <p>Reference: [1] Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada (Environment Canada, 2011).</p> | | |
| IR-138 | CNSC | COPC in Lichen | Section 9.2.4.2.2 Appendix 10-A (ERA) | <p>Context: A quantitative assessment using modelling dispersion and uptake of COPCs in the environment was completed for the Project as part of the ERA, to support conclusions drawn in the EIS. In Appendix 10-A (ERA), COPCs in plant tissue was estimated for lichen. Table 5-5 of the ERA (p. 5.24) named “Complete Exposure Pathways for All Selected Ecological Receptors to be Assessed using the IMPACT Model” lists the exposure pathway for lichen as direct contact on soil.</p> <p>Rationale: Airborne COPC can deposition on lichen and subsequently enter the food chain; therefore, the “contact with air” pathway should be considered. In fact, lichen species are frequently used to monitor the deposition and accumulation of airborne contaminants (e.g., dust, metals). It is also noted that based on sampling results of the 2017 baseline studies, lichen frequently contain higher concentrations of COPC than blueberry (compare Table 9.2-6 and Table 9.2-7 in the EIS), especially at sampling sites with elevated concentrations (e.g., RSV9 and RSV10).</p> | <p>Please include the exposure pathway of direct deposition (dry and wet) of airborne contaminants on lichen in the quantitative ERA, or justify why this exposure pathway was not considered.</p> <p>See also related: IR-189.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|--|---------------------|
| IR-139 | ECCC | Change to an environmental component due to hazardous contaminants | Section 9.2.5.2.7, Waste and Hazardous Materials Management | <p>Context: In this section, the Proponent outlines various measures to mitigate air emissions, including implementation of the air quality programs within the Environmental Management System, regular maintenance and inspection of equipment, and elimination of unnecessary idling of equipment. However, the intention to use industry-standard emission control systems has not been substantiated.</p> <p>Rationale: For the protection of air quality, it is important to specify the emission standards that equipment will have (e.g., Tier 3 or Tier 4 engines). Vehicles and equipment with Tier 4 engines have much lower emissions of contaminants than those with Tier 3 engines. If non-Tier 4 engines are used, ECCC recommends that best management practices are followed, including proper maintenance of the engine and anti-idling measures.</p> | Confirm if vehicles and equipment will be equipped with Tier 4 engines where feasible. | |
| IR-140 | CNSC | Change in the Areal Extent of Wetlands | Section 9.2.6.4 | <p>Context: Predicted residual effects on the areal extent of wetlands include the direct effect of loss of wetlands and several indirect effects of alteration of wetlands. As stated in the EIS, wetlands can exhibit low resilience and high susceptibility to disturbance. At the same time, wetlands tend to support a high species diversity, and are considered to have a moderate to high potential to support listed plant species. Lastly, wetlands are rare on the landscape compared to terrestrial ecosites (see Table 9.2-5).</p> <p>Rationale: Several wetland ecosites (BS19/24, BS25, BS27) occur only in small areas (< 30 ha) in the RSA but are predicted to experience disturbance of 6-64%, most notably the ecosite BS19/24 where 0.8 of 1.2 ha are predicted to be disturbed. It is noted that wetlands are scattered throughout the landscape as shown in Figure 9.2-8. More information is requested regarding the ecological impact of this disturbance.</p> | <p>1. Please provide a discussion on the ecological impact of disturbance to rare wetland ecosites.</p> <p>2. Please provide information on whether adequate other habitat is available for species impacted in these disturbed sites in close proximity, taking into account the home ranges of susceptible species.</p> <p>3. Please provide additional information on whether wetland connectivity is maintained through the landscape within the LSA/RSA.</p> <p>See also related: IR-141.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends that Denison conduct monitoring of species present in wetlands before and after disturbance, with a focus on listed plant species.</p> | Verify text changes |
| IR-141 | ECCC | Wetlands | Section 9.2.6.4.1 | <p>Context and Rationale: The Proponent states that: “Direct loss of wetlands has been mitigated by reducing the size of the Project Area to the extent practicable during Project design.</p> <p>However, up to 0.5 ha (less than 0.1%) of all wetlands within the Terrestrial RSA are anticipated to be removed from the Project Area during Construction (Table 9.2-16).”</p> <p>Information is not provided on whether wetlands in the terrestrial RSA are considered ecologically, economically or socially important to the region. Information on the regional importance of the wetlands that will be lost is needed in order to assess effects, including a wetland</p> | <p>1. Provide information that accounts for whether wetlands are considered ecologically, economically and socially important to the region.</p> <p>2. If the above is affirmative provide a wetland compensation plan to offset the loss. Consistent with the Operational Framework For Use of Conservation Allowance [1] a minimum ratio of 2:1 should be the starting point when determining the amount to be offset.</p> <p>[1] Available at : https://publications.gc.ca/site/eng/9.696852/publication.html</p> | |

| IR-142 | ECCC CNSC | Wildlife and Wildlife habitat | Section 9.3.3.2.1 Scientific Literature Review – Wolverine Section 9.3.5 Mitigation Measures Section 9.3.6 Residual Effects Evaluation | <p>Context: The Proponent did not conduct any field work to identify potential wolverine dens in the Project area and therefore did not present any mitigations for the potential impacts to wolverine dens.</p> <p>In Section 9.3.3.2.1, the Proponent states: “Denning females are sensitive to disturbance during denning season in February to April and may abandon their dens and, in some cases, their litter, which may decrease their reproductive success. “</p> <p>In Section 9.3.6, the Proponent states: “In the Project Area, 145.0 ha or 100% of available wolverine habitat is assumed to be removed and will not be available to wolverine for the duration of the Project (Table 9.3-13). Similarly, 145.0 ha (3.4%) of available wolverine habitat within the Wildlife LSA is anticipated to be removed, all from the Project Area, during site clearing in Construction. In the Terrestrial RSA, up to 0.5% (145.0 ha; from the Project Area) of available wolverine habitat is anticipated to be removed during site clearing in Construction.”</p> <p>The residual effect assessment estimates that 8.2% of available wolverine habitat within the Terrestrial RSA may be altered or lost (Table 9.3-20).</p> <p>Rationale: As Wolverine is a Species at Risk Act Schedule 1 listed species, effects need to be identified, avoided, lessened and monitored. Mitigations, such as setback distances, should be used to protect important habitat features, such as dens.</p> <p>Wolverine occupy large home ranges and, therefore, need vast tracts of undisturbed land to maintain viable populations. The species avoids most human footprint types and linear features.</p> | <p>1. Please provide additional information on whether the lost and/or altered wolverine habitat overlaps with wolverine home ranges.</p> <p>2. Describe any important wolverine habitat feature (i.e., dens) that may be lost as a result of the Project.</p> <p>3. Assess the need for pre- construction/pre-clearing surveys to identify any wolverine denning sites.</p> <p>4. Please provide additional information on whether the remaining, available, undisturbed wolverine habitat size is suitable to maintain populations.</p> | |
| IR-143 | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3, Baseline Studies | <p>Context and Rationale: The baseline caribou data is insufficient to understand potential Project impacts to this species. Presence/absence detection was provided by camera traps, incidental observations, winter track and pellet survey.</p> <p>Additional information and analyses on caribou use of the landscape during all life stages of the Project area is required to assess impacts and to determine significance of impact from the Project to caribou.</p> | <p>Provide details on the baseline caribou data including:</p> <ul style="list-style-type: none">• Revision of map 9.3-8 to include all observations, categorized by type, season and year (see also IR-145); and• Description of seasonal use of the LSA, RSA and caribou range.• Description of Project areas used by caribou.• Description of future studies planned to assess habitat use by caribou. Include specific details on how many additional years of aerial surveys will be completed to assess the caribou baseline conditions. <p>Utilizing additional data noted above and specified in IR-</p> | |

|--------|------------|-------------------------------|--|--|---|------------------|
| | | | | | 145, explain how caribou use of the area could be affected by the Project throughout all seasons and life stages (e.g., calving, post-calving, rutting, wintering). See also related: IR-152. | |
| IR-144 | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3, Baseline Studies – map 9.3-8 | <p>Context and Rationale: The mapping of caribou observations during baseline studies provided in Figure 9.3-8, “Caribou Sign Observations in the Wildlife Study Areas,” is insufficient to enable conclusions to be drawn.</p> <p>ECCC is not able to review the spatial aspect of caribou observations without a map of all available observations. Additional information is available, as stated in Section 9.3.3.3.3:</p> <p><i>“A total of 200 observations were made between 2017 and 2019 and recorded as either caribou sign (i.e., tracks, pellets, and evidence of feeding activity based on ground feeding craters and arboreal feeding evidence) or photographs (collected through the wildlife camera study) to document caribou presence in the LSA and RSA. Most observations occurred in the Terrestrial RSA, with observations concentrated in the north and southeast portions.</i></p> <p><i>Three observations occurred in the southeast portion of the Wildlife LSA, and no caribou sign was observed in the Project Area. Figure 9.3-8 provides an overview of some caribou sign observed during the baseline studies.”</i></p> | Update map 9.3-8 to show all caribou observations during baseline studies, broken down by type of observation (camera, incidental, pellet, track) and season/year when the observation was made. Include additional data from the Province of Saskatchewan (see also IR-145) to help characterize caribou use on a spatial map. | |
| IR-145 | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3, Woodland Caribou | <p>Context and Rationale: The Proponent has not provided sufficient information on how caribou use the landscape, including identification of areas for different life stages of caribou (calving, post-calving, rutting and wintering).</p> <p>The University of Saskatchewan published a report entitled Population and habitat ecology of boreal caribou and their predators in the Saskatchewan Boreal Shield. This report contains information on habitat types that are used during different life stages. Additionally, Appendix H of the Amended Recovery Strategy for the Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada 20202 [1] details habitat characteristics required by boreal caribou to carry out life processes necessary for survival and recovery.</p> <p>The scientific literature review (Section 9.3.3.3.1) on Woodland Caribou states: “While calving areas have not been documented within the SK1 range, it is recognized that caribou may use open fen and treed bog habitat types for calving during the spring/summer period. In Saskatchewan, caribou habitat used during the calving season in the SK2 range demonstrated a strong selection for treed</p> | <p>1. Provide, based off existing literature or available data and the Amended Recovery Strategy for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada:</p> <ul style="list-style-type: none">information on known important habitat features or biophysical attributes in Project areas for different caribou life stages (calving, post-calving, rutting, wintering),a map(s) of the type and spatial extent of important caribou habitat features or biophysical attributes of the study areas as defined in Appendix H of the Recovery Strategy,<ul style="list-style-type: none">mapping should be at the RSA/LSA level as well as larger-scale mapping at the scale of the Project footprint. <p>2. Assess the potential direct and indirect effects based on additional information on caribou from bullet A above.</p> <p>See also related IRs: IR-143 and IR-152.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------------|---|--|--|------------------|
| | | | | <p>muskegs, but avoidance of jack pine, mixed hardwood stands, and roads (Dyke 2008).”</p> <p>ECCC is not able to verify the Proponent’s effects assessment without sufficient information on important habitat or biophysical attributes for caribou within the study areas.</p> <p>[1] https://www.canada.ca/en/environment-climate-change/services/species-risk-public-registry/recovery-strategies/woodland-caribou-boreal-2020.html#toc0</p> | <p>Suggestions for mitigation and follow-up measures: ECCC recommends that the Proponent contact the Province of Saskatchewan to enquire about obtaining caribou telemetry data in the Project area. The data can be analyzed to determine important habitat features in the Project area.</p> | |
| IR-146 | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3.1, Woodland Caribou, Scientific Literature Review - Predation | <p>Context and Rationale: The information on impacts of predation and apparent competition for caribou in relation to the proposed Project are insufficient.</p> <p>In the section on caribou predators (9.3.3.3.1), the Proponent provided details on densities of wolves and their overlap with caribou and speaks of apparent competition. The Proponent did not examine other predators, such as black bear.</p> <p>The analysis on impacts of predation and apparent competition is insufficient since known predators have been omitted without explanation from the assessment of effects. ECCC is not able to verify the Proponent’s effects assessment since important species have not been considered in the assessment.</p> | <p>Provide further information and analyses on all potential predators of caribou, including impacts from apparent competition.</p> | |
| IR-147 | ECCC | SAR - Boreal Caribou | Section 9.3.4.2.1, Alteration and/or Loss of Habitat | <p>Context and Rationale: The process of in-situ recovery mining will likely create changes to the surface topography and potential ground subsidence as well as changes to groundwater elevations. These changes can affect the plant communities and ecosite types.</p> <p>In Section 9.3.4.2.1 the Proponent states that: “Following decommissioning and reclamation, wildlife habitat is expected to recover to baseline conditions.”</p> <p>A more thorough explanation regarding post-decommissioning landscape is required to assess Project impacts.</p> | <p>1. Provide further rationale and/or analysis regarding the return of wildlife habitat to baseline conditions post-decommissioning. Incorporate other environmental impacts including:</p> <ul style="list-style-type: none">• Ground subsidence and impacts on wildlife habitat• Changes to aquifers and impacts on wildlife habitat <p>2. Describe reclamation activities/measures, including temporal information that will be implemented to help in the recovery to baseline conditions.</p> | |
| IR-148 | ECCC | Wildlife and Wildlife habitat | Section 9.3.4.2.1, Alteration and/or Loss of Habitat | <p>Context and Rationale: ECCC analyzes disturbance for caribou at the range level, in this case within the SK1 range. However, the Proponent did not provide an adequate assessment of total disturbance at the range level. The draft EIS (Section 9.3.4.2.1 p. 9-211) reads: “The SK1 Boreal Shield Woodland Caribou Management Unit has relatively low levels of anthropogenic disturbance and was exposed to large fire disturbances in the past 40 years (ECCC 2019). Environment and Climate Change Canada (2019) identified this caribou population as</p> | <p>Provide the following in order to support analysis of habitat disturbance:</p> <ol style="list-style-type: none">1. Calculation of total disturbance including natural and anthropogenic disturbance at the range level.2. Description of effects on existing habitat at the scale of the range (for < 40% undisturbed habitat in the SK1). Include: | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|--------------|-------------------------------|--|---|--|------------------|
| | | | | <p>being self-sustaining at a threshold of 40% undisturbed habitat with the total anthropogenic disturbance not exceeding 5% of their habitat. The current anthropogenic disturbance levels (without areas burnt by past forest fires) for the study areas are below this threshold (with the exception of the already disturbed Project Area) and are estimated as: 24.8 ha (14.6%) for the Project Area, 168 ha (3.5%) for the Wildlife LSA, and 599 ha (1.5%) for the Terrestrial RSA.”</p> <p>Analysis of habitat disturbance should be calculated at the range level in order to assess impacts and determine significance.</p> <p>Analysis should be consistent with the methodology described in the document Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada (Environment Canada, 2011) [1].</p> <p>[1]https://publications.gc.ca/site/eng/401605/publication.html, p. 28/41</p> | <ul style="list-style-type: none">an account (and GIS file if available) of existing habitat affected, using the following formula: (Project footprint + 500m buffer) - overlapping (permanent alteration(s) + 500m buffer) <ol style="list-style-type: none">A map of the SK1 range showing all disturbed and undisturbed habitat, including predicted disturbance (direct and indirect) resulting from the Project.Description of whether the Project is expected to compromise the ability of the range to be restored to the undisturbed habitat threshold, and provide a rationale for the conclusion. <p>See also related: IR-154.</p> | |
| IR-149 | ECCC CNSC | Wildlife and Wildlife habitat | Section 9.3.5.2, Additional Wildlife-specific Mitigation Measures | <p>Context: The EIS describes that ongoing research is performed to inform the development of a Woodland Caribou Management Plan. This includes studies on the effectiveness of linear disruption features on predator/prey movements, and a field program for long-term reclamation planning. Moreover, it is stated that the Plan will include a detailed assessment of the need for habitat offsets.</p> <p>The draft EIS Section 9.3.5.2 states: “A wildlife monitoring plan and a Woodland Caribou Management Plan will be developed to address wildlife-specific mitigation measures based on proven and accepted mitigation following standard industry guidelines and BMPs. The plans will provide guidance to avoid or minimize potential adverse effects of the Project on wildlife and wildlife habitat, including monitoring and follow-up programs, as appropriate. It will be in place during all phases of the Project and will be subject to ongoing review and revision as required. If monitoring identifies a need for additional or revised mitigation measures, a process of adaptive management (as described in the plan) will be triggered.”</p> <p>Rationale: The draft EIS does not present sufficient species-specific mitigation measures for boreal caribou. ECCC is not able to assess potential residual impacts to caribou without specific mitigations.</p> <p>Since the Woodland Caribou Management Plan is still under development, it is difficult to judge whether the measures will be adequate to mitigate and/or offset potential project effects on Woodland caribou and its critical habitat.</p> | <p>Provide the Woodland Caribou Management Plan, to demonstrate effective mitigation of potential project effects, along with wildlife-specific mitigation measures for review.</p> <p>The Plan should be informed by and consistent with the Boreal Caribou Recovery Strategy and demonstrate that avoidance and minimization measures will be applied to mitigate for predicted Project effects to boreal caribou and its critical habitat prior to considering offsetting measures. That is, the Plan should follow the mitigation hierarchy and information should be provided as outlined below:</p> <ol style="list-style-type: none">AVOID: Describe all measures that will be taken to avoid effects to boreal caribou and avoid the destruction or alteration boreal caribou critical habitat.MINIMIZE: Describe all measures that will be taken to minimize the effects to boreal caribou and minimize the destruction of boreal caribou critical habitat.RESTORE ON-SITE: describe the measures that will be taken to restore disturbed areas of the project, related to construction, operation and maintenance, on boreal caribou critical habitat, remaining after considering the avoidance and minimization measures.Characterize the risk of the adverse effects that are likely to result from the project on boreal | |

|--------|------------|-------------------------------|---|---|--|------------------|
| | | | | | <p>caribou and its critical habitat after avoidance minimization, and onsite restoration measures have been considered.</p> <p>5. OFFSET: Describe the measures that will be implemented outside the Designated Project area to mitigate adverse effects, destruction or alteration of boreal caribou critical habitat by the Designated Project during construction and operation.</p> <p>6. Characterize the risk of the adverse effects that are likely to result from the project on boreal caribou and its critical habitat after avoidance, minimization, onsite restoration, and offset measures have been considered.</p> <p>Describe all relevant uncertainties on the effectiveness of the measures to address adverse effects on boreal caribou and the rationale for the selected measure, in light of the mitigation hierarchy.</p> <p>See also related IRs: IR-149 and IR-157.</p> | |
| IR-150 | ECCC | Wildlife and Wildlife habitat | Section 9.3.5.2.1, Best Management Practices for working in Boreal Woodland Caribou Range in Saskatchewan | <p>Context and Rationale: In the draft EIS Section 9.3.5.2.1, the Proponent states: “Denison proactively initiated research to provide field-based findings on the effectiveness of linear disruption features on predator/prey movements.”</p> <p>“Results will help the development of proactive and meaningful restoration strategies as an ongoing part of the overall Project (Omnia 2022). Additionally, the 2023 field program will support a program that uses the results from the 2021/2022 Caribou Trail Study in long-term reclamation planning. The program will be led by the University of Saskatchewan and is funded by Denison, an Indigenous-owned environmental company, the Northwest Communities Environmental Services (Métis owned), Mitacs, and the Natural Science and Engineering Research Council of Canada through an alliance grant. The Caribou Trail Study and the reclamation plan will culminate with the development of a Woodland Caribou Management Plan.”</p> <p>ECCC is available to support the Proponent through review of study programs should those programs be made available during the review process.</p> <p>ECCC requests to see the 2021/2022 study to further our review of caribou use in the Project area.</p> | Provide the report for 2021/2022 Caribou Trail study for long-term reclamation planning for ECCC review. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|---|---|------------------|
| IR-151 | ECCC | Wildlife and Wildlife habitat | Section 9.3.6.4 | Context and Rationale: In the analysis of residual and cumulative effects for woodland caribou, information and analyses on impacts to connectivity and movement across the landscape is lacking. | 1. Using available reports and data, provide an analysis of impacts to landscape connectivity for woodland caribou at the LSA and Range scales. 2. Determine whether the Project is expected to result in a reduction of connectivity within or between the ranges and provide a rationale for the conclusion. Describe how movement corridor(s) may be affected by Project activities and infrastructure. | |
| IR-152 | CNSC | Woodland Caribou Residual Effects Evaluation | Section 9.3.6.4, Appendix 9-B | Context: Baseline studies for Woodland caribou include: <ul style="list-style-type: none">• Winter Track Count Survey to assess presence, abundance, feeding activity, and ecosite affiliation;• Pellet Group/Browse Availability Survey to detect presence and abundance of caribou, and frequency of occurrence and abundance of lichen;• Covert Camera Survey to determine presence and use of linear features (roads, trails, and hand-cut lines). The Saskatchewan Conservation Strategy for Boreal Woodland caribou [1] states that caribou are very susceptible to predation during the calf-rearing period, and populations are extremely sensitive to even minor changes in mortality rates. Rationale: It is unclear if, or how, any data on seasonal and spatial use of habitat was considered in the residual effect analysis, for example summer/winter home ranges, sensitive life stages including calving (e.g., location of calving sites). It should be noted that the English River First Nation have identified caribou calving areas in the vicinity of the project footprint. Reference: [1] Saskatchewan Ministry of Environment. 2013. Conservation Strategy For Boreal Woodland Caribou (Rangifer tarandus caribou) in Saskatchewan. Saskatchewan Ministry of Environment. Fish and Wildlife Technical Report 2014. | Please provide a summary of available baseline data on habitat use during all seasons and life stages, in particular sensitive stages such as calving, and how habitat use during all seasons and life stages was considered in the residual effect analysis. See also IR-145 and IR-143. | |
| IR-153 | CNSC | Woodland Caribou Residual Effects Evaluation | Section 9.3.6.4.1 | Context: According to ECCC (2020), forest fires can directly alter habitat, making it unsuitable for boreal caribou (e.g., through loss of mature conifer stands, loss of lichens and other forage plants, barriers to movement). Boreal caribou generally do not return to burned areas for several decades until the forest is old enough to support lichens and other food sources, although they may make limited use of burned areas to feed on new growth. The residual effects evaluation of alteration and/or habitat loss lists ecosites BS3 and BS7 (regenerating forest types) as available habitat in | 1. Please provide further information on the suitability of ecosites BS3 and BS7 for Woodland caribou in different life stages. 2. Please provide the results of a residual effect analysis not including ecosites BS3 and BS7 for conservatism. 3. If 2 leads to habitat fragmentation, consider connectivity of habitat patches in the residual effect analysis. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|---|------------------|
| | | | | <p>Table 9.3-22, which represent 43.5% of the Regional Study Area.</p> <p>Rationale: It is unclear whether the ecosites BS3 and BS7 (regenerating forest types) represent suitable habitat for Woodland caribou year-round. More information is required on the habitat quality (e.g., time since last forest fire) and suitability for different life stages of caribou.</p> <p>For conservatism, it is recommended to perform a second residual effect analysis not including regenerating forest ecosites.</p> | | |
| IR-154 | CNSC | Woodland Caribou Alteration and/or Loss of Habitat | Section 9.3.6.4.1 | <p>Context: Lichen, the primary food source for Woodland caribou (up to 70% of the year-round diet), can be exposed to airborne contaminants and dust deposition at distances of 1–40 km (e.g., increased metal concentrations or dust were detected in lichen at distances of 1–40 km from a mine site [1, 2]).</p> <p>Rationale: Further information is requested on how the potential for contamination of the food source “lichen” is reflected in the applied buffers of direct and indirect disturbance for woodland caribou.</p> <p>References: [1] Watkinson et al. (2021). Effects of dust deposition from diamond mining on subarctic plant communities and barren-ground caribou forage. Journal of Environmental Quality 50(4): 990-1003. doi: 10.1002/jeq2.20251. [2] Chen et al. (2017). Does dust from arctic mines affect caribou forage? Journal of Environmental Protection 8(3): 258-276. doi: 10.4236/jep.2017.83020.</p> | <p>1. Please provide additional justification for how the potential for contamination of the food source “lichen” is reflected in the applied buffers for sensory disturbance.</p> <p>See also related IRs: IR-137, IR-148 and IR-156.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends the following:</p> <ul style="list-style-type: none">• COPC in Lichen monitoring is recommended in transects from the Project site to assess COPC concentrations and confirm whether the chosen buffer is conservative. | |
| IR-155 | ECCC | Wildlife and Wildlife habitat | Section 9.3.6.4.1, Alteration and/or Loss of Habitat | <p>Context and Rationale: In Section 9.3.6.4.1 of the draft EIS, the Proponent presents figure 9.3-14 and table 9.3-22, which “depicts available woodland caribou habitat in the Project study areas” and provide a summary of available Woodland Caribou Habitat in the Project Area, Wildlife Local Study Area, and the Terrestrial Regional Study Area.</p> <p>The Proponent does not provide a biologically relevant explanation on the ecosites that are considered available woodland caribou habitat.</p> <p>According to the amended recovery strategy for Caribou, all habitat within SK1 range has been designated as critical habitat. To align with best current knowledge and the amended recovery strategy, the map and table should show the biophysical attributes, as outlined in Appendix H of the recovery strategy.</p> | <p>1. Provide a biologically relevant explanation about how available caribou habitat was determined or determine available habitat based on new data from the province of Saskatchewan (See IR-145).</p> <p>2. Consider referencing Appendix H of the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020 to define important biophysical features.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------------|--|--|--|------------------|
| IR-156 | ECCC | Wildlife and Wildlife habitat | Section 9.3.6.4.1 Section 9.3.7.3.1 | <p>Context and Rationale: In Section 9.3.6.4.1 of the draft EIS, the Proponent identified that 142 ha of available caribou habitat within the Project footprint will be directly impacted or lost, while an additional 1,165 ha will be indirectly impacted by Project activities such as sensory disturbance. They assessed the residual and cumulative effect of alteration to habitat for woodland caribou as not significant: “The residual effect of alteration and/or loss of available woodland caribou habitat is not expected to result in a change that will alter caribou habitat integrity to the point where it would not be able to sustain the regional woodland caribou population. Therefore, the effect is assessed as not significant.”</p> <p>Section 9.3.7.3.1 of the draft EIS states: “It is not expected that the cumulative effects of alteration and/or loss of habitat will alter the integrity of woodland caribou habitat within the Terrestrial RSA to the point where it is not sustainable or available to contribute to ecological functions. Therefore, the cumulative effects resulting from the Project’s residual effect interacting with residual effects from other projects and activities is predicted to be not significant.”</p> <p>For the residual effect of alteration and/or loss of available caribou habitat (Section 9.3.6.4.1, Table 9.3-24), the proponent assessed the magnitude as low, the geographic extent as local, the duration as long-term, the frequency as frequent, the reversibility as fully reversible, the context as high and the likelihood as likely. The rationale provided by the proponent is insufficient to determine the accuracy of these assessments, given the lack of data and the small size of the assessment area. ECCC does not support the residual effects assessment of low magnitude, given the uncertainties related to seasonal use by caribou in the project area and the current level of disturbance in the SK1 range.</p> <p>For the cumulative effect of alteration and/or loss of available caribou habitat (Section 9.3.7.3.3 , Table 9.3-30), the proponent assessed the magnitude as moderate, the geographic extent as beyond the RSA, the duration as long-term, the frequency as frequent, the reversibility as fully reversible, the context as high, the likelihood as likely, the significance as not significant and the level of confidence as moderate. The rationale provided by the proponent is insufficient to determine the accuracy of these assessments, given the lack to data presented for caribou and the small size of the RSA, compared to the SK1 region. ECCC does not support the conclusion of the cumulative effects assessments or for the level of confidence.</p> <p>The Amended Recovery Strategy for the Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada 2020 states that the range is currently at the 60% disturbance management threshold.</p> | <p>Provide a revised assessment of residual and cumulative effects, taking into consideration that the disturbance within the SK1 range is above the disturbance management threshold required for survival and recovery of the species.</p> <p>See also related IRs: IR-137 and IR-154.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------------|--|---|--|------------------|
| | | | | Therefore, any activity likely to result in the alteration or destruction of critical habitat may impact on the species survival and recovery. In addition, the Proponent’s assessment was based on information that was lacking data on calving, wintering and rutting areas, and connectivity and caribou movements. The absence of considerations of the regional context of disturbance does not provide a conclusion based on best available information. | | |
| IR-157 | ECCC | Wildlife and Wildlife habitat | Section 9.3.9 Ungulates, Furbearer and Woodland Caribou Summary | <p>Context and Rationale: The Proponent has committed to developing a Woodland Caribou Management Plan, which will include a “detailed assessment for the need for habitat offsets.” The Woodland Caribou Management Plan will support ECCC’s review of the Proponent’s assessment of residual effects following mitigation and offsetting.</p> <p>This plan should consider ECCC’s Operational Framework for Use of Conservation Allowances (ECCC, 2012). ECCC is available to assist the Proponent in the determination of appropriate offsets that would balance against Project adverse effects after the application of measures to avoid, minimize and restore on-site are adopted.</p> <p>Based on the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020, anthropogenic impacts to local caribou populations experience a lag effect, which occurs over extended periods. This lag effect needs to be adequately considered when proposing offsets.</p> <p>ECCC is available to assist the Proponent in understanding how critical habitat is described in the Recovery Strategy and the determination of appropriate offsets that would balance against Project effects based on the predicted impacts to caribou habitat.</p> | <p>Provide the Woodland Caribou Management Plan for review. The plan should clearly demonstrate efforts to avoid and minimize any Project effects and restore on-site any disturbed areas prior to the consideration of offsetting. Details on how severity of disturbance and vulnerability of the species were considered should be explained.</p> <p>See also related: IR-149.</p> <p>Suggestions for mitigation and follow-up measures: ECCC notes that the Woodland Caribou Management Plan should clearly explain efforts to address Project effects, including any contribution to cumulative adverse effects, after it has been determined that all options in the previous steps of the mitigation hierarchy (i.e., avoidance, and minimization,) have been fully considered and applied.</p> <p>In the Woodland Caribou Management Plan, provide details on how the factors outlined in the Operational Framework for Use of Conservation Allowances (ECCC, 2012) were considered in determining the offsetting amounts, including the severity of disturbance and vulnerability of the caribou population. Important factors including time lag (the amount of time from restoration work to when the habitat would be considered caribou habitat) would also need to be considered.</p> <p>ECCC typically recommends a minimum offset multiplier of 4:1 (offset outcome: area disturbed). This is a benchmark ratio applied to a project that is in the lower end of the risk spectrum, such as one with a low severity impact adversely affecting a low vulnerability ecological component. In general, the minimum 4:1 multiplier accounts for time-lags to restoration, uncertainty in outcomes, a precautionary approach, and the adverse impact itself in its specific context. Offset multipliers are variable and determined by project-specific circumstances and associated risks and uncertainties.</p> | |

|--------|------------|----------------------|---|--|--|------------------|
| IR-158 | ECCC | Migratory birds | Section 9.4.1.2, Key Indicators and Measurable Parameters | <p>Context and Rationale: In Section 9.4.1.2 the Proponent outlined key indicators for “Migratory Breeding Birds” which includes Waterbirds and Waterfowl, Upland Game Birds and Migratory Songbirds. These are broad categories, which do not allow for assessment of the variation in habitat requirements or ecology of individual species or guilds.</p> <p>ECCC advises the Proponent to identify additional focal species that have the ability to represent anticipated impacts to a broader guild of species. Indicator species should be demonstrably sensitive to the potential effect of interest, and suitable for inferring effects on other species.</p> <p>Species may be grouped into guilds for assessment based on similarities in ecology or vulnerability to Project effects (e.g., species at elevated risk of collision with vehicle traffic).</p> | Identify focal species/guilds for each key indicator species within the Migratory Breeding Birds valued components. Provide an updated analysis of Project effects on migratory birds. | |
| IR-159 | ECCC | Migratory birds | 9.4.3.2.3 Baseline Studies – Migratory Songbirds Appendix 9-B, Section 2.10.2, Results | <p>Context and Rationale: Information presented in the draft EIS is insufficient to accurately predict Project impacts to breeding birds. The Proponent collected a single year of breeding songbird point counts and aerial waterfowl surveys (including avian species at risk). A single year of surveys in which birds may be unusually scarce or abundant could severely compromise interpretation of post-construction monitoring data.</p> <p>Additionally, data presented in the draft EIS is from 2017 and ECCC advises that more recent data is needed for a comprehensive baseline to verify Project impacts.</p> <p>Data from the Saskatchewan Conservation Data Centre (HABISask), the Saskatchewan Breeding Bird Atlas and the Boreal Avian Modelling project contain information on avian densities and avian species at risk that could supplement field data.</p> <p>The national standard for major projects recommends a minimum of two years of field surveys to be provided, so that temporal variability can be considered when comparing post-construction against baseline records and other available data.</p> | Supplement breeding bird point count data and aerial waterfowl data collected during 2017 with additional pre-construction field data or existing post-2017 data/modelling to provide a comprehensive baseline that can be used to verify Project impacts during construction and operational phases. | |
| IR-160 | ECCC | Migratory birds | Section 9.4.3.2.3 Baseline Studies – Migratory Songbirds | <p>Context and Rationale: ECCC advises that the results of the field studies need to be interpreted/analyzed in the context of the study area. The Proponent presents results on areas with highest richness and diversity but does not make a link to habitat that will be lost or experience indirect effects.</p> <p>Results from baseline studies as well as other supplemental information as per IR-159 should be used in effects assessment.</p> | Provide results interpreted in the context of Project direct and indirect effects. Include discussion on the habitat types that will be lost or indirectly impacted during the Project and the overall impact on the avian community, using results from the analysis of baseline studies and other supplemental data (as per IR-159). | |

|--------|------------|----------------------|--|---|--|------------------|
| | | | | | Discussion should support the conclusions of the effects assessment. See also related IRs: IR-161 and IR-162. | |
| IR-161 | CNSC | Bird Species at Risk | Section 9.4.3.3 Appendix 10-A (ERA) | <p>Context: For the assessment of effects on Bird Species at Risk (SAR), in the EIS it was decided to use representative species for certain SAR birds:</p> <ul style="list-style-type: none">Olive-sided Flycatcher and Common Nighthawk were selected to represent Barn Swallow.Yellow Rail and Rusty Blackbird were selected as substitutes for Horned Grebe. <p>No further rationale is provided to demonstrate that the identified surrogate species are representative of the Barn Swallow and Horned Grebe in the EIS. For example, do they share a common diet?</p> <p>Moreover, in the residual effects assessment, limited discussion is provided on the conservatism of chosen suitable habitat types for both surrogate and represented species, in the calculation of habitat loss and alteration, as well as change in mortality. For example, how does habitat for Common Nighthawk and Barn Swallow overlap (do they use identical habitat types?) and how does this affect the calculation of habitat loss and alteration used to evaluate the magnitude of residual effect?</p> <p>Finally, in the ERA, Lesser Scaup is the surrogate for Horned Grebe. Yellow Rail is also represented by Lesser Scaup but Rusty Blackbird is represented by Olive-sided Flycatcher.</p> <p>Rationale: It is unclear what criteria were applied to select surrogate species for Barn Swallow and Horned Grebe, and how the chosen surrogates relate to Barn Swallow and Horned Grebe in terms of habitat type and range, nesting, and feeding requirements etc.</p> <p>There is also inconsistency with respect to the use of surrogate species for the Horned Grebe between the EIS and ERA supporting document.</p> | <p>1. Please provide additional information to justify the selection of surrogate species for Barn Swallow and Horned Grebe in the EIS. This should include a description of the similarity of SAR and associated surrogate species and any relevant uncertainties.</p> <p>2. Please provide conservative estimates of habitat loss and alteration for the represented and not directly assessed species (Barn Swallow, Horned Grebe).</p> <p>3. Please provide clarity as to why different surrogate species are used for Horned Grebe between the EIS and ERA.</p> <p>See also related IRs: IR-160 and IR-162.</p> | |
| IR-162 | ECCC | Migratory birds | Section 9.4.3.3, Bird Species at Risk | <p>Context and Rationale: Not all avian species at risk present in the study area were included as Key Indicators in the avian species at risk (SAR) valued component (VC). Barn swallow and horned grebe were recorded in the study area, but not included as VCs. Additionally, bank swallow may inhabit the Project area. Impacts to Species at Risk Act Schedule 1 listed species need to be identified, avoided, lessened and monitored.</p> | <p>1. Explain how nesting habitat requirements of barn swallow is represented by common nighthawk and olive-sided flycatcher as a VC or assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>2. Explain how nesting habitat requirements of horned grebe are represented by yellow rail and rusty blackbird as</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|--------------|----------------------|---|--|--|------------------|
| | | | | <p>In Section 9.4.3.3. the Proponent states: “It is acknowledged that the listed Barn Swallow (<i>Hirundo rustica</i>) and Horned Grebe (<i>Podiceps auratus</i>) could potentially occur in the Terrestrial RSA. Incidental observations occurred during the baseline studies (Appendix 9-B). To focus the effects assessment on a few key species (described in the following) it was decided to use Olive-sided Flycatcher and Common Nighthawk to represent Barn Swallow as well, and to use Yellow Rail and Rusty Blackbird as a substitute for Horned Grebe. Unlike Horned Grebe, Yellow Rail and Rusty Blackbird are also listed provincially.”</p> <p>Barn swallow, bank swallow and horned grebe may have different nesting habitat requirements than the representative species discussed in the draft EIS. An explanation of how differing species are representative of one another is required, or if an explanation cannot be provided, the species should be assessed individually.</p> | <p>a VC, or assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>3. Assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>See also related IRs: IR-160 and IR-161.</p> | |
| IR-163 | ECCC | Migratory birds | Section 9.4.3.3.3, Baseline Studies – Avian species at risk VCs | <p>Context and Rationale: The baseline studies and data analysis for species at risk (SAR) birds is insufficient to accurately predict Project effects.</p> <p>ECCC recommends the use of predictive modeling in relation to survey data and habitat attributes to produce distribution and density maps. Sites within the study area that support particularly high densities or diversity of an individual species, based on direct observation and, where appropriate, distribution or occupancy models, would greatly improve confidence in Project impact predictions.</p> <p>Additional information on specific habitat use or models of habitat used by SAR would facilitate a more complete analysis of Project effects.</p> | <p>Provide additional information, including mapping/modelling of specific habitat requirements for each avian species at risk or provide a justification of models used in the draft EIS.</p> | |
| IR-164 | ECCC | Migratory birds | Section 9.4.4.2.1, Alteration and/or Loss of Habitat – Migratory Breeding Birds | <p>Context and Rationale: The discussion on impacts to migratory songbirds presented by the Proponent is not sufficient to understand the impacts on various guilds of birds (e.g., aerial insectivores, forest birds, wetland birds, habitat specialists).</p> <p>As per IR-158, focal representative species/guilds should be used as key indicators (KI) in the Migratory Breeding Birds Valued Component. A greater level of detail on Project impacts to migratory songbirds with differing habitat requirements is needed for a fulsome assessment of effects.</p> | <p>1. Provide further discussion on impacts to different focal species/guilds within the Migratory Breeding Birds Valued Component.</p> <p>2. Provide mapping of important features or habitat types that will be lost due to the Project for different guilds of migratory birds.</p> | |
| IR-165 | CNSC ECCC | Birds (all species) | Section 9.4.4.2.2 Section 9.4.5.2.4, Avian Deterrence and | <p>Context: On p. 9-364 of the EIS, it is stated that exposure to hazardous materials through contact with contaminated waste ponds could affect avian health and contribute to mortality.</p> <p>However, the ERA places the avian receptors only in waterbodies and</p> | <p>Please perform an ecological risk assessment with avian receptors located at the contaminated waste ponds, including:</p> | |

| | | | | <p>incidents. For further details, please refer to the Avoiding Harm to Migratory Birds website at: https://www.canada.ca/en/environment-climate-change/services/avoiding-harm-migratory-birds.html</p> <p>In order to assess the effectiveness of species-specific mitigations and need for additional mitigations ECCC requires details on the species-specific mitigation measures proposed, and the monitoring plans.</p> | | |
| IR-167 | ECCC | Migratory birds | Section 9.4.5.2.1 Work Timing Windows and Habitat Disturbance | <p>Context and Rationale: The Proponent has stated that when it is not practicable to clear outside of the breeding bird window, they will conduct pre-clearing surveys. Section 9.4.5.2.1 states: “Prior to commencing any site clearing (i.e., vegetation clearing and/or soil disturbance) during the nesting season, pre-clearing nest surveys will be conducted at that location within the Project Area.”</p> <p>ECCC does not recommend the use of nest searches or pre-clearing surveys for active bird nests during the breeding season as a mitigation, given the difficulty associated with finding nests reliably and the high likelihood of disturbing nesting birds when searching. Instead, ECCC recommends that clearing and grubbing activities not be conducted during the breeding bird season.</p> <p>The Migratory Birds Regulations 2022 (MBR 2022) brings new scenarios that need to be considered:</p> <ol style="list-style-type: none">1. Most migratory birds:<ul style="list-style-type: none">- Nests are protected only when they are in use or when live eggs or chicks are present.2. Migratory birds listed in MBR 2022 Schedule 1:<ul style="list-style-type: none">- For the 18 species of migratory birds identified on Schedule 1, the MBR 2022 provide year-round nest protection until they can be deemed abandoned.3. Migratory birds listed under SARA:<ul style="list-style-type: none">- For some SARA listed migratory birds, the residence prohibition (s.33) will protect nests that are not active, but are re-used in subsequent years, and the critical habitat prohibition (s.58) will protect nests that are part of the critical habitat identification. Those prohibitions apply everywhere in Canada and at all times of the year. In these cases, a SARA permit will be required. | <p>Provide the following information:</p> <ul style="list-style-type: none">• details on how vegetation clearing related to site development will be conducted to minimize risk to migratory birds and species at risk (SAR).• the timing window that will be used for vegetation removal to reduce risk to migratory birds and SAR | |
| IR-168 | ECCC | Migratory birds | Section 9.4.5.2.4, Avian Deterrence and Prevention of Entrapment | <p>Context and Rationale: The Proponent mentions that avian deterrents will be used on power transmission lines, buildings and other Project infrastructure. However, the Proponent does not mention any deterrents that will be used for deterring birds from the water or waste management facilities.</p> | <ol style="list-style-type: none">1. Provide information on avian deterrents to be used to prevent birds or other wildlife entering water or waste management ponds.2. Explain how proposed timing of use of deterrents will reduce risk of migratory birds making contact with | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|----------------------|---|--|---|------------------|
| | | | | Details on deterrents for all Project components should be identified to assess residual and cumulative impacts to migratory birds. | treatment waters outside of the nesting season (i.e., during migration and stop overuse). 3. Explain which deterrents will be used, which deterrents were considered, and what alternative, adaptive measures will be considered if deterrents are unsuccessful for any Project components. | |
| IR-169 | ECCC | Migratory birds | Section 9.4.6.3, Residual Effects Evaluation for Migratory Birds, Table 9.4-15 and Map 9.4-11 | <p>Context and Rationale: The analysis of available habitat types for migratory songbirds appears incorrect.</p> <p>In their interpreted ecosite mapping, the Proponent identified 25 different ecosite types. In their table 9.4-15 and map 9.4-11, the Proponent only lists 8 ecosite types that are available migratory songbird habitat. Section 9.4.6 Residual Effects Evaluation for Migratory Songbirds reads: “Considering the baseline data (Appendix 9-B), migratory songbird habitat is described in the following text without species-specific differentiation and referred to as available habitat for migratory songbirds. Based on the baseline study results, 66.8%, 52.2%, and 50.7% of the Project Area, Wildlife LSA, and Terrestrial RSA, respectively, are assumed to provide available habitat for migratory songbirds (Table 9.4-15).”</p> <p>All Project areas, except some anthropogenic features and open water, would be considered available habitat for migratory songbirds. Although some ecosite types may have lower density and diversity, it is expected that all ecosites provide migratory songbird habitat.</p> | 1. Explain how information in Table 9.4-15 and map 9.4-11 were derived. 2. Explain why other habitat types were not considered as available habitat for migratory songbirds. | |
| IR-170 | ECCC | Migratory birds | Section 9.4.6.4, Residual Effects Evaluation for Bird SAR, Table 9.4-19 | <p>Context and Rationale: The table and map presented by the Proponent do not appear representative of all available habitat for common nighthawk (CONI). Although CONI do preferentially use open areas such as gravel (often an anthropogenic disturbance) and regenerating forest, as identified in the draft EIS, they also use rock outcrops that can be within forested areas. As this area lies within the pre- Cambrian shield, there are likely rock outcrops that are also available habitat.</p> <p>As aerial insectivores, CONI select nesting areas in close proximity to wetlands or lakes where there is abundant forage.</p> <p>Habitat requirements and preferences for all species at risk is required for developing effective mitigations and adaptive management.</p> | 1. Provide an updated table and map that considers all available habitat for common nighthawk. 2. Additionally, as part of environmental management plans the Proponent should include species-specific mitigations that are biologically relevant to all the species at risk for all Project phases and components. | |
| IR-171 | ECCC | Migratory birds | Section 9.4.6.4, Residual Effects Evaluation | <p>Context and Rationale: Section 9.4.6.4 Residual Effects Evaluation for Bird SAR – Common Nighthawk reads: “Progressive reclamation is anticipated to begin during Construction. However, a conservative approach is used, with Common Nighthawk (CONI) habitat in the</p> | Develop mitigation plans appropriate for avoiding collisions of common nighthawks with vehicles, when and where nighthawks are observed foraging near or roosting on gravel roads. Demonstrate how the planned mitigation | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|----------------------|---|---|---|------------------|
| | | | | <p>Project Area considered to be unavailable for the duration of the Project, only becoming available as habitat following Post-Decommissioning (i.e., during the regeneration of vegetation following Decommissioning).”</p> <p>CONI may nest on the roadsides of access roads within the Project area. As such, the Project area should still be considered available habitat for the duration of the Project and appropriate mitigations and adaptive management should be discussed for this species.</p> | <p>activities will result in reduced residual effects from this pathway.</p> | |
| IR-172 | CNSC | Birds (all species) | Section 9.4.6.4.2 | <p>Context: Populations of listed species may be less resilient to changes in mortality.</p> <p>CSA N288.6:22 Clause 7.2.4.3 states that effects on a few individuals of endangered, threatened, or vulnerable species would not be acceptable.</p> <p>The residual effects assessment for “Change in Mortality” for bird species at risk states that Project mitigation measures identified in Section 9.4.5 are expected to limit interactions between bird species at risk and potential sources of direct and indirect mortality. However, the mitigation measures are not discussed with respect to their effectiveness to limit interactions, specifically for bird species at risk.</p> <p>Rationale: It is unclear if the proposed mitigation measures are effective in preventing mortality in bird species at risk for which even only a few deaths could negatively impact the population.</p> | <p>Please provide a discussion on mitigation measures with respect to their effectiveness in minimizing mortality for bird species at risk, for which effects on a few individuals would not be acceptable.</p> | |
| IR-173 | ECCC | Migratory birds | Section 9.4.8 Monitoring and Follow-up | <p>Context and Rationale: Monitoring and follow up programs are part of adaptive management and implementation of additional mitigations.</p> <p>In Section 9.4.8 the Proponent states: “Considering the Project planning, baseline survey results, and proposed mitigation measures, no follow-up programs are considered to be warranted at this time.”</p> <p>Project impacts related to mortality of birds, such as collisions with the transmission line, mortality along roads and use of waste and water management facilities should be monitored during all phases of the Project and adaptively managed.</p> | <p>Provide details on the follow-up program to monitor impacts to avian mortality. The follow-up plan should include:</p> <ul style="list-style-type: none">• Monitoring of avian use of waste and water facilities• Monitoring of mortality along access roads• Monitoring of mortality related to transmission lines• Monitoring of effectiveness of avian deterrents. | |
| IR-174 | ECCC | SAR - Bats | Appendix 9-B, Denison Mines Corporation Wheeler River Project, Terrestrial Environment, Wildlife and Vegetation | <p>Context and Rationale: The Proponent conducted acoustic surveys for bats and confirmed presence of two Species at Risk Act (SARA) schedule 1 listed bat species in the Project area, little brown myotis (<i>Myotis lucifugus</i>) and northern myotis (<i>Myotis septentrionalis</i>). However, the Proponent did not do an effects assessment of either of these bat species.</p> | <p>1. Conduct an effects assessment for little brown myotis and northern myotis, including the likelihood that tree clearing during the bat roosting period, is likely to ‘kill’, ‘harm’, or ‘harass’ Little Brown Myotis and Northern Myotis and its ability to carry out its life processes.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-----------------------------|--|---|--|------------------|
| | | | Baseline Inventory, Section 2.1.4 Acoustic Bat Surveys | Although bats are present in the study area, no work was done to identify hibernaculum or maternal roosting sites. All species at risk that are expected to be present in the Project area should be assessed and species-specific mitigations detailed. | <p>2. Describe and map locations of suitable myotis hibernacula and/or maternal roost habitat within the Local Study Area and Regional Study Area and explain how these habitats may be affected by Project activities.</p> <p>3. Describe what mitigation measures will be taken to avoid the breeding period for bats.</p> <p>4. Describe any pre-construction/pre- clearing surveys will be conducted to identify any hibernaculum and maternal roosting sites. Describe how monitoring will support adaptive management.</p> | |
| IR-175 | CNSC | Provincially Listed Species | Appendix 9-B; section 2.2.2 | <p>Context: Vegetation and wildlife habitat characterization field surveys were completed in 2017, based on which ecosite factsheets were prepared. The factsheets list observations of two provincially listed plant species with a rank of S3 (vulnerable/rare to uncommon; Table 2.4-2) according to the Saskatchewan Conservation Data Centre, which are not discussed in the main EIS document:</p> <ul style="list-style-type: none">• Angle-leaved sundew (<i>Drosera anglica</i>) observed in ecosites BS19, BS20, BS22, BS25• Neat Spike-rush (<i>Eleocharis nitida</i>) observed in ecosite BS25 <p>Table 9.2-12 in section 9.2.6.2.1 of the EIS indicates that there may be indirect disturbance to some of these ecosites (BS19, BS20, BS25). In section 9.2.6.3.1 it is discussed that listed plant species are not likely to return once lost from a specific location.</p> <p>Rationale: Given that not all areas in the revised Project footprint were surveyed for listed plant species in baseline studies, there is uncertainty as to whether any species were missed, in particular those that have been observed in ecosites present in the LSA/RSA (e.g., <i>Drosera anglica</i> and <i>Eleocharis nitida</i>, see also Appendix 2 Table of Appendix 9-B). It should also be noted that rare plant surveys were completed in summer 2017 only (section 2.4.2 of Appendix 9-B), which may underestimate annual rare species that may be dormant in the seed bank in some years due to specific seed emergence requirements.</p> <p>It is acknowledged that the proponent committed to pre-construction listed plant surveys targeted on ecosites encountered in the Project Area but not previously surveyed, as well as ecosites within the Project Area with high potential to support listed plants.</p> <p>More information is requested on the potential indirect effects on rare plant species as well as the planned pre-construction surveys.</p> | <p>1. Please provide a discussion on the potential risks from indirect effects on ecosites with observed rare plant species</p> <p>2. Please provide additional information on the ecosites included in the planned pre-construction listed plant surveys</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends focusing monitoring on ecosites that have known observations of listed plant species outside of the Project Area (e.g., BS19, BS20, BS22, BS25).</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|--|---|------------------|
| IR-176 | CNSC | Human Health with respect to radiation exposure | Section 10.1.4.2.1 Section 10.1.6.1.4 Appendix 10-A (ERA) | <p>Context: In section 10.1.4.2.1, the proponent provides an evaluation of air quality constituents of potential concern to human health. It states: “A screening value for radon gas of 200 becquerels per cubic metre (Bq/m3) was available from Health Canada, which applies to total radon including background sources (Health Canada 2009). The radon concentrations which were predicted are incremental concentrations (i.e., above background) and were therefore compared to the applicable incremental screening value of 60 Bq/m3 for indoor air established by the Canadian Nuclear Safety Commission (CNSC) (Health Canada 2010a; Radiation Protection Regulations. SOR/2000-203).”</p> <p>The 60 Bq/m3 radon concentration value also appears in section 7.1.2 of Appendix 10-A (ERA).</p> <p>Further in section 10.1.6.1.4, it is stated: “Radon dose was calculated separately from the dose due to other radionuclides; however, the predicted radon concentration was compared against the CNSC incremental concentration limit of 60 Bq/m3.”</p> <p>The Radiation Protection Regulations do not stipulate a limit for radon above background for sites licensed by the CNSC. The effective dose limits for Nuclear Energy Workers (NEWs) and persons that are not NEWs are listed in section 13 of these regulations, and in subsection 1(3) of these regulations for the general public.</p> <p>The annual effective dose from all sources associated with the licensed activities and within the scope of the Nuclear Safety Control Act and Regulations must be compared to the applicable effective dose limit. For members of the public this limit is 1 mSv per calendar year.</p> <p>In Section 4.2.5.3 of Appendix 10-A (ERA), there appears to be no reference mentioned for the radon equilibrium factors. These factors are a significant input into the dose calculations for radon.</p> <p>Rationale: The reason for the requested change is to ensure consistency with the Radiation Protection Regulations.</p> | <p>The EIS and appendices should be aligned with the Radiation Protection Regulations by:</p> <ol style="list-style-type: none">1. Removing the reference to a 60 Bq/m3 limit.2. Reporting the assessment results as the total dose, from all radionuclides combined including radon progeny, and by comparing this annual effective dose to the effective dose limit. <p>Provide a summary of the conservative assumptions that have been included in the dose calculations.</p> <p>Provide a reference that shows how the radon equilibrium factors were determined.</p> | |
| IR-177 | HC | Change to an environmental component due to radiological contaminants | Section 10.1.4.2.1 (p. 10-22) Appendix 10-A (ERA): Appendix B Table B.9, Ref. 19-2638 | <p>Context: Section 10.1.4.2.1 states that, “Screening values for radionuclide concentrations in ambient air were not available. All relevant radionuclides were assessed in the HHRA in terms of their contribution to the total radiological dose to human and ecological receptors” (p. 10-22).</p> <p>Section 10 Appendix 10-A (ERA) states that, “No formal screening was conducted for radionuclides. However, since radiation dose to human</p> | <ol style="list-style-type: none">1. Assess predicted radionuclides in Section 10 Appendix 10-A (ERA) using appropriate available screening values. Alternatively, provide a justification for why a screening wasn’t conducted for radionuclides despite the availability of screening values (e.g., ICRP 96 and NORM Guidelines, 2011).2. Clarify if uranium progenies in air are considered in the | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|---|---|---|------------------|
| | | | Section 6, Table 6.1-1 (p. 6-7) | <p>receptors is of public and regulatory interest, the radionuclides in the uranium-238 decay series are carried forward as COPCs for further assessment” (Appendix 10-A (ERA): Appendix B Ref. 19-2638).</p> <p>Table 6.1-1 lists radionuclides as a key indicator for air quality, but only uranium and radon are considered in Section 6, and Section 10 Table B.9 does not include doses from uranium progeny in air.</p> <p>Rationale: Health Canada recommends using screening values that are available for radionuclides if they are appropriate for the dose and if the screening values have listed assumptions (such as particulate size and worker exposure time that can be adapted to in Denison’s models). Two examples are ICRP 96, which CNSC uses in their regulatory reports to derive reference air quality values for Pb-210, Ra-226, and Th-230 (CNSC: Regulatory Oversight Report for Uranium Mines and Mills in Canada 2019); and Health Canada’s Guidelines for Management of NORM (Health Canada: Canadian Guidelines for the Management of Naturally Occurring Radioactive Materials, 2011).</p> | atmospheric transport and air quality modelling and are simply not reported, or if they are not included in the models because no screening criteria are available. | |
| IR-178 | HC | Change to an environmental component due to hazardous contaminants | Section 10.1.4.2.1 (p. 10-22) Section 6.1.4.2, Potential Project Related Effects (p. 6-31) | <p>The Baseline + Project scenario was not provided for radon levels.</p> <p>Context: Section 6.1.4.2 states that the predicted levels for radon were not added to the respective baseline air quality levels (p. 6-31), and further explains that “In all modelled phases of the Project, annual average radon concentrations at receptors beyond the Property Boundary are expected to be indiscernible from background levels.”</p> <p>In Section 10.1.6.1.4, a different approach to evaluating predicted radon levels is mentioned: “the predicted radon concentration was compared against the CNSC incremental concentration limit of 60 BQ/m3”(p. 10-44).</p> <p>Rationale: Without a rationale as to why baseline levels of radon were not included in the assessment, HC cannot fully evaluate the appropriateness of the air quality assessment. While Health Canada is of the opinion that using background radon levels as a screening value is appropriate in this case from a health perspective, different approaches to screening predicted radon levels in different sections appear to be used (i.e., background radon levels vs. CNSC incremental concentration).</p> | <p>1. Provide further information on whether and how baseline radon concentrations in air were determined.</p> <p>2. Include baseline radon concentrations in the predicted total concentrations when comparing to existing guidelines; alternatively, provide a rationale for why baseline concentrations of radon were not included.</p> <p>3. Discuss the potential health implications of the project-only increment-over-baseline radon levels</p> | |
| IR-179 | CNSC | Groundwater quality decommissioning objectives. | Section 10.1.4.2.2, Release of Treated Effluent to Whitefish Lake During Decommissioning | <p>Context: It is stated that “This process would continue until the recovered water meets acceptable groundwater quality decommissioning objectives”.</p> <p>Rationale: The information provided does not include groundwater</p> | Please provide groundwater quality decommissioning objectives or a reference to the information. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|--|--|------------------|
| | | | | quality decommissioning objectives nor a reference to these objectives. | | |
| IR-180 | CNSC | Human health with respect to hazardous contaminants | Section 10.1.6.1.1, Human Receptors Selection and Characterization | <p>Context: Within the Human Health assessment, offsite receptors during the operation period are only considered downstream of Whitefish Lake. The only identified concern was for Se to the Fisher/Trapper located at Russel Lake. This section cites Indigenous Knowledge as informing the receptor selection and location.</p> <p>Rationale: While the assessment is fairly conservative in the assumptions made on intake and receptor habits, it stands to reason that if the trapper receptor was located closer to the operation, such as at McGowan or Whitefish Lakes, this exceedance of Se could be more pronounced.</p> <p>In terms of maintaining a conservative assessment, if the most vulnerable receptor can be shown to be protected at the point of highest expected COPC concentration, it can be concluded that this receptor would be protected further away from the project. Considering this, why was the hunter/trapper receptor not also assessed at Whitefish or McGowan Lake? Was Indigenous Knowledge specific in mentioning Whitefish or McGowan Lakes were not used for the activities carried out by identified receptors?</p> | <p>Please provide justification for excluding a receptor from occupancy at lakes closer to the project during operation (McGowan, Whitefish). Alternatively, conduct a risk assessment to a receptor at these lakes during operation to determine if there is a predicted risk that may require monitoring or mitigation.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends the following:</p> <ul style="list-style-type: none">• Assessment of a receptor located closer to the point of effluent release may need to be considered to ensure there are negligible risks• If Se is expected to exceed hazard quotients further upstream, selenium removal technology may be required as part of the effluent treatment process as a mitigation measure. Other COPC's exceeding an HQ of 1 may also be identified under this process that could require specific monitoring or mitigation measures. | |
| IR-181 | CNSC | Human Health with respect to radiation exposure | Section 10.1.6.1.4 | <p>Context: In section 10.1.6.1.4, it is stated: “The maximum incremental radon concentration at the camp worker site during Operation was predicted to be 12.4 Bq/m3, which is below the CNSC limit of 60 Bq/m3 for incremental radon.”</p> <p>As per IR-176, there is no such CNSC limit for incremental radon.</p> <p>The camp worker would be considered a person who is not a nuclear energy worker (NEW) and subject to the dose limits of section 13 and 14 of the Radiation Protection Regulations, not the dose limit for the general public as per subsection 1(3) of the Radiation Protection Regulations. The CNSC has regulatory requirements for the ascertainment and recording of doses of radiation as per section 5 of the Radiation Protection Regulations. Every licensee must ascertain and record the magnitude of exposure to radon progeny, the effective dose and equivalent dose received by and committed to a person who performs duties in connection with any activity that is authorized by the Nuclear Safety and Control Act or is present at a place where that activity is carried on.</p> <p>The camp worker performs duties in connection with the licensed activity and is present at the location where the activity is carried out. Hence, they are not considered to be a member of the general public</p> | <p>The EIS and appendices should be aligned with the Radiation Protection Regulations by:</p> <ol style="list-style-type: none">1. Removing the reference to a 60 Bq/m3 limit for incremental radon.2. Revising all references to the ‘public dose limit’ applied to camp workers (non-NEWs) to align with section 13 and 14 of the Radiation Protection Regulations. <p>The proponent should explain why the radon dose for the camp worker appears as 0.13 mSv/year in one instance and 0.02 mSv/year in another.</p> <p>The proponent is also asked to provide the rationale as to why a non-NEW has a higher radon dose than a NEW.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|--|---|------------------|
| | | | | <p>(who has no connection with the activity)</p> <p>Further, the proponent indicates that the maximum incremental radon dose to the camp worker was estimated to be 0.13 mSv/year during Operation. The assessment assumes that the camp worker spends 100% of the time indoors. Table 10.1-11 shows the maximum total incremental dose for the camp worker to be 0.02 mSv/year. This appears to be a discrepancy.</p> <p>Table 5.2 in Appendix 10-C provides internal annual dose from radon inhalation. The radon doses to some NEW workers (9.44E-02 mSv/a Driller 1 and 1.03E-01 mSv/a Wellfield Operator 1, 2) here appear less than the radon dose (0.13 mSv/year from section 10.1.6.1.4) to the camp worker, who is a non-nuclear energy worker.</p> <p>Rationale: The reason for the requested change is to ensure consistency with the Radiation Protection Regulations and the environmental impact statement.</p> | | |
| IR-182 | HC | Change to an environmental component due to radiological contaminants | Section 10.1.6.1.4, (p. 10-44) | <p>Context: Section 10.1.6.1.4 states, "The limit is incremental and is exclusive of natural background, such as natural levels of radon and medical exposures. A dose constraint of 0.3mSv/yr was established for the public from all radionuclides and all pathways for the Project, as recommended by Health Canada (2010a). The dose constraint represents a dose lower than the public dose limit that ensures the combined dose from multiple sources does not result in exceedance of the public dose limit. Radon dose was calculated separately from the dose due to other radionuclides; however, the predicted radon concentration was compared against the CNSC incremental concentration limit of 60 BQ/m3" (p. 10-44).</p> <p>Rationale: Calculating radon separately from all radionuclides may underestimate the health risks by not considering combined doses from multiple sources when comparing to the public dose limit constraint of 0.3 mSv/yr recommended by Health Canada (2010a).</p> | 1. Provide clarification on how combined doses from all sources would be accounted for in respecting the public dose limit of 0.3 mSV/yr if radon concentrations are being calculated separately. | |
| IR-183 | CNSC | Human Health with respect to radiation exposure | Section 10.2 Appendix 10-C | <p>Context: Exposure scenarios for workers have been identified and high-level summaries of the assumptions and resultant dose estimates have been provided. However, the detailed dose calculations have not been provided.</p> <p>Rationale: The method used to estimate effective, equivalent and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data, for at least the most dose significant scenarios.</p> | Provide the dose calculations for deriving the dose estimates for workers in all exposure scenarios, for at least the most dose significant scenarios. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|---|--|------------------|
| IR-184 | CNSC | Human Health with respect to radiation exposure | Section 10.2 Appendix 10-C, 2.0 | <p>Context: It is stated in Appendix 10-C, section 2.0 that: “In addition, the CNSC has proposed a 100 mSv 5-year equivalent dose to lens of eye, in accordance with recent recommendations of the International Commission for Radiological Protection (ICRP, 2012a). This implies an average annual equivalent dose to lens of 20 mSv/a and will be considered as an applicable dose limit for workers.”</p> <p>As per section 14 of the Radiation Protection Regulations, the equivalent dose limit for the lens of an eye for nuclear energy workers (NEWs), effective January 1, 2021, is 50 mSv in a one-year dosimetry period.</p> <p>Rationale: The reason of the requested change is to ensure consistency with the Radiation Protection Regulations.</p> | The EIS and Appendix 10-C should be aligned with the Radiation Protection Regulations regarding the equivalent dose limit for the lens of an eye for NEWs. | |
| IR-185 | CNSC | Human Health with respect to radiation exposure | Section 10.2.3.2 Appendix 10-C Table 3.10-3.12 | <p>Context: The Geometries for External Exposure Scenarios Modelled in MicroShield for Sources in various locations were provided in tables 3.10-3.12 in appendix 10-C. The doses from those scenarios were omitted.</p> <p>Rationale: The method used to estimate effective, equivalent, and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data.</p> | The proponent is asked to provide all the necessary information and assumptions required to perform the MicroShield calculations independently and to list the resulting calculated values from the listed scenarios. | |
| IR-186 | CNSC | Human Health with respect to radiation exposure | Section 10.2.3.2.4 Section 10.2.3.2.6 Section 10.2.4 Appendix 10-C, Section 3.2 | <p>Context: In sections 10.2.3.2.4 and 10.2.3.2.6, as well as section 3.2 of Appendix 10-C, the proponent has stated that workers in the drying and packaging areas of the processing plant will be required to wear powered air purifying respirators (PAPR) to reduce/eliminate inhalation exposure.</p> <p>Further in section 10.2.4, which elaborates mitigation measures, it is stated: “For the drying and packaging/loading areas of the ISR plant, use of PAPR has been assumed. It will be needed in these areas, and it has been planned in these areas to substantially reduce doses from inhalation of uranium dust. Dust levels in these areas will be monitored and kept ALARA.”</p> <p>The use of respirators appears to be in contradiction of the requirements of section 13 of the Uranium Mines and Mills Regulations, which states: <i>No licensee shall rely on the use of a respirator to comply with the Radiation Protection Regulations unless the use of the respirator (a) is for a temporary or unforeseen situation; and (b) is permitted by the code of practice referred to in the licence.</i></p> <p>The proponent is also reminded that respirators should not be the first choice for dose reduction in workplaces. They should only be used when the hierarchy of control (elimination, substitution, engineering,</p> | <p>Provide the rationale for mandating the use of respirators by workers in the drying and packaging areas of the processing plant.</p> <p>Include the demonstration of the application of the hierarchy of control for radiological protection within the design of these areas of the processing plant.</p> <p>Justify that this approach complies with section 13 of the Uranium Mines and Mills Regulations.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|---|--|--|------------------|
| | | | | or administrative controls) is not possible. Rationale: At this stage of the project, the proponent is expected to identify design improvements to these areas of the ISR plant/processing plant following the hierarchy of control for the radiological protection of workers, as per regulatory requirements and as described in REGDOC-2.7.1, <i>Radiation Protection</i> . | | |
| IR-187 | CNSC | Human Health with respect to radiation exposure | Section 10.2.3.2.4 Section 10.2.3.2.6 Appendix 10-C, Section 3.3, 6.0 | Context: The exposure scenarios and assumptions for the workers in the drying area and the packaging/loading area of the processing plant include the wearing of PAPRs, which is assumed to provide a 1000-fold reduction in dust exposure. Further to reference IR-186, the use of a respirator as well as in worker dose predictions for the project, appears to contravene section 13 of the Uranium Mines and Mills Regulations, and does not follow the hierarchy of controls for radiological protection of workers as described in REGDOC-2.7.1, <i>Radiation Protection</i> . Rationale: At this stage of the project, the proponent is expected to identify design improvements to these areas of the ISR plant/processing plant following the hierarchy of control for the radiological protection of workers, as per regulatory requirements and as described in REGDOC-2.7.1, <i>Radiation Protection</i> . | Modify the exposure scenarios and assumptions (i.e., remove the use of a respirator) for the workers in the drying area and the packaging/loading area of the processing facility. Assess the resultant exposures against CNSC regulatory dose limits and the ALARA principle. Identify mitigation measures as per the hierarchy of control for radiological protection. | |
| IR-188 | CNSC | Human Health with respect to radiation exposure | Section 10.2.4 | Context: The following is stated in section 10.2.4: “Dust inhalation is also a potentially substantial component of worker dose at the core shack. At this location, PAPR will not be required; however, N95 masks will be used, and dust levels will be monitored here...It may be possible to increase air exchange in the core shack, above the planned six exchanges per hour, should this be necessary. This would also reduce radon exposure in the core shack.” If it is possible to increase air exchanges in the core shack, it is not clear why this was not assessed and incorporated in the design of the core shack. Rationale: It appears that a control measure (e.g., air exchange protocols in the core shack) to reduce the exposure to workers has been identified. However, it is not certain if it has been formally documented to ensure that it is incorporated in the engineered design of the core shack. | Provide details on how the control measures to reduce the exposure to both workers through the air exchange protocols in the core shack have been formally documented to ensure that it is incorporated in the engineered design of the core shack. | |
| IR-189 | CNSC | Woodland Caribou Ecological Model | Appendix 10-A (ERA) | Context: In the ERA (p. C.12, section 2.3.6 Woodland Caribou) it is stated: “For the ecological model a diet comprised of 50% browse, 20% lichen and 30% macrophytes is assumed for the woodland caribou.” | Please provide additional evidence to support that those Woodland Caribou who may have higher consumption rates of lichen as part of their diet, will remain protected. This can be provided through including a second model | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|--|-------------------------------|
| | | | | <p>In the EIS, section 9.3.3.3.1, it is stated: “Research has shown that up to 70% of the year-round diet of caribou may consist of ground and arboreal lichens.”</p> <p>Rationale: It is unclear whether the assumptions in the ecological model in the ERA regarding Woodland caribou diet are conservative, given only 20% lichen intake in the model. Lichen is known to accumulate COPC such as metals and dust from the atmosphere.</p> | <p>that assumes 70% lichen in the diet.</p> <p>See also related: IR-138.</p> | |
| IR-190 | HC | Change to an environmental component due to hazardous contaminants | <p>Appendix 10-A (ERA), Table 3-8 (p. 3.31) and Table 3-9 (p. 3.36)</p> <p>Appendix 6, Table 5 (p. 16)</p> | <p>NO2 criteria is not being consistently compared.</p> <p>Context: Provincial and federal air quality criteria/screening values for NO2 have been used inconsistently.</p> <p>Table 3-9 in Appendix 10-A (ERA) uses the 2015 Saskatchewan Ambient Air Quality Standards (SAAQS) value of 300 µg/m3 to compare the maximum concentrations of NO2 at receptor locations for the 1-hour average period, while Table 5 of Appendix 6 uses the 2025 Canadian Ambient Air Quality Standards (CAAQS) of 79µg/m3 for the same average period time.</p> <p>Rationale: By utilizing the SAAQS screening value for NO2, the maximum concentrations at receptor locations exceed the 1-hour threshold solely during the decommissioning stage (Table 3-9). However, if the 2025 CAAQS are applied, the screening values would be exceeded at receptor locations for all project phases. It is best practice to use the more protective air quality standards to evaluate potential human health risks associated with project activities.</p> | <p>1. Compare the predicted maximum concentrations to the most protective applicable air quality standards available. Alternatively, provide a rationale as to why the SAAQS for NO2 were used rather than the more protective 2025 CAAQS to determine potential exceedances and screen for the need for additional mitigation measures.</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends use of the standards from the 2025 CAAQS for NO2 in future mitigation and follow-up plans.</p> | Validate revisions to comment |
| IR-191 | HC | Change to an environmental component due to hazardous contaminants | <p>Appendix 10-A (ERA), Table 3-9 (p. 3.36) and Table 3-10 (p. 3.46)</p> <p>Section 6.1.8 (p. 6-44)</p> | <p>Non-threshold substances are not included in screening and monitoring plans.</p> <p>Context: Fine particulate matter (PM2.5) is not being considered further in secondary air quality screening for short and long-term exposure at human and ecological receptors because it is not predicted to exceed the screening values of the Ontario Ambient Air Quality Criteria (OAAQC) or the Canadian Ambient Air Quality Standards (CAAQS) for both annual and 24-hour average periods (Tables 3-9 and 3-10). Furthermore, it is not compared against the baseline for analysis.</p> <p>Table 3-9 indicates that coarse PM (PM10) is predicted to exceed the 24-hour CAAQS during all phases of the project. However, Appendix 10-A p. 3.46 states that, “There were no exceedances of PM2.5 which is generally considered to be a more reliable indicator of potential health effects. However, health effects would be infrequent and</p> | <p>1. Include PM2.5 and PM10 in the secondary air quality screening for short and long- term exposure at human receptors.</p> <p>2. Include PM10 and PM2.5 in the air quality monitoring plan as they are non- threshold substances.</p> <p>3. Provide a discussion of the significance of predicted exceedances of health- based standards.</p> <p>4. Identify additional mitigation measures to reduce concentrations of non- threshold air contaminants associated with the project.</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends use of the <u>2025 CAAQS Management Levels</u> to develop mitigation measures that</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|---|------------------|
| | | | | <p>reversible, subsiding after exposure; therefore, PM10 was not considered for further quantitative assessment in the ERA.”</p> <p>PM10 and PM2.5 were not included in the air quality monitoring plan (Section 6.1.8).</p> <p>Rationale: Particulate matter and NO2 are considered non- threshold pollutants, meaning that health effects can occur at any level of exposure, The CAAQS for PM2.5 PM.10, and NO2 recognize that there is no population health threshold for human health effects; therefore, any increase in exposure will result in an incremental population risk (Environment Canada and Health Canada, 2012; CCME, 2000). The CAAQS values should not be construed as limits to which polluting up to is allowed. In addition, based on the principles of keeping clean areas clean and continuous improvement, proposed mitigation measures should not be confined to meeting the standards but should also be targeted towards reducing population exposure to CACs associated with the proposed project.</p> <p>Furthermore, although health risks associated with PM2.5 are higher than those associated with PM10, both fractions are considered non-threshold pollutants and identified by IARC (2013) as causes of cancer.</p> <p>Reference: [1] International Agency for Research on Cancer (IARC). 2013. IARC monographs on the evaluation of carcinogenic risks to humans. Volume 109. Outdoor air pollution. Lyon: International Agency for Research on Cancer.</p> | reduce project contributions of non-threshold pollutants (e.g., PM2.5, NO2). | |
| IR-192 | CNSC | Human Health with respect to radiation exposure | Appendix 10-A (ERA), Section 3.1.1.2, including Tables 3-1 and 3-2 | <p>Context: Section 3.1.1.2 in Appendix 10-A (ERA) provides the method of how select constituents including cadmium, chromium, selenium and lead-210 were determined. This section does not mention how the other constituents as listed in Tables 3-1 and 3-2 are determined.</p> <p>The values for Th-230 and U-238 in Table 3-1 are unexpected. Typically, these values should be at equilibrium.</p> <p>Rationale: The technical basis for the selection of constituents of concern is required as part of the environmental and human health risk assessments.</p> | <p>1. Provide the methodology of how all listed constituents are determined.</p> <p>2. Provide the rationale as to why Th-230 and U-238 are not in equilibrium.</p> | |
| IR-193 | ECCC | Change to an environmental component due to hazardous contaminants | Appendix 10-A (ERA), Section 3.1.1.2 Section 8.2.4.2.3 | <p>Context: Appendix 10-A (ERA) Table 3-1 ‘Screening of Effluent Quality against Surface Water Quality Guidelines for the Wheeler River ERA’ does not include acute water quality thresholds for all COPCs compared against predicted effluent quality. For example, it is stated that the final effluent quality discharge target for uranium is 0.057 mg/L. However, the CCME water short term (acute) water quality</p> | <p>1. Provide acute and chronic water quality thresholds for all required COPCs with monitoring required under the MDMER.</p> <p>2. Ensure all water quality thresholds are derived from receiving environment baseline parameters and that these</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|---|---|--|
| | | | | <p>guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe.</p> <p>All water quality thresholds should be derived from receiving environment parameters, and there are discrepancies between the values used in Appendix 10-A (ERA) Table 3-1 and the values presented in Tables 8.2-8 and 8.2-10 in Section 8.2.4.2.3 of the draft EIS. No selected screening value for TSS has been calculated from baseline conditions. Un-ionized ammonia, which is a regulated Schedule 4 substance under the MDMER, has not been included.</p> <p>Rationale: A review of all modelling results for all COPCs under the MDMER will assist ECCC in understanding the potential risks to the receiving environment.</p> | thresholds are consistently applied throughout the draft EIS. | |
| IR-194 | ECCC | Aquatic species | Appendix 10-A (ERA), Section 3.1.1.2 and Section 3.1.2.3 | <p>Context: In the ERA, COPCs should be selected for further assessment based upon the following factors:</p> <ol style="list-style-type: none">1. COPC concentrations in effluent that exceed selected water quality guidelines for the protection of aquatic biota, and2. Baseline COPC concentrations in the LSA that exceed selected surface water and sediment quality guidelines for the protection of aquatic biota. <p>However, only COPCs that had concentrations in effluent that exceeded guidelines were assessed further. Baseline concentrations of COPCs in sediment were not considered. In addition to this, not all COPCs that require monitoring under the MDMER had predicted effluent concentrations. From Section 8.2.3.3 Table 8.2-2 of the Aquatic Environment Report, it appears Aluminum in McGowan Lake and Whitefish Lake South and North, and pH in Whitefish Lake North exceed water quality guidelines. Predicted effluent concentrations or near-field surface water concentrations for Aluminum and pH are not provided.</p> <p>Rationale: It is not possible to determine if there is risk from effluent to the receiving environment and aquatic receptors based on the current information provided.</p> | <ol style="list-style-type: none">1. As noted in IR-114, provide the information on predicted effluent quality for COPCs with required monitoring under the MDMER.2. Provide the information on predicted maximum receiving environment surface water concentrations for COPCs with required monitoring under the MDMER in IR-114.3. Update the ERA to assess the risk of any additional MDMER COPC concentrations in effluent that exceed water quality guidelines.4. Update the ERA to assess the risk of COPCs that had elevated baseline water and sediment quality concentrations in the receiving environment. | Validate this correction with Samantha (previously referred to ECCC-SW-16) |
| IR-195 | ECCC | Change to an environmental component due to hazardous contaminants | Appendix 10-A (ERA), Section 3.1.2.1 | <p>Context: Figure 3-2 depicts modelled concentrations of COPCs in the receiving environment surface water during all Project phases. Effluent discharge rates during Operations and Decommissioning are not anticipated to differ significantly. However, COPC concentrations seem to decrease rapidly after the end of the operations period despite effluent releases continuing into the decommissioning phase.</p> | <ol style="list-style-type: none">1. Provide further information on modelled maximum COPC concentrations for each individual Project phase with estimated timing for peak concentrations to appear in the receiving environment.2. Provide further information on predicted effluent quality during the Project decommissioning phase. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|---|--|------------------|
| | | | | Rationale: There has been no information provided on predicted changes in effluent COPC concentrations and discharge rates during the decommissioning phase. It remains unclear how COPC concentrations would decrease so quickly following the end of operations. | 3. Update ERA figures and conclusions as needed. | |
| IR-196 | ECCC | Change to an environmental component due to hazardous contaminants | Appendix 10-A (ERA), Section 3.1.2.3 | Context: Table 3-6 provides predicted maximum sediment concentrations of COPCs compared to sediment quality guidelines. Several selected sediment screening values are not the most stringent sediment quality guidelines, with no justification provided. Additionally, copper and lead appear to be missing guidelines that are available from the Burnett-Seidel and Liber (2013) study. Rationale: The most stringent guidelines should be used for the sediment quality risk assessment in the ERA. Use of the most stringent guidelines will allow the most protective assessment to analyze risks to the receiving environment, aquatic and terrestrial biota. | 1. Provide further information and justification for the selection of less stringent thresholds. 2. Update the ERA as needed. | |
| IR-197 | ECCC | Aquatic species | Appendix 10-A (ERA), Section 3.2 | Context: It remains unclear if atmospheric deposition from Project related emissions has been incorporated into modelling for the ERA and surface water and sediment quality assessments. Rationale: While expected Project air emissions are unlikely to have direct impacts on the aquatic receiving environment and aquatic biota, this Project effect pathway may have indirect effects through accumulation of COPCs over time or deposition of contaminants that are not expected in effluent, which should be evaluated with predicted emissions data incorporated into water quality modelling predictions. | Incorporate atmospheric deposition from Project-related emissions into water quality modelling and assess any Project related effects to aquatic receptors from this pathway. | |
| IR-198 | HC | Change to an environmental component due to radiological contaminants | Appendix 10-A (ERA) Appendix B, Tables B.7 and B.8 Ref. 19-2638 Appendix 10-A (ERA), Table 4-3 Ref. 19-2638 (p. 4.17) | Context: Section 10 Appendix 10-A (ERA) contains Table 4-3 (p. 4.17), which lists ingestion rates for traditional foods and includes the category “organs” for Mammals. Tables B.7 and Table B.8 in Section 10 Appendix 10-A (ERA) Ref. 19-2638 provide the predicted concentrations of radionuclides for ecological receptors during the project phases and during future centuries, respectively. They list the concentrations of radionuclides in moose and in moose organs, which is presented as a single cumulative organ value. Other terrestrial and aquatic animals (such as the black bear and woodland caribou) that are a part of the traditional diet of nearby Indigenous communities have higher concentrations of radionuclides than moose, yet concentrations are not provided for organs of these species. Rationale: While Health Canada is not aware of transfer factors to | 1. Provide more clarification on how the mammalian organ ingestion rates are calculated (which animals and relative contribution percentages). 2. Provide a rationale for why concentrations of radionuclides were not assessed in organs of animals (other than moose) that are consumed as country foods by Indigenous people harvesting in the area. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|---|---|--|-------------------------------|
| | | | | individual organs, or to organs in animals that are not ruminants, it would be beneficial to have a better understanding of radionuclide concentrations in the organs of other animals that may be consumed by local Indigenous communities. | | |
| IR-199 | ECCC | Change to an environmental component due to hazardous contaminants | Appendix 10-A (ERA), Sections 3.2.1 and 3.3.1, Wheeler River Project IMPACT Model | <p>Context: Model calibrated concentrations of selenium, uranium, and lead- 210 are under-predicted compared to measured baseline concentrations for water quality in the IMPACT modelling based on Figure 3-2. Calibrated concentrations of cobalt are under-predicted and there is poor agreement between model calibrated and measured concentrations of arsenic, lead-210, polonium-210, and radium-226 for sediment quality in Figure 3-3.</p> <p>Rationale: It is unclear how poor agreement between model calibrated and measured baseline concentrations of COPCs impacts the near-field and far-field modelling predictions of COPCs during all Project phases. It is also unclear why measured concentrations of COPCS could not be used directly as model inputs when there was poor agreement.</p> | <p>1. Provide justification as to why model calibrated concentration inputs of COPCs were preferable for use in predictive modelling of water and sediment quality over measured baseline concentrations.</p> <p>2. Provide a rationale detailing how under- or over-predicted model calibrated COPC concentration inputs influence IMPACT model predictions and uncertainty for water and sediment quality. Provide specific details on how this may impact the risk analysis for parameters that have been highlighted as having poor agreement between calibrated and measured concentrations (i.e., arsenic, selenium, uranium, lead-210, polonium-210, and radium-226).</p> | |
| IR-200 | HC | Indigenous Peoples' health / Socio- economic conditions | Section 10 (p. 4.10) Appendix 10-A (ERA), Table 4-4 (p. 4.19) | <p>Indigenous consultation should be included in the Country Foods analysis.</p> <p>Context: The Proponent obtained country food consumption data through engagement with a single local fisher/trapper and from a dietary survey administered by CanNorth to the English River First Nations (ERFN) in 2017. However, the potential health risks to consumers of traditional food were only assessed using the data obtained from the CanNorth dietary survey. Section 10 of the EIS <i>states the following:</i> “The diet assumptions for the fisher/trapper are conservative and are based on engagement with a local fisher/trapper. The diet of the fisher/trapper is representative of one person, who consumes a unique composition and quantity of traditional foods (e.g., ingestion rate of 175 kg/yr of caribou, equivalent to approximately 2 to 3 servings per day). Most people fishing, hunting, and trapping in the Local Study Area and Regional Study Area would consume traditional foods more consistent with the average traditional foods consumer diet which was developed from the ERFN country foods study. In comparison, the ERFN country foods study in Section 10 Appendix 10-A (ERA) Table 4- 4 indicates a caribou ingestion rate of 2.6 kg/yr (1 to 2 servings per month) and a total game ingestion rate of 21.3 kg/yr” (p. 4.10).</p> <p>Rationale: Health Canada is in general agreement that the dietary habits of the local fisher/trapper may be an outlier and not necessarily representative of most of the local population. However, a rationale has not been provided to demonstrate whether and how the 2017</p> | <p>1. Evaluate the suitability of using the 2017 EFRN survey results and consider surveying additional community members (such as local hunters/trappers) to obtain more representative country food consumption rates for use in the traditional foods risk assessment, and for communicating the results to the communities.</p> <p>2. Additionally, consider evaluating consumption patterns (and applicable TRVs) of sensitive or vulnerable populations (e.g., elders, toddlers, women of childbearing age) in the traditional food risk assessment and provide risk levels for these sub-groups separately.</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends providing the community with the opportunity to validate the ERFN 2017 survey results.</p> | Validate revisions to comment |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|---|--|------------------|
| | | | | ERFN dietary survey results are representative of consumption patterns of local Indigenous communities. Also, it is unclear whether or how the ERFN dietary survey results account for the consumption patterns of vulnerable or more sensitive subgroups (e.g., heavy consumers, children and women of child-bearing age) | | |
| IR-201 | ECCC | Aquatic species | Appendix 10-A (ERA), Section 5.0 | <p>Context: For the ERA methodology the Proponent followed CSA N288.6-12 for the assessment of risk to aquatic biota from radionuclide and non-radionuclide COPCs. This is the 2012 version, and a more recent 2022 version was publicly released.</p> <p>Rationale: The Proponent should review the most up-to-date version of the standard to ensure no changes to the methodology of the COPC exposure assessment are required for the ERA.</p> | Update the COPC exposure assessment methodology in the ERA using the most recent CSA N288.6-22 standard, as needed. | |
| IR-202 | CNSC | QA/QC | Appendix 10-A (ERA), Section 6.0-Quality Assurance | <p>Context: This section provides only Quality Assurance (QA) of the ERA, including planning and preparation of the ERA.</p> <p>Rational: The Quality Control (QC) aspects are not included. Both QA and QC aspects provide confidence that ERA results are defensible and fit for use in decision-making.</p> <p>The N288.6 (Clause 10.2) requires that “Appropriate QA/QC requirements shall exist for all aspects of the ERA and should be specified prior to conducting the ERA”.</p> | Please include appropriate QC aspects, as per a Clause 10.2 of the N288.6. | |
| IR-203 | CNSC | Sediment Quality and Benthic Invertebrates | Appendix 10-A (ERA), Section 6.2 Future Centuries Sensitivity Analysis | <p>Context: This section of the ERA states “If treated effluent was released at the maximum upper bound discharge rate, the modelled concentrations of all COPCs are expected to be below their corresponding sediment quality guidelines.” It appears from Figure 6-2: “Comparison of maximum concentrations of COPCs in sediment at expected and upper bound discharge rate” that cadmium and vanadium would be over their sediment quality guidelines indicated if maximum upper bound discharge rates are used.</p> <p>Rationale: It is not clear which is correct; the statement that no exceedances of sediment quality guidelines when considering the maximum upper limit effluent release, or the figures indicating there could be exceedances for cadmium and vanadium. This discrepancy in the ERA should be explained and corrected.</p> | Please provide clarity on if cadmium and vanadium are expected to be over the sediment quality guidelines for the maximum upper bound discharge rate scenario. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|---|--|---|------------------|
| IR-204 | CNSC | Human health with respect to hazardous contaminants | Appendix 10-A (ERA), 7.1.1, Non-radiological Human Health Risk Assessment | <p>Context: In the human health risk assessment of the non-radiological COPCs, it was determined that the project incremental HQ was predicted to remain below 0.2 for all non-carcinogens and all pathways during all phases of the project, except for selenium for the fisher/trapper at Russell Lake from the fish ingestion pathway.</p> <p>Rationale: Given that the fisher/trapper receptor will likely be exposed to higher concentrations of selenium from the consumption of fish at Russell Lake, there is an elevated risk of selenosis in exposed individuals. This potential for selenosis would be further exacerbated in individuals who consume fish taken from other lakes closer to the mining operation. There is, however, no discussion of mitigation of these risks to exposed individuals.</p> | <p>Please provide a discussion of measures that could be applied to mitigate the risk of selenosis in exposed individuals who consume fish from Russell Lake and other waterbodies closer to the mining operation.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends the following:</p> <ul style="list-style-type: none">• Selenium abatement technologies may be considered to eliminate or reduce selenium in effluent entering the lake system.• If HQs continue to exceed 0.2, then it may be necessary to post fish consumption advisories, in consultation with the Medical Officer of Health for the jurisdiction where the project is located. | |
| IR-205 | CNSC | Geology and Groundwater | Section 7, appendix H | <p>Context: In this appendix the analytical concentration of various groundwater samples taken from monitoring wells is reported.</p> <p>Rationale: There is one sample labeled as “Tracer Tank” with no definition available in the current report. It is difficult to judge whether the results presented are relevant to the EIS and how it may impact the findings therein.</p> | <p>Please clarify the definition of “tracer tank”.</p> | |
| IR-206 | ISRD | Current use of lands and resources for traditional purposes | Section 11 Section 12 Section 15 Section 16 | <p>Context: Impacts to Lands and Resources Use have been identified by Indigenous Nations and communities.</p> <p>Rationale: Additional information is required to demonstrate whether Indigenous Nations and communities were engaged directly by Denison regarding the cumulative effects assessment, significance determination and residual effects, and thus the overall conclusions on potential adverse impacts of the project on the potential or established Indigenous and/or treaty rights and effects of changes to the environment on Indigenous peoples, pursuant to paragraph 5(1)(c) of the CEAA 2012.</p> | <p>Please describe any outstanding or residual issues or concerns raised by Indigenous Nations and communities that Denison was unable to address. In addition, outline any plans to find solutions or continue discussions with the potentially impacted Indigenous Nations and communities.</p> | |
| IR-207 | CNSC | Current use of lands and resources for traditional purposes | Section 11, Perceived Risks to Lands and Resources | <p>Context: The EIS states: “Resource users may also experience changes in their perception of the quality of resources for consumption such as the palatability of fish or wildlife or have apprehensions about the safety of resources for consumption. These changes may affect the patterns of ILRU during all Project phases including Post Decommissioning. The ERFN refer to this indicator as a “psycho-social’ effect, meaning that even if people know their fears are “<i>perceived fears, the fear ... is real and has real impacts on ERFN members’ perception of their overall health and well-being</i>” (ERFN and SVS 2022a).” (p. 11-11)</p> | <p>How does Denison plan to work directly with Indigenous Nations and communities who currently use the potentially impacted areas, including the RSA, to mitigate and monitor the perceived risks and/changes to the RSA?</p> <p>Has Denison had discussions with the potential impacted Indigenous Nations and communities on how fear and avoidance behaviors and related impacts on traditional land use will be mitigated, especially within the RSA?</p> <p>Additional information is needed to determine if Denison has engaged directly with the Indigenous Nations and</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|---|--|--|------------------|
| | | | | <p>Resource harvesters may experience Project-related disturbances and, depending on how these changes are perceived, it may cause some resource harvesters to avoid the Project Area.</p> <p>Reductions in harvests may occur based on fear or uncertainty about the ongoing quality of country foods. For example, <i>“People stopped picking berries in this area when Key Lake mine was established because of concerns about health impacts”</i> (ERFN and SVS 2022b).</p> <p>Rationale: CNSC’s Generic Guidelines for the Preparation of an EIS state: “The EIS will document specific suggestions raised by Indigenous groups for mitigating the effects of changes to the environment on Indigenous peoples (section 5(1)(c) of CEAA 2012). For the mitigation measures intended to address the effects of changes to the environment for Indigenous peoples, the proponent must discuss the residual effects with the Indigenous groups prior to submitting the EIS.”</p> <p>These changes may affect the patterns of ILRU during all Project phases including Post Decommissioning.</p> | <p>communities to develop potential mitigation measures to address fear and avoidance impacts, such as a community monitoring program, which could help to reduce the perceived risk to lands and resource use through education, collaboration, and long-term monitoring with Indigenous Nations, in order to build trust.</p> <p>Suggestions for mitigation and follow-up measures: It is recommended that Denison consider engaging with potentially impacted Indigenous Nations and communities on the collaborative development and implementation of a monitoring program to help address concerns about potential impacts on lands and resources as a result of the project. The program(s) could help to monitor changes over time related the potential perceived risk of contamination of the land from Project activities and subsequent effects on the quality of fish, vegetation, and wildlife resources, which in turn could affect the safety of traditional foods and human health, and impacts on culture practices, and overall community well-being that travel to region yearly.</p> | |
| IR-208 | CNSC | Indigenous physical and cultural heritage | Tables 11.1-3, 11.1-4 and 11.1-5 Section 11.1.3.2.6 | <p>Context: Black bear is listed as a species hunted by several Indigenous nations, including Pinehouse residents. CNSC participated in an in-person engagement with Pinehouse residents in October 2022 and bears eating waste was identified as a concern for hunting and consumption.</p> <p>Rationale: Perceived risk of eating animals that are contaminated by hazardous or radiological wastes could deter community members from harvesting animals that are normally part of their traditional diet. Fencing for waste was specified as a deterrent for human trespassers, not animals.</p> | Please specify measures that Denison will take to ensure bears and other animals do not scavenge from waste facilities. | |
| IR-209 | CNSC | Indigenous Peoples' health / Socio-economic conditions | Section 12.1.4.2.1 (p. 12-22) Section 12.1.5 Section 12.1.6.2 | <p>Context: KML indicates that working at a mine camp could inhibit community members from participating in cultural activities and sharing them with family and community members, resulting in a loss of cultural knowledge and language, thus impact knowledge transmission (p. 12-22).</p> <p>Rationale: Denison addresses this by briefly identifying culturally sensitive policies which would eliminate residual effects (p. 12-30)</p> | Please provide detailed proposed mitigation measure for KML’s concerns related to loss of cultural knowledge and language should they work for Denison. | |
| IR-210 | CNSC | Current use of lands and resources for | Section 12.1.4.2.2, Potential Effect 2: Change in Traditional Diet, Perceived | <p>Context: The EIS states: “Project activities could change the perceived suitability of country foods. An ecological risk assessment (ERA) was conducted to consider both radiological and toxicological risks to ecological receptors such as terrestrial and aquatic invertebrates,</p> | Given concerns with psycho-social impacts and the influence of perception discussed by ERFN earlier on in the EIS, does Denison have information on the perspectives | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|----------------------|--|--|--|------------------|
| | | traditional purposes | Suitability of Country Foods (p. 12-26) | <p>terrestrial and aquatic vegetation, fish, and terrestrial and aquatic mammals and birds. Results for the radiological assessment predicted no exceedances of the radiation dose benchmark for the ecological receptors. For non-radiological COPCs, no exceedances were predicted except for selenium in fish from Russell Lake, based on a conservative dietary assumption for one resource user. The traditional foods diet for the fisher/trapper is conservative as it assumes that their annual fish consumption (183 kg of fish per year) would be obtained from Russell Lake, meaning the exceedance of the benchmark for selenium from fish would only occur if fish were only sourced from this one lake. This one exceedance could potentially change the perceived safety of country foods for community members and make country foods a less desirable part of a traditional diet.</p> <p><u>Experience from other uranium operations in northern Saskatchewan suggests that resource use will continue despite the potential selenium exceedance. An examination of members of the Hatchet Lake Denesų́liné First Nation who live in Wollaston Lake near the Rabbit Lake operation found that over years of being active on the landscape both with and without the presence of the uranium industry, members had developed their own culturally appropriate practice of risk assessment and management based on their relationship with the land. Hatchet Lake Denesų́liné First Nation members appear to be more concerned with the direct effects of uranium mining on the local environment and less concerned about uranium mining’s effects on their health through consumption of plants and animals. This is likely due to their high level of confidence in recognizing affected plants and wildlife and avoiding them (Elias et al. 1997).</u></p> <p>The usage patterns of the ERFN Trapper have similarly allowed for continued use and access to areas proximal to other uranium operations. The ERFN Trapper had a positive relationship with other uranium operations in the ILRU LSA. He also continued to trap (i.e., used his trapline in Fur Block N-18), fish, and opportunistically pick berries, and consumed those resources during operations (KPI Program 2021). Good relationships between Denison and a new trapper who eventually takes over the trapline from the ERFN Trapper would promote continued use.” (p. 12-26)</p> <p>Rationale: The underlined reference suggests that negative perceptions may not prevent traditional resource users from continuing to consume, due to adaptation to potential risks in the environment.</p> | from Indigenous Nations and communities to validate this conclusion is applicable? | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|---|---|------------------|
| IR-211 | CNSC | Accidents and Malfunctions | Section 14.6.1, Bounding Scenario 1, Vehicle Accident and Aquatic Release of Radioactivity | <p>Context: Scenario 1 describes a spill of uranium concentrate into the lake. It’s not clear how the ecological risk assessment was performed. It is stated that sediment concentrations in post-remediation conditions are expected to exceed the benthic invertebrate benchmark and that these results indicate that a spill of uranium concentrate could potentially affect benthic invertebrate populations following a spill, but the spatial extent would be limited. For water, it is stated that when evaluating the potential effect, a comparison was made between the results of the estimated short-term water quality 1,892 µg/L (1.892 mg/kg) and the guideline (33 µg/L). This indicates that there may be some aquatic species that could be affected, but the effects are expected to be transient as the water concentration quickly drops to a long-term level of 0.19 µg/L. However, when looking at dose to other receptors, the results of the ecological risk assessment indicated short-term ingestion of contaminated water resulting from an accident would not result in potential risks to grouse, vole, or deer, however rationale for how these receptors were chosen is not provided.</p> <p>Rationale: It’s not clear from the EIS, why the receptors grouse, vole, and deer were chosen to evaluate ecological effects from a potential spill, and why they differ from receptors in the ERA. It is also not clear if the pathway from sediment ingestion/contact was considered for semi-aquatic receptors as they could be exposed to the increased concentrations post-spill. It is also not clear if SARA species exposure to sediment and water post-spill was considered.</p> | Please clarify why grouse, vole, and deer were chosen as receptors for the ecological risk assessment performed for accidents and malfunctions scenario 1 and clarify if the sediment pathway to receptors post-spill was considered, as well as if SARA species were considered. | |
| IR-212 | HC | Human health with respect to hazardous contaminants | Section 14 (p. 14-3) Appendix 16-C (p. 14 & 15) | <p>The follow-up plan does not sufficiently describe how various parties will be engaged in the design, implementation, and review of monitoring programs.</p> <p>Context: Section 14 of the EIS states that “The overarching fear of contamination from the mine is woven in to almost every other concern noted by participants in the TK study. It is worth acknowledging this concern separately given the potential for mental health impacts related to people’s experiences of fear and anxiety” (p. 14- 3).</p> <p>The commitment regarding monitoring and follow-up activities appears limited to “<i>shar[ing] information in a transparent manner with the General Public, and specifically those Communities of Interest and Nearby Land Users with whom Denison is regularly engaging about the Project. Such an information-sharing program would consider the involvement of the Regulators to make sure the information available addresses the issues identified as concerns</i>” (p. 14).</p> | <p>1. Provide details of how local, provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program.</p> <p>2. Describe the steps that will be taken if there are any exceedances of established benchmarks or deviation from predictions.</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends that the proponent’s plan for communicating follow-up results (environmental and country foods) aims at, among other things, responding to community concerns regarding country foods to minimize avoidance of this resource. This goes beyond a passive dissemination of information and developing a strategy based on dialogue and the direct involvement of communities in monitoring, surveillance, and risk communication activities.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|----------------------------|--|---|---|------------------|
| | | | | Rationale: Country food safety is not regulated federally unless foods are sold commercially. Certain aspects of country food safety and availability may be covered by provincial regulators. It is unclear whether and how various levels of government and potentially affected communities would be involved in the development of the follow-up and monitoring program. It is also unclear what the information sharing program entails and how it would inform any adaptive management if monitoring results deviated from the predictions. | | |
| IR-213 | CNSC | Accidents and Malfunctions | Section 14.5.3 Appendix 14-A | <p>Context: The proponent states that the assessment of accidents and malfunctions began with the initial identification of hazard scenarios. Hazard scenarios were identified using a systematic approach that considered the existence of sources of hazards and initiating events for the Project in consideration of Project activities and components.</p> <p>The hazard identification was conducted to identify a comprehensive list of potential project-related accident and malfunction scenarios associated with the key project components and activities with further details provided in Appendix 14-A. The initial hazards were then screened qualitatively based on likelihood and consequence to determine overall risk level using a risk matrix approach. Bounding scenarios were then selected from this initial list of hazard scenarios.</p> <p>The results of numerical analyses (RESPEC, 2021) of detailed strip model suggest that the deformation imposed on the cemented steel casing from downward movement of the rock mass may exceed the assumed casing-strain yield limits and the failure limit locally after extracting the uranium ore. However, this potential hazard is not identified in the hazard identification.</p> <p>Rationale: Exceedance of steel casing yield limits and failure limit would either compromise the steel casing integrity or damage the steel casing and result in the leakage of injected solution, which could impact on mine operation and contaminate the surrounding groundwater.</p> | Please include the hazard of steel casing yield or damage in the table of hazard identification evaluation and conduct an initial risk screening and further detailed assessment as required. | |
| IR-214 | CNSC | Accidents and Malfunctions | Section 14.5.3 Appendix 14-A, section 3.2.3 | <p>Context: Hazard scenarios were identified using a systematic approach that considered the existence of sources of hazards and initiating events for the Project in consideration of Project activities and components. Details for how each of these project components and activities are considered in the initial hazard scenario identification process are provided in the accidents and malfunctions TSD (see Appendix 14-A; Ecometrix 2022).</p> <p>However, in Table 3-1 to Table 3-14 in Appendix A of Appendix 14-A, the following inconsistencies were identified:</p> | Please clarify or correct all inconsistent and/or inaccurate information in Tables 3-1 to 3-14 in Appendix A of Appendix 14-A. | |

Hazard ID# 12.1 has a L=2 and S=3, but it’s risk ranking is moderate, which is inconsistent with the term in Figure 14.5-2</div><div>vi. Hazard ID# 13.3 has a L=2. Based on the operation experience in the similar projects in the northern Saskatchewan, ponds lining failure and leakage is a very likely event. Rationale needs to be provided to support L=2 or change the number for L.</div></div> <div>Rationale: Inconsistent or inaccurate/incorrect information was included in Accidents and Malfunctions assessment.</div> | | |
| IR-215 | CNSC | Human health with respect to hazardous contaminants | Section 14.6 | <div><div>Context: One of the potential risks of a uranium mine and mill is a spill of untreated effluent.</div><div>Rationale: In the EIS, it doesn’t appear that the scenario of a spill of untreated effluent to the environment has been considered.</div><div>A failure of the piping containing the untreated effluent could result in an uncontrolled release to the environment and could affect the groundwater, soil quality, and terrestrial biota.</div></div> | Please evaluate and provide the results for a bounding scenario of a spill of untreated effluent or provide justification for its exclusion. | |
| IR-216 | CNSC | Human Health with respect to radiation exposure | Section 14.6.1 Section 14.6.7 Appendix 14-A | <div><div>Context: Radiological doses to human receptors, including workers (i.e., driver(s) of the vehicles), from the Bounding Scenarios 1 (Vehicle Accident Including Rollover, Collision, Run Off Road) and 7 (Vehicle Accident Including Rollover, Collision, Run Off Road) have not been assessed.</div><div>Rationale: An estimate of the effective doses to human receptors, including workers, are required to determine whether the expected doses meet the dose limits set out in the Radiation Protection Regulations.</div></div> | Provide estimates (including calculations) of the potential radiological doses to human receptors, including workers, resulting from Bounding Scenarios 1 and 7. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|----------------------------|--|---|--|------------------|
| IR-217 | CNSC | Accidents and Malfunctions | Sections 14.6.1 and 14.6.2 | <p>Context: Highway 914 crosses the Wheeler River 10 km southwest of the access road junction. A vehicle accident, including a rollover, collision, or run off road, at or near the bridge could potentially result in a release of uranium concentrate and release of fuels and chemicals into the surface water at this location. Denison believes that a release of uranium concentrate and a release of fuels and chemicals at this location would bound the releases at any other water crossing along the transportation corridor. However, no information on what other water crossings along the transportation corridor exist and how bounding scenarios 1 and 2 would bound the risk of releasing uranium concentrate and fuels and chemicals at other crossings.</p> <p>Rationale: The release of uranium concentrate and fuels and chemicals at water crossings would contaminate the water body at the crossings and pose a risk to the environment and public health.</p> | Please provide information on all water crossings along the transportation corridor and justification why bounding scenarios 1 and 2 would bound the effects of the accidental releases of uranium concentrate and fuels and chemicals at these crossings. | |
| IR-218 | CNSC | Accidents and Malfunctions | Sections 14.6.1.1 and 14.6.1.4 | <p>Context: Table 14.6-1 indicates that the average flow of Wheeler River south of Russel Lake is 17,340 L/s or 17.34 m3/s. This rate is used for uranium dissolution rate calculation. However, in section 14.6.1.4, it states that the average annual flow is 24.3 m3/s. In Table 14.6-3, the last two rows appear to be added wrongly.</p> <p>It also states that sediment quality results are shown in Table 14.6-5 for post-remediation conditions. During minimum flow conditions, the affected volume is expected to be smaller, resulting in a higher sediment concentration. In comparison, higher flow conditions are expected to result in a greater footprint and lower concentrations. However, in Table 14.6-5, the average sediments concentration and porewater concentration appear to be incorrect and switched between average flow and maximum flow.</p> <p>Rationale: Inconsistent/inaccurate information provided in the EIS.</p> | Please clarify and correct the inconsistent information on average flow rate of Wheeler River at the crossing and incorrect information in Table 14.6-3, and average sediment concentration and porewater concentration under average and maximum flow conditions in Table 14.6-5. | |
| IR-219 | CNSC | Accidents and Malfunctions | Sections 14.6.1.1.1 and 14.6.1.4.1; Sections 5.1.1 and 8.1 of Appendix 14-A | <p>Context: When assessing the release characterization of Bounding Scenario 1, the proponent assumed that 95% of the released uranium concentrate can be recovered from the release location without sufficient justification, and that different water column depths, i.e., 10 cm and 5 cm, and average water depth of 1.2 m at the release location were used without explanation.</p> <p>Rationale: As the recovery rate of the uranium concentrate would have an impact on the assessment of its potential effects, it is necessary to understand how the recovery rate and water level were selected for assessing this bounding scenario.</p> | Provide further rationale for assuming 95% recovery rate and for using different water column depths for uranium concentrate release characterization. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|----------------------------|--|---|--|------------------|
| IR-220 | CNSC | Accidents and Malfunctions | Section 14.6.1.1.1 Appendix 14-A, Section 5.1.1 | <p>Context: The proponent states that based on drum deformations performed in a previous analysis (McSweeney et al. 2004), if a drum experienced a crush force of 100,000 lbs., then the deformation of the drum would cause the lid to detach from the drum. Using this drum failure mechanism, and assuming the drums weigh 450 kg and are arranged four across in the truck, at a speed of 48 km/h, the front 25% of the drums would fail, at 60 km/h to 97 km/h 55% would fail, at 145 km/h 75% would fail, and at ≥193 km/h all would fail. Given that the speed of the truck is likely between 60 km/h to 97 km/h, it was concluded that less than 55% of the drums would fail upon a traffic accident scenario.</p> <p>It is assumed to be 40 drums per shipment, so some stacking or rows of drums should be expected in this scenario. The drums stacked above could be at greater risk of deformation in a traffic accident. It is not clear whether drums stacking was considered in the previous study cited by the proponent and whether less than 55% fail is still an adequate percentage of drum failures in such traffic accident scenarios if drums stacking is needed.</p> <p>Rationale: Drum failure percentage will impact the release quantity of uranium in such an accident scenario and then impact the consequence assessment. Therefore, the drum failure should be adequately assessed and supported with sufficient information and justification.</p> | Please provide information and/or rationale as to whether drum stacking would impact drum failure at different speeds and confirm whether 55% drum fail for such an accident is still valid. | |
| IR-221 | CNSC | Accidents and Malfunctions | Section 14.6.1.3, Appendix 14-A, Section 7.1 | <p>Context: It is projected that there would be about 100 drums packaged per mill operating day. One trip per day for 330 days per year is assumed for the probability evaluation. This means 100 drums per trip, which is inconsistent with description in section 14.6.1.1.1 where assuming 40 drums in one shipment per day.</p> <p>Rationale: Shipments per day will impact the probability evaluation, and number of drums per trip will impact the release of uranium during an accident.</p> | Please clarify the number of shipments per day and number of drums per shipment that are expected and re-calculate the probability as necessary. | |
| IR-222 | CNSC | Accidents and Malfunctions | Section 14.6.2.4 | <p>Context: Bounding Scenario 2 consists of the aquatic release of fuel and hazardous chemicals due to traffic accidents. The EIS states that amongst the fuels considered for this scenario, the consequences of the release of gasoline and solvents are bounded by the consequences associated with the release of diesel. Both gasoline and solvents are lighter with higher vapour pressure; therefore, they have a shorter half-life in the aquatic environment and a lesser tendency for adsorption to sediments and suspended solids in the water column. There is no other justification provided to show that the release of diesel can bound other chemicals such as sulfuric acid and sodium hydroxide that are heavier than diesel.</p> | Please provide further justification that the consequences of the release of sulfuric acid and sodium hydroxide can be bounded by the consequences associated with the release of diesel. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|--|--|------------------|
| | | | | Rationale: The release of either sulfuric acid or sodium hydroxide during accident could change the water PH significantly at the releasing location, which would post a negative impact on the local environment. | | |
| IR-223 | CNSC | Accidents and Malfunctions | Section 14.6.4.1 Appendix 7-A, Appendix K | Context: The EIS states that the 3D strip numerical model predicted that stresses and displacements did not show instability in the altered sandstone or basement rock at the location where a freeze wall would be placed around the Phoenix Deposit boundary (RESPEC 2021). The potential damage to the freeze wall due to mine-induced stresses and displacements under this scenario is excluded. Rationale: One outer section of the freeze wall (i.e., north-east freeze wall of the phase 4 mining area) and some internal cross walls are located in the desilicified zone. The RESPEC 2021 report (i.e., Appendix K of Appendix 7-A) appears not to have included the desilicified zone in the geomechnical modeling, nor is provided the stresses and the displacements/deformation of the area northeast of the phase 4 ore body where a significant extent of the desilicified zone exists. | Please provide information on the stresses and displacements/deformation of the area northeast of the phase 4 ore body from the geomechanical studies to demonstrate the resulted stresses and displacements will not impact on the freeze wall integrity after IRs for geomechanical studies for ore extraction are addressed. Technical Discussion Required: Yes | |
| IR-224 | CNSC | Human Health with respect to radiation exposure | Section 14.6.5.4 Appendix 14-A | Context: For the Bounding Scenario 5 (Process System and Piping Failure), doses to receptors at distances of 100 and 500 metres (0.25 and 0.01 mSv respectively) are predicted. The assessment also indicated that the dose to the unprotected worker staying inside the processing plant during the spill could exceed the 50 mSv dose limit specified by CNSC if workers did not leave the area quickly after the spill. The proponent did not provide the dose calculations for deriving the dose estimates. Rationale: The method used to estimate effective, equivalent, and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data. | Provide the dose calculations for deriving the dose estimates for workers and members of the public for Bounding Scenario 5 (Process System and Piping Failure). | |
| IR-225 | CNSC | Human Health with respect to radiation exposure | Section 14.6.5.4 Appendix 14-A | Context: With the Bounding Scenario 5 (Process System and Piping Failure), the proponent states that Denison ensures that the process is designed to include control measures to reduce the exposure to both workers and members of the public as low as achievable. The measures would ensure that the processing plant is adequately ventilated, and that spills or leaks are detected by loss of system pressure, observation, or flow imbalance. It is not indicated where these additional measures have been detailed/elaborated within the EIS. | Provide details on how the control measures to reduce the exposure to both workers and members of the public, identified in the assessment of Bounding Scenario 5, have been formally documented and incorporated in the engineered design of the processing facility. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|---|--|------------------|
| | | | | Rationale: Control measures to reduce the exposure to both workers and members of the public as low as achievable, that are identified in the assessment of Bounding Scenario 5, must be formally documented to ensure that they are carried over into the engineered design of the processing plant. | | |
| IR-226 | CNSC | Accidents and Malfunctions | Sections 14.6.6.1 and 14.6.6.4 | Context: It is stated that in the case of the accident and for a release amount of 1 kg inside the processing plant, the dose to offsite receptors at 200 m from the project site was calculated to be less than the CNSC public dose limit of 1 mSv. The analysis also indicated that the dose to a worker in a full-face-piece powered air-purifying respirator who stays in the area would be 88 mSv, which exceeds the annual worker dose limit of 50 mSv. Rationale: Section 14.6.6.1 indicates that 2 kg of uranium concentrate could be released in case of the accident. No rationale is provided why 1 kg rather than 2 kg uranium concentrate is used for dose calculation. If 2 kg is used as the source term, the dose to offsite receptors at 200m and workers in the area would be higher. | Please provide the rationale for using a source term of 1 kg rather than 2 kg of uranium concentrate for the dose calculation to offsite receptors and workers. If sufficient rationale cannot be provided, the doses to offsite receptors and workers should be recalculated using 2 kg uranium concentrate, and the results provide. | |
| IR-227 | CNSC | Accidents and Malfunctions | Section 14.6.6.1.1 | Context: Bounding Scenario 6 involves a fire and/or explosion within the processing plant, resulting in the release of a large amount uranium to the atmosphere. The airborne source term for this scenario is estimated with equation developed by the United States Department of Energy (USDOE), where the respirable faction is assumed to only include particles of 10 mm and smaller. Rationale: No rationale was provided to support the consideration of only 10 mm and smaller particles. As provided in Table 14.6-3, the particle size of uranium <15 mm is less than 20%. Majority of the uranium particle size is larger than 10 mm. The airborne source term is an important factor for the effects assessment and should be calculated with transparent and justified information/data. | Provide rationale for only considering 10 mm and smaller particles for the respirable fraction. | |
| IR-228 | CNSC | Human Health with respect to radiation exposure | Section 14.6.6.4 Appendix 14-A | Context: For the Bounding Scenario 6 (Facility Fire and/or Explosion), the predicted dose is less than 1 mSv to a member of the public 200 metres away from the project site. The analysis also indicated that the dose to a worker in a full-face powered air-purifying respirator who stays in the area would be 88 mSv, which exceeds the annual worker dose limit of 50 mSv. The proponent did not provide the dose calculations for deriving the dose estimates. Rationale: The method used to estimate effective, equivalent, and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data. | Provide the dose calculations for deriving the dose estimates for workers and members of the public for Bounding Scenario 6 (Facility Fire and/or Explosion). | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|--|---|--|------------------|
| IR-229 | CNSC | Human Health with respect to radiation exposure | Section 14.6.6.4 Appendix 14-A | <p>Context: With the Bounding Scenario 6 (Facility Fire and/or Explosion), the proponent states that Denison would ensure that the design of the plant includes control measures to reduce the exposure to both workers and members of the public to levels that are as low as achievable. The measures would ensure that the processing plant is adequately ventilated.</p> <p>It is not indicated where these additional measures have been detailed/elaborated within the EIS.</p> <p>Rationale: Control measures to reduce the exposure to both workers and members of the public as low as achievable, that are identified in the assessment of Bounding Scenario 6, must be formally documented to ensure that they are carried over into the engineered design of the processing plant.</p> | Provide details on how the control measures to reduce the exposure to both workers and members of the public, identified in the assessment of Bounding Scenario 6, have been formally documented and incorporated in the engineered design of the processing facility. | |
| IR-230 | CNSC | Accidents and Malfunctions | Section 14.6.7.4 | <p>Context: It is stated that a conservative penetration time of 15 min was applied in the assessment. Based on this assumption, the maximum depth of contamination could be 90 cm (for penetration rate of 0.1 cm/s). It is not clear why the penetration time of 15 minutes is considered conservative as the penetration time would depend on the time needed for the emergency response team to respond.</p> <p>It is also stated that the wide range of the calculated velocities is a result of variation of soil conditions and the slope of the surface. The distance that the groundwater can travel under these extreme (i.e., conservative) conditions ranges from 0.15 m to 100 m. It is not clear how the groundwater travel distance of 0.15m and 100m is calculated.</p> <p>Rationale: The penetration time will influence the penetration depth of the released materials, which in turn, considering the groundwater travel distance, will impact the potential areas and volumes of contaminated soils and shallow groundwater.</p> | Please provide justification for applying 15 minutes of penetration time, and why it is considered conservative. In addition, please provide information on how the groundwater travel distance of 0.15 m and 100 m was obtained. | |
| IR-231 | CNSC | Accidents and Malfunctions | Sections 14.6.6.4 and 14.6.6.5 | <p>Context: The EIS states that in the unlikely event of an unmitigated accidental release of uranium due to a dryer explosion, doses to the workers are expected to have a moderate effect, while doses to members of the public are expected to have a minor effect. Based on this evaluation, the severity of the consequences of this accident and malfunction scenario is predicted to be moderate. In consideration of both probability and consequences, the overall risk related to Bounding Scenario 6 is predicted to be low.</p> <p>Rationale: When there is an explosion within the process plant, it is likely there will have worker fatality. The severity of the consequences</p> | Please re-evaluate the consequence and the risk of Bounding Scenario 6 by considering the potential worker fatality resulted from an explosion. | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|--|--|--|--|------------------|
| | | | | of an explosion would be catastrophic and the risk of Bounding Scenario 6 would be higher. | | |
| IR-232 | ECCC | Change to an environmental component due to hazardous contaminants | Appendix 14-A, Table 3-7, ID# 7.1 Appendix 14-A, Table 5-5 | <p>Context: The Proponent indicates in Appendix 14-A, Table 3-7 that a release of sulfuric acid is a low consequence event therefore would not require further assessment. However, according to a Safety Datasheet on high concentrated sulfuric acid (ICSC 0362 - SULFURIC ACID, concentrated (> 51% and < 100%) (ilo.org)), the substance is incompatible with certain materials and can give off toxic fumes. Furthermore, it reacts with various metals to produce hydrogen gas, which is explosive.</p> <p>The Proponent provides estimates of chemicals, including sulfuric acid, to be transported to site in Appendix 14-A, Table 5-5. The annual consumption of sulfuric acid is estimated at 15,417 m3, in 617 trucks per year, but the concentration is not stated.</p> <p>Rationale: Given the high reactivity and inherent corrosive nature of sulfuric acid combined with the volume and concentration that may be stored on site, ECCC requests that the Proponent provide a detailed risk assessment related to a terrestrial spill of sulfuric acid, specifically at the processing plant.</p> | 1. Provide the volume and the concentration of sulfuric acid that will be stored on site. 2. Provide a detailed risk assessment of the fate and behavior of sulfuric acid during a release into the environment. | |
| IR-233 | HC | Human health with respect to hazardous contaminants | Appendix 14-A, Section 8.7 (p. 8.10) | <p>An effects assessment for a transportation accident scenario involving radioactive materials was not included.</p> <p>Context: The proponent provided an effects assessment relating to a diesel spill on the ground (Section 14 Appendix 14-A, Section 8.7). However, no information was provided regarding the potential human health effects of a uranium concentrate release at the two locations considered (Section 14 Appendix 14-A p. 8.10).</p> <p>Rationale: An accident involving radioactive material may have an impact on human receptors, based on the proximity of receptors and the proposed response protocols.</p> | 1. Assess and describe the potential health effects (chemical and radiological) of a transportation accident involving a uranium concentrate spill at the following locations: a) km 160 of Hwy 914, which is the location of a cultural camp that has been established by the ERFN. b) km 67 of Hwy 914, which is a gathering location for the Kineepik Métis Local associated with the Northern Village of Pinehouse. c) All other potential sites of importance for the public and Indigenous peoples. | |
| IR-234 | CNSC | Effect of Environment | Section 15.2.2 | <p>Context: Effects of seismic events on the uranium extraction and post decommissioning are not assessed.</p> <p>Rationale: Seismic events could further exacerbate the stability of the voids induced by the uranium extraction, which will result in extra stresses and displacements/deformation in the overlying rock formations. These extra stresses and displacements/deformation could impact on the mine operation and post decommissioning groundwater flow and contaminant transport.</p> | Please provide an assessment of seismic events on the mine-induced voids stability and the resulted effects on the mine operation and post decommissioning. Technical Discussion Required: Yes | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-----------------------|--|---|--|------------------|
| IR-235 | ECCC | Fish and fish habitat | Section 15.5.2, Expected Environmental Conditions | <p>Context: In this section it is stated that: “Table 15.5-1 and Table 15.5-2 summarize the predicted mean values of the climate variables for the Tomblin Lake regional grid unit, following the RPC4.5 and RCP8.5 scenarios, respectively, as indicated by the Climate Atlas (PCC 2019).”</p> <p>RCP4.5 represents predicted climate conditions of a moderate carbon future.</p> <p>RCP8.5 represents predicted climate conditions under a high carbon future.</p> <p>The values shown in Tables 15.5-1 and 15.5-2 show averages of 25.9 and 26.7 mm for RCP4.5 and 25.9/27.5 mm for RCP8.5. These values do not correspond to the source indicated by the Proponent.</p> <p>Rationale: Based on the Proponent’s description we would expect to find the same values for “Max 1-Day Precipitation (mm)”in the Climate Atlas for RCP4.5 and RCP8.5 scenarios. ECCC was unable to duplicate the results.</p> <p>ECCC queried the Climate Atlas for Tomblin Lake and returned a result of “Region Geikie River.” https://climateatlas.ca/find-local-data</p> <p>ECCC then queried the Climate Atlas for Max 1 Day Precipitation (mm). https://climateatlas.ca/data/grid/782/maxdaypr_2030_85/line https://climateatlas.ca/data/grid/782/maxdaypr_2030_45/line</p> <p>The results displayed an array of values ranging from 83.6 mm (2050) to 87.3mm (2092) for a Regional Concentration Pathway RCP8.5 scenario and values ranging from 48.9mm (2050) to 89.5 mm (2083) for an RCP4.5 scenario.</p> <p>These values do not match the averages shown in Tables 15.5-1 and 15.5-2.</p> | <p>1. Provide the source of the data displayed in Max 1-Day Precipitation (mm) category in Tables 15.5.1 and 15.5-2.</p> <p>2. Provide detailed calculations for the following average values:</p> <ul style="list-style-type: none">• 25.9 mm 26.7 mm in Table 15.5-1: Predicted Climate Conditions of a RCP4.5 Moderate Carbon Future• 25.9 mm 27.5 mm in Table 15.5-2: Predicted Climate Conditions of a RCP8.5 High Carbon Future <p>3. Explain how the data shown in Tables 15.5.1 and 15.5.2 were used in the precipitation risk assessment.</p> <p>4. Denote the differences between “mean”, “value/max value”, and “fluctuation”, in the calculation of extreme event risk.</p> <p>5. Compare model derived data against:</p> <ol style="list-style-type: none">1. Natural variability of the observed data.2. Variability in the statistics generated via observation based time series. <p>Technical Discussion Required: Yes</p> | |
| IR-236 | ECCC | Fish and fish habitat | Section 15.5.2, Expected Environmental Conditions | <p>Context: It is stated that, “Table 15.5-1 and Table 15.5-2 summarize the predicted mean values of the climate variables for the Tomblin Lake regional grid unit...”</p> <p>As per the Proponent’s description, Tomblin Lake was chosen as representative location for Wheeler when Climate Atlas was used as data source.</p> <p>Rationale: In those two tables, for the “Max 1-Day Precipitation (mm)” the historical average is given as 24.1mm. Local time series analysis for the climatic region in which Wheeler Project is located provide</p> | <p>1. Provide a clear explanation on how the historical mean for 1-Day Max Precipitation was calculated.</p> <p>2. Compare the values obtained via various means (ex: copied from the internet, modeled via some online algorithm, derived from specialty literature), against time series analysis based on observations.</p> <p>Technical Discussion Required: Yes</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|-------------------------------------|---|---|--|------------------|
| | | | | <p>averages (for 1-day max precipitation) of approximately 30+ mm.</p> <p>It is the Proponent’s responsibility to keep the required database current and up to date, because the length of the time series influences all derived statistics. Statistical analysis of extreme events is highly dependent of the mean with extreme values reaching values 3 to 4 times higher than the mean.</p> | | |
| IR-237 | CNSC | EA follow-up and monitoring program | Appendix 16-C throughout, including Table 1.5-1: Wheeler River Monitoring and Follow-up Program Summary (p. 8-15) | <p>Context: CNSC’s Generic Guidelines for the Preparation of an EIS state: “The EIS should provide discussion on the follow-up program’s requirements, and include:</p> <ul style="list-style-type: none">objectives and structure of the follow-up program and the VCs targeted by the programtabular summary and explanatory text of the main components of the program including:<ul style="list-style-type: none">a description of each monitoring activity under that component<u>which of the two generic program objectives the activity is relevant to (e.g., verify EA predictions, determine effectiveness of mitigation measures)</u>the specific statement from the EA that goes along with that generic objective and will be the focus for that activity (e.g., program objective: verify predicted effects; environmental assessment effect: no potential adverse effects)the specific monitoring objective for that activityplanned schedule<u>roles and responsibilities to be played by the proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the program results</u><u>possible involvement of independent researchers</u><u>program funding sources</u>information management and reporting (reporting frequency, methods and format)<u>possible opportunities for the proponent to include the participation of the public and Indigenous groups, during the development and implementation of the program</u> <p><u>The follow-up program plan should be sufficiently described in the EIS to allow independent judgment as to the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures.”</u> (Section 11)</p> <p>Rationale: The Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information, and</p> | <p>It is recognized that this document will evolve over the planning process and be finalized prior to the EA Decision; however, as plans are developed and revised, CNSC staff expect that updates will be made to this document and provided with any future versions of the EIS.</p> <p>Appendix 16-C Summary of Monitoring and Follow-up Programs must include sufficient details to allow CNSC staff to determine the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures. This includes concrete monitoring plans (sampling locations, frequency, etc.).</p> <p>Additionally, please incorporate any relevant information included in the EIS into this Summary.</p> | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response |
|--------|------------|---|---|---|--|------------------|
| | | | | <p>while some of the aspects detailed in the Generic EIS Guidelines are included, the aspects underlined are missing or appear incomplete.</p> <p>Further, all information from throughout the EIS should be incorporated into this Summary. For example, the EIS notes that: “Groundwater samples will be collected at least monthly and semi-annually in the wells within the freeze wall and on the freeze wall perimeter, respectively” (p. 7-109) and that “At least five to seven multi-well clusters are proposed across the mined area (Figure 7.8-2). Sampling will include KI parameters or the full suite of COPC at different times in the remediation process” (p. 7-111).</p> <p>These details (only examples) are not included in Appendix 16-C.</p> | | |
| IR-238 | CNSC | Current use of lands and resources for traditional purposes | Various sections of the EIS, including: Section 8 Section 9 Section 10 Section 11 Section 12 Section 15 Section 16 Appendix 16-C (p. 3) | <p>Context: The EIS indicates that “further detailed [follow-up and monitoring programs] will be developed as Project designs are finalized that may influence the nature, frequency, and locations of monitoring. In addition, input from regulatory agencies, the public and Indigenous Peoples will be considered.” (Appendix 16-C, p.3)</p> <p>It is not clear in several section(s) of the EIS and the Indigenous Engagement Report, whether Denison has provided the interested Indigenous Nations and communities with the opportunity to participate in the development, implementation, and review of monitoring and mitigation measures, as per the guidance of REGDOC-3.2.2 and CNSC’s Generic EIS Guidelines.</p> <p>Rational: As outlined in Section 11 of CNSC’s Generic Guidelines for the Preparation of an EIS, please include roles and responsibilities to be played by the proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the monitoring program results as well as possible opportunities for the proponent to include the participation of the public and Indigenous Nations and communities, during the development and implementation of the program.</p> | <p>Please provide additional information to demonstrate whether Indigenous Nations and communities were engaged directly on the potential mitigation and monitoring measures to address the concerns raised regarding potential impacts of the project on the potential or established Indigenous and/or treaty rights.</p> <p>Provide a rationale if this engagement has not been completed. As the Project develops, please provide concrete actions Denison will take in the follow-up and monitoring programs to engage Indigenous Peoples to alleviate concerns and incorporate their interests, and when this engagement is planned to take place.</p> | |

ⁱ **Additional Lung Cancer Mortality from PM2.5: Recommended Approach and Sample Calculation**
Health Canada, Water and Air Quality Bureau, October 2022

Health Canada (2022) provides a quantitative estimate of the risk of lung cancer associated with exposure to PM2.5 in Canada. The pooled hazard ratio (HR) for lung cancer mortality in the Canadian population is 1.127 (95% CI: 1.085, 1.170)

per 10 µg/m3 increase in long-term exposure to ambient PM2.5. The slope coefficient (β) for this relationship is 0.01196, as derived below:

$$\begin{aligned} e^{(\beta \times 10 \text{ } \mu\text{g}/\text{m}^3)} &= \text{pooled hazard ratio per } 10 \text{ } \mu\text{g}/\text{m}^3 \\ e^{(\beta \times 10 \text{ } \mu\text{g}/\text{m}^3)} &= 1.127 \\ \beta \times 10 \text{ } \mu\text{g}/\text{m}^3 &= \ln 1.127 \\ \beta &= (\ln 1.127)/(10 \text{ } \mu\text{g}/\text{m}^3) \\ \beta &= 0.01196 \end{aligned}$$

The additional lung cancer mortality (over the baseline rate) from PM2.5 derived from a given source can be determined using the equation below, based on the attributable fraction or (HR-1)/HR (Greco et al. 2020):

$$ALCM = \left[\frac{(e^{\beta \cdot Exposure} - 1)}{e^{\beta \cdot Exposure}} \right] \cdot Baseline \text{ rate} \cdot Years$$

ALCM = additional lung cancer mortality cases per 100,000 population

β = 0.01196 (slope coefficient from meta-analysis in Health Canada (2022))

Exposure = estimated PM2.5 exposure concentration from the relevant source(s) (µg/m3) (does not include baseline PM2.5 exposure)

Baseline rate = 45.5 per 100,000 (current Canadian Age Standardized Mortality Rate (ASMR) for lung cancer from Canadian Cancer Statistics Advisory Committee 2021); the Canadian baseline rate is appropriate as the slope coefficient was derived from Canada-wide studies and an updated ASMR of Canada (if available) would be appropriate for use in the calculation

Years = years of project or project phase

Sample calculation:

Project estimates an exposure from relevant source(s) of 0.067 µg/m3 over 50 years of operation

$$\begin{aligned} ALCM &= \left[\frac{(e^{\beta \cdot Exposure} - 1)}{e^{\beta \cdot Exposure}} \right] \cdot Baseline \text{ rate} \cdot Years \\ ALCM &= \left[\frac{(e^{0.01196 \cdot 0.067} - 1)}{e^{0.01196 \cdot 0.067}} \right] \cdot 45.5 \cdot 50 \end{aligned}$$

ALCM = 1.8 additional lung cancer mortality cases per 100,000

|--------|---|--|---|---|
| AD-01 | Canadian Nuclear Safety Commission (CNSC) | Glossary sections | <p>There are terms used throughout the EIS that may either need defining, or inclusion in the glossary.</p> <ul style="list-style-type: none">“Bounding”, “bounding case” and “bound” are used frequently throughout the EIS to describe the scope of the assessment. For example, p. 2-6 the EIS States: “Denison has bound the environmental assessment above the deposit...”“Laydown”. P. 2-54 states: “During Construction, Denison plans to create a laydown area next to the future domestic landfill to temporarily store construction waste. Examples of materials include clean wood, plastics, metal, and concrete. The construction laydown area will not be lined, but it will have a berm surrounding the area to minimize run-on and runoff.”“Deflagration” (p. 2-22)“Speed of sound” The EIS states: “Deflagration means the material burns slower than the speed of sound, thus no shock waves are generated. Propellant permeability enhancement methods reach injection pressures of up to 8,000 psi and are near instantaneous over periods of milli seconds...” (p. 2-22) - Explain briefly what is meant by “speed of sound”“Dries” (p. 2-65): “the main dries will be located in the processing plant”“Scarified” 2-84 Laydown areas will be scarified, covered with 0.5 to 1.0 m of stockpiled overburden, and vegetated with native, self-sustaining species.“Furblock” (p. 4-29)“Cutlines” (p. 4-101) | Add this terminology to either one of the early glossaries, or when describing the methodology, in order to help readers understand these terms (particularly non-technical readers, such as Indigenous peoples and members of the public). |
| AD-02 | CNSC | General | Mining solution and lixiviant are used interchangeably throughout the EIS. When both are used periodically, may be difficult for a member of the public to recognize that these are one in the same (mining fluid seems more often used). | Be consistent in how this is referred to, in order to ensure it’s clear to readers that these are one and the same. |
| AD-03 | CNSC | Throughout the Executive Summary (ES) and draft EIS | <p>Errors in formatting and grammar were identified throughout ES and EIS. Some examples are underlined below:</p> <ul style="list-style-type: none">“often referred to as “the final uranium product (yellowcake” (ES, p.16)“Whitefish Lake;;” (ES, p.47)“Forest fires are common throughout most of northern Saskatchewan, however, and are an important natural disturbance of northern boreal forest ecosystems” (p.72)“Other comments that the process reminded them of fracking, which carried a negative connotation...” incomplete sentence (EIS, p. 2-3)“.During this phase, water taking will mainly be used by the processing plant and wellfield remediation and to support the potable water plant and wash bay.” (EIS, p. 8-29)“In McGowan Lake, meanmercury concentrations in Northern Pike” (EIS, p. 8-224) | Please correct these and any other formatting, spelling or grammatical errors. |

¹ Unless otherwise stated, the section noted refers to the draft EIS

| Ref. # | Department | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Advice to the Proponent |
|--------|--|--|--|--|
| | | | <ul style="list-style-type: none">“Flows and water levels in lakes and rivers within the LSA will realize some adverse change (reduction) as a result of overprinting drainage areas reporting specifically to Whitefish Lake and water taking from this same waterbody.” (8-38)“Residual effects characteristics specific to Fish Health are defined in Table 8.5-6 with evaluation of residual effects provided in ” (EIS, p. 8-242)“Potential Project residual effects on the Fish Health VC are primarily related to c the controlled” (EIS, p. 8-249)“...resulting in a moderate level of uncertainty. .” (EIS, p. 9-47)“...the assessment. Error! Reference source not found. Provides a summary of unique identification numbers referenced within Section 10.1.” (10-10)“Kineepik Métis Local #9 have also note how the Project...” (EIS, p. 11-57)“But do not compose the same volume of consumption” (EIS, p. 11-56) – should this be comprise?“ Phoenix Infrastructure. I In total, approximately 284 ha” (EIS, p. 11-156) <p>Please note, this list is not exhaustive.</p> | |
| AD-04 | CNSC | Section 2.2.1 Mining (p. 2-4 to 2-5) | An arial view could be useful to help a reader understand the proposed freeze wall earlier in section 2 (e.g., The shape, whether it surrounds the deposit). This is unclear but there are good images further down in the EIS (i.e., Figure 2.3-1 on p. 2-78). | Consider adding image to Section 2.2.1, similar to or containing aspects of Figure 2.3-1. |
| AD-05 | Transport Canada (TC) | Sections 2.2.3.2, 2.2.3.10, 2.2.5.1, 2.3.1.6, 8.3.4.2.2, 11.1.4.4.2, | The two water crossings over Kratchkowsky Creek and Hart Creek and the water intake and effluent discharge/intake pipeline and diffuser at Whitefish Lake may be subject to the <i>Canadian Navigable Waters Act</i> (CNWA). However, these works may be exempt from the CNWA, if they meet the requirements of the Minor Works Order. | <p>*This advice pertains to the regulatory phase.*</p> <p>It is recommended that the Proponent self-assess each work using TC’s Project Review Tool as follows: https://npp-submissions-demandes-ppn.tc.canada.ca/projectreview-outildexamenduprojet</p> <p>If the works do not fit the Minor Works Order, the Proponent has the option to either submit an application for approval to the NPP, or use the public resolution process, as these are all unscheduled waterways. The full text of the Minor Works Order is available here: https://laws-lois.justice.gc.ca/eng/regulations/SOR-2021-170/page-1.html.</p> <p>Background information on the NPP, the Minor Works Order, the application for approval process and the public resolution process are available here: https://tc.canada.ca/en/programs/navigation-protection-program/apply-npp</p> |
| AD-06 | Environment and Climate Change Canada (ECCC) | Section 2.2.3.8, Project Description | <p>In this section it is stated that: “The third step of the Industrial Wastewater Treatment Plant (IWWTP) is anticipated to further neutralize and improve the remaining water quality proposed to be achieved with further pH adjustments through agitated tanks and a clarifier with negligible solids generation expected at this stage. Several additional technologies including ion exchange are being evaluated as part of an ongoing Best Available Technology Study to be complete as part of future permitting.” ECCC would be interested in reviewing this study when it becomes available.</p> <p>Considering that the third step of the effluent treatment process in the IWWTP is still undergoing development, ECCC cannot make final conclusions regarding the efficacy of the treatment process. When final treatment technologies have been evaluated and selected, ECCC would like to review this information to allow for release to the environment.</p> | ECCC requests the opportunity to review the Best Available Technology Study and selected treatment technologies for the IWWTP when the report becomes available. |

| Ref. # | Department | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Advice to the Proponent |
|--------|------------|--|---|---|
| AD-07 | TC | Section 2.2.5.3 | <p>With respect to the proposed airstrip, under the <i>Aeronautics Act</i>, the proposed airstrip would be considered an “aerodrome”, which is defined as:</p> <p>“aerodrome means any area of land, water (including the frozen surface thereof) or other supporting surface used, designed, prepared, equipped or set apart for use either in whole or in part for the arrival, departure, movement or servicing of aircraft and includes any buildings, installations and equipment situated thereon or associated therewith.”</p> <p>Aerodromes, including the one proposed by Denison, are subject to the <i>Aeronautics Act</i> and the Canadian Aviation Regulations (CARs).</p> | <p>*This advice pertains to the regulatory phase.*</p> <p>The proponent must notify the Minister of Transport of the proposed airstrip (aerodrome). This notification, being a summary report to the Minister of Transport, is required by section 307 of the CARs (CARs 307). CARs 307 also requires Denison to undertake consultation in the prescribed manner before it constructs the proposed aerodrome at the mine site. Details of the consultation are to be included in the above-mentioned summary report to the Minister of Transport.</p> <p>CARs 307 identifies the requirement to consult to include anyone seeking to undertake a prescribed aerodrome work at a certified or non-certified aerodrome, whether it is the creation of a new aerodrome or, at an existing aerodrome, lengthening an existing runway or making a new one. The Regulation also provides minimum expectations for how the consultation should be conducted, including timelines, who to notify and under what circumstances. The intent of the Regulation is to compel consultation in advance of an aerodrome work that will result in sustained and regular impact on interested parties as identified in the Regulation.</p> <p>As the proposed aerodrome will not be within 4 kilometres of a city or built-up area, under CARs 307, the proponent is required to consult the following interested parties:</p> <ul style="list-style-type: none">(i) the Minister of Transport,(ii) the providers of air navigation services,(iii) the operator of a certified or registered aerodrome located within a radius of 30 nautical miles from the location of the proposed aerodrome work,(iv) the authority responsible for a protected area located within a radius of 4 000 m from the location of the proposed aerodrome work,(v) any local land use authority where the proposed aerodrome work is to be carried out, and(vi) the owner of any land bordering the land on which the proposed aerodrome work is to be carried out. <p>Proponents are encouraged to share their plans with the local land use authority before the consultation period. The local land use authority may have information about other nearby projects or developments that could impact on the proponent's plans.</p> <p>In summary, regarding the airstrip (aerodrome), the proponent must complete the consultation and file the summary report with the Minister of Transport, prior to commencing construction of the aerodrome.</p> <p>Further details can be found at: https://laws-lois.justice.gc.ca/eng/regulations/SOR-96-433/FullText.html#s-307.01.</p> |

| Ref. # | Department | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Advice to the Proponent |
|--------|------------|--|--|---|
| | | | | TC recommends that the proponent contact TC’s Aerodromes Group at CASPNR-SACRPN@tc.gc.ca before starting the consultation, to ensure it is completed in accordance with CARs 307. |
| AD-08 | CNSC | Figs. 3.4-1, 4.3. 1, and where applicable throughout the EIS | Some maps in the EIS do not contain highway numbers. | Please consider including the highway numbers on the maps early in the Draft EIS when laying out the project location so the reader can become familiar with road network within northern Saskatchewan when discussions take place. |
| AD-09 | CNSC | Section 4, including Figures 4.3.1 and/or 4.3.2 and where applicable throughout the EIS. | The maps included in the EIS in sections do not have any Treaty boundaries. First Nation Treaties should be included on the map. Not all First Nations reserves, and boundaries are included on the map such as Cree Lake and Slush Lake, please include on map and consider adding others from the NAD. | It is recommended that Denison update the maps in these sections to include Treaty Boundaries and community locations are included on the Project location map in Figure 4.3.2 and other maps throughout the entire EIS where applicable. |
| AD-10 | CNSC | Section 4 | Overall, CNSC believes that Denison is abiding by the communications strategies and products identified in their PIDP, but would be interested in additional information that is available. | While CNSC staff are satisfied that the proponent meets the requirements with this EIS, further clarity and detail on the strategic planning behind these communications activities would be beneficial and would further support the overall goals of the Project’s engagement activities. |
| AD-11 | CNSC | Section 4 Indigenous Engagement Report (IER) | There is a summary of what engagement activities will occur moving forward. However, it is not clear which engagement activities/meetings will occur during the different stages of the EA/ project life cycle. Please provide additional details upon submission of the Final EIS. | Denison should consider clarifying in the updated IER which engagement activities will occur during each stage of the project moving forward as per Reg Doc 3.2.2 before submitting the Final EIS. |
| AD-12 | CNSC | Section 4 IER | Information included in the EIS Section 4 and IER regarding engagement activities, communication and issues and concerns raised will need to be updated when the next version of the EIS is submitted. The EIS and IER will need to be updated to include information from Fall of 2022 until approximately two months prior to the submission date of the next EIS. | When re-submitting the EIS, ensure that the engagement log, issues and concerns tables and information about engagement activities done to date have been updated. No action needed only advice to update this section before submission with most up to date engagement activities including any that take place with other Indigenous Nations and communities not included in the Draft EIS. |
| AD-13 | CNSC | Section 4 IER | Denison states that validation of VC selection was completed with ERFN, the Northern Village of Beauval, the Northern Village of Pinehouse Lake, and the Northern Hamlet of Patuanak (hereafter Beauval, Pinehouse, and Hamlet of Patuanak, respectively). The EIS states that this was completed through a shared online survey. The EIS also indicates that YNLR was also included in this process. | <p>How has Denison validated VC selection with the other Indigenous Nations and communities that have showed interest and if so, by what methods (survey’s, engagement, meetings, review of Draft sections etc.?) Did Indigenous Nations and communities select any VC’s that were not included in the EIS and if so why not?</p> <p>Please elaborate and provide more details in the EIS on any other methods used including engagement sessions that were completed with Indigenous Nations and communities, through in-person community workshops, VC selection approval through early review of Draft EIS sections.</p> |
| AD-14 | CNSC | Section 4.3.1, Pg 246 | On this page, Denison states that MN-S is “currently structured with a President, an Executive, a Provincial Metis Council, Regional Presidents, and Local Presidents. The wording of ‘Regional President’ is incorrect and should be changed to say, ‘Regional Director’. | Please update all wording of “Regional President” to “Regional Director” when referring to MN-S. |
| AD-15 | ECCC | Sections 5.3.4 (Table 5.3-3); 8.1.3.3 Climate Change; 8.1.3.4 Climate Change Influenced Extreme Events; Table 15.4-1: Summary of Potential Effects of Short-term Extreme Weather | The Proponent indicates that the Project’s full lifetime is roughly 40 years (including the post-decommissioning phase) and that climate conditions are important design considerations for a number of sensitive aspects of the Project. Potential future climate changes and their potential effects on the Project and Valued Components (VCs) are described in various sections of the draft EIS. Notably, in Section 15.5.2, ensemble mean projections are provided for several climate variables for two future time periods and emissions scenarios (RCP 4.5 and 8.5). In Section | ECCC recommends that when considering potential future climate change and relevant effects on the Project, the Proponent consider the range of variability from the ensemble of models (not just the ensemble mean). ECCC also recommends that the Proponent consult the 2019 Canadian Standards Association Guidance on Intensity Duration Frequency for Canadian Water Resources practitioners , which provides examples of alternative methodologies to estimate |

| Ref. # | Department | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Advice to the Proponent |
|--------|------------|---|--|---|
| | | Events on the Project and Associated Mitigation; Section 15.5 Climate Change. | <p>8.1.3.4, the Proponent describes possible future changes in short-duration precipitation extremes (based on Intensity Duration Frequency or IDF curves from the IDF_CC tool) and indicates that an increase in their frequency and magnitude may occur over the Project lifetime “... and may require consideration for greater storage and conveyance capacity for Project water management infrastructure” (p.8-41).</p> <p>The Proponent indicates that aspects of the Project are being designed to meet standards based on design values that appear to be derived from observed (i.e. historical) climate conditions (e.g. water management infrastructure; see Table 15.4-1). In Section 15.5.3, they indicate that an adaptive management approach will be used to address some aspects of future climate change as necessary. For example, page 15-19 of the draft EIS states that: “Denison will develop an Emergency Preparedness and Response Program for the Project to address forest fires and extreme weather that may occur. If unforeseen effects on the Project occur from longer and more severe forest fire seasons associated with climate change, or increased frequency or severity of extreme weather (e.g., ice storms, snowstorms, flooding), Denison will apply adaptive management that includes monitoring climate factors so that they can proactively mitigate or prevent adverse climate effects on the Project.” (Emphasis added).</p> | <p>future return values for design as needed.</p> <p>In terms of adaptive management, ECCC recommends that the Proponent clearly outline what climate factors will be monitored to mitigate or prevent adverse climate-related effects. This should include information on when and how the climate factors would be monitored and under what circumstances particular adaptive management approaches would be applied.</p> |
| AD-16 | CNSC | Section 5.10 (p.70) and throughout the EIS | <p>In section 5.10 of the ES, where the seven scenarios are listed, formatting is inconsistent. Likelihood is in quotes in some places, but not in all.</p> <p>Not significant is bolded inconsistently throughout the EIS.</p> <p>As well, in many cases noted as “not significant”, where others note “are not expected to have a significant effect”.</p> | <p>Suggest making formatting consistent if going to use quotes and bolding to highlight sections of the text.</p> <p>Also, validate that use of “not significant” and “are not expected to have a significant effect” are consistently used (where appropriate).</p> |
| AD-17 | ECCC | Appendix 6-A Air Quality Technical Supporting Document A.10 | Some of the off-road vehicles have an emission rating of Tier 2 but in Appendix 6-A Section A.10 the Proponent claims that “for non-road diesel combustion, Tier 4 emission factors were assumed”. Choosing an engine with a lower Tier will increase emissions in NOx significantly and the Proponent should be using the best available technologies to minimize environmental impacts. | ECCC recommends that the Proponent choose engines that meet the most stringent emission standards to the extent possible, which are Tier 4 for the compression-ignition engines, during all phases of the Project. |
| AD-18 | ECCC | Appendix 6-C, Climate Baseline and GHG Emissions Report | <p>Understanding Project emissions is important to inform analysis of a Project’s potential impact on Canada’s emissions targets and climate change commitments.</p> <p>ECCC notes that Section 4.0 and Appendix C: Greenhouse Gas Emissions Calculations of Appendix 6-C identifies the source of emissions and quantifies them in the construction, operation, and decommissioning phases of the Project, in accordance with the Draft Technical Guide Related to the SACC (Draft Technical Guide). While ECCC recognizes that the emissions will be relatively small in the post-decommissioning phase, the identification and quantification of the emissions in this phase is not found in the draft Environmental Impact Statement (EIS). The post- decommissioning phase is expected to last 15 years, likely going past 2050.</p> <p>The draft EIS does not discuss emission intensities of the Project, only the grid electricity. The draft EIS also does not discuss the Project’s potential impacts on Canada’s climate targets.</p> | <p>ECCC recommends that the identification of the sources of Greenhouse Gas (GHG) emissions and quantification of these emissions be described for the post-decommissioning phase, as done for the other phases.</p> <p>ECCC recommends the Proponent include discussion on the emission intensities of the mining of the product, following the guidance of the SACC and the Draft Technical Guide.</p> <p>ECCC recommends that the Proponent discuss the potential impacts that the Project may have on Canada’s ability to meet its climate-related targets, following the guidance of the SACC and the Draft Technical Guide.</p> |
| AD-19 | ECCC | Appendix 6-C, Climate Baseline and GHG Emissions Report | The draft EIS lacks information related to estimates of impact on carbon sinks and emissions from land-use changes. As land use shifts from a vegetated site prior to development, to an industrialized site, removal of vegetation and peat will have impacts on carbon sinks and construction emissions. | <p>Land Use Change</p> <p>Regarding the lack of site-specific information of above-ground mass of vegetation, an initial site survey on-site using basic information such as site class and species would assist in determining the above-ground biomass. More specific data, such as</p> |

| Ref. # | Department | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Advice to the Proponent |
|--------|------------|---|---|---|
| | | | <p>Section 6, Appendix 6-C, 4.1.2 Land Use Change states that site-specific information of above-ground mass of vegetation was not available and default data from Table 20 of the Draft Technical Guide were applied. The default data is contained in this table is not applicable in this case, as they represent aboveground woody vegetation in cropland systems.</p> <p>ECCC recognizes that the usage of the median value of 0.51 for the carbon content is reasonable.</p> <p>From the information given in the draft EIS, it does not seem that the soil carbon was taken into account. In the absence of detailed information, the Proponent assumed that the area cleared would also be excavated (and drained in the case of wetland areas) which would create significant additional emissions from soil disturbances and drainage.</p> <p>Section 4.1.2 also states the Project involves clearing an area of approximately 169.6 hectares. There are no estimates on the impact on carbon sinks related to the Project.</p> | <p>regional data from provinces, forest companies, or literature may be available, and generic national data is available (e.g., Fo148-1-2E.pdf (publications.gc.ca), 4775.pdf (nrcan.gc.ca)).</p> <p>ECCC recommends that the Proponent also consider biomass that are not aboveground and confirm whether soil carbon is taken into account, as well as wetlands.</p> <p><i>Carbon Sinks</i> ECCC recommends that the Proponent provide a quantitative and qualitative description of the Project’s impact on carbon sinks, following the guidance of the SACC and the Draft Technical Guide.</p> |
| AD-20 | NRCan | Section 7.3.1, Physical Geography | Drumlins and eskers in the region trend Northeast to Southwest as opposed to northwest to southeast as written on page 7, line 18. Correct orientations are used on page 7, line 23. | NRCan recommends revising the text. Please refer to 250 000 scale Surficial Geology Lines from Quaternary mapping, CSRS NAD83 Zone 13, Saskatchewan Geological Survey 2017. |
| AD-21 | NRCan | Section 7.3.2.3, Metacrystalline Basement Rock | Pegmatite missing from list of basement rock types. | NRCan suggests addition of pegmatite to the list of basement tock types as shown on Figure 7.3-6. |
| AD-22 | NRCan | Section 7.3.3.1, Aquifer Properties, Section 7.3.2.3, Metacrystalline Basement Rock, Appendix 7A, 2.0, 2.3.1, 2.3.2 | The terms “metacrystalline” and “metagranitic gneiss” are not frequently used terms in scientific literature. Gneiss is, by definition, a metamorphic rock. | NRCan suggests revision to “Crystalline Basement rocks” or “Basement metamorphic rocks”, and “granitic gneiss” as used in Figure 7.3-6. Please refer to Oxford Dictionary of Earth Sciences. |
| AD-23 | NRCan | Appendix 7A, 2.3.1, Metacrystalline basement rock | Orogeny is the process, orogen (or orogenic belt) is the feature produced by orogeny. | NRCan suggests replacing “Tran Hudson Orogeny” with Trans Hudson Orogen”. |
| AD-24 | NRCan | Appendix 7A, 2.3.1, Metacrystalline basement rock | Quartzite is by definition a metamorphic rock, and the term is used later without the meta-prefix. | NRCan suggests replacement of the term “meta-quartzite” with “quartzite”. |
| AD-25 | NRCan | Appendix 7A, 2.3.4, Athabasca Group Sandstones and Conglomerates | Sands are unlithified, whereas you are referring to grain sizes in this case. | In Table 2-1, NRCan suggests replacing the term “sands” with “grain sizes” under MFc and MFb descriptions. |
| AD-26 | NRCan | Appendix 7A, 2.3.5, Overburden | Typo on page 2, line 7: “A grain size sample was collected in GWR-033 from approximately 9 m below ground surface, and the same consisted of 8.8% clay (less than 4 µm). | NRCan suggests revision of “same” to “sample” and clay to “clay-sized” grains. |
| AD-27 | CNSC | Section 8.2.1.3 – Spatial and Temporal Boundaries | It is noted that McGowan Lake is an identified reference lake for the Key Lake Mill site. With the establishment of the Wheeler River mine, effluent would be flowing into McGowan Lake, which could potentially interfere with Key Lake’s environmental monitoring program by compromising McGowan Lake’s baseline conditions. Depending on the loading of COPC’s into McGowan Lake and resultant water concentrations, it may no longer be accepted as an acceptable reference lake for use by Key Lake. This would require Cameco to modify their monitoring program at the Key Lake Mill. | The CNSC advises Denison to communicate with Cameco to ensure they are aware of this situation. Coordination between the two companies may be necessary to ensure Key Lakes environmental monitoring program is not compromised. It is recommended to discuss this potential issue with Cameco ahead of time to determine the best path forward. |

| Ref. # | Department | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Advice to the Proponent |
|--------|------------|---|---|--|
| AD-28 | ECCC | Section 8.2.4.2.3 Appendix 10-A, Section 3.1.1.2 | <p>Tables 8.2-9 and 8.2-10 in Section 8.2.4.2.3 Part II_S8 Aquatic Environment and Table 3-1 in Appendix 10-A Section 3.1.1.2 demonstrate predicted maximum effluent concentrations of Constituents of Potential Concern (COPCs) and maximum predicted receiving environment concentrations.</p> <p>The final effluent quality discharge target for uranium is 0.057 mg/L. However, the Canadian Council of Ministers of the Environment (CCME) water short-term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guideline, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe. While uranium is not a Schedule 4 substance with prescribed concentration limits under the Metal and Diamond Mining Effluent Regulations (MDMER), the MDMER requires the characterization of uranium concentrations in effluent under Schedule 5, and requires that all mine effluent released from final discharge points be non-acutely lethal.</p> <p>Under Schedule 5 Section 9(d) of the MDMER, the Proponent will likely be required to conduct selenium fish tissue sampling if average annual concentrations of selenium in effluent equals or exceeds 5 ug/L.</p> | Discharges from the proposed Project will alter water quality in the immediate receiving area, and this may include some sublethal effects on aquatic biota, which must be minimized. It remains the Proponent’s responsibility to adhere to the MDMER to ensure that effluent at the end-of-pipe from all final discharge points be non-acutely lethal and meet requirements for prescribed deleterious substances under Schedule 4 of the regulations. |
| AD-29 | CNSC | Section 8.3.3 Figures 8.3.5 etc. 8.5-4 | It does not appear that aquatic baseline sampling maps for Russell Lake have LAB 1 and 2 locations showing the baseline sampling locations within Russell Lake. (Figures 8.3.5). Please update the Figures throughout aquatic environment section to include of the baseline sampling studies/ locations within Russell Lake. | Please update maps and sections in EIS to reflect aquatic baseline studies that were completed. |
| AD-30 | CNSC | EIS sections 8.4.3.2.4 Benthic Invertebrate Community and 8.4.7.6 Climate Change Considerations | <p>ECCC EEM guidance recommends the use of multiple reference areas as it offers the greatest statistical power to detect a meaningful difference between a reference area and an exposure area and can also give an indication of variability among reference areas. It is also important to incorporate multiple reference locations into the study design to aid in designing against spatial confounding factors.</p> <p>Section 3 of the Aquatic Environment Baseline Study Report details the similarities between benthic invertebrate communities by using the mean Bray-Curtis index between sampling locations and the median reference condition for the lake group size. It’s not clear in the EIS if there are any issues expected to be able to use this data to compare project effect locations to references sites into the future, as some sampling locations are currently not very similar to the reference sites.</p> <p>In addition, climate change could affect the sediment and benthic communities in the future. The EIS states “the frequency and magnitude of extreme precipitation events have the potential to change water levels and flows in the RSA, which may affect sediment transport, deposition, and therefore benthic invertebrate habitat. Changes to average and upper and lower bounds of ambient temperatures may also affect aquatic habitat, which in turn may affect benthic invertebrate communities. Climate change over the life of the Project (i.e., 35 to 40 years) will be monitored as part of the Project’s environmental monitoring programs, and influences on water quality, sediment quality, and benthic invertebrates will require adaptive management to mitigate any potential effects of the Project that may be exacerbated by climate-related changes on the aquatic environment”. It is recommended to ensure that appropriate number/location of reference sites are sampled to enable any changes to sediment or benthic invertebrate communities that may be due to climate changes, and not project effects, are able to be assessed.</p> | Considering climate change may change the lake conditions from baseline conditions, and that there is already natural variability between lakes that will be used as reference lakes and exposure lakes, it could become difficult to show changes to sediment/benthic invertebrates are not due to project activities, therefore there is a recommendation to ensure the current baseline data is adequate, and to consider if additional data, and addition of additional reference stations, will be needed moving forward. |

| Ref. # | Department | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Advice to the Proponent |
|--------|------------|--|--|--|
| | | | | |
| AD-31 | CNSC | Section 8.4.6.1, Residual Effects Characterization | The EIS states “Local Indigenous communities have expressed direct concern with respect to mercury. Mercury has not been identified as a COPC for the Project as it is currently not present in the receiving environment (i.e., background condition) at detectable concentrations and will not be produced as part of the mine process; therefore, it will not be discharged to the aquatic environment. However, it is understood that potential nutrient enrichment-related effects are possible and can be linked to increases in mercury in the environment.” Based off concerns from Indigenous communities, and the fact that phosphate is a COPC in the effluent, and elevated concentrations of mercury were measured near the Kratchkowsky Lake bottom, adding methylmercury to the environment sampling plans may be beneficial. | Please consider adding methylmercury to the environment sampling plans (such as fish dorsal muscle) in order to confirm there are no unexpected effects of the project on levels, and to satisfy stakeholder concerns. |
| AD-32 | CNSC | Section 9.1.8.3, Appendix 10-A (ERA) section 3.2.1.5 | <p>It appears there is no consistency between the assessment of soil quality in the ERA and the baseline soil sampling program presented in the EIS. The baseline program includes 10 soil permanent sampling locations (Appendix 9-B, section 2.5). Sampling at these locations is proposed to be continued during the Operation Phase, and monitoring data will be compiled and reported annually/periodically (EIS section 9.1.8.3).</p> <p>Conversely, the ERA estimates and predicts concentrations of COPC in soil based on atmospheric deposition. Furthermore, the location of ecological receptors in the ERA (Figure 5-2) is different from the permanent soil sampling plot locations (Appendix 9-B, Figure 2.5-1). It is unclear why measured baseline soil quality data were not discussed in the ERA and whether future monitoring data will be considered in the ERA to verify accuracy of predicted COPC concentrations</p> | Please clarify how baseline measured data on COPC concentrations in soil is considered in the current and future iterations of the ERA. |
| AD-33 | CNSC | Section 9.3.3.1.2 | <p>Indigenous knowledge is summarized with regard to moose, including:</p> <ul style="list-style-type: none">• Calving sites close to the Wheeler River, with lots of muskeg in the area. A moose calving area is located in the Terrestrial RSA, southwest of the Project Area.• A wildlife corridor is used by moose, running between Cree Lake (outside and to the west of the Terrestrial RSA) and Russel Lake (in the southern portion of the Terrestrial RSA). <p>It is unclear how this information is incorporated into the residual effects assessment.</p> | Please clarify how Indigenous knowledge on moose calving sites and corridors in the RSA is incorporated into the residual effects assessment for the key indicator “moose”. |
| AD-34 | CNSC | Appendix 9-B | <p>Baseline studies for birds are restricted to short time frames in one year only, for example:</p> <ul style="list-style-type: none">• Breeding Songbird Point Count Call Survey (June 7 and 17, 2017)• Aerial Waterfowl and Raptor Stick Nest Survey (June 15 and 16, 2017) <p>The Canadian Wildlife Service (2022) recommends:</p> <ul style="list-style-type: none">• Consider the potential effects of projects on birds throughout the year and document the distribution and abundance of birds in all seasons. Some species may be under-represented in existing data bases due to temporally restricted periods of detectability.• Explicitly target species at risk and other focal species.• Conduct at least two years of field surveys as a national standard for major projects, so that temporal variability can be considered in future comparisons to baseline data. <p>Reference: Canadian Wildlife Service. 2022. Guidance Regarding Data Needed to Support Assessment of Project Effects on Birds. Environment and Climate Change Canada, Gatineau, Quebec. 80 p.</p> | Please consider conducting surveys following CWS’s recommendations or provide an explanation as to how current baseline data for birds is sufficient to characterize the existing environment. |

| Ref. # | Department | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Advice to the Proponent |
|--------|-----------------------------------|--|--|---|
| | | | | |
| AD-35 | CNSC | Section 10, IMPACT MODEL | Denison discusses details of the IMPACT model but has not provided scenario(s) used to facilitate review. | Please consider providing CNSC with the IMPACT model scenario file(s) in the spirit of regulatory cooperation. |
| AD-36 | English River First Nation (ERFN) | Section 10.1.3.2, Traditional Foods Diet (p. 10-15) | The EIS States: "The ERFN is comprised of seven reserve lands across Saskatchewan" (p. 10-15) While this is accurately reflecting a source document, the source document is incorrect. | Please update to "The ERFN is comprised of seven historical settlements that have now grown into 19 different reserves across Saskatchewan" |
| AD-37 | CNSC | Section 10.1.9, Human Health Summary and Appendix 10-A – 4.4.1 Risk Estimation | The Human Health section of the EIS, as well as the ERA, indicates that there is an exceedance for selenium for the fisher/trapper receptor, with the Project estimated to contribute to the majority of this exceedance (0.93 of the HQ). While the assessment is conservative by assuming an increase intake rate of fish solely sourced from Russel Lake, the precautionary principle should be considered to ensure in reality the HQ for selenium remains below 1, even under conservative assumptions. | Please conduct of effluent, water, and aquatic organism monitoring (as already suggested in EIS) to confirm HQ's are highly conservative in the EIS modelling and receptors remain protected. Should it be determined Se concentrations are increasing in the environment at such a rate as there may be in impact to the environment or human health, installation of a selenium removal circuit into the effluent treatment process should be considered. The proponent should ensure that the proposed wastewater treatment system design incorporates the capability for expansion or upgrades in alignment with the precautionary approach, pollution prevention, and continuous improvement. |
| AD-38 | CNSC | Appendix 10-A (ERA) | It is unclear if measured or modelled COPC concentrations in blueberry were used in the calculations of human receptor dose. Similarly, it is unclear if measured or modelled COPC concentrations in lichen and blueberry were used in the calculations of ecological receptor dose. CSA N288.6-22, Clause 7.3.6 states that "Measured concentrations of COPCs should be used, where possible, in the exposure assessment." Please see the Clause for further information. | Please clarify if measured or modelled COPC concentrations in blueberry / lichen were used in the calculations of human and ecological receptor dose. |
| AD-39 | CNSC | Appendix 10-A (ERA), Table 2-2 | Table 2-2: Estimated Home Ranges of Selected Terrestrial Ecological Receptors Based on the reference McLoughlin et al. (2016), the Home Range for Woodland Caribou is indicated as "Expected = 80 km2" which represents the mean range sizes pooled over the two study years for calving/post-calving. The indicated Minimum (67 km2) and Maximum (267 km2), however, do not relate to the calving/post-calving stage, which is not clearly stated in Table 2-2. In contrast, these values are actually mean range size values for autumn/rut and early winter, respectively, as described in the source document on Page 83 (McLoughlin et al., 2016). It should be noted that in terms of true minimum and maximum, the source document states that individual home ranges, based on up to two years of GPS locations, varied in size from 16.2 km2 to 1363.9 km2 (Page 82 of McLoughlin et al., 2016). Reference: McLoughlin et al. 2016. Population dynamics and critical habitat of woodland caribou in the Saskatchewan Boreal Shield. Interim Project Report, 2013–2016. Department of Biology, University of Saskatchewan, Saskatoon. 162 pp. Available online at http://mcloughlinlab.ca/lab/wp-content/uploads/2019/06/2013-2016-SK-Boreal-Shield-Caribou-Project-Interim-Report-Nov-18-2016.pdf | Please provide clear details on the source of the home range values listed in Table 2-2. |
| AD-40 | CNSC | Appendix 10-A (ERA) section 3.2.1.5 | Although the soil type selected in the ERA for modeling of atmospheric deposition to soil is sandy soil, organic soils have been delineated and characterized (section 9.1.3.3 of the EIS) as | Please clarify if COPC modeling based on sandy soil is protective of organic/peaty soil and provide justification. |

| Ref. # | Department | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Advice to the Proponent |
|--------|------------|---|--|--|
| | | | valued component (i.e., “Organic Matter/Peat”). It is unclear if the soil quality modeling performed in the ERA is protective for soil types other than sandy soil. | |
| AD-41 | CNSC | Appendix 10-A (ERA), Table 5-5 | Table 5-5: Complete Exposure Pathways for All Selected Ecological Receptors to be Assessed using the IMPACT Model The exposure pathway for phytoplankton is stated as “direct contact in sediment”, however, phytoplankton live suspended in the water column. It is acknowledged that in the IMPACT modelling report, phytoplankton is described with an occupancy factor of 1 in water (Table 2-5). | Please add the pathway “direct contact in water” to Table 5-5 and revise all calculations accordingly. |
| AD-42 | CNSC | Appendix 10-A (ERA), Table B.12 | Table B.12: Sample Calculation – Adult Recreational Fisher/Hunter (McGowan Lake) Dose and Risk Calculations for Selenium The source for the Terrestrial Plant Ingestion Dose for Labrador tea and blueberry is stated as “Table C.5”, however, this table could not be located. | Please provide the referred-to Table C.5 or an alternate source of information for the Terrestrial Plant Ingestion Dose for Labrador tea and blueberry. |
| AD-43 | CNSC | Appendix 10-A (ERA), Environmental Risk Assessment for Wheeler River Technical Support Document | The ERA is prepared by Ecometrix and submitted to Denison Mines. It is unclear if the ERA submitted has been reviewed and accepted by the proponent (Denison Mines). CSA N286-12 clause 9.5.5 specifies that “the selected supplier’s technical documents that are required to be submitted shall be reviewed and accepted”. Meeting these CSA N286-12 requirements will ensure that the proponent has control of the purchased services as a future licensee applicant. | Provide clarifications if ERA documents have been reviewed and accepted by the proponent. |
| AD-44 | CNSC | Section 11 | It is not clear whether all of the interested Indigenous Nations and communities were engaged on the results and findings of the Heritage Resources Impact Assessments (HHRIA) or just ERFN? | CNSC staff would appreciate an update on any engagement activities that have taken place with regards to any of the HHRIAs for the Project, or any site or thing that is of historical, archaeological, paleontological or architectural significance as requested by other Indigenous Nations and communities to date. |
| AD-45 | CNSC | Section 11.1.4.5.2. Perceived Suitability/Safe Use of Resources (p. 11-59) | The EIS States: “Section 2.6.1 in Section 2 describes the extensive review of mining methods that led to the decision to adopt the ISR mining method.” (p. 11-59). This reference is not correct, as this section does not contain a review of the mining methods. | Please update this to reflect the appropriate section. |
| AD-46 | TC | Section 14.6.7.2 | Transport Canada would like to clarify that although the proponent may use a third party to assist in developing emergency response assistance plans (ERAPs), it is the proponent’s responsibility to submit the ERAP application(s) to Transport Canada, per Section 7(1) of the <i>Transportation of Dangerous Goods Act, 1992</i> as follows: Emergency response assistance plan 7 (1) No person shall import, offer for transport, handle or transport dangerous goods in a quantity or concentration that is specified by regulation — or that is within a range of quantities or concentrations that is specified by regulation — unless the person has an emergency response assistance plan that is approved under this section before (a) importing the dangerous goods; (b) offering the dangerous goods for transport; or | *This advice pertains to the regulatory phase.* Transport Canada notes that the sentence highlighted in yellow below is incorrect and should be revised or removed. While a contractor could assist the proponent to develop the ERAP(s), it is the responsibility of the proponent to apply to Transport Canada for approval of the plan(s). 14.6.7.2 Design and Mitigation Considerations Principal traffic risk mitigation measures include: <ul style="list-style-type: none">• traffic control measures such as speed limits;• travel management plans;• spill and emergency response planning; and• driver training. |

| Ref. # | Department | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Advice to the Proponent |
|--------|--------------------|--|--|---|
| | | | (c) handling or transporting the dangerous goods, in the case where no other person is required to have an emergency response assistance plan under paragraph (a) or (b) in respect of that handling or transporting. | <p>Additionally, Denison considered several provisions to make sure that the effects of a terrestrial release of hazardous materials are as low as practicable. In addition to transportation mitigations listed for Scenarios 1 and 2, the following provisions were considered.</p> <ul style="list-style-type: none">• The <i>Transportation of Dangerous Goods Act, 1992</i> (Government of Canada 2019) outlines the requirements for entities that transport dangerous goods to establish emergency response assistance plans. These plans list specialized personnel and equipment that are required for responding to an incident. It is expected that a contractor responsible for the transportation of uranium concentrate, fuel, and hazardous chemicals would develop these plans. |
| AD-47 | Health Canada (HC) | Appendix 14-A (p. 8-9) | <p>Context: No emergency response plan has been provided within the draft EIS, which states that emergency response plans will be developed in the future (Section 14 Appendix 14-A, p.8-9).</p> <p>Rationale: For any emergency event, Health Canada considers the protection of human health as a primary consideration in the development of emergency preparedness and response plans. This includes monitoring for human health impacts and the provision of health-related guidance. Further, this will be a requirement of the licensing process.</p> <p>The proponent should ensure that the emergency response plans consider the protection of all relevant potential human receptors that could be impacted by an onsite or project-related off-site accident involving the release of chemical and/or radiological substances.</p> | <p>It is recommended that Denison develop an emergency response plan in consultation with potentially affected communities and stakeholders that includes, but is not limited to, the following:</p> <ol style="list-style-type: none">1. All relevant contact information of the communities, especially related to km 160 of Hwy 914, which is the location of a cultural camp that has been established by the English River First Nation and km 67 of Hwy 914 that is a gathering location for the Kineepik Metis Local associated with the Northern Village of Pinehouse.2. Description of the mechanisms for communication with communities in case of an emergency.3. Description of the partnership with and the training of local communities and local responders (see Section 14 Appendix 14-B, p.1).4. Description of mutual aid agreements with neighboring industries/municipalities, where appropriate. |
| AD-48 | ECCC | Appendix 16-C, Summary of Monitoring and Follow-up Programs | Appendix 16-C does not include consideration of any monitoring and follow-up programs regarding GHGs. | ECCC recommends that the Proponent consider developing a GHG follow-up program to measure and compare actual GHG emissions against the draft EIS estimates, including reporting the Project’s actual emissions and updating the emissions estimates as needed. |
| AD-49 | ECCC | Appendix 16-A Summary of Residual Effects Appendix 16-B Summary of Cumulative Effects | ECCC notes that GHG mitigation measures have not been considered for the Project. Furthermore, the Project’s lifetime is expected to extend into 2050 and beyond. Consistent with the information requirements of the SACC, and aligning with Canada’s commitment to achieve net-zero GHG emissions by 2050, the Proponent should provide a credible plan that describes how the Project will achieve net-zero emissions by 2050. | <p>ECCC recommends that the draft EIS include an assessment of potential GHG mitigation measures throughout all phases of the Project. This could include a Best Available Technologies / Best Environmental Practices (BAT/BEP) Determination, as described in Section 3.2 of the Draft Technical Guide.</p> <p>ECCC also recommends that the Proponent provide a credible Net-Zero Plan on how to achieve the target of 0 kt CO2 eq/year, for the year 2050 and beyond, following the guidance of the SACC and the Draft Technical Guide.</p> |

Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement
For response by regulators or government entities (Posted June 2023, updated with comment 26 on April 2024)

| Number | Source | Reference to EIS ¹ , appendix, or TSD | Comment Summary (all original submissions can be found on Canadian Impact Assessment Registry reference: 80171) | Regulator Response |
|--------|--|--|--|--|
| 1. | Birch Narrows Dené Nation (BNDN) (February 28, 2023) | Section 12.0 and 13.0 | <p>Comment #17: BNDN notes that no specific management or monitoring plan has been included in the EIS documentation related to the verification of residual socio-economic impacts, both positive and negative, for the local economy.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none">Denison must develop a Socio-Economic Monitoring Plan for the life of the Project to verify the effects assessment included in the EIS and to be included in the Project’s approach to adaptive management. This Plan would include an approach, co-developed with Indigenous groups in the local study area (including BNDN), to monitoring the realization of the benefits and impacts of the Project (e.g., employment and procurement targets, training and capacity building, community investments, etc.) as mitigation and enhancement measures are implemented. Monitoring and subsequent regular evaluation would allow for the real-time adjustment of targets and/or an approach to adjusting enhancement measures or identifying offsetting benefits where targets are not met. <p>See Section 4.2 for additional information on this topic (p. 19-21).</p> | <p>As a provincial Environmental Assessment (EA) under the Saskatchewan <i>Environmental Assessment Act</i> is currently underway, the provincial process requires proponents to outline the possible impact on local communities and socioeconomic factors². As such, the proponent provided detailed information regarding socio-economic impacts (both positive and negative) within the EIS to meet the provincial EA requirements.</p> <p>For EAs evaluated under the <i>Canadian Environmental Assessment Act</i> of 2012 (CEAA 2012), considerations for socio-economic impacts are made when effects are identified as described in section 5(1)(c), which stipulates:</p> <p>(c) with respect to aboriginal peoples, an effect occurring in Canada of any change that may be caused to the environment on</p> <ul style="list-style-type: none">(i) health and socio-economic conditions,(ii) physical and cultural heritage,(iii) the current use of lands and resources for traditional purposes, or(iv) any structure, site or thing that is of historical, archaeological, paleontological or architectural significance. <p>As per REGDOC 2.9.1, CNSC staff expect that an applicant characterize the socio-economic environment and identify all indirect socio-economic effects. An indirect effect is a secondary environmental effect that occurs as a result of a change that a project may cause to the environment.</p> <p>CNSC staff are satisfied with Denison’s evaluation of potential impacts from the proposed project, their evaluation of socio-economic factors and their commitment to informing BNDN throughout the monitoring program design and implementation (28, Commitments Register Version 4). Further, Denison will be expected to provide a more detailed EA Follow-Up monitoring plan prior to a Commission hearing, will be evaluated and refined in further detail.</p> |
| 2. | BNDN (February 28, 2023) | Section 12.0 and 13.0 | <p>Comment #17: BNDN notes that no specific management or monitoring plan has been included in the EIS documentation related to the verification of residual socio-economic impacts, both positive and negative, for the local economy.</p> <p>Request/recommendation:</p> | Please refer to CNSC’s response to comment #1 above. |

| | | | | |
|----|---|--|--|--|
| | | | <ul style="list-style-type: none"> The Crown must include the development of a Socio-Economic Monitoring Plan as a condition of approval for the Project. <p>See Section 4.2 for additional information on this topic (p. 19-21).</p> | |
| 3. | BNDN (February 28, 2023) | Appendix 9B Section 2.5.1 Appendix 8E Table 4 | <p>Comment #18: In several instances in the draft EIS Denison has noted that Indigenous Nations are concerned with the possibility of mercury contamination from mining operations. BNDN shares these concerns with other Indigenous Nations. Due to the very low concentrations of mercury present in the Phoenix deposit, Denison has not meaningfully studied the potential impacts the Project may have on altering mercury biogeochemistry in the downstream environment.</p> <p>BNDN notes that background mercury concentrations can be elevated in many unexpected and remote locations due to atmospheric deposition (often due to coal plants) (Jackson, 1997). BNDN is very concerned that Denison has not analyzed for mercury as part of their baseline soil geochemistry assessments for the Project, especially in wetlands downstream of the Project. Mercury concentrations in wetland soils are sensitive to changes in water chemistry that can lead to increased mercury methylation. This is especially acute from increases in nutrients and sulphates which can active sulfate reducing microorganisms that methylate mercury (Liu, Li, & Cai, 2012). Table 4 of Appendix 8e shows that the effluent discharged to Whitefish Lake will have mercury concentrations almost 5,700 times background concentrations. This dramatic increase in sulfate loading to Whitefish Lake may not exceed water quality objectives unto itself but may be sufficient to meaningfully change mercury biogeochemistry in downstream wetlands.</p> <p>BNDN is very concerned with the complete lack of assessment and analysis of baseline mercury concentrations and the potential changes to mercury cycling that could be induced by the Project.</p> <p>Request/recommendation:</p> <ol style="list-style-type: none"> BNDN requests that Denison undertake baseline studies of mercury concentrations in soils, with a focus on baseline concentrations of mercury in organic wetland soils downstream of the project. Note that mercury sampling should sample total mercury and methylmercury in all analyses, as well as porewater total mercury and methylmercury. The study design and implementation should be undertaken collaboratively with BNDN. BNDN recommends that the CNSC requires Denison to undertake a baseline assessment of mercury in soils (with a focus on wetlands) prior to construction of the Project. This may be established as a condition of approval for the Project. Depending on the findings of the baseline mercury in soils and wetlands studies, the CNSC should include a condition of approval on the Project that requires Denison to monitor mercury biogeochemistry in the receiving environment over the life of mine. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>CNSC staff are satisfied with Denison’s commitments to collecting additional background information pertaining to water and sediment quality mercury and methyl mercury from local study area lakes and rivers prior to development (Refer to IR-46 and IR-48 in Table XX (hyperlink the IR table here), as well as undertaking monitoring of total and methyl mercury and monitoring of mercury in country foods (i.e. fish tissue) (8-42, 8-44, Commitments Register version 4).</p> <p>As noted in the Federal Indigenous Review Team’s (FIRT) conclusions on IR-198-R1, the following elements will be further assessed as part of licensing technical reviews, prior to the granting of a licence:</p> <ol style="list-style-type: none"> Establishing/confirming baseline concentrations of Hg in water, sediment, and fish tissues with additional baseline data collection before construction; Regular monitoring of sulphate as an indicator for mercury in water quality, and monitoring of mercury in fish tissue during construction, operation and post-closure; and, Undertaking an HHRA should monitoring results exceed established/confirmed baseline levels, to inform decisions on adaptive management and mitigation measures <p>CNSC staff will be monitoring Denison’s activities with regards to meeting these expectations.</p> |
| 4. | BNDN (February 28, 2023) | Figure 2.2-15 Section 2.2.3 | <p>Comment #30: Denison notes that they have made the conservative assumption that no water would be recycled as mining solution as part of their water balance calculations. BNDN agrees that this conservative assumption is appropriate for assessment of potential impacts of the Project. While this assumption is appropriate for the environmental assessment, BNDN wishes to understand the proportion of industrial wastewater that may be recycled on site and any commitments</p> | <p>CNSC staff are satisfied with Denison’s response that they intend to continue to refine effluent quality and volume predictions are part of the BATEA assessment and licensing phase of the project and their commitment (10-17, Commitments Register version 4) to maximize the recycle and reuse of process water to reduce freshwater intake and release. REGDOC-2.9.1 requires Denison to ensure that their effluent and emissions</p> |

| | | | | |
|----|---|-------------------|--|--|
| | | | <p>Denison is willing to make regarding continual refinement of the water treatment process to increase the proportion of water that is recycled.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> a) BNDN requests that Denison commit to continual refinement of the Industrial Waste Water Treatment Plant (IWWTP) treatment process to maximize the amount of water that is recycled to the deposit. b) BNDN recommends that the Crown include a condition of approval for the project regarding continual improvement of water treatment to maximize recycling. c) BNDN requests that Denison share available information on the proportion of water that they currently anticipate being able to recycle. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>preventive and control measures are established using best industry practice, incorporating the application of BATEA, ALARA, process optimization, continuous improvement and the results of an ERA.</p> <p>This will be further assessed as part of the licensing technical assessment, prior to the granting of a licence. If licence conditions are required, these will be proposed incorporated into the Licence and Licence Conditions Handbook.</p> |
| 5. | BNDN (February 28, 2023) | Table 2.3-3 | <p>Comment #32: Table 2.3-3 of the draft EIS shows Denison's proposed mining area decommissioning objectives, which are the groundwater quality objectives for the residual water in the ore zone following the flushing of the system during mine decommissioning. BNDN is surprised to see that relatively high concentrations of metals are expected to remain in the restoration solution as a final objective, such as 100 mg/l uranium and 2 mg/l cobalt, amongst many other metals.</p> <p>BNDN notes that potential risks to groundwater and surface water could be dramatically reduced through more stringent mining area decommissioning objectives. It is also feasible that processing efficiencies and high uranium prices may allow for substantially lower concentrations of uranium to be mined economically. The long-term contamination of groundwater from the high concentration of metals in the restoration solution is one of BNDN's primary concerns with the Wheeler River Project, and BNDN would strongly prefer that Denison strive to minimize the residual contamination remaining in groundwater following decommissioning to the greatest extent possible.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> a) BNDN requests that Denison provide documentation that estimates the time, efforts and costs associated with reducing concentrations of metals in the restoration solution by 1 order of magnitude and 2 orders of magnitude. Note that these calculations should include costs that could be recovered by processing subeconomic UBS. b) BNDN requests that Denison work with BNDN through terms defined in a BNDN project agreement to establish achievable decommissioning objectives that would be satisfactory to BNDN. c) BNDN requests that the Crown place a condition of approval upon the Wheeler River Project that Denison is required to work with BNDN to establish mutually agreeable mining area decommissioning objectives. d) BNDN requests that Denison undertake a study of ISR operations elsewhere in the world to determine the lowest concentrations of UBS that could be processed economically utilizing industry best practices and commit to exceeding global standards. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>Through the CNSC's licensing process, Denison is required to submit a preliminary decommissioning plan. If the proposed Wheeler River Project receives positive EA and licensing decisions from the Commission, Denison will have to update the preliminary decommissioning plan every 5 years at a minimum. Before decommissioning, Denison will be required to submit a detailed decommissioning plan (DDP) as part of the licence application to decommission the Wheeler River Project. Consultation with Indigenous Nations and communities, as well as members of the public is a requirement for the development and review of the DDP.</p> <p>CNSC staff are satisfied that Denison is expecting to continue to optimize remediation targets and objectives through updates to the decommissioning plan. CNSC staff expect that Denison will continue engaging with interested Indigenous Nations and communities throughout the development of these plans and over the project lifecycle.</p> |
| 6. | BNDN (February 28, 2023) | Section 2.9.1.3.1 | <p>Comment #36: Denison documents their conceptual level environmental protection program, including several proposed management and monitoring plans which they will develop to manage operations on site.</p> | <p>CNSC staff are satisfied with Denison's commitment to share information with interested Indigenous Nations and communities throughout the monitoring program design and implementation process.</p> |

| | | | | |
|----|---|-----------------|---|---|
| | | | <p>The environmental protection measures which Denison undertakes at the Project site are highly consequential to BNDN, and BNDN requires the opportunity to provide our knowledge and input into environmental protection measures developed for activities within our Ancestral Lands.</p> <p>Request/recommendation:</p> <p>a) BNDN requests that Denison commit to involving BNDN in the development, review and approval of all environmental monitoring plans developed for the Project. Details of BNDN involvement in the development of environmental monitoring plans should be undertaken within an Environmental Committee, with specific terms defined within a BNDN-Denison Project Agreement for the Wheeler River Project</p> <p>b) BNDN requests that the CNSC impose a condition of approval on the project which states the requirement for Denison to consult with BNDN on all environmental management and monitoring plans for the project.</p> <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>If the proposed Wheeler River Project receives positive EA and licensing decisions from the Commission, CNSC staff will ensure Denison is meeting their EA commitments through an EA follow-up and monitoring program, which can span the lifecycle of the facility. Denison will also have to meet the requirements in their licence conditions handbook throughout the applicable licensing phase.</p> <p>Denison has committed to monitoring that will verify ERA model predictions, provide data to improve model predictions, follow requirements and guidance in CSA N288.4-19 (CSA 2019), as well as engagement with local communities on this topic (10-12, Commitments Register Version 4), as expected by the CNSC. Further, CNSC staff are committed to collaborating on monitoring and follow-up activities with interested Nations and communities, particularly where potential impacts on traditional land use and rights are identified.</p> |
| 7. | BNDN (February 28, 2023) | Section 7.6.2.3 | <p>Comment #37: In Section 7.6.2.3 of the draft EIS and the geology and groundwater summary table in Appendix 16A, Denison states that they expect no residual effects to groundwater quality during the operations, decommissioning or future centuries period of the Project. Denison has also not placed a significance determination on the impacts to groundwater quality based on the findings of the draft EIS due to groundwater being considered an intermediate VC.</p> <p>BNDN disagrees with both the residual effects assessment and the fact that groundwater quality has been assessed solely as an intermediate VC. The protection of groundwater resources is highly important to BNDN. Our members place immense value on clean spring water and the protection of groundwater more generally. The advancement of the Wheeler River Project will permanently impair groundwater resources in and around the Wheeler River Project. The contamination of groundwater at the Project will have a significant impact on our members’ connection to the land and ability to exercise our Treaty and Aboriginal rights. BNDN see the limited interpretation of residual effects and the lack of inclusion of groundwater quality as a receptor VC as a significant oversight in the assessment of impacts of the Project on the environment and BNDN Treaty and Aboriginal rights. This must be corrected to properly assess the Project and thus ensure that project impacts are appropriately mitigated and accommodated.</p> <p>Request/recommendation:</p> <p>a) Denison must apply a significant determination to groundwater quality and quantity for all projects phases, including the future centuries period. The significance determination must be developed following consultation and engagement with BNDN.</p> <p>b) Denison must re-evaluate the residual effects of the project on groundwater quality including the future centuries period. This re-evaluation must be following consultation and engagement with BNDN.</p> <p>c) BNDN requests that the CNSC work with our Nation to understand the significant impacts that the permanent contamination of groundwater caused by the project will have on our Treaty and Aboriginal rights.</p> <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>CNSC staff have reviewed Denison’s response to this comment, and through the EIS technical review, which resulted in over 50 Information requests from the Federal Review Team related to groundwater, CNSC staff are satisfied with the responses provided. CNSC staff will continue to assess how the proposal meets regulatory requirements prior to the granting of a license.</p> <p>Since the commencement of the Wheeler River Project EA in 2019, CNSC staff have identified Indigenous Nations and communities who may have an interest in the project and have provided each identified Nation or community with a notice of the commencement of the EA, the opportunity to apply for participant funding, and a copy of the project description and draft EIS for comment.</p> <p>CNSC staff has expressed an interest in meeting with BNDN to discuss concerns raised and would be happy to arrange meetings with CNSC SMEs to provide any additional information on these concerns, as well as any other questions BNDN may have related to groundwater, and CNSC staff’s assessment.</p> <p>CNSC staff will continue to provide interested Indigenous Nations and communities with timely project updates and opportunities to review information at key points during the EA process. To date, this has included review of Denison’s Project Description and draft EIS, and will include review of CNSC’s EA report and Commission Member Document (CMD), Denison’s CMD, as well as an opportunity to present at the public Commission hearing.</p> <p>Further, CNSC staff are committed to ensuring that any information related to BNDN that is shared is adequately reflected in CNSC documentation and conclusions on Denison’s proposal.</p> |

| | | | | |
|-----|---|---------------------------------|---|---|
| 8. | BNDN (February 28, 2023) | Section 7.8.2 | <p>Comment #38: Section 7.8.2 of the draft EIS documents the groundwater monitoring proposed for the surface facilities and the ISR recovery area. It also describes a conceptual excursion contingency plan wherein Denison has proposed their plans to manage situations where groundwater contamination occurs beyond what is predicted in the EIS. BNDN notes that Section 7.8.2 lacks information on the involvement of Indigenous Nations related to groundwater monitoring.</p> <p>As stated previously, BNDN is highly concerned with the level of impact the Project will have on groundwater resources. As such BNDN requires Denison to communicate excursions of groundwater and the consequent management of excursions to our Nation.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> a) BNDN requests that Denison revise Section 7.8.2 to include Indigenous engagement and input for groundwater monitoring results and the management of observed groundwater excursions. The manner in which Denison engages BNDN on groundwater monitoring and management will likely occur through an Environmental Committee, which should be defined in a BNDN-Denison Project Agreement. b) BNDN requests that the CNSC impose a condition of approval on the Project that clarifies that Denison is required to engage with impacted Indigenous Nations such as BNDN on groundwater monitoring and management. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>CNSC staff are satisfied with Denison’s commitment to share information with BNDN throughout the monitoring program design and implementation process (commitment 28 of Table 3-2, Denison’s Commitments to the Public, Indigenous Nations and Communities, Commitments Register version 4).</p> <p>If the proposed Wheeler River Project receives positive EA and licensing decisions from the Commission, CNSC staff will ensure Denison is meeting their EA commitments through an EA follow-up and monitoring program, which can span the lifecycle of the facility. Denison will also have to meet the requirements in their licence conditions handbook throughout the applicable licensing phase.</p> |
| 9. | BNDN (February 28, 2023) | Appendix 8E Table 4 | <p>Comment #41: Table 4 of Appendix 8e of the draft EIS shows the predicted site discharge concentrations of the contaminants of potential concern (COPCs). BNDN notes that the concentrations of a number of COPCs do not achieve water quality objectives that is the best available technology economically achievable (BATEA). Example COPCs include copper, molybdenum, selenium, uranium, vanadium, zinc and ammonia.</p> <p>BNDN requires proponents operating on our Ancestral Lands to, at a minimum, achieve BATEA standards for effluent treatment and discharge. This takes reasonable and appropriate precaution without imposing unreasonable costs on the operation.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> a) BNDN requests that Denison commit to achieving BATEA criteria for all COPCs in their effluent. b) Denison must work with BNDN to identify mutually agreeable and appropriate effluent discharge criteria for their effluent. BNDN expects that identifying suitable effluent discharge criteria will be undertaken through an Environmental Committee with a terms of reference defined in a BNDN-Denison project agreement c) BNDN requests that the CNSC impose a condition of approval on the Project that BNDN is engaged. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>Denison will be required to demonstrate that their water treatment plant is the best available technology economically achievable in accordance with CNSC REGDOC 2.9.2. Denison will also be required to meet the release limits in the Metal and Diamond Mining Effluent Regulations for all phases of the project. Denison will also be required to test the contaminants of potential concern as outlined in the legislations referenced and they will be subject to licensing conditions for environmental monitoring.</p> <p>CNSC staff are satisfied with Denison’s commitment to share information with BNDN throughout the monitoring program design and implementation process (commitment 28 of Table 3-2, Denison’s Commitments to the Public, Indigenous Nations and Communities, Commitments Register version 4).</p> <p>If the proposed Wheeler River Project receives positive EA and licensing decisions from the Commission, CNSC staff will ensure Denison is meeting their EA commitments through an EA follow-up and monitoring program, which can span the lifecycle of the facility. Denison will also have to meet the requirements in their licence conditions handbook throughout the applicable licensing phase.</p> |
| 10. | BNDN (February 28, 2023) | 8.2.4.1.1 Site Water Management | <p>Comment #45: BNDN is concerned that the small volume of Effluent Monitoring and Release Ponds may create a lack of operational flexibility. For example, in the EIS, it is stated that:</p> <p>“Treated water from the IWWTP will be pumped to the three Effluent Monitoring and Release Ponds (each 3,300 m3). These ponds will be designed to hold effluent for 72 hours for testing before discharge to the environment.” – EIS, pp 723</p> | <p>If the proposed Wheeler River Project receives positive EA and licensing decisions from the Commission, Denison will be required to meet all applicable effluent discharge thresholds. This will include all requirements and criteria listed in the <i>Metal and Diamond Mining Effluent Regulations</i>.</p> |

| | | | | |
|-----|--|---------|---|--|
| | | | <p>If water quality in these ponds exceeds discharge criteria then there may be a need to store water so that additional treatment and monitoring can occur prior to discharge. However, only having capacity for three days of storage means it is unlikely the Proponent would be able to adequately treat water prior to reaching storage capacity, resulting in a need for emergency release of poor- quality water.</p> <p>Request/recommendation:</p> <p>a) BNDN requests that additional storage capacity be included as part of the design for water management system. This must include adequate storage capacity to ensure Denison has the ability to retain water for sufficient time to allow treatment, in the event that exceedances of water quality discharge criteria occur. Alternatively, Denison can commit to halting discharge (and operations if required) should water quality exceed discharge criteria. Discharge into Whitefish Lake would resume once water quality in the Effluent Monitoring and Release Ponds has been returned to below discharge criteria.</p> <p>b) BNDN requests that the CNSC impose a condition of approval for the Project that requires Denison to must meet effluent discharge criteria prior to discharge and must halt operations if treated effluent in the monitoring and release ponds does not meet effluent discharge criteria.</p> <p>See Section 4.4 for additional information on this topic (p. 48-51).</p> | <p>Denison will also have to meet the requirements and criteria listed in the CNSC’s applicable regulatory documents (such as REGDOC-2.9.1, <i>Environmental Protection: Environmental Principles, Assessments and Protection Measures</i> and REGDOC-2.9.2, <i>Environmental Protection: Controlling Releases to the Environment</i>) and in the applicable CSA standards (including CSA N288.5-22, <i>Effluent Monitoring Program at Nuclear Facilities and Uranium Mines and Mills</i>).</p> <p>Throughout the lifecycle of the facility, CNSC staff will perform ongoing monitoring and compliance activities to ensure Denison is respecting the applicable effluent monitoring requirements and other requirements listed within their licence conditions handbook.</p> |
| 11. | Peter Ballantyne Cree Nation (PBCN) (March 3, 2023) | General | <p>The Wheeler River project falls within PBCN traditional territory, where traditional land use activities have historically been and are currently practiced. PBCN has traditional territory spanning Treaty 10 with the nearest community of Southend located 185km away from the Project. PBCN has exercised aboriginal rights in and around the Project site and currently exercises Indigenous and Treaty Rights in proximity to the Project.</p> <p>PBCN is concerned that the Project has potential adverse environmental, cultural and socio-economic impacts to PBCN members, lands and uses, including hunting, fishing and gathering in all seasons.</p> <p>Both Denison and CNSC indicate that they have fulsome aboriginal engagement policies and guidelines and appear to be undertaking their delegated Crown duty to consult in good faith, as informed by those policies, principles, legal and regulatory requirements. However, there has been an initial error in the assessment, both by Denison and CNSC, as PBCN was erroneously excluded from indigenous engagement, ostensibly due to distance from Wheeler and a lack of understanding of PBCN lands and Indigenous activities potentially impacted by the project.</p> <p>PBCN wishes to participate fully in the regulatory review of the Wheeler River project. PBCN requests that the CNSC ensure that it’s review timelines be adjusted, as required, to ensure fulsome participation by PBCN with the proponent and the regulator, going forward.</p> <p>PBCN’s goals are to:</p> <ul style="list-style-type: none">Meet with CNSC to share PBCN knowledge of its land, and Indigenous uses, and how these may be impacted by the Project and methods to address any adverse impacts. | <p>The CNSC ensures that all nuclear EA and licensing decisions under CEAA 2012 and the NSCA uphold the honour of the Crown and uphold Indigenous peoples’ potential or established Indigenous and/or Treaty Rights pursuant to section 35 of the <i>Constitution Act, 1982</i>. Since the commencement of the Wheeler River Project EA in 2019, CNSC staff have identified First Nations and Métis who may have an interest and rights in relation to the project and have provided each identified Nation or community with a notice of the commencement of the EA, the opportunity to apply for participant funding, and a copy of the project description and draft EIS for comment.</p> <p>Although PBCN was not originally identified as being potentially impacted by the project based on information available to CNSC staff with regards to PBCN’s rights and interests, PBCN applied for and was awarded Participant Funding for review of the draft EIS. From this time on, CNSC staff have included PBCN on all communications related to progress of the proposed project, have met with PBCN to discuss the project and concerns raised, and continue to welcome any relevant information on how the proposed project may impact PBCN’s land use and potentially impact PBCN’s Treaty Rights. CNSC staff have provided funding support and encouraged PBCN to provide specific information with regards to their current and traditional land use and rights practices that could be impacted by the proposed project. To date, PBCN has not provided specific information regarding how their rights and interests could be directly impacted by the proposed project.</p> <p>The CNSC understands the importance of building strong and ongoing relationships with potentially impacted Indigenous Nations and communities and ensuring that the consultation process is meaningful and addresses the concerns raised by the Nations and communities. CNSC staff will continue to build relationships and engage regularly with all interested Indigenous Nations and communities, including PBCN, in order to consider issues and concerns related to the project. CNSC staff will continue to provide interested Indigenous Nations and communities with timely project updates and opportunities to review information at key points during the EA</p> |

| | | | | |
|-----|---|---|--|--|
| | | | <ul style="list-style-type: none">Establish a shared understanding of how PBCN would like to be engaged in the regulatory review, including, but not restricted to, timely project updates, information and an opportunity to discuss concerns throughout the EA process, including the review of the dEIS, CNSC’s staff’s EA Report, and other project-related documentation | <p>process. This will include the upcoming review of CNSC’s EA report and Commission Member Document (CMD), Denison’s CMD, as well as an opportunity to present at the public Commission hearing.</p> <p>As per the requirements and guidance of the CNSC’s regulatory document REGDOC-3.2.2, Indigenous Engagement, CNSC staff expect that Dennison will continue engaging with PBCN and other Indigenous Nations and communities to identify potential concerns related to impacts on Indigenous and/or Treaty Rights as a result of the proposed project.</p> |
| 12. | PBCN (March 3, 2023) | General | <p>The Wheeler River project falls within PBCN traditional territory, where traditional land use activities have historically been and are currently practiced. PBCN has traditional territory spanning Treaty 10 with the nearest community of Southend located 185km away from the Project. PBCN has exercised aboriginal rights in and around the Project site and currently exercises Indigenous and Treaty Rights in proximity to the Project.</p> <p>PBCN is concerned that the Project has potential adverse environmental, cultural and socio-economic impacts to PBCN members, lands and uses, including hunting, fishing and gathering in all seasons.</p> <p>Both Denison and CNSC indicate that they have fulsome aboriginal engagement policies and guidelines and appear to be undertaking their delegated Crown duty to consult in good faith, as informed by those policies, principles, legal and regulatory requirements. However, there has been an initial error in the assessment, both by Denison and CNSC, as PBCN was erroneously excluded from indigenous engagement, ostensibly due to distance from Wheeler and a lack of understanding of PBCN lands and Indigenous activities potentially impacted by the project.</p> <p>PBCN meets nearly all of Denison’s stated criteria to evaluate Indigenous communities located within the Saskatchewan Northern Administration District that would be engaged by Denison.</p> <p>A full and accurate description of PBCN’s rights and interests is an essential part of the Wheeler dEIS and is necessary to ensure a fulsome environmental assessment. PBCN is interested in the opportunity to collaborate with Denison mines to comprehensively identify PBCN’s rights and interests that may be impacted by the project.</p> <p>PBCN’s goals are to:</p> <ul style="list-style-type: none">Work together with Denison in a spirit of mutual respect to cooperate to collectively identify means to avoid, mitigate or otherwise address potential negative impacts of the project on PBCN’s territory and the exercise of its Indigenous rights and interests.Participate in a funding agreement with Denison to facilitate and support PBCN participation and meaningful engagement in the EA process.Meet with Denison to share PBCN knowledge of its land, and Indigenous uses, and how these may be impacted by the Project and methods to address any adverse impacts.Explore employment and job opportunities related to the Project. | <p>Please refer to CNSC’s response to comment #11 above.</p> |
| 13. | Kineepik Metis Local #9 (KML) and the | Water Security Education of In-Situ Recovery and | <p>Section 1.5 and 3.4 of KML and NVP submission: KML as a community wishes to understand the technical background of water protection processes, the Lixiviant solutions, interactions of chemical compounds with water and toxicity. The KML Community will require this knowledge to have confidence in the continued success of the new mining application on our traditional territories. What are the potential effects to the aquifers and waters around Denison and Wheeler River?</p> | <p>In response to KML’s comments, CNSC staff have met regularly with KML and coordinated with the KML team to arrange information sessions with community members, as well as conduct outreach, consultation and engagement where staff have learned more about KML land use and traditional practices, as well as shared information on the EA process, the technology proposed, and answer questions. CNSC staff have also held</p> |

| | | | | |
|-----|--|--|--|--|
| | Northern Village of Pinehouse (NVP) (February 17, 2023) | Freeze Wall Technology | <p>KML describes that they need to understand:</p> <ul style="list-style-type: none">• how water protection processes such as reverse osmosis and water treatment are used in the mining operations.• the exact molecular compounds that are part of the “Lixiviant” solution• how this chemical compound interacts with water and at what concentrations that is becomes toxic. <p>KML further states: “If these processes are not well understood by our communities, how can we state that we are prior informed and offer consensus to the process?”</p> <p>Ultimately, as noted in their summary of Primary Concerns:</p> <ol style="list-style-type: none">1) There is a need for funding for education and training to reach a standard of knowledge in mining, science and math required to understand the impacts of uranium mining industry that is expected for an Indigenous community to be able to make free and prior informed decision on impact and expectation of that industry.2) Development of a centre of Excellence in Pinehouse to organically develop the knowledge transference required for Indigenous community to understand the uranium mining industry including regulations, materials used, transportation, end use of products, education required mitigation efforts etc.3) Support for training and education to support KML and Pinehouse on uses of artificial intelligence in the mining projects and to what level this activity can be managed by and in the community. A strategy to build capacity for matriculation graduates with the following classes English 30A 30B Chemistry 30, Physics 30, Math 30. <p>KML wants to increase the community western education levels so that they are knowledgeable and have the capacity to protect themselves and the environment.</p> | <p>monthly meetings with KML representatives, in order to provide updates on the proposed project, and discuss topics of concern to KML. CNSC staff have received KML’s KML Value Ecosystem Components Study, which inform the CNSC’s assessment and EA process.</p> <p>It is CNSC staff’s determination that Denison has adequately engaged and shared information throughout this process and are satisfied with Denison’s engagement with KML to date.</p> <p>Further, Denison’s EIS states that residents and communities in the LSA, including members of KML and NVP will be given first priority for employment, training, and business opportunities. Denison further indicates that mitigation and enhancement measures will be implemented by Denison to enhance the positive effects of the Project on employment and training, income, traditional economy, and business opportunities and minimize adverse effects including:</p> <ul style="list-style-type: none">• A Human Resource Development Plan to initially prioritize Indigenous and non-Indigenous communities in the LSA in terms of employment and training opportunities;• Establishment of a procurement approach through all phases of the Project, focusing on businesses based within the LSA communities, followed by Indigenous and / or businesses in the RSA;• Negotiation with the Province of Saskatchewan to develop the Project’s Surface Lease Agreement and Human Resource Development Agreement. <p>CNSC staff and subject matter experts are committed to continued information sharing with KML and consultation on topics that are of primary concern to their members.</p> |
| 14. | KML and NVP (February 17, 2023) | Road safety concerns Maintenance of 914 road with 914 Extension | <p>Section 5 and 5.2 of KML and NVP submission: When determining community safety with respect to need for increased transportation for a new operation, the Indigenous people of KML have the following concerns:</p> <ul style="list-style-type: none">• The state of the existing road from 165 to 914: The road has received upgrades up to the kilometer 75 on highway 165. From Kilometer 75 to Kilometer 112 where Highway 165 ends and Highway 914 begins, Highway 914 needs an upgrade in width all the way to Pinehouse to create a more industrialized road. KML are not looking forward to the spring road conditions with just the current industry activity.• Every community member has reported near miss incidents with the increased traffic caused by the general resurgence of the Uranium Industry using semi truck and heavy hauls to transport material to the operations and project sites. With the increase in incidents and near misses the opportunity for a major incident is inevitable, with the current road conditions. Adding the development of a new Denison mining operation will only increase this potential for incidents for people using this road.• When you add the rough road conditions, visibility reduction in the winter and summer with dust and snow flurry from large vehicles. This causes unsafe conditions and increases the potential for incidents.• The current capacity for road maintenance from the community members of Pinehouse are not prepared for the additional maintenance requirements for the road becoming a connected road. <p>The road must be developed to an industrial rating to allow for the increase in industrial use so that members of KML do not experience safety issues. KML is requesting that the Transport Canada, Ministry of Highways respond to the concerns of</p> | <p>CNSC staff have met regularly with KML and coordinated with the KML team to arrange information sessions with community members, as well as conduct outreach and engagement where staff have learned more about KML land use and traditional practices, as well as shared information on the EA process, the technology proposed, and answer questions. CNSC staff have also held monthly meetings with KML representatives, in order to provide updates on the proposed project, and discuss topics of concern to KML. CNSC staff have received KML’s KML Value Ecosystem Components Study, which informs the CNSC’s assessment and EA process, where community safety with respect to roads in Saskatchewan is well documented.</p> <p>CNSC staff are satisfied with Denison’s engagement with KML to date, and in June 2024 received letters of support for the proposed project from both KML and NVP, which indicated their support and consent for the development and operation of the Project.</p> <p>Highway improvements are not within scope of the EA review under CEAA 2012, however, CNSC notes KML’s perspective of increased traffic volumes and subsequent desire for highway safety and improvements. CNSC staff are also satisfied with Denison’s commitment to work with KML to establish an Emergency Preparedness and Response Program and work together as partners with KML in discussions about upgrading highways with the provincial government (commitment 14 and 16 of Table 3-2, Denison’s Commitments to the Public, Indigenous Nations and Communities, Commitments Register version 4).</p> |

| | | | | |
|-----|--|---|--|--|
| | | | <p>Pinehouse and inform the community of the plans for road infrastructure development. KML would request the road be developed to the standard that the Key Lake and McArthur River road is managed all the way to Junction of Highway 165 and Highway 2.</p> <p>KML and NVP request further capacity to develop road management capacity so KML can provide the support necessary to manage the integrity of the road.</p> <p>As also noted in their summary of Primary Concerns, this includes a requirement for:</p> <ul style="list-style-type: none">• Immediate efforts to build and increase emergency response capacity with community people from KML and NVP to support capacity for road incidents.• Significant improvements to the road to an industrial grade from Highway 2 to the Key Lake gatehouse to support the massive increase in heavy traffic from Industry | <p>CNSC recommends that Denison continue to work with KML and NVP to and engage in discussions around safety concerns regarding highways with the Provincial Government.</p> |
| 15. | KML and NVP (February 17, 2023) | Waste management of new development and historical issues | <p>Section 6.1 of KML and NVP submission: KML is concerned with cumulative impacts from historical legacy exploration and mining practices. Not specific to Denison, Cameco or Orano, KML notes that land users have often found remnants of past poor exploration practices which are now affecting our continued land use. The abandoned camps and industrial and domestic waste left with no known program for clean up are the most significant of these remnants. They would like the EIS to host in partnership with provincial government regulators to host a conversation on progressive reclamation of these legacy sites.</p> <p>This conversation should prioritise the community capacity and an environmental agent for process that occur on our traditional territories. This conversation could include changing the policies of waste (future waste) being brought into the NAD. KML’s contention is that waste that is brought into the region should be removed entirely from the region. The need for a regional waste management facility or a transfer station must be developed in partnership with KML.</p> <p>As noted in their summary of Primary Concerns, this includes a requirement for:</p> <ul style="list-style-type: none">• Immediate efforts to build capacity in a regional waste management operation within or near the community. To build current and future expertise in domestic waste, special waste, recycling, and the development of a transfer station in Pinehouse to support all mining activity including current operation and exploration. | <p>CNSC staff have concluded that Denison’s cumulative effects assessment for the proposed Wheeler River Project is acceptable.</p> <p>As a member of the International Atomic Energy Agency (IAEA), Canada strives to implement its waste management practices so that they align with the best practices and the guidelines of the IAEA and the international community. In addition, to ensure compliance with its international legal commitments, the CNSC must regularly report on its regulatory performance, undertake peer reviews, and undergo scrutiny by the IAEA.</p> <p>Consultation with Indigenous Nations and communities, and engagement with the public are important aspect of the CNSC’s regulatory and decision-making processes to ensure that their concerns are heard and addressed throughout the regulatory process and in order to determine that the project as proposed by the proponent, will make adequate provisions to protect people and the environment.</p> <p>Canada's Radioactive Waste Policy Framework clearly defines the role of government, and waste producers and owners. The government has the responsibility to develop policy, to regulate, to oversee producers and owners to ensure that they comply with legal requirements and meet their funding and operational responsibilities in accordance with approved waste disposal plans. It also makes clear that waste producers and owners are responsible, in accordance with the principle of “the polluter pays”, for the funding, organization, management and operation of disposal and other facilities required for their wastes.</p> <p>The CNSC licenses, monitors and inspects nuclear facilities, including radioactive waste management facilities in order to protect the health, safety and security of Canadians and the environment. The CNSC operates within a modern and robust legislative and regulatory framework. This framework consists of laws passed by the Parliament of Canada that govern the regulation of activities of Canada’s nuclear industry. The regulatory framework also includes instruments such as regulations, licences and regulatory documents.</p> <p>Consultation with the public, Indigenous Nations and communities and interested parties is an important part of the process for the CNSC in the development of regulatory tools and the framework. All draft documents are made available for public feedback and all comments are posted on the CIAR.</p> |

| | | | | |
|-----|--|---|---|---|
| | | | | <p>Under the CNSC’s regulatory framework, applicants are responsible for selecting and justifying their proposed project. At the present time, the framework and mandate of the Commission is to consider the proposed project and any potential significant adverse environmental effects it can have before making an EA decision. The EA process is currently ongoing and the Commission has not yet rendered a decision on the project.</p> <p>CNSC staff are satisfied with Denison’s engagement with KML and NVP to date, and in June 2024 received letters of support for the proposed project from both KML and NVP, which indicated their support and consent for the development and operation of the Project.</p> |
| 16. | KML and NVP (February 17, 2023) | UNDRIP and TRC Protocols | <p>Section 6.3 of KML and NVP submission: KML sees limited mention that this project has respected the intent of the United Nations Declaration on the Rights of Indigenous People or the Recommendations of the Truth and Reconciliation Commission. There is limited opportunity for this project to review the implications of UNDRIP and TRC and how this project will cause to effect for the Indigenous rights bearing members of Pinehouse. This is not case for other agencies providing information for this project.</p> <p>KML request advocacy to increase education for external agencies on the need to develop greater understanding of UNDRIP and TRC calls to actions. These agencies can be contractors, regulators, and managers within the companies. This process could be developed if the agencies co develop a centre of excellence in Pinehouse.</p> | <p>The CNSC is committed to supporting the Government of Canada’s whole-of-government approach to implementing the United Nations Declaration on the Rights of Indigenous Peoples Act (UNDA) and the principles of the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP). The CNSC’s processes for consultation and engagement with Indigenous peoples are mindful of and consistent with the principles articulated in UNDRIP. The CNSC follows existing legal frameworks including CEAA 2012, the NSCA and the common law duty to consult in conducting its consultation, regulatory and decision-making processes which further supports the UNDRIP and the FPIC principle. CNSC works towards achieving consensus with potentially impacted Indigenous Nations and communities through meaningful consultation, identifying mitigations and accommodation measures to address concerns and potential impacts and supporting Nations in arriving at their own position on the project and position on consent. CNSC staff support Nations with articulating and communication their position on FPIC to the Commission so that it can be taken into account as part of the decision-making process.</p> <p>Consultation with Indigenous Nations and communities and public engagement are important aspect of the CNSC’s regulatory and decision-making processes to ensure that their concerns are heard and addressed throughout the regulatory process and in order to determine that the project as proposed by the proponent, will make adequate provisions to protect people and the environment.</p> <p>The framework and mandate of the Commission is to consider the proposed project and any potential significant adverse environmental effects it can have before making an EA decision. CNSC staff will not move forward with a recommendation to the Commission unless we deem the proposal to be safe. Further, the Commission will only allow the project to proceed if it is convinced that it is safe for the public and the environment. In addition, the Commission must ensure as part of its decision-making that the honour of the Crown has been upheld and that the CNSC has met its Duty to Consult and Accommodate obligations as part of the consultation and regulatory process.</p> <p>CNSC staff are satisfied with Denison’s engagement with KML and NVP to date, and in June 2024 received letters of support for the proposed project from both KML and NVP, which indicated their support and consent for the development and operation of the Project.</p> |
| 17. | KML and NVP (February 17, 2023) | Co-Management, Food Sovereignty and Metis Land Access | <p>Section 6.4 of KML and NVP submission: Potential impacts to KML are from increased development and access to their territory. Current provincial regulation of hunting, fishing, tourism, resources development and increase human traffic will affect and limit our ability to practice our protected rights. Western business with greater acumen may displace economic activity as they note that they are still evolving their understanding of the industry business practices.</p> | <p>This comment is out of scope of the CNSC’s mandate and CEAA 2012, however both federal and provincial staff are aware of these concerns.</p> |

| | | | | |
|-----|---|--|---|---|
| | | | KML request further study on how current provincial regulations including opportunity for co-management so lessen the impacts from this project and from increased encroachment. | In June 2024, both regulatory bodies received letters of support for the proposed project from KML and NVP, which indicated their support and consent for the development and operation of the Project. Both provincial and CNSC staff are satisfied with Denison’s engagement with KML and NVP to date. |
| 18. | KML and NVP (February 17, 2023) | Waste Management Plan | <p>Section 6.5 of KML and NVP submission: KML describes Indigenous Economic Leakage and Triggered Response Capacity as concerns:</p> <ul style="list-style-type: none">Indigenous Economic Leakage: the lack of capacity within Indigenous communities like Pinehouse prior to massive development projects like uranium mining operations. No ability in existing community development to capitalize on industrial activity in their areas because of historic colonization and racism. There are limited businesses, stores, materials and infrastructure within community to support and build upon.Triggered Response Capacity: the respond required by the Indigenous people of KML to meet the need of industry. The community is required to change focus away from Indigenous community needs to focus on the needs of Industry. This includes time to respond to the industrial education, safety protocols, regulatory responses. The need as a community to participate in the Duty to Consult on exploration requests, feasibility studies, Environmental impact studies, negotiate agreements, industry training requirements. All of this removes the community ability for practicing Indigenous cultural activities, less time of Cree language retention. This response increases as the Collateral Effect increase. <p>It is acknowledged by KML that these are factors are exacerbated by an additional mine. As noted in their summary of Primary Concerns, this necessitates:</p> <ul style="list-style-type: none">Systemic increases in the use of services in Pinehouse including COOP store and PBNLP, Pinehouse Housing Corporation, Pinehouse Fishing COOP and Wild Rice, and KML Metis Local to prevent the continuation of Indigenous economic leakage.Consideration to build industry supporting infrastructure such as warehousing, hotels, bulk fuels parts and mining necessities in Pinehouse to support community development and to stop the Indigenous economic leakage which has occurred over the last 50 years of development. | <p>As noted in previous comments, CNSC staff have worked with KML to ensure that concerns raised by KML have received satisfactory responses from Denison, and other parties as required. Socio-economic concerns are primarily considered in the scope of factors reviewed by the province and the proponent.</p> <p>In June 2024, both regulatory bodies received letters of support for the proposed project from KML and NVP, which indicated their support and consent for the development and operation of the Project. Both provincial and CNSC staff are satisfied with Denison’s engagement with KML and NVP to date.</p> |
| 19. | English River First Nation (ERFN) (February 22, 2023) | Section 12.1.6 Residual Effects Evaluation | <p>Comment #ERFN-187: Section 12.1.6 of the EIS defines a significant adverse residual effect on Cultural Expression as “an effect that is highly different from baseline conditions and trends and cannot be managed or mitigated through adjustments to existing programs, policies, or other mitigation.” The EIS goes on to state that “because residual adverse effects on Cultural Expression are not expected to result in this level of change, effects are expected to be not significant for the Project.”</p> <p>ERFN does not agree with this assessment of the potential residual effects of the Project, which is fundamentally deficient based on the limited scope of KIs and measurable parameters that were selected for analysis. ERFN also does not agree that the mitigation measures presented in Section 12.1.5 are sufficient to address effects of the Project on Cultural Expression that will be highly different from baseline conditions.</p> <p>Question/Recommendation: Until Section 12.1 is revised to include a more holistic consideration of KIs and measurable parameters for Cultural Expression that ERFN has set out above, Denison’s assessment of the nature of potential Residual Effects should be considered incomplete and deficient. In addition, until ERFN confirms CNSC that Denison and ERFN have reached mutually</p> | <p>The CNSC ensures that all EA and licensing decisions under CEAA 2012 and the NSCA uphold the honour of the Crown and consider Indigenous peoples’ potential or established Aboriginal and/or treaty rights pursuant to section 35 of the <i>Constitution Act, 1982</i>.</p> <p>Denison and ERFN have reached an agreement regarding concerns in section 12.1, with Denison committing to working with ERFN to understand how follow-up programs might be executed at the community level to address community perspectives. Indigenous Knowledge from ERFN was integrated throughout the Cultural Expression section.</p> <p>CNSC staff are satisfied with this outcome, and Denison is required to report to the CNSC regarding their engagement activities and it is expected that further details will be provided in the EIS and Denison’s Indigenous Engagement Report. CNSC staff will be requiring that Denison follow up on any commitments made to Indigenous Nations and communities, and Denison will be required to continue engaging, according to any EA or licence conditions. CNSC staff are committed to collaborating on conducting oversight of Denison’s compliance with any proposed licence condition with ERFN.</p> |

| | | | | |
|-----|---|---|--|--|
| | | | agreed-upon terms of mitigation and accommodation that address the effects of the Project on Cultural Expression, this EIS should not be considered complete or approved by CNSC. | |
| 20. | ERFN (February 22, 2023) | Section 12.2.6 Residual Effects Evaluation | <p>Comment #ERFN-194: Section 12.1.6 of the EIS defines a significant adverse residual effect on Cultural Expression as “an effect that is highly different from baseline conditions and trends and cannot be managed or mitigated through adjustments to existing programs, policies, or other mitigation.” The EIS goes on to state that “because residual adverse effects on Cultural Expression are not expected to result in this level of change, effects are expected to be not significant for the Project.” ERFN does not agree with this assessment of the potential residual effects of the Project, which is fundamentally deficient based on the limited scope of KIs and measurable parameters that were selected for analysis. ERFN also does not agree that the mitigation measures presented in Section 12.2.5 are sufficient to address effects of the Project on Cultural Expression that will be highly different from baseline conditions.</p> <p>Question/Recommendation: Until Section 12.2 is revised to include a more holistic consideration of KIs and measurable parameters for Community Well-Being that ERFN has set out above, Denison’s assessment of the nature of potential Residual Effects should be considered incomplete and deficient. In addition, until ERFN provides confirmation to CNSC that Denison and ERFN have reached mutually agreed upon terms of mitigation and accommodation that address the effects of the Project on Community Well-Being, this EIS should not be considered complete or approved by CNSC.</p> | <p>The CNSC ensures that all EA and licensing decisions under CEAA 2012 and the NSCA uphold the honour of the Crown and consider Aboriginal peoples’ potential or established Aboriginal and/or treaty rights pursuant to section 35 of the <i>Constitution Act, 1982</i>.</p> <p>Denison and ERFN have reached an agreement regarding concerns surrounding Cultural Expression, with Denison committing to working with ERFN to understand how follow-up programs might be executed at the community level to address community perspectives. Indigenous Knowledge from ERFN was integrated throughout the Cultural Expression section.</p> <p>CNSC staff are satisfied with this outcome, Denison is required to report to the CNSC regarding their engagement activities with ERFN.</p> |
| 21. | ERFN (February 22, 2023) | Section 13.2.1 Key Indicator: Employment and Training (all indicators) | <p>Comment #ERFN-213: The data are not presented from a GBA+ perspective, limiting the assessment’s estimate of the Project adverse or disproportionate impacts separated based on gender, sexual orientation, race, or other factors which have historically been used to disadvantage populations interacting with mining projects.</p> <p>Question/Recommendation: Complete the assessment using a GBA+ framework.</p> | <p>Denison, through a Human Resource Development Plan, will initially prioritize Indigenous and non-Indigenous communities in the local study area in terms of employment and training opportunities (anticipated to be in institutions in northern Saskatchewan) and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project.</p> <p>GBA plus analysis is not a requirement for environmental assessments of designated projects under CEAA 2012. With this in mind, CNSC staff understand that through the draft EIS review process, Denison has worked directly with ERFN to understand, consolidate and resolve any of its outstanding concerns. Denison and ERFN have come to a resolution in this area of interest.</p> <p>CNSC staff are satisfied with this outcome and expects Denison to report to the CNSC regarding on-going engagement activities with ERFN.</p> |
| 22. | ERFN (February 22, 2023) | Section 13.5.2. Summary of Project- related Residual Adverse Effects on Economy | <p>Comment #ERFN-238: The effects of the Traditional Economy are likely underestimated. The effects from a GBA+ perspective are unknown. The potential boom- bust effects of the Project are not considered.</p> <p>Question/Recommendation: Assess the impact of the project on GBA+. Re-assess the direction of the residual impact if necessary.</p> | <p>Denison and ERFN have come to a resolution in this area of interest as of November 2023. Indigenous Knowledge has been integrated throughout Section 13 Economics and Section 13.1.4 provides further details on the influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Economic Assessment. Denison notes that the "Traditional Economy" was included as a key indicator in Section 13 and was integrated in a fulsome manner.</p> <p>As noted previously, GBA plus analysis is not a requirement for environmental assessments of designated projects under CEAA 2012. However, CNSC staff are satisfied with this outcome and expects Denison to report to the CNSC regarding on-going engagement activities with ERFN.</p> |

| | | | | |
|-----|---|---|---|---|
| 23. | ERFN (February 22, 2023) | Section 14.6.3.4 Evaluation of Consequences | <p>Comment #ERFN-257: Denison argues in sections 14.6.3.1, 14.6.3.3 and 14.6.3.4 without substance that the risk of groundwater contamination due to the loss of freeze capacity is very unlikely. The lack of evidence presented to substantial these claims is alarming to ERFN. ERFN agree that under normal circumstances the likelihood of the freeze wall failing allowing for groundwater contamination is on the lower end of the likelihood spectrum, however, ERFN are not currently assessing effectiveness under normal circumstances, but rather as a result of accident or malfunction. Based on the discussion provided in section 14.6.3.4, there is great concern to ERFN that Denison would be a) able to detect the failure of a freeze wall and b) identify the exposure pathway to enable Denison to take appropriate action before catastrophic environmental impacts are observed.</p> <p>Question/Recommendation: ERFN is gravely concerned about the information put forward by Denison in section 14.6.3 regarding the risk assessment associated with likelihood and consequences of failure by the freeze wall. Denison has not presented a viable method to monitor the effectiveness of the freeze wall. Additionally, Denison indicates that there are no viable methods of detecting impacts or intervening until they are observed, indicating failure of the freeze wall. Finally, when speaking to the likelihood of an accident or malfunction, Denison only offer a best guess. ERFN requests that CSNC and Denison take seriously the possible threat to the environment and by extension ERFN Rights and interests associated with the failure of the freeze wall. ERFN cannot overstate the need to provide additional analysis of contingency measures to avoid containment in the event the freeze wall fails to contain mining fluids and other sources of groundwater contamination associated with Wheeler River activities.</p> | <p>Denison has committed to no residual effects to groundwater beyond the mining area during operations and during decommissioning activities; nor effects from changes in groundwater to surface water in the vicinity of the project during the same time period. Denison also provided more information on the freeze wall and ISR mining approach. Denison will continue to work with ERFN to align the ERA updates and reviews of those updates as recommended.</p> <p>An agreement was reached between Denison and ERFN in November 2023. Denison is required to report to the CNSC regarding their engagement activities with ERFN.</p> |
| 24. | YNLR (March 4, 2023) | Section 3 Value of IK in EA Practice, various pages | <p>Comment #9, 10, 12, 15, 16, 17, 19 and 35, Appendix B: YNLR notes that as the Athabasca Denesųliné were not considered to be an Indigenous COI, the opportunities to contribute to our knowledge to this discussion were diminished or lost.</p> <p>Comment #19, Appendix B: The mis-categorization as the Athabasca Denesųline am Indigenous Community rather than as an Indigenous COI is a step backwards rather than forwards with regards to reconciliation. A letter to Denison dated July 29, 2022, YNLR critiqued the designations of COI and IC as being artificial and marginalizing. Denison responded October 28, 2022, after the submission of Wheeler River EIS with an alternative view.</p> <p>Other related comments include:</p> <ul style="list-style-type: none"> • Comment #9, Appendix B: Only 4 of 31 aspects influenced (from EIS Table 3.5-1) for Indigenous knowledge and 3 of 37 aspects influenced (from EIS Table 3.5-2) for local knowledge were taken from Athabasca Denesųline knowledge sources. How will Denison address this? • Comment #10, Appendix B: YNLR notes that the Athabasca Denesųliné communities should be considered an Indigenous COI per Denison’s definition (EIS page 4-vii) as they are/have: <ul style="list-style-type: none"> ○ signatories of Treaty 10 and Athabasca Denesųline traditional territory is within the Project area (Hatchet Lake First Nation is a signatory to Treaty 10 as recognised on page 4-47 of the draft EIS) ○ established Treaty rights in proximity to the Project ○ more likely to experience impacts, for example, water drainage as indicated on page 1-7 of the EIS ultimately flows into Wollaston Lake where the Athabasca Denesųline community of Hatchet Lake is located • Comment #12 and 16, Appendix B: YNLR notes that the Project is located within Nuhenéné (the Athabasca Denesųliné traditional territory) as recognised on page 4-61 of the draft EIS. Further, Hatchet Lake First Nation is a signatory to Treaty 10, while Black Lake First Nation and Fond du Lac First Nation are signatories to Treaty 8, and as such all have | <p>The CNSC ensures that all of its EA and licensing decisions under CEAA 2012 and the NSCA uphold the honour of the Crown and uphold Indigenous peoples’ potential or established Aboriginal and/or treaty rights pursuant to section 35 of the <i>Constitution Act, 1982</i>.</p> <p>CNSC staff have identified Indigenous Nations and communities who may have an interest and rights in relation the project, including the Ya’thi Néné and provided each identified group with a notice of the commencement of the EA, the opportunity to apply for participant funding and a copy of the project description and draft EIS for comment. CNSC staff work primarily with Ya’thi Néné Lands and Resources Office, who coordinates any consultation activities, on behalf of Hatchet Lake, Black Lake and Fond-du-lac Denesuline First Nations.</p> <p>As per the requirements and guidance of the CNSC’s REGDOC 3.2.2, Indigenous Engagement, CNSC staff expect that Denison will continue engaging with YNLR and other identified Indigenous Nations and communities to identify potential concerns related to impacts on Aboriginal and/or treaty rights as a result of the proposed project and working collaboratively with the identified communities on addressing these concerns, where appropriate, as this process continues. Denison is also required to report to the CNSC regarding their engagement activities.</p> <p>CNSC staff have determined that Denison has demonstrated a commitment to working with identified Indigenous Nations and communities including establish working relationships and to develop engagement work plans. In response to concerns about this, Denison has added Hatchet Lake Denesuline First Nation who is represented by Ya’thi Néné as a Community of Interest for the Denison Wheeler River Project in the Final EIS and reflected local and traditional knowledge shared by YNLR and the First Nations that it represents in the Final EIS. Denison has also committed to sharing information on environmental monitoring plans as they develop, to</p> |

| | | | | |
|-----|---|---|--|---|
| | | | <p>Treaty Rights within the Project area and that ; that our communities are in proximity to the Project and have demonstrated traditional activity</p> <ul style="list-style-type: none">• Comment #15, Appendix B: YNLR notes that the Athabasca Denesųline has relationships with other projects such as McArthur River and Key Lake as indicated in ROC-78, page 504, Combined Appendices for the Wheeler River Project Draft EIS.• Comment #17, Appendix B: Given these EIS defined criteria, YNLR has difficulty understanding why the Athabasca Denesųliné have been excluded from Indigenous COI status for this project. Exclusion of COI status means loss of opportunity for the communities to be part of greater engagement throughout all stages of the Project. Lost opportunities are considerable and include loss of participation at all phases of the Project and include influence regarding the boundaries of the study areas, possibilities for increased discussions regarding environmental and health concerns, mitigation procedures, and planned remediation, potential to participate in monitoring and research projects and future opportunities such as employment.• Comment # 35, Appendix B: YNLR notes that the engagement database demonstrates that their opportunities to contribute were limited. For example, of the approximately 101 pages of Engagement Database tables that are dispersed through several sections of the appendices for the EIS (2022), there are 6 entries credited to the Athabasca Denesųliné. Given an average of 3 to 5 entries per page in the tables, this means that only 1-2% of the contributions were made by the Athabasca Denesųliné. These limited opportunities may well be the result of the exclusion of Athabasca Denesųline from the COI category. | <p>support collaboration on monitoring plans of specific interest with YNLR. CNSC staff are satisfied with these commitments and results.</p> <p>Over the course of this process, CNSC staff have met regularly with YNLR and their board, to discuss CNSC's mandate and regulatory oversight role with regards to the Wheeler River Project, as well as other licenced sites. CNSC staff have also been working directly with YNLR to organize meetings and discussions with SMEs from CNSC and Environment and Climate Change Canada, to answer outstanding questions and concerns related to the project, CEAA 2012 methodologies, as well as regulatory processes followed by the Government of Canada. The CNSC also provides updates on and discusses the Wheeler River Project as part of regular engagement meetings with YNLR as part of the CNSC-YNLR Terms of Reference for long-term engagement which was established in 2022.</p> <p>CNSC staff will continue to provide Indigenous Nations and communities, including YNLR and impacted locals, with timely project updates and opportunities to review information and be consulted and engaged at key points during the EA process. To date, this has included review of Denison's Project Description and draft EIS, and will include review of CNSC's EA report and Commission Member Document (CMD), Denison's CMD, as well as an opportunity to present at the public Commission hearing.</p> <p>In addition to information sharing and providing opportunities for review of documents, CNSC staff will be working directly with YNLR as the rights impact assessments and Environmental assessment report are drafted. CNSC staff are committed to ensuring that any information related to YNLR, the Nations and communities they represent and their rights and interests are adequately reflected in CNSC documentation and conclusions on Denison's proposal.</p> |
| 25. | MN-S (March 4, 2023) | <p>Executive Summary, Section 3 Project Setting</p> <p>Executive Summary, Section 3.4.3 Proposed Schedule and Activities</p> <p>Executive Summary, Section 4 General</p> <p>EIS, Glossary</p> | <p>Issue #ES-002: Denison does not acknowledge that the Project falls within the MN-S Homeland.</p> <p>Issue #ES-013: MN-S is listed under Indigenous Organizations instead of Indigenous Communities of Interest.</p> <p>Issue #ES-012, ES-005 and 4-001: Per Denison's definition, MN-S, NR1 Locals, and NR3 Locals should be considered an Indigenous Community of Interest. Denison notes site visits as the only engagement-associated activities in each Project Phase. Additional involvement opportunities should be provided to MN-S throughout the life of the Project</p> <p>Further, MNS refers to CNSC correspondence (Appendix A) indicating that consultation and engagement was expected to be with NR1 Locals, NR2 Locals, NR3 Locals, and MN-S. Given NR2's involvement in NexGen and Fission, MN-S limited its engagement and consultation expectations to NR1 Locals, NR3 Locals, and itself.</p> <p>Recommendations:</p> <ul style="list-style-type: none">• Denison needs to engage all potentially impacted Métis, including: MN-S, NR1 Locals, and NR3 Locals, in addition to Kineepik Metis Local #9, as an Indigenous Community of Interest throughout the life of the Project.• Denison needs to revise their Indigenous Community of Interest definition in the Final EIS to reflect the uniqueness of Métis governance structures. Specifically, a definition that recognizes Métis Locals proximate to the Project, MN-S, and MN-S regional leadership. | <p>The CNSC is committed to ensuring that all of its EA and licensing decisions under CEAA 2012 and the NSCA uphold the honour of the Crown and uphold Indigenous peoples' potential or established Aboriginal and/or treaty rights pursuant to section 35 of the <i>Constitution Act, 1982</i>.</p> <p>CNSC staff have identified Indigenous Nations and communities who may have rights and an interest in the project, including the Métis Nation of Saskatchewan (MN-S). MN-S was provided with a notice of the commencement of the EA, the opportunity to apply for participant funding and a copy of the project description and Denison's Draft EIS for comment.</p> <p>CNSC staff regularly meet with MN-S to discuss topics that relate to CNSC's mandate, including progress on the proposed Wheeler River Project, related to both the licensing and EA process.</p> <p>As per the requirements and guidance of the CNSC's REGDOC 3.2.2, Indigenous Engagement, CNSC staff have confirmed that Denison has engaged with MN-S and other identified Indigenous Nations and communities (including Kineepik Métis Local) to identify potential concerns related to impacts on Aboriginal and/or treaty rights as a result of the proposed project and working collaboratively with the identified communities on addressing these concerns, where appropriate.</p> |

| | | | | |
|-----|---|------------------|--|--|
| | | | <ul style="list-style-type: none">• Denison needs to engage MN-S, NR1 Locals, and NR3 Locals, to understand their preferred level of involvement throughout the life of the Project.• Denison needs to acknowledge MN-S, NR1 Locals, and NR3 Locals as an Indigenous Community of Interest in the Final EIS.• Denison needs to revise the Final EIS Executive Summary to note that the Project falls within the Homeland of MN-S, NR1 Locals, and NR3 Locals. Denison needs to apply this change throughout the EIS, where applicable.• Denison to acknowledge that lease review data is not an appropriate way to determine Métis traditional resource use in and around the Project in the Final EIS. | <p>Denison is required to report to the CNSC regarding their engagement activities and it is expected that further details will be provided in the evergreen Indigenous Engagement Report in any future submissions. Denison has committed to work with identified Indigenous Nations and communities to establish working relationships and to develop engagement work plans. Further, in response to MN-S's comments, CNSC staff have confirmed that in the Final EIS Denison have acknowledged that the project falls within the MN-S homeland. Denison agreed to fund a Metis Knowledge Study and capacity agreement, has reflected Traditional knowledge shared by MN-S and continues to engage with MN-S with respect to mitigation, monitoring and decommissioning as the project continues to advance.</p> <p>CNSC staff will continue to provide Indigenous Nations and communities, including MN-S and potentially impacted Métis Locals, with timely project updates and opportunities to review information and be consulted and engaged at key points during the EA process. This will include the upcoming review of CNSC's EA report and Commission Member Document (CMD), Denison's CMD, as well as an opportunity to present at the public Commission hearing.</p> |
| 26. | Prince Albert Grand Council (PAGC) (March 6, 2023) | General Comments | <p>Overall Comments from the PAGC submission: The EIS does not address multiple issues related to ecosystems, human health, and the long-term sustainability of the Wheeler River project, particularly Indigenous concerns regarding the loss of caribou, wolverine and other culturally significant animals. There are no details on economic benefits from the mines through Indigenous partnerships, including equity-based participation in the workforce with training opportunities for Indigenous personnel to operate in management roles.</p> <p>PAGC requests a response from the CNSC in writing to the General Manager Lands and Resources Secretariat Mr. Robin McLeod indicating how the outlined concerns will be addressed.</p> | <p>Through the EIS technical review, CNSC staff have assessed Denison's proposal and have received satisfactory responses on questions related to their assessment.</p> <p>With regards to economic benefits, Denison has provided detailed information regarding socio-economic impacts (both positive and negative) within the EIS to meet the provincial EA requirements, and the requirements of REGDOC 2.9.1. CNSC staff are satisfied with Denison's evaluation of potential impacts from the proposed project and their evaluation of socio-economic factors.</p> <p>CNSC staff understand that Denison has developed agreements with interested Nations and communities, where they have demonstrated to the proponent that they have the potential to be impacted by the project. This is outside the purview of the CNSC; however, CNSC staff have identified Indigenous Nations and communities who may have an interest and rights in relation to the project and provided each with a notice of the commencement of the EA, the opportunity to apply for participant funding and a copy of the project description and Denison's Draft EIS for comment. Additionally, CNSC staff have been and will continue to work through specific issues raised by each Indigenous Nation and community and will be assessing the potential impacts to rights in collaboration with those Nations and communities who have the potential to be impacted by the project. CNSC staff will continue to provide interested Indigenous Nations and communities with timely project updates and opportunities to review information and be consulted and engaged at key points during the EA process. This will include the upcoming review of CNSC's EA report and Commission Member Document (CMD), Denison's CMD, as well as an opportunity to present at the public Commission hearing.</p> |

Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement

|--------|--|--|--|---|
| 1 | Lac La Ronge Indian Band (LLRIB) (February 9, 2023) | General | <p>Resource development projects in the Traditional Territory of LLRIB have had significant impact to community members and their traditional way of life. LLRIB is concerned about potential adverse impacts to the ability to hunt, fish and trap for food and/or carry out traditional uses including cultural, spiritual or other important sites near the proposed project area.</p> <p>LLRIB encourages Denison Mines to:</p> <ul style="list-style-type: none"> reach out to the LLRIB to engage LLRIB members and impacted land users. support the LLRIB Heritage Fund which enables community members to practice traditional activities reach out to LLRIB's economic development company, Kitsaki Management, to ensure local and Indigenous involvement | <p>The Lac La Ronge Indian Band ("LLRIB") hosted Denison Mines Corp. ("Denison") at the Lac La Ronge Indian Band ("LLRIB") Traditional Lands & Resources Advisory Committee ("TLRAC") meeting in Missinipe, on August 30, 2023. Denison appreciated the invitation to provide the TLRAC with an update on the Wheeler River Project ("Project"), including responding to the specific concerns raised by LLRIB in its February 9, 2023 letter to the Canadian Nuclear Safety Commission providing comments on Denison's comprehensive Environmental Impact Statement for the Project.</p> <p>As we affirmed during the meeting, the Project is located in the N-18 furblock for registered trappers and is outside the publicly available information regarding the LLRIB Traditionally Occupied Territory. Denison heard the TLRAC's information and perspective shared with us that there are LLRIB land users in the area, irrespective of furblock boundaries, and there remains general concern that land users could be impacted by the Project. As Denison explained during the meeting, we would welcome any specific information about land users in and around the Project area. From the evidence Denison is aware of so far, we are of the view that the outcome of Denison's comprehensive effects assessment in the areas of aquatic and terrestrial environments, and the associated potential impacts to the ability to exercise Indigenous Rights, leads to the conclusion that there will be no significant adverse residual effects to land use activities resulting from the Project. We recognize that this is an evolutionary process, such that if further information arises which indicates a different or more nuanced conclusion, we will review it and consider whether changes to our current direction are appropriate.</p> <p>In accordance with our Indigenous Peoples Policy, Denison is committed to collaborating with Indigenous peoples and communities to build long-term, respectful, trusting, and mutually beneficial relationships. With respect to using Kitsaki-owned businesses to support Denison's activities, Denison is proud of the work we have done to date with Kitsaki Management-owned companies including CanNorth and Northern Resource Trucking, and understand the opportunities for further work in the future as the Project progresses. As mentioned in the meeting, since 2019, Denison has spent more than \$1.1M dollars with Kitsaki-owned companies and has intentions to continue this positive trend as much as possible. Denison also understand the interests in general employment opportunities at the Project once approval is received to proceed, and are happy to have already received the contact information for the Community Relations Liaison Officer for Lac La Ronge Indian Band. This helpful contact will ensure that we have a fulsome listing of entities to which employment opportunities can be shared over the next while.</p> <p>Further, we understand as a company working in northern Saskatchewan, Denison wishes to respect and support efforts and initiatives that our neighbours, such as LLRIB and the TLRAC feel are important. As noted in your correspondence dated February 9, 2023 we understand that the Heritage Fund is such an initiative, and as such, Denison is pleased to contribute to the Heritage Fund for the amount of \$5,000. We trust that this contribution will continue to support and encourage community members to practice traditional activities.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|---|---|--|---|---|
| 2 | Birch Narrows Dene Nation (BNDN) (February 28, 2023) | Section 5.7; 5.8.1 | <p>Comment #1: The Project is located within the treaty and ancestral lands of BNDN and maintains both current and historical significance to the community. BNDN Indigenous Knowledge, Land Use and Occupancy are not currently considered within the EIS. Should the Project proceed without the consideration of BNDN's Knowledge, Land Use and Occupancy, it may cause irreparable loss of culturally significant sites and access to resources that the community depends upon. It may also contribute to a loss in cultural transmission.</p> <p>Request/recommendation:</p> <p>a) Denison should provide BNDN with funds to conduct a community-led Indigenous Knowledge, Land Use and Occupancy Study for consideration within the EIS process. At minimum, the Study should consider BNDN's Indigenous Ecological Knowledge, commercial and non-commercial harvesting practices, and cultural occupation of the region (including historical sites). The Study should also consider cultural transmission, information about the history of the area and BNDN community members' perspectives on the Project.</p> <p>b) The community-led Indigenous Knowledge, Land Use and Occupancy Study should be a component of a broader process agreement between BNDN and Denison that serves as a pathway for obtaining BNDN's consent for the Project.</p> <p>c) Denison should work with BNDN to consider the appropriate integration of the results into all aspects of the EIS and management/monitoring plans, as well as any additional appropriate mitigation and/or accommodation measures.</p> <p>See Section 4.1 for additional information on this topic.</p> | <p>Denison's engagement with BNDN is consistent with the identification of BNDN as an Indigenous Community who has expressed an interest in the Project. However, Denison acknowledges and understands this information from BNDN. As such, over the past year(s), Denison has met with BNDN and has respectfully requested further information from BNDN in respect to the land use activities occurring in and around the Project in order to more meaningfully understand the potential for adverse impacts to BNDN and therefore consider the potential for further studies and/or integration into the EIS of such information. Denison remains of the perspective that receipt of this information from BNDN is a necessary first step in this process, and has not received information in this regard to date.</p> <p>Project effects have been mitigated for the most intensive resource user(s), irrespective of affiliation.</p> <p>Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a community specific monitoring regime, suited to each of their interests and needs, in an agreed-upon fashion. Denison is committed to continual improvement in relation to such collaborative monitoring programs, in order to adapt to areas of interest which can change over time. It is expected that the data collected through such monitoring regimes would also be relevant to other Indigenous nations who may have interest in the Project. Therefore, Denison does not anticipate separate funding for BNDN at this time.</p> <p>Further, the assessment has been completed based on Valued Components (VCs), including the VC of Indigenous Land and Resource Use. Key indicators for Indigenous Land and Resource Use include:</p> <ul style="list-style-type: none"> • resource availability for harvesting subsistence resources (distribution and abundance of animals, plants, and wildlife for harvest and suitability of animals, plants, and wildlife for consumption); • land/water availability to practice traditional land use (TLU); and • perceived suitability of lands and resources therein. <p>Measurable parameters are identified for each of the key indicators, as presented in Table 11.1-1 of the EIS. The assessment does not take a distinctions based approach (i.e., the potential impact on each Indigenous community is not evaluated separately), but rather on the key indicators and associated measurable parameters.</p> <p>Mitigation to eliminate, reduce, or control potential adverse effects of the Project on Indigenous Land and Resource Use would apply to any BNDN uses proximal to the Project. Given proven mitigation is to be applied to traffic disturbances, noise, air quality, and increased competition for resources, the effects are expected to be minimal.</p> <p>As outlined in Denison's Indigenous Peoples Policy, Denison is committed to respecting Indigenous knowledge and values regarding environmental stewardship and Indigenous peoples' connection to the land, and to minimize potential effects, wherever possible.</p> |
| 3 | BNDN (February 28, 2023) | Heritage Baseline Study 2017 (Golder); Heritage Resource Impact Assessment 2020 (Golder); Heritage Resources Management Plan 2022 (Canada North) | <p>Comment #2: Archaeology as a profession has been dominated in North America by non-Indigenous researchers, despite most sites being Indigenous in origin. It is positive that Golder Associates made efforts to engage and involve Indigenous communities (by including an ERFN representative in fieldwork and by considering ERFN and Pinehouse Kineepik Metis land use maps) in their 2017 heritage baseline study and 2020 heritage resource impact assessment. Notwithstanding, the proposed Project area is within BNDN's treaty and ancestral lands and there may be heritage sites that the community is aware of. BNDN was not involved in either of these studies and BNDN may have Indigenous Knowledge of important heritage sites within the Study Area that should be considered.</p> <p>Request/recommendation:</p> <p>a) Denison should provide BNDN with funds to conduct a community-led Indigenous Knowledge, Land Use and Occupancy Study for consideration within the EIS process.</p> <p>b) The Heritage Resources Management Plan should be updated following the consideration</p> | <p>Denison's engagement with BNDN is consistent with the identification of BNDN as an Indigenous Community who has expressed an interest in the Project. However, Denison understands this information from BNDN. As such, over the past year(s), Denison has met with BNDN and has respectfully requested further information from BNDN in respect to the land use activities to occurring in and around the Project, in order to more meaningfully understand the potential for adverse impacts to BNDN and therefore consider the potential for further studies and / or integration into the EIS of such information. Denison remains of the perspective that receipt of this information from BNDN is a necessary first step in this process, and has not received information in this regard to date.</p> <p>Project effects have been mitigated for the most intensive resource user(s), irrespective of affiliation.</p> <p>Denison continues to work with its Indigenous Communities of Interest with reserves and</p> |

| | | | | |
|---|---|--|--|--|
| | | | <p>of Indigenous Knowledge, Land Use and Occupancy provided by BNDN. This may result in the requirement for further assessment and/or mitigation measures, which should be developed in consultation with BNDN.</p> <p>c) Denison should facilitate BNDN involvement in any additional archaeological fieldwork that takes place, including providing BNDN with capacity funding for members who participate. Terms to facilitate BNDN involvement in future archaeological work should be a component of a broader process agreement between BNDN and Denison.</p> <p>See Section 4.1 for additional information on this topic (p. 12-14).</p> | <p>residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a community specific monitoring regime, suited to each of their interests and needs, in an agreed-upon fashion. Denison is committed to continual improvement in relation to such collaborative monitoring programs, in order to adapt to areas of interest which can change over time. It is expected that the data collected through such monitoring regimes would also be relevant to other Indigenous nations who may have interest in the Project. Therefore, Denison does not anticipate separate funding for BNDN at this time.</p> <p>Following the implementation of the mitigation measures outlined in the Heritage Resource Management Plan (HRMP), the likelihood of residual effects is considered low and residual effects on Heritage Resources will occur infrequently and can be mitigated with the HRMP. Known archaeological resources identified in the Project Area were deemed to have low potential for archaeological interpretation and additional work or mitigation measures were not required for the sites; the Heritage Conservation Branch had no further concerns with these sites and work could proceed as planned. Should unknown archaeological and cultural resources be identified during the Project, effects will be mitigated using the HRMP. While effects to archaeological resources are irreversible, they can be mitigated by following the HRMP, by either avoiding additional damage to the resource by creating a buffer zone around the site, or by assessing the resource according to The Heritage Property Act to enable the full interpretation of the site before continuing with work. Furthermore, based on the low occurrence of known Heritage Resources in the Project Area (two), and the location of the Heritage Resources (near waterbodies, along an existing trail and away from the main developments), there is a low potential for the identification or disturbance of previously unknown archaeological sites throughout the life of the Project. Therefore, any residual effects (i.e., destruction of Heritage Resources) is considered to be negligible. Further, HRMP includes feedback from Indigenous nations with demonstrated significant land use activities in and around the Project.</p> <p>As outlined in Denison's Indigenous Peoples Policy, Denison is committed to respecting Indigenous knowledge and values regarding environmental stewardship and Indigenous peoples' connection to the land, and to minimize potential effects, wherever possible.</p> <p>Please see Section 11.3.2 Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Assessment for Heritage Resources. The Section describes how field assistants from local Indigenous communities were involved with the HRIA baseline studies, allowing for in-field consultation during the assessment to make sure that areas deemed to have potential by the land users were surveyed.</p> |
| 4 | BNDN (February 28, 2023) | Heritage Baseline Study 2017 (Golder) – methods; Heritage Resource Impact Assessment 2020 (Golder) – methods | <p>Comment #3: The methodology within both the 2017 and 2020 heritage studies included 'judgmental' shovel probing and initial troweling through soil to identify cultural heritage material. While the discretion of a professional archaeologist needs to be taken into account, relying subjectively on which areas to shovel test and not employing a systematic approach is not reproducible and may result in sites being missed; this is of particular concern given that large sections of the areas retaining potential were not subject to shovel testing. Further, troweling through soil rather than subjecting all excavated soil to sifting through 6mm mesh means that artifacts/ecofacts may easily be overlooked. Given that the north of Saskatchewan has not been thoroughly investigated archaeologically, and given that 76 sites and nine find areas were recorded just 35 km south of the Project area as part of Dr. David Meyer's multi-year archaeological investigation, the results of these assessments do not seem rigorous.</p> <p>Request/recommendation:</p> <p>a) BNDN recommends that Denison undertake further archaeological investigations based on the results of the BNDN TKLU study prior to construction of the project.</p> <p>b) Future archaeological assessment programs should be designed collaboratively with BNDN and other Impacted Indigenous Nations.</p> <p>See Section 4.1 for additional information on this topic (p. 12-14).</p> | <p>The 2017 and 2020 heritage studies were reviewed by the Heritage Conservation Branch. The HRIA was completed using standard pedestrian reconnaissance and visual inspection field techniques, complimented by the excavation of shovel probes and shovel tests and it was determined the site has limited interpretive potential. Please see Section 11.3.2 Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Assessment for Heritage Resources. The Section describes how field assistants from local Indigenous communities were involved with the HRIA baseline studies, allowing for in-field consultation during the assessment to make sure that areas deemed to have potential by the land users were surveyed. The details of monitoring and follow-up plans are being developed to support the separate process of Project licensing and permitting. The specific means by which provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program, are currently under consideration with the Denison project team. It is noted that Section 4.2.1 of the draft EIS provides the variety of ways in which Denison has engaged with Interested Parties to date and it is assumed it would continue to use these means and others that may be identified to fulfill its key corporate principals for developing positive relationships (see draft EIS Section 4.2).</p> <p>Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a community specific monitoring regime, suited to each of their interests and needs, in an agreed-upon fashion. Denison is</p> |

| 8 | BNDN (February 28, 2023) | Heritage Resources Management Plan 2022 (Canada North) – 5.1 1e & 1f | <p>Comment #7: BNDN notes that there has been limited engagement of our Nation as part of the archaeological baseline studies undertaken at the site. The Wheeler River Project is within our Treaty and Ancestral Lands where our members have deep ancestral ties and continue to exercise our rights to this day. As stewards of the land since time immemorial and holders of both Treaty and Aboriginal rights in the Project area, Denison must engage with us as partners on their activities on our lands. This includes their planning and decision-making related to archaeological materials to which our members have ancestral and spiritual ties.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - Indigenous communities should be consulted and engaged in decision making rather than merely informed if the archaeological material is expected to be Indigenous in origin. <p>See Section 4.1 for additional information on this topic (p. 12-14).</p> | <p>Please see Section 11.3.2 Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Assessment for Heritage Resources. The Section describes how field assistants from local Indigenous communities were involved with the HRIA baseline studies, allowing for in-field consultation during the assessment to make sure that areas deemed to have potential by the land users were surveyed.</p> <p>Even the most thorough investigations may not identify all archaeological materials that may be present. Denison advises that if unanticipated archaeological materials or features are encountered as a result of construction or reclamation activities, all work in the immediate area should cease and the Heritage Conservation Branch and local authorities (if applicable) contacted.</p> |
| 9 | BNDN (February 28, 2023) | Heritage Resources Management Plan 2022 (Canada North) – 5.1 7 | <p>Comment #8: Given the Ancestral and Treaty ties our members have to the project area, our members have valuable knowledge and context to inform the Heritage Resource Impact Assessment (HRIA) for the Project that must be considered prior to being reviewed or approved by any regulatory body.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - The draft HRIA should be reviewed by BNDN and other impacted Indigenous Nations prior to being submitted for regulatory approval. <p>See Section 4.1 for additional information on this topic (p. 12-14).</p> | <p>Denison's engagement with BNDN is consistent with the identification of BNDN as an Indigenous Community who has expressed an interest in the Project. However, Denison understands this information from BNDN. As such, over the past year(s), Denison has met with BNDN and has respectfully requested further information from BNDN in respect to the land use activities to occurring in and around the Project, in order to more meaningfully understand the potential for adverse impacts to BNDN and therefore consider the potential for further studies and / or integration into the EIS of such information. | 10 | BNDN (February 28, 2023) | Heritage Resources Management Plan 2022 (Canada North) – 5.1.1 | <p>Comment #9: Discerning archaeological artifacts/ecofacts is difficult at times even to the trained eye; consequently, it is important to undergo training to understand what you could be looking for.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> a) Staff should undergo training regarding the cultural material they may encounter while on site b) BNDN and other Indigenous communities should be invited to attend this training <p>See Section 4.1 for additional information on this topic (p. 12-14).</p> | <p>Section 5.1.1 describes how all staff working on the Project should be informed of the possibility that they could encounter archaeological resources during their work or leisure time, which will include the proper procedure to follow in the case of a chance find. This could be facilitated by a short archaeological education section in the employee orientation, outlining the types of sites and artifacts that could be encountered in the area, as well as what to do when a potential artifact or site is found. If the chance find is deemed to be an archaeological site, then an HRIA is required and a qualified archaeologist must complete the assessment.</p> <p>Section 11.3.5 Mitigation Measures describes the management of archaeological resources and includes the assessment of the discovery by a qualified archaeologist and mitigation measures including avoidance of the site, shovel testing, systematic and intensive shovel testing, excavation, and/or construction monitoring. The HRMP outlines mechanisms for Indigenous engagement including the communities and implementation of appropriate cultural protocols.</p> |
| 11 | BNDN (February 28, 2023) | Heritage Resources Management Plan 2022 (Canada North) – 5.3 | <p>Comment #10: In numerous instances the Heritage Resources Management Plan (HRMP), Denison has used noncommittal language to describe future Indigenous engagement related to heritage resources. BNDN notes that engagement of impacted Nations is essential for proper heritage resource management and as such the language in the HRMP should reflect the necessity of this engagement.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - Throughout the HRMP, Denison must change the language of “should” to “will” where appropriate. For example: management options will be presented to the applicable Indigenous communities for feedback and will include consultation. <p>See Section 4.1 for additional information on this topic (p. 12-14).</p> | <p>The Heritage Resources Management Plan will be revisited for use of language 'should' to 'will' where appropriate.</p> |

|----|---|--|---|---|
| 12 | BNDN (February 28, 2023) | Heritage Resources Management Plan 2022 (Canada North) – 5.3.1 | <p>Comment #11: BNDN notes that Section 5.3.1 does not confirm that impacted Indigenous Nations will have the opportunity to participate in future archaeological fieldwork. While BNDN understands that many impacted Nations will have arrangements directly with Denison to facilitate member participation, this should additionally be made available to all impacted Indigenous Nations as part of best practices at the Project.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - In addition to any provisions developed in a Project Agreement between BNDN and Denison for the Wheeler River Project, Denison should include a clause that confirms that all impacted Indigenous communities will be invited to have monitors participate in any additional fieldwork and that Denison will provide capacity funding for Nations that wish to participate. <p>See Section 4.1 for additional information on this topic (p. 12-14).</p> | <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. Denison does not anticipate separate funding for BNDN at this time.</p> <p>BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> <p>The details of monitoring and follow-up plans are being developed to support the separate process of Project licensing and permitting. The specific means by which provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program, are currently under consideration with the Denison project team. It is noted that Section 4.2.1 of the draft EIS provides the variety of ways in which Denison has engaged with Interested Parties to date and it is assumed it would continue to use these means and others that may be identified to fulfil its key corporate principals for developing positive relationships (see draft EIS Section 4.2).</p> |
| 13 | BNDN (February 28, 2023) | Section 13.0 | <p>Comments #12, 14 and 15: BNDN is not included as a Local Study Area (LSA) Community despite being closer to the Project than other LSA Communities. The Project is situated on BNDN's ancestral lands. BNDN members currently and historically use the LSA for harvesting (commercial and personal) and ceremonial purposes.</p> <p>Without the LSA Community designation, BNDN members are less likely to be employed or trained through the Project. BNDN members are not entitled to priority training and employment provisions from Denison on the Project. Further, BNDN businesses and partnerships are not entitled to priority procurement provisions from Denison on the Project.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN must be identified as a LSA Community. BNDN members and businesses must be eligible for LSA priority status for employment, training, and contracting opportunities. The EIS should be revised accordingly. - A formal agreement between BNDN and Denison is required to outline socioeconomic offsetting measures and benefits should the Project move forward. This must include ways for BNDN businesses and member owned businesses to participate in the Project. Denison references a Human Resource Development Plan (HRDP) as a mitigation measure to ensure local and regional community members are hired in priority. However, Denison does not provide sufficient details to allow Birch to assess the adequacy of the HRDP. <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests the ability to review and comment on Denison's Human Resource Development Plan to provide input and recommendations to encourage community participation and employment in the Project. <p>See Section 4.2 for additional information on this topic (p. 19-23).</p> | <p>Spatial boundaries for the Economy VC were selected to reflect the geographic areas where economic impacts from the Project are likely to be detectable and measurable. These impacts are expected to be driven primarily by the relationship and interactions between the Project and the Communities of Interest ("COI"). Economic benefits surrounding Project employment (including income and training) are likely to be targeted toward the communities identified within the spatial boundaries. Economic impacts extending beyond the LSA are likely to be diffused and undetectable within the broader economy. The spatial boundaries were selected based on the consideration of communities where Project recruitment is likely to be prioritized, consideration of previous EAs conducted in the region, and consideration of information shared through key persons in the interview program. The LSA for the assessment of the economy includes the following communities: ERFN (including Indian Reserve Wapachewunak 192D and Indian Reserve La Plonge 192) and Patuanak, Northern Hamlet (Patuanak); Pinehouse Lake, Northern Village; and Beauval, Northern Village.</p> <p>Denison, through a Human Resource Development Plan, will initially prioritize Indigenous and non-Indigenous communities in the LSA in terms of employment and training opportunities (anticipated to be in institutions in northern Saskatchewan) and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project, which could include such items as on-the-job training and career counselling to help with advancement from foundational positions, advance sharing of job qualification requirements, clearly identifying training requirements and working with various training institutions to make sure such appropriate training is available, and creation of scholarship and support programs. Priority for employment and training will then focus on Indigenous and non-Indigenous residents of the RSA and then beyond the RSA.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|-----------------------|---|---|
| 14 | BNDN (February 28, 2023) | Section 12.0 and 13.0 | <p>Comment #13: There is no BNDN specific Indigenous Knowledge or socioeconomic data presented in the EIS.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - Denison must conduct Indigenous Knowledge and Community well-being Study (or similar) to gather BNDN specific information. These studies will allow for a more fulsome assessment of the Project on BNDN rights and interests. Additionally, BNDN specific data will enhance Denison's baseline data and help to inform mitigation and monitoring measures. <p>See Section 4.2 for additional information on this topic (p. 19-22).</p> | <p>Denison's engagement with BNDN is consistent with the identification of BNDN as an Indigenous Community who has expressed an interest in the Project. However, Denison understands this information from BNDN. As such, over the past year(s), Denison has met with BNDN and has respectfully requested further information from BNDN in respect to the land use activities to occurring in and around the Project, in order to more meaningfully understand the potential for adverse impacts to BNDN and therefore consider the potential for further studies and / or integration into the EIS of such information. Denison remains of the perspective that receipt of this information from BNDN is a necessary first step in this process, and has not received information in this regard to date.</p> <p>Spatial boundaries for the Economy VC were selected to reflect the geographic areas where economic impacts from the Project are likely to be detectable and measurable. These impacts are expected to be driven primarily by the relationship and interactions between the Project and the COI. Economic benefits surrounding Project employment (including income and training) are likely to be targeted toward the communities identified within the spatial boundaries. Economic impacts extending beyond the LSA are likely to be diffused and undetectable within the broader economy. The spatial boundaries were selected based on the consideration of communities where Project recruitment is likely to be prioritized, consideration of previous EAs conducted in the region, and consideration of information shared through key persons in the interview program. The LSA for the assessment of the economy includes the following communities: ERFN (including Indian Reserve Wapachewunak 192D and Indian Reserve La Plonge 192) and Patuanak, Northern Hamlet (Patuanak); Pinehouse Lake, Northern Village; and Beauval, Northern Village.</p> <p>The spatial boundaries selected for Community Well-being were chosen because they permit baseline characterization in sufficient detail to enable potential interactions between the Project and the well-being of the community. These boundaries were developed in consideration of where interactions are likely to occur. The spatial boundaries were derived based on the consideration of communities where Project recruitment is likely to be prioritized, consideration of previous EAs conducted in the region, and consideration of information shared through key persons in the interview program. The LSA for the Community Well-being VC includes ERFN (including Indian Reserves Wapachewunak 192D and La Plonge 192) and Patuanak, Northern Hamlet; Pinehouse Lake, Northern Village; and Beauval, Northern Village.</p> |
| 15 | BNDN (February 28, 2023) | Section 12.0 | <p>Comment #16: While EIS does consider the effects of population changes related to the Project on social adaptability, demand for services and housing, it does not address the full range of potential impacts associated with a transient workforce. Significant research has been conducted to demonstrate the negative impacts of remote workers and work camps on Indigenous women and girls. This must be considered in the EIS.</p> <p>The EIS must include an assessment of all potential effects of a transient workforce and changes to population dynamics, including those disproportionately experienced by Indigenous women and girls, and other segments of the population. This must incorporate findings of research like the 2017 study completed by Lake Babine Nation and Nak'azdli Whut'en (Indigenous Communities and Industrial Camps), and/or related research in the context of the LSA.</p> <p>See Section 4.2 for additional information on this topic (p. 19-21).</p> | <p>Both the construction and operation camps will operate on a fly-in/out basis, meaning the opportunities for interactions between the workforce and Indigenous communities are limited as workers will be transported by air directly to the site. Section 12.2.4.2.1 provides the actions to minimize the extent the Project contributes to in- and out- migration in the LSA, including:</p> <ul style="list-style-type: none"> • Denison will initially prioritize the COI in terms of employment opportunities and will work with the leadership of these communities to assist in determining hiring practices during all phases of the Project. Priority for hiring will then focus on Indigenous and non-Indigenous residents of the RSA and then beyond the RSA. • Employees will not be permitted to commute to the site by any means other than the fly-in/fly-out worker rotation systems (i.e., they cannot drive to the site). • Pick-up and drop-off points are being planned at two locally central points in communities within the LSA, at one additional site in Saskatchewan (i.e., Saskatoon), and potentially at other locations. • Housing for workers will be provided at the camps with free accommodations and meals. <p>Although difficult to predict, communities in the LSA are not expected to experience any substantial population growth or change in demographics as a result of the Project, particularly with mitigation measures identified. Although the potential exists for some individuals to return to the COI, it is anticipated that this would be difficult to discern from existing in-/out-migration rates. As population and demographics are not expected to experience any change as a result of the Project, this pathway will not be carried forward to the residual effects assessment.</p> |

| 18 | BNDN (February 28, 2023) | Appendix 9B Section 2.5.1 Appendix 8E Table 4 | <p>Comment #18: In several instances in the draft EIS Denison has noted that Indigenous Nations are concerned with the possibility of mercury contamination from mining operations. BNDN shares these concerns with other Indigenous Nations. Due to the very low concentrations of mercury present in the Phoenix deposit, Denison has not meaningfully studied the potential impacts the Project may have on altering mercury biogeochemistry in the downstream environment.</p> <p>BNDN notes that background mercury concentrations can be elevated in many unexpected and remote locations due to atmospheric deposition (often due to coal plants) (Jackson, 1997). BNDN is very concerned that Denison has not analyzed for mercury as part of their baseline soil geochemistry assessments for the Project, especially in wetlands downstream of the Project. Mercury concentrations in wetland soils are sensitive to changes in water chemistry that can</p> | <p>Although baseline concentrations of total mercury in sediment were not collected during the baseline program, Denison will collect background information pertaining to sediment total and methyl mercury from LSA lakes and rivers prior to site development.</p> <p>As indicated in draft EIS Section 8.4.6.1, Residual Effects Characterization, mercury is not associated with the local geology and is not expected to be released in the effluent at measurable levels and was therefore not identified as a COPC. Denison notes that there is potential for increased methylmercury production in the receiving environment under a certain combination of factors to which the Project may contribute; however, prediction of methylmercury production is not practical. Denison commits to monitoring mercury and methylmercury in the aquatic environment over the life of the Project to determine the potential</p> |

| | | | | |
|----|---|--|--|--|
| | | | <p>lead to increased mercury methylation. This is especially acute from increases in nutrients and sulphates which can active sulfate reducing microorganisms that methylate mercury (Liu, Li, & Cai, 2012). Table 4 of Appendix 8e shows that the effluent discharged to Whitefish Lake will have mercury concentrations almost 5,700 times background concentrations. This dramatic increase in sulfate loading to Whitefish Lake may not exceed water quality objectives unto itself but may be sufficient to meaningfully change mercury biogeochemistry in downstream wetlands.</p> <p>BNDN is very concerned with the complete lack of assessment and analysis of baseline mercury concentrations and the potential changes to mercury cycling that could be induced by the Project.</p> <p>Request/recommendation:</p> <p>a) BNDN requests that Denison undertake baseline studies of mercury concentrations in soils, with a focus on baseline concentrations of mercury in organic wetland soils downstream of the project. Note that mercury sampling should sample total mercury and methylmercury in all analyses, as well as porewater total mercury and methylmercury. The study design and implementation should be undertaken collaboratively with BNDN.</p> <p>b) BNDN recommends that the CNSC requires Denison to undertake a baseline assessment of mercury in soils (with a focus on wetlands) prior to construction of the Project. This may be established as a condition of approval for the Project.</p> <p>c) Depending on the findings of the baseline mercury in soils and wetlands studies, the CNSC should include a condition of approval on the Project that requires Denison to monitor mercury biogeochemistry in the receiving environment over the life of mine.</p> <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>changes in mercury concentrations in fish tissue over time. As the Project advances and operational monitoring is underway, Denison will assess health risks from fish consumption by comparing fish tissue data collected during operation from the monitoring program against Health Canada's mercury guideline of 0.5 ug/g wet weight. This is a human health risk-based maximum permissible concentration. Mercury data presented throughout the draft EIS represents total mercury. Denison agrees to include methylmercury as part of the constituents monitored in fish throughout all project phases.</p> <p>Engagement on licensing requirements, such as the development of the environmental monitoring program and the associated monitoring regime will occur to support Project permitting and licensing efforts.</p> <p>As the Project advances and operational monitoring is underway, Denison will assess health risks from fish consumption by comparing fish tissue data collected during operation from the monitoring program against applicable human health risk-based maximum permissible concentrations.</p> |
| 19 | BNDN (February 28, 2023) | Appendix 7C Section 3.5.6.2.1 Figures 7.6-10 and 7.6-11 | <p>Comment #19: Figure 7.6-10 and 7.6-11 of the draft EIS show the results of Denison's modelling of uranium mobility and adsorption from the ore body following the decommissioning of the mine. The figures show that the model indicates that all dissolved uranium will be effectively removed from solution within a short distance of the orebody via adsorption to clays present in the bedrock. In Section 3.5.6.2.1 of Appendix 7c of the draft EIS Denison notes that there is very limited literature available on uranium fate and transport, especially in similar environments to the Wheeler River Project. Denison's uranium speciation model relies almost entirely on a single academic article studying the partitioning of uranium in the alteration halo surrounding the Cigar Lake uranium deposit. Of very important note is that this paper is focused on the pre-mining environment at Cigar Lake and does not examine how uranium partitioning may be dramatically altered by ISR mining. Health Canada published a document on uranium in drinking water in 2017 literature review of uranium mobility, complexation and chemistry in groundwater which documents the widely varying behaviour of uranium in groundwater depending on redox conditions, pH, pressure, and other ions available for complexation which may increase or decrease uranium mobility (Health Canada, 2017).</p> <p>Uranium will be present in extremely high concentrations (100 mg/l) in the restoration solution. Many other anions and cations which uranium is known to form complexes with will also be present in the solution at very high concentrations. The limited literature upon which Denison has developed their models to predict uranium mobility post- decommissioning is insufficient to confidently assert that the very concentrated restoration solution will behave as predicted. Uranium is a common groundwater contaminant around the world and is known to be stable in dissolved forms in groundwater in many locations. Furthermore, some studies have indicated that the effectiveness of adsorption as a mechanism for attenuation of uranium in solution is significantly overstated, especially in environments where there is competition from other ions, as there will be in the restoration solution (Gandhi, Sampath, & Maliyekkal, 2022).</p> <p>BNDN is very concerned that Denison has portrayed their groundwater contamination model in Appendix 7c with an inappropriate level of confidence given the level of uncertainty reasonably inferred from the lack of foundational literature relevant to the circumstances at Wheeler River and the well- understood complexity of uranium fate and transport in groundwater. It is not impossible to imagine that surface water contamination could eventually occur, especially given the exceptionally high concentrations of uranium in the restoration solution. By consenting to the Wheeler River Project, BNDN is supporting a process that will be irreversible</p> | <p>Denison's engagement with BNDN is consistent with the identification of BNDN as an Indigenous Community who has expressed an interest in the Project. As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation (ERFN) and Kineepik Métis Local (KML) on details and updates to the decommissioning plan which includes mining area remediation plans and associated post-decommissioning modelling of groundwater from the remediated mining area, suited to each of their interests and needs. As part of these updates, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that updates to the decommissioning plan and groundwater modelling would also be relevant to other Indigenous nations who may have an interest in the Project. As such, Denison will not be developing a process agreement with the BNDN to address concerns raised about pertaining to long-term groundwater quality for the Wheeler River Project. This comment is also applicable to other comments where the same request was made by the BNDN. The balance of this response pertains to groundwater quality and the numerical groundwater model presented in draft EIS will focus on the technical content of the concerns raised.</p> <p>Denison's groundwater SME and author of the modelling report (Appendix 7C) acknowledges that the modelling report did not include a lengthy discussion of uranium speciation and mobility. However, the reactive transport modelling done using the PHREEC geochemical code was carefully informed by relevant literature, and was certainly not restricted to consideration of one study (Cigar Lake). In Section 3.5.3 of Appendix 7C we reference important studies pertaining to uranium complexation in solution by carbonate species (Guillaumont et al. 2003; Gorman-Lewis et al., 2008; Grenthe et al., 2020) and ternary complexes of uranium with calcium and magnesium and carbonates in solution (Dong and Brooks, 2006). These complexation reactions were added into the Project-specific PHREEQC database developed as part of the work presented in Appendix 7C. The database was updated to include solution-phase complexes of uranium in Guillaumont, 2003, which is a comprehensive summary of known reaction constants for uranium with dissolved-phase ligands. Further, the consideration of sorption of uranium-carbonate complexes to quartz, goethite and illite is shown in Appendix E of Appendix 7C, and relies on information from multiple publications. The reactive transport modelling was done using piChem (FELOW + PHREEQC) because of the ability of that approach to carefully consider speciation of uranium, and the potential interactions of uranium with other species in solution.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|--|--|--|
| | | | <p>once it commences and may be very difficult to manage should the underlying modeling assumption prove to be inaccurate by a significant margin. As a Nation whose members put a very high emphasis on the protection of groundwater resources, BNDN requires substantially greater reassurance through dialogue with Denison and further studies to have confidence that the Project will not irreparably degrade the natural environment in our Ancestral Lands.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - Denison must develop a process agreement with BNDN to work through our concerns related to long-term groundwater contamination from the Project. This process agreement would lay out the pathway to obtaining BNDN consent for the Project through providing our Nation with confidence that the groundwater and surface water near to the project will not be irreparably contaminated. The process agreement will include additional studies and consultation activities with BNDN that Denison must undertake. The satisfaction of all terms in the process agreement would be defined by the signing of a Project Agreement between Denison and BNDN. - BNDN recommends that Denison commit to funding bench-scale studies to validate the outputs from their FEFLOW and PHREEQC modelling. The bench-scale studies should be undertaken by an independent academic. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>The comment to which the BNDN refer in Section 3.5.6.2.1 of Appendix 7C is: "[t]o the best of our knowledge, there is very little information published about the solid-phase speciation of uranium and other constituents associated with ore bodies and the overlying and underlying rocks in the Athabasca basin". This is not speaking specifically to the speciation of uranium in the solid phase. Experimental work that provide information on solid-phase speciation include sequential extraction schemes and spectroscopic studies, such as recent work by Bayle et al., 2023 (https://pubmed.ncbi.nlm.nih.gov/37417589/). Research on the solid-phase speciation of uranium is not addressed in Health Canada (2017). As indicated, we were not able to find research pertaining to sequential extractions of spectroscopic studies of uranium in the solid phase for relevant materials/conditions. It is for this reason that we presented results of solid-phase uranium speciation in the available study by Percival 1989. It is acknowledged that this study was for Cigar Lake. The relevance of the work for the Wheeler River Project is high.</p> |
| 20 | BNDN (February 28, 2023) | Section 7.6.2.1 Appendix 7C Section 4.6 | <p>Comment #20: In Section 7.6.2.1 of the draft EIS, Denison mentions that they anticipate the outward migration of lixiviant as is observed at other ISR operations globally, and has incorporated their assumed concentrations of metals and the extent of area affected by flare from the ISR operations. Section 4.6 of Appendix 7c states that the flare zone is expected to extend 11 to 13 m but have modelled with a "conservative 50 m flare zone. It is not clear how Denison derived their assessment that the flare zone would extend 11 to 13 m and that a 50 m flare zone is considered conservative for the purposes of modelling. BNDN requires further information to have confidence that the design is as conservative as the Proponent has suggested.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that Denison provide further information on how the size of the area above the deposit affected by flare was calculated and how they determined that 50% restoration solution was determined as the appropriate concentration to base water quality modelling. This item would be best addressed and resolved with BNDN through the process agreement to address BNDN's concerns related to long term groundwater contamination from the Project. See Section 4.3 for additional information on this topic (p. 25-28). | <p>Groundwater modelling and flow path analysis calibrated to field conditions have evaluated upward solution migration and demonstrated that the maximum height that injected fluids will migrate upwards from the ore zone during active mining is likely between 11 to 13 m (Section 2 of the draft EIS). For conservatism, a 50-m vertical zone above the deposit was assumed to be potentially disturbed by mining activities. Denison specified 50m flare threshold based on their commitment to maintain inward hydraulic gradients, and or adding extraction wells as necessary to limit the migration of the flare.</p> <p>With the engineered controls described above, flare is not anticipated above 11-13 m. However, the decision was made to assume 50% of the restored solution uniformly between 15 and 50 m above the mineralized zone because there will be a natural gradient from 100% restored solution to 0% restored solution (i.e., baseline conditions) over this distance. The uncertainty associated with this decision was addressed in the uncertainty analysis presented in Section 4.7 of Appendix 7C, where 100% restored solution was assumed to be present over the entire 50 m height above the ore zone. The results of the model under both scenarios was consistent: no water quality effects above groundwater screening criteria, apart from those that reflect natural conditions, in Whitefish Lake.</p> <p>Over the life of the Project, groundwater quantity and quality monitoring activities will be completed to assess the performance of various components of the Project associated with engineering mining designs and performance and infrastructure designs to protect groundwater. A detailed Groundwater Monitoring Plan (GWMP) will be prepared to support licensing. The GWMP will include an Excursion Contingency Plan, and measures for adaptive management. The GWMP will be informed by the understanding of existing groundwater conditions at the Project Area (Appendix 7-A), the reactive transport modelling of groundwater COPCs associated with the restored mining area (Appendix 7-C), and the commitments made within the Geology and Groundwater section of the EIS.</p> <p>Please refer to the first part of Denison's response to BNDN comment #19 in regard to BNDN's suggestion of a process agreement.</p> |

|----|---|-----------------------------|---|---|
| 21 | BNDN (February 28, 2023) | Appendix 7C Section 3.2.2.1 | <p>Comment #21: Section 3.2.2.1 of Appendix 7C of the draft EIS describes the natural redox conditions in the ore zone as naturally reducing. The operation of the wellfield will result in the groundwater in the ore zone becoming oxidizing. Post decommissioning, the groundwater in the ore zone can be reasonably anticipated to return to baseline (reducing) redox conditions. BNDN notes that as redox conditions becoming increasingly reducing post closure, adsorption kinetics of contaminants adsorbed to clays could shift so that contaminants desorb from clays and are remobilized into solution. It is not clear to BNDN that the evolution of redox geochemistry and its implication on adsorption kinetics has been adequately considered by Denison.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests further information on how increasingly reducing groundwater conditions post decommissioning may impact adsorption kinetics of contaminants expected to adsorb to clays. <p>This item would be best addressed and resolved with BNDN through the process agreement to address BNDN's concerns related to long term groundwater contamination from the Project. See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>Solution-phase concentrations of metals and uranium are what influence the desorption of these elements from clays over time; but the BNDN is correct that there may be hysteresis, or a kinetic component to desorption to equilibrium conditions. Re-establishment of reducing redox conditions - primarily through scavenging of residual oxidant with pyrite - with progressive movement of natural groundwater through the mining area in the Decommissioning period is anticipated to result in concentrations of metals and uranium at baseline conditions because the same mineral phases as are present now are expected to control the solubility of those elements. Secondary minerals may influence concentrations for a small number of constituents. In all cases, concentrations of these elements will not exceed those assumed in the model.</p> <p>In the model as presented, desorption from clays was taken into account for protons that had sorbed to chlorite in the mining area as a sensitivity analysis. The desorption of protons did not have an adverse effect on the water quality in Whitefish Lake. See draft EIS Appendix 7-C Sections 3.5.6.4 and 4.7.</p> <p>Please refer to the first part of Denison's response to BNDN comment #19 in regard to BNDN's suggestion of a process agreement.</p> |
| 22 | BNDN (February 28, 2023) | Appendix 7C Section 3.4 | <p>Comment #22: In Section 3.4 of Appendix 7C Denison reports that they have excluded colloids from their post- decommissioning geochemical modelling. Denison has also noted that colloids would serve to enhance mobility of contaminants and they could precipitate out of solution. BNDN is concerned that by excluding the precipitation of colloids with adsorbed contaminants as a pathway for contaminant transport, Denison has significantly underestimated the mobility of contaminants and the consequent risks to the receiving environment.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that Denison prepare an additional geochemical model that considers the roles that colloids could potentially contribute to contaminant transport. The findings of this additional model (along with the other models) should be reviewed with BNDN. <p>This item would be best addressed and resolved with BNDN through the process agreement to address BNDN's concerns related to long term groundwater contamination from the Project. See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>The authors acknowledged in Appendix 7C the potential for transport of COPCs in association with colloids was possible, and used previous research in a highly relevant system (Cigar Lake) to make the professional judgement that this process would not significantly alter the results of the numerical model. Colloid transport is not included routinely in reactive transport modelling because of the difficulty in a) accurately measuring the colloidal fraction in groundwater under existing conditions as the basis for the numerous assumptions that would need to be made to include them in numerical modelling and b) the challenges with applying modelling approaches that have been developed at the scale of regional models (e.g., Molnar et al., https://www.pure.ed.ac.uk/ws/portalfiles/portalf/109261315/109261203_Molnar_PFV.pdf). Refinement of the mining area decommissioning objectives and associated modelling will be done as the Project progresses through updates to the Decommissioning Plan; nevertheless, the objectives as they may evolve will be bound by the objectives evaluated in the EIS, which as shown are protective of aquatic biota in Whitefish Lake. The final acceptable mining area decommissioning objectives will be developed prior to initiation of groundwater remediation, as part of the Detailed Decommissioning Plan (DDP). Prior to executing decommissioning activities, Denison shall prepare and submit the DDP to regulators for acceptance. In this case the DDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission and would also be informed by conditions on the ground at the site at that time, operational experience that has been gained and the regulatory landscape at that time. As is highlighted above, the decommissioning plan will evolve over time and the plan will become more refined as the Project advances.</p> <p>Please refer to the first part of Denison's response to BNDN comment #19 in regard to BNDN's suggestion of a process agreement.</p> |
| 23 | BNDN (February 28, 2023) | Appendix 7C Section 4.0 | <p>Comment #23: In Section 4.0 of Appendix 7c of the draft EIS, Denison reports that the composition of restoration solution 1 and restoration solution 2 were derived from metallurgical testing. While this is likely the best, BNDN notes that the initial solution used in the geochemical modelling is enormously consequential in the accuracy of the modelling and require further confirmation and confidence that the restoration solutions are accurate to within a reasonable margin of error for the geochemical modelling.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that Denison provide further information on how the chemistry in restoration solution 1 and restoration solution 2 were derived and any evidence they can provide that gives them confidence that these solutions are an accurate reflection of what will be observed in the wellfield. <p>This item would be best addressed and resolved with BNDN through the process agreement to address BNDN's concerns related to long term groundwater contamination from the Project. See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>Further information on how the chemistry in restoration solutions #1 and #2 were derived and evidence providing confidence that the reflect conditions that are expected in the mining area with remediation of the mining area is provided in the Denison Feasibility Report (2023) and a summary is attached as part of Denison's response to Federal Indigenous Review Team (FIRT) information requirement #67.</p> <p>Please refer to the first part of Denison's response to BNDN comment #19 in regard to BNDN's suggestion of a process agreement.</p> |

Wheeler River Project Draft EIS

| | | | | |
|----|---|---------------------------|---|--|
| 24 | BNDN (February 28, 2023) | Appendix 7C | <p>Comment #24: BNDN notes that Denison has not provided any discussion on the extent to which the lixiviant and the solution used to flush the wellfield at the end of operations will interact with the underlying paleo weathered bedrock. BNDN notes that it is possible that there are mineral phases within the paleo weathered bedrock that are also readily soluble when exposed to the lixiviant. While BNDN recognizes that the paleo weathered bedrock has a low permeability, it is unclear to BNDN as to whether the lixiviant will contribute to mobilization of contaminants from the paleo weathered bedrock that requires consideration in the post-decommissioning groundwater model.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that Denison provide any available information on how the bedrock may be altered (through dissolution of soluble mineral phases) by the lixiviant and the flushing of the wellfield during decommissioning, and whether this has been factored into their post-decommissioning groundwater model. <p>This item would be best addressed and resolved with BNDN through the process agreement to address BNDN's concerns related to long term groundwater contamination from the Project. See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>In the modelling presented in Appendix 7-C, the mining area is assumed to span the entirety of the depth of the paleoweathered zone within the area of the freeze wall, as described in Section 4.6. Thus, in the Decommissioning period, the water quality in that entire portion of the paleoweathered zone was assumed to be equivalent to that of the "restored solution". This reflects, as the BNDN notes, the dissolution of soluble minerals associated with the paleoweathered zone due to interaction with the mining solutions. This assumption is conservative because the whole of the paleoweathered zone does not have the uranium mineralization of the ore zone, nor the concentrations of other COPC-containing mineral phases.</p> <p>Some alteration of the clays is expected, as is some bleaching (loss of iron-rich minerals); however, there is uncertainty with respect to the specific changes in the nature of the paleoweathered zone that have continued to be explored by Denison through experimental/metallurgical work. The decision was made in the numeric modelling to treat the portion of the paleoweathered zone within the freeze as geochemically unreactive - meaning that no sorption to clays or desorption from clays (with the exception of chlorite in the "pH tail" scenario (Section 3.5.6.4) was assumed for this zone. Thus, sorption of COPCs to clays in the paleoweathered zone within the numeric model occurred only outside of the freeze wall footprint, where the minerals will not have been exposed to mining solutions and will not have been altered.</p> <p>Please refer to the first part of Denison's response to BNDN comment #19 in regard to BNDN's suggestion of a process agreement.</p> |
| 25 | BNDN (February 28, 2023) | Appendix 7C Section 5.2.2 | <p>Comment #25: In section 5.2.2 of Appendix 7c of the draft EIS Denison reports the assumptions built into their post- decommissioning groundwater modelling. BNDN notes that Denison has assumed that adsorption reaction sites are assumed to be available uniformly throughout the subsurface parameter zones. The presence of sufficient adsorption sites is a primary variable which determines the outcomes of the groundwater modelling, as adsorption of ions out of solution is the primary means by which contaminant transport is attenuated in Denison's modelling. BNDN is concerned that the presence of a variable that is so consequential to the findings of the model is based primarily on assumptions with limited information to base the assumptions upon.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that Denison provide justification for the assumption that adsorption sites will be uniformly available throughout the sub-surface parameter zones. BNDN requests that Denison provide information on how they estimated the extent to which adsorption sites are already saturated prior to mining. <p>This item would be best addressed and resolved with BNDN through the process agreement to address BNDN's concerns related to long term groundwater contamination from the Project. See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>We note the uncertainty assessment in the draft EIS tests conditions where less sorption sites are available (1/10th of the characterized amount). Further, refinement of the mining area decommissioning objectives and associated modelling will be done as the Project progresses through updates to the Decommissioning Plan; nevertheless, the objectives as they may evolve will be bound by the objectives evaluated in the EIS, which as shown are protective of aquatic biota in Whitefish Lake. The final acceptable mining area decommissioning objectives will be developed prior to initiation of groundwater remediation, as part of the Detailed Decommissioning Plan (DDP). Prior to executing decommissioning activities, Denison shall prepare and submit the DDP to regulators for acceptance. In this case the DDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission and would also be informed by conditions on the ground at the site at that time, operational experience that has been gained and the regulatory landscape at that time. As is highlighted above, the decommissioning plan will evolve over time and the plan will become more refined as the Project advances. Denison is committed to continue to engage with Indigenous Nations and communities to solicit input.</p> <p>Please refer to the first part of Denison's response to BNDN comment #19 in regard to BNDN's suggestion of a process agreement.</p> |
| 26 | BNDN (February 28, 2023) | Appendix 7C Table 3-10 | <p>Comment #26: Table 3-10 of Appendix 7c of the draft EIS shows the expected adsorbing mineral properties of the mineral phases to which contaminants are expected to adsorb out of solution. BNDN notes that the lixiviant and restoration solution could affect the ability of adsorption. In particular, the clays immediately surrounding the orebody are within the freeze wall and will be directly exposed to the lixiviant during operations, which may impact the clays ability to adsorb contaminants out of solution.</p> <p>BNDN notes that the clays immediately surrounding the orebody may be soluble in the presence of the lixiviant or may be altered to have a lower capacity to adsorb metals. BNDN requires further information from Denison to have confidence that the clay phases which play a crucial role in contaminant attenuation will not have their adsorptive capacity impacted by the operation of the wellfield.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that Denison provide available information on whether clay mineral phases are anticipated to dissolve through the ISR mining process, and whether the restoration solution will impact the ability of clays to effectively adsorb contaminants. <p>This item would be best addressed and resolved with BNDN through the process agreement to address BNDN's concerns related to long term groundwater contamination from the Project. See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>Please see Denison's response above to BNDN Comment #24. Sorbing phases including clays were excluded from the mining area in the numeric model. Sorption occurs only to materials outside of the mining area that are not exposed to, and thus no altered by interaction with the mining solutions.</p> <p>Please refer to the first part of Denison's response to BNDN comment #19 in regard to BNDN's suggestion of a process agreement.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|--------------------------------|--|--|
| 27 | BNDN (February 28, 2023) | Section 1.1.1 | <p>Comment #26: In Section 1.1.1 of the Draft EIS, Denison notes that “the Gryphon deposit is not amenable to ISR mining and, accordingly, is not included in the EIS”. Denison has previously reported that the Gryphon deposit has nearly as much uranium as the Phoenix deposit. While the Gryphon deposit is not amenable to ISR, it is potentially still an economic resource which Denison may wish to mine.</p> <p>While the Gryphon deposit is not in scope for this environmental assessment, BNDN expects to be kept informed of future potential mining activities on the Wheeler River Project which Denison may be considering, including additional exploration on the Property, as future activities on the Property will also have impacts on our Treaty and aboriginal rights and interests.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - Given the potential longer term mining activities at the Wheeler River project beyond the Phoenix deposit, BNDN requests that any project agreement between BNDN and Denison include terms for ongoing dialogue related to future exploration and project development activities at the Wheeler River Project and at all Denison Projects on BNDN Ancestral Lands. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | Denison acknowledges that, if development of the Gryphon deposit as an underground mine is proposed in the future, this would require additional regulatory review and approval as well as engagement with Indigenous Communities of Interest. Please also refer to the first part of Denison's response to BNDN comment #19 in regard to BNDN's suggestion of a process agreement. |
| 28 | BNDN (February 28, 2023) | Section 2.3.3.1.3 | <p>Comment #28: In Section 2.3.3.1.3 of the draft EIS Denison describes the proposed decontamination, demolition and disposal activities at the Project. BNDN notes that Denison has described a detailed process for decommissioning the injection and recovery wells but has not described how the freeze wells will be decommissioned. BNDN notes that the freeze well holes may serve as preferential pathways for contaminated groundwater movement. Given the proximity of freeze wells to the orebody and the number of freeze wells proposed to be drilled, proper closure of freeze wells is also important for protection water quality long term.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> a) BNDN request that Denison clarify the process by which they will decommission the freeze wells. b) BNDN requests that Denison decommission the freeze wells using the same process as is proposed for the decommissioning of the injection and recovery wells. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | The freeze holes will be decommissioned in the same manner as the ISR wellfield injection and recovery wells. All wells once decommissioned will undergo a mechanical integrity and leak off test prior to being grouted and sealed internally preventing interaction of surface water from the underlying aquifer at the mineralized depth. The freeze pipes, which will be located inside the freeze holes, will simply be unthreaded and removed from site after the freeze wall is no longer required. |
| 29 | BNDN (February 28, 2023) | Section 2.3.3.1.3 | <p>Comment #29: Denison describes the thawing of the freeze wall as part of the decommissioning of the mine. BNDN notes that water expands when frozen and could potentially be capable of expanding pre-existing joints and fractures within the host rock. BNDN is concerned that the thawing of the freeze wall could lead to expanded joints and fractures which would allow for far more rapid contaminant transport away from the ore body and restoration solution than is modelled in the post-decommissioning groundwater model.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN request that Denison provide evidence from academic literature or other mine sites employing freeze wall technology to determine the extent the freeze wall could expands joints and fractures within the rock once thawed, including at unconformities or other pre-existing structural weaknesses within the host rock. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | Please refer to the Attachment to IR-10 for information on the freeze wall integrity and basis for the design, which relies on site field data and lived experience from several existing Saskatchewan mining operations. |
| 30 | BNDN (February 28, 2023) | Figure 2.2-15 Section 2.2.3 | <p>Comment #30: Denison notes that they have made the conservative assumption that no water would be recycled as mining solution as part of their water balance calculations. BNDN agrees that this conservative assumption is appropriate for assessment of potential impacts of the Project. While this assumption is appropriate for the environmental assessment, BNDN wishes to understand the proportion of industrial wastewater that may be recycled on site and any commitments Denison is willing to make regarding continual refinement of the water treatment process to increase the proportion of water that is recycled.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> a) BNDN requests that Denison commit to continual refinement of the Industrial Waste Water Treatment Plant (IWWTP) treatment process to maximize the amount of water that is recycled to the deposit. b) BNDN recommends that the Crown include a condition of approval for the project regarding continual improvement of water treatment to maximize recycling. c) BNDN requests that Denison share available information on the proportion of water that they currently anticipate being able to recycle. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | The EIS carried forward two options for the source of freshwater: 1) surface water and 2) groundwater. This freshwater will meet all Project needs for potable water, drilling, and process water and allow Denison to obtain the water from groundwater wells or from the surface water (Whitefish lake). The effluent quality and volume predictions in the EIS provide a bounding scenario of the basis of the assessment of Project effects. Denison is undertaking a sequential EA and licensing process under the Nuclear Safety and Control Act. For context, the EA process for a Project under CEAA 2012 and the Saskatchewan Environmental Assessment Act is long and complex. As such, the inputs and outputs (including IWWTP water recycle volumes and effluent quality) developed for the IWWTP were necessary and determined by Denison's Project engineers early in the EA process to allow for the EIS biophysical and human assessments to advance. Detailed design information on the IWWTP, including recycle volumes, were not available, which is standard for engineering and EA sequencing for major projects. Denison intends to continue to refine effluent quality and volume predictions as part of the BATEA assessment and licensing phase of the Project. The predictions provided in the EIS will continue to bound the assessment, and provide a conservative representation of risk to human health and the environment. Further, more detailed information regarding the design and operation of the IWWTP and water management infrastructure (including discharge rates, recycle rates among many other things), as informed in part by the BATEA assessment, will be included with |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|----------------------------------|---|--|
| | | | | Denison's application for the license to operate which will provide opportunity for review and comment by Interested Parties. For reference, the IWWTP would be commissioned prior to the Operation phase as no discharge of treated effluent would occur until that time. |
| 31 | BNDN (February 28, 2023) | Figure 2.2-15 Section 2.2.3.2 | <p>Comment #31: In Section 2.2.3.2 and Figure 2.2-15 of the draft EIS, Denison describes their water balance for the project and anticipated water needs to operate the ISR wellfield. BNDN notes that the EIS does not describe how Denison derived their estimate for the quantity of water required to operate the ISR wellfield. BNDN is concerned that the volume of water required to operate the wellfield may be substantially greater than is estimated in the draft EIS. Utilizing greater volumes of water in the wellfield would have cascading effects throughout the water balance, including greater demand on the IWWTP, greater storage volumes required in the process water storage pond, greater UBS holding pond capacity and greater volumes of effluent discharge to Whitefish Lake. BNDN is concerned with the potential cascading risks associated with an inaccurate assessment of the volume of water required to operate the ISR wellfield. BNDN also wishes to understand whether it is possible that Denison will be required to operate the wellfields at a higher pressure, even if only temporarily. BNDN notes that operating wells at higher pressure come with additional workplace and environmental hazards, especially when dealing with a strongly acidic lixiviant.</p> <p>Request/recommendation:</p> <p>a) To demonstrate that Denison has not significantly underestimated the volume of water required to operate the wellfield, BNDN requests that Denison provide evidence that the volume of water required to operate the wellfield is accurate. This should include an assessment of their level of confidence they have in their estimated water consumption.</p> <p>b) BNDN requests that Denison provide BNDN with information on potential contingency measures (such as constructing additional process water pond capacity) should their estimated water consumption be underestimated</p> <p>c) Denison must commit to updating their mixing zone assessment should they find it necessary to discharge greater quantities of effluent to Whitefish Lake than is estimated in the draft EIS.</p> <p>d) Denison must document the implications of operating the wellfield at a substantially higher pressure than currently expected.</p> <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>a) Based on Denison's site-specific drilling, development, and pumping requirements over several years of exploration activities, the wellfield drilling water estimates presented in the EIS water balances are achievable. Denison's recently released feasibility study reaffirms the EIS assumptions related to water use and water recycle abilities.</p> <p>b) A key aspect of Denison's management system will be ongoing evaluation of the Project's performance compared to EIS predictions as well as continual improvement and adaptive management, as required. Should water consumption needs fall below those outlined in the EIS, Denison will follow all required permitting, licensing, and engagement with Indigenous nations and communities to describe and assess what those contingency measures would be.</p> <p>c) The near-field analysis (Section 8.2.4.2.3) identified that under all flow regime scenarios (i.e., 7Q10, monthly low, and monthly average), constituents are expected to be well mixed within Whitefish Lake (LA-5) and below the most restrictive criteria for the protection of aquatic life (Table 8.2-10; Appendix 8-C and Appendix 8-D). Additionally, the extent of the mixing zone in Whitefish Lake is estimated to be less than 5 m under all flow scenarios assessed (Table 8.2-11). Denison will comply with the Water Security Agency's Guidelines for Effluent Mixing Zones and Denison would update modeling if the base assumptions associated with the discharge of treated effluent to Whitefish Lake were changed, as needed.</p> <p>d) Wellfield pressures were described in the draft EIS, Sections 2.2.1.4.2 and 2.2.1.4.3. In terms of pressures, ISR mining is planned at nominal pressures of 100 psi and intermittent pressures of up to 250 psi.</p> |
| 32 | BNDN (February 28, 2023) | Table 2.3-3 | <p>Comment #32: Table 2.3-3 of the draft EIS shows Denison's proposed mining area decommissioning objectives, which are the groundwater quality objectives for the residual water in the ore zone following the flushing of the system during mine decommissioning. BNDN is surprised to see that relatively high concentrations of metals are expected to remain in the restoration solution as a final objective, such as 100 mg/l uranium and 2 mg/l cobalt, amongst many other metals.</p> <p>BNDN notes that potential risks to groundwater and surface water could be dramatically reduced through more stringent mining area decommissioning objectives. It is also feasible that processing efficiencies and high uranium prices may allow for substantially lower concentrations of uranium to be mined economically. The long-term contamination of groundwater from the high concentration of metals in the restoration solution is one of BNDN's primary concerns with the Wheeler River Project, and BNDN would strongly prefer that Denison strive to minimize the residual contamination remaining in groundwater following decommissioning to the greatest extent possible.</p> <p>Request/recommendation:</p> <p>a) BNDN requests that Denison provide documentation that estimates the time, efforts and costs associated with reducing concentrations of metals in the restoration solution by 1 order of magnitude and 2 orders of magnitude. Note that these calculations should include costs that could be recovered by processing subeconomic UBS.</p> <p>b) BNDN requests that Denison work with BNDN through terms defined in a BNDN project</p> | <p>Groundwater remediation targets provided in the draft EIS were derived from metallurgical test results completed from 2017 to 2021 with over 125 kg of material recovered from Phoenix deposit that underwent leaching and neutralization test work (see response to IR-67). In 2022 and 2023, metallurgical test work continued to further optimize remediation and strategies and confirm test work results presented in the draft EIS. It is expected that metallurgical test work will continue in the future to further optimize remediation targets, and this will be advanced through updates to the Decommissioning Plan. The Feasibility Field Test (FFT) provided additional confirmation that pH target and remediation targets could be met. Data gathered during the neutralization phase of the FFT provide confidence that groundwater targets proposed in the draft EIS can be met technically and economically. Based on laboratory testing and the results of the 2022 field testing, subsurface remediation is planned to consist of rinsing the ore zone with 35 pore volumes of fresh water, slowly raising the pH and then pumping about 75 pore volumes of basic solution through the same portion of the ore zone. This basic solution will in effect further raise the pH to a level that impedes further leaching of the deposit and reduces aqueous concentrations of contaminants of concern to below their environmental target levels.</p> <p>Refinement of the mining area decommissioning objectives and associated modelling will be done as the Project progresses through updates to the Decommissioning Plan; nevertheless, the objectives as they may evolve will be bound by the objectives evaluated in the EIS, which as shown are protective of aquatic biota in Whitefish Lake. The final mining area decommissioning</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|------------------------------------|---|---|
| | | | <p>agreement to establish achievable decommissioning objectives that would be satisfactory to BNDN.</p> <p>c) BNDN requests that the Crown place a condition of approval upon the Wheeler River Project that Denison is required to work with BNDN to establish mutually agreeable mining area decommissioning objectives.</p> <p>d) BNDN requests that Denison undertake a study of ISR operations elsewhere in the world to determine the lowest concentrations of UBS that could be processed economically utilizing industry best practices and commit to exceeding global standards.</p> <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>objectives will be developed prior to initiation of groundwater remediation as part of the Detailed Decommissioning Plan (DDP). Prior to executing decommissioning activities, Denison shall prepare and submit the DDP to regulators for approval. The DDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission and would also be informed by conditions on the ground at the site at that time, operational experience that has been gained and the regulatory landscape at that time. As is highlighted above, the decommissioning plan will evolve over time and the plan will become more refined as the Project advances.</p> <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. Denison does not anticipate separate funding for BNDN at this time.</p> |
| 33 | BNDN (February 28, 2023) | Section 2.2.2.2.2 Figure 2.2-18 | <p>Comment #33: In Figure 2.2-18 of the draft EIS, Denison shows the proposed design of the double composite liner system for the ponds on site and the uranium bearing solution (UBS) holding area. BNDN notes that the risks associated with temporary storage of UBS is much greater than other contact water on site which is proposed to be stored in a similar means. As such, BNDN is concerned that the proposed UBS holding area does not have adequate leak detection given the additional risk associated with the UBS relative to contact water on site. BNDN also notes that open air storage of UBS presents the risk of incidental interactions with wildlife near to the project (such as birds), which would potentially be acutely toxic. BNDN is also concerned that there is no leak detection system below the secondary HDPE geomembrane and geosynthetic clay liner. Should the secondary containment layers also become compromised, Denison does not have a system planned to detect this.</p> <p>Request/recommendation:</p> <p>a) BNDN requests that Denison commit to storing UBS in appropriate tanks as opposed to open air storage.</p> <p>b) BNDN requests that Denison include a leak detection pipe in the prepared subgrade below the secondary containment as well as between the primary and secondary containment layers. BNDN also requests that the prepared subgrade be engineered to facilitate maximum utility of the leak detection below the secondary containment.</p> <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>As outlined in draft EIS Section 2.2.2.2.2, Denison will evaluate options to use tanks instead of holding area as engineering advances. It is also important to note that Denison is completing a sequential EA and licensing process for the Project (see draft EIS Section 1). Denison considers the EA to be a planning and decision-making tool that assesses the potential effects of the Project in a careful and precautionary manner and integrates results of engagement with Indigenous nations and communities. The details requested by BNDN will be developed to support licensing and will be included in Management System programs / plans including for example the Groundwater Monitoring Plan and the Emergency Response and Preparedness Plan.</p> |
| 34 | BNDN (February 28, 2023) | Figure 2.3-1 | <p>Comment #34: Denison shows an additional ore body to the Southwest of Phase 5. Denison has not included this additional ore body in the mine plan in the draft EIS and has not discussed whether they have intentions to mine this ore body or undertaking a project change at a later date to include this additional ore body.</p> <p>It is unclear whether this additional ore body has any implications for the long term groundwater quality modelling either through the additional orebody altering anticipated groundwater chemistry, or the restoration solution dissolving metals in the additional orebody increasing overall metal loading. Given the probable difference in groundwater and mineral geochemistry in the additional orebody relative to the overlying sandstone and underlying basement rock, there is likely to be interaction between the restored solution and the additional orebody post-closure.</p> <p>Request/recommendation:</p> <p>a) BNDN requests that Denison clarify whether they are considering adding the additional orebody to the southwest of Phase 5 into the mine plan, including clarifying whether the additional ore body is amenable to ISR mining.</p> <p>b) BNDN requests that Denison clarify what the anticipated permitting associated with the additional ore body would be.</p> <p>c) BNDN requests that the post- decommissioning groundwater modelling for the Project include interactions between the additional ore body and the restoration solution to understand if the ore body poses a risk of additional metal loading to groundwater.</p> <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>a) and b) The small deposit to the SW of Phase 5 is amendable to ISR, but is of lower grade than the areas targeted in mining phases 1 through 5 and mining of that low grade areas is not being considered at this time. It is noted that The Project mining and milling capacity will be bound by the assumptions in the EIS, which includes a production rate higher than the current reserves. The Project would be reviewed to determine what if any changes to the design basis would be anticipated and then what permitting would be required, should additional mining beyond what is contemplate by the EA be considered in the future.</p> <p>c) The additional modelling recommended by the review comment is unnecessary at this time. The low grade area is not considered in the mine plan at this time. Should that change, as noted above, the Project would be reviewed to determine what if any changes to the design basis would be anticipated and then what permitting would be required. Such modeling as envisioned by the review comment would be done that time as may be required. Hydrogeological investigations have been ongoing in the field and in laboratories since 2014. Packer, open hole, and cross hole tests have been completed in conjunction with exploration drilling programs. As well, permeability tests have been completed on sections of available competent core within the Phoenix deposit. Open hole water level surveys have been completed across the site in 2015, 2017, 2021 and 2022. Data gathered during the field tests have been utilized for both the EA groundwater model as well as the mining model. The primary direction of groundwater flow at depth is to the north east, which means restored solutions will move away from the small deposit to the SW. Additionally, as noted in the response to BNDN Comment #32, the restored solution will be basic and will further raise the pH to a level that impedes further leaching of the</p> |

| | | | | |
|----|---|------------------------------------|--|--|
| | | | | deposit and reduces aqueous concentrations of contaminants of concern to below their environmental target levels. |
| 35 | BNDN (February 28, 2023) | Section 2.2.1.3 Section 7.6.2.1 | <p>Comment #35: Denison intends to use a freeze wall as tertiary containment for the operation of the wellfield during operations. In general BNDN is supportive of this containment measure but requires further information to have confidence that the freeze walls will operate as designed. In particular, BNDN notes that while the freeze wall will be continuous from the ground surface all the way into the basement rocks underlying the orebody, the freeze wall is by far the most consequential immediately around the ore body itself. The orebody is approximately 400 m below the ground surface (where the earth would be significantly warmer) and the lixiviant is expected to be at least 10 degrees warmer than the surrounding groundwater would be. Considering that the cold brine will need to be injected nearly half a kilometer into the earth where warm lixiviant will be injected into the wellfield, BNDN is concerned that the freeze wall may be ineffective in and around the ore body where it is required. Furthermore BNDN is concerned that the monitoring system for assessing the stability of the freeze wall may not adequately detect the continuity of the freeze wall at depth. As such, BNDN is concerned that the freeze wall may be ineffective and in fact obscure our ability to recognize contamination of the surrounding groundwater from the freeze wall operating ineffectively.</p> <p>Request/recommendation:</p> <p>a) BNDN requests that Denison provide information to demonstrate that the freeze wall will in fact be frozen in and around the ore body. If there is any doubt that the freeze wall will indeed be frozen around the ore body, Denison should describe further measures they can undertake to ensure that the freeze wall is frozen as intended around the ore body.</p> <p>b) Denison must provide BNDN with further information on how they will monitor the performance and continuity of the freeze wall.</p> <p>c) BNDN requests further information on the proposed groundwater monitoring program around the wellfield.</p> <p>d) BNDN requests the opportunity to review the groundwater monitoring plan and to review groundwater monitoring data as part of a BNDN-Denison environmental committee developed through a BNDN-Denison project agreement.</p> <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>a) Please refer to the Attachment to IR-10 for information on the freeze wall integrity and basis for the design, which relies on site field data and lived experience from several existing Saskatchewan mining operations.</p> <p>b) The following explains how the continuous freeze wall will be monitored. The alignment of the freeze wall is located 25 m offset from the lateral extent of the recoverable ore and the freeze wall will grow in thickness both towards the ore and away from the ore. The freeze wall will solidify all liquid porewater and develop into a contiguous impermeable barrier many metres thick. Ground temperature monitoring will be installed through a series of continuous fiberoptic temperature and pressure wells from surface to the depth of impermeable basement rock below the unconformity. Such monitoring wells/systems will be installed on both the ore (inside) and non-ore (outside) sides of the freeze wall to confirm the thickness of frozen ground. There will be sufficient operational controls in place to verify that the freeze plant is operating, to measure the temperature in the ore zone, and to measure the temperature on opposite sides (inside and outside) of the freeze wall so that early detection of any upset conditions can be identified and addressed. Options for addressing issues include: lowering the temperature of the freeze system to draw more heat out; increasing the freeze coolant flow rates in freeze wells nearer to active ISR cells; and/or to adaptively manage the lixiviant injection and recovery rates in cells located nearest to the freeze wall.</p> <p>c) Regarding the monitoring program: A framework for the groundwater monitoring plan was provided in Section 7.8.2 of the draft EIS and is commensurate with the level of development of the Project. Further details regarding the Environmental Management Program and its associated plans (of which the groundwater monitoring plan is one) will be developed later in 2023 and 2024 as part of the licensing process. Engagement on licensing requirements, including on program and plan documentation will occur at that time.</p> <p>d) As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on monitoring regimes, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project, such as BNDN. Denison does not anticipate separate funding for BNDN at this time.</p> |
| 36 | BNDN (February 28, 2023) | Section 2.9.1.3.1 | <p>Comment #36: Denison documents their conceptual level environmental protection program, including several proposed management and monitoring plans which they will develop to manage operations on site.</p> <p>The environmental protection measures which Denison undertakes at the Project site are highly consequential to BNDN, and BNDN requires the opportunity to provide our knowledge and input into environmental protection measures developed for activities within our Ancestral Lands.</p> <p>Request/recommendation:</p> <p>a) BNDN requests that Denison commit to involving BNDN in the development, review and approval of all environmental monitoring plans developed for the Project. Details of BNDN involvement in the development of environmental monitoring plans should be undertaken within an Environmental Committee, with specific terms defined within a BNDN-Denison Project Agreement for the Wheeler River Project</p> <p>b) BNDN requests that the CNSC impose a condition of approval on the project which states</p> | <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. Denison does not anticipate separate funding for BNDN at this time.</p> <p>BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|-----------------|---|---|
| | | | <p>the requirement for Denison to consult with BNDN on all environmental management and monitoring plans for the project.</p> <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> <p>The details of monitoring and follow-up plans are being developed to support the separate process of Project licensing and permitting. The specific means by which provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program, are currently under consideration with the Denison project team. It is noted that Section 4.2.1 of the draft EIS provides the variety of ways in which Denison has engaged with Interested Parties to date and it is assumed it would continue to use these means and others that may be identified to fulfil its key corporate principals for developing positive relationships (see draft EIS Section 4.2).</p> |
| 37 | BNDN (February 28, 2023) | Section 7.6.2.3 | <p>Comment #37: In Section 7.6.2.3 of the draft EIS and the geology and groundwater summary table in Appendix 16A, Denison states that they expect no residual effects to groundwater quality during the operations, decommissioning or future centuries period of the Project. Denison has also not placed a significance determination on the impacts to groundwater quality based on the findings of the draft EIS due to groundwater being considered an intermediate VC. BNDN disagrees with both the residual effects assessment and the fact that groundwater quality has been assessed solely as an intermediate VC. The protection of groundwater resources is highly important to BNDN. Our members place immense value on clean spring water and the protection of groundwater more generally. The advancement of the Wheeler River Project will permanently impair groundwater resources in and around the Wheeler River Project. The contamination of groundwater at the Project will have a significant impact on our members' connection to the land and ability to exercise our Treaty and Aboriginal rights. BNDN see the limited interpretation of residual effects and the lack of inclusion of groundwater quality as a receptor VC as a significant oversight in the assessment of impacts of the Project on the environment and BNDN Treaty and Aboriginal rights. This must be corrected to properly assess the Project and thus ensure that project impacts are appropriately mitigated and accommodated.</p> <p>Request/recommendation:</p> <p>a) Denison must apply a significant determination to groundwater quality and quantity for all projects phases, including the future centuries period. The significance determination must be developed following consultation and engagement with BNDN.</p> <p>b) Denison must re-evaluate the residual effects of the project on groundwater quality including the future centuries period. This re-evaluation must be following consultation and engagement with BNDN.</p> <p>c) BNDN requests that the CNSC work with our Nation to understand the significant impacts that the permanent contamination of groundwater caused by the project will have on our Treaty and Aboriginal rights.</p> <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>The Groundwater Quality VC was carried through the EIS as an intermediate VC. The shallow and deeper groundwaters are not considered to be a potable water source currently nor in the future within the LSA (defined in Section 7.1.3.1), as detailed in Section 7.1.1.1. Within the LSA, the Groundwater VC was considered an intermediate VC as it is a pathway to the aquatic environment and considered in the future centuries period in Section 8. It is also important to note that the mining area is 400 m below surface and the existing/baseline groundwater quality in the ore zone area is poor (e.g., high in iron and uranium compared to shallower groundwater; Figure 7.3-11). Section 7.6 describes the residual effects evaluation for geology and groundwater, including for the life of mine (0 to 38 years) and the future centuries period. It is Denison's opinion that the approach associated with evaluating Project effects to groundwater quality is appropriate and reasonable for the reasons presented in the draft EIS.</p> <p>Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a community specific monitoring regime, suited to each of their interests and needs, in an agreed-upon fashion. One of the key goals of such collaboration with each Indigenous nation will be to provide the information necessary to the communities such that it provides confidence to community members regarding the impacts from the Project to the aspects of the environment which matter the most to them. Denison is committed to continual improvement in relation to such collaborative monitoring programs, in order to adapt to areas of interest which can change over time. It is expected that the data collected through such monitoring regimes would also be relevant to other Indigenous First Nations who may have interest in the Project.</p> <p>The details of monitoring and follow-up plans are being developed to support the separate process of Project licensing and permitting. The specific means by which provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program, are currently under consideration with the Denison project team. It is noted that Section 4.2.1 of the draft EIS provides the variety of ways in which Denison has engaged with Interested Parties to date and it is assumed it would continue to use these means and others that may be identified to fulfil its key corporate principals for developing positive relationships (see draft EIS Section 4.2).</p> |
| 38 | BNDN (February 28, 2023) | Section 7.8.2 | <p>Comment #38: Section 7.8.2 of the draft EIS documents the groundwater monitoring proposed for the surface facilities and the ISR recovery area. It also describes a conceptual excursion contingency plan wherein Denison has proposed their plans to manage situations where groundwater contamination occurs beyond what is predicted in the EIS. BNDN notes that Section 7.8.2 lacks information on the involvement of Indigenous Nations related to groundwater monitoring.</p> <p>As stated previously, BNDN is highly concerned with the level of impact the Project will have on groundwater resources. As such BNDN requires Denison to communicate excursions of groundwater and the consequent management of excursions to our Nation.</p> <p>Request/recommendation:</p> <p>a) BNDN requests that Denison revise Section 7.8.2 to include Indigenous engagement and input for groundwater monitoring results and the management of observed groundwater excursions. The manner in which Denison engages BNDN on groundwater monitoring and management will likely occur through an Environmental Committee, which should be defined in a BNDN-Denison Project Agreement.</p> <p>b) BNDN requests that the CNSC impose a condition of approval on the Project that clarifies</p> | <p>Denison agrees with BNDN's comment that groundwater monitoring will be an important component of the Project as it advances.</p> <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|---------------------|---|---|
| | | | that Denison is required to engage with impacted Indigenous Nations such as BNDN on groundwater monitoring and management. See Section 4.3 for additional information on this topic (p. 25-28). [Additional questions on this topic directed to regulators or government entities are included in the CNSC table] | The details of monitoring and follow-up plans are being developed to support the separate process of Project licensing and permitting. The specific means by which provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program, are currently under consideration with the Denison project team. It is noted that Section 4.2.1 of the draft EIS provides the variety of ways in which Denison has engaged with Interested Parties to date and it is assumed it would continue to use these means and others that may be identified to fulfil its key corporate principals for developing positive relationships (see draft EIS Section 4.2). |
| 39 | BNDN (February 28, 2023) | Appendix 8D | Comment #39: In Appendix 8d, Denison documents their baseline aquatic studies undertaken for the Wheeler River EIS. Denison has included some lakes and rivers upstream of the Project as background sites for understanding project impacts to the aquatic environment. BNDN notes that there are many additional sites throughout our Ancestral Lands which would benefit from ongoing aquatic monitoring and would be potentially suitable for the Project as background sampling sites. Request/recommendation: - BNDN requests that Denison work with our Nation to identify potential additional background sampling sites within our Ancestral Lands for aquatic monitoring for the life of Project. The details of such should be defined in the BNDN-Denison project agreement. See Section 4.3 for additional information on this topic (p. 25-28). | Denison appreciates and acknowledges the recommendation. At this time Denison believes suitable candidate reference areas are available upstream of the Project site in areas located in the same drainage system / watershed. While proximity to the Project is only one of many considerations for suitable reference area selection in this case the ability to be able to compare relevant measurement endpoints between "reference" vs "potentially influence" sampling locations where the primary difference between locations is the point source discharge is compelling rationale. Additionally, data that have been collected from upstream areas as part of baseline programs provides the opportunity to implement aquatic monitoring according to a Before After Control Impact (BACI) design, that will provide the ability to monitor change temporally (among sampling periods) and spatially (among sampling areas), thereby providing a more robust means by which to assess potential mine related effects, which is a powerful means by which to assess and isolate potential mine related effects from natural environmental change. Given the above, Denison does not see that there is rationale for investigating lakes over a regional extent to establish reference areas for aquatic monitoring as is suggested. |
| 40 | BNDN (February 28, 2023) | Section 2.2.1.4.2 | Comment #40: In Section 2.2.1.4.2 of the Draft EIS Denison discusses the operation of the wellfield during the operations phase of the mine. BNDN notes that many of the details in this section are conceptual in nature and thus could require significant refinements in design to achieve the desired recovery consistently throughout the life of mine. Amongst other concerns related to operations of the ISR wellfield, BNDN is concerned that Denison may alter the chemical composition of the lixiviant used in the ISR wellfield which could cause inadequately understood changes in potential effects of the Project to the environment. These effects could include significant changes to the final restorative solution at the end of mine life or significant changes in the treatment requirements for the IWWTP that impact the ability of Denison to achieve effluent quality criteria for significant periods of time. Request/recommendation: a) BNDN requests that Denison provide information on: - The likelihood of the chemical composition of the lixiviant changing throughout the life of project - Potential changes to the lixiviant composition - The implications for long term groundwater quality and effluent treatment from changes in lixiviant chemistry b) BNDN requests that Denison commit to ongoing communications and engagement with BNDN regarding changes to the wellfield operation throughout the life of mine. The terms of engagement should be defined in a BNDN-Denison project Agreement. See Section 4.3 for additional information on this topic (p. 25-28). | a) It is important to note that Denison is completing a sequential EA and licensing process for the Project (see draft EIS Section 1). Detailed ISR mining-related information needed to support licensing and permitting has not been included in the EIS; it will be provided to regulators as part of permitting and licensing. For the EIS, an initial understanding of the mine plan and mining area remediation was needed to initiate the assessment of migration of constituents of potential concern in groundwater out of this area in the post-decommissioning period. The findings and conclusions of the EIS were also used, in turn, to inform and bound the engineering and feasibility work. As part of the metallurgical test program, over 125kg of core from the Phoenix deposit has been leached in a variety of settings, including bottle rolls, column tests, and intact core tests. This has helped to predict concentrations of both the lixiviant as well as the production solutions. The lixiviant (mining solution) concentrations will vary depending on each individual well production profile. To ensure reagent consumption is effective and efficient it will be varied during the life of each well dependent on its characteristics. The initial acidification of the well requires a lower acid content to ensure the formation does not plug due to precipitation, whereas during periods of high production the well can accept a higher acid concentration. Towards the end of the recovery curve, the uranium is more difficult to access and therefore the strength of the acid or the flow rate to the well need to be optimized to ensure efficient use of reagents. It is expected that the lixiviant concentrations will vary between 0-60 g/L H2SO4, and 0-20g/L H2O2 and will be situationally dependent. There is also the capability to add Fe2(SO4)3, however it is not expected that this will be required in significant concentration due to the natural abundance of iron in the deposit. b) Please see response to Comment #19 for Denison's response on a Project agreement. |
| 41 | BNDN (February 28, 2023) | Appendix 8E Table 4 | Comment #41: Table 4 of Appendix 8e of the draft EIS shows the predicted site discharge concentrations of the contaminants of potential concern (COPCs). BNDN notes that the concentrations of a number of COPCs do not achieve water quality objectives that is the best available technology economically achievable (BATEA). Example COPCs include copper, molybdenum, selenium, uranium, vanadium, zinc and ammonia. BNDN requires proponents operating on our Ancestral Lands to, at a minimum, achieve BATEA standards for effluent treatment and discharge. This takes reasonable and appropriate precaution without imposing unreasonable costs on the operation. Request/recommendation: a) BNDN requests that Denison commit to achieving BATEA criteria for all COPCs in their effluent. | a) Denison is undertaking a sequential EA and licensing process under the NSCA. For context, the EA process for a Project under CEAA 2012 and the Saskatchewan Environmental Assessment Act is long and complex. As such, the inputs and outputs (e.g., effluent quality) needed for the EIS were developed by Denison's Project engineers early in the EA process to allow for the biophysical and human assessments to advance. An example of one of these outputs is the IWWTP effluent quality. The effluent quality predictions in the EIS provide a bounding scenario of the basis of the assessment of Project effects. As stated in the Draft REGDOC 2.9.2 Denison understands that a BATEA assessment be conducted to determine the predicted design release characteristics as part of the licence application for a new facility or activity. Outside of the EIS process, the Project detailed engineering is progressing, including the design of the IWWTP and associated refinement of effluent quality predictions. Denison is |

Wheeler River Project Draft EIS

| | | | | |
|----|---|---------------------|--|---|
| | | | <p>b) Denison must work with BNDN to identify mutually agreeable and appropriate effluent discharge criteria for their effluent. BNDN expects that identifying suitable effluent discharge criteria will be undertaken through an Environmental Committee with a terms of reference defined in a BNDN-Denison project agreement</p> <p>c) BNDN requests that the CNSC impose a condition of approval on the Project that BNDN is engaged.</p> <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>following Draft REGDOC 2.9.2 to arrive at a treatment option that remains within the bounds of the EA, which ultimately predicts no significant impacts to the receiving environment. The maximum design release characteristics for the IWWTP will be provided as part of Denison's licence application to the CNSC.</p> <p>b) As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to engagement with English River First Nation and Kineepik Métis Local as it relates to effluent discharge criteria, suited to each of their interests and needs. Denison does not anticipate working closely with BNDN on this topic.</p> |
| 42 | BNDN (February 28, 2023) | Appendix 8E Table 7 | <p>Comment #42: Table 7 of draft EIS Appendix 8e shows the anticipated size of the mixing zone under 3 different flow conditions, including the calculated 7Q10 flow. While BNDN understands that Denison expects to discharge relatively small volumes of effluent to Whitefish Lake compared to a conventional open pit or underground mining operation, BNDN is concerned that the mixing zone assessment underestimates the magnitude of impact that the project will have on Whitefish Lake.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that Denison undertake a plume delineation study and provide BNDN the opportunity to review the findings of the study through the BNDN-Denison Environmental Committee for the Wheeler River Project. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>The prediction uncertainty analysis (i.e., "sensitivity analysis") presented in Appendix 7-C included an evaluation of the change in the model prediction (i.e., plume migration) with respect to changes in the conductivity of materials along the flow path to the receptor, Whitefish Lake (i.e., Scenarios 4, 5, and 6) as well as regarding the hydraulic conductivity of the mined-out ore zone. As such we feel that the work requested by the reviewer has already been completed and reported upon within the draft EIS. In addition, the uncertainty of the Intermediate Sandstone Aquifer was evaluated (see IR55), where higher hydraulic conductivity within the Intermediate Sandstone Aquifer were found to reduce the proportion of water from the ore zone reaching Whitefish Lake, which would have the effect of further reducing (i.e., diluting) concentrations simulated and presented in the EIS documentation. As such, the conditions documented in the draft EIS are already conservative with respect to the uncertainty in these parameters. The near-field analysis (Section 8.2.4.2.3) identified that under all flow regime scenarios (i.e., 7Q10, monthly low, and monthly average), constituents are expected to be well mixed within Whitefish Lake (LA-5) and below the most restrictive criteria for the protection of aquatic life (Table 8.2-10; Appendix 8-C and Appendix 8-D). Additionally, the extent of the mixing zone in Whitefish Lake is estimated to be less than 5 m under all flow scenarios assessed (Table 8.2-11). Denison will comply with the Water Security Agency's Guidelines for Effluent Mixing Zones.</p> <p>The above notwithstanding in-field confirmation of the extent of the effluent mixing zone is anticipated following commissioning of the IWWTP and effluent discharge system during the Operation phase of the Project.</p> <p>As a result of the continued technical review until October 2024, Denison will conduct a sensitivity analysis of low flows and high flows to assess how low and high flows may change under future climate conditions and the potential implications on water quality predictions made during the EA phase.</p> <p>As a result of the continued technical review until October 2024, Denison has made the commitment that the final diffuser configuration will not change the environmental assessment conclusions of risk to aquatic receptors and that the water quality will remain below guideline</p> |
| 43 | BNDN (February 28, 2023) | Appendix 10A | <p>Comment #43: BNDN notes that the environmental risk assessment (draft EIS Appendix 10a) makes no mention of potential impacts the project may have on mercury biogeochemical cycling and the consequent risks to the environment and human health. This is unsurprising given the lack of baseline sampling of mercury in sediments and soils, especially wetland soils. The lack of baseline sampling of mercury is a significant oversight given the significant impact that mining operations can have on mercury biogeochemistry, including mercury methylation, and mobility of mercury species within the environment.</p> <p>BNDN is very concerned with the complete lack of assessment of this important consideration for the project and the consequent inability for our members to adequately understand the potential risks to our Treaty and Aboriginal rights from these risks. Note that the absence of baseline information gathered can be reasonably considered an impact on our Treaty and Aboriginal rights as our members will avoid exercising our rights if BNDN lack the information to have confidence that it is safe to do so.</p> | <p>Although baseline concentrations of total mercury in sediment have not been collected during baseline sampling to date, Denison will collect background information pertaining to sediment total and methyl mercury from LSA lakes and rivers prior to site development.</p> <p>As indicated in EIS Section 8.4.6.1, Residual Effects Characterization, mercury is not associated with the local geology and is not expected to be released in the effluent at measurable levels and was therefore not identified as a COPC. Denison notes that there is potential for increased methylmercury production in the receiving environment under a certain combination of factors to which the Project may contribute; however, prediction of methylmercury production is not practical. Denison commits to monitoring mercury and methylmercury in the aquatic environment over the life of the Project to determine the potential changes in mercury concentrations in fish tissue over time.</p> <p>As the Project advances and operational monitoring is underway, Denison will assess health risks from fish consumption by comparing fish tissue data collected during operation from the monitoring program against Health Canada's mercury guideline of 0.5 ug/g wet weight. This is a human health risk-based maximum permissible concentration. Mercury data presented</p> |

| | | | | <p>throughout the draft EIS represents total mercury. Denison agrees to included methylmercury as part of the constituents monitored in fish throughout all project phases.</p> <p>As the Project advances and operational monitoring is underway, Denison will assess health risks from fish consumption by comparing fish tissue data collected during operation from the monitoring program against applicable human health risk-based maximum permissible concentrations.</p> |
| 44 | BNDN (February 28, 2023) | Table 2.2-4 | <p>Comment #44: In Table 2.2-4 of the Draft EIS, Denison documents their planned chemical used for the project. BNDN notes that Denison intends to use zero-valent iron (ZVI) in the IWWTP, but not as part of the remediation solution for the mine. BNDN notes that ZVI is used to treat contaminants in groundwater around the world. Denison has not discussed whether they have investigated the possibility of utilizing ZVI to remediate the wellfield during decommissioning. Protection of groundwater is of exceptional importance to BNDN. BNDN is concerned that Denison has not made a complete or comprehensive effort to understand how to minimize negative impacts to groundwater from the project using proven technologies that may be suitable for remediating the restoration solution in the wellfield during the decommissioning phase of the mine.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that Denison investigate the suitability of using zero-valent iron to remediate the groundwater within the wellfield as part of the decommissioning process. <p>See Section 4.3 for additional information on this topic (p. 25-28).</p> | <p>Refinement of the mining area decommissioning objectives and associated modelling will be done through updates to the Decommissioning Plan, and will be bounded by the objectives evaluated in the EIS. The use of zero-valent iron will be evaluated, as applicable.</p> |
| 45 | BNDN (February 28, 2023) | 8.2.4.1.1 Site Water Management | <p>Comment #45: BNDN is concerned that the small volume of Effluent Monitoring and Release Ponds may create a lack of operational flexibility. For example, in the EIS, it is stated that: "Treated water from the IWWTP will be pumped to the three Effluent Monitoring and Release Ponds (each 3,300 m3). These ponds will be designed to hold effluent for 72 hours for testing before discharge to the environment." – EIS, pp 723</p> <p>If water quality in these ponds exceeds discharge criteria then there may be a need to store water so that additional treatment and monitoring can occur prior to discharge. However, only having capacity for three days of storage means it is unlikely the Proponent would be able to adequately treat water prior to reaching storage capacity, resulting in a need for emergency release of poor- quality water.</p> <p>Request/recommendation:</p> <p>a) BNDN requests that additional storage capacity be included as part of the design for water management system. This must include adequate storage capacity to ensure Denison has the ability to retain water for sufficient time to allow treatment, in the event that exceedances of water quality discharge criteria occur. Alternatively, Denison can commit to halting discharge (and operations if required) should water quality exceed discharge criteria. Discharge into Whitefish Lake would resume once water quality in the Effluent Monitoring and Release Ponds has been returned to below discharge criteria.</p> <p>b) BNDN requests that the CNSC impose a condition of approval for the Project that requires Denison to must meet effluent discharge criteria prior to discharge and must halt operations if treated effluent in the monitoring and release ponds does not meet effluent discharge criteria. See Section 4.4 for additional information on this topic (p. 48-51).</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>a) During Construction, no effluent is expected to be released to the aquatic environment. Contact water stored in the Clean Waste Rock Pond during Construction will be held onsite until the Industrial Wastewater Treatment Plant (IWWTP) is commissioned. At that time the water from the pond would be conveyed to the IWWTP, treated, and released to Whitefish Lake per permit / license requirements. The sequence for Construction activities will occur in a logical manner based on Project execution plans. For example, construction of the wellfield runoff pond will be prioritized during the early part of Construction and it will able to hold 38,200 m3 of water. This will provide contingency and additional water storage capacity if contact water produced exceeds estimates or the volume available in the Clean Waste Rock Pond. Other secondary contingency measures are also available should the volume of water requiring management exceed site infrastructure storage volume. This could include use a hydrovac for offsite disposal.</p> <p>Section 2 Project Description, Section 2.2.3.9 Treated Effluent Monitoring and Release Ponds of the draft EIS outlines Denison's commitment to test effluent prior to discharge to Whitefish Lake, to ensure it meets federal and provincial discharge limits. Any pond not meeting the criteria will be recycled back to the Industrial Wastewater Treatment Plant via the process water pond.</p> <p>b) Denison expects the Provincial Approval to Operate a Pollutant Control Facility will contain specific effluent quality limits and monitoring to confirm effluent quality meets the approved limits. Denison will also be required to meet conditions in CNSC licensing documentation, as well as MDMER effluent discharge criteria.</p> |
| 46 | BNDN (February 28, 2023) | Appendix 8D Aquatic Environment Baseline Study | <p>Comment #46: Fish community sampling is an important component of baseline studies for many reasons, including identifying species present (including any species at risk) and evaluating relative abundance (e.g. CPUE). A robust program should include multi- season and multi-year approach. This allows improved characterization of seasonal habitat use and accounts for natural variability.</p> <p>In the baseline aquatic assessments, the Proponent has focused fish community sampling in fall 2016, with some limited additional sampling of in spring 2017. This low level of effort will make it difficult to draw meaningful comparisons with monitoring work that will occur during the life of mine.</p> <p>Furthermore, CPUE has only been reported for electrofishing effort. As a result, there is very</p> | <p>It is Denison's and their aquatic SME's opinion that the baseline fish community sampling efforts, including information provide from Indigenous and local resource users, provide a sufficient basis for conducting an effects assessment (draft EIS Section 8.3 Fish and Fish Habitat). Based on the information collected there is a good understanding of fish species presence / absence, relative abundance, fish habitat characteristics including areas that contribute to important life history stages (e.g., spawning areas) and fish habitat use. Denison does not believe further extensive baseline collection are needed to support the environmental assessment process but will implement targeted aquatic surveys prior to site development (see below).</p> |

| | | | | |
|----|---|---------------------------|--|--|
| | | | <p>limited information available for relative abundance of fish in important waterbodies, including Whitefish Lake, McGowan Lake, and Russell Lake.</p> <p>**BNDN notes that a raw representation of total effort is provided in table A-13 of Appendix 8D but requests that an assessment of total effort, total catch, and CPUE be presented in the EIS for each capture method/location**</p> <p>Request/recommendation:</p> <p>a) BNDN requests that the Proponent build on the existing data for fish community sampling by collecting an additional round of spring and fall sampling.</p> <p>b) BNDN requests that an assessment of total effort, total catch, and CPUE be provided for each capture method/location where fish sampling has occurred.</p> <p>See Section 4.4 for additional information on this topic (p. 48-51).</p> | <p>With respect to inclusion of the additional information requested the following is noted. Both detailed and summary data are presented in the Baseline Aquatic Environment Report that was provided as an appendix to the draft EIS. Effort and catch by sampling gear type by sampling location are shown for example in Table A-13 of the Baseline Aquatic Environment Report and metrics such as CPUE and total catches can be derived from these data if desired. Denison does not see the need to derive these metrics for presentation in the final version of the EIS (and supporting documents). This is in part related to the fact that the aquatic effects assessment did use abundance / relative abundance metrics such as CPUE as measurable parameters (MPs; a parameter or metric associated with a key indicator that can be used to detect and measure Project-related changes) to represent the fish and fish habitat VC, nor would it have been practical to use them for this purpose. There would be no practical or reliable way to derive such a prediction of change relative to Protect-aquatic habitat interactions.</p> <p>While abundance / relative abundance metrics may be reported during future monitoring they would not likely be seen as a key measurable parameters for fish monitoring. More subtle measures of fish health would be used for this purpose - it is reasonable to assume that fish health measures will be more sensitive to change than abundance measures and provide an earlier indication of potential Project-related effects. This is what is envisioned and required by the MDMER EEM program, whereby measures of fish health (e.g., growth, reproduction, condition) are used to assess potential effects. As noted above, Denison will implement targeted aquatic surveys prior to site development. At this time it is envisioned that a pre-development EEM program survey following guidance provided in the Metal Mining Technical Guidance Document will be implemented at the site, with sampling at future effluent exposed and reference areas. Best practice is to undertake an analysis of candidate reference areas using the existing baseline information and investigate their utility as controls prior to project development. Execution of the pre-development EEM represents a Before-After-Control-Impact (BACI) design for aquatic monitoring, that will provide the ability to monitor change temporally (among sampling periods) and spatially (among sampling areas), thereby providing a more robust means by which to assess potential mine related effects.</p> |
| 47 | BNDN (February 28, 2023) | 8.2.5 Mitigation Measures | <p>Comment #47: The Proponent has identified one mitigation measure that includes sharing of monitoring results to assess performance of water management system (EIS, pp 8-90, 8.2.5 Mitigation Measures). BNDN is supportive of this type of information sharing and believes that it can be an important component of transparency and trust- building between the Proponent and other parties. However, it is important that information sharing be done in a way that is accessible to community members.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests involvement in discussions with Denison about sharing of information related to water quality monitoring (and environmental monitoring more broadly). Some methods of communication that may support accessibility of data include: <ul style="list-style-type: none"> o Public-facing summary reports on a regular schedule (e.g. quarterly or annually) o Real-time access to environmental monitoring data through online database portals. o Semi-regular community meetings hosted in Turnor Lake (e.g. every 12-18 months, as decided in conjunction with BNDN leadership within a Project Agreement with BNDN). o Presentations to BNDN staff, leadership, and/or community members by BNDN Environmental Monitors. The specific methods used for information sharing and appropriate levels of support from Denison can be determined through consultation with BNDN. <p>See Section 4.4 for additional information on this topic (p. 48-51).</p> | <p>Denison agrees with BNDN that water quality monitoring will be interest to Indigenous nations and communities. As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes would also be relevant to other Indigenous nations who may have interest in the Project. BNDN will be informed throughout the monitoring program design and implementation process. Further details on the Public Information Program and Public Disclosure will form part of the documentation submitted in support of the CNSC licensing for the Project. It is also noted for further reference that there are existing, non-Denison monitoring programs such as the CNSC's Independent Environmental Monitoring Program (https://nuclearsafety.gc.ca/eng/resources/maps-of-nuclear-facilities/iemp/index.cfm), and the Eastern Athabasca Regional Monitoring Program (www.earmmp.ca/). Results from these programs provide relevant information and can complement Denison's Project-specific monitoring program. One forum for discussion of monitoring results is the Northern Saskatchewan Environmental Quality Committee(https://www.saskatchewan.ca/residents/first-nations-citizens/saskatchewan-first-nationsmetis-and-northern-initiatives/northern-saskatchewan-environmental-quality-committee).</p> <p>Please see response to Comment #19 for Denison's response on a Project agreement.</p> |

Results from these programs provide relevant information and can complement Denison's Project-specific monitoring program. One forum for discussion of monitoring results is the Northern Saskatchewan Environmental Quality Committee(https://www.saskatchewan.ca/residents/first-nations-citizens/saskatchewan-first-nationsmetis-and-northern-initiatives/northern-saskatchewan-environmental-quality-committee).</p> <p>Please see response to Comment #19 for Denison's response on a Project agreement.</p> |
| 49 | BNDN (February 28, 2023) | 8.3 Fish and Fish Habitat | <p>Comment #49: Increased fishing pressure in Whitefish Lake from employees working at the Project site and increased ability for visitors due to improved access could negatively impact fish populations.</p> <p>Preferred species, large-bodied fish, and older individuals are most likely to be targeted. This may have negative consequences on the population structure of fish in the lake as well as the ability of BNDN members to exercise fishing rights.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN recommends that the policies Denison sets related to staff and contractors fishing while on site are determined collaboratively with BNDN through the Environmental Committee defined in a BNDN-Denison project agreement. <p>See Section 4.4 for additional information on this topic (p. 48-51).</p> | <p>Please note that the Project will not change public access to the area. The existing gate on Highway 914 near Cameco's Key Lake Operation will remain in place and no changes to the gate and the process for controlling access to Highway 914 north of the Key Lake Operation are proposed as part of the Wheeler River Project. As described in the draft EIS, workforce members will be transported to/from site via a fly-in/fly-out rotation and will, therefore, not use ground travel options during shift changes, which will eliminate fishing on local lakes during commutes to/from the site and during time off work. Denison site vehicles will not be available for recreational purposes. While at the Project site and off duty, workers may opt to fish local waterbodies. To protect sustainable use of resources, only catch and release of fish will be encouraged, and fish storage or cooking facilities will not be provided. To prevent entry of land users from entering the Project Area, Denison will control access to the property with both a north and south security gate. Overall, given a lack of resources to access fishing locations and store fish harvests, workforce fishing is expected to cause minimal disturbances to local users. Section 11 of the draft EIS provides the assessment of potential Project effects on Indigenous Land and Resource Use (Section 11.1) and Other Land and Resource Use (Section 11.2). The mitigation measures proposed in the aquatic and terrestrial assessments translated into undetectable changes in resource availability to existing and future users and rightsholders. The assessment does not take a distinctions based approach (i.e., the potential impact on each Indigenous community is not evaluated separately), but rather on the key indicators and associated measurable parameters. Mitigation to eliminate, reduce, or control potential adverse effects of the Project on Indigenous Land and Resource Use would apply to any uses proximal to the Project. Given proven mitigation is to be applied to traffic disturbances, noise, air quality, and increased competition for resources, the effects are expected to be minimal. As outlined in Denison's Indigenous Peoples Policy, Denison is committed to respecting Indigenous knowledge and values regarding environmental stewardship and Indigenous peoples' connection to the land, and to minimize potential effects, wherever possible.</p> <p>Detailed Project plans and programs related to staff and contractor fishing will be developed to support Project permitting and licensing efforts.</p> |

| 50 | BNDN (February 28, 2023) | 8.3.4 Assessment of Project- related Effects | <p>Comment #50: The EIS provides very few details regarding how spills, leaks, and other accidents and malfunctions will be managed to mitigate the impacts on fish and fish habitat. Over the life of the mine there will inevitably be accidents and malfunctions. One of the most common environmental issues that will be encountered is leaks and spills. These can typically be managed through good monitoring and preparedness, though if they occur near water, the ability to clean them quickly is difficult and can result in harm to aquatic communities. Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN request additional information regarding the development of spill prevention programs, emergency management procedures, and monitoring and remediation programs for accidents and malfunctions. Representatives from BNDN need to be included in the planning and execution of monitoring and remediation activities to provide community perspectives in Project activities. One method through which BNDN can be involved in these discussions is through the development of an Environmental Committee (see comment #51 also). See Section 4.4 for additional information on this topic (p. 48-51). | <p>A standalone Accidents and Malfunctions (A&M) assessment was completed and is summarized in Section 14 of the EIS (full report is Appendix 14-A of the EIS). The A&M assessment considered almost 70 accident scenarios including many that would relate to the unplanned release of chemicals and radiation to the environment with potential to effect country foods. Specific scenarios including the release of chemicals and radiation to the aquatic environment and to the terrestrial environment adjacent to the ERFN and KML culture camps located along Hwy 914. The overall risks in consideration of likelihood and consequence were characterized as low. The assessment concluded that with planned engineering / environmental design features, mitigation measures, and emergency response, as well as implementing industry best practices that the risks to the environment from accidents and malfunctions can be reduced to levels that are as low as reasonably practical.</p> <p>Section 2.9.1.3 of the draft EIS provides Denison's commitment to develop an Environmental Management System, which includes an Emergency Preparedness and Response Program (EPRP) and an Environmental Protection Program (EPP; including an Environmental Monitoring Plan). The EPRP would be established to identify how the Project will prepare for and addresses emergencies that may affect the health and safety of persons, the environment, and the protection of property. The EPRP would be developed in a manner that aligns with guidance provided by CNSC in REGDOC-2.10.1. The EPP would be established to provide an overarching framework for key environmental monitoring and management plans and to ensure a means to demonstrate compliance with applicable environmental regulatory requirements and other performance targets that Denison may set. As noted on the draft EIS, Denison has opted to execute the overall Project approvals process - that is, the environmental assessment and licensing / permitting processes - in series and not simultaneously. As such, the details of these programs and plans will be developed during the licensing / permitting phase and will be available for review at that time rather than as part of the final EIS. The level of information provided in the draft EIS is appropriate for the current stage of the Project approvals process.</p> <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. Denison does not anticipate any funding to BNDN at this time. BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: programs will meet regulatory requirements, programs will confirm the effectiveness of mitigation measures and predictions made in the assessment, programs will be implemented in an adaptive management framework (if/where applicable) to reduce effects during the lifetime of the Project, and program spatial boundaries will be sufficiently extensive to measure EIS predictions.</p> |
| 51 | BNDN (February 28, 2023) | 8.3.8 Monitoring and Follow-up | <p>Comment #51: There is no discussion on how Indigenous communities, such as BNDN, will be included in environmental management, emergency management, monitoring, and remediation. This includes issues related to ongoing permitting or specific remediation such as in the case of an accident or malfunction. Request/recommendation:</p> <ul style="list-style-type: none"> - To support BNDN's ongoing participation in monitoring and oversight of the Project, BNDN request the establishment of an Environmental Committee or similar oversight mechanism. The purpose of the committee will be to review monitoring data and monitoring reports produced during the life-of-mine to ensure that the environmental protection is sufficient for all VCs. The committee can also participate in permitting throughout the life-of-mine for all relevant applications (e.g. Fisheries Act Authorizations, water permits, Closure Plan updates etc.) and provide input to management plans (e.g. EPPs, Surface Water Management Plan, Environmental Monitoring Plans, etc.). The specific details of such a committee can be developed through consultation with BNDN and must be formalized through a BNDN-Denison project agreement. See Section 4.4 for additional information on this topic (p. 48-51). | <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. Denison does not anticipate separate funding for BNDN at this time.</p> <p>BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |

Wheeler River Project Draft EIS

| | | | | |
|----|---|---------------------------|---|---|
| | | | | <p>The details of monitoring and follow-up plans are being developed to support the separate process of Project licensing and permitting. The specific means by which provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program, are currently under consideration with the Denison project team. It is noted that Section 4.2.1 of the draft EIS provides the variety of ways in which Denison has engaged with Interested Parties to date and it is assumed it would continue to use these means and others that may be identified to fulfil its key corporate principals for developing positive relationships (see draft EIS Section 4.2).</p> |
| 52 | BNDN (February 28, 2023) | 8.3.5 Mitigation Measures | <p>Comment #52: Mitigation measures are an important component of Project management which are critical for environmental protection. Upon review of the suggested mitigation measures, BNDN has identified some opportunities for additional mitigation.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN request that the following standard mitigation measures be included as part of the list described in Section 8.3.5: <ul style="list-style-type: none"> o Maintain vegetated buffers of at least 100m with all waterbodies wherever practical; o All equipment must be inspected prior to use on-site to ensure that they are clean and free of soil or other contaminants; o Maintain spill kits on all vehicles used on-site; o All machinery will be kept in good working order and inspected regularly for drips, leaks, and spills; o In the event of a spill, Denison will take all necessary actions, where it is safe to do so, to immediately stop the spill, contain contaminants, clean up and dispose of contaminated materials; o Denison will maintain a record of all spills and report upon each spill within 48 hours, including information on spill response, cleanup, and remediation; o Vehicle refueling will occur at a distance of at least 100m; o Fuel tanks will be located in areas that are lined and contained; o Fuel tanks will be located at least 500m from known waterbodies. <p>See Section 4.4 for additional information on this topic (p. 48-51).</p> | <p>Denison acknowledges the input and will consider the suggestions as the project moves forward. The draft EIS contains a number of mitigations referenced in different biophysical and human environment assessments; these mitigations together form Denison's fulsome commitment list of Project mitigation measures moving forward. Many of the proposed additional mitigation measures are already included in the draft EIS. A few examples are provided here:</p> <ul style="list-style-type: none"> - Section 2.2.7.6: No fuels, oils, or other hazardous substances will be stored within 100 m of any water body. No equipment maintenance or re-fuelling will be conducted within 100 m of a water body. - Section 2.8: Fuel storage and distribution infrastructure will be constructed in accordance with applicable legislation requirements; Fuels will be stored in approved, above-ground, double-walled storage tank(s) equipped with secondary containment in accordance with provincial regulations and standards; Stationary and mobile equipment will be fueled with a fuel-dispensing truck. - Section 9.2.5.2.7: Standard operating procedures will be employed, and regular inspections of equipment and machinery will be completed to verify they are in good working order; Vehicles and equipment will be maintained in good working condition (e.g., no leaks) and furnished with industry-standard spill response kits. <p>Denison also notes that Section 2.9.1.3 of the draft EIS provides Denison's commitment to develop an Environmental Management System, which includes an Emergency Preparedness and Response Program (EPRP) and an Environmental Protection Program (EPP; including an Environmental Monitoring Plan). The EPRP would be established to identify how the Project will prepare for and addresses emergencies that may affect the health and safety of persons, the environment, and the protection of property. The EPRP would be developed in a manner that aligns with guidance provided by CNSC in REGDOC-2.10.1. The EPP would be established to provide an overarching framework for key environmental monitoring and management plans and to ensure a means to demonstrate compliance with applicable environmental regulatory requirements and other performance targets that Denison may set. As noted on the draft EIS, Denison has opted to execute the overall Project approvals process - that is, the environmental assessment and licensing / permitting processes - in series and not simultaneously. A such, the details of these programs and plans will be developed during the licensing / permitting phase and will be available for review at that time rather than as part of the final EIS. The level of information provided in the draft EIS is appropriate for the current stage of the Project approvals process.</p> <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. Denison does not anticipate any funding to BNDN at this time. BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |

Wheeler River Project Draft EIS

| | | | | |
|----|---|---------------------------------|--|---|
| 53 | BNDN (February 28, 2023) | 8.3 Fish and Fish Habitat | <p>Comment #53: Unfortunately, due to the nature of planning and licensing for complex projects such as the Wheeler River mine, there are many documents, plans, licenses and approvals which may not be available for review during the environmental assessment process or which will take place subsequent to completion of the assessment. For example, Denison will be preparing important documentation governing environmental management of the Project following the Environmental Assessment. While these are not currently available, there is a need to engage with BNDN to obtain input on these documents as planning progresses.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that Denison consult with our staff members and advisors on important environmental documentation/plans/licenses that are not available as part of the EA process. <p>This list includes, but is not limited to:</p> <ul style="list-style-type: none"> o Surface Water Management Program o Erosion and Sediment Control Plan o Fish Salvage Plan o Spill Response Plan o MDMER approvals and EEM plans o Saskatchewan Water Security Agency permits for o Aquatic habitat protection o Operating a waterworks o Operating a sewage works o Effluent Monitoring Plan o Environmental Monitoring Plan(s) o Decommissioning and Reclamation Plan <p>Engagement with BNDN on these plans should occur through an Environmental Committee or similar oversight mechanism (see above). The specific details of such a committee can be developed through consultation with BNDN and must be formalized through a BNDN- Denison project agreement for the Wheeler River Project.</p> <p>See Section 4.4 for additional information on this topic (p. 48-51).</p> | <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. Denison does not anticipate separate funding for BNDN at this time.</p> <p>BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> <p>The details of monitoring and follow-up plans are being developed to support the separate process of Project licensing and permitting. It is noted that Section 4.2.1 of the draft EIS provides the variety of ways in which Denison has engaged with Interested Parties to date and it is assumed it would continue to use these means and others that may be identified to fulfil its key corporate principals for developing positive relationships (see draft EIS Section 4.2).</p> |
| 54 | BNDN (February 28, 2023) | 8.4.3.1 Methodology and Metrics | <p>Comment #54: The collection of sediment samples was completed using cores and grab petit Ponar in three upstream reference locations (LA-7A, LA-8, and LA-9), Whitefish Lake (LA-5 and LA-6), McGowan Lake (LA-1), and Russell Lake (LAB-1 and LAB-2). Sediment quality testing was conducted to characterize COPC including nutrients, metals, and radionuclides.</p> <p>Only the top 2 cm of cores of grab samples were analyzed in the lab. It is not clear in the methodology why laboratory analysis was limited to the top 2 cm.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests additional information on the rationale for only analyzing COPC within the top 2 cm of sediment samples. This should include information on whether this limited data will negatively affect the ability to evaluate potential impacts of groundwater contamination entering Whitefish Lake from below during operations, decommissioning, and future centuries. <p>See Section 4.4 for additional information on this topic (p. 48-51).</p> | <p>Baseline sediment chemistry was conducted on the 0-2cm horizon as this is the area in contact with surface water and the zone inhabited by benthic invertebrates. It is also the sediment layer in which changes in sediment chemistry would be expected to change in response to Project-related inputs and thus provides the most appropriate data for comparison to follow-up monitoring.</p> <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project.</p> <p>BNDN will be informed throughout the monitoring program design and implementation process. | | | | | |
|----|---|--|---|---|
| 55 | BNDN (February 28, 2023) | 8.4.3.2.3 Metals | <p>Comment #55: Despite significant concerns regarding the presence of mercury in water and sediment, the Proponent has elected not to test sediments for it. BNDN acknowledges that the mining process does not use mercury and it is present in low levels in the background environment. However, for the purposes of good stewardship, communications, and trust, having an assessment of the background levels of mercury is important to BNDN.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that the proponent sample sediments for mercury to establish background levels. This is information that is culturally important given the potential harm and the psychological toll of mercury in aquatic ecosystems. Background levels can then be compared with ongoing monitoring throughout the life of mine. <p>See Section 4.4 for additional information on this topic (p. 48-51).</p> | Denison will collect background information pertaining to sediment total and methyl mercury from LSA lakes and rivers prior to site development. |
| 56 | BNDN (February 28, 2023) | Table 8.5-2: Baseline Fish Tissue Chemistry Summary | <p>Comment #56: In Section 8.5 Fish Health, the Proponent has included a summary table with information on contaminants in fish tissue and bone tissue. The information provided does not include total number of samples.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests table 8.5-2 be updated with information on total number of fish (n) samples for each location. <p>See Section 4.4 for additional information on this topic (p. 48-51).</p> | The requested information is presented in Appendix 8-D in the draft EIS. |
| 57 | BNDN (February 28, 2023) | 9.2.5.2 Additional Vegetation- specific Mitigation Measures | <p>Comment #57: The Proponent has committed to using seed that is certified weed-free, with a valid "Certificate of Seed Analysis" for the revegetation process.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN recommends that, in addition to using weed-free certified seeds, consultation occur with Indigenous communities, including BNDN, to select an appropriate seed mix that closely mimics the pre- construction plant community and includes plants of medicinal and traditional importance. This could be done by either sourcing seed mix from a local seed distributor, or using wild seed propagated from plants collected from the Project Area. In addition, the seed mix should contain native plant species only. <p>See Section 4.5 for additional information on this topic (p. 59-60).</p> | <p>Specific details of the seed mixture and overall reclamation plan will be developed through updates to the Decommissioning Plan, on which Interested Parties will be provided opportunity for review and input. The decommission plan in the EIS is a conceptual plan. A preliminary decommissioning plan will be included with licence application and reviewed and updated during operations. Prior to executing Decommissioning activities, Denison shall prepare and submit a detailed decommissioning plan to regulators for acceptance, which builds on the preliminary decommissioning plan.</p> <p>Additionally, Denison has partnered with the University of Saskatchewan and Northwest Communities Environmental Services (an Indigenous-owned environmental company) under the Developing Eco-Restoration Together (DERT) program. This unique project aims to co-create ecological restoration practices that centre Indigenous peoples, worldviews, and values while also braiding knowledge from the land, Indigenous knowledge, and western science. The project is supported by the three partners but is ultimately guided by the Indigenous Project Advisory Board, and the Community Liaison/Education Coordinator. Through restoration trials, community engagement, and various planting techniques, Denison, with their partners are seeking to return ecosystem functions in areas where they have been previously disturbed (e.g., exploration cutlines). Through collaboration with community members, University of Saskatchewan, industry partners, two graduate students, and local youth, this project is expected to ultimately inform the creation of a framework for effective restoration practices in northern Saskatchewan that centre on caribou and Indigenous communities.</p> |
| 58 | BNDN (February 28, 2023) | 9.3.4.2.1 Alteration and/or Loss of Habitat Figure 9.3-9 Available Habitat for Moose | <p>Comment #58: The EIS uses a 500 m buffer around the Project Area to define indirect habitat alteration for moose (Figure 9.3-9). This includes habitat alteration from sensory disturbance such as anthropogenic noises, vehicle traffic, aircraft traffic, and increased predator access. However, the EIS references scientific research that states that roads and vehicle traffic can affect moose habitat selection, resulting in habitat avoidance up to 1 km from roads (Shanley and Pyare 2011).</p> <p>Furthermore, the EIS acknowledges uncertainty concerning the available background and baseline information used to identify available moose habitat in this assessment. Without considering a larger avoidance buffer (as demonstrated in various research) around proposed anthropogenic disturbances, BNDN believe that the EIS underestimates the potential extent of moose habitat alteration. To be more conservative, a 1000 m buffer should be used surrounding the Project area.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN recommends using a 1000 m buffer surrounding the Project Area to measure the extent of moose habitat alteration. BNDN believe this analysis will provide a more accurate and conservative outcome with respect to potential project impacts to moose. <p>See Section 4.5 for additional information on this topic (p. 59-60).</p> | It is Denison's and their terrestrial SME's opinion that the approach used to characterize moose habitat alteration provided a sufficient basis for conducting the ungulate (VC) moose (KI) effects assessment (draft EIS Section 9.3). The Project Area had a 500 m buffer applied to account for indirect effects/habitat alteration; this area is within the wildlife LSA. Availability of habitat is not a key limiting factor for moose populations. |

Wheeler River Project Draft EIS

| | | | | |
|----|---|--|---|---|
| 59 | BNDN (February 28, 2023) | 9.3.5.2.7 Mitigation Measures | <p>Comment #59: One of the mitigation measures implemented to protect ungulates, furbearers, and Woodland Caribou includes de-icing the Project roads for winter traction, which will result in fewer wildlife collisions.</p> <p>Salt used for de-icing is likely to attract ungulates, including moose, to roadways to satisfy their mineral requirements (Rea et al 2021).</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that the Proponent revise this mitigation measure to explicitly state that salt will not be used for de-icing Project roads to avoid attracting ungulates to the Project Area. This mitigation measure can be found in section 9.3.5.2.7 Road and Traffic Management. <p>See Section 4.5 for additional information on this topic (p. 59-60).</p> | Denison has committed to using alternative measures on Project roads for de-icing and winter traction (e.g., sand, gravel) or dust suppression (e.g., water) whenever practicable (Section 12.0). |
| 60 | BNDN (February 28, 2023) | 9.3.6.4.1 Alteration and/or Loss of Habitat Figure 9.3-14 | <p>Comment #60: The EIS uses a 500 m buffer around the Project Area to define Woodland Caribou habitat alteration from sensory disturbance. However, scientific research expects up to 5 km (or greater) of Caribou avoidance around mining Projects, and that related semi-permeable barriers, such as roads, likely exacerbate this effective habitat loss [(Smith et al. 2000; Dyer et al. 2001; Courtois et al. 2008; Vistnes and Nellemann 2008; Nagy 2011; Polfus et al. 2011; Leblond et al. 2011, 2013; CPAWS Wildlands League 2013; Johnson et al. 2015)]. Without considering a larger avoidance buffer (as demonstrated in various research) around proposed anthropogenic disturbances, we believe that the EIS underestimates the potential extent of Caribou habitat alteration.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that the Proponent present the extent of caribou habitat alteration/loss from the proposed Project within a range of uncertainty informed by scientific research. <p>Specifically, the percent alteration of habitats must be presented using a 500 m (low end) up to a 5,000 m (high end) buffer. BNDN believe this analysis will provide a more accurate range of outcomes with respect to potential project impacts to caribou.</p> <p>See Section 4.5 for additional information on this topic (p. 59-60).</p> | <p>It is Denison's and their terrestrial SME's opinion that the approach used to characterize caribou habitat alteration provided a sufficient basis for conducting the caribou effects assessment (draft EIS Section 9.3). The Project Area had a 500 m buffer applied to account for indirect effects/habitat alteration; this area is within the wildlife LSA (refer to Figure 9.3-9 for a map showing the spatial areas). The 500 m buffer for habitat alteration was selected in accordance with ECCO's assessment of disturbed areas, which buffered (500 m) anthropogenic disturbances to evaluate the habitat. The alteration of available habitat is quantified in this EIS by applying a buffer of 500 m around the Project Area in which Project effects in the form of sensory disturbance are likely to affect available the habitat and make it functionally unavailable for use.</p> <p>Following submission of the draft EIS in October 2022, Denison has met with Saskatchewan Ministry of Environment (SK ENV) staff to develop a framework for future woodland caribou offset. This information has been presented to the provincial and federal review teams as part of the response to federal information requirements in August 2023 as the Conceptual Caribou Mitigation Plan. The Conceptual Caribou Mitigation Plan (the Plan), developed proactively by Denison, has a different objective than the draft EIS. The Plan builds on the assessment of potential Project effects and commitments to consider additional mitigation (offset) to account for non-significant residual effects highlighted in the draft EIS. The Plan is expected to be advanced with ongoing consultation with the SK ENV, as SK ENV finalize the caribou range plan for SK1. The EIS is a conservative planning tool, whereas the Plan is a practical, living document designed to define management works associated with caribou. The Plan is not a requirement for EA determination per se, but is provided as a guidance document to help Denison proactively describe and inform the development and implementation of appropriate mitigation measures related to caribou and their habitat. The Plan is an evergreen document. It will be consistent with the management goals of SK ENV for the SK-1 caribou conservation unit (once available) and will be developed/refined in consultation with local communities including English River First Nation and Kineepik Métis Local in Pinehouse and SK ENV. Denison is continuing to work with SK ENV to estimate habitat offset scenarios based on the current Project design which will be refined as the Project advances. A boreal caribou habitat offset calculator is under development by SK ENV and Denison is collaborating with SK ENV to define key scenario attributes.</p> |
| 61 | BNDN (February 28, 2023) | 9.4.3.3 Bird Species at Risk Appendix 9-B | <p>Comment #61: Incidental observations of Barn Swallow (<i>Hirundo rustica</i>) occurred during baseline studies (Appendix 9-B). This bird SAR was not included as a Key Indicator for this Valued Component. Instead, the EIS represents the Barn Swallow using two other SAR birds including the Olive-sided Flycatcher (<i>Contopus cooperi</i>), and Common Nighthawk (<i>Chordeiles minor</i>). This does not make ecological sense because Barn Swallows use distinct habitat and exhibit distinct breeding behaviour from these other SAR. Therefore, the barn swallow should be its own key indicator because it will have unique levels of habitat alteration/loss and levels of mortality than the other species.</p> <p>In addition, Barn Swallows have a higher likelihood of being impacted by project activities than the other representative SAR, because they nest directly on artificial structures. The EIS states that species that nest on buildings are more susceptible to entrapment in Project components. This species is listed as Threatened on SARA Schedule 1. In Canada, the Migratory Birds Convention Act, 1994 protects Barn Swallow, its nests, and eggs.</p> <p>Request/recommendation:</p> <ol style="list-style-type: none"> BNDN requests that the Barn Swallow is included as its own key indicator for the VC Bird SAR within the EIS. Additional surveys should be conducted to confirm the presence of any Barn Swallow nests | The process and rationale for selection of VCs and establishment of KIs and associated MPs is described in Section 5.3 in Section 5. Raptors, Migratory Breeding Birds, and Bird Species at Risk VCs were selected based on their likelihood of interaction with the Project, as well as their contributing roles to biodiversity and ecosystem function. The methodology for the habitat-based assessment appropriately evaluated potential adverse effects on avian species using the accepted VC and KI approach for focus of the assessment. As described in the EIS, the Common Nighthawk (similar to the Barn Swallow) is an aerial insectivore that uses a variety of habitats, including anthropogenically disturbed and cleared areas (Section 9.4.3.3.1). As such, effects on these anthropogenically disturbed areas were appropriately assessed in the habitat-based EA methodology. Since Barn Swallows nest almost exclusively on human-made structures, specific Barn Swallow exclusion methods will be added as mitigation measures to the EIS (Section 9.4.5). If Barn Swallow nests should be encountered, any subsequent activities would be conducted in accordance with the 2022 Migratory Birds Regulations. The habitat-based approach for the assessment supports the use of surrogates that are known to utilize the same habitat types. Habitat loss and alteration were assessed for the Key Indicator species included in this Valued Component. A conservative approach of identifying available habitat for these species was chosen to include habitat for those species not directly assessed (i.e., Barn |

| | | | <p>on all buildings in the Project Area prior to commencement of construction.</p> <p>c) If Barn Swallow nests are located, contact the SK MOE for regulatory advice on the appropriate actions given the specific situation.</p> <p>d) The Proponent should monitor all barn swallow nests found within the Project Area to confirm their continued usage throughout the lifecycle of the mine. If avoidance of nests is observed near Project activities, the Proponent should adopt an adaptive management approach and provide additional nesting sites elsewhere. Specifically, the Proponent could consider installing nesting structures in suitable areas to provide alternative nesting options for Barn Swallows.</p> <p>e) Staff should be trained to identify and report barn swallows and their nests.</p> <p>f) Future monitoring programs during the life of the project must include the barn swallow. See Section 4.5 for additional information on this topic (p. 59-60).</p> | <p>Swallow through Common Nighthawk habitat).</p> <p>Subsequent to filing the draft EIS, Denison has developed a new Species at Risk appendix to Section 9 which will be included in the final EIS (a new SAR appendix (new Appendix 9-D). It has been included as to Attachment IR-131. This new EIS appendix lists all SAR species potentially occurring in the Project study areas, with links to applicable and appropriate mitigation measures described in the draft EIS. The new appendix also includes a summary of the life history requirements, the expected Project effects, proposed mitigation measures, and anticipated residual effects on barn swallow.</p> <p>As a result of the continued technical review until October 2024, the additional specific commitment has been made: Denison has committed to pre-construction and pre-clearing surveys for multiple species. Surveys will be completed by a qualified professional biologist that will refer to available guidance and protocols.</p> |
| 62 | BNDN (February 28, 2023) | 9.4.3.3 Bird Species at Risk Appendix 9-B | <p>Comment #62: Incidental observations of Horned Grebe (<i>Podiceps auratus</i>) occurred during baseline studies (Appendix 9- B). This species is listed as Special Concern on SARA Schedule 1. The Horned Grebe was not included as a Key Indicator for this Valued Component. Instead, the EIS represents this species with two other bird SAR, Yellow Rail (<i>Coturnicops noveboracensis</i>), and Rusty Blackbird (<i>Euphagus carolinus</i>). The Horned Grebe uses distinct habitat from these other species. Therefore, the Horned Grebe should be its own key indicator because it will have different levels of habitat alteration/loss and levels of mortality.</p> <p>Request/recommendation:</p> <p>a) BNDN requests that the Horned Grebe is included as its own Key Indicator for the VC Bird SAR within the EIS.</p> <p>b) b. Future monitoring programs during the life of the Project must include the Horned Grebe. See Section 4.5 for additional information on this topic (p. 59-60).</p> | <p>The process and rationale for selection of VCs and establishment of KIs and associated MPs is described in Section 5.3 in Section 5. Raptors, Migratory Breeding Birds, and Bird Species at Risk VCs were selected based on their likelihood of interaction with the Project, as well as their contributing roles to biodiversity and ecosystem function. While Horned Grebe was not included as a avian SAR in the draft EIS, the EIS identified Yellow Rail and Rusty Blackbird as a surrogate species. To focus the effects assessment on key species, it was decided to use the provincially listed Yellow Rail (and Rusty Blackbird) as surrogates for Horned Grebe. Horned Grebe use similar wetland habitat types for nesting, foraging and protective cover as Yellow Rail. The habitat-based approach for the assessment supports the use of surrogates that are known to utilize the same habitat types. Habitat loss and alteration were assessed for the Key Indicator species included in this Valued Component. A conservative approach of identifying available habitat for these species was chosen to include habitat for those species not directly assessed (i.e., Horned Grebe through Yellow Rail and Rusty Blackbird habitat). As such, potential effects on these habitat types were assessed appropriately in the draft EIS.</p> <p>Subsequent to filing the draft EIS, Denison has developed a new Species at Risk appendix to Section 9 which will be included in the final EIS (a new SAR appendix (new Appendix 9-D). It has been included as Attachment to IR-131. This new EIS appendix lists all SAR species potentially occurring in the Project study areas, with links to applicable and appropriate mitigation measures described in the draft EIS. The new appendix also includes a summary of the life history requirements, the expected Project effects, proposed mitigation measures, and anticipated residual effects on Horned Grebe.</p> <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project.</p> |
| 63 | BNDN (February 28, 2023) | 9.4.3.3 Bird Species at Risk | <p>Comment #63: The Bank Swallow (<i>Riparia riparia</i>), a bird SAR may be present within the terrestrial RSA. This species was not included in the EIS as a key indicator for bird SAR. This species is listed as Threatened on SARA Schedule 1.</p> <p>The breeding range of the Bank Swallow (<i>Riparia riparia</i>) overlaps with the terrestrial RSA. Bank swallows breed in varying natural and artificial habitat with sand-silt substrates including vertical banks, riverbanks, bluffs, stockpiles, aggregate pits, and roadcuts (COSEWIC 2013). Suitable habitat may be present because soil surface textures across the RSA are predominantly sand textured (sand, loam sand/sandy loam and silty sand). The creation of soil stockpiles during construction may create suitable breeding habitat for this species.</p> <p>Request/recommendation:</p> <p>a) BNDN requests a justification for excluding the Bank Swallow from the EIS.</p> <p>b) If a valid justification does not exist, BNDN requests this species be added as a Key Indicator for bird SAR unless it can be proven not present in the RSA.</p> <p>c) All soil stockpiles should be monitored for Bank Swallow nesting activity before the stockpiles are disturbed when needed for site reclamation.</p> | <p>The process and rationale for selection of VCs and establishment of KIs and associated MPs is described in Section 5.3 in Section 5. Raptors, Migratory Breeding Birds, and Bird Species at Risk VCs were selected based on their likelihood of interaction with the Project, as well as their contributing roles to biodiversity and ecosystem function. Subsequent to filing the draft EIS, Denison has developed a new Species at Risk appendix to Section 9 which will be included in the final EIS (a new SAR appendix (new Appendix 9-D). It has been included as Attachment to IR-131. This new EIS appendix lists all SAR species potentially occurring in the Project study areas, with links to applicable and appropriate mitigation measures described in the draft EIS. The new appendix also includes a summary of the life history requirements, the expected Project effects, proposed mitigation measures, and anticipated residual effects on bank swallow.</p> |

| 64 | BNDN (February 28, 2023) | 9.4.3.3.2 Information from Indigenous Knowledge, Local Knowledge, and Engagement | <p>Comment #64: The EIS states that knowledge providers reported that multiple Whooping Cranes (<i>Grus americana</i>) have been observed along the Wheeler River, Moore River, and along the Cree River (outside of the terrestrial RSA) (19-LK-ERFNTrip- 134.169) (19-LK- ERFNTrip-134.170). Whooping Cranes are listed as Endangered on SARA Schedule 1. The EIS does not include this species as a key indicator for SAR birds, nor does it include an explanation why this species was omitted despite being reported by a knowledge provider from English River First Nation. Request/recommendation: a) BNDN requests an explanation for excluding this species despite being reported by a Trapper from English River First Nation. If a valid justification does not exist, the species Whooping Crane (<i>Grus americana</i>), should be included as a key indicator for SAR birds. b) Future monitoring programs during the life of the Project must include surveys for the Whooping Crane. See Section 4.5 for additional information on this topic (p. 59-60).</p> | <p>The process and rationale for selection of VCs and establishment of KIs and associated MPs is described in Section 5.3 in Section 5. Raptors, Migratory Breeding Birds, and Bird Species at Risk VCs were selected based on their likelihood of interaction with the Project, as well as their contributing roles to biodiversity and ecosystem function. The local trapper's observation of Whooping Crane was outside of the avian RSA. The rationale for the selection of the SAR Key Indicators was provided in draft EIS Section 9.4.1. For these reasons, Whooping Crane was not included as a SAR Key Indicator in the draft EIS. for further reference as noted above subsequent to filing the draft EIS, Denison has developed a new Species at Risk appendix to Section 9 which will be included in the final EIS (a new SAR appendix (new Appendix 9-D). It has been included as Attachment to IR-131. This new EIS appendix lists all SAR species potentially occurring in the Project study areas, with links to applicable and appropriate mitigation measures described in the draft EIS. The new appendix also includes a summary of the life history requirements, the expected Project effects, proposed mitigation measures, and anticipated residual effects on bank swallow</p> <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. | 65 | BNDN (February 28, 2023) | 9.4.3.3.3 Baseline Studies | <p>Comment #65: Short-eared Owls (<i>Asio flammeus</i>) were not observed during the baseline surveys (Appendix 9-B). This is likely because targeted surveys for this species were not conducted. The detection probability of Short-eared Owls is very low at sunrise when the breeding songbird point count surveys were conducted. Short-eared Owls are most detectable from one hour before sunset to half an hour after sunset. Request/recommendation: a) BNDN requests that short-eared Owls continue to be assumed present within suitable habitat, unless proven otherwise by a qualified biologist using the Short-Eared Owl Survey Protocol (Saskatchewan Ministry of Environment 2015). b) Future monitoring programs should utilize the protocol developed by the Saskatchewan Ministry of Environment to better (2015) understand whether this species is present. See Section 4.5 for additional information on this topic (p. 59-60).</p> | <p>The process and rationale for selection of VCs and establishment of KIs and associated MPs is described in Section 5.3 in Section 5. Raptors, Migratory Breeding Birds, and Bird Species at Risk VCs were selected based on their likelihood of interaction with the Project, as well as their contributing roles to biodiversity and ecosystem function. Short-eared Owl were included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). In the EIS, Short-eared Owl were assumed to be present and breeding in the Project study areas. As described in the EIS, pre-construction surveys will be conducted prior to the commencement of any vegetation clearing or soil disturbance. Avian species will also be routinely monitored throughout the life of the Project. Results from the surveys and monitoring activities are expected to inform the adaptive management process to update Project design and identify the need for additional mitigation measures, if required.</p> <p>As a result of the continued technical review until October 2024, the additional specific commitment has been made: Denison has committed to pre-construction and pre-clearing surveys for multiple species. Surveys will be completed by a qualified professional biologist that will refer to available guidance and protocols.</p> |
| 66 | BNDN (February 28, 2023) | 9.4.3.3.3 Baseline Studies | <p>Comment #66: Yellow Rail (<i>Coturnicops noveboracensis</i>) were not observed during the baseline surveys (Appendix 9-B). This is likely because targeted surveys for this species were not conducted. The Yellow Rail is nocturnal; therefore, survey effort must take place between 23:00-3:00. Therefore, this species would not have been observed when the breeding songbird point count surveys were conducted. Request/recommendation: a) BNDN requests that Yellow Rail should continue to be assumed present within suitable habitat, unless proven otherwise by a qualified biologist using the Yellow Rail Survey Protocol (Saskatchewan Ministry of Environment 2014). b) Future monitoring programs should utilize the protocol developed by the Saskatchewan</p> | <p>The process and rationale for selection of VCs and establishment of KIs and associated MPs is described in Section 5.3 in Section 5. Raptors, Migratory Breeding Birds, and Bird Species at Risk VCs were selected based on their likelihood of interaction with the Project, as well as their contributing roles to biodiversity and ecosystem function. Yellow Rail were included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). In the EIS, Yellow Rail were assumed to be present and breeding in the Project study areas. As described in the EIS, pre-construction surveys will be conducted prior to the commencement of any vegetation clearing or soil disturbance. See Section 4.5 for additional information on this topic (p. 59-60). | management process to update Project design and identify the need for additional mitigation measures, if required. As a result of the continued technical review until October 2024, the additional specific commitment has been made: Denison has committed to pre-construction and pre-clearing surveys for multiple species. Surveys will be completed by a qualified professional biologist that will refer to available guidance and protocols. |
| 67 | BNDN (February 28, 2023) | Appendix 9-B | Comment #67: Two bat species, Little Brown Bat (<i>Myotis lucifugus</i>) and Northern Myotis (<i>Myotis septentrionalis</i>) were detected during passive acoustic surveys in 2019 (Appendix 9- b). These species are listed as Endangered by COSEWIC and SARA schedule. Despite being present, bats were completely excluded from the EIS. Areas that will be cleared for mine development and operations could contain maternity roost trees. Based on Appendix 9-b, this habitat was not adequately evaluated through field surveys. Request/recommendation: a) BNDN requests justification for excluding bat species from the EIS despite two Endangered species confirmed present. b) BNDN also request the Proponent put protocols in place to identify and assess bat maternity roost trees prior to clearing and employ mitigation measures such as retaining maternity roost trees, modifying the timing of clearing, and offsetting for the destruction of habitat for endangered species. See Section 4.5 for additional information on this topic (p. 59-60). | Subsequent to filing the draft EIS, Denison has developed a new Species at Risk appendix to Section 9 which will be included in the final EIS and has been included in the response to YNLR (a new SAR appendix (new Appendix 9-D) will be added to Section 9 of the final EIS. It has been included here as Attachment IR-131. This new EIS appendix lists all SAR species potentially occurring in the Project study areas, with links to applicable and appropriate mitigation measures described in the draft EIS. The new appendix also includes a summary of the life history requirements, the expected Project effects, proposed mitigation measures, and anticipated residual effects on bats. As a result of the continued technical review until October 2024, the additional specific commitment has been made: Denison will conduct additional bat baseline surveys prior to commencing any work/activities at the project site. Denison will use the baseline data to verify the EA predictions. |
| 68 | BNDN (February 28, 2023) | 9 Terrestrial Ecology 9.1.8 Monitoring and Follow-up 9.2.8 Monitoring and Follow-up 9.3.8 Monitoring and Follow-up 9.4.8 Monitoring and Follow-up | Comment #68: Denison's proposed terrestrial ecology mitigations described are generalized and conceptual in the EIS. With the level of detail provided in the EIS, it is not possible for BNDN to comment on the adequacy or effectiveness of the proposed mitigation measures or whether proposed mitigations will meaningfully diminish Project impacts on BNDN rights and interests. Request/recommendation: - BNDN holds invaluable indigenous knowledge related to terrestrial ecology topics including traditional and medicinal plants, ungulates, furbearers, game birds etc. within the RSA. BNDN must be meaningfully involved in the development and implementation of the various management and monitoring plans mentioned throughout Chapter 9 of the EIS to ensure that proposed impacts are sufficiently reduced. These plans include but are not limited to the wildlife monitoring plan, avian monitoring, and Woodland Caribou Management Plan. The role that BNDN will have in developing management and monitoring plans should be defined within a project agreement between BNDN and Denison. See Section 4.5 for additional information on this topic (p. 59-60). | As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. Denison does not anticipate separate funding for BNDN at this time. BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. The details of monitoring and follow-up plans are being developed to support the separate process of Project licensing and permitting. The specific means by which provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program, are currently under consideration with the Denison project team. It is noted that Section 4.2.1 of the draft EIS provides the variety of ways in which Denison has engaged with Interested Parties to date and it is assumed it would continue to use these means and others that may be identified to fulfil its key corporate principals for developing positive relationships (see draft EIS Section 4.2). |
| 69 | BNDN (February 28, 2023) | Section 6.0 | Comment #69: Denison's air dispersion model does not include any receptor locations related to BNDN traditional land and resources use (TLRU) and Indigenous Knowledge (IK) sites. BNDN members use the lands and waters in the Project area for TLRU and ceremonial purposes. Request/recommendation: - BNDN TLRU and IK sites should be considered in Denison's air quality assessment. The geographic locations for TLRU and IK should be inputted into the air dispersion model as special receptors. This will provide site specific data for BNDN land users who use the LSA so they can effectively assess the Project's impact on land use and rights. See Section 4.6 for additional information on this topic (p. 67-71). | Scoping of the air quality assessment followed a conservative approach and described where modelled concentrations returned to background levels. The air quality assessment included human receptors in the Project Area and Local Study Area (refer to draft EIS, Figure 6.1-3). These receptor locations are consistent with what was presented in the ERA (Section 10.1 and Appendix 10-A). |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|-------------|--|---|
| 70 | BNDN (February 28, 2023) | Section 6.0 | <p>Comment #70: Denison states in the EIS “the Cameco McArthur River Operation and Key Lake sites are currently in Care and Maintenance mode; therefore, there is currently no truck traffic between the sites on Highway 914. When these sites are to become operational again, there is potential for a cumulative effect at sensitive locations near the highway.” On November 28th, 2022, operations resumed at Cameco’s McArthur River Uranium Mine and Key Lake Mill. Denison did not model Cameco related air emissions in their air dispersion model. The EIS model does not account for any of Cameco’s air emissions from the mill, mine, and associated truck traffic between sites. Without this data included in the model, the EIS does not adequately account for the cumulative effects of Cameco’s McArthur River Mine and Key Lake Mill on the atmospheric environment.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - Denison must redo air dispersion modeling to account for the Cameco McArthur River Uranium Mine and Key Lake Mill which have resumed operations since the EIS was released. Without this data included in the model the EIS does not accurately capture baseline conditions or cumulative effects on the atmospheric environment. <p>Fugitive dust and uranium emissions (and potentially other contaminants) have increased potential for exceedances with the resumption of Cameco’s operations, as exceedances are already predicted with the Wheeler River Project alone.</p> <p>See Section 4.6 for additional information on this topic (p. 67-71).</p> | <p>Please refer to Section 6.1.3.2 and 6.1.7. The regional SK MOE data presented in Table 6.1-12 were conservatively used to represent background concentrations of TSP, PM10, PM2.5, CO, SO2, and NO2 for the Wheeler River Project air quality assessment. While traffic associated with Cameco Operations was not modelled, conservative regional background concentrations from the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) and the La Loche monitoring station were used for particulate matter, NO2, SO2, and CO (see Section 6.1.3.2.5 and Appendix 6-A). The La Loche monitoring station is located near anthropogenic sources, while the Project is in a remote area removed from anthropogenic sources. Accordingly, emissions to air from traffic associated with Cameco’s operations are captured by the regional background concentrations used in the air dispersion model and are considered in the assessment of Project-related effects discussed in Section 6.1.4. Model predictions of COPC concentrations and depositions were added to background levels and compared to the available standards summarized in Table 6.1-5 at receptors located outside the property boundary.</p> <p>To confirm the residual effects of the Project on Air Quality and demonstrate compliance with provincial ambient air quality standards, an adaptive air quality management program will be implemented. The air quality management program will contain various plans which will be finalized during permitting and licensing. The plans within the air quality management program will incorporate monitoring requirements directed by provincial and federal regulators and by Indigenous groups and other Interested Parties as requested.</p> |
| 71 | BNDN (February 28, 2023) | Section 6.0 | <p>Comment #71: The Project is predicted to produce exceedances for TSP of 313% over the regulatory limit. 24-hour TSP concentrations exceed the criterion 28% of the time during Construction, 21% of the time during Operations. These exceedance conditions do not include TSP emissions from Cameco’s McArthur River Mine and Key Lake Mill which have now resumed operations. There is also the potential for wildfire smoke to further exacerbate dust emissions. TSP exceedances represent a potential health risk for land users and workers near the Project site. Especially for at-risk groups such as elders, youth, and people with existing respiratory conditions.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> a) Denison must employ additional mitigation measures to reduce TSP emissions on site including enhanced dust suppression efforts. b) Denison must remodel TSP to include emissions from Cameco’s McArthur River Mine and Key Lake Mill. c) Please provide information on how TSP will be monitored during the Project and how Denison will know when exceedance conditions are occurring. d) Please provide information on how adaptive management will be used when a TSP exceedance is discovered. Including discussion on how the Project will be managed during poor air quality events caused by wildfire smoke. e) Please provide information on how exceedances conditions near the Project site will be communicated to the public. <p>See Section 4.6 for additional information on this topic (p. 67-71).</p> | <p>a) A change in a measurable parameter is not a significant effect, per the EA methodology outlined in Section 5. This threshold approach is both transparent and reasonable with the context of the assessment, though it is acknowledged that some level of change in the VC (or more precisely its measurable parameter) is deemed acceptable on condition that the change is not of a magnitude from which negative effects could accrue. Denison directs BNDN to Table 6.1-19 to 6.1-21 for the complete residual effect characterization for TSP exceedances. This includes a consideration of the residual effect related to TSP in the full context of direction, magnitude, geographic extent, duration, frequency, reversibility, context, and likelihood. In Section 10.1 of the draft EIS, the SMEs concluded that while there were predicted exceedances of air quality criteria for particulate matter, they were not identified for further assessment in the HHRA—these COPCs are unlikely to be associated with a human health or environmental risk, and any exposures to people at elevated concentrations would be infrequent, short-term, and highly localized.</p> <p>b) Please refer to Section 6.1.3.2. The regional SK MOE data presented in Table 6.1-12 were conservatively used to represent background concentrations of TSP, PM10, PM2.5, CO, SO2, and NO2 for the Wheeler River Project air quality assessment. While traffic associated with Cameco Operations was not modelled, conservative regional background concentrations from the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) and the La Loche monitoring station were used for particulate matter, NO2, SO2, and CO (see Section 6.1.3.2.5 and Appendix 6-A). The La Loche monitoring station is located near anthropogenic sources, while the Project is in a remote area removed from anthropogenic sources. Accordingly, emissions to air from traffic associated with Cameco’s operations are captured by the regional background concentrations used in the air dispersion model and are considered in the assessment of Project-related effects discussed in Section 6.1.4. Model predictions of COPC concentrations and depositions were added to background levels and compared to the available standards summarized in Table 6.1-5 at receptors located outside the property boundary.</p> <p>c) and d) To confirm the residual effects of the Project on Air Quality and demonstrate compliance with provincial ambient air quality standards, an adaptive air quality management program will be implemented. The air quality management program will contain various plans which will be finalized during permitting and licensing. The plans within the air quality management program will incorporate monitoring requirements directed by provincial and federal regulators and by Indigenous groups and other Interested Parties as requested. In terms of worker health and safety while forest fire smoke is present, Denison will consider this through the Occupational Health and Safety Program. Information on how the Project will prepare for and addresses emergencies that may affect the health and safety of persons, the environment, and the protection of property related to forest fires will be included in the Emergency Preparedness and Response Program.</p> |

| | | | | |
|----|---|-------------|---|---|
| | | | | <p>e) As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |
| 72 | <p>BNDN (February 28, 2023)</p> | Section 6.0 | <p>Comment #72: The Project is predicted to produce exceedances for PM10 of 232% over the regulatory limit. 24- hour PM10 concentrations exceed the criterion 17% of the time during Construction, 12% of the time during Operations.</p> <p>These exceedance conditions do not include PM10 emissions from Cameco's McArthur River Mine and Key Lake Mill which have now resumed operations. There is also the potential for wildfire smoke to further exacerbate dust emissions.</p> <p>PM10 exceedances represent a potential health risk for land users and workers near the Project site. Especially for at-risk groups such as elders, youth, and people with existing respiratory conditions.</p> <p>Request/recommendation:</p> <p>a) Denison must employ additional mitigation measures to reduce PM10 emissions on site including enhanced dust suppression efforts.</p> <p>b) Denison must remodel PM10 to include emissions from Cameco's McArthur River Mine and Key Lake Mill.</p> <p>c) Please provide information on how PM10 will be monitored during the Project and how Denison will know when exceedance conditions are occurring.</p> <p>d) Please provide information on how adaptive management will be used when a PM10 exceedance is discovered. Including discussion on how the Project will be managed during poor air quality events caused by wildfire smoke.</p> <p>e) Please provide information on how exceedances conditions near the Project site will be communicated to the public.</p> <p>See Section 4.6 for additional information on this topic (p. 67-71).</p> | <p>a) A change in a measurable parameter is not a significant effect, per the EA methodology outlined in Section 5. This threshold approach is both transparent and reasonable with the context of the assessment, though it is acknowledged that some level of change in the VC (or more precisely its measurable parameter) is deemed acceptable on condition that the change is not of a magnitude from which negative effects could accrue. Denison directs BNDN to Table 6.1-22 and 6.1-23 for the complete residual effect characterization for PM10 exceedances. This includes a consideration of the residual effect related to PM10 in the full context of direction, magnitude, geographic extent, duration, frequency, reversibility, context, and likelihood. In Section 10.1 of the draft EIS, the SMEs concluded that while there were predicted exceedances of air quality criteria for particulate matter, they were not identified for further assessment in the HHRA—these COPCs are unlikely to be associated with a human health or environmental risk, and any exposures to people at elevated concentrations would be infrequent, short-term, and highly localized.</p> <p>b) Please refer to Section 6.1.3.2. The regional SK MOE data presented in Table 6.1-12 were conservatively used to represent background concentrations of TSP, PM10, PM2.5, CO, SO2, and NO2 for the Wheeler River Project air quality assessment. While traffic associated with Cameco Operations was not modelled, conservative regional background concentrations from the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) and the La Loche monitoring station were used for particulate matter, NO2, SO2, and CO (see Section 6.1.3.2.5 and Appendix 6-A). The La Loche monitoring station is located near anthropogenic sources, while the Project is in a remote area removed from anthropogenic sources. Accordingly, emissions to air from traffic associated with Cameco's operations are captured by the regional background concentrations used in the air dispersion model and are considered in the assessment of Project-related effects discussed in Section 6.1.4. Model predictions of COPC concentrations and depositions were added to background levels and compared to the available standards summarized in Table 6.1-5 at receptors located outside the property boundary.</p> <p>c) and d) To confirm the residual effects of the Project on Air Quality and demonstrate compliance with provincial ambient air quality standards, an adaptive air quality management program will be implemented. The air quality management program will contain various plans which will be finalized during permitting and licensing. The plans within the air quality management program will incorporate monitoring requirements directed by provincial and federal regulators and by Indigenous groups and other Interested Parties as requested. In terms of worker health and safety while forest fire smoke is present, Denison will consider this through the Occupational Health and Safety Program. Information on how the Project will prepare for and addresses emergencies that may affect the health and safety of persons, the environment, and the protection of property related to forest fires will be included in the Emergency Preparedness and Response Program.</p> <p>e) As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations</p> |

| | | | | |
|----|---|-------------|---|--|
| | | | | who may have interest in the Project. BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. |
| 73 | BNDN (February 28, 2023) | Section 6.0 | <p>Comment #73: The Project is predicted to produce exceedances for uranium of 148% over of the regulatory limit.</p> <p>These exceedance conditions do not include uranium emissions from Cameco's McArthur River Mine and Key Lake Mill which have now resumed operations.</p> <p>Uranium exceedances represent a potential health risk for land users and workers near the Project site. Additionally, uranium deposition in the aquatic and terrestrial environment can cause effect pathways to humans through the food chain through the consumption of edible/medicinal plants, berries, fish, and wildlife.</p> <p>Request/recommendation:</p> <p>a) Denison must employ additional mitigation measures to reduce uranium emissions on site including enhanced scrubber systems and containment measures.</p> <p>b) Denison must remodel uranium to include emissions from Cameco's McArthur River Mine and Key Lake Mill.</p> <p>c) Please provide information on how uranium emissions will be monitored during the Project and how Denison will know when exceedance conditions are occurring.</p> <p>d) Please provide information on how adaptive management will be used when a uranium exceedance is discovered.</p> <p>e) Please provide information on how exceedance conditions near the Project site will be communicated to the public.</p> <p>See Section 4.6 for additional information on this topic (p. 67-71).</p> | <p>a) A change in a measurable parameter is not a significant effect, per the EA methodology outlined in Section 5. This threshold approach is both transparent and reasonable with the context of the assessment, though it is acknowledged that some level of change in the VC (or more precisely its measurable parameter) is deemed acceptable on condition that the change is not of a magnitude from which negative effects could accrue. Denison directs BNDN to Table 6.1-27: Air Quality – Summary of the Characteristics Ratings for Residual Effect 9 (Operation, 24-hour Uranium Exceedances) for the complete residual effect characterization. This includes a consideration of the residual effect (24-hour U exceedance during operation) in the full context of direction, magnitude, geographic extent, duration, frequency, reversibility, context, and likelihood. Further, in Section 10.1 of the draft EIS, all relevant radionuclides were assessed in the HHRA in terms of their contribution to the total radiological dose to human and ecological receptors and COPCs identified for air were radionuclides (U-238, U-234 and radon); refer to Table 10.1-7 for a summary of human health exposure pathways. The HHRA estimated dose and risk during all Project phases to the following receptors: camp worker, seasonal resident, recreational fisher/hunter, fisher/trapper. The incremental radiation dose to all human receptors during all Project phases is predicted to be below the regulatory public dose limit of 1 mSv/yr and the dose constraint of 0.3 mSv/yr during all Project phases. Overall, since the radiation dose estimates would be below the public dose limit, no discernable health effects are anticipated due to exposure of these receptors to radioactive releases from the Project.</p> <p>b) Please refer to Section 6.1.3.2. The Key Lake data from camp high volume air samplers from 2009 to 2018 (Table 6.1-13) were selected to represent background concentrations of uranium, arsenic, and nickel for the Wheeler River Project air quality assessment. Model predictions of COPC concentrations and depositions were added to background levels and compared to ambient air quality standards and criteria.</p> <p>c) and d) To confirm the residual effects of the Project on Air Quality and demonstrate compliance with provincial ambient air quality standards, an adaptive air quality management program will be implemented. The air quality management program will contain various plans which will be finalized during permitting and licensing. The plans within the air quality management program will incorporate monitoring requirements directed by provincial and federal regulators and by Indigenous groups and other Interested Parties as requested.</p> <p>e) As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |

Wheeler River Project Draft EIS

| | | | | |
|----|---|---|--|--|
| 74 | BNDN (February 28, 2023) | Section 6.0 | <p>Comment #74: The Saskatchewan MOE Air Quality Modelling Guidelines specifies that the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) should be used for assessments in Saskatchewan. Denison opted to use the CLAMET/CALPUFF dispersion model for the EIS.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> Please provide additional rationale for the selection of the CALPUFF model over the provincially recommended AERMOD. <p>See Section 4.6 for additional information on this topic (p. 67-71).</p> | <p>As described in Section B.1 of Appendix 6-A, staff at the Saskatchewan Ministry of Environment (Air Quality Branch) were consulted on the selection of CALPUFF and development of the CALMET meteorological data set, beginning in 2019. The CALMET consultation included an initial discussion about the general approach, and once the CALMET runs were completed, two technical memos were produced and reviewed by Ministry staff including: 1) a memo completed in March 2020 summarizing the general CALMET approach and results (e.g., wind roses, temperature data, precipitation data); and 2) a follow-up memo completed in May 2021, which answered specific questions posed by Ministry staff. Ministry staff also completed a review and provided feedback on the CALPUFF model setup in August 2021. The specific rationale for the use of CALPUFF in lieu of AERMOD as documented in the March 2020 memo was as follows: the domain size needed to generate inputs for the human health and ecological risk assessment (HHERA) is estimated to be 60 km by 60 km. The Saskatchewan Air Modelling Guide recommends CALPUFF for long-range transport (i.e., > 50 km); CALPUFF includes wet and dry removal processes and chemical transformation algorithms that are needed to generate inputs for the HHERA and the terrestrial and aquatic assessments; and, the approach is consistent with other uranium mines in the area.</p> |
| 75 | BNDN (February 28, 2023) | Appendix 6-C Climate Baseline and Greenhouse Gas Emissions Report | <p>Comment #75: Carbon dioxide emissions related to air travel for Project personnel were not included in the GHG emissions calculations. Project related emissions from air travel would be significant source due to the remote nature of the site. The GHG emission estimate included in EIS Appendix 6-C does not provide a fulsome representation of Project related GHG emissions.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> Denison must include emissions from air travel for project personnel in the GHG emissions calculations. This will provide a more accurate representation of project-related GHG emissions. <p>See Section 4.6 for additional information on this topic (p. 67-71).</p> | <p>Assessment of upstream or Scope 3 GHGs under Environment and Climate Change Canada's Strategic Assessment of Climate Change guide are only required for projects that are likely to exceed the upstream threshold of 500 kt of CO₂e per year. The upstream GHG emissions for the Project are expected to be well below this threshold (draft EIS Section 2.5) and in the range of 25 to 31 kt of CO₂e.</p> |
| 76 | BNDN (February 28, 2023) | Section 6.0 | <p>Comment #76: Denison acknowledges the Project's contribution to climate change through GHG emissions but does not outline a plan to offset GHG emissions. Other mines in Canada, including the Canadian Malartic Mine in Quebec have GHG offset plans in which carbon emissions are tracked and offsetting activities are developed in collaboration with local First Nations (Canadian Malartic, 2014).</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> Denison must develop a GHG/Carbon offsetting plan to mitigate potential impacts of the Project to climate change. Denison could work with BNDN and other local First Nations on initiatives that help to offset the Project's GHG emissions (e.g. tree planting, wetland restoration, carbon offsets). This would demonstrate a commitment to corporate social responsibility, climate stewardship and reconciliation on Denison's behalf. <p>See Section 4.6 for additional information on this topic (p. 67-71).</p> | <p>Denison anticipates being subject to ECC's reporting requirements for emitters over 10,000 tonnes CO₂e and the information is collected under section 26 of the Canadian Environmental Protection Act. In order to meet these reporting requirement, Denison will be tracking Scope 1 and 2 GHG emissions. Options to offset the Project's GHG emissions will be considered as the Project advances. In draft EIS Section 2.5 Greenhouse Gas Emissions Denison has committed to looking for opportunities to optimize energy management and improve the energy intensity of the Project where practical.</p> |
| 77 | BNDN (February 28, 2023) | Section 6.0 | <p>Comment #77: The Project is reliant on burning diesel for construction, supplementary power generation, mine processing activities, and mine equipment. The GHG intensive nature of the Project's construction and operation phases are a concern for BNDN and not consistent with federal or provincial directives to reduce GHGs. Cleaner technology and fuel sources are available to reduce the Project's GHG emissions. For a project based around supplying fuel for the energy transition, a more progressive approach that utilizes Best Available Technology is required in order to reduce GHG emissions.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> Where feasible Denison must implement the use of low carbon technology and fuels in the final Project design to reduce GHG emissions. Specifically, Denison should redesign the Project to: <ul style="list-style-type: none"> Replace all diesel electricity generation with LNG/CNG generators (and add in renewables where feasible) for construction phase Replace all diesel powered mine equipment and vehicles with electric or LNG/CNG models Use renewable energy sources for electricity generation (e.g. wind, solar) as early in the project lifecycle as possible <p>See Section 4.6 for additional information on this topic (p. 67-71).</p> | <p>Thank you for the comment. The EIS is a planning tool and the details of Project design including use of fuels will be evaluated by Denison as the Project advances. However, we note that in Section 2.5 Greenhouse Gas Emissions of the draft EIS that Denison will look for opportunities to optimize energy management and improve the energy intensity of the Project where practical.</p> <p>In terms of EIS scoping for the basis of effects assessments, Denison took a conservative approach to estimating combustion products use by assuming back-up diesel generators were running continually (worst-case scenario). This is expected to bound actual Project fuel use.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|---|--|---|
| 78 | BNDN (February 28, 2023) | Section 6.0 | <p>Comment #78: Denison does not specify how it will monitor air contaminant concentrations during all phases of the Project. Continuous on-site ambient air monitoring for all COPCs (including particulates, metals, and radon) is the only way to truly assess the Project's impact on air quality and compliance with government standards.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - Denison must conduct continuous on-site monitoring for all contaminants of concern (including particulates, metals, and radon) in order to assure regulatory compliance and verify the accuracy of air dispersion models and EIS predictions. <p>See Section 4.6 for additional information on this topic (p. 67-71).</p> | <p>To confirm the residual effects of the Project on Air Quality and demonstrate compliance with provincial ambient air quality standards, an adaptive air quality management program will be implemented. The air quality management program will contain various plans which will be finalized during permitting and licensing. The plans within the air quality management program will incorporate monitoring requirements directed by provincial and federal regulators and by Indigenous groups and other Interested Parties as requested.</p> |
| 79 | BNDN (February 28, 2023) | Section 6.0 | <p>Comment #79: Denison does not specify how BNDN will be involved in air quality monitoring during construction, operations and decommissioning phases of the Project.</p> <p>Request/recommendation:</p> <ol style="list-style-type: none"> BNDN requests the implementation of robust and long-term environmental monitoring to verify protection of the environment, including community-led monitoring during Construction and Operations of the Project. Denison must develop specific roles and responsibilities to BNDN members in relation to air quality monitoring and site wide environmental monitoring. This should include, at a minimum, one environmental monitor position for BNDN. This would provide increased transparency and confidence to Denison's environmental management practices and performance. <p>See Section 4.6 for additional information on this topic (p. 67-71).</p> | <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. Denison does not anticipate separate funding for BNDN at this time.</p> <p>BNDN will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> <p>The details of monitoring and follow-up plans are being developed to support the separate process of Project licensing and permitting. The specific means by which provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program, are currently under consideration with the Denison project team. It is noted that Section 4.2.1 of the draft EIS provides the variety of ways in which Denison has engaged with Interested Parties to date and it is assumed it would continue to use these means and others that may be identified to fulfil its key corporate principals for developing positive relationships (see draft EIS Section 4.2).</p> |
| 80 | BNDN (February 28, 2023) | Section 2.2.2.2.2 Uranium Bearing Solution Holding Area | <p>Comment #80: The Proponent states that the UBS holding area will have leak detection (Figure 2.2-18). The system is shown as a pipe running under the pond.</p> <p>Request/recommendation:</p> <ol style="list-style-type: none"> BNDN requests more details on the leak detection system used for all ponds shown in Figure 2.2-18. BNDN requests that Denison respond to all the following questions in writing: <ul style="list-style-type: none"> Is the pipe connected to an automated sensing system? If not, how frequently is the system monitored? What chemical or physical indicator(s) are used to detect a leak? What are the detection limits/thresholds for each indicator? What is the precision of each indicator? Who is notified, and how quickly would a response be mobilized? <p>See Section 4.7 for additional information on this topic (p. 77).</p> | <p>It is important to note that Denison is completing a sequential EA and licensing process for the Project (see draft EIS Section 1). Denison considers the EA to be a planning and decision-making tool that assesses the potential effects of the Project in a careful and precautionary manner and integrates results of engagement with Indigenous nations and communities. The details requested by BNDN will be developed to support licensing and will be included in Management System programs / plans including for example the Groundwater Monitoring Plan and the Emergency Response and Preparedness Plan.</p> |
| 81 | BNDN (February 28, 2023) | Section 2.2.2.2.2 Uranium Bearing Solution Holding Area Section 2.2.4.5 Process Precipitate Pond | <p>Comment #81: The Proponent states that the UBS holding area will have leak detection (Figure 2.2-18). The system is shown as a pipe running under the pond.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests to know what specific containment/restoration methods will be used in the event that a leak is detected, and how quickly they would be implemented. This applies to both the UBS holding area and process precipitate pond. <p>See Section 4.7 for additional information on this topic (p. 77).</p> | <p>It is important to note that Denison is completing a sequential EA and licensing process for the Project (see draft EIS Section 1). Denison considers the EA to be a planning and decision-making tool that assesses the potential effects of the Project in a careful and precautionary manner and integrates results of engagement with Indigenous nations and communities. The details requested by BNDN will be developed to support licensing and will be included in Management System programs / plans including for example the Groundwater Monitoring Plan and the Emergency Response and Preparedness Plan.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|---|---|---|
| 82 | BNDN (February 28, 2023) | Section 2.2.2.2 Uranium Bearing Solution Holding Area | <p>Comment #82: The Proponent states that the UBS holding area will be designed as a pond contained by a double composite liner system (Figure 2.2- 18), and that options to use tanks instead of holding area will be evaluated as engineering advances. Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests that Denison undertake a risk assessment for the design of the UBS holding area. BNDN recommends the safer, less environmentally risky option be selected and that BNDN can review and provide input into the decision that Denison makes. <p>See Section 4.7 for additional information on this topic (p. 77).</p> | <p>As outlined in draft EIS Section 2.2.2.2, Denison will evaluate options to use tanks instead of holding area as engineering advances. It is also important to note that Denison is completing a sequential EA and licensing process for the Project (see draft EIS Section 1). Denison considers the EA to be a planning and decision-making tool that assesses the potential effects of the Project in a careful and precautionary manner and integrates results of engagement with Indigenous nations and communities. The details requested by BNDN will be developed to support licensing and will be included in Management System programs / plans including for example the Groundwater Monitoring Plan and the Emergency Response and Preparedness Plan.</p> |
| 83 | BNDN (February 28, 2023) | Section 2.2.1.4.5 | <p>Comment #83: The Proponent states that the wellfield pipelines will be designed to have secondary containment or catchment and have leak detection systems in place at key locations. BNDN requests more details on the leak detection system used for wellfield lines. Specifically, BNDN requests that Denison respond to the following questions:</p> <ul style="list-style-type: none"> - Is an automated sensing system used? - Will automated controls shut off pressure in the event of a significant leak? - If no automation is used, how frequently is the system monitored? - What chemical or physical indicator(s) are used to detect a leak? - What are the detection limits/thresholds for each indicator? - What is the precision of each indicator? - Who is notified, and how quickly would a response be mobilized? <p>See Section 4.7 for additional information on this topic (p. 77).</p> | <p>Wellfield piping system will transport the mining solution to and from the processing plant. The flow rates and pressures of the individual well lines will be monitored in the pumphouses. This data will be transmitted to the processing plant for remote monitoring through a master control system. Through the master control system, operators will be capable of controlling pumphouse production lines remotely.</p> <p>The specific details requested by BNDN in this comment are not available at this time and will be developed as part of detailed design to support Project licensing and permitting. Denison considers the EA to be a planning and decision-making tool that assesses the potential effects of the Project in a careful and precautionary manner and integrates results of engagement with Indigenous nations and communities. Denison views the EIS as an important planning tool that will be used to support future activities and represents one stage in the rigorous overall approvals process for a uranium mining facility in Canada. Denison completed feasibility designs for the Project in 2023. The engineering design of the wellfield pipelines including control measures to monitor and respond to leaks will be included in the detailed design information provided to the CNSC during Project licensing.</p> |
| 84 | BNDN (February 28, 2023) | Section 2.2.1.4.5 Primary Containment of Mining Solution – Wells | <p>Comment #84: The Proponent states that the well designs and operational monitoring of the wellfield will mitigate accidental release of mining solution or UBS in the sandstone above the mining area. Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests to know how Denison will monitor the integrity of wells once in production. Will tests be conducted at regular intervals? <p>See Section 4.7 for additional information on this topic (p. 77).</p> | <p>The well designs and operational monitoring of the wellfield will mitigate accidental release of mining solution or UBS in the sandstone above the mining area. Each well will have double containment: mining solution will travel inside an inner casing with the outer casing acting as secondary containment for the mining fluids. Wells will be continually monitored for operational parameters such as injection pressures, injection flow rates, and recovery flow rates. This data will be transmitted to the processing plant for remote monitoring through a master control system. Through the master control system, operators will be capable of controlling pumphouse production lines remotely. Wellfield monitoring will facilitate detection of any issues with the injection and recovery wells.</p> <p>A network of monitoring wells installed within the freeze wall area will be equipped with pressure instrumentation for the determination of the vertical strain/stresses placed on the formation to do mining zone space creation. This monitoring network is designed to detect if these strains may be approaching their acceptable levels prior to failure. The injection and recovery wells will also be equipped with devices for pressure and temperature that can detect a breach in the well casing if one were to occur. As a preventative measure, annual mechanical integrity testing is conducted on the wells to ensure their containment and compliancy.</p> <p>Active monitoring will allow for operational shutdown if a scenario is approaching a failure mode.</p> |
| 85 | BNDN (February 28, 2023) | Section 2.2.1.4.5 Fuel Storage and Dispensing Facility | <p>Comment #85: The Proponent states that fuels will be stored in approved, above-ground, 25,000 L double-walled storage tank(s) equipped with secondary containment in accordance with provincial regulations and standards. Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests to confirm when the permanent fuel storage facility will be constructed. If temporary fuel storage for construction is required, indicate how much, how it will be stored and dispensed, and show on a sketch where it will be located. Construction fuel requirements for site development may be significant. <p>See Section 4.7 for additional information on this topic (p. 77).</p> | <p>Details on when Denison will construct the permanent fuel storage facility or precisely where temporary fuel storage tanks will be located are not available at this phase of the Project and these details are not required to support EIS review. However, at the EIS stage it is important to note that Denison is committed to construction and operating all fuel storage and distribution infrastructure in accordance with applicable legislative requirements. Fuels will be stored in approved, above-ground, double-walled storage tank(s) equipped with secondary containment in accordance with provincial regulations and standards. In Saskatchewan, the permitting process for hazardous substances including above ground storage tanks for diesel, propane, gas, and jet fuel are governed by The Hazardous Substances and Waste Dangerous Goods Regulations; Environmental Code Chapter E-10.2 Reg 3 (HSWDG). Denison will need to apply for an Approval to Construct, Install, Alter and Expand a Storage Facility and Store Hazardous Substances and/or Waste Dangerous Goods and secure an approval from the Ministry of Environment pursuant to The Environmental Management and Protection Act, 2010, and The</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|---|--|--|
| | | | | Hazardous Substances and Waste Dangerous Goods Regulations. Denison will have to adhere to the Terms and Conditions of the approval, complete regular inspections of the facilities, and maintain an Emergency Response Contingency Plan. The Ministry of Environment staff also conduct regular inspections to ensure the conditions of the approval are being followed. |
| 86 | BNDN (February 28, 2023) | Section 2.2.4.5 Process Precipitate Pond | <p>Comment #86: The Proponent states that process precipitates may be stored in totes inside the process precipitate pond.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests details on the procedures for placement and handling of precipitate totes within the pond. Care should be taken to ensure that equipment and totes do not compromise the pond lining. Totes should be sealed and transport of totes from the plant to the pond should be carefully planned to minimize the risk of a spill, and in the event of a spill ensure that runoff is captured on the site. <p>See Section 4.7 for additional information on this topic (p. 77).</p> | <p>The precipitate pond is proposed as a lined area with berms (as shown in Section 2, Figure 2.2-18) and may be more clearly described as being a lined pad. As such, process precipitates can be placed into totes, which can be placed on the lined area ('pond') for containment during storage. Details on the plans for precipitate management, placement and handling will be developed to support Project licensing and permitting. Denison agrees the integrity of the liner and totes are important considerations which will be factors in the plans. We also refer BNDN to the following draft EIS sections and comments responses:</p> <ul style="list-style-type: none"> - Waste Management: Waste management is described in Section 2.2.4 of the draft EIS and includes discussion of all waste types that will be generated by Project-related activities. The following is noted in Section 2.2.4 for reference, "Conventional waste, radiologically contaminated waste, and hazardous waste will be managed at the Project. Denison is committed to conducting stringent waste characterization throughout the life of the Project. This includes physical, radiological, and chemical characterization to maintain accurate waste inventories and determine how wastes will be dispositioned through either re-use, recycling, temporary storage, or permanent disposal (on or off site). This includes clearance of material that meets unconditional release requirements and can be safely removed from site. A waste management program will be developed for the Project to support licensing and permitting. The waste management program and associated plans developed to support licensing will be based on the 4 R's: Reduce, Reuse, Recycle, and Recover, and will detail how each type of waste generated on site will be managed. Resources used to develop the waste management program will include, but are not limited to, the CNSC's REGDOC-2.11 series, related Canadian Standards Association (CSA) standards, and the Hazardous Substances and Waste Dangerous Goods Regulations (Government of Saskatchewan 2000)." - Water Management: Water management is described in Section 2.2.3 of the draft EIS and includes Denison's commitment to capturing any contact water. Clean, non-contact runoff will be diverted around Project components where possible. Contact water, including, for example, runoff from the wellfield and around the processing plant, will be collected in various ponds and eventually routed through the IWWTP for treatment prior to release to Whitefish Lake. Refer to Figure 2.2-17 for runoff collection assumptions. - Emergency Preparedness and Response Program: Please also see Denison's response to BNDN comment 87 below for information on the Emergency Preparedness and Response Program. |
| 87 | BNDN (February 28, 2023) | Section 2.8 Project Design Features | <p>Comments #87 and 88: Denison states that they will maintain an up-to-date record of the various hazardous substances on site and will maintain Safety Data Sheets and appropriate procedures for spill management, handling, and clean up in an accessible location</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests a description of the safety and spill response training programs that employees will undergo. What is the duration of each training program and how often will retraining be conducted? - BNDN requests to know what resources will be kept on site for management and clean-up of spills, for example spill kits, absorbents, neutralization agents, vacuum trucks, PPE, hand tools, etc. <p>See Section 4.7 for additional information on this topic (p. 77).</p> | <p>The details requested related to the Emergency Preparedness and Response Program are being developed to support licensing efforts. The EIS is a planning tool to provide an assessment of the potential Project effects on the human and biophysical environment; at the EIS stage a detailed Management System is not required.</p> <p>A brief description of the Emergency Preparedness and Response Plan is provided in the draft EIS, Section 2.9.1.3.5: and included below for reference. Please also refer to draft EIS, Section 14 Accidents and Malfunctions for an assessment of the potential accidents and malfunctions that could occur in association with the Project and a description of the potential effects on human health or the biophysical environment, considering environmental design features and mitigation measures that would be implemented to reduce such effects.</p> <p>2.9.1.3.5 Emergency Preparedness and Response Program The Emergency Preparedness and Response Program would identify how the Project will</p> |

| | | | | <p>prepare for and addresses emergencies that may affect the health and safety of persons, the environment, and the protection of property. The objectives of the program would include the following:</p> <ul style="list-style-type: none"> • identification of accidents and emergencies and the actions and responsibilities in the event of an emergency; • Project requirements for emergency response equipment and personnel; • internal incident command structure to effectively manage complex, lengthy, and large scale emergencies; • required communications with external emergency services, statutory bodies, and public, Indigenous groups, and regulatory agencies; • development of appropriate emergency procedures; and • assurance of availability of vital information during an emergency. <p>Emergency Preparedness and Response Program would be developed consistent with guidance provided by CNSC in REGDOC-2.10.1, Nuclear Emergency Preparedness and Response.</p> |
| 88 | BNDN (February 28, 2023) | Section 2.2.2.2.4 Yellowcake drying and packaging | <p>Comment #89: The Proponent describes various measures used to mitigate yellowcake dust emissions: the yellowcake drying and packaging area will be outfitted with hygiene systems to capture dust generated during the material handling of the yellowcake product and sent to either the dryer or calciner venturi scrubbers. All equipment located after the dewatering of the yellowcake will be selected to provide minimal dust generation and outfitted with dust collection systems where required. The ventilation system in this area of the processing plant will also be adequately designed to provide safety of workers and control fugitive dust emissions.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN recommends redundant hygiene systems be installed (n+1 units) to ensure continuity of air filtration in the event of equipment failure. <p>See Section 4.7 for additional information on this topic (p. 77).</p> | <p>Should dust collection systems in the yellowcake drying and packaging area fail and generate a hazard for the workers, the plant will be shut down until repairs are completed. A redundant hygiene system is not economical to implement. Hygiene scrubbers are typically very reliable and can be repaired in short time frames.</p> |
| 89 | BNDN (February 28, 2023) | Draft EIS 9.3.5.1 Project Design Measures | <p>Comment #90: The Proponent states that all contaminated areas will be fenced to avoid contact with workers and wildlife. Fences will be monitored and maintained.</p> <p>Request/recommendation:</p> <ul style="list-style-type: none"> - BNDN requests to know the size and type of fence considered for each project area. - Confirm if the wellfields will be fenced. Show all fences on a site layout drawing like Figure 2.2-1. <p>See Section 4.7 for additional information on this topic (p. 77).</p> | <p>Access to the property will be controlled by both a north and south security gate. In the draft EIS, Denison has committed to fencing the domestic landfill (Section 2.2.4.3.1) and having a fenced storage area near the operations centre. Details on the size and type of fencing are not defined at this stage of the Project, but will meet the criteria outlined in the EIS. The wellfield is not proposed to be fenced. For the wildlife-specific mitigation measures, refer to Section 9.3.5.2.5 Wildlife Deterrence and Prevention of Wildlife Entrapment and Section 9.3.5.2.8 Waste and Hazardous Materials Management.</p> |
| 90 | Peter Ballantyne Cree Nation (PBCN) (March 3, 2023) | General | <p>The Wheeler River project falls within PBCN traditional territory, where traditional land use activities have historically been and are currently practiced. PBCN has traditional territory spanning Treaty 10 with the nearest community of Southend located 185km away from the Project. PBCN has exercised aboriginal rights in and around the Project site and currently exercises Indigenous and Treaty Rights in proximity to the Project.</p> <p>PBCN is concerned that the Project has potential adverse environmental, cultural and socio-economic impacts to PBCN members, lands and uses, including hunting, fishing and gathering in all seasons.</p> <p>Both Denison and CNSC indicate that they have fulsome aboriginal engagement policies and guidelines and appear to be undertaking their delegated Crown duty to consult in good faith, as informed by those policies, principles, legal and regulatory requirements. However, there has been an initial error in the assessment, both by Denison and CNSC, as PBCN was erroneously excluded from indigenous engagement, ostensibly due to distance from Wheeler and a lack of understanding of PBCN lands and Indigenous activities potentially impacted by the project. PBCN wishes to participate fully in the regulatory review of the Wheeler River project. PBCN requests that the CNSC ensure that it's review timelines be adjusted, as required, to ensure fulsome participation by PBCN with the proponent and the regulator, going forward.</p> <p>PBCN's goals are to:</p> <ul style="list-style-type: none"> - Meet with CNSC to share PBCN knowledge of its land, and Indigenous uses, and how these may be impacted by the Project and methods to address any adverse impacts. - Establish a shared understanding of how PBCN would like to be engaged in the regulatory review, including, but not restricted to, timely project updates, information and an opportunity to discuss concerns throughout the EA process, including the review of the dEIS, CNSC's staff's | <p>Denison followed the criteria identified in CNSC's REGDOC 3.2.2 v 1.2 in determining the Project's Indigenous Communities of Interest. By way of background, Denison has been the operator of the Wheeler River property since 2004, and its predecessors have been in the area since the 1980s. Denison followed a systematic and comprehensive process to identify Indigenous communities who may be impacted by the Project, informed by a wide variety of information, such as the wildlife and fur block management administration areas, existing traditional land use information (particularly information made available through the Key Lake and McArthur River public review processes), access restrictions on Highway 914 north of Key Lake, anticipated impacts to water, anticipated transportation routes, and publicly available descriptions of Indigenous Nations' traditional territories, including that of PBCN. Our approach was further informed by our discussions with those Indigenous Nations with the potential to be adversely effected by Project activities, as well as Indigenous organizations in the region, and supported by information from and interactions with representatives of the Saskatchewan Ministry of Environment (MOE) and Canadian Nuclear Safety Commission (CNSC). Denison has been discussing the interests and concerns identified by PBCN on an on-going basis since March of 2023, and will continue to share information regarding the Project.</p> |

|----|---|---------|---|--|
| | | | EA Report, and other project-related documentation [Additional questions on this topic directed to regulators or government entities are included in the CNSC table] | |
| 91 | PBCN (March 3, 2023) | General | <p>The Wheeler River project falls within PBCN traditional territory, where traditional land use activities have historically been and are currently practiced. PBCN has traditional territory spanning Treaty 10 with the nearest community of Southend located 185km away from the Project. PBCN has exercised aboriginal rights in and around the Project site and currently exercises Indigenous and Treaty Rights in proximity to the Project.</p> <p>PBCN is concerned that the Project has potential adverse environmental, cultural and socio-economic impacts to PBCN members, lands and uses, including hunting, fishing and gathering in all seasons.</p> <p>Both Denison and CNSC indicate that they have fulsome aboriginal engagement policies and guidelines and appear to be undertaking their delegated Crown duty to consult in good faith, as informed by those policies, principles, legal and regulatory requirements. However, there has been an initial error in the assessment, both by Denison and CNSC, as PBCN was erroneously excluded from indigenous engagement, ostensibly due to distance from Wheeler and a lack of understanding of PBCN lands and Indigenous activities potentially impacted by the project.</p> <p>PBCN meets nearly all of Denison's stated criteria to evaluate Indigenous communities located within the Saskatchewan Northern Administration District that would be engaged by Denison. A full and accurate description of PBCN's rights and interests is an essential part of the Wheeler dEIS and is necessary to ensure a fulsome environmental assessment. PBCN is interested in the opportunity to collaborate with Denison mines to comprehensively identify PBCN's rights and interests that may be impacted by the project.</p> <p>PBCN's goals are to:</p> <ul style="list-style-type: none"> - Work together with Denison in a spirit of mutual respect to cooperate to collectively identify means to avoid, mitigate or otherwise address potential negative impacts of the project on PBCN's territory and the exercise of its Indigenous rights and interests. - Participate in a funding agreement with Denison to facilitate and support PBCN participation and meaningful engagement in the EA process. - Meet with Denison to share PBCN knowledge of its land, and Indigenous uses, and how these may be impacted by the Project and methods to address any adverse impacts. - Explore employment and job opportunities related to the Project. <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | Denison remains committed to conducting meaningful engagement with Indigenous communities potentially affected by the Project and to understanding how the proposed development of the Project may affect the ability of Indigenous peoples to exercise collective Indigenous and Treaty Rights. Denison has been corresponding with PBCN on these issues and concerns since March of 2023, including written correspondence and an in-person meeting with PBCN on September 20, 2023. We believe that consultation and engagement is an iterative, two-way process, such that as we learn about the Project, its potential impacts, and the interests of Indigenous peoples in the region, we will continue to tailor our approach to engagement. It is in this spirit that we have continued to engage with PBCN to better understand the Nation's interests and land uses in the vicinity of the Project. |
| 92 | PBCN (March 3, 2023) | General | <p>PBCN has concerns regarding potential impacts to Valued Components including but not limited to water quality, fish, wildlife, aquatic vegetation, Human health, country food consumption, resource use, and socio-economic factors.</p> <p>Areas of specific concern are:</p> <ul style="list-style-type: none"> • What are the potential impacts to the landscape, including aquatic and terrestrial environments? • What are the effects on the growing/carrying capacity of both aquatic and terrestrial environments for Country Foods due to potential changes to the landscape and risk of contaminants? • What are potential accident or spill impacts on the harvesting of plant specific country foods? • Will there be limitations to access lands for country food harvesting due to mining traffic or operation of the mines? • How will Denison use freshwater from Whitefish Lake? • What are the potential impacts to boreal shield woodland caribou? • How will Denison contain effluent from the mine and manage anticipated downstream impacts? In particularly interconnected waterbodies? • What are the socio-economic impacts of the Project, including vulnerable populations, from construction through operation? | The potential effects of the Wheeler River Project on the aquatic and terrestrial environments have been comprehensively assessed in the EIS and related supporting documentation. The spatial scale is very small (resulting from ISR mining method) of 160 hectares (for reference, the McIlvenna Bay Project is 1,029 hectares [8 times bigger than Denison's Project]). A conservative approach was taken in the assessment and the overall conclusion was made that there would be no significant adverse residual effects in consideration of proposed mitigations. |

While it is acknowledged that the footprint is not “zero” it is a small footprint on the landscape scale and the assessment of the potential effects of the Project has concluded that the Project will not cause a change in any component of the environment that would alter its status or integrity beyond an acceptable level. Specifically, as it concerns the risk of introduction of contaminants to the environment the following is noted. A Human Health risk Assessment (HHRA) was undertaken for the Project in Section 10. The HHRA evaluated direct exposure to constituents of potential concern (or contaminants) released to air and water, and through indirect exposure to the constituents associated with soil, sediment, and food, such as fish, wildlife, and plants. The assessment was inclusive of information based on use of traditional foods and a specific traditional food diet from ERFN. The overall conclusion of the HHRA was that there would be no significant adverse effects to human health from the Project.</p> |
| 92 | PBCN (March 3, 2023) | General | <p>PBCN has concerns regarding potential impacts to Valued Components including but not limited to water quality, fish, wildlife, aquatic vegetation, Human health, country food consumption, resource use, and socio-economic factors.</p> <p>Areas of specific concern are:</p> <ul style="list-style-type: none"> • What are the potential impacts to the landscape, including aquatic and terrestrial environments? • What are the effects on the growing/carrying capacity of both aquatic and terrestrial environments for Country Foods due to potential changes to the landscape and risk of contaminants? • What are potential accident or spill impacts on the harvesting of plant specific country foods? • Will there be limitations to access lands for country food harvesting due to mining traffic or operation of the mines? • How will Denison use freshwater from Whitefish Lake? • What are the potential impacts to boreal shield woodland caribou? • How will Denison contain effluent from the mine and manage anticipated downstream impacts? The A&M assessment considered almost 70 accident scenarios including many that would relate to the unplanned release of chemicals and radiation to the environment with potential to effect country foods. Specific scenarios including the release of chemicals and radiation to the aquatic environment and to the terrestrial environment adjacent to the ERFN and KML culture camps located along Hwy 914. The overall risks in consideration of likelihood and consequence were characterized as low. The assessment concluded that with planned engineering / environmental design features, mitigation measures, and emergency response, as well as implementing industry best practices that the risks to the environment from accidents and malfunctions can be reduced to levels that are as low as reasonably practical.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|---|---------|--|---|
| 92 | PBCN (March 3, 2023) | General | <p>PBCN has concerns regarding potential impacts to Valued Components including but not limited to water quality, fish, wildlife, aquatic vegetation, Human health, country food consumption, resource use, and socio-economic factors.</p> <p>Areas of specific concern are:</p> <ul style="list-style-type: none"> • What are the potential impacts to the landscape, including aquatic and terrestrial environments? • What are the effects on the growing/carrying capacity of both aquatic and terrestrial environments for Country Foods due to potential changes to the landscape and risk of contaminants? • What are potential accident or spill impacts on the harvesting of plant specific country foods? • Will there be limitations to access lands for country food harvesting due to mining traffic or operation of the mines? • How will Denison use freshwater from Whitefish Lake? • What are the potential impacts to boreal shield woodland caribou? • How will Denison contain effluent from the mine and manage anticipated downstream impacts? Access north of the Key Lake Road is already limited to a select number of individuals/resource harvesters, and will remain in place until such a time that the access is changed by other parties. Limitation to Indigenous Land and Resource Use beyond the Project footprint and along Highway 914 are expected to result from Project related traffic. Denison is sensitive to areas of high value to ERFN and KML along Highway 914, and is working with these communities to ensure that appropriate mitigations and restrictions are in place during periods of intensive use, such as community-hosted cultural camps proximal to Highway 914. These, and any other mitigations could be applicable to all users of Highway 914, inclusive of PBCN. Although the known trapper in the Project area is recently deceased, it is understood that similar uses are expected from future ERFN members. When the trapline is transferred, a trapper's compensation agreement with inclusions for loss of commercial income and/or any in-kind support related to access and continued use will be contemplated with the future user (irrespective of their home community).</p> |
| 92 | PBCN (March 3, 2023) | General | <p>PBCN has concerns regarding potential impacts to Valued Components including but not limited to water quality, fish, wildlife, aquatic vegetation, Human health, country food consumption, resource use, and socio-economic factors.</p> <p>Areas of specific concern are:</p> <ul style="list-style-type: none"> • What are the potential impacts to the landscape, including aquatic and terrestrial environments? • What are the effects on the growing/carrying capacity of both aquatic and terrestrial environments for Country Foods due to potential changes to the landscape and risk of contaminants? • What are potential accident or spill impacts on the harvesting of plant specific country foods? • Will there be limitations to access lands for country food harvesting due to mining traffic or operation of the mines? • How will Denison use freshwater from Whitefish Lake? • What are the potential impacts to boreal shield woodland caribou? • How will Denison contain effluent from the mine and manage anticipated downstream impacts? Based on a conservative (i.e., high) estimate of water taking it was estimated that the taking would result in a reduction of flow of about 3% at times of low flow and the lake level could change by about 1 cm. These small incremental changes would be beyond the ability of monitoring techniques to practically measure and are much less than the natural variability seen. For these reasons the EIS concluded that these minor incremental changes did not represent a significant adverse effect.</p> |
| 92 | PBCN (March 3, 2023) | General | <p>PBCN has concerns regarding potential impacts to Valued Components including but not limited to water quality, fish, wildlife, aquatic vegetation, Human health, country food consumption, resource use, and socio-economic factors.</p> <p>Areas of specific concern are:</p> <ul style="list-style-type: none"> • What are the potential impacts to the landscape, including aquatic and terrestrial environments? • What are the effects on the growing/carrying capacity of both aquatic and terrestrial environments for Country Foods due to potential changes to the landscape and risk of contaminants? • What are potential accident or spill impacts on the harvesting of plant specific country foods? • Will there be limitations to access lands for country food harvesting due to mining traffic or operation of the mines? • How will Denison use freshwater from Whitefish Lake? | <p>The Caribou in SK1 are stable. Potential effects on Woodland Caribou were considered in Section 9.3 of the EIS and it was concluded that there would be no significant adverse effects. The full reasoning for that conclusion can be found in the EIS but the conclusion was based on several factors including the small spatial scale of the Project relative to the SK1 range (0.001%), risk of Project-related mortality being below natural variation, and the various mitigations that will be implemented. An initial Draft Caribou Management Plan has been developed, provided to regulators, and this document will be used as a framework to further reduce or mitigate potential Project-related effects. The plan is a living document that will evolve over time in response to the eventual Provincial overall management plan for the SK1 range.</p> |

Water treatment will occur; testing will occur prior to release; and no release will occur if water quality does not meet objectives. The predictive modeling showed that constituent concentrations including radionuclides would be below water quality objectives for the protection of aquatic life (i.e., no effects would be expected) at the outlet of White Lake well upstream of the outflow of the Iceland River to Russel Lake. Since no impact are expected to occur in these areas close to the Project, it can also be concluded that no effects would accrue in areas further downstream in the watershed where contributing sub watersheds are many, many-times the size of the sub watersheds near the Project site. In addition, the HHRA concluded that there would be no human health risks related to the Project for traditional food users in consideration of traditional food uses in relatively close proximity to the Project site. As above, if Project effects are not found in relatively close proximity to the site, there is no risk of Project effects in more downstream areas. Finally, the A&M assessment (see response to Question #8; Section 14 of the EIS) did evaluate unplanned releases of chemicals and radioactivity to the environment. As noted, the assessment concluded that with planned engineering / environmental design features, mitigation measures, and emergency response, as well as implementing industry best practices that the risks to the environment from accidents and malfunctions can be reduced to levels that are as low as reasonably practical.</p> |
| 92 | PBCN (March 3, 2023) | General | <p>PBCN has concerns regarding potential impacts to Valued Components including but not limited to water quality, fish, wildlife, aquatic vegetation, Human health, country food consumption, resource use, and socio-economic factors.</p> <p>Areas of specific concern are:</p> <ul style="list-style-type: none"> • What are the potential impacts to the landscape, including aquatic and terrestrial environments? • What are the effects on the growing/carrying capacity of both aquatic and terrestrial environments for Country Foods due to potential changes to the landscape and risk of contaminants? • What are potential accident or spill impacts on the harvesting of plant specific country foods? • Will there be limitations to access lands for country food harvesting due to mining traffic or operation of the mines? • How will Denison use freshwater from Whitefish Lake? • What are the potential impacts to boreal shield woodland caribou? • How will Denison contain effluent from the mine and manage anticipated downstream impacts? With respect to employment, as noted in Section 13.3.2.1 of the EIS, Residents of Saskatchewan's North (i.e., those resident in the northern administration district of Saskatchewan, inclusive of PBCN communities) are prioritized for employment as an expected condition of the Surface Lease Agreement, similarly for goods and services to service the Project. With respect to procurement, Denison has established an internal procurement policy approach. The approach requires that Denison consider businesses within the local study area first and the Northern Administrative District second, prior to looking elsewhere (southern Saskatchewan and/or outside of Saskatchewan) throughout all phases of the Project. PBCN businesses would fall in the category of northern Saskatchewan businesses, which would place them in line for second preference if project needs cannot be met within the local study area.</p> |
| 92 | PBCN (March 3, 2023) | General | <p>PBCN has concerns regarding potential impacts to Valued Components including but not limited to water quality, fish, wildlife, aquatic vegetation, Human health, country food consumption, resource use, and socio-economic factors.</p> <p>Areas of specific concern are:</p> <ul style="list-style-type: none"> • What are the potential impacts to the landscape, including aquatic and terrestrial environments? • What are the effects on the growing/carrying capacity of both aquatic and terrestrial environments for Country Foods due to potential changes to the landscape and risk of contaminants? • What are potential accident or spill impacts on the harvesting of plant specific country foods? • Will there be limitations to access lands for country food harvesting due to mining traffic or operation of the mines? • How will Denison use freshwater from Whitefish Lake? | <p>Denison acknowledges PBCN interests in respect of the Project. Detailed monitoring programs to be developed through licensing and this will include how data is going to be reported and shared. The regulators have developed third party monitoring programs and undertake data review on an ongoing basis.</p> |

| 93 | Kineepik Métis Local #9 (KML) and the Northern Village of Pinehouse (NVP) (February 17, 2023) | Water Security Education of In-Situ Recovery and Freeze Wall Technology | <p>Section 1.5 and 3.4 of KML and NVP submission: KML as a community wishes to understand the technical background of water protection processes, the Lixiviant solutions, interactions of chemical compounds with water and toxicity. The KML Community will require this knowledge to have confidence in the continued success of the new mining application on our traditional territories. What are the potential effects to the aquifers and waters around Denison and Wheeler River?</p> <p>KML describes that they need to understand:</p> <ul style="list-style-type: none"> - how water protection processes such as reverse osmosis and water treatment are used in the mining operations. - the exact molecular compounds that are part of the “Lixiviant” solution - how this chemical compound interacts with water and at what concentrations that is becomes toxic. <p>KML further states: “If these processes are not well understood by our communities, how can we state that we are prior informed and offer consensus to the process?”</p> <p>Ultimately, as noted in their summary of Primary Concerns:</p> <ol style="list-style-type: none"> 1) There is a need for funding for education and training to reach a standard of knowledge in mining, science and math required to understand the impacts of uranium mining industry that is expected for an Indigenous community to be able to make free and prior informed decision on impact and expectation of that industry. 2) Development of a centre of Excellence in Pinehouse to organically develop the knowledge transference required for Indigenous community to understand the uranium mining industry including regulations, materials used, transportation, end use of products, education required mitigation efforts etc. 3) Support for training and education to support KML and Pinehouse on uses of artificial intelligence in the mining projects and to what level this activity can be managed by and in the community. A strategy to build capacity for matriculation graduates with the following classes English 30A 30B Chemistry 30, Physics 30, Math 30. <p>KML wants to increase the community western education levels so that they are knowledgeable and have the capacity to protect themselves and the environment.</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>Denison has estimated a workforce of 300 during the two-year Construction phase and 180 during the Operation phase. Mineral sector positions are typically considered to be higher paying than many other industrial positions. Residents and communities in the LSA (ERFN (including Indian Reserve Wapachewunak 192D and Indian Reserve La Plonge 192) and Patuanak, Northern Hamlet (Patuanak); Pinehouse Lake, Northern Village; and Beauval, Northern Village) will be given first priority for employment, training, and business opportunities, followed by residents and communities in the RSA (Northern Saskatchewan Administrative District). Mitigation and enhancement measures will be implemented by Denison to enhance the positive effects of the Project on employment and training, income, traditional economy, and business opportunities and minimize adverse effects including:</p> <ul style="list-style-type: none"> • A Human Resource Development Plan to initially prioritize Indigenous and non-Indigenous communities in the LSA in terms of employment and training opportunities; • Establishment of a procurement approach through all phases of the Project, focusing on businesses based within the LSA communities, followed by Indigenous and / or businesses in the RSA; • Negotiation with the Province of Saskatchewan to develop the Project’s Surface Lease Agreement and Human Resource Development Agreement. <p>See Section 13 for a summary on local, provincial, and federal Project benefits and Denison’s approach to employment, training, and business participation opportunities for communities.</p> <p>See Section 13 for information regarding employment, employment opportunities, and career growth for community members.</p> <p>As outlined in Denison’s Indigenous Peoples Policy, Denison recognizes the critical necessity of advancing reconciliation with Indigenous peoples in Canada and the important role of Canadian business in the reconciliation process. Denison is committed to providing Indigenous people and businesses with sustainable economic opportunities and benefits and sharing the economic benefits of Denison’s business activities.</p> <p>In terms of building capacity locally for emergency response and waste management, Denison supports KML’s vision on these items where it makes sense and is possible and will continue with ongoing discussions in this regard.</p> |
| 94 | KML and NVP (February 17, 2023) | Language and Culture Restitution | <p>Section 2.2 of KML and NVP submission: KML note that loss of language can be correlated to the introduction of the Saskatchewan Uranium Industry.</p> <p>Prior to the industry development, Pinehouse was among the most fluent speaking communities in northern Saskatchewan. All children in Pinehouse spoke Cree with limited English and French capacity. Since the collateral effect of industry became the prominent community discourse the support for Cree language was diminished and marginalized by industry as English is the primary language used by industry.</p> <p>KML and NVP are actively working to determine how to stop the current language extinction process with strategies around creating more resources for culture and language. KML is leading the process for recovering from this loss. KML are using our own source revenue and resources to bring pride in the language and culture for community members of KML. KML will continue to bring this attention to all proponent activities that occur on the KML territory for KML are all are responsible to remove the effects of colonisation and institutional racism.</p> | <p>Denison respects the concern raised by KML regarding language and culture related to working at an industrial operation. Denison and KML will be working on specific items of interest to mitigate these types of concerns through private contractual arrangements, which may include specific mitigation and accommodation measures in this respect.</p> <p>Mitigation measures associated with potential effects to cultural continuity (including knowledge transfer and language) are described in Section 12.1.5 and include:</p> <ul style="list-style-type: none"> • working with Indigenous COIs to understand culturally important periods relative to harvest times and cultural camps to facilitate Indigenous employees taking time off to participate in such activities; • implementation of Denison’s Indigenous Peoples Policy and advancement of reconciliation • Using a commuter rotation system has also shown to be effective in allowing Indigenous employees continued opportunities to spend time on the land, and important factor in the transmission of knowledge and language (see Section 11 for a description of potential effects to land use). |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|--|--|---|--|
| | | | | <p>In discussions with Indigenous Communities of Interest since the filing of the draft EIS, it has become apparent that Denison should add additional commitment / mitigation measure in relation to this area of interest, as follows:</p> <ul style="list-style-type: none"> • Encouragement to speak languages of choice while at site, except during safety sensitive situations. <p>Section 12.1.5 of the final EIS will be updated to include the additional commitment / mitigation measure in relation to culture and language, as follows:</p> <ul style="list-style-type: none"> • Encouragement to speak languages of choice while at site, except during safety sensitive situations. |
| 95 | KML and NVP (February 17, 2023) | Mining methods and education Education of In-Situ Recovery and Freeze Wall Technology | <p>Section 3.1 and 3.4 of KML and NVP submission: KML and NVP must be educated on all aspects of the Denison project to remove limited understanding of the processes that occurred within our traditional territories. They note that they cannot learn how to protect the land if they cannot understand the math and science involved in mining and environmental protection. KML people require higher education levels because of the collateral effect, on their population, caused by industry [which the proposed Wheeler River project adds to]. They further assert that they must understand the technological advantages being employed in the Denison Wheeler River Project. This transference of knowledge can occur through a sustained and supported education program.</p> <p>The community will also require confidence that any environmental incidents are managed in a way that is fully understood by the community. A long term plan would be to develop and build that capacity in the community to manage the incidents and monitor any environmental cleanup processes. They want assurance that the standards being followed and that as a community, KML are able to action a response to mitigate potential environmental impact. This knowledge must become an integral part of the community knowledge and capacity for this project and for uranium exploration and mining in general.</p> <p>As noted in their summary of Primary Concerns, this includes:</p> <ul style="list-style-type: none"> - Begin training and education support for community to prepare for employment at the mining operations with a focus on females, youth, and previously marginalized land users. Effort to increase employment in trades and drilling related work. <p>See also other related Primary Concerns from Document, #1-3.</p> | See responses to KML and NVP Public Comment #93 |
| 96 | KML and NVP (February 17, 2023) | Road safety concerns Maintenance of 914 road with 914 Extension | <p>Section 5 and 5.2 of KML and NVP submission: When determining community safety with respect to need for increased transportation for a new operation, the Indigenous people of KML have the following concerns:</p> <ul style="list-style-type: none"> - The state of the existing road from 165 to 914: The road has received upgrades up to the kilometer 75 on highway 165. From Kilometer 75 to Kilometer 112 where Highway 165 ends and Highway 914 begins, Highway 914 needs an upgrade in width all the way to Pinehouse to create a more industrialized road. KML are not looking forward to the spring road conditions with just the current industry activity. - Every community member has reported near miss incidents with the increased traffic caused by the general resurgence of the Uranium Industry using semi truck and heavy hauls to transport material to the operations and project sites. With the increase in incidents and near misses the opportunity for a major incident is inevitable, with the current road conditions. Adding the development of a new Denison mining operation will only increase this potential for incidents for people using this road. - When you add the rough road conditions, visibility reduction in the winter and summer with dust and snow flurry from large vehicles. This causes unsafe conditions and increases the potential for incidents. - The current capacity for road maintenance from the community members of Pinehouse are not prepared for the additional maintenance requirements for the road becoming a connected road. <p>The road must be developed to an industrial rating to allow for the increase in industrial use so that members of KML do not experience safety issues. KML is requesting that the Transport Canada, Ministry of Highways respond to the concerns of Pinehouse and inform the community of the plans for road infrastructure development. KML would request the road be developed to the standard that the Key Lake and McArthur River road is managed all the way to Junction of Highway 165 and Highway 2.</p> <p>KML and NVP request further capacity to develop road management capacity so KML can provide the support necessary to manage the integrity of the road.</p> | <p>The EIS for the Wheeler River Project was completed with consideration of Project components that include: ISR, Drilling, Freeze Wall, Wellfield, Processing, Water Management, Waste Management, Access and Transportation, Power, Support Facilities, Project Area, Project Activities, Ancillary Projects, GHG Emissions, Project Schedule, Project Benefits, Project Design Features, Management System, and Project Alternatives.</p> <p>Through an alternative means assessment, Denison considered options in relation to access and transportation. The access road alignment will follow part of the existing exploration access road, stream crossing structures will use clear span bridges, and worker transportation will be air transport to a) nearby Cameco operations or, b) a new airstrip constructed and operated by Denison.</p> <p>Denison incorporated the feedback provided on road options select the current road alignment for the Project.</p> <p>See Section 2 of the EIS for information and technical detail pertaining to Project Components and Project alternatives; see also EIS Appendix 2-C for Alternative Means Assessment.</p> <p>Highway improvements are not within Denison's jurisdiction and are not considered in the EIS for the Wheeler River Project. However, Denison notes KML's perspective of increased traffic volumes and subsequent desire for highway improvements.</p> <p>On Highway 914 between Key Lake and Pinehouse, Denison anticipated that road users would see an increase between 16% and 40% over the life of the mine. Trucks travelling on this section of highway will increase from 35 to 53 at peak operational times.</p> <p>Denison's vision in respect of this concern is that Denison and KML work together as partners in discussions about highways with the Provincial Government.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----|--|---|--|---|
| | | | <p>As also noted in their summary of Primary Concerns, this includes a requirement for:</p> <ul style="list-style-type: none"> - Immediate efforts to build and increase emergency response capacity with community people from KML and NVP to support capacity for road incidents. - Significant improvements to the road to an industrial grade from Highway 2 to the Key Lake gatehouse to support the massive increase in heavy traffic from Industry <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>However, in respect of actions Denison can undertake regarding traffic along the road at times important for the undertaking of cultural activities, Denison commits to:</p> <ol style="list-style-type: none"> 1) Assisting KML with the clear identification of the forthcoming culture camp along highway 914 (providing clear signage) 2) Having Project vehicle slow down to 40km/hr from mid-August to mid-October, during the times when KML members may be using the portion of the road near the culture camp. To be specific, this includes 2.5km before the entry into the culture camp, and 2.5km after the entry into the culture camp. <p>See Denison's response to comment #97 for information pertinent to emergency response capabilities.</p> <p>See EIS Section 2, Appendix 2-B for more detail pertaining to traffic volumes.</p> |
| 97 | KML and NVP (February 17, 2023) | Emergency Response Services | <p>Section 5.1 of KML and NVP submission: Pinehouse will inherit significant impacts from the transportation of goods and services to the mining operations. Safety of our community member is a paramount concern for the community. KML will be impacted from increased heavy haul traffic and this will impede our ability to hunt for food. KML will also bear the effects of needed emergency services from our community first from the increased need for emergency response, which could dilute the limited emergency response services KML currently are provided. KML will also inherit any future security emergency requirement and expanded exploration and developmental impacts.</p> <p>The expectation is that within the life of the mine the community and industry will co- develop capacity to engage in emergency response including environmental spills, traffic incidents, air traffic incidents, emergency road security, search and rescue, fire fighting, and water rescue. See also other related Primary Concerns from Document, #5.</p> | <p>Denison will establish a Transportation of Dangerous Goods Program, intended to provide for the safe transport of goods by conforming to all applicable laws, regulations, company policies, and procedures. The Transportation of Dangerous Goods Program applies to all modes of transport and all locations where Denison assumes care and control of the materials.</p> <p>Denison will establish an Emergency Preparedness and Response Program to identify how the Project will prepare for and addresses emergencies that may affect the health and safety of persons, the environment, and the protection of property. Emergency Preparedness and Response Program would be developed consistent with guidance provided by CNSC in REGDOC-2.10.1, Nuclear Emergency Preparedness and Response (CNSC 2016).</p> <p>Increased pressure on emergency services is most likely to stem from an accident or malfunction on Highways 914 or 165. The extent to which these changes could affect any given community would depend on the nature of the accident or malfunction. Accidents and malfunctions for the Project were determined to (generally) have a highly unlikely to unlikely probability of occurrence, with an overall risk rating of low to moderate; however, the severity of accidents and malfunctions was determined to be minor to major. If such an event were to occur, local resources may be called upon to provide support, which may result in a call to fire, RCMP, or ambulance services depending on the nature of the event. Denison will provide any necessary training and/or equipment to local first responders to make sure they are sufficiently prepared to deal with an unlikely accident or malfunction.</p> <p>Denison's objective is to utilize existing emergency response teams from other operations prior to drawing on community-based resources. In the unlikely event that this were to occur, and KML resources were drawn upon, the Agreement negotiated between provides the foundation for discussions in respect of such incidents.</p> <p>See Section 2 for information pertaining to the above programs.</p> |
| 98 | KML and NVP (February 17, 2023) | Waste management of new development and historical issues | <p>Section 6.1 of KML and NVP submission: KML is concerned with cumulative impacts from historical legacy exploration and mining practices. Not specific to Denison, Cameco or Orano, KML notes that land users have often found remnants of past poor exploration practices which are now affecting our continued land use. The abandoned camps and industrial and domestic waste left with no known program for clean up are the most significant of these remnants. They would like the EIS to host in partnership with provincial government regulators to host a conversation on progressive reclamation of these legacy sites.</p> <p>This conversation should prioritise the community capacity and an environmental agent for process that occur on our traditional territories. This conversation could include changing the policies of waste (future waste) being brought into the NAD. KML's contention is that waste that is brought into the region should be removed entirely from the region. The need for a regional waste management facility or a transfer station must be developed in partnership with KML.</p> <p>As noted in their summary of Primary Concerns, this includes a requirement for:</p> <ul style="list-style-type: none"> - Immediate efforts to build capacity in a regional waste management operation within or near the community. To build current and future expertise in domestic waste, special waste, recycling, and the development of a transfer station in Pinehouse to support all mining activity including current operation and exploration. | <p>Denison conducted a cumulative effects assessment, which included the Highway 914 extension project, on categories the Atmospheric and Acoustic Environment; Geology and Groundwater; the Aquatic Environment; the Terrestrial Environment; Human Health; Land and Resource Use; Quality of Life; and Economics.</p> <p>Denison respects and understands KML's concern about the cumulative effects in the region, particularly in relation to access to traditional lands and resources in correlation with industrial and mining developments. The residual effects of the Project are expected to interact with the residual effects of other projects and activities in the ILRU RSA, resulting in potential cumulative effects to Indigenous land use activity in the area. This is largely due to the proposed Highway 914 extension project.</p> <p>See Section 16 for a summary of the cumulative effects assessments for each category above.</p> <p>As outlined in Denison's Indigenous Peoples Policy, Denison recognizes the critical necessity of advancing reconciliation with Indigenous peoples in Canada and the important role of Canadian business in the reconciliation process. Denison is committed to providing Indigenous people</p> |

|-----|--|---|--|---|
| | | | [Additional questions on this topic directed to regulators or government entities are included in the CNSC table] | <p>and businesses with sustainable economic opportunities and benefits and sharing the economic benefits of Denison's business activities.</p> <p>In terms of building capacity locally for emergency response and waste management, Denison supports KML's vision on these items where it makes sense and is possible.</p> <p>General discussions to continue as part of ongoing dialogue.</p> |
| 99 | KML and NVP (February 17, 2023) | Loss of Use and Access to Traditional Lands and Resources | <p>Section 6.2 of KML and NVP submission: While one project or mining operation does not materially affect KML's land use practices, the substantial and growing projects and mineral exploration activity severely limits their ability to practice land use for the region north of Haultain River. KML land users are now experiencing loss of use with some areas leading to complete exclusion for food sovereignty and traditional activities. As an example of this, hunting practices currently use high powered rifles to engage with big game including moose, bear, deer, and caribou in the area.</p> <p>How will Denison ensure the community can continue to practice this method of food gathering in a safe method?</p> | <p>In 2018, KML approached Denison to support a land use mapping initiative in the Project area. The 2018 study builds on existing land use maps, completed in 2011. A verification meeting was held in late 2018 to make sure no geographic data gaps existed and that the results speak for the whole community. In 2022, KML prepared a document to voice their perspectives on Project VCs and to provide a record for EIS development. Based on 12 community engagement sessions and review of the land use maps, KML explained their unique social, cultural, and historical context, expressed a general consensus of support for the Project, and described issues and concerns.</p> <p>See Section 3 for information on IK and LK and how this information was integrated throughout the EIS. See Section 11 for information on how the Project will interact with land and resources including how potential effects will be mitigated.</p> |
| 100 | KML and NVP (February 17, 2023) | UNDRIP and TRC Protocols | <p>Section 6.3 of KML and NVP submission: KML sees limited mention that this project has respected the intent of the United Nations Declaration on the Rights of Indigenous People or the Recommendations of the Truth and Reconciliation Commission. There is limited opportunity for this project to review the implications of UNDRIP and TRC and how this project will cause to effect for the Indigenous rights bearing members of Pinehouse. This is not case for other agencies providing information for this project.</p> <p>KML request advocacy to increase education for external agencies on the need to develop greater understanding of UNDRIP and TRC calls to actions. These agencies can be contractors, regulators, and managers within the companies. This process could be developed if the agencies co develop a centre of excellence in Pinehouse.</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>Denison respects KMLs perspectives on the matter and understands this is not an industry only prerogative. As outlined in Denison's Indigenous Peoples Policy, Denison recognizes the critical necessity of advancing reconciliation with Indigenous peoples in Canada and the important role of Canadian business in the reconciliation process. Denison is committed to providing Indigenous people and businesses with sustainable economic opportunities and benefits and sharing the economic benefits of Denison's business activities.</p> |
| 101 | KML and NVP (February 17, 2023) | Co-Management, Food Sovereignty and Métis Land Access | <p>Section 6.4 of KML and NVP submission: Potential impacts to KML are from increased development and access to their territory. Current provincial regulation of hunting, fishing, tourism, resources development and increase human traffic will affect and limit our ability to practice our protected rights. Western business with greater acumen may displace economic activity as they note that they are still evolving their understanding of the industry business practices.</p> <p>KML request further study on how current provincial regulations including opportunity for co-management so lessen the impacts from this project and from increased encroachment.</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>See response to KML and NVP Public Comment #99. The Agreement negotiated between Denison and KML outlines specific commitments for KML participation in environmental monitoring associated with the Project.</p> |
| 102 | KML and NVP (February 17, 2023) | Waste Management Plan | <p>Section 6.5 of KML and NVP submission: Waste generated from the operation, construction and maintenance of mines and exploration projects need to be better understood by the community. KML is of the view that waste management may represent the greatest source of environmental liability arising from this project and the mining industry in northern Saskatchewan in general. KML request that planning for waste management including capacity for Pinehouse to host a waste management company and a transfer station in Pinehouse to be considered. As a community that uses this land for food, shelter and culture KML want the capacity and responsibility to manage waste for this project and the industry in general and prepare for future development.</p> <p>See also other related Primary Concerns from Document, #6.</p> | <p>As outlined in Denison's Indigenous Peoples Policy, Denison recognizes the critical necessity of advancing reconciliation with Indigenous peoples in Canada and the important role of Canadian business in the reconciliation process. Denison is committed to providing Indigenous people and businesses with sustainable economic opportunities and benefits and sharing the economic benefits of Denison's business activities.</p> <p>In terms of building capacity locally for emergency response and waste management, Denison supports KML's vision on these items where it makes sense and is possible.</p> <p>General discussions to continue as part of ongoing dialogue.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----------------------------------|--|-----------------------|--|--|
| 103 | KML and NVP (February 17, 2023) | Waste Management Plan | <p>Section 6.5 of KML and NVP submission: KML describes Indigenous Economic Leakage and Triggered Response Capacity as concerns:</p> <ul style="list-style-type: none"> - Indigenous Economic Leakage: the lack of capacity within Indigenous communities like Pinehouse prior to massive development projects like uranium mining operations. No ability in existing community development to capitalize on industrial activity in their areas because of historic colonization and racism. There are limited businesses, stores, materials and infrastructure within community to support and build upon. - Triggered Response Capacity: the respond required by the Indigenous people of KML to meet the need of industry. The community is required to change focus away from Indigenous community needs to focus on the needs of Industry. This includes time to respond to the industrial education, safety protocols, regulatory responses. The need as a community to participate in the Duty to Consult on exploration requests, feasibility studies, Environmental impact studies, negotiate agreements, industry training requirements. All of this removes the community ability for practicing Indigenous cultural activities, less time of Cree language retention. This response increases as the Collateral Effect increase. <p>It is acknowledged by KML that these are factors are exacerbated by an additional mine. As noted in their summary of Primary Concerns, this necessitates:</p> <ul style="list-style-type: none"> - Systemic increases in the use of services in Pinehouse including COOP store and PBNLP, Pinehouse Housing Corporation, Pinehouse Fishing COOP and Wild Rice, and KML Métis Local to prevent the continuation of Indigenous economic leakage. - Consideration to build industry supporting infrastructure such as warehousing, hotels, bulk fuels parts and mining necessities in Pinehouse to support community development and to stop the Indigenous economic leakage which has occurred over the last 50 years of development. <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | See response to KML and NVP Public Comment #102. |
| Main Area of Concern for ERFN #1 | | | <p>Concern was raised for the use of the more sophisticated CALPUFF modelling package rather than Meteorological Society / Environmental Protection Agency Regulatory Model. Has the province accepted this method as appropriate? Concern is in reference to Section 6.1.4.2.</p> | <p>As described in Section B.1 of Appendix 6-A, staff at the Saskatchewan Ministry of Environment (Air Quality Branch) were consulted on the selection of CALPUFF and development of the CALMET meteorological data set, beginning in 2019. The CALMET consultation included an initial discussion about the general approach, and once the CALMET runs were completed, two technical memos were produced and reviewed by Ministry staff including: 1) a memo completed in March 2020 summarizing the general CALMET approach and results (e.g., wind roses, temperature data, precipitation data); and 2) a follow-up memo completed in May 2021, which answered specific questions posed by Ministry staff. Ministry staff also completed a review and provided feedback on the CALPUFF model setup in August 2021. The specific rationale for the use of CALPUFF in lieu of AEROMOD as documented in the March 2020 memo was as follows:</p> <ul style="list-style-type: none"> • The domain size needed to generate inputs for the human health and ecological risk assessment (HHERA) is estimated to be 60 km by 60 km. The Saskatchewan Air Modelling Guide recommends CALPUFF for long-range transport (i.e., > 50 km); • CALPUFF includes wet and dry removal processes and chemical transformation algorithms that are needed to generate inputs for the HHERA and the terrestrial and aquatic assessments; and, <p>The approach is consistent with other uranium mines in the area.</p> |
| Main Area of Concern for ERFN #2 | | | <p>ERFN would like to further understand the progressive remediation of the mining area proposed, including thawing of the freeze wall in phases; it is believed reasonable for ERFN to request the following:</p> <ol style="list-style-type: none"> Engagement between ERFN and Denison Mines throughout the life of the project, specifically pertaining to the remediated / restored solution targets and associated environmental effects monitoring. The EIS appears to only provide the remediated / restored solution targets and the concentration of COCPs following mixing in Whitefish Lake Middle (the basin where impacted groundwater expected to interact with the receiving environment). ERFN requests clarification on the targets and concentrations in the EIS. Alignment of environmental risk assessment updates and review of updates by ERFN prior to execution of progressive mine area remediation phases. Prior to freeze wall thaw, there should be approved progressive decommissioning objectives that are considered conservatively protective of the receiving environment and contingency planning that would allow for continued remediation following freeze wall thaw, if this is deemed necessary by monitoring results. Further, the progressive decommissioning objectives should be considered living and reviewed regularly, as a finalized decommissioning and closure | <p>With respect to:</p> <ol style="list-style-type: none"> Denison has committed to meeting the mining area decommissioning objectives presented in the draft EIS (Table 2.3-3). These were modelled in draft EIS Section 7 with recharge to Whitefish Lake. Refinement of mining area decommissioning objectives is expected as part of updates to the decommissioning plan, which forms the basis of the decommissioning cost estimate and associated financial assurance. The conceptual decommissioning plan (CDP) included in the draft EIS (Section 2.3.3) contains the appropriate level of detail for this stage of the Project and recognizes that the details of the decommissioning plan and the elements thereof (including remediation and restoration targets and monitoring) will evolve and become more detailed and specific as the Project advances. The subsequent iteration of the plan is the preliminary decommissioning plan (PDP) which will be submitted to regulators as part of Project licensing and permitting. The PDP would reflect input that will be solicited from ERFN and others prior to its submission. Finally, prior to executing decommissioning activities, Denison shall prepare and submit a detailed decommissioning plan (DDP) to regulators for acceptance, which builds on the PDP. In this case the DDP would reflect input that will be solicited from ERFN and others prior to its submission and would also be informed by conditions on the ground at the Project site at that time, operational experience that has been gained and the regulatory landscape at |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----------------------------------|--|--|---|---|
| | | | <p>plan has not been approved. Concern is in reference to Section 2.3.3.1.1.</p> | <p>that time. To reiterate, as highlighted above, the decommissioning plan, including the mining area decommissioning objectives, will evolve over time becoming more detailed and specific as the Project advances. Denison is committed to working with ERFN to solicit input through this process.</p> <p>ii. From Denison's response and EIS contents, Denison is committing to no residual effects to groundwater beyond the mining area during operations and during decommissioning activities; nor effects from changes in groundwater to surface water in the vicinity of the project during the same time period. As such, no potential groundwater effects pathway occurs until restored solution targets are achieved and controls isolating the mining area are removed. As interpreted, this would imply that during operations and early decommissioning activities, there will be no measurable change to groundwater outside of the mining area.</p> <p>iii. As recommended, Denison will work with ERFN to align the ERA updates and reviews of those updates as recommended.</p> <p>iv. The narrative posed by the review comments is consistent with Denison's perspective on how the decommissioning process (and therefore development of the decommissioning plan including decommissioning objectives) will be implemented. The reader is further referred to the response to part i provided above that describes the overall progression of the CDP to the DDP. As noted, Denison will engage with ERFN to solicit input during all phases of the process and Project.</p> |
| Main Area of Concern for ERFN #3 | | | <p>ERFN would like clarification on whether or not start up of backup generators for the injection and recovery wells and IWWTP will be immediate? Is there a concern of loss of mining solution containment because of a power outage? ERFN understands there will be planned period when the IWWTP will be offline, does this planning also encompass unplanned events? ERFN requests commitment from Denison Mines of ongoing engagement pertaining to the development of the wellfield environmental effects monitoring and Emergency Preparedness and Response Plan. Concern is in reference to Section 2.2.6.2.</p> | <p>Electrical service to the Project will be provided via an approximate 5-km extension tap from the existing 138 kV overhead transmission line that runs along Highway 914. Denison expects an average of six outages per year based on information provided by SaskPower. An outage would be anticipated to last a few hours for a given event. As noted in the draft EIS, Denison will have back-up power supply available with diesel generators to supply power to essential services and functions.</p> <p>In the event of a power interruption, essential services would include the processing plant HVAC system and ensuring the power to the processing plant was maintained to provide Denison the overall ability to shutdown the processing plant in a safe manner. While this is happening (i.e., processing plant shut down), the majority of the electrical loads from the generators will be directed to these activities. Once the processing plant is shutdown safely, loads can then be redirected on a priority basis.</p> <p>In terms of the wellfield operation, the inwards hydraulic gradient only needs to be maintained when mining solutions are being injected. In the event of a power interruption, no mining solution injection would be occurring, therefore no UBS recovery would be required for vertical containment as the system would become static. Denison may use the "sit and soak" method in the wellfield as part of routine ISR mining (i.e., no injection or recovery) which essentially provides Denison the ability to store or hold solutions underground.</p> <p>In terms of the freeze wall, the design and nature of the freeze wall means that the integrity of the freeze wall will not change during short-term power outages. Even if a longer outage is envisioned, freeze wall integrity is would not be compromised. Once developed, the freeze wall would take months to thaw. It is also noted that the freeze wall provides tertiary containment of the mining solution / UBS.</p> <p>With regard to unplanned events and/or care and maintenance situations, Denison would manage the wellfield as follows:</p> <ol style="list-style-type: none"> 1. Provided power is still available to site the UBS can be used as make-up in the mining solution and recirculated into the wellfield in a closed loop system. 2. If power is lost to the site, the well pumps can be shut off with existing mining solution and UBS remaining stagnant within the mining zone. As the mining zone is contained within the freeze wall with the combined absence of pumping/injecting, no hydraulic gradient existing (translating to no flow). <p>As per correspondence dated July 26, 2023, Denison is committed to engagement with ERFN where input will be solicited and opportunity for document review will be provided, as necessary, for the Environmental Management Program, including development of the Heritage Resource Management Plan, Emergency Preparedness and Response Plan, and Environmental Effects Monitoring Programs. Denison and ERFN have an agreed upon process for such activities in the future.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----------------------------------|--|--|---|--|
| Main Area of Concern for ERFN #4 | | | <p>It appears that a specific source term for the clean waste rock has not been provided, and that if deemed to need management a liner will be integrated into the pond design and contact water would be sent to the IWWTP. ERFN expects that the material would be non-potential-acid generating and non-potential metal leaching. ERFN is asking for clarification as to what will inform this decision, for example is it that the clean waste rock would not need management if the leachate would meet surface water quality guidelines?</p> <p>Concern in reference to Section 2.2.4.8.</p> | <p>Conceptually, clean waste rock is defined as non-mineralized and non-potentially acid generating (non-PAG) rock. More precise criteria (numeric and/or narrative), and testing program documentation, will be developed as part of the Waste Management Program that will describe the basis for waste rock segregation based on mineralized content and acid generating potential.</p> <p>For further reference the following is noted. "Clean" waste rock (as described above) is expected to comprise clean sandstone cuttings and core. Waste rock from the sandstone will be characterized during construction and operation per the Waste Management Program prior to placement on the clean waste rock pad. Waste rock characterization will be done primarily based on geological and geochemical characteristics though static and kinetic testing, as appropriate, following standard testing guidance to ensure the rock is both non-mineralized and non-PAG. Any waste rock identified as being mineralized or PAG will be stored on the special waste pad. While the draft EIS did not definitely state that a clean waste rock pond would be constructed, Denison has since committed to constructing a single geomembrane lined pond adjacent to the clean waste rock pad to collect contact water. The contact water in the clean waste rock pond will be routed to the process water pond for eventual treatment in the IWWTP and ultimately released to Whitefish Lake.</p> |
| Main Area of Concern for ERFN #5 | | | <p>In the EIS, there are no details provided in relation to the off-site processing and permanent disposal of the process precipitates. Please clarify whether or not this activity will be encompassed in decommissioning and closure or would this activity potentially occur during operations. As there are processing and disposal options within ERFN Nutsiye-kwi Benéne, ERFN requests commitment from Denison Mines to ongoing engagement pertaining to this component of the operations.</p> <p>Concern in reference to Section 2.2.4.5.</p> | <p>Denison is committed to continued dialogue with ERFN on the details related to the sale, transport, off-site processing, and final disposal of the process precipitates. At this time it is envisioned that these details will be developed as part of the decommissioning plan updates and will outline the timing for when these assets are removed from the Wheeler River Project site, as well as the regulatory approvals process to which such activities may be subject, including but not necessarily limited to provincial approvals or federal licensing requirements and statutory obligations such as those described in the Transportation of Dangerous Goods Regulations.</p> |
| Main Area of Concern for ERFN #6 | | | <p>It appears to be stated that during construction contact water discharge to the receiving environment from the Clean Water Rock Pond might be required in the case of upset conditions (e.g., extreme precipitation event). As such, ERFN requests commitment from Denison Mines to ongoing engagement pertaining to development of a Construction Environmental Management Plan, including discharge monitoring and trigger action response planning, as well as having a qualified environmental professional design this plan and/or be present during high-risk construction activities.</p> <p>Concern in reference to Section 8.3.4.2.1 and Section 8.3.4.2.3.</p> | <p>During construction, no effluent is expected to be released to the aquatic environment.</p> <p>As part of both diamond and rotary drilling activities during construction, a centrifuge will be used for separating out solids in order to recycle fluids. Only solid drill cuttings, not wastewater, will be produced and all muds and waters will be recycled as part of the drilling process. Upon completion of a drilling campaign, all remaining mud and water will be stripped of solids, treated with mud zymes to break down polymers, and injected back down into the mineralized horizon. During active drill campaigns clean water will be held in approved tanks.</p> <p>Any contact water stored in the clean waste rock pond during construction will be held onsite until the Industrial Wastewater Treatment Plant (IWWTP) is commissioned. At that time the water from the pond would be conveyed to the IWWTP, treated, and released to Whitefish Lake per permit / licence requirements.</p> <p>It is also important to note that the sequencing of construction activities will occur in a manner that prioritizes water management based on Project execution plans. For instance, construction of the wellfield runoff pond will be prioritized during the early part of construction and it will be able to hold 38,200 m3 of water. This will provide contingency and additional water storage capacity if contact water produced exceeds estimates or the volume available in the clean waste rock pond during construction. Should the volume of water requiring management exceed site infrastructure storage volumes during construction, contingency measures would be available and could include for example use a hydrovac for offsite disposal.</p> <p>More broadly in terms of Project water management pond designs, ponds will be constructed to maintain a minimum freeboard of at least 1.0 m to allow for continued functioning during a probable maximum precipitation (PMP) event. The PMP event used for feasibility engineering designs is 493 mm. The PMP is very conservative as it effectively assumes a full year of precipitation in one event, under both existing and future climate conditions. For comparison, the PMP is well above both the 24-hour maximum precipitation (e.g., 72 mm recorded at Key Lake in 1998) and 1:100, 24 hour return precipitation events (e.g., 88.6 mm for climate change influenced IDF curves). However, in the event that a pond's design basis is exceeded, emergency spillways will direct excess water away safely as not to compromise the integrity of</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|----------------------------------|--|--|---|---|
| | | | | <p>the water management infrastructure. An unplanned event such as a pond exceeding its design capacity will be reported to ERFN in a timely manner per the commitments in the Public Information Program.</p> <p>ERFN's engagement and review of the Environmental Management Program, including the Emergency Preparedness and Response Plan, will be completed in the agreed upon process for such future activities. The program and plans will outline commitments for the construction phase. While details on the plans are not available at this time, Denison welcomes ERFN's input and recognizes the importance of having qualified environmental professionals onsite during construction activities.</p> |
| Main Area of Concern for ERFN #7 | | | <p>In relation to IWWTP effluent it is stated that discharge will be to a surface waterbody or injected into groundwater via deep well inject. However, the EIS only assesses direct release of 10.1 L/s of effluent to Whitefish Lake during operations and decommissioning. As such, any deviation from this discharge plan would need to be assessed and approved prior to implementation. Concern in reference to Section 8.2.4.1.</p> | <p>Reference to effluent discharge via deep well injection was a typo in the draft EIS and will be removed from Section 8 of the final EIS. Effluent release is to Whitefish Lake only and no deep well injection of effluent is planned.</p> |
| Main Area of Concern for ERFN #8 | | | <p>Can you provide clarification re: Sulphate and sulphate (Hardness) concentrations provided? It would be anticipated that the screening concentration would change because of hardness, but it is unclear as to why the predicted concentration would increase?</p> <p>Concern in reference to Table 8.2-10.</p> | <p>There was a typographical error in Table 8.2-10 in the draft EIS; the sulphate (hardness) value in column LA-5 Well Mixed (7Q10) should read 63.83 mg/L. Table 8.2-10 is updated in the EIS and also includes the addition of MDMER constituents (these were added to address a comment from the federal review process, IR-114).</p> |
| Main Area of Concern for ERFN #9 | | | <p>Specifically, the EIS appears to only provide the IWWTP effluent quality and the concentration of COCPs following mixing in Whitefish Lake Middle (the basin where impacted discharge is expected to interact with the receiving environment). As dilution in Whitefish Lake Middle is required to meet guidelines for some COCPs, are chronic toxicity effects possible within the initial dilution zone within the basin including salinity? If yes, what portion of the available habitat would be impacted by elevated levels of COCPs? In relation to the potential for chronic exposure within a dilution zone, ERFN requests engagement as this should be captured within the aquatic effects monitoring. Concern in relation to Section 8.2.4.2.3.</p> | <p>An analysis of near-field effluent mixing was undertaken as part of the EIS, based on discharge to Whitefish Lake through an off-shore multiport diffuser. Simulations were carried under different flow scenarios using CORMIX to assess the size of the mixing zone. In this case, the meaning of "mixing zone" can be used synonymously with "regulatory mixing zone" that is defined as an area (or water volume) where numeric water quality thresholds (i.e., chronic effects thresholds) may be exceeded as long as conditions inducing acute toxicity are prevented. Such a situation (i.e., existence of a regulatory mixing zone) is envisioned by the MDMER (and in fact permitted by statute), as well as the provincial water quality policy framework.</p> <p>The results of effluent mixing analysis predicted that the regulatory mixing zone would be very small under each of the modelled scenarios. It was predicted that constituent concentrations would be equal to or less than their respective water quality objectives (i.e., chronic effects thresholds) within a few meters (up to 5 m) of discharge and by definition those constituent concentrations would be protective of the most sensitive life stage of the most sensitive resident aquatic taxa.</p> <p>Both effluent-based and receiver-based monitoring plans will be developed as the Project moves forward and Denison is committed to working with ERFN in that process. For reference, at minimum the programs would be designed consistent with and to meet the requirements of the MDMER, as well as provincial operating permits that will be negotiated subsequent to the EA process. Under MDMER, effluent (end of pipe) monitoring would include laboratory-based chemical and biological (acute and sublethal toxicity) measurement and testing (see MDMER Part 2, Division 2 – Effluent Monitoring Conditions). Under MDMER, receiver-based monitoring, including effluent and water quality monitoring studies and biological studies are completed within the framework of the Environmental Effects Monitoring program (MDMER, Schedule 5).</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----------------------------------|--|--|---|--|
| Main Area of Concern for ERFN #10 | | | <p>It would appear that a temperature assessment was not completed for the proposed heated treated effluent discharge line. It is assumed if there is the potential for adverse effect to the receiving environment, discharge limits would be stipulated as a licensing condition. ERFN requests engagement regarding the establishment of effluent discharge limits, as well as finalized remediated/restored solution targets.</p> <p>Section 8.2.4.2.5.</p> | <p>The EIS does consider the potential thermal effects of effluent in Whitefish Lake; please refer to Appendix 8-E Constituent Concentrations and Mixing Zone Assessment Report. Because the effluent holding ponds are outside, Denison anticipates very minimal differences in the temperature of effluent entering the lake versus the lake water itself. Effluent will be discharged to Whitefish Lake via a pipeline and multiport diffuser that will be situated at depth of 3-4 meters depth. The effluent itself will be held in effluent monitoring ponds prior to discharge and maximum effluent temperature is assumed to be 5 degrees Celsius during the winter. Water temperature in Whitefish Lake during ice-cover is expected to be between 3 and 4 degrees Celsius. As such, the effluent may have a temperature difference of between 1 and 2 degrees Celsius in the immediate zone of the diffuser ports. Mixing of the effluent with the receiving water will be nearly instantaneous and over an area of less than 5 m and generally near its depth of discharge (3 to 4 m). As a result, the thermal change within the highly localized mixing zone will be less than a degree Celsius.</p> <p>We note that Denison will be collecting field temperature in effluent samples as part of the requirements under Schedule 3 of the MDMER. Water quality monitoring will also be conducted to meet the requirements of the MDMER and includes recording temperature of water in both exposure (e.g., Whitefish Lake) and reference areas, per MDMER Section 7(1)(b). It is also assumed that similar monitoring requirements would be included within provincial approvals.</p> <p>The above monitoring will allow Denison to test the assumptions made in the EIS and to understand any potential thermal effects of effluent in Whitefish Lake. This level of monitoring is appropriate as a starting point. If based on monitoring data it was evident that the EIS assumptions were not being met the monitoring program would be adapted accordingly. This approach is consistent with Denison's overall approach to its proposed environmental monitoring programs that will incorporate adaptive management.</p> |
| Main Area of Concern for ERFN #11 | | | <p>Can it be clarified as to whether or not the clear span bridges proposed for stream crossings will be temporary or intended for use throughout the life of the project? There is uncertainty as the DFO Interim Code of Practice for Temporary Stream Crossings, but the use of these crossing doesn't seem to be limited to a limited stage of the life of mine?</p> <p>Concern in reference to Section 8.3.5.</p> | <p>The two clear span bridges proposed at stream crossing locations would be in place for the life of the Project to allow for transportation of staff and contractors between the airstrip and the main Wheeler River Project site.</p> <p>Section 8.3.5 of the draft EIS does list adherence to the Interim Code of Practice for Temporary Stream Crossings as a mitigation measure, as applicable. Denison does not expect this code of practice would apply to the final, constructed clear span bridges, since these are not temporary structures. However, depending on how construction sequencing and logistics proceeds, Denison may use temporary watercourse crossings to access the eastern shores of the streams, as needed. Temporary stream crossings are employed for short term access across a watercourse by construction vehicles when an existing crossing is not available or practical to use. Denison acknowledges that any temporary watercourse crossings, if used, are not intended for prolonged use, per the code of practice.</p> |
| Main Area of Concern for ERFN #12 | | | <p>What is the rationale for the timeframe (post-closure) criteria in terms of concluding full reversibility of an effect? Table 3-4 of Appendix 10-A indicates that mass flux (mg/s) rates of molybdenum and selenium persist for 1000 years or more following the end of decommissioning. Further, it is our experience that effects to sediment quality would not decrease for some time following cessation of the water quality effects.</p> <p>Concern in reference to Table 8.3-9.</p> | <p>The Section 8.3 assessment related to the Fish and Fish Habitat Valued Component's Key Indicator of surface water quality is focused on the release of treated effluent. As such, the timeframe for the fully reversible rating in Table 8.3-9 is the post-decommissioning period and considers whether or not the residual effect on surface water quality can be reversed once the activity causing the residual effect (i.e., treated effluent release) ceases. Refer to draft EIS, Appendix 10-A, Figure 3-2 for modelled concentrations of COPCs in water, which show COPC concentrations returning to baseline concentrations in the post-decommissioning period. The figure shows the first five years of post-decommissioning and the actual post-decommissioning period extends to a total of 15 years.</p> <p>The "future centuries" scenario evaluates the potential effects post-restoration (i.e., beyond the Project timeline of 0-38 years) and reflects the time period over which the highest constituent concentrations in groundwater are predicted to migrate towards and interact with surface water. The period of time between the cessation of discharge of treated effluent to Whitefish Lake and when remediated solution in the decommissioned mining area migrates to Whitefish Lake is hundreds to thousands of years. To be conservative the future centuries modelling in Appendix 10-A assumed the mass flux from groundwater to Whitefish Lake starts 200 years after the post-decommissioning phase. Between the end of post-decommissioning period and the start of the future centuries, any changes to surface water quality from treated effluent release would be fully reversed (refer to Appendix 10-A, Figure 3-4). The EIS considered the post-</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----------------------------------|--|--|--|---|
| | | | | <p>decommissioning changes through the future centuries assessment which was completed in Appendix 10-A. The predicted maximum concentrations of COPCs in water and sediment during future centuries are shown in Appendix 10-A, Table 3-5. There are no predicted exceedances of water and sediment quality guidelines for any of the COPCs and as such, the future centuries evaluations were not carried through the residual effect characterizations in Section 8.</p> <p>As a result of the continued technical review until October 2024, Denison was requested to further assess copper compared to Federal Environmental Quality Guidelines and the following clarification was made within the EIS:</p> <p>Denison notes one exception for copper where baseline concentrations exceed the FEQG (due to the copper analytical detection limit being equal to the FEQG) and an incremental increase in concentration is predicted such that the predicted copper concentration (0.0006 mg/L) would be greater than the FEQG of 0.0002 mg/L under baseline conditions, indicating a slight increased level of risk to the most sensitive aquatic biota. We expect this exceedance will not persist through future iterations of the future centuries modelling once additional baseline surface water quality data is collected at detectable concentrations.</p> |
| Main Area of Concern for ERFN #13 | | | <p>There appears to be some uncertainty regarding the benthic invertebrate community and tissue chemistry data provided. Regarding the tissue chemistry, it is understood that baseline data would have been used to evaluate the baseline predicted by the environmental effects assessment, and as such questions regarding the ERA sampling program may not affect the outcome of the assessment. However, having a robust baseline in terms of benthic invertebrate community composition and abundance would be required to complete a before-and-control-impact assessment (pre and post operations). It is our experience that benthic invertebrate community composition and relative abundance are sensitive end point to changes in aqueous and sediment metal concentrations. If changes are observed above those predicted in the EIS, the first area of investigation would be metal speciation and contaminant bioaccumulation in the organisms.</p> <p>Concern in reference to Section 8.4.3.2.5 and Table 8.4-4.</p> | <p>For clarity, in the ERA model (Appendix 10-A) the benthic invertebrate tissue chemistry predictions shown are modelled values based on exposure to surface water and sediment in consideration of Project-related releases to the aquatic environment and appropriate bioaccumulation factors. The measured baseline benthic invertebrate chemistry was not used specifically within the ERA, but the ERA was informed by the measured data in that the baseline data were used to validate the model predictions. Generally, there was reasonable agreement for many parameters though some constituent concentrations were either over- or underestimated by the model. The model predictions will be updated as part of routine ERA updates throughout the life of the Project. Additionally, the model predictions will be compared to measured benthic invertebrate tissue chemistry collected as part of monitoring programs. The overall objective of this process is to continue to gain a better understanding of potential risks associated with the Project as more operational data are generated and reduce the uncertainty related to estimating such risks.</p> <p>A very brief overview of the benthic invertebrate data collected as part of the environment baseline characterization is shared below for reference. Benthic invertebrate samples were collected in 2016 at ten lake locations and a total of 78 benthic invertebrate taxa from 38 major taxonomic groups (Families) were identified within the study area (Appendix 8-D). Chironomids were prevalent across the study area and were the most numerically dominant taxon at most locations. Other taxonomic groups that represented more than 10% of the total benthic invertebrate density at a sampling location were detritus worms (Naididae), pill clams (Pisidiidae), water fleas from the families Holopedidae and Macrothricidae, and phantom midges (Chaoboridae). From a feeding group perspective, predatory taxa and those that feed on fine particulate organic matter (collector-gatherers) were generally the most abundant groups in lakes within the study area.</p> <p>As alluded to in the review comment, benthic invertebrates will be utilized to assess potential effects related to the Project, and in particular those that may be associated with the discharge of effluent. As such, and also as noted in the review comment a “robust” baseline data set is needed to evaluate such effects. The baseline benthic invertebrate collections made in areas relevant to assessing the potential effects of effluent discharge were sampled with rigour (i.e., sample replication and processing methodology) consistent with the federal EEM program requirements, and therefore in that regard meet the robustness test and can be used to help define the before condition in the Before After Control Impact (“BACI” – described #39) framework. Moving forward (that is in the operations phase of the Project), benthic invertebrate community sampling will be implemented through the site’s EEM program and, at minimum, would be completed in a manner consistent with MDMER requirements. Sampling would focus on upstream reference areas and downstream effluent exposed areas and would be statistically based to ensure an appropriate level of statistical power is provided to determine whether there are mine-related effects, or not. Endpoints that would be measured include density, richness, evenness and community composition (via the B-C Index).</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----------------------------------|--|---|---|---|
| | | | | <p>The above does not preclude the execution of a further before operations benthic invertebrate community sampling program that would further define the before condition in the BACI framework. Such considerations are in the early planning stages and will be considered in the next stage of EMS documentation whereby plans and procedures are developed. As previously indicated Denison is committed to involving ERFN in development of those plans.</p> |
| Main Area of Concern for ERFN #14 | | | <p>It is stated that pre-constructed listed plant surveys / breeding bird surveys would be required on the final project footprint with ecosites that were not sampled in 2017; however, it is ERFN's understanding from the June 22nd site tour that almost all of the footprint has already been disturbed. Were preconstruction surveys completed prior to clearing activities? Concern in relation to Section 9.1.1.1 and Section 9.4.3.</p> | <p>The commitments made in the EIS, including those related to pre-construction surveys, are applicable to the Project as it advances to the Project development phase. Any forest clearing completed by Denison to date was done in accordance with the Saskatchewan mineral exploration guidelines and permitted through Saskatchewan Ministry of Environment, Lands Branch as part of exploration activities.</p> <p>While some limited areas above the Phoenix uranium deposit and trails have been cleared in previous years to access the site as part of exploration activities, the majority of the proposed Project Area has not been cleared. For example, the footprints of the proposed airstrip, camp, processing plant, borrow area, landfills, and portions of the access roads within the Project Area are undisturbed areas consisting primarily of upland jack pine ecosites. Please refer to draft EIS Figure 9.2-6: Vegetation Communities and Ecosystems within the Project Study Areas for a visual representation of the current anthropogenic disturbance within the Project Area. The current anthropogenic disturbance in the Project Area is approximately 24.8 hectares which represents less than 15% of the total Project Area (169.6 ha) (refer to draft EIS table 9.4-20 Summary of Available Common Nighthawk Habitat, Direct Habitat Loss, and Habitat Alteration in the Study Areas).</p> |
| Main Area of Concern for ERFN #15 | | | <p>ERFN is looking for commitment later in the permitting phase to discuss the development and monitoring of key indicators (KIs) for community health and wellness that reflect the perspectives of community members within the region. Firstly, it is recommended that human health evaluation efforts and KIs / measurement endpoints be reviewed and consider expanding to encompass directly the health of Patuanak/Wapachewunak community members and perceived risks. This may not be required to finalize the EIS as we understand the Human Health Conceptual Site Model based on fisher/trapper on Whitefish Lake and post-closure permanent resident on Whitefish Lake, however, it would be valuable to addressing concerns throughout the life of the project. For example, continued engagement with ERFN communities has identified that regardless of historical radiation protection performance, country food monitoring results and mine/mill personnel health monitoring, community member still believe that uranium mining contributes to cancer rates in community members. Perhaps a community specific KI could be developed and monitored (e.g., a limited uranium testing program looking at levels in ERFN residents on reserve versus off reserve). Further, local scale economy and wellness KIs could be proposed that reflect community members perspectives (e.g., local traffic rates / accidents and community quality of life and income disparity). Concern in relation to Section 10.1.1.2, Section 10.1.1.3, Section 10.1.3.2, Section 12.1.1.2, and Section 12.1.6</p> | <p>As noted in the draft EIS, Section 10.1.8 monitoring will focus on collecting data to verify ERA model predictions as well as provide data to improve model predictions as the Project begins, with the goal of reducing uncertainty over time. It is expected this will be an iterative process, and will be approached in consultation with Indigenous groups, other stakeholders, and relevant federal and provincial agencies with interest. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. The environmental monitoring program is anticipated to include air emissions, surface water, sediment, soil samples, fish tissue sampling, benthic invertebrate tissue sampling, and country food sampling. Monitoring is currently anticipated on Whitefish Lake, McGowan Lake and Russell Lake, and could be expanded based on the interests of ERFN.</p> <p>Although no specific monitoring is currently anticipated with regards to the Cultural Expression VC (Section 12.1.8) follow-up programs for the EIS are proposed to address any uncertainties identified during the EA process. Denison is committed to working with ERFN to understand how this might be executed at the community level to address community perspectives.</p> |
| 104 | English River First Nation (ERFN) (February 22, 2023) | Section 6.1.1.2.3 Other Guidelines and Standards | <p>Comment #ERFN-001: Background radon concentrations were used for predicted concentrations for the Project without an appropriate rationale for why CNSC criteria are not used. Question/Recommendation: Provide rationale why background radon concentrations were used in favour of air quality emissions standards/criteria from CNSC for predicted radon concentrations from the Project.</p> | <p>As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| 105 | ERFN (February 22, 2023) | Section 6.1.1.3 Spatial and Temporal Boundaries | <p>Comment #ERFN-002: For simplicity, a single criterion and time-averaging period were selected for each COPC based on the most stringent criteria or standard presented (federal/provincial). Time period effects are expected to occur in relation to project phases and activities (scenarios), and that the prediction of effects are applicable to/driven by MPs and air quality criteria (1-hour, and 24-hour – short term emissions; and, 30-day, and annual averaging periods). Average compositions from dust fall data during baseline studies was limited to two sampling events (September and October 2021) and presented as a percentage of fixed dust fall – the lowest average of measurable concentrations was used to represent background levels.</p> <p>Question/Recommendation: The AQ modelling assumptions used for the Project are heavily reliant on conversion calculations and average baseline measurable concentrations from passive monitoring methods, instead of a more conservative approach using maximum measurable concentrations. Denison iterates that maximum concentrations for each scenario were extracted from modelling results and compared to criteria to determine effects; however, for dust fall, the lowest average measurable baseline concentrations were used to represent background levels in the modelling.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 106 | ERFN (February 22, 2023) | Section 6.1.1.2.4 Summary of Assessment Criteria (KIs and MPs) Section 6.1.3.2 Existing Environment Air Quality | <p>Comment #ERFN-003: As KIs associated with the Air Quality VC pertain to levels of dust, combustion products, uranium, metals, and/or radionuclides; passive monitoring methods (commenced in 2016) were used to characterize the baseline air quality for the Project (included particulate matter [dust fall], NO₂, SO₂, radon, and external gamma). Provincial regional background concentrations were used for TSP, PM₁₀, PM_{2.5}, NO₂, SO₂, CO; while Key Lake ECCC background data were used to represent concentrations of uranium, arsenic, and nickel; and Cigar Lake data were used for copper, lead, selenium, and zinc background concentrations.</p> <p>Question/Recommendation: Passive methods represent averaged concentrations for deployment periods, and in some cases are not directly comparable to the regulatory criteria identified in Table 6.1-5. Conversion calculations were used on the passive monitoring data to compare the minimum requirements of averaged baseline results gathered, against identified provincial/federal criteria for use in modelling effects for the Project. Only predicted short-term (less than 3 years) and medium-term exceedances of modelled COPC concentrations of TSP, PM₁₀, uranium (24-hour), and NO₂ (1-hour) to exceed air quality criteria at receptors located outside of the Property Boundary (6.1.4.2); however, as per the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012), the eight highest 1-hour predictions and the single highest 24-hour prediction at each receptor can be discarded.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 107 | ERFN (February 22, 2023) | Section 6.1.1.2.4 Summary of Assessment Criteria (KIs and MPs) Section 6.1.3.2 Existing Environment Air Quality | <p>Comment #ERFN-004: Table 6.1-15 shows 24-hour Arsenic concentrations met criteria established in Table 6.1-5 for background level comparisons (0.003 µg/m³ – used conversion calculation due to passive sampling techniques used for baseline).</p> <p>Question/Recommendation: The EIS lacks clarity with respect to COPCs, as there was no discussion on the effects of 24-hour Arsenic concentrations meeting established criteria, nor was rationale included for the addition of Zinc as a COPC.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 108 | ERFN (February 22, 2023) | Section 6.1.3.2.7 Adopted Background Considerations | <p>Comment #ERFN-005: Ontario criteria for uranium in PM₁₀ were conservatively selected as the Project criteria although particle size information for ISR stacks (main source of Project uranium emissions) remains unknown. Input data to run the dispersion modelling included meteorological data from one year (2016 – minimum under guidelines).</p> <p>Question/Recommendation: Information is lacking on how uranium emissions can be mitigated if ISR plant stacks demonstrate particle sizes other than inhalable particulate matter (i.e., respirable particulate matter [PM_{2.5}] levels). Adjustments and refinements to the modelling and thus conclusions were made, heavily based on assumptions.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

|-----|---|--|---|--|
| 109 | ERFN (February 22, 2023) | Section 6.1.3.1 Climate (Existing Environment) Section 6.1.7.1 Climate Change Considerations (Cumulative Effects) | Comment #ERFN-006: Climate considerations within the EIS do not address the potential for permafrost in the project area or potential disruption of permafrost by the Project (i.e., contributing GHG emissions directly and indirectly related to the project or as it relates to climate change). Question/Recommendation: Update Section 6 to include permafrost implications from interactions with the Project. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 110 | ERFN (February 22, 2023) | Section 6.1.3.1 Climate (Existing Environment) | Comment #ERFN-007: Baseline wind direction blowing predominantly from the west (~10%), followed by south and east directions (Appendix 6-C) with an average wind speed of 3.5 m/s. Proponent doesn't demonstrate relative maximums and minimums of wind speed over the averaging periods and wind data are not available for the climate normal period or from baseline studies for comparison and integration into project design/seasonal mitigations. Question/Recommendation: Update baseline information to reflect seasonal wind speed maximums and minimums and integrate it into mitigations. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 111 | ERFN (February 22, 2023) | Section 6.1.4.2 Potential Project-Related Effects | Comment #ERFN-008: "The propagation of air emissions from Project activities associated with Construction, Operation, and Decommissioning was predicted using version 7 of the CALMET/CALPUFF modelling package (Exponent 2015). ... While the Saskatchewan Air Quality Modelling Guideline identifies that the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) should be used for most assessments in Saskatchewan, Section 3.3 of the guideline does allow for the use of more sophisticated models, including CALPUFF, where justified (SK MOE 2012a)." (pp. 6-30) Question/Recommendation: From the Saskatchewan Air Quality Monitoring Guideline (Section 3.3) "The use of specialized models [CALPUFF] requires consultation... [and] maybe approved by the ministry on a case-by-case basis. This justification should clearly state the reasons why the approved models are not appropriate..." (SKMOE 2012). Provide a rationale for why the approved models were not appropriate based on the limited meteorological dataset available. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 112 | ERFN (February 22, 2023) | Section 6.1.5 Mitigation Measures | Comment #ERFN-009: Additional mitigation measures include the use of chemical dust suppressants to address Air Quality. Denison does not provide evidence discussing the potential impacts on Air Quality from the use of chemical dust suppressants. Question/Recommendation: ERFN requests that Denison provide discussion regarding the potential impacts of using chemical suppressants to mitigate dust including whether there are any risks to air quality associated with the chemical suppressants themselves. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 113 | ERFN (February 22, 2023) | Section 6.1.6.2 Significance and Confidence (Residual Effects Evaluation) | Comment #ERFN-010: Denison states that a gap analysis memo and model input summary was prepared as part of the draft EIS. The memo appears to be missing from the EIS appendices. Question/Recommendation: Please either provide ERFN with the memo or clearly indicate where in the appendices this information is available. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| 114 | ERFN (February 22, 2023) | Section 6.2.3.1 Baseline Noise Measurement Program (Existing Environment) | <p>Comment #ERFN-011: Baseline data are not sufficient to support the assessment of noise impacts.</p> <p>Data were only collected for 2 locations during 1 week in May 2021 and did not include a portion of Highway 914 (like atmospheric component and identified traffic impacts from Project Activities).</p> <p>Unrepresentative data (meteorological events – temperature, relative humidity, precipitation, wind speed) were removed prior to summarization (14 hours, or 7.5% of measurement data). One of the two monitoring locations was disturbed during the monitoring period and these data were also discarded in the analysis.</p> <p>Question/Recommendation:</p> <p>Denison must provide further baseline information to support sound level criteria conclusions, project level-, residual-, and cumulative effects evaluations for modelling that links noise receptors with other VCs; as compliance determination is based on baseline measurements. Noise significance determination for receptor VCs may not be representative of actual conditions.</p> <p>Per the EIS, “based on professional experience, the SK MOE has considered the Alberta Directive 038 (AER 2013) as a suitable stand in for provincial guidance...”</p> <p>Please clarify how the current baseline data collection for noise aligns with this recommended guidance.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 115 | ERFN (February 22, 2023) | Section 2.3.3.1.1 Mining Area Remediation | <p>Comment #ERFN-012: Section 2.3.3.1.1 states that “the mining area decommissioning objectives have been developed through groundwater modelling work and are achievable based on metallurgical testing.” Section 7.6.2.1 refers to decommissioning objectives. The objectives are not appropriate for environmental protection. Table 2.3-3 decommissioning objectives portrays water quality that represents a substantial environmental risk and would need generations of monitoring to assess migration of this highly impacted plume. pH 4 is highly acidic and metal/radium levels are concerning (200 Bq/L radium is 200 to 1,000 times over safe limits). For species where baseline levels are higher than safe levels, baseline levels should be used as a target.</p> <p>Question/Recommendation:</p> <p>(i) Further effort should be taken to define the remediation goals that are achievable with best available technology and a commitment should be made to remediate to the maximum extent possible (until baseline levels are reached or the water is deemed suitable with no risk or need to monitor further). Funds spent to remediate will reduce the need for multi- generational monitoring and an unreasonable burden and risk on future generations (to monitor for a very long period of time).</p> <p>(ii) An options assessment for decommissioning objectives should be conducted based on Best Available Technologies (BAT) for treatment of contaminated groundwater and non-degradation approaches for the decommissioning objectives. Consultation on decommissioning objectives is required. Please revise the project closure plan to reflect updated decommissioning objectives.</p> <p>Also noted in Appendix B, Comment #1 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 116 | ERFN (February 22, 2023) | Section 2.3.3.1.1 Mining Area Remediation | <p>Comment #ERFN-013: To determine groundwater targets for decommissioning, the levels for groundwater protection from contaminated sites should be used for this project. This would involve use of typical numerical standards rather than the risk-based approach used in the EIS. A minimum level of protection is to define baseline groundwater levels where baseline is greater than water quality guidelines for groundwater. It is acceptable to use the higher value as the target, with baseline being defined as 95% background.</p> <p>Question/Recommendation:</p> <p>As a point of reference, any groundwater decommissioning objective should be compared to the 95% background levels and/or numerical groundwater standards for contaminated sites at the depth of impact compared.</p> <p>Also noted in Appendix B, Comment #2 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

|-----|---|---|--|--|
| 117 | ERFN (February 22, 2023) | Section 2.3.3.1.1 Mining Area Remediation | <p>Comment #ERFN-014: Over the course of the project, a certain mass of acid will be added into solutions for injection into the formation. Use of peroxide/ferric may indirectly add acid load via oxidation of sulphide minerals or other oxidation-reduction reactions. Some of the acid used in the project will be neutralized on surface as part of water treatment and discharge. The difference between total acid added to the formation and acid neutralized on surface through treatment represents the net acid load added to the formation and left underground. The EIS describes one mitigation for the leach area as being pumping alkali solution (i.e. caustic) into the leach formation to neutralize residual acid.</p> <p>Question/Recommendation: The mass load of alkali used during decommissioning should be commensurate with the net acid load added to the formation throughout the Project. Mitigation planning along these lines is recommended for consideration to support development of more environmentally responsible decommissioning targets. Also noted in Appendix B, Comment #3 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 118 | ERFN (February 22, 2023) | Section 2.3.3.1.1 Mining Area Remediation | <p>Comment #ERFN-015: Section 2.3.3.1.1 on decommissioning and remediation of the mine area is vague and should be expanded. For example, certain reagents "may" be used, freshwater will be mixed with contaminated water as a remediation method, and remediation plans will be further refined.</p> <p>Question/Recommendation: Without prejudice to previous comments on the suitability of proposed decommissioning objectives (i.e. Table 2.3-3), the EIS requires a more specific plan on how decommissioning objectives will be achieved and how remediation targets will be assessed to be met. Also noted in Appendix B, Comment #4 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 119 | ERFN (February 22, 2023) | Section 2.3.3.1.1 Mining Area Remediation | <p>Comment #ERFN-016: To be able to plan for decommissioning, it is essential that targets developed now, at the EIS stage. Otherwise, the project could be unacceptable to communities in the long term and there is no recourse.</p> <p>Question/Recommendation: Mitigation planning to meet the closure targets must be outlined conceptually so that bonding can be put in place to ensure the targets are met and the project is acceptable. With that in mind, development of targets and an approach to achieve these targets is required at the EIS level and should not be deferred. Also noted in Appendix B, Comment #5 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 120 | ERFN (February 22, 2023) | Section 2.3.3.1.1 Mining Area Remediation | <p>Comment #ERFN-017: The EIS states that the freeze wall will be allowed to thaw once recovered water meets the proposed mining decommissioning groundwater quality objectives and has been demonstrated to be "stable over sufficient time." The freeze wall should be maintained until there is no longer a groundwater plume. It is not environmentally responsible to leave the risk in the ground to monitor for many generations with the optimistic assumption that such a plume will not reach receiving environments. There is no precedent in Canada for the approach of purposefully leaving heavily impacted mine water injected underground with the expectation that it will not reach surface water. Modelling of such a plume is inherently uncertain and the highly impacted water represents a significant environmental hazard/liability.</p> <p>Question/Recommendation: (i) The approach should be to fully mitigate the groundwater zone impacted until the targets are reached. The stress on communities is too high if a groundwater plume of acidity is left in the ground. Adequate neutralization is critical for the groundwater impact zone so that a plume does not develop. Similar to regulation of contaminated sites source areas and plumes, the site is not remediated until it meets this standard of care. (ii) It is unclear from the EIS how it will be determined that the freeze wall is no longer required at the site. ERFN must be engaged indecision-making for thawing of the freeze wall after Decommissioning objectives have been met. Also noted in Appendix B, Comment #6 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|--|
| 121 | ERFN (February 22, 2023) | Section 7.8.2.2.4 Post-Decommissioning | <p>Comment #ERFN-018: Section 7.8.2.2.4 groundwater monitoring, post-decommissioning outlines that monitoring will continue indefinitely, until “transfer of the site into the provincial institutional control program.” This ongoing monitoring requirement and stress on communities and ongoing governance should be avoided or minimized to the extent possible by increasing the amount of remediation of the fluids to background levels.</p> <p>Purposely avoiding remediation efforts by passing the responsibility to ongoing monitoring adds significant uncertainty about whether objectives will be achieved, and should further mitigation be required, funds for execution would not be available from the closed project.</p> <p>Question/Recommendation: Monitoring should be done as a last approach after all efforts have been made to maximize remediation and minimize/remove the groundwater plume. For this project, the timelines and risks are too great to avoid mitigation measure for source control. The freeze wall, remediation pumping and treatment should continue until no further improvements are possible or targets are reached that reduce the need for long-term plume monitoring.</p> <p>Also noted in Appendix B, Comment #7 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 122 | ERFN (February 22, 2023) | Section 7.8.2.2.3 - Decommissioning Operation; Figure 7.8-2 | <p>Comment #ERFN-019: Please clarify what changes to the groundwater monitoring network established during Operations will be anticipated during Decommissioning, including potential pathways of water from the mine site to the receiving environment. Figure 7.8-2 on PDF p. 618 of the EIS is meant to illustrate the conceptual groundwater monitoring network during Decommissioning; however the figure does not show the proposed monitoring locations.</p> <p>Question/Recommendation: A conceptual map similar to Figure 7.8-1 would be valuable and aid ERFN in determining the adequacy of the monitoring network and assessing potential impacts to important water courses.</p> <p>Also noted in Appendix B, Comment #8 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 123 | ERFN (February 22, 2023) | Section 7.8.2.2.3 Decommissioning | <p>Comment #ERFN-020: The EIS mentions progressive reclamation in general terms.</p> <p>Question/Recommendation: The concept of progressive reclamation is recommended to be applied to remediation of groundwater in the different zones of the leach field after leaching of the zone is complete. For example, progressive reclamation/remediation of the Phase 1 and 3 could be started while leaching of Phase 4 and 5 is underway.</p> <p>Also noted in Appendix B, Comment #9 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 124 | ERFN (February 22, 2023) | EIS Section 2.2.1.4.6 Mining Solution | <p>Comment #ERFN-021: The way water recycle is discussed and assessed in the EIS is inconsistent. Section 2.2.1.4.6 states “once [Uranium Bearing Solution] UBS is recovered to surface, it will be pumped from the wellfield into the processing plant where uranium will be removed from the UBS (Section 2.2.2). The treated solution created can be refortified with reagents as required and pumped back into the mining area to maximize water recycling during the life of the mine. No water recycling has been included in the water balances, although it is expected to occur.”</p> <p>Similarly, Section 2.2.3 states, “Denison intends to recycle process water to the greatest extent possible, thereby reducing the demand for freshwater supply and volume of treated effluent. To develop a conservative assessment basis for the EA, the water recycled flows from the industrial wastewater treatment plant back into the processing plant and wellfield have not been incorporated into the estimates for freshwater withdrawal and treated effluent discharge.”</p> <p>All models must be updated to include the operational strategy employed by Denison and actual conditions to occur during operations as best as possible.</p> <p>From the perspective of fresh water withdrawal from the environment, evaluating the project water balance with the assumption that no water is recycled is conservative. However, from a water management and water treatment perspective the opposite is true as use of water recycle reduces risks by reducing the total amount of solution requiring management, reducing the rate of discharge of treated effluent and associated contaminant load going to Whitefish Lake.</p> <p>Question/Recommendation: (i) The EIS should incorporate assessment of water recycling into a separate case for the water balance/water quality model (similar to the way base/upper case modeling is used for other phenomenon). The EIS should discuss limits of water recycling, such as the minimum amount of water required to operate the project or the potential for contaminant accumulation in leachate</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| | | | <p>that prevents effective recycle.</p> <p>(ii) Further, recycling all or portion of the process water may increase the concentration of contaminants reporting to the IWWTP and may impact the effluent quality achievable. Accumulation of contaminants in the recycled solution and its impact on the performance of the IWWTP and effluent quality must be assessed and discussed. Incorporating water recycle may reduce the amount of process water requiring treatment and discharge and so may help ameliorate the concern with the high salinity of treated water.</p> <p>Also noted in Appendix B, Comment #10 (Source Environmental Associates).</p> | |
| 125 | ERFN (February 22, 2023) | Section 2 General | <p>Comment #ERFN-022: The EIS describes several water storage ponds on surface including precipitate ponds and process water ponds. The design basis for these ponds in terms of how much solution storage is required is not clear in the EIS.</p> <p>Question/Recommendation:</p> <p>The EIS should discuss the sizing basis for these ponds in more detail, including storage capacity for probable-maximum-flood, pond capacity used by precipitate, freeboard volume, and normal operations volume. This should also be discussed in the context of the total amount of solution requiring management at a given time (underground and on surface) and the extent of water recycle achievable. The ability to safely manage process water on surface is a critical mitigation measure for the project and so understanding the design basis for these features is required to assess risk to the environment.</p> <p>Also noted in Appendix B, Comment #11 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 126 | ERFN (February 22, 2023) | Section 2.2.2.2.1 Radon Purge Tank | <p>Comment #ERFN-023: Figure 2.2-13, the Processing Plant Overview shows the 5,000 m3 uranium solution holding area would include tanks. This is incongruent with Section 2.2.2.2.1, which states that the UBS holding area will be contained by a double composite liner system with leak detection adjacent to the processing plant and under a fabric tension building system.</p> <p>Question/Recommendation:</p> <p>It is unclear if Figure 2.2-13 shows what is currently being considered for the design.</p> <p>Also noted in Appendix B, Comment #12 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 127 | ERFN (February 22, 2023) | Section 7.4.2 Potential Project- related Effects; EIS Section 7.6.1 Life of Mine (0 to 38 years) | <p>Comment #ERFN-024: Section 7.4.2 and section 7.6.2.1 describe scenarios for upward migration of acidic, impacted mining waters and include discussion of upward migration distances of 11 to 50 m. The basis for these scenarios is not made clear in the work and the rationale for why these scenarios are conservative is not sufficient. Upward migration could be a real risk for the project. For example, current and decommissioned boreholes for monitoring could be a pathway for migration of acidic, contaminated fluids to the surface.</p> <p>Question/Recommendation:</p> <p>The EIS should provide a compelling case for the conservatism of the current approach and/or more rigorously assess the impact of substantive upward migration of leach solution.</p> <p>Also noted in Appendix B, Comment #13 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 128 | ERFN (February 22, 2023) | Section 2.2.1.3 Freeze Wall | <p>Comment #ERFN-025: Section 2.2.1.3 states "current plans are for the freeze wall to be a minimum of 10 m thick, be installed 25 m away from the uranium deposit, and extend 30 m into the basement rock (Figure 2.2-6)." This is 20 m smaller than the maximum extent of the area approximated to be influenced by mining around the deposit (50 m). This increases the risk of contaminants leakage from the mining affected area with potentially negative impacts on the receiving environment especially considering that the primary means of containing containment within the leaching zone relies on maintaining an inward hydraulic gradient by recovering more solution than what is being injected (1%). This is subject to planned and unplanned operational downtime due to maintenance or other reasons.</p> <p>Question/Recommendation:</p> <p>Please explain the rationale for the selection of a 30-m thick freeze wall and how it ensures the containment of contaminants as predicted under a variety of different site and mining conditions.</p> <p>Also noted in Appendix B, Comment #14 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

|-----|---|--|---|---|
| 129 | ERFN (February 22, 2023) | Section 2.2.1.3.1 Freeze Plant | <p>Comment #ERFN-026: The ammoniacal solution will be used in the freeze plant to maintain the freeze wall in place for the execution of mining activities. Section 2.2.1.3.1 states that “the freeze plant will be designed with ammonia safety in mind to monitor for and minimize risks to workers and the environment from potential leakages.” However, no information is provided on potential underground leakages and assessment of potential negative impacts on water quality/balance as well as any appropriate mitigation measures. This is important because as stated in the Application, “the sandstone hosting the uranium deposit is permeable and groundwater can flow horizontally through the deposit.”</p> <p>Question/Recommendation:</p> <p>(i) Has the freeze-wall brine been evaluated as a potential source of groundwater contamination?</p> <p>(ii) How would leakage of freeze-wall liquid be detected or assessed?</p> <p>Also noted in Appendix B, Comment #15 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 130 | ERFN (February 22, 2023) | Section 2.2.6.2 Back-up Power Supply | <p>Comment #ERFN-027: Section 2.2.6.2 of the EIS states that “to provide electrical service during times of utility outages, diesel generators will be installed to service the site and maintain essential functions. The generators will be used to maintain power to the processing plant and the camp, as well as to maintain other essential services as required.” Given that maintaining the freeze wall as well as a negative water balance in the ISR area are key to the mitigation of environmental impacts, a plan must be developed for maintaining the operation of the ISR pumping and freeze systems during power outages.</p> <p>Question/Recommendation:</p> <p>The EIS should discuss the impact of short term power outages on freeze-wall operation and efficacy and on the water balance associated with solution injection/recovery.</p> <p>Also noted in Appendix B, Comment #16 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 131 | ERFN (February 22, 2023) | Section 2.2.3.8 Industrial Wastewater Treatment Plant | <p>Comment #ERFN-028: An important aspect of preventing environmental impacts is the industrial wastewater treatment plant (IWWTP) that is to treat excess process water and surface runoff. The EIS provides limited information about this system, its design basis, the Project-specific testing conducted, or how the predicted effluent quality provided in Table 2.2-1 of the EIS was developed. Section 2.2.3.8 states, “a metallurgical test program was completed at SRC to help define the IWWTP design and performance criteria.” However, no reference is provided to this program, nor have its results or conclusions have been discussed in the Application. This is a key part of the mine design and it is important, for review, that the EIS provide the information needed to understand and evaluate the efficacy of the proposed mitigation measures.</p> <p>Question/Recommendation:</p> <p>Table 2.2-1 in Section 2.2.3.9 outlines the upper bound effluent quality proposed for the Project and states, “the effluent quality was determined to be achievable through laboratory test results conducted by Denison at SRC.” However, this section does not provide a comparison of the concentrations achieved at the bench scale with the upper bound limits.</p> <p>Also noted in Appendix B, Comment #17 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 132 | ERFN (February 22, 2023) | Section 2.2.3.9 Treated Effluent Monitoring and Release Ponds | <p>Comment #ERFN-029: The IWWTP process appears to use processes similar to those of other waste water treatment sites in the Canadian uranium mining sector. It would be useful if the EIS discussed the IWWTP relative to analogue sites in terms of the treatment technologies used and the quality of effluent achieved at other sites.</p> <p>Question/Recommendation:</p> <p>How does the predicted effluent quality shown inspection 2.2.3.9 compare to effluent from analogue sites in the Canadian uranium sector, for example water treatment systems at Cameco and Orano’s projects in the region?</p> <p>Also noted in Appendix B, Comment #18 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 133 | ERFN (February 22, 2023) | Section 2.2.3.9 Treated Effluent Monitoring and Release Ponds | <p>Comment #ERFN-030: Table 2.2-1 of the EIS shows predicted effluent quality for the IWWTP. This table includes a prediction that the total dissolved solids in effluent is predicted to be 6,420 mg/L, with 600 mg/L chloride and 3,915 mg/L sulphate. The table also includes predicted effluent for copper of 0.042 mg/L. These levels approach the British Columbia’s water quality guidelines associated with acute toxicity and so may be acutely toxic at the end-of-pipe (i.e. prior to discharge via diffuser in Whitefish Lake and subsequent dilution). Section 36.3 of the Fisheries Act specifies that, no person shall deposit or permit the deposit of a deleterious substance of any type in water frequented by fish.”[1] The Canadian Metal and Diamond Mining Effluent Regulations (MDMER) includes a definition of deleterious substance as effluent that is</p> | <p>As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement.</p> <p>As a result of the continued technical review until October 2024, Denison updated Table 2.2-1 to be reflective of the Federal Environmental Quality Guidelines for Copper.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| | | | <p>acutely lethal to several commonly tested species of fish and aquatic life.</p> <p>Question/Recommendation:</p> <p>Guidelines are not prescriptive and so the predicted effluent may or may not be acutely toxic, but since the levels of contaminants in predicted effluent are relatively high, it is recommended that the risk of acutely toxic effluent at end-of-pipe be assessed to support the EIS. Specifically, it is recommended that acute toxicity tests as described by MDMER be conducted on water quality matching the predicted effluent presented in the EIS.</p> <p>[1] https://laws-lois.justice.gc.ca/eng/acts/F-14/page-5.html#docCont</p> <p>Also noted in Appendix B, Comment #19 (Source Environmental Associates).</p> | |
| 134 | ERFN (February 22, 2023) | Section 2.2.3.8 and 2.2.3.9 | <p>Comment #ERFN-031:</p> <p>(i) Sections 2.2.3.8 and 2.2.3.9 of the EIS describe the IWWTP and note that the design of the system is being informed by an ongoing Best Available Technology (BAT) study. The EIS is not clear if the system as described in the EIS is a reflection of application of BAT or if this is an interim design pending completion of the BAT study.</p> <p>(ii) Similarly, the EIS notes the use of zero valent iron (ZVI) as a treatment reagent but it is not apparent how this is to be used in the process. ZVI can be a very effective method for removing metals and metalloids from mine water, particularly for relatively small treatment systems</p> <p>(iii) Finally, the impact of different treatment technologies on TDS of effluent should be considered given the previous comment about potential for acute toxicity with the predicted effluent quality. Salt removal systems should be evaluated</p> <p>Question/Recommendation:</p> <p>(i) Given the predicted effluent quality in 2.2.3.9 and the relatively high predicted levels of copper, it is recommended that this BAT study include assessment of use of organosulphide reagents (i.e. trimercapto-triazine). This type of chemical is a common and inexpensive method of removing heavy metals such as copper and cadmium from water. Use of organosulphide is commonly incorporated into mine water treatment systems and is generally recognized as part of BAT treatment of mine water [1]. Copper levels in the range of single digit parts per billion (ppb) are achievable, below the 22 ppb predicted effluent quality.</p> <p>(ii) ERFN support the inclusion of this reagent in the process but requests additional information on how it is to be used. The predicted level of selenium in effluent (42 ppb) can likely be improved on through better application of ZVI</p> <p>(iii) Overall, ERFN support the use of a BAT study to inform design of the IWWTP and recommend that further bench testing be conducted in the future following the BAT study to improve on the predicted effluent quality presented in the EIS</p> <p>[1] https://mend-nedem.org/wp-content/uploads/MEND3.50.1BATEAppAD.pdf Also noted in Appendix B, Comment #20 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 135 | ERFN (February 22, 2023) | Section 2.2.3.8 Industrial Wastewater Treatment Plant | <p>Comment #ERFN-032: According to the IWWTP flowsheet shown in section 2.2.3.8 of the EIS, treated effluent will be recycled</p> <p>Question/Recommendation:</p> <p>Considering that the leach is acidic and the IWWTP involves acid neutralization, it is recommended that drawing water for recycle from earlier in the treatment process be considered. This would reduce reagent demands from unnecessary acidification/neutralization as well as the amount of radionuclide and metals-laden treatment by-products that will have to be used and managed.</p> <p>Also noted in Appendix B, Comment #21 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 136 | ERFN (February 22, 2023) | Section 2.2.3.9 Treated Effluent Monitoring and Release Ponds | <p>Comment #ERFN-033: Section 2.2.3.9 of the EIS states, "the effluent quality was determined to be achievable through laboratory test results conducted by Denison at SRC." However, Section 6.2 of Appendix 10- A (Sensitivity Analysis) states, "If treated effluent is released at the maximum upper bound discharge rate, cadmium concentration in Whitefish Middle/South and McGowan Lake (LA-1) would exceed its surface water quality guideline of 0.00004 mg/L, and chromium concentration in Whitefish Middle/South would exceed its surface water quality guideline of 0.001 mg/L. The modelled concentrations of other COPCs are expected to be below their corresponding surface water quality guidelines."</p> <p>Question/Recommendation:</p> <p>Methods of preventing these exceedances should be explored and incorporated into the project. For example, alternative treatment technology may reduce metal loading with treated effluent, and greater water recycle would reduce the volume of treated water discharged, reducing the load of metal introduced to Whitefish Lake via treated effluent.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| | | | <p>More generally, these exceedances caused by a higher rate of discharge is an example of how the assumption to exclude water recycling from water balance predictions is not entirely conservative.</p> <p>Also noted in Appendix B, Comment #22 (Source Environmental Associates).</p> | |
| 137 | ERFN (February 22, 2023) | Section 7.0 Geology and Groundwater | <p>Comment #ERFN-034: The Application lacks a clear discussion of the various source terms that were considered for water quality modelling. Most reagents utilized for the ISR process include highly soluble contents and must be considered for modelling purposes. The Application is lacking a clear discussion of the various source terms and information geochemical stability of various sources that were considered for water quality modelling.</p> <p>Question/Recommendation: Please clearly describe the sources of various contaminants in process water and how they inform water management/water treatment design. Distinguish between contaminants found in natural groundwater, contaminants released through leaching, and contaminants introduced as mill reagents (i.e. sulphate, TDS).</p> <p>Also noted in Appendix B, Comment #23 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 138 | ERFN (February 22, 2023) | Section 2.2.1.4.3 Permeability Enhancement | <p>Comment #ERFN-035: Section 2.2.1.4.3 lists options considered for enhancing leach solution permeability in the leaching zone and includes potential for use of propellant permeability enhancement.</p> <p>Question/Recommendation: (i) How does this material compare to common blasting explosives (i.e. ANFO) in terms of potential for water soluble explosive residue to be left behind after use? (ii) ANFO is commonly an environmentally relevant source of ammonia, nitrite, and nitrate at mine sites. (iii) Please discuss the potential impact of propellant permeability enhancement products as a source of contaminants.</p> <p>Also noted in Appendix B, Comment #24 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 139 | ERFN (February 22, 2023) | Section 2.2.2 Processing Plant Components | <p>Comment #ERFN-036: Section 2.2.2 states “Denison’s processing plans are based on numerous metallurgical tests completed as part of engineering activities. A detailed metallurgical testing program was developed and implemented in collaboration with the Saskatchewan Research Council (SRC) under the supervision of several third- party consultants and Denison.</p> <p>Around 1,000 L of UBS was produced by leaching over 64 kg of core samples recovered from the Phoenix deposit and the UBS produced was tested using variations of several parameters to define the processing plant design and its components.” This work is critical for informing levels of contaminants expected to be leached in the in-situ process which in turn require treatment and management. This work is not discussed substantially in the EIS.</p> <p>Question/Recommendation: The EIS should discuss how this work was carried out, a summary of key conclusions including estimates of freshwater and recycled water use, recoveries expected, reagents consumed, waste produced and steady-state contaminant concentrations.</p> <p>Also noted in Appendix B, Comment #25 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 140 | ERFN (February 22, 2023) | Section 2.2.4.8 Clean Waste Rock and Clean Waste Rock Pad | <p>Comment #ERFN-037: Section 2.2.4.8 states that approximately 7,800 m3 of clean waste rock will be generated because of mining activities, and Section 2.2.3.6 states that “a pond may be constructed beside the clean waste rock pad (Section 2.2.4.8) to collect runoff if required. The pond would be a single geomembrane-lined pond (Figure 2.2-26). Water collected in the clean waste rock pond would be routed to the process water pond.”</p> <p>Question/Recommendation: The Application however does not provide information on the geochemical stability of the waste rock and how waste rock is expected to impact water quality of runoff/pond inflow.</p> <p>Also noted in Appendix B, Comment #26 (Source Environmental Associates).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| 141 | ERFN (February 22, 2023) | Section 2.2.3.8 Industrial Wastewater Treatment Plant | <p>Comment #ERFN-038: Section 2.2.3.8 states that “the majority of the IWWTP precipitates formed during the second stage of treatment are gypsum and these precipitates are not expected to be radioactive.”</p> <p>Question/Recommendation:</p> <p>(i) How much radioactivity is expected in these solids?</p> <p>(ii) Did the metallurgical test program include testing these solids for radioactivity and, if available, have these results been considered in the long-term management strategy for these solids?</p> <p>Also noted in Appendix B, Comment #27 (Source Environmental Associates).</p> | <p>As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement.</p> <p>As a result of the continued technical review until October 2024, the additional specific commitment has been made: Denison has committed to pre-construction and pre-clearing surveys for multiple species. Surveys will be completed by a qualified professional biologist that will refer to available guidance and protocols.</p> |
| 142 | ERFN (February 22, 2023) | Section 2.2.3 Water Management | <p>Comment #ERFN-039: Figures 2.2-15 and 2.2-16 show that water from the IWWTP process precipitate pond will be recycled to the process pond at a rate of 5.35 m3/h that then primarily reports back to the IWWTP for treatment with some used for drilling. The water from the IWWTP precipitate pond forms ~65% and 41% of the flow rate reporting to the IWWTP for treatment during the operations and Decommissioning phases, respectively, so this is a significant source of feed water to the IWWTP.</p> <p>Question/Recommendation:</p> <p>The geochemical stability of the precipitates in the two ponds should be evaluated and incorporated as source terms in water quality modeling. This should be discussed in the EIS.</p> <p>Also noted in Appendix B, Comment #28 (Source Environmental Associates).</p> | <p>As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement.</p> |
| 143 | ERFN (February 22, 2023) | Section 7.0 Geology and Groundwater | <p>Comment #ERFN-040: The EIS does not provide information on the mine’s plans for events of care and maintenance (C&M) or temporary closure. C&M is an important potential phase of mine life that warrant assessment of potential impacts. During C&M, changes to the site- wide water balance would be expected, potentially requiring modifications to the water management strategies at the site. In particular, it is important that a conceptual plan for how solution would be recovered/injected/managed on surface during a period of care and maintenance.</p> <p>Question/Recommendation:</p> <p>The EIS should include a conceptual description of how each major piece of mine infrastructure would be operated during C&M maintenance and how risk of environmental impact would be mitigated under these conditions. The following topics are recommended for discussion in C&M planning at the EIS level:</p> <p>(i) Any significant changes to the water management strategies at the site, including whether the Industrial Wastewater Treatment Plant would be expected to continue operating during C&M.</p> <p>(ii) Any significant changes in how the freeze wall would be operated.</p> <p>(iii) Discussion of how leachate and process solution would be managed, i.e. would injection/recovery continue or cease, would any recovered solution be subjected to uranium recovery, how solution would be managed on surface if re-injection ceased.</p> <p>(iv) If monitoring activities would change during care and maintenance.</p> <p>(v) If any new mitigation measures are required to address C&M specific risks.</p> <p>The development of the Care and Maintenance Plan must include input from ERFN. Also noted in Appendix B, Comment #29 (Source Environmental Associates).</p> | <p>As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement.</p> |
| 144 | ERFN (February 22, 2023) | Section 2.9.1 Environmental Management System Framework | <p>Comment #ERFN-041: Section 2.9.1 includes discussion of several environmental management plans.</p> <p>Question/Recommendation:</p> <p>As a general comment, ERFN recommend that requirements for any project plan include the following, at a minimum, in addition to plan- specific topics:</p> <p>(i) Purpose and objectives of the plan;</p> <p>(ii) Roles and responsibilities of staff including identification of Qualified Professionals(s);</p> <p>(iii) Schedule for implementing the plan through relevant project phases;</p> <p>(iv) Means by which the effectiveness of the mitigation measures will be evaluated including the schedule for evaluating effectiveness;</p> <p>(v) Schedules and methods for the submission of reporting to specific regulatory agencies, ERFN, and the public and the required form and content of those reports;</p> <p>(vi) Process and timing for updating and revising the plan including consultation with regulatory agencies and ERFN that would occur in connection with such updates and revisions.</p> <p>Further, following the development of a plan, the plan should be provided to regulatory agencies and ERFN for review and consultation. Consultation should include invitation for agencies and</p> | <p>As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| | | | ERFN to provide their views on the content of the plan in a reasonable timeframe. Subsequently, Denison should provide a written explanation to each party that provided comments describing how the views and information provided by the party has been considered in the revised plan or why such views and information were not addressed in a revised plan Also noted in Appendix B, Comment #30 (Source Environmental Associates). | |
| 145 | ERFN (February 22, 2023) | Section 2.9.1 Environmental Management System Framework | Comment #ERFN-042: Section 2.9.1 of the EIS discusses environmental management activities including emergency response. As written, this section of the EIS focuses on the roles and responsibilities of Project staff. Communication to ERFN in the event of a mine emergency is critical for ERFN to evaluate potential impacts to rights and interests. Some mines in Canada overlook the importance of this communication and erode important partnerships with their Indigenous hosts by communicating information late or without transparency. Question/Recommendation: Recommendations for inclusion in the Plan include a communication protocol based on emergency risk ratings and communications with Nation representatives for high consequence near-miss incidents (i.e. near-miss incidents that could have resulted in major environmental impacts or medical emergencies), as these can be valuable opportunities to improve training and operating practices. It is recommended that management plans and emergency response planning include communication protocols with ERFN so that ERFN is alerted to any incident in a timely fashion. Collaboration with ERFN in plan development, communication protocol, involvement of ERFN members in monitoring/response planning is recommended. Also noted in Appendix B, Comment #31 (Source Environmental Associates). | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 146 | ERFN (February 22, 2023) | Section 2.2.4.5 Process Precipitate Pond | Comment #ERFN-043: Section 2.2.4.5 states “the precipitates generated in the processing plant will be transferred to the process precipitate pond.....this pond design will allow the precipitate totes to be stacked below ground level.....any runoff collected in the pond will be directed to the process water pond and recycled through the plant.” The Application also states that the waste stored in this pond contains 2-3% uranium rendering it potentially economic for resale and recovery. Question/Recommendation: A plan for managing this material should reprocessing not be economically viable should be prepared and discussed in the EIS. Also noted in Appendix B, Comment #32 (Source Environmental Associates). | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 147 | ERFN (February 22, 2023) | Section 2.2.4.3.2 Industrial Landfill | Comment #ERFN-044: Section 2.2.4.3.2 discusses the industrial landfill that accepts industrial waste including radiologically contaminated waste. Leachate from this landfill will be collected and sent to the leachate collection pond immediately north of the landfill and eventually to the process water pond. Although the Application states that “upon closure of the site, the industrial landfill will be covered with an engineered impermeable liner system to minimize infiltration of precipitation into the containment system,” the leachate is not expected to stop. The Application however does not provide information on the management of the leachate from the industrial landfill post- closure. Question/Recommendation: Considering the limited life of the double liner system used for the landfill area, management of radiologically contaminated waste and its impact on the receiving environment for all phases of the project must be discussed in the EIS. Also noted in Appendix B, Comment #33 (Source Environmental Associates). | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 148 | ERFN (February 22, 2023) | Section 2.2.2.2.1 Radon Purge Tank | Comment #ERFN-045: Section 2.2.2.2.1 states “the radon purge tank will contain a mechanical ventilation system to facilitate the aeration of the solution and the removal of radon gas from the UBS to the air outside of the plant.” Question/Recommendation: (i) Is radon stripping on the exhaust proposed or is it to be directed into the atmosphere? (ii) Has exposure outside the building been evaluated? Also noted in Appendix B, Comment #34 (Source Environmental Associates). | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

|-----|---|---|---|--|
| 149 | ERFN (February 22, 2023) | Section 8.1.3 Existing Environment | Comment #ERFN-046: Detailed baseline hydrology collected in 2011-2014, prior to the operation of Cameco Cigar Lake. Very little data have been collected since (~1 measurement per year 2016-2019) Question/Recommendation: Update continuous flow data to include more recent years, with emphasis on low-flow period and winter flows. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 150 | ERFN (February 22, 2023) | Section 8 General (Aquatic Environment) | Comment #ERFN-047: Surface water withdrawal Question/Recommendation: Please provide description(of waterbody characteristics as well as the precise latitude and longitude proposed) of all water withdrawal points to be used at any point during this project. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 151 | ERFN (February 22, 2023) | Section 8 General (Aquatic Environment) | Comment #ERFN-048: Recycling of process water. Question/Recommendation: Please provide examples from existing ISR projects that support the efficacy of process water treatment and re-use. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 152 | ERFN (February 22, 2023) | Section 8.1 General (Aquatic Environment) | Comment #ERFN-049: Recycling of process water appears to not be meaningfully incorporated into water balance modelling. Question/Recommendation: Please clarify and justify how recycled process water was incorporated into surface water quantity / water balance modelling. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 153 | ERFN (February 22, 2023) | Section 8.1.5 Mitigation Measures | Comment #ERFN-050: Denison makes “loose” promises with regard to maintenance and monitoring of water control structures, and avoiding sedimentation in local waterbodies/watercourses Question/Recommendation: Provide a water management plan (WMP) that addresses each phase of the project. Denison notes high confidence in assessments, implying few/no unknowns that would inhibit the creation of a sufficient WMP | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 154 | ERFN (February 22, 2023) | Section 8.1.9 Surface Water Quality | Comment #ERFN-051: Notable lack of winter data for stream and lake sites. Question/Recommendation: Conduct at least 1 winter field visit to verify/refine field data. The focus should be on watercourses adjacent to and directly interacting with the project, and the proposed discharge zone in South Whitefish Lake. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|--|
| 155 | ERFN (February 22, 2023) | Section 8.2.3.3; Tables 8.2-2 to 8.2-4 Existing Surface Water Quality | Comment #ERFN-052: Note these tables use different benchmark/guideline compared to the Water Quality baseline study for Molybdenum and Zinc. Question/Recommendation: Proponent to provide justification for use of different Water Quality guidelines, or else adjust tables to reflect guidelines used in baseline study. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 156 | ERFN (February 22, 2023) | Table 8.2-5 Existing Surface Water Quality | Comment #ERFN-053: Potential project interactions during construction. Question/Recommendation: (i) What about the potential for a grout/cement spill to the environment? (ii) Proponent should include recognition of potential deleterious interaction of construction materials (notably grout/cement) with the aquatic environment, and appropriate mitigation. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 157 | ERFN (February 22, 2023) | Section 8.2.4.1.1 Site Water Management | Comment #ERFN-054: It is noted that the treated effluent holding ponds are designed to hold water for 72 hr. prior to discharge. Question/Recommendation: What laboratory will be used to test treated effluent samples to provide results within 72 hr? What if the water is deemed unfit to discharge? Please provide a surface water quality monitoring plan that includes clear information regarding sampling and analysis timelines to ensure discharge water is sufficiently tested prior to release. “Emergency release” due to pond capacity overage is unacceptable. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 158 | ERFN (February 22, 2023) | Section 8.2.4.1.1 Site Water Management | Comment #ERFN-055: “Loose” commitment to Water Quality monitoring – “Treated water...will be monitored prior to release.” Question/Recommendation: At what locations? How often? Which parameters? Recommend the creation of a draft surface water monitoring plan to ensure appropriate actions are in place. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 159 | ERFN (February 22, 2023) | Section 8.2.4.1.1 Site Water Management | Comment #ERFN-056: “Prior to release to a surface waterbody or injected into groundwater via deep well injection.” Treated water discharge to South Whitefish Lake, where sufficient dilution of effluent would be anticipated, was the prior commitment. This is the first instance mentioned of deep well injection of effluent. Question/Recommendation: Clarify the proposed effluent discharge method, and if Denison intends to use deep well injection, then the EIS should be updated to reflect the potential interactions associated with this method. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 160 | ERFN (February 22, 2023) | Section 8.2.4.2 Potential Project-related Effects | (applies elsewhere as well) Comment #ERFN-057: Section notes that “Whitefish Lake” will receive discharge during operation and decommissioning, however, EIS separates into North and South Whitefish Lake. Question/Recommendation: Clarify throughout which Whitefish Lake (north or south) will be the receiving environment for effluent discharge. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| 161 | ERFN (February 22, 2023) | Section 8.2.4.2.1 Mobilization of Suspended Materials | Comment #ERFN-058: "acceptable levels" of TSS is noted as the deciding factor for safe discharge of treated water. Question/Recommendation: (i) What about other chemical constituents? All COPCs in the effluent are predicted to exceed long-term Water Quality Guidelines(CCME). (ii) What about MDMER requirements for the effluent to pass toxicity testing at end- of- pipe? (iii) Clarify whether Denison intends TSS to be the only factor contributing to the safety of effluent for discharge, and how the MDMER requirements for toxicity testing will be met. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 162 | ERFN (February 22, 2023) | Section 8.2.4.2.1 Mobilization of Suspended Materials | Comment #ERFN-059: Salinity does not appear to be included as a factor for considering effluent safe for discharge. Question/Recommendation: Predicted salinity of effluent is sufficiently high as to possibly result in failure of the acute toxicity testing required under MDMER. (i) Please justify the exclusion of salinity as a factor for considering effluent safe for discharge. (ii) Please ensure the potential impacts of salinity on aquatic VCs are recognized and discussed. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 163 | ERFN (February 22, 2023) | Table 8.2-10 | Comment #ERFN-060: Sulphate is given 2 different values in the table in the LA-5 well-mixed column (633 and 63.83), but not in other columns. Question/Recommendation: (i) Clarify whether this is a typo, or whether these rows are referring to different constituents. (ii) Clarify why predicted sulphate is anticipated to be lower for the lower screening concentration. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 164 | ERFN (February 22, 2023) | Section 8.2.4.2.3; Table 8.2-11 Near- Field Water Quality Model | Comment #ERFN-061: Mixing zone modelling. Question/Recommendation: (i) Why is plume formation in South Whitefish Lake modelled based on mixing zones in rivers? (ii) Justify the use of a lentic mixing model to represent effluent plume formation in a lotic environment. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 165 | ERFN (February 22, 2023) | Section 8.2.4.2.3 Near- Field Water Quality Model | Comment #ERFN-062: Mixing zone modelling in winter; there are very minimal data for the receiving waterbody in the winter, other than 1 shallow sampling event in April. Assumption is under-ice temperatures at the diffuser will be 3-4oC, with effluent emerging at 5oC. April sampling event suggests that under- ice temperatures may be closer to 0.5°C. Question/Recommendation: (i) How much effect will temperature differences between effluent and surrounding water have on mixing? (ii) Please clarify how mixing changes if input current from Icclander R. drops to near zero. (iii) Please clarify the effect of effluent salinity on mixing during winter. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 166 | ERFN (February 22, 2023) | Table 8.2-11 | Comment #ERFN-063: Average current velocity predicted in South Whitefish Lake at the discharge location is 0.23 m/s. However, in S. 4.3 of the Ecometrix aquatic baseline, average current velocity at S-6 (the channel feeding South Whitefish Lake) is 0.2 m/s. Question/Recommendation: (i) Why are the current velocities used to model the discharge mixing greater than the measured inflow velocities? (ii) Justify the disconnect between the current velocities measured upstream of the discharge location, and the velocities used to model the mixing zone. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| 167 | ERFN (February 22, 2023) | Section 8.2.7 Cumulative Effects | Comment #ERFN-064: Meeting Water Quality benchmarks Question/Recommendation: ERFN recognizes and appreciates Denison's commitment to meeting Water Quality benchmarks within and down stream of South Whitefish Lake. How will "appropriate benchmarks" be determined? | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 168 | ERFN (February 22, 2023) | Section 8.2.8 Monitoring and Follow-up | Comment #ERFN-065: Monitoring program expectations, guidance, and commitment. Question/Recommendation: The proposed monitoring seems, on its surface, reasonable. However, as noted above it is important to see a water quality monitoring plan integrated with a water management plan grounded in guidance and regulatory requirements (e.g., MDMER) that includes appropriate triggers, actions, and safeguards. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 169 | ERFN (February 22, 2023) | Section 8.2.9 Surface Water Quality Summary | Comment #ERFN-066: Site-specific effluent treatment: the EIS overall is vague about the treatment planned for effluent prior to discharge. Question/Recommendation: Please provide examples of successful existing effluent treatment, preferably from ISR projects, which will form the basis for the site- specific treatment. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 170 | ERFN (February 22, 2023) | Section 8.3.1.1 Valued Component Selection | Comment #ERFN-067: MDMER requirements and deleterious substances. Question/Recommendation: Per MDMER guidance, please include a recognition that testing for Ammonia (un- ionized) is required under MDMER, and the requirement that effluent (at end-of-pipe, prior to dilution) must pass lethality testing. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 171 | ERFN (February 22, 2023) | Section 8.3.3.1 Fish Habitat | Comment #ERFN-068: Fish habitat characterization. Question/Recommendation: (i) What fish habitat characterization standards were used during field surveys? (ii) Were members of the field teams environmental professionals experienced in the assessment of fish habitat? | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 172 | ERFN (February 22, 2023) | Table 8.3-5 | Comment #ERFN-069: Burbot spawning habitat Question/Recommendation: What criteria were used to identify Burbot spawning habitat? Based on Burbot habitat preferences, SA-6 (at minimum) should be suitable for spawning. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| 173 | ERFN (February 22, 2023) | Table 8.3-5 | <p>Comment #ERFN-070: Fish species distribution and spawning habitat. Table 8.3-4 suggests the presence of Lake Whitefish in South Whitefish Lake(LA-5).</p> <p>Question/Recommendation:</p> <ul style="list-style-type: none"> - Clarify fish presence in South Whitefish Lake, specifically Lake Whitefish and Lake Trout. ERFN would like to emphasize the importance of Northern Pike, Lake Whitefish, Lake Trout, Walleye, and White/Longnose Sucker to community members. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 174 | ERFN (February 22, 2023) | Figure 8.3-8 | <p>Comment #ERFN-071: The proposed effluent discharge point appears to be extremely close to Northern Pike spawning habitat at the north/upstream end of South Whitefish Lake.</p> <p>Question/Recommendation:</p> <p>Please clarify the measures proposed to ensure effluent discharge does not affect Northern Pike spawning habitat, recognizing that Northern Pike spawning occurs shortly after ice-off, before high water.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 175 | ERFN (February 22, 2023) | Section 8.3.4.2.1 Construction | <p>Comment #ERFN-072: First mention of potentially “necessary” releases to the environment during the construction phase.</p> <p>Question/Recommendation:</p> <ul style="list-style-type: none"> (i) What defines a situation where the release of collected/stored water is “necessary” during construction? (ii) Are there any other parameters other than TSS that will be measured to determine that water collected during construction is “safe”? (iii) Where will the collected water be discharged in the event of a “necessary” release during construction? <p>ERFN would like to emphasize that a water management plan would address many of these questions.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 176 | ERFN (February 22, 2023) | Section 8.3.4.2.1 (and elsewhere) Mobilization of Suspended Materials | <p>Comment #ERFN-073: TSS as the parameter measured to determine the “safety” of effluent prior to discharge. Note that MDMER also requires that effluent at end-of-pipe must pass lethality testing.</p> <p>Question/Recommendation:</p> <ul style="list-style-type: none"> (i) Please provide justification for only considering TSS with respect to the safety of effluent for discharge. (ii) If multiple parameters will be considered, please update the text to reflect this; at minimum, “e.g.,” should be used rather than “i.e.,”. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 177 | ERFN (February 22, 2023) | Section 8.3.4.2 Potential Project- related Effects | <p>Comment #ERFN-074: Consideration of overprinting as the only potential effect to fish habitat. Defining harm to fish habitat based solely on area</p> <p>Question/Recommendation:</p> <p>Effects to the quality/usability of fish habitat should be considered as part of the EIS, rather than simply the surface area covered by project structures.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 178 | ERFN (February 22, 2023) | Section 8.3.4.2.3 Controlled Discharge to Receiving Environments | <p>Comment #ERFN-075: “Discharge to the environment is not expected during construction.” This directly contradicts the statements in other sections regarding the potential for necessary water releases during construction.</p> <p>Question/Recommendation:</p> <p>Provide clarification regarding potentially necessary releases during construction.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| 179 | ERFN (February 22, 2023) | Section 8.3.4.2.3 (and elsewhere) Controlled Discharge to Receiving Environments | Comment #ERFN-076: "Effluent rates during Decommissioning are expected to be less than during Operation." Denison commonly uses "expected" but does not provide elaboration. Question/Recommendation: Please provide clarity and justification (e.g., examples) for expectations regarding effluent rates. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 180 | ERFN (February 22, 2023) | Section 8.3.5 Mitigation Measures | Comment #ERFN-077: Adherence to DFO Interim Code of Practice for Temporary Stream Crossings. The proposed crossings are clear span bridges, which do not classify as temporary crossings. Question/Recommendation: Based on DFO code of practice guidance, the proposed crossings do not meet the requirements for being "temporary." Please update this section to include adherence to: Code of Practice for Clear Span Bridges and Code of Practice for Culvert Maintenance. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 181 | ERFN (February 22, 2023) | Section 8.3.5 Mitigation Measures | Comment #ERFN-078: Monitoring and management of effluent. Question/Recommendation: Given that discharge is anticipated to trigger MDMER, adherence to the requirements for effluent quality within MDMER should be explicitly recognized as part of mitigation measures. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 182 | ERFN (February 22, 2023) | Section 8.3.5 Mitigation Measures | Comment #ERFN-079: Preparation of an environmental code of practice. Question/Recommendation: (i) Please provide clarification regarding a timeline for the preparation of an environmental code of practice. It is ERFN's preference that this document be in place prior to construction. (ii) Will the environmental code of practice include consideration and planning in the event of malfunctions, as required under S19 of CEAA 2012? (iii) Will the environmental code of practice include and adaptive management plan for effluent discharge and treatment? | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 183 | ERFN (February 22, 2023) | Section 8.3.6.1 Construction | Comment #ERFN-080: Determination of effluent safety for release to environment. Question/Recommendation: Note again that earlier sections had asserted that contact water during construction would not be released to environment. Please revise the final sentence of paragraph 2 to be relevant to the fish & fish habitat section, as it currently refers to sediment chemistry and benthic invertebrate communities. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 184 | ERFN (February 22, 2023) | Section 8.3.6.1 Construction | Comment #ERFN-081: Upgrading two stream crossings to clear-span bridges. Question/Recommendation: ERFN would like to re-emphasize the above comment [reference to ERFN comment 77] related to adherence to DFO's Code of Practice for Clear Span Bridges. The proposed crossings are clear span bridges, which do not classify as temporary crossings. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| 185 | ERFN (February 22, 2023) | Section 8.3.6.1 Operation | Comment #ERFN-082: Continued reference to deep-well injection of effluent. Question/Recommendation: Provide clarity throughout document on whether effluent will be discharged to South Whitefish Lake, or, to ground via deep well injection. If deep well injection is proposed, please revise EIS to reflect the potential interactions of this method. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 186 | ERFN (February 22, 2023) | Section 8.3.6.1 Operation (and elsewhere) | Comment #ERFN-083: The effluent discharge will be heated to avoid freezing during winter. Question/Recommendation: (i) What are the implications for mixing during winter, given effluent will likely be considerably warmer than the surrounding water? (ii) How has Denison accounted for the potential for the warmer effluent creating an attractant effect, a reduction in DO, or other interaction that increases the risk of impacts to aquatic biota? (iii) Has Denison collected under-ice thermocline/isocline and in-situ WQ data during winter to support any assertions? | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 187 | ERFN (February 22, 2023) | Section 8.3.6.1 Operation (and elsewhere) | Comment #ERFN-084: Effluent discharge point. Question/Recommendation: Bottom-feeding fish such as White Sucker are in extended contact with and will often ingest sediments. Effects on White Sucker were modelled based on sufficient dilution of effluent. What protections will be built into the effluent discharge outlets to ensure bottom-feeding fish such as White Sucker are sufficiently excluded from the mixing zone? | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 188 | ERFN (February 22, 2023) | Table 8.3-9 | Comment #ERFN-085: The magnitude of residual effect. ERFN disagrees that the parameters and decisions that form the basis for the mixing model and the IMPACT model are sufficient to reliably predict that constituents introduced by project activities will remain below applicable guidelines. Question/Recommendation: Mixing zone calculations should be revisited to account for actual hydrological conditions at the discharge point in South Whitefish Lake. IMPACT model calculations should be revisited to examine worst-case scenarios (e.g., maximum potential discharge of 81 m3/hr. during low-flow and winter) and use more accurate starting points for water quality (existing baseline conditions in South Whitefish Lake rather than a region-wide geometric mean). | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 189 | ERFN (February 22, 2023) | Table 8.3-9 | Comment #ERFN-086: Reversibility. The assertion of fully reversible Water Quality effects relies on the assumption that all COPCs in the effluent are well-mixed and eventually exit South Whitefish Lake. Question/Recommendation: Please provide clarification and justification for the assumption that COPCs in effluent remains in solution and exit South Whitefish Lake, rather than concentrating over time and/or sequestering in sediments with the potential for future release. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 190 | ERFN (February 22, 2023) | Table 8.3-10 | Comment #ERFN-087: Magnitude. This row mentions changes to benthic invertebrate habitat. Question/Recommendation: This table is supposed to be discussing residual effects to fish habitat. Please ensure the residual effect tables include the correct information. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| 191 | ERFN (February 22, 2023) | Table 8.3-10 | Comment #ERFN-088: Magnitude. The assertion of low magnitude relies on defining a change to fish habitat based solely on % of surface area affected. Question/Recommendation: Recommend revising this table and the associated written section to include discussion relating to potential changes to the quality of fish habitat in addition to the amount. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 192 | ERFN (February 22, 2023) | Section 8.3.6.2 Significance and Confidence | Comment #ERFN-089: The judgement of not significant is reliant on successful mitigation measures, and that ecological integrity won't be altered beyond "an acceptable level." Question/Recommendation: (i) Recommend updating this section upon revision of the mitigation section, per above comments. (ii) What does "ecological integrity" mean? How is it measured? How will it be monitored? (iii) How will "an acceptable level" be determined? Acceptable to whom? ERFN requests that any determination of acceptability include consideration of the rights and values of Indigenous Peoples | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 193 | ERFN (February 22, 2023) | Section 8.3.6.2 Significance and Confidence | Comment #ERFN-090: "The predicted confidence with respect to the Fish and Fish Habitat VC is high as the mobilization of suspended materials can be readily mitigated." Question/Recommendation: Please clarify the justification for not considering other Water Quality-related factors (e.g., chemistry) and focusing on TSS mitigation. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 194 | ERFN (February 22, 2023) | Section 8.3.6.2 Significance and Confidence | Comment #ERFN-091: Conservative nature and accuracy of Water Quality modelling. Despite assumptions being conservative, the discharge model cannot produce conservative predictions if the inputs are inaccurate. Question/Recommendation: Please see ERFN comments 47-52, 55, 56, 58-64, 66-67, 73, 78, 80, 82-83, 85 and 86 for concerns regarding inaccurate model inputs. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 195 | ERFN (February 22, 2023) | Section 8.3.6.2 (and elsewhere) Significance and Confidence | Comment #ERFN-092: Focus on suspended materials. Sulphate in the effluent is predicted to be exceptionally high (almost 4,000 mg/L), with baseline values in South Whitefish Lake <1 mg/L. Question/Recommendation: Why were potential cascading effects of Water Quality not considered in the residual effects assessment? Very high sulphate in effluent has the potential to instigate eutrophication and/or cyanobacterial blooms through sulphate reduction pathways. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 196 | ERFN (February 22, 2023) | Section 8.3.6.2 Significance and Confidence | Comment #ERFN-093: Assertion of conservative assumptions for Water Quality modelling. Year-round discharge at the average rate (36.5 m3/hr.) is not conservative. Question/Recommendation: Please revisit the modelling with sufficiently conservative assumptions, such maximum potential discharge(81 m3/hr.) during low-flow and/or winter. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| 197 | ERFN (February 22, 2023) | Section 8.3.6.2 Significance and Confidence | Comment #ERFN-094: Use of conservative 95th percentile for baseline Water Quality. According to the model documentation provided in the EIS appendices, the geometric mean condition across all regional waterbodies was used to define baseline WQ. Question/Recommendation: Recommend revisiting the Water Quality modelling using the 95th percentile specifically for South Whitefish Lake(LA-5) as the baseline. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 198 | ERFN (February 22, 2023) | Table 8.4-2 | Comment #ERFN-095: Based on baseline data, 3 of 5 samples from LA-5 are >75% clay, and 2 of 5 are >70% sand. With only one year of data and without knowing where samples were collected in the lakes, it is unlikely that the classifications are truly representative of the average condition and variation of bottom sediments in study lakes. Question/Recommendation: (i) ERFN recommends Denison collect additional sediment samples to create a sufficient baseline (ii) ERFN recommends that Denison ensure future sediment sampling stations are located such that, at a minimum, sediments at the inlet, outlet, and potential discharge location of South Whitefish Lake are characterized. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 199 | ERFN (February 22, 2023) | Table 8.4-3 | Comment #ERFN-096: Sediment chemistry tables. Question/Recommendation: Why is there no standard deviation or standard error associated with the mean values in this table? Note that for LA-5, 3 of 5 samples have chemistry much more similar to the “maximum” values in Table 8.4-3 than the “mean” values. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 200 | ERFN (February 22, 2023) | Table 8.4-4 | Comment #ERFN-097: Benthic invertebrate endpoints. Note that diversity, evenness, and Bray-Curtis for the 2 of 5 sand- dominated samples from LA-5 are considerably higher than for the 3 of 5 clay-dominated samples. This seems to suggest that some areas in LA-5 are especially sensitive to stressors, as suggested in the above paragraph. Question/Recommendation: (i) Why is there no standard deviation or standard error associated with the mean values in this table? (ii) ERFN recommends Denison consider the potentially sensitive areas within the proposed receiving environment (LA-5) in addition to the average condition. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 201 | ERFN (February 22, 2023) | Table 8.4-4 | Comment #ERFN-098: Benthic invertebrate endpoints for LA-5 appear to be miscalculated. Based on raw benthos baseline data, total family richness at LA-5 across all reps is 22 (however, mean is 13). %Cladocera, the dominant taxon (water fleas) is 65% across all reps (58% avg). Question/Recommendation: (i) Please revisit and confirm the summary calculations for Table 8.4-4. (ii) Why were more typically pelagic taxa, such as Cladocera, not excluded from benthic invertebrate community characterizations as is often recommended in analytical guidance? | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 202 | ERFN (February 22, 2023) | Section 8.4.3.2.5 Benthic Invertebrate Chemistry | Comment #ERFN-099: Use of caddisfly larvae to characterize benthos tissue. Caddisflies are rare across the LSA, and extremely rare in South Whitefish Lake(LA-5) based on baseline data (only 4 individuals across all 5 replicates). Question/Recommendation: (i) Why were caddisfly larvae selected for benthic invertebrate tissue characterizations when they do not appear to be representative of the community? (ii) ERFN recommends Denison revisit the characterization of baseline benthic invertebrate tissue using taxa that are more relevant to the project or whole- community samples. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| 203 | ERFN (February 22, 2023) | Table 8.4-5 | Comment #ERFN-100: Benthic invertebrate tissue chemistry summary. Question/Recommendation: Please include any available tissue chemistry guidelines in this table. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 204 | ERFN (February 22, 2023) | Table 8.4-5 | Comment #ERFN-101: Benthic invertebrate tissue chemistry summary. One sample per lake, representing only one year of baseline data, is insufficient to characterize baseline conditions. Question/Recommendation: ERFN recommends Denison conduct at least one additional year of baseline data collection, including the collection of multiple benthic invertebrate tissue samples from South WhitefishLake. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 205 | ERFN (February 22, 2023) | Section 8.5.3 Existing Environment | Comment #ERFN-102 to 104: Fish tissue collection. Question/Recommendation: (i) Why were Lake Whitefish and Walleye not collected for tissue analyses? These species were also identified by ERFN citizens as important resources. (ii) Please provide additional justification for only using 5 fish in a single sample year for the characterization of baseline fish tissue chemistry. (iii) Why were organs, such as livers, discarded? Liver chemistry analyses are commonly recommended in fish tissue characterization guidance. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 206 | ERFN (February 22, 2023) | Section 8.5.4.2.2 Construction | Comment #ERFN-105: "Discharge to the environment is not expected during Construction." There appear to be contradictions across sections regarding whether discharge during construction will not occur, or whether it would occur "if necessary." Any discharge, even emergency discharge, would have implications for the fish health VC and should be considered in this section. Question/Recommendation: Please provide clarity throughout the document with regards to the anticipated effects from discharge (including "if necessary" emergency discharge) during construction. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 207 | ERFN (February 22, 2023) | Section 8.5.4.2.2 Operation and elsewhere Section 8.5.6.2 Significance and Confidence in the Assessment | Comment #ERFN-106 and ERFN-111: "The Project was assessed as having...a continuous effluent discharge rate of 81.0 m3/hr." This statement appears to contradict earlier assertions (see comment # ERFN -093 regarding S 8.3.6.2, above) that the conservative WQ model was based on average discharge of 36.5 m3/hr. Question/Recommendation: Please provide clarification throughout document on whether the assessments were based on the greatest potential effects at a discharge rate of 81 m3/hr., or a reduced potential effect at a discharge rate of 36.5 m3/hr. If assessments were not conducted based on discharge at 81 m3/hr., please provide additional justification for using less- conservative estimates. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 208 | ERFN (February 22, 2023) | Section 8.5.4.2.2 Operation | Comment #ERFN-107: "Sediment baseline concentrations were predicted from surface water concentrations." Question/Recommendation: Why were sediment baseline concentrations not based on actual sediment baseline data? | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| 209 | ERFN (February 22, 2023) | Section 8.5.4.2.2 Operation | Comment #ERFN-108: "The dw to ww ratio of 0.25 to 1 from CSA N288.1-20 was used." Note that the recommended ww criterion after conversion, if site- specific data were used, would be closer to 2.28 mg/kg (ww) and White Sucker tissue predictions would exceed this criterion. Question/Recommendation: Why were site-specific %moisture data not used for this conversion? It would likely be closer to 0.2 to 1 based on actual fish tissue baseline data. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 210 | ERFN (February 22, 2023) | Figure 8.5-5 | Comment #ERFN-109: Predicted tissue concentrations of selenium in Northern Pike and White Sucker. Based on the IMPACT model report, Northern Pike were exposed to COPCs through water only (despite being used to represent piscivorous predator), and White Sucker were exposed through water and sediments (as it is a bottom-feeder). Question/Recommendation: (i) Please justify the use of the IMPACT model data for Northern Pike tissue, given that it excludes any pathway related to piscivory. (ii) Please justify the use of the IMPACT model data for White Sucker tissue, given that it excludes any pathway related to the consumption of benthic invertebrates in addition to exposure to sediment. (iii) Note that studies on the toxicity of effluent to fish at the nearby Cameco Key Lake mine directly implicated dietary selenium. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 211 | ERFN (February 22, 2023) | Section 8.5.5 Mitigation Measures | Comment #ERFN-110: "Implement Project-specific monitoring programs...that include...and applying adaptive management, if necessary." Question/Recommendation: Please remove the "if necessary" qualifier; ERFN considers the monitoring mentioned in 8.5.5 and the application of adaptive management to be necessary for the successful mitigation of residual effects. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 212 | ERFN (February 22, 2023) | Section 8.5.6.2 Significance and Confidence in the Assessment | Comment #ERFN-112 "A high degree of confidence was assumed." Question/Recommendation: ERFN does not echo the high degree of confidence in this assessment, for multiple reasons including (but not limited to): apparent contradictions in the assessment methods and parameters, distinctly lacking baseline data, unsupported selection of modelling parameters, numerous assumptions without evidence for their validity, no references to contingency planning. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 213 | ERFN (February 22, 2023) | Section 8.5.8 Monitoring and Follow-Up | Comment #ERFN-113: Regulatory criteria for monitoring data comparison. Question/Recommendation: ERFN requests including comparisons to any applicable human health guidelines and/or screening criteria in all monitoring programs | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 214 | ERFN (February 22, 2023) | Section 8.5.8 Monitoring and Follow-Up | Comment #ERFN-114: Monitoring locations. Question/Recommendation: ERFN requests the addition of a monitoring site for (at minimum) aquatic sediments, located within the Northern Pike spawning habitat north of the proposed discharge location | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| 215 | ERFN (February 22, 2023) | Section 8.5.8 Monitoring and Follow-Up | Comment #ERFN-115: "It is recognized that additional collection of pre-mining fish tissue concentrations in Whitefish Lake and a reference area is needed." ERFN acknowledges and appreciates this recognition, but notes that the majority of baseline data for aquatic biota and sediments is extremely lacking. This also appears to be the only recognition of insufficient baseline data throughout the entire EIS. Question/Recommendation: Please update the other EIS sections to reflect the data gaps in the baseline sections, and an outline of the plan to address these gaps. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 216 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Table 1-2 | Comment #ERFN-116: High-level sample locations are provided, but an appropriate evaluation and characterization of baseline conditions require targeted sampling in specific areas. Question/Recommendation: Please update Table 1-2 to include sampling site coordinates (and replicate coordinates, if they are different), or, please provide a separate list of precise sample coordinates. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 217 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Figure 1-7 | Comment #ERFN-117: Based on this figure, neither bathymetry nor habitat surveys were completed on South Whitefish Lake (LA-5). Bathymetry and fish habitat are crucial to evaluating potential project impacts in the receiving environment. Question/Recommendation: (i) If these surveys have been completed, please update Figure1- 7 and provide the location of these data. (ii) If these surveys represent a data gap, ERFN recommends that Denison complete bathymetry and habitat surveys on South Whitefish Lake to sufficiently characterize the effluent discharge receiving environment. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 218 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Figure 1-8 | Comment #ERFN-118: Although benthic invertebrate sampling was completed in South Whitefish Lake, based on this figure, the potential inputs from upstream have not been characterized. Question/Recommendation: ERFN recommends collecting benthic invertebrate samples at SA-6 to characterize the potential upstream inputs to the benthic invertebrate community of the receiving environment. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 219 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Section 2.0 | Comment #ERFN-119: ERFN recognizes that Denison followed standardized or recommended field methodology during the collection of baseline information. Question/Recommendation: (i) What guidance did Denison follow to determine the frequency of baseline sampling? (ii) What guidance did Denison follow to determine the number of years that would provide sufficient characterization of the aquatic baseline? (iii) What guidance did Denison follow to determine the sampling locations and the number of samples? | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 220 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Section 3.5.1 | Comment #ERFN-120: The hydrological baseline data are now 8-10yearsold. These data are too old to sufficiently characterize the current baseline conditions, especially given that development has occurred in the Project area within that time. Question/Recommendation: Denison should collect updated hydrological baseline data for South Whitefish Lake, including (but not limited to) water level, ice thickness, and bathymetry. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| 221 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Section 3.5.1.3 | Comment #ERFN-121: The South Whitefish Lake bathymetric baseline data collected by Golder in 2012 suggests that the average depth was 1.1 m. This appears to contradict the depth used in the mixing model (~3 m). Question/Recommendation: Please clarify the data and decisions that contributed to the depth parameter used for the mixing model. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 222 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Section 3.5.4 | Comment #ERFN-122: Section suggests a collection of habitat data in South Whitefish Lake was completed in 2012 by Golder, and observations were made during the 2016 field program. Question/Recommendation: (i) Where are these data? Does Denison have a detailed characterization of the aquatic habitat in South Whitefish Lake available? (ii) ERFN does not agree that high-level observations made during 2016 are sufficient to confirm that aquatic habitat has remained unchanged for the last 10 years. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 223 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Section 3.5.5 | Comment #ERFN-123: As referenced in comment #ERFN-092, the baseline phytoplankton community for South Whitefish Lake is nearly 30% Cyanophyceae, the highest proportion of cyanobacteria in any Project waterbody except Russel Lake. This is likely to influence the risk of eutrophication in the receiving environment. Question/Recommendation: Please confirm whether the risk of eutrophication in South Whitefish Lake has been considered and justify its exclusion from the EIS. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 224 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Section 3.5.7 | Comment #ERFN-124: Fish spawning habitat. Question/Recommendation: ERFN recognizes the inclusion of Indigenous Knowledge in confirming local fish spawning habitat. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 225 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Table 3-7C | Comment #ERFN-125: Caddisflies comprise <1% of the benthic invertebrate community in the receiving environment. Question/Recommendation: Please justify the specific selection of caddisflies for characterizing the baseline benthic invertebrate tissue chemistry. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 226 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Table 3-8 | Comment #ERFN-126: No tissue chemistry guidelines are provided for benthic invertebrates. Question/Recommendation: ERFN recommends the inclusion of any available tissue chemistry guidelines for benthic invertebrates, including those from other Canadian jurisdictions, to provide sufficient context for evaluating the baseline data. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|--|
| 227 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Table 3-10 | Comment #ERFN-127: There appears to be a disagreement between the n's provided in this table, and the description of fish tissue collection methods in the baseline and EIS. The methods section implies that 5 total samples were collected per waterbody, with some samples representing more than 1 fish. Question/Recommendation: Please clarify the fish tissue collection and analysis methods. Were all fish analyzed separately? Were tissues for each "sample" aggregated if multiple fish were required? | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 228 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Table 3-10 | Comment #ERFN-128: The table presents the average concentration of parameters, but no indication of variation/accuracy. Question/Recommendation: Please provide standard deviation and/or standard error for fish tissue chemistry average values. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 229 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Figures 3-10 and 3-11 | Comment #ERFN-129: The inclusion of bathymetric and habitat survey data for North Whitefish Lake (LA-6) from 2018 highlights the lack of similar surveys on South Whitefish Lake (LA-5), which is the actual receiving environment. Question/Recommendation: (i) Please justify the lack of current bathymetric and habitat survey data for South Whitefish Lake. (ii) Denison should conduct multibeam sonar surveys on South Whitefish Lake, the receiving environment, to sufficiently characterize bathymetry and aquatic habitat. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 230 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Section 4.6.1 | Comment #ERFN-130: Paragraph two notes that stage- discharge curves were updated in 2019 to account for greater discharge measured during manual surveys in 2019. Question/Recommendation: (i) Were stage-discharge curves adjusted for flows measured in recent years, other than 2019? Were manual measurements collected in any other recent years? (ii) If not, please justify the adjustment of stage-discharge curves based on a single year that had a higher- than-average discharge. How does Denison know that flows in 2019 were not abnormally high? | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 231 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Section 4.6.1.2 and Table 4-1 | Comment #ERFN-131: "In May-early June 2018, the flow at SA-6 was fluctuating around 0.7 m3/s until end of May before decreasing." This appears to imply that freshet flows in 2018 (assumedly high flows for that year) were near the minimum discharge measured from Sept 2016 to Aug 2019 (0.717 m3/s). Question/Recommendation: (i) Were stage-discharge curves updated to reflect the flows in 2018? (ii) Please clarify the decisions and data used for updating stage-discharge curves. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 232 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Section 4.6.3 | Comment #ERFN-132: "Mean channel wetted width, water depth and water velocity were 14 m, 0.7 m and 0.2 m/s, respectively." Question/Recommendation: How does a wide, slow, low-gradient inflow translate to the current velocities used for mixing modelling? Please refer to the earlier comment and justify the assumptions made for the mixing model. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| 233 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Section 4.6.3 | Comment #ERFN-133: "Snails (Gastropoda), mayfly nymphs (Hexagenia sp.) and dragonfly nymphs were observed." Field observations do not substitute for sample collection and taxonomy. Question/Recommendation: As noted in an comment #ERFN-118, ERFN recommends benthic invertebrate sampling at SA-6 to sufficiently characterize the benthic invertebrate community upstream of South Whitefish Lake. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 234 | ERFN (February 22, 2023) | Appendix 8-D Baseline Aquatic Environment Study Section 4.6.4 | Comment #ERFN-134: Burbot were recovered at SA-6 but were considered not present in South Whitefish Lake. Question/Recommendation: Please justify the assertion that burbot are not present in South Whitefish Lake, despite recovering them shortly upstream at SA-6. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 235 | ERFN (February 22, 2023) | Appendix 10-A, Appendix A: Wheeler River Project IMPACT Model Figure 2-1 | Comment #ERFN-135: This figure illustrates that absorption from surface water was only source of COPCs investigated for Northern Pike as part of the IMPACT model. Northern Pike was intended to represent piscivorous predators for the purpose of this modelling. Question/Recommendation: Please justify the results of the IMPACT model for Northern Pike despite not accounting for piscivory or any other feeding. Note that studies on the toxicity of effluent to fish at the nearby Cameco Key Lake mine directly implicated dietary selenium. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 236 | ERFN (February 22, 2023) | EIS Appendix 10-A, Appendix A: Wheeler River Project IMPACT Model Table 3-4 | Comment #ERFN-136: The "Water Baseline" used for the IMPACT model integrates surface water quality from multiple regional waterbodies. This results in baseline chemistry that is lower (sometimes 10x lower) than the chemistry of South Whitefish Lake, the receiving environment. Question/Recommendation: Please revisit the IMPACT model using surface water quality data accurate to the South Whitefish Lake receiving environment. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 237 | ERFN (February 22, 2023) | Section 9.2.1, 9.3.1, and 9.4.1: Influence of IK, LK and Engagement on VC selection. | Comment #ERFN-137: Concerns raised by the ERFN during August 2022 engagement sessions (e.g., for subsistence/harvestable foods, important vegetation communities, and wildlife habitat) do not appear to have been considered during VC selection. Question/Recommendation: Update Section 9 to incorporate concerns raised in the August 2022 submission and demonstrate how these comments have been addressed or considered in the assessment as VCs, or KIs for existing VCs (i.e., wetlands, woodland caribou). | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 238 | ERFN (February 22, 2023) | Section 9.2.1, 9.3.1, and 9.4.1: Influence of IK, LK and Engagement on MP considerations. | Comment #ERFN-138: Relevant criteria for VC selection according to the EIS includes: "contributing roles to biodiversity, ecosystem function, and maintenance of wildlife habitat," and "contributions to environmental, socio-economic, and cultural values of Indigenous groups, the public and other Interested Parties" (EIS 9.2.1, 9.3.1, and 9.4.1), among others. Question/Recommendation: Overall changes in habitat for wildlife and plants of cultural importance within the Project area, LSA and RSA must be considered as a measurable parameter. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| 239 | ERFN (February 22, 2023) | Section 9: Influence of IK, LK and Engagement on Mitigation and Monitoring considerations. | <p>Comment #ERFN-139: Wetlands were recognized in the EIS as important for multiple reasons and designated a VC. However, the potential impacts and their mitigation and monitoring were not adequately characterized or discussed.</p> <p>Question/Recommendation:</p> <p>(i) Changes in aerial extent of wetlands as the single MP for this VC is insufficient to monitor all changes in these habitats – they are key lifecycle habitat (breeding/foraging/cover) areas for species of management concern as they relate to both the EIS and ERFN (e.g., small furbearers such as beaver, mink; large ungulates such as moose; game birds/species at risk; supports growth of subsistence foods such as cranberries).</p> <p>(ii) Drawdown effects on wetlands were not identified as a potential effect, even though water withdrawal requirements exist for majority of Project timeline, and Project design incorporates an inward hydraulic gradient.</p> <p>(iii) Overall changes in habitat for wildlife and plants of cultural importance within the Project area, LSA and RSA must be considered as a measurable parameter.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 240 | ERFN (February 22, 2023) | Section 9.1.4, (9.2.4, 9.3.4 and 9.4.4): Influence of IK, LK and Engagement on Mitigation and Monitoring considerations | <p>Comment #ERFN-140: “Reclamation design planning is at a conceptual or pre-feasibility stage. Presently, most Project features are planned to be reclaimed by re- instating (to the extent practical) predominant topographical contours and drainage features, and preparing the site (e.g., via grading, and scarifying and/or other surface preparations) in a manner that promotes natural revegetation.... Certain Project features (e.g., the clean waste rock pile) may be integrated into the end-landscape... to create a safe, stable, and self- sustaining landscape.” (pp. 9-28)</p> <p>Concerns were raised in engagement sessions about documenting caribou calving locations and participating in mitigating possible effects(SVS, 2022).The loss of wetland areas may reduce the amount of habitat available for moose and caribou calving, as well as other stages of the irrespective life histories. This interaction will directly impact the availability of this important resource.</p> <p>Question/Recommendation:</p> <p>Section 9 and Table 3.5-1 should be updated to reflect recommendations for reclamation priorities identified in the ERA and ERA-annex, in addition to federal recovery strategies (i.e., Woodland caribou, wolverine) mitigations and management recommendations for species at risk, and species-specific IK and LK. Denison must consider all pathways of effects, including those which are indirect, such as the loss or conversion of lands used as habitat by species of cultural importance</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 241 | ERFN (February 22, 2023) | Section 9.1.3.3: Influence of IK, LK and Engagement on VC selection. | <p>Comment #ERFN-141: Permafrost was investigated but not adequately characterized to support conclusions made in the EIS. Potential presence is established, and engagement concerns were raised “specifically referencing cumulative effects through mention of climate change and the vulnerability of northern environments,” “potential effect of exploration on various characteristics of the biophysical environment” (pp. 4-25); and “possible changes to permafrost on the Wheeler River” (pp. 4-33).</p> <p>Question/Recommendation:</p> <p>Sections 6and9 should be updated to include verification of the presence/absence/extent of permafrost within the Project Area or permafrost interactions with the Project within the CEA.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 242 | ERFN (February 22, 2023) | Section 9.1.4: Assessment of Project- related Effects. | <p>Comment #ERFN-142: “Activities during Post- Decommissioning (comprising site inspections, monitoring and on-site engagement with interested parties) were deemed to have no interaction because they do not involve any land clearing, surface preparations or major earthworks” (EIS 9.1.4).</p> <p>Post-Decommissioning activities should incorporate changes issued by regulatory bodies, required mitigations or actions identified through the Denison Environmental Monitoring System/adaptive management process, and/or Indigenous/third party engagement recommendations.</p> <p>Question/Recommendation:</p> <p>Update Section 9 to include further detail regarding post-decommissioning activities resulting in earthworks for: changes issued by regulatory bodies, required mitigations or actions identified through the Denison Environmental Monitoring System/adaptive management process, and/or Indigenous/third party engagement recommendations.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| 243 | ERFN (February 22, 2023) | Section 9.1.1.1 VC Selection (Terrain, Soil, and Organic Matter/Peat) and 9.2.3.2 Listed Plant Species VC | <p>Comment #ERFN-143: Baseline studies for the Terrestrial Environment component of the EIS were conducted from 2017-2019 and were refined in 2019 with a focus on the Phoenix development only. Soil and terrain baseline data was presented at broad scale and coarse resolution (1:20,000) in the original investigations (Appendix 9-B), and baseline vegetation data categorized disturbed forest stands as novel regenerating forest types. This was defined and corrected further by the literature review and mapping contained in Appendix 9-C. Vegetation/wildlife habitat characterization were completed over two surveys in July-Aug 2017 (Appendix 9-B; with no sampling completed for waterbodies/disturbed non-vegetated lands), before the project footprint was altered – in consultation with the SK MOE, the EIS can carry forward with existing information with the condition that additional rare plant pre-disturbance surveys would accompany project approval.</p> <p>Question/Recommendation: ERFN appreciate the recognition of a data deficiency and concur that additional rare vascular plant surveys are required in ecosites not sampled previously to fully investigate the terrestrial environment component of the project and related effects. As baseline survey efforts focused on mid- and late-season rare vascular species, and further information on wetlands in the RSA is proposed to better characterize wildlife habitat and availability of subsistence harvestable food/medicinal plant resources, early-season surveys that also target wetland habitats are recommended.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 244 | ERFN (February 22, 2023) | Section 9.2.4.2.2 Change in the Concentrations of COPC in Vegetation | <p>Comment #ERFN-144: Per the ERA, vegetation and soil collection and chemistry were completed at 10 permanent sample plots in August 2017 – terrestrial lichens, current year's growth of blueberry(leaf, stem, berries), and soil samples were collected. Radionuclide levels are relatively consistent(lichen, blueberry and soils); however, several metal/elemental parameters were elevated when compared to Rio Rinto's Roughrider Project.</p> <p>Question/Recommendation: The EIS identified Labrador tea and browse as also being estimated for metals/radionuclides COPCs in the ERA – this was not included in the ERA; however, red-backed voles were also tested during the small mammal baseline program (Appendix 9-B). Update section to reflect same.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 245 | ERFN (February 22, 2023) | Section 9.3.1.1 VC Selection (Ungulates, Furbearers, and Woodland Caribou) | <p>Comment #ERFN-145: This VC list omits several species which have been identified by ERFN as commercially important for trapping purposes, including Lynx, Muskrat, Fisher, Fox, Otter, and Mink. As noted in the ERFN Traditional Knowledge Study, concern was raised about the impacts of the mine and associated infrastructure on the ability to trap and trapping success. Presence of lynx, fisher, fox, otter, muskrat, beaver and mink were identified in the baseline winter tracking studies (Appendix 9-B).</p> <p>Question/Recommendation: Presence of all ERFN-identified traditionally important species were observed in the baseline winter tracking studies (Appendix 9-B). Overall changes in habitat for wildlife and plants of cultural importance within the Project area, LSA and RSA must be considered as a measurable parameter</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 246 | ERFN (February 22, 2023) | Section 9.4.3 Existing Environment (Raptors, Migratory Breeding Birds, and Bird Species at Risk) | <p>Comment #ERFN-146: Appendix 9-C identifies knowledge gaps for information to fully describe the wildlife assemblage in the RSA, including avian species of management concern. Species Detection Survey Protocols (SK MOE 2021) were not implemented for the baseline avian surveys.</p> <p>Recommendations for sensitive timing windows and setback distances from high disturbance activities should be considered for rusty blackbird, which may also use the RSA. The baseline survey did not account for early- season breeding species of management concern (i.e., owls, woodpeckers, game birds).</p> <p>Question/Recommendation: Additional surveys are recommended utilizing appropriate species detection survey protocols to account for VCs and additional species of management concern with the potential to occur in the project area.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| 247 | ERFN (February 22, 2023) | Section 9 (General) VC Selection | Comment #ERFN-147: Some small mammals were shown to observe elevated levels of select COPCs during baseline studies (Appendix 9-B) but were not discussed in the EIS. Bats and Amphibians were also not considered in the EIS as VC or KIs, even though both bat species and one amphibian species are listed under SARA. Traditional species of cultural importance for gathering and subsistence were also not included. Question/Recommendation: Provide a rationale why these components were not considered. | |
| 248 | ERFN (February 22, 2023) | Section 9 (General) VC Selection | Comment #ERFN-148: Several iterations in the EIS state baseline studies were not designed to establish relative abundance estimates for furbearer VCs, whereas certain baseline surveys (Appendix 9-B) were designed to provide quantitative data on the occurrence and relative abundance (i.e., semi-aquatic furbearer shoreline study, winter track count). Question/Recommendation: Provide rationale for not incorporating relative abundance. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 249 | ERFN (February 22, 2023) | Section 9.3.3 Existing Environment; EIS Section 9.3.5 Mitigation Measures | Comment #ERFN-149: Appendix 9-C identifies knowledge gaps for information to fully describe the wildlife assemblage in the RSA, including ungulates (woodland caribou and moose), but there is no recognition of the implications of these gaps or suggestions to address them. Question/Recommendation: ERFN notes if recent aerial ungulate survey data are unavailable, the Proponent should consider management and development recommendations available for the region and management areas, in addition to the federal recovery strategy for caribou, as part of the EIS. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 250 | ERFN (February 22, 2023) | Section 9.3.5 Mitigation Measures | Comment #ERFN-150: The mitigations for linear disturbances identify ongoing research into the effectiveness of disrupting predator-prey dynamics along linear disturbances. Appendix 9-B includes recommendations for reclamation of linear disturbances around the Project Area. Question/Recommendation: ERFN acknowledges the efforts by Denison and the recommendations provided in Appendix 9-B for the reclamation of linear disturbances, and requests the Proponent to consider prioritizing progressive reclamation in these areas as a commitment within the EIS, in addition to utilizing ongoing research data to adjust and inform reclamation planning and implementation. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 251 | ERFN (February 22, 2023) | Section 9.1.5, 9.2.5, 9.3.5, 9.4.5 (General) Mitigation Measures | Comment #ERFN-151: Spill response plan. Question/Recommendation: It is recommended that monitoring during Project Activities occur to minimize discrete spills wherever possible, per the Spill Response Plan. Spill Response Plan should include reportable quantities, spills report line directly to proponent, and specific procedures for documenting and reporting spills to regulatory bodies. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 252 | ERFN (February 22, 2023) | Section 9.2.5.2.4 Invasive Plant Management | Comment #ERFN-152: Additional mitigation measures include use of herbicides or other bio-controls to address invasive species establishment. Denison does not provide evidence discussing the potential impacts to the Terrestrial Environment VCs from the use of herbicides or other bio-controls. Question/Recommendation: Denison must provide information on how impacts will be mitigated if herbicides or other bio-controls are used. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| 253 | ERFN (February 22, 2023) | Section 9 (General) Wildlife mitigations | Comment #ERFN-153: Fencing for deterrence of entrapment in certain Project areas Question/Recommendation: Fencing should be buried deep enough to prevent potential interactions with burrowing animals, and high enough to prevent wildlife movement over the fence. Fencing should be monitored for entrapped wildlife at regular intervals identified within the EMS, and a plan should be in place for the non-lethal removal of trapped wildlife if required. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 254 | ERFN (February 22, 2023) | Section 10.1.1.2 Key Indicators and Measurable Parameters | Comment #ERFN-154: Public Health is Identified as a Key Indicator and is informed by Measurable Parameters which include: "Evaluation of risk of exposure to COPCs through use of hazard quotient, incremental lifetime cancer risk, or radiation dose," is a very narrow view of human health as it is affected by this project. This ignores a wide range of physical and psychological factors which may influence the health and wellbeing of ERFN citizens. Question/Recommendation: Denison should provide additional analysis of the Public Health Key Indicator which includes Measurable Parameters to qualitatively or quantitatively assess mental health, psycho- social factors and wellness as it may be influenced by this project. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 255 | ERFN (February 22, 2023) | Section 10.1.1.3 Spatial and Temporal Boundaries | Comment #ERFN-155: The spatial boundaries for the assessment of Human Health are not appropriate as it ignores the many persons who use the area surrounding the project but do not reside within the LSA or RSA catchment area. Most ERFN land users live further south in Patuanak/ Wapachewunak Reserve but use the area around the project to harvest and exercise rights, therefore must be considered within the geographic scope of the assessment Question/Recommendation: Denison reassesses the Public Health key indicator to include Patuanak/Wapachewunak Reserve, as the closest population centre. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 256 | ERFN (February 22, 2023) | Section 10.1.3.2 Traditional Foods Diet | Comment #ERFN-156: Denison note that Walleye and Lake Whitefish are the most commonly consumed fish within the study area to inform the HHRA. While these are important species, they may not be fully representative of the full risks posed by fish. For example, longer- living fish such as Lake Trout are consumed, and as top predators are at a greater risk for bioaccumulation Question/Recommendation: Denison should consider bioaccumulation risks associated with other country foods consumed. This includes considering and incorporating species which are both consumed in the greatest quantities, but also are representative of the greatest risk for use in the HHRA. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 257 | ERFN (February 22, 2023) | Section 10.1.4.1 Potential Interactions Between the Project and Valued Component/Key Indicators | Comment #ERFN-157: Table 10.1-3 Outlines a list of project phases/activities and an indication of whether they are likely to interact with Public Health. This table, however, fails to provide information about the effects of pathways or how the proposed activities may result in impacts on public health. Question/Recommendation: ERFN request Denison provide a breakdown of the effects pathways and predicted or plausible impacts for each of the project activities which may influence public health. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 258 | ERFN (February 22, 2023) | Section 10.1.4.2.1 Air Emissions During Construction, Operation, and Decommissioning | Comment #ERFN-158: As outlined in Appendix 6A, elevated levels of NO2 and Radon are expected to be observed outside of the area established as the LSA and in some cases the RSA to assess human health. Therefore, the assessment of potential project-related effects associated with air emissions during construction, operation, and decommissioning should be considered in complete. Question/Recommendation: Denison provides a revised assessment of Potential project-related effects as a result of air emissions during construction, operation, and decommissioning in areas beyond the geographical scope of elevated atmospheric emissions are predicted. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| 259 | ERFN (February 22, 2023) | Section 10.1.4.2.1 Air Emissions During Construction, Operation, and Decommissioning | <p>Comment #ERFN-159: Denison note that there are several instances in which exceedances of air quality criteria for NO₂, PM₁₀ and uranium are expected, they were not identified for further assessment in the human health risk assessment, "as these COPCs are unlikely to be associated with a human health or environmental risk." The adequate rationale is not provided to dismiss these potential contributors to human health risk, and air quality exceedance of any COPC, should be sufficient rationale within itself to carry forward any factor.</p> <p>Question/Recommendation: ERFN are confused as to why Denison has chosen to dismiss the consideration of COPCs which exceed air quality criteria from further human health risk assessment. By removing these potential risk sources, Denison appears to be picking and choosing which factors are important prior to carrying out any analysis. ERFN recommend that Denison amend the Human Health Risk Assessment and include NO₂, PM₁₀ and uranium as possible human health risk factors until appropriate evidence can be presented to demonstrate that these will not present harm.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 260 | ERFN (February 22, 2023) | Section 10.1.4.2.1 Air Emissions During Construction, Operation, and Decommissioning | <p>Comment #ERFN-160: Denison notes that "a pond may be constructed beside the clean waste rock pad to collect runoff if required. Any runoff from the clean waste rock pond will be directed to the process water pond". This statement contradicts itself, as in the first sentence, Denison indicates that they may establish a water collection pond to collect runoff from the clean waste rock pile, however, this is followed by stating that runoff will be directed to the process water pond. It is unclear the purpose of this additional pond that may be constructed.</p> <p>Question/Recommendation: Denison should provide additional information on the rationale for the construction of this additional pond and what role it will play in both mitigating risk to human health and providing overall contact water management.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 261 | ERFN (February 22, 2023) | Section 10.1.4.2.1 Air Emissions During Construction, Operation, and Decommissioning | <p>Comment #ERFN-161: It is unclear under which circumstances effluent may be discharged to Whitefish Lake as Denison states they intend to process water by circulating it through the injection and recovery wells.</p> <p>Question/Recommendation: Please provide additional information regarding the source of water to be discharged to Whitefish Lake</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 262 | ERFN (February 22, 2023) | Section 10.1.4.2.1 Air Emissions During Construction, Operation, and Decommissioning | <p>Comment #ERFN-162: Denison appears to be confusing the application of multiple water quality applications. Specifically, they state: "The most restrictive federal or provincial guidelines for surface water quality, based on Canadian drinking water quality guidelines, are the CCME water quality guidelines for the protection of freshwater aquatic life, the federal environmental quality guidelines, and the Saskatchewan environmental quality guidelines." These are all separate water quality guidelines and apply to different aspects of water quality management.</p> <p>Question/Recommendation: Denison must be clear as to the guidelines which are being used at all times during the analysis to ensure that they are applied appropriately.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 263 | ERFN (February 22, 2023) | Section 10.1.4.2.1 Air Emissions During Construction, Operation, and Decommissioning | <p>Comment #ERFN-163: Denison notes that effluent was assessed using a benchtop model simulation of the material processing and effluent treatment process. Using the derived effluent, a handful of constituents were assessed including cadmium, chromium, selenium, and lead. Other COPCs exist beyond these parameters and should be assessed appropriately.</p> <p>Question/Recommendation: Denison should perform additional broad-suite analysis of all parameters as set by CCME water quality guidelines for the protection of freshwater aquatic life and the Metal and Diamond Mining Effluent Regulations.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

| | | | | |
|-----|---|--|--|--|
| 264 | ERFN (February 22, 2023) | Section 10.1.4.2.1 Air Emissions During Construction, Operation, and Decommissioning | <p>Comment #ERFN-164: Total dissolved solids (TDS) within itself is not known to be detrimental to the aquatic environment, however, can have adverse aesthetic impacts. That said, TDS is comprised of many other dissolved constituents, such as chloride, calcium, sodium, potassium, fluoride, and others, which may be harmful in elevated concentrations. Given TDS is expected to exceed the water quality guideline by more than 10-fold, it is necessary to identify the contributing factors before TDS can be ruled out as a potential risk.</p> <p>Question/Recommendation: Denison should provide an analysis of the constituents which contribute to high TDS and propose a method of reducing TDS to meet water quality guidelines.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 265 | ERFN (February 22, 2023) | Section 10.1.4.2.1 Air Emissions During Construction, Operation, and Decommissioning; Table 10.1-4 | <p>Comment #ERFN-165: Molybdenum is concerning high. CCME note that the long-term concentration of molybdenum for the protection of aquatic life is 0.073 ug/L which is several orders of magnitude less than what was observed in effluent tests. Similarly, sulphate is also very high, which once released into the environment may influence pH and acidification of the downstream environment.</p> <p>Question/Recommendation: Denison must demonstrate how it plans to minimize the source effluent of molybdenum and sulphate associated with this project.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 266 | ERFN (February 22, 2023) | Section 10.1.6.1.1 Human Receptors Selection and Characterization; Table 10.1-6 | <p>Comment #ERFN-166: The human receptors outlined in Table 10.1-6 are not fully representative of land users and those who may be impacted. There is a need to consider other more vulnerable human receptor groups such as youth, Elders, and pregnant females who interact with the land and consume high levels of traditional foods similar to Fisher/Trapper. Similarly, other human health receptors should be considered for permanent residents.</p> <p>Question/Recommendation: Denison should reanalyze their human health risk assessment including the use of vulnerable personas such as youth, pregnant female, and Elder.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 267 | ERFN (February 22, 2023) | Section 10.1.6.1.3 Exposure Assessment and Pathway Modelling | <p>Comment #ERFN-167: In assessing exposure pathways, it is noted that COPCs may travel through multiple ecological receptors before being consumed or otherwise taken up by humans. However, it is unclear whether Denison has considered the potential for bioaccumulation, additive, or synergistic effects when viewing the exposure pathway through a cumulative effects lens.</p> <p>Question/Recommendation: Denison should provide clarity into all assumptions which went into the pathway modelling including considerations for cumulative effects and bioaccumulation of COPCs en route to human end points.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 268 | ERFN (February 22, 2023) | Section 10.1.6.1.4 Human Health Risk Assessment Results; Table 10.1-8 | <p>Comment #ERFN-168: Denison does not provide a Hazard Quotient (HQ) for Aquatic Plants. However, aquatic plants may be directly consumed by ERFN land users. As a result, this represents a knowledge gap within the assessment.</p> <p>Question/Recommendation: Denison should assess the hazard quotients associated with aquatic plant consumption. If no information related to the TVR is available use available proxy (e.g., terrestrial plants) to estimate a conservative hazard quotient.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 269 | ERFN (February 22, 2023) | Section 10.1.6.1.4 Human Health Risk Assessment Results; Table 10.1-8 | <p>Comment #ERFN-169: Although in most cases project incremental HQ is not on its own a key driver in Project Total HQ exceeding individual or total benchmarks, the high baseline emphasizes the need to minimize additional inputs. ERFN does not accept arguments that suggest that since the baseline is already elevated, any additional inputs are negligible. Rather, any additional inputs only worsen the risks which are already present.</p> <p>Question/Recommendation: For all COPCs where individual or total HQs are above benchmarks, Denison must proactively identify solutions for minimizing additional inputs.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| 270 | ERFN (February 22, 2023) | Section 10.2.1.1 Valued Component Selection | <p>Comment #ERFN-170: Denison notes that unwanted constituents, specifically iron and radium, will be removed from the recovered lixiviant material prior to uranium precipitation. This unwanted precipitate does however contain a valuable amount of uranium and therefore will be stored and shipped to be processed at an eligible licensed facility. It is unclear where this facility may be located, and furthermore, it is unclear whether the impacts of transportation of this material and the potential for accidents or malfunctions has been considered elsewhere in this EIS.</p> <p>Question/Recommendation: Denison must provide additional information about its plans to move waste products containing radium and uranium offsite for additional processing.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 271 | ERFN (February 22, 2023) | Section 10.2.4 Mitigation Measures | <p>Comment #ERFN-171: Mitigation measures should ensure there are redundant protections in place to minimize risk to worker health. Specifically, in any instance where the use of powered air purifying respirator (PAPR) will be effective in reducing radiation exposure, it should be applied. This then can be made redundant through the use of personal protective equipment such as the use of N95 or a self-contained breathing system.</p> <p>Question/Recommendation: Denison should take an additive approach rather than an either/or approach to identifying and applying mitigations for limiting radiation exposure to workers.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
