| 272 | ERFN (February 22, 2023) | Table 3.5-1: How Indigenous Knowledge was Incorporated into Existing Environment and Effects Assessment Sections | <p>Comment #ERFN-172: Not all of the information in this table explains how the knowledge was incorporated or used to inform the effects assessment sections. Rather, in many instances, it states what the knowledge was instead of how it was used.</p> <p>Question/Recommendation: Provide a reference table identifying and acknowledging all of the information that was provided by ERFN and indicates how the information was incorporated and weighted into the assessment of the effects. If needed, ERFN can support by providing this information if the TK report is not clear enough.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 273 | ERFN (February 22, 2023) | Section 4.1.2 Denison's Indigenous Peoples Policy and Investment and Sustainability Philosophy | <p>Comment #ERFN-173: The EIS states that "Denison is committed to operating the Project in a fully sustainable manner, considering not only the maintenance of high standards of safety and environmental compliance." (p.4-3). It is not clear what "fully sustainable" means or how the definition was informed.</p> <p>Question/Recommendation: Provide clear definition, with backed-up literature and evidence, as to what "fully sustainable" means. Further, clarify how ERFN values were included in the understanding of "fully sustainable." That is, has this definition been informed by Indigenous Knowledge and worldviews, and if so, then how have project planning and activities adjusted and if not, then provide an explanation as to why.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 274 | ERFN (February 22, 2023) | Section 11.0 Land and Resource Use General comment | <p>Comment #ERFN-174: Denison has separated out the quality of life, land and resource use, economics and other VCs as if they can be considered separately.</p> <p>Question/Recommendation: Provide an explanation as to how land and resource use was considered in quality of life effects assessment.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 275 | ERFN (February 22, 2023) | Section 11.0 Land and Resource Use | <p>Comment #ERFN-175: Repeatedly, Denison states that there is "limited amount of Indigenous uses in proximity to the Project" and it appears these conclusions have been made from Denison's interpretation of ERFN's TK report. It was made clear to Denison that there is extensive use in the area and that the report is limited in scope and is not statistically representative of ERFN rights holders. Further, Denison has failed to frame the EIS from a rights-based approach. The rights of the Indigenous peoples of Canada recognized and affirmed by section 35 of the Constitution Act, 1982 (Section 22(1)(c)) are collective rights, and assuming minimal impact based on the inaccurate understanding of a few land users does not adequately assess impacts to Indigenous Rights.</p> <p>Other instances of inaccurate wording of use include:</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

| | | | | |
|-----|---|--------------------------------------|---|--|
| | | | <ul style="list-style-type: none"> - “Overall, given the limited use of the ILRU LSA, adverse effects that are low in magnitude, the limited geographic extents of effects, and the reversibility of effects, the conclusion relative to changes to ILRU is not significant.” - “The absence of the Key Lake gate and the removal of the process of providing identification will provide recreational users and local Indigenous communities with greater access to the ILRU LSA, which is not currently used intensively” (p. 11-70 – emphasis added) - “Overall, given limited use of the ILRU LSA, adverse effects that are low in magnitude, the limited geographic extents of effects, and the reversibility of effects, the conclusion relative to changes to ILRU is not significant.” (p. 11-74) - “Big game hunting is absent in the Project Area and is sparse and infrequent in the ILRU LSA. Indigenous harvests of terrestrial species are primarily conducted south of the Key Lake gate and/or closer to communities.” (p.11-49) <p>Question/Recommendation: ERFN made it clear in their submissions that the information provided was not statistically representative and does not include the entire IK or land use of ERFN members. ERFN’s Traditional Knowledge Study & Health and Socio- Economic Study Report states: “the results in this Study showcase the information shared by some of ERFN’s land users, trappers and Elders and cannot be considered a complete representation of ERFN knowledge and use in the Study Area. Nevertheless, these results demonstrate that the Project is likely to have significant impacts on ERFN’s Aboriginal and Treaty Rights and Interests without appropriate and effective measures including mitigation, accommodation, monitoring/follow- up, environmental management and protection planning, along with an ongoing role in environmental oversight. ERFN continues to assert that it is only through a collaborative and co-production approach to the EA that these measures will be appropriately designed and implemented.”</p> <p>There remains a disconnect between Denison’s conclusions of impacts and the results that were provided in ERFN’s Traditional Knowledge Study & Health and Socio- Economic Study Report.</p> <p>Denison must ensure that it considers the collectively held rights of ERFN protected by section 35 of the Constitution Act and Treaty 10. Individual ERFN land users have important interests to be considered, and in some instances, they exercise rights held by the collective. However, such users do not represent the constitutional interests of the collective; the elected Chief and Council bear that critical and all-encompassing responsibility Denison must recognize that inherent Aboriginal rights or Treaty Rights must not be infringed upon, and where impacts cannot be avoided, accommodation measures must be complete.</p> <p>(i) Provide reasoning as to why these statements were made and evidence that Denison understands the impact that these statements have. That is, they belittle the information provided and misrepresent potential impacts on the collective rights of ERFN.</p> <p>(ii) Provide adequate funding for ERFN to undertake a comprehensive Rights Impact Assessment that is led independently by ERFN</p> <p>(iii) It is expected that Denison will remove all of these inaccurate statements, and all other similar statements in the EIS, and re-evaluate impacts based on an understanding of collective rights and recognition of the cumulative impacts of past activities</p> | |
| 276 | ERFN (February 22, 2023) | Section 11.1.7 Cumulative Effects | <p>Comment #ERFN-176: The EIS states, “existing projects were not considered as part of the CEA because they were captured and assessed within baseline conditions” (p. 11-69). However, Denison has not shown how CE from past projects was acknowledged within the baseline of ILRU. Rather, in many instances, as noted above, Denison has misinterpreted ERFN’s Traditional Knowledge Study & Health and Socio- Economic Study Report. There is limited recognition of the discussion on impacts from past projects and how this has altered current baseline conditions, including the likelihood that current baseline conditions have moved beyond ERFN’s acceptable threshold of impact.</p> <p>Question/Recommendation: Until Section 11.1.7, and Section 11 in general, adequately considers cumulative effects of past projects and impacts to ERFN’s harvesting activities, and ability to access ancestral lands as they were prior to contact from a rights-impacts lens, Section 11.1.7 is considered inadequate and incomplete.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| 277 | ERFN (February 22, 2023) | Section 11.1.5 Mitigation Measures | <p>Comment #ERFN-177: Denison has stated that there will be no further mitigation or monitoring for Resource Availability, Availability of Lands/Waters, and in general ILRU monitoring. This is unsatisfactory as ERFN is in disagreement that impacts to ILRU will not be significant.</p> <p>Question/Recommendation: Prior to approval, Denison needs to work with ERFN to develop a program that monitors changes to ERFN's relationship and use of the area. This needs to be led by ERFN and occur with frequency across all phases of the project. It will provide relevant and useful information to Denison and ERFN to monitor potential changes and impacts from the project and any additional monitoring activities that may need to occur.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 278 | ERFN (February 22, 2023) | Section 11.1.4.5.1 Aesthetic Experience | <p>Comment #ERFN-178: Denison states that "to control road dust during summer (May to October), water and/or chemical dust suppressant will be applied to all site roads (Section 6.1.5 in Section 6)." p. 11-56. There is no description of chemical dust suppressant and Section 6.1.5 only indicates that water will be used twice daily as a dust suppressant.</p> <p>Question/Recommendation: (i) Confirm how dust will be managed – is it water or chemical dust suppressant? (ii) If the latter, provide information on the product that will be used and all impacts to plants and wildlife.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 279 | ERFN (February 22, 2023) | Section 11.1.4.3 Resource Availability for Subsistence Harvesting | <p>Comment #ERFN-179: With respect to furbearer habitat, Denison states "effects are predicted to belong-term but reversible because the alteration of available furbearer habitat is expected to be reversed as sensory disturbances diminish with the end of Project Operation activities and subsequent Decommissioning of Project components." p. 11-50.</p> <p>While there is recognition that this impact may be reversible to furbearing animals, it is not clear how this is a reversible to the used of the area by ERFN. This long-term impact will last for at least a generation. It is clear from past projects, settlements, and colonial activities that a lot of knowledge can be lost within a generation when you remove the access and ability for knowledge transfer.</p> <p>Question/Recommendation: Provide an explanation as to how predictions across all of section 11.1.4 considered potential for contribution to the degradation of cultural practices and knowledge transfer. Provide analysis on the potential impacts of project activities on knowledge transfer and land use for ERFN citizens who have rights across their entire ancestral territory. This needs to be done with the assumption that removal of an area for land use will result in an impact to ERFN's collectively held section 35 rights.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 280 | ERFN (February 22, 2023) | Section 11.1.3.2.1 English River First Nation/Patunuak | <p>Comment #ERFN-180: There is concern as to how well Denison reviewed the reports from ERFN. For example, in Section 11.1.3.2.1 English River First Nation/Patunuak on p. 11-30 Denison states "no access routes or culture/historical trails were identified as intersecting with the Project site (ERFN and SVS 2022b)." ERFN dispute this statement and urge Denison to re-review ERFN's report and remind Denison of the information provided in this report: "Participants spoke of using the Fox Lake Road, which runs through the Wheeler River Project site, as an access route for harvesting activities throughout an area stretching from the Key Lake mine to McArthur River mine ... One participant expressed concerns that this route (1018-14) may be blocked by Project activity. Another participant stressed how this entire area (1004-18) is used by ERFN people as a contemporary gathering place."</p> <p>Question/Recommendation: Denison will need to do a more carefully review of ERFN's reports and include all information provided in the EIS. That is, all information summarized will need to be confirmed for accuracy and gaps in the information summarized will need to be filled.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 281 | ERFN (February 22, 2023) | Section 11.1.3 Existing Environment | <p>Comment #ERFN-181: This section does not adequately discuss or highlight the history and experience of ERFN. Additional valuable information that frames the existing environment and impacts to land use was provided in ERFN's Traditional Knowledge Study & Health and Socio-Economic Study Report.</p> <p>Question/Recommendation: Provide ERFN with the capacity and opportunity to edit and add to this section so that the EIS is framed with additional and relevant information.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|--|
| 282 | ERFN (February 22, 2023) | Section 16.6.3 Heritage Resources | <p>Comment #ERFN-182: Heritage Resource Management Plan.</p> <p>Question/Recommendation:</p> <p>In Section 16.6.3 Denison states that a "Heritage Resources Management Plan (HRMP) has been developed by Denison and outlines the steps that will be taken should anymore archaeological sites be identified Even though they say that these steps include "discussions with local indigenous leadership." this is not evident. Prior to this document being approved, ERFN requests the opportunity to complete a third-party review and provide feedback to Denison.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 283 | ERFN (February 22, 2023) | Section 16.6.3 | <p>Comment #ERFN-183: Cultural Heritage Monitors.</p> <p>Question/Recommendation:</p> <p>Prior to the approval of the project, Denison must commit to hiring ERFN Cultural Heritage Monitors who will be present during any construction and/or land disturbance work. This area is still considered to have high potential for archeological sites even if Denison was not able to locate many sites during their assessments.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 284 | ERFN (February 22, 2023) | Section 12.1.2.1, 12.2.2.1, 12.3.2.1 Influence of Indigenous Knowledge, Local Knowledge and Engagement on the Assessment, English River First Nation | <p>Comment #ERFN-184: EIS Section 12.1.2.1, 12.2.2.1, and 12.3.2.1 sets out a list of the submissions and reports provided by ERFN that included Traditional Knowledge and perspectives that have informed Section 12.1, 12.2 and 12.3 of the assessment respectively. ERFN notes that these lists do not include ERFN's submission of comments to Denison on a draft of the EIS provided to ERFN before its submission to CNSC, despite this submission including important information regarding our Traditional Knowledge and perspectives that was meant to inform changes to these sections of the Draft EIS. ERFN notes that as a result, numerous comments on this section of the EIS below are a restatement of concerns raised in our August 2022 submission that remain unaddressed. ERFN also notes that the contents of ERFN's August 2022 submission are also not reflected in Table 4.3-2 which is meant to outline Key Issues and Concerns raised English River First Nation in previous engagements and submissions and demonstrate how these comments have been addressed or considered in the Draft EIS.</p> <p>Question/Recommendation:</p> <p>Section 12 must be updated to incorporate the concerns raised in the August 2022 submission and restated in the comments below.</p> <p>In addition, Table 4.3-2 should be updated to reflect the Key Issues and Concerns raised in ERFN's August 2022 submission and demonstrate how these comments have been addressed or considered in Section 12 of the EIS.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 285 | ERFN (February 22, 2023) | Section 12.1.1.2 Key Indicators and Measurable Parameters | <p>Comment #ERFN-185: Section 12.1.1.2 states that a Key Indicator (KI) "is an important aspect of a VC that may be affected by the Project and its activities" and that a measurable parameter "is the metric associated with the KI that can be used to characterize changes to attributes of the environment that may change as a result of the Project and/or other human developments and natural factors" (p. 12-7).</p> <p>For the valued component of Cultural Expression and this section of the assessment, Table 12.1-1 sets out Denison's selection of KIs to include:</p> <ol style="list-style-type: none"> 1. Knowledge Transfer 2. Traditional diet <p>While ERFN is supportive of Cultural Expression being included as an important facet of Quality of Life and identified as a key value component included in the scope of the effects assessment, the KIs and measurable parameters selected by Denison in Section 12.1.1.2 are insufficient and do not reflect a holistic consideration of Cultural Expression, even by Denison's own definition set out in Section 12.1. ERFN notes that concerns have been raised in previous engagement with ERFN and in our August 2022 submission of comments on the Draft EIS regarding the limited scope of these KIs and that additional KIs and measurable parameters must be included to reflect a more holistic understanding of Cultural Expression informed by Indigenous perspectives. Because the selection of these KIs and measurable parameters is a foundational step in the assessment that informs the scope and approach to the subsequent characterization of existing conditions, assessment of project-related effects, identification of</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| | | | <p>mitigation measures and assessment of residual effects and cumulative effects, the insufficient scope of KIs and measurable parameters selected by Denison therefore results in a fundamental deficiency of Section 12.1 of the assessment of the effects.</p> <p>Section 12.1 should be revised to include an analysis of additional KIs and measurable parameters of Cultural Expression more closely related to values identified for protection by ERFN citizens. These may include:</p> <ul style="list-style-type: none"> - Ability to practice traditional activities - Cultural Identity - Connection to ERFN Traditional Territory - Ability to speak ERFN dialects of Dene and Cree - Intergenerational knowledge transfer - Collecting, processing, using, and sharing traditional medicines - Spiritual and cultural vitality | |
| 286 | ERFN (February 22, 2023) | Section 12.1.4.1 Potential Project – Valued Component and Key Indicator Interactions | <p>Comment #ERFN-186: Table 12.1-2 outlines potential interactions between project phases and activities, and KIs for Cultural Expression. ERFN notes that Employment and Expenditures are not identified to have potential interactions.</p> <p>ERFN disagrees with this assessment as employment may alter the ability for ERFN citizens to engage in traditional activities and intergenerational knowledge transfer, as citizens will be unable to engage in on-the-land activities and cultural knowledge sharing during rotational work periods.</p> <p>Question/Recommendation: Denison should revise Table 12.1-2 to recognize potential interactions between employment and KIs for Cultural Expression</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 287 | ERFN (February 22, 2023) | Section 12.1.6 Residual Effects Evaluation | <p>Comment #ERFN-187: Section 12.1.6 of the EIS defines a significant adverse residual effect on Cultural Expression as “an effect that is highly different from baseline conditions and trends and cannot be managed or mitigated through adjustments to existing programs, policies, or other mitigation.” The EIS goes on to state that “because residual adverse effects on Cultural Expression are not expected to result in this level of change, effects are expected to be not significant for the Project.”</p> <p>ERFN does not agree with this assessment of the potential residual effects of the Project, which is fundamentally deficient based on the limited scope of KIs and measurable parameters that were selected for analysis. ERFN also does not agree that the mitigation measures presented in Section 12.1.5 are sufficient to address effects of the Project on Cultural Expression that will be highly different from baseline conditions.</p> <p>Question/Recommendation: Until Section 12.1 is revised to include a more holistic consideration of KIs and measurable parameters for Cultural Expression that ERFN has set out above, Denison’s assessment of the nature of potential Residual Effects should be considered incomplete and deficient. In addition, until ERFN confirms CNSC that Denison and ERFN have reached mutually agreed- upon terms of mitigation and accommodation that address the effects of the Project on Cultural Expression, this EIS should not be considered complete or approved by CNSC. [Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 288 | ERFN (February 22, 2023) | Section 12.2.1.2 Key Indicators and Measurable Parameters | <p>Comment #ERFN-188: Section 12.2.1.2 states that a Key Indicator (KI) “is an important aspect of a VC that may be affected by the Project and its activities” and that a measurable parameter “is the metric associated with the KI that can be used to characterize changes to attributes of the environment that may change as a result of the Project and/or other human developments and natural factors” (p. 12-44).</p> <p>For the valued component of Community Well-Being and this section of the assessment, Table 12.2- 1 sets out Denison’s selection of KIs to include:</p> <ol style="list-style-type: none"> 1. Population and Demographics (from in/out migration as people seek employment opportunities), 2. Income of local workers (from participation in employment and/or contracting activities), and 3. Community cohesion (from changes in income and participation in a commuter rotation system). <p>While ERFN is supportive of Community Well-Being being identified as a key value component</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| | | | <p>and included in the scope of the effects assessment, the KIs and measurable parameters selected by Denison are insufficient and do not reflect a holistic consideration of well-being informed by Indigenous determinants of well-being, despite Denison's acknowledgment that communities in the LSA are predominantly (95.2%) Aboriginal (Section 12.2.3.1, p. 12-56). ERFN notes that concerns have been raised in previous engagement with ERFN and in our August 2022 submission of comments on the Draft EIS regarding the limited scope of these KIs and that additional KIs and measurable parameters must be included to reflect a more holistic understanding of Community Well-Being informed by Indigenous perspectives. Because the selection of these KIs and measurable parameters is a foundational step in the assessment that informs the scope and approach to the subsequent characterization of existing conditions, assessment of project related effects, identification of mitigation measures and assessment of residual effects and cumulative effects, the insufficient scope of KIs and measurable parameters selected by Denison therefore results in a fundamental deficiency of Section 12.1 of the assessment of the effects.</p> <p>Question/Recommendation: ERFN has shared with Denison (ERFN and SVS 2022a), that the four components of ERFN health and well-being, often referred to as the "the medicine wheel," is the core guiding principle to overall ERFN health and well-being, and include:</p> <ul style="list-style-type: none"> - Physical health - Mental health - Spiritual health - Emotional health <p>The KIs selected by Denison and subsequent steps of the assessment of the effects must be amended to include more holistic KIs and parameters relevant to these ERFN determinants of Community Well-Being, in collaboration with ERFN and based on the results of studies and submissions provided by ERFN to date. Potential KIs/parameters could include, but are not limited to:</p> <ul style="list-style-type: none"> - Food security - Access to traditional foods - Psychosocial Impacts - Spiritual and cultural vitality o Ability to practice traditional activities o Cultural Identity o Connection to ERFN Traditional Territory o Ability to speak ERFN dialects of Dene and Cree o Intergenerational knowledge transfer o Collecting, processing, using, and sharing traditional medicines | |
| 289 | ERFN (February 22, 2023) | Section 12.2.4.1 Potential Interactions Between the Project and Valued Components/Key Indicators | <p>Comment #ERFN-189: In Section 12.2.4.1, Denison sets out the assessment of potential interactions between the Project and VC/KIs, based on "IK, LK, discussions with Indigenous groups, government agencies, and the public, KPIs for the Project, the professional judgment of members of the Project team, and consideration of existing conditions in the study areas for the VCs and KIs" (Page 12-73). ERFN notes the only project activities Denison has determined will interact with the VC/KIs considered in this section of the assessment are employment and expenditures, and Denison states that no other construction activities, operation activities, or decommissioning activities are anticipated to have any interactions with Community Well-Being. ERFN does not agree with this assessment of the Project's potential interactions with Community Well-Being, and it is ERFN's position that numerous other Project activities will have potential adverse effects on ERFN's Community Well-Being.</p> <p>Question/Recommendation: This assessment should be considered incomplete and fundamentally deficient. The assessment must be redone with a more holistic consideration of KIs and pathways to effects developed in collaboration with ERFN and based on the results of studies completed by ERFN to date.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

| 290 | ERFN (February 22, 2023) | Section 12.2.4.2 Potential Project Related Effects | <p>Comment #ERFN-190: While Section 12.2.4.2.1 does consider the effects of population changes related to the Project on demand for housing and general concerns with the in- and-out migration of LSA residents, it doesn't address the full range of potential impacts associated with a transient workforce.</p> <p>Question/Recommendation: Section 12.2.4.2 must include an assessment of all potential effects of a transient workforce and changes to population dynamics, including those disproportionately experienced by women and other segments of the population. This should incorporate findings of research like the 2017 study completed by Lake Babine Nation and Nak'azdli Whut'en (Indigenous Communities and Industrial Camps), and/or related research in the context of the LSA.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 291 | ERFN (February 22, 2023) | EIS Section 12.2.4.2 Potential Project Related Effects | <p>Comment #ERFN-191: While Section 12.2.4.2.2 does include consideration of the effects of increased income on existing issues for LSA residents including substance abuse and domestic violence, corresponding mitigation measures in Section 12.2.5 are limited to training and programming on the Project site, which is not sufficient to address these potential impacts and should not be considered sufficient to prevent residual effects.</p> <p>Question/Recommendation: Section 12.2.5 must also include Denison's commitments to support the establishment and improvement of social services and wellness programs located in, led and implemented by each of the Indigenous communities in the LSA through the provision of funding and other resources.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 292 | ERFN (February 22, 2023) | EIS Section 12.2.4.2 Potential Project- Related Effects | <p>Comment #ERFN-192: Despite acknowledging in its characterization of the existing environment for income of local workers in Section 12.2.3.2 that "the traditional economy in the LSA provides important non-cash income to citizens and contributes to the overall sense of well-being for communities" (p. 12-64), and that "Wheeler River is a culturally and economically important area for ERFN and a place where fishing, hunting, and trapping occur throughout the year" (p. 12-65), the assessment of potential project related effects for this KI in Section 12.2.4.2 only considers effects on personal income for residents of the LSA through employment on the Project.</p> <p>Question/Recommendation: The assessment of effects for income and financial well-being must be expanded to include participation in the traditional and subsistence economy, the Project's potential effects on ERFN's fishing, hunting and trapping and the relationship between participation in the traditional economy and the overall sense of well-being for communities, which Denison acknowledges in Section 13.3.2.3.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 293 | ERFN (February 22, 2023) | EIS Section 12.2.4.2 Potential Project- Related Effects | <p>Comment #ERFN-193: Despite acknowledging in its characterization of the existing environment for community cohesion in Section 12.2.3.3 that ERFN's practice of traditional activities such as hunting, fishing, trapping and gathering is a crucial component of community cohesion and well-being (p. 12-70), Denison's assessment of effects for this KI in Section 14.2.4.2.3 only considers time spent by LSA residents employed by the Project away from their communities and families during work rotation. While employment and participation in the Project by ERFN citizens is optional, the Project has broader direct impacts on the Ancestral Territory, effecting all ERFN citizens. Therefore, regardless of whether employment interferes with aspects of Community Well-Being, the existence of the Project will change the manner in which all ERFN citizens interact with Nuhtsiye-kwi Benéne, and in turn ERFN's overall community cohesion, Community Well-Being and Quality of Life.</p> <p>Question/Recommendation: The assessment of effects for community cohesion must be expanded to include all the Project's potential effects on ERFN's practice of traditional activities, including fishing, hunting and trapping.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 294 | ERFN (February 22, 2023) | Section 12.2.6 Residual Effects Evaluation | <p>Comment #ERFN-194: Section 12.1.6 of the EIS defines a significant adverse residual effect on Cultural Expression as "an effect that is highly different from baseline conditions and trends and cannot be managed or mitigated through adjustments to existing programs, policies, or other mitigation." The EIS goes on to state that "because residual adverse effects on Cultural Expression are not expected to result in this level of change, effects are expected to be not significant for the Project." ERFN does not agree with this assessment of the potential residual effects of the Project, which is fundamentally deficient based on the limited scope of KIs and measurable parameters that were selected for analysis. ERFN also does not agree that the mitigation measures presented in Section 12.2.5 are sufficient to address effects of the Project on Cultural Expression that will be highly different from baseline conditions.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| | | | <p>Question/Recommendation:</p> <p>Until Section 12.2 is revised to include a more holistic consideration of KIs and measurable parameters for Community Well-Being that ERFN has set out above, Denison's assessment of the nature of potential Residual Effects should be considered incomplete and deficient. In addition, until ERFN provides confirmation to CNSC that Denison and ERFN have reached mutually agreed upon terms of mitigation and accommodation that address the effects of the Project on Community Well-Being, this EIS should not be considered complete or approved by CNSC.</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | |
| 295 | ERFN (February 22, 2023) | Section 12.3.3.1 Methods and Limitations | <p>Comment #ERFN-195: Traffic volume data for Highways 914 and 165 are based on short term traffic counts conducted over a 48- hour counting period, however, continuous traffic monitoring data and subsequent average daily traffic volume reports are not produced for these highways. This traffic data is infrequently updated and only provides a snapshot of actual traffic conditions which may not be representative of actual conditions. The impacts of the Project to ERFN's rights and interests related to increased traffic and access to the Project area is a crucial concern, and an accurate baseline of traffic data is vital to the integrity of the subsequent assessment of potential effects, development of mitigation measures, residual effects evaluation and characterization of cumulative effects.</p> <p>Question/Recommendation:</p> <p>Denison should establish long-term traffic monitoring stations along Highway 914 and 165 to provide a more accurate description of existing traffic conditions along these key access routes for the Project.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 296 | ERFN (February 22, 2023) | Section 12.3.6.1 Residual Effects Characterization | <p>Comment #ERFN-196: Denison states a significant effect on the Infrastructure and Services VC (including the measurable parameters of traffic and community infrastructure and services, and emergency services) would result if projected demands are above the current capacity, are routinely above the current levels for an extended period of time, are unlikely to return to existing conditions, and cannot be mitigated through adjustments to programs, policies, plans, or through other mitigations. Local and regional emergency services are limited and could be easily overwhelmed by even moderate scale emergencies.</p> <p>Question/Recommendation:</p> <p>Denison must demonstrate plans to be largely self-reliant on internal emergency response measures, and able to sustain emergency management until transportation is available to or from the Project area either by air or ground.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 297 | ERFN (February 22, 2023) | Section 12.3.4.2.1 Potential Effect 1 – Change in Traffic | <p>Comment #ERFN-197: While Section 12.3.4.2.1 describes Denison's assessment of changes to traffic volume during Project construction, operation and decommissioning, this section of the EIS does not go onto describe how the effects of increased traffic may interact with traditional land use and Quality of Life, which is the overall valued component considered in Section 12 of the EIS.</p> <p>Question/Recommendation:</p> <p>Section 12.3.4.2.1 should be modified to include an analysis of how the Project's change to traffic conditions and road use will result in effects to traditional land use and Quality of Life, and include mitigation measures to address these potential effects.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 298 | ERFN (February 22, 2023) | Section 13.1 Scope of the Assessment | <p>Comment #ERFN-198: The guiding questions are narrowly focused and could be expanded to understand impacts from a GBA+ perspective. The questions do not ask how the Project will help to retain economic benefits for LSA communities.</p> <p>Question/Recommendation:</p> <p>The assessment could be enhanced by reviewing the findings from a GBA+ perspective. The assessment should make clear recommendations to help LSA maximize potential economic effects.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| 299 | ERFN (February 22, 2023) | Section 13.1 Scope of the Assessment | Comment #ERFN-199: "Characterize existing conditions"; This could be enhanced by forecasting the baseline conditions without the project to match the temporal boundaries of the project, as well as characterizing existing conditions. Forecasting key indicators and measurable parameters without the project based on trends and existing conditions could enhance the assessment. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 300 | ERFN (February 22, 2023) | Section 13.1.2 Key Indicators and Measurable Parameters | Comment #ERFN-200: Based on the Terms of Reference, the Traditional Economy could be a separate VC. However, the Draft EIS considers Traditional Economy as a KI. Question/Recommendation: Given the importance of the Traditional Economy to ERFN, selecting it as a separate VC with a set of Key Indicators could enhance the assessment and monitoring of the potential Project's effects. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 301 | ERFN (February 22, 2023) | Section 13.1.2 Key Indicators and Measurable Parameters | Comment #ERFN-201: Typo, the Economy VC is comprised of five, not four KIs. Question/Recommendation: Please fix typo. | The typo is corrected in the EIS Section 13.1.2. |
| 302 | ERFN (February 22, 2023) | Section 13.1.2 Key Indicators and Measurable Parameters | Comment #ERFN-202: Direct/Indirect/Induced for employment and income – Direct employment/income could be outside of the LSA or RSA. Question/Recommendation: Acknowledge that Direct employment in this assessment is limited to the direct employment by Denison and contractors in the Study areas. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 303 | ERFN (February 22, 2023) | Section 13.1.2 Key Indicators and Measurable Parameters | Comment #ERFN-203: Indirect/Induced for employment; the suggested measure for indirect and induced employment is aggregated employment and unemployment rates; Input-output modelling could be used to estimate indirect and induced employment. Question/Recommendation: Enhance measurement of indirect and induced employment through input-output modelling. This would help understand the other enabled employment impacts of the project. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 304 | ERFN (February 22, 2023) | Table 13.1-1: Key Indicators and Measurable Parameters for Economy | Comment #ERFN-204: Measurable parameters employment and training; employment is limited to direct project-related employment opportunities. There are 2 issues: 1. It is implied that many of these opportunities will be captured by fly- in/fly-out workers that won't impact the LSA. 2. There's no estimating of the quantity of indirect and induced employment. Indirect and induced employment can often represent the same number of jobs provincially as direct employment. The question for all these jobs is how many of them will be captured in the LSA and RSA. Recommendations: 1. Estimate indirect and induced employment impacts using input- output modelling. 2. Estimate the number of direct and indirect jobs that will be captured in the LSA and RSA vs. out of the study area. Induced jobs in the study areas could be proportional to the percentage of | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| | | | total direct and indirect jobs captured in the study areas. Regardless of the methodology Denison uses, an estimate of the economic impact on local employment in the LSA and RSA would add to the assessment. | |
| 305 | ERFN (February 22, 2023) | Table 13.1-1: Key Indicators and Measurable Parameters for Economy | Comment #ERFN-205: Measurable parameters – Income; Wages and salaries paid by Denison are only part of the income impact in the study areas. Not all the income will be captured in the study areas, and some income will be generated through indirect and induced activities. Question/Recommendation: Income impacts in the community should be based on the same employment capture assumptions that are used for capturing employment. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 306 | ERFN (February 22, 2023) | Table 13.1-1: Key Indicators and Measurable Parameters for Economy | Comment #ERFN-206: Measurable parameters – Income; Income disparity is not included in the measurable parameters; Projects that can create relatively high-paying jobs for some of the residents in a community can create income disparity. This can result in increases in household costs for all residents. The impact of the project on income disparity could be important. Question/Recommendation: Consider adding income disparity as a measurable parameter of the Income key indicator. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 307 | ERFN (February 22, 2023) | Table 13.1-1: Key Indicators and Measurable Parameters for Economy | Comment #ERFN-207: Business opportunities does not look at the impact of the project on the labour supply for existing businesses. Relatively high-paying jobs associated with the project could result in existing businesses not being able to hire and retain the employees necessary to operate their businesses. Question/Recommendation: The assessment could be enhanced by including impact on labour for existing businesses as a measurable parameter for the Business Opportunities Key Indicator. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 308 | ERFN (February 22, 2023) | Table 13.1-1: Key Indicators and Measurable Parameters for Economy | Comment #ERFN-208: Measurable parameters: Doesn't specify that measurable parameters will be looked at in a disaggregated fashion. Question/Recommendation: The assessment could be enhanced by collecting disaggregated data on these measurable parameters when it was available. Project impacts of the key indicators are likely not homogeneous across all demographic factors. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 309 | ERFN (February 22, 2023) | Section 13.1.3.2 Temporal Boundaries | Comment #ERFN-209: The existing environment focuses on the past three census periods (2006, 2011, 2016). The assessment would benefit from reviewing and incorporating data from the latest census. Question/Recommendation: Incorporate demographic and economic data from the 2021 Census. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|--|
| 310 | ERFN (February 22, 2023) | Section 13.1.3.2 Temporal Boundaries | Comment #ERFN-210: The temporal boundaries seem appropriate, but the existing conditions without the project do not forecast what the measurable indicators will be without the project. Question/Recommendation: Forecast baseline measurable indicators without the project for the temporal boundaries presented in the assessment. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 311 | ERFN (February 22, 2023) | Section 13.2 Existing Environment | Comment #ERFN-211: Most of the data presented in 13.2.1.4/13.2.1.5/13.2.1.6 only shows percentages of participation. The associated nominal values are unclear. Question/Recommendation: Because the nominal values are important for understanding the scale of impact of the project, add nominal values throughout the sections. This is important because the entire LSA has only 875 people in their labour force. How is that spread across the different communities? Small changes in these variables could be material to the different communities. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 312 | ERFN (February 22, 2023) | Section 13.2.1 Key Indicator: Employment and Training | Comment #ERFN-212: The Draft EIS stated, “due to the small populations of La Plonge and Patuanak, data from Statistics Canada have been suppressed to protect confidentiality. Accordingly, data for the LSA are not fully representative, but the effect on reported statistics is believed to be minimal at the LSA level, given the low population of those two localities” (p. 13-18). Question/Recommendation: The random rounding for small populations makes the census data unreliable as an absolute indicator. Denison has done a good job using qualitative interview data to add to the baseline understanding of unemployment. Given the challenges in the census at capturing unemployment for these small populations, specific details for measuring unemployment as part of the monitoring plan would be valuable. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 313 | ERFN (February 22, 2023) | Section 13.2.1 Key Indicator: Employment and Training (all indicators) | Comment #ERFN-213: The data are not presented from a GBA+ perspective, limiting the assessment's estimate of the Project adverse or disproportionate impacts separated based on gender, sexual orientation, race, or other factors which have historically been used to disadvantage populations interacting with mining projects. Question/Recommendation: Complete the assessment using a GBA+ framework. [Additional questions on this topic directed to regulators or government entities are included in the CNSC table] | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 314 | ERFN (February 22, 2023) | Section 13.2.1.5 Employment by Sector | Comment #ERFN-214: The employment by industry sector shows that the LSA has a higher concentration of employment in mining than the RSA and the province as a whole. This suggests that not all the jobs associated with the project will go to a fly-in/fly-out work force. Employment in the LSA could be impacted by the project: Many workers are already in the mining industry. Question/Recommendation: Do not rule out effects due to the fly-in/fly-out nature of the project (municipal revenue, indirect and induced employment, and income). | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 315 | ERFN (February 22, 2023) | Section 13.2.2.1 Total Personal Income | Comment #ERFN-216: Personal Income data is presented for the LSA for Indigenous and non-Indigenous individuals, but the make- up of the population (Indigenous vs non- Indigenous) was not presented. Question/Recommendation: Include nominal values to show the size of the Indigenous and non-Indigenous populations in the LSA. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|--|
| 316 | ERFN (February 22, 2023) | Section 13.2.3 Key Indicator: Traditional Economy | Comment #ERFN-218: Some baseline data is missing from this section. Traditional economy baseline data is presented in the project's effects section for the first time. Specifically, the commercial harvester who had traplines near the project site was not identified in this section, nor was the typical locations of non-commercial harvesting identified. These are referenced in the effects section. It would be helpful if they were previously introduced. Question/Recommendation: Add the baseline elements of the Traditional Economy referenced in the effects section to the baseline section. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 317 | ERFN (February 22, 2023) | Section 13.2.3 Key Indicator: Traditional Economy | Comment #ERFN-219: Kineepik Métis Local and Pinehouse Lake member concerns and thoughts about the impact of the project should likely be in the effects section, not the baseline. Question/Recommendation: Move information related to the effects of the project to the project effects section. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 318 | ERFN (February 22, 2023) | Section 13.2.4 Key Indicator: Business Opportunities | Comment #ERFN-220: There is no discussion on challenges local businesses have in finding labour to operate their businesses. Question/Recommendation: Adding the challenges of local businesses to finding labour would enhance this section. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 319 | ERFN (February 22, 2023) | Table 13.3-1: Potential Project Interactions for Economy | Comment #ERFN-221: The Traditional Economy may have interactions with other phases/activities of the Project, and the interactions are not limited to only employment and expenditures. Project activities and the presence of the Project may interact with current and future Traditional users. Question/Recommendation: Work with traditional users and Knowledge Holders to review the approach of outcomes of the assessment to the Traditional Economy. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 320 | ERFN (February 22, 2023) | Section 13.3.2 Potential Project-related Effects | Comment #ERFN-222: The assessment does not quantify anticipated effects for LSA communities and relies on a qualitative and subjective assessment. Question/Recommendation: Review existing baseline data and run scenarios (best, likely, worst case) to estimate potential capture with the LSA for economic benefits. Denison should conduct an analysis to estimate KI changes in LSA and RSA. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 321 | ERFN (February 22, 2023) | Section 13.3.2.1 Potential Effect 1 – Employment and Training (p.13-61) | Comment #ERFN-223: The Draft EIS states, “training programming will be determined in consultation with COI and are anticipated to involve existing training facilities and programs (Process Operation Technical [SIIT] Meadow Lake, Chemical Technology [Saskatchewan Polytechnic]) as well as specific ISR training, where required. Denison will initially prioritize Indigenous and non-Indigenous communities in the LSA in terms of employment and training opportunities” (p. 13-61). However, Denison has not made firm commitments as of now. Question/Recommendation: (i) Clarify how Denison plans to prioritize Indigenous and non-Indigenous local communities in terms of employment and training. (ii) Establishing a local recruitment and training centre within a nearby community would enhance the positive impacts of the Project on Employment and Training. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| 322 | ERFN (February 22, 2023) | Section 13.3.2.1 Potential Effect 1 – Employment and Training | Comment #ERFN-224: Presentation of historic baseline participation and employment rates in the effects section. The effects of the project on these measurable indicators are missing. Question/Recommendation: Remove the presentation of baseline data of these indicators. Add the estimated effects of the project on these indicators. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 323 | ERFN (February 22, 2023) | Section 13.3.2.1 Potential Effect 1 – Employment and Training | Comment #ERFN-225: The draft EIS states, “training opportunities are anticipated to be delivered by institutions in northern Saskatchewan or Saskatchewan more broadly and will be determined in consultation with LSA communities” (p. 13-64) Question/Recommendation: Supporting local hiring practices through the establishment of a local recruitment and training centre within a nearby community for ensuring Indigenous and non-Indigenous members have a pathway to having higher quality positions than general labour or junior positions. This would enhance the positive Project impact on Employment and Training. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 324 | ERFN (February 22, 2023) | Section 13.3.2.3 Potential Effect 3- Traditional Economy | Comment #ERFN-226: The potential effects on the Traditional Economy are likely underestimated. The erosion of traditional economic practices resulting from the cumulative effects of resource projects is a concern voiced by ERFN. Question/Recommendation: Work with traditional users and Knowledge Holders to develop a robust compensation plan, considering future users. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 325 | ERFN (February 22, 2023) | Section 13.3.2.4 Potential Effect 4 – Business Opportunities | Comment #ERFN-228: The impact of the project on business to hire and retain labour to support existing business operations has not been addressed. Question/Recommendation: Forecast the impact of the project on existing businesses access to labour to support existing operations. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 326 | ERFN (February 22, 2023) | Section 13.3.2.4 Potential Effect 4 – Business Opportunities | Comment #ERFN-229: The Draft EIS states, “Denison has established an internal procurement approach that requires the procurement of all goods and services for the Project to first consider businesses based within the LSA communities prior to looking elsewhere in northern Saskatchewan, southern Saskatchewan, and/or outside of Saskatchewan throughout all phases of the Project” (p. 13-68). There were limited specifics associated with this commitment. Question/Recommendation: Clarify how Denison plans to develop procurement strategies that favour local works and businesses. Engage Indigenous and non-Indigenous businesses in the development of these procurement strategies | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 327 | ERFN (February 22, 2023) | Section 13.4 Mitigation and Enhancement Measures | Comment #ERFN-230: Mitigation measures are vague and require more clarity. How Indigenous and local hiring will be prioritized and maximized, the likelihood and type of local procurement and training opportunities should be clearly outlined. Question/Recommendation: Develop a robust and clear set of actions to maximize potential benefits to LSA. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| 328 | ERFN (February 22, 2023) | Section 13.4 Mitigation and Enhancement Measures | <p>Comment #ERFN-231: The workforce transition plan will be a key mitigation measure to protect the LSA communities against any boom- bust effects of the Project. More clarity on this plan, including financial commitments to ensure the long-term economic benefits for the LSA, are needed. This plan should also address transition planning for any local businesses working with the Project.</p> <p>Question/Recommendation: Provide details with financial commitments in the workforce transition plan. This should be developed prior to Project approvals and should be revisited on an ongoing basis.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 329 | ERFN (February 22, 2023) | Section 13.5.1 Residual Effects Characterization | <p>Comment #ERFN-232: The residual impacts on employment are said to be positive and low to moderate, without quantifying the impact. At points in the analysis, it is said that there will be little impact on employment and residency due to the fly-in/fly-out nature of the project. Then in this section it is said that the impact on employment could have a moderate effect on the economy. This could cascade to a moderate impact on income disparity, business access to labour, and municipal government cost driven by community growth.</p> <p>Question/Recommendation: Quantify the impacts on employment. Cascade the impacts on employment to impacts on income, business opportunity and government finance.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 330 | ERFN (February 22, 2023) | Section 13.5.1.2 Income | <p>Comment #ERFN-233: The residual impact on Income is seen as positive and moderate. This analysis does not consider the impact on income inequality and how that could impact the LSA and RSA. This might change to direction of the impact.</p> <p>Question/Recommendation: Include income disparity as a measurable impact in the analysis and determine if it changes the direction of the impact of the project on Income.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 331 | ERFN (February 22, 2023) | Section 13.5.1.3 Traditional Economy | <p>Comment #ERFN-234: The residual impact of the project on the traditional economy is seen as having a magnitude of negligible to low. The characterization of the ability of the workforce to participate in the traditional economy as being minimal or low does not seem to be supported by the evidence presented. Evidence presented indicated that some workers at other similar facilities felt that their ability to participate in the traditional economy had been negatively impacted (13-67).</p> <p>Question/Recommendation Provide additional evidence to support the magnitude of the impact as being negligible to low or adjust the magnitude of the impact. The magnitude of the negative impact could potentially be reduced if Denison proposed additional time off be granted to workers to participate in traditional seasonal harvesting activities.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 332 | ERFN (February 22, 2023) | Section 13.5.1.3 Traditional Economy | <p>Comment #ERFN-235: The residual impact of the project on the traditional economy is seen as having a reversibility as fully reversible. The assessment doesn't address the contribution of participating in the traditional economy's impact on social customs and relationships. This effect was identified in the baseline (p. 13-51), but not assessed in section 13.3.2.3. If there is a more than low impact on the traditional economy, this could have a lasting impact on social customs and relationships. This might make return to the traditional economy not as fully reversible as the analysis proposes.</p> <p>Question/Recommendation: Provide additional evidence as to how impacts to the traditional economy won't impact the social customs and relationships, or how if it does these will be able to be reversed after decommissioning.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| 333 | ERFN (February 22, 2023) | Section 13.5.1.4 Business Opportunities | Comment #ERFN-236 and ERFN-237: The residual impact of the project on business opportunities has a direction of positive. The assessment does not include the impact of the project of existing businesses' access to labour to support ongoing business operations. If the project negatively impacts existing businesses' access to labour the direction of the impact on business opportunity could change. Question/Recommendation: Assess the impact of the project on existing businesses access to labour. Re-assess the direction of the residual impact if necessary. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 334 | ERFN (February 22, 2023) | Section 13.5.2. Summary of Project- related Residual Adverse Effects on Economy | Comment #ERFN-238: The effects of the Traditional Economy are likely underestimated. The effects from a GBA+perspective are unknown. The potential boom- bust effects of the Project are not considered. Question/Recommendation: Assess the impact of the project on GBA+.Re-assess the direction of the residual impact if necessary. [Additional questions on this topic directed to regulators or government entities are included in the CNSC table] | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 335 | ERFN (February 22, 2023) | Section 13.5.2 Summary of Project- related Residual Adverse Effects on Economy | Comment #ERFN-239: The residual adverse effects and economy summary may need to be updated if some of the additional analysis is done. Question/Recommendation: Re-assess the residual adverse effects on the economy after updating the residual effects on the other key indicators. Revise as necessary the Economy Summary. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 336 | ERFN (February 22, 2023) | Section 13.7 Monitoring and Follow- up | Comment #ERFN-240: There is very little information on how the economic environment will be monitored. Question/Recommendation: Develop a clear monitoring and follow-up plan with ERFN, addressing each of the Key Indicators and outlining the measurements and reporting that will be undertaken. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 337 | ERFN (February 22, 2023) | Section 14.2 Scope, Scale, and Objectives of the Assessment | Comment #ERFN-241: Denison notes that the overall objective of Section 14 Accidents and Malfunctions is to "evaluate the potential effects to human health or the biophysical environment resulting from radiological and conventional accidents and malfunctions in consideration of proposed environmental protection measures" however, continue to state that "some hazards related to work safety were identified; however, worker safety (i.e., risks and consequences) is beyond the scope of this assessment." The lack of full consideration of worker safety with respect to radiological hazards suggests that Denison have failed to identify and consider the full range of accidents, as many of the greatest risks with this project are directly related to worker health and safety, and expand well beyond the health of any one individual (e.g., impacts to worker health and safety may have direct impacts on aquatic or terrestrial conditions, as well as socio-economic perceptions of the mine). Question/Recommendation: Denison must include assessment and consideration of all worker safety risks and consequences associated with accidents and malfunctions for this section to be considered complete. Without this section reviewers are unable assess the broader impacts of the projects and the overall risks to both the environment and society in which this project is set. This request is in alignment with REGDOC-2.9.1 Section A.3.4 which notes that "[t]he applicant should provide an assessment of potential health and environmental effects resulting from postulated radiological and conventional malfunctions or accidents." Our interpretation of this wording is that it applies to both environmental and human health which includes both public and worker health. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| 338 | ERFN (February 22, 2023) | Section 14.4 Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Assessment | <p>Comment #ERFN-242: Examples of Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Assessment outlined in section 14.4 only demonstrate that concerns were raised during engagement activities, however, Denison fails to demonstrate how it included specific Traditional Knowledge both in the assessment of Accidents and Malfunctions, as well as how Traditional Knowledge would be used in monitoring and or response in the event of an accident or malfunction. As a result, ERFN assert that Denison has done a poor job of meaningfully considering the input from ERFN and others.</p> <p>Question/Recommendation: Denison must demonstrate how Traditional Knowledge, not only community concerns, was considered in the assessment of accidents and malfunction including risks, monitoring, and proposed interventions and mitigations.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 339 | ERFN (February 22, 2023) | Section 14.4 Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Assessment; Table 14.4- 1 | <p>Comment #ERFN-243: Table 14.4-1 outlines a summary of engagement records related to accidents and malfunctions; however, Denison does not provide sufficient information regarding the concern which was raised and context in which it was raised. Specifically, in many cases, Denison only present a handful of words as the "comment" and then speaks to assessment consideration, but reviewers are unable to identify the concern which is being raised in most cases. As a result, Denison is able to present a solution for assessment consideration to a concern which is not identified.</p> <p>Question/Recommendation: Denison must provide complete engagement records outlining full comments/concerns with the context in which they were presented in order to demonstrate that these concerns were indeed appropriately considered in relation to the assessment of accidents and malfunctions.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 340 | ERFN (February 22, 2023) | Section 14.4 Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Assessment; Table 14.4- 1 | <p>Comment #ERFN-244: Table 14.4-1 outlines many of the concerns raised through engagement with ERFN and others, however, Denison only point to these concerns being addressed and considered in the Emergency Response Plan and other documents which have not yet been drafted. ERFN find it inappropriate for Denison to continue to defer meaningful discussions about potential impacts and ability to respond beyond the EIS stage. It is necessary to fully understand Denison's mitigation and response for all foreseeable events at this stage in order to evaluate possible residual effects of this project.</p> <p>Question/Recommendation: Denison must provide a draft version of the Emergency Response Plan which outlines all foreseeable effects pathways associated with accident or malfunction, monitoring options to ensure accidents or malfunctions are appropriately detected, and possible consequences and interventions as a result of an accident or malfunction.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 341 | ERFN (February 22, 2023) | Section 14.5.1 Overview | <p>Comment #ERFN-245: Denison has identified several risk scenarios as part of the accidents and malfunctions analysis; however, it has not conducted an effects pathway assessment with ERFN directly, allowing Denison and ERFN citizens to communicate concerns associated with the project and potential accidents and malfunctions. As a result, ERFN see that Denison's accidents and malfunctions assessment to be narrow in scope and only speak to western science perspectives.</p> <p>Question/Recommendation: Denison should provide appropriate capacity and support to enable ERFN to engage Denison in establishing an effects pathway assessment to ensure that monitoring, mitigation, and intervention associated with all potential environmental impacts appropriately consider ERFN TK and input, based on how the land is used and the societal impacts of this project.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 342 | ERFN (February 22, 2023) | Section 14.5.2 Process Hazards Analysis | <p>Comment #ERFN-246: Denison note that while there are standards and regulatory documents which govern the assessment of risk and probability for an accident or malfunction associated with a reactor facility, similar REGDOCs do not exist for a mining environment. ERFN agree that REGDOCs focusing on risk and probability assessment for a reactor facility is not overly appropriate to a uranium mine facility. However, there remain additional hazards which do not occur at non-nuclear facilities(e.g., non-uranium metal mines), that should be considered.</p> <p>Question/Recommendation: Denison should demonstrate how it utilized lessons learned from other uranium mines in the regional context(e.g., McClean Lake, Cigar Lake, and McArthur River), as well as other ISR facilities in the United States and elsewhere to ground the Hazards Analysis.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|--|
| 343 | ERFN (February 22, 2023) | Section 14.5.2 Process Hazards Analysis; Figure 14.5-2 | <p>Comment #ERFN-247: Denison outlines in Figure 14.5-2 a matrix considering likelihood and consequence severity of an accident or malfunction. This approach is used widely in environmental assessment, however, the definitions used to delineate consequence are not appropriately framed through the lens of ERFN land users who live near the facility and use the lands resources which would be affected to exercise rights and traditional practices. As a result, ERFN find the term consequence severity to be superficial.</p> <p>Question/Recommendation: Denison must consider, in its hazard analysis risk matrix, not only the potential impacts to human and environmental health, but also consider by extension the impacts to society, land use, traditional and non-traditional economic factors, and importantly, perceptions in the event of an accident or malfunction. For example, while an accident or malfunction may only have a narrow physical footprint in which the environment is impacted, this incident, especially if associated with a radiological event, could have a much larger perceived area of impact. As a result, the consequence severity may be much greater when viewed through the perspective of ERFN land users rather than what is measurable through western scientific methods.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 344 | ERFN (February 22, 2023) | Section 14.5.4 General Design and Mitigation Considerations | <p>Comment #ERFN-248: Section 14.5.4 outlines general design and mitigation considerations for the project. In the preface for this subsection, Denison outline intentions and commitments to "setting high standards for various aspects of its operations, which will serve to mitigate potential Project-related effects." However, only provide a generic overview of measures and features which they are considering. They do not present options and analysis for the consideration of these measures and therefore ERFN are unable to conduct any sort of meaningful assessment of whether they will be effective.</p> <p>Question/Recommendation: Denison must do more to appropriately identify, assess, and proactively propose meaningful options for mitigations to be considered. Specifically, ERFN expects that Denison outline specific hazards, and discussion on measures which will proactively prevent impact and alternative measures to serve as contingency.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 345 | ERFN (February 22, 2023) | Section 14.5.4 General Design and Mitigation Considerations | <p>Comment #ERFN-249: Denison note that "the processing plant will be designed with expert consideration of potential environmental and health and safety effects to mitigate interactions to the extent possible." While ERFN do not suspect that this wording implies that other aspects of the project will not be designed with expert consideration of potential environmental and health and safety effects in mind, this statement perfectly exemplifies the frustration ERFN faces in meaningfully evaluating the potential mitigation measures, which are absent.</p> <p>Question/Recommendation: ERFN requests that Denison provide detailed design and activity options based on each identified risk such that the effectiveness and appropriateness of each measure can be adequately assessed.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 346 | ERFN (February 22, 2023) | Section 14.5.6 Definition of Bounding Scenarios | <p>Comment #ERFN-250: Denison notes that "the processing plant will be designed with expert consideration of potential environmental and health and safety effects to mitigate interactions to the extent possible." While ERFN do not suspect that this wording implies that other aspects of the project will not be designed with expert consideration of potential environmental and health and safety effects in mind, this statement perfectly exemplifies the frustration ERFN faces in meaningfully evaluating the potential mitigation measures, which are absent.</p> <p>Question/Recommendation: ERFN request that Denison provide detailed design and activity options based on each identified risk such that the effectiveness and appropriateness of each measure can be adequately assessed.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 347 | ERFN (February 22, 2023) | Section 14.5.6 Definition of Bounding Scenarios; Table 14.5-2 | <p>Comment #ERFN-251: Loss of freeze capacity is identified as High Risk. Based on the risk matrix outlined in Figure 14.5-2 the overall risk is based on both likelihood and consequence severity. It is however unclear the circumstance which led the loss of the freeze capacity to be evaluated as high risk(similarly, failure of the freeze wall is identified as moderate risk, however, again the factors which led to this initial risk characterization are not discussed). ERFN agrees that the consequence severity for loss of freeze capacity and failure of freeze wall to be amongst the greatest for this project, however, what is unclear is whether Denison is suggesting the likelihood is also elevated.</p> <p>Question/Recommendation: ERFN requests that Denison provides an overview of factors which led them to the characterization of risk as presented, including both likelihood, consequence severity, and</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|--|
| | | | rational for why those risks were determined to fall within each respective likelihood and consequence severity levels. | |
| 348 | ERFN (February 22, 2023) | Section 14.6.1.1.1 Release Characterization | <p>Comment #ERFN-252: ERFN questions the approach used to assess the dissolution rate of uranium on a number of factors.</p> <p>a) Denison uses concentrate samples from the McClean Lake operation as a proxy for yellow cake produced at the Wheeler River project, without providing discussion as to whether these are truly interchangeable for the purposes of assessing solubility. Given the significant differences in processing, it is unclear whether McClean Lake samples are an appropriate proxy.</p> <p>b) The information provided outlining the rate at which uranium will come out solution is not clear. Specifically, ERFN raise concerns that solubility (4,800 ug/L) is used directly to measure the rate of dissolution. Solubility and dissolution rate should have an inversely proportionate relationship.</p> <p>c) Denison make an assumption that only dissolved(soluble) uranium will be mobilized by water. This is not accurate as flowing water can mobilized material which is not dissolved either as bed load or as suspended load, which may travel significantly downstream.</p> <p>d) Denison indicates that "that most (98% of the mass) of the uranium concentrate is expected to settle within a short distance of the release (i.e., within approximately 20 m of the release point), even under high flow conditions in the Wheeler River due to a relatively slow water velocity (<0.8 m/s)." This is a very narrow range of expected impacts; however, insufficient information has been made available to understand the spatial modelling that has been conducted to support this assertion</p> <p>Question/Recommendation: Denison must provide additional information regarding the methods used to model possible uranium flow, including providing a particle dispersion map of the downstream environment to illustrate expected movement and areas which could be effected in the event of an accident and spill.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 349 | ERFN (February 22, 2023) | Section 14.6.1.3 Evaluation of Probability | <p>Comment #ERFN-253: Generalized national or provincial transportation accident statistics is not an appropriate proxy given the unique conditions which face transportation of material from the Wheeler River site. Specifically, generalize statistics do not consider the increased risks of driving on a remote roadway, that is poorly lit and has frequent encounters with wildlife.</p> <p>Question/Recommendation: Denison must consider the additive or interactive effects of the road conditions unique to the Wheeler River project, which may increase accident rates beyond that of conventional roadway accident statistics.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 350 | ERFN (February 22, 2023) | Section 14.6.1.4.2 Exposure Assessment | <p>Comment #ERFN-254: The assessment of risk associated with a vehicular accident in which uranium is spilled into Wheeler River does not consider either the psychological/ perceived impacts of the spill, in which ERFN citizens may be less likely to want to interact with the river following an accident regardless of whether the spill was appropriately cleaned up, or the impacts to fish and aquatic habitat as a result of cleanup efforts. Given the need to clean the physical substrate significant amounts of fish habitat would be destroyed in order to effectively remediate a spill site.</p> <p>Question/Recommendation: Denison must consider the secondary implications of mitigation measures and interventions in the event there is an accident resulting in a spill.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| 351 | ERFN (February 22, 2023) | Section 14.6.3.1 Scenario Description | <p>Comment #ERFN-255: Denison note that the freeze wall will require a minimum of 12 months to thaw in the event of freezing system failure. It is unclear where this value originated from and the factors which contribute to such a slow thawing cycle.</p> <p>Question/Recommendation: ERFN requests that Denison provide modelling data for the thawing rates of freeze wall based on the geological properties to be encountered by the freeze wall.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 352 | ERFN (February 22, 2023) | Section 14.6.3.3 Evaluation of Probability | <p>Comment #ERFN-256: Denison notes that a probability value of 1×10^{-7} was established for the likelihood of loss of freeze capacity based on professional judgement. ERFN contests this value as entirely speculative and offered without substance. There are a wide range of factors that may contribute to short and long-term reductions or losses in freeze capacity (e.g., power failure, equipment failure, maintenance), which are not discussed.</p> <p>Question/Recommendation: Denison must provide a more meaningful assessment of specific factors which could lead to the loss or reduction of freeze capacity, demonstrating how they may contribute to an overall likelihood of loss of freeze capacity.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 353 | ERFN (February 22, 2023) | Section 14.6.3.4 Evaluation of Consequences | <p>Comment #ERFN-257: Denison argues in sections 14.6.3.1, 14.6.3.3 and 14.6.3.4 without substance that the risk of groundwater contamination due to the loss of freeze capacity is very unlikely. The lack of evidence presented to substantiate these claims is alarming to ERFN. ERFN agree that under normal circumstances the likelihood of the freeze wall failing allowing for groundwater contamination is on the lower end of the likelihood spectrum, however, ERFN are not currently assessing effectiveness under normal circumstances, but rather as a result of accident or malfunction. Based on the discussion provided in section 14.6.3.4, there is great concern to ERFN that Denison would be a) able to detect the failure of a freeze wall and b) identify the exposure pathway to enable Denison to take appropriate action before catastrophic environmental impacts are observed.</p> <p>Question/Recommendation: ERFN is gravely concerned about the information put forward by Denison in section 14.6.3 regarding the risk assessment associated with likelihood and consequences of failure by the freeze wall. Denison has not presented a viable method to monitor the effectiveness of the freeze wall. Additionally, Denison indicates that there are no viable methods of detecting impacts or intervening until they are observed, indicating failure of the freeze wall. Finally, when speaking to the likelihood of an accident or malfunction, Denison only offer a best guess. ERFN requests that CSNC and Denison take seriously the possible threat to the environment and by extension ERFN Rights and interests associated with the failure of the freeze wall. ERFN cannot overstate the need to provide additional analysis of contingency measures to avoid containment in the event the freeze wall fails to contain mining fluids and other sources of groundwater contamination associated with Wheeler River activities.</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 354 | ERFN (February 22, 2023) | Section 14.6.4.1 Scenario Description | <p>Comment #ERFN-258: Denison suggests that the "low temperature of the formation in and around the compromised section of the freeze wall would most likely cause the fluids to freeze and seal or partially seal the opening, further reducing the rate of contamination." It is unclear how mining fluids may influence the freezing point of groundwater, and therefore allow mining fluids to either thaw the freeze wall or be immune to subsequent freezing by surrounding materials.</p> <p>Question/Recommendation: ERFN request Denison provide a breakdown of expected freezing points for mining fluids or other liquids within the mining theatre which may interact with the freeze wall.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|--|
| 355 | ERFN (February 22, 2023) | Section 14.6.4.1 Scenario Description | <p>Comment #ERFN-259: Denison speculates that migration of fluids from the mining theatre beyond a compromised freeze wall section would be slow due to low temperatures.</p> <p>a) This assertion is not supported by ground water modelling or other evidence accounting for groundwater flow, especially as liquids are being injected and extracted via ISR mine operations.</p> <p>b) If migration is indeed slow, it would imply that the detection of impacts would also be slow. This may mean that impacts from a compromised freeze wall may not be observed until after the mine has completed its production life. ERFN is therefore concerned that the inability to detect impacts may result in a legacy of contamination which may not be the responsibility of Denison if they are not detected until after the mine has completed closure and reclamation activities.</p> <p>Question/Recommendation:</p> <p>(i) Denison should provide detailed scenario based modelling to demonstrate expected flow rather beyond a compromised freeze wall.</p> <p>(ii) Denison should include an appropriate groundwater monitoring program surrounding the project to run throughout the entire lifecycle of the mine to best capture potential contamination and migration of mining fluids.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 356 | ERFN (February 22, 2023) | Section 14.6.5.2 Design and Mitigation Considerations | <p>Comment #ERFN-260: Radon is an odorless, colourless gas. While a burst pipe of vessel under pressure may result in obvious signs of a leak, leaky valves and or fittings may allow for radon to escape undetected.</p> <p>Question/Recommendation:</p> <p>Denison should identify measures to ensure that valves and fittings are inspected and maintained in routine intervals. Also, ERFN recommend that radon detectors be installed and monitored near all enclosed infrastructure where radon gas may escape.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 357 | ERFN (February 22, 2023) | Section 14.6.6.1.1 Release Characterization | <p>Comment #ERFN-261: Denison assumes that in the event of an explosion 90% of the uranium would be trapped within the damaged dryer unit, however, fail to substantiate this assumption.</p> <p>Question/Recommendation:</p> <p>Denison should base assumptions on maximum risk scenarios rather than minimum or probable risk scenarios. As a result, ERFN request that the LPF be equated to 1 rather than 0.1.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 358 | ERFN (February 22, 2023) | Section 14.6.6.2 Design and Mitigation Considerations | <p>Comment #ERFN-262: In speaking to design and mitigation considerations Denison only make hypothetical or aspirational commitments (e.g. "Denison would make sure that the design of the plant includes control measures to reduce exposure levels to workers and members of the public to levels that are as low as achievable."). These are not specific design considerations or hard commitments.</p> <p>Question/Recommendation:</p> <p>Denison should commit to best practices, including the implementation of specific measures rather than simply stating plans to commit the implementation of design and mitigation considerations.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 359 | ERFN (February 22, 2023) | Section 14.8 Key Findings and Conclusions | <p>Comment #ERFN-263: Denison has presented an accidents and malfunctions assessment that speaks only to a handful of concerns, while presenting in many cases minimal evidence to substantiate its assertions and assumptions. ERFN is very concerned by the lack of consideration for contingency planning associated with the identified risks.</p> <p>Question/Recommendation:</p> <p>ERFN does not consider section 14 sufficiently comprehensive or meaningful for the purposes of assessing risks.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|--|
| 360 | ERFN (February 22, 2023) | Section 15.2.1. Existing Environmental Conditions | <p>Comment #ERFN-264: ERFN agree that the probability of a significant seismic event effecting the project site is low, however, it is not zero. Further, given the inherent design of the project, which relies on the establishment of multiple closely spaced deep wells to be drilled for injection and extraction, well design must be such that it can withstand significant shear forces associated with horizontal movement. Denison presents an inconclusive outline of design considerations to be incorporated to minimize risks to well structures, and the freeze wall as a result of a significant seismic event.</p> <p>Question/Recommendation: ERFN request Denison provide an analysis looking at other similar projects to identify specific design considerations to mitigate risks to below-ground infrastructure as a result of seismic activity.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 361 | ERFN (February 22, 2023) | Section 15.2.1. Existing Environmental Conditions | <p>Comment #ERFN-265: Human induced seismic activity has been observed in association with the use of injection wells. This have been most notably observed in association with hydraulic fracturing in the extraction of shale gas, where high- pressure fluid liquid is forced into geological formations with the intention of fracturing the rock to release trapped gasses. However, similar human induced seismic activity has been observed in other instances where injection wells are used, resulting in large changes of water or gas form underground reservoirs, creation of voids space, changes in pore-pressure, all have been associated with increases in seismic activity (Ellsworth, 2013). ERFN is concerned that similar human induced seismic activity may increase as a result of the extraction process being proposed by Denison.</p> <p>Question/Recommendation: ERFN request that Denison provide evidence using examples of other in situ recovery uranium mines around the world to discuss the potential risks of increased seismic activity as a result of the proposed activity.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 362 | ERFN (February 22, 2023) | Section 15.2.2. Effects on the Project | <p>Comment #ERFN-266: Although seismic activity is unlikely, it is still possible. Given the inherent hazards associated with this project there is a need to ensure that project infrastructure can withstand all likely seismic events.</p> <p>Question/Recommendation: ERFN request that Denison provide information on the magnitude and duration of a seismic event for which infrastructure will be designed to withstand. Included should be an analysis of the likelihood of such and event to occur at the project site.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 363 | ERFN (February 22, 2023) | Section 15.3.2 Effects on the Project | <p>Comment #ERFN-267: Denison notes that although potential exists for forest fires to occur during the life of the Project, fire is not expected to have a detrimental effect on the Project given the design features and mitigation measures that Denison with have in place with the Fire Protection Program, which will be developed specifically for the Project and based on proven programs at existing northern sites. Denison does not provide additional information on what mitigations will be included in the Fire Protection Program, nor does it provide information on which existing programs they will be based on. Forest fires present perhaps one of the greatest environmental threats to the safe operation of this project, as fires are frequent in the region, inherently difficult to control, and likely to increase as a result of climate change.</p> <p>Question/Recommendation: (i) ERFN request that Denison provide additional information on fire mitigation and suppression measures that are to be established and maintained to minimize the risk of fire to the project. Specifically, more information is needed to describe how infrastructure used in the extraction, handling, processing, and storage of uranium ore and products will be safeguarded against fire (such as the use of fire proof building materials). (ii) Additional information is requested on the existing northern sites used to inform the development of the Fire Protection Program. (iii) Denison does not contemplate risks or consequences of an uncontrolled fire affecting the project site. ERFN request that additional information be provided modelling atmospheric dispersal potential of radioactive material from stockpiles and facilities in the event fire were to impact the project footprint.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

| | | | | |
|-----|---|---|--|--|
| 364 | ERFN (February 22, 2023) | Section 15.3.2 Effects on the Project | <p>Comment #ERFN-268: Denison notes that the potential for increased forest fire frequency and severity due to climate change in the coming decade, referencing Section 15.3.2. However, no additional information about the potential interplay between forest fires and climate change is discussed in this section beyond this sentence.</p> <p>Question/Recommendation: ERFN requests that Denison revise this section to either accurately cite the appropriate section reference or provide additional discussion on the potential impacts of increase forest fire frequency and severity on the project as a result of climate change.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 365 | ERFN (February 22, 2023) | Section 15.4.2 Effects on the Project Table 15.4- 1 | <p>Comment #ERFN-269: Denison notes that in response to major precipitation events, suitable equipment and design systems will be selected for the project to operate under heavy precipitation conditions, however, do not specify what design standard will be selected.</p> <p>Question/Recommendation: Given that climate change has the potential to increase the frequency and severity of heavy precipitation events, ERFN request that Denison specify a design standard which outlines the return period for an event (e.g., 1 in 100, 1 in 500 event).</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 366 | ERFN (February 22, 2023) | Section 15.4.2 Effects on the Project Table 15.4- 1 | <p>Comment #ERFN-270: Non-contact surface runoff may include water which contains elevated amounts of suspended solids or other water quality constituents which are greater than allowable for discharge to the environment as a result of contact with roadway surfaces, or modified landcover. The likelihood of poor water quality is greater in surface runoff during extreme and prolonged precipitation or melt events.</p> <p>Question/Recommendation: Please provide an outline of how Denison plans to monitor and appropriately intervene in instances where non-contact surface water runoff does not meet appropriate water quality standards as a result of an extreme or prolonged precipitation or melt event.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 367 | ERFN (February 22, 2023) | Section 15.4.2 Effects on the Project Table 15.4- 1 | <p>Comment #ERFN-271: While it is logical for the water management infrastructure to be designed to allow for water to be transferred from pond to pond as required, during a significant or prolonged precipitation or melt event, water storage ponds are likely to all rise proportionately, making this mitigation potentially fruitless.</p> <p>Question/Recommendation: Please identify design considerations including maximum storage capacity, operational freeboard, spillway location and design, and excess treatment capacity which may allow for additional treated effluent discharge to environment in the event total pond capacity is exceeded.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 368 | ERFN (February 22, 2023) | Section 15.4.2 Effects on the Project Table 15.4- 1 | <p>Comment #ERFN-272: Denison notes that the system as proposed is designed to recycle a significant amount of the process water encountered, minimizing the amount of water that is needed to be withdrawn from Whitefish Lake. However, it is unclear from the description provided whether or not operational plan to be developed include considerations for minimum or maximum water levels within the storage ponds.</p> <p>Question/Recommendation: Please outline whether water storage ponds require a minimum amount of water to maintain operations of mine processes and function of the ponds themselves.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 369 | ERFN (February 22, 2023) | Section 15.4.2 Effects on the Project Table 15.4- 1 | <p>Comment #ERFN-273: Water takings and recycle may be effected during periods of extended drought. Increased water taking from Whitefish Lake may impact the water level in the lake, fish habitat, and use.</p> <p>Question/Recommendation: Please outline total water balance including maximum expected water takings from Whitefish Lake.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| 370 | ERFN (February 22, 2023) | Section 15.4.2 Effects on the Project Table 15.4- 1 | <p>Comment #ERFN-274: The use of additional energy generation on site as a result of air conditioning will increase the carbon footprint of the project.</p> <p>Question/Recommendation:</p> <ul style="list-style-type: none"> (i) Please provide analysis of how increased air temperatures will alter the overall carbon emissions to be produced by this project. (ii) In the event that diesel generators are required as a result of a power outage, please provide a synopsis of how operations may be impacted, including a reduction in operations to minimize carbon emissions associated with running generators. (iii) It is recommended that during summer months, alternative energy options are utilized rather than diesel generators to provide backup power. This will minimize the carbon and nitrogen dioxide footprint. <p>Please provide information on how the use of emergency diesel backup generators has been included into the predicted nitrogen dioxide and carbon emissions/air quality assessment.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 371 | ERFN (February 22, 2023) | Section 15.4.2 Effects on the Project Table 15.4- 1 | <p>Comment #ERFN-275: Denison do not provide a discussion on the potential impacts of wind erosion on stockpiles or other dry- stacked materials during an extremely high wind event.</p> <p>Question/Recommendation:</p> <ul style="list-style-type: none"> (i) ERFN recommend that PM15, metals, and radioactive material be modelled under extreme wind conditions, demonstrating potential dispersal, and associated implications. (ii) ERFN request that Denison develop appropriate mitigation plans for minimizing dust from roadways, stockpiles, and dry-stacked materials as a result of extremely high winds - including those associated with tornadic events. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 372 | ERFN (February 22, 2023) | Section 15.5 Climate Change | <p>Comment #ERFN-276: Denison notes that concerns related to climate change were raised during engagement and consultation activities, however, these concerns pertain to climate change rather than GHG emissions specifically. While this may be technically accurate, climate change and the release of GHG emissions should be considered as synonymous as the cause-and-effect relationship is well established. Denison will be responsible for the emission of significant amounts of GHG, which although are difficult to quantify in their impact on the local and regional environment, contribute to climate change which is experienced at local, regional, and global levels.</p> <p>Question/Recommendation:</p> <p>Denison must recognize the inherent connectedness between its operation and climate change. Further, it is necessary that Denison implement meaningful and realistic approaches to minimizing its GHG emissions and contributions to climate change.</p> | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 373 | ERFN (February 22, 2023) | EIS Section 15.5.3 Effects on the Project | <p>Comment #ERFN-277: Throughout much of the assessment on the effects of the environment on the project, Denison downplays the potential uncertainty due to natural events. This includes providing minimal discussion on the potential for flooding, excess snowfall, and tornadic events, as well as insufficient discussion on planned mitigation options for addressing effects of the environment identified.</p> <p>Question/Recommendation:</p> <ul style="list-style-type: none"> (i) Denison should provide analysis of potential effects of the environment on the project as a result of surface water flooding, excess snowfall events, and tornados on the project. (ii) Denison should provide additional information linking mitigation measures to possible effects of the environment, including specific design standards to demonstrate the project will be designed to minimize risks. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |
| 374 | ERFN (February 22, 2023) | Section 15 General | <p>Comment #ERFN-278: The Wheeler River project is located in an area of discontinuous permafrost. This aspect is not identified or examined with respect to the potential impacts of the environment on this project.</p> <ul style="list-style-type: none"> (i) ERFN see this as a potential significant oversight as works conducted and infrastructure constructed on discontinuous permafrost may be impacted by permafrost melt. As frost heave and slumping may adversely impact the project site. (ii) Permafrost has an ability to trap methane and other GHGs from escaping into the environment. Permafrost which is melted or disturbed may release those gases. If permafrost will be disrupted by project activities, Denison must consider GHGs to be released as part of its impacts on the environment <p>Question/Recommendation:</p> <ul style="list-style-type: none"> (i) Denison must provide discussion on the presence or absence of discontinuous permafrost in RSA, and whether that permafrost will be impacted by project activities. | As part of an agreed-upon process between ERFN and Denison Mines, ERFN further directed Denison to provide responses to 15 Main Areas of Concern identified by ERFN, which summarized comment numbers 104 to 374 (see Main Areas of Concern for ERFN #1-15 incorporated into this table) in the CNSC Consolidated Comments from Indigenous Nations and Communities and the Public on the Wheeler River Project Draft Environmental Impact Statement. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|--|-----------------------------|--|---|
| | | | (ii) Where permafrost may be impacted, Denison must quantify the amount of GHG that will be released from melting or disturbed permafrost areas. | |
| 375 | Ya'thi Nene Land and Resource Office (YNLRO) (March 4, 2023) | EIS Executive Summary, p. 2 | <p>YNLR Comment March 4, 2023 Comments #1, 2 and 3, Appendix A: YNLR sees a potential benefit of the in-situ approach as it is designed to reduce the surface disturbance of the Project, and the potential leakage of contaminants from excavated rock and tailings. However:</p> <ul style="list-style-type: none"> - YNLR is concerned that the extraction of source water for the Project may have a negative effect on stream flows both below- and aboveground. - YNLR is concerned with the potential effects of contaminants released during and after the Project. <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Denison acknowledges these concerns and notes the comment from YNLR references the Executive Summary. Both of the areas of interest raised by the comment are addressed in the main part of the draft EIS and supporting appendices. Denison refers YNLR to the following sections for comprehensive evaluation of these aspects of the Project:</p> <ul style="list-style-type: none"> • Potential changes in surface water quantity as the result of the Project, including consideration of water taking activities, are presented in the hydrology assessment (draft EIS, Section 8.1). • Potential changes to groundwater quantity and quality as the result of the Project, including consideration of the long-term implications of the mining method, are presented in the groundwater assessment (draft EIS, Section 7). Specifically, the 'future centuries' temporal scope of the assessment for Groundwater considers the period for which the highest COPC concentrations in groundwater are predicted to interact with surface water based on groundwater modeling described in Appendix 7-C. Due to the relatively long travel time (relatively low groundwater velocities) between the mining area (Section 7.6.2.2.3) and the surface water environment where groundwater/surface water interactions are expected, as well as the potential for chemical reactions along the groundwater flow pathway, a 'future centuries' scenario was deemed appropriate to fully assess potential future effects beyond the Project timeline (i.e., 0 to 38 years). The 'future centuries' temporal scope was also developed in recognition of the concerns raised by Interested Parties through the engagement process around the potential for the Project to influence water quality into the future. <p>These assessments, completed in a transparent and rigorous manner, concluded that residual effects of the Project would not be significant. Follow-up and monitoring programs will be employed to confirm mitigation measures are functioning as planned and to confirm EA predictions. For example, a groundwater monitoring plan, including an excursion contingency plan and measures for adaptive management will be implemented for the Project.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 375. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |

| | | | | |
|-----|--|--------------------------------|--|--|
| 376 | YNLRO (March 4, 2023) | EIS Executive Summary, p. 2 | <p>YNLR Comment March 4, 2023 Comment #4, Appendix A: based on the information from p. 2 of the Project Overview: YNLR assumes no permanent work camp will be constructed. YNLR expects that a sizeable proportion of the Project workers will be hired from the local and regional area.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Denison's Indigenous Peoples Policy sets out priority for Indigenous employment and procurement (among other items). With respect to employment, as noted in Section 13.3.2.1 of the EIS, Residents of Saskatchewan's North (i.e., those resident in the northern administration district of Saskatchewan, inclusive of YNLR) are prioritized for employment as an expected condition of the Surface Lease Agreement, similarly for goods and services to service the Project. With respect to procurement, Denison has established an internal procurement policy approach. The approach requires that Denison consider businesses within the local study area first and the Northern Administrative District second, prior to looking elsewhere (southern Saskatchewan and/or outside of Saskatchewan) throughout all phases of the Project. YNLR businesses would fall in the category of northern Saskatchewan businesses, which would place them in line for second preference if project needs cannot be met within the local study area.</p> <p>Details on the Project components are provided in EIS Section 2. The Project will be operated as a fly-in/fly-out mine, meaning the opportunities for interactions between the workforce and Indigenous communities are limited as workers will be transported by air directly to the site. The proposed camp or accommodations facility is anticipated to be a turnkey building manufactured off site and assembled and commissioned on site. The building's design will be sized to accommodate a peak load of about 190 individuals during Operation; however, due to its modularized design, additional modules can be easily installed should additional beds be required in the future.</p> <p>Section 13 provides the assessment for the key indicator of employment and training, which is a component of the Economy Valued Component. A summary of residual environmental effects on employment and training is found in Table 13.5-2. Employment opportunities represent direct and indirect benefits associated with construction and operation of projects, particularly in the vicinity of communities where unemployment is typically high.</p> <p>Additionally, because the property is located on Crown Land, a mineral surface lease agreement will be negotiated with the Province, specifically the Ministries of Environment and Government Relations. The agreement grants surface rights for the purpose of accessing the land to extract minerals under the Crown Resources Land Regulations. The mineral surface lease agreement provides long term rental of Crown land for mining and milling in Saskatchewan. The agreement also contain specific commitments for environmental protections for the life of the project, OH&S protocols, reporting requirements, and socio-economic benefits for residents of northern Saskatchewan.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 376. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
|-----|--|--------------------------------|--|--|

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|--|--------------------------------|---|--|
| 377 | YNLRO (March 4, 2023) | EIS Executive Summary, p. 2 | <p>YNLR Comment March 4, 2023 Comment #5, Appendix A: YNLR is concerned with the potential increase in road and off- road traffic affecting wildlife and fisheries sustainability.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Please note that the Project will not change public access to the area. The existing gate on Highway 914 near Cameco's Key Lake Operation will remain in place and no changes to the gate and the process for controlling access to Highway 914 north of the Key Lake Operation are proposed as part of the Wheeler River Project. The proposed operation is fly-in, so Project related traffic to the area would only be related to deliveries of materials to and from the site. On-site staff will not have access to personal (or company) vehicles and will largely be "confined" to the camp and work areas during their shifts. Refer to draft EIS, Section 12 Quality of Life for the assessment of potential Project effects on the Key Indicator of Infrastructure and services (traffic) and the associated measurable parameter of change in traffic volumes and types and risk of accident.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 377. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 378 | YNLRO (March 4, 2023) | EIS Executive Summary, p. 2 | <p>YNLR Comment March 4, 2023 Comment #6, Appendix A: YNLR supports this built-in precautionary approach to the Project's risk assessment. However, given the lengthy timeline of the Project, YNLR would like to see that lost (i.e., unmitigated) wildlife and fisheries habitat be offset in some manner. A response to this should be approached through an anticipated impact benefit agreement.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Through the EA process to date, Denison believes it has identified areas where offset may be required based on Project-Environment interactions. To this end, Denison has made a specific commitment to develop a Caribou Mitigation Plan (submitted in response to provincial and federal EIS review comments) that includes provision for potential habitat offset. Details of the habitat offset will be developed in collaboration with Saskatchewan Ministry of Environment.</p> <p>It is also important to consider the site decommissioning plan within this context, though such restoration activities are not typically discussed as "offsets". Denison's decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP.</p> <p>No other specific needs for "offset" have been identified based on the effects assessment.</p> <p>Denison will continue to engage with YNLR on topics of interest.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 378. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's</p> |

| | | | | |
|-----|--|-----------------------------|--|--|
| | | | | concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR. |
| 379 | YNLRO (March 4, 2023) | EIS Executive Summary, p. 2 | <p>YNLR Comment March 4, 2023 The EIS Executive Summary outlines mitigation measures, monitoring requirements, and commitments needed for Denison to have confidence that Project is operating as planned and that the actual effects resulting from Project Construction, Operation, and Decommissioning are at or below predicted effects. Comment #7, Appendix A: Despite these reassuring statements, YNLR is aware that predictions may fall short, hence the need for close collaboration with Indigenous Peoples, communities, and organizations, including their input into the design and implementation of transparent and statistically-robust project monitoring programs.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) Denison states that they will inform YNLR of the development of their monitoring plan. This does not meet the YNLR request for input and collaboration into the design of monitoring programs.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Denison acknowledges the comment and is committed to ongoing engagement and dialogue with interested parties with respect to monitoring. Details of follow-up and monitoring plans will be prepared in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies. YNLR will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: programs will meet regulatory requirements, programs will confirm the effectiveness of mitigation measures and predictions made in the assessment, programs will be implemented in an adaptive management framework (if/where applicable) to reduce effects during the lifetime of the Project, and programs will have spatial boundaries that are sufficiently extensive to measure EIS predictions.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licensing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR's consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. As noted in the meeting, the detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps. Further, as an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, "YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development." Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. As a starting point, the EIS contains conceptual level information for various monitoring plans associated with the Project, commensurate with the requirements for an environmental assessment, the primary basis of which is informed by regulatory guidance and requirements. The conceptual monitoring plans also take into account any input received through engagement activities, where appropriate. As the Project advances into permitting and licensing, the conceptual monitoring plans evolve into detailed monitoring plans, the designs of which must adhere to Provincial and Federal regulatory requirements but can be further enhanced by the involvement of the YNLR and other Indigenous communities. Denison provided the summary of monitoring and follow-up programs (Section 16 of the EIS) to the YNLR as an outcome of the February 22, 2024 meeting, with the request to identify those items of further interest to the YNLR to enable the co-development of a path forward. It is Denison's perspective that, in order to advance a meaningful process to further involve the YNLR in the development of the monitoring plans, it is necessary for Denison to understand the key areas of interest to the YNLR. This was the basis of Denison's request whereby the YNLR identify a starting point for this exchange, based on the conceptual monitoring programs</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|--|--|---|--|
| | | | | provided in the EIS. In the absence of specific feedback on the conceptual monitoring plans/programs, Denison re-iterates its commitment to providing the YNLR with the detailed monitoring plans, as developed through the permitting and licensing process, for input and collaboration as the Project advances. |
| 380 | YNLRO (March 4, 2023) | EIS Executive Summary, p. 2, 12, 44, 45 and 47 | <p>YNLR Comment March 4, 2023</p> <p>Comments #8, 10, 21 and 22, Appendix A: YNLR remains concerned about the nature and disposition of project contaminants during and after the mining process.</p> <ul style="list-style-type: none"> - YNLR supports the Project outcome of lower aboveground disturbance, it retains concerns about the management inputs and outputs of the ISR method, particularly project water sources, quantity, and release along with its associated contaminants. - The release of contaminants before and after the Project's completion worries YNLR, which sets a high priority on clean and abundant groundwater and surface water. The Indigenous People, communities, and organizations YNLR represents will be here long after mine decommissioning, so minimizing this risk with statements regarding the length of time it takes is not helpful. - As with groundwater, YNLR places a high value on the quantity and quality of surface waters. Monitoring of water will be critical, and YNLR expects to be consulted and heavily involved with respect to this activity. <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023)</p> <p>No timeline for consultation has been offered. The response simply restates Denison's original comments in the EIS.</p> <p>Denison promises dialogue. YNLR wants to see the predecommissioning monitoring plan for contaminant releases so that mitigation can be applied long before decommissioning. YNLR wants to be involved with all monitoring plans and programs from conception to implementation.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024)</p> <p>While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development.</p> <p>YNLR has provided its responses on caribou offsets and other aspects of caribou restoration and mitigation planning in the responses contained in their letters of 02 February 2024 and 13 March 2024. The concerns expressed in those responses remain valid and unaddressed. YNLR did request from Denison, in their meeting of 22 Feb 2024, specific information as to where their caribou offsets are located and what was the information and methodology used to determine these offsets, however, Denison declined to provide this information. Additionally, YNLR is also on record with CNSC and Denison (see attached letters at appendix 3) that there is a divergence of opinion of the results of the YNLR and Denison Cumulative Effects analysis. Given that the results of the CE analysis is the basis for how much land, suitable for caribou, is required for offsetting: YNLR's interest in the details of Denison's caribou offset plan is a valid concern (see Appendix 3 for a review of YNLR's GIS based Method for Assessing Cumulative Environmental Effects). Respecting preliminary decommissioning plans: decommissioning plans are based on the extent to which restoration and offsetting are carried out prior to decommissioning, therefore while their receipt from Denison is appreciated any conclusions that can be determined from this plan is incomplete without the former requested information on offset</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023)</p> <p>Denison acknowledges the comment and concerns raised by YNLR. Denison believes the assessment of potential effects, such as those highlighted in the review comment, have been considered in a robust manner in the EIS and appropriate mitigations have been proposed. Denison is committed to ongoing engagement and dialogue with interested parties on key Project aspects such as that referenced in the review comment.</p> <p>With specific reference to site decommissioning the following is noted. Denison's decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024)</p> <p>Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licensing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR's consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. As noted in the meeting, the detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps. As an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS.</p> <p>YNLR has shared comments with respect to Woodland Caribou offsets, including those related to the definition of offsets, timing, and mitigation measures as part of present-day mitigation measures for the Project, and should be applied in advance of decommissioning. YNLR has also requested to see the predecommissioning monitoring plan for containment releases. As an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided a document titled Summary of Monitoring, which outlines the Project's commitments for monitoring programs for all phases of the Project from preconstruction to post decommissioning. Details of monitoring will be developed prior to, and applicable for each phase of the Project, including decommissioning. Denison has also provided YNLR with the Preliminary Decommissioning Plan, of which Denison offers to include YNLR in discussions as more details are developed for the Preliminary Decommissioning Plan. Denison has also provided YNLR with the Draft Caribou Management Framework, which outlines mitigation and restorative measures within the Provincial government framework. Denison welcomed feedback on the Draft Caribou Management Framework and remains open and willing to receive additional feedback.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024)</p> <p>YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, "YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development."</p> |

| | | | | |
|-----|--|---|--|---|
| | | | plans. Therefore, YNLR concerns stated in their comments remain valid and unaddressed. | <p>Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. As a starting point, the EIS contains conceptual level information for various monitoring plans associated with the Project, commensurate with the requirements for an environmental assessment, the primary basis of which is informed by regulatory guidance and requirements. The conceptual monitoring plans also take into account any input received through engagement activities, where appropriate. As the Project advances into permitting and licensing, the conceptual monitoring plans evolve into detailed monitoring plans, the designs of which must adhere to Provincial and Federal regulatory requirements but can be further enhanced by the involvement of the YNLR and other Indigenous communities. Denison provided the summary of monitoring and follow-up programs (Section 16 of the EIS) to the YNLR as an outcome of the February 22, 2024 meeting, with the request to identify those items of further interest to the YNLR to enable the co-development of a path forward.</p> <p>It is Denison's perspective that, in order to advance a meaningful process to further involve the YNLR in the development of the monitoring plans, it is necessary for Denison to understand the key areas of interest to the YNLR. This was the basis of Denison's request whereby the YNLR identify a starting point for this exchange, based on the conceptual monitoring programs provided in the EIS. In the absence of specific feedback on the conceptual monitoring plans/programs, Denison re-iterates its commitment to providing the YNLR with the detailed monitoring plans, as developed through the permitting and licensing process, for input and collaboration as the Project advances.</p> <p>Denison is committed to the development of a caribou mitigation and offsetting plan for the Project. This plan will be developed ahead of construction and independent of the development of the Project's detailed decommissioning plan.</p> <p>Denison provided the YNLR with a draft Caribou Management Framework which outlines mitigation and restorative measures within the Provincial Government framework. Denison continues to remain open to feedback from the YNLR on the draft Caribou Management Framework. Further, Denison's previous offer to involve the YNLR in discussions with respect to the development of the decommissioning plans still stands. Decommissioning plans at this stage are conceptual as outlined in the EIS and will continue to be refined through each phase of the Project as it progresses.</p> |
| 381 | YNLRO (March 4, 2023) | EIS Executive Summary Freeze Wall, p. 12 and 13 | <p>YNLR Comment March 4, 2023</p> <p>Comments #11, 12 and 13, Appendix A: Containment of the mining solution and uranium bearing solution within the mining area will be achieved through a defence-in-depth approach with three levels of containment.</p> <ul style="list-style-type: none"> - YNLR assumes that information and data exist with respect to the environmental safety of freeze wall technology in uranium mining operations within Saskatchewan. Has Denison reviewed these data and are they considered/presented as part of this EIS? If not, why not? - What happens to the freeze wall and its retained contaminants at the end of the Project's life? – despite safeguards and remediation, it has potential to release contaminants after mining is completed. - Monitoring and adaptive management are important components of sustainable uranium mining. YNLR expects to be consulted/included in the design and implementation of the Project's environmental monitoring programs. <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023)</p> <p>This statement is misleading because ground freezing to contain contaminants in a uranium mining extraction project has never been done in Canada before. Independent assessment comments are needed here. It is unclear that groundwater contaminates monitoring outside of the freeze wall is unnecessary to monitor this risk of leakage and confirm the conclusions of the predictive modeling. It is good that Denison later alludes that monitoring is necessary; however, prior comments as to the extent of YNLR involvement in planning and execution of monitoring is reiterated.</p> <p>It is noted that Denison has committed to ground water monitoring; however, prior comments as to the extent of YNLR involvement in planning and execution of monitoring is reiterated.</p> <p>TK will have no input into ground water contamination until health risks are noted decades or</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023)</p> <p>Denison notes this comment is on the Executive Summary and that more detailed information is available in the main part of the draft EIS e.g., Section 2 Project Description and Section 7 Geology and Groundwater (and associated appendices).</p> <p>Ground freezing technology is well established and used widely throughout the world. Its use in a mining environment was pioneered in Saskatchewan's potash mining industry for shaft sinking activities, and later adapted for use in Saskatchewan's uranium industry. Ground freezing to control and eliminate groundwater from entering mining areas is a fundamental component of two existing Athabasca Basin underground uranium mines: Cameco Corporation's McArthur River Operation and Cigar Lake Operation. Freeze walls, when fully developed, are capable of withstanding significant external pressures because the ice in the pore voids greatly improves the bulk strength of the soil. For example, in the province of Saskatchewan, ground freezing is used to support the sinking of deep potash mine shafts, which must penetrate through the Mannville formation at a depth between 400 and 500 m below surface. The Mannville formation is often described as saturated, unconsolidated beach sand and it would not support shaft excavation in a thawed state. Freezing is used to create a structural and impermeable wall up to 5 m thick, which can resist a stress gradient driven by full hydrostatic and/or lithostatic pressures on the outside of the wall, and an open to atmosphere excavation within the shaft. This loading condition is much more extreme than any condition the freeze walls at the Phoenix deposit will experience because the interior side of the freeze wall where active ISR mining is occurring is not open to atmosphere and is fluid filled in the same way that the regional groundwater system is on the exterior side of the freeze wall, creating a balanced pressure system, where loading is equal on both the interior and exterior sides. While freeze walls are very strong when fully developed, they are also plastic in nature. This means that they can slowly deform without failing in response to localized ground deformations. As the freeze wall deforms towards a lower stress zone, it maintains its thickness and integrity. While the above example</p> |

| | | | |
|--|--|--|--|
| | | <p>centuries later. Therefore, the relevance of this statement from Denison saying that TK will inform the ground water monitoring plan is questionable.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development.</p> <p>YNLR appreciates the offer of Denison's Technical expert to brief YNLR on their concerns with freeze-wall technology. Unfortunately, Denison's freeze-wall technical expert is no more independent than Denison's Cumulative Effects technical expert, that YNLR staff spoke to on 22 Feb 2024. Hence, YNLR's concerns as stated in their response remains. Going forward on this item, YNLR will engage with CNSC for access to an independent technical expert on freeze-wall technology.</p> <p>Denison's above statement is a reassertion of their comment addressed by YNLR in their letters of 02 February 2024 and 13 March 2024. Therefore, YNLR's concerns as to their involvement in monitoring, remain valid and unaddressed.</p> | <p>referred to potash shafts, other examples can be drawn from the experience at the McArthur River or Cigar Lake uranium mines. At McArthur River, open stopes are generated directly adjacent to a freeze wall that is a nominal 4 m thick. At Cigar Lake, open mine cavities 10 m high and several metres in diameter commonly exist within the frozen ground. Neither site has had a breach of the freeze wall during mining activity. Given that the freeze wall at Denison will be much thicker than at McArthur River and that it will be located up to 25 m from the ore zone, it is not anticipated that it will be exposed to a stress environment that will put it at risk.</p> <p>Since the mine design includes the freeze wall as a tertiary management strategy, movement of mining solution is restricted and contained horizontally during operations. Wellfield pumping is the primary form of containment and provides the hydraulic containment to keep mining solution within the 50 m mining area (see Section 2.2.1.4.2). During the operation phase, and under normal operational conditions there is no interaction between the mining zone and surface water or down gradient groundwater environments, and the groundwater assessment (Section 7) focuses on the post-decommissioning period following removal of the freeze wall, once the groundwater flow paths return to pre-mining conditions. During mining area remediation (see Section 2.3.3.1.1), the freeze wall will remain in place until decommissioning objectives are achieved. Refinement of the mining area decommissioning objectives and associated modelling will be done through updates to the Decommissioning Plan, and will be bounded by the objectives evaluated in the EIS. To carefully evaluate how constituents dissolved in the remediated groundwater within the mining area may migrate away from and interact with the environment, a rigorous numerical model of groundwater flow and chemical constituent behaviour along the groundwater flow path was used as a predictive tool. The model is based on proven scientific principles and processes (e.g., groundwater flow, contaminant transport, and geochemical reaction processes) and allowed future conditions to be evaluated. Migration of dissolved constituent concentrations along the groundwater flow path from the mining area to Whitefish Lake (the local surface water receptor) is predicted to take hundreds to thousands of years, with concentrations remaining below values that would result in an environmental risk.</p> <p>Given the nature of the ISR mining method that will be employed by the Project groundwater monitoring is an important consideration. The groundwater monitoring plan would be developed in consideration of how Project facilities and activities could interact with the groundwater environment and groundwater users to define monitoring needs (locations, frequencies and constituents). Data generated from the groundwater monitoring plan would serve various purposes, such as to assess performance and the controls associated with the ISR process, demonstrate compliance with internal action levels, assess performance of emissions control systems, and contribute to the understanding of the potential influence of the Project on the groundwater environment. The groundwater monitoring program would demonstrate, during each Project phase, that:</p> <ul style="list-style-type: none"> • excursions are not occurring; if excursions do occur, an early warning/timely signal will be provided of when and where they are occurring such that appropriate further evaluation and actions can be undertaken; • commitments made in the EA are being achieved; and • protection of groundwater end use/receiving environment is being achieved. <p>The groundwater monitoring plan would be informed by existing local and traditional knowledge, ongoing engagement activities with interested parties, information generated by development of EIS and its supporting documents, relevant guidance, such as CSA Standard N288.7-15, Groundwater Protection Programs at Class I Nuclear Facilities and Uranium Mine and Mills as well as any applicable licenses, approvals, and permits.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) Denison would be pleased to coordinate a meeting between YNLR and the technical expert Denison utilized, Greg Newman from Newman's Geotechnique, to design the freeze wall and confirm its effectiveness for the geological and hydrogeological conditions for an ISR mine at Wheeler River. A meeting could be the most effective means for YNLR to seek information about the areas of concern with respect to the freezing technology.</p> <p>Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licencing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted that detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and</p> |
|--|--|--|--|

| | | | | |
|--|--|--|--|---|
| | | | | <p>procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps.</p> <p>Further, as an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS. Denison would like to clarify that the current rigorous groundwater modelling does not indicate there will be groundwater contamination nor health risks from the Project. The groundwater monitoring program will be robust and meet all regulatory standards for the type of mining proposed for the Project. Further, Denison would like to note that consideration of local and Traditional Knowledge in all facets of the Wheeler River Project will be guided by local and Traditional Knowledge Holders to the extent they wish to share information. As an example, Traditional Knowledge may or may not be relevant to groundwater monitoring results, but may have relevance to the considerations in the planning for such monitoring.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024)</p> <p>YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, “YNLR interprets the notion of ‘sharing’ information after its been developed as being non-collaborative and we prefer being ‘involved’ in the program/plan design and development.”</p> <p>Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. As a starting point, the EIS contains conceptual level information for various monitoring plans associated with the Project, commensurate with the requirements for an environmental assessment, the primary basis of which is informed by regulatory guidance and requirements. The conceptual monitoring plans also take into account any input received through engagement activities, where appropriate. As the Project advances into permitting and licensing, the conceptual monitoring plans evolve into detailed monitoring plans, the designs of which must adhere to Provincial and Federal regulatory requirements but can be further enhanced by the involvement of the YNLR and other Indigenous communities. Denison provided the summary of monitoring and follow-up programs (Section 16 of the EIS) to the YNLR as an outcome of the February 22, 2024 meeting, with the request to identify those items of further interest to the YNLR to enable the co-development of a path forward.</p> <p>It is Denison’s perspective that, in order to advance a meaningful process to further involve the YNLR in the development of the monitoring plans, it is necessary for Denison to understand the key areas of interest to the YNLR. This was the basis of Denison’s request whereby the YNLR identify a starting point for this exchange, based on the conceptual monitoring programs provided in the EIS. In the absence of specific feedback on the conceptual monitoring plans/programs, Denison re-iterates its commitment to providing the YNLR with the detailed monitoring plans, as developed through the permitting and licensing process, for input and collaboration as the Project advances.</p> <p>Denison respects the YNLR’s desire to seek other expertise. In any event, should the YNLR wish to meet with the qualified professional utilized to design the freeze wall, Denison would be happy to facilitate.</p> <p>Denison has offered to involve the YNLR in groundwater monitoring plans and notes that the timeline and detail for the development of these plans extends beyond the environmental assessment process. Denison remains open to the YNLR’s involvement in groundwater monitoring plans now and in the future. Further, Denison reiterates that it will continue to consider local and Traditional Knowledge in all facets of the Project to the extent holders of such knowledge wish to share information with us.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|--|--|--|--|
| 382 | YNLRO (March 4, 2023) | EIS Executive Summary, p.16 | <p>YNLR Comment March 4, 2023 Comment #14, Appendix A: Will the released radon gas be of any concern to natural resources, such as fish and wildlife?</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Inhalation pathway to terrestrial wildlife and birds was included in the Ecological Risk Assessment (EcoRA). Please refer to the draft EIS Appendix 10-A Section 5 and an excerpt is provided below for reference: Exposure pathways consider the various routes by which radionuclides and/or chemicals may enter the body of the receptor, or for radionuclides, may exert effects from outside the body. Exposures to environmental media may be direct (i.e., by contact) or indirect (i.e., via constituent transport through the food chain). For each type of ecological receptor, draft EIS Appendix 10-A Table 5-5 summarizes the relevant exposure pathways to various environmental media including air, surface water, soil, and sediment. Airborne COPCs partition to soil and plants. For most COPCs, ingestion pathways dominate over inhalation and air immersion. The latter pathways are considered minor pathways in the EcoRA, but inhalation was included in the IMPACT model and is thus included in draft EIS Appendix 10-A Table 5-5. Exposure to constituents that may deposit from air to surface water was not considered, as that pathway is considered negligible according to CSA N288.1-20. As such, a pathway of radon in air to aquatic receptors such as fish was not evaluated. Radiological dose to aquatic receptors is evaluated through water and sediment exposure, as appropriate based on the receptor's characteristics. For fish, aquatic plants, and aquatic invertebrates, contact with water and constituent uptake from water via bioaccumulation represents the main exposure pathway. Direct contact or uptake from sediment are also considered for benthic invertebrates and bottom-feeding fish.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 382. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 383 | YNLRO (March 4, 2023) | EIS Executive Summary, p.18 Land and Resource Use, p. 11- 50 to 11-52 | <p>YNLR Comment March 4, 2023 Comment #15, Appendix A: While Project water reuse is laudable, its overall conservation and management are significant concerns for YNLR, particularly the quantities removed from the ecosystem and the fate of contaminated water released back into the ecosystem from the Project that end up in Wollaston Lake. YNLR expects to be consulted/included in the design and implementation of the Project's environmental monitoring programs. Comment #85, Appendix A: YNLR remains concerned with the potential effects of Project contamination on culturally important natural resources. These concerns stem from the nature of the materials being mined, and the novel method (ISR) by which they are being extracted. Northern residents and Indigenous Peoples will be living here long after the mine is exhausted, thus effective monitoring is critical, as is the inclusion of impacted Aboriginal and Treaty rights holders in the design and implementation of arm's length, transparent, and statistically-robust monitoring programs.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) The monitoring plans are not yet drafted and therefore this is an unacceptable. response. The request is reiterated for Denison to support a collaborative approach at the concept and methodology development stage. "Monitoring plans when drafted" makes this an unacceptable response to the YNLR concern, this does not go beyond the statement in the EIS and therefore the further response here continues to be unacceptable; prior comments as to the extent of YNLR involvement in planning and execution of monitoring is reiterated.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) The specific activity of water withdrawal from Whitefish Lake was assessed in the draft EIS, Section 8.1. The conservative estimate of water withdrawal would result in a reduction of flow of about 3% at times of low flow and the lake level could change by 1cm; this minor change is beyond the ability of monitoring techniques to practically measure, and the assessment concluded that the Project would not result in a significant effect on surface water quantity (hydrology). It is noted that there will be a separate permitting process that will consider water withdrawal for Project support that will occur following the EIS. Monitoring, including of water withdrawal rates and of potential effects (e.g., change in water flow, change in lake levels) will be implemented as the Project moves forward. Denison is committed to sharing information with Indigenous Communities of Interest (COIs) in a mutually agreed-upon fashion. Overall, the approach that will be utilized with respect to Indigenous community engagement will be aligned with Denison's Indigenous Peoples Policy. Denison's Indigenous Peoples Policy commits the company to respecting Indigenous knowledge and values regarding environmental stewardship and Indigenous peoples' connection to the land. The relevant monitoring plans for the species/resources that support a traditional diet will reflect and incorporate these values and will be reflective of the Indigenous COIs priorities. The monitoring plans when drafted will include more detail about communication methods and their effectiveness would be assessed through ongoing engagement with Indigenous communities. As outlined in Denison's Indigenous Peoples Policy, Denison is committed to respecting Indigenous knowledge and values regarding environmental stewardship and Indigenous</p> |

|--|--|--|---|
| | | <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024)</p> <p>While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development.</p> | <p>peoples' connection to the land, and to minimize potential effects, wherever possible. Through continued and focussed engagement with the YNLR since the YNLR identified its interest in the Project in 2019, Denison has come to better understand the Athabasca Denesų́líné communities' relationship to the Project site and current use of the areas for traditional purposes. Denison acknowledges that the Hatchet Lake Denesų́líné First Nation has the potential for established Indigenous and Treaty Rights proximal to the Project. The Hatchet Lake Denesų́líné First Nation, as represented by the YNLR will be identified as an Indigenous COI in the revised draft EIS. Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project. Denison is committed to continual improvement in relation to such collaborative monitoring programs, in order to adapt to areas of interest which can change over time. YNLR will be informed throughout the monitoring program design and implementation process.</p> <p>A list of commitments, including specific commitment or mitigation measures related to Project effects as an outcome of engagement, made in the draft EIS, throughout the Federal information request period and the Provincial comment response period, will be included with the submission of the final EIS. For clarity, this would not include any private, confidential accommodations made under contractual agreements.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024)</p> <p>Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licencing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR's consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. As noted in the meeting, the detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps.</p> <p>Further, as an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024)</p> <p>YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, "YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development."</p> <p>Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. As a starting point, the EIS contains conceptual level information for various monitoring plans associated with the Project, commensurate with the requirements for an environmental assessment, the primary basis of which is informed by regulatory guidance and requirements. The conceptual monitoring plans also take into account any input received through engagement activities, where appropriate. As the Project advances into permitting and licensing, the conceptual monitoring plans evolve into detailed monitoring plans, the designs of which must adhere to Provincial and Federal regulatory requirements but can be further enhanced by the involvement of the YNLR and other Indigenous communities. Denison provided the summary of monitoring and follow-up programs (Section 16 of the EIS) to the YNLR as an outcome of the February 22, 2024 meeting, with the request to identify those items of further interest to the YNLR to enable the co-development of a path forward. It is Denison's perspective that, in order to advance a meaningful process to further involve the YNLR in the development of the monitoring plans, it is necessary for Denison to understand the key areas of interest to the YNLR. This was the basis of Denison's request whereby the YNLR identify a starting point for this exchange, based on the conceptual monitoring programs provided in the EIS. In the absence of specific feedback on the conceptual monitoring plans/programs, Denison re-iterates its commitment to providing the YNLR with the detailed monitoring plans, as developed through the permitting and licensing process, for input and collaboration as the Project advances.</p> |

| | | | | |
|-----|--|---------------------------------|---|---|
| 384 | YNLRO (March 4, 2023) | EIS Executive Summary, p. 26 | <p>YNLRO Comment March 4, 2023 Comments #16 and 17, Appendix A: YNLR supports Denison's corporate Indigenous Peoples Policy (IPP) and looks forward to collaborating with Denison to ensure that the Project's socioeconomic benefits reach local Indigenous People. YNLR acknowledges that Denison incorporated the YNLR report into the EIS and looks forward to further working with the company collaboratively regarding the rights of Indigenous People. YNLR is interested in an impact benefit agreement with Denison ensuring mutual benefits from the Project and co-management of environmental monitoring and mitigation.</p> <p>YNLRO Comment March 13, 2024 (Response to Denison Comment November 22, 2023) "YNLR will be informed throughout the monitoring program design and implementation process." Once again this is an unacceptable delay and does not go beyond the original statements in the EIS. Prior comments made, as to the extent of YNLR collaborative involvement, in planning and execution of monitoring is reiterated.</p> <p>YNLRO Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) As outlined in Denison's Indigenous Peoples Policy, Denison is committed to respecting Indigenous knowledge and values regarding environmental stewardship and Indigenous peoples' connection to the land, and to minimize potential effects, wherever possible. Through continued and focussed engagement with the YNLR since the YNLR identified its interest in the Project in 2019, Denison has come to better understand the Athabasca Denesųtiné communities' relationship to the Project site and current use of the areas for traditional purposes. Denison acknowledges that the Hatchet Lake Denesųtiné First Nation has the potential for established Indigenous and Treaty Rights proximal to the Project. The Hatchet Lake Denesųtiné First Nation, as represented by the YNLR will be identified as an Indigenous COI in the revised draft EIS. Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project. Denison is committed to continual improvement in relation to such collaborative monitoring programs, in order to adapt to areas of interest which can change over time. YNLR will be informed throughout the monitoring program design and implementation process. A list of commitments, including specific commitment or mitigation measures related to Project effects as an outcome of engagement, made in the draft EIS, throughout the Federal information request period and the Provincial comment response period, will be included with the submission of the final EIS. For clarity, this would not include any private, confidential accommodations made under contractual agreements.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licencing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR's consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. As noted in the meeting, the detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps. Further, as an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, "YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development." Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. As a starting point, the EIS contains conceptual level information for various monitoring plans associated with the Project, commensurate with the requirements for an environmental assessment, the primary basis of which is informed by regulatory guidance and requirements. The conceptual monitoring plans also take into account any input received through engagement activities, where appropriate. As the Project advances into permitting and licensing, the conceptual monitoring plans evolve into detailed monitoring plans, the designs of which must adhere to Provincial and Federal regulatory requirements but can be further enhanced by the involvement of the YNLR and other Indigenous communities. Denison provided the summary of monitoring and follow-up programs (Section 16 of the EIS) to the YNLR as an outcome of the February 22, 2024 meeting, with the request to identify those items of further interest to the YNLR to enable the co-development of a path forward. It is Denison's perspective that, in order to advance a meaningful process to further involve the YNLR in the development of the monitoring plans, it is necessary for Denison to understand the key areas of interest to the YNLR. This was the basis of Denison's request whereby the YNLR identify a starting point for this exchange, based on the conceptual monitoring programs provided in the EIS. | | | | | conceptual monitoring plans/programs, Denison re-iterates its commitment to providing the YNLR with the detailed monitoring plans, as developed through the permitting and licensing process, for input and collaboration as the Project advances. |
| 385 | YNLRO (March 4, 2023) | EIS Executive Summary, p. 26, 28 and 59 Land and Resource Use, p. 11- 52 and 11- 53 | <p>YNLR Comment March 4, 2023 Comments #18, 19 and 29, Appendix A:</p> <ul style="list-style-type: none"> - Indigenous People, communities, and organizations YNLR represents are rights holders, and are not to be arbitrarily grouped and treated as non-rights holders. This is an important distinction, as the rights they hold are constitutionally protected. This must be respected and recognized in the ongoing dialogue between the company and Indigenous Peoples through their chosen representatives, like YNLR. - The Athabasca Denesųtiné people are rights holders and not stakeholders with respect to the Project. These rights include full access and use of the natural resources of the area. Any proposed infringement on these rights by the Project will need to be discussed well ahead of the Project's start date. <p>Comment #86, Appendix A: The EIS minimizes effects of Lands and Waters availability and access on northern residents and Indigenous Peoples. Any impairment to the ability of Indigenous Peoples to utilize their Aboriginal and Treaty rights to the use of natural resources for their traditional activities constitutes an infringement of those constitutionally protected rights and must be justified. Rigorous examination of these impacts and negotiated compensation for these impacts should therefore be seriously considered.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Denison acknowledges the comment. In March 2019, Denison was notified by the YNLR that the Indigenous communities within the local Athabasca communities identified were interested in the Project and that YNLR held the Duty to Consult from these communities. Since receiving correspondence from the YNLR office in 2019 Denison has been collaboratively working with the YNLR office in a mutually agreed upon manner and will continue to do so. Denison's approach to identifying Indigenous COIs considered several factors as identified in Section 4.3.1 of the EIS. Being signatories of Treaty 10 was among, but not the sole applicable criteria, and not all Treaty 10 communities are considered as Indigenous COIs for the Project. Through continued and focussed engagement with the YNLR since the YNLR identified its interest in the Project in 2019, Denison has come to better understand the Athabasca Denesųtiné communities' relationship to the Project site and current use of the areas for traditional purposes. Denison acknowledges that the Hatchet Lake Denesųtiné First Nation has the potential for established Indigenous and Treaty Rights proximal to the Project. The Hatchet Lake Denesųtiné First Nation, as represented by the YNLR will be identified as an Indigenous COI in the revised draft EIS. With respect to Denison's consideration of Indigenous Knowledge shared by the Athabasca Denesųtiné knowledge sources, Denison notes that Tables 3.5-1 will be updated to better reflect where the YNLR's An Exploration of Recorded Athabasca Denesųtiné Traditional Knowledge, Land Use and Occupancy Information in the Vicinity of the Denison Mines Wheeler River Project, which was included as an Appendix to the EIS, was considered and included as Table 3.5-1 does not reflect all instances the report was utilized.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 385. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 386 | YNLRO (March 4, 2023) | EIS Executive Summary, p. 52 | <p>YNLR Comment March 4, 2023 Comments #24 and 25, Appendix A: Fish, fish habitat, and fish health are all extremely important to northern people of Saskatchewan, and especially Indigenous People. Wild fish are a culturally important source of protein and provide economic opportunities in the form of commercial fishing and recreational angling.</p> <ul style="list-style-type: none"> - YNLR will be eager to and expects to be involved in collaborating with Denison in the future monitoring of these vital natural resources. - Based on existing federal fishers legal and policy requirements, YNLR expects that all fish habitat destroyed or altered by the Project will be more than offset. | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Denison has committed to collaborating with Indigenous Communities of Interest with reserves and residential communities most proximal to the Project on specifics of environmental monitoring regimes, suited to each of their interests and needs. As part of these programs, Denison and the Communities of Interest will be sharing information in an agreed-upon fashion. Denison expects that important country foods harvested for food and cultural purposes (e.g., moose, fish, etc.), surface water quality, and other areas of interest will form parts of these monitoring programs, including other areas of potential concern as they evolve over time. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. The specific potential for need for approval(s) under the Fisheries Act related to effects on fish</p> |

|-----|--|-------------------------------------|--|---|
| | | | <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) There is no monitoring plan developed yet to substantiate Denison's determination here. YNLR continues to state its desire for collaboration in the development of monitoring analysis and assessment plans.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development.</p> | <p>and fish habitat (i.e., harmful alteration, disruption and destruction) resulting from Project activities has been assessed and presented in the draft EIS. Based on the assessment, Denison has determined that effects can be avoided and mitigated and therefore there will be no need for fish habitat offsets under the Fisheries Act.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licensing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR's consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. As noted in the meeting, the detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps.</p> <p>Further, as an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, "YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development." Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. As a starting point, the EIS contains conceptual level information for various monitoring plans associated with the Project, commensurate with the requirements for an environmental assessment, the primary basis of which is informed by regulatory guidance and requirements. The conceptual monitoring plans also take into account any input received through engagement activities, where appropriate. As the Project advances into permitting and licensing, the conceptual monitoring plans evolve into detailed monitoring plans, the designs of which must adhere to Provincial and Federal regulatory requirements but can be further enhanced by the involvement of the YNLR and other Indigenous communities. Denison provided the summary of monitoring and follow-up programs (Section 16 of the EIS) to the YNLR as an outcome of the February 22, 2024 meeting, with the request to identify those items of further interest to the YNLR to enable the co-development of a path forward. It is Denison's perspective that, in order to advance a meaningful process to further involve the YNLR in the development of the monitoring plans, it is necessary for Denison to understand the key areas of interest to the YNLR. This was the basis of Denison's request whereby the YNLR identify a starting point for this exchange, based on the conceptual monitoring programs provided in the EIS. In the absence of specific feedback on the conceptual monitoring plans/programs, Denison re-iterates its commitment to providing the YNLR with the detailed monitoring plans, as developed through the permitting and licensing process, for input and collaboration as the Project advances.</p> |
| 387 | YNLRO (March 4, 2023) | EIS Executive Summary, p. 54 and 55 | <p>YNLR Comment March 4, 2023 Comment #26, Appendix A: YNLR places a high priority on wildlife and wildlife habitat, from both ecological and sociocultural perspectives. Given the long-time frame of the Project, YNLR are concerned about the lack of significance associated with the residual and cumulative effects assessments of all ecological VCs. YNLR believes that the addition of this mine with its associated disturbances will have a cumulative effect on wildlife, especially for woodland caribou, as the area is already crisscrossed with many kilometres of seismic cut lines through the LSA, RSA and beyond (Figure 9.2-6, page 9-83, EIS and Appendix 9B). YNLR maintains <u>that in order for the Project to meaningfully attempt to mitigate this concern, the company must work with Indigenous partners to create an effective habitat offset plan for this species</u>. This should form part of any project approval. Such a plan should, for instance, include steps to restore the considerable caribou habitat degraded by past mineral exploration activities.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Through the EA process to date, Denison believes it has identified areas where offset may be required based on Project-Environment interactions. To this end, Denison has made a specific commitment to develop a Caribou Mitigation Plan (a preliminary draft of which has been submitted in response to provincial and federal EIS review comments) that includes provision for potential habitat offset. Details of the habitat offset will be developed in collaboration with Saskatchewan Ministry of Environment.</p> <p>It is also important to consider the site decommissioning plan within this context, though such restoration activities are not typically discussed as "offsets". Denison's decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure. The Project's Conceptual Decommissioning Plan (CDP) is included in the</p> |

|--|--|--|--|--|
| | | | <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) Public comment #387: The consideration of offsets in the decommissioning plan is not appropriate as a substitute for considerations of offsets in a present-day mitigation plan. Offsets are a method to address current habitat damage from the impacts of development while mitigation is underway. Offsets augment habitat requirements now and into the future. Consideration of offsets in a decommissioning plan is primarily for the damage that could not be mitigated in a preceding mitigation and management plan. YNLR reiterates its stated desire to collaborate, now, with Denison in the development of all plans for monitoring and mitigation. Notification to YNLR by Denison for plans and processes after their development is complete is not acceptable.</p> <p>Restoration of the area to pre disturbance conditions could be considered as an 'offset'. As long the DDP is done well in advance, it doesn't matter. However, the discussion for offsets should really be considered during the life of the mine, not afterwards.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) Public comment #387: While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development.</p> <p>YNLR has provided its responses on caribou offsets and other aspects of caribou restoration and mitigation planning in the responses contained in their letters of 02 February 2024 and 13 March 2024. The concerns expressed in those responses remain valid and unaddressed. YNLR did request from Denison, in their meeting of 22 Feb 2024, specific information as to where their caribou offsets are located and what was the information and methodology used to determine these offsets, however, Denison declined to provide this information. Additionally, YNLR is also on record with CNSC and Denison (see attached letters at appendix 3) that there is a divergence of opinion of the results of the YNLR and Denison Cumulative Effects analysis. Given that the results of the CE analysis is the basis for how much land, suitable for caribou, is required for offsetting: YNLR's interest in the details of Denison's caribou offset plan is a valid concern (see Appendix 3 for a review of YNLR's GIS based Method for Assessing Cumulative Environmental Effects). Respecting preliminary decommissioning plans: decommissioning plans are based on the extent to which restoration and offsetting are carried out prior to decommissioning, therefore while their receipt from Denison is appreciated any conclusions that can be determined from this plan is incomplete without the former requested information on offset plans. Therefore, YNLR concerns stated in their comments remain valid and unaddressed.</p> | <p>draft EIS. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP.</p> <p>Denison will continue to engage with YNLR on topics of interest.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) Public comment #387: Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licencing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR's consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. As noted in the meeting, the detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps. As an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS.</p> <p>YNLR has shared comments with respect to Woodland Caribou offsets, including those related to the definition of offsets, timing, and mitigation measures as part of present-day mitigation measures for the Project, and should be applied in advance of decommissioning. YNLR has also requested to see the predecommissioning monitoring plan for containment releases. As an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided a document titled Summary of Monitoring, which outlines the Project's commitments for monitoring programs for all phases of the Project from preconstruction to post decommissioning. Details of monitoring will be developed prior to, and applicable for each phase of the Project, including decommissioning. Denison has also provided YNLR with the Preliminary Decommissioning Plan, of which Denison offers to include YNLR in discussions as more details are developed for the Preliminary Decommissioning Plan. Denison has also provided YNLR with the Draft Caribou Management Framework, which outlines mitigation and restorative measures within the Provincial government framework. Denison welcomed feedback on the Draft Caribou Management Framework and remains open and willing to receive additional feedback.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, "YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development."</p> <p>Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. | 389 | YNLRO (March 4, 2023) | EIS Executive Summary, p. 59 | <p>YNLR Comment March 4, 2023 Comment #28, Appendix A: While the overall direct footprint of the Project is relatively small, YNLR maintains that any wildlife habitat destroyed or altered by the Project should be more than offset or compensated for in some fashion. One example would be the additional disturbance created by the proposed Highway 914 extension. This needs to be accounted for by Denison.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) See above stated comments on CE, WLC and offsets.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment April 05, 2024) While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development. YNLR has provided its responses on caribou offsets and other aspects of caribou restoration and mitigation planning in the responses contained in their letters of 02 February 2024 and 13 March 2024. The concerns expressed in those responses remain valid and unaddressed. YNLR did request from Denison, in their meeting of 22 Feb 2024, specific information as to where their caribou offsets are located and what was the information and methodology used to determine these offsets, however, Denison declined to provide this information. Additionally, YNLR is also on record with CNSC and Denison (see attached letters at appendix 3) that there is a divergence of opinion of the results of the YNLR and Denison Cumulative Effects analysis. Given that the results of the CE analysis is the basis for how much land, suitable for caribou, is required for offsetting: YNLR's interest in the details of Denison's caribou offset plan is a valid concern (see Appendix 3 for a review of YNLR's GIS based Method for Assessing Cumulative Environmental Effects). Respecting preliminary decommissioning plans: decommissioning plans are based on the extent to which restoration and offsetting are carried out prior to decommissioning, therefore while their receipt from Denison is appreciated any conclusions that can be determined from this plan is incomplete without the former requested information on offset plans. Therefore, YNLR concerns stated in their comments remain valid and unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) To be clear, Denison's proposed Project does not require any extension to the existing Highway 914. There is a Highway 914 extension project under evaluation by the Ministry of Highways, but this project is not related to or ancillary to the Wheeler River Project. As noted in response to other comments, through the EA process to date, Denison believes it has identified areas where offset may be required based on Project-Environment interactions. To this end, Denison has made a specific commitment to develop a Caribou Mitigation Plan (a preliminary draft of which has been submitted in response to provincial and federal EIS review comments) that includes provision for potential habitat offset. Details of the habitat offset will be developed in collaboration with Saskatchewan Ministry of Environment. It is also important to consider the site decommissioning plan within this context, though such restoration activities are not typically discussed as "offsets". Denison's decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP. No other specific needs for "offset" have been identified based on the effects assessment.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licensing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR's consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. As noted in the meeting, the detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps. As an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS. YNLR has shared comments with respect to Woodland Caribou offsets, including those related to the definition of offsets, timing, and mitigation measures as part of present-day mitigation measures for the Project, and should be applied in advance of decommissioning. YNLR has also requested to see the predecommissioning monitoring plan for containment releases. As an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided a document titled Summary of Monitoring, which outlines the Project's commitments for monitoring programs for all phases of the Project from preconstruction to post decommissioning. Details of monitoring will be developed prior to, and applicable for each phase of the Project, including decommissioning. Denison has also provided YNLR with the Preliminary Decommissioning Plan, of which Denison offers to include YNLR in discussions as more details are developed for the Preliminary Decommissioning Plan. Denison has also provided YNLR with the Draft Caribou Management Framework, which outlines mitigation and restorative measures within the Provincial government framework. Denison welcomed feedback on the Draft Caribou Management Framework and remains open and willing to receive additional feedback.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, "YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development." Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. As a starting point, the</p> |
|-----|--|---------------------------------|--|---|

| | | | | |
|-----|--|--|---|--|
| | | | | <p>EIS contains conceptual level information for various monitoring plans associated with the Project, commensurate with the requirements for an environmental assessment, the primary basis of which is informed by regulatory guidance and requirements. The conceptual monitoring plans also take into account any input received through engagement activities, where appropriate. As the Project advances into permitting and licensing, the conceptual monitoring plans evolve into detailed monitoring plans, the designs of which must adhere to Provincial and Federal regulatory requirements but can be further enhanced by the involvement of the YNLR and other Indigenous communities. Denison provided the summary of monitoring and follow-up programs (Section 16 of the EIS) to the YNLR as an outcome of the February 22, 2024 meeting, with the request to identify those items of further interest to the YNLR to enable the co-development of a path forward.</p> <p>It is Denison's perspective that, in order to advance a meaningful process to further involve the YNLR in the development of the monitoring plans, it is necessary for Denison to understand the key areas of interest to the YNLR. This was the basis of Denison's request whereby the YNLR identify a starting point for this exchange, based on the conceptual monitoring programs provided in the EIS. In the absence of specific feedback on the conceptual monitoring plans/programs, Denison re-iterates its commitment to providing the YNLR with the detailed monitoring plans, as developed through the permitting and licensing process, for input and collaboration as the Project advances.</p> <p>Denison is committed to the development of a caribou mitigation and offsetting plan for the Project. This plan will be developed ahead of construction and independent of the development of the Project's detailed decommissioning plan.</p> <p>Denison provided the YNLR with a draft Caribou Management Framework which outlines mitigation and restorative measures within the Provincial Government framework. Denison continues to remain open to feedback from the YNLR on the draft Caribou Management Framework. Further, Denison's previous offer to involve the YNLR in discussions with respect to the development of the decommissioning plans still stands. Decommissioning plans at this stage are conceptual as outlined in the EIS and will continue to be refined through each phase of the Project as it progresses.</p> |
| 390 | YNLRO (March 4, 2023) | EIS Executive Summary Monitoring Programs, p. 74 | <p>YNLR Comment March 4, 2023 Comment #30, Appendix A: YNLR expects to be included as part of the design and implementation of all monitoring programs. All such programs should be transparent, arm's length, include significant involvement and participation of Indigenous People, communities, and organizations and be statistically robust.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) See comments above on YNLR collaboration in the development and implementation of monitoring plans. YNLR needs a general statement concerning requested collaboration in management and monitoring plans.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Denison has committed to collaborating with Indigenous Communities of Interest with reserves and residential communities most proximal to the Project on specifics of environmental monitoring regimes, suited to each of their interests and needs. As part of these programs, Denison and the Communities of Interest will be sharing information in an agreed-upon fashion. Denison expects that important country foods harvested for food and cultural purposes (e.g., moose, fish, etc.), surface water quality, and other areas of interest will form parts of these monitoring programs, including other areas of potential concern as they evolve over time. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project.</p> <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." The monitoring and follow-up program will include measurement of water quality parameters to meet regulatory criteria (i.e., provincial discharge permits, Metal and Diamond Mining Effluent Regulations [MDMER; Government of Canada 2022] and CSA N288.4-19 (CSA Group 2019). At a minimum, this will include collection of non-radiological parameters (e.g., metals, nutrients, hardness, temperature, pH, TDS, TSS, and sulphate) and radiological parameters.</p> <p>Denison has committed to collaborating with Indigenous Communities of Interest with reserves and residential communities most proximal to the Project on specifics of environmental monitoring regimes, suited to each of their interests and needs. As part of these programs, Denison and the Communities of Interest will be sharing information in an agreed-upon fashion. YNLR will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: programs will confirm the effectiveness of mitigation measures and predictions made in the assessment, programs will be implemented in an adaptive management framework (if/where applicable) to reduce effects during the lifetime of the Project, and programs will have spatial</p> |

| | | | | |
|--|--|--|--|--|
| | | | | <p>boundaries that are sufficiently extensive to measure EIS predictions. Additionally, regulators will be involved with setting specific requirements for follow-up and monitoring, as well as reporting, through licence conditions (CNSC) and provincial approvals. A number of monitoring and reporting requirements will be generated through the completion of the environmental assessment process. Denison and its lifecycle regulators will be in regular communication throughout the life of the Project as part of routine reporting, site inspections, licence and permit renewals. Denison is committed to ongoing engagement with regulators and recognizes that this will include information sharing related to follow-up and monitoring results and any needed adaptive management plans. It is also noted for further reference that there are existing, non-Denison monitoring programs such as the CNSC's Independent Environmental Monitoring Program (https://nuclearsafety.gc.ca/eng/resources/maps-of-nuclear-facilities/iemp/index.cfm), and the Eastern Athabasca Regional Monitoring Program (www.earmp.ca/). Results from these programs provide relevant information and can complement Denison's Project-specific monitoring program. One forum for discussion of monitoring results is the Northern Saskatchewan Environmental Quality Committee (https://www.saskatchewan.ca/residents/first-nations-citizens/saskatchewan-first-nationsmetis-and-northern-initiatives/northern-Saskatchewan-environmental-quality-committee).</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licencing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR's consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. As noted in the meeting, the detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps. Further, as an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, "YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development."</p> <p>Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. As a starting point, the EIS contains conceptual level information for various monitoring plans associated with the Project, commensurate with the requirements for an environmental assessment, the primary basis of which is informed by regulatory guidance and requirements. The conceptual monitoring plans also take into account any input received through engagement activities, where appropriate. As the Project advances into permitting and licensing, the conceptual monitoring plans evolve into detailed monitoring plans, the designs of which must adhere to Provincial and Federal regulatory requirements but can be further enhanced by the involvement of the YNLR and other Indigenous communities. Denison provided the summary of monitoring and follow-up programs (Section 16 of the EIS) to the YNLR as an outcome of the February 22, 2024 meeting, with the request to identify those items of further interest to the YNLR to enable the co-development of a path forward.</p> <p>It is Denison's perspective that, in order to advance a meaningful process to further involve the YNLR in the development of the monitoring plans, it is necessary for Denison to understand the key areas of interest to the YNLR. This was the basis of Denison's request whereby the YNLR</p> |

| | | | | identify a starting point for this exchange, based on the conceptual monitoring programs provided in the EIS. In the absence of specific feedback on the conceptual monitoring plans/programs, Denison re-iterates its commitment to providing the YNLR with the detailed monitoring plans, as developed through the permitting and licensing process, for input and collaboration as the Project advances. |
| 391 | YNLRO (March 4, 2023) | EIS Executive Summary, p. 76 | <p>YNLR Comment March 4, 2023 Comment #31, Appendix A: The EIS states: “On the basis of the Project information and related evaluation and assessment of effects, Denison believes that the Project can be constructed, operated, and decommissioned in a manner that is not likely to cause significant adverse effects to the biophysical or human environments.” This is perhaps an overly optimistic conclusion. However, YNLR is willing to discuss how the company moves forward and is interested in creating more formal processes to achieve this, such as the signing of an impact benefit agreement.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) This is not an open comment or invitation by Denison to address this concern with any process, commitment, or funding. Further to this; there is no indication in the response that Denison even accepts the YNLR comment hence this issue, raised in the original comments to Denison's EIS remains unresolved.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) No further response provided by YNLR as per letter dated June 19, 2024.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Denison notes YNLR's perspective on this.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) Denison and YNLR have collaborated on an appropriate process in relation to the identified comment made by YNLR and both parties are actively working together in this respect.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) No further response from YNLR as per in letter dated June 19, 2024. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> |
| 392 | YNLRO (March 4, 2023) | Section 1.0 Project Introduction and Overview, p. 1-1, 1-5 and 1-18 | <p>YNLR Comment March 4, 2023 Comments #32 and 33, Appendix A: The Project is located within Nuhenéné and of principal concern to YNLR is that the Project be fully sustainable with respect to cultural rights and traditions, socioeconomic equity, and environmental protection. To achieve this end, YNLR expects Denison to work collaboratively with the people of Nuhenéné through the YNLR office. YNLR supports the sustainable mining of uranium within Nuhenéné.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Denison notes YNLR's perspective on this. In March 2019, Denison was notified by the YNLR that the Indigenous communities within the local Athabasca communities identified were interested in the Project and that YNLR held the Duty to Consult from these communities. Since receiving correspondence from the YNLR office in 2019 Denison has been collaboratively working with the Nuhenéné through the YNLR office in a mutually agreed upon manner and will continue to do so.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 392. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 393 | YNLRO (March 4, 2023) | Section 8.0 Aquatic Environment, p. 8.-38 | <p>YNLR Comment March 4, 2023 Comment #34, Appendix A: The EIS recognized that the utilization of water will result in an adverse impact on the drainage but dismissed the issue given that a reduction in the stream flow rate is expected to be less than 3%. It would therefore be prudent to closely monitor the flow regime to identify possible adverse effects throughout the life of the Project.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) This comment by Denison is encouraging in that it accepts YNLR's concern for a monitoring requirement. However, it does nothing to address YNLR's position that is must be</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) In the draft EIS, conservative estimate of water taking would result in a reduction of flow of about 3% at times of low flow and the lake level could change by 1cm. While this incrementally small change in water quantity is beyond the ability of monitoring techniques to practically measure, Denison will conduct hydrological monitoring. Monitoring will likely include streamflow and lake level monitoring as well as continuous monitoring with stage dataloggers with details of monitoring plans to be finalized to support Project permitting and licensing.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024)</p> |

| | | | | |
|-----|--|---|---|---|
| | | | <p>collaboratively involved in all plans' development and implementation.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development.</p> | <p>Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licencing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR's consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. As noted in the meeting, the detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps.</p> <p>Further, as an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, "YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development." Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. As a starting point, the EIS contains conceptual level information for various monitoring plans associated with the Project, commensurate with the requirements for an environmental assessment, the primary basis of which is informed by regulatory guidance and requirements. The conceptual monitoring plans also take into account any input received through engagement activities, where appropriate. As the Project advances into permitting and licensing, the conceptual monitoring plans evolve into detailed monitoring plans, the designs of which must adhere to Provincial and Federal regulatory requirements but can be further enhanced by the involvement of the YNLR and other Indigenous communities. Denison provided the summary of monitoring and follow-up programs (Section 16 of the EIS) to the YNLR as an outcome of the February 22, 2024 meeting, with the request to identify those items of further interest to the YNLR to enable the co-development of a path forward. It is Denison's perspective that, in order to advance a meaningful process to further involve the YNLR in the development of the monitoring plans, it is necessary for Denison to understand the key areas of interest to the YNLR. This was the basis of Denison's request whereby the YNLR identify a starting point for this exchange, based on the conceptual monitoring programs provided in the EIS. In the absence of specific feedback on the conceptual monitoring plans/programs, Denison re-iterates its commitment to providing the YNLR with the detailed monitoring plans, as developed through the permitting and licensing process, for input and collaboration as the Project advances.</p> |
| 394 | YNLRO (March 4, 2023) | Section 8.0 Aquatic Environment, p. 8-40, 8-42, 8-98 and 8-99 | <p>YNLR Comment March 4, 2023 Comment #35, Appendix A: Utilizing the extent of the LSA and the fact that it does not overlap with projects located within the same drainage system seems to be quite arbitrary and convenient. By this criterion, each mine does not trigger a cumulative effect according to the EIS, although they are all additive to the water flow regime. This methodology then arbitrarily and conveniently determines that "mitigation measures" for each of the mines is not warranted since there was a determination of no cumulative effects in sections 8.1.7.1, 8.1.7.2, 8.1.7.3 and 8.1.7.4.</p> <p>Comment #36, Appendix A: The determination of Cumulative Effects Characterization and the resultant Determination of Significance is highly subjective, therefore a much more extensive monitoring program is required. Such a program should start prior to the construction phase and carry on at least several years into the operation portion of the Project to at least demonstrate local and cumulative effects of mining projects within the watershed.</p> <p>Comment #37, Appendix A: YNLR agrees that the hydrological monitoring program remain throughout the life of the Project but as per the above, the study should have a much broader</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) In terms of watersheds and nearby uranium operations, only Key Lake Operation's drainage area interacts with the Wheeler River Project. Drainages from both operations would combine at Russell Lake. As such, the Key Lake Operation was included as an existing project in the CEA sections of the aquatic environment. The drainages associated with McArthur River Operation and Cigar Lake Operation are separate from the Project. The RSA is the area that surrounds and includes the LSA, and was established to assess the potential, largely indirect effects of the Project, as well as other activities, in a regional context. The RSA is large enough to capture the extent of potential effects (i.e., zone of influence) on a VC and defines the area within which cumulative effects may occur (i.e., cumulative effects assessment boundary). The RSA for the Surface Water Quality VC is bounded by the regional watershed area in which the Project Area is located. The RSA for this assessment is based on the whole watershed within which the Project is located and extends downstream to include Russell Lake (refer to draft EIS Figure 8.2-3). Given the very low magnitude of predicted changes in water quantity in the LSA (in the draft EIS, conservative estimate of water taking would result in a reduction of flow of about 3% at times of low flow and the lake level could change by 1cm), it would not be measurable further downstream into the RSA. The CEA considers whether residual adverse effects of the Project on a given VC will overlap</p> |

| | | | | |
|--|--|--|---|---|
| | | | <p>mandate in order to measure local and regional effects on VCs.</p> <p>Comment #41, Appendix A: YNLR is concerned that the conclusion that the residual effects from Project operations will not have an adverse effect on surface water is highly speculative. Again, this indicates the need for a comprehensive monitoring program to validate the speculation on water quality with rigorous statistical evidence.</p> <p>Comment #42, Appendix A: YNLR questions the logic track that states, “additional mitigation measures not warranted” because of the determination of no cumulative effects, then “a determination of significance is not warranted” as no cumulative effects were identified for water quality because surface water impacts are expected to remain localized...for all the mining operations in the region. Impacts on water quality and mitigation measures “not warranted” should be demonstrated through field studies and research rather than relying on a theoretical modelling approach.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) These comments do not address the YNLR’s original concern (the residual effects from Project operations will not have an adverse effect on surface water is highly speculative) and the above stated requests for collaboration at the conceptual and methodological stages of monitoring development are reiterated.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) While encouraging, this still does not address YNLR’s concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison’s EIS and revised EIS YNLR, has been consistent in their request to be “involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed”. Denison has been consistent in their responses “to share further information about plans as they are developed”. The Denison response, explicitly, does not address YNLR’s concerns stated in YNLR’s letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of ‘sharing’ information after its been developed as being non-collaborative and we prefer being ‘involved’ in the program/plan design and development.</p> | <p>spatially and/or temporally with the same residual adverse effects on the VC resulting from other past, present, and reasonably foreseeable projects or activities. The CEA follows standard methodology as per provincial (e.g., Guidelines for an Environmental Assessment) and federal guidance (e.g., Assessing Cumulative Environmental Effects under the Canadian Environmental Assessment Act, 2012).</p> <p>Cumulative effects assessment is important to Indigenous communities in general because incremental effects to the environment can weaken resource economies, affect important resources such as plants, fish, and wildlife, affect rights-based and cultural activities, and affect both the health of wildlife and humans. Indigenous perspectives can be complementary to the CEA for the Project, and Denison acknowledges the important relationship of the Indigenous Communities of Interest to the lands and waters. The Indigenous Communities of Interest of ERFN and the Kineepik Métis Local #9 at Pinehouse (KML) have shared their Indigenous Knowledge on past, present, and predicted cumulative effects through the following:</p> <ul style="list-style-type: none"> • Wheeler River Project – Summary of Health and Socio-Economic Study Results (ERFN and SVS 2022a); • Wheeler River Project - Summary of Traditional Knowledge Study Results (ERFN and SVS 2022b); • Kineepik Valued Ecosystem Components – KML Pre-statement for Denison EIS (KML and NVP 2022); and • Response to the Environment Impact Assessment For the proposed Ministry of Highways 914 Extension Project (KML and Limnos Environmental 2022). <p>These perspectives on cumulative effects have been summarized in Section 3.4.8 of Section 3. Denison and the Communities of Interest agreed on the high value of this contribution being part of the EIS.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licencing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR’s consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. As noted in the meeting, the detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps.</p> <p>Further, as an outcome of a meeting between Denison and YNLR on February 22, 2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, “YNLR interprets the notion of ‘sharing’ information after its been developed as being non-collaborative and we prefer being ‘involved’ in the program/plan design and development.”</p> <p>Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. As a starting point, the EIS contains conceptual level information for various monitoring plans associated with the Project, commensurate with the requirements for an environmental assessment, the primary basis of which is informed by regulatory guidance and requirements. The conceptual monitoring plans also take into account any input received through engagement activities, where appropriate. As the Project advances into permitting and licensing, the conceptual monitoring plans evolve into detailed monitoring plans, the designs of which must adhere to Provincial and Federal regulatory requirements but can be further enhanced by the involvement of the YNLR and other Indigenous communities. Denison provided the summary of monitoring and follow-up programs (Section 16 of the EIS) to the YNLR as an outcome of the February 22, 2024 meeting, with the request to identify those items of further interest to the YNLR to enable the co-development of a path forward.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|--|---|---|--|
| | | | | It is Denison's perspective that, in order to advance a meaningful process to further involve the YNLR in the development of the monitoring plans, it is necessary for Denison to understand the key areas of interest to the YNLR. This was the basis of Denison's request whereby the YNLR identify a starting point for this exchange, based on the conceptual monitoring programs provided in the EIS. In the absence of specific feedback on the conceptual monitoring plans/programs, Denison re-iterates its commitment to providing the YNLR with the detailed monitoring plans, as developed through the permitting and licensing process, for input and collaboration as the Project advances. |
| 395 | YNLRO (March 4, 2023) | Section 8.0 Aquatic Environment, p. 8-92, 8-93 and 8-96 | <p>YNLR Comment March 4, 2023 Comment #40, Appendix A: There are several comments in the EIS that recognize the potential for a negative effect on water quality from the site water management system into Whitefish Lake. Statements taken from residents have identified concerns about the release of elements such as "mercury" because of the mining activity. While the report recognized that detectable concentrations of mercury will not be produced, the local comment should be considered as a proxy for a variety of contaminants such as selenium, arsenic, cobalt, zinc, etc., as well as the concern expressed by residents, rather than being taken literally as mercury as the only contaminant of concern. YNLR reiterates that concerns about water quality are warranted given that the EIS indicates that there will be a continuous (year-round) average discharge of water from the mine site of more than 36,000 litres/hour for the entire life of the Project. This discharge will be especially evident during low flow periods.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) The comment from YNLR references text in Section 8.2 of the draft EIS which is the water quality assessment. Please refer to draft EIS Section 8.1 for the water quantity assessment and information on potential changes in water flow. Denison acknowledges the concern raised by YNLR and believes the water quality assessment, including the assessment of potential water quality effects on ecological and human health, presented in the EIS and supporting documentation is robust and supports the conclusions drawn. With regard to YNLR's concerns around contaminants in treated effluent, we refer YNLR to Appendix 10-A Environmental Risk Assessment (ERA) for Wheeler River. The ERA predicts and assesses the risk to representative human and ecological receptors resulting from exposure to radiological and non-radiological substances expected to be released throughout the Project Phases. The ERA encompasses a human health risk assessment (HHRA) and an ecological risk assessment (EcoRA), which have been prepared to be compliant with Canadian Standards Association Group (CSA) N288.6-12 Environmental Risk Assessments for Class I Nuclear Facilities and Uranium Mines and Mills (CSA, 2012). It also meets the requirements for an ERA outlined in Section 4.1 of Regulatory Document 2.9.1, Environmental Principles, Assessments and Protection Measures (CNSC, 2020). The ERA has been developed with current science and current regulatory attitudes in mind. The predicted radiological and non-radiological to human and ecological receptors demonstrate that the Project can be conducted in a manner that is protective of human and ecological health.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 395. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR</p> |
| | | | | As a result of the continued technical review until October 2024, Denison has included a commitment to assess health risks from local fish consumption by comparing fish tissue data collected during operation from the monitoring program against Health Canada's mercury guideline. |

| | | | | |
|-----|--|---|---|--|
| 396 | YNLRO (March 4, 2023) | Section 8.0 Aquatic Environment, p. 8-102 | <p>YNLR Comment March 4, 2023 Comment #43, Appendix A: While appreciating current water quality standards, YNLR suggests that monitoring programs be designed to more than meet regulatory requirements of the license conditions. The EIS recognizes that the Project area lies primarily within an undisturbed area of the boreal forest (aside from the extent of seismic activity carried out within this area). YNLR would like to be involved in specific follow-up and monitoring plans as identified in the EIS.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) See comments above on YNLR collaboration in the development and implementation of monitoring plans. YNLR needs a general statement concerning requested collaboration in management and monitoring plans.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Denison has committed to collaborating with Indigenous Communities of Interest with reserves and residential communities most proximal to the Project on specifics of environmental monitoring regimes, suited to each of their interests and needs. As part of these programs, Denison and the Communities of Interest will be sharing information in an agreed-upon fashion. Denison expects that important country foods harvested for food and cultural purposes (e.g., moose, fish, etc.), surface water quality, and other areas of interest will form parts of these monitoring programs, including other areas of potential concern as they evolve over time. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project.</p> <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." The monitoring and follow-up program will include measurement of water quality parameters to meet regulatory criteria (i.e., provincial discharge permits, Metal and Diamond Mining Effluent Regulations [MDMER; Government of Canada 2022] and CSA N288.4-19 (CSA Group 2019). At a minimum, this will include collection of non-radiological parameters (e.g., metals, nutrients, hardness, temperature, pH, TDS, TSS, and sulphate) and radiological parameters.</p> <p>Denison has committed to collaborating with Indigenous Communities of Interest with reserves and residential communities most proximal to the Project on specifics of environmental monitoring regimes, suited to each of their interests and needs. As part of these programs, Denison and the Communities of Interest will be sharing information in an agreed-upon fashion. YNLR will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: programs will confirm the effectiveness of mitigation measures and predictions made in the assessment, programs will be implemented in an adaptive management framework (if/where applicable) to reduce effects during the lifetime of the Project, and programs will have spatial boundaries that are sufficiently extensive to measure EIS predictions. Additionally, regulators will be involved with setting specific requirements for follow-up and monitoring, as well as reporting, through licence conditions (CNSC) and provincial approvals. A number of monitoring and reporting requirements will be generated through the completion of the environmental assessment process. Denison and its lifecycle regulators will be in regular communication throughout the life of the Project as part of routine reporting, site inspections, licence and permit renewals. Denison is committed to ongoing engagement with regulators and recognizes that this will include information sharing related to follow-up and monitoring results and any needed adaptive management plans. It is also noted for further reference that there are existing, non-Denison monitoring programs such as the CNSC's Independent Environmental Monitoring Program (https://nuclearsafety.gc.ca/eng/resources/maps-of-nuclear-facilities/iemp/index.cfm), and the Eastern Athabasca Regional Monitoring Program (www.earmp.ca/). Results from these programs provide relevant information and can complement Denison's Project-specific monitoring program. One forum for discussion of monitoring results is the Northern Saskatchewan Environmental Quality Committee (https://www.saskatchewan.ca/residents/first-nations-citizens/saskatchewan-first-nationsmetis-and-northern-initiatives/northern-saskatchewan-environmental-quality-committee).</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licencing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR's consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. As noted in the meeting, the detailed monitoring plans are not yet developed given the stage of the Project in the regulatory process. Given the number of plans and procedures to be developed it would be helpful for Denison and YNLR to work together to establish a process for next steps. Further, as an outcome of a meeting between Denison and YNLR on February 22,</p> |
|-----|--|---|---|--|

| | | | | |
|-----|--|---|--|--|
| | | | | <p>2024, Denison provided YNLR a document from the draft Wheeler River Environmental Impact Statement (EIS) titled Summary of Monitoring. The document outlines the conceptual monitoring program for all stages of the Project and how they tie to each Valued Component assessed in the EIS.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) YNLR expressed the desire to be involved in the program design and development of all monitoring and other plans at a conceptual level when experimental design and methodologies are being deployed, stating that, “YNLR interprets the notion of ‘sharing’ information after its been developed as being non-collaborative and we prefer being ‘involved’ in the program/plan design and development.”</p> <p>Denison feels it is important to clarify the processes related to the development of various monitoring programs for the Project and the manner in which involvement can occur with interested Indigenous nations, such as those represented by the YNLR. As a starting point, the EIS contains conceptual level information for various monitoring plans associated with the Project, commensurate with the requirements for an environmental assessment, the primary basis of which is informed by regulatory guidance and requirements. The conceptual monitoring plans also take into account any input received through engagement activities, where appropriate. As the Project advances into permitting and licensing, the conceptual monitoring plans evolve into detailed monitoring plans, the designs of which must adhere to Provincial and Federal regulatory requirements but can be further enhanced by the involvement of the YNLR and other Indigenous communities. Denison provided the summary of monitoring and follow-up programs (Section 16 of the EIS) to the YNLR as an outcome of the February 22, 2024 meeting, with the request to identify those items of further interest to the YNLR to enable the co-development of a path forward.</p> <p>It is Denison’s perspective that, in order to advance a meaningful process to further involve the YNLR in the development of the monitoring plans, it is necessary for Denison to understand the key areas of interest to the YNLR. This was the basis of Denison’s request whereby the YNLR identify a starting point for this exchange, based on the conceptual monitoring programs provided in the EIS. In the absence of specific feedback on the conceptual monitoring plans/programs, Denison re-iterates its commitment to providing the YNLR with the detailed monitoring plans, as developed through the permitting and licensing process, for input and collaboration as the Project advances.</p> |
| 397 | YNLRO (March 4, 2023) | Section 8.0 Aquatic Environment Fish and Fish habitat, p. 8-117, 8-140, 8-141, 8-153, 8-252 and 11-50 | <p>YNLR Comment March 4, 2023 Comment #44, 45, 46, 49, 52 and 84, Appendix A: It is noted that the aquatic survey and fish sampling were carried out in 2016, which is now somewhat dated. It is also noted that work that would affect fish and fish habitat could/should only be carried out between July 16 and September 30th, as both spring and fall spawning species were collected in the fish sample.</p> <p>YNLR acknowledges that the amount of fish habitat directly affected by the Project is small. However, a much bigger concern is the indirect effects of increased human activity in the area over several decades and beyond, particularly with respect to the consequent increase in fish harvest. This will directly affect the ability of Indigenous Peoples to exercise their Aboriginal and Treaty rights.</p> <p>Related comments:</p> <ul style="list-style-type: none"> - YNLR would be eager to see how “a fish salvage plan to relocate fish prior to in-water works” might be carried out? Such an approach may not be practicable or effective. - While the sentiment of the above fish management strategy is laudable, it is not practical in terms of preserving fish numbers given the increased human access to the lakes that the mining activity will create. - The EIS does recognize the value of sucker species to residents, which is a positive step, as these fish species are netted for a variety of purposes. Increased local traffic will also undoubtedly provide more access for both subsistence and recreational fishing. As part of the mitigation measures YNLR proposes working with authorities to regulate recreational fishing prior to the onset of the construction phase of the Project and revisiting these regulations at | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) The response to the review comment are organized by theme, consistent with the comment. Fish salvage: Details of a fish salvage program, if required, will be developed to support Project permitting and licensing. Briefly, for any in-water work, the work area would be isolated from rest of the waterbody. Any fish remaining inside the isolated work area would be captured and relocated outside of the work area. Based on the experience of Denison and its SME team it is noted that such programs are implemented successfully on a routine basis with effective and site-specific planning.</p> <p>Indirect effects related to increased human activity in the area: Please note that the Project will not change public access to the area. The existing gate on Highway 914 near Cameco’s Key Lake Operation will remain in place and no changes to the gate and the process for controlling access to Highway 914 north of the Key Lake Operation are proposed as part of the Wheeler River Project. The proposed operation is fly-in, so Project related traffic to the area would only be related to deliveries of materials to and from the site. On-site staff will not have access to personal (or company) vehicles and will largely be “confined” to the camp and work areas during their shifts. Section 11 of the draft EIS provides the assessment of potential Project effects on Indigenous Land and Resource Use (Section 11.1) and Other Land and Resource Use (Section 11.2). The mitigation measures proposed in the aquatic and terrestrial assessments translated into undetectable changes in resource availability to existing and future users and rightsholders. Recreational fishing: As described in the draft EIS and as noted above, workforce members will be transported to/from site via a fly-in/fly-out rotation and will, therefore, not use ground travel options during shift changes, which will eliminate fishing on local lakes during commutes to/from the site and during time off work. Denison site vehicles will not be available for recreational purposes. While at the Project site and off duty, workers may opt to fish local</p> |

| | | | |
|--|--|--|---|
| | | <p>intervals throughout the mine's operation and decommissioning.</p> <ul style="list-style-type: none"> - YNLR disagrees with the assumptions used (Section 8.3.7.2 to 8.3.7.5), which "assume" specific monitoring and follow-up for Fish and Fish Habitat related to cumulative effects is not warranted. - YNLR would like to be involved in designing and carrying out of a monitoring program, which would test the "no cumulative effect" assumption. - YNLR would like to be involved in a monitoring program for fish health. Further, this monitoring program should continue for the life of the Project or until it is demonstrated that the current filtering programs are effective. <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) YNLR looks forward to the details on how this collaboration will be conducted.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) While encouraging, this still does not address YNLR's concerns as stated in their responses in their letters of 02 February 2024 and 13 March 2024. From the beginning, of their review of Denison's EIS and revised EIS YNLR, has been consistent in their request to be "involved in all monitoring and other plans at a conceptual level when experimental design and methodologies are being developed". Denison has been consistent in their responses "to share further information about plans as they are developed". The Denison response, explicitly, does not address YNLR's concerns stated in YNLR's letters of 02 February 2024 and 13 March 2024. Hence these concerns remain. YNLR interprets the notion of 'sharing' information after its been developed as being non-collaborative and we prefer being 'involved' in the program/plan design and development.</p> | <p>waterbodies. To protect sustainable use of resources, only catch and release of fish will be encouraged, and fish storage or cooking facilities will not be provided. To prevent entry of land users from entering the Project Area, Denison will control access to the property with both a north and south security gate. Overall, given a lack of resources to access fishing locations and store fish harvests, workforce fishing is expected to cause minimal disturbances to local users. Monitoring: In the draft EIS, Denison outlines its plans to conduct fish health monitoring in tandem with surface water quality, sediment quality, benthic invertebrate and fish and fish habitat sampling. Sampling locations will be co-located to facilitate comparison to water quality and sediment quality characteristics. Denison has committed to collaborating with Indigenous Communities of Interest with reserves and residential communities most proximal to the Project on specifics of environmental monitoring regimes, suited to each of their interests and needs. As part of these programs, Denison and the Communities of Interest will be sharing information in an agreed-upon fashion. YNLR will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: programs will meet regulatory requirements, programs will confirm the effectiveness of mitigation measures and predictions made in the assessment, programs will be implemented in an adaptive management framework (if/where applicable) to reduce effects during the lifetime of the Project, and programs will have spatial boundaries are sufficiently extensive to measure EIS predictions. Denison is committed to maintaining positive relations with all local interested parties and will be open to discussions on any issues or concerns that arise.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) Denison is committed to working with YNLR to share information about monitoring plans as they are developed through the permitting and licencing process. In a meeting between YNLR and Denison on February 22, 2024, it was noted by YNLR's consultants that the areas of immediate interest to YNLR are surface and groundwater, aquatics, wildlife, and Woodland Caribou monitoring. | 398 | YNLRO (March 4, 2023) | Section 8.0 Aquatic Environment, p. 8-151 | <p>YNLR Comment March 4, 2023 Comment #47, Appendix A: The statement on page 8-151 recognizes that the discharge of treated effluent during the Operation and Decommissioning phase may interact with Cameco's current releases contributing to cumulative effects.</p> <p>It is recommended that a study be undertaken to assess the basin effect of water discharges.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) The requested information is presented in draft EIS Section 8.2.7 Cumulative Effects (surface water quality). The summary referenced in the YNLR comment is made in Section 8.3 Fish and Fish Habitat. Specific monitoring and follow-up plans for the Surface Water Quality VC will be prepared to refine and finalize the approach and specific metrics following consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC-specific program.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 398. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 399 | YNLRO (March 4, 2023) | Section 8.0 Aquatic Environment, p. 8-152 | <p>YNLR Comment March 4, 2023 Comment #48, Appendix A: Sediment quality of Whitefish Lake and downstream is not "anticipated" to overlap with the Key Lake Operation.</p> <p>It would be prudent to test this hypothesis to ensure that water quality in the flowage is maintained given the high value placed on these waters by residents.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Any changes in sediment quality would be preceded by changes in surface water quality. Should the surface water quality monitoring program identify changes beyond those predicted in the EIS, adaptive management measures would be implemented and may include monitoring of sediment quality further downstream in the watershed. In addition, the Environmental Effects Monitoring (EEM) program under the Diamond Mining and Effluent Regulations will provide a framework for monitoring changes in the aquatic environment.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 399. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |

| 400 | YNLRO (March 4, 2023) | Section 8.0 Aquatic Environment, p. 8-232 | <p>YNLR Comment March 4, 2023 Comment #51, Appendix A: Water management during construction indicates that there is to be no planned discharge to Whitefish Lake. If a release of water from the mine site becomes necessary, in addition to monitoring suspended solid levels, there should be a communication plan to inform area residents of the pending release and its duration.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) During Construction, no effluent is expected to be released to the aquatic environment. Contact water stored in the Clean Waste Rock Pond during Construction will be held onsite until the Industrial Wastewater Treatment Plant (IWWTP) is commissioned. At that time the water from the pond would be conveyed to the IWWTP, treated, and released to Whitefish Lake per permit / license requirements. The sequencing of Construction activities will occur in a logical manner based on Project execution plans. For example, construction of the wellfield runoff pond will be prioritized during the early part of Construction, and it will be able to hold 38,200 m3 of water. This will provide contingency and additional water storage capacity if contact water produced exceeds estimates or the volume available in the Clean Waste Rock Pond. Other secondary contingency measures are also available should the volume of water requiring management exceed site infrastructure storage volume. Depending on the situation and volume of water needing management, this could include for example use a hydrovac for offsite disposal. Alternatively, in the instance that there is a planned release of water during construction, this would be permitted by Saskatchewan Ministry of Environment. In accordance with our Indigenous Peoples Policy, Denison is committed to collaborating with Indigenous peoples and communities to build long-term, respectful, trusting, and mutually beneficial relationships. Denison has identified key objectives respecting Indigenous engagement associated with the Project:</p> <ul style="list-style-type: none"> • Build and maintain authentic relationships based on a foundation of trust, good faith, and transparency. • Create a respectful dialogue process that promotes communication and collaboration among Denison and Indigenous communities, in a timely and accurate fashion. • Understand how the proposed development of the Project may affect the interests of Indigenous peoples (including Indigenous and/or Treaty Rights), and work with Indigenous peoples to avoid, mitigate, or otherwise address effects, while also collaborating to maximize potential positive effects. <p>In addition, Denison is required to have a Public Information Disclosure Protocol as set out by the CNSC. This would include any notification to the wider public of unplanned discharges.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 400. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 401 | YNLRO (March 4, 2023) | Section 9.0 Terrestrial Environment Fig 9. 2-6, p. 9-83 | <p>YNLR Comment March 4, 2023 Comment #53, Appendix A: YNLR is concerned about the potential residual and cumulative effects of the extensive seismic network on the soils of the RSA and LSA. Were these and other potential network effects considered in the analyses?</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Through the EA process to date, Denison believes it has identified areas where offset may be required based on Project-Environment interactions. To this end, Denison has made a specific commitment to develop a Caribou Mitigation Plan (a preliminary draft of which has been submitted in response to provincial and federal EIS review comments) that includes provision for potential habitat offset. Details of the habitat offset will be developed in collaboration with Saskatchewan Ministry of Environment.</p> <p>It is also important to consider the site decommissioning plan within this context, though such restoration activities are not typically discussed as "offsets". Denison's decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support</p> |

| 408 | YNLRO (March 4, 2023) | Section 9.0 Terrestrial Environment, p. 9-275, 9-280, 9-300, Section 11.0 Land and Resource Use, p. 11-46 and 11- | <p>YNLRO Comment March 4, 2023</p> <p>Comment #61, 62, 82, 83, Appendix A: The EIS correctly highlights the cultural importance of moose and woodland caribou to Indigenous People, which underscores YNLR's concerns regarding the conclusions of the residual and cumulative effects assessments of these species, particularly for caribou.</p> <p>YNLRO questions the optimistic conclusions drawn by Denison regarding the ongoing availability of woodland caribou for traditional use.</p> <ul style="list-style-type: none"> - The buffered direct habitat loss alone eliminates the LSA and RSA for caribou habitation for decades to come (Appendix 9B), so how can it 'sustain the regional woodland caribou population' in any way? - The reference to 'proven' mitigation measures is rather vague and requires further explanation. - YNLR is unaware of these proven mitigation measures, other than isolation from human disturbance. <p>YNLRO disagrees with this overall residual effects conclusion for these wildlife VCs, especially in regard to woodland caribou (Appendix 9B), for the following reasons:</p> <p>(i) Comment #64, Appendix A: In addition, the reason why SK1 holds one of the very few sustainable caribou populations despite a high level of forest fire, is because of currently very low levels of human intrusion, which suggests that the provincial and federal approval processes, BMPs, and mitigation measures have not been sufficient in the rest of the species' range throughout the entirety of Canada.</p> <p>(ii) Comment #83, Appendix A: Woodland caribou populations have strongly declined across Canada despite all types of project mitigation, so YNLR doubts that similar mitigation efforts will be effective here. A woodland caribou 'management' plan is not sufficient. YNLR believes that, at a minimum, Denison should commit to an aggressive caribou habitat offset plan before work on the Project begins. In addition, it is unclear what constitutes this proposed mitigation. A caribou management plan is proposed (Section 9), however nothing short of a full caribou habitat offset plan will suffice to sustain the region's population. Offset activities should include the ongoing restoration of the existing seismic lines, among other things. This work is best accomplished in consultation and collaboration with Indigenous People, their communities, and organizations.</p> <p>YNLRO Comment March 13, 2024 (Response to Denison Comment November 22, 2023)</p> <p>No further response provided by YNLR.</p> <p>YNLRO Comment June 19, 2024 (Response to Denison Comment on April 05, 2024)</p> <p>YNLRO Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023)</p> <p>Through the EA process to date, Denison believes it has identified areas where offset may be required based on Project-Environment interactions. To this end, Denison has made a specific commitment to develop a Caribou Mitigation Plan (a preliminary draft of which has been submitted in response to provincial and federal EIS review comments) that includes provision for potential habitat offset. Details of the habitat offset will be developed in collaboration with Saskatchewan Ministry of Environment.</p> <p>It is also important to consider the site decommissioning plan within this context, though such restoration activities are not typically discussed as "offsets". Denison's decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP.</p> <p>Denison will continue to engage with YNLR on topics of interest.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024)</p> <p>No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024)</p> <p>There have been no further comments from the YNLR on EIS reference no. 408. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 409 | YNLRO (March 4, 2023) | Section 9.0 Terrestrial Environment, p. 9-280, 9-287 and 9-302 | <p>YNLRO Comment March 4, 2023</p> <p>Comment #62, 63, 64, 66, 67 and 68, Appendix A: Past and future direct and indirect effects of seismic line clearing appear to have been ignored in this assessment (Appendix 9B). The fact that most caribou sightings occurred away from seismically disturbed areas independent of habitat type supports this observation.</p> <p>YNLRO disagrees with this overall residual effects conclusion for these wildlife VCs, especially in regard to woodland caribou (Appendix 9B), for the following reasons:</p> <ul style="list-style-type: none"> - Comment # 63 and 64, Appendix A: The extent of past seismic line cutting is very high for both the LSA and RSA. However, direct and indirect (edge) effects on wildlife, especially woodland caribou, seem to have been overlooked or minimized. Future exploration disturbance should have been estimated and included based on the rate of historic disturbance if nothing else. - Comment #67, Appendix A: Most of these mitigation measures (listed on p. 9-308) are quite superficial and would contribute little to the long-term conservation of wildlife in the RSA and LSA. The proposed caribou management plan needs to be a fully developed Caribou Habitat Offset Plan given the extent of already altered habitat by seismic activities. Also note that this has a high potential for a direct impact on Aboriginal and Treaty rights. More, some Indigenous | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023)</p> <p>Through the EA process to date, Denison believes it has identified areas where offset may be required based on Project-Environment interactions. To this end, Denison has made a specific commitment to develop a Caribou Mitigation Plan (a preliminary draft of which has been submitted in response to provincial and federal EIS review comments) that includes provision for potential habitat offset. |-----|--|---|---|---|
| 411 | YNLRO (March 4, 2023) | Section 9.0 Terrestrial Environment | <p>YNLNR Comment March 4, 2023</p> <p>Comment #68, Appendix A: Section 9.3.9 of the draft EIS indicates that with the implementation of the above (and additional) mitigation measures, the residual effects on the Ungulates, Furbearer, and Woodland Caribou VCs were assessed as follows:</p> <ul style="list-style-type: none"> - Moose. Not significant: the residual effects of alteration and/or loss of available habitat and of change in mortality are not expected to result in a change that will alter habitat integrity to the point where it would not be able to sustain the regional ungulate populations or the integrity of the regional moose population to the point where it could not be sustained. - Furbearers. Not significant: the residual effects of alteration and/or loss of available habitat and of change in mortality are not expected to result in a change that will alter habitat integrity to the point where it would not be able to sustain the regional furbearer populations or the integrity of the regional furbearer populations to the point where they could not be sustained. - Woodland caribou. Not significant: the residual effects of alteration and/or loss of available habitat and of change in mortality are not expected to result in a change that will alter habitat integrity to the point where it would not be able to sustain the regional woodland caribou population or the integrity of the regional woodland caribou population to the point where they could not be sustained. <p>YNLNR believes this summary to be overly optimistic and somewhat inaccurate for the following reasons:</p> <ul style="list-style-type: none"> - The RSA and LSA are too small relative to the home range of woodland caribou to serve as a basis for assessing residual and cumulative effects on the species. - Large portions of the RSA and LSA have been badly degraded by mineral exploration activities (particularly by line-cutting for seismic surveys; Appendix 9B), yet their direct and indirect (edge) impacts seem not to have been considered in the effects assessments. This is puzzling given the known impact that these features have on wildlife, especially caribou, wolverine, other predators, and many avian species. The EIS maps themselves clearly show an avoidance of these seismically-disturbed areas by woodland caribou. <p>YNLNR strongly believes that, at a minimum, an aggressive Caribou Habitat Offset Plan should be co-developed before Project work begins, and regular monitoring of the caribou population be conducted throughout the life of the Project.</p> <p>YNLNR Comment March 13, 2024 (Response to Denison Comment November 22, 2023)</p> <p>No further response provided by YNLNR.</p> <p>YNLNR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024)</p> <p>YNLNR Response: YNLNR does not know what Denison means by the phrase 'deemed complete.' YNLNR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLNR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLNR Comment March 4, 2023)</p> <p>Through the EA process to date, Denison believes it has identified areas where offset may be required based on Project-Environment interactions. To this end, Denison has made a specific commitment to develop a Caribou Mitigation Plan (a preliminary draft of which has been submitted in response to provincial and federal EIS review comments) that includes provision for potential habitat offset. Details of the habitat offset will be developed in collaboration with Saskatchewan Ministry of Environment.</p> <p>It is also important to consider the site decommissioning plan within this context, though such restoration activities are not typically discussed as "offsets". Denison's decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS. The details of decommissioning and restoration will be refined over time as the Project proceeds. As the YNLNR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLNR.</p> |
| 412 | YNLRO (March 4, 2023) | Section 9.0 Terrestrial Environment, p. 9-320, 9-384, 9-389, 9-408, 9-413, 9-414, 9-454, 9-457, 9-460, 9-465, 9-469 Section 11.0 Land and Resource Use | <p>YNLNR Comment March 4, 2023</p> <p>Comment #69, Appendix A: in Section 9.4 of the EIS lists Raptors, Migratory Breeding Birds and Bird Species at Risk together (p. 9-320).</p> <p>YNLNR questions how and why these three avian VCs were selected and grouped.</p> <p>The three VCs include dozens of breeding bird species with hugely varying habitat requirements, so it is difficult to see how it is possible to accurately predict Project effects for many of these species, especially when so many are lumped together in only one Migratory Breeding Birds VC. In addition, the scarcity of raptors and avian species at risk makes them poor candidates for effects assessments because of low sample sizes.</p> <p>Comment #72 and 73, Appendix A: With only two water-based species selected to represent all forest raptors in the Project area, the results and conclusions of this assessment are extremely limited. For the forest birds in particular, this is compounded by the non-inclusion of the historic network of seismic cut lines across the landscape (Appendix 9B), and the resulting underestimation of direct and edge effects.</p> | <p>Denison Response November 22, 2023 (Response to YNLNR Comment March 4, 2023)</p> <p>An EIS requires scoping in order to determine the appropriate content for the assessment and focus the EIS on key areas of concern and relevance. As per standard, accepted EA practice, the EA was organized by and focused on VCs. The VCs are aspects of the biophysical and human environments that will likely be affected (adversely or positively) by the Project. The VCs reflect identified scientific, local knowledge and Indigenous knowledge, and community interests regarding the Project and its potential effects and are typically identified early in the EA process as a result of questions and concerns raised through engagement with government departments and agencies, Indigenous and community groups, and the general public. Key Indicators are an important component or aspect of the VC that is expected to be affected (changed) as a result of the Project. The KIs may comprise subsets or a guild of the VC, certain aspects of the VC that may be affected by the Project and/or which have a particular importance. The three avian VCs (with Key Indicators in brackets) were: Raptors (bald eagle and osprey), Migratory Breeding Birds (waterbirds and waterfowl, upland game birds, and migratory songbirds), and Bird Species at Risk (common nighthawk, short-eared owl, yellow rail, rusty blackbird, and olive-sided flycatcher). The residual effects evaluation was completed on the Key Indicator species. The rationale for selecting these avian Key Indicators is available in Section 9.4.1.2. For instance, the inclusion of Species At Risk birds is a requirement of the Species at Risk Act and the CNSC's</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|--|--|---|--|
| | | | <p>Comment #74, Appendix A: Species at risk generally make very poor indicators of ecological integrity/biodiversity because of their relative scarcity. In fact, three of the VC bird species at risk selected were not even detected during the Project surveys. This very low quantity and data quality greatly weakens any conclusions regarding the Project residual effects.</p> <p>Comment # 75, Appendix A: YNLR cannot find any mention of the extensive seismic line network impacts (Appendix 9B) included in the effects assessment for birds. This was also the case for the caribou and wildlife assessments.</p> <p>Comment #76 and 77: Appendix A: The selection of weak indicators and the ad hoc grouping of dissimilar species make these predictions quite unreliable. This potential error is likely compounded by the apparent exclusion of the direct and indirect effects of the existing seismic cutline network (Appendix 9B). Concern about these extensive network of seismic cut lines were also raised by Indigenous People at several places in the EIS.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>REGDOC 2.9.1 also notes that applicants should identify all biological species at risk in the area; the avian Species at Risk were not included in the EIS to be indicators of ecological integrity/biodiversity.</p> <p>The avian effects assessment was habitat based. The assessment methods used a conservative approach with the assumption that, following the implementation of site-specific mitigation measures, the proposed Project activities would have a residual effect on these species' guilds regardless of species presence on site. As described in the EIS, pre-construction surveys will be conducted prior to the commencement of any vegetation clearing or soil disturbance. Avian species will also be routinely monitored throughout the life of the Project. Results from the surveys and monitoring activities are expected to inform the adaptive management process to update Project design and identify the need for additional mitigation measures, if required. Denison is of the professional opinion that the data presented, and analysis provided in the avian assessment of the draft EIS is sufficient given 1) the local / regional environment, 2) the level of interaction of the Project with birds that is expected, and 3) because bird densities are not expected to be limited by habitat regionally.</p> <p>The Wheeler River Project Environmental Impact Statement - Denison's Response to Woodland Caribou Habitat Comments discusses how existing cutlines were considered in avian assessments. All past anthropogenic disturbances (which includes cutlines to support mineral exploration) were considered in the terrestrial environment assessments. These human disturbances were mapped and considered/addressed appropriately in Section 9 including the Existing Environment, Residual Effects Characterization, and Cumulative Effects Assessment sections, as they relate to Terrain, Soil and Organic Matter/Peat (Section 9.1); Vegetation and Ecosystems, Listed Plant Species and Wetlands (Section 9.2); Ungulates, Furbearers and Woodland Caribou (Section 9.3); Raptors, Migratory Breeding Birds, and Bird Species at Risk (Section 9.4). The cutlines were classified as previously disturbed and considered as low-quality habitat or no habitat, depending on the species being assessed and their habitat requirements. An anthropogenic layer is included on draft EIS, Figure 9.2-6, which includes geophysical cutlines. Please note that anthropogenic features were mapped at IKONOS 1:5,000. This anthropogenic layer is not listed under available habitat types for any of the wildlife or avian VCs in subsequent assessments (e.g., Figures 9.3-9 to 9.3-14, Figures 9.4-8 to 9.4-11, Figures 9.4-13 to 9.4-15) except for Common Nighthawk (Figure 9.4-12), which is a species that is known to use anthropogenic features.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 412. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 413 | YNLRO (March 4, 2023) | Section 9.0 Terrestrial Environment, p. 9- 356 and 9-357 | <p>YNLR Comment March 4, 2023</p> <p>Comment #71, Appendix A: The EIS states: "<i>In this assessment, alteration of habitat is defined as indirect habitat alteration where suitable habitat for the Raptors, Migratory Breeding Birds, and Bird Species at Risk VCs and their associated KIs remains physically intact but is rendered less suitable or unsuitable for their use. Sources of habitat alteration include Project-related habitat fragmentation (i.e., the breaking apart of continuous habitat into smaller, spatially distinct patches), edge effects (i.e., the influence of recently cleared areas on adjacent habitats), and sensory disturbance.</i>" (Page 9-356, EIS)</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Please refer to the Wheeler River Project Environmental Impact Statement - Denison's Response to Woodland Caribou Habitat Comments for a discussion of how existing cutlines were considered in avian assessments. All past anthropogenic disturbances (which includes cutlines to support mineral exploration) were considered in the terrestrial environment assessments. These human disturbances were mapped and considered/addressed appropriately in Section 9 including the Existing Environment, Residual Effects Characterization, and Cumulative Effects Assessment sections, as they relate to Terrain, Soil and Organic Matter/Peat (Section 9.1); Vegetation and Ecosystems, Listed Plant Species and Wetlands</p> |

| | | | | |
|-----|--|-------------------------------------|--|--|
| | | | <p><i>"A minimum patch size is often required to fulfill all required life requisites (Robbins et al. 1989, Askins 1994, Vance et al. 2003, Butcher et al. 2010). When available suitable habitat is below a minimum patch size threshold, individual birds may get displaced despite the continued presence of suitable habitat. As a result, patch size at the individual and population level may have a species-specific effect on habitat use and could affect reproductive success, health, and survival (Askins 1994, Villard et al. 1999, Vance et al. 2003, Suorsa et al. 2004, Butcher et al. 2010)."</i> (Page 9-357, EIS)</p> <p><i>"Edge effects include the influence of recently cleared areas on adjacent intact habitats. Gradients of light intensity, temperature, wind, relative humidity, as well as snow accumulation and melt may occur along the border between cleared areas and intact habitats (Bannerman 1998, Kremsater and Bunnell 1999), which could alter habitat suitability for avian use. Bannerman (1998) suggested that the richness and density of generalist bird species may increase along forest edges based on the variety of vegetation and abundance of food (e.g., American Crow and Blue Jay. However, numbers of habitat specialist species (e.g., Red-breasted Nuthatch and Pileated Woodpecker may decrease near edges because they use edge habitats less frequently or avoid them (George and Dobkin 2002). The potential influx of individuals into edge habitats, or the potential displacement of individuals into other areas, may increase crowding and subsequent inter-and intra-specific competition for breeding habitat, food, and other resources (Hagan et al. 1996, Schmiegelow et al. 1997, Bannerman 1998, George and Dobkin 2002, Calizza et al. 2017)."</i> (Page 9-357, EIS)</p> <p>The above descriptions summarize the potential effects of the Project on breeding bird habitats. When wooded landscapes are subjected to widespread seismic activity, the same effects occur: continuous parcels of forest are divided by miles of cut lines, resulting in smaller habitat patches and greater habitat edge. As a result, bird species that prefer contiguous habitats are declining, while birds that prefer habitat edges are increasing.</p> <p>How will the EIS address already existing direct and indirect impacts of these historic seismic linear disturbances across the LSA and RSA (Appendix 9B) that were ignored.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>(Section 9.2); Ungulates, Furbearers and Woodland Caribou (Section 9.3); Raptors, Migratory Breeding Birds, and Bird Species at Risk (Section 9.4). The cutlines were classified as previously disturbed and considered as low-quality habitat or no habitat, depending on the species being assessed and their habitat requirements. An anthropogenic layer is included on draft EIS, Figure 9.2-6, which includes geophysical cutlines. Please note that anthropogenic features were mapped at IKONOS 1:5,000. This anthropogenic layer is not listed under available habitat types for any of the wildlife or avian VCs in subsequent assessments (e.g., Figures 9.3-9 to 9.3-14, Figures 9.4-8 to 9.4-11, Figures 9.4-13 to 9.4-15) except for Common Nighthawk (Figure 9.4-12), which is a species that is known to use anthropogenic features.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 413. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 414 | YNLRO (March 4, 2023) | Section 9.0 Terrestrial Environment | <p>YNLR Comment March 4, 2023 Comment #78, Appendix A: Why were amphibians excluded as a VC/KI? Bats? Both were surveyed (Appendix 9B).</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Subsequent to filing the draft EIS, Denison has developed a new Species at Risk appendix to Section 9 which will be included in the final EIS and has been included in the response to YNLR (a new SAR appendix (new Appendix 9-D) will be added to Section 9 of the final EIS. It has been included here as Attachment IR-131). This new EIS appendix lists all SAR species potentially occurring in the Project study areas, with links to applicable and appropriate mitigation measures described in the draft EIS. The new appendix also includes a summary of the life history requirements, the expected Project effects, proposed mitigation measures, and anticipated residual effects on bats and amphibians.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 414. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Wheeler River Project Draft EIS

| | | | | |
|-----|--|--|--|--|
| 417 | YNLRO (March 4, 2023) | Section 11.0 Land and Resource Use, p. 11-50, 11-57, 11-58, 11-79, 11-138 and 11-139 | <p>YNLR Comment March 4, 2023</p> <p>Comment #84, 87, 88 and 89, Appendix A: The EIS notes that “The presence of the Project workforce will increase the numbers of people in the ILRU LSA by an estimated 300 during Construction and 180 during Operation and Decommissioning.” (p. 11-57)</p> <p>YNLR notes that:</p> <ul style="list-style-type: none"> - This is a significant increase in the number and persistence of humans in the area, and despite these vague reassurances, YNLR believes that this increase will affect the ability of Indigenous Peoples to exercise their Aboriginal and Treaty rights and increase the pressures on the natural resources of the area. - YNLR believes that Denison provides an overly optimistic conclusion regarding the impacts of the Project on traditional resource use by Indigenous peoples. - One indicator of increased human activity is truck traffic. However, these numbers do not include non-truck traffic. How will Denison address this? <p>As with the impacts on the traditional use of land and natural resources by Aboriginal and Treaty rights holders, the human presence in the region is going to increase, which in turn will put additional pressures on fish and wildlife resources.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023)</p> <p>No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024)</p> <p>YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023)</p> <p>Section 12.3.3.2.1 of the EIS describes how access north of the Key Lake gatehouse for employees of northern mines, Indigenous resource harvesters from select communities, cabin owners, and lease owners provides for controlled access to users. Further, Denison staff will not be allowed to hunt or fish. Denison expects to continue to work with Indigenous COI to share information about the proposed impacts of the Project in relation to the potential to adversely impact the exercise of hunting, fishing, trapping and the carrying out of traditional uses as a result of the Project. Information in this respect will be provided as an update to the EIS. Further mitigations identified in Section 12 include:</p> <ul style="list-style-type: none"> • Air transportation will be used to transport most workers between the Project site and designated pick-up and drop-off points in communities. Pick-up points will be located at two locally central points in communities within the LSA, one additional site in northern Saskatchewan, and potentially other locations to minimize time spent away from families. • Denison's Environment, Health, Safety, and Sustainability Policy will be enforced. • Liaison with LSA communities and relevant authorities (e.g., RCMP, health and service providers) will continue. • Culturally sensitive employment policies that support the Indigenous workforce will be implemented (e.g., having an Elder representative at the Project site to provide cultural programming) <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024)</p> <p>No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024)</p> <p>There have been no further comments from the YNLR on EIS reference no. 417. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 418 | YNLRO (March 4, 2023) | Appendix 16-A Summary of Residual Effects, p. 1 | <p>YNLR Comment March 4, 2023</p> <p>Comment #90, Appendix A: There are about three dozen Valued Component/Key Indicators that are assessed for the significance of residual effects (effects that remain after mitigation) from the Project. They include sediment quality, benthic invertebrates, fish and fish habitat, fish health, terrain, soil, organic matter, vegetation abundance, listed plant species, wetlands, ungulates (moose), furbearers (wolverine, pine marten, mink, muskrat), woodland caribou, raptors (bald eagle, osprey), migratory breeding birds (water birds and waterfowl, upland game birds, migratory songbirds), avian species at risk (5), human health and safety, Indigenous land and resource use, other land and resource use, heritage resources, traditional diet, community well-being (income and cohesion), traffic, infrastructure & services, and economics.</p> <p><u>The residual effects of the Project on all of these VCs/Kis are concluded to be non-significant in the EIS.</u></p> <p>YNLR questions this overly optimistic and statistically unlikely prediction. For example, the sheer number of fish and wildlife species that the few selected VC/Kis represent would suggest that some will be adversely affected, even if by chance alone. The assessment effectively states that the Project is advantageous and/or neutral to all biophysical and human values, which YNLR rejects. If the Project proceeds, YNLR will want to be closely associated with all project monitoring programs.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023)</p> <p>No further response provided by YNLR.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023)</p> <p>The draft EIS carefully evaluated the residual adverse effects remaining on VCs and KIs following implementation of mitigation measures. The EIS conservatively identifies where change from existing conditions are expected for each VC or KI, and assesses this change (i.e., the residual effect) for significance. For instance, the wildlife and avian assessments concluded that the residual effects of the Project are not expected to result in a change to the viability and persistence of the VCs and associated KIs and were, therefore, predicted to be not significant. As the review comment correctly notes residual effects identified in the EIS were deemed to be not significant - that is, the level of effect (change) did not meet the threshold of significance as defined for the VC. The EIS also discusses the certainty (and uncertainty) of the conclusions drawn by the assessment. Each VC or KI is evaluated independently and based on specific Project-environment interactions and VC-specific mitigations. Denison is confident that the conclusions drawn in the EIS with respect to potential effects and their significance are supported by the analysis presented.</p> <p>Details of follow-up and monitoring plans will be prepared in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies. YNLR will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: programs will meet regulatory requirements, programs will confirm the effectiveness of mitigation measures and predictions made in the assessment, programs will be implemented in an adaptive management framework (if/where applicable) to reduce effects during the lifetime of the Project, and programs will have spatial boundaries that are sufficiently extensive to measure EIS predictions.</p> |

Wheeler River Project Draft EIS

| | | | | |
|-----|--|--|---|---|
| | | | <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 418. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 419 | YNLRO (March 4, 2023) | Appendix 16-A Summary of Cumulative Effects | <p>YNLR Comment March 4, 2023 Comment #91, Appendix A: There are about three dozen Valued Component/Key Indicators that are assessed for the significance of cumulative effects (effects that remain after mitigation) from the Project. These include air quality, noise, terrain morphology and stability, groundwater quantity and quality, surface water quality and quantity, soil quantity and quality, organic matter, sediment quality, benthic invertebrates, fish and fish habitat, fish health, vegetation abundance, listed plant species, wetlands, moose, furbearers, woodland caribou, raptors, migratory breeding birds, avian species at risk, human health, Indigenous land and resource use, other land and resource use, heritage resources, traditional diet, income of workers, community cohesion, traffic, community infrastructure and services, and economics.</p> <p>As with the summary of the residual effects, <u>the cumulative effects of the Project on all of these VCs/Kis are concluded to be non-significant in the EIS.</u></p> <p>Again, YNLR believes this to be an overly optimistic and statistically unlikely prediction for the same reasons as given above, for example, inadequate spatial boundaries, poorly chosen and grouped VCs and Kis, the apparent omission of the existing linear disturbance network in the effects assessments, and the largely qualitative nature of the assessments and their resultant 'significance.'</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Please refer to the response to YNLR comments #418. Additionally, Denison notes that there are a number of review comments that have a similar theme. Rather than repeating the same narrative in this table Denison has developed an inclusive technical memo to provide a more coherent and complete response, the Wheeler River Project Environmental Impact Statement - Denison's Response to Woodland Caribou Habitat Comments. See attached.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 419. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 420 | YNLRO (March 4, 2023) | Executive Summary Monitoring and Follow- Up Programs | <p>YNLR Comment March 4, 2023 Comment #92, Appendix A: YNLR believes there is a lot of uncertainty remaining from this EIS. This stems from several items, including the relatively novel nature of the ISR methodology with its potential effects on water quality and fish health, to the questionable conclusion that the mine will be neutral with respect to the persistence of woodland caribou in the region.</p> <p>If the mine is to be approved, YNLR wants a transparent, independent, statistically robust monitoring program implemented for the life of the Project and beyond. YNLR expects northern Indigenous Peoples to be involved in the design and implementation of such a program.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.'</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Details of follow-up and monitoring plans will be prepared in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies. YNLR will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: programs will meet regulatory requirements, programs will confirm the effectiveness of mitigation measures and predictions made in the assessment, programs will be implemented in an adaptive management framework (if/where applicable) to reduce effects during the lifetime of the Project, and programs will have spatial boundaries are sufficiently extensive to measure EIS predictions. Additionally, Denison has identified key objectives respecting Indigenous engagement associated with the Project:</p> <ul style="list-style-type: none"> • Build and maintain authentic relationships based on a foundation of trust, good faith, and transparency. • Create a respectful dialogue process that promotes communication and collaboration among Denison and Indigenous communities, in a timely and accurate fashion. • Understand how the proposed development of the Project may affect the interests of Indigenous peoples (including Indigenous and/or Treaty Rights), and work with Indigenous |

|-----|--|--|--|---|
| 423 | YNLRO (March 4, 2023) | Section 1.0 Project Introduction and Overview, p. 1-5 and 4-12 | <p>YNLR Comment March 4, 2023 Comment #3, Appendix B: There YNLR notes that the Hatchet Lake Denesų́łíné First Nation, an Athabasca Denesų́łíné community, is the closest to the Project. The Wheeler River EIS seems to rely on road distance rather than physical proximity.</p> <p>Road distance should not be utilized to determine community importance or impacts since not all travel methods require continuous roads. Travel to this part of our traditional territory is typically achieved cross country rather than by road.</p> <p>Comment #13, Appendix B: YNLR notes that Hatchet Lake First Nation is located 150 km...Black Lake First Nation is located 180 km...and Fond du Lac First Nation is located 230 km away from the Project as recognised on page 4-47 of the draft EIS. Our community members generally access the Project area via overland routes rather than the established Provincial Road network.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Thank you for the information.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 423. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 424 | YNLRO (March 4, 2023) | Section 1.0 Project Introduction and Overview, p. 1-4 and 1-7 | <p>YNLR Comment March 4, 2023 Comment #4 and 5, Appendix B: Athabasca Denesų́łíné land uses include, but are not limited to, large and small game harvesting, gathering activities, and fishing, all of which are of key cultural importance.</p> <p>It is important to note that the Hatchet Lake Denesų́łíné First Nation and the community of Wollaston Post are situated at Wollaston Lake and given their downstream location there is potential for negative impacts.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Potential effects from the Project on surface water quality were comprehensively assessed in Section 8.2 of the draft EIS. The assessment evaluated discharge of treated effluent from the site using predictive modeling. Water treatment will be conducted in the onsite Industrial Waste Water Treatment Plant (IWWTP) and treated effluent will be tested prior to release to Whitefish Lake. Treated effluent that does not meet the effluent discharge criteria in the provincial approval to operate or effluent criteria defined in the Metal and Diamond Mining Effluent Regulations will not be released to Whitefish Lake and will be recirculated to the process water pond for eventual re-treatment in the IWWTP. In the draft EIS, Section 8.2 the predictive modeling showed that constituent concentrations including radionuclides would be below water quality objectives for the protection of aquatic life (i.e., no effects would be expected) at the outlet of Whitefish Lake. The outlet of Whitefish Lake is well upstream of the inflow of Iceland River to Russell Lake. Since no effects on surface water quality are expected to occur in the lake closest to the Project, no effects would accrue in areas further downstream in the watershed, where contributing sub watersheds are many, many-times the size of the sub watersheds near the Project site. As such, there will be no effects on surface water quality in Wollaston Lake from the Project activities.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 424. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |

| 425 | YNLRO (March 4, 2023) | Section 3.0 Value of IK in EA Practice, p. 3-5 | <p>YNLR Comment March 4, 2023 Comment #7, Appendix B: YNLR notes that while the wording for EIS Page 3-5, first paragraph, is an improvement from the May 2021 draft, it does not make clear that no Wheeler River site specific Athabasca Denesųtine knowledge or land use studies were undertaken and that the information presented is from a variety of other projects with differing objectives and study areas. The issue is better captured/described in the EIS on page 11-39.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Acknowledged, updated language will be included in the EIS.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 425. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 426 | YNLRO (March 4, 2023) | Section 3.0 Value of IK in EA Practice, p. 3-10 | <p>YNLR Comment March 4, 2023 Comment #8, Appendix B: YNLR notes that there appears to be grammatical errors for page 3-10, last paragraph of the EIS.</p> <p>YNLR requests edits to: "Ya'thi Néné Lands and Resources, the point of contact for and representative of the Athabasca Denesųtine communities of Black Lake, Fond du Lac, and Hatchet Lake Denesųtine First Nations, as well as the northern hamlets/settlements of Stony Rapids, Wollaston Lake, Uranium City, and CamsellPortage, provided their report: <u>An Exploration of Recorded Athabasca Denesųtine Traditional Knowledge, Land Use and Occupancy Information in the Vicinity of Denison Mines Wheeler River Project</u>, that summarized traditional knowledge and land use and occupancy information collected for various other projects and initiatives and partially documented Athabasca Denesųtine use in the Project area, although it is not considered as a site-specific study."</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Acknowledged, edit will be made to the EIS.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 426. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 427 | YNLRO (March 4, 2023) | Section 3.0 Value of IK in EA Practice, various pages | <p>YNLR Comment March 4, 2023 Comment #9, 10, 12, 15, 16, 17, 19 and 35, Appendix B: YNLR notes that as the Athabasca Denesųtine were not considered to be an Indigenous COI, the opportunities to contribute to our knowledge to this discussion were diminished or lost.</p> <p>Comment #19, Appendix B: The mis-categorization as the Athabasca Denesųtine am Indigenous Community rather than as an Indigenous COI is a step backwards rather than forwards with regards to reconciliation. A letter to Denison dated July 29, 2022, YNLR critiqued the designations of COI and IC as being artificial and marginalizing. Denison responded October 28, 2022, after the submission of Wheeler River EIS with an alternative view.</p> <p>Other related comments include:</p> <ul style="list-style-type: none"> - Comment #9, Appendix B: Only 4 of 31 aspects influenced (from EIS Table 3.5-1) for Indigenous knowledge and 3 of 37 aspects influenced (from EIS Table 3.5-2) for local knowledge were taken from Athabasca Denesųtine knowledge sources. How will Denison address this? - Comment #10, Appendix B: YNLR notes that the Athabasca Denesųtine communities should be considered an Indigenous COI per Denison's definition (EIS page 4-vii) as they are/have: o signatories of Treaty 10 and Athabasca Denesųtine traditional territory is within the Project | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Denison's approach to identifying Indigenous COIs considered several factors as identified in Section 4.3.1 of the EIS. Being signatories of Treaty 10 was among, but not the sole applicable criteria, and not all Treaty 10 communities are considered as Indigenous COIs for the Project. Through continued and focussed engagement with the YNLR since the YNLR identified its interest in the Project in 2019, Denison has come to better understand the Athabasca Denesųtine communities' relationship to the Project site and current use of the areas for traditional purposes. Denison acknowledges that the Hatchet Lake Denesųtine First Nation has the potential for established Indigenous and Treaty Rights proximal to the Project. The Hatchet Lake Denesųtine First Nation, as represented by the YNLR will be identified as an Indigenous COI in the revised draft EIS.</p> <p>With respect to Denison's consideration of Indigenous Knowledge shared by the Athabasca Denesųtine knowledge sources, Denison notes that Tables 3.5-1 will be updated to better reflect where the YNLR's An Exploration of Recorded Athabasca Denesųtine Traditional Knowledge, Land Use and Occupancy Information in the Vicinity of the Denison Mines Wheeler River Project, which was included as an Appendix to the EIS, was considered and included as Table 3.5-1 does not reflect all instances the report was utilized. With respect to Table 3.5-2, only a limited number of data sources were considered and labelled as Local Knowledge - which</p> |

Wheeler River Project Draft EIS

| | | | | |
|-----|--|---|---|--|
| | | | <p>area (Hatchet Lake First Nation is a signatory to Treaty 10 as recognised on page 4-47 of the draft EIS)</p> <ul style="list-style-type: none"> o established Treaty rights in proximity to the Project o more likely to experience impacts, for example, water drainage as indicated on page 1-7 of the EIS ultimately flows into Wollaston Lake where the Athabasca Denesųline community of Hatchet Lake is located <p>- Comment #12 and 16, Appendix B: YNLR notes that the Project is located within Nuhenéné (the Athabasca Denesųliné traditional territory) as recognised on page 4-61 of the draft EIS. Further, Hatchet Lake First Nation is a signatory to Treaty 10, while Black Lake First Nation and Fond du Lac First Nation are signatories to Treaty 8, and as such all have Treaty Rights within the Project area and that ; that our communities are in proximity to the Project and have demonstrated traditional activity</p> <p>- Comment #15, Appendix B: YNLR notes that the Athabasca Denesųline has relationships with other projects such as McArthur River and Key Lake as indicated in ROC-78, page 504, Combined Appendices for the Wheeler River Project Draft EIS.</p> <p>- Comment #17, Appendix B: Given these EIS defined criteria, YNLR has difficulty understanding why the Athabasca Denesųliné have been excluded from Indigenous COI status for this project. Exclusion of COI status means loss of opportunity for the communities to be part of greater engagement throughout all stages of the Project. Lost opportunities are considerable and include loss of participation at all phases of the Project and include influence regarding the boundaries of the study areas, possibilities for increased discussions regarding environmental and health concerns, mitigation procedures, and planned remediation, potential to participate in monitoring and research projects and future opportunities such as employment.</p> <p>- Comment # 35, Appendix B: YNLR notes that the engagement database demonstrates that their opportunities to contribute were limited. For example, of the approximately 101 pages of Engagement Database tables that are dispersed through several sections of the appendices for the EIS (2022), there are 6 entries credited to the Athabasca Denesųliné. Given an average of 3 to 5 entries per page in the tables, this means that only 1-2% of the contributions were made by the Athabasca Denesųliné. These limited opportunities may well be the result of the exclusion of Athabasca Denesųline from the COI category.</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>is representative of information collected outside of a community-led IK process, key person interviews, or engagement events. As such, there may be limited examples in which knowledge shared constituted local knowledge, and may have been considered as either IK or engagement outcomes.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 427. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 428 | YNLRO (March 4, 2023) | Section 4.0 Engagement, p. 4-14, 4-61 | <p>YNLR Comment March 4, 2023 Comment #20 and 22, Appendix B: YNLR note that project is within Nuhenéné. There is no need to state the southern edge. It could be argued that the Project is on the northern edge of other Indigenous groups areas. Such descriptions have been applied inconsistently to the groups. Territories should be described in an unbiased manner.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 430 | YNLRO (March 4, 2023) | Section 4 Engagement, p. 4-65 | <p>YNLR Comment March 4, 2023 Comment #24, Appendix B: YNLR believes that the EIS section on page 4-65 referring to the letter sent by Denison dated October 28, 2022 rather than in early October as stated in the draft EIS. Given the draft EIS was submitted to the CNSC on October 24, 2022, four days before Denison responded to YNLR concerns, further opportunity to provide clarifications or specific details for inclusion in the EIS were lost.</p> <p>YNLR does not agree that all our concerns have been addressed in the EIS.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Denison understands the EIS involves an iterative process and Denison will continue to engage with YNLR at their direction.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 430. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 431 | YNLRO (March 4, 2023) | Section 11 Land and Resource Use, p. 11-8 | <p>YNLR Comment March 4, 2023 Comment #26, Appendix B: YNLR notes that the Athabasca Denesytine had limited opportunity to contribute to VCs. One community virtual meeting was presented to the Athabasca Denesytine, while there appears to have been approximately 12 events for other First Nation communities (combined) including workshops, school presentations, meetings (in person and virtual) and open houses (draft EIS pp 4-16 to 4-86). While YNLR appreciate the opportunity to participate and recognize the impacts of Covid-19, the difference between Athabasca Denesytine participation and other groups is stark.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) In March 2019, Denison was notified by the YNLR that the Indigenous communities within the local Athabasca communities identified were interested in the Project and that YNLR held the Duty to Consult from these communities. Since receiving correspondence from the YNLR office in 2019 Denison has been collaboratively working with the YNLR office in a mutually agreed upon manner and will continue to do so. Denison understands the EIS involves an iterative process and Denison will continue to engage with YNLR at their direction.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> |

| | | | <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 431. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 432 | YNLRO (March 4, 2023) | Section 11 Land and Resource Use, p. 11-14 | <p>YNLR Comment March 4, 2023 Comment #27, Appendix B: YNLR notes that the Athabasca Denesųtlné have demonstrated land use in both the local and regional land use as per our report (YNLR 2022). YNLR has reported 371 Athabasca Denesųtline Traditional Land Use and Occupancy data entries within the Denison regional study area. These include 18 points for harvesting of big game, such as barren ground caribou, moose, and woodland caribou, 29 overnight sites, 21 points where birds or eggs such as duck and spruce grouse were harvested. Other activities include furbearer harvesting, fishing, including commercial and tourism related activities such as guiding. A map of these activities is reiterated here.</p> <p>YNLR Comment March 13, 2024 (Response to Denison Comment November 22, 2023) No further response provided by YNLR.</p> <p>YNLR Comment June 19, 2024 (Response to Denison Comment on April 05, 2024) YNLR Response: YNLR does not know what Denison means by the phrase 'deemed complete.' YNLR's responses in their letters of 02 February 2024 and 13 March 2024 remain unchanged and YNLR's concerns in those responses remains unaddressed.</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Thank you, noted.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 432. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |
| 433 | YNLRO (March 4, 2023) | Section 11 Land and Resource Use, p. 11-18, 11-40, 11-41, 11-94 and 11-95 | <p>YNLR Comment March 4, 2023 Comment #28, 31 and 32, and 34 Appendix B: YNLR notes that Denison's understanding of the nature of the 2022 YNLR Report is incomplete. As YNLR noted many times, this report is an amalgamation of known information contained within YNLR's database. It comes from a variety of projects each with differing objectives and geographic scope. It is not a Wheeler River-specific Athabasca Denesųtlné Knowledge, Land Use, and Occupancy (ADKLUO) Study. This, in our opinion, leads to misunderstandings and misrepresentations within the draft EIS.</p> <p>Additional clarifications are that our report is not a Wheeler River-specific TLU study, nor were any such specific works undertaken or commissioned. This is important because it sets the tone for comparisons with other Indigenous groups who have met with Denison far more frequently and conducted far more intensive and focused works. Additionally, the limited engagement with did not allow for a shared Athabasca Denesųtline – Denison in- depth exploration of Athabasca Denesųtlné experiences.</p> <p>Using the YNLR Report requires an understanding that the amalgamated information comes from a variety of projects and was collected for a variety of purposes. For example, the report mentions woodland caribou values, tracks, and sightings within the EIS study area. This information comes from various caribou studies and our database records project information. This information clearly demonstrates that Athabasca Denesųtline members were in the EIS area, that harvesting or other values were not recorded is a function of the purpose of the woodland caribou study rather than an indication that Athabasca Denesųtline do not utilize the area for other traditional purposes. Other such interpretations or misrepresentations exist within the report. Additional engagement with the Athabasca Denesųtlné communities and YNLR could have ensured further clarification.</p> <p>Information from the 2022 YNLR Report Section 3.3 appears to have been disregarded in the draft EIS. This information includes references to activities mentioned during duty-to- consult works for other projects with the LSA. This includes hunting, fishing (including commercial) and the gathering of berries and medicines. The responses also indicate that the land is used for</p> | <p>Denison Response November 22, 2023 (Response to YNLR Comment March 4, 2023) Section 11.1.2.4 of the EIS will be updated to reflect the fact that the YNLR's report is an amalgamation of known information from YNLR's database and was not collected explicitly for the purposes of the Project, and as such, should be interpreted by the reader with caution. Section 3.3 of the YNLR's report notes that the comments shared are not geo-located. Without having the locations disclosed, information may have been excluded from Section 11.0 as there was no way to confirm whether those activities overlapped with the spatial boundaries under consideration for potential effects to Indigenous Land and Resources Use.</p> <p>Denison Response April 05, 2024 (Response to YNLR Comment March 13, 2024) No further response from YNLR. Denison will proceed on the basis that the comment is deemed acceptable and complete by YNLR, unless otherwise advised.</p> <p>Denison Response June 28, 2024 (Response to YNLR Comment June 19, 2024) There have been no further comments from the YNLR on EIS reference no. 433. As such, Denison assumes that its responses provided November 2023 are satisfactory and are therefore deemed complete. YNLR responded indicating that the YNLR's comments in letter dated February 02, 2024 and March 13, 2024 remain unchanged and unaddressed. Denison has provided a comprehensive response to each of YNLR's comments in kind and has sought to address YNLR's concerns. Denison has stated its commitment to work with the YNLR and to collaboratively develop monitoring plans. Denison remains committed to engaging with the YNLR on these concerns. As the YNLR has provided no further comments to Denison's responses November 2023, Denison is unclear on how to address the comments in a way that is satisfactory for the YNLR.</p> |

| 439 | Métis Nation of Saskatchewan (MN-S) (March 4, 2023) | Executive Summary, Section 2 Project Overview EIS, Section 4.3.4.1 Engagement with Indigenous Organizations | <p>Issue #ES-001: To date, Denison's engagement approach has not been collaborative. Denison has not engaged all potentially impacted Métis communities. Denison has focused engagement efforts on Métis communities in NR3.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to engage all potentially impacted Métis communities. Specifically, to see Denison equally engage NR1 Locals and NR3 Locals in addition to Kineepik Metis Local #9 throughout the life of the Project. Denison needs to include MN-S, NR1 Locals, and NR3 Locals under Indigenous Communities of Interest - Denison needs to engage MN-S, NR1 Locals, and NR3 Locals on Project information, Project-related employment, procurement, and cultural opportunities, engagement expectations (e.g., involvement of youth and Elders), and approach for gathering and incorporating Métis Knowledge into Project reports, plans, and processes. | <p>Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations.</p> <p>Denison has updated the revised draft EIS executive summary to acknowledge that the Project falls within the MN-S Homeland, including the unique situation that the MN-S have in the area.</p> <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> |
| 440 | MN-S (March 4, 2023) | Executive Summary, Section 3 Project Setting Executive Summary, Section 3.4.3 Proposed Schedule and Activities Executive Summary, Section 4 General EIS, Glossary | <p>Issue #ES-002: Denison does not acknowledge that the Project falls within the MN-S Homeland.</p> <p>Issue #ES-013: MN-S is listed under Indigenous Organizations instead of Indigenous Communities of Interest.</p> <p>Issue #ES-012, ES-005 and 4-001: Per Denison's definition, MN-S, NR1 Locals, and NR3 Locals should be considered an Indigenous Community of Interest. Denison notes site visits as the only engagement-associated activities in each Project Phase. Additional involvement opportunities should be provided to MN-S throughout the life of the Project</p> <p>Further, MNS refers to CNSC correspondence (Appendix A) indicating that consultation and engagement was expected to be with NR1 Locals, NR2 Locals, NR3 Locals, and MN-S. Given NR2's involvement in NexGen and Fission, MN-S limited its engagement and consultation expectations to NR1 Locals, NR3 Locals, and itself.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to engage all potentially impacted Métis, including: MN-S, NR1 Locals, and NR3 Locals, in addition to Kineepik Metis Local #9, as an Indigenous Community of Interest throughout the life of the Project. - Denison needs to revise their Indigenous Community of Interest definition in the Final EIS to reflect the uniqueness of Métis governance structures. Specifically, a definition that recognizes Métis Locals proximate to the Project, MN-S, and MN-S regional leadership. - Denison needs to engage MN-S, NR1 Locals, and NR3 Locals, to understand their preferred level of involvement throughout the life of the Project. - Denison needs to acknowledge MN-S, NR1 Locals, and NR3 Locals as an Indigenous Community of Interest in the Final EIS. - Denison needs to revise the Final EIS Executive Summary to note that the Project falls within the Homeland of MN-S, NR1 Locals, and NR3 Locals. Denison needs to apply this change throughout the EIS, where applicable. - Denison to acknowledge that lease review data is not an appropriate way to determine Métis traditional resource use in and around the Project in the Final EIS. <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations.</p> <p>Denison has updated the revised draft EIS executive summary to acknowledge that the Project falls within the MN-S Homeland, including the unique situation that the MN-S have in the area.</p> <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> |
| 441 | MN-S (March 4, 2023) | Executive Summary, Section 3.4.2.4 Waste Management | <p>Issue #ES-004: Denison's EIS does not outline where hazardous waste will be taken for proper recycling or disposal.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to share where hazardous waste will be taken for proper recycling and disposal with MN-S, NR1 Locals, and NR3 Locals | <p>Waste management is described in Section 2.2.4 of the Draft EIS and includes discussion of all waste types that will be generated by Project-related activities. The following is noted in Section 2.2.4 for reference, "Conventional waste, radiologically contaminated waste, and hazardous waste will be managed at the Project. Denison is committed to conducting stringent waste characterization throughout the life of the Project. This includes physical, radiological, and chemical characterization to maintain accurate waste inventories and determine how wastes will be dispositioned through either re-use, recycling, temporary storage, or permanent disposal (on or off site). This includes clearance of material that meets unconditional release requirements and can be safely removed from site.</p> <p>A waste management program will be developed for the Project to support licensing and permitting. The waste management program and associated plans developed to support licensing will be based on the 4 R's: Reduce, Reuse, Recycle, and Recover, and will detail how each type of waste generated on site will be managed. Resources used to develop the waste management program will include, but are not limited to, the CNSC's REGDOC-2.11 series, related Canadian Standards Association (CSA) standards, and the Hazardous Substances and</p> |

Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| | | | | <p>Waste Dangerous Goods Regulations (Government of Saskatchewan 2000)."</p> <p>Hazardous waste management in particular discussed in Section 2.2.4.4. of the Draft EIS where the following is noted, "Denison identified a need to have a small (250 m2) pad designated for temporary storage of hazardous waste such as paints, solvents, hydrocarbons, and used oil. The temporary storage pad will have a composite liner system (Figure 2.2 24). Hazardous wastes will be taken off site by waste management service providers for proper recycling as soon as practical."</p> <p>As referenced in the Draft EIS, the specific details related to hazardous waste management will be documented as part of the overall, waste management program that will be developed as the Project advances from the environmental assessment process into licensing and permitting. Hazardous wastes will be managed consistent with regulatory requirements, using licensed third-party waste management/haulage providers and licensed waste management facilities. Denison will inform the MN-S and relevant locals when such documentation has been prepared through engagement mechanisms in place at that time.</p> |
| 442 | MN-S (March 4, 2023) | Executive Summary, Section 3.4.8 Indigenous Knowledge | <p>Issue #ES-003 and ES-007: Denison did not engage MN-S on potential Project-related effects to Métis traditional use activities (such as but not limited to: hunting, trapping, and fishing) and therefore may not be aware of potential traditional use activities conducted by Métis peoples in and around the Project. Denison's reliance on reviewing traditional resource user leases is not an appropriate way to determine Métis traditional resource use in and around the Project.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to incorporate Métis Knowledge from the Métis Knowledge Study (MKS) into their discipline-specific effects assessment, the Final EIS, and all monitoring plans for the Project, where applicable. - Denison needs to engage MN-S, NR1 Locals, and NR3 Locals to determine the appropriate funding, process, and timeline to conduct the MKS. | <p>Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations.</p> <p>Denison has updated the revised draft EIS executive summary to acknowledge that the Project falls within the MN-S Homeland, including the unique situation that the MN-S have in the area.</p> <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> |
| 443 | MN-S (March 4, 2023) | Executive Summary, Section 4.1 Introduction | <p>Issue #ES-009: MN-S has not had an opportunity to review Denison's engagement plan.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to share all engagement plans and reports of interest to MN-S, NR1 Locals, and NR3 Locals for review and comment. | <p>Since being advised by the MN-S in October 2019 that a number of Métis Locals had delegated to the MN-S the Duty to Consult for the Project, Denison has been engaged in extensive ongoing discussions with the MN-S with the goal of reaching agreement regarding the EA process and MN-S' participation in it. Denison continues to engage with the MN-S, inclusive of engagement in NR1 and NR3, at their direction and there is no formal engagement plan, as such Denison does not feel there is a need for MN-S review as continued engagement is informed by and at the direction of the MN-S in an ongoing manner.</p> <p>For example, In recognition of the MN-S potential interests in the Project, Denison and MN-S have negotiated a capacity funding agreement. This agreement outlines a mutually agreeable framework and applicable funding arrangements to facilitate the MN-S' participation and engagement in the EA process for the Project.</p> <p>The parties have specifically agreed to a process between each other that will be funded by Denison and undertaken on behalf of the MN-S in connection with the EA of the Project: a Métis Knowledge Study, meetings to focus on VCs and preliminary effects, and regular meetings and associated costs for hosting such meetings.</p> |
| 444 | MN-S (March 4, 2023) | Executive Summary, Section 4.1 Introduction Executive Summary, Section 4.2 Engagement Approach EIS, Section 2.2.1 Mining EIS, Section 4.3.1 Engagement with Identified Indigenous Communities and | <p>Issue #ES-008 and ES-010: Denison has not engaged all potentially impacted Métis communities.</p> <p>Issue #4-006: Métis communities in NR1 and NR3 meet multiple evaluation criteria identified by Denison. Denison's engagement to date has not included Métis communities in NR1. Denison's explanation related to the selection of Indigenous groups to be engaged on the Project is unsatisfactory.</p> <p>Issue #4-007: The Project is located within Métis NR1 in Saskatchewan. However, several key Métis communities with whom Denison is engaging are located in Métis NR3. Denison's explanation related to the selection of Indigenous groups to be engaged on the Project is unsatisfactory. The MN-S website states that "consultations must be with the Métis government structures that are elected and supported by the Métis people." (MN-S n.d.c.). Denison has not engaged with Métis communities outside of NR3.</p> | <p>Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations.</p> <p>Denison has updated the revised draft EIS executive summary to acknowledge that the Project falls within the MN-S Homeland, including the unique situation that the MN-S have in the area.</p> <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|---|
| | | Organizations, and Supporting Criteria EIS, Section 4.3.2.1.3 Key Engagement Activities EIS, Section 4.3.4 Engagement with Indigenous Organizations | <p>Issue #ES-011: Denison's engagement to date has largely been with Métis communities in NR3. Particularly, the Kineepik Metis Local #9 community. There are only two entries related to engagement with Métis communities (with exclusion to Kineepik Metis Local #9) in Appendix 2A: Section 2 – Engagement Database Summary Table – Project Description.</p> <p>Kineepik Metis Local #9. This record demonstrates little engagement was conducted with Métis communities in NR1 and NR3.</p> <p>Issue #2-001 and 4-008: Denison has not had meetings to introduce the Project, share information on Project alternatives and options, VCs, the ISR ming method and proposed freezing method, or any other topics of interest to the MN-S and Métis communities in NR1. These communities also did not receive a VC survey to identify VCs of importance to Citizens and/or other interests and concerns related to the Project.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to engage all potentially impacted Métis communities. Specifically, to equally engage all NR1 and NR3 communities, in addition to Kineepik Metis Local #9 throughout the life of the Project. Denison needs to include MN-S, NR1 Locals, and NR3 Locals under Indigenous Communities of Interest. - To facilitate a collaborative approach to engagement, Denison needs to engage MN-S, NR1 Locals, and NR3 Locals on Project information, Project-related employment/procurement/cultural opportunities, engagement expectations (e.g., involvement of youth and Elders), and approach for gathering and incorporating Métis Knowledge into Project reports, plans, and processes. | 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study. |
| 445 | MN-S (March 4, 2023) | Executive Summary, Section 5 General | <p>Issue #ES-014: Denison did not engage MN-S on potential Project-related effects to Métis traditional use activities such as (but not limited to): hunting, trapping, and fishing. No Métis Knowledge was used to inform the Project's spatial boundaries.</p> <p>Issues #ES-015 to ES-24: Denison has not engaged MN-S to understand Métis knowledge to inform the development of the Project's environmental monitoring and management plans (e.g., Caribou Management Plan). This applies to monitoring air emissions, noise monitoring, geology, groundwater quantity and quality, surface water quality, sediment quality, fish and fish habitat and human health. Information to be gathered during the Métis Knowledge Study will contribute to the development of these plans.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to incorporate Métis Knowledge from the MKS into their discipline- specific effects assessment, the Final EIS, and all monitoring and management plans for the Project, where applicable. - Denison needs to engage MN-S to determine the appropriate funding, process, and timeline to conduct the MKS. - MN-S would like the opportunity to review applicable Project management documents that provide information that is relative to the potential impacts of the Project on traditional land use activities, these include, but are not limited to the following: Preliminary Decommissioning Plan, Status of the Environment reports, Environmental Effects Monitoring reports, annual reports, updated environmental risk assessments and the Final Decommissioning. - Denison needs to provide plain language summaries, posters/handouts, and presentations on monitoring and effects management plans and programs to MN-S, NR1 Locals, and NR3 Locals. Denison needs to share all engagement plans and reports of interest to MN-S, NR1 Locals, and NR3 Locals for review and comment. - Denison needs to engage MN-S, NR1 Locals, and NR3 Locals to better understand how they would like to be informed of monitoring results (e.g., 1-page plain language summaries, annual monitoring report, community meetings etc.). | <p>Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations.</p> <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> <p>Section 12.2.4.2.1 describes that multiple pick-up points for workers will be determined as part of Project design, including additional locations to be determined relative to eligible labour force supply.</p> <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |
| 446 | MN-S (March 4, 2023) | Executive Summary, Section 5.4.2 Surface Water Quality | <p>Issue #ES-20: The draft EIS does not clarify the influence of groundwater temperature on Whitefish Lake.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to confirm the influence of groundwater temperature on Whitefish Lake in the Final EIS. | There is no expectation of influence of groundwater temperature on Whitefish Lake during any phase of the Project. Groundwater would be expected to enter (discharge) to Whitefish Lake at its typical ambient temperature. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| 447 | MN-S (March 4, 2023) | Section 2.2.1.3.2 Freeze Wall Timeline | Issue #2-002: The removal of the freeze wall may cause increased migration of constituents that could cause environmental release to the receiving environment unintentionally. Recommendations: Denison needs to clarify the following with MN-S, NR1 Locals, and NR3 Locals: a) the freezing effects on the Upper and Lower barrier zones post mining, and b) if the freeze thaw process could cause increased fracturing potential within these zones. | A separate technical memo including information related to freeze wall integrity and the basis for design of the freeze wall, which relies on site field data and lived experience from several exiting Saskatchewan mining operations, is provided as Attachment IR-10 . |
| 448 | MN-S (March 4, 2023) | Section 2.3.4 Post-decommissioning | Issue #2-002: Denison does not acknowledge MN-S, NR1, or NR3 involvement in the design and implementation of the post-decommissioning monitoring program. Recommendations: Denison needs to engage MN-S, NR1 Locals, and NR3 Locals in the design and implementation of decommissioning planning and all subsequent monitoring programs for the Project. This will allow Métis to share their interests in the long-term state of the land and incorporate Métis knowledge. It will also create opportunities for Métis youth and Elders to participate in monitoring programs. | Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations. A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study. Section 12.2.4.2.1 describes that multiple pick-up points for workers will be determined as part of Project design, including additional locations to be determined relative to eligible labour force supply. As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. |
| 449 | MN-S (March 4, 2023) | Section 2.3.5 Ancillary Projects | Issue #2-004: Denison's EIS suggests SaskPower's work related to the extension of an existing 138 kV line will be independent from work led by Denison. Recommendations: - Denison needs to clarify whether the additional 138 kV line was factored into the cumulative effects evaluation. - Denison needs to clarify whether the proposed Project can proceed without the 138 kV line construction. - Denison needs to clarify the timing of the construction of the line and Wheeler River Project construction. - Denison needs to confirm that SaskPower will engage with MN-S, NR1 Locals, and NR3 Locals on line routing and design. - Denison needs to confirm if/when the 138 kV line will be decommissioned. | The Wheeler River Project includes a power line as an ancillary component. Denison evaluated the impact of the electrical infrastructure as part of the overall mine project. In the cumulative assessment, both the mine and its ancillary components were considered together, and cumulatively with other reasonably foreseeable projects. SaskPower will build, own, and operate the transmission line, and is responsible for separate permitting and engagement for their part of the project. SaskPower is also responsible for scheduling construction and decommissioning of the line and related communication. |
| 450 | MN-S (March 4, 2023) | Section 2.7 Project Benefits | Issue #2-005: Denison notes some jobs will require a Grade 12 education in addition to in-house training programs, but does not offer to support Métis peoples obtain Grade 12 education to access available positions. Recommendations: - MN-S would like confirmation on what kind of education and training support Denison will make available to maximize employment from Communities of Interest. - Denison needs to support Métis training opportunities through Northlands College. - MN-S would like additional details on which roles will need Grade 12, and how many roles are available for people without Grade 12. | Denison, through a Human Resource Development Plan, will initially prioritize Indigenous and non-Indigenous communities in the LSA in terms of employment and training opportunities (anticipated to be in institutions in northern Saskatchewan) and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project, which could include such items as on-the-job training and career counselling to help with advancement from foundational positions, advance sharing of job qualification requirements, clearly identifying training requirements and working with various training institutions (such as Northlands College) to make sure such appropriate training is available, and creation of scholarship and support programs. Priority for employment and training will then focus on Indigenous and non-Indigenous residents of the RSA and then beyond the RSA. All positions at the Project will require a Grade 12 education or equivalent. Section 13.3.2.1 |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|---|
| | | | | <p>describes how foundational positions (i.e. entry level) require Grade 12 education and in-house training programs, although a combination of skills and experience may be considered. These positions would include process plant operators, site services, drillers, and catering/janitorial staff.</p> <p>Denison will update the Economics Section to reflect the latest census and the effects that Covid has had on employment in the LSA and RSA.</p> <p>Further, Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS.</p> |
| 451 | MN-S (March 4, 2023) | Section 2.7 Project Benefits | <p>Issue #2-006 and 2-007: Denison does not specify the goods and services during Construction, Operation, and Decommissioning. MN-S is interested in sharing potential goods and services opportunities for Métis peoples (e.g., chefs and artisans). Denison has not specified how it is transmitting knowledge nor provided an explanation of the procurement approach.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide specific information on the goods and services opportunity available to Métis as per labour force and business analysis. - Denison needs to clarify how it has made MN-S, NR1, and NR3 Locals aware of the procurement approach and opportunities, and how it will keep them informed through the life of the Project. | <p>Denison will establish a procurement approach throughout all phases of the Project, prioritizing the procurement of goods and services for the Project toward businesses based within the LSA communities prior to looking elsewhere in northern Saskatchewan, southern Saskatchewan, and/or outside of Saskatchewan. This procurement approach may consider advance sharing of purchasing requirements of goods and services throughout all phases of the Project, efforts to increase the capacity and capabilities of businesses to increase successful bidding outcomes, and the development of a business registry.</p> |
| 452 | MN-S (March 4, 2023) | Section 2.9.1.3.1 Environmental Protection Program | <p>Issue #2-008 and 2-009: The Draft EIS does not include a draft Environmental Protection Plan (EPP) or a summary of how the EPP will be developed. The Métis Knowledge Study is yet to be completed and these plans should not be completed without considering the Métis Knowledge Study. Draft monitoring plans were not available for review to confirm how Denison plans to inform plans with existing local and traditional knowledge.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide an Environmental Protection Plan with the Final EIS. - Denison needs to involve MN-S, NR1 Locals, and NR3 Locals in the development and implementation of the Environmental Protection Program so that Métis can ensure their interests and Métis Knowledge are included. Additionally involvement in the development of monitoring plans and review of MN-S knowledge usage and how it informed the plan should also be undertaken. - Denison needs to share all engagement plans and reports of interest to MN-S, NR1 Locals, and NR3 Locals for input, review and comment. - Denison needs to include an implementation and reporting plan with the monitoring plans. | <p>With respect to Part i) of the comment the following is noted. The MN-S review comments accurately indicates that a draft Environmental Protection Plan was not included in the EIS submission; rather, Section 2.9.1.3.1 of the draft EIS provides the commitment to develop an Environmental Protection Program (EPP) and associated plans. The EPP would be established to provide an overarching framework for key environmental monitoring and management plans and to ensure a means to demonstrate compliance with applicable environmental regulatory requirements and other performance targets. The EPP would be developed in a manner that aligns with the ISO 14001 EMS Standard. As noted on the draft EIS, Denison has opted to execute the overall Project approvals process - that is, the environmental assessment and licensing / permitting processes - in series and not simultaneously. As such, the documentation referenced in the MN-S review comment will be developed during the licensing / permitting phase and will be available for review at that time rather than as part of the final EIS. The level of information provided in the draft EIS is appropriate for the stage at which the overall Project approvals process currently sits, and as noted, MN-S, and others, will have an opportunity to review documentation that is developed at later stages of the overall approvals process as appropriate.</p> <p>With respect to Parts ii), iii) and iv) of the comment the following is noted. Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLRO are understood as organizations. A study agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. The Métis Knowledge Study was received by Denison on October 24, 2023, and Denison has integrated relevant information from the Study into the EIS accordingly.. It is important to note that Denison has incorporated Métis land use information and perspectives into the draft EIS, through the funding of the Kineepik Métis Land and Occupancy information along with the KML VEC statement, of which relevant information has been incorporated directly into the draft EIS to determine effects to the human environment. Additionally, and as noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other stakeholders, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: programs will meet regulatory requirements, programs will confirm the effectiveness of mitigation measures and predictions made in the assessment, programs will be implemented in an adaptive</p> |

| | | | | |
|-----|---|--|--|---|
| | | | | management framework (if/where applicable) to reduce effects during the lifetime of the Project, and programs will have spatial boundaries that are sufficiently extensive to measure EIS predictions. |
| 453 | MN-S (March 4, 2023) | Section 2.9.1.3.5 Emergency Preparedness and Response Program | Issue #2-010: No Emergency Preparedness and Response Program was available for review. Recommendations: - Denison needs to include an Emergency Preparedness and Response Program in the Final EIS for review. - Denison to include information on transportation accidents within the Emergency Preparedness and Response Program. | <p>With respect to Part i) of the comment the following is noted. The MN-S review comments accurately indicates that a draft Emergency Preparedness and Response Program was not included in the EIS submission; rather, Section 2.9.1.3.5 of the draft EIS provides the commitment to develop an Emergency Preparedness and Response Program (EPRP). The EPRP would be established to identify how the Project will prepare for and addresses emergencies that may affect the health and safety of persons, the environment, and the protection of property. The EPRP would be developed in a manner that aligns with guidance provided by CNSC in REGDOC-2.10.1. As noted on the draft EIS, Denison has opted to execute the overall Project approvals process - that is, the environmental assessment and licensing / permitting processes - in series and not simultaneously. As such, the documentation referenced in the MN-S review comment will be developed during the licensing / permitting phase and will be available for review at that time rather than as part of the final EIS. The level of information provided in the draft EIS is appropriate for the stage at which the overall Project approvals process currently sits, and as noted, MN-S, and others, will have an opportunity to review documentation that is developed at later stages of the overall approvals process as appropriate.</p> <p>With respect to Part ii) of the comment the following is noted. The EPRP will include information relevant to transportation accidents and responses thereof. Further, information regarding aspects of emergency response with respect to transportation accidents was provided in the draft EIS and direction to that information is highlighted as follows for reference. Postulated traffic accident scenarios were considered in the Accidents and Malfunctions Technical Supporting Document (TSD; Appendix 14-A) as summarized in Section 14 of the draft EIS. As mitigation for such scenarios the accidents and malfunctions assessment highlighted commitments to develop the EPRP and several plan and procedure level documents (e.g., spill response plan; an emergency response plan; a traffic and transportation plan; a travel management plan; personnel training procedures). Additionally, Section 12.3 of the draft EIS discusses mitigation measures that will be implemented to reduce adverse traffic effects, as well as mitigation measures to be implemented to reduce adverse effects on emergency services capacity such as:</p> <ul style="list-style-type: none"> • All drivers serving the Project will receive appropriate training related to the nature of materials being transported, including driver training to the highest standards based on the transportation of nuclear substances. • Vehicles transporting dangerous goods and/or hazardous products will display required placards and labels in accordance with provincial legislation and will follow designated highway corridors. • All materials transported by truck will be compliant with any weight restrictions or permits, spring road restrictions, or geometric constraints set out by the Saskatchewan MOHI. • Denison will maintain Project roads and the main access road to the site. First aid facilities will be supplied during construction. • A primary care paramedic will be contracted to provide care on site through all phases of the Project. Denison will provide the appropriate amount of First Aid and CPR training to make sure employees have adequate coverage. • Mandatory safety orientations will be held for contractors and workers. • First aid personnel will provide transport to a hospital by air when required or by Saskatchewan's air ambulances; • Health and safety management programs will be developed for Construction, Operation, and Decommissioning. • Workers will be trained in fuel handling, equipment maintenance, and fire prevention and response measures. • Denison's Environment, Health, Safety, and Sustainability Policy will be enforced. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| | | | | <ul style="list-style-type: none"> • Continued liaison with LSA communities and relevant authorities (e.g., RCMP, health and service providers) will be undertaken to provide updates, discuss any Project-related concerns, and make sure that the required resources are in place. • Project-specific contingency, emergency response, and spill prevention plans will be developed to reduce the likelihood and severity of accidents and potential fires. • Based on the outcomes of discussions with COI, Denison may provide support and/or training to local emergency services to make sure that staff are adequately prepared in the unlikely event of an accident, malfunction, or spill on Highways 914 or 165. This may include the provision of specialty materials or equipment to deal with an emergency response. |
| 454 | MN-S (March 4, 2023) | Section 3.4.2.3 Métis Nation – Saskatchewan Section 3.4.8 Lands Taken Up from an Indigenous Perspective | <p>Issue #3-001 and 3-002: The Draft EIS does not yet include Métis Knowledge from NR1 and NR 3 other than Kineepik. The Draft EIS does not include information on how Denison intends to include the outcome of the Métis Knowledge Study.</p> <p>Perspectives on cumulative impacts have only been considered for English River First Nation and Kineepik Metis. This has resulted in an absence of MN-S perspective regarding cumulative impacts within the Project and surrounding areas.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide a clear indication of how the MKS findings were included in the Final EIS (e.g., effects analysis, cumulative effects analysis, mitigation measures, etc.) including confirming use with MN-S. - The Assessment should not be considered complete until the Métis Knowledge Study is finished and factored in. | Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLRO are understood as organizations. A study agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. The Métis Knowledge Study was received by Denison on October 24, 2023, and Denison has integrated relevant information from the Study into the EIS accordingly. It is important to note that Denison has incorporated Métis land use information and perspectives into the draft EIS, through the funding of the Kineepik Métis Land and Occupancy information along with the KML VEC statement, of which relevant information has been incorporated directly into the draft EIS to determine effects to the human environment. |
| 455 | MN-S (March 4, 2023) | Section 3.4.6 Addressing Divergence Between Indigenous Knowledge and Western Scientific Knowledge Systems | <p>Issue #3-003: Details are not provided regarding how these programs and plans will be developed and implemented, or how they will integrate the needs of all the Indigenous and Métis communities.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to clarify whether discrepancies will only be addressed by follow-up and monitoring. - Denison needs to involve MN-S, NR1 and NR3 in determining other means for examining divergences and informing follow-up and monitoring (e.g., collaborative field studies). | <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> <p>As the Project site will be self-sufficient in terms of meeting the needs of the Project and its workforce, the effects related to local communities are associated with the effects of participation in employment and the associated commuter rotation system. With the application of mitigation measures described in Section 12.3.5, and given the distance between communities in the LSA and the Project site, the residual adverse effects are expected to be low in magnitude. The overall conclusion relative to changes to Infrastructure and Services is not significant.</p> |
| 456 | MN-S (March 4, 2023) | Section 4.1.2 Denison's Indigenous Peoples Policy and Investment and Sustainability Philosophy | <p>Issue #4-002: The EIS notes that "In 2021, Denison announced the adoption of an Indigenous Peoples Policy (IPP). The IPP reflects Denison's recognition of the important role of Canadian business in the process of reconciliation with Indigenous peoples in Canada and outlines Denison's commitment to take action towards advancing reconciliation. The IPP was developed based on Denison's experiences with, as well as feedback and guidance received from, Indigenous communities with whom Denison is actively engaged. This approach was designed to make sure the IPP appropriately captures a mutual vision for reconciliation. The IPP identifies five key areas of action that will support the ongoing development of a continuously evolving Reconciliation Action Plan (RAP): Engagement; Empowerment; Environment; Employment; and Education. Through the RAP, Denison is striving to interweave the principles of reconciliation throughout all areas of the company's operations (Denison 2021a)."</p> <p>Denison does not explain how it will accomplish free, prior, and informed consent (FPIC) as per the IPP and RAP [2].</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to clarify how it intends to consider free, prior, and informed consent (FPIC). <p>[2] Engagement – We are committed to building long-term and mutually respectful relationships through proactive engagement and consultation with Indigenous people. Our aim is to work to achieve the free, prior, and informed consent, where the potential for impacts to rights may occur, before proceeding with economic development projects and during ongoing activities and operations</p> | Denison's IPP is a principles based policy and addresses its vision for reconcile-action in all of Denison's activities. How the policy will be executed will vary on a project to project and community to community basis. The process includes a continually evolving Reconciliation Action Plan, that Denison will seek periodic input on from its Indigenous partners to ensure that it remains relevant to in the ongoing evolving landscape of reconciliation. |

| | | | | |
|-----|---|---|--|--|
| 457 | MN-S (March 4, 2023) | Section 4.2 Engagement Approach Section 4.3.1 Engagement with Identified Indigenous Communities and Organizations, and Supporting Criteria | Issue #4-003 and 4-005: MN-S is listed under Indigenous Organizations instead of Indigenous Communities of Interest. Not all potentially impacted Métis communities are listed in this figure. Métis communities listed under Indigenous Communities of Interest include Kineepik Metis Local #9, Sipishik Metis Local #37, Patuanak Metis Local #82. Métis communities listed under Other Indigenous Communities include Dore/Sled Lake Métis Local #67 and A La Baie Métis Local #21. These Métis communities are all within NR3. Only NR3 communities are listed in Figure 4.3-2: Unidentified Indigenous Communities and Organizations in Relation to the Project. Recommendations: - Denison needs to revise its understanding of Métis, Métis governance and the differences between MN-S and Métis Locals. - Denison needs to include MN-S, NR1 Locals, and NR3 Locals as Communities of Interest, or explain why they limited their selection of Métis communities in their listing. | Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations. A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study. Section 12.2.4.2.1 describes that multiple pick-up points for workers will be determined as part of Project design, including additional locations to be determined relative to eligible labour force supply. As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. |
| 458 | MN-S (March 4, 2023) | Section 4.2 Engagement Approach | Issue #4-003: MN-S appreciates Denison's willingness to evolve engagement activities in response to feedback from MN-S over time. Recommendations: - Denison to continue engaging and involving MN-S, NR1 Locals, and NR3 Locals during the revisions of the Draft EIS and completion of outstanding plans. | Noted, throughout the engagement, Denison has consistently affirmed its interest in MN-S participation and the incorporation of Métis knowledge into the EIS, in addition to the information and input that has already been gathered with KML. |
| 459 | MN-S (March 4, 2023) | Section 4.3.2.3 Engagement with Sipishik Métis Local #37 | Issue #4-009: Denison is taking engagement direction from MN-S to not lump public engagement efforts with Métis engagement is appreciated. Recommendations: - Denison needs to engage Beauval/Sipishik Métis Local #37 throughout the life of the Project. | Noted, Denison will continue to engage with MN-S, including Beauval/Sipishik Métis Local #37, at their direction for the life for relevant stages of the Project. |
| 460 | MN-S (March 4, 2023) | Section 4.3.2.3.4 Key Issues and Concerns | Issue #4-010: The safety of all Métis peoples that will be engaged or employed by the Project is of utmost importance. Racism towards Métis peoples will not be tolerated. Denison's policies need to support a safe work culture for all. Recommendations: - Denison needs to share all policies related to creating a safe workplace with MN-S, NR1 Locals, and NR3 Locals for review and comment (e.g., health and safety policies and the Workplace Violence & Harassment Policy). - Denison needs to create a culturally safe workplace for Métis peoples. - Denison needs to clarify its policies to prevent incidents of workplace violence and harassment and identify clear actions to address potential incidents of workplace violence and harassment. - Denison needs to mandate cultural awareness training for all employees to help with one the Project's established principles: "approaching sustainability and engagement activities with the utmost respect for Indigenous communities, Indigenous Rights, and Indigenous Knowledge". | Denison has an established Workplace Violence and Harassment Policy and an Indigenous Peoples Policy, both of which are publicly available on Denison's website. These two policies create the conditions for an inclusive and diverse work environment and a safe work culture for all. Policies will be adapted to the conditions of the Project and Denison welcomes specific feedback on Métis interests and concerns. Further, Section 12.2.5 Mitigation Measures for Community Well-being describes the establishment of health and wellness programming on-site, an Employee and Family Assistance Program (EFAP), a no alcohol and drug policy on Project site, the enforcement of Denison's Environment, Health, Safety, and Sustainability Policy, the implementation of culturally sensitive employment policies to support the Indigenous workforce (for example, having an Elder representative at the Project site to provide cultural programming), among others. |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|---|
| 461 | MN-S (March 4, 2023) | Section 4.3.2.4.3 Key Issues and Concerns | <p>Issue #4-011: Denison created “Key Issues and Concerns” tables in their EIS to document responses to issues and concerns identified by Indigenous Groups.</p> <p>Denison marked issues and concerns that they believe have been addressed as “Complete” in “Key Issues and Concerns” tables throughout the Draft EIS. Directing MN-S and Métis Locals to chapters within the EIS is not a sufficient response to an issue or concern identified by MN-S and Métis peoples. One- way information sharing is not an effective means for addressing or mitigating issues and concerns identified by MN-S and Métis people. Responses to issues regarding effects should discuss the presence or absence of effects, rather than responding that effects were studied.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to respond to issues and concerns identified through engagement during meetings with and communications to MN-S, MN-S, NR1 Locals, and NR3 Locals. - Denison needs to implement a collaborative engagement approach that allows MN-S, NR1 Locals, and NR3 Locals to provide feedback and inform Project decision-making, plans, and outcomes versus one-way information sharing engagement approach. | <p>Since being advised by the MN-S in October 2019 that a number of Métis Locals had delegated to the MN-S the Duty to Consult for the Project, Denison has been engaged in extensive ongoing discussions with the MN-S with the goal of reaching agreement regarding the EA process and MN-S’ participation in it. Denison continues to engage with the MN-S, inclusive of engagement in NR1 and NR3, at their direction and there is no formal engagement plan, as such Denison does not feel there is a need for MN-S review as continued engagement is informed by and at the direction of the MN-S in an ongoing manner.</p> <p>For example, in recognition of the MN-S potential interests in the Project, Denison and MN-S have negotiated a capacity funding agreement. This agreement outlines a mutually agreeable framework and applicable funding arrangements to facilitate the MN-S’ participation and engagement in the EA process for the Project.</p> <p>The parties have specifically agreed to a process between each other that will be funded by Denison and undertaken on behalf of the MN-S in connection with the EA of the Project: a Métis Knowledge Study, meetings to focus on VCs and preliminary effects, and regular meetings and associated costs for hosting such meetings.</p> |
| 462 | MN-S (March 4, 2023) | Section 4.3.4.1.2 Agreements Relative to the Environmental Assessment Process | <p>Issue #4-014: Denison’s Draft EIS notes that Denison and MN-S were in the process of developing a capacity funding agreement. Since the Draft EIS was published, Denison and MN-S reached an agreement.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to revise the Final EIS to note that a capacity funding agreement was reached with MN-S. | The EIS will be updated to reflect the capacity funding agreement reached with the MN-S. |
| 463 | MN-S (March 4, 2023) | Section 5.3.1 Valued Components Selection | <p>Issue #5-001: Métis input to VC selection was limited to NR3 communities.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to confirm the selected valued components with Métis Locals in NR1 and NR3 and revise the Final EIS as required to reflect their input. | <p>At the direction of the MN-S, Denison participated in meetings on February 12, 2023 with NR1 and on February 13, 2023 with NR3. The participants at these sessions were identified and invited by the MN-S. During these meetings, Denison shared information about the Project and the associated VCs assessed as part of the environmental assessment. No new VCs were identified as part of that discussion, and should new ones emerge through process, we would consider them at that time.</p> <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> |
| 464 | MN-S (March 4, 2023) | Section 5.4 Influence of Indigenous Knowledge, Local Knowledge, and Engagement | <p>Issue #5-002: The use of “complimentary and influential” does not reflect current best practices that acknowledge Indigenous Knowledge as an equal but different way of knowing (than western science). This terminology implies that Indigenous Knowledge can be absorbed into a scientific approach.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to confirm use of the wording “complimentary and influential” and how the use of Indigenous Knowledge is treated as equal to western science in the Final EIS. - Denison needs to confirm if it intends the use of “complimentary” or “complementary”. Best practices will differ depending on intention. | <p>Section 5.1 of the EIS explains that the project is assessment under the Canadian Environmental Assessment Act, 2012, along with the Saskatchewan Environmental Assessment Act. As such, the Canadian Environmental Assessment Agency’s reference guidance (CEAA 2015) on considering Aboriginal traditional knowledge for EAs under the Canadian Environmental Assessment Act 2012 is considered as relevant guidance. Further to this (see Section 3.3.1 of the EIS) Denison has committed to working with Indigenous communities in a spirit of mutual respect and cooperation. Denison’s Indigenous Peoples Policy reflects the company’s belief that reconciliation is advanced through collaboration with Indigenous peoples and communities to build long-lasting, respectful, trusting, and mutually beneficial relationships. Section 3.2.2 of the EIS notes that access to Indigenous Knowledge is a privilege and must be respected. Prior to sharing and collecting IK, local protocols and procedures developed by the Indigenous COIs for the management of IK were requested and applied. For some communities, this meant Indigenous Knowledge was shared with Denison and its consultants for use in the EIS with measures in place to protect the privacy of the IK, and in others communities consented to reports being shared and appended to the EIS itself. Denison will continue to work with the Indigenous COIs to ensure this information is shared and protected in manner consistent with community protocols.</p> <p>Noted, the use of ‘complimentary’ and ‘complementary’ will be revisited throughout the EIS.</p> |

|-----|---|---|--|---|
| 465 | MN-S (March 4, 2023) | Section 5.6.1 Potential Interactions Between the Project and Valued Components/Key Indicators | <p>Issue #5-003: Interactions with the Human Environment Valued Components should be consistent with interaction table in related technical VC assessment sections. Comments have been made for revision to some of the interaction table in related VCs.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to update Table 5.6-2 be to be consistent with revised interaction tables for related VCs. | Acknowledged. Table 5.6-2, Summary Interaction Matrix for Valued Components in the Human Environment, will be cross-checked against the VC interactions tables related to the biophysical environment and updated for consistency in the final EIS, and in consideration of the comments provided by the reviewer on the individual biophysical environment VC interaction tables as noted. |
| 466 | MN-S (March 4, 2023) | Section 5.3 Scope of the Assessment | <p>Issue #5-004: It's best practice in environmental assessments to acknowledge limitations on data and analysis used for the assessment. This identifies constraints imposed on the assessment due to limitations in data or analysis that can influence or limit the ability to predict potential effects of the Project. This may be provided as a "technical boundary" or in some other transparent way as a part of the assessment reporting.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide details in the Final EIS on data and analysis limitations. | Data and analysis limitations are described within the relevant VCs existing environment, where applicable. As an example, See Section 12.2.3 Existing Environment for Community Well-Being which describes the limitations of Statistics Canada Census of Population Data, the limitations of Statistics Canada incident-based crime statistics, limitations associated to key person interviews, and others. |
| 467 | MN-S (March 4, 2023) | Section 5.8 Residual Effects Evaluation | <p>Issue #5-005: Details should be provided on what level of residual effects are carried forward for residual effects evaluation. This would help provide a consistent method for bringing measurable effects for a full residual effect assessment. This ensures that measurable (even minor) are not overlooked in residual effects characterization and consideration of significance. From review of the Draft EIS, there are instances where effects that remain after the implementation of all mitigation measures and management plans are characterized as minor and not carried forward for evaluation.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide details on the development and choice of thresholds used to describe residual effects including how LK and IK were considered in threshold development. - Denison needs to provide further explanation as to why minor effects will have no or negligible effects and should not be considered further. | <p>Section 5 of the draft EIS provides an overview of the assessment methodology, including how residual effects were characterized (i.e., those effects that were measurable after consideration of proposed mitigation. Each technical section of the draft EIS where effects are considered (draft EIS Sections 6 through 13) uses this assessment framework in consideration of the specific VCs / KIs that have been defined to represent that environmental component. Effects thresholds that define the presence / or absence of a residual effect have been described for each VC / KI. In some cases the thresholds are narrative in nature and in some cases, where available, numeric thresholds are used. The former tended to be based on SME knowledge and experience in like assessments and situations and in the latter the thresholds tended to be derived from published environmental quality objectives and guidelines. As an example, the manner by which residual effects were characterized for the Fish and Fish Habitat VC is given. Section 8.3.6.1 of the draft EIS provides the definition for a residual effect as follows, "A residual adverse effect on the Fish and Fish Habitat VC is defined as a measurable change in the concentrations of a surface water quality parameter(s) that exceed relevant water quality assessment benchmarks that represent concentrations that are protective of aquatic biota and water uses in watercourse and waterbodies that receive mine-affected drainage." In this example a numeric threshold is used (i.e., a relevant water quality assessment benchmark) and rationale is provided for its use (i.e., represent concentrations that are protective of aquatic biota and water uses in watercourse and waterbodies that receive mine-affected drainage). The threshold is both transparent and reasonable with the context of the assessment, though it is acknowledged that some level of change in the VC (or more precisely its measurable parameter) is deemed acceptable on condition that the change is not of a magnitude from which negative effects could accrue.</p> <p>Each technical section of the draft EIS where effects are considered (draft EIS Sections 6 through 13) notes how Indigenous Knowledge (IK), Local Knowledge (LK) and Engagement influenced the assessment. Whether generic or specific in nature the information was considered and woven into the assessment where possible. For example, water and the protection of water was generally noted as a key consideration to Indigenous peoples and LK holders. Accordingly, informs the framework of the assessment to ensure that water quality related VCs are included to provide a comprehensive evaluation related to water quality and affirms the need to assess water quality and sediment quality as they inform assessments for benthic invertebrates, fish and fish habitat, human health, and Indigenous land and resource use components.</p> |

|-----|---|---|--|--|
| 468 | MN-S (March 4, 2023) | Section 5.9.1 Cumulative Effects Assessment Process Section 12.1.7 Cumulative Effects | <p>Issue #5-006 and 12-005: Denison acknowledges that cumulative effects are important to Indigenous communities in section 5.9.3 (p. 5-42).</p> <p>For many Indigenous communities and governments, cumulative effects analysis requires an assessment this includes pre-development conditions to understand the impacts of past and existing activities that continue to affect the context for environmental and social systems. Considering the fuller context of historic change during an EA is an evolving best practice and is recognized through numerous Canadian cumulative effects assessment initiatives and management frameworks (e.g., Indigenous Centre for Cumulative Effects) and recent Indigenous led environmental assessment (e.g., Squamish Nation Assessment Process).</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide further detail on what projects and activities were considered in the cumulative effects i.e., table listing projects. - Denison needs to provide further detail on how it considers cumulative effects important to Indigenous communities and whether it includes an evaluation of changes to pre- development conditions as is being done as practice in other environmental assessments. This would allow Indigenous communities to better understand the ongoing impacts of past and existing activities that continue to affect Indigenous cultural use of lands and resources. | <p>With respect to review comment i) the following is noted. Section 5.9.2 of the draft EIS provides an overview of other Projects and activities that were considered present and reasonably foreseeable and could be a source of residual effects that could interact with the Project-specific residual effects. A preliminary list of projects and activities for potential consideration in the VC-specific cumulative effects assessment for the Project was provided in Table 5.9-1 of the draft EIS and their locations were shown relative to the Project site in Figure 5.9-1. Per Section 5.9.2.1 of the draft EIS, the original (or "preliminary") list of Projects and activities was scrutinized relative to various screening criteria to identify those present and reasonably foreseeable Projects and activities that were likely to interact with the Project VC in cumulative manner. It was this subset of Projects and activities that was carried forward into the cumulative effects assessment as described in Section 5.9.2.1.1 of the draft EIS.</p> <p>With respect to comment ii) the following is noted. The Wheeler River Project EIS is subject the Canadian Environmental Assessment Act, 2012. In this assessment framework, the Project-specific cumulative effects assessment (CEA) considers whether residual adverse effects of the Project on a given VC will overlap spatially and/or temporally with residual adverse effects on the VC resulting from other past, present, and reasonably foreseeable projects or activities. The CEA follows standard methodology as per provincial (e.g., Guidelines for an Environmental Assessment [Government of Saskatchewan 2022]) and federal guidance (e.g., Assessing Cumulative Environmental Effects under the Canadian Environmental Assessment Act, 2012 [Government of Canada 2019]). As noted in the IR, Section 5.9.3 of the draft EIS describes how Denison considers the cumulative effects assessment to be important to Indigenous peoples. As noted, the cumulative effects assessment is important to Indigenous communities because incremental effects to the environment can weaken resource economies, affect important resources such as plants, fish, and wildlife, affect rights-based and cultural activities, and affect both the health of wildlife and humans. Denison also noted and acknowledged the important relationship of the Indigenous Communities of Interest to the lands and waters in the Project study areas and sought out information from Indigenous Communities of Interest (ERFN and the Kineepik Métis Local #9 at Pinehouse (KML)) with respect to their Indigenous Knowledge on past, present, and predicted cumulative effects. Denison believes that the cumulative effects assessment does appropriately consider changes to pre- development conditions.</p> <p>References Government of Canada. 2019. Assessing Cumulative Environmental Effects under the Canadian Environmental Assessment Act, 2012. https://www.canada.ca/en/impact-assessment-agency/services/policy-guidance/assessing-cumulative-environmental-effects-ceaa2012.html. | 469 | MN-S (March 4, 2023) | Section 5.9.2 Identification of Present or Reasonably Foreseeable Projects and Activities | <p>Issue #5-007: Clarity is required that this includes existing ongoing activities that may not be certain but are highly likely to occur such as forestry and mine exploration activity. Denison did not include the new powerline that SaskPower is building in Table 5.9-1: Projects and Activities for Consideration in the Cumulative Effects Assessment for the Valued Components. See Section 2.3.1.9 for more details on the powerline to be constructed by SaskPower.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide further detail on the projects and activities that were considered for cumulative effects and why certain projects and activities were not included. For example, Denison needs to explain how reasonably foreseeable projects and activities that may not be certain but are highly likely in the RSA, such as mining exploration or infrastructure use and maintenance, are not included in Table 5.9-1. | <p>Section 5.9.2 of the draft EIS provides an overview of other Projects and activities that were considered present and reasonably foreseeable and could be a source of residual effects that could interact with the Project-specific residual effects. A preliminary list of projects and activities for potential consideration in the VC-specific cumulative effects assessment for the Project was provided in Table 5.9-1 of the draft EIS and their locations were shown relative to the Project site in Figure 5.9-1. Per Section 5.9.2.1 of the draft EIS, the original (or "preliminary") list of Projects and activities was scrutinized relative to various screening criteria to identify those present and reasonably foreseeable Projects and activities that were likely to interact with the Project VC in cumulative manner. Also show in Section 5.9.2.1 are the criteria by which the Present or Reasonably Foreseeable Projects and Activities were assessed. These criteria are consistent with CEAA's interim technical guidance on a future project (or physical activity) and how it could be considered reasonably foreseeable and areas as follows:</p> <ul style="list-style-type: none"> • The intent to proceed is officially announced by a proponent. • The project or activity is under regulatory review (i.e., the application is in process). • The submission for regulatory review is imminent. • The project or activity is identified in a publicly available development plan that is approved or for which approval is anticipated (e.g., a wastewater treatment plant in a city's long term development plan). • The physical activity supports—or is consistent with—the long-term economic or financial |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|---|
| | | | | <p>assumptions and engineering assumptions made for the project's planning purposes.</p> <ul style="list-style-type: none"> • A physical activity is required in order for the project to proceed (e.g., rail or port transportation facilities, or a transmission line). • The economic feasibility of the project is contingent upon the future development. • The completion of the project would facilitate or enable the future development. <p>Further information with respect to present and reasonably foreseeable projects and activities pertaining to exploration and mining activities, infrastructure use and maintenance, lodges/outfitters and tourist/ recreational activities and Indigenous and other land use activities are described in draft EIS Sections 5.9.2.1.1 through 5.9.2.1.4, respectively. Rationale for not carrying forward projects / activities that were part of initial screening is described in Section 5.9.2.2.</p> <p>The review comments has specifically references the power line development associated with the implementation of the Project. In response the following is offered. While it is true the power line to service the Project will be constructed by Sask Power the power line has been considered a Project activity for the purpose of the effects assessment and has been assessed in that context. With that there is no rationale nor need for assessing it as a separate project / activity within the CEA.</p> |
| 470 | MN-S (March 4, 2023) | Section 7.4.1 Potential Project- Valued Components Interactions | <p>Issue #7-001: There is lack of geotechnical information in the Draft EIS that would expand explanation of Project interactions with geology and groundwater.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - The Final EIS needs to demonstrate Denison's commitment to developing appropriate mitigations to avoid or limit identified adverse effects resulting from the Project, whether direct or indirect. | <p>Denison recognizes that geology and groundwater are of particular importance within the context of the EIS given the proposed mining method and believes that the assessment presented in the EIS and its supporting documentation is comprehensive. Denison is committed to developing / implementing appropriate mitigations to avoid or limit identified adverse effects resulting from the Project, whether direct or indirect. Proposed mitigation measures specific to geology and groundwater and presented in the draft EIS, Section 7.5, Mitigation Measures, and Table 7.5-1 therein provides a summary of mitigation measures based on Project phases for the geology and groundwater VC.</p> |
| 471 | MN-S (March 4, 2023) | Section 7.5 Mitigation Measures | <p>Issue #7-002: There is lack of information, details and modelling related to potential subsidence.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide additional detail in the Final EIS about mitigation measures related to operations affecting subsidence at ground surface including managing for different subsidence areas, different subsidence sizes, and whether subsidence will propagate further ground surface disturbances that will require further and continuous action. - Denison needs to prepare a management and monitoring plan for subsidence. | <p>To clarify with respect to the potential for subsidence, it is noted that the portion of the deposit being mined is never truly a void and what remains after mining will be a honeycomb texture with water-filled interstices. The mined area is filled with a fluid at all times, whether it be a mining solution, groundwater, or the neutralizing solution. This is different from a more traditional underground operation such as Cigar Lake, where there is physical excavation of the orebody, leaving a temporary air-filled space. Although the uranium ore is high-grade by global standards it is not entirely massive in nature. As such, the uranium will be leached in a 'honeycomb' texture leaving behind a structure of partial intact rock mass with the remaining area being filled by fluid. This retains the pressure balance of the mining zone with the adjacent water-saturated rock masses.</p> <p>Although the above provides context on the absence of true, air-filled voids remaining post-mining, the risk of subsidence has been assessed appropriately in the draft EIS and its supporting documents (see draft EIS as Appendix K to Appendix 7-C; see also draft EIS Section 7 Geology Valued Component - Terrain Morphology and Stability Key Indicator and draft EIS Section 9 Terrain Valued Component - Terrain Morphology Key Indicator and Terrain Stability Key Indicator). The analysis presented in the draft EIS shows there is negligible risk of subsidence and the magnitude of subsidence, if it were to occur, is the range of 7.5 cm at surface.</p> <p>Subsequent to the filing of the draft EIS, Denison has undertaken additional modelling with refined, more granular inputs including consideration of subunits within the altered zone. With this more refined analysis, the potential surface subsidence has been reduced from 7.5 cm to 2.4 to 2.8 mm. Further, this potential subsidence, if it were to occur, would be limited to the footprint directly above the deposit. Given the low levels of risk that has been determined, Denison believes the monitoring and contingency plans as envisioned in the draft EIS are commensurate with this low level of risk and appropriate.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|---|
| 472 | MN-S (March 4, 2023) | Section 8.0 Aquatic Environment | <p>Issue #8-001: Key waterbodies are inconsistently named on the maps/figures throughout section Section 8.0 Aquatic Environment. Key waterbodies include those considered as reference or exposure waterbodies, and any others of importance to NR2 and NR3 Locals.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to revise maps/figures to include labels for key waterbodies referenced in the EIS, particularly for figures included in section 8. - Denison needs to ensure waterbodies are named consistently throughout section 8.0 Aquatic Environment. | Acknowledged. Denison will update all maps/figures throughout Section 8 in the final EIS to more consistently include lake names. |
| 473 | MN-S (March 4, 2023) | Section 8.3.6.1 Residual Effects Characterization | <p>Issue #8-002: Not all fishing and hunting activities are documented. Currently, the MKS has not been completed and therefore this assumption may be incorrect.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to revise the fish and fish habitat section as part of the inclusion and consideration of the MKS in the Final EIS. - Denison needs to include additional information in the Final EIS that describes data limitations. A conservative approach would consider all waterbodies in the area to be potential fishing waterbodies for current and future use purposes. | <p>The draft EIS was prepared in consideration of the information available to Denison at that time. Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations. A study agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. The Métis Knowledge Study was received by Denison on October 24, 2023, and Denison has integrated relevant information from the Study into the EIS accordingly. It is important to note that Denison has incorporated Métis land use information and perspectives into the draft EIS, through the funding of the Kineepik Métis Land and Occupancy information along with the KML VEC statement, of which relevant information has been incorporated directly into the draft EIS to determine effects to the human environment.</p> <p>While Denison acknowledges the comment regarding what it perceives as a desire to include more regional data regarding fishing waterbodies of interest to MN-S within the context of cumulative effects, it believes the draft EIS and supporting documentation (including the aquatic environment baseline report, Appendix 8-D) provide a spatially extensive and appropriate description of fish habitat and fish resources in water bodies and water courses to assess potential cumulative effects given the spatial extent of Project interactions with the environment. For the purpose of a Project-specific CEA a cumulative effect can only exist when a residual Project effect overlaps in time and space with other current or reasonably foreseeable projects / activities. Where no such overlap exists, it is beyond the scope of a Project-specific CEA.</p> |
| 474 | MN-S (March 4, 2023) | Section 8.3.8 Monitoring and Follow-up | <p>Issue #8-003: Russell Lake is not identified as a location to monitor fish health.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to include Russell Lake in the aquatic monitoring program as cumulative effects from the Key Lake operation will be detected in this waterbody and this is an important local fisheries resource waterbody. - Denison should commit to involving MN-S, NR1 and NR3 in the development of management and monitoring plans for the aquatic environment in the Final EIS. | <p>As indicated in the review comment, Russell Lake was not specifically referenced as a location to monitor fish health. This would be based on the draft EIS conclusion that environmental change that might affect fish health (e.g., water quality) would not extend beyond the LSA and into Russell Lake. This however does not preclude incorporating Russell Lake into follow up monitoring based on alternative rationale. Specific details for follow up monitoring program design have yet to be developed and the appropriateness / suitability of sampling areas (including Russell Lake) will be evaluated through that process. Such determinations as to the appropriateness of sampling areas to be utilized for follow up monitoring for the aquatic environment will be made when that monitoring program / plan documentation is developed and would be subject to discussion with Interested Parties. As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other stakeholders, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: programs will meet regulatory requirements, programs will confirm the effectiveness of mitigation measures and predictions made in the assessment, programs will be implemented in an adaptive management framework (if/where applicable) to reduce effects during the lifetime of the Project, and programs will have spatial boundaries that are sufficiently extensive to measure EIS predictions.</p> <p>For further reference the following provides an overview of the information presented in the draft EIS and its supporting documentation regarding Russel Lake. Aquatic baseline surveys were conducted at two stations (LAB-1 and LAB-2) in Russell Lake and were considered 'far-field' stations in relation to the proposed mining plan for the Wheeler River Project. Data collection</p> |

|-----|---|--|--|---|
| | | | | <p>methods and results are presented in the draft EIS throughout the applicable subsections of Section 8.</p> <ul style="list-style-type: none"> • Section 8.2 details the Surface Water Quality methods and results, • Sections 8.3 and 8.5 detail fish habitat, community, and health methods and results; and • Section 8.4 details sediment quality and benthic invertebrate community and chemistry methods and results. <p>A breakdown of where specific processes and results are located for each of these components is presented below:</p> <p>Surface Water Quality/Chemistry: Surface Water Quality was sampled in Russell Lake. Methods and metrics are presented in Section 8.2.3.1. Water was sampled in Russell Lake and presented in Table 8.2-2 (Pages 8-60 to 8-62) of Section 8.2.3.3 of the EIS report, and summarized in Table 8.2-4. Surface Water predicted maximum Constituents of Potential Concern for the Russell Lake Inlet (LAB-1) are presented in Table 8.2-13 of Section 8.2.4.2.4. Cumulative effects are also assessed in Section 8.2.7. Detailed baseline summary data is presented in Appendix 8-D of the report in Table 3-3.</p> <p>Sediment Quality/Chemistry: Sediment was sampled in Russell Lake, and the sample methodology is presented in Section 8.4.3.1. Sediment grain size results are summarized in Table 8.4-2 in Section 8.4.3.2.1, and full data is presented in Appendix 8-D, Table 3-4. Sediment chemistry was summarized in Table 8.4-3, and full data is in Appendix 8-D, Table 3-5.</p> <p>Fish Habitat, Tissue Chemistry, and Community: Russell lake is not clearly indicated in the initial list of sample areas presented in Section 8.3.3 or Section 8.5.3; however, habitat information is presented in the Fish Habitat table (Table 8.3-4) of Section 8.3.3.2, and both Russell Lake sample locations (LAB-1 and LAB-2) and their associated fish community data are presented in the fish community map (Figure 8.3-6). Fish community and information is also presented in Table 8.3-4. Baseline fish community information is presented in Appendix 8-D of the report in Table 3-9. Fish chemistry summary data (Mean, Max, Min) for Northern Pike and White Sucker bone and tissue samples is presented in Table 8.5-2 of Section 8.5.3 of the Draft EIS. Detailed fish tissue data summary is presented in Appendix 8-D of the report in Table 3-10.</p> <p>Benthic Invertebrate Chemistry and Community: Benthic invertebrates were sampled in Russell Lake, and the sample methodology is presented in Section 8.4.3.1. Benthic invertebrate endpoints are summarized in Table 8.4-4 of Section 8.4.3.2.4, and benthic invertebrate chemistry is summarized in Table 8.4-5. Detailed baseline benthic invertebrate community and chemistry data is presented in Appendix 8-D of the report in Table 3-8, and community data in Tables 3-7A to 3-7D.</p> <p>Also, refer to Cumulative Effects sections within each part of the Aquatic Environment assessment in the draft EIS for a discussion of potential cumulative effects in Russell Lake. (i.e., Section 8.2.7 for surface water quality; Section 8.3.7 for fish and fish habitat, 8.4.7 for sediment quality and benthic invertebrates, and 8.5.7 for fish health).</p> |
| 475 | MN-S (March 4, 2023) | Section 8.5.7.1 Potential Cumulative Effects | <p>Issue #8-004: "Fish Health VC are primarily related to c the controlled" – there is a typo in the report.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to address the typo and replace "c" with the complete word. | <p>Acknowledged. The typo will be corrected in the final version of the EIS as follows, "Potential Project residual effects on the Fish Health VC are primarily related to controlled discharge of site water into local receiving environments during all Project phases."</p> |

|-----|---|---|---|--|
| 476 | MN-S (March 4, 2023) | Section 8.5.8 Monitoring and Follow-up | <p>Issue #8-005: It is unclear whether there is a physical barrier between Whitefish Lake North and Whitefish Lake South that would allow Whitefish Lake North to be considered as an appropriate reference area for monitoring fish health.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to clarify in the Final EIS on an appropriate reference area for monitoring fish health. - Denison needs to confirm fish movements between Whitefish Lake North and Whitefish Lake South and that Whitefish Lake North will be an appropriate reference lake. If it is not appropriate, then another reference lake such as Kochichowsky Lake may need to be considered for monitoring fish health. | <p>To clarify, there is no physical barrier between the north and south portions of Whitefish Lake.</p> <p>As indicated in the review comment the north basin of Whitefish Lake was suggested in the EIS as a potential upstream or reference monitoring for aquatic environment endpoints, including those related to fish health. Specific details for follow up monitoring program design have yet to be developed and the appropriateness / suitability of sampling areas will be evaluated through that process. The north basin of Whitefish Lake is the most proximal aquatic feature upstream of where treated effluent would be discharged and in that regard is a good candidate as a reference or non-influenced area. It is understood that proximity is not the only consideration as to the suitability of an area to be utilized as a reference area - as indicated in the review comment fish movement and mobility between sampling areas is also an important consideration since it is necessary to make comparisons, in the case of fish health, between / among independent fish populations. Such determinations as to the appropriateness of sampling areas to be utilized for follow up monitoring for the aquatic environment will be made when that monitoring program / plan documentation is developed and would be subject to discussion with Interested Parties.</p> |
| 477 | MN-S (March 4, 2023) | Section 9.1.1.3 Spatial Boundaries | <p>Issue #9-001: The terrestrial RSA seems small in consideration of woodland caribou and determining the impacts of the Project in association with the SK1 caribou population.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to evaluate the terrestrial RSA as it relates to the SK1 caribou population and Environment Canada's woodland caribou management plan. Provide a detailed explanation in the Final EIS as to how the terrestrial RSA was determined. | <p>The Project Area was delineated to capture all direct, and most indirect, likely adverse effects on caribou; as this is the zone of influence most likely to affect caribou in the vicinity of the Project (i.e., in the vicinity of human activity, equipment use and vehicle use). The Project Area (169.6 ha) is the direct footprint of proposed Project infrastructure (74.8 ha) with a buffer applied, thereby representing the area of maximum physical disturbance. The Project Area is not VC-specific, but consistent throughout the EIS.</p> <p>The Wildlife LSA was designed to capture the majority of the Project effects. The LSA extends beyond Project Area of the site to include a reasonable estimation of where sensory disturbance from Project-related activities would extend and where effects on wildlife including caribou are most likely to occur. That is the primary rationale for selection of the spatial extent of the LSA – Denison believes this is an appropriate spatial scale that applies broadly to the wildlife VCs as a whole given the perceived mechanism of VC-Project interaction.</p> <p>Importantly, as noted in draft EIS Section 9.3.6.4, in the caribou assessment, the Project Area had a 500 m buffer applied to account for indirect effects/habitat alteration; this area is within the wildlife LSA (refer to Figure 9.3-14 for a map showing the spatial areas). The 500 m buffer for habitat alteration for caribou was selected in accordance with ECCO's (2020) assessment of disturbed areas, which buffered (500 m) anthropogenic disturbances to evaluate woodland caribou habitat. The alteration of available woodland caribou habitat is quantified in this EIS by applying a buffer of 500 m around the Project Area in which Project effects in the form of sensory disturbance are likely to affect available woodland caribou habitat and make it functionally unavailable for use.</p> <p>Boreal caribou occur as one continuous population across the SK1 range, including within the Terrestrial RSA. It was decided to not use the entire SK1 range as an assessment area (e.g., due to the dilution factor) and instead use the Terrestrial RSA to appropriately and adequately assess residual and cumulative effects in proportion to the Project. It was deemed to be not feasible to use a large area like the SK1 range to assess residual Project effects because this would provide inappropriate context or "dilute" the adverse effects of the Project on the caribou that have a home range that overlaps with the RSA.</p> <p>The reviewer is also referred to the response provided to Information Requirement (IR) No. 137 from the Federal Indigenous Review Team (FIRT).</p> |

| 478 | MN-S (March 4, 2023) | Section 9.2.3.3 Wetlands Valued Components | <p>Issue #9-002: Figure 9.2-8 identifies lakes and waterbodies separately. There is a lack of clarity between a lake and a waterbody and its treatment in the EIS.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to clarify and distinguish in the Final EIS if and why lakes and waterbodies are treated differently. | <p>Footnote 4 of Table 9.2-5 of the draft EIS describes "lakes" and "waterbodies" the difference within the context of the assessment as follows: "Lakes have been defined as either named lakes or waterbodies observed to exhibit an average depth of ≥ 2 m (Ecometrix Incorporated 2020). Waterbodies are defined as areas of open water observed to exhibit an average depth of < 2 m (Ecometrix Incorporated 2020), or unnamed areas of open water without any existing bathymetric information."</p> <p>For further reference it is noted that lakes were not considered wetlands and not carried forward in our assessment, but waterbodies (identified as either < 2m deep or without bathymetric information) were conservatively considered to be shallow open water wetlands and assessed in the wetland assessment.</p> |
| 479 | MN-S (March 4, 2023) | Section 9.2.7.3 Cumulative Effects Characterization and Determination of Significance | <p>Issue #9-003: There is inadequate evaluation of the combined impact of all of these changes in vegetation on the terrestrial ecosystem. It is unclear whether there will be any short-term or long-term impacts on the overall health of the terrestrial ecosystem due to the individual changes to the terrestrial components.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide in the Final EIS an assessment of the cumulative impacts of all of the individual changes to the vegetation (e.g., change in vegetation types, a change in the COPC levels in vegetation and a change in wetland composition) on the entire terrestrial ecosystem. | <p>The assessment of potential Project related effects on the vegetation VCs followed standard assessment methodology using specific KIs and associated MPs. There is no practical, reliable way to combine all of the various KIs and associated MPs into a single, combined expression of potential effects as suggested by the review comment. The standard approach and practice is that each VC is evaluated independently using the KIs and associated MPs, setting appropriately conservative effects thresholds.</p> <p>As outlined in draft EIS Section 9.2.7.4, the residual effects of the Project, in conjunction with the comparable residual effects from past, present, and reasonably foreseeable future projects on the vegetation abundance and constituent concentrations in vegetation KIs were predicted to be not significant. Thus, the cumulative effects are not expected to alter the integrity of the Vegetation and Ecosystems VC (i.e., it remains sustainable and available to contribute to ecological functions) and is predicted to be not significant. Similarly, the residual effects of the Project, in conjunction with the comparable residual effects from past, present, and reasonably foreseeable future projects on the listed plant species and wetlands KIs were predicted to be not significant. Thus, the cumulative effects are not expected to alter the integrity of the Listed Plant Species VC and Wetlands VC (i.e., they remain sustainable and available to contribute to ecological functions) and are predicted to be not significant.</p> |
| 480 | MN-S (March 4, 2023) | Section 9.3.3.1.1 Scientific Literature Review | <p>Issue #9-004: The EA assumptions for moose harvest numbers and success are based on the SK database information which includes information for hunters in the southern portion of the province and for non-Indigenous peoples. Reliance on draw licences to support Project models does not capture Métis harvesting and traditional use activities in the Northern Administrative District of Saskatchewan. Métis do not participate in the draw system as they are recognized rights holders.</p> <p>Indigenous and non-Indigenous hunters have different hunting patterns. Although the data used in the EA is accurate for non- Indigenous hunters, this data should be used cautiously when assessing a project that is in an area where there is mostly (if not all) Indigenous hunters for moose and other ungulates.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide confirmation that the assumption that moose harvest information used in the Draft EIS is based on the SK database which includes information for hunters in the southern portion of the province and for non- Indigenous peoples. If yes: <ul style="list-style-type: none"> o Denison to acknowledge in the Final EIS that the Terrestrial Ecosystem Effects Assessment relied on draw licences to support assessment conclusions and these conclusions do not capture Métis harvesting and traditional use activities in the Northern Administrative District of Saskatchewan. In addition, Denison to note Métis do not participate in the draw system as they are recognized rights holders in the Final EIS. - Denison needs to incorporate Métis Knowledge from the MKS to the Project's Terrestrial Ecosystems Effects Assessment. - Denison to co-develop and implement a moose-specific monitoring and management plan with the Métis. - Denison needs to include Métis harvesting patterns in the Final EIS (e.g., rabbit, moose, caribou, fox etc.). | <p>With respect to bullet #1 the following is noted. Denison can confirm that the information provided in Section 9.3 (as well as 11.1) of the Draft EIS related to moose harvest data is based on the information that was publicly available from the Saskatchewan Ministry of Environment to contextualize moose harvest in the province and did not include specific harvest information from Indigenous sources as this was not available at the time. The final version of the EIS will provide further clarification as to the source of the moose harvest data, and that specifically it was obtained via the publicly available data regarding draw licenses.</p> <p>With respect to bullet #2 the following is noted. The draft EIS was prepared in consideration of the information available to Denison at that time. Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations. A study agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. The Métis Knowledge Study was received by Denison on October 24, 2023, and Denison has integrated relevant information from the Study into the EIS accordingly. It is important to note that Denison has incorporated Métis land use information and perspectives into the draft EIS, through the funding of the Kineepik Métis Land and Occupancy information along with the KML VEC statement, of which relevant information has been incorporated directly into the draft EIS to determine effects to the human environment.</p> <p>With respect to bullet #3 the following is noted. Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3, is committed to such engagement with respect to monitoring. As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other stakeholders, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: programs will meet</p> |

The draft EIS was prepared in consideration of the information available to Denison at that time. Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations. A study agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023 The Métis Knowledge Study was received by Denison on October 24, 2023, and Denison has integrated relevant information from the Study into the EIS accordingly.. It is important to note that Denison has incorporated Métis land use information and perspectives (including harvesting) into the draft EIS, through the funding of the Kineepik Métis Land and Occupancy information along with the KML VEC statement, of which relevant information has been incorporated directly into the draft EIS to determine effects to the human environment.</p> |
| 481 | MN-S (March 4, 2023) | Section 9.3.4.2.1 Alteration and/or Loss of Habitat | <p>Issue #9-005: The nature of vegetation regeneration on an altered landscape can have continuing effects on woodland caribou. This conclusion is sufficiently vague and assume regeneration will be suitable for woodland caribou.</p> <p>Denison does not provide information on the removal and decommissioning of the roads built for the Project or the extension of the transmission line in the Draft EIS. Linear disturbances like these are incredibly impactful to Métis traditional land use in and around the Project.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to identify how it will be determined that post-decommissioning revegetated habitat will be suitable for woodland caribou including any risk assessments completed to confirm the predictions. - Denison needs to involve MN-S as well as NR1 and NR3 Locals in decommissioning planning, mitigation, and monitoring. - Denison to provide further information on the removal and decommissioning of roads built for the Project and the extension of the transmission line built by SaskPower in the Final EIS. | <p>With respect to bullet #1 the following is noted. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS, and are presented at a relatively high level commensurate with the stage of Project development, including consideration of site restoration. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP. As the decommissioning plan becomes more specific and granular it is expected that the design basis will become more detailed. Consistent with this approach / process, the expectation is that restoration goals will be defined, the activities to be implemented to meet these goals will be defined and performance criteria to confirm that the goals are being / have been reached will also be defined. It is also noted that Denison has developed a Conceptual Caribou Mitigation Plan (the Plan) during discussions between Denison and Saskatchewan Ministry of Environment (ENV) in May and June 2023. As noted at this time the Plan is conceptual in nature but will go hand in hand with, and evolve with the decommissioning plan over time. Since the boreal caribou range plan for SK-1 is under development, it is understood that this Plan will be updated as more information becomes available. The conceptual nature of the Plan at this time is in part due to the absence of range plan priorities and reflects Denison's commitment to continue to work with ENV to meet the management objectives and management strategies for the SK1 range.</p> <p>With respect to bullet #2 the following is noted. Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3 and is committed to such engagement with respect to decommissioning planning, mitigation, and monitoring.</p> <p>With respect to bullet #3 the following is noted. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS, and are presented at a relatively high level commensurate with the stage of Project development, including consideration of site restoration. | 482 | MN-S (March 4, 2023) | Section 9.3.4.2.2 Change in Mortality | <p>Issue #9-006: Changes in the numbers of prey and/or predators during the post-decommissioning period could impact what animals are available for harvesting by the MN-S in the long-term.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to clarify and confirm the duration of the habitat changes that may interfere with predator/prey densities including any risk assessments completed to confirm the predictions. - Denison needs to involve MN-S, as well as NR1 and NR3 Locals in decommissioning planning, mitigation, and monitoring. | <p>With respect to bullet #1 the following is noted. Denison's decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure. Plans for the post-decommissioning phase, including land restoration are at the conceptual stage and will evolve over time. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS, and are presented at a relatively high level commensurate with the stage of Project development, including consideration of site restoration. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP. As the decommissioning plan becomes more specific and granular it is expected that the design basis will become more detailed and specifics as to what the post-decommissioning landscape will entail and the wildlife it would support as referenced in the review question will be developed. It is also noted that Denison has developed a Conceptual Caribou Mitigation Plan (the Plan) based on discussions between Denison and Saskatchewan Ministry of Environment (ENV) in May and June 2023. The Plan is conceptual in nature but will go hand in hand with, and evolve with the decommissioning plan over time. Since the boreal caribou range plan for SK-1 is under development, it is understood that this Plan will be updated as more information becomes available. The conceptual nature of the Plan at this time is in part due to the absence of range plan priorities and reflects Denison's commitment to continue to work with ENV to meet the management objectives and management strategies for the SK1 range.</p> <p>With respect to bullet #2 the following is noted. | 483 | MN-S (March 4, 2023) | Section 9.3.5.2 Additional wildlife specific mitigation measures | <p>Issue #9-007: A wildlife monitoring plan and a Woodland Caribou Management Plan are important tools for managing caribou in the short and long-term.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to involve MN-S as well as NR1 and NR3 Locals in the creation of the Woodland Caribou Management Plan, and include the plan in the Final EIS | <p>Denison has developed a Conceptual Caribou Mitigation Plan (the Plan) based on discussions between Denison and Saskatchewan Ministry of Environment (ENV) in May and June 2023. As noted the Plan is conceptual in nature at this time, largely because of the absence of range plan priorities. Denison is committed to continue to work with ENV to meet the management objectives and management strategies for the SK1 range as the boreal caribou range plan for SK-1 is developed. The Plan is a living document and will evolve over time as more information becomes available. In this regard, Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3 and is committed to such engagement with respect to decommissioning planning, mitigation, and monitoring.</p> |
| 484 | MN-S (March 4, 2023) | Section 9.3.6.4.1 Alteration and/or Loss of Habitat | <p>Issue #9-008: The woodland caribou may not return to the Project area for up to 20 years following post-decommissioning due to available food resources. This may have an impact on long-term harvesting of woodland caribou by the MN-S.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to clarify and confirm the duration of the habitat changes that may interfere with predator/prey densities including any risk assessments completed to confirm the predictions. - Denison needs to clarify and confirm the duration of the habitat changes that may interfere with predator/prey densities including any risk assessments completed to confirm the predictions. | <p>Denison acknowledges the comment and notes the following. Following submission of the draft EIS in October 2022, Denison has met with Saskatchewan Ministry of Environment (SK ENV) staff to develop a framework for future woodland caribou offset. This information has been presented to the provincial and federal review teams as part of the response to federal information requirements in August 2023 as the Conceptual Caribou Mitigation Plan.</p> <p>The Conceptual Caribou Mitigation Plan (the Plan), developed proactively by Denison, has a different objective than the draft EIS. The Plan builds on the assessment of potential Project effects and commitments to consider additional mitigation (offset) to account for non-significant residual effects highlighted in the draft EIS. The Plan is expected to be advanced with ongoing consultation with the SK ENV, as SK ENV finalize the caribou range plan for SK1. The EIS is a conservative planning tool, whereas the Plan is a practical, living document designed to define management works associated with caribou. The Plan is not a requirement for EA determination per se, but is provided as a guidance document to help Denison proactively describe and inform the development and implementation of appropriate mitigation measures related to caribou and their habitat.</p> <p>The Plan is an evergreen document. It will be consistent with the management goals of SK ENV for the SK-1 caribou conservation unit and will be developed/refined in consultation with local communities including English River First Nation and Kineepik Métis Local in Pinehouse and regulators. As noted above, the boreal caribou range plan for SK-1 is under development and it is understood that this Plan will be updated as more information becomes available. The conceptual nature of the Plan is in part due to the absence of range plan priorities and reflects</p> |

| | | | | |
|-----|---|---------------------------------------|--|---|
| | | | | <p>Denison's commitment to continue to work with the province to meet the management objectives and management strategies for the SK1 range.</p> <p>Denison is continuing to work with SK ENV to estimate habitat offset scenarios based on the current Project design which will be refined as the Project advances. A boreal caribou habitat offset calculator is under development by SK ENV and Denison is collaborating with SK ENV to define key scenario attributes. SK ENV will engage with Indigenous communities and nations as the province develops and refines the range management plan for SK1.</p> |
| 485 | MN-S (March 4, 2023) | Section 9.3.7.3.3 Woodland Caribou | <p>Issue #9-009: The 5% threshold disturbance is for a viable population which is the SK1 population.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide confirmation that the Final EIS appropriately used the Environment Canada threshold values on the woodland caribou population as they relate to the SK1 population. - Denison needs to confirm that the RSA and threshold is suitable in areal extent. See comment 9-001. - Denison needs to commit to re-evaluating their woodland caribou information in the Final EIS. Specifically, to ensure the woodland caribou information used by Denison is in alignment with the SK1 Range Plan being developed by the Province. | <p>In terms of the woodland caribou population in SK1, the likelihood of self-sustainability for the Boreal Shield range (SK1) has been updated from "unknown" (EC 2012) to "likely" in the amended recovery strategy (ECCC 2020). The SK1 range comprises more than 18,000,000 ha and is characterized by high fire disturbance and low anthropogenic disturbance (ECCC 2020). For SK1, the amended recovery strategy (ECCC 2020) identifies 40% undisturbed habitat in the range as the disturbance management threshold, which provides a measurable probability (71%) for the local population to be self-sustaining. This threshold is considered a minimum threshold because at 40% undisturbed habitat there remains a risk (29%) that the SK1 local population cannot be self-sustaining. According to ECCC (2020) disturbed habitat is habitat showing: i) anthropogenic disturbance visible on Landsat at a scale of 1:50,000, including habitat within a 500 m buffer of the anthropogenic disturbance; and/or ii) fire disturbance in the last 40 years, as identified in data from each provincial and territorial jurisdiction (without buffer). In contrast, according to ECCC (2020) undisturbed habitat is habitat not showing any: i) anthropogenic disturbance visible on Landsat at a scale of 1:50,000, including habitat within a 500 m buffer of the anthropogenic disturbance; and/or ii) fire disturbance in the last 40 years, as identified in data from each provincial and territorial jurisdiction (without buffer). The cumulative effects assessment in the draft EIS showed that the Project is expected to add 0.001% of anthropogenic disturbance at the scale of the SK1 Boreal Shield Woodland Caribou Management Unit (Section 9.3.7.3.3 of the EIS).</p> <p>Specific to woodland caribou, the draft EIS evaluated and assessed potential Project-related effects on the boreal population of woodland caribou following standard environmental assessment (EA) methodology. The assessment of potential effects considered both direct (i.e., habitat loss) and indirect effects (i.e., habitat alteration) on caribou and their habitat, while assuming that caribou were present year-round and during all of their life stages (i.e., calving, rearing, mating, over wintering). The rationale for the definition of study areas for the purpose of the assessment of the Terrestrial Environment valued components (VCs) is described in Section 9.1.1 of the draft EIS. The Project Area (169 ha or 1.69 km²) and LSA were delineated based on the expected extent of potential direct (footprint) and indirect (sensory disturbance) Project effects; whereas, the RSA considered an 8 km buffer around the Project Area to provide an appropriate spatial scale upon which potential Project effects could be evaluated at the landscape scale where key Terrestrial Environment VCs reside and move within and upon which cumulative effects could be assessed. Boreal caribou occur as one continuous population across the SK1 range (18,034,870 ha), including within the Terrestrial RSA. After consideration, it was decided by Denison and its Subject Matter Experts at EDI Environmental Dynamics Inc. to use the Terrestrial RSA for the cumulative effects assessment for caribou rather than the entire SK1 range. This decision was made largely on the basis that it would not be feasible / appropriate to use a such large area like the SK1 range to assess cumulative effects since consideration of such a large spatial extent would likely "dilute" the contribution of the Project to potential effects at that scale. In support of this decision, comparison of the Project-specific habitat effects (i.e., the Project Area plus a 500 m buffer to account for sensory disturbance) relative to the scale of the SK1 range (as the applicable management unit for portion of the woodland caribou population that uses the Terrestrial RSA) was made. The comparison indicated that the Project is expected to add 0.001% of anthropogenic disturbance at the scale of the SK1 Boreal Shield Woodland Caribou Management Unit (Section 9.3.7.3.3 of the EIS). As can be seen, the default conclusion at the range scale could only be that the Project does not contribute to cumulative effects at a practical measurable level.</p> <p>Denison and its SMEs believe the EIS took a precautionary or conservative approach to understanding/addressing the likely residual effects (i.e., effects remaining after mitigation</p> |

| | | | | <p>measures were considered) of the Project on caribou and their habitat. This approach provides is appropriate as a planning tool to inform/support future Project-related regulatory approvals processes and to guide the scope and nature of follow-up monitoring. After consideration of measures to avoid and mitigate the potential for effects on caribou and their habitat it was concluded that the likely residual effects of the Project on caribou and their habitat were not significant.</p> <p>While the EIS did not consider specific additional opportunities to offset the non-significant effects, Denison has been working to develop a Conceptual Caribou Mitigation Plan. The plan was submitted to the provincial and federal review teams as part of the response to federal information requirements in August 2023 as the Conceptual Caribou Mitigation Plan and Denison has been in close contact with the Saskatchewan Ministry of Environment (SK ENV), as stewards of woodland caribou from a regulatory perspective.</p> <p>References: Environment and Climate Change Canada (ECCC). 2020. Environment and Climate Change Canada, Ottawa. xiii + 143pp.</p> |
| 486 | MN-S (March 4, 2023) | Section 9.3.8 Monitoring and Follow-up | <p>Issue #9-010: Previous sections of the Draft EIS identified the development of the Woodland Caribou Management Plan.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to confirm the preparation and inclusion of a Woodland Caribou Management Plan within this section of the Final EIS. | <p>Denison acknowledges the comment and notes the following. Following submission of the draft EIS in October 2022, Denison has met with Saskatchewan Ministry of Environment (SK ENV) staff to develop a framework for future woodland caribou offset. This information has been presented to the provincial and federal review teams as part of the response to federal information requirements in August 2023 as the Conceptual Caribou Mitigation Plan. The Conceptual Caribou Mitigation Plan (the Plan), developed proactively by Denison, has a different objective than the draft EIS. The Plan builds on the assessment of potential Project effects and commitments to consider additional mitigation (offset) to account for non-significant residual effects highlighted in the draft EIS. The Plan is expected to be advanced with ongoing consultation with the SK ENV, as SK ENV finalize the caribou range plan for SK1. The EIS is a conservative planning tool, whereas the Plan is a practical, living document designed to define management works associated with caribou. The Plan is not a requirement for EA determination per se, but is provided as a guidance document to help Denison proactively describe and inform the development and implementation of appropriate mitigation measures related to caribou and their habitat. The Plan is an evergreen document. It will be consistent with the management goals of SK ENV for the SK-1 caribou conservation unit and will be developed/refined in consultation with local communities including English River First Nation and Kineepik Métis Local in Pinehouse and regulators. As noted above, the boreal caribou range plan for SK-1 is under development and it is understood that this Plan will be updated as more information becomes available. The conceptual nature of the Plan is in part due to the absence of range plan priorities and reflects Denison's commitment to continue to work with the province to meet the management objectives and management strategies for the SK1 range. Denison is continuing to work with SK ENV to estimate habitat offset scenarios based on the current Project design which will be refined as the Project advances. A boreal caribou habitat offset calculator is under development by SK ENV and Denison is collaborating with SK ENV to define key scenario attributes. SK ENV will engage with Indigenous communities and nations as the province develops and refines the range management plan for SK1.</p> |
| 487 | MN-S (March 4, 2023) | Section 11.1.1.1 Values Component Selection | <p>Issue #11-001: Arrangements and applicable funding to facilitate MN-S' participation and engagement in the EA process are underway. It is expected that MN-S will be given the opportunity to validate VC selection and have this information reflected in the Final EIS.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison, in the Final EIS, needs to demonstrate that it confirmed the selected valued components with Métis Locals in NR1 and NR3. - Denison needs to include in the Final EIS input from the Métis Knowledge Study and any changes in the selection of VCs and their characterization. | <p>At the direction of the MN-S, Denison participated in meetings on February 12, 2023 with NR1 and on February 13, 2023 with NR3. The participants at these sessions were identified and invited by the MN-S. During these meetings, Denison shared information about the Project and the associated VCs assessed as part of the environmental assessment. No new VCs were identified as part of that discussion, and should new ones emerge through process, we would consider them at that time.</p> <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> |

| 488 | MN-S (March 4, 2023) | Section 11.1.2.3 The Métis Nation of Saskatchewan | <p>Issue #11-002: The EIS states: "The parties have specifically agreed to a process between each other that will be funded by Denison and undertaken on behalf of the MN-S in connection with the EA of the Project: a Métis Knowledge Study, meetings to focus on VCs and preliminary effects, and regular meetings and associated costs for hosting such meetings."</p> <p>The correct name is "Métis Nation-Saskatchewan" (no "of").</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to correctly reference Métis Nation- Saskatchewan throughout the Final EIS. - Denison needs to include in the Final EIS input from the Métis Knowledge Study and any changes in the selection of VCs and their characterization. | <p>The EIS will be updated throughout to the correct name "Métis Nation-Saskatchewan" (no "of").</p> <p>At the direction of the MN-S, Denison participated in meetings on February 12, 2023 with NR1 and on February 13, 2023 with NR3. The participants at these sessions were identified and invited by the MN-S. During these meetings, Denison shared information about the Project and the associated VCs assessed as part of the environmental assessment. No new VCs were identified as part of that discussion, and should new ones emerge through process, we would consider them at that time.</p> <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> |
| 489 | MN-S (March 4, 2023) | Section 11.1.4.1 Potential Interactions Between the Project and Valued Component/Key Indicators | <p>Issue #11-003: Many of the Project Phase/Activities listed would contribute to a change in the environmental setting for Indigenous land and resource users within the LSA. Interactions should be considered for temporary or longer-lasting aesthetics impact related to Project-related dust, lighting, noise, and visual disturbance.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to revise Table 11.1-7 in the Final EIS to include the addition of interactions and effects analysis for "Perceived suitability of lands and resources therein" that considers Project-related construction and decommission impacts to Indigenous Land and Resource Use. For example, the development of access roads and site preparation during construction, and demolition and disposal of surface infrastructure during decommission, would likely result in some interaction with ILRU related to noise, dust, or traffic. | <p>Table 11.1-7 will be revisited to include to the development of access roads and site preparation during construction, and demolition and disposal of surface infrastructure during decommission.</p> |
| 490 | MN-S (March 4, 2023) | Section 11.1.4.3.1 Terrestrial Resource Availability | <p>Issue #11-004: Missing information to support the claim that other large terrestrial mammals, such as elk and white-tailed deer species, are not found in sufficient abundance in the LSA to be assessed as part the Project.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to include additional information in the Final EIS on why large terrestrial mammals that are harvested in the LSA (such as elk and white-tailed deer) are not found in sufficient abundance in the LSA to support this conclusion. | <p>The Saskatchewan Ministry of Environment (SK MOE) manages the conservation and allocation of wildlife resources on behalf of all Saskatchewan residents. Many resource management tools are used to manage species abundance and to reduce conflict between resource users. Tools include hunting seasons, management areas, considering other land use activities, limiting firearm types, and harvest limits. In addition to these tools, the SK MOE has developed a wildlife allocation policy to determine how harvestable game is allocated to hunters and manage resource management conflicts (SK MOE 2017a).</p> <p>Section 11.2.3.1 describes that the Wildlife Management Zones and Special Areas Boundaries Regulations, 1990 (Government of Saskatchewan 2014) define Wildlife Management Zones (WMZs) as areas for managing, harvesting, controlling, or regulating wildlife. Wildlife Management Zones are defined based on several factors including ecosystem classification and by land tenure or ownership. Wildlife Management Zones are primarily used to help with species conservation, as the goal is to have hunters harvest the surplus of a species. For the management of big game, the LSA is within WMZ 75. The RSA extends into WMZs 74, 75, and 76. Section 11.2.3.1.2 describes how other big game species, such as white-tailed deer or elk, are not hunted in WMZ 75 due to the absence or low abundance of these species.</p> <p>Section 9.3.3.1 of the EIS describes the existing environment in terms ungulates. The ungulates VC is represented by one KI: moose. A potential reason for low moose density could be the poorly productive shield ecosystem and successional dynamics both of favour conifers at all seral stages with limited production of deciduous browse post-disturbance.</p> <p>Appendix 9-A describes baseline data collection for the terrestrial environment, including winter track and pellet count surveys for wildlife within the study area.</p> |

| 491 | MN-S (March 4, 2023) | Section 11.1.5 Mitigation Measures | <p>Issue #11-005: In the Draft EIS, Denison has proposed to develop mitigation measures and management planning, but has not begun engaging with Métis Community of Interest and MN-S on contents of mitigation measures or management plans.</p> <p>It is good practice for Communities of Interest, including Métis, to have the opportunity to contribute to the scoping, development, and implementation of mitigation measures and management plans (and monitoring programs), including effectiveness reviews and the application of an adaptive management approach.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to include in the Final EIS, effects mitigation, and management and monitoring plans that were prepared with MN-S and NR1 and NR3 Locals involvement and agreement. | <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |
| 492 | MN-S (March 4, 2023) | Section 11.1.8 Monitoring and Follow-up | <p>Issue #11-06: In the Draft EIS, Denison has proposed to develop monitoring programs, but as not begun engaging with MN-S or NR1 and NR3 Locals on contents of these programs.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to include in the Final EIS, management and monitoring plans that were prepared with MN-S and NR1 and NR3 Locals involvement and agreement. | <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> <p>As the Project site will be self-sufficient in terms of meeting the needs of the Project and its workforce, the effects related to local communities are associated with the effects of participation in employment and the associated commuter rotation system. With the application of mitigation measures described in Section 12.3.5, and given the distance between communities in the LSA and the Project site, the residual adverse effects are expected to be low in magnitude. The overall conclusion relative to changes to Infrastructure and Services is not significant.</p> |
| 493 | MN-S (March 4, 2023) | Section 11.1.7 Cumulative Effects Section 11.2.7 Cumulative Effects | <p>Issue #11-07 and 11-12: For many Indigenous communities and governments, cumulative effects analysis requires an assessment that includes pre-development conditions to understand the impacts of past and existing activities that continue to affect the context for environmental and social systems.</p> <p>An evolving best practice during an EA is to consider the fuller context of historic change. This practice is recognized through numerous Canadian cumulative effects assessment initiatives and management frameworks (e.g., Indigenous Centre for Cumulative Effects) and recent Indigenous led environmental assessment (e.g., Squamish Nation Assessment Process).</p> | Noted. |
| 494 | MN-S (March 4, 2023) | Section 11.2.3.1.2 Big Game Hunting | <p>Issue #11-08: The EA assumptions for big game numbers and success are based on the SK database information which includes information for hunters in the southern portion of the province and for non-Indigenous peoples. Reliance on draw licences to support Project models does not capture Métis harvesting and traditional use activities in the Northern Administrative District of Saskatchewan. Métis do not participate in the draw system as they are recognized rights holders.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison to acknowledge in the Final EIS that the Terrestrial Ecosystem Effects Assessment relied on draw licences to support assessment conclusions and these conclusions do not capture Métis harvesting and traditional use activities in the Northern Administrative District of Saskatchewan. In addition, Denison to note Métis do not participate in the draw system as they are recognized rights holders in the Final EIS. - Denison needs to incorporate Métis Knowledge from the MKS to the Project's Terrestrial Ecosystems Effects Assessment. | <p>Section 9.3.3.1.1 describes how the Project is located in WMZ 75, while WMZ 73, 74, and 76 are adjoining WMZ 75 (Figure 9.3.6). Between 2014 and 2020 (the years for which data are available), no draw licences were sold for any of these WMZ and, therefore, no associated harvest was reported to have occurred in the area based on draw licenses. While this breakdown to WMZ harvest numbers is not available for resident regular licences, it is assumed that most of the annual harvest through resident regular licences occurred in the southern part of the province.</p> <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> |

|-----|---|---|---|---|
| 495 | MN-S (March 4, 2023) | Section 11.2.3.1.4 Upland Game Bird Hunting | Issue #11-09: To characterize trends in wildlife harvesting it would be more appropriate to show a period longer than 1 year; at least 5 years where available. Recommendations: - Following best practices, Denison should include at least 5 years of data in the Final EIS for upland game bird harvest and harvest effort in Game Bird Management. | Temporal boundaries for characterizing components of the OLRU existing environment varied by topic. Commercial trapping and fishing data were presented based on the data available from the Province of Saskatchewan, and with multiple years of data presented where available. Other topics such as recreational fishing and hunting considered data where available, but in some instances is based on licensing quotas which do not always vary from year to year, or are based on self-reported outcomes. Specific to game bird harvesting, over 5 years of data is provided on annual grouse harvest (2014 to 2020) in Section 9.4.3, Table 9.4-3. |
| 496 | MN-S (March 4, 2023) | Section 11.2.3.9 Indigenous Perspectives on Other Land and Resource Use | Issue #11-10: The characterization of Indigenous perspectives on other land and resource use does not yet reflect MN-S and NR1 and NR3 Locals values or interests as this has not yet been provided. It is expected that when made available, this information will be reflected in the Final EIS. Recommendations: - Denison needs to include in the Final EIS, information provided by Métis Locals in NR1 and NR3 on their perspectives on other land and resource use. | A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study. As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. |
| 497 | MN-S (March 4, 2023) | Section 11.2.4.5.1 Aesthetic Experience | Issue #11-011: This conclusion is not consistent with the methods detailed on page 5-30 in section 5.8 as the Draft EIS identifies noticeable residual effects related to traffic (increased traffic volume) and noise (low to moderate impact). These effects should be taken to residual effects assessment. Recommendations: - To be consistent with the methods detailed in section 5.8, Denison should include all noticeable Project-related effects for residual effects assessment. For example, effects were identified related to traffic (increased traffic volume) and noise (low to moderate impact) but were not taken to residual effects assessment for Other Land and Resource Use in the Final EIS. | Potential Project disturbances considered under this pathway included increases in traffic, noise, air quality, modification of the wilderness experience, and increases in competition for resources. These disturbances will be most detectable in locations proximal to the Project site. Effects have the most potential to affect cabin leaseholders due to their use of ground travel, hunting and fishing activities, and general proximity to the Project. With the exception of dust which has proven mitigation strategies, the overall disturbances are negligible and there are a limited number of resource users who will experience them to any detectable degree. Therefore, this pathway is not carried forward for residual effects assessment. Section 11.2.5 describes the mitigation measures to reduce the impacts of traffic, noise, and others. Further mitigations for traffic are described in Section 12.3.5 in Section 12 and for noise are described in Section 6.2.5 in Section 6. |
| 498 | MN-S (March 4, 2023) | Section 12.1.2.3 Other Sources of Information and Local Knowledge | Issue #12-001: Arrangements and applicable funding to facilitate the MN-S' participation and engagement in the EA process are underway. It's expected that MN-S will be given the opportunity to provide information related to cultural expression and this information will be reflected in the Final EIS. Recommendations: - Denison needs to include in the Final EIS, information provided by Métis Locals in NR1 and NR3 on their input related to cultural expression. | Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations. A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study. Section 12.2.4.2.1 describes that multiple pick-up points for workers will be determined as part of Project design, including additional locations to be determined relative to eligible labour force supply. As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing |

| | | | | adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. |
| 499 | MN-S (March 4, 2023) | Section 12.1.4.2.1 Potential Effect 1: Change in Knowledge Transmission | <p>Issue #12-002: Need some clarification on this statement as it's reasonable to assume that both parents (mother and father), aunts' and uncles, and other relatives who are members of the community/family would potentially be employed and be away from home. Transmission of knowledge has the potential to be disturbed if multiple family and community members are away on working rotation.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide clarity in the Final EIS on the statement that "knowledge transmission is likely to continue because the entire family and community are involved" considering the potential that with local hiring practices in place, multiple family and community members may be away on working rotation and not able to adequately facilitate knowledge transfer. | <p>Denison acknowledges that both parents (mother and father), aunts' and uncles, and other relatives who are members of the community/family could potentially be employed by the Project. Mitigation measures associated with potential effects to cultural continuity and the commuter-rotation system are described in Section 12.1.5 and include:</p> <ul style="list-style-type: none"> - Working with Indigenous COIs to understand culturally important periods relative to harvest times and cultural camps to facilitate Indigenous employees taking time off to participate in such activities, where practicable; - Implementation of Denison's Indigenous Peoples Policy and advancement of reconciliation - Using a commuter rotation system has also shown to be effective in allowing Indigenous employees continued opportunities to spend time on the land, and important factor in the transmission of knowledge and language (see Section 11 for a description of potential effects to land use). <p>Denison remains committed to maintain positive working relationships with all Indigenous COIs and will be open to discussion on any issues or concerns that arise.</p> <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |
| 500 | MN-S (March 4, 2023) | Section 12.1.4.2.1 Potential Effect 1: Change in Knowledge Transmission | <p>Issue #12-003: The Draft EIS points to follow-up programs as a way to address any uncertainties identified during the EA process. Insufficient detail is provided to reflect how avoidance of areas near the Project may occur; monitoring (and adaptive management) is needed. More clarity on how monitoring will be developed (in section 12.1.8, p. 12-34) to address this uncertainty.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide more detail in the Final EIS on monitoring (and adaptive management) for areas of uncertainty such as displacement of cultural activities. This includes management and monitoring plans that were prepared with MN-S involvement and agreement. | <p>Changes to knowledge transmission as described in Section 12.1.4.2.1 stem from two factors: changes to Indigenous Land and Resource Use, and individual participation in the commuter rotation system - both of which have the potential to affect the ways in which individuals spend time participating in cultural activities. Although there is some uncertainty as to the extent to which individuals will continue to participate in activities that support knowledge transmission, experience from other uranium operations in northern Saskatchewan, the shared and communal nature of cultural expression (i.e., occurs within entire extended families and communities) combined with the Project's minimal effects to land and resource use are not expected to alter the ways in which cultural expression currently occurs (or might vary under regular circumstances). As such, no specific monitoring related to changes to cultural expression are planned.</p> <p>Denison acknowledges the concern raised regarding cultural activities related to working at an industrial operation. Mitigation measures associated with potential effects to cultural continuity (including knowledge transfer and language) are described in Section 12.1.5 and include:</p> <ul style="list-style-type: none"> - working with Indigenous COIs to understand culturally important periods relative to harvest times and cultural camps to facilitate Indigenous employees taking time off to participate in such activities; and - implementation of Denison's Indigenous Peoples Policy and advancement of reconciliation; <p>Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3 and is committed to such engagement with respect to decommissioning planning, mitigation, and monitoring. Denison remains committed to maintaining positive relationships</p> |

| | | | | with Indigenous communities and will be open to discussion on any issues or concerns that arise over the course of the Project. |
| 501 | MN-S (March 4, 2023) | Section 12.1.4.2.2 Potential Effect 2: Change in Traditional Diet | <p>Issue #12-004: The EIS states: "Experience from other uranium operations in northern Saskatchewan suggests that resource use will continue despite the potential selenium exceedance. . . members had developed their own culturally appropriate practice of risk assessment and management based on their relationship with the land. . . .The ERFN Trapper had a positive relationship with other uranium operations in the ILRU LSA." The claims made in this section sound like the potential Project effects being identified are to be mitigated by ILRU users' behavior, based on past behavior patterns, rather than Project mitigation.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to include in the Final EIS, health risk assessment management and monitoring plans that are prepared with MN-S involvement and agreement to address suitability of land and resources for Indigenous land users. - Denison should confirm this assertion through a monitoring program that will focus on providing data to verify the predictions and include communication planning to convey health risk assessment results. This may also address assumptions about perceived suitability of lands and resources. | <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> <p>As the Project site will be self-sufficient in terms of meeting the needs of the Project and its workforce, the effects related to local communities are associated with the effects of participation in employment and the associated commuter rotation system. With the application of mitigation measures described in Section 12.3.5, and given the distance between communities in the LSA and the Project site, the residual adverse effects are expected to be low in magnitude. The overall conclusion relative to changes to Infrastructure and Services is not significant.</p> |
| 502 | MN-S (March 4, 2023) | Section 12.1.8 Monitoring and Follow-up | <p>Issue #12-006: Areas of uncertainty were identified in the analysis of Cultural Expression (e.g., displacement of cultural activities). Adaptive management is an appropriate strategy for helping to reduce uncertainty about environmental effects and the effectiveness of mitigation. It provides flexibility to identify new mitigation measures or to modify existing ones during the life of the Project.</p> <p>In the Draft EIS, Denison has proposed to develop monitoring programs, but has not begun engaging with MN-S on contents of these programs. As a rights holder, MN-S should have the opportunity to contribute to the scoping, development, and implementation of monitoring programs, including effectiveness reviews and the application of an adaptive management approach.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Considering areas of uncertainty were identified in the analysis of Cultural Expression (e.g., displacement of cultural activities) in the Draft EIS, MN-S request more details in the Final EIS on monitoring (and adaptive management) for areas of uncertainty related to Indigenous cultural expression. This includes a monitoring program that will focus on providing data to verify the predictions and include communication planning to convey health risk assessment results. This may also address assumptions about perceived suitability of lands and resources. | <p>Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations.</p> <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> <p>Section 12.2.4.2.1 describes that multiple pick-up points for workers will be determined as part of Project design, including additional locations to be determined relative to eligible labour force supply.</p> <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |

|-----|---|---|--|--|
| 503 | MN-S (March 4, 2023) | Section 12.2.2 Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Assessment | Issue #12-007: Arrangements and applicable funding for a Métis Knowledge study is underway but not yet incorporated in the assessment. Recommendations: - Denison, in the Final EIS, needs to incorporate the outcome of the Métis Knowledge Study. | A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study. As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. |
| 504 | MN-S (March 4, 2023) | Section 12.2.4.1 Potential Interactions Between the Project and Valued Component / Key Indicators | Issue #12-08: The interaction table (12.2-5) identifies "Employment and Expenditures" as the only project component that would influence community well-being. This is inconsistent with previous interactions tables and information in the Draft EIS that identified potential interactions with the physical components and activities of the project that could affect aspects of community identity and cohesion (e.g., section 12.1 Cultural Expression). Comments were raised in the Draft EIS that community health and well-being is related to the relationship with the environment including issues such as changes in water quality or quantity, and mental health being affected by industrial development. Furthermore, section 12.2.3.3 (p. 12-66 to 12-73) identifies the natural environment as a component of community cohesion. This should be better reflected in the analysis of Community Well-being. Recommendations: - In the Final EIS, Table 12.2-5: Potential Project Interactions for Community Well-being (p. 12-74 to 12-77) should include the addition of interactions and effects analysis for "Change in Community Cohesion" that considers Project-related construction, operations, and decommission impacts to mental, physical, and cultural health that stem from a relationship with the environment. | Denison acknowledges that there is an interrelationship between the two and for the purposes of the EIS has been organized into separate sections. Section 11.1 provides an assessment on perceived suitability of lands and resources therein, along with human health. See Section 11.1.4, 11.1.5, and 11.1.6 for further information. |
| 505 | MN-S (March 4, 2023) | Section 12.2.4.2.1 Potential Effect 1 – Change in Population and Demographics | Issue #12-009: In the Draft EIS, Denison has proposed to develop mitigation measures and management planning, but as not begun engaging with MN-S on contents of mitigation measures or management plans. As a rights holder, MN-S should have the opportunity to contribute to the scoping, development, and implementation of mitigations, such as input into the location of pick-up points and commuter transportation options. Recommendations: - The Final EIS should include detail on how the input provided by Métis Locals in NR1 and NR3 and MN-S will influence the development of the location of pick-up points and commuter transportation options and address concerns related to in-migration and out-migration pressures. | Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations. A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study. Section 12.2.4.2.1 describes that multiple pick-up points for workers will be determined as part of Project design, including additional locations to be determined relative to eligible labour force supply. As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. |

| | | | | Denison will establish a procurement approach throughout all phases of the Project, prioritizing the procurement of goods and services for the Project toward businesses based within the LSA communities prior to looking elsewhere in northern Saskatchewan, southern Saskatchewan, and/or outside of Saskatchewan. This procurement approach may consider advance sharing of purchasing requirements of goods and services throughout all phases of the Project, efforts to increase the capacity and capabilities of businesses to increase successful bidding outcomes, and the development of a business registry. |
| 508 | MN-S (March 4, 2023) | Section 12.2.4.2.3 Potential Effect 3 – Change in Community Cohesion | Issue #12-012: “Community concerns” are identified related to impact to family and community cohesion due to working away from home for long periods. More detail is needed to understand Denison's approach and commitment to addressing community concerns related to community and family cohesion effects for residents of the LSA. Recommendations: - Denison needs to provide more detail within the Final EIS related to worker rotation system mitigation. Particularly considering the identification of reported difficulty in balancing the demands of a worker rotation system with domestic commitments, and many local community members concern of being unable to achieve a work-life balance. | Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. Denison recognizes that both parents and members of the community/family could potentially be employed by the Project. Mitigation measures associated with potential effects to community cohesion and the commuter-rotation system are described in Section 12.1.5 and include: - Working with Indigenous COIs to understand culturally important periods relative to harvest times and cultural camps to facilitate Indigenous employees taking time off to participate in such activities, where practicable; - Implementation of Denison's Indigenous Peoples Policy and advancement of reconciliation - Using a commuter rotation system has also shown to be effective in allowing Indigenous employees continued opportunities to spend time on the land, and important factor in the transmission of knowledge and language (see Section 11 for a description of potential effects to land use). As noted in the draft EIS, Section 8.2.9 “Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program.” MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. |
| 509 | MN-S (March 4, 2023) | Section 12.2.4.2.3 Potential Effect 3 – Change in Community Cohesion | Issue #12-013: Terminology like “could” is a vague indicator of commitment to developing strategies to address training and support systems for workers. More detail is needed to understand Denison's approach and commitment to addressing community concerns related to providing appropriate local resources for training and support as access to education and supports systems effects for residents of the LSA. Recommendations: - Denison needs to provide more detail within the Final EIS related to their role in developing and providing culturally appropriate resources for training, education and supports systems as access has already been identified as a barrier to local communities. - Denison needs to support Métis training opportunities through Northlands College. | Denison, through a Human Resource Development Plan, will initially prioritize Indigenous and non-Indigenous communities in the LSA in terms of employment and training opportunities (anticipated to be in institutions in northern Saskatchewan) and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project, which could include such items as on-the-job training and career counselling to help with advancement from foundational positions, advance sharing of job qualification requirements, clearly identifying training requirements and working with various training institutions (such as Northlands College) to make sure such appropriate training is available, and creation of scholarship and support programs. Priority for employment and training will then focus on Indigenous and non-Indigenous residents of the RSA and then beyond the RSA. All positions at the Project will require a Grade 12 education or equivalent. Section 13.3.2.1 describes how foundational positions (i.e. entry level) require Grade 12 education and in-house training programs, although a combination of skills and experience may be considered. These positions would include process plant operators, site services, drillers, and catering/janitorial staff. Denison will update the Economics Section to reflect the latest census and the effects that Covid has had on employment in the LSA and RSA. Further, Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in |

As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|------|---|--|--|--|
| | | | | <p>Section 12.2.4.2.1 describes that multiple pick-up points for workers will be determined as part of Project design, including additional locations to be determined relative to eligible labour force supply.</p> <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |
| 516 | MN-S (March 4, 2023) | Section 12.2.8 Monitoring and Follow-up | <p>Issue #12-020: This statement is vague about who will monitor community cohesion and whether Government departments and private- sector companies are committed to provide those services for the life of the Project. It also ignores previous statements in the Draft EIS that identify direct and indirect effects of uncertainty related to changes to community well-being that would be related to the Project.</p> <p>Denison's earlier statements indicate that monitoring and follow-up will be an aspect of mitigation. The statements seem contradictory.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison, in the Final EIS, needs to demonstrate that whether Government departments and private-sector companies are committed to provide community cohesion- related services for the life of the Project. - Denison needs to distinguish and clarify earlier statements of monitoring and follow- up with the assertion here. | <p>Denison is committed to implementing measures within its control and responsibilities (for example the EFAP and other measures). As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> <p>Monitoring of community cohesion at the community level is something Denison understands is for the Government to consider.</p> |
| 517, | MN-S (March 4, 2023) | Section 12.3.1.3.1 Spatial Boundaries | <p>Issue #12-021: Contrary to the text describing the Traffic Study Area, Highway 914 and Highway 165 are not labelled on Figure 12.3-3.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - MN-S request the revision of Figure 12.3-3 to include labelling of Highway 914 and Highway 165 in the Final EIS. | <p>Please refer to Figure 12.3-4 which describes the location of the Project in relation to Highway 914 and 165.</p> |
| 518 | MN-S (March 4, 2023) | Section 12.3.4.2.1 Potential Effect 1 – Change in Traffic | <p>Issue #12-022: The 31% or 51% increase in truck traffic on Highway 914 seems to represent a more than slight increase in traffic volume. It is acknowledged that this is related to 18 additional trucks per day. Clarification is required to determine if there would be a similar % increase in potential collisions.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to clarify and provide analysis of the impact of traffic volume and what is a suitable threshold. | <p>Denison believes it has fulfilled its information requirements for the EIS and supporting documentation as outlined in the EA guidance provided by the province and federal government. Notwithstanding that, Denison recognizes that further information will be required as the project moves through the EA and licensing / permitting processes. Denison will work with the province to identify and scope additional information requirements.</p> |
| 519 | MN-S (March 4, 2023) | Section 12.3.4.2.1 Potential Effect 1 – Change in Traffic | <p>Issue #12-023: Clarity is required to explain why collisions can not be predicted with accuracy given the availability of existing predictive modelling for traffic management planning.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison should provide further clarification in the Final EIS of why collisions can not be predicted with accuracy given the availability of existing predictive modelling for traffic management planning. | <p>To clarify, the text in Section 12.3.4.2.1. could have more specifically referenced accident rates as part the discussion of an increase in the number of collisions due to the Project. Overall, it is expected that accident rates will not be affected by the incremental increase in traffic associated with the Project. Traffic volume is a poor predictor of accident rates on relatively well traveled roads - that is, the accident rate does not show a direct relationship with traffic volume and is relatively consistent in this case. Extrapolating existing accident rates and specifically applying them to the Projects related traffic would provide some insight but it is understood that such extrapolation would be very conservative and overestimate the actual level of risk. Accident statistics are inclusive of all manner of accidents, the majority if which are single vehicle accidents that do not result in significant harm to people or property. Moreover, it would be expected that the likelihood of Project-related traffic accidents would occur at lower rates than those attributed to the general public based on the mitigations described in the draft EIS</p> |

Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|---|
| | | | | <p>(Section 12.3.5) including: all drivers serving the Project will receive appropriate training related to the nature of materials being transported, including driver training to the highest standards based on the transportation of nuclear substances; vehicles transporting dangerous goods and/or hazardous products will display required placards and labels in accordance with provincial legislation and will follow designated highway corridors; an Emergency Response Plan will be developed in case there is a spill during the transportation of dangerous goods and/or hazardous products; and all, materials transported by truck will be compliant with any weight restrictions or permits, spring road restrictions, or geometric constraints set out by the Saskatchewan MOHI.</p> <p>The above notwithstanding, Denison recognizes the level of concern regarding Project related transportation it has received through engagement activities to date and will continue to solicit input on transportation concerns as the Project moves forward and as the Program / Plan / Procedure documentation is developed during licensing since elements of this documentation directly align with management of the aforementioned concerns (e.g., emergency response planning, transportation management planning).</p> |
| 520 | MN-S (March 4, 2023) | Section 12.3.4.2.2 Potential Effect 2 – Change in Community Infrastructure and Services | <p>Issue #12-024: Clarification is required to explain how Denison intends to provide employee maintenance support services that address the indirect effect to the community members (e.g., childcare, etc.) identified in this statement.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison to provide in the Final EIS additional detail on commitments to support employee families while on rotation. | <p>Section 12.3.5 describes the mitigation measures applicable to community infrastructure and services within the LSA communities, the following mitigation measures will be implemented to reduce adverse effects:</p> <p>(1) Services and programs will be provided on-site and will be accessible to workers. These services and programs may alleviate pressures on social and health services within LSA communities.</p> <p>(2) An EFAP will be part of each worker's benefits package and will provide supports to individuals and their families that may not be readily available in the communities. Employee and family assistance programs typically provide free assessments, short-term counselling, referrals, and follow-ups to employees and their family members who are having personal or work-related problems. Generally, EFAPs can be accessed remotely by workers and their immediate family. Denison will aim to educate their staff on the offerings of their EFAPs, as well as making that information shareable with individuals' families.</p> |
| 521 | MN-S (March 4, 2023) | Section 12.3.4.2.2 Potential Effect 2 – Change in Community Infrastructure and Services | <p>Issue #12-025: The services listed in Table 12.3-14 are predominately crisis management services and general health care services which are provided by existing organizations in the community/region. Clarification is required to identify the community services that Denison will make available to the families of local employees to address shift rotation issues (e.g., childcare services) and how Denison will help families with access these services.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison should clarify their commitment to providing provide community social services to the families of local employees to address issue identified in relation to the shift rotation (e.g., childcare services) | <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> <p>As the Project site will be self-sufficient in terms of meeting the needs of the Project and its workforce, the effects related to local communities are associated with the effects of participation in employment and the associated commuter rotation system. With the application of mitigation measures described in Section 12.3.5, and given the distance between communities in the LSA and the Project site, the residual adverse effects are expected to be low in magnitude The overall conclusion relative to changes to Infrastructure and Services is not significant.</p> |
| 522 | MN-S (March 4, 2023) | Section 12.3.2 Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Assessment (p. 12- 108) | <p>Issue #12-026: Arrangements and applicable funding for a Métis Knowledge study is underway but not yet incorporated in the assessment.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to include in the Final EIS, Métis Knowledge study findings on their perspectives on infrastructure and services. | <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." | | | | | adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. |
| 523 | MN-S (March 4, 2023) | Section 12.3.4.2.2 Potential Effect 2 – Change in Community Infrastructure and Services | Issue #12-027 and 12-028: Clarification is required to indicate how the on-site programs would support community-based health services. Recommendations: - Denison to provide additional information of on-site health services that will alleviate community-based health services in NR1 and NR3. - Denison needs to confirm how social responsibility guidelines will support community infrastructure and services in NR1 and NR3 to help offset some of the interactions and effects to local communities and timelines for the action. | As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions. As the Project site will be self-sufficient in terms of meeting the needs of the Project and its workforce, the effects related to local communities are associated with the effects of participation in employment and the associated commuter rotation system. With the application of mitigation measures described in Section 12.3.5, and given the distance between communities in the LSA and the Project site, the residual adverse effects are expected to be low in magnitude. The overall conclusion relative to changes to Infrastructure and Services is not significant. |
| 524 | MN-S (March 4, 2023) | Section 12.3.5 Mitigation Measures | Issue #12-029: Most of the mitigations provided are standard worker health and safety and materials handling measures required for worker and environmental safety and don't address potential effects to traffic within the LSA. Detail is required to demonstrate how measures will address potential hazards from increased traffic volumes, and potential risk for conflict between road users and mining traffic. Recommendations: - Denison needs to provide additional information in the Final EIS on how the mitigation will alleviate traffic related impacts. | Denison believes the mitigations it has outlined for transportation management (and associated risks thereof) as detailed in the draft EIS (Section 12.3.5, Section 14, Appendix 14-A) are reasonable and practical measures it can take to manage its Project activities. It is acknowledged that the information provided in the EIS and its supporting documentation is presented at a planning level; however, this level of detail is appropriate at this stage of Project development. Further details as to how these mitigations will be implemented will be developed during the licensing / permitting phase and will be available for review at that time, rather than as part of the final EIS. Further to this, and as noted elsewhere, Denison recognizes the level of concern regarding Project related transportation it has received through engagement activities to date and will continue to solicit input on transportation concerns as the Project moves forward and as the Program / Plan / Procedure documentation is developed during licensing since elements of this documentation directly align with management of the aforementioned concerns (e.g., emergency response planning, transportation management planning). Mitigations in Section 12.3.5 also require Denison truck traffic to slow to 40 km/hr for a minimum of 2.5 km on either side of the culture camp(s) in which are understood to occur in September and October (dates may be adjusted at the communities' direction). Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3 and is committed to such engagement with respect to mitigation measures and monitoring plans. |
| 525 | MN-S (March 4, 2023) | Section 13.1.1 Valued Component Selection | Issue #13-001: This section of the draft EIS states: "Residents in the LSA and Regional Study Area (RSA) have expressed interest and concern about the Project's effect on the local economy, through income, training and employment opportunities, and business opportunities. Initial direction and input into VC selection was obtained from: - discussions with Indigenous and non-Indigenous Communities of Interest (COI); - discussions with LK holders; - discussions with government agencies and the public; - results of Denison's baseline studies; - regional data from other EAs; - results from engagement and consultation activity; and - similar or recent projects in the region." (p. 13-5 to 13-6) Recommendations: | Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. At the direction of the MN-S, Denison participated in meetings on February 12, 2023 with NR1 and on February 13, 2023 with NR3. The participants at these sessions were identified and invited by the MN-S. During these meetings, Denison shared information about the Project and the associated VCs assessed as part of the environmental assessment. No new VCs were identified as part of that discussion, and should new ones emerge through process, we would consider them at that time. |

| 528 | MN-S (March 4, 2023) | Section 13.1.4 Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Assessment | Issue #13-004: Denison has not sufficiently engaged MN-S, NR1 communities, and NR3 communities on the assessment of the Economics VC. Recommendations: - Denison needs to meet with MN-S, NR1 Locals, and NR3 Locals to discuss Project- related economic issues and interests. - MN-S request additional detail is included within the Final EIS, on how the input provided by MN-S, NR1 Locals, and NR3 Locals will influence the assessment of the Economics VC. | Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. At the direction of the MN-S, Denison participated in meetings on February 12, 2023 with NR1 and on February 13, 2023 with NR3. The participants at these sessions were identified and invited by the MN-S. During these meetings, Denison shared information about the Project and the associated VCs assessed as part of the environmental assessment. No new VCs were identified as part of that discussion, and should new ones emerge through process, we would consider them at that time. |
| 529 | MN-S (March 4, 2023) | Section 13.2.1.2 Participation Rate | Issue #13-005: Denison has not assessed the participation rate, employment rate, or unemployment rate of MN-S or NR1 and NR3 communities. Recommendations: - In the Final EIS, Denison needs to expand the description of the existing environment to include NR1 communities and NR3 communities. | Spatial boundaries for the Economy VC were selected to reflect the geographic areas where economic impacts from the Project are likely to be detectable and measurable. These impacts are expected to be driven primarily by the relationship and interactions between the Project and the COI. Further, Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. |
| 530 | MN-S (March 4, 2023) | Section 13.2.1.3 Employment Rate | Issue #13-006: Denison acknowledges that several barriers to employment in northern Saskatchewan exist without providing solutions to address and/or mitigate such barriers. Recommendations: - Denison needs to provide more detail within the Final EIS related to their role in developing and providing resources for training and employment as access has already been identified as a barrier to local communities. | Section 13.4 Mitigation and Enhancement Measures provides details on Denison's Human Resource Development Plan, which will initially prioritize Indigenous and non-Indigenous communities in the Local Study Area in terms of employment and training opportunities and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project - such as on the job training and career counselling to help with advancement from foundational positions, advance sharing of job qualification requirements, clearly identifying training requirements and working with various training institutions, including Northlands College, to make sure such appropriate training is available, and creation of scholarship and support programs. Priority for employment and training will then focus on Indigenous and non-Indigenous residents of the Regional Study Area and then beyond the Regional Study Area. A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study. |
| 531 | MN-S (March 4, 2023) | Section 13.2.3 Key Indicator: Traditional Economy | Issue #13-007: The Métis Knowledge study by MN-S has not been completed and included in the Draft EIS. Recommendations: - Denison needs to engage all potentially impacted Métis communities. Specifically, Denison should equally engage all NR1 and NR3 Locals in addition to Kineepik Metis Local #9 on potential Project-related effects to Métis traditional economy throughout the life of the Project. - The Final EIS needs to include the Métis Knowledge Study once completed. | A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study. |-----|---|---|--|--|
| 532 | MN-S (March 4, 2023) | Section 13.2.4.1 Local Businesses | <p>Issue #13-008: The EIS states: “Economic leakage (i.e., money leaving the local economy) is a relevant concern, particularly for small, concentrated economies. Economic leakage can occur at various points through the cascade of spending in an economy, but the closer that leakage occurs to the point source of investment, the more potential economic benefit that is lost.” (p. 13-51)</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide more certainty and detail within the Final EIS related to local employment and procurement mitigation to manage for and reduce ‘economic leakage’. | Denison's Indigenous Peoples Policy sets out priority for Indigenous employment and procurement (among other items). With respect to employment, as noted in Section 13.3.2.1 of the EIS, Residents of Saskatchewan's North (i.e., those resident in the northern administration district of Saskatchewan) are prioritized for employment as an expected condition of the Surface Lease Agreement, similarly for goods and services to service the Project. With respect to procurement, Denison has established an internal procurement policy approach. The approach requires that Denison consider businesses within the local study area first and the Northern Administrative District second, prior to looking elsewhere (southern Saskatchewan and/or outside of Saskatchewan) throughout all phases of the Project. Section 13.4 Mitigation and Enhancement Measures also provides details on Denison's Human Resource Development Plan, which will initially prioritize Indigenous and non-Indigenous communities in the Local Study Area in terms of employment and training opportunities and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project, priority for employment and training will then focus on Indigenous and non-Indigenous residents of the Regional Study Area and then beyond the Regional Study Area. |
| 533 | MN-S (March 4, 2023) | Section 13.3.1 Potential Interactions Between the Project and Valued Component / Key Indicators | <p>Issue #13-009: Denison does not include MN-S or NR1 communities within the LSA in the assessment on the economy and therefore employment, training, and business opportunities will not be prioritized for all potentially impacted Métis.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison to include MN-S and all NR1 communities in the LSA for the economy VC in the Final EIS. | <p>Spatial boundaries for the Economy VC were selected to reflect the geographic areas where economic impacts from the Project are likely to be detectable and measurable. These impacts are expected to be driven primarily by the relationship and interactions between the Project and the COI.</p> <p>Further, Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. |-----|---|--|--|---|
| 536 | MN-S (March 4, 2023) | Section 13.3.2.1 Potential Effect 1 - Employment and Training | <p>Issue #13-012 and 13-013: Denison has not identified Métis-specific considerations to their employment and training program. Denison has indicated that there will in-house training, as well. It is not clear how this will be delivered.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide more certainty and detail within the Final EIS related to local training and employment. More detail within the Final EIS related to Denison's role in developing and providing resources for training and employment as access has already been identified as a barrier to local communities. This includes training programs prepared with MN-S/NR1 and NR3 Locals involvement and agreement. - More information is needed to understand Denison's approach and commitment to addressing effects to local employment especially as it relates to Foundational positions and why a Grade 12 education is required. - Denison needs to update the Economics Section to reflect the latest census and the effects that Covid has had on employment in the LSA and RSA. - Denison needs to engage MN-S, NR1 Locals, and NR3 Locals to discuss employment and training opportunities for Métis (e.g., discussing Métis-specific recruitment strategies). Opportunities to discuss include (but are not limited to): hiring and training practices during all phases of the Project, on-the-job training and career counselling to help with advancement from foundational positions, advance sharing of job qualification requirements, clearly identifying training requirements and working with various training institutions to make sure such appropriate training is available, and creation of scholarship and support programs. | <p>Denison, through a Human Resource Development Plan, will initially prioritize Indigenous and non-Indigenous communities in the LSA in terms of employment and training opportunities (anticipated to be in institutions in northern Saskatchewan) and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project, which could include such items as on-the-job training and career counselling to help with advancement from foundational positions, advance sharing of job qualification requirements, clearly identifying training requirements and working with various training institutions (such as Northlands College) to make sure such appropriate training is available, and creation of scholarship and support programs. Priority for employment and training will then focus on Indigenous and non-Indigenous residents of the RSA and then beyond the RSA.</p> <p>All positions at the Project will require a Grade 12 education or equivalent. Section 13.3.2.1 describes how foundational positions (i.e. entry level) require Grade 12 education and in-house training programs, although a combination of skills and experience may be considered. These positions would include process plant operators, site services, drillers, and catering/janitorial staff.</p> <p>Denison will update the Economics Section to reflect the latest census and the effects that Covid has had on employment in the LSA and RSA.</p> <p>Further, Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS.</p> |
| 537 | MN-S (March 4, 2023) | Section 13.3.2.2 Potential Effect 2 – Income | <p>Issue #13-014: Initiating efforts with LSA communities excludes most of the Métis communities and keeps them from benefiting.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - The Final EIS needs to include additional evaluation of non- LSA communities potential for income benefits. | <p>Denison's Indigenous Peoples Policy sets out priority for Indigenous employment and procurement (among other items). With respect to employment, as noted in Section 13.3.2.1 of the EIS, Residents of Saskatchewan's North (i.e., those resident in the northern administration district of Saskatchewan) are prioritized for employment as an expected condition of the Surface Lease Agreement, similarly for goods and services to service the Project. With respect to procurement, Denison has established an internal procurement policy approach. The approach requires that Denison consider businesses within the local study area first and the Northern Administrative District second, prior to looking elsewhere (southern Saskatchewan and/or outside of Saskatchewan) throughout all phases of the Project. Section 13.4 Mitigation and Enhancement Measures also provides details on Denison's Human Resource Development Plan, which will initially prioritize Indigenous and non-Indigenous communities in the Local Study Area in terms of employment and training opportunities and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project, priority for employment and training will then focus on Indigenous and non-Indigenous residents of the Regional Study Area and then beyond the Regional Study Area.</p> |
| 538 | MN-S (March 4, 2023) | Section 13.3.2.3 Potential Effect 3 - Traditional Economy | <p>Issue #13-015: Denison has not incorporated Métis Knowledge from MN-S, NR1, or NR3 (except Métis Knowledge from Kineepik).</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison will need to revise the potential effects evaluation after completion of the MKS. | <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |

Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|---|
| 539 | MN-S (March 4, 2023) | Section 13.3.2.3 Potential Effect 3 - Traditional Economy | Issue #13-016: Denison has not included details on closure planning including traditional economic activities that can be expected upon decommissioning. Recommendations: In the Final EIS, Denison needs to provide additional information on closure planning and what traditional economic activities can be expected upon decommissioning. | The draft EIS includes the Project's Conceptual Decommissioning Plan (CDP) (see Section 2.2.3). As the name implies the decommissioning plan for the site is presented at a relatively high level commensurate with the stage of Project development, including consideration of physical decommissioning activities and reclamation (or restoration) activities. With specific reference to reclamation / restoration the draft EIS notes that disturbed areas would be returned to become a self-sustaining and viable wildlife habitat, but little further detail is provided at this early stage. That detail will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP. As the decommissioning plan becomes more specific and granular it is expected that the design basis will become more detailed. Denison noted the MN-S interest in how traditional economic activities can be integrated into the decommissioning plan and such considerations can be made as the plan evolves. Denison is committed to continued engagement with the MN-S at their direction, inclusive of engagement in NR1 and NR3, and within that context expects that integration of traditional economic activities within the context of site decommissioning will be part of those discussions. |
| 540 | MN-S (March 4, 2023) | Section 13.3.2.3 Potential Effect 3 - Traditional Economy | Issue #13-017: Denison has not engaged MN-S, NR1, and NR3 to understand Métis-specific effects of the Project's proposed commuter-rotation schedule. Recommendations: (1) In the Final EIS, Denison needs to provide more detail related to worker rotation system mitigation. Particularly considering the identification of reported difficulty in balancing the demands of a worker rotation system with traditional economy activities. | Denison acknowledges the concern raised regarding participation in the traditional economy related to working at an industrial operation. Participation in the worker rotation system would present similar challenges as those described in the Métis Knowledge Study Report which describes how people's ability to go out on the land is challenged by work schedules generally and the busyness of the modern world. Mitigation offered for other VCs would equally apply to an individual's ability to continue to participate in culturally important activities, such as: - working with Indigenous COIs to understand culturally important periods relative to harvest times and cultural camps to facilitate Indigenous employees taking time off to participate in such activities; and - implementation of Denison's Indigenous Peoples Policy and advancement of reconciliation; Other uranium operations in northern Saskatchewan have shown that using a commuter rotation system has been effective in allowing Indigenous employees continued opportunities to spend time on the land, which similarly supports the traditional economy. Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3, and within that context expects that the concerns raised by the review comment will be part of those discussions. |
| 541 | MN-S (March 4, 2023) | Section 13.3.2.3 Potential Effect 3 - Traditional Economy | Issue #13-018: As identified in section 11.1.6 (p. 11-66 to 11-68), Indigenous land use may be affected by the Project despite mitigations. It is reported that Project-related effects such as noise and dust can cause avoidance of the area by some resource harvesters while others may be undeterred. Recommendations: (1) Denison needs to include in the Final EIS, information provided by Métis in NR1 and NR3 once the MKS is completed. (2) Denison needs to support Métis training opportunities through Northlands College. | Section 13.4 Mitigation and Enhancement Measures provides details on Denison's Human Resource Development Plan, which will initially prioritize Indigenous and non-Indigenous communities in the Local Study Area in terms of employment and training opportunities and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project - such as on the job training and career counselling to help with advancement from foundational positions, advance sharing of job qualification requirements, clearly identifying training requirements and working with various training institutions, including Northlands College, to make sure such appropriate training is available, and creation of scholarship and support programs. Priority for employment and training will then focus on Indigenous and non-Indigenous residents of the Regional Study Area and then beyond the Regional Study Area. A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study. |

| 542 | MN-S (March 4, 2023) | Section 13.4 Mitigation and Enhancement Measures | <p>Issue #13-019: Limited listing of potential measures for consideration.</p> <p>Recommendations:</p> <p>(1) It is unclear from the description of Mitigation and Enhancement Measures whether Impact and Benefit Agreements (IBAs) will be included. Impact and Benefit Agreements are a normal vehicle for extending economic benefits to Indigenous communities.</p> <p>(2) In the Final EIS, confirm whether IBAs are also a mitigation and enhancement measure.</p> | <p>Denison's Indigenous Peoples Policy sets out priority for Indigenous employment and procurement (among other items). With respect to employment, as noted in Section 13.3.2.1 of the EIS, Residents of Saskatchewan's North (i.e., those resident in the northern administration district of Saskatchewan) are prioritized for employment as an expected condition of the Surface Lease Agreement, similarly for goods and services to service the Project. With respect to procurement, Denison has established an internal procurement policy approach. The approach requires that Denison consider businesses within the local study area first and the Northern Administrative District second, prior to looking elsewhere (southern Saskatchewan and/or outside of Saskatchewan) throughout all phases of the Project. Section 13.4 Mitigation and Enhancement Measures also provides details on Denison's Human Resource Development Plan, which will initially prioritize Indigenous and non-Indigenous communities in the Local Study Area in terms of employment and training opportunities and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project, priority for employment and training will then focus on Indigenous and non-Indigenous residents of the Regional Study Area and then beyond the Regional Study Area.</p> |
| 543 | MN-S (March 4, 2023) | Section 13.4 Mitigation and Enhancement Measures | <p>Issue #13-20: Denison has not engaged MN-S or all NR1 Locals and NR3 Locals to understand employment and training needs to support Métis involvement in the Project.</p> <p>Recommendations: Denison indicated multiple pick-up points but a minimum of 3 points (2 in the LSA and 1 in Saskatoon). In the Final EIS, Denison needs to clarify if pick-up points will be extended to the RSA communities so that they can take advantage of employment opportunities.</p> | <p>Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. For the purposes of the organization of the EIS, such organizations as the MN-S and YNLR are understood as organizations.</p> <p>A Capacity Funding Agreement was signed with the MN-S to complete a Métis Knowledge Study by the end of October 2023. As part of this study agreement, Denison agreed to fully fund the Métis Knowledge Study. Denison received the Métis Knowledge Study from the MN-S on October 24, 2023. Denison has updated the revised draft EIS to include relevant information in the assessment from the Métis Knowledge Study.</p> <p>Section 12.2.4.2.1 describes that multiple pick-up points for workers will be determined as part of Project design, including additional locations to be determined relative to eligible labour force supply.</p> <p>As noted in the draft EIS, Section 8.2.9 "Specific follow-up and monitoring plans will be prepared to refine and finalize approach in consultation with Indigenous groups, other interested parties, and relevant federal and provincial agencies with interest in the development and implementation of this VC specific program." MN-S will be informed throughout the monitoring program design and implementation process. Monitoring program design and implementation will be guided by the following principles: meet regulatory requirements, confirm the effectiveness of mitigation measures and predictions made in the assessment, implementing adaptive management (if/where applicable) to reduce effects during the lifetime of the Project, and will ensure that spatial boundaries are sufficiently extensive to measure EIS predictions.</p> |
| 544 | MN-S (March 4, 2023) | Section 13.5.1.1 Employment and Training | <p>Issue #13-021: Denison has not identified mitigation and enhancement measures to support their conclusion that employment and training residual effects are expected to be low to moderate in magnitude.</p> <p>Recommendations:</p> <p>(1) Denison needs to expand its description of mitigation and enhancement measures to better support their conclusion that employment and training residual effects that are low to moderate in magnitude in Section 13.5.</p> | <p>Denison recognizes that there is a need for and will be an annual evaluation of outcomes. The residual effect on employment and training during Construction, Operation, and Decommissioning is expected to be positive. Positive effects are expected to occur primarily in the LSA and RSA but are also expected to extend beyond the RSA as the labour demands of the Project are unlikely to be met with local resources only. Effects associated with employment are expected to occur continuously through each Project phase, while it is anticipated that training efforts will be focused largely during the operational phase (although some initiatives may be in place prior to the onset of Operation to maximize opportunities). Effects will be reversed after Decommissioning is completed; however, individuals who benefits from employment and training will have skills to carry forward to future opportunities.</p> <p>Section 13.5 describes the mitigation and enhancement measures for economy, including those specific to education and training:</p> <ul style="list-style-type: none"> Denison, through a Human Resource Development Plan, will initially prioritize Indigenous and non-Indigenous communities in the LSA in terms of employment and training opportunities (anticipated to be in institutions in northern Saskatchewan) and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the |

| 546 | MN-S (March 4, 2023) | Section 15.5.3 Effects on the Project | <p>Issue #15-001: Meeting current regulations and building codes may not be sufficient for short-term or long-term environmental effects as they are characterized in the Draft EIS (e.g., forest fires, flooding). Please provide detail on how the Project will be designed to exceed current regulations in anticipation of changing to environmental conditions.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide additional detail in the Final EIS describing how the Project will be designed beyond current regulations and building codes in anticipation of changes to environmental conditions. | <p>From an operations perspective the current mine design is sufficiently robust such that changes in environmental conditions that may be expected, such as increased precipitation event intensity, over the operational life of the mine can be accommodated. For example, the design basis for water management infrastructure far exceeds standard design basis. The following is noted regarding the design basis for water management infrastructure for reference. The probable maximum precipitation (PMP) value of 493 mm selected for design of water management infrastructure, such as ponds, is similar to total annual precipitation (456 mm from Key Lake station, and 483 mm from 1981-2020 climate normals). The selected PMP is well above (>5 times higher): 1) current/measured 24-hour maximum precipitation, 2) modelled 1 in 100 year 24-hour return for current conditions, 3) modelled 1:100 year 24 hour return for a future (2020-2050) period, 4) the predicted maximum 1-day precipitation under different emissions scenarios for the future (including RCP8.5 in the 2021-2050 period).</p> <p>Design basis to accommodate environmental change over the longer term is a factor that will be considered as it pertains to decommissioning. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS, and are presented at a relatively high level commensurate with the stage of Project development. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP. As the decommissioning plan becomes more specific and granular it is expected that the design basis will become more detailed. Denison is committed to and will factor in longer term considerations of environment and climate within the evolution of the decommissioning plan,</p> |

| | | | | |
|-----|---|---|---|---|
| | | | | and in particular as it concerns how changes in environment and climate could affect decommissioning and restoration goals. |
| 547 | MN-S (March 4, 2023) | Section 15.5.3 Effects on the Project | <p>Issue #15-002: Further details are required on how emergency preparedness and response plans will adaptively respond to changing climatic conditions and potential unforeseen effects to the Project.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide additional detail in the Final EIS about their commitment to developed adaptive emergency preparedness and response plans to address unforeseen effects to the Project resulting from climate change. | <p>Section 2.9.1.3.5 of the draft EIS provides the commitment to develop an Emergency Preparedness and Response Program (EPRP). The EPRP would be established to identify how the Project will prepare for and addresses emergencies that may affect the health and safety of persons, the environment, and the protection of property. The EPRP would be developed in a manner that aligns with guidance provided by CNSC in REGDOC-2.10.1. As noted on the draft EIS, Denison has opted to execute the overall Project approvals process - that is, the environmental assessment and licensing / permitting processes - in series and not simultaneously. As such, the documentation will be developed during the licensing / permitting phase and will be available for review at that time rather than as part of the final EIS. The level of information provided in the draft EIS is appropriate for the stage at which the overall Project approvals process currently sits, and as noted, MN-S and others, will have an opportunity to review documentation that is developed at later stages of the overall approvals process as appropriate. It is confirmed that the EPRP will include provision for change management and an explanation as to how change management will occur. The EPRP will be a living document that will be reviewed regularly and updated as needed - such updates may be required for a myriad of reasons including those related to climate change as noted by the review comment.</p> |
| 548 | MN-S (March 4, 2023) | Appendix 2-A 19-EN-CNSC-1.23, Workshop, 2018-01-16 | <p>Issue #2A-001: The site tour on January 16, 2018 only included the following Métis representation: A La Baie Métis Local #21, Kineepik Métis Local #9, MN-S, and Patuanak Métis Local #82. In addition, other Indigenous Nations were present. It is unclear from Denison's table format who asked how long to freeze and would the freeze wall be kept intact for the life of the operation. Denison shared responses to these questions in their Draft EIS.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Engagement on the proposed Project needs to extend to NR1 communities. The Final EIS should include proof of this engagement and responses to concerns raised. | <p>Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|--|
| 549 | MN-S (March 4, 2023) | Appendix 2-A 22-EN-EQC-648.1, Presentation, 2022- 03-03 | Issue #2A-002: These meetings had representation from Métis Local #39 (La Loche) and no other Métis. It is unclear who asked, "What are the concerns with groundwater monitoring...". MN-S does not consider Denison's engagement with the EQC as engagement with MN-S or Métis communities. MN-S prefers Denison specify feedback shared at joint workshops by Indigenous Nation. Recommendations: - Denison engagement with Métis communities has been limited. In the Final EIS, MN-S expects to see more informed engagement and responses to concerns raised. | Thanks and noted. Denison continues to engage with the MN-S at their direction, inclusive of engagement in NR1 and NR3. Denison understands the MN-S is a governing body of the Métis Citizens in Saskatchewan and recognizes that communities the MN-S governs may be included as a COI and are recognized as such in the EIS. |
| 550 | MN-S (March 4, 2023) | Appendix 7-C, Numerical Modelling: Post-decommissioning Evaluation, Executive Summary | Issue #7C-001: Page ii of this document states states: ""By accounting for these reactions, the simulated dissolved constituent plumes emanating from the ore zone reach their maximum extents within the deeper units (i.e., Lower Sandstone Aquifer and deeper parts of the Desilicified Zone) after approximately 10,000 years. Consequently, concentrations at Whitefish Lake throughout the future centuries are simulated to be similar to background concentrations. Under the base case scenario, which represents a conservative estimate of the conditions present, there are no exceedances of the groundwater quality screening criteria protective of freshwater aquatic life in the receiving environment." Whether conditions are "conservative" or not, is dependent on perspective. Recommendations: - Denison needs to provide further rationale detailing how the "base case scenario" represents a conservative estimate of the conditions present. | It is acknowledged that additional details could have been added to the Appendix 7-C Executive Summary to provide more fulsome context for the comment that the "base case scenario" is conservative. The basis for this statement was the robust data set of subsurface geochemistry that supported the assumptions in the model with respect to concentrations of sorbing mineral phases and the uncertainty analysis that was performed. The uncertainty analysis evaluated the potential that conditions at the base case were not adequately conservative. The uncertainty analysis is detailed in Section 4.7 of the report. This included increasing the mass of chemical constituents of potential concern (COPCs) within the source (mining area), increasing the hydraulic conductivity of key zone and/or hydrostratigraphic units, decreasing the number of reactive sites for sorption of COPCs, removing some sorbent phases altogether from key hydrostratigraphic units, and other scenarios focused on geochemical and hydrologic uncertainties. Altogether, there were 15 uncertainty scenarios tested in addition to the base case. For the base case, and all uncertainty scenarios, no exceedances of ground water quality screening criteria were generated at Whitefish Lake into the future (i.e. over the "future centuries" period), apart from those that reflect natural conditions. The results are provided in detail in Sections 4.6.6 and 4.7.1 of Appendix 7-C and the consistency of the uncertainty results with the base case affirms that the base case simulation is appropriate for decision-making. |
| 551 | MN-S (March 4, 2023) | Appendix 7-C, Numerical Modelling: Post-decommissioning Evaluation, Executive Summary | Issue #7C-001: Denison provides no rationale for "conservative dispersivity values" in the Draft EIS. Recommendations: - Denison needs to provide site-specific research to confirm literature dispersivity values are conservative in the Final EIS. | Site-specific research, as understood from the comment, would require a natural gradient tracer test over the distances of interest (> 1 km). Such testing would take centuries, and therefore is not practical. For this reason, use of literature dispersivities is standard practice. |
| 552 | MN-S (March 4, 2023) | Appendix 7-C, Numerical Modelling: Post-decommissioning Evaluation, Executive Summary | Issue #7C-001: Additional modelling will be needed to confirm at the time of decommissioning the assumption that there is "large assimilative capacity" of the groundwater system, in order to manage risk in Whitefish Lake. Recommendations: - Denison to complete simulations that increase focus on maintaining containment of the contaminant source for a greater period of time (i.e., a higher level of focus on source term control and flushing), and less reliance on management of contaminant along the pathway, prior to the contaminant reaching the receptor. In other words, simulations that focus, to a greater extent, on evaluating the benefit of additional effort and time on source term control (the first step in the risk hierarchy of source, pathway, receptor). | The comment is noted and it is Denison's intent to continue to evaluate what is reasonably achievable with respect to remediation of the mining zone water quality prior to discontinuation of containment measures. After 30+ years of monitoring we will be in a better position to update predictions and have enhanced confidence in the assimilative capacity. Flushing of the source zone is part of the planned remedy and would only be stopped once the target level of remediation has been achieved. Beyond that flushing period (which may take years), if conditions indicate additional long-term source control is required, then Denison may have to do that, but our current understanding suggests long-term source control is not needed so long as the flushing is able to reduce source concentrations to the target amounts. Lab testing suggests the proposed flushing will be effective at reducing concentrations to the target values. Additionally, we note that refinement of the mining area decommissioning objectives and associated modelling will be done as the Project progresses through updates to the Decommissioning Plan; nevertheless, the objectives as they may evolve will be bound by the objectives evaluated in the EIS, which as shown are protective of aquatic biota in Whitefish Lake. The final acceptable mining area decommissioning objectives will be developed prior to initiation of groundwater remediation, as part of the Detailed Decommissioning Plan (DDP). Prior to executing decommissioning activities, Denison shall prepare and submit the DDP to regulators for acceptance. In this case the DDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission and would also be informed by conditions on the ground at the site at that time, operational experience that has |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|--|---|
| | | | | been gained and the regulatory landscape at that time. As is highlighted above, the decommissioning plan will evolve over time and the plan will become more refined as the Project advances. |
| 553 | MN-S (March 4, 2023) | Appendix 7-C, Numerical Modelling: Post- decommissioning Evaluation, 2.4 Scope of Work | Issue #7C-001: Denison assumes non-surface reaching groundwater will not be extracted or accessed by future generations. Recommendations: - Denison to study and provide further understanding of deep groundwater characteristics with MN-S, NR1 Locals, and NR3 Locals prior to commencement of mining operations. This information may affect final closure options. - Denison to consider modelling for surface receptors of deep groundwater beyond the boundaries identified in Section 1.1. | Denison did complete engagement with Interested Parties, including Indigenous Communities of Interest and it is based on that engagement that it is understood deep groundwater use does not presently occur, nor is expected to in the future. Further, impacted groundwater is 100's of meters below ground surface, which is far below what would be needed for a future water supply as the flow through the shallower aquifer is far greater than through the deep aquifer. During operations, Denison will continue and expand groundwater monitoring to ensure that current study findings are realistic. Modelling simulations report the highest levels of predicted discharge to surface water - any discharge to more distant surface water bodies would be at even further reduced concentrations. Prior to executing decommissioning activities, Denison shall prepare and submit the DDP to regulators for acceptance. In this case the DDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission and would also be informed by conditions on the ground at the site at that time, operational experience that has been gained and the regulatory landscape at that time. |
| 554 | MN-S (March 4, 2023) | Appendix 7-C, Numerical Modelling: Post- decommissioning Evaluation 2.4.1 Groundwater Recharge | Issue #7C-001: Denison's Draft EIS does not confirm if the groundwater recharge rates were adjusted for potential changes to recharge as a result of climate change. Recommendations: - Denison should develop a Project-specific climate change model database, which clearly articulates the shared socioeconomic pathway (SSP) the Project is choosing from IPCC AR6, and show how that scenario has been down-scaled for use within Project modelling predictions, and present the results in the Final EIS. | <p>A qualitative and quantitative assessment of climate change and groundwater and surface water is provided:</p> <p>The experience of the Project team regarding studies of climate change and the impacts on groundwater at other sites generally shows a range of potential positive and offsetting negative impacts. While warmer temperatures will lead to extended periods of summer drought conditions extending into early fall, warmer winters are predicted as well, resulting in less snowpack accumulation, more frequent snowmelt events, and more frequent rainfall during periods when evapotranspiration is negligible. These warmer winter conditions are often simulated to produce enhanced groundwater recharge during late fall, winter, and early spring conditions. In particular, the lack of enhanced snowpack is simulated to result in less severe spring run-off conditions, indicating that more of the winter precipitation that falls will infiltrate. Overall, this is anticipated to result in enhanced groundwater recharge in the mid- to late-century periods.</p> <p>If, however, lower groundwater recharge was to result from climate change, it would reduce the groundwater driving force for mass transport of mining related fluids, and reduce mass loading to receiving water bodies such as Whitefish Lake. In other words, lower groundwater recharge resulting from higher evapotranspiration would result in slower mass transport to the receiving water bodies, reducing the risk of exposure.</p> <p>Section 8.1.3.4 (and Appendix 8-C) provides a quantitative assessment of the potential changes in surface water quantity due to climate change. The 1:100 year, 24-hour return period rainfall events for the baseline and climate change influenced IDF curves are 79.9 mm and 88.6 mm, respectively. The PMP for the Project is estimated to be 493 mm (refer to IR-15 and AD-15) which is well above both 24-hour maximum precipitation and 1:100, 24 hour return precipitation events. The PMP is very conservative (e.g., assumes effectively a full year of precipitation in one event) under both existing and future conditions (climate change). The potential impacts of climate change to precipitation and therefore flows was summarized in Appendix 6-C, Table 10 with the total annual precipitation and the maximum 1-day events being variable over the next four decades (Table 1). Regardless, the climate change scenario indicates a potential increase in event based assimilative capacity in the receiving environment.</p> <p>TABLE 1- Existing and Predicted Precipitation Data for Key Lake (provided in EIS, Appendix 6- C, Table 10).</p> |

Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|---|
| | | | | <p>To mitigate the potential for unplanned release of deleterious substances into the surface water environment even during the next 40 years of climate change, the PMP of 493 mm was used for water management engineering designs. During a PMP, water requiring management will report to the wellfield runoff pond which will be sized to accommodate a PMP event at the site. This pond has been sized to 38,200 m³ (excluding a freeboard of 1 meter). From the wellfield runoff pond, water will then be sent to the process water pond for treatment if required. In Section 2.8 Project Design Features, Denison notes that "Ponds will be designed to maintain a minimum freeboard of at least 1.0 m to allow for continued functioning during a probable maximum precipitation (PMP) event." As such, the project has been designed to manage water during PMP and greater, and therefore mitigation of potential impacts to water quality due to climate change has been initially included as part of the EIS. As a result, it is Denison's opinion that a quantitative assessment of potential impacts to surface water quality is not warranted as it is likely to indicate improved results from the conservative assessment of potential water quality changes during operation and decommissioning phases. Continued monitoring of background, effluent and receiver water quality will be undertaken and provide the ability for adaptive management throughout the life of the mine in association with potential climatic changes to the local and regional area.</p> <p>As a result the continued technical review until October 2024, Denison has made the following commitment: Denison will conduct a sensitivity analysis of low flows and high flows to assess how low and high flows may change under future climate conditions and the potential implications on water quality predictions made during the EA phase.</p> |
| 555 | MN-S (March 4, 2023) | Appendix 7-C 2.4.2 Surface Water Features | <p>Issue #7C-001: Water levels in surface water features are not static; they change in response to regional climate and flow conditions. This would influence the interaction between groundwater and surface water, as the assumption by the model developer is that water levels are input as static head boundary conditions.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to explain in the Final EIS why static head boundary conditions are used for the modelling beyond a need to simplify the modelling. | <p>Water levels within surface water bodies were monitored over several years. The range of observed water levels at Whitefish Lake (SA-6) during 2016-2018 was 499.5 to 500.2 m ASL, with an average of 500.1 m ASL; as such the value assigned in the model (500.0) is an accurate (and slightly conservative) reflection of the average water level observed. What is important is the hydraulic head difference over the 300-year (or more) transport travel time. Recognizing that future conditions could be different by as much as 2 m (i.e., the depth of Whitefish Lake), this range of water level could be tested.</p> |
| 556 | MN-S (March 4, 2023) | Appendix 7-C 2.5.2.1 Water Level Elevations – Quantitative Calibration | <p>Issue #7C-001: Denison does not provide the basis, explanation, or literature to state that a calibrated model to observe water levels is sufficient with a deviation of +/- 2m.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide an explanation, basis, and/or literature to state that a calibrated model to observe water levels is sufficient with a deviation of +/- 2m in the Final EIS. | <p>The mean residual is 0.23 m, not 2 m as inferred. The 2 m guidelines are merely presented for reference. The literature is quoted regarding the goodness of fit parameter NRMS, which is normalized so that it can be applied to any model. The NRMS achieved within the Denison model is 4.1%, whereas the literature (Spitz and Moreno) recommend 10% or less. As such the model is considered calibrated by literature standards. The qualitative term "excellent match" is based on 30-years of experience in developing 100's of similar numerical groundwater flow models.</p> |
| 557 | MN-S (March 4, 2023) | Appendix 7-C 2.5.2.3 Statistical Measures of Calibration to Water Levels | <p>Issue #7C-001: Denison provides no rationale/basis for considering a mean error of 0.23 considered to be an "excellent match" to the observed water levels.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison should provide an explanation, basis, and/or literature for why a mean error of 0.23 is considered to be an "excellent match" to the observed water levels in the Final EIS. | <p>The mean residual is 0.23 m, not 2 m as inferred. The 2 m guidelines are merely presented for reference. The literature is quoted regarding the goodness of fit parameter NRMS, which is normalized so that it can be applied to any model. The NRMS achieved within the Denison model is 4.1%, whereas the literature (Spitz and Moreno) recommend 10% or less. As such the model is considered calibrated by literature standards. The qualitative term "excellent match" is based on 30-years of experience in developing 100's of similar numerical groundwater flow models.</p> |

Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|--|--|
| 558 | MN-S (March 4, 2023) | Appendix 7-C 2.6.3 Groundwater Flow Quantity | Issue #7C-001: Ecological receptors could potentially be exposed to groundwater flows. Recommendations: - Denison should provide an understanding of deep groundwater as a contaminant pathway to ecological receptors within immediate vicinity in the Final EIS. | Denison and its SMEs believe that this (i.e., what is referenced in the review comments) is what has been done (and presented in the report) by evaluating groundwater flow to a small portion of Whitefish Lake. At other locations (e.g., the edges of the Lake), shallow groundwater will be discharging, which has not come into contact with the deeper groundwater. |
| 559 | MN-S (March 4, 2023) | Appendix 7-C 2.7.1 Groundwater Demand | Issue #7C-001: The Project has assumed that it is “conservative” to supply all water for the Project from outside the ore zone, and assume minimal influent from re-cycled / treated water. This statement supports that position. Recommendations: - Denison should provide simulations that maximize recycling treated water, rather than minimize using recycled water for the Project. - Denison to confirm how groundwater quality predictions differ when recycled and treated water is used to supply water to the Project, as compared to assuming conditions as noted in this statement. | <p>With respect to the first bullet: It is believed that the analysis completed is appropriate given that it represents a conservative (i.e., protective) means by which to assess the activities potential effects. The scenarios / simulations referenced in the review comment therefore are bounded by the conservative water supply assessment as it concerns potential Project effects to groundwater quantity. Denison concurs with the idea that it would be beneficial to maximize recycling of water and will strive to do so; however, this is more of an operational consideration. As outlined in draft EIS Section 2.2.3, Denison intends to recycle process water to the greatest extent possible, thereby reducing the demand for fresh water supply and volume of treated effluent. In an effort to develop a conservative assessment basis for the EA, the water recycle flows from the industrial wastewater treatment plant back into the processing plant and wellfield have not been incorporated into the estimates for freshwater withdrawal and treated effluent discharge.</p> <p>An overview of the site water balance during Construction, Operation, and Decommissioning are provided in draft EIS Figure 2.2-14, Figure 2.2-15, and Figure 2.2-16, respectively. These figures provide a summary of the water needs for certain Project activities, plans for water treatment (both potable and wastewater), and the general flow of managed water at the site. The estimated flows in the site water balances do not account for water recycle back into the processing plant and wellfield. This results in a conservative estimate of both freshwater withdrawal needs and treated effluent discharge rates.</p> <p>With respect to the second bullet point: Under the modelled scenarios, in which water is withdrawn from three water supply wells, the shallow groundwater system is simulated to recover very quickly following the cessation of decommissioning. Thus, the taking of shallow groundwater during Operations and Decommissioning will not influence the overall transport of potential contaminants in Post-Decommissioning after the containment (including the freeze wall) is removed. In addition, it should be recognized that if less water is withdrawn from the shallow bedrock for Operation, that additional groundwater left in the flow system will naturally act to further dilute any concentrations reaching the shallow aquifer and surface water receptors. That is why we feel the simulations presented are conservative.</p> |
| 560 | MN-S (March 4, 2023) | Appendix 7-C 2.7.3 Hydrogeological Change Due to Mine Operations | Issue #7C-001: The interaction of increase drought or increased precipitation (i.e., climate change) could potentially affect the length of time for full recovery of groundwater recharge due to potential changes in climate conditions. Recommendations: - MN-S requests that interaction between climate change scenarios and groundwater modelling should be included in the Final EIS. | <p>The experience of the Project team regarding studies of climate change and the impacts on groundwater at other sites generally shows a range of potential positive and offsetting negative impacts. While warmer temperatures will lead to extended periods of summer drought conditions extending into early fall, warmer winters are predicted as well, resulting in less snowpack accumulation, more frequent snowmelt events, and more frequent rainfall during periods when evapotranspiration is negligible. These warmer winter conditions are often simulated to produce enhanced groundwater recharge during late fall, winter, and early spring conditions. In particular, the lack of enhanced snowpack is simulated to result in less severe spring run-off conditions, indicating that more of the winter precipitation that falls will infiltrate. Overall, this is anticipated to result in enhanced groundwater recharge in the mid- to late-century periods. If, however, lower groundwater recharge was to result from climate change, it would reduce the groundwater driving force for mass transport of mining related fluids, and reduce mass loading to receiving water bodies such as Whitefish Lake. In other words, lower groundwater recharge resulting from higher evapotranspiration would result in slower mass transport to the receiving water bodies, reducing the risk of exposure.</p> <p>The groundwater model will be updated over the course of mine life to among other things support the decommissioning plan that will consider recovery in the mining zone. Such model</p> |

| | | | | |
|-----|---|---|---|---|
| | | | | scenarios would incorporate up to date information with respect to climate change and the potential effects of climate change on the groundwater environment. |
| 561 | MN-S (March 4, 2023) | Appendix 7-C 2.7.3 Hydrogeological Change Due to Mine Operations | <p>Issue #7C-001: It is unclear if the statements made about full recovery and 90% recovery are defensible given that calibrated hydraulic conductivity values, as shown in Table 2-2 (p. 2.7), for the lower sandstone aquifer ranges over 2 orders of magnitude, and the ore zone calibrated hydraulic conductivity over nearly 5 orders of magnitude, and that no range in hydraulic conductivity is reported for the desilicified sandstone aquifer (i.e., a single calibration value is reported).</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison should provide simulations that consider the full range of calibrated hydraulic conductivity values in the Final EIS. | <p>The calibrated hydraulic conductivity values are consistent with observed data. The calibrated K value for the intermediate aquitard was 1×10^{-8} m/s, which is in the middle of the range of values reported from point testing within this unit (Range: 10^{-10} to 3.8×10^{-6} m/s), and similar to the geomean value (8.4×10^{-9} m/s). Thus, the calibrated K value is within a factor of 1.2 of, and higher than, the geomean value. The hydraulic conductivity value for the Intermediate Aquitard is similar to that applied by AECL at Cigar Lake (5×10^{-8} m/s). Similarly, the K values applied for the Upper and Lower Sandstone Aquifer units are consistent with the field measured values, particularly for this fractured rock environment. The high end of the packer tested range of K values varied by 2 orders of magnitude between the aquifer and aquitard units, which is consistent with the definition of aquifer / aquitard differentiation. The interpretation of an aquifer-aquitard-aquifer sequence is consistent with the AECL interpretation of the Athabasca Sandstone at the Cigar Lake mine.</p> <p>When packer testing in fractured rock, the hydraulic conductivity associated with any test depends on whether the packed zone contains a continuous fracture set. However, for the unit as a whole, it is important that the model represent the hydraulic conductivity (or transmissivity) representative of the interconnected fracture network. Thus, it is appropriate that the applied hydraulic conductivity values within the aquifers are consistent with the higher end of tested conductivity values within those units. Within aquitard units, having singular higher conductivity fracture values from packer tests that test local fractures only, does not necessarily indicate large-scale transmissivity.</p> <p>A fault feature is suspected along the western perimeter of the Lower Sandstone Aquifer near Kratchkowsky and Williams Lake, located 1.5 km west of the mine site (also as depicted on the Hydrogeological Conceptual Site Model). This feature was interpreted to exist based on the similarity in groundwater levels between deep and shallow aquifers in that particular area (c.f., water levels along the creek south of Williams Lake and within GWR-029, as well as water levels recorded in open boreholes near Kratchkowsky Lake), as well as geochemistry in GWR-029. The geochemistry and water levels show in the vicinity of GWR-029 are different, however, than conditions within the Lower Sandstone aquifer further east of this area, above and east of the Phoenix deposit.</p> <p>The effect of the fault feature along the western edge of the Lower Sandstone aquifer was incorporated within the numerical model both through enhanced hydraulic conductivity parameters, as required to match observed water levels, and boundary conditions applied to introduce as much inflowing water to the Lower Sandstone Aquifer as the water level data suggest is reasonable.</p> <p>As a result of the continued technical review until October 2024, Denison will do additional sampling and characterization of the desilicified zone to support the post operation transport model.</p> |

| 562 | MN-S (March 4, 2023) | Appendix 7-C 3.1.1 Groundwater Remediation | <p>Issue #7C-001: No time period is provided to reach acceptable levels of remaining contaminants or effective remediation accomplished in order to leave the area in a pre- mining condition.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide more clarity on what the expected time period to reach acceptable levels of remaining contaminants or effective remediation in order to leave the area in a pre- mining condition. This unknown time frame may play into the viability of remediation and final closure costing. | <p>Groundwater remediation targets provided in the draft EIS were from derived from metallurgical test results completed from 2017 to 2021 with over 125 kg of material recovered from Phoenix deposit that underwent leaching and neutralization test work (see response to IR-67). In 2022 and 2023, metallurgical test work continued to further optimize remediation and strategies and confirm test work results presented in the draft EIS. It is expected that metallurgical test work will continue in the future to further optimize remediation targets, and this will be advanced through updates to the Decommissioning Plan. The Feasibility Field Test (FFT) provided additional confirmation that pH target and remediation targets could be met. Data gathered during the neutralization phase of the FFT provide confidence that groundwater targets proposed in the draft EIS can be met technically and economically. Based on laboratory testing and the results of the 2022 field testing, subsurface remediation is planned to consist of rinsing the ore zone with 35 pore volumes of fresh water, slowly raising the pH and then pumping about 75 pore volumes of basic solution through the same portion of the ore zone. This basic solution will in effect further raise the pH to a level that impedes further leaching of the deposit and reduces aqueous concentrations of contaminants of concern to below their environmental target levels.</p> <p>Refinement of the mining area decommissioning objectives and associated modelling will be done as the Project progresses through updates to the Decommissioning Plan; nevertheless, the objectives as they may evolve will be bound by the objectives evaluated in the EIS, which as shown are protective of aquatic biota in Whitefish Lake. The final acceptable mining area decommissioning objectives will be developed prior to initiation of groundwater remediation, as part of the Detailed Decommissioning Plan (DDP). Prior to executing decommissioning activities, Denison shall prepare and submit the DDP to regulators for acceptance. In this case the DDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission and would also be informed by conditions on the ground at the site at that time, operational experience that has been gained and the regulatory landscape at that time. As is highlighted above, the decommissioning plan will evolve over time and the plan will become more refined as the Project advances.</p> <p>As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project.</p> |
| 563 | MN-S (March 4, 2023) | Appendix 7-C 5.2.2 Assumptions | <p>Issue #7C-001: Climate change as a variable does not appear to have been incorporated into the modelling.</p> <p>Recommendations:</p> <ul style="list-style-type: none"> - Denison needs to provide more clarity in the Final EIS on how climate change as a variable has been incorporated into the ground water modelling as climate changes scenarios and effects on the groundwater could affect the closure pathway. | <p>The experience of the Project team regarding studies of climate change and the impacts on groundwater at other sites generally shows a range of potential positive and offsetting negative impacts. While warmer temperatures will lead to extended periods of summer drought conditions extending into early all, warmer winters are predicted as well, resulting in less snowpack accumulation, more frequent snowmelt events, and more frequent rainfall during periods when evapotranspiration is negligible. These warmer winter conditions are often simulated to produce enhanced groundwater recharge during late all, winter, and early spring conditions. In particular, the lack of enhanced snowpack is simulated to result in less severe spring run-off conditions, indicating that more of the winter precipitation that falls will infiltrate. Overall, this is anticipated to result in enhanced groundwater recharge in the mid- to late-century periods. If, however, lower groundwater recharge was to result from climate change, it would reduce the groundwater driving force for mass transport of mining related fluids, and reduce mass loading to receiving water bodies such as Whitefish Lake. In other words, lower groundwater recharge resulting from higher evapotranspiration would result in slower mass transport to the receiving water bodies, reducing the risk of exposure.</p> <p>The groundwater model will be updated over the course of mine life to among other things support the decommissioning plan that will consider recovery in the mining zone. Such model scenarios would incorporate up to date information with respect to climate change and the potential effects of climate change on the groundwater environment.</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|--|---|---|---|
| 564 | Prince Albert Grand Council (PAGC) (March 6, 2023) | General Comments | <p>Overall Comments from the PAGC submission: The EIS does not address multiple issues related to ecosystems, human health, and the long-term sustainability of the Wheeler River project, particularly Indigenous concerns regarding the loss of caribou, wolverine and other culturally significant animals. There are no details on economic benefits from the mines through Indigenous partnerships, including equity-based participation in the workforce with training opportunities for Indigenous personnel to operate in management roles.</p> <p>[Additional questions on this topic directed to regulators or government entities are included in the CNSC table]</p> | <p>The potential effects of the Wheeler River Project on the aquatic and terrestrial environments have been comprehensively assessed in the EIS and related supporting documentation. The spatial scale is very small (resulting from ISR mining method) of 160 hectares. A conservative approach was taken in the assessment and the overall conclusion was made that there would be no significant adverse residual effects in consideration of proposed mitigations.</p> <p>The Wildlife LSA was designed to capture the majority of the Project effects. The Wildlife LSA extends beyond the Project Area of the site to include a reasonable estimation of where sensory disturbance from Project-related activities would extend and where effects on wildlife including caribou are most likely to occur. Further the Local Study Area for Indigenous Land and Resource Use (Section 11.1) is defined as the Project footprint plus the maximum combined extents of the supporting Valued Components for the Regional Study Area for aquatic, terrestrial, noise, and health as these components can affect the Indigenous resource use environment to ensure that all possible effects to resources were considered. Section 9 describes how consideration of potential effects to wildlife and wildlife habitat are considered within the EIS. In regard to caribou, Denison has developed a Conceptual Caribou Mitigation Plan based on discussions between Denison and Saskatchewan Ministry of Environment. Denison utilized Traditional Knowledge provided by Indigenous communities in the assessment and in the development of the Plan.</p> <p>A Human Health Risk Assessment (HHRA) was undertaken for the Project in Section 10. The HHRA evaluated direct exposure to constituents of potential concern (or contaminants) released to air and water, and through indirect exposure to the constituents associated with soil, sediment, and food, such as fish, wildlife, and plants. The assessment was inclusive of information based on use of traditional foods. The overall conclusion of the HHRA was that there would be no significant adverse effects to human health from the Project.</p> <p>Denison's decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP.</p> <p>Denison, through a Human Resource Development Plan, will initially prioritize Indigenous and non-Indigenous communities in the LSA in terms of employment and training opportunities (anticipated to be with institutions in northern Saskatchewan) and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project, which could include such items as on-the-job training and career counselling to help with advancement from foundational positions, advance sharing of job qualification requirements, clearly identifying training requirements and working with various training institutions to make sure such appropriate training is available, and creation of scholarship and support programs. Priority for employment and training will then focus on Indigenous and non-Indigenous residents of the RSA and then beyond the RSA.</p> |
| 565 | PAGC (March 6, 2023) | Loss of Use and Access to Traditional Lands and Resources | <p>The EIS does not capture Indigenous Elders' understanding of the human impact, climate change and cumulative effects on wildlife including caribou or other species at risk and the resulting impacts on Indigenous livelihoods. Denison's EIS states that existing disturbances in the area are from exploration activities with a general description of how disturbances from these activities will be managed. PAGC does not find sufficient evidence that the affected areas can be restored to their former state and will impact woodland caribou habitats.</p> <p>PAGC Elders prioritize the removal or reduction of human disturbances to the landscape for caribou recovery and wish to avoid projects which have a significant environmental impact. PAGC elders do not want to see any animals or plants disappear from the landscapes they use based on their traditional understanding of the relationship between humans and nature. This impacts the ability to practice treaty rights and entitlements to the lands which impact physical and mental health and mixed economy connected to hunting and gathering.</p> <p>PAGC urges Denison to understand and take an eco-cultural approach to preserve wildlife and landscape health when planning mining operations and decommissioning processes. This should include use of Indigenous Knowledge in delineating caribou habitats despite the data</p> | <p>Denison remains committed to conducting meaningful engagement with Indigenous communities potentially affected by the Project and to understanding how the proposed development of the Project may affect the ability of Indigenous peoples to exercise collective Indigenous and Treaty Rights.</p> <p>The potential effects of the Wheeler River Project on the aquatic and terrestrial environments have been comprehensively assessed in the EIS and related supporting documentation. The spatial scale is very small (resulting from ISR mining method) of 160 hectares. A conservative approach was taken in the assessment and the overall conclusion was made that there would be no significant adverse residual effects in consideration of proposed mitigations.</p> <p>The Wildlife LSA was designed to capture the majority of the Project effects. The LSA extends beyond Project Area of the site to include a reasonable estimation of where sensory disturbance from Project-related activities would extend and where effects on wildlife including caribou are most likely to occur. Section 9 describes how consideration of potential effects to wildlife and wildlife habitat are considered within the EIS. In regard to caribou, Denison has developed a Caribou Management Framework based on discussions between Denison and Saskatchewan Ministry of Environment. Wheeler River Project Draft EIS

| | | | | |
|-----|---|---|---|---|
| | | | and woodland caribou traditional ecological knowledge available in the report published by Mamun and Brook (2017). | <p>communities in the assessment and in the development of the Framework. Denison notes that the objective of Mamun and Brook (2017) was to support the provincial range planning process for conservation of woodland caribou. The range planning process for SK1 is currently underway. As needed, Denison's Framework will be updated to be consistent with the management goals defined by ENV for SK1. Additionally, as part of its boreal caribou management efforts, the province is working with industry to develop effective and practice approaches to mitigate potential effects of activities on woodland caribou through offsetting. Denison is committed to continue to work with the province to finalize the habitat offset requirement using the province's habitat offset calculator.</p> <p>Section 11 of the draft EIS provides the assessment of potential Project effects on Indigenous Land and Resource Use (Section 11.1) and Other Land and Resource Use (Section 11.2). The mitigation measures proposed in the aquatic and terrestrial assessments translated into undetectable changes in resource availability to existing and future users and rightsholders. The assessment does not take an eco-cultural approach but rather one focused on VCs, key indicators and associated measurable parameters, which are standard in impact assessment. Mitigation to eliminate, reduce, or control potential adverse effects of the Project on Indigenous Land and Resource Use would apply to any uses proximal to the Project. Given proven mitigation is to be applied to traffic disturbances, noise, air quality, and increased competition for resources, the effects are expected to be minimal.</p> <p>Denison's decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP.</p> |
| 566 | PAGC (March 6, 2023) | Appendix 7-C 2.5.2.3 Statistical Measures of Calibration to Water Levels | Additional traffic and associated noise from the proposed project are a concern and PAGC requests that Denison puts a speed limit of about 70km/hour for trucks in the boreal forest where woodland caribou reside and are used by barren land caribou in winter. | <p>The proposed operation is fly-in, so Project related traffic, and associated noise, to the area would only be related to deliveries of materials to and from the site. On-site staff will not have access to personal (or company) vehicles. The Project will not change public access to the area. The existing gate on Highway 914 near Cameco's Key Lake Operation will remain in place and no changes to the gate and the process for controlling access to Highway 914 north of the Key Lake Operation are proposed as part of the Wheeler River Project.</p> <p>Section 12.3.4.2.1 of the draft EIS describes change in traffic as a result of the Project, including truck average annual daily traffic and average annual daily traffic. Given proven mitigation, as described in Section 12.3.5, to be applied to traffic disturbances and associated noise the effects are expected to be minimal. Section 11.1.5 also describes the mitigation measures to reduce the impacts of traffic and noise, among others. For example, air transportation will be used to transport most workers between the Project site and designated pick-up and drop-off points in communities and noise generating equipment will be situated behind on-site obstructions.</p> <p>In regard to caribou, Denison has developed a Conceptual Caribou Mitigation Plan based on discussions between Denison and Saskatchewan Ministry of Environment. Denison recognizes the level of concern regarding Project related transportation it has received through engagement activities to date and will continue to solicit input on transportation concerns as the Project moves forward. As outlined in Denison's Indigenous Peoples Policy, Denison is committed to respecting Indigenous knowledge and values regarding environmental stewardship and Indigenous peoples' connection to the land, and to minimize potential effects where possible. As an example, Section 11.1.5.3 describes that Denison will require truck traffic to slow down to 40 km/hr for a minimum of 2.5 km o either side of the ERFN and KML (Pinehouse #9) cultural camps, which are understood to occur in September and October (but may be adjusted at the communities direction).</p> |

Comments from Indigenous Nations and Communities and the Public
Wheeler River Project Draft EIS

| | | | | |
|-----|---|--|---|--|
| 567 | PAGC (March 6, 2023) | Appendix 7-C 2.6.3 Groundwater Flow Quantity | PAGC finds that science-based models used for EIA reports put Indigenous people at a disadvantage as Indigenous communities are not involved in the collection, analysis and interpretation of data for models. Indigenous culture does not make use of models, rather, they follow natural changes and patterns which sometimes are not reflected in scientific findings. Requesting feedback from Indigenous communities on a report full of models prepared without Indigenous involvement has limited value as PAGC members are not fully engaged throughout the process. This approach is somewhat disrespectful to Indigenous communities as they are not part of the development process and PAGC reserves the right to reject the EIA or EIS. PAGC requests a commitment from Denison to get Indigenous communities involved in each stage of the documentation and report preparation process. | Denison acknowledges that Indigenous ways of knowing are distinct from western science, and have included Indigenous knowledge shared by communities in the impact assessment process. For example, Section 10.1.2 describes that Indigenous Knowledge and Local Knowledge were used to inform assumptions used in the human health risk assessment which helped identify human health receptors (i.e., people) who consume traditional foods, specifically in terms of their locations, residency times, and components of the traditional foods diet. In this instance, Indigenous knowledge was used to complement western science. Denison remains committed to conducting meaningful engagement with Indigenous communities potentially affected by the Project and to understanding how the proposed development of the Project may affect the ability of Indigenous peoples to exercise collective Indigenous and Treaty Rights. Through the environmental assessment process ERFN and other Indigenous communities have opted to utilize third party supports to complement their review of the EIS. Third party reviews were supported by both agreements executed between Denison and Indigenous communities, along with participant funding offered by the CNSC. Section 4 of the EIS describes the engagement undertaken with Indigenous communities and organizations. Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, and an example of their continued involvement from the outset to end of a process includes the commitment to collaborating with English River First Nation and Kineepik Métis Local on a community specific monitoring regime, suited to each of their interests and needs, in an agreed-upon fashion. Denison is committed to continual improvement in relation to such collaborative monitoring programs, in order to adapt to areas of interest which can change over time. It is expected that the data collected through such monitoring regimes would also be relevant to other Indigenous nations who may have interest in the Project. |
| 568 | PAGC (March 6, 2023) | Appendix 7-C 2.7.1 Groundwater Demand | PAGC request additional details from Denison regarding plans to incorporate Indigenous partnership in the economic benefit of the mines, equity-based participation in the workforce and training opportunities for Indigenous personnel to operate in management roles. PACG suggest arranging long-term funding for youth education in science that would prepare them for careers in biology and environmental science, which is very uncommon among Indigenous communities. Increasing Indigenous representation in science and technology, and participation in development planning is therefore a valuable long-term goal. | As outlined in Denison's Indigenous Peoples Policy, Denison recognizes the critical necessity of advancing reconciliation with Indigenous peoples in Canada and the important role of Canadian business in the reconciliation process. Denison is committed to providing Indigenous people and businesses with sustainable economic opportunities and benefits and sharing the economic benefits of Denison's business activities. Denison's Indigenous Peoples Policy sets out priority for Indigenous employment and procurement (among other items). With respect to employment, as noted in the Economics section of the EIS, Residents of Saskatchewan's North (i.e., those resident in the northern administration district of Saskatchewan) are prioritized for employment as an expected condition of the Surface Lease Agreement, similarly for goods and services to service the Project. With respect to procurement, Denison has established an internal procurement policy approach. The approach requires that Denison consider businesses within the local study area first and the Northern Administrative District second, prior to looking elsewhere (southern Saskatchewan and/or outside of Saskatchewan) throughout all phases of the Project. Denison, through a Human Resource Development Plan, will initially prioritize Indigenous and non-Indigenous communities in the LSA in terms of employment and training opportunities (anticipated to be in institutions in northern Saskatchewan) and will work with the leadership of these communities to assist in determining hiring and training practices during all phases of the Project. This may include initiatives associated with youth education in science if that is the interest and priority of the communities. Training could also include such items as on-the-job training and career counselling to help with advancement from foundational positions, advance sharing of job qualification requirements, clearly identifying training requirements and working with various training institutions to make sure such appropriate training is available, and creation of scholarship and support programs. Priority for employment and training will then focus on Indigenous and non-Indigenous residents of the RSA and then beyond the RSA. |

| Reference to EIS, appendices, or supporting documentation | Section 2.2.1.4.2.3, Tertiary Containment of Mining Solution - Freeze Wall |
| Context and Rationale | <p>Context: The Proponent stated that as a tertiary means of containment for the mining area, the uranium deposit is proposed to be surrounded by a freeze wall that extends from the surface to the basement rock, isolating the mining area from regional groundwater. Current plans are for the freeze wall to be a minimum of 10 m thick, be installed 25 m away from the uranium deposit, and extend 30 m into the basement rock (Figure 2.2-6).</p> <p>As explained in Section 2.2.1.4.2.2, mining solution will be injected into the ore zone under pressure and will likely react, not just with the uranium in the ore zone, but also the binding or cementing material in the sandstone. This means that some portion of the sandstone above the uranium layer and perhaps some portions of the freeze wall will dissolve, thereby creating more void than just the thickness of the uranium layer or horizon. The void may affect the integrity of the freeze wall as containment.</p> <p>Rationale: It is not clear how the Proponent will monitor the freeze wall to verify whether portions of the freeze wall are being dissolved in the mining process and how it plans to verify the integrity of the freeze wall as a containment for the mining solution. In addition, if the dissolution reaction of the uranium ore is exothermic, then the heat generated may also affect the integrity of the freeze wall.</p> |
| Information Requirement | <ol style="list-style-type: none"> 1. Explain how the integrity of the freeze wall will be maintained as a means of containment that prevents migration of the mining solution out of the ore zone into the receiving environment. 2. Demonstrate that the mining solution injected under pressure will not compromise the integrity of the freeze wall as a containment. |

| | |
|--|--|
| | <p>3. Demonstrate how both exothermic and chemical reactions of the mining solution used to dissolve the uranium ore will not compromise the integrity of the freeze wall as a containment.</p> <p>Technical Discussion Required: Yes. ECCC would like to better understand the chemical constituents that compose the mining solution and the chemical reactions that it will cause</p> |
|--|--|

Response:

The general theme of the comments and questions stated above seem to be related to:

- verification of the freeze wall extents;
- response of the freeze wall to potential chemical interaction with the lixiviant;
- response of the freeze wall to induced hydraulic or lithostatic stress; and
- response of the freeze wall to potential exothermic processes related to ISR.

The alignment of the freeze wall is located 25 m offset from the lateral extent of the recoverable ore and the freeze wall will grow in thickness both towards the ore and away from the ore. The freeze wall will solidify all liquid porewater and develop into a contiguous impermeable barrier many metres thick. Ground temperature monitoring will be installed on both the ore and non-ore sides of the freeze wall to confirm the thickness of frozen ground and to validate thermal finite element models of the entire area. Thermal models can very accurately represent real conditions because ground thermal properties used in the analyses only vary by a factor of two to four across all ground types, unlike hydraulic or strength properties, which can vary by many orders of magnitude across relatively short distances.

The figures below are an example of field data validating modelled predictions for a shaft freeze wall at depth.

Figure 1: Illustration of a calibrated FEM model for freezing in clay (left) and rock (right). Temperatures were measured offset from the freeze wall pipe locations and compared with model predictions at the same location.

The injection and recovery wells will be set up such that they are within the confines of the ore itself and migration of fluids towards the freeze wall and through non ore ground between the ore and freeze wall should be minimized because hydraulic gradients will induce preferential flow to recovery wells and away from the freeze wall. Having said that, if significant excursion of lixiviant were to occur and it were to contact the freeze wall, it is not expected to chemically dissolve the in situ ice. The freezing point depression of the lixiviant proposed for this project was determined to be -1°C and, as such, it would freeze off and become immobile before significant volume could negatively impact the freeze wall. If the lixiviant were to dissolve some of the host soil / rock binding material at the freeze wall surface, it would occupy the resulting void space, but then freeze off, which would halt further migration within the freeze wall.

Freeze walls, when fully developed, are capable of withstanding significant external pressures because the ice in the pore voids greatly improves the bulk strength of the soil. For example, in the province of Saskatchewan, ground freezing is used to support the sinking of deep potash mine shafts, which must penetrate through the Mannville formation at a depth between 400 and 500 m below surface. The Mannville formation is often described as saturated, unconsolidated beach sand and it would not support shaft excavation in a thawed state. Freezing is used to create a structural and impermeable wall up to 5 m thick, which can resist a stress gradient driven by full hydrostatic and/or lithostatic pressures on the outside of the wall, and an open to atmosphere excavation within the shaft. This loading condition is much more extreme than any condition the freeze walls at the Phoenix deposit will experience because the interior side of the freeze wall where active ISR mining is occurring is not open to atmosphere and is fluid filled in the same way that the regional groundwater system is on the exterior side of the freeze wall, creating a balanced pressure system, where loading is equal on both the interior and exterior sides.. While freeze walls are very strong when fully developed, they are also plastic in nature. This means that they can slowly deform without failing in response to localized ground deformations. As the freeze wall deforms towards a lower stress zone, it maintains its thickness and integrity. While the above example referred to potash shafts, other examples can be drawn from the experience at the McArthur River or Cigar Lake uranium mines. At McArthur River, open stopes are generated directly adjacent to a freeze wall that is a nominal 4 m thick. At Cigar Lake, open mine cavities 10 m high and several metres in diameter commonly exist within the frozen ground. Neither site has had a breach of the freeze wall during mining activity. Given that the freeze wall at Denison will be much thicker than at McArthur River and that it will be located up to 25 m from the ore zone, it is not anticipated that it will be exposed to a stress environment that will put it at risk.

The leaching process has the potential to be exothermic and generate heat, which may flow toward the freeze wall. In this instance, there is low sulphur content in the ore zone and the exothermic reaction will be minimal. Despite this, all thermal modelling in support of the freeze design assumed that the freeze wall had to develop and be sustained in the presence of an ore zone that generated a nominal amount of heat—sufficient enough to sustain a minimum temperature of 10°C even though it would naturally tend to cool below this in response to the freeze system. It is understood that the lixiviant may be heated as part of the pre-injection process, so some accounting for heat in the ore zone was included in the analysis to date. Should the lixiviant generate more exothermic reaction than predicted, there is a very low risk of it degrading the freeze wall in any significant amount. Referring back to the potash mine shaft freezing illustration, it is not uncommon for in shaft excavation activity and concrete work to

generate temperatures between 30 and 60°C that act on a freeze wall only 5 m thick and only a few metres away from the exposed shaft wall. In this extreme case, the freeze wall is more than capable of removing the generated heat. The physics of heat flow are such that heat generated by the ISR process would be free to flow towards the freeze wall; however, most of it would flow to the coldest location (e.g., the actual freeze pipes at the mid-point of the wall thickness) before it is manifested as an observable significant rise in ground temperature. Even if the heat were to warm the ore side of the freeze wall, it would not impact the non-ore side of the wall (which is where half of the total wall thickness resides). This heat may penetrate to the center of the wall but if the refrigeration plant is operating, that heat can not then flow “up gradient” on the non-ore side of the wall and thaw that side.

The concentration of the lixiviant (max ~8% sulfuric acid conc.) has a freezing point of ~-4°C. The lixiviant itself will not react chemically with the freeze wall, other than having a slightly different freezing point than formation water. The main reaction expected is dissolution of uraninite with the combination of sulfuric acid, hydrogen peroxide, and ferric iron. This reaction is exothermic, but there are several natural mitigating factors of the wellfield that aid in minimizing heat transport to the freeze wall:

- The wellfield will have flexibility in terms of reagent concentrations being added. With the bulk of the uranium being contained within a higher-grade core (interior to the deposit), the exterior of the deposit will see either lower injection/recovery flows or lower concentrations of lixiviant to be efficient with reagent consumption. Whether the concentration or flow is reduced, this limits the reaction rate and therefore total heat generation at the extremities of the deposit.
- There is no refortification of reagents underground compared to typical uranium tank leaching. This prevents additional heat generation from dilution of sulfuric acid or hydrogen peroxide.
- The heat capacity of lixiviant/UBS should be higher than the ore in the deposit, which means the UBS solution will carry the majority of the heat to surface rather than keeping the heat of reaction at depth.
- In the event the freeze wall thickness monitoring network detected an actionable thinning to the freeze wall, the concentration of lixiviant could be decreased which would reduce the heat generated per m³ of lixiviant and re-establish the desired freeze wall thickness.

To summarize the risk of the degradation of the freeze wall due to exothermic reaction, it is almost impossible—with the freeze plant operating—to practically add sufficient sustained heat to thaw the proposed freeze wall to the point hydraulic containment is compromised. Sufficient operational controls will be in place to verify the freeze plant is operating, to measure the temperature in the ore zone, and to measure the temperature on adjacent sides of the freeze wall so that early detection of any upset conditions can be identified and addressed. Options for addressing issues are to lower the temperature of the freeze system to draw more heat out, to increase the freeze coolant flow rates in freeze wells nearer to active ISR cells, or to adaptively manage the lixiviant injection and recovery rates in cells located nearer the freeze wall.

1 Summary of Ya'Thi Néné Lands and Resource Office (YNLR) Comments

Denison Mines Corp. (Denison) received consolidated comments from Indigenous Nations and Communities and the public on the draft Wheeler River Project (the Project) Environmental Impact Statement (EIS) from the Canadian Nuclear Safety Commission on June 27, 2023.

These comments are at: [available on the federal impact assessment registry \(https://iaac-aeic.gc.ca/050/documents/p80178/152187E.pdf\)](https://iaac-aeic.gc.ca/050/documents/p80178/152187E.pdf).

This technical memorandum (memo) is provided to supplement Denison's responses to YNLR's comments that can be found in the comment / disposition table. The memo addresses a number of comments that pertained to a similar theme – that is, woodland caribou habitat and questions regarding how the Project could add to the existing disturbances on the landscape, primary mineral exploration cutlines. Specifically, this memo considers YNLR comments numbers 53 to 68 and provides a more coherent, inclusive, and integrated response to facilitate review.

2 Existing Anthropogenic Disturbance: Considerations in the Terrestrial Environment Component of the Environmental Impact Assessment

2.1 Baseline Characterization

A two-step procedure was used to develop baseline mapping for the Local Study Area (LSA) and Regional Study Area (RSA) that including delineation of anthropogenic disturbance. First, the Environment and Climate Change Canada (ECCC) national level anthropogenic mapping was downloaded and clipped to the study area boundaries (ECCC 2015). Second, to improve the resolution and ensure appropriate characterization of disturbance, all visually discernible anthropogenic features in the area were digitized at a scale 1:5,000. To support this process and enhance the final product, a combination of 2018 project specific ortho-photography, Landsat Imagery (2018) and Map Info Microsoft Bing Imagery (2018) were used to visually identify/confirm anthropogenic features. Industrial clearings (polygons) were hand drawn based on the imagery. All linear features were digitized as lines and buffered to create polygons as per the widths detailed below:

- Cutline: 1.75 m
- Right-of-way (ROW): 2.5 m
- Trail: 4 m
- Rough Road: 5.5 m
- Road: 10 m
- Transmission ROW: 40 m
- McArthur-Key Haul Road/Highway 914: 40-60 m

The baseline efforts to characterize and map anthropogenic disturbance in the LSA and RSA were used to develop the ecosite mapping that was used in Section 9 of the EIS to support assessment of potential Project related effects on relevant Valued Components and Key

Indicators. Considering this approach, existing geophysical cutlines are included in baseline studies and results from baseline field surveys reflect wildlife species use of the area under existing conditions.

2.2 Exploration Activities

As noted in the YNLR review comment mineral exploration activities occur in the Athabasca Basin. Denison believes it is useful herein to clarify mineral exploration terminology within the context of its understanding of such activities in the region (in which it engages) and terminology used by YNLR.

For clarification seismic lines and cut lines are two very different items in terms of scale. A seismic survey is a geophysical survey type that is not typically used in the Athabasca Basin as part of exploration activities as it has had limited positive results. When used, it requires the development of relatively large and wide lines (~5 m; seismic lines) to accommodate the movement of seismic equipment that is mounted on a half-ton sized equipment. In Denison's experience, seismic survey applications are generally restricted to projects in an advanced state of development, as they are expensive to complete and do not provide good value at the early stage of the exploration cycle. In contrast, cut lines, which are generally no more than a 1 m wide, are the preferred methods to orientate a ground survey once airborne surveys have identified an area of exploration interest. These cut lines do not remove the roots of the trees and leave slash (tree branches, woody debris) behind to promote new vegetation growth. Cut lines can facilitate geophysical surveys such as magnetics, electromagnetic, gravity, and resistivity. More recently, technologies such as drones have been adapted to accommodate detailed magnetic and electromagnetic surveys which can be flown close to the ground surface without the need of cut lines. Other surveys such as resistivity still require a level of precision that rely on the use of cut lines to accommodate crews and equipment.

In order to conduct mineral exploration activities on Crown land within Saskatchewan, surface disturbance permits are required from the Ministry of Environment before any work can be started. The Mineral Exploration Guidelines for Saskatchewan provides information to assist in the planning, initiation, and completion of a mineral exploration program in a fashion that will help minimize environmental impacts and meet relevant legislative requirements. The Mineral Exploration Guidelines include a variety of best management practices including those related to access and forest clearing/harvesting operations.

For context and to relate this information back to Section 2.1 Baseline Characterization, the majority of the straight linear features digitized in the LSA and RSA as part of the baseline anthropogenic mapping were cutlines. These lines were buffered by 1.75 m to create polygons.

2.3 Appendix 9-B

Appendix 9-B of the draft EIS presents the baseline inventory for wildlife and vegetation which was completed by Omnia Biological Services (Omnia) from 2016 to 2019. The baseline report is meant to summarize the findings from targeted studies and field surveys. The objectives of the terrestrial baseline surveys were to:

- Characterize the existing terrestrial environment in the Project Area,
- Inform pre-feasibility engineering design work,
- Inform environmental effects and technical assessments,
- Establish a framework to facilitate future environmental effects monitoring, and
- Support the development of project specific mitigation strategies .

Accordingly, **the baseline report was not intended to provide an assessment of Project effects**. It is recognized that Appendix 9-B, Section 2.3 Linear Feature Natural Regeneration Assessment, is not aligned with the overall objectives of the baseline report and moreover, is not meant to be read in conjunction with, or contribute to, the effects assessment presented in the EIS.

In addition, there are incorrect statements contained in Appendix 9-B, Section 2.3 Linear Feature Natural Regeneration Assessment, which are a result of incorrect interpretation of methodological approach to consider caribou habitat disturbance. These statements were effectively outside the scope of the baseline scope and report objectives and in retrospect should not have been reported.

Here is one of the statements in Appendix 9-B, Section 2.3 Linear Feature Natural Regeneration Assessment which has caused confusion around existing disturbance on the landscape:

For SK1, in 2018, ECCC indicated that to ensure sustainable caribou populations total buffered anthropogenic disturbance should not exceed five percent and that total disturbance (natural + buffered anthropogenic) should not exceed 40 percent. Currently, under this scheme, the Denison project area is considered to be completely disturbed when taking into account buffered anthropogenic disturbance in the LSA and is 82% disturbed in the RSA. Linear disturbances, in the form of exploration lines, temporary exploration trails and all season and seasonal roads were most common.

Denison provides the following clarifications and corrections:

- The baseline information used an outdated recovery strategy. The Omnia baseline report was finalized in 2019 and the most recent recovery strategy available at that time and referenced in the report was from 2012 (EC 2012). The 2020 amended recovery strategy (ECCC 2020) replaces the 2012 Recovery Strategy (ECCC 2012).
- The anthropogenic mapping completed to support the draft EIS was done at a higher resolution/scale compared to ECCC's approach in the amended recovery strategy (ECCC 2020).

- As noted above, **anthropogenic mapping was done using digitization at the 1:5,000 scale** to support the EIS.
- ECCC (2020) mapped total disturbance levels on boreal caribou ranges across their distribution in Canada as a predictor of self-sustainability for boreal caribou local populations. The total disturbance footprint was measured as the combined effects of fire that has occurred in the past 40 years and **buffered (500 m) anthropogenic disturbance defined as any human-caused disturbance to the landscape that could be visually identified from Landsat imagery at a scale of 1:50,000.**
- Contrary to what was shown Section 2.3 of Appendix 9-B, applying a 500 m buffer to geophysical cut lines digitized at 1:5,000 scale is not consistent with the amended recovery strategy (ECCC 2020). **At the 1:50,000 using Landsat imagery, geophysical cutlines would not be visible.**
- Given the above, the information presented in the Omnia baseline report (Appendix 9-B, Section 2.3 Linear Feature Natural Regeneration Assessment) was erroneous in that it was beyond the scope and objective of the baseline program. In fact, this section of the baseline report reflects and is related to Denison's initiation of a proactive, multi-year research program to better understand how wildlife use linear features. We have attached an interim report from Omnia for YNLR's reference. Among other things the report includes information on wildlife landscape use and movement from trail camera data that indicates considerable use of and movement along linear features. This interim report and the linear feature deactivation work is also discussed in the conceptual woodland caribou mitigation plan. The baseline report should have focused on the results of surveys and existing information that describe the existing conditions in the project areas and should not have extended beyond this scope. The assessment of potential Project effects on the various terrestrial Valued Components (VCs) is included in the main part of Section 9 and as indicated Appendix 9-B, Section 2.3 Linear Feature Natural Regeneration Assessment, was not meant to be read in conjunction with, or contribute to, the effects assessment presented in the EIS.

Denison recognizes that a number of YNLR's comments reference Appendix 9-B and regrets the confusion it has caused during YNLR's review of the draft EIS. Denison will revise Appendix 9-B to remove the discussion on cumulative effects and buffered anthropogenic disturbances. We refer YNLR to the analysis and assessment completed by the environmental assessment (EA) technical leads and biologists at EDI Environmental Dynamics Inc., as presented in Section 9 of the draft EIS.

2.4 Assessment of Potential Effects on Woodland Caribou and their Habitat

All past anthropogenic disturbances (which includes cutlines to support mineral exploration) were considered in the various terrestrial environment assessment components. These human

disturbances were mapped and considered/addressed appropriately in Section 9 including the Existing Environment, Residual Effects Characterization, and Cumulative Effects Assessment sections, as they relate to Terrain, Soil and Organic Matter/Peat (Section 9.1); Vegetation and Ecosystems, Listed Plant Species and Wetlands (Section 9.2); Ungulates, Furbearers and Woodland Caribou (Section 9.3); Raptors, Migratory Breeding Birds, and Bird Species at Risk (Section 9.4). **The cutlines were classified as previously disturbed areas and considered as low-quality habitat or no habitat, depending on the species being assessed and their habitat requirements.**

An anthropogenic disturbance layer is included on draft EIS, Figure 9.2-6, which includes geophysical cutlines. Please note that anthropogenic disturbance features were mapped at IKONOS 1:5,000. This anthropogenic disturbance layer is not listed under available habitat types for any of the wildlife or avian VCs in subsequent assessments (e.g., Figures 9.3-9 to 9.3-14, Figures 9.4-8 to 9.4-11, Figures 9.4-13 to 9.4-15), except for Common Nighthawk (Figure 9.4-12) that is a species known to use anthropogenic features.

In terms of the woodland caribou population in SK1, the likelihood of self-sustainability for the Boreal Shield range (SK1) has been updated from “unknown” (EC 2012) to “likely” in the amended recovery strategy (ECCC 2020). The SK1 range comprises more than 18,000,000 ha and is characterized by high fire disturbance and low anthropogenic disturbance (ECCC 2020). For SK1, the amended recovery strategy (ECCC 2020) identifies 40% undisturbed habitat in the range as the disturbance management threshold, which provides a measurable probability (71%) for the local population to be self-sustaining. This threshold is considered a minimum threshold because at 40% undisturbed habitat there remains a risk (29%) that the SK1 local population cannot be self-sustaining. According to ECCC (2020) disturbed habitat is habitat showing: i) anthropogenic disturbance visible on Landsat at a scale of 1:50,000, including habitat within a 500 m buffer of the anthropogenic disturbance; and/or ii) fire disturbance in the last 40 years, as identified in data from each provincial and territorial jurisdiction (without buffer). In contrast, according to ECCC (2020) undisturbed habitat is habitat not showing any: i) anthropogenic disturbance visible on Landsat at a scale of 1:50,000, including habitat within a 500 m buffer of the anthropogenic disturbance; and/or ii) fire disturbance in the last 40 years, as identified in data from each provincial and territorial jurisdiction (without buffer). The cumulative effects assessment in the draft EIS showed that the Project is expected to add 0.001% of anthropogenic disturbance at the scale of the SK1 Boreal Shield Woodland Caribou Management Unit (Section 9.3.7.3.3 of the EIS).

Specific to woodland caribou, the draft EIS evaluated and assessed potential Project-related effects on the boreal population of woodland caribou following standard environmental assessment (EA) methodology. The assessment of potential effects considered both direct (i.e., habitat loss) and indirect effects (i.e., habitat alteration) on caribou and their habitat, while assuming that caribou were present year-round and during all of their life stages (i.e., calving, rearing, mating, over wintering). In this way, the EIS took a precautionary or conservative approach to understanding/addressing the likely residual effects (i.e., effects remaining after mitigation measures were considered) of the Project on caribou and their habitat. This approach provides is appropriate as a planning tool to inform/support future Project-related

regulatory approvals processes and to guide the scope and nature of follow-up monitoring. After consideration of measures to avoid and mitigate the potential for effects on caribou and their habitat it was concluded that the likely residual effects of the Project on caribou and their habitat were **not significant**. While the EIS did not consider specific additional opportunities to offset the non-significant effects, Denison has been working to develop a Conceptual Caribou Mitigation Plan (see Section 5 below). The plan was submitted to the provincial and federal review teams as part of the response to federal information requirements in August 2023 as the Conceptual Caribou Mitigation Plan and Denison has been in close contact with the Saskatchewan Ministry of Environment (SK ENV), as stewards of woodland caribou from a regulatory perspective.

3 Spatial Scale for the Caribou Assessment

Several of YNLR comments were related to the spatial scale of the caribou assessment. This section presents an overview of the approach taken in the terrestrial assessment and specifically where the SK1 range was considered in the caribou assessment.

The rationale for the definition of study areas for the purpose of the assessment of the Terrestrial Environment valued components (VCs) is described in Section 9.1.1 of the draft EIS. The Project Area (169 ha or 1.69 km²) and LSA were delineated based on the expected extent of potential direct (footprint) and indirect (sensory disturbance) Project effects; whereas, the RSA considered an 8 km buffer around the Project Area to provide an appropriate spatial scale upon which potential Project effects could be evaluated at the landscape scale where key Terrestrial Environment VCs reside and move within and upon which cumulative effects could be assessed.

Boreal caribou occur as one continuous population across the SK1 range (18,034,870 ha), including within the Terrestrial RSA. After consideration, it was decided by Denison and its Subject Matter Experts at EDI Environmental Dynamics Inc. to use the Terrestrial RSA for the cumulative effects assessment for caribou rather than the entire SK1 range. This decision was made largely on the basis that it would not be feasible / appropriate to use a such large area like the SK1 range to assess cumulative effects since consideration of such a large spatial extent would likely "dilute" the contribution of the Project to potential effects at that scale. In support of this decision, comparison of the Project-specific habitat effects (i.e., the Project Area plus a 500 m buffer to account for sensory disturbance) relative to the scale of the SK1 range (as the applicable management unit for portion of the woodland caribou population that uses the Terrestrial RSA) was made. The comparison indicated that the Project is expected to add 0.001% of anthropogenic disturbance at the scale of the SK1 Boreal Shield Woodland Caribou Management Unit (Section 9.3.7.3.3 of the EIS). As can be seen, the default conclusion at the range scale could only be that the Project does not contribute to cumulative effects at a practical measurable level.

In addition, it is appropriate to also consider the assessment of terrestrial environment from the perspective of Land and Resource Use per Section 11 of the draft EIS, since the two (Terrestrial Environment and Land Are Resource Use) are so intimately related. For context the Terrestrial Environment RSA, fits within the Indigenous Land and Resource Use RSA. Section 11 of the

EIS is focused on Land and Resource Use and includes consideration for various terrestrial VCs and key indicators (KIs) as resources. With respect to Indigenous Land and Resource Use, the definition of spatial boundaries is offered in Table 11.2-2, which notes that the LSA is inclusive of the area in which direct and indirect effects to relevant VCs could likely occur, and includes the maximum combined extent of supporting VCs associated with the aquatic, terrestrial, noise, and health LSAs. Additionally, it is inclusive of trapping, fishing, and travel through and adjacent to the Project Area. The RSA is inclusive of trapping block N-18, which represent a familiar reference for local Indigenous communities and capture the broad land usage patterns of local communities.

4 Cumulative Effects Assessment under the Canadian Environmental Assessment Act, 2012

The Wheeler River Project EIS is subject the *Canadian Environmental Assessment Act, 2012*. In this assessment framework, the Project-specific cumulative effects assessment (CEA) considers whether residual adverse effects of the Project on a given VC will overlap spatially and/or temporally with residual adverse effects on the VC resulting from other past, present, and reasonably foreseeable projects or activities. The CEA follows standard methodology as per provincial (e.g., Guidelines for an Environmental Assessment [Government of Saskatchewan 2022]) and federal guidance (e.g., Assessing Cumulative Environmental Effects under the Canadian Environmental Assessment Act, 2012 [Government of Canada 2019]).

For residual effects to be considered in the CEA for the Project, the following criteria had to be met:

- potential exists for a residual adverse effect of the Project on a VC;
- the residual adverse effect can be demonstrated to act cumulatively with the residual adverse effects from other projects or activities on the same VC;
- other projects or activities must have been, or are expected to be, carried out in the reasonably foreseeable future; and,
- the cumulative effect is likely to occur.

The approach for assessing cumulative effects considers both the current conditions (which include changes caused by past development, projects, and activities, and are, therefore, considered in the baseline condition of the VC) and the identified reasonably foreseeable future projects and/or activities.

The steps of the CEA for each VC are:

1. Determine the spatial boundaries for the CEA, which is VC specific, and typically the RSA for the VC.
2. Determine the project inclusion list of all other past, present, and reasonably foreseeable projects and/or activities that are expected to have adverse residual effects that extend into the VC RSA.

3. Consider all Project-related residual effects that were identified during the effects assessment for each VC, regardless of significance.
4. Identify the potential for interaction (i.e., must overlap spatially and temporally) of the Project-related residual effects with those of other projects and activities identified in Step 2 above.
5. Identify and describe the cumulative effects, and if practical, identify technically and economically feasible mitigation measures (i.e., in addition to those already identified to mitigate potential Project effects) to avoid, reduce, or otherwise mitigate the predicted cumulative effects.
6. Qualitatively assess and evaluate (i.e., characterize) the cumulative effects with respect to the likely nature and degree of change from the existing (baseline) environment as a result of the Project's residual effects in combination with the residual effects of other relevant future projects and activities.
7. Determine the significance of the cumulative effect using characterization criteria as defined for the residual effects evaluation.

In the draft EIS, Denison included a number of project activities as existing/present and reasonably foreseeable. This includes historic anthropogenic disturbance associated with exploration activity, drilling, and access creation in support of past exploration and mining activities have occurred within the Athabasca Basin since the 1940s when uranium was first discovered in the region.

4.1 Woodland Caribou CEA

The CEA framework described above provides the framework upon which the CEA for woodland caribou was conducted. Residual effects resulting from the Project in combination with those from ongoing and reasonably foreseeable projects and activities that were identified (see draft EIS, Section 9.3.7.2) may act cumulatively to potentially affect woodland caribou in the Terrestrial RSA. The key endpoints through which the CEA was considered included the alteration and/or loss of habitat and change in mortality. For reference, for alteration and/or loss of habitat the draft EIS considers existing habitat disturbances due to past and ongoing anthropogenic development, which includes old exploration trails and disturbances associated with line cutting, drilling, and access development.

The woodland caribou population in the region is reported to be stable and their anthropogenic habitat disturbance is currently estimated at 1.5% in the Terrestrial RSA, which is below the 5% threshold of anthropogenic disturbance recommended as a requirement to sustain viable populations (ECCC 2019). The Project will add another 0.4% of anthropogenic disturbance (considering the Project Area of 169.6 ha) adding up to 1.9% of anthropogenic disturbance in the Terrestrial RSA. It is not expected that the cumulative effect of alteration and/or loss of habitat will alter the integrity of woodland caribou habitat within the Terrestrial RSA to the point where it is not sustainable or available to contribute to ecological functions. Therefore, the cumulative effect resulting from the Project's residual effect interacting with residual effects from other projects and activities is predicted to be **not significant**.

4.2 How Indigenous Perspectives Influenced the Cumulative Effects Assessment

Cumulative effects assessment is important to Indigenous communities in general because incremental changes to the environment can weaken resource economies, affect important resources such as plants, fish, and wildlife, affect rights-based and cultural activities, and affect both the health of wildlife and humans (Indigenous Centre for Cumulative Effects 2021). Indigenous perspectives can be complementary to the CEA for the Project, and Denison acknowledges the important relationship of the Indigenous Communities of Interest to the lands and waters. The Indigenous Communities of Interest of English River First Nation (ERFN) and the Kineepik Métis Local #9 at Pinehouse (KML) have shared their Indigenous Knowledge on past, present, and predicted cumulative effects through the following sources:

- Wheeler River Project – Summary of Health and Socio-Economic Study Results (ERFN and SVS 2022a);
- Wheeler River Project - Summary of Traditional Knowledge Study Results (ERFN and SVS 2022b);
- Kineepik Valued Ecosystem Components – KML Pre-statement for Denison EIS (KML and NVP 2022); and
- Response to the Environment Impact Assessment For the proposed Ministry of Highways 914 Extension Project (KML and Limnos Environmental 2022).

These perspectives on cumulative effects have been summarized in Section 3.4.8 of draft EIS. Denison and the Communities of Interest agreed on the high value of this contribution being part of the EIS.

Denison recognizes that Indigenous Knowledge systems offer an alternative source of knowledge, often complementary to western science (Eckert et al. 2020). The CEA for the Project followed standard methodology as per provincial (Government of Saskatchewan 2022) and federal guidance (Government of Canada 2019). Among the sources of information to consider, the federal guidance notes the importance of “Aboriginal traditional knowledge, community knowledge and scientific knowledge, or simply an expression of concern regarding potential cumulative effects to a particular VC” (Government of Canada 2019). All sources of information were considered by discipline leads as described in the respective draft EIS sections and in Section 4, Engagement. The CEA for all VCs completed for the Project incorporated, as appropriate, the characterization of activities/events that have shaped the existing environment and continue to influence the VCs used for the EIS.

5 Conceptual Caribou Mitigation Plan

Following submission of the draft EIS in October 2022, Denison has met with Saskatchewan Ministry of Environment (SK ENV) staff to develop a framework for future woodland caribou offset. This information has been presented to the provincial and federal review teams as part of the response to federal information requirements in August 2023 as the Conceptual Caribou Mitigation Plan (**Error! Reference source not found.**).

The Conceptual Caribou Mitigation Plan (the Plan), developed proactively by Denison, has a different objective than the draft EIS. The Plan builds on the assessment of potential Project effects and commitments to consider additional mitigation (offset) to account for non-significant residual effects highlighted in the draft EIS. The Plan is expected to be advanced with ongoing consultation with the SK ENV, as SK ENV finalize the caribou range plan for SK1. The EIS is a conservative planning tool, whereas the Plan is a practical, living document designed to define management works associated with caribou. The Plan is not a requirement for EA determination *per se*, but is provided as a guidance document to help Denison proactively describe and inform the development and implementation of appropriate mitigation measures related to caribou and their habitat.

The Plan is an evergreen document. It will be consistent with the management goals of SK ENV for the SK-1 caribou conservation unit and will be developed/refined in consultation with local communities including English River First Nation and Kineepik Métis Local in Pinehouse and regulators. As noted above, the boreal caribou range plan for SK-1 is under development and it is understood that this Plan will be updated as more information becomes available. The conceptual nature of the Plan is in part due to the absence of range plan priorities and reflects Denison's commitment to continue to work with the province to meet the management objectives and management strategies for the SK1 range.

Denison is continuing to work with SK ENV to estimate habitat offset scenarios based on the current Project design which will be refined as the Project advances. A boreal caribou habitat offset calculator is under development by SK ENV and Denison is collaborating with SK ENV to define key scenario attributes. SK ENV will engage with Indigenous communities and nations as the province develops and refines the range management plan for SK1.

6 Closing

Denison is confident in the methodology used in the terrestrial assessments and the assumptions used to conduct the woodland caribou assessment were conservative and the assessment followed a precautionary approach. The CEA was conducted in a manner consistent with the requirements of CEAA 2012 and related guidance documents for a Project-specific CEA and appropriately assessed potential cumulative effects for woodland caribou at the RSA and range (SK1) scales. The EIS concluded that the Project could be implemented in consideration of proposed mitigations whereby **both Project-related and cumulative residual effects would be not significant.**

Wheeler River Project

Public Notice - Conformity Review for the Wheeler River Project EIS Submission

August 29, 2023: On August 18, 2023, Denison Mines Corp. (Denison) re-submitted responses to the Federal Indigenous Review Team's information requests (IRs) for the proposed Wheeler River Project to the Canadian Nuclear Safety Commission (CNSC). CNSC staff conducted a completeness check and determined that outstanding IRs have passed completeness and supporting submissions are adequate to proceed to the EIS Technical Review. More information can be found in the [August 28, 2023 letter to Denison](#), and [completeness check table](#).

The next phase of technical review by the Federal Indigenous Review Team will run from August 30, 2023 to November 27, 2023. Subject Matter experts will review the responses to IRs provided to Denison in March 2023, which includes the following documents:

- Wheeler River Project: Denison's Responses to Information Requests from the Federal and Indigenous Review Team (August 18, 2023).
- Update to Indigenous Engagement Activities for the Wheeler River Project - draft EIS
- Wheeler River Project Commitments Table - draft EIS

Wheeler River Project

Public Notice - Technical Review for the Wheeler River Project EIS Submission

December 5, 2023: The federal and Indigenous review team (FIRT) has completed their technical review of the responses to information requirements (IRs) submitted by Denison Mines Corp. (Denison) and has found that the information provided does not fully address the regulatory requirements for the environmental assessment (EA). To date, the FIRT technical review of Denison's responses to the 238 information requests (IRs) has resulted in 144 accepted IRs and 18 follow-up IRs.

Additional information in the advice to proponent table contain guidance and advice that Denison should take into consideration when responding to IRs and when revising the draft EIS.

The following documents have been posted:

- Letter from CNSC staff to Denison with the Outcome of Denison's Submission of Responses to Information Requests
- Annex 1 - FIRT - Information Requirements for the Wheeler River Environmental Impact Statement
- Annex 2 - FIRT - Advice to the Proponent for the Wheeler River Environmental Impact Statement

CNSC staff expect Denison to submit complete revised responses to all outstanding and new IRs as well as advice to the proponent, along with a revised EIS and supporting documentation. Denison's responses may be reviewed several times to ensure the responses meet requirements. Once the revised draft EIS meets regulatory requirements, CNSC staff will proceed with developing an EA report.

Date modified: 2023-12-08

e-Doc: 7149498

December 5, 2023

Ms. Janna Switzer
Director, HSE Regulatory Compliance
Denison Mines Corp.
jswitzer@denisonmines.com

Subject: Results of the Federal-Indigenous Review Team technical review of the August 18, 2022 responses to Information Requests for the proposed Wheeler River Project

Dear Mrs. Switzer,

On August 18, 2023, Denison Mines Corp. (Denison) submitted responses to Information Requests (IRs) for the Wheeler River Project [1]. On August 30, 2023, CNSC staff found the submission [1] to contain the required information to proceed with the Federal-Indigenous Review Team (FIRT) technical review of the responses to information requests for the proposed Wheeler River Project [2].

Outcome of the EIS Technical Review

The FIRT has completed the technical review of the submission and has found that the information provided does not fully address the regulatory requirements for the environmental assessment (EA). To date, the FIRT technical review of Denison's responses to 238 IRs has resulted in 144 accepted IRs and 18 follow-up IRs triggered by responses to an original IR or supplementary material provided in Denison's submission. Of the 94 IRs that were not accepted, there are cases where the technical approach is accepted and the IRs can be resolved once text for the EIS has been provided and accepted by the FIRT. The updated table is provided in the attached Annex 1 [3].

Additional information in an Advice to Proponent table contains guidance and advice that Denison should take into consideration when responding to IRs and revising the draft EIS. This is included in the attached Annex 2 [4].

Expectations and Next Steps

On December 5th, 2023 or shortly thereafter, CNSC staff will post IR response [3] and Advice to Proponent [4] tables on the Canadian Impact Assessment Registry for the [Wheeler River Project](#) (Reference number: 80178).

CNSC staff expect Denison to submit complete responses to all IRs and advice to proponent comments and re-submit a revised EIS. CNCS staff also request that Denison provide a document revision history

with the revised EIS and concordance table, for reviewers to locate the changes that have been made to revised documents. It is expected that Denison clearly indicate how the revised EIS incorporated changes as a result of responses to the IRs. CNSC staff and members of the FIRT are available and willing to meet with Denison to discuss the path forward and to clarify expectations for the IR responses.

Revisions to Evergreen Documents

CNSC staff are also formally requesting that Denison provide revised versions of the Commitments table and Indigenous Engagement Reports, as part of its revised EIS documentation.

Commitments Table

The Commitments table, or Report, should capture all mitigation measures, follow-up program measures and commitments that have been referenced in the EA documentation in a single location for completeness and traceability. As requested in March 2023 [5], this report should include a listing of all commitments made by Denison based on the documentation submitted to date including:

- the EIS
- correspondence with the public and Indigenous Nations and communities
- responses to IRs
- additional commitments Denison has made in any documentation to members of the public and Indigenous Nations and communities and to whom these commitments apply

These commitments should be triaged based on whether they are within the scope of regulatory requirements or beyond (e.g., good governance, social responsibility), and indicate how each of these commitments will be tracked as part of Denison's programs.

As also mentioned in the March letter [5], it would be helpful if Denison could organize this information in tabular format providing the following information:

- details of the commitment
- the phase(s) of the project where the commitment will be carried out (e.g., all phases)
- where the commitment is referenced (which document, table, etc. and where it can be found)
- how this commitment will be tracked (project EA follow-up program, site-wide programs, etc.)

Indigenous Engagement Report

Similarly, it is expected that as per the requirements of REGDOC 3.2.2 Indigenous Engagement, an updated Indigenous Engagement Report (IER) be submitted to the CNSC as Denison's engagement activities progress. This is considered supplementary information that underpins responses to IRs. Therefore, CNSC staff expect Denison to submit an update on all engagement activities to date as part of Denison's next submission in a revised IER.

Both of these documents are evergreen and should continue to be updated over the remainder of the regulatory review process, as well as if the project is approved, after the public hearings and Commission decisions.

Should you have any questions, please do not hesitate to contact me, directly by phone at 343-540-6213 or by email at Jessica.Way@cnsccsn.gc.ca.

Sincerely,

- Original Signed By -

Federal Indigenous Review Team (FIRT) Review of Denison Responses to Information Requests (IRs) and Supporting Documents Received August 18, 2023

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|---|---|---|--|---|----------------------|----------|
| IR-01 | - | English River First Nation (ERFN) | Current use of lands and resources for traditional purposes | General | <p>Context: Denison has not gone far enough in terms of learning from and incorporating information from ERFN provided in the <i>Traditional Knowledge Study and Health and Socio-Economic Study Report</i>. It appears Denison put a disproportionate amount of reliance on the views and interests of one ERFN land user. While we applaud the efforts of Denison to seek feedback from ERFN land users directly and to work closely with such land users, ERFN’s rights and interests in the region of the Project (and the potential of the Project to adversely impact such rights and interests) extend well beyond that of just one land user.</p> <p>Rationale: It is important for the Proponent and regulators to understand that while the rights and interests of individual ERFN members are important to consider, the Elders and elected leaders of ERFN represent the collective rights and interests of ERFN as a Nation. The results of the scoping study indicated that ERFN holds firmly established rights to the area where the planned project is located. Numerous studies conducted over several decades have examined ERFN's relationship and connection to land use and occupancy of the region where the proposed mine is located from traditional land use, subsistence harvesting, ecological, and sociocultural and economic perspective.</p> | <p>The draft EIS should be revised to reflect the totality of ERFN TK and land use information.</p> <p>Denison and CNSC must continue to work with ERFN to ensure that impacts on ERFN rights are appropriately and fully considered, mitigated, and accommodated.</p> | | Accepted |
| IR-02 | - | Canadian Nuclear Safety Commission (CNSC) | Mitigation Measures | General Appendix 16-C | <p>Context: Denison’s 2019 Wheeler River Terms of Reference states: “The EIA will also discuss the monitoring programs required to demonstrate regulatory compliance and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders.”</p> <p>The CNSC’s Generic Guidelines for the Preparation of an Environmental Impact Statement (EIS), also state: “The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the Proponent intends to implement them and the environmental outcome the mitigation is designed to address.</p> <p>Rationale: The EIS and the Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information. It is not clear which monitoring programs will be employed to demonstrate regulatory compliance, and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders.</p> | <p>CNSC staff expect Denison to provide a comprehensive list of commitments along with the next version of the EIS, including any commitments made to Indigenous Nations and communities and other stakeholders (As committed in the Wheeler River Terms of reference, and as noted in the November 28th, 2022 email from CNSC staff to Denison: <i>Future Submission of a Commitments Table for Wheeler River EIS</i>).</p> | | Accepted |
| IR-03 | - | CNSC | Site preparation | Section 1.3.2 Temporal Boundaries | <p>Context: The EIS and TSD-ERA provide assessment on the Project timeframe, including construction, operation, and decommissioning phases.</p> <p>Rational: The site preparation phase is not included in the timeframe (EIS</p> | <p>Please provide an assessment of those facility characteristics and activities that may interact with the environment during the site preparation phase, along with an assessment of their potential effects, in order to reflect the entire lifecycle or provide a rationale for its exclusion.</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|--|--|---|---|--|--|--------------|
| | | | | Appendix 10-A (ERA) | and TSD-ERA). As per REGDOC 2.9.1, the sub-section 4.1.1 Complexity of the environmental risk assessment requirements states that “The applicant or licensee shall identify facility characteristics and activities that may interact with the environment during the relevant phase of the facility or activity’s lifecycle (for example, site preparation, construction, operation, and decommissioning.” | | | |
| IR-04 | - | Environment and Climate Change Canada (ECCC) | Fish and fish habitat | Section 2, Project Description Section: Glossary | <p>Context: The Proponent defines ‘clean waste rock’ as “Waste rock generated as sandstone cuttings and core from drilling activities associated with well and freeze hole development that does not have uranium containing materials”.</p> <p>ECCC notes that the use of the term “Clean Waste Rock” could be misunderstood to mean that the waste rock is devoid of any contaminant. Even when the waste rock referred to as “clean waste rock” does not contain uranium materials, it could contain other metals or contaminants that could have adverse environmental effects. It is also not clear whether the “clean waste rock” is characterized for Acid Rock Drainage/Metal Leaching (ARD/ML) given that some portion of the basement rock is to be drilled out to anchor the freeze walls and may have ARD/ML potential.</p> <p>Rationale: The current definition of ‘clean waste rock’ in the draft EIS could lead to inappropriate handling and disposal if it is assumed to be devoid of any metals or other contaminants that might negatively affect the environment.</p> | Provide a clear and more detailed definition of the term ‘clean waste rock’. | | Accepted |
| IR-05 | - | CNSC | Change to an environmental component due to hazardous contaminants | Section 2.2.1.2 | <p>Context: Water volumes for mud/diamond drilling is listed as minimal as the mud will be re-used. The mud is identified as a mixture of water, clay, and environmentally friendly polymers that clean out the cuttings and help to keep the drilling bit cool.</p> <p>Rationale: Although the mud for drilling will be re-used, there could be environmental impacts should there be an accident while drilling.</p> | Please identify the components of the environmentally friendly polymers for the drilling mud and potential environmental impacts should the mud not be recovered. | | Accepted |
| IR-06 | - | CNSC | Geology and groundwater | Section 2.2.1.4, Wellfield for In Situ Recovery Mining | <p>Context: This Section of the EIS indicates that a tracer test was completed in 2021 and a feasibility field test was initiated in 2022. No information from these tests is included in the EIS and no reporting timelines are provided.</p> <p>Rationale: Guidance from the IAEA (2001) and best practices highlighted by regulatory regimes in other countries such as the United States (IAEA, 2016) and Australia (Geoscience Australia, 2010) indicates that single and multi-well trial (feasibility) testing for mining and remediation techniques should be carried out before a licence for full-scale operations can be granted. This is part of the requirement for Proponents to demonstrate to government authorities that all potential risks have been considered during the life of operation and post-remediation of the mine.</p> | <p>1. Please provide a summary of the results of field tests (i.e., tracer tests, wellfield leach tests, and remediation trials) in the EIS, or provide a technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS.</p> <p>2. Please indicate how outcomes from these field tests inform the design of In Situ Recovery. This information should include:</p> <ul style="list-style-type: none">• feasibility of meeting remediation targets.• groundwater flow conditions and validation of flow models.• mobilization of contaminants (e.g., Al, Se or V).• potential for free gas evolution/two-phase flow.• identifying composition of lixiviant and production solutions. | <p>This response has not been accepted.</p> <p>The mining area decommissioning objectives shown in Table 2.3-3 of the original EIS (Section 2.3.3.1.1) show different numerical values when compared to those shown in Table IR-06-1 of Denison's response to IR-06. Notably, allowable proportions of Al, As, Cd, Cr, Cu, Fe, Mo, SO4, Se, U, V, and Zn are increased over the initial decommissioning objectives. Denison's Final Proposed EIS update for IR-06 does not include any text regarding alteration of decommissioning objectives for the mining area.</p> <p>Please also see follow-up IR-06-R1.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-------------------------|---|---|---|--|--------------|
| | | | | | <p>Additionally, Section 8.5.2 of the Generic EIS Guidelines states: “Units may be characterized as aquifers or aquitards, and unit descriptions should include their geochemical characteristics, vertical and lateral permeabilities, transport mechanism (diffusion versus advection) and the directions of groundwater flow”,</p> <p>And that “The applicant or licensee should present a conceptual and numerical hydrogeological model that discusses the hydrostratigraphy and groundwater flow systems”.</p> <p>Outcomes from the tracer test inform model parameters such as effective porosity (see IR-78), dispersion, and dispersivity (see IR-96). The wellfield leach tests and remediation trails ultimately inform environmental monitoring during site activities, and the source term for the groundwater model. This source term represents the contaminants which flow through the desilicified zone into Whitefish Lake, which represents a source of contamination considered in the ERA.</p> <p>References: [1] International Atomic Energy Agency (IAEA). 2001. | IR-06 | IR-06-R1 | CNSC | Geology and groundwater | Section 2.2.1.4, Wellfield for In Situ Recovery Mining | <p>Context: This Section of the EIS indicates that a tracer test was completed in 2021 and a feasibility field test was initiated in 2022. No information from these tests is included in the EIS and no reporting timelines are provided.</p> <p>Rationale: Guidance from the IAEA (2001) and best practices highlighted by regulatory regimes in other countries such as the United States (IAEA, 2016) and Australia (Geoscience Australia, 2010) indicates that single and multi-well trial (feasibility) testing for mining and remediation techniques should be carried out before a licence for full-scale operations can be granted. This is part of the requirement for Proponents to demonstrate to government authorities that all potential risks have been considered during the life of operation and post-remediation of the mine.</p> <p>Additionally, Section 8.5.2 of the Generic EIS Guidelines states: “Units may be characterized as aquifers or aquitards, and unit descriptions should include their geochemical characteristics, vertical and lateral permeabilities, transport mechanism (diffusion versus advection) and the directions of groundwater flow”,</p> | <p>1. Please provide a summary of the results of field tests (i.e., tracer tests, wellfield leach tests, and remediation trials) in the EIS, or provide a technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS.</p> <p>2. Please indicate how outcomes from these field tests inform the design of In Situ Recovery. This information should include:</p> <ul style="list-style-type: none">• feasibility of meeting remediation targets.• groundwater flow conditions and validation of flow models.• mobilization of contaminants (e.g., Al, Se or V).• potential for free gas evolution/two-phase flow.• identifying composition of lixiviant and production solutions.• success despite presence of >2% carbonate minerals (siderite, FeCO3) in the ore zone (see Table 4-3 of Appendix 7-A).• site-specific data to parameterize, validate, and refine solute transport models (hydraulic conductivity, effective porosity, dispersivity, diffusion, etc.). | <p>CNSC staff request that Denison provide clarification relating to the alteration of mining area decommissioning objectives. Additionally, Denison is requested to provide a discussion on how alteration of the mining area decommissioning objectives fits within the geochemical reactive transport modelling presented in Appendix 7-C (i.e. effect of increase proportions of allowable COPCs on surface water quality), given that these objectives (as shown by "Restored Solution #1" in Table 3-5 of Appendix 7-C) are used as the bounding scenario for groundwater quality during reactive transport scenarios.</p> <p>Original EIS – Table 2.3-3:</p> | Follow-up IR |

|-----------------------|----------------|----------------------------------|---|--|---|---|--|-----------|-------|-------------------|----|--|-----|----------|------|---|---------|------|------|---------|------|-------|--------|------|---|----------|------|------|--------|------|------|------|------|-----|------------|------|-----|--------|------|-----|------|------|-----|----------|------|-----|----------|------|------|------|------|-----|---------|------|-----|----------|------|------|-----------------------|------|----------|-----------|-------|----------------------------------|---|----|----------|-----|------|---------------|------|-----|-----|--------------|------|-----|------|-------------|------|-----|------|--------------|------|-----|-----|--------------|------|-----|---------|-------------|------|------|--------|---------------|------|------|---------|-------------|------|------|-------|-----------|------|-----|-----|---------------|------|----|-----|----------------|------|------|------|-----------------|------|------|------|-------------|------|-----|-----|-------------|------|------|------|-----------|------|---|------|---------|------|-------|------|----------|------|------|--------|---------|------|-----|----|-----------|-------|----------------------------------|---|----------|------|------|-----|------|------|------|-----|
| | | | | | <p>And that “The applicant or licensee should present a conceptual and numerical hydrogeological model that discusses the hydrostratigraphy and groundwater flow systems”.</p> <p>Outcomes from the tracer test inform model parameters such as effective porosity (see IR-78), dispersion, and dispersivity (see IR-96). The wellfield leach tests and remediation trails ultimately inform environmental monitoring during site activities, and the source term for the groundwater model. This source term represents the contaminants which flow through the desilicified zone into Whitefish Lake, which represents a source of contamination considered in the ERA.</p> <p>References: [1] International Atomic Energy Agency (IAEA). 2001. | IR-07 | - | ECCC | Fish and fish habitat | <p>Section 2.2.1.4.2, Wellfield Operation</p> <p>Section 2.2.1.4.2.2, Secondary Containment of Mining Solution – Pumping</p> | <p>Context: The description in Sections 2.2.1.4.2 and 2.2.1.4.2.2 refer to the differential rates of injection and withdrawal, which implies that more solution will be withdrawn through the recovery well than volume of mining solution injected. According to the description of the site, a freeze wall will create a barrier between the uranium deposit to be mined and outside the isolated area to prevent inflow of groundwater from the sandstone outside the freeze wall. Secondly, it was indicated that the basement rock below the uranium deposit will prevent infusion of groundwater from below.</p> | Clarify where the extra groundwater will come from to sustain this differential rate of injection and withdrawals during operation and if this extra water has been accounted for in the model and the amount of water that ends up in the receiving environment. | | Accepted | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

|--------------|----------------|------|---|---|--|--|----------------------|----------|
| | | | | | <p>The Proponent stated that inward hydraulic gradient will be created by recovering more solution than is being injected. In general, the wellfield will operate to draw a minimum of 1% more solution out of the wellfield compared to solutions injected in. This will help avoid increased subsurface pressures from injection pressure build up within the deposit.</p> <p>Rationale: It is not clear where the extra groundwater will come from that will sustain this differential rate of injection and withdrawals as the freeze wall and bedrock basement will isolate the injection well from groundwater.</p> <p>If it is assumed that there is limited amount of groundwater present in the sandstone layer above the uranium deposit, that amount of groundwater in the sandstone layer is finite and will be exhausted at some point. Therefore, it is not clear where the extra groundwater will come from. If the extra volume of water is not accounted for in the modelling, that would ultimately affect the volume of water that ends up in the receiving environment and likewise the amount of contaminants contained.</p> | | | |
| IR-08 | - | ECCC | Change to an environmental component due to radiological contaminants | Section 2.2.1.4.2.2 Project Description | <p>Context: This section describes how an inward hydraulic gradient will be created within the mining area as a secondary containment method for control of mining solution. While the process is described, there is no information on contingency measures in place for pump failure or system maintenance solutions. There is also no information on how quickly the hydraulic gradient, and therefore secondary containment, would be compromised if any pumps stopped working. It is also unclear how primary containment (i.e., well design) failure, such as physical/mechanical issues compromising casings, would affect the creation of the hydraulic gradient and secondary containment as well.</p> <p>Rationale: It is important to have contingency planning in place in the event that there are any issues with the hydraulic gradient and secondary containment system for control of the acidic mining solution.</p> <p>There is no information in this section on how the hydraulic gradient (i.e., secondary containment) would be maintained if a well or pump (i.e., Primary containment) experienced problems.</p> | Provide further information regarding how the inward hydraulic gradient system functions, with particular focus on how the hydraulic gradient and secondary containment will be maintained if any wells or pumps were compromised. | | Accepted |
| IR-09 | - | CNSC | Geology and Groundwater | Section 2.2.1.4.2.2 | <p>Context: This section indicates that mining solution within the mining area can primarily be controlled by maintaining an inward hydraulic gradient. The inward hydraulic gradient will be created by recovering more solution than is being injected.</p> <p>Rationale: If, for some reason, the recovered solution is much more than that being injected, an excessive drawdown could be created. If, by accident, mining solution is leaking into the upper sandstone aquifer through crack in injection/recovery well casing at the same time, it would be challenging to</p> | Please clarify if any measure will be implemented to avoid excessive drawdown and develop contingency measures to address such accident. | | Accepted |

|--------------|----------------|------|--|--|---|---|--|----------|
| | | | | | remediate the upper sandstone aquifer in dry conditions (due to excessive drawdown). | | | |
| IR-10 | - | ECCC | Fish and fish habitat | Section 2.2.1.4.2.3, Tertiary Containment of Mining Solution - Freeze Wall | <p>Context: The Proponent stated that as a tertiary means of containment for the mining area, the uranium deposit is proposed to be surrounded by a freeze wall that extends from the surface to the basement rock, isolating the mining area from regional groundwater. Current plans are for the freeze wall to be a minimum of 10 m thick, be installed 25 m away from the uranium deposit, and extend 30 m into the basement rock (Figure 2.2-6).</p> <p>As explained in Section 2.2.1.4.2.2, mining solution will be injected into the ore zone under pressure and will likely react, not just with the uranium in the ore zone, but also the binding or cementing material in the sandstone. This means that some portion of the sandstone above the uranium layer and perhaps some portions of the freeze wall will dissolve, thereby creating more void than just the thickness of the uranium layer or horizon. The void may affect the integrity of the freeze wall as containment.</p> <p>Rationale: It is not clear how the Proponent will monitor the freeze wall to verify whether portions of the freeze wall are being dissolved in the mining process and how it plans to verify the integrity of the freeze wall as a containment for the mining solution. In addition, if the dissolution reaction of the uranium ore is exothermic, then the heat generated may also affect the integrity of the freeze wall.</p> | <p>1. Explain how the integrity of the freeze wall will be maintained as a means of containment that prevents migration of the mining solution out of the ore zone into the receiving environment.</p> <p>2. Demonstrate that the mining solution injected under pressure will not compromise the integrity of the freeze wall as a containment.</p> <p>3. Demonstrate how both exothermic and chemical reactions of the mining solution used to dissolve the uranium ore will not compromise the integrity of the freeze wall as a containment.</p> <p>Technical Discussion Required: Yes. ECCC would like to better understand the chemical constituents that compose the mining solution and the chemical reactions that it will cause.</p> | The Proponent’s response is accepted but see AD-50 in the Advice to Proponent table. | Accepted |
| IR-11 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.2.3 Project Description | <p>Context: It is unclear how much contact water may be produced during the drilling of the mine well field during the construction phase of the proposed Project. Figure 2.2-14 indicates that no water will be produced during the drilling process in the construction phase. In Section 2.2.1.2 both mud rotary drilling and diamond drilling are proposed for the creation of wells. Both processes require water, however only mud rotary drilling produces liquid mud that is then reused in the drilling process.</p> <p>Rationale: It is unclear if the liquid mud produced during drilling can be reused indefinitely with further water additions, or if this eventually becomes the clean sand grain cutting and how it will be disposed of (i.e., liquid or solid waste). If the mud produced from drilling is classified as liquid waste and disposed of as contact water, it is not clear if this is accounted for in the site water management plan and water balance during the construction phase. Contact water from well drilling during the construction phase has not been quantified or accounted for in Figure 2.2-1, and therefore it is unclear if proposed infrastructure during the construction phase has the capacity to contain this waste stream in addition to the waste streams currently outlined in Figure 2.2-1.</p> | Provide further information on potential wastewater produced during the construction phase from drilling processes, and if proposed infrastructure can contain any water produced. | | Accepted |

|--------------|----------------|------|--|---|--|--|--|--------------|
| IR-12 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.2.3, Project Description | <p>Context: There is not enough information provided within the draft EIS and site water infrastructure designs to determine if the infrastructure will sufficiently contain mine site contact and non-contact water runoff. It is unclear how water management will occur during all proposed Project stages at the Project airstrip, which is located away from the main Project site. No information has been provided regarding water that may come into contact with fuels and oils from machinery on the air strip, how and where that contaminated water will be treated, and how surface runoff around the airstrip will be managed. Additionally, it is unclear if contaminants from heavy machinery on roads have been considered during runoff collection plans throughout the mine Project site. Water management at the airstrip and roads can have impacts on surface water quality and sediment quality and contaminants (e.g., Hydrocarbons) from these sources should be considered in overall site water management plans.</p> <p>In Section 2.2.3.1 a site drainage plan for contact and non-contact water has been provided in Figure 2.2-17, and water balances have been provided for the different Project phases in Figures 2.2-14 to 2.2-16. In Section 2.2.3.4 a volume of 30,000m³ for the process water pond is provided, and it is stated that the process water pond has the capacity to contain Probable Maximum Precipitation (PMP) event estimated to be 483.3mm while allowing for 1.0m of freeboard. However, there are no estimates on the total volume of water that may be drained from the overall site infrastructure (i.e., the well field, processing areas, etc.) during a 24-hr PMP event. Additionally, in Figure 2.2.17 culvert locations are provided, however there is no further information on culvert designs, flow ratings and capacity for PMP events.</p> <p>Rationale: In order to be able to understand site water management and flood risk potential, more information needs to be provided regarding the site water infrastructure designs and capture volumes during PMP events. This information will aid ECCC in understanding how contact and non-contact water will be conveyed throughout the site. Runoff from roads and the site airstrip will contain contaminants from vehicles, heavy machinery, aircrafts and de-icing practices. Additional information on the runoff collection systems and expected contaminant concentrations for the site airstrip and roads is needed to determine if the receiving environment and aquatic and terrestrial receptors are protected.</p> | <ol style="list-style-type: none">1. Provide information on how contact and non-contact water from the site airstrip will be managed. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.2. Provide further information on how potential contaminants in runoff from roads have been considered in the site water management. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.3. Provide estimated volumes of water to be drained from overall site infrastructure (such as the mine terrace, airstrip, camp area etc.), during a 24-hr PMP event.4. Provide additional information on culvert designs and conveyance capacity for PMP events. | <p>This response has not been accepted, for the following reasons (numbers correspond with original IR):</p> <p>1-2. In Figure 2.2-17 (Site Drainage Plan with Flow Direction and Culvert Locations) of EIS, site drainage or water management layout is not included for the access road to the airport and the airport area although they constitute part of the Project site. Although surface run off from airstrip or site road are mainly expected to be clean or non-contact water, CNSC expects Denison to provide information on water management system to mitigate risk of flooding and erosion at the airport and the access road. In addition, the access road connecting the mining site with airport crosses two streams (Kratchkowsky Creek and Hart Creek) that flow into Whitefish Lake, CNSC staff expects Denison to ascertain that culverts or crossings will be designed in such a manner that the flood hazard does not increase. Therefore, CNSC staff request that Decision provide information on how the surface runoff generated at airstrip and airport access road would be managed.</p> <p>3. CNSC accepts estimated total volume of runoff from the wellfield area to Wellfield Pond however the PMP value of 489.3mm is obtained from 1999 study [A.1], based on historical rainfall data pre-1998, which appears to require updated PMP value.</p> <p>CNSC requests that Denison use a PMP value that is estimated using historical rainfall data that includes the most up to date meteorological data or provide justification on the validity of the current PMP.</p> <p>Further, the site infrastructure runoff water has not been considered in the water management infrastructure. Site water management planning should consider the capture of noncontact water to understand the potential effects of contaminants from non-contact water on the surrounding environment.</p> <p>Please also see follow-up IR-12-R1A and IR-12-R1B, related to this IR.</p> <p>Reference: [A.1] Atmospheric & Hydrologic Sciences Division – Atmospheric Environment Branch. 1999. Environment Canada Prairie & Northern Region – Point Probable Maximum Precipitation for the Prairie Provinces. Regina, Saskatchewan. Report No. AHSD – R99 – 01.</p> | Not Accepted |
| IR-12 | IR-12-R1A | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.2.3, Project Description Proponent response to IR-12 | <p>Context: Runoff water from site infrastructure such as the airstrip and roads may be categorized as non-contact water because it does not come into contact with contaminants of potential concern (COPCs) directly from mining operations infrastructure. However, it still has the potential to contain deleterious substances from mine-related activities such as operation of vehicles, including heavy machinery and aircraft, spills, fire management</p> | <ol style="list-style-type: none">1. Update site water management plans to include management of potentially deleterious substances contained in non-contact water from all site infrastructure.2. Provide updated estimates of water volumes to be drained and managed from overall site infrastructure (including runoff from roads, airstrip, camp | | Follow-Up IR |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------------------|--|--|--|--|---|--------------|
| | | | | | <p>practices, and snow removal practices. The <i>Metal and Diamond Mining Effluent Regulations</i> (MDMER) pursuant to the <i>Fisheries Act</i> requires all mine effluent and seepage from the mine site that contains deleterious substances be discharged through a final discharge point. This includes deleterious substances in non-contact water from all site infrastructure including the airstrip, roads, and camp area.</p> <p>Rationale: All mine effluent and seepage that contains deleterious substances must be discharged through a final discharge point. This includes site non-contact water which has the potential to contain deleterious substances such as those released from vehicles, machinery, aircrafts, spills, and de-icing practices. The Proponent has not included how non-contact water runoff from site infrastructure will be captured within site water management planning. To understand the potential effects of contaminants from non-contact water on the surrounding environment, site water management planning needs to be updated to include the capture of non-contact water.</p> | area, etc.) during the different Project phases. Include updated information on water treatment flows, capacity and effluent discharge during normal operations, and a 24-hr Probable Maximum Precipitation (PMP) Event. | | |
| IR-12 | IR-12-R1B | ECCC | Water Quality - Change to an environmental component due to hazardous contaminants | Section 2.2.3, Project Description Proponent response to IR-12 | <p>Context: The Proponent has clarified that there is no infrastructure in place for management of non-contact water from site infrastructure that may contain COPCs, including but not limited to roads, the airstrip, and the campground.</p> <p>Rationale: To understand the potential effects of contaminants from non-contact water on the surrounding environment, site water management planning needs to be updated to include the type of infrastructure and its location for the capture of non-contact water.</p> | Provide a map marking the locations of proposed surface drainage structures for runoff collection including collection ditches, culverts, diversion ditches, perimeter berms, collection ponds and other similar structures. | | Follow-Up IR |
| IR-13 | - | ECCC CNSC | Fish and fish habitat | Section 2.2.4, Waste Management Section 2.2.7.7, Borrow Area Section 2.3.1.3 Site Preparation and Earthworks | <p>Context: The Proponent indicates that a borrow area is planned for an area northeast of the processing plant. The borrow material or overburden will be used during construction for roads, airstrip, pads, and in the batch plant for concrete production needs, during Operation for ongoing maintenance of various Project components and during decommissioning for fill and cover material. Suitable construction fill material will be sourced from the proposed borrow area and any suitable clean sandstone generated during freeze wall and well drilling (Section 2.2.7.7).</p> <p>It was also noted in Sections 2.2.1.3 and 2.2.14 that the freeze wall will be established by drilling over 300 vertical holes from surface to the basement rock. The freeze holes will extend 30 m into the basement rock and will produce waste rock from basement rock (Figure 2.2-6). However, there is no information whether the waste rock from basement rock would potentially be acid generating and/or metal leaching. This means that all the extra 30 m of basement rock should also be characterized for potential ARD/ML to determine use or appropriate disposal.</p> <p>Rationale: ECCC notes that the Proponent did not indicate whether the</p> | Please provide: 1. Information on whether the waste rock from the basement rock is potentially acid generating and metal leaching; a. Confirm that any borrow material to be used for construction will be characterized for potential ARD/ML. b. Confirm that the part of waste rock recovered from the basement rock, will also be tested for potential ARD/ML. 2. Criteria for segregating the potential acid generating and metal leaching waste rock, if it exists, from clean waste rock; and, 3. A plan to manage the potential acid generating and metal leaching waste rock, if it exists. | <p>This response has not been accepted.</p> <p>In the response, Denison expected that portion of basement rock will be potentially acid generating and stated that all basement rock will be stored on the special waste pad. Waste rock from the sandstone will also be characterized primarily based on geological and geochemical characteristics, and if a portion of the waste rock is potentially acid generating, it will also be stored on the special waste pad. However, criteria for segregating the potential acid generating waste rock from the clean waste rock are not provided.</p> <p>Denison will examine opportunities to reprocess the mineralized core and cuttings by either recovering uranium or placing the materials underground into the mining area at the end of a well's production. However, it is not clear how the potentially acid generating waste rock will be disposed of in the long term.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|--|--|---|--|--------------|
| | | | | | <p>borrow material and the drill out part of the sandstone layers and basement rock will be tested for Acid rock drainage/metal leaching (ARD/ML) potential before they will be used during construction, operation and decommissioning. ARD/ML is an environmental hazard that will have an adverse effect on waterbodies frequented by fish.</p> <p>Potential acid generating and metal leaching waste rock could pose negative impacts on the environment if they are not managed adequately.</p> | | | |
| IR-14 | - | CNSC | Wastes and Decommissioning | <p>Section 2.3.3.1.3 Decontamination, Demolition, and Disposal (p. 2-82)</p> <p>Table 4.3-2: Key Issues and Concerns from English River First Nation (p. 4-33)</p> | <p>Context: The EIS states “Concrete foundations will be left in place. Any portions of concrete foundations remaining above grade will be levelled and rebar will be cut-off at grade. Large slabs will be perforated on a 2-m grid to permit drainage. Concrete slabs will be covered with 0.5 m of development rock or locally stockpiled till.” (p. 2-82)</p> <p>Further, Denison notes that “Concern about responsible authority for restoring the environment, including contaminants when mining concludes. How long will it take to have the environment fully restored and, if Denison is no longer the operator, how will this be completed?” (p. 4-33). This comment status is noted as <i>Complete</i>.</p> <p>Rationale: Permanent structures will remain following decommissioning, according to the excerpt above. It’s unclear how engagement activities influenced Denison’s planned decommissioning approach, or how the comment above has been addressed or received.</p> | <p>How has the proposal to leave these foundations in place been received by the Indigenous Nations and communities during engagement sessions? Have engagement activities influenced Denison’s planned decommissioning approach? Describe in additional detail how the comment from p. 4-33 has been addressed and how this has been received by those who expressed this concern?</p> | <p>This response has not been accepted.</p> <p>The response provided in IR-28 indicates that responses will be updated in the final EIS and future iterations of the IER. Although Denison commits to provide a PDP at a later date, the commitment does not include incorporating or addressing Indigenous concerns. The current response also does not address the concerns raised by Indigenous Nations and communities regarding restoration of the environment or indicate that it was brought to their awareness).</p> <p>Additionally, IR-28 highlights examples of how engagement will be captured in future iterations of the IER and “final EIS”. Please provide proposed text for the revised EIS, for subject matter expert (SME) review and acceptance.</p> | Not Accepted |
| IR-15 | - | ECCC | Fish and fish habitat | <p>Section 2.2.3.4 Project Description</p> <p>Section 8.1.3.4.2, Aquatic Environment</p> | <p>Context: In Section 2.2.3.4 it is stated that the estimated PMP event for Project infrastructure planning is 483.3mm. In Section 8.1.3.4.2 it is stated that the PMP is 489.3 mm.</p> <p>Rationale: It is unclear which value is the correct PMP value and if Project infrastructure has been planned correctly.</p> | <p>Provide the correct PMP value and verify that Project infrastructure has been designed utilizing the correct value.</p> | | Accepted |
| IR-16 | - | CNSC | Human health with respect to hazardous contaminants | <p>Section 2.2.3.8</p> | <p>Context: The EIS and technical supporting documents do not provide sufficient justification for the selection of the proposed wastewater treatment systems for the industrial wastewater treatment plant or the domestic wastewater treatment plant.</p> <p>In addition, it is not clear how the upper bound of the industrial wastewater treatment plant effluent quality was obtained.</p> <p>Rationale: Draft REGDOC-2.9.2 formally documents the CNSC’s expectations to licensees for controlling releases to the environment. For proposed new facilities, these expectations include conducting a best available technology and techniques, economically achievable (BATEA) Assessment, and determining key parameters necessary to support the EIS. These include identifying:</p> | <p>Please provide a summary of the BATEA assessment to justify the selection of the wastewater treatment plant system.</p> <p>As part of the summary, please identify the anticipated environmental release targets used to inform the design, as well as the maximum predicted design release concentrations and loadings to the receiving environment. The maximum predicted design releases should be used in the ERA to demonstrate protection of people and the environment.</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|--|---|---|--|--|--------------|
| | | | | | <ul style="list-style-type: none">environmental release targets to inform the design of wastewater treatment systems to constrain the quantity and concentration of contaminants and physical stressors released into the environment,the best available technology and techniques through an options analysis; andthe anticipated influent characteristics, overall treatment efficiencies, and maximum predicted design release as the output of the assessment. <p>Consideration of the principle of pollution prevention and BATEA is also a requirement of REGDOC-2.9.1.</p> <p>CNSC staff have met with Denison to discuss the expectations in draft REGDOC-2.9.2.</p> | | | |
| IR-17 | - | CNSC | Human health with respect to hazardous contaminants | Section 2.2.3.8 | <p>Context: It is also acknowledged that Denison stated in meetings with CNSC staff that Denison intends to propose final release targets to the CNSC as part of the licence application submission.</p> <p>Rationale: It is not clear in the submission whether Denison has considered whether any applicable technology-based performance standards exist in Canada or internationally, and would be relevant as effluent discharge targets, in order to ensure principles of pollution prevention are applied. Consideration of this would help ensure that the proposed effluent discharge targets harmonize with existing federal, provincial/territorial, and/or municipal requirements. For example, there are release limits for radium-226, TSS, and pH outlined in the federal Metal and Diamond Mining Effluent Regulations, which have been demonstrated to be achievable in the uranium mine and mill industry.</p> <p>In addition, countries like the United States, where in-situ recovery has been conducted in the past, have specific technology-based limits. These are known as New Source Performance Standards and are identified in US Code of Federal Regulations (US CFR) 40, Chapter 1, Subchapter N, Part 440 – Ore Mining and Dressing Point Source Category. It is not clear whether these have been considered in Denison’s assessment. These should be considered when identifying suitable achievable technologies.</p> | Denison should harmonize their proposed Effluent Release Targets with the technology-based performance standards that exist in the Metal and Diamond Mining Effluent Regulations where applicable, or other suitable international regulations. | | Accepted |
| IR-18 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.2.3.9, Project Description Appendix 8-E | <p>Context: In Table 2.2-1 the upper bound Industrial Wastewater Treatment Plant (IWWTP) effluent quality final discharge targets for Constituents of Potential Concern (COPCs) are provided. General parameters (e.g., temperature, pH, etc.), and several Schedule 4 Substances with maximum authorized concentrations (lead, nickel, suspended solids, and un-ionized ammonia) under the Metal and Diamond Mining Effluent Regulations (MDMER) have not been provided in this table. There are several COPCs (aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese) for effluent characterization under Schedule 5 Section 4 of the MDMER that</p> | <p>1. Update Table 2.2-1 and Appendix 8-E to include all general parameters required for environmental effects monitoring: pH, temperature, hardness, alkalinity, and conductivity.</p> <p>2. Update Table 2.2-1 and Appendix 8-E to include missing Schedule 4 Substances under the MDMER with maximum authorized concentrations: lead, nickel, suspended solids, and un-ionized ammonia.</p> <p>3. Update Table 2.2-1 and Appendix 8-E to include missing Schedule 5</p> | <p>This response has not been accepted.</p> <p>ECCC requested that the Proponent update Table 2.2-1 and Appendix 8-E to include all general water quality parameters required for environmental effects monitoring, including pH, temperature, hardness, alkalinity and conductivity. This information was not provided in the updated table in the Proponent’s response. ECCC also requested that the Proponent Update Table 2.2-1 and Appendix 8-E to include missing Schedule 5 Section 4 parameters required for effluent characterization under the Metal and</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-----|----------------------|---|--|---|--|--------|
| | | | | | <p>have not been provided in this table. Additionally, no information on water quality guidelines has been provided in this table.</p> <p>Furthermore, it is stated that the final effluent quality discharge target for uranium is 0.057 mg/L. However, the Canadian Council of Ministers of the Environment (CCME) water short term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe.</p> <p>Rationale: ECCC requests the Proponent include the general water quality parameters that influence water quality thresholds, parameters in Schedule 4 and Schedule 5 Section 4 of the MDMER, and their respective water quality guidelines for consideration and transparency.</p> <p>Discharges from the proposed Project will alter water quality in the immediate receiving area, and this may include some sublethal effects on aquatic biota, which must be minimized. It remains the Proponent’s responsibility to adhere to the MDMER to ensure that effluent at the end-of-pipe from all final discharge points be non- acutely lethal and meet requirements for prescribed deleterious substances under Schedule 4 of the regulations.</p> | <p>Section 4 parameters required for effluent characterization under the MDMER: aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese.</p> <p>4. Include all acute and chronic water quality thresholds for each parameter in Table 2.2-1 and Appendix 8-E.</p> <p>5. Describe additional mitigation measures that can be considered to minimize impacts to aquatic biota from uranium concentrations in effluent.</p> | <p>Diamond Mining Effluent Regulations (MDMER) including aluminum, iron, nitrate, thallium and manganese. The Proponent has not provided the requested information for aluminum, iron, nitrate, thallium and manganese. In the Proponent’s response it is stated that, “Schedule 5 parameters are included where available.” However, it is unclear if this means that the requested effluent characterization concentrations for these parameters is currently unknown, or if these parameters are expected to have negligible concentrations in the effluent. Furthermore, ECCC requested that the Proponent include all acute and chronic water quality thresholds under the most stringent of the MDMER, CCME, and/or Provincial Guidelines for each parameter in Table 2.2-1 and Appendix 8-E. This information has not been provided as only chronic toxicity guidelines have been provided.</p> <p>The Proponent is legally required to meet MDMER release targets and intends to continue to refine effluent quality predictions as part of the BATEA assessment and licensing phase of the Project. ECCC must advise the CNSC of predicted effects of COPCs to surface water quality and recognize the Proponent’s legal requirement to comply with the MDMER. Therefore, proposed and draft effluent targets must be reviewed against the requirements of the regulations and with an eye to any potential effects to the receiving environment for both regulated and other effluent parameters. It is necessary for ECCC to review effluent targets for general water quality parameters and MDMER Schedule 5 Section 4 parameters required for effluent characterization and environmental effects monitoring to determine if effluent at the end-of-pipe from all final discharge points is not predicted to be acutely lethal. Additionally, the predicted uranium effluent concentration currently exceeds the acute water quality guidelines for the protection of aquatic life. Table 2.2-1 does not currently provide the information necessary to verify acute and chronic thresholds.</p> <p>Therefore, please see the following reiterated requests:</p> <p>1. Update Table 2.2-1 and Appendix 8-E to include all general parameters required for environmental effects monitoring: pH, temperature, hardness, alkalinity, and conductivity.</p> <p>2. Update Table 2.2-1 and Appendix 8-E to include the following missing Schedule 5 Section 4 parameters required for effluent characterization: aluminum, iron, nitrate, thallium, and manganese. Provide further explanation if this information is not available.</p> <p>3. Include all acute and chronic water quality thresholds for each parameter in Table 2.2-1 and Appendix 8-E. Include information on the concentrations of modifying environmental factors (i.e. pH, hardness, etc.) used to calculate these guidelines as footnotes.</p> | |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-------|---|---|--|---|--|----------|
| | | | | | | | 4. Provide a clear commitment to ECCC for continued consultation on developing effluent discharge targets including a review of final predicted effluent discharge targets once available. | |
| IR-19 | - | ECCC | Change to an environmental component due to radiological contaminants | Section 2.2.4 Project Description | <p>Context: In this section, it is proposed that the IWWTP precipitate pond will have a single geosynthetic composite liner system, which is used for ponds/pads that only store non-radioactive materials.</p> <p>However, from Section 2.2.3.9 on industrial wastewater treatment, it is unclear if the precipitates from the stage three neutralization process that are pumped to the IWWTP precipitates pond will have any residual radioactivity.</p> <p>Rationale: For the protection of the surrounding environment, it is important that any ponds/pads that are expected to store radiological contaminants be designed to have proper controls (i.e., liners with monitoring systems) in place.</p> | <p>1. Confirm the characterization of the precipitates that are to be stored in the IWWTP precipitate pond.</p> <p>2. If radiological constituents are expected within those precipitates, update the draft EIS to ensure the proposed geosynthetic liner system for the IWWTP precipitate pond will be adequate to ensure the protection of the surrounding environment.</p> | | Accepted |
| IR-20 | - | NRCan | Fish and fish habitat | Section 2.3.3.1.1 Appendix 7-C | <p>Context: The Proponent's objective for mining area remediation is to restore the groundwater within the confines of the freeze wall to an acceptable remediation target (EIS, sec. 2.3.3.1.1). The Proponent's acceptable decommissioning objectives for groundwater quality are provided in EIS Table 2.3-3 and in Table 3-5 of Appendix 7-C. These objectives were based on laboratory core flood tests performed by flushing samples of ore with groundwater and groundwater amended with sodium hydroxide or sodium bicarbonate. The composition of the remediated groundwater observed in the core flood tests serves as the source term for the post-decommissioning reactive transport modeling presented in section 4 of Appendix 7-C.</p> <p>Rationale: In NRCan's opinion, it is important for reviewers to be able to assess the level of remediation achieved in order to reach the Proponent's decommissioning groundwater quality objectives. Therefore, the Proponent should provide complete water quality data for the pregnant lixiviant that remains in the ore zone after the end of mining and prior to any remediation.</p> | NRCan requests that the Proponent revise Table 3-5 of Appendix 7-C to show the water quality in lixiviant remaining in the ore zone at the end of mining, prior to remediation activities. | | Accepted |
| IR-21 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.3.3.1.3, Project Description | <p>Context: The decommissioning process for the wellfield and associated infrastructure is discussed, however there is no information provided on the potential risk for subsidence of the ground above the depleted uranium deposit. After the uranium has been dissolved and pumped to the surface, a cavity will be formed in the area where the uranium used to exist. This could destabilize the overlying substrates, causing the ground at the surface to sink in the future. There is currently no information regarding this risk, and how it may alter the overlying environment, surface water features, runoff, or existing nearby waterbodies.</p> | Provide further information on the potential risks from subsidence including the probability of occurrence, how it may affect surface water features, and if there exists any risk to the planned decommissioning of waste management infrastructure. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-------|-----------------------|---|---|---|---|--------------|
| | | | | | Rationale: From a surface water and sediment quality perspective, it is important to understand how potential subsidence in the future post-decommissioning may affect the existing environment. It is currently unclear if there is any risk to the aquatic environment if subsidence were to occur and alter existing waterbodies, create new surface water features, or if there will be any risk to the decommissioned onsite industrial landfill and industrial wastewater treatment plant precipitate pond. | | | |
| IR-22 | - | NRCan | Fish and fish habitat | Section 2.10 Appendix 2-C, section 1.1.1.4 | Context: With respect to the choice of In-Situ Recovery (ISR) mining solution, two alternatives were assessed: alkaline and acidic lixivants (Appendix 2-C, sec. 1.1.1.4). In the consideration of technical and economic feasibility of the alternatives (Table 2, Appendix 2-C), the Proponent concludes that: Option 1 (alkaline) is not technically feasible based on the uranium deposit geochemistry. Option 2 (acidic) is technically and economically feasible based on the uranium deposit geochemistry and ability to dissolve uranium. Accordingly, the alkaline alternative was not carried forward into the Environmental Assessment (EIS, Table 2.10-1; Appendix 2-C, Table 3). While acidic ISR solutions are widely used internationally (e.g., Kazakhstan), in the United States, where the environmental regulatory regime is more strict, alkaline solutions have been used exclusively since 1970. Rationale: In NRCan's opinion, the Proponent should provide a more thorough technical justification for adopting an acidic ISR lixiviant. | In the Alternative Means Assessment (Appendix 2-C), NRCan requests that the Proponent provides a more thorough technical justification for selecting an acidic ISR lixiviant rather than a less environmentally problematic alkaline leach used exclusively in the USA. | | Accepted |
| IR-23 | - | CNSC | Alternative Means | Section 2.10.2 Alternative Means Appendix 2-A PD Engagement Tables Appendix 2-C Alternative Means Assessment (p. 3) | Context: There are multiple rows in the Indigenous Tables for Appendix 2-A where comments and concerns raised by Indigenous Nations and communities and other members of the public were taken into consideration in the Alternative Means Assessment. However, it is unclear how these were considered. A few examples: <ul style="list-style-type: none">16-EN-DesNd-101.1: Interested in any future business opportunities that may be available as Denison advances their Wheeler River Project.16-EN-ERFN-100.15: In that territory near the Wheeler River there are a lot of spawning and calving areas for moose, caribou; those creeks are for whitefish spawning. There's lots of heavy muskeg there. A lot of us have been there, and we'd like to know there'll still be access to the area.6-EN-ERFN-100.17: Today because of climate change, things are starting to happen that normally didn't happen. Even the permafrost is now further down. In the Wheeler River area, where there's some permafrost, have your environment guys seen a change? Will there be a change? These are some of the questions that need to be answered in order to come out with a positive spin. | Please explain how comments and concerns collected during Denison's engagement sessions were considered or influenced the alternative means assessment. Please include this information in the EIS and/or it's appendices. | This response has not been accepted. The response and additional Annex (Table 2.10-1) provided in the draft EIS submission do not address concerns listed in the examples requested by CNSC staff. The additional row in Table 2.10-3 meant to address input received from interested parties does not clearly demonstrate how comments received regarding alternative means were incorporated into the evaluation factor. Additionally, references provided in this row are not in the submission package or the original EIS. | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|---|--|---|--|--------------|
| | | | | | <p>Rationale: Appendix 2-C, Alternative Means assessment, states (p.3): “Engagement with Interested Parties naturally included alternatives means and the engagement input was included in the evaluation of alternative means. Refer to the references list below and <i>Appendix 2-A Engagement Database Summary – Project Description</i> for details of engagement information referenced in this alternative means assessment.”</p> <p>It is unclear in section 2.10.2 of the EIS, Appendix 2-A or Appendix 2C how the comments documented by Denison have been considered or influenced the alternative means assessment.</p> | | | |
| IR-24 | - | CNSC | Alternative Means | Section 2.10.2 Alternative Means | <p>Context: While Appendix 2-C (Alternative Means Assessment) is detailed and includes all aspects of the Alternative means assessment that are required, the summary of the analysis and conclusions in Section 2.10.2 of the EIS lacks the level of detail required to understand the methodology used, and how Denison arrived at these conclusions.</p> <p>Rationale: As noted in the Agency’s Operational Policy Statement on Addressing “Purpose of” and “Alternative Means” under the CEAA 2012: “If a preferred means is selected, the analysis and the rationale for the choice should be explained from the perspective of the Proponent, and be documented in the EIS in sufficient detail to provide context for public and technical comment periods during the project EA, and ultimately to allow the decision maker to understand the choice.”</p> | <p>Please summarize the analysis of the alternative means assessment within the body of the EIS, in sufficient detail that a reader of the EIS has adequate information to understand the methodology used, and how Denison arrived at these conclusions.</p> <p>*Note: In addition to the adding text to summarize, Table 6 in Appendix 2-C could be useful to understanding table 2.10.1 in the EIS.</p> | | Accepted |
| IR-25 | - | CNSC | Current use of lands and resources for traditional purposes | Section 3, Sections 4, Section 5, Section 11 (and all other applicable once Métis Knowledge Use Study is completed) | <p>Context: The EIS states that Denison is currently negotiating an agreement with MN-S and no traditional land use information is included throughout the EIS given no agreement was signed or Traditional land use information was shared at the time the EIS was being drafted.</p> <p>As noted in the EIS Denison has committed that: “As information becomes available from the agreed-upon process between the Métis Nation – Saskatchewan and Denison, it will be incorporated into the final EIS.” (p. 11-36)</p> <p>Rationale: More information is required to better understand the issues and concerns, valued components, and current use of lands and resources for traditional purposes by MN-S near the Project area.</p> <p>Requirements are detailed in CNSC’s Generic EIS Guidelines, section 8.9: Indigenous land and resource use.</p> | <p>Please update the revised Draft EIS to reflect the integration of the Métis Use and Knowledge Study in the Draft EIS where applicable, when this study is completed and provided to Denison.</p> <p>In addition, please include an updated Issues and Concerns table that includes relevant information from the MN-S as a result of engagement activities and relevant MN-S studies in the next version of the EIS, as appropriate.</p> <p>Should this information not be made available to Denison at the time of revising the draft EIS, the next version of the EIS and the response to this IR should provide a status update on discussions and engagement with MN-S and next steps.</p> | <p>This response has not been accepted.</p> <p>As the information from MN-S has not yet been incorporated into a version of the EIS for review, CNSC cannot accept this response as complete. MN-S has provided new information to Denison and this should be reflected in Denison’s assessment.</p> <p>CNSC requires that Denison provide additional information within the revised version of the EIS. The response should include the newly revised text within the EIS and the page numbers of where staff can find the information.</p> | Not Accepted |
| IR-26 | - | CNSC | Precautionary principle and approach | Section 3.4.8 Lands Taken Up from an Indigenous Perspective (p. 3-14) | <p>Context: Denison states: “Discrepancies among IK and western scientific information provide an opportunity for Denison to take a precautionary approach. Examples of concrete actions to address uncertainty in cases where IK and LK have differing conclusions on predicted Project effects</p> | <p>Please clarify how the precautionary principle, and the Privy Council Office’s, A Framework for the Application of Precaution in Science-based Decision Making About Risk, sets out guiding principles for the application of</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|---|---|--|--|--------------|
| | | | | | <p>include addressing uncertainty through monitoring and follow-up programs and communicating results of those monitoring and follow-up programs to demonstrate they have been responsive to the IK shared.” (p. 3-14)</p> <p>Rationale: CNSC’s Generic Guidelines for the Preparation of an EIS state: “In documenting the analyses included in the EIS, the Proponent will demonstrate that all aspects of the Project have been examined and planned in a careful and precautionary manner in order to avoid significant adverse environmental effects.</p> <p>A document by Canada’s Privy Council Office, A Framework for the Application of Precaution in Science-based Decision Making About Risk, sets out guiding principles for the application of precaution to science-based decision making.” (Section 2.5)</p> | <p>precaution to science-based decision making has been considered and incorporated into the EA described in the EIS.</p> | | |
| IR-27 | - | CNSC | Cumulative Effects Analysis | Section 3.4.8 | <p>Context: During an outreach and engagement trip by CNSC in October 2022, an abandoned exploration camp adjacent to the proposed Wheeler River site was observed. This site has not been identified within the EIS as part of the cumulative effects assessment. As noted in section 3.4.8, KML has also raised concerns with Denison related to abandoned camps and industrial waste left with no programs for clean-up.</p> <p>Rationale: Section 9.4.3 of CNSC’s Generic Guidelines for the Preparation of an EIS states that “The applicant shall assess any residual adverse environmental effects of the Project in combination with other past, present or reasonably foreseeable projects and/or activities within the study area.”</p> | Please specify why abandoned exploration camps and industrial waste aren’t taken into consideration when completing cumulative effects assessment. | | Accepted |
| IR-28 | - | CNSC | Current use of lands and resources for traditional purposes | Section 4, IER and engagement appendices, including: Appendix 2-A Appendix 6-B Appendix 7-B Appendix 8-A Appendix 9-A Appendix 10-B Appendix 11-A Appendix 12-A Appendix 13-A Appendix 14-B | <p>Context: The summary of issues tables do not appear to include all of the key issues identified by the Indigenous Nations and communities.</p> <p>For example, some Indigenous Nations and communities have shared concerns with respect to accident prevention and overall safety on the Key Lake road (Highway 914) due to increased traffic, impacts on treaty rights and section 35 rights due to cumulative impacts, and decommissioning, that were not captured in the issues and concerns and summary tables in Section 4.3.2 and in the IER.</p> <p>The tables in the engagement appendices include a column titled “Response (From Denison)”. The “Response” column does not include responses, but instead points the reader to where this comment or concern was considered. When navigating to the sections referenced, it is often unclear how this information was considered or influenced the assessment.</p> <p>Rationale: Additional detail is required in order to ensure the key issues are all identified and to understand the status of validation for each issue raised and the response provided.</p> | <p>1. Update the summary of issues and concerns tables to include all relevant issues and concerns raised by each of the Indigenous Nations and communities to date, including concerns raised in the Indigenous Knowledge studies provided, additional engagement, and Draft EIS comments.</p> <p>2. Please include a column in the issues and concerns tables to clearly articulate the specific mitigation/monitoring measures that Denison have committed to, or any other measures, in order to address the concerns raised by each Indigenous Nation and community during the engagement process to date.</p> <p>3. Denison must demonstrate that each Indigenous Nation and community has validated that the summary of issues and concerns table reflects their understanding or agreement, and/or a path forward to complete the validation throughout the EIS and the updated IER.</p> <p>Validation must be complete by the time the technical review is complete, prior to submission of a final EIS. Should Denison not be able to fully address issues, concerns or feedback raised by any Indigenous Nation or community,</p> | <p>This response has not been accepted.</p> <p>Denison provided information about the verification process for KML with an example chart that CNSC staff deem acceptable. CNSC requires that Denison complete this process with all identified Indigenous Nations and communities.</p> <p>It will be expected that a fully updated IER and issues and concerns tables for each Nation as per the original IR, in a future version of the revised EIS for SME review and acceptance.</p> <p>For part 3 of the IR, Denison must have validation from all Nations and Communities. Validation from ERFN, YNLRO and other Nations with interest in the Project should also be obtained. Alternatively, a path forward to complete the validation can also be provided.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|---|--|---|----------------------|----------|
| | | | | | | through mitigation and monitoring measures, this should be documented, and a rationale provided. 4. Update the response column of the Engagement tables to describe how these were considered in the sections referenced. Consider renaming this column to reflect the nature of the content (i.e., how the information was considered). | | |
| IR-29 | - | CNSC | Current use of lands and resources for traditional purposes | Section 4.3.2 and IER | Context: In this section, Denison includes the engagement with BNDN and includes a summary of issues and concerns table for the Nation. Within the history of interactions (Section 4.3.3.2.1). Rationale: Denison states that they have been providing information on the Project to BNDN in 2019, 2021 and again in 2022 and that Denison and BNDN have not responded to date in order to advance further engagement and dialogue. | Please ensure updated information of any additional engagement activities that Denison has completed with BNDN related to understanding their current and traditional land use and potential interests near the proposed project is provided. | | Accepted |
| IR-30 | - | CNSC | Indigenous physical and cultural heritage | Section 4.3.2.1.3, Table 4.3.2 | Context: Concerns were raised during engagement sessions that “Elders are not being consulted as most of the engagement has been through online means and without a translator”. Rationale: There’s no indication that a translator has been employed to engage with Elders since 2021 in the engagement Table 4.3.2. | How has Denison adapted engagement with Elders from the ERFN since receiving this comment on March 31, 2021? | | Accepted |
| IR-31 | - | CNSC | Indigenous Engagement | Section 4.4.2.1.3, Key Engagement Activities (p. 4-88) | Context and Rationale: Regarding the following: “An open house for the general public was planned to be hosted in 2022 on preliminary effects and mitigation, but due to concerns identified by MN-S about hosting a public open house in a community with a significant Métis population, this meeting was postponed by Denison. Denison looks forward to rescheduling the meeting in collaboration with the MN-S.” (p. 4-88) | Please provide an update on the evolution or progress of this engagement with local communities, following collaboration with MN-S (or otherwise). | | Accepted |
| IR-32 | - | CNSC | Current use of lands and resources for traditional purposes | Section 5.3 Section 9.0 Terrestrial Environment | Context: Some sections of the EIS (such as Fish and Fish Habitat, Indigenous Lands and resource use) indicate that Indigenous and/or local knowledge was considered when defining the spatial boundaries. However, this is not included in other sections, such as Terrestrial Environment. Rationale: Section 5.2.2 of CNSC’s Generic EIS Guidelines require that spatial boundaries be defined by considering, but not limited to, the following criteria: Community and Indigenous traditional knowledge, ecological and technical considerations. | Please provide any additional details about how any comments or concerns raised were considered in defining the spatial boundaries with Indigenous Nations and communities with respect to spatial boundaries, for the Terrestrial Section and which specific Indigenous Nations and communities were engaged on these topics and how their input and knowledge was incorporated into the EIS. If already presented in the EIS text body, please indicate where this information can be found or link to Section 4 of the EIS or in the IER. | | Accepted |
| IR-33 | - | CNSC | Residual Effect Characterization | Section 5.8.1, Definitions for Residual Effects Characterization and Significance | Context: Denison uses specific criteria (Residual Effect Characteristics: Direction, magnitude, geographic extent, duration, frequency, reversibility, context and likelihood) and associated ratings (e.g., adverse/positive, low/moderate/high) for the predicted effects assessment. However, it is unclear whether an aggregation method was used in order to determine whether impacts will be significant or not significant, depending on the | If an aggregation method was used and ratings (e.g., High, medium, low) were weighted, what weightings were used, how were these calculated? Please also describe any decision rules that informed the determination of significance. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-----------------------------|--|--|---|----------------------|----------|
| | | | | Section 5.8.1.1, Residual Effects Characteristics Section 8, Table 8.3-9: Fish and Fish Habitat - Surface Water Quality | <p>combination of rating categories (i.e., weightings that were calculated, use of decision rules).</p> <p>For example, medium term and long term are both used to represent the same time category: “Effects are expected to last between 3 to 38 years (i.e., effects expected during Construction through to the end of post-Decommissioning).” (See table 8.4-13 on p. 8-200 compared to table 8.4-12 on p. 8-199 and table 8.5-9 on p. 8-246).</p> <p>Rationale: The Generic Guidelines state: “The method used to describe the level of the adverse effect should be transparent and reproducible.”</p> <p>In Table 8.3-11, duration was moderate, but again uses same rationale. There is no 'moderate' in Table 8.3-8, and by the same rationale, this should be medium-term to be consistent with definitions provided and summary Table 8.3-12.</p> <p>It was noted that all three tables should be deemed medium-term based on definitions of ratings outlined in Table 8.3-8. Frequency was also showing up as "continuous" and "continuously" in these tables.</p> | <p>If no aggregation was used, how did Denison ensure that results were consistent, given the varying rankings for each of the key criteria, and varying combination?</p> <p>Regarding inconsistencies in ratings, please use consistent terminology for same rating.</p> | | |
| IR-34 | - | CNSC | Cumulative Effects Analysis | Section 5.9.2.2 (p. 5-41) | <p>Context: Denison identifies the Gryphon deposit as a project that is not reasonably foreseeable. The direct quote from the EIS indicates that the “Development of the Gryphon deposit as an underground mine was evaluated at the prefeasibility level in 2018 but has not advanced to feasibility study or EA. Denison has not announced an intent to proceed with the development of the Gryphon deposit.” (p. 5-41)</p> <p>Rationale: The guidance Assessing Cumulative Environmental Effects under the CEAA, 2012 defines <i>Reasonably Foreseeable</i> as a “physical activity [that] is expected to proceed, e.g. the Proponent has publicly disclosed its intention to seek the necessary EA or other authorizations to proceed.”</p> <p>In a press release by Denison Mines (2018: Denison announces decision to advance Wheeler River Project following positive PFS results), Denison publicly disclosed intention to seek the necessary EA for Gryphon to proceed: “After careful consideration of the risks and opportunities associated with permitting and concurrent advancement of project engineering activities, the Company has decided to submit a PD and initiate the EA process in early 2019 for the Phoenix ISR operation, and to bring the Gryphon operation forward, at a later date, as required to achieve the PFS plan of Gryphon first production by 2030.”</p> <p>Further, Denison’s Wheeler River Webpage references a “start of pre-production activities for the Gryphon operation in 2026”</p> | Please update the cumulative effects assessment in the EIS to include the Gryphon deposit as a Present or Reasonably Foreseeable Project. | | Accepted |

|--------------|----------------|--------------------|---|--|---|--|---|--------------|
| IR-35 | - | CNSC | Change to an environmental component due to hazardous contaminants | Section 6, Chemicals of Potential Concern | <p>Context: The use of petroleum products (e.g., propane, gasoline, and diesel) at the Denison Mines Wheeler River site is associated with vehicles and periodic operational testing of emergency generators as well as stationary pumps for emergency power or fire water systems. Thus, the air emissions will contain acrolein.</p> <p>Rationale: This chemical of potential concern (COPC) poses potential risks to human health via inhalation, but acrolein appears to have been missed or deemed insignificant. However, its consideration in the assessment will provide information on the significance of the associated risk.</p> | Please consider acrolein in the assessment or provide a rationale for its exclusion. | <p>This response has not been accepted.</p> <p>Although the requested assessment is provided in response to IR-35, this information also needs to be reflected in a revised version of the EIS. Please provide proposed text for the revised EIS, for SME review and acceptance.</p> <p>Please also see follow-up IR-35-R1.</p> | Not Accepted |
| IR-35 | IR-35-R1 | Health Canada (HC) | Change to an environmental component due to hazardous contaminants IR-35 Response from Denison | Section 6, Chemicals of Potential Concern | <p>Context: Potential health risks from long-term exposure to acrolein were not considered in the Proponent’s response to IR-35.</p> <p>Rationale: No annual predicted concentrations for acrolein were provided in the draft EIS or in the response to IR-35. Concentrations were modelled for short-term exposure (1h and 24h) only in the draft EIS and compared to the 1-hour and 24-hour Ontario Ambient Air Quality Criteria for acrolein. It is Health Canada (HC) guidance to assess both potential short and long-term health effects. The predicted annual concentrations for acrolein should be compared against chronic reference concentrations (e.g., the USEPA Reference Concentration (RfC)¹ (0.02 µg/m³) and the Tolerable Concentration (TC) from Environment and Climate Change Canada and Health Canada’s Priority Substances List Assessment Report² (0.4 µg/m³)).</p> | Use predicted annual concentrations and available chronic reference concentrations to account for potential health risks from long-term exposure to acrolein to support the decision to screen out acrolein as a COPC from further assessment. | | Follow-Up IR |
| IR-36 | - | CNSC | Other | Section 6, Table 6.1-11 Baseline External Gamma Monitoring | <p>Context: For one of the exposures in the summary table for baseline external gamma monitoring (Table 6.1-11), the cell states "Destroyed in Field".</p> <p>Rationale: No rationale or indication as to why or how it was destroyed is provided.</p> | Please provide any additional info available as to how equipment was destroyed. | | Accepted |
| IR-37 | - | CNSC | Air Quality | Section 6.1.1.1, CALPUFF model | <p>Context: "The Saskatchewan Ministry of Environment (SK MOE) has developed the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) to assist Proponents in conducting air dispersion modelling assessments in a consistent manner. The guideline defines the recommended approach for dispersion modelling assessments in Saskatchewan, including model selection, emission source characterization, and the determination of compliance criteria to apply."</p> <p>Rationale: Saskatchewan air quality guideline requires consultation on use of CALPUFF model, where it states" The ministry acknowledges that there will be situations where specialized air dispersion models such as CALPUFF,</p> | Please confirm and provide a summary of the consultation with the Saskatchewan MOE on the use of CALPUFF model for the Wheeler River EIS as per provincial air quality guidelines. | <p>This response has not been accepted.</p> <p>Although a summary is provided in response to IR-37, this also needs to be reflected in revised version of EIS. Please provide proposed text for the revised EIS, for SME review and acceptance.</p> | Not Accepted |

|--------------|----------------|------|--|---|---|--|----------------------|----------|
| | | | | | <p>CALQ3HCR and others may be applicable. The use of specialized models requires consultation with the ministry” OR “Pre-consultation with the ministry must be undertaken prior to the facility conducting specialized modelling (p. 3).” It is not clear if Denison Mines consulted with Saskatchewan MOE on use of CALPUFF model.</p> <p>Noted that Section 6.1.4.2 is again referring to Saskatchewan MOE guidance for justification, but no indication that they consulted with them (a requirement).</p> | | | |
| IR-38 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 6.1.4.1, Potential Interactions Between the Project and Valued Component / Key Indicators | <p>Context: In this section, the Proponent identifies primary interactions between Project activities and air quality valued components and their associated key indicators. These primary interactions may result in an adverse effect on the valued component. Among the primary interactions are the use of emergency generators in a backup role should there be an interruption of the provincial electrical grid. However, it is not evident what is the anticipated frequency and duration of interruption to grid power.</p> <p>Rationale: The Proponent states in the conservative operation scenario that while the site will be powered from the provincial grid at the operations stage, the back-up power generators were assumed to be operating under emergency conditions as a worst-case scenario. ECCC acknowledges the positive impact of extending the electrical grid to the Project site with resultant reduction in generator emissions. The impact of an interruption in grid power would be greatest during the winter months when energy use would be greatest and surface-based temperature inversions, which vertically trap emissions, would be strongest.</p> | Provide an evaluation of a worst-case scenario of grid power interruptions (i.e., average aggregate length of power outages) during the winter months for this section of the electrical power grid. | | Accepted |
| IR-39 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 6.1.4.2, Potential Project-Related Effects | <p>Context: In this section, the Proponent discusses the approach taken for air dispersion numerical modelling. Using their CALMET data set, the Proponent’s CALPUFF model runs indicated exceedances for 24- hour total suspended particulates, 24-hour particulate matter (PM10), 1-hour nitrogen dioxide, and 24-hour uranium concentrations. However, there is no mention of possible diurnal and seasonal occurrences of the exceedances.</p> <p>Rationale: Adequate assessment of the modelling results requires knowledge of the temporal characteristics for the exceedances. For example, wintertime exceedances may be due to strong temperature inversions, especially during the overnight to morning hours. These strong inversions are challenging for numerical models to capture. Exceedances during warmer months may be due to specific wind directions, which transport emissions directly to downwind receptors.</p> | Provide additional information on any diurnal and seasonal influences of the modelled exceedances. | | Accepted |
| IR-40 | - | CNSC | Air Quality | Section 6.1.6.2.1, Air quality significance determination | <p>Context: Significance determination was not conducted for air quality due to interconnectedness with other assessment endpoints.</p> | Please provide additional information to demonstrate where and how these air quality assessment endpoints were factored in. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|--|---|--|---|---|--------------|
| | | | | | Rationale: It is not clear where and how these air quality assessment endpoints were factored into the assessment. | | | |
| IR-41 | - | CNSC | Air Quality | Section 6.1.6.2.2, Background concentrations | <p>Context: The EIS states that "Conservative regional background concentrations from the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) and based on the La Loche monitoring station were used for particulate matter, NO2, SO2, and CO. The La Loche monitoring station is located near anthropogenic sources, while the Project is in a remote area removed from anthropogenic sources."</p> <p>Rationale: If La Loche monitoring station is located near anthropogenic sources and the Project is not, use of this data is not a conservative or realistic representation of background.</p> <p>For a realistic approach, background data considered should be upper 95th percentile (or max if n<10) from an area representative of project location</p> <p>For a conservative approach, background data from an area located even further from anthropogenic sources (if this exists) should be used, or an upper limit of background less than upper 95th should be applied as the background.</p> <p>Upper limit of background is used to screen out COPCs or often subtracted from total to ascertain relative contribution / impact from source, so using a higher upper limit may result in COPCs screening out or appear to have a lower relative contribution. If background was added to source, then approach used would be conservative. If this is the case, confirmation and reference to where this is discussed in methodology should be provided.</p> | Please provide additional rationale to justify the appropriateness of La Loche monitoring station concentrations as background for project location. | <p>This response has not been accepted.</p> <p>Please propose a more suitable background site to use as background subtraction. La Loche is not a suitable background site as it is potentially impacted from other industrial sources; it is expected that another background site removed from other industrial sources be identified and used.</p> | Not Accepted |
| IR-42 | - | HC | Physical stressors (noise and vibration) | Section 6.2.4.2.2, (p. 6-66) Section 6, Section 6.2.9, (p. 6-72) | <p>Nighttime noise impacts are not adequately considered for human receptors.</p> <p>Context: The EIS states in Section 6.2.9 that, “While the predicted sound levels were less than the guideline values, the increase from baseline was predicted to be noticeable” (p. 6-72). No information is provided on individual noise events occurring during the nighttime period.</p> <p>Rationale: While the increase from baseline is predicted to be noticeable, it is important to also consider that changes to the characteristics of the sound from baseline (e.g., a change in frequency, changes in sound modulation, increased impulsiveness or tonality, or a shift in noise from the daytime to being more at night) may cause noise to be even more noticeable. Consult ANSI S12.9-2005/Part 4, clause A.1.3 for further information.</p> <p>In particular, consideration should be given to potential impacts on sleep, where adverse impacts are reported to begin when sound levels inside bedrooms exceed 30 dBA for continuous noise sources and 45 dBA LAmix for discrete noise events (WHO, 1999).</p> | <p>1. Provide a description of the project- related nighttime noise sources that may impact human receptors as well as a qualitative discussion of the resulting potential impacts on perception considering not only changes in sound levels but also sound characteristics (e.g., tonality, impulsivity).</p> <p>2. Confirm whether individual nighttime noise events exceeding 45 dBA LAMax outdoors (or 30 dBA indoors) are expected to occur more than 15 times over the nighttime period at any nearby potentially noise-sensitive human receptor location(s). This may be of particular concern if some construction and/or operations activities occur during sleeping hours.</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-----|--|---|--|--|---|--------------|
| IR-43 | - | HC | Physical stressors (noise and vibration) | Section 6.2.5, (p. 6-66) Section 6.2.5, (p. 6-71) | <p>Mitigation measures for project-related noise were not identified for the Construction phase.</p> <p>Context: The mitigation measures provided in Section 6.2.5, including a complaint management system is also to be implemented as part of the EMS, are only proposed for the operations phase.</p> <p>However, construction activities are predicted to last more than one year. Construction noise will involve the use of equipment operating at the site, construction of surface facilities, drilling, and partial operation of the freeze plant. It will also include regular truck trips and air traffic for personnel changes.</p> <p>Rationale: It is unclear if listed mitigation measures also apply to the construction phase (or only to the operations phase).</p> | <p>1. Clarify whether mitigation measures and the proposed EMS apply to the Construction phase. If not, identify mitigation measures for noise impacts related to Construction phase activities, and consider applying the EMS to the Construction phase and implementing the community complaints and response procedure from the beginning of construction activities.</p> <p>2. Health Canada suggests that construction noise lasting longer than 1 year be assessed as operational noise, and that noise mitigation measures be applied also to the construction phase. Special consideration should be given to mitigation measures for construction noise that occurs at night, in order to minimize impacts on sleep (i.e., avoiding tonal or impulsive noise sources at night).</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends use of Appendix H of Health Canada (2017), which identifies additional construction noise mitigation measures that could also be considered to reduce project- related noise.</p> | | Accepted |
| IR-44 | - | HC | Physical stressors (noise and vibration) | Section 6.2.8, (p. 6-71) | <p>The noise complaints resolution and response procedure is not sufficiently described in the EIS.</p> <p>Context: Section 6.2.8 discusses Monitoring and Follow- up. The Proponent indicates: “The EMS will also include a community complaints and response procedure” (p. 6-71).</p> <p>Rationale: Details have not been provided regarding how the complaints would be received, addressed or what the timelines will be for providing a response or resolution. It is important to provide information to potentially affected communities in advance of particularly noisy activities. Community consultation and advanced notification of noisy activities has been shown to reduce complaints (see Health Canada, 2017).</p> | <p>1. Provide the details of the noise complaints resolution and response procedure as per Health Canada (2017).</p> <p>2. Consider conducting community consultations and/or implementing an advanced community notification system to pro-actively reduce the probability noise-related impacts and complaints.</p> | <p>This response has not been accepted as <i>preliminary</i> details for mitigation and monitoring plans for noise impacts and complaints resolution process were not provided.</p> <p>The response partially addresses IR-44 through the commitment to developing the complaints resolution process. However, CNSC expects that the noise complaint resolution and response procedure will be included for review in the EIS.</p> <p>Section 9 (p. 44) of the EIS Guidelines state that the EIS “shall present an outline of the preliminary environmental monitoring program, including:</p> <ul style="list-style-type: none">the description of the characteristics of the monitoring program where foreseeable (e.g., location of interventions, planned protocols, list of measured parameters, analytical methods employed, schedule, human and financial resources required),plans to engage Indigenous groups in monitoring, where appropriate.” <p>Please provide proposed text for the revised EIS, for SME review and CNSC acceptance.</p> | Not Accepted |
| IR-45 | - | HC | Change to an environmental component due to hazardous contaminants | Section 6 Air Quality Technical Supporting Document Section 6.3.1 | <p>The carcinogenic risks of diesel exhaust from the Project should be assessed.</p> <p>Context: Section 6.3.1 discusses modelled predictions of exceedances for Particulate Matter (PM). TSD p. 22 states: “concentrations of 24-hour PM2.5 are also elevated around the standby generators at the freeze plant, which emit fine particulate matter from combustion of diesel fuel”. However, diesel particulate matter is not evaluated for the whole project in the air quality model or the air quality assessment.</p> | <p>1. Evaluate the carcinogenic risk of all potential diesel exhaust from the Project based on the approach proposed by Health Canada (2022). Additional guidance (Additional Lung Cancer Mortality from PM2.5: Recommended Approach and Sample Calculation”) is provided as an appendix to this comment table.ⁱ</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-----|--|---|--|---|----------------------|----------|
| | | | | | <p>Rationale: Health Canada has determined that diesel exhaust is carcinogenic in humans which is consistent with the conclusion of the International Agency for Research on Cancer (IARC), and that diesel exhaust is associated with significant population health impacts in Canada.</p> <p>To characterize the carcinogenic risk of diesel exhaust from a project, HC has published a report (2022)¹ which provides a quantitative assessment of the relationship between ambient PM2.5 exposure and lung cancer risk. Specifically, this report quantifies the increase in risk of lung cancer mortality (over the baseline rate in the Canadian population) due to PM2.5 exposure.</p> <p>This quantitative assessment is considered appropriate to characterize risks from diesel PM given the contribution of diesel exhaust to ambient PM2.5 in Canada, and that the carcinogenicity of diesel exhaust has generally been evaluated based on the respirable PM fraction^{1,2,3}.</p> <p>References: [1] HC. 2022. Lung Cancer and Ambient PM2.5 in Canada: A Systematic Review and Meta-analysis. Available at: https://publications.gc.ca/site/eng/9.907038/publication.html [2] HC. 2016. Human Health Risk Assessment for Diesel Exhaust. Available at: http://publications.gc.ca/collections/collection_2016/sc-hc/H129-60-2016-eng.pdf [3] IARC. 2013. IARC monographs on the evaluation of carcinogenic risks to humans. Volume 109. Outdoor air pollution. https://publications.iarc.fr/Book-And-Report-Series/Iarc-Monographs-On-The-IdentificationOf-Carcinogenic-Hazards-To-Humans/Outdoor-Air-Pollution-2015</p> | | | |
| IR-46 | - | HC | Physical stressors (noise and vibration) | Appendix 6-A Table A-1 | <p>Low-frequency noise and associated potential human health effects were not assessed.</p> <p>Context: Some equipment that may emit low-frequency noise (LFN) have been listed in Table A-1: Assessment Scenarios and Sound Level Data (Section 6 Appendix A); however, no information describing potential impacts of this type of sound on nearby human receptors are presented.</p> <p>Rationale: Low frequency noise can be associated with the introduction of noticeable vibrations and rattles in nearby structures. Research indicates that annoyance related to noise is greater when low-frequency noise is present (ISO 1996-1:2003). As sound environments are usually characterized using A-weighted decibel levels (dBA) that reflect the frequencies most audible to the human ear, the impacts of low- frequency noise may need to be assessed separately.</p> | 1. Clarify whether any project-related activities (construction, operation and/or decommissioning) may produce LFN that could impact off-site human receptors. Evaluate LFN in the noise assessment, if and where applicable. See Appendix C of Health Canada (2017) for a discussion of LFN. | | Accepted |

|--------------|----------------|------|--|---|---|---|--|--------------|
| IR-47 | - | ECCC | Air Quality | Appendix 6-A, A.1 | <p>Context and Rationale: Verification of the following calculation is required for assessing predicted emissions of dust from general construction. It appears the result of 0.70 ton/acre/month is incorrect and should instead be 0.314 ton/acre/month.</p> <p>Appendix 6-A, Appendix A, A.1 (p. A4) TSP Emission Factor for General Construction:</p> $EF (TSP) = 0.11 \frac{\text{ton}}{\text{acre}} \frac{1}{\text{month}} \times 1.2 \frac{\text{ton}}{\text{acre}} \frac{1}{\text{month}} + 0.42 \frac{\text{ton}}{\text{acre}} \frac{1}{\text{month}}$ $= 0.70 \frac{\text{ton}}{\text{acre}} \frac{1}{\text{month}}$ | Explain how the emission factor total suspended particulates (EF (TSP)) result was obtained or rectify if it is incorrect and update the draft EIS to reflect the correction. | | Accepted |
| IR-48 | - | HC | Physical stressors (noise and vibration) | Appendix 6-E, Figure 6.2.3, p. 6-57 | <p>Noise-sensitive receptors are not included on noise contour maps.</p> <p>Context: Noise-sensitive receptors are identified in the acoustic model report in Section 6 Appendix 6-E but not presented on any maps in the atmospheric and acoustic sections of the main report (Figure 6.2-3).</p> <p>Rationale: The noise assessment typically includes a map illustrating modelled noise levels from the Project at receptor locations in the study area.</p> <p>Certainty regarding the presence of human receptors in the regional study area is also recommended in order to assess cumulative impacts.</p> | 1. For more clarity, identify noise-sensitive receptors on Figure 6.2-3: Noise Assessment Study Area as well as on contour maps showing the baseline and predicted noise levels. | <p>This response has not been accepted.</p> <p>The map provided in the response did not include the contour lines requested in IR-48 to illustrate the maximum baseline and predicted noise levels. Furthermore, the map does not provide labels for receptor locations that appropriately describe the type of noise-sensitive receptor.</p> <p>HC requests that a map showing the following be provided:</p> <ol style="list-style-type: none">1. Contour lines representing the maximum baselines and predicted noise levels at the location of the receptors;2. Labels for receptor locations that are more descriptive of receptor type (e.g., hunting camp, ceremonial area). <p>It was also noted that the receptor location of Risk 2 (i.e., Trapper/Intensive Land User) in the provided map was not consistent with other receptor location maps in the Draft EIS (e.g. Section 10, Figure 10.1-7 Human Receptor Locations for the Project Human Health Risk Assessment). These differences included both the receptor location (i.e., opposite sides of McGowen Lake) and type (i.e. Trapper/Intensive Land User vs. Seasonal Resident). The receptor locations and types should be confirmed and consistently used throughout the EIS, and any discrepancies should be explained.</p> <p>Finally, a portion of Figure 8 – Adjusted Ldn (p.19 – appendix 6-E) is cut off from the page, preventing proper review. HC requests that the full/complete version adjusted to fit the page be provided.</p> | Not Accepted |
| IR-49 | - | HC | Physical stressors (noise and vibration) | Appendix 6-E, 4.0 Table A.1 | <p>The Noise Source Characterization is incomplete.</p> <p>Context: Section 3.0 of the Draft EIS Section 6 Appendix 6- E discusses Source Characterization. There is no detail regarding potential tonal or impulsive noise sources in Section 3.0.</p> | 1. Identify any tonal, regularly impulsive, highly impulsive, or high-energy impulsive noises likely to be produced during project activities that could be audible at noise sensitive receptors. Furthermore, describe the timing (e.g., hours of night-time activities), frequency and duration of noise events, and their sound characteristics, including frequency spectrum. See Health Canada (2017) for details. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|--|---|---|---|--|--------------|
| | | | | | Rationale: The draft EIS should include a description of sound source characteristics (e.g., tonal, impulsive, highly impulsive) in order to properly inform the quantitative noise assessment and which assumptions/adjustments need to be applied and to properly evaluate impacts of project noise on health of affected receptors. | | | |
| IR-50 | - | HC | Physical stressors (noise and vibration) | Appendix 6-E, 4.0 Table A.1 | <p>The description of noise modelling does not document or justify the use of sound level adjustments.</p> <p>Context: ISO Standard 9613-2 has been used for the sound level modelling; however, it is unclear if all applicable adjustments have been considered as per ISO 1996-1:2016 (Table A.1).</p> <p>Rationale: When modelling techniques are used to estimate present (baseline) or future (construction and operational) sound levels, these techniques and any accompanying assumptions, including the use of sound level adjustments, it is important to provide appropriate documentation and justification.</p> <p>Note that in situations where more than one source characteristic adjustment is applicable (e.g., impulsive or tonal), only the higher of the adjustments is used. However, all time-of-day adjustments and the quiet rural area adjustment are to be added to the highest of the applicable source adjustments.</p> | 1. Clarify whether ISO-1996-1:2016 has been considered in the modelling to account for any applicable sound level adjustments. Adjustments should be considered when calculating Ln (night- time sound level) and Ldn (day-night sound level). In addition, if applicable, adjustments can be applied depending on the noise characteristic (impulsive, highly impulsive, etc.), and because the Project location is considered to be in a quiet rural area. See: ISO 1996-1:2016 and Health Canada (2017) for details. | | Accepted |
| IR-51 | - | CNSC | Geology and Groundwater | Section 7, Figure 7.8-1 Appendix 7-C | <p>Context: Figure 7.8-1 (p. 7-107, main EIS report) shows monitoring well cluster outside of the freeze wall.</p> <p>Rationale: It is not clear what the targeted hydro-stratigraphic units of each monitoring well cluster are. In addition, it is not clear how the establishment of the freeze wall and any leakage from the brine solution will be monitored. If there is any “window” within the freeze wall (i.e., the freeze wall is not continuous), is there any way to identify that?</p> | <p>Please clarify the targeted hydro-stratigraphic units of each monitoring well cluster in Figure 7.8-1 (p. 7-107, main EIS report).</p> <p>Please clarify how the establishment of a continuous freeze wall will be monitored.</p> | | Accepted |
| IR-52 | - | ECCC | Fish and fish habitat | Section 7, Geology and Groundwater Appendix 7 | <p>Context: According to the Proponent, “an acidic or low pH mining solution will be used to leach uranium ores from the ground. Mining solution may be a mixture of sulphuric acid, hydrogen peroxide, ferric sulphate, and freshwater (from shallow groundwater well or surface waterbody) or recycled water.</p> <p>Wellfield will consist of a combination of injection and recovery wells, in the general the arrangement of one recovery well in the center surrounded by four injection wells (5-spot pattern) with about 5 to 10 m between wells. The final wellfield is expected to include approximately 300 wells over an area measuring 90 m wide x 750 m long”.</p> <p>As the components/contaminants mentioned in the description of the hydrogeologic contaminant transport processes above may be transported</p> | <p>1. Explain why 3D hydrogeology and contaminant transport numerical modelling of the injection and extraction wells was not presented.</p> <p>2. Alternatively, provide simulation results and a sensitivity analysis for the injection and extraction of the acidic solution in the mining area.</p> | <p>This response has not been accepted as the Proponent did not provide the information that would allow validation of the conclusion that hydraulic containment was successful.</p> <p>Hydraulic containment is to be utilized as a process to prevent the migration of contaminants away from injection well locations by groundwater. The Proponent indicated that tracer testing demonstrated hydraulic containment of the injected solution (as per the response to IR-6).</p> <p>Hydraulic containment is an important process as part of a multi-pronged approach to preventing the migration of contaminants to Whitefish Lake by groundwater migration. Consideration of all field test data will allow ECCC to review the Proponent’s conclusions about hydraulic containment.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-------|-------------------------|---|---|---|--|--------------|
| | | | | | to Whitesfish Lake through groundwater, the injection and recovery wells should be included in the model. Rationale: The hydrogeologic contaminant transport processes described above are an important part of the proposed Project and it is not clear why numerical modelling results and a sensitivity analysis for the above processes was not presented. | | Provide all field test data to allow ECCC to review the conclusion that hydraulic containment was successful. | |
| IR-53 | - | CNSC | Geology and Groundwater | Section 7.3, Table 7.3.-2 Appendix 7-C | Context: The field-based hydraulic conductivity values (referred to as K values hereafter) in Table 7.3-2 (p. 7-32, main EIS report) indicate that the K value ranges of upper and lower sandstone aquifers have a significant overlap with those of the intermediate sandstone aquitard. However, the calibrated K value in Table 2-2 (p. 2.7, Appendix 7-C)) for the intermediate sandstone aquitard is close to the lower end of the field-based K value range, while the calibrated K values for the upper and lower sandstone aquifers are close to the upper end of the field-based K value range. Rationale: It is not clear how representative the calibrated K values are of the field-based K values for each hydro-stratigraphic unit, and if the significant difference between the K values for the upper and lower sandstone aquifers and those for the intermediate sandstone aquitard is supported by the geological properties of the corresponding stratigraphy units. It is stated in the report (p. 7-36, main EIS report) that “Vertical fracture or fault zones that hydraulically connect the Local (upper) and Semi-Regional (lower) groundwater flow regimes are present throughout the Athabasca Basin”. But fractures and fault zones are not explicitly considered in the model. There is possibility that these features could increase the hydraulic connection between the upper and lower sandstone aquifer. | Please provide additional information to support the representativeness of the calibrated K values (for example, use graph to present the measured K values and the calibrated K values). | This response has not been accepted. Please include figure(s) (y axis representing depth below ground, x axis representing K, different length of vertical line segment representing different packer testing intervals, etc.) showing the field measured K values, as well as the calibrated K value for the upper sandstone aquifer, intermediate aquitard, and lower sandstone aquifer. This would help demonstrate the distribution of field measured K values and representativeness of calibrated K values. | Not Accepted |
| IR-54 | - | CNSC | Geology and Groundwater | Section 7.3.1 | Context: EIS states: “The most important associated topographic features in the region are the northwest to southeast trending drumlins and eskers....” This is not the trend shown on the provided maps, nor described elsewhere in the report, e.g., Section 7.3.2.1 Rationale: Inaccurate information in the EIS | Please update the EIS where required to accurately describe the topographical features. | | Accepted |
| IR-55 | - | NRCan | Fish and fish habitat | Section 7.3.3.1; Appendix 7-A, sections 3.4, 3.5, 3.8, 4.2; Appendix 7-C, section 2.8 | Context: According to the Proponent's conceptual hydrogeological model (EIS, sec 7.3.3, Figure 7.3-7, Table 7.3-2; Appendix 7-A, sec. 3.4, Table 3-4), the horizontal hydraulic conductivity of the Intermediate Sandstone (Iss) aquitard is 8.4 E-09 m/s based on field measurements. The Proponent further assumes a 10:1 anisotropy ratio for the unit (Appendix 7-A, sec. 3.5.1) such that its estimated vertical conductivity is 8.4 E- 10 m/s. Based on this information, structural geology and groundwater quality data, the Proponent concludes that the connectivity between the Upper sandstone | In the "Parameter Uncertainty Assessment" for the numerical groundwater flow model (Appendix 7-C, sec. 2.8), NRCan requests that the Proponent develop a calibrated numerical model with an alternate conceptualization of the Intermediate sandstone as a "leaky" aquitard with a horizontal hydraulic conductivity on the order of 1 E-07 m/s and a much lower anisotropy ratio. This should involve modifying the model lateral boundary conditions to allow for groundwater inflow/outflow across the entire thickness of the Athabasca Sandstone Group rather than just the Lower Sandstone aquifer. | This response has not been accepted. In response to IR-55, the Proponent states “The viewpoint from the third party assessment team does not align with the conceptual model proposed by the reviewer; however, an alternative calibrated groundwater flow model with a hydraulic conductivity of 1.0E-7 for the Intermediate Sandstone unit has been developed.” | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-------------------------|---|---|--|--|--------------|
| | | | | | <p>aquifer and the Intermediate Sandstone aquifer (sic) is limited (EIS sec. 7.3.3.3; Appendix 7-A, sec. 4.4). While acknowledging the paucity of conductivity data and the Proponent's attempt to mitigate this by leveraging collateral information on fracture frequency and clay content (Appendix 7-A, sec. 3.3.1), NRCan considers that the hydraulic conductivity assigned to the Iss aquitard is unrealistically low and inconsistent with the following lines of evidence: a) The conductivity value for the Iss is based on the geometric mean of 18 field measurements, 12 of which are from the same borehole (WR-695) located in the Gryphon zone, beyond the domain of the numerical model (Appendix 7-A, Appendix C, Table C-1). If the conductivity data were weighted equally, with one value per borehole, the geometric mean would be approximately 1.5 E-07 m/s, or two orders of magnitude higher; b) The Proponent notes that vertical fracture or fault zones that hydraulically connect Upper and Lower aquifer systems are present throughout the Athabasca Basin including in the Phoenix area (EIS, sec. 7.3.3.2.2; Appendix 7-A, sec.3.8.1); c) The Proponent notes that groundwater chemistry data (major ions) corroborate the presence of structurally controlled vertical hydraulic connections between the Upper and Lower aquifer systems (EIS, sec. 7.3.3.2.2, sec. 7.3.3.3; Appendix 7-A, 4.3.3); d) Groundwater chemistry data (Appendix 7-A, sec. 4.2, Table 4-1) also indicate the presence of detectable levels of "bomb" tritium (indicating recharge waters < 50 years old) in the Lower Sandstone Aquifer (GWR-025, GWR-008, GWR-033) and in the Iss (GWR-009, GWR-034), outside the area of U mineralization. This is also evidence of vertical hydraulic connection through the Iss. In summary, whereas the Proponent conceptualizes the Iss as a very low-permeability unit with localized vertical hydraulic connection (WS Shear), NRCan interprets the Iss as a "leaky" aquitard with pervasive fracture-controlled and much higher vertical hydraulic conductivity.</p> <p>Rationale: The significance of NRCan's alternative interpretation of the Iss hydrostratigraphic unit is that deep groundwaters, including mining-impacted waters, may represent a greater proportion of baseflow discharge to Whitefish Lake than the 1% currently estimated in the Proponent's groundwater flow model (EIS, sec. 7.4.2.1, p.7-51; Appendix 7-C, sec. 2.6.3).</p> | | If the alternative model requested in IR-55 has been developed by the Proponent, NRCan requests that full details of this model be provided in an attachment. | |
| IR-56 | - | CNSC | Geology and Groundwater | Section 7.3.3.2 | <p>Context: It is stated in Section 7.3.3.2 (p. 7-37, main EIS report) that “Exploration boreholes drilled in the Phoenix area, where left unplugged, have the potential to provide preferential flow paths between the Overburden and Upper and Lower Sandstone Aquifers. Exploration holes were reportedly grouted approximately 10 to 20 m above and below the ore zone, resulting in open holes remaining throughout the overlying materials. These portions of the open holes may act as open conduits for groundwater flow through the 400 m of Athabasca Group Sandstone.”</p> <p>Rationale: It is not clear why the exploration boreholes have not been decommissioned.</p> | Please clarify why the exploration boreholes have not been decommissioned and the timeline to decommission the boreholes according to appropriate guidelines/procedures. If it is not decommissioned before the ISR operation, what is the potential impact of the unplugged boreholes on the mining solution migration? | <p>This response has not been accepted.</p> <p>Although Denison’s response is acceptable, in order for the response to be accepted the following text should be incorporated in the EIS:</p> <p>“During Operation, select exploration boreholes will be re-utilized for narrow diameter injection wells that will be developed with monitoring devices for the determination of excursions and water levels. Exploration boreholes not selected for the use of narrow injection wells will be grouted to surface to seal off any remaining conduit.”</p> | Not Accepted |

|--------------|----------------|-------|-----------------------|--|--|---|---|--------------|
| IR-57 | - | NRCan | Fish and fish habitat | Section 7.3.3.2 Appendix 7-A, sections 3.1.2 and 3.7 Appendix 7-C, section 2.5.2 | <p>Context: The Proponent's conceptual model of groundwater flow in the Local Study Area (EIS, sec 7.3.3, Figure 7.3-7) involves an unconfined Upper system hosted by overburden and the Upper sandstone aquifer, and a Lower confined system hosted by the Lower Sandstone Aquifer. The Intermediate Sandstone aquitard acts as a confining unit. Vertical heads gradients are directed downwards west of the Phoenix deposit and upwards beneath surface water receptors including Whitefish Lake (EIS, sec. 7.3.3.2).</p> <p>Using head data from nested monitoring wells (Appendix 7-A, sec. 3.1.2, Table 3-1) the Proponent calculates upward gradients in cluster WR-607, between the Lower Sandstone aquifer and the Upper Sandstone aquifer. In cluster LA-5, an upward gradient is calculated between the Upper Sandstone and the overburden unit (Appendix 7-A, Table 3-5). In areas west and south-west of the Phoenix deposit, groundwater is estimated to flow downward under a vertical gradient of approximately 0.015 m/m (Appendix 7-A, p.3-15).</p> <p>Rationale: In NRCan's opinion, the Proponent's interpretation of vertical head gradients in the LSA is not fully accurate. For the "Up-Gradient" monitoring well cluster, the tabulated head data (Appendix 7-A, Table 3-1) and data logger hydrographs (Appendix 7-A, Appendix B) indicate a downward gradient (0.014 m/m) from the overburden unit to the Intermediate Sandstone and an upward gradient (0.056 m/m) from the Lower Sandstone to the Intermediate Sandstone. Head data from the "NW" monitoring well cluster indicate a similar pattern of downward (0.016 m/m) and upward (0.014 m/m) gradients converging in the Intermediate Sandstone. In the "Downgradient" and "SE" monitoring well clusters, head observations and data logger hydrographs indicate downward gradients from the shallow aquifer system but essentially equal heads in the Intermediate and Lower Sandstones. This more complex picture of groundwater flow systems in the LSA does not appear to have been captured in the Proponent's conceptual model. Given the importance of the baseline hydrogeological regime for predicting the transport and fate of COPCs in the post-decommissioning period, the Proponent needs to demonstrate that the numerical groundwater flow model accounts for observed vertical head gradients.</p> | In section 2.5.2 of Appendix 7-C (Calibration Results), the Proponent should demonstrate that the numerical groundwater flow model reproduces quantitatively or at least qualitatively the vertical head gradients calculated from observations in the nested monitoring well clusters (Appendix 7-A, Table 3-1). | <p>This response has not been accepted.</p> <p>Using data provided in Attachment #57 (observed and simulated static water levels, screen mid-point elevations), NRCan was unable to reproduce the head gradient values reported by the Proponent in their table.The Proponent should check the gradient calculations.</p> | Not Accepted |
| IR-58 | - | ECCC | Fish and fish habitat | Section 7.3.2.4, Ore Deposit | <p>Context: The Proponent states that the Phoenix ore bodies are long and narrow (approximately 25 to 50 m wide) and are located within or near a graphitic pelite unit. Hydrothermal alteration associated with the ore zone is a discontinuous envelope of clay alteration and a sulphide-cemented rock zone that extends into the overlying sandstone and the underlying basement (Figure 7.3-3). This black, clay-rich zone is approximately 3 m thick on average and locally hydraulically isolates the ore zone from the overlying sandstones and underlying weathered basement rock.</p> <p>Rationale: As indicated by the Proponent, a 3 m black clay rich zone isolates</p> | <p>1. Verify that there will be no downward migration of mining solution into the paleo- weathered basement rock or that there is no flow along the unconformity surface.</p> <p>2. If downward migration of the mining solution occurs, explain how it will be mitigated.</p> | | Accepted |

|--------------|----------------|-------|-------------------------|---|--|--|--|--------------|
| | | | | | the ore zone from the overlying sandstones and underlying weathered basement rock. It is, however, unclear whether this discontinuous clay layer will prevent downward migration of uranium-bearing solution into the Paleo-weathered basement rock or horizontal flow along the unconformity surface to escape into the environment. Escape of uranium-bearing solution into the environment will have a negative effect on the receiving environment. | | | |
| IR-59 | - | CNSC | Fish and fish habitat | Section 7.4 Assessment of Project-related Effects, Figure 7.4-2 (p. 7-56) | Context: Figure 7.4-2: Simulated Change in Groundwater Discharge and Flow through Whitefish Lake Over the Life of the Project appears to be missing information. Rationale: Legend is included below the image, but the Legend box is blank. The green dotted line is not represented by anything in the legend. | Please update this Figure to ensure it is complete, and that features are properly indicated in the legend. | | Accepted |
| IR-60 | - | NRCan | Fish and fish habitat | Section 7.4.2.1 Appendix 7-C, section 5.2.1, Appendix B | Context: In the discussion of the limitations of the numerical groundwater flow model (Appendix 7-C, sec. 5.2.1), the Proponent invokes the well known modeling principles of "Occam's razor" and "Parsimony" which guided the parametrization of hydraulic conductivity in model layers. The Proponent states that hydrogeologic property values were applied uniformly for, among other units, the Lower Sandstone aquifer beyond the immediate area of desilicified materials. However, in the layer parametrization for the Lower Sandstone aquifer (Appendix 7-C, Appendix B, Figure B-5), NRCan notes a large zone of enhanced conductivity (1 E-05 m/s) extending south from Kratchkowsky Lake, which contrasts with the value (2 E-07 m/s) assigned elsewhere outside the desilicified zone. NRCan also notes the extremely detailed parametrization of hydraulic conductivity in the clay cap overlying the ore zone where borehole control is dense (Appendix 7-C, Appendix B, Figure B-6). Rationale: In NRCan's opinion, these model features appear to violate the principle of "Parsimony" and require greater justification supported by field observations. | NRCan requests that the Proponent provide justification based on field evidence for the multiple hydraulic conductivity zones assigned to the Lower Sandstone aquifer and the clay cap above the ore zone. | | Accepted |
| IR-61 | - | CNSC | Geology and Groundwater | Section 7.4.2 | Context: There is no discussion of potential induced seismicity from mining processes. Rationale: Induced seismicity may lead to a loss of process as identified for natural seismicity. | Please provide information on the potential mining-induced seismicity. | This response has not been accepted. CNSC staff expect a discussion of the occurrence of mining-induced seismicity in general in Saskatchewan, and the inclusion of a summary of potential sources of induced seismicity related to ISR mining (such as the response that Denison provided for IR-61) and the corresponding mitigation measures in the EIS. The paucity of records of seismicity in northern Saskatchewan (as stated in EIS Section 15.2) does not necessarily indicate a lower potential for future induced seismicity. It should be noted that earthquakes of up to magnitude (M_L) 4.4 are spatially correlated with locations of extractive industries with ongoing activity. Please provide proposed text for the revised EIS, for SME review and acceptance. | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------------------|-------------------------|--|---|--|---|--------------|
| IR-62 | - | ECCC | Fish and fish habitat | Section 7.4.2, Potential Project-related Effects | <p>Context: The Proponent indicates that the mining area includes:</p> <ul style="list-style-type: none">the ‘active mining area’, which is the target ore zone;a zone extending between 11 and 13 m above the active mining area that represents the maximum vertical height over which the injected mining fluids will migrate upwards from the ore zone during active mining; anda zone extending 50 m vertically upwards from the active mining area (that incorporates the active mining area and the 11 to 13 m zone defined in the previous bullet) that was selected to account for potential upset conditions. <p>Rationale: It is not clear to ECCC how the Proponent would be able to limit the mining solution migration within 11 & 13 m above active mining as the maximum vertical height over which the injected mining fluid will migrate. As the mining fluid will be injected under pressure into zones with possible presence of fractures, the pressure may also cause additional fractures and given that the solution is warm/hot will possibly dissolve the other cementing material in the sandstone above, making it difficult to accurately predict where the solution will migrate to.</p> | <p>1. Explain plans to limit the upward migration of mining solution into the overlying layer to 11 and 13m above the ore zone.</p> <p>2. Explain what impacts will occur if the mining solution migrates beyond the predicted height.</p> | | Accepted |
| IR-63 | - | CNSC | Geology and groundwater | Section 7.4.2.1, Potential Effect #1: Groundwater Quantity – Construction to Decommissioning Appendix 7-C, Section 2.7, Groundwater Conditions During Mine Operations | <p>Context: The numerical groundwater model described was calibrated to observed water level and stream baseflow data. Table 7.4-3 in the EIS indicates that Denison recognizes the potential for freeze wall operation to impact groundwater quantity. To simulate this impact, the model was adapted to reduce recharge (to 50%) within the freeze wall area, reduce hydraulic conductivity associated with the vertical freeze walls, and simulate pumping within the freeze wall area. Recovery from pumping and effects on discharge to groundwater discharge to Whitefish Lake are discussed in the potential effects section.</p> <p>Rationale: Although this assessment considered drawdown of the water table and discharge to Whitefish Lake, the discussion did not address the potential effects of operating the freeze wall on the local and semi-regional groundwater regimes. What would the pathway be for groundwater to pass around the freeze wall? What is the basis for the parameters selected, e.g., 50% recharge and lower hydraulic conductivity for freeze well? These factors need to be considered when evaluating the potential impacts of freeze well operations on groundwater flow conditions and corresponding receptors.</p> | Please provide a more fulsome discussion on the impact of freeze wall operations on local and semi-regional groundwater regimes and potential receptors. Please provide the rationale for assumptions made for key model parameters (e.g., selection of 50% recharge, hydraulic conductivity value used to represent freeze wall). In addition, please discuss the potential pathways for groundwater flow around the freeze wall, complete with figures demonstrating these pathways. | | Accepted |
| IR-64 | - | ECCC CNSC | Fish and fish habitat | Section: 7.4.2.2, Potential Effect #2: Terrain Morphology and Stability – Operation | <p>Context: The Proponent stated that the geological assessment predicted maximum vertical displacement in altered sandstone immediately above the mining area (17.5 cm). A very minor change in elevation at ground surface (of less than 7.5 cm) was predicted within a discrete and localized area overlying the ore body. The modelling work is considered to provide a worst-case bounding scenario. If subsidence were to occur over the lifetime of the Project, or in the years following mining, the extent of vertical displacement</p> | <p>Explain:</p> <ul style="list-style-type: none">Will this be revisited with updated data based on extraction feasibility results?How will the surface expression of a subsidence will be limited to 7.5 cm and localized? | <p>This response has not been accepted.</p> <p>CNSC staff expect Denison to include within the EIS a summary of the results of RESPEC’s most recent numerical modelling study that suggests negligible ground subsidence associated with the proposed volumetric extraction as this is an important consideration for designing an appropriate implementation plan for subsidence control and remediation measures.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-------------------------|---|--|---|---|--------------|
| | | | | Appendix 7-A, Appendix K (p. 12) | <p>is not expected to exceed that predicted in the modelling, which is based on an assumed volume extraction.</p> <p>Rationale: ECCC notes that the thickness of the ore zone has an average thickness of 5 m with a range of 2 to 17 m, and is 25-50 m wide and that the overburden rock above the ore zone measures about 400 m. Therefore, it is not clear how the Proponent determined that the surface expression of a subsidence on the surface if it occurs will be limited to 7.5 cm and localized. A subsidence greater than 7.5 cm, implies that the void in the ore zone will be narrower, and will affect the amount of water migrating through the zone.</p> <p>It was the recommendation of the consultant who conducted the work in Appendix K that more accurate material properties should be used for future modelling.</p> | Suggestions for mitigation and follow-up measures: ECCC recommends that the Proponent consider implementing remediation measures immediately after mining to prevent subsidence from occurring in the first place. | | |
| IR-65 | - | CNSC | Geology and Groundwater | Section 7.4.2.2 | <p>Context: It is stated the maximum subsidence is 7.5cm based on modeling with an assumed volume extraction. Has subsidence from dewatering/pumping and from lack of inflow of groundwater due to freeze wall been considered?</p> <p>Rationale: Surface facilities and wells may be impacted if there is unaccounted for subsidence.</p> | Please provide additional details for any dewatering/pumping induced subsidence. | <p>This response has not been accepted.</p> <p>CNSC staff expect Denison to include within the EIS a summary of their response to IR-65 to establish their basis for a low probability of pumping and/or dewatering subsidence. Please provide proposed text for the revised EIS, for SME review and acceptance.</p> | Not Accepted |
| IR-66 | - | CNSC | Geology and Groundwater | Section 7, Table 7.5-1, Row 1, Column 6 | <p>Context: Column 6 in Table 7.5-1 indicates the mitigation measures for a valued component. For Row 1, Geology, there is no description of mitigation measures but only that contingency plans will be developed if based on monitoring.</p> <p>Rationale: Subsidence may impact wells and surface infrastructure.</p> | Please provide additional details on monitoring and contingency plans related to the geological environment (e.g., subsidence), including triggers for implementing such plans. | <p>This response has not been accepted.</p> <p>Denison claims that the expected risk from subsidence is negligible. Granted that updated models by RESPEC indicate negligible ground subsidence, in practice, modelled and actual subsidence measurements usually vary. Therefore, CNSC staff still deem it necessary to include additional details on subsidence monitoring and contingency plans (including triggers for implementing these). Moreover, since Denison plans to survey well collar elevations notwithstanding the negligible ground subsidence modelled by RESPEC, they might as well discuss the techniques that they plan to employ. Currently, it is not clear what method they plan to utilize to potentially detect elevation changes in well collars that cannot also be used to detect subsidence of the overall terrain. Denison has discussed the limitations (i.e., resolution) of Lidar, which is a good start. However, it must be noted that vertical accuracy and precision are more important considerations than spatial resolution for evaluating the applicability of subsidence monitoring techniques for this project, especially considering the size of the study area. CNSC staff also recommend that Denison further explore the applicability of methods such as DGPS, InSAR, and UAV-based Lidar change detection for their monitoring plan.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-------|-------------------------|---|---|--|--|--------------|
| IR-67 | - | CNSC | Geology and groundwater | Section 7.6.2.1 (Remediation Objectives) | <p>Context: Metallurgical testing, including batch reaction, coreflood testing and column tests are mentioned frequently throughout Sections 2 and 7 of the EIS. Outside of the composition of restored solutions from coreflood tests #2B and 3C, results from these various tests are not reported in the EIS or any associated Appendices.</p> <p>Rationale: The results from metallurgical testing are important to a number of items discussed in the EIS, including (but not limited to): evolution of hydrochemistry during remediation, source of salts in Lower Sandstone Aquifer porewaters, process plans, industrial wastewater treatment, estimating composition and volume of process precipitates, and composition of mining fluids and leachate. In particular, the EIS posits that mining area decommissioning objectives are achievable based on metallurgical testing and provides these objectives in Table 2.3-3. CNSC staff need to understand the specifics of this metallurgical testing, given its importance for the development and justification for mining and remediation activities. Denison must also provide information demonstrating that the proposed restoration actions and remediation targets are As Low As Reasonably Achievable (ALARA).</p> | <p>1. Please provide a summary of the results and the analysis of results of the metallurgical tests within the EIS, or provide the technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS. This should include sample information for cores (e.g., mineralogy, location, U content, depth), test conditions (e.g., duration, # of iterations, column length, flow rate, temperature, pressure, sample frequency, influent/effluent composition), as well as results and how they are pertinent to the development of ISR activities.</p> <p>2. Please provide further clarification/justification on how results from two singular coreflood tests (i.e., Coreflood #2B and Coreflood #3C) can justify large-scale remediation activities and targets following solution mining.</p> <p>3. Please provide material demonstrating that the proposed restoration actions and remediation targets are ALARA.</p> | <p>This response has not been accepted, as this information should be provided in the EIS.</p> <p>CNSC staff request that Denison either include a high-level summary of the results of the metallurgical tests (including the data) or include appendices to the EIS that contain the data provided in attachments IR-20, IR-67, IR-69 and cite these within the EIS.</p> <p>Please provide proposed text for the revised EIS, for SME review and acceptance.</p> | Not Accepted |
| IR-68 | - | NRCan | Fish and fish habitat | Section 7.6.2.2.3 Appendix 7-C, sections 3.3, 4.1, 4.4.4 and 4.7 | <p>Context: Sources terms for the COPCs considered in 3D reactive transport modeling are given by the composition of "Restoration Solution #1", which the Proponent believes is representative of groundwater quality in the ore zone after remediation at decommissioning (Appendix 7-C, sec. 3.3, Table 3-5; sec 4.0). The Proponent considers COPC source terms as "initial conditions" for groundwater quality in the ore zone at the start of the model simulation period. During the simulation, no additional mass of COPCs is transferred to groundwater in the ore zone.</p> <p>Rationale: In NRCan's opinion, this representation of COPC sources is not conservative as it fails to account for various long-term slow mass release processes. These processes could include redissolution of secondary phases formed during ISR mining (e.g., radium-bearing gypsum or barite, jarosite, alunite) and migration of unrecovered lixiviant or restored solution from low-permeability regions or stagnant zones that were not fully swept during mining or remediation. NRCan notes that scenario #2 in the Proponent's transport prediction uncertainty analysis (Appendix 7-C, sec. 4.7) does consider an extended source release period for protons (desorption from chlorite). However, in NRCan's opinion, additional modeling scenarios should consider extended-release periods for other COPCs as well.</p> | NRCan requests that the Proponent's reactive transport prediction uncertainty analysis (Appendix 7-C, sec. 4.7) consider extended source release periods for additional COPCs. | | Accepted |
| IR-69 | - | NRCan | Fish and fish habitat | Section 7.6.2.2.3 Appendix 7-C, sections 3.1 and 3.2 | <p>Context: For hydrogeological and geochemical assessments in support of ISR projects, the Proponent identifies two aspects of primary importance (Appendix 7-C, sec. 3.1). These are a) groundwater remediation (Appendix 7-C, sec. 3.1.1); and b) the assimilative capacity of host rocks downgradient from the ore zone (Appendix 7-C, sec. 3.1.2). According to the Proponent, the objective of groundwater remediation at decommissioning is to achieve</p> | NRCan requests that the Proponent provide a detailed description of the expected mineralogical and hydrogeochemical changes occurring within the ore and barrier zones as a result of the injection of acidic lixiviant. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------------------|--|---|---|--|---|--------------|
| | | | | | <p>water quality in the mined zone that does not pose a risk to receptors at the point of exposure. Assimilative capacity refers to the ability of groundwater-rock reactions to naturally sequester or attenuate COPCs migrating from the ore zone during the post-decommissioning period.</p> <p>Rationale: However, in NRCan's opinion, the Proponent has neglected to mention the most fundamental aspect for hydrogeological and geochemical assessments in support of ISR projects. That aspect is the choice of ISR lixiviant and its effects on the mineralogy and hydrogeochemistry of the ore zone during mining operations. The Proponent provides information on the pre-mining mineralogy (Appendix 7-C, sec. 3.2.1) and hydrogeochemistry (Appendix 7-C, sec. 3.2.2) but no information on their expected changes as a result of ISR mining. This Information is important when considering source terms in reactive transport modeling.</p> | | | |
| IR-70 | - | CNSC ECCC | Fish and fish habitat Geology and groundwater | Section 7.6.2.2.3, Evaluation of Geochemical Reactive Transport Appendix 7-C, Section 4.4.2, Sub-Domain Model Hydrogeologic Parameters | <p>Context: The EIS indicates that “changes to hydrogeological conditions within the mining area were considered during development of the 3D sub-domain model. Dissolution of ore within the active mining area is expected to enhance ... hydraulic conductivity”.</p> <p>In Section 4.7 (Prediction Uncertainty Analysis), predictive uncertainty scenarios are provided. For scenario 7, the hydraulic conductivity (K) of the ore zone was increased even further than initial model assumptions. The value used is not indicated in the text.</p> <p>Rationale: A hydraulic conductivity (K) value of 5x10-6 m/s, which is a factor of five (5) greater than the value assumed for the ore zone, was applied in the base case numerical model to account for this impact. It is unclear from the information provided in Section 7 of the EIS or associated Appendices what the basis of this five-fold increase in K value for the ore zone, and how this was judged to be conservative, or to adequately represent anticipated conditions. This parameter is important as it impacts the rate at which contaminants flow from the ore zone following mining activities. Due to of the dissolution of uranium, larger voids will likely be created, and the hydraulic conductivity may increase by more than a factor of 5 compared to pre-project material. Therefore, a variation of at least one or two orders of magnitude for hydraulic conductivity should be used in the sensitivity analysis. Having a representative, conservative value for hydraulic conductivity is essential for understanding groundwater as a pathway of contaminant transport to Whitefish Lake and potential impacts to aquatic life. The K value used in the predictive uncertainty analysis should be reported.</p> | Please provide a more fulsome discussion on the anticipated impacts of mining on permeability of the ore zone due to mining activities in the EIS or in an Appendix. The value used for scenario 7 of the prediction uncertainty analysis should be provided. The scientific rationale for the use of a K value only a factor of five greater than the value assumed for the ore zone in the 3D regional model should be provided, alternatively, provide simulation results for a more conservative scenario. Specifically, this discussion should address the potential effects of mechanical permeability enhancement with tools, dissolution of ore, gas plugging, chemical plugging, plugging due to ion exchange, and mechanical plugging. | <p>This response has not been accepted.</p> <p>In the discussion of K values for the Ore Zone in Section 2.3.1.7 of Appendix 7-C, Denison notes that available measurements are derived from permeameters and likely underestimate actual conditions because they do not account for macro-scale fracture flow in the ore zone. Section 4.4.2 of Appendix 7-C indicates that a hydraulic conductivity value of 5E-06 m/s (5 times greater than value assumed for the ore zone in the 3D regional-scale model) was assigned to represent mining post-decommissioning for the base case scenario. The description for Scenario #7 of the sensitivity analysis reads "higher hydraulic conductivity within the ore zone". In their response to IR-70, Denison states that for Scenario #7, "the hydraulic conductivity in the ore zone was raised to be a uniform value of 2E-07 m/s to represent the effective dissolution of any clay cap minerals". No information relating to permeability or hydraulic conductivity is provided in the IR-20/IR-67/IR-69 attachment outside of qualitative observations of increased permeability following leaching with lixiviant. The information provided to CNSC staff thus far indicates that hydraulic conductivity (K) values for the base case scenario was 5E-06 m/s, and 2E-07 m/s for the higher ore zone hydraulic conductivity scenario (Scenario #7). Clearly this interpretation is not logical given that 2E-07 < 5E-06. Furthermore, Denison's assertion that the post-mining conductivity of the ore zone is unimportant relative to the hydraulic conductivity of lower sediments and desilicified zone is not supported by the data presented in Table 4-6 of Appendix 7-C. The table below provides a summary of predicted groundwater concentrations for key COPCs (As, Se, U) for Scenarios 5, 6, and 7, as well as the relative percent difference to values predicted by the base case scenario. For these COPCs, it appears that increased ore zone hydraulic conductivity brings about the same order of magnitude changes as does varying K values for the lower sandstone (LSS). As such, it is important that the parameterization for Scenario #7 of the sensitivity analysis is valid - Denison is requested to provide clarification on this matter.</p> | Not Accepted |

| IR-71 | - | CNSC | Geology and groundwater | Section 7.7.1, Climate Change Considerations | <p>Context: The report states that in a scenario of increased precipitation and decreased/constant evaporation, climate change may result in greater flows in the Wheeler River drainage system and increased recharge to groundwater, which would correspond to increased groundwater discharge to Whitefish Lake. Additionally, it is also stated that climate change was evaluated qualitatively.</p> <p>Rationale: It is not clear why the impacts of increased evapotranspiration associated with higher average temperatures were not considered, even though these are likely outcomes of temperature increases due to climate change in areas such as the Prairies (Climate trends and projections -</p> | Please provide a discussion on potential effects of increased evapotranspiration, as well as decreased groundwater recharge for the study area. Provide justification for performing qualitative assessment of impacts of climate change rather than a quantitative one. | <p>This response has not been accepted.</p> <p>The effect of climate change on groundwater recharge in Prairies or Canada is generally uncertain due to the large degree of uncertainty in the modelling of future recharge although future changes in temperature and precipitation are expected to alter groundwater recharge (through changes to runoff, evapotranspiration, and snow accumulation). While CNSC staff accepts the response on potential effects of increased evapotranspiration, as well as decreased groundwater recharge for the study area, no justification has been provided on why quantitative analysis was not completed to address the effect of climate change on groundwater recharge.</p> | Not Accepted | | | | | | | | | | | | | | | | | | | | | | | | |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-------------------------|---|---|--|--|--------------|
| | | | | | Canada.ca). It is also not clear why climate change considerations were not assessed quantitatively. | | | |
| IR-72 | - | CNSC | Geology and groundwater | Section 7.8.2, Groundwater Monitoring | <p>Context: Monitoring seems to consider COPCs from surface facilities, and excursion of pumped mine fluid in the Lower Sandstone Aquifer. There does not appear any discussion on how the proposed monitoring program considers potential excursions of brine from freeze wells.</p> <p>Rationale: It is unclear how potential excursions of brine from freeze wells will be monitored. Would this be through the fiber optic cables installed within the freeze well network? Or would it be achieved in the monitoring well clusters? If this is the case, how would an excursion of brine from a freeze well be differentiated from an excursion of mining solution?</p> | Please provide further information regarding how potential excursions of brine from freeze wells will be monitored as part of the proposed groundwater monitoring program. | <p>This response has not been accepted.</p> <p>CNSC staff request that Denison discuss the potential for excursions of brine from freeze wells and that they include a summary of plans to monitor these using key indicators of freeze wall brine migration, such as electrical conductivity (EC) and chloride (CaCl2), in the EIS (even at a high level if these are still being currently developed).</p> <p>Please provide proposed text for the revised EIS, for SME review and acceptance.</p> | Not Accepted |
| IR-73 | - | CNSC | Geology and groundwater | Section 7.8.2.2, In Situ Recovery Mining Area Appendix 7-A, Appendix C | <p>Context: The EIS recommends that a follow-up study be carried out to supplement available data on hydraulic conductivity in the Desilicified Zone (DSZ).</p> <p>Rationale: Appendix C (Summary of Hydraulic Testing Data and Conductivity Values) of Appendix 7A indicates that only n = 6 hydraulic conductivity values are available for the DSZ, one of which appears unreliable due to a problem with packer sealing. This is relatively few values compared to the Intermediate and Lower Sandstones. Additionally, limited hydraulic head data from boreholes screened in the DSZ is available (GWR-037, GWR-012 and GWR-014; See Figures 16/17 in Appendix 7-A) – most information appears to originate from open core holes. The information presented in its current form is insufficient considering the importance of this zone as a preferential pathway for contaminants following remediation activities, and the heterogeneity of the unit due to intense hydrothermal alteration and fracturing. Further information regarding hydrogeological properties and groundwater flow would aid greatly in validating and refining the numerical groundwater model.</p> | <p>As per the EIS recommendations, please provide additional information to supplement available data on hydraulic conductivity in the DSZ. Please provide the following information as part of the follow-up study:</p> <ol style="list-style-type: none">1. identification of the vertical conductivity (KV) as there is an upward flow component (isotropy was assumed in DSZ for numerical model, this assumption must be verified)2. quantification of the horizontal and vertical flow gradients in the DSZ; and3. identification and mapping of any structures with the potential to influence groundwater flow in the DSZ, such as fracture/fault zones. | | Accepted |
| IR-74 | - | CNSC | Geology and Groundwater | Section 7.8.2.3 | <p>Context: It is stated in Section 7.8.2.3 (p. 7-113, main EIS report) that, at the Post-Decommissioning Stage, “Excursion are signaled by a change in water quality that is outside of that bounded by modelling predictions”, and “The model predictions spatiotemporally bound COPC concentrations in the subsurface that do not pose a risk to the receiving environment. Water quality that is outside of this bounding is defined as representing a material increase over a meaningful period compared to the predicted values either in rate of change or magnitude of change of COPC concentrations.”</p> <p>Rationale: It is not clear in which locations (e.g., is it in the mining area, or downstream of the mining area, or anywhere else?) the water quality is used to compare with the model predictions to determine if excursion occurs.</p> | Please clarify in which locations the water quality data is used to compare with the model predictions to determine if excursion occurs. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-------------------------|--|--|--|---|--------------|
| IR-75 | - | CNSC | Geology and Groundwater | Appendix 7-A, Appendix K | <p>Context: The geomechanical study showed that the stability of the remnant ore zone and surrounding rock mass is highly sensitive to the magnitude of the material properties. To quantify this risk, the Proponent conducted a sensitivity analysis to assess the influence that material properties have on the stability of key stratigraphic layers. The results of the sensitivity analyses suggest that small variations in the cohesion magnitude and angle of internal friction may significantly influence the stability of the altered sandstone, ore zone, and upper and lower clays.</p> <p>Rationale: By considering the potential uncertainties and risks in association with the geomechanical study and the empirically derived rock mass strength parameters and the non-site specific physical parameters of different rock formations used for the modeling, the Proponent’s consultant suggests to define a laboratory testing program to address data gaps in the current geotechnical data and increase confidence in the material properties, and use more accurate material properties to model the phased extraction of uranium-enriched rock and assess the associated risks for cavity collapse and failure in the steel casing. CNSC staff concurs with these suggestions.</p> | Please provide a plan to implement recommendations for further detailed geomechanical studies to reduce the uncertainties and risks in association with the stability and deformation analyses of ore zone rock matrix and its overlying rock mass formations and assess their impacts on the mine operation. | <p>This response has not been accepted.</p> <p>As stated in the original comment, the geomechanical study (Appendix K of Appendix 7-A of EIS, RESPEC 2021) showed that the stability of the remnant ore zone and surrounding rock mass is highly sensitive to the magnitude of the material properties. The results of the sensitivity analyses suggest that small variations in the cohesion magnitude and angle of internal friction may significantly influence the stability of the altered sandstone, ore zone, and upper and lower clays. Although the Proponent has conducted additional numerical modelling by adding the desilicified sandstone into the model with conservative mechanical properties for this zone, the mechanical properties of other materials are basically same as the original modelling (i.e., empirically derived average material properties of key stratigraphic layers). The new modelling (RESPEC 2023, i.e., Attachment IR-21) does not address the uncertainties associated with the non-site specific physical and mechanical parameters of different rock formations used for the modeling. Some mechanical parameters used appear to be inadequate, e.g., the mechanical properties of overburden and rock-mass modulus of desilicified sandstone. The use of isotropic in-situ stress state is non-conservative. No sufficient justification/rationale is provided on the excavation of 30 percent of rock by volume from the high-grade ore zone to which 50% was used in the RESPEC (2021), which could have significant impact on the modelling results. In addition, Figure 2 of Attachment IR-21 does not show the desilicified sandstone although it is stated that the desilicified sandstone is considered in the modeling. Also see CNSC’s disposition to Denison’s response to IR-83.</p> | Not Accepted |
| IR-76 | - | CNSC | Geology and Groundwater | Appendix 7-A, Appendix K (p. 12) | <p>Context: Based on the consultant’s report, the modeled vertical strain is approaching or exceeding the tensile and compressive yield limits for steel casing.</p> <p>Rationale: Failure of steel casing may result in process loss or alter groundwater flow and quality.</p> | Please provide additional details on how casing integrity will be monitored and potential effects mitigated. | <p>This response has not been accepted.</p> <p>CNSC staff request that Denison include summary of the potential for steel casing failure and plans for monitoring and mitigating its effects (such as the response to IR-76) within the EIS, for SME review and acceptance.</p> | Not Accepted |
| IR-77 | - | CNSC | Geology and Groundwater | Appendix 7-A, Appendix K Results of a Geomechanical Study Investigating the Influence of Uranium Extraction on Mining-Cavity Stability for the Wheeler River Uranium Project (Revision 1) | <p>Context: It is reported in the appendix K report, within Appendix 7-A, that both phase I scoping analysis and phase II detailed strip model were investigated by numerical modelling. The analysis discussed influence on host rock stability as a result of incremental increase in volumetric extraction and graded conservative treatment of material properties.</p> <p>Rationale: As critical components of a numerical geomechanical simulation, initial and boundary conditions are crucially important to the confidence and reliability of the modelling results. However, this information is absent from the current report. In-situ principal stresses largely affects the stability of the excavated host rock, and the vertical strain and surface subsidence. This information is also absent in current form.</p> | Please provide details on the boundary and initial conditions applied on stress loading and strain for the numerical analysis. In particular, the in-situ principal stresses, which are critical to correct understanding of the excavation disturbance to the host rock, should be provided and justified as appropriate. | | Accepted |

|--------------|----------------|------------------|--|---|--|---|---|--------------|
| IR-78 | - | CNSC ECCC | Fish and fish habitat Geology and groundwater | Appendix 7-A, Section 3.5.2, Porosity Appendix 7-C, Section 2.3.2.1, Porosity Values | <p>Context: This section of the report outlines the estimated/assumed effective porosity values. The only reference provided is for permeameter testing on rock core samples (Scibek, 2019).</p> <p>Additionally, the report states that “As tracer test results to estimate effective porosity were unavailable at the time of modelling, effective porosity values for the sandstone bedrock and basement units were sourced from literature values”, where literature values are effective porosities from the Cigar Lake study (AECL, 1994), situated approximately 40 km NE of Wheeler River. No on-site Wheeler River field data was used to justify this value. Additionally,, in the Cigar Lake study, the authors reported that, because results from tracer tests and pumping tests were unavailable, “a practical approach was adopted, i.e., to use the porosity values obtained from laboratory measurements made on core samples, and to assume that those numbers were close to the average field kinematic (effective) porosity values”.</p> <p>Rationale: The source of reported effective porosity values is unclear from Section 3.5.2 in Appendix A (e.g. literature review, field work, laboratory work).</p> <p>In Section 2.3.2.1 of Appendix 7-C, there is a lack of clarity regarding the effective porosity data used in the numerical model. It appears that no site-specific data derived from tracer tests or pumping tests is used in the numerical model. Given that effective porosity directly correlates to seepage velocity and by extension transport time and distribution of COPCs in groundwater, it is an important parameter. Given its relative importance for contaminant fate and transport, effective porosity should be based on field measurements, or at the very least accounted for in the sensitivity analysis.</p> | <p>1. Please provide the reference for the data substantiating the assumed effective porosity values reported in Appendix 7-A and used in the numerical model in Appendix 7-C.</p> <p>2. Please provide information on how the site-specific effective porosity values from tracer tests or pumping tests, were considered in the numerical models. Section 2.2.1.4 of the EIS asserts that tracer tests were carried out in 2021 – this information should thus be available for improving/updating models. Alternatively, provide a sensitivity analysis for the effective porosity in the Desilicified Zone, or contaminant transport simulation results with more conservative effective porosity values.</p> | <p>This response has not been accepted.</p> <p>Effective porosity is an important parameter to understanding groundwater flow and contaminant transport. The Proponent states that “As tracer test results to estimate effective porosity were unavailable at the time of modelling, effective porosity values for the sandstone bedrock and basement units were sourced from literature values”, including porosities from the Cigar Lake study (AECL, 1994), situated approximately 40 km NE of Wheeler River. No on-site Wheeler River field data was used to explain this value. Additionally, in the Cigar Lake study, the authors reported that, because results from tracer tests and pumping tests were unavailable, “a practical approach was adopted, i.e., to use the porosity values obtained from laboratory measurements made on core samples, and to assume that those numbers were close to the average field kinematic (effective) porosity values”.</p> <p>In response to the IR, the Proponent explained and supported their methodology for selecting a value for effective porosity. This method included consideration of literature values and a regional analogue at Cigar Lake. ECCC notes that a tracer test was conducted, the results of which were not considered in the selection of the effective porosity parameter</p> <p>If field test data is available that is potentially relevant to determining effective porosity, it should be included in the EIS when discussing effective porosity. The field test data should also be made available for ECCC to review, to confirm the conclusions reached by the Proponent. ECCC acknowledges that other sources of information can be useful when explaining the most appropriate value for effective porosity such as literature values and regional analogues, as per the Proponent’s IR response. However, field test results should be presented in the EIS and considered as a part of such an explanation. If the Proponent feels that not utilizing field test data is the most accurate approach when selecting an effective porosity value, then this conclusion should be reached with consideration of the field test data as a part of the evaluation.</p> <p>Provide a discussion of how the effective porosity values are selected, including a discussion of how field test results were considered. This information is necessary to confirm that the selected effective porosity values are valid. This also relates to IR-52.</p> | Not Accepted |
| IR-79 | - | CNSC | Geology and groundwater | Appendix 7-A, Section 4, Groundwater Chemistry | <p>Context: Table 4-1 in Section 4 of Appendix 7-A provides groundwater monitoring results from sampling activities carried out at 26 monitoring wells in 2019, 2020, and 2021. The majority of these wells were only sampled once (n = 8) or twice (n = 17). In some cases (Lower Sandstone Aquifer/Intermediate Sandstone Aquitard), the variability of results between sampling events is quite high. Data for the Paleoweathered Zone is sparse.</p> | <p>Please provide the statistical basis (number of samples and variability) by which “baseline” is defined and the justification that the current information is sufficient to adequately characterize groundwater quality. In order to ensure sufficient baseline information is collected, further iterations of sample collection for groundwater monitoring wells in all defined hydrostratigraphic units may be required. In addition, groundwater quality downgradient from the proposed mining area should be further</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-------------------------|--|--|--|--|--------------|
| | | | | | Rationale: Insufficient information is presented in the EIS and associated Appendices to concretely define baseline groundwater chemistry for the different hydrostratigraphic units. As defined in the CNSC’s Generic Guidelines for the Preparation of an EIS : “Based on the scope of the project, the EIS will present sufficiently detailed baseline information to determine the effects the project could have on the VCs and analyze those effects”. This is particularly important given certain features of the study area (i.e., presence of zones of thermal alteration/desilicification, as well as hydraulically active fractures/faults), and the need to adequately characterize baseline conditions in the Desilicified Zone downgradient from the proposed mining area. As an example, the US Nuclear Regulatory Commission (NRC) typically requires a minimum of four (4) quarterly samples from (i) surficial aquifers, (ii) production aquifers, (iii) overlying aquifers, and (iv) underlying aquifers to characterize preoperational groundwater quality (E. Striz, pers. comm.). | characterized to assess spatial influence of alteration and hydraulically active features, | | |
| IR-80 | - | CNSC | Geology and groundwater | Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit | Context: This section provides data for groundwater samples collected during the Cigar Lake analogue study and Millennium Project for further regional context. The previous studies are heavily referenced to support interpretations made for the conceptual site model. Rationale: The Piper Plots in Figure 26 are difficult to interpret (many overlapping circles with variegated colors), and Cigar Lake samples plot predominantly as Na/K-Cl/SO4 groundwater facies. Conversely, samples collected as part of the Phoenix Project (current), plot either as Ca-HCO3 or Ca-SO4/Cl groundwater facies. No explanation is provided for the observed hydrogeochemical differences between groundwater from the Phoenix project and the Cigar Lake analogue study/Millenium Project. | Please provide additional clarity to and interpretation of Figure 26 in Appendix 7-A, including a revision to the Figure to allow for easier interpretation. This could include clear identification of end members, as well as arrows indicating proposed evolution of groundwater chemistry. Further discussion should be provided describing observed differences between groundwater chemistry at the Phoenix project compared to Millenium/Cigar Lake. | | Accepted |
| IR-81 | - | CNSC | Geology and groundwater | Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit | Context: The report states in the description of hydrochemistry of the Lower Sandstone Aquifer that, “On the basis of groundwater chemistry and tritium values in that groundwater, the authors (of the Cigar Lake analogue study in 1994) concluded that the groundwater reflected a younger water component that had penetrated to depth along hydraulically active fractures/faults. The same conclusion is made here (in the Wheeler River EIS) for the Phoenix study area – meaning that fracture/fault conditions are such that some areas of the MFa are characterized by younger/recharge groundwaters”. Rationale: Tritium results for most wells in the Lower Sandstone Aquifer (MFa) reported in Table 4-1 of Appendix 7-A exhibit tritium concentrations <15 Bq/L for the 2020 sample, and 0.1 or <0.1 Bq/L for the 2021 sample. Tritium in modern precipitation typically varies from 1 – 3 Bq/L. Conclusions made in the text are not supported by data, especially given that tritium values are not reported in the EIS for local precipitation or surface water. This is important in reinforcing the assumption from the conceptual model | Provide a further discussion on the interpretation of tritium in groundwater, rather than echoing conclusions from the Cigar Lake analogue study. Consideration should be given to the assertion that modern meteoric water circulates at depth in the Lower Sandstone Aquifer. Collection and analysis of stable isotope (e.g., δ2H, δ18O) samples is a cost-effective solution which would greatly improve understanding of groundwater hydrology and support the development of a conceptual model. | This response has not been accepted. CNSC staff agree with the interpretations drawn from the information presented in the response to IR-81. However, it remains that the EIS does not contain an assessment of the tritium data presented, aside from the text quoted in the original IR-81 relating to Section 4.3.3 of Appendix 7-A. As such, CNSC staff request that Denison revise the EIS to include a high-level summary of the tritium data presented in the response to IR-81, being (i) the data is limited in value to conceptual model development, (ii) conclusions from tritium data at Cigar Lake at not reproducible with the current dataset, and (iii) Denison will continue to monitor tritium to further evaluate the usefulness in refining the conceptual model. Please provide proposed text for the revised EIS, for SME review and acceptance. | Not Accepted |

|--------------|----------------|------|-------------------------|---|--|--|--|----------|
| | | | | | that modern meteoric water circulates at depth in the Lower Sandstone Aquifer. | | | |
| IR-82 | - | CNSC | Geology and groundwater | Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit Appendix 7-C, Section 3.5 | <p>Context: A. In-field measurements of Oxidation-Reduction Potential (ORP) for three (3) out of twenty-six (26) groundwater samples are presented in Table 4-1 of Appendix 7-A. Although sparse, these values are also used to characterize redox conditions for representative groundwaters in Table 3-5 of Appendix 7-C.</p> <p>B. In Section 3.5.5 of Appendix 7-C it is stated that groundwaters in the PHREEQC model were allowed to equilibrate with atmospheric concentrations of oxygen, resulting in oxidizing subsurface conditions. In Section 3.7 of Appendix 7-C it states that input files for 3D reactive transport were generated based on outcomes for PHREEQC modelling. However, in reading Section 4 of Appendix 7-C, it is unclear whether this assumption (equilibration with atmospheric oxygen) was carried forward for the 3D model.</p> <p>C. As per p. 3.49 of Appendix 7-C, “A small amount of reactive pyrite was assumed for the first 500 m of transport away from the ore zone in the model, primarily in the desilicified sediments of the Lower Sandstone Aquifer, and deeper portion of the Intermediate Sandstone Aquitard”.</p> <p>Rationale: A. Given the importance of redox conditions for U mobilization and precipitation/dissolution of minerals (e.g., pyrite/metal oxyhydroxides) and the corresponding influence on contaminant transport from both a modelling and monitoring perspective, these should be further characterized. It should also be noted that the measurement of Oxidative-Reductive Potential (ORP) in natural waters can be complex and difficult due to the variability and disequilibrium of natural systems and issues inherent to electrode calibration (e.g., Schuring et al., 2000). Measurements of redox couples (e.g., As(III)/As(V); Fe(II)/Fe(III); S(-II)/S(VI)) are typically recommended to accurately characterize redox conditions in natural waters (Schuring et al., 2000).</p> <p>B. The assumptions regarding redox conditions for the 3D solute transport model should be clarified.</p> <p>C. The amount of pyrite (e.g., % by weight) assumed for the purposes of modelling should be clarified, given the potential role of pyrite as a reducing agent in limiting the transport of COPCs.</p> <p>Reference: [1] Schuring J.; Schulz, H. D.; Fischer, W.R.; Bottcher, J.; and Duijnisveld, M.H.W. 2000. Redox: Fundamentals, Processes and Applications. Springer: Berlin.</p> | <p>1. Provide further discussions and information (i.e., ORP measurements or analytical data for redox couples) on redox conditions at the Phoenix site. Particular focus should be given to the spatial heterogeneity of redox processes. Tools such as the reference provided [2] below provide an example of simplified framework for characterizing redox conditions in aquifers.</p> <p>2. Clarify assumptions regarding initial redox conditions for the 3D solute transport model.</p> <p>3. Provide the % reactive pyrite by weight assumed for models in the text. Justification for proportions used, such as analytical data, should also be provided.</p> <p>Reference: [2] Jurgens, B.C., McMahon, P.B., Chapelle, F.H., and Eberts, S.M., 2009, An Excel workbook for identifying redox processes in ground water: U.S. Geological Survey Open-File Report 2009–1004 8 p.</p> | Please see AD-65 in the Advice to Proponent table. | Accepted |

|--------------|----------------|------|-------------------------|---|--|--|---|--------------|
| IR-83 | - | CNSC | Geology and Groundwater | Appendix 7-A, Section 7.4.2.2 and Appendix K | <p>Context: Leaching of uranium from the ore zone will generate voids within the ore zone, which could fail and collapse. Failure of the voids would cause displacement in overlying rocks, which will lead to the eventual ground subsidence. Based on the developed geological model, a geomechanical study was conducted to assess potential maximum vertical displacement in the overlying rock formations and predict the ground subsidence. While a layer of altered sandstone is modeled above the ore zone, the desilicified zone, a zone that is comprised of completely to partially unconsolidated sands and has very low rock quality, high fracture intensity, and high friability, and low strength in the area overlying and east of the Phoenix deposit, appears not to have been included in the model for geomechanical modeling. The evaluated displacement/deformation in the overlying rock formation and the resulted ground subsidence would not be conservative without including the desilicified zone.</p> <p>Rationale: Stability of the ore zone rock matrix and the potential displacement/deformation in the overlying rock formations when voids in the extracted ore zone collapse are critical for protecting the overlying aquifers, preventing substantial ground subsidence, safeguarding casing integrity, and mitigating plug-off of the remaining ore as well as efficiently mining extraction. The deformed zone in the overlying rock formations will change in hydraulic conductivity that will impact on the assessment of potential effects on groundwater flow and contaminant transport in the zone. Therefore, the rock mass behavior including and above the ore zone should be adequately understood and the potential displacement/deformation should be assessed and quantified with adequately defined geological model.</p> | Please provide details whether and how the desilicified zone is considered in the geomechanical modeling of the detailed strip model. Such details should include figures and the linkage between the geomechanical model including the determination of strength parameters of the desilicified zone and the geological model including information on the core delineation of the desilicified zone. | <p>This response has not been accepted.</p> <p>As stated in the CNSC’s disposition to Denison’s response to IR-75, Figure 2 of Attachment IR-21 (RESPEC 2023) does not show the desilicified sandstone although it is stated that the desilicified sandstone is considered in the numerical modeling. Therefore, the extent of desilicified sandstone modelled is not clear. It is also not clear where the vertical plane represented by Figure 2 is cut from Figure 1. The linkage between the geomechanical model represented by Figure 2 in RESPEC (2023) and the geological model in EIS S07 is not provided.</p> <p>Please provide the requested information.</p> | Not Accepted |
| IR-84 | - | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: It is stated in Section 2.5.2.4 (p. 2.35, Appendix 7-C) that “In addition to calibrating to water level elevations targets, the model was calibrated to estimates of groundwater discharge to Whitefish Lake. A match between simulated and observed flows helps to support that groundwater recharge rates are reasonable, and to provide validation for water budget assessments. Baseflow calibration targets were developed using point streamflow measurements collected upstream and downstream of Whitefish Lake. Figure 2-10 (p. 2.26, Appendix 7-C) shows the locations of the baseflow calibration targets, and Table 2-7 (p. 2.35, Appendix 7-C) illustrates the model-simulated groundwater discharge rates in relation to the estimated range of baseflow from stream measurements. The simulated baseflow to Whitefish Lake is in good agreement with the estimated representative baseflow”.</p> <p>Rationale: It is not clear in Figure 2-10 (p. 2.26, Appendix 7-C) where the point streamflow measurements were conducted upstream and downstream of Whitefish Lake. Additionally, it is not clear how the groundwater discharge to Whitefish Lake is simulated, since the model domain does not cover the whole Whitefish Lake.</p> | <p>1. Please clarify in Figure 2-10 where the point streamflow measurements were conducted upstream and downstream of Whitefish Lake.</p> <p>2. Please clarify how the groundwater discharge to Whitefish Lake is simulated considering that the model domain does not cover the whole Whitefish Lake.</p> | <p>This response has not been accepted, as the issue has not been sufficiently clarified.</p> <p>1. In Appendix 7-C of the EIS, Figure 2-10 shows that Whitefish Lake is between SA-5 and SA-6, not SA-2 and SA-6. Additionally, under the heading "Surface Water Stations" of Table 2-7 are “SA-6 to SA-2”, not “SA-6 and SA-2”.</p> <p>2. Figure 2-10 does not show SA-7. Surface water flow direction should be illustrated to help understand the relative location of upstream and downstream. Additionally, under the heading of “feature monitored” of Table 2-7 is “flow from LA-6 to Whitefish Lake”. Figure 2-10 shows LA-2, but no LA-6.</p> | Not Accepted |

|--------------|----------------|------|-------------------------|---|---|---|--|--------------|
| IR-85 | - | CNSC | Geology and Groundwater | Appendix 7-C | Context: Section 2.7.3 (Appendix 7-C) mentions Wells A, B and C, and Figure 2-17 (p. 2.43, Appendix 7-C) illustrates the predicted drawdown ranges at Well B and Well C. Rationale: It is not clear where Well A, Well B and Well C are located. | Please provide the locations of Well A, Well B and Well C illustrated in a Figure. | | Accepted |
| IR-86 | - | CNSC | Geology and Groundwater | Appendix 7-C | Context: It is stated in Section 2.7.3 (p. 2.41, Appendix 7-C) that “Both the pumping demand and the recharge changes were incorporated into a transient simulation performed using the calibrated groundwater flow model. The model simulation was started at the beginning of mine construction, with initial conditions taken from the calibrated model. The simulation period was extended for 40 years to include the entire period of construction, operation, and decommissioning, and extending through 17 years post decommissioning”. Rationale: It is not clear what is the difference between the calibrated model and transient model in terms of parameters (such as the K values for the mining zone), boundary conditions, etc. | Please clarify the parameters, boundary conditions and any other aspects as used in the transient model that are different from the calibrated model. | This response has not been accepted. The response is acceptable, but the information as explained in the response should be incorporated in the appropriate sections of Appendix 7-C. Please provide proposed text for the revised EIS, for SME review and acceptance. | Not Accepted |
| IR-87 | - | CNSC | Geology and Groundwater | Appendix 7-C | Context: In Section 2.8 (p. 2.45, Appendix 7-C) Parameter uncertainty assessment, only parameters for certain zones (part of each specific hydro-stratigraphic unit as shown in Figure 2-19, p. 2.46, Appendix 7-C) related to the pathway from the ore zone toward Whitefish Lake were allowed to vary in order to find combinations of parameter values that met statistical calibration criteria. If each hydro-stratigraphic units within the whole model domain were treated as parameter zones that can have varied hydraulic conductivity values, a different combination of parameter values could be obtained that meet statistical calibration criteria too. Rationale: The parameter values for parameter zones between the mining area and Whitefish Lake is important in determining the hydraulic connection between the mining area and Whitefish Lake. Parameter values in other parameter zones could also be important. For example, if the K values for the intermediate sandstone aquitard are significantly larger than in the current calibration results, the interaction between the upper sandstone aquifer and the lower sandstone aquifer could be more active, and the mined-out zone could be more active hydraulically and groundwater in the minded-out zone could have a shorter residence time than in the current calibrated model. Additionally, it is noted that Figure 2.19 (p. 2.46, Appendix 7-C) illustrates the parameter zone for the intermediate sandstone aquitard. However, Figure 2.20 (p. 2.49, Appendix 7-C) did not include the intermediate sandstone aquitard in the results. | It is recommended that the parameter zones in the Parameter uncertainty assessment include hydro-stratigraphic units in the whole model domain to investigate the possible combination of parameter values that could make the groundwater in the mined-out zone more active hydraulically. | | Accepted |

|--------------|----------------|------|-------------------------|---|---|---|---|--------------|
| IR-88 | - | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: The conceptual hydrogeological model includes upper sandstone aquifer, intermediate sandstone aquitard, and lower sandstone aquifer. The desilicified zone above the ore zone have enhanced hydraulic conductivity. The boundary condition for the lower sandstone aquifer on the west (upstream) side was assigned to have specified head, which provide source of water for the lower sandstone aquifer.</p> <p>As a result of the conceptual model setup, the upper sandstone aquifer is hydraulically active and the groundwater residence time within the upper sandstone aquifer is relative short. In contrast, the lower sandstone aquifer (and the ore zone) is hydraulically inactive, and the groundwater residence time in the lower sandstone aquifer is relatively long (as shown in the particle tracking results in Figure 7.6-2 (p. 7-71, main EIS report), and the simulated plume for chloride in Figure 7.6-7(p. 7-86, main EIS report)).</p> <p>It is stated in Section 2.6.4 (Appendix 7-C) that “As noted above in section 2.6.3, it is estimated that 99% of the groundwater discharge to Whitefish Lake is derived from groundwater that has only flowed through shallow deposits (i.e., Overburden and Upper Sandstone Aquifers). Contribution of deep groundwater flow through the Desilicified Zone within the Intermediate Sandstone Aquitard is estimated to be < 1% of the groundwater discharging to Whitefish Lake”. This simulation result is reflective of the conceptual model.</p> <p>Section 7.3.3.3 (p. 7-42) states that “The Lower Sandstone Aquifer is characterized spatially by two types of groundwater. The first groundwater type is most like that observed in the Local Flow System. This reflects hydraulically active fractures and fault systems that allow fresh recharge water to penetrate and mix with deeper waters in the aquifer. The second type of groundwater is within the zone of thermal alteration around the ore zone”.</p> <p>The hydraulic connectivity of the ore zone with the upper sandstone aquifer has important implication on the groundwater restoration. The ore zone is not hydraulically active locally because it is enclosed by a clay zone before the mining operation. But if it is located within a hydraulically active area, or on a groundwater flow pathway that is hydraulically active, the mined-out zone (with much larger porosity and hydraulic conductivity) could become active hydraulically after mining operation is finished.</p> <p>Figure 7.6-7 (p. 7-86, main EIS report) shows that the chloride plume is most persistent within the mined-out mining area. This seems to indicate the mined-out zone is hydraulically inactive after the mining operation is finished.</p> <p>It is stated in Section 7.3.3.2 (p. 7-37, main EIS report) that “Exploration</p> | <p>It is recommended to conduct the following work to demonstrate if the mined-out zone is hydraulically active:</p> <ol style="list-style-type: none">1. Determine the groundwater residence time in the lower sandstone aquifer and compare it with the simulated residence time in the numerical model.2. Conduct additional particle tracking to demonstrate where groundwater originating from the mined-out zone flow towards (forward tracking) and where groundwater flowing towards the mined-out zone originates from. This would help determine why groundwater in the mined-out zone is not hydraulically active.3. Conduct sensitivity analysis to investigate the effect of higher K values for the intermediate sandstone aquitard and the K and porosity values of the mined-out zone on the plume migration. | <p>This response has not been accepted, as the following point was not adequately addressed:</p> <p>1. It is recommended that groundwater residence time in the lower sandstone aquifer be estimated and compared with the simulated residence time in the numerical model. Otherwise further justification should be provided why this is not possible.</p> <p>Groundwater residence time can be estimated using isotopes (the reference below is an example paper in this regard).</p> <p>Reference: Martin Kralik (2015), How to Estimate Mean Residence Times of Groundwater. Procedia Earth and Planetary Science, Volume 13, Pages 301-306.</p> | Not Accepted |

|--------------|----------------|------|-----------------------|--|--|---|---|--------------|
| | | | | | <p>boreholes drilled in the Phoenix area, where left unplugged, have the potential to provide preferential flow paths between the Overburden and Upper and Lower Sandstone Aquifers. Exploration holes were reportedly grouted approximately 10 to 20 m above and below the ore zone, resulting in open holes remaining throughout the overlying materials. These portions of the open holes may act as open conduits for groundwater flow through the 400 m of Athabasca Group Sandstone.” So, there is possibility that the unplugged borehole could increase the hydraulic connection between the upper and lower sandstone aquifer.</p> <p>Rationale: It is important to understand if the larger area containing ore zone is hydraulically active. Additional confidence would be gained if there is any other evidence that support that the area containing the ore zone is not hydraulically active, and groundwater residence time in the lower sandstone aquifer surrounding the ore zone is comparable with the simulated results.</p> <p>Table 2-4 (p. 2.16, Appendix 7-C) shows the effective porosity (0.01-0.05) of the ore body. Figure B7 (p. B.8, Appendix 7-C) shows that the calibrated K values for the mined-out zone is 1x10-6 m/s. Section 3.5.2 (p. 3.24, Appendix 7-C) states that “The same average linear velocity was assumed for the mining area (source zone), following from the discussion in Section 4.4.2, where the hydraulic conductivity value in this zone following mining was set to 5x10-6 m/s, and a porosity of 0.2 is assumed for the ore zone (Table 4-2)”. It is not clear what the justification is for the selection of the porosity and K values for the mined-out area, and whether they are conservative. It is also not clear, what the potential impact on the groundwater flow and COPCs transport would be If the mined-out zones collapse.</p> | | | |
| IR-89 | - | ECCC | Fish and fish habitat | Appendix 7-C, Numerical Modelling: Post-Decommissioning Evaluation, Section 2.3.1.4, Desilicified Zone | <p>Context: The Proponent states that a hydraulic conductivity value of 5x10-6 m/s was uniformly assigned to the model layers representing the Desilicified Zone. They additionally state that this value is consistent with packer and pumping tests screened in this unit that have interpreted hydraulic conductivity values ranging from 1x10-6 to 3x10-5 m/s (Appendix C), with a geomean of 6.0x10-6 m/s.</p> <p>Considering that the Desilicified Zone is of particular interest because it is the main pathway for the COPC to reach Whitefish lake, and that hydraulic conductivities are not entirely understood, ECCC recommends that a larger range of hydraulic conductivities be simulated to understand potential effects on fish and fish habitat.</p> <p>Rationale: The Desilicified Zone is a critical layer in the hydrogeological model as it represents a key potential pathway of contaminants to Whitefish Lake. The base case hydraulic conductivity value (5x10-6 m/s) is even lower than the geometric mean, not to mention the highest value found. When simulating geochemical processes and contaminant transport within this important pathway a more conservative approach should be employed.</p> | <p>1. Provide an in-depth rationale for choosing a value of 5x10-6 m/s as the base case for the hydraulic conductivity, in both the PH REdox EQUilibrium (PHREEQC) and Finite-Element Ground Water Flow (FEFLOW) models.</p> <p>2. Provide a rationale for keeping the sensitivity analysis within one order of magnitude considering the lack of physical data on the Desilicified Zone. Alternatively, provide contaminant transport simulation results with more conservative hydraulic conductivity (e.g., more than 3x10-5 m/s) values in the Desilicified Zone.</p> <p>See also related: IR-96.</p> | <p>This response has not been accepted.</p> <p>The Proponent used calibration-constrained uncertainty analysis to establish boundaries when conducting sensitivity analysis of hydraulic conductivity in the groundwater model.</p> <p>For sensitivity analysis to adequately manage uncertainty, parameter values that are outside of those determined by calibration-constrained uncertainty analysis should be used. There always exists some degree of uncertainty in using hydrogeologic data as a complete representation of a regional groundwater system. This uncertainty can be accounted for by broadening parameter ranges in a sensitivity analysis. Limiting sensitivity analysis to calibration-constrained values implies that available field data is a perfect and complete representation of the broader groundwater system, which may not be an accurate assumption.</p> <p>Considering the limitations of available physical data in the Desilicified Zone, a more conservative sensitivity analysis is required in order to adequately assess how contaminants may flow towards Whitefish Lake.</p> | Not Accepted |

|--------------|----------------|------|-----------------------|---|--|--|--|--------------|
| | | | | | Modifying this parameter will affect travel times and distribution of COPC in the subsurface. | | Please also see follow-IR-89-R1, and AD-66 in the Advice to Proponent table. | |
| IR-89 | IR-89-R1 | ECCC | Fish and fish habitat | Appendix 7-C, Numerical Modelling: Post-Decommissioning Evaluation, Section 2.3.1.4, Desilicified Zone IR-89 Response from Denison | <p>Context: The Proponent states that the range of hydraulic conductivities considered in sensitivity analysis was limited to values that fit within a calibration constrained uncertainty analysis of the model.</p> <p>Considering that the Desilicified Zone is of particular interest because it is the main pathway for the COPC to reach Whitefish lake, and that hydraulic conductivities are not entirely understood, ECCC recommends that a larger range of hydraulic conductivities be simulated to understand potential effects on the aquatic environment.</p> <p>The Proponent clarified the details of the calibration-constrained uncertainty analysis that was used for parameter bounding within the model, with hydraulic conductivity sensitivity bounds determined based on model calibration values that were supported by the available physical data.</p> <p>Rationale: ECCC agrees that calibration constrained uncertainty analysis using hydraulic head field data is useful to determine probable upper limits of K values. However, there is always some degree of uncertainty in groundwater data and models. Sources of such uncertainty may include errors, lack of complete and representative field data to determine key parameters, or any number of heterogeneities associated with groundwater systems over large scales. Such uncertainties will always exist and can be accounted for by conducting a sensitivity analysis that accounts for the lack of physical data in the Desilicified Zone by running modelling scenarios using parameters that are outside of the calibration constrained values.</p> | Expand the sensitivity analysis of hydraulic conductivity outside of calibration constrained parameters to account for the lack of physical data in the Desilicified Zone. | | Follow-Up IR |
| IR-90 | - | ECCC | Fish and fish habitat | Appendix 7-C, Section 2.4 and 2.6 | <p>Context: Hydraulic conductivities and hydraulic gradients play an important role in groundwater flow, geochemical modeling, and contaminant transport for the PHREEQC and FEFLOW models. Although there is an important vertical component to the contaminant transport, there is no distinction made between lateral and vertical hydraulic conductivities of hydraulic gradients.</p> <p>Rationale: According to the conceptual model, there is an important vertical aspect to the groundwater flow thus incorporating any vertical hydraulic gradient or hydraulic conductivity information into the calibration would increase confidence in the results.</p> <p>Providing a distinct value for vertical hydraulic conductivity will improve the accuracy of the model in regards to the transport of contaminants to Whitefish Lake through the Desilicified zone, which is important to understand potential impacts to aquatic life.</p> | <p>1. Explain if the vertical and lateral hydraulic gradients and hydraulic conductivities are assumed to be equivalent.</p> <p>2. Provide a rationale for not distinguishing between vertical and lateral hydraulic gradients.</p> <p>3. Alternatively, provide both lateral and vertical hydraulic gradient estimates and the implications on contaminant transport.</p> | | Accepted |

|--------------|----------------|-------|-------------------------|---|--|---|----------------------|----------|
| IR-91 | - | NRCan | Fish and fish habitat | Appendix 7-C, section 2.5.2 | <p>Context: The numerical model calibration quality plot (Appendix 7-C, sec. 2.5.2.1, Figure 2-13) contains a small error. The vertical (simulated heads) and horizontal (observed heads) axes do not have the same scales (499 to 521 masl versus 499 to 522 masl). Therefore, the line of ideal fit is offset.</p> <p>Rationale: As a result, NRCan notes that observed heads in the 510-512 masl range are underpredicted by the model. NRCan also notes that the calibration statistics (Appendix 7-C, sec.2.5.2.3) are highly leveraged by two data points from open boreholes south of Kratchkowsky Lake where simulated values are largely controlled by the nearby constant-head boundary in the Lower Sandstone aquifer (520 masl).</p> | The Proponent should correct the scales on the axes of Figure 2-13 in Appendix 7-C. The Proponent should also comment on the effect on calibration of the clustering of most observation wells in the ore zone. | | Accepted |
| IR-92 | - | CNSC | Geology and groundwater | Appendix 7-C, Section 3.2.1, Mineralogical Composition | <p>Context: Table 3-2 summarizes the clay content of the Athabasca Group sandstones and the Paleoweathered Zone. Although minimum, maximum and median values are provided, the number of samples and variability of the dataset are not. Rationale for incorporating illite into reactive transport modelling and excluding kaolinite/dichlorite is provided in the text.</p> <p>From p. 3.29 in Appendix 7-C: “The illite content was based on the normative clay composition determined from site-specific corehole elemental analysis (median illite by mass is 7.68%; Table 3-2) and using portable infra-red mineral analysis indicating median illite content by mass is 13.1% (data not shown)”</p> <p>From p. 3.30 in Appendix 7-C: “Using the minor amount of illite compared to the more dominant chlorite is conservative in that not all sorptive capacity of the clays is accounted for in the simulated paleoweathered zone”. This conservative assumption appears contrary to assumptions for the desilicified zone (DSZ) and Athabasca Group sandstones “Illite was used to represent the total clay content, which varies from 1.74% to 5.85% by mass in the hydrostratigraphic units within the Athabasca Group sandstones and Desilicified Zone”.</p> <p>Rationale: Information is missing in the EIS regarding the clay composition of hydrostratigraphic units. Results from infrared mineral analysis are not reported.</p> <p>The assumption for the solute transport model is that all clays in the downgradient DSZ are illite. However, clay content in the Read Formation (Lower Sandstone Aquifer) downgradient of the ore zone is low in illite (0.42%) compared to kaolinite (0.52%) and dichlorite (1.18%). A value of 3.9% illite clay by weight is used for the DSZ, but Table 3-2 indicates median content is 2.42% illite. It is not clear why illite was used to represent total clay content for the DSZ, as opposed to the conservative assumptions used for the Paleoweathered Zone, nor has any basis or justification been given.</p> | <p>1. Please provide in Table 3- the number of samples and variability of the datasets used to estimate the clay content of hydrostratigraphic units for the model. Include results from infrared mineral analysis in the text if the information is used to support assumptions for modelling.</p> <p>2. Please provide further information/discussion within the EIS relating to the assumptions of clay content in hydrostratigraphic units for modelling. Provide further justification and rationale as to why total clay content in the Athabasca Group sandstones and Desilicified Zone is assumed to be illite, and how this assumption is conservative. This discussion could include a comparison of the properties (cation exchange capacity, surface area) of illite vs. kaolinite vs. dichlorite for the anticipated range of subsurface conditions (pH, redox, U concentrations, etc.).</p> | | Accepted |

|--------------|----------------|------|-------------------------|---|---|---|----------------------|----------|
| IR-93 | - | CNSC | Geology and Groundwater | Appendix 7-C, Table 3-10: Properties of Adsorbing Mineral Phases | <p>Context: In Appendix 7-C, section 3.5.6.2.2 Ion Exchange and Surface Complexation, the consideration of ion exchange and surface complexation and the corresponding parameters and chemical reaction are discussed.</p> <p>Rationale: The site density of sorbent Goethite was reported in Table 3-10 to be 1.6E3 mol/kg. Taking into account the specific surface area of 60 m2/g, this equals to 1600/6E4 mol/m2, or 0.0266 mol/m2, 1.6e4 sites/nm2.</p> <p>This value largely overestimates the site density of goethite, which is reported to be in the range of 2~6 sites/nm2. The reference used in the EIS report indicates the similar range of variation for this specific parameter.</p> <p>There are plenty of similar studies on SCM of iron oxides in literature. It is suggested to consult with more than one single study to enhance the reliability of model parameters.</p> <p>The overestimation of sorption site density will directly result in underestimation of the affected COPCs’ concentrations in pore fluid. This will result in underestimation of COPC transport plume in the affected underground space, and potentially the dissolved concentrations in the hydrogeological sink.</p> | Please provide additional evidence to justify the model parameter of site density for goethite, applied to the numerical model. If necessary, the reactive transport modelling should be re-run to update the contents presented in the EIS report. | | Accepted |
| IR-94 | - | CNSC | Geology and Groundwater | Appendix 7-C, Numerical modelling: post-decommissioning evaluation, Section 3.5.5, Subsurface Conditions Incorporated | <p>Context: It is reported in this section the assumed subsurface conditions that were applied in the geochemical site conceptual models. Critical phenomenon of pH tail was mentioned. Inclusion and exclusion of corresponding geochemical reactions were discussed briefly.</p> <p>Rationale: It was reported that the residual reduced minerals of uraninite and pyrite were not included in the modelling of the remediated mining area. The argument was based on consideration of the upstream groundwater, passing through the mined zone, will not be oxidizing and groundwater conditions are expected to be similar to pre-mine conditions. However, this ignores the pH tail effect that releases proton H+ sorbed to solid surface during ISR flooding. By ignoring this process, there is a potential risk of underestimating the source terms for some key COPCs. Exclusion of uraninite and pyrite in remediated mining area modelling is contradictory to pH-tail effect. The justification is not sufficient in the current form.</p> | Please provide additional evidence to justify the approach for excluding uraninite and pyrite from the analysis of remediated mining area. This may require the results from additional modelling. | | Accepted |
| IR-95 | - | CNSC | Geology and Groundwater | Appendix 7-C, Table 3-11 | <p>Context: The Table 3-11 reported the Solid-Phase Concentrations and Partitioning Constants for COPCs. Data were both measured and simulated.</p> <p>Rationale: It is unclear how the partition coefficients of various COPCs upon desilicified and paleoweathered rocks were obtained. It was not reported at what pH were these Kd analyzed. Sorption of chemicals on solid phase is known to be pH dependent. It is unclear whether pH influence was considered in the measurement and analysis of apparent partition</p> | Please justify the choice of applying a linear form partition coefficient for the modelling and assessment, and whether it provides a conservative approach to the assessment results. Clarity around the experimental conditions during the measurement of partitioning coefficient of various COPCs on the target rocks may help support this assumption. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-------------------------|---|---|--|---|--------------|
| | | | | | <p>coefficients.</p> <p>In addition, uptake of metals on clay is highly nonlinear, and always has a maximum capacity. Even with a very strong affinity towards specific metal ions, the sorption will be saturated at elevated concentrations. Therefore, assuming a linear correlation needs to be cautious of the concentration range of target COPC species, and the applicable sorption capacity of the clay mineral.</p> <p>In the current model, only the linear form of sorption is considered, although with discussion of Kd value selection. Additional rationale is needed to justify if the applied methodology is sufficient for assessment.</p> | | | |
| IR-96 | - | CNSC | Geology and groundwater | Appendix 7-C, Section 4.4.4, Sub-Domain Model Transport Boundary Conditions | <p>Context: From the text, “Transport parameters were specified for diffusion (1x10-9 m2/s), longitudinal dispersivity (10 m along the plume trajectory), and transverse dispersivity (5 m)”. The source of this information is not provided in Appendix 7-C. It is unclear if the values used are defaults in the modelling software, from literature, from small-scale laboratory tests, or are site-specific values determined through tracer tests.</p> <p>Rationale: The use of a calibrated flow model does not imply that the solute transport model is calibrated. The transport parameters (such as effective porosity, dispersivity and reactive transport parameters) can only be calibrated by matching simulated and observed spatial and/or temporal distributions of a solute. Sensitivity analysis indicates that decreasing longitudinal and transverse dispersivities by a factor of two resulted in exceedances of groundwater criteria for both selenium (Se) and cobalt (Co). Given the clear influence of these values on contaminant transport, it is important that transfer parameter values are justified in the solute transport model. In addition, the influence of large-scale heterogeneity on dispersion and solute transport predictions should be discussed, to identify any uncertainty in the model predictions, and provide confidence that the applied model is adequately representing groundwater flow and solute transport.</p> <p>Further guidance on solute transport modelling can be found in BC MOE (2012) [1].</p> <p>Reference: [1] British Columbia Ministry of the Environment (BC MOE). 2012. Guidelines for Groundwater Modelling to Assess Impacts of Proposed Natural Resource Development Activities. Report no. 194001, 385 p.</p> | <p>1. Please provide the source of the numerical value used for diffusion and longitudinal and transverse dispersivity, and provide justification if default values by the model code were used.</p> <p>2. Please provide a discussion on the influence of large-scale heterogeneity on dispersion and solute transport predictions in the modelling report.</p> <p>See also related: IR-89.</p> | <p>This response has not been accepted.</p> <p>CNSC staff appreciate the comprehensive information provided relating to longitudinal dispersivity and variation based on scale. However, it should be noted that guidance from Gelhar et al. (1992) and the BC MOE (2012) indicate that horizontal transverse dispersivity values should be approximately 1 order of magnitude lower than longitudinal dispersivity values, and vertical transverse dispersivity values should be approximately 2 orders of magnitude lower than longitudinal dispersivity. For the model presented in the EIS, transverse dispersivity is represented by a singular value of 5 meters, with the supporting rationale that the Gelhar et al. (1992) identified 5 meters as a representative value. It is important to note that the Gelhar et al. (1992) paper considered 5 meters to be representative for horizontal transverse dispersivity and identified that vertical transverse dispersivity is smaller than horizontal transverse dispersivity. Additionally, it is important to note that Petrotek (2021) used a transverse dispersivity of 1 m in their numerical models of the ore zone aquifer. CNSC staff thus request that Denison provide further information relating to why horizontal and vertical transverse dispersivity are represented using a singular value, and how this value is considered appropriate to represent both dimensions.</p> <p>Reference: Petrotek 2021. Groundwater Model Report Phase 1, Phoenix Deposit Wheeler River Project. Prepared for Denison Mines. December 2021.</p> | Not Accepted |
| IR-97 | - | ECCC | Fish and fish habitat | Appendix 7-C, Figures 4-6, 4-7a, 4-7b, 4-8a, 4-8b, 4-9a, 4-9b | <p>Context: Appendix 7, Figures 4-6, 4-7a, 4-7b, 4-8a, 4-8b, 4-9a, 4-9b present contaminant transport simulations of chloride, selenium, cadmium, and uranium. All simulations use initial condition concentrations at t=0 (or end of mining operations. In the 3D FEFLOW contaminant transport model it is not</p> | <p>1. Explain and clarify if mining operations will mobilize contaminants beyond operations?</p> | <p>It should be noted that the fate and transport simulations of the COCs are dependent on groundwater flow. Therefore, the Proponent’s conclusions on the transport of COCs, may need to be revisited depending on how IR-89 is resolved.</p> | Accepted |

|--------------|----------------|------|--|---|---|--|---|--------------|
| | | | | | clear why initial condition concentrations were chosen rather than a constant concentration boundary. It is also unclear if mining activities will cause mobilization of the contaminants beyond the end of operations. Rationale: The choice of boundary conditions may impact the predicted transport of contaminants that reach Whitefish Lake through groundwater, which may have impacts to aquatic life. | 2. Clarify if the source of contamination, (e.g., uranium, selenium) will cease after operations? 3. For the 3D model please provide the rationale for using initial concentrations rather than constant concentration boundary conditions for contaminant concentrations. | | |
| IR-98 | - | CNSC | Change to an environmental component due to hazardous contaminants | Section 8, Aquatic Environment | Context: It states in EIS in Section 8.3.7.1 (p. 8-151) that "Cameco's Key Lake Operation will overlap spatially and temporally with the Project". Rationale: It is not clear whether there is the possibility that planned Denison discharges would eventually flow into and influence a background reference lake used by Key Lake operation. | Please provide supporting information to demonstrate whether discharges from the proposed operation will not eventually flow into a reference lake used by another existing operation. | | Accepted |
| IR-99 | - | CNSC | Aquatic environment | Section 8, Water Quality, Table 8.2-13 | Context: Table 8.2-13 shows the maximum concentration of hazardous and radiological COPC's in surface water throughout the local study area. However, the concentration for all constituents is stated as mg/L. Rationale: It is unusual for radiological COPC's to be displayed in mg/L, radiological constituents are typically displayed in Bq/L | Please use Bq/L when displaying concentration of radiological COPC's. If this was a typographical error in the table, please indicate as such and revise the table to indicate values are indeed in Bq/L. Please also review other tables displaying concentrations of radiological constituents to ensure this error is not repeated in other tables. | | Accepted |
| IR-100 | - | HC | Indigenous Peoples' health / Socio-economic conditions | Section 8, (p. 8-195) Section 8.5.3, Table 8.5-2, (p. 8-226) | Mercury is excluded as a COPC in the assessment. Inadequate consideration of mercury and methylmercury in fish and other country foods, and use of incorrect Hg-related health guideline values can underestimate the risks to human health among country food consumers. Context: Section 8 states "Mercury has not been identified as a COPC for the Project as it is currently not present in the receiving environment (i.e., background condition) at detectable concentrations and will not be produced as part of the mine process; therefore, it will not be discharged to the aquatic environment. However, it is understood that potential nutrient enrichment-related effects are possible and can be linked to increases in mercury in the environment" (p. 8-195). Table 8.5-2 shows that there is mercury present in the tissues of Northern Pike and White Sucker sampled in the waterbodies within the local study area and in Russell Lake. These fish are regularly consumed by nearby communities according to the ERFN 2017 dietary survey. In Section 8.5.3, fish tissue concentrations are compared to Health Canada's human health risk- based maximum permissible mercury concentration (0.5 µg/g wet weight), which is applicable | 1. Include mercury (including methylmercury) as a COPC in the assessment given the baseline presence of mercury in sampled fish, the potential increase of methylmercury in receiving waters due to nutrient enrichment resulting from the Project, the significant fish consumption by the local population and that country foods, particularly fish, are an important source of dietary exposure to mercury. 2. Assess health risks from fish consumption by calculating hazard quotients for baseline and predicted methylmercury levels in country foods using Health Canada's pTDI for methylmercury (Health Canada, 2007). 3. Clarify whether mercury data represented throughout the EIS represents total mercury, inorganic mercury or methylmercury. Suggestions for mitigation and follow-up measures: Health Canada recommends including methylmercury in the list of COPCs to be monitored in fish throughout all project phases. See also related Advice to the Proponent: AD-31 . | This response has not been accepted. Health Canada does not support the responses to points 1 and 2 of IR-100. 1. The response to IR-100 point 1 indicates that mercury (including methylmercury) was not included as a COPC in the assessment because mercury is not associated with the local geology and therefore not expected to be released in the effluent at measurable levels, and because prediction of methylmercury production, based on a variety factors, is not practical. Health Canada continues to recommend that mercury (including methylmercury) be included in the assessment given <ol style="list-style-type: none">1) the detected presence of mercury in fish under baseline conditions, and2) the high consumption rates of fish and other country foods by Indigenous land users, particularly intensive land users such as the Trapper receptor. 2. The response to IR-100 point 2 continues to state that the HC maximum level (ML) for mercury of 0.5 µg/g (or 0.5 ppm) will be used to assess risks to human health from fish consumption during monitoring. The use of the HC ML for mercury is not appropriate in this case as it was developed for retail fish using consumption rates for the Canadian general population. Health Canada's provisional tolerable daily intake (pTDI) values of 0.20 µg/kg | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------------------|-----------------------|--|--|--|--|--------------|
| | | | | | <p>to most species of commercially sold fish rather than country foods.</p> <p>Rationale: It is recommended that mercury be listed as a COPC considering it is in fact present in fish tissue under existing conditions, the significant consumption of fish by the local Indigenous communities, and its toxicological significance to human health.</p> <p>Further, the Health Canada provisional tolerable daily intake (pTDI) value of 0.2 µg/kg/bw/day (Health Canada, 2007) is a more appropriate reference level when evaluating consumption of mercury in fish by Indigenous people, as it allows for the consideration of food consumption patterns in the risk assessment that differ from the general population and is protective of the most sensitive sub-group (i.e., developing foetus).</p> <p>It is important to note that methylmercury, rather than inorganic mercury, is generally the predominant mercury species present in fish and is also the most toxicologically significant form. The assumption of 100% of mercury in fish and other country food items being present as methylmercury ensures that the potential health risks are not underestimated. It is unclear, however, if the mercury data presented throughout the EIS represent total mercury, inorganic mercury or methylmercury.</p> | | <p>bw/day for young children and women of childbearing age (Health Canada, 2007) are more appropriate reference levels when evaluating consumption of mercury in fish by Indigenous people, as it allows for the consideration of food consumption patterns in the risk assessment that differ from those used to develop the ML for retail fish and is protective of the most sensitive sub-group (i.e., developing fetus).</p> <p>For instance, the HC Human Health Risk Assessment of Mercury in Fish and Health Benefits of Fish Consumption (Health Canada, 2007) currently employs 40 g as an estimate of daily fish intake by adults who are at the high end of fish intake. This rate is below the rate of consumption for intensive land users for the Project, which is ~500g of fish per day, meaning that the HC ML may not be protective of all land users/receptors.</p> <p>Health Canada reiterates its recommendation to assess health risks from fish consumption by calculating hazard quotients for baseline and predicted methylmercury levels in country foods using Health Canada’s pTDI values for methylmercury (Health Canada, 2007).</p> | |
| IR-101 | - | ECCC CNSC | Fish and fish habitat | Section 8.1.1.3, Section 8.2.1.3 Aquatic Environment | <p>Context: In Section 8.1.1.3 Spatial and Temporal Boundaries the Project Area, Local Study Area (LSA) and Regional Study Area (RSA) are established as they pertain to surface water quantity. The same is done in Section 8.2.1.3 for surface water quality. In Section 8.1.1.3 Figure 8.1-4, the locations of the Project Area, LSA, RSA and surface water features and monitoring stations are provided.</p> <p>However, the locations of wetlands located near the Project area and within the LSA and RSA have not been provided. The location of wetlands within or near the Project footprint, as well as the other wetlands existing within the LSA can be confirmed from Part II_S9 Terrestrial Environment, Section 9.2.3.3 Figure 9.2.-8, including the wetland classifications. There appears to be at least one shallow open water wetland and several bogs located within the Project Area. There is no consideration of wetlands or potential effects to wetland hydrology, surface water or sediment quality throughout the aquatic environment assessments. There is no baseline information regarding wetlands and their status as fish habitat and ecological function, or assessment of potential effects to flow rates, water levels, water quality, sediment quality, or biota.</p> <p>Rationale: There is currently not enough information provided for ECCC to provide advice on the potential risks of the proposed Project to wetland hydrology, surface water and sediment quality within the LSA. This pathway of effects is important to assess in terms of potential effects to wetland habitat availability and quality due to changes in flow rates, water levels,</p> | <p>1. Provide baseline information regarding wetland characterization within the Project Area and LSA, including: locations, wetland type, size, water surface elevation, depth, water flow pathways, and the presence of wildlife receptors including presence of fish/fish habitat within the Aquatic Environment section of the draft EIS. If this information is available in annexes or baseline studies, summarize it within the main body of the Aquatic Environment section of the draft EIS with references to respective documents for review.</p> <p>2. Provide baseline information on wetland surface water and sediment quality characterization for wetlands within the Project footprint.</p> <p>3. Provide an assessment of potential effects to wetlands within the LSA and potential effects to ecological receptors during all phases of the proposed Project.</p> <p>4. Provide further information on mitigation measures and monitoring that would be applied for the protection of wetlands.</p> | <p>This response has not been accepted for the following reasons:</p> <p>1. The response (#1(d)) by the proponent states that “Surface elevations for the wetland have been assessed and the information is summarized below and in the Attachment IR-101 Figure 1 Elevations of wetland features in the LSA” but it is not indicated that this information will be placed in the EIS. CNSC staff requests proponent to include the information provided in response #1(d) and Attachment IR-101 Figure 1 (Elevations of Wetland Features in the LSA) and Attachment IR-101 Figure 2: (Denison Wheeler River Project SSA and Wetland Feature Distribution) in the EIS.</p> <p>2. The Proponent stated in response #2 (a) and (b) that “surface water quality and sediment quality in wetlands were not specifically sampled in the wetland complexes adjacent to the Project footprint during the original baseline assessment.” CNSC staff requests the proponent to provide justification why they have relied on measurements upstream and downstream of the wetlands over direct measurements in the wetland areas. It is recommended to conduct direct measurements in the wetland areas.</p> <p>3. The information provided did not satisfy the IR. Additional information regarding the potential impacts to wetlands due to changes in surface water quality and sediment quality should be included within Section 8.3 of the main EIS. This is needed to fully understand the scope of potential effects to the aquatic environment.</p> | Not Accepted |

|--------------|----------------|------------------|-----------------------|--|--|--|---|--------------|
| | | | | | water quality, sediment transport, sediment quality and potential effects to terrestrial and aquatic receptors. It is necessary to evaluate if changes in groundwater and surface water runoff flows and routing will affect water levels and habitat availability within wetlands. Potential effects from COPCs and radionuclides to surface water and sediment, or potential effects to ecological receptors within wetlands have not been evaluated. | | <p>a. Update Section 8.3 to include additional information on predicted water and sediment quality impacts to wetlands from the Proponent’s response to directly consider wetlands as fish and fish habitat for the purpose of assessing water quality impacts.</p> <p>b. Update Section 8.3 to provide an assessment of potential effects to wetlands from water and sediment quality changes within the LSA.</p> <p>4. It is stated in response #4 that “[...] Updated baseline information on wetland depths and water-levels may be useful in providing a frame of comparative reference to potential changes during the operation, decommissioning and post-decommissioning phases of the project” and CNSC staff agrees with the proponent and recommend collection of monitoring information on the wetland areas.</p> | |
| IR-102 | - | ECCC CNSC | Fish and fish habitat | Section 8.1.3.1 Appendix 8-C, including Appendix II, Table 1 (p. 2) | <p>Context: Only one measured-results dataset for baseline stream flow exists that is relevant to the Project data from the Water Survey of Canada (WSC) station for Wheeler River (06DA005), and the Proponent used constructed records. The Proponent states that data from 06DA005 was used to extend local hydrometric station records and calculate baseline water quantity metrics. However, this was done through a complex combination of daily data correlation or monthly unit area runoff relationship, with or without offset, where some stations were based off constructed records instead of the real long-term dataset at 06DA005 (see Section 8.1.3.1 and Appendix II of Appendix 8-C, Table 1, p.2 (PDF p. 569)). Appendix 8-C references previous reports in its own appendices, but no equations are shown and there is no description of the accuracy of the fit, or explanation for not referring back to the one dataset (WSC station). Subsequent statistics calculated from these constructed records (e.g., 7Q10 needed for SK water licenses) would be affected by this uncertainty.</p> <p>Rationale: Fish habitat can be altered by changes to depositional and erosional patterns in streams. Confidence in the Proponent’s estimate of baseline water quantity, and by extension Project effects to fish habitat, cannot be established without a complete description of the method applied, as well as a discussion of its accuracy.</p> | <p>1. Provide more information on the extension of Project hydrometric station data using WSC station 06DA005.</p> <p>2. Discuss the accuracy of any correlations/relationships and justify any deviations from simple unit area runoff relationships in the estimation of baseline water quantity values for the Project hydrometric stations. Constructing records from records that are themselves constructed is not recommended.</p> <p>3. If baseline water quantity metrics need to be revised, discuss (if any) resulting changes to the effects assessment.</p> | <p>This response has not been accepted for the following reasons:</p> <p>1. Given the limitation of data availability extension of flow records based on the nearest active WSC hydrometric station (Wheeler River (06DA005)) is acceptable although other methods are not shown to be explored by the proponent including rainfall-runoff modelling techniques (such model can be calibrated at 06DA005 thus computed flow at subbasins or sub watershed can be estimated with good degree of confidence), drainage area ratio method, etc. CNSC staff recommends proponent to consider aforementioned methods or similar or provide justification why other methods were not considered.</p> <p>2. In Attachment IR-102 Figure 1 to 7 show the plots of measured versus the estimated daily flows using the relationship developed for extension of daily flows at SA-1, SA-2, SA-3, SA-4, SA-5, SA-6, SB-3, LA-1 and LA-5. CNSC staff however finds it difficult to determine the predictive accuracy of the relationships based on visual comparisons. Therefore, CNSC staff requests that the proponent provide quantitative measures of prediction accuracy, for example in the form of Root Mean Square Error, correlation coefficient, etc., for the Equations presented in Table 1 of Attachment IR-102.</p> <p>In addition, CNSC staff requests that the proponent provide clarification on whether the current relationships are only limited to baseline characterization or will also be considered for estimation of design flows at SA-4 and SA-5 for culvert/crossing design for the access road.</p> <p>3. Response to third part of the IR to be re-assessed when proponent addresses the above two comments ([1] and [2]).</p> | Not Accepted |

|--------------|----------------|------------------|-----------------------|---|---|---|---|--------------|
| IR-103 | - | ECCC CNSC | Fish and fish habitat | Section 8.1.3.4 Climate Change Influenced Extreme Events | <p>Context: The Proponent notes that Intensity duration frequency (IDF) curves are used to estimate the size of water management structures around a site and that the IDF curves are often specific to climate monitoring stations.</p> <p>The Proponent used the IDF_CC Tool 5.0 developed by the Institute for Catastrophic Loss Reduction (2021) which generates Intensity Duration Frequency (IDF) curves at ungauged locations in order to estimate future IDF curve values under influences of climate change. This tool generates sub-daily values at ungauged locations by interpolation and distance weighing from gauged locations.</p> <p>Rationale: IDF trends exhibit random behavior at some locations and correlated behavior at other locations. The choice of gauged locations will infer the statistics for the ungauged locations, including the IDF trends. Without identification of the gauged locations, it is not possible to assess if the modelled data is realistic or not. If the modelled data is not accurate the design of water management structures on the site may not be sufficient resulting in the potential for impacts to the Project from flooding or extreme weather events.</p> | Provide the gauged stations used to generate the sub daily duration values found in Table 8.1-6: Baseline of Intensity Duration Frequency data. | <p>This response has not been accepted.</p> <p>In the Context and Rationale of AD-15 in the Annex 1 – Denison Response, ECCC recommends that the Proponent consult CSA PLUS 4013:19 (2019) <i>Technical guide: Development, interpretation and use of rainfall intensity-duration-frequency (IDF) information: Guideline for Canadian water resources practitioners</i> regarding the consideration of future changes in short-duration precipitation extremes. In IR-103, ECCC indicated that in order to assess the accuracy of the Intensity duration frequency (IDF) curves, ECCC required that the Proponent provide the gauged stations generating the values for the modelled data. The Proponent provided the closest gauged stations, however, the future short duration precipitation values were based on statistical relationships fitted between local scale observed extreme precipitation and modelled simulations extremes.</p> <p>Additionally, on page 15-19 of the draft EIS states that: “Denison will apply adaptive management that includes monitoring climate factors so that they can proactively mitigate or prevent adverse climate effects on the Project.” Denison did not provide details on how climate factors will be considered within their adaptive management plans.</p> <p>Rationale: Estimates of future short duration precipitation that are based on statistical relationships fitted between local scale observed extreme precipitation and modelled simulations extremes, such as the approach used by the Proponent, are unlikely to provide reliable projections. This is because the amount of information regarding changes in local-scale observed extreme precipitation contained in short records is not sufficient to constrain a regression (model the statistical relationship) between local and larger scale simulations (Li et al., 2019; ECCC 2022). An alternative approach is to base future projections on a comprehensive assessment that integrates climate science understanding and model projections over a large region. The recent Canadian Standards Association (CSA 2019) guidance on IDF for Canadian Water Resources practitioners provides such an assessment. In terms of adaptive management, the Proponent should clearly outline what climate factors will be monitored to mitigate or prevent adverse climate-related effects. This should include information on when and how the climate factors would be monitored and under what circumstances particular adaptive management approaches would be applied.</p> <p>In order to assess the Proponent’s adaptive management strategies for future extreme precipitation events, ECCC requests that the Proponent consult the CSA (2019) guidance when using future IDF projections in the Project design and provide revised estimates of the potential future changes in short-duration precipitation extremes over the Project’s duration.</p> <p>1. Provide revised estimates of the potential future changes in short-</p> | Not Accepted |

(2019). How much information is required to well constrain local estimates of future precipitation extremes? <i>Earth’s Future</i>, 11-24.</p> | |
| IR-104 | - | ECCC | Fish and fish habitat | <p>Section 8.1.3.4.2 Probable Maximum Precipitation (PMP) Events</p> <p>Appendix 8C</p> | <p>Context and Rationale: The Proponent notes: “The probable maximum precipitation (PMP) event is a design standard value for an extreme rainfall event. The PMP event does not have an estimated return period but is instead based on the theoretical maximum amount of water that a storm could produce based on the maximum persisting dew point.”</p> <p>The Proponent provides a PMP value of 489.3 mm, which is based on data and methodologies available in 1999, taken from the Atmospheric Environment Branch Report (1999), Report Number AHSD-R99-01. The Proponent references Appendix 8C for details. Appendix 8C contains no supplementary information other than what is already provided in Section 8.1.3.4.2.</p> <p>The assumptions and methodologies presented in the report are the results of time series analyses available in 1999. As time series evolve so do the derived statistics. In order to assess potential flood risks and impacts to the Project from flooding, data that is current and representative of the changing climate is needed. The Proponent should explain why they’ve used data from 1999 rather than using up to date data, describe what alternative methods for determining PMP they have considered, and describe how they will support their use of 489.3 mm as a PMP, or describe how they will generate a refreshed PMP. The main factor that influences the statistical data output is the length of the time series hence the reason to keep the statistical data. The PMP values can be substantially (>10%) different if two decades of data is used in the statistical analysis.</p> | <p>1. Provide a revised PMP value (using up to date data) or justify the use of a PMP that is based on data and methodologies from 1999 as opposed to a more recent time series analysis.</p> <p>2. Describe the alternative methods for determining PMP values that were considered. Include descriptions of both “statistical” outcomes and “rational” outcomes as applicable.</p> <p>Technical Discussion Required: Yes</p> | <p>This response to part 1. has not been accepted.</p> <p>There are an additional 24 years of meteorological datasets since the 1999 study thus all historical rainfall extremes including those since 1999 study should be considered to estimate up to date PMP at the Project site The proponent’s justification on whether the 1999 or 1994 PMP estimates are current and conservative should be substantiated based on meteorological data analysis. An estimation of updated PMP is achievable by the proponent as meteorological data is freely available and accessible from ECCC and the proponent should provide a revised PMP.</p> <p>The Proponent should also clarify how recent the data used to calculate the PMP or the time series is and explain the use of an older data set that will not produce as accurate of a PMP value as a more recent data set would produce, even when estimates are conservative.</p> <p>Specifically, a. Explain the rationale for the use of the data set which was used to derive the PMP. B. Clarify if the PMP and/or the time series was calculated using more recent data.</p> <p>This will allow for an accurate evaluation of the validity of results derived from the data sets selected by the Proponent.</p> <p>.</p> | Not Accepted |

|--------------|----------------|---|--|--|---|--|--|--------------|
| IR-105 | - | Directorate of Fisheries and Oceans (DFO) | Fish and fish habitat | Section 8.1.4.1, Potential interactions between project and valued component/key indicators Surface Water Quantity Section 8.1.4.2.2, Surface Water Taking 8.3.4.1, Potential interactions between project and valued component/key indicators | Context: Table 8.1-8 and Table 8.3-6 in the EIS indicates a potential for freeze wall operation to influence groundwater interactions and surface water quantity and as a result, impact fish and fish habitat. Section 8.1.4.2.2 references Section 7 Geology and Groundwater for details on potential impacts. In addition, IR-63 notes the groundwater model does not describe the pathway in which groundwater would pass around the freeze wall during operation and any resulting potential effects on groundwater discharge to Whitefish Lake. Rationale: As per IR-63, the groundwater model analysis is insufficient to make conclusions on the potential effects of the freeze wall on groundwater discharge into Whitefish Lake. DFO requires this information to fully understand if altered groundwater regimes will result in changes to Whitefish Lake water levels and any potential impacts to fish and fish habitat as a result of changing water levels. | 1. Provide a more fulsome analysis of the potential impact of freeze wall operations on local and semi-regional groundwater regimes, and subsequently to fish and fish habitat within Whitefish Lake. The analysis should provide a rationale of how the scope of the groundwater model is relevant to and able to detect changes at the scale of fish and fish habitat. 2. If impacts to fish and fish habitat in Whitefish Lake are predicted to occur due to changes in the groundwater regime, describe any mitigation measures that could be used to avoid these impacts. 3. If impacts are predicted that cannot be avoided, characterize residual effects on fish and fish habitat. | | Accepted |
| IR-106 | - | CNSC | Change to an environmental component due to hazardous contaminants | Section 8.1.4.2.3, Surface Water Discharge | Context: It is stated in this section under construction that all site contact water will be held in the Clean Waste Rock Pond. Rationale: It is unclear from this section what will happen to the contact water held in the Clean Waste Rock Pond, and whether it will be removed from site or released at a later time. What is the contingency plan if more contact water is produced during construction than the Clean Waste Rock Pond has capacity for. | Please indicate what will happen to the contact water stored in the Clean Waste Rock Pond during construction activities, will it be released after the wastewater treatment plant is installed? Further, please describe the contingency plan if contact water produced exceeds estimates and will exceed the volume of the clean waste rock pond? | | Accepted |
| IR-107 | - | CNSC ECCC | Aquatic environment | Section 8.2.3.3, Existing Surface Water Quality | Context: Under the methodology and metrics section (8.2.3.1) it is stated baseline water quality was sampled in 2016, 2018, and 2019. Looking at the data in Appendix A of Appendix 8D it seems that some waterbodies have little data available for baseline characterization. For example, Whitefish Lake only has 3 and 5 samples taken between its two sample stations, with sampling frequency seeming intermittent. Rationale: The amount of data available for baseline water quality characterization does not seem sufficient to adequately characterize the baseline and the variation it would experience. An effective baseline characterization is vital to ensure water quality is indeed not being affected by the Project. In addition, it is not clear if data quality objectives were applied to determine baseline information was adequate. To meet CEAA 2012 requirements, and CNSC expectations outlined in REGDOC 2.9.1, Environmental Principles Assessments and Protection Measures, the applicant is required to complete a characterization of the baseline environment. | Please clarify which data quality objectives were used for the baseline characterization data. Please provide justification whether the number of datapoints collected with inconsistent frequency in baseline surface water characterization is sufficient to meet data quality objectives and to adequately characterize the baseline, and whether Denison is confident that the data collected is enough for a robust water quality baseline characterization. Suggestions for mitigation and follow-up measures: CNSC recommends that additional water samples are collected and analyzed at a consistent frequency to ensure a robust baseline | This response has not been accepted. From the baseline water quality data table (Table A-1 of Appendix 8D) it remains unclear that water quality was sampled on a monthly basis in 2016, 2018, and 2019, mainly due to Table A-1 referring to specific sampling dates, instead of an mean value of 12 samples/year. It is also unclear which federal requirements Denison is referring to using in their response. Staff are supportive of continued baseline monitoring to maintain an accurate dataset of baseline conditions. CNSC and ECCC staff have the following expectations: 1. Provide the monthly monitoring data referenced in the response or indicate where it can be found within the EIS and its appendices. 2. Confirm which federal requirements were used when assessing potential impacts through EA. 3. Confirm which data quality objectives were used to establish the baseline, provide references if available | Not Accepted |

|--------------|----------------|------|--|---|---|--|---|--------------|
| | | | | | <p>As described in REGDOC 2.9.1 Appendix B.2, Characterization of the Baseline Environment for Environmental Assessment Under CEAA 2012, the “baseline information should be sufficient to support the use of an aquatic dispersion model to conduct the site-specific ERA and to support an assessment of the effects of the environment on the facility or activity”</p> <p>In addition, the “applicant or licensee should include an assessment of any limitations or gaps in the quality and extent of baseline data and methods, as well as the method(s) by which they have been addressed.”</p> | | <p>4. Incorporate the additional available baseline data collected into the analysis and conclusions of the finalized EIS and ERA to increase the robustness of the established baseline.</p> | |
| IR-108 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.3.3 Aquatic Environment | <p>Context: Tables 8.2-2 and 8.2-3 provide summaries of the baseline surface water quality in the LSA. No justifications for the selection of water quality guidelines have been provided. COPCs that require calculations based on other parameters such as hardness, pH, or temperature to derive guidelines (i.e., ammonia, cobalt, zinc, etc.) should be indicated within the table, with a note specifying the parameter values used in the calculations, so that thresholds may be confirmed. No baseline data for un-ionized ammonia has been provided, which is a Schedule 4 substance requiring monitoring under the MDMER. For cobalt, manganese, and vanadium, Federal Environmental Quality Guidelines (FEQGs) and/or CCME Canadian Water Quality Guidelines (CWQGs) for the Protection of Aquatic Life have not been included. A guideline of 26 mg/L has been provided for molybdenum as a Saskatchewan Environmental Quality Guidelines (SEQG), however the actual SEQG is 31 mg/L and the CCME CWQG is 0.073 mg/L.</p> <p>Rationale: In order to assess potential changes to surface water quality from Project related activities, ECCC requires that data on all parameters that require MDMER effluent and receiving environment monitoring be provided for assessment, including accurate water quality guidelines where available.</p> | <p>1. Update Tables 8.2-2 and 8.2-3 to include all COPCs that require effluent characterization and receiving environment monitoring under the MDMER.</p> <p>2. Update Tables 8.2-2 and 8.2-3 to include missing or corrected water quality guidance thresholds, and information on values used to derive thresholds for COPCs that are dependent on general parameters.</p> | <p>This response has not been accepted.</p> <p>There are incorrect guidelines remaining in the updated tables, and the supporting information on parameter values used to derive benchmarks has not been provided. This information is required to understand potential changes to surface water quality from Project related activities and facilitate threshold confirmation. Use of the incorrect threshold could allow for effluent to be discharged at concentrations exceeding MDMER limits.</p> <p>See also follow-up IR-108-R1.</p> | Not Accepted |
| IR-108 | IR-108-R1 | ECCC | Change to an environmental component due to | Section 8.2.3.3 Aquatic Environment IR-108 Response from Denison | <p>Context: Incorrect benchmark environmental quality guidelines and guidelines that cannot be verified remain within the updated Tables 8.2-2 and 8.2-3 provided in the Proponent’s response. The Proponent provided an Aluminum Saskatchewan Environmental Quality Guidelines (SEQG) value of 0.005 mg/L in both tables. This is incorrect and appears to be the guideline for irrigation, not the guideline for protection of aquatic biota. The Proponent provided a Molybdenum SEQG of 26 mg/L in both tables. This value is incorrect. The correct SEQG for Molybdenum is 31 mg/L and the Canadian Water Quality Guideline (CWQG) is 0.073 mg/L. The Proponent provided a Nitrate SEQG of 13.29 mg/L in both tables. This value is incorrect. The correct SEQG for Nitrate is 3 mg/L and the CWQG is 13 mg/L.</p> <p>Rationale: In order to verify the benchmark environmental quality guidelines that are calculated based on environmental modifying factors such as pH, hardness and dissolved organic carbon (DOC), the specific concentrations of these environmental modifying parameters used in the calculations must be</p> | <p>1. Update Tables 8.2-2 and 8.2-3 to include footnotes with the concentrations of environmental modifying parameters such as pH, hardness and DOC used to derive guidelines for Aluminum, Cadmium, Copper, Lead, Manganese, Nickel and Zinc.</p> <p>2. Update Tables 8.2-2 and 8.2-3 to include the correct benchmark guideline value for Aluminum, Molybdenum and Nitrate. Include the concentrations of environmental modifying parameters needed for deriving guidelines. If the most stringent guideline value is not selected for use, provide a rationale for use of the chosen guideline.</p> <p>3. Update Tables 8.2-2 and 8.2-3 to include the calculated guideline value for manganese and the environmental modifying parameter concentrations used to calculate the guideline. A benchmark environmental quality guideline has not been provided for Manganese, however a chronic CWQG guideline exists that can be derived based on environmental modifying parameter concentrations.</p> | | Follow-Up IR |

|--------------|----------------|------|--|--|--|--|---|--------------|
| | | | | | provided. Additionally, incorrect benchmarks for Aluminum, Molybdenum, and Nitrate remain within the updated tables provided by the Proponent. No benchmark was provided for Manganese. It is not clear if Total Chromium or Hexavalent Chromium was measured as the table does not specify, and the benchmark provided was for Hexavalent Chromium. This information is required to understand potential changes to surface water quality from Project related activities and facilitate threshold confirmation. Use of the incorrect threshold could allow for effluent to be discharged at the wrong concentration. | Update Tables 8.2-2 and 8.2-3 to specify if Total Chromium or Hexavalent Chromium was measured. See also related IR-115-R1. | | |
| IR-109 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.1.1 Aquatic Environment | <p>Context: In this section it is stated “Treated water from the IWWTP will be pumped to the three Effluent Monitoring and Release Ponds (each 3,300 m3). These ponds will be designed to hold effluent for 72 hours for testing before discharge to the environment” (p. 8-75). It is unclear what procedure will be followed if effluent in monitoring ponds does not meet discharge requirements following testing.</p> <p>Additionally, it is also stated that “Treated water in the Effluent Monitoring and Release Ponds will be monitored prior to release to a surface waterbody or injected into groundwater via deep well injection.” However, the MDMER pursuant to the Fisheries Act requires all mine effluent and seep. From the mine site that contain deleterious substances be discharged through a final discharge point.</p> <p>Rationale: In order to fully understand effluent management, more information is required regarding the procedure for managing effluent in monitoring ponds that does not meet discharge requirements. It is unclear how effluent that does not meet discharge requirements will be managed if it needs re-treatment and re-testing prior to discharge.</p> <p>ECCC reminds the Proponent that Project effluent from all final discharge points must meet federal legislation requirements.</p> | Provide further information regarding management of effluent in monitoring ponds that does not meet the requirements for discharge under the MDMER. | <p>This response has not been accepted.</p> <p>There are statements made throughout the EIS that “Treated water in the Effluent Monitoring and Release Ponds will be monitored prior to release to a surface waterbody or injected into groundwater via deep well injection.” However, the Proponent has confirmed that all treated effluent will be discharged to Whitefish Lake through a final discharge point to ensure it meets <i>Metal and Diamond Mining Effluent Regulations</i> (MDMER) requirements.</p> <p>It is not clear why the above statement regarding effluent release to groundwater via deep well injection has been included in the EIS when this is not part of the confirmed effluent discharge management plan. The Proponent should update the EIS to remove text regarding effluent release to groundwater via deep well injection or provide explanation as to why this information has not been excluded from the EIS to clarify if this is an intentional part of the Project design or if this was an accidental inclusion.</p> <p>The Proponent should update the EIS to remove text regarding effluent release to groundwater via deep well injection or provide additional explanation.</p> <p>Please provide proposed text for the revised EIS, for SME review and acceptance.</p> | Not Accepted |
| IR-110 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.1.1 Aquatic Environment Appendix 8-E, Section 2.1 | <p>Context: It is stated that the diffuser at the final effluent discharge point will be located in approximately 3m of water. However, in Figure 8.2-5 displaying the location of the proposed diffuser and lake bathymetry, the diffuser location seems to be located in 2-2.5m of water. A similar image in Figure 1 Section 2.0 of Appendix 8-E also indicates that the diffuser seems to be located in 2-2.5m of water. Additionally, while thermal effects are unlikely, this cannot be confirmed until a more detailed diffuser design is provided for review.</p> <p>Updated Rationale: The Proponent should confirm the location and depth of the proposed diffuser in order to confirm that modelling predictions for effluent discharged into the receiving environment are accurate.</p> | <p>Provide confirmation of the diffuser depth and location.</p> <p>ECCC requests the opportunity to review the finalized diffuser design once it is available.</p> | <p>This response has not been accepted.</p> <p>ECCC requests confirmation that the finalized diffuser design will be available for review once it is completed as reviewing it will be necessary to confirm the location and depth of the proposed diffuser and modelling predictions for effluent discharged into the receiving environment.</p> | Not Accepted |

|--------------|----------------|------|--|---|--|--|----------------------|----------|
| | | | | | A review of the final discharge design is necessary to confirm the location and depth of the proposed diffuser and modelling predictions for effluent discharged into the receiving environment. | | | |
| IR-111 | - | CNSC | Fish and fish habitat | Section 8.2.4.2.2, Controlled Discharge | <p>Context: This section of the EIS indicated that the scenario was assessed using a conservative assumption of a continuous freshwater withdrawal rate of 40.5 m3/hr, and a continuous effluent discharge rate of 81.0 m3/hr.</p> <p>Rationale: The withdrawal rate assessed is half of the effluent rate, it is unclear from the text where the other half of the volume of effluent is coming from, if not drawn from the lake.</p> | Please clarify where the other half of the total volume of effluent discharged is from in the water balance between water intake and effluent. | | Accepted |
| IR-112 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.2.2, Aquatic Environment Appendix 8-E, Section 1.2.1 Appendix 10-A (ERA), Section 3.1 | <p>Context: This section of the EIS states that, “for the purpose of assessing the scenario of greatest potential effects, the Project was assessed as having a continuous freshwater withdrawal rate of 40.5 m³/hr and a continuous effluent discharge rate of 81.0 m³/hr.” (p. 8-21)</p> <p>However, several sentences later it is stated that, “The approach to assessing Project-related effects on the Surface Water Quality VC was conservative for the following reasons: The assessment was based on a continuous (year-round) discharge rate at an expected average effluent discharge of 0.0101 m3/s (or 36.5 m3/hr) throughout Construction, Operation, and Decommissioning...”</p> <p>This is a continuous theme throughout Section 8, Aquatic Environment, where the discharge rate for the surface water quality assessment changes between 36.5 m3/hr and 81.0 m3/hr. However, in Appendix 10-A (ERA) the 36.5 m3/hr discharge rate is the only value used for the near and far-field modelling.</p> <p>It should be made clear in the main body of the draft EIS that the average effluent discharge rate of 36.5 m3/hr has been used as the input for the near- and far-field modelling for effluent, surface water and sediment quality predictions. The maximum upper bound discharge rate is 81 m3/hr; however, modelling for effluent, surface water and sediment quality was not completed for this discharge rate.</p> <p>Rationale: It remains unclear throughout the draft EIS that all predictions of COPC concentrations in effluent, and receiving environment surface water and sediment are based upon the effluent discharge rate of 36.5 m3/hr, and not the maximum upper bound discharge rate of 81 m3/hr. All conclusions about risk to the environment and aquatic and terrestrial biota must make this clear. If the Proponent wishes to make conclusions based on the maximum upper bound discharge rate of 81 m3/hr, modelling needs to be conducted using this rate of discharge.</p> | <p>1. Confirm that the surface water quantity, quality, and aquatic biota risk assessments and modelling, were conducted using the discharge rate for 36.5 m3/hr within the draft EIS.</p> <p>2. Revise any statements or conclusions in the draft EIS to improve clarity about the usage of the maximum upper bound discharge rate of 81 m3/hr. Remove statements regarding use of the discharge rate of 81 m3/hr during modelling and risk assessments to the receiving environment as needed.</p> | | Accepted |

|--------------|----------------|------------------|--|--|---|--|--|--------------|
| IR-113 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.2.3 and Section 8.4.7.6, Aquatic Environment | <p>Context: No quantitative assessment of climate change has been conducted. Representative concentration pathways (RPC) projections for climate change have not been integrated with near-and far-field modelling to assess impacts to surface water quality or sediment quality in the future.</p> <p>Rationale: Changes in air and water temperatures, precipitation, snow melt, ice formation, etc., due to climate change can all influence COPC concentrations in surface water and sediment. It is not possible to assess the potential impacts from climate change on predicted surface water and sediment COPC concentrations with the current information.</p> | Provide a quantitative analysis of the potential impacts of predicted COPCs from mine effluent to surface water and sediment quality with climate change scenarios for the Project lifespan incorporated into modelling. Include modelling predictions regarding the influence of changes to air and water temperatures, precipitation, snow melt, ice formation, etc., on COPC concentrations in surface water and sediment. | <p>This response has not been accepted.</p> <p>Based on the information provided it is not possible to assess the resiliency of the Project to potential adverse effects from climate change and potential impacts to surface water and sediment quality. The Proponent should review the guidance documents available on the Strategic Assessment of Climate Change (SACC) website with regards to climate change resilience and provide a quantitative analysis of the potential impacts of predicted COPCs from mine effluent to surface water and sediment quality with climate change scenarios for the Project lifespan incorporated into modelling.</p> <p>Include modelling predictions regarding the influence of changes to air and water temperatures, precipitation, lake levels, flow rates, etc., on COPC concentrations in surface water and sediment. The Proponent should refer to the SACC website for guidance on conducting this quantitative analysis.</p> <p>See also follow-up IR-113-R1.</p> | Not Accepted |
| IR-113 | IR-113-R1 | ECCC | Fish and fish habitat | Section 8.2.4.2.3 and Section 8.4.7.6, Aquatic Environment IR-113 Response from Denison | <p>Context: The Proponent states the following, “The PMP is very conservative (e.g., assumes effectively a full year of precipitation in one event) under both existing and future conditions (climate change)”. This statement suggests that the PMP value utilized considers future climate changes such as possible changes in the frequency or intensity of extreme precipitation events.</p> <p>Rationale: As noted by the Proponent, increases in extreme rainfall are anticipated with a warmer climate. For precipitation extremes across Canada, the relative change in event frequency is expected to be larger for more extreme and rarer events. Given that the extreme precipitation is expected to intensify in the future (Kunkel et al. 2013), the Proponent should consider how these potential changes will influence design values such as PMP.</p> | <p>Clarify if climate change has been considered in the PMP value provided. If it has not been considered, discuss how potential increases in PMP have been and/or need to be considered in the Project design.</p> <p><u>Reference</u> Kunkel, K., Karl, T. R., Easterling, D. R., Redmond, K., Young, J., Yin, X., & Hennon, P. (2020). Probable maximum precipitation and climate change. <i>Geophysical Research Letters</i>, 1402-1408.</p> | | Follow-Up IR |
| IR-114 | - | ECCC CNSC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.2.3 and Section 8.2.4.2.4 | <p>Context: Tables 8.2-9, 8.2-10 and 8.2-13 demonstrate predicted maximum effluent concentrations of COPCs and maximum predicted receiving environment concentrations in the near- and far-field. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, TSS and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization.</p> <p>For zinc, it is unclear how guidelines have been calculated when CCME thresholds can only be derived with hardness values <250 mg/L. Additionally, water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment</p> | <p>1. Update all tables to include all COPCs with required monitoring under the MDMER including acute and chronic thresholds.</p> <p>2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota.</p> <p>3. Provide baseline data on the concentrations of methylmercury in surface water, sediment and fish tissues (i.e., large-bodied sports fish and small-bodied forage fish) in the LSA and RSA receiving environment to establish a baseline prior to potential Project impacts.</p> <p>4. Provide an assessment of risk from methylmercury to ecological receptors due to changes in sulphate concentrations in effluent, and potential deposition of mercury from Project related atmospheric emissions in the receiving environment.</p> | <p>This response has not been accepted.</p> <p>The Proponent has not updated all tables to include missing data for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate, and phosphorous, all of which are COPCs with monitoring requirements under the MDMER.</p> <p>The Proponent has not updated tables to include predictions of total hardness concentration in effluent and the receiving environment or acute water quality thresholds, and water quality thresholds have not been derived using baseline receiving environment concentrations.</p> <p>All water quality thresholds should be derived from receiving environment parameters to determine if any baseline receiving environment and effluent COPCs exceed water quality thresholds.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-----------------------|---|---|---|---|--------------|
| | | | | | <p>baseline concentrations.</p> <p>Mercury has been identified as a COPC of interest to Indigenous groups for the proposed Project. Table 8.2-8 indicates that background concentrations of mercury in LA-5 are low, and predicted effluent concentrations are also low. However, no information has been provided on background methylmercury concentrations or expected atmospheric deposition of mercury from Project related emissions. Predicted effluent concentrations of 3915 mg/L of sulphate are quite high, and sulphate is known to increase mercury methylation rates in aquatic environments.</p> <p>Rationale: A review of all modelling results for all COPCs under the MDMER will assist ECCC in understanding the potential risks to the receiving environment. ECCC recommends the use of the most stringent guidelines for the protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds.</p> <p>Increased sulphate availability can lead to increased methylation rates of mercury and methylmercury in sediment and surface water. Methylmercury is a toxin that can bioaccumulate within the food chain and present risks to aquatic biota and wildlife consuming aquatic biota. Potential changes to methylmercury concentrations in water quality, sediment and fish tissues should be assessed due to the proposed sulphate loadings in effluent.</p> <p>Additionally, in accordance with the MDMERs, Denison will be required to demonstrate that their effluent quality meets the limits in the MDMER. Denison is expected to provide the predicted effluent quality for lead, nickel, and un-ionized ammonia to demonstrate compliance with the MDMERs.</p> | | <p>Please:</p> <ol style="list-style-type: none">1. Update all tables to include missing data for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate and phosphorus.2. Update tables to include predictions of total hardness concentrations (in mg/L CaCO₃) in effluent and the receiving environment.3. Update tables to include acute water quality thresholds to ensure COPCs do not have the potential to be acutely lethal at the end-of-pipe.4. Ensure that all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota. | |
| IR-115 | - | ECCC | Fish and fish habitat | Section 8.2.4.2.3 Aquatic Environment Appendix 10-A (ERA), Section 3.1.1.1 | <p>Context: Table 8.2-8 demonstrates baseline concentrations of COPCs in LA-5 South Whitefish Lake, their respective water quality guidelines from applicable sources, and proposed Project thresholds. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, Total Suspended Solids (TSS) and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization. Water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations. The water quality objective selected for molybdenum is the 31 mg/L SEQG rather than the CCME guideline of 0.073 mg/L.</p> <p>Rationale: ECCC recommends the use of guidelines that will ensure the</p> | <ol style="list-style-type: none">1. Update Table 8.2-8 to include all COPCs with required monitoring under the MDMER.2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.3. Provide additional information to justify the use of the selected water quality guideline for molybdenum. | <p>This response has not been accepted.</p> <p>Items 1. and 3. in the Proponent’s response adequately responded to the IR. However, the water quality thresholds in item two have not been derived using baseline receiving environment concentrations and not all COPCs which require monitoring under the MDMER have been included in the updated table. Additionally, the Proponent did not account for changes in baseline hardness concentrations in the receiving environment due to the deposition of effluent. Water hardness is an environmental modifying factor which can influence the toxicity of COPCs in the aquatic environment, therefore requiring the mentioned COPCs as well as background concentrations of total hardness in the receiving environment to accurately determine potential effects of COPCs upon the receiving aquatic environment. The Proponent should also provide rationale to support that all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.</p> | Not Accepted |

|--------------|----------------|------|-----------------------|---|--|--|-------------------------------|--------------|
| | | | | | protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds. | | See also follow-up IR-115-R1. | |
| IR-115 | IR-115-R1 | ECCC | Fish and fish habitat | Section 8.2.4.2.3 Aquatic Environment Appendix 10-A (ERA), Section 3.1.1.1 IR-115 Response from Denison | <p>Context: In the Proponent’s response to item two, it is mentioned that the derived water quality thresholds used in Table 8.2-8 and in the assessment (Section 8.2.4.2.3, Aquatic Environment; Appendix 10-A (ERA), Section 3.1.1.1) are based on hardness concentrations found in effluent. The Proponent mentions that hardness derived from IWWTP discharge will consider IWWTP discharge on the receiving environment and provide “a reasonable estimate of expected hardness in effluent”. However, this does not consider induced hardness (i.e., hardness concentration increases in the receiving environment over the lifecycle of the Project) from effluent contributions as a Project effect; the receiving environment baseline concentrations of hardness have been altered due to inputs from Project effluent. Providing only one estimate of expected effluent hardness in the receiving environment is not an appropriate means of conducting the effects assessment.</p> <p>Additionally, the following COPCs have not been included in the updated table provided in the Proponent’s response: un-ionized ammonia, aluminum, iron, manganese, thallium and total dissolved solids (TDS). It is noted that these COPCs are also subject to monitoring requirements under the <i>Metal and Diamond Mining Effluent Regulations</i> (MDMER).</p> <p>Rationale: Background concentrations of un- ionized ammonia, aluminum, iron, thallium, manganese and TDS are required to determine potential effects to the environment. The Proponent will also require this information to satisfy their obligations under the MDMER.</p> <p>The purpose of the surface water quality assessment is to determine if changes to the receiving environment over the project lifecycle will have significant adverse effects on biota. Changes from baseline in hardness concentrations in the receiving environment due to the deposition of effluent is a Project related effect and therefore providing a single baseline water quality threshold which is applicable only to one set of conditions is not an appropriate method to evaluate impacts across a shifting hardness baseline.</p> <p>Water hardness is an environmental modifying factor, various concentrations of hardness influence the toxicity of other COPCs in the aquatic environment. Using water quality thresholds that have been derived from high effluent hardness concentrations will not be protective of aquatic biota, particularly in the early stages of the project lifecycle when receiving environment water quality will be similar to baseline water quality.</p> | <p>1. Update Table 8.2-8 to include the following COPCs: un-ionized ammonia, aluminum, iron, manganese, thallium and total dissolved solids (TDS).</p> <p>2. Update Table 8.2-8 to include background concentrations of total hardness (in mg/L CaCO₃) in the receiving environment.</p> <p>3. Provide rationale that all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.</p> <p>See also related IR-108-R1</p> | | Follow-Up IR |

| IR-123 | - | ECCC | Change to an environmental component due to radiological contaminants | Section 8.4.3.2.3, Aquatic Environment Appendix 8-D, Table 3-5 | <p>Context: Table 8.4-3 provides a summary of the baseline concentrations of COPCs in sediments in the LSA. Sediment quality thresholds and justification for the selection of those thresholds have not been provided. Table 3-5 in Appendix 8-D does provide benchmarks but the selection of benchmarks is not discussed, and the most stringent guidelines are not used for some COPCs. Additionally, there is no data provided for sediment concentrations of mercury, which is a COPC that requires surface water quality monitoring and effluent characterization under the MDMER.</p> <p>Rationale: Further information should be provided regarding any exceedances of sediment quality thresholds in baseline concentrations of COPCs, which should be recommended for further assessment of risk due to effluent discharges.</p> | <p>1. Provide sediment quality thresholds and justification for the selection of those thresholds for comparison against measured baseline COPC concentrations in the LSA.</p> <p>2. Provide data on baseline concentrations of mercury in sediment.</p> <p>3. Identify any COPCs with baseline concentrations that exceed sediment quality thresholds in the LSA.</p> | | Accepted |
| IR-124 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.4.4.2.3, Aquatic Environment | <p>Context: Table 8.4-7 provides maximum concentrations of surface water COPCs in sediment. The following COPCs, which are required to evaluate the risk from effluent to sediment quality, were not evaluated:</p> <ol style="list-style-type: none">1. COPCs that have monitoring requirements in receiving environment surface water and effluent under the MDMER,2. COPCs that exceed water quality guidelines in effluent, and,3. COPCs that have baseline concentrations that exceed sediment quality thresholds in the receiving environment. <p>Rationale: Due to the lack of information on COPCs with baseline concentrations that exceed sediment quality guidelines, and COPCs that require monitoring under the MDMER, a determination on risk to sediment quality and aquatic biota cannot be made.</p> | <p>1. Provide the information on baseline exceedances of COPCs in sediment.</p> <p>2. Provide an assessment of risk for any COPCs that have baseline exceedances of sediment quality thresholds in the receiving environment.</p> <p>3. Provide an assessment of risk from any COPCs that require monitoring in the receiving environment and effluent under the MDMER. Please include any COPCs in effluent that will exceed water quality guidelines.</p> | <p>This response has not been accepted.</p> <p>An updated risk assessment for COPCs that requires monitoring under the MDMER with effluent concentrations that exceed guidelines has not been completed. This information is necessary to facilitate the determination on risk to sediment quality and aquatic biota.</p> <p>See also follow-up IR-124-R1.</p> | Not Accepted |
| IR-124 | IR-124-R1 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.4.4.2.3, Aquatic Environment IR-124 Response from Denison | <p>Context: In the Proponent’s response it is stated, “Schedule 5 parameters will be monitored as per the MDMER once under this regulation (i.e., meeting regulated criteria of discharge to the environment [50 m3/day). Please refer to Table 8.2-13 of attachment IR-114. In these cases, COPCs including Schedule 4 parameters were below screening criteria.”</p> <p>If concentrations of Schedule 5 parameters in effluent exceed water quality thresholds, these parameters are necessary for ECCC to examine in the risk assessment to determine the potential for effluent to be acutely lethal and for adverse effects to aquatic biota. These parameters will also be required to be characterized under Section 4, 5 and 7 of the MDMER. As per CSA N288.6-22 Section 7.2.5.2.1, “Screening of environmental concentrations of chemical and radiochemical substances released to the environment should be performed to identify COPCs for further evaluation in the risk assessment. Both measured concentrations and concentrations calculated from release rates may be used in the screening analysis. The screening concentrations should be compared to screening criteria, and chemicals that exceed screening criteria should be identified as COPCs.”</p> | Provide an assessment of risk from any MDMER Schedule 5 parameters that are required to be characterized in effluent and in surface water quality in the receiving environment and that have effluent concentrations that will exceed water quality guidelines derived from environmental baseline conditions. | | Follow-Up IR |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-----------------------|---|--|--|--|--------------|
| | | | | | <p>As per CSA N288.6-22 Section 7.2.5.4.2, “If COPCs exceed the screening level for one medium, they should be carried forward into the EcoRA for all media that are likely to contribute to exposure. For example, for a given COPC, if a water screening benchmark is exceeded, the same COPC should be carried forward for sediment if its concentration was above the detection limit.”</p> <p>Additionally, updated Table 8.2-13 of attachment IR-114 has been found to be insufficient due to maximum concentrations in surface water for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate and phosphorus being absent and the use of incorrect water quality thresholds.</p> <p>Rationale: Due to the lack of information on COPCs with concentrations that exceed water quality thresholds in effluent, a determination on risk to sediment quality and aquatic biota cannot be made.</p> | | | |
| IR-125 | - | CNSC | Fish and fish habitat | Section 8.5, Aquatic Environment and Fish health | <p>Context: Indigenous Knowledge studies and information collected in relation to the Project clearly identified the importance of water quality and fish health to local Indigenous peoples and is discussed throughout the Draft EIS. For example:</p> <ul style="list-style-type: none">“Russell is one lake where I commercially fish. How will this effluent impact the water quality, fish health? Will I be able to sell fish from here? If there is going to water” pollution, I just want to know” (19-LK-ERFNTrip-134.255) ““How are you going to protect the water quality? We are concerned about mercury in fish, other animals, etc. Is there mercury or arsenic in the uranium solution?” (p. 8-53) <p>Rationale: Several Indigenous Nations and communities and local resources users have indicated Russell Lake is an important body of water both culturally for traditional use and was used as commercial fishery in the past and from an aquatic ecosystem perspective.</p> | <p>One of the many mitigation measures mentioned throughout the aquatic environment section states:</p> <p>“Denison will work with the associated communities to develop and implement the Project-specific monitoring programs and a framework to share the results for the purpose of assessing the performance of the water management system.” (p.10-32)</p> <p>Has Denison considered the collection of additional baseline fish tissue species that are of importance to Indigenous Nations and communities and local cabin owners from Russell Lake? Assuming the species would be walleye (commercially and recreationally) and lake white whitefish that is traditionally an important species consumed.</p> <p>Please provide more information on the engagement to date on the development of the Surface Water Management Program and Monitoring program that Denison is developing and engagement to date with interested Indigenous Nations and communities in the region on fish and fish health.</p> | Response is accepted, but also see AD-51 in the Advice to Proponent table. | Accepted |
| IR-126 | - | ECCC | Aquatic species | Section 8.5.3 Appendix 10-A (ERA), Section 5.3.1.1.8 | <p>Context: The Proponent has used the US Environmental Protection Agency (US EPA) guidelines for the assessment of selenium fish tissue concentrations in Section 8.5.3 of the draft EIS and in the Environmental Risk Assessment (ERA) in Appendix 10-A (ERA) of Section 10.</p> <p>Rationale: ECCC’s Federal Environmental Quality Guidelines of 6.7 ug/g dry weight fish whole body tissue for selenium should be used, as it is more protective than the US EPA guidelines.</p> | Update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA (Appendix 10-A (ERA) in Section 10) as needed using ECCC’s FEQG. | <p>This response has not been accepted.</p> <p>The selenium fish tissue assessment has not been updated to reflect the ECCC Federal Environmental Quality Guidelines (FEQG). A predicted effluent concentration of 0.042 mg/L of selenium has been provided for the Project (updated Tables 8.2-9 and 8.2-10 Attachment IR-114 Denison’s Response). ECCC acknowledges that the Proponent prefers the use of the US EPA guidelines due to the ability to perform fish tissue muscle TRV, however, Environmental Effects Monitoring (EEM) would require a study on fish tissue selenium whole- body or egg-ovary concentrations. The current baseline data will not be comparable to future EEM studies using fish tissue muscle concentrations of selenium and US EPA guideline methodology. There is</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|--|---|---|--|----------|
| | | | | | | | <p>currently EEM guidance under development for conducting selenium fish tissue sampling in fish populations that will utilize the FEQG which applies to fish tissue egg-ovary and whole-body concentrations of selenium. Additionally, the Proponent has made a commitment to utilize the most stringent guidelines available.</p> <p>Based on the Project’s proposed effluent concentrations of selenium, fish tissue sampling will be required as part of the EEM monitoring for the Project. The ECCC FEQG is the guideline applied to these studies, and the current use of this guideline will facilitate the comparison to future monitoring studies.</p> <p>Furthermore, the Proponent has not provided sufficient explanation in their response for the use of the less stringent US EPA guideline compared to the more conservative FEQG.</p> <p>The Proponent should explain their use of the US EPA guidelines over the ECCC FEQG or update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA as needed using ECCC’s FEQG.</p> <p>As noted in IR-126, please update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA (Appendix 10- A (ERA) in Section 10) as needed using ECCC’s FEQG. If the FEQG will not be used, provide further rationalization for the use of the US EPA guidelines when creating the study on fish tissue selenium concentration in the EEM.</p> | |
| IR-127 | - | CNSC | Aquatic environment | Appendix 8-E, Section 1.2.1, Hydrological Inputs | <p>Context: Within this section it states that the 7Q10 low flow rate used in the mixing assessment “was provided verbally to Ecometrix by NewFields Canada during a project meeting on 26 April 2022”</p> <p>Rationale: The statement that this value was provided verbally is not an infallible method of communicating data, as the value could have been misheard, misremembered, or recorded improperly.</p> | Please verify that the 7Q10 value used in the assessment is the correct value determined by NewFields. | | Accepted |
| IR-128 | - | CNSC | Current use of lands and resources for traditional purposes | Section 9 Various pages in section 11.1, Land and Indigenous Resource Use Section 12 Section 14 | <p>Context: The increased road traffic (14-18 trucks per day during construction/operations) may have indirect impact on ungulates, furbearers and wood land caribou presence/absence for traditional and subsistence hunting have been raised to CNSC staff when meeting with Indigenous Nations and communities and are presented in the EIS.</p> <p>Rationale: The increased traffic and therefore dispersal of game (moose, woodland caribou) due to increased traffic has been raised as a concern with respect to increased mortality on wildlife and decreased ability to practice traditional rights.</p> | <p>How have the potential residual impacts with respect to increased traffic and noise (due to current and future operations) been communicated to Indigenous Nations and communities who use the road #914 for cultural and traditional activities (such as moose harvesting, berry picking and small game and birds)?</p> <p>Please provide any additional information on the engagement that has taken place to date with Indigenous Nations and communities with respect to concerns and potential impacts on current use of lands and resources due to increased road traffic, and any mitigation measures proposed by Indigenous Nations and communities to minimize the potential impacts.</p> | Response is accepted, but also see AD-54 in the Advice to Proponent table. | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|----------|---|--|--|---|--|--------------|
| IR-129 | - | CNSC | Current use of lands and resources for traditional purposes | Section 9 Section 10 Section 11, including Section 11.1.4.3.1 (p. 11-46) Section 12 Section 16 | <p>Context: ERFN indicated they are concerned about declining moose populations from an influx of hunters; more people may be accessing the area year after year, and worried populations may be affected by the Project (21-EN-ERFN-473.13).</p> <p>Further, the EIS highlights that: “Vehicle collisions are the most likely source of direct mortality for moose. Effective mitigation measures (e.g., breaks in snowbanks; speed limits; and exclusion fencing around contaminated waste pads and ponds) will be implemented to reduce moose mortality.” (p. 11-46)</p> <p>Rationale: The Technical Guidance for Assessing the Current Use of Lands and Resources for Traditional Purposes under CEEA 2012 notes: “The views of affected Aboriginal groups on mitigation be considered and included in the EIS. This could assist in ensuring that the environmental effects on the current use of land and resources for traditional purposes are at an acceptable level for the community.”</p> <p>Sources for indirect moose mortality (e.g., increased hunter access, changes to health due to sensory disturbances, changes to predator-prey dynamics) may result in mortality outside the Wildlife LSA. The residual effect of change in moose mortality is likely to occur. Although mitigation measures are expected to reduce, but not fully eliminate, the residual effect on moose.</p> <p>The potential residual impact on the moose and other large game populations in the broader regional study area may potentially impact Indigenous treaty rights, culture, and community well-being if the harvesting of moose and large game declines due to increased traffic, noise, and vehicle mortality or increased outside hunting pressure.</p> | <p>Please provide additional information on the discussions Denison has had with Indigenous Nations and communities on how to mitigate any residual project impacts on their traditional harvesting activities of large game such as moose.</p> <p>More information is required to determine if Denison has engaged directly with ERFN/KML and other Indigenous Nations who utilize the area to harvest moose to determine current baseline harvest numbers that provide subsistence, continued cultural identity and community well-being, as well as discussions on how the Project could potentially impact moose populations and the harvesting of moose for traditional practices.</p> | Response is accepted, but also see AD-62 in the Advice to Proponent table. | Accepted |
| IR-130 | - | H. Mulye | Physical stressors (noise and vibration) on wildlife | Section 9, Terrestrial Environment | <p>Context: Sensory disturbances such as noise have been identified as stressors for selected wildlife (Ungulates, Furbearers, and Woodland Caribou), birds and amphibians in the Project area. However, there is no consideration of impacts from vibrations on these species. Also, impacts of noise and vibration on reptiles have not been assessed in the Project area.</p> <p>Rationale: While noise has been qualitatively assessed for selected wildlife, birds, and amphibians, there is no consideration of project-related vibrations as a sensory disturbance/physical stressor. Sensitive terrestrial species (specifically, herpetofauna, amphibians, invertebrates, and caribou) can be impacted by vibrations emanating from the operation of heavy machinery, blasting activities, and other anthropogenic activities at the Project site.</p> <p>Also, impacts of physical stressors (noise and vibration) on reptiles were not assessed. These species should be included in this assessment due to their sensitivity to noise and vibrations.</p> | <p>Please provide a discussion of impacts of physical stressors (specifically vibrations) on wildlife, birds, and amphibians in the Project area. Specific mitigation measures and/or monitoring for impacts from project-related vibrations should be considered, as appropriate.</p> <p>Also, include reptiles in the assessment of project-related noise and vibrations as sensory disturbance/physical stressor, or a justification for their exclusion.</p> | <p>This response has not been accepted.</p> <p>Denison has agreed to update the final EIS (Sections 9.3 and 9.4) to include vibration as a physical stressor to fauna in the project area.</p> <p>Please provide proposed text for the revised EIS, for SME review and acceptance.</p> | Not Accepted |

|--------------|----------------|------|--|---|---|--|---|----------|
| IR-131 | - | ECCC | Migratory birds, Wildlife and Wildlife Habitat | Section 9, Terrestrial Environment | <p>Context and Rationale: As per the requirement outlined in Section 79 of the Species at Risk Act (SARA): <i>The person must identify the adverse effects of the project on the listed wildlife species and its critical habitat and, if the project is carried out, must ensure that measures are taken to avoid or lessen those effects and to monitor them. The measures must be taken in a way that is consistent with any applicable recovery strategy and action plans. This is accomplished by ensuring that the Proponent has identified, avoided, lessened and will monitor effects to species at risk.</i></p> <p>As per the CNSC’s Generic Guidelines for the Preparation of an EIS pursuant to the Canadian Environmental Assessment Act, 2012: “<i>The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the Proponent intends to implement them and the environmental outcome the mitigation is designed to address. The EIS will describe mitigation measures in relation to species and/or critical habitat listed under the Species at Risk Act (SARA). These mitigation measures will be consistent with any SARA permit, applicable recovery strategy and/or action plan</i>”.</p> <p>The draft EIS neither lists the adverse effects to all listed schedule 1 SARA species, nor outlines the measures that will be taken to avoid or lessen these effects. The Proponent references that additional species-specific mitigations will be detailed in environmental management plans but has not provided those plans for review.</p> | Identify all species at risk listed on Schedule 1 of the Species at Risk Act and their critical habitat that are likely to be affected by the Project and describe how they may be adversely affected by the Project. Describe what measures will be taken to avoid or lessen the effects of each Project activity and stage, and how these effects will be monitored to ensure they are avoided or minimized. | | Accepted |
| IR-132 | - | ECCC | Wildlife and Wildlife habitat | Section 9, Terrestrial Environment | <p>Context and Rationale: ECCC has identified that three species at risk arthropods (yellow banded bumble bee, transverse lady beetle, and nine-spotted lady beetle) have ranges overlapping the Project area and these were not mentioned in the draft EIS.</p> | 1.Conduct an effects assessment for arthropod species at risk. 2. Explain what mitigation measures will be used to minimize potential effects. | | Accepted |
| IR-133 | - | ECCC | | Section 9, Terrestrial Environment | <p>Context and Rationale: There is potential for some species at risk (e.g., myotis species, barn or bank swallows, common nighthawk) to be attracted to and use mine infrastructure (buildings, roads etc.) once constructed for nesting, roosting, or foraging.</p> <p>Details on mitigation measures and adaptive management with respect to attraction to Project components should be identified to assess residual and cumulative impacts to species at risk.</p> | For all Project phases, describe the mitigation measures and adaptive management to prevent and minimize effects on species at risk that may utilize mine infrastructure. | | Accepted |
| IR-134 | - | ECCC | Wildlife and Wildlife habitat | Section 9, Terrestrial Environment | <p>Context and Rationale: The draft EIS states in multiple places that vegetation clearing may occur year-round.</p> <p>In order to correspond with the timing of emergence from hibernation, tree clearing should not be conducted during the bat roosting period. If maternity roost trees are removed after pregnant females have established a roost</p> | Provide important roosting dates for bat species at risk in the Project area. | <p>The Proponent provided a complete response regarding the roosting dates for bat species at risk, however follow-up IRs are required.</p> <p>See follow-up IR-134-R1.</p> | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|--|---|---|---|----------------------|--------------|
| | | | | | area, there is a higher likelihood of abortion than there would be otherwise. Species-specific mitigations are required to protect bat SAR. | | | |
| IR-134 | IR-134-R1 | ECCC | Wildlife and Wildlife habitat | Section 9, Terrestrial Environment | <p>Context: The Proponent has committed to conduct pre-construction and pre-clearing surveys for multiple species, however the timing and methods for the surveys were not provided. Knowing the survey methodology for pre-construction and pre-clearing for little brown myotis and northern myotis is important for assessing cumulative impacts, effectiveness of adaptive management strategies as well as determining how bat species were considered in the EIS.</p> <p>Rationale: ECCC can determine whether the methodology the Proponent will use to collect data is appropriate and if the methodology would contribute to a more complete understanding cumulative effects and adaptive management strategies.</p> <p>A clear outline of how timing has been considered and incorporated into the methodologies is required to understand how sensitive periods for bats, such as roosting, have been considered in the EIS. An understanding of the methodologies and how these sensitive periods are being considered is required to evaluate the effectiveness of mitigation strategies and adaptive management strategies which are being developed by the Proponent.</p> | The information provided by the Proponent regarding the roosting dates and potential habitat for bats is complete, however, the information related to the pre-construction and pre-clearing surveys is missing details on important habitat features for bat species at risk. As two Species at Risk Act (SARA) schedule 1 listed bat species, little brown myotis (<i>Myotis lucifugus</i>) and northern myotis (<i>Myotis septentrionalis</i>) have been identified in the Project area, effects need to be identified, avoided, lessened and monitored. | | Follow-up IR |
| IR-135 | - | ECCC | Migratory birds, Wildlife and Wildlife Habitat | Section 9, Terrestrial Environment | <p>Context and Rationale: The mitigation measures for birds and wildlife presented in the draft EIS are very general. Additional detail is required for a complete assessment of residual and cumulative Project effects to birds and wildlife.</p> <p>The Proponent has committed to providing a number of plans including, a Decommissioning Plan, a Spill Response Plan, a Waste Management Plan, a Surface Water Monitoring Plan, a Remediation and Closure Plan, a Radiation Protection Plan, a Soil and Vegetation Monitoring Plan, a Wildlife Monitoring Plan, and a Woodland Caribou Management Plan. In order to assess potential affects to migratory birds and wildlife from Project related activities, ECCC requires details on species-specific mitigation measures, and monitoring plans.</p> | <p>The following information should be included in the various plans and should be provided for review during the environmental assessment:</p> <p>1. For all Project phases, describe the species-specific mitigation measures and responses to prevent and minimize effects on migratory birds or species at risk (SAR) birds and mammals that may utilize mine infrastructure.</p> <p>2. Explain how light pollution will be managed and what specific mitigation measures will be used to minimize effects to migratory birds and SAR birds and mammals.</p> <p>3. Provide details on what methods will be used for erosion control and how they will prevent sediment from entering waters frequented by migratory birds or SAR. Explain what actions will be taken if the erosion control measures are not successful.</p> <p>4. Provide details on noise and other sensory disturbance monitoring and mitigations if noise levels surpass thresholds.</p> <p>5. Describe time windows and species- specific mitigations related to maintenance activities such as vegetation management, road or building repair and stream crossing replacements.</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|--|---|---|--|--------------|
| IR-136 | - | CNSC | Soil Salvage Monitoring | Section 9.1.8.2 | <p>Context: The Proponent plans to salvage and stockpile soil and organic matter/peat in order to use it in reclamation activities during decommissioning. Periodic monitoring of the stockpiles is proposed to be conducted to verify that soil and organic matter/peat are delineated, stripped, handled, and stockpiled as recommended, and to evaluate the stability of salvaged soil, e.g., in relation to potential erosion and/or degradation. It is unclear whether monitoring includes soil quality in terms of concentrations of COPCs.</p> <p>Rationale: It is expected that project-related activities (road and airport traffic, drilling) can result in open-source (i.e., fugitive) dust and process-source dust (incl. radionuclides), which can accumulate and result in changes in soil quality of the stockpiled soil and organic matter/peat as described in Sections 9.1.4.2.2 and 9.1.4.2.3).</p> | Please clarify if COPC concentrations monitoring is planned to be performed for stockpiled soil and organic matter/peat. | | Accepted |
| IR-137 | - | ECCC | Migratory birds, Wildlife and Wildlife Habitat, Vegetation and Wetlands | Section 9.2.1.3, Spatial and Temporal Boundaries for Vegetation and Ecosystems, Listed Plant Species and Wetlands Section 9.3.1.3.1, Spatial Boundaries for Ungulates, Furbearers and Woodland Caribou 9.4.1.3.1, Spatial Boundaries for Raptors, Migratory Breeding Birds, and Bird Species at Risk | <p>Context and Rationale: The CNSC’s Generic Guidelines for the Preparation of an EIS Pursuant to the Canadian Environmental Assessment Act, 2012 states that: “The EIS will describe the spatial boundaries, including local and regional study areas, for each VC to be used to assess the potential adverse environmental effects of the Project and provide a rationale for each boundary.</p> <p>Spatial boundaries will be defined taking into account the appropriate scale and spatial extent of potential environmental effects, community knowledge and Indigenous knowledge, current or traditional land and resource use by Indigenous groups, ecological, technical, social and cultural considerations.”</p> <p>The information provided in the EIS does not enable a biologically relevant assessment of the Project’s effects.</p> <p>The Proponent did not provide rationale for the selection of study areas for individual vegetation, wildlife or migratory bird valued components (VC). Different VCs may have different spatial boundaries for the LSA and/or RSA. For wildlife and bird VCs, the LSA is defined as a 1.7-km buffer from the Project area, and the RSA is defined as a 6.6-km buffer around the LSA. There is no information on how the spatial boundaries were derived.</p> <p>Specific to Woodland Caribou, boreal population (hereafter referred to as boreal caribou):</p> <p><u>Project Footprint:</u> In a scientific assessment of critical habitat (Environment Canada, 2011) [1] ECCC demonstrated that the application of a 500-m buffer to mapped anthropogenic features best represents the combined effects of increased predation and avoidance on caribou population trends at the national scale. Adding a 500-m buffer to the Project footprint is required to represent functional habitat loss.</p> | <p>Provide a biologically relevant rationale for the delineated study boundaries (LSA and RSA) for all different valued components. Include the following information:</p> <ul style="list-style-type: none">Descriptions of how the RSA and LSA boundaries were derived for all VCs. <p>Specific to boreal caribou:</p> <p><u>Project Footprint:</u></p> <ul style="list-style-type: none">Include a 500-m buffer of area of maximum physical disturbance to represent functional habitat loss for boreal caribou <p><u>LSA:</u></p> <ul style="list-style-type: none">Include a description of how the LSA takes into account boreal caribou avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance to individuals. <p><u>RSA:</u></p> <ul style="list-style-type: none">Include a description of how the RSA used in the draft EIS is an accurate representation of the SK1 boreal caribou range; orRe-do the assessment with the RSA at the scale of the range <p>See also related IRs: IR-154 and IR-156.</p> | <p>This response has not been accepted.</p> <p>A biologically relevant explanation for the chosen RSA for caribou was not provided. It is not clear if the RSA is representative of the SK1 range for factors such as variability and biophysical features. Describe how the RSA used in the draft EIS is an accurate representation of the SK1 boreal caribou range. This clarification is necessary to ensure the RSA is representative of the entire SK1 Caribou range, including the natural variability of the landscape, and to assess any project effects that may be affected by an inaccurate RSA. It is also required to verify the Proponent’s assessment of cumulative impacts to caribou.</p> <p>See also AD-56 in the Advice to Proponent table.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-----|----------------------|---|--|------------------------------|----------------------|--------|
| | | | | | <p>The draft EIS does not appear to use a buffer for their Project area. The draft EIS (Section 9.3.1.3.1) states: “Project Area: the area within which the Project and all components/activities are located (i.e., the area of maximum physical disturbance). The Project Area covers 169.6 ha and is not VC-specific, but consistent throughout the EA.” (p. 9-168)</p> <p><u>LSA</u>: The defined LSA for boreal caribou has to consider avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance. This required information is not detailed in the draft EIS.</p> <p>Adverse effects of Projects including predator and prey access to undisturbed areas, reduction in connectivity, and sensory disturbance to individual boreal caribou can vary and extend several kilometers depending on Project activities and ecological context. At minimum, the LSA should capture the above- mentioned effects. For boreal caribou, the Project footprint should be defined as the immediate area to be cleared, plus a 500-m buffer to represent functional habitat loss. Following this guidance, the LSA should be defined as a buffer of the Project footprint with the 500-m buffer.</p> <p><u>RSA</u>: The Amended Recovery Strategy for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada states: <i>Mitigation of adverse effects from individual projects/activities will require a coordinated approach and management of cumulative effects within and among ranges. A cumulative effects assessment is essential to position the proposed project/activity in the context of all current and future development activities. The cumulative effects assessment will:</i></p> <ul style="list-style-type: none">• <i>Assess the impact of all disturbances (anthropogenic and natural) at the range-scale;</i>• <i>Monitor habitat conditions, including the amount of current disturbed and undisturbed habitat, and amount of habitat being restored;</i>• <i>Account for planned disturbances; and</i>• <i>Assess the distribution of disturbance in large ranges for risk of range retraction in parts of the range.</i> <p>The proposed Project’s cumulative effects for boreal caribou are possible at the scale of the SK1 boreal caribou range. The RSA used for boreal caribou for this Project is only 40,173.6 ha, compared to the SK1 range, which is 18,034,870 ha. As such, it is too small to capture cumulative effects to this species and does not follow the Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada (Environment Canada, 2011) or the Amended Recovery Strategy for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada.</p> | | | |

| IR-138 | - | CNSC | COPC in Lichen | Section 9.2.4.2.2 Appendix 10-A (ERA) | Context: A quantitative assessment using modelling dispersion and uptake of COPCs in the environment was completed for the Project as part of the ERA, to support conclusions drawn in the EIS. In Appendix 10-A (ERA), COPCs in plant tissue was estimated for lichen. Table 5-5 of the ERA (p. 5.24) named “Complete Exposure Pathways for All Selected Ecological Receptors to be Assessed using the IMPACT Model” lists the exposure pathway for lichen as direct contact on soil. Rationale: Airborne COPC can deposition on lichen and subsequently enter the food chain; therefore, the “contact with air” pathway should be considered. In fact, lichen species are frequently used to monitor the deposition and accumulation of airborne contaminants (e.g., dust, metals). It is also noted that based on sampling results of the 2017 baseline studies, lichen frequently contain higher concentrations of COPC than blueberry (compare Table 9.2-6 and Table 9.2-7 in the EIS), especially at sampling sites with elevated concentrations (e.g., RSV9 and RSV10). | Please include the exposure pathway of direct deposition (dry and wet) of airborne contaminants on lichen in the quantitative ERA, or justify why this exposure pathway was not considered. See also related: IR-189. | | Accepted |
| IR-139 | - | ECCC | Change to an environmental component due to hazardous contaminants | Section 9.2.5.2.7, Waste and Hazardous Materials Management | Context: In this section, the Proponent outlines various measures to mitigate air emissions, including implementation of the air quality programs within the Environmental Management System, regular maintenance and inspection of equipment, and elimination of unnecessary idling of equipment. However, the intention to use industry-standard emission control systems has not been substantiated. Rationale: For the protection of air quality, it is important to specify the emission standards that equipment will have (e.g., Tier 3 or Tier 4 engines). Vehicles and equipment with Tier 4 engines have much lower emissions of contaminants than those with Tier 3 engines. If non-Tier 4 engines are used, ECCC recommends that best management practices are followed, including proper maintenance of the engine and anti-idling measures. | Confirm if vehicles and equipment will be equipped with Tier 4 engines where feasible. | Response is accepted, but also see AD-55 in the Advice to Proponent table. | Accepted |
| IR-140 | - | CNSC | Change in the Areal Extent of Wetlands | Section 9.2.6.4 | Context: Predicted residual effects on the areal extent of wetlands include the direct effect of loss of wetlands and several indirect effects of alteration of wetlands. As stated in the EIS, wetlands can exhibit low resilience and high susceptibility to disturbance. At the same time, wetlands tend to support a high species diversity, and are considered to have a moderate to high potential to support listed plant species. Lastly, wetlands are rare on the landscape compared to terrestrial ecosites (see Table 9.2-5). Rationale: Several wetland ecosites (BS19/24, BS25, BS27) occur only in small areas (< 30 ha) in the RSA but are predicted to experience disturbance of 6-64%, most notably the ecosite BS19/24 where 0.8 of 1.2 ha are | 1. Please provide a discussion on the ecological impact of disturbance to rare wetland ecosites. 2. Please provide information on whether adequate other habitat is available for species impacted in these disturbed sites in close proximity, taking into account the home ranges of susceptible species. 3. Please provide additional information on whether wetland connectivity is maintained through the landscape within the LSA/RSA. See also related: IR-141. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|--------------|-------------------------------|--|--|---|--|----------|
| | | | | | predicted to be disturbed. It is noted that wetlands are scattered throughout the landscape as shown in Figure 9.2-8. More information is requested regarding the ecological impact of this disturbance. | Suggestions for mitigation and follow-up measures: CNSC recommends that Denison conduct monitoring of species present in wetlands before and after disturbance, with a focus on listed plant species. | | |
| IR-141 | - | ECCC | Wetlands | Section 9.2.6.4.1 | <p>Context and Rationale: The Proponent states that: “Direct loss of wetlands has been mitigated by reducing the size of the Project Area to the extent practicable during Project design.</p> <p>However, up to 0.5 ha (less than 0.1%) of all wetlands within the Terrestrial RSA are anticipated to be removed from the Project Area during Construction (Table 9.2-16).”</p> <p>Information is not provided on whether wetlands in the terrestrial RSA are considered ecologically, economically or socially important to the region. Information on the regional importance of the wetlands that will be lost is needed in order to assess effects, including a wetland compensation plan if the wetlands are considered regionally important.</p> | <p>1. Provide information that accounts for whether wetlands are considered ecologically, economically and socially important to the region.</p> <p>2. If the above is affirmative provide a wetland compensation plan to offset the loss. Consistent with the Operational Framework For Use of Conservation Allowance [1] a minimum ratio of 2:1 should be the starting point when determining the amount to be offset.</p> <p>[1] Available at : https://publications.gc.ca/site/eng/9.696852/publication.html</p> <p>See also related: IR-138.</p> | | Accepted |
| IR-142 | - | ECCC CNSC | Wildlife and Wildlife habitat | Section 9.3.3.2.1 Scientific Literature Review – Wolverine Section 9.3.5 Mitigation Measures Section 9.3.6 Residual Effects Evaluation | <p>Context: The Proponent did not conduct any field work to identify potential wolverine dens in the Project area and therefore did not present any mitigations for the potential impacts to wolverine dens.</p> <p>In Section 9.3.3.2.1, the Proponent states: “Denning females are sensitive to disturbance during denning season in February to April and may abandon their dens and, in some cases, their litter, which may decrease their reproductive success. “</p> <p>In Section 9.3.6, the Proponent states: “In the Project Area, 145.0 ha or 100% of available wolverine habitat is assumed to be removed and will not be available to wolverine for the duration of the Project (Table 9.3-13). Similarly, 145.0 ha (3.4%) of available wolverine habitat within the Wildlife LSA is anticipated to be removed, all from the Project Area, during site clearing in Construction. In the Terrestrial RSA, up to 0.5% (145.0 ha; from the Project Area) of available wolverine habitat is anticipated to be removed during site clearing in Construction.”</p> <p>The residual effect assessment estimates that 8.2% of available wolverine habitat within the Terrestrial RSA may be altered or lost (Table 9.3-20).</p> <p>Rationale: As Wolverine is a Species at Risk Act Schedule 1 listed species, effects need to be identified, avoided, lessened and monitored. Mitigations, such as setback distances, should be used to protect important habitat features, such as dens.</p> | <p>1. Please provide additional information on whether the lost and/or altered wolverine habitat overlaps with wolverine home ranges.</p> <p>2. Describe any important wolverine habitat feature (i.e., dens) that may be lost as a result of the Project.</p> <p>3. Assess the need for pre- construction/pre-clearing surveys to identify any wolverine denning sites.</p> <p>4. Please provide additional information on whether the remaining, available, undisturbed wolverine habitat size is suitable to maintain populations.</p> | <p>The information provided by the Proponent is complete, however, a follow up IR regarding survey methods for all pre-construction and pre-clearing surveys is required.</p> <p>See follow-up IR-142-159-167.</p> | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|----------------------------|-------------------|------|-------------------------------|---|--|---|--|--------------|
| | | | | | Wolverine occupy large home ranges and, therefore, need vast tracts of undisturbed land to maintain viable populations. The species avoids most human footprint types and linear features. | | | |
| IR-142 IR-159 IR-167 | IR-142-159-167-R1 | ECCC | Wildlife and Wildlife Habitat | Reference to EIS: Section 9.3.3.3, Baseline Studies Section 9.3.5 Mitigation Measures IR 142, 159, and 167 Responses from Denison | Context: The Proponent has committed to conduct pre-construction and pre-clearing surveys for multiple species, however the timing and methods for the surveys were not provided. Rationale: Knowing the survey methodology for pre-construction and pre-clearing surveys across multiple species is important because the Proponent is intending to collect data so that ECCC can determine whether the methodology used to collect the data is appropriate and if the methodology would contribute to understanding cumulative effects and adaptive management. Understanding how timing has been considered and incorporated into the methodologies is required to understand how sensitive periods, such as nesting, breeding, foraging and migration, have been considered in the EIS. An understanding of the methodologies and how these sensitive periods are being considered is required to evaluate the effectiveness of mitigation strategies and adaptive management being developed by the Proponent for each species mentioned in IR-142, IR-159 and IR-167. | Provide survey methodology and timing for all preconstruction and pre-clearing surveys, including avian and species at risk surveys (caribou, wolverine). | | Follow-Up IR |
| IR-143 | - | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3, Baseline Studies | Context and Rationale: The baseline caribou data is insufficient to understand potential Project impacts to this species. Presence/absence detection was provided by camera traps, incidental observations, winter track and pellet survey. Additional information and analyses on caribou use of the landscape during all life stages of the Project area is required to assess impacts and to determine significance of impact from the Project to caribou. | Provide details on the baseline caribou data including: <ul style="list-style-type: none">• Revision of map 9.3-8 to include all observations, categorized by type, season and year (see also IR-145); and• Description of seasonal use of the LSA, RSA and caribou range.• Description of Project areas used by caribou.• Description of future studies planned to assess habitat use by caribou. Include specific details on how many additional years of aerial surveys will be completed to assess the caribou baseline conditions. Utilizing additional data noted above and specified in IR-145, explain how caribou use of the area could be affected by the Project throughout all seasons and life stages (e.g., calving, post-calving, rutting, wintering). See also related: IR-152. | This response has not been accepted. The information provided by the Proponent is insufficient to understand potential Project impacts and appropriate mitigation that would be required. Information on important habitat features and how caribou are using the landscape is required to complete an accurate assessment of the Project impacts to caribou habitat and habitat use. In the absence of this information, ECCC will assume a conservative estimate that all habitat features are high value and are used for important life functions. Although the Proponent provided a map showing telemetry points (provided by the Province of Saskatchewan), this map doesn’t have sufficient detail to assess habitat use and important biophysical features of the Project area. These details are necessary to assess habitat use and important biophysical features of the Project area. See follow-up IR-143-144-R1 and IR-143-145-R1. | Not Accepted |
| IR-144 | - | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3, Baseline Studies – map 9.3-8 | Context and Rationale: The mapping of caribou observations during baseline studies provided in Figure 9.3-8, “Caribou Sign Observations in the Wildlife Study Areas,” is insufficient to enable conclusions to be drawn. ECCC is not able to review the spatial aspect of caribou observations without a map of all available observations. Additional information is available, as | Update map 9.3-8 to show all caribou observations during baseline studies, broken down by type of observation (camera, incidental, pellet, track) and season/year when the observation was made. Include additional data from the Province of Saskatchewan (see also IR-145) to help characterize caribou use on a spatial map. | This response has not been accepted. The information provided by the Proponent is insufficient to understand potential Project impacts to this species and characterize the risk to determine impacts from the Project to caribou and appropriate level of | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-------------------------------|---|--|---|--|--------------|
| | | | | | <p>stated in Section 9.3.3.3.3:</p> <p><i>“A total of 200 observations were made between 2017 and 2019 and recorded as either caribou sign (i.e., tracks, pellets, and evidence of feeding activity based on ground feeding craters and arboreal feeding evidence) or photographs (collected through the wildlife camera study) to document caribou presence in the LSA and RSA. Most observations occurred in the Terrestrial RSA, with observations concentrated in the north and southeast portions.</i></p> <p><i>Three observations occurred in the southeast portion of the Wildlife LSA, and no caribou sign was observed in the Project Area. Figure 9.3-8 provides an overview of some caribou sign observed during the baseline studies.”</i></p> | | <p>offsetting mitigation that would be required. The revised map 9.3-8 shows seasonal use, however, it is challenging to see the overlapping features. The map does not allow the reader to get a good understanding of the seasonality of the data. Due to the fact that caribou use different habitat types in differing ways over the course of a year, seasonality of the data will allow for a deeper understanding of habitat use.</p> <p>The scale provided on the current map does not allow for a proper assessment of seasonal use, including differentiation of habitat use.</p> <p>Individual maps by season and survey type with larger scale insets that show areas with overlapping points would help to clarify the map and allow for a greater understanding of spatial and temporal features of caribou habitat.</p> <p>See follow-up IR-143-144-R1.</p> | |
| IR-145 | - | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3, Woodland Caribou | <p>Context and Rationale: The Proponent has not provided sufficient information on how caribou use the landscape, including identification of areas for different life stages of caribou (calving, post-calving, rutting and wintering).</p> <p>The University of Saskatchewan published a report entitled Population and habitat ecology of boreal caribou and their predators in the Saskatchewan Boreal Shield. This report contains information on habitat types that are used during different life stages. Additionally, Appendix H of the Amended Recovery Strategy for the Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada 20202 [1] details habitat characteristics required by boreal caribou to carry out life processes necessary for survival and recovery.</p> <p>The scientific literature review (Section 9.3.3.3.1) on Woodland Caribou states: “While calving areas have not been documented within the SK1 range, it is recognized that caribou may use open fen and treed bog habitat types for calving during the spring/summer period. In Saskatchewan, caribou habitat used during the calving season in the SK2 range demonstrated a strong selection for treed muskegs, but avoidance of jack pine, mixed hardwood stands, and roads (Dyke 2008).”</p> <p>ECCC is not able to verify the Proponent’s effects assessment without sufficient information on important habitat or biophysical attributes for caribou within the study areas.</p> <p>[1] https://www.canada.ca/en/environment-climate-change/services/species-risk-public-registry/recovery-strategies/woodland-caribou-boreal-2020.html#toc0</p> | <p>1. Provide, based off existing literature or available data and the Amended Recovery Strategy for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada:</p> <ul style="list-style-type: none">information on known important habitat features or biophysical attributes in Project areas for different caribou life stages (calving, post-calving, rutting, wintering),a map(s) of the type and spatial extent of important caribou habitat features or biophysical attributes of the study areas as defined in Appendix H of the Recovery Strategy,<ul style="list-style-type: none">mapping should be at the RSA/LSA level as well as larger-scale mapping at the scale of the Project footprint. <p>2. Assess the potential direct and indirect effects based on additional information on caribou from bullet A above.</p> <p>See also related IRs: IR-143 and IR-152.</p> <p>Suggestions for mitigation and follow-up measures: ECCC recommends that the Proponent contact the Province of Saskatchewan to enquire about obtaining caribou telemetry data in the Project area. The data can be analyzed to determine important habitat features in the Project area.</p> | <p>This response has not been accepted.</p> <p>The map provided by the Proponent lacks spatial and temporal details needed to complete an assessment of habitat importance to caribou relative to the Project. The Proponent did not provide information or mapping on known important habitat features, habitat quality or biophysical attributes and mapping was not provided at the different scales as requested in the IR.</p> <p>ECCC recommends that the Proponent provide mapping of important caribou habitat features, such as those used for calving, wintering, and movement to assess how caribou utilize the landscape and assess potential impacts to caribou due to impacts to these areas. Knowing detailed data on caribou habitat use will contribute to identifying mitigation measures and potential offsetting.</p> <p>In the absence of telemetry data, mapping of habitat quality, based on a combination of known ecosites and known important biophysical features will provide a reasonable alternative, where known important caribou habitat features cannot be mapped.</p> <p>The provision of information on habitat use and biophysical features will facilitate the verification of the Proponent’s effects assessment.</p> <p>See follow-up IR-143-145-R1.</p> | Not Accepted |

| | | | | | not detecting presence or not detecting presence as frequently. Mapping of important caribou habitat features is required to assess important potential impacts to caribou. In the absence of telemetry data, mapping of habitat quality, based on a combination of known ecosites and known important biophysical features will provide a reasonable alternative where known important caribou habitat features cannot be mapped. | | | |
| IR-146 | - | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3.1, Woodland Caribou, Scientific Literature Review - Predation | Context and Rationale: The information on impacts of predation and apparent competition for caribou in relation to the proposed Project are insufficient. In the section on caribou predators (9.3.3.3.1), the Proponent provided details on densities of wolves and their overlap with caribou and speaks of apparent competition. The Proponent did not examine other predators, such as black bear. The analysis on impacts of predation and apparent competition is insufficient since known predators have been omitted without explanation from the assessment of effects. ECCC is not able to verify the Proponent’s effects assessment since important species have not been considered in the assessment. | Provide further information and analyses on all potential predators of caribou, including impacts from apparent competition. | | Accepted |
| IR-147 | - | ECCC | SAR – Boreal Caribou | Section 9.3.4.2.1, Alteration and/or Loss of Habitat | Context and Rationale: The process of in-situ recovery mining will likely create changes to the surface topography and potential ground subsidence as well as changes to groundwater elevations. These changes can affect the plant communities and ecosite types. In Section 9.3.4.2.1 the Proponent states that: “Following decommissioning and reclamation, wildlife habitat is expected to recover to baseline conditions.” A more thorough explanation regarding post-decommissioning landscape is required to assess Project impacts. | 1. Provide further rationale and/or analysis regarding the return of wildlife habitat to baseline conditions post- decommissioning. Incorporate other environmental impacts including: <ul style="list-style-type: none">Ground subsidence and impacts on wildlife habitatChanges to aquifers and impacts on wildlife habitat 2. Describe reclamation activities/measures, including temporal information that will be implemented to help in the recovery to baseline conditions. | | Accepted |
| IR-148 | - | ECCC | Wildlife and Wildlife habitat | Section 9.3.4.2.1, Alteration and/or Loss of Habitat | Context and Rationale: ECCC analyzes disturbance for caribou at the range level, in this case within the SK1 range. However, the Proponent did not provide an adequate assessment of total disturbance at the range level. The draft EIS (Section 9.3.4.2.1 p. 9-211) reads: “The SK1 Boreal Shield Woodland Caribou Management Unit has relatively low levels of anthropogenic disturbance and was exposed to large fire disturbances in the past 40 years (ECCC 2019). Environment and Climate Change Canada (2019) identified this caribou population as being self-sustaining at a threshold of 40% undisturbed habitat with the total anthropogenic disturbance not exceeding 5% of their habitat. The current anthropogenic disturbance levels (without areas burnt by past forest fires) for the study areas are below this threshold (with the exception of the already disturbed Project Area) and are estimated | Provide the following in order to support analysis of habitat disturbance: <ol style="list-style-type: none">Calculation of total disturbance including natural and anthropogenic disturbance at the range level.Description of effects on existing habitat at the scale of the range (for < 40% undisturbed habitat in the SK1). Include:<ul style="list-style-type: none">an account (and GIS file if available) of existing habitat affected, using the following formula: (Project footprint + 500m buffer) – overlapping (permanent alteration(s) + 500m buffer)A map of the SK1 range showing all disturbed and undisturbed habitat, including predicted disturbance (direct and indirect) resulting from the Project. | This response has not been accepted, due to outstanding information related to #2. ECCC’s role is to provide advice to the CNSC under the Species at Risk Act and/or the Migratory Birds Convention Act to support compliance with these pieces of legislation in their decision making. Having access to project study area shapefiles allows ECCC to do their due diligence in validating any overlapping Critical Habitat, important habitat features, species at risk ranges, migratory birds ranges and other potentially important local or landscape characteristics. Obtaining project shapefiles from proponents is standard practice for our analysis of environmental impacts of projects. | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------------------|-------------------------------|---|---|---|--|--------------|
| | | | | | <p>as: 24.8 ha (14.6%) for the Project Area, 168 ha (3.5%) for the Wildlife LSA, and 599 ha (1.5%) for the Terrestrial RSA.”</p> <p>Analysis of habitat disturbance should be calculated at the range level in order to assess impacts and determine significance.</p> <p>Analysis should be consistent with the methodology described in the document Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada (Environment Canada, 2011) [1].</p> <p>[1]https://publications.gc.ca/site/eng/401605/publication.html, p. 28/41</p> | <p>4. Description of whether the Project is expected to compromise the ability of the range to be restored to the undisturbed habitat threshold, and provide a rationale for the conclusion.</p> <p>See also related: IR-154.</p> | <p>ECCC requested for more detailed mapping at the level of the project footprint in order to be able to have higher confidence in our analysis relative to potential effects on caribou Critical Habitat. However, as the requested mapping was not provided by the Proponent, ECCC is required to make assumptions that could impact our determination of potential effects and possible offsetting requirements to mitigate impacts to caribou Critical Habitat (as per the Federal Recovery Strategy for Woodland Caribou). We are aware that the project footprint may change, which may result in changes to the final recommended offset amount. We are prepared to work with a draft file with the understanding that it is still being finalized. The fact that the landscape may change over time based on data available does not negate the fact that baseline analysis is still required to determine impacts on caribou, and we still require the study area shapefiles to continue with our general analysis of the study area, given the limited data that was provided by the proponent.</p> <p>Please provide the requested shape files.</p> | |
| IR-149 | - | ECCC CNSC | Wildlife and Wildlife habitat | Section 9.3.5.2, Additional Wildlife-specific Mitigation Measures | <p>Context: The EIS describes that ongoing research is performed to inform the development of a Woodland Caribou Management Plan. This includes studies on the effectiveness of linear disruption features on predator/prey movements, and a field program for long-term reclamation planning. Moreover, it is stated that the Plan will include a detailed assessment of the need for habitat offsets.</p> <p>The draft EIS Section 9.3.5.2 states: “A wildlife monitoring plan and a Woodland Caribou Management Plan will be developed to address wildlife-specific mitigation measures based on proven and accepted mitigation following standard industry guidelines and BMPs. The plans will provide guidance to avoid or minimize potential adverse effects of the Project on wildlife and wildlife habitat, including monitoring and follow-up programs, as appropriate. It will be in place during all phases of the Project and will be subject to ongoing review and revision as required. If monitoring identifies a need for additional or revised mitigation measures, a process of adaptive management (as described in the plan) will be triggered.”</p> <p>Rationale: The draft EIS does not present sufficient species-specific mitigation measures for boreal caribou. ECCC is not able to assess potential residual impacts to caribou without specific mitigations.</p> <p>Since the Woodland Caribou Management Plan is still under development, it is difficult to judge whether the measures will be adequate to mitigate and/or offset potential project effects on Woodland caribou and its critical habitat.</p> | <p>Provide the Woodland Caribou Management Plan, to demonstrate effective mitigation of potential project effects, along with wildlife-specific mitigation measures for review.</p> <p>The Plan should be informed by and consistent with the Boreal Caribou Recovery Strategy and demonstrate that avoidance and minimization measures will be applied to mitigate for predicted Project effects to boreal caribou and its critical habitat prior to considering offsetting measures. That is, the Plan should follow the mitigation hierarchy and information should be provided as outlined below:</p> <ol style="list-style-type: none">1. AVOID: Describe all measures that will be taken to avoid effects to boreal caribou and avoid the destruction or alteration boreal caribou critical habitat.2. MINIMIZE: Describe all measures that will be taken to minimize the effects to boreal caribou and minimize the destruction of boreal caribou critical habitat.3. RESTORE ON-SITE: describe the measures that will be taken to restore disturbed areas of the Project, related to construction, operation and maintenance, on boreal caribou critical habitat, remaining after considering the avoidance and minimization measures.4. Characterize the risk of the adverse effects that are likely to result from the Project on boreal caribou and its critical habitat after avoidance minimization, and onsite restoration measures have been considered.5. OFFSET: Describe the measures that will be implemented outside the Designated Project area to mitigate adverse effects, destruction or alteration of boreal caribou critical habitat by the Designated Project during construction and operation. | <p>This response has not been accepted.</p> <p>The Conceptual Caribou Management Plan does not provide sufficient detail to understand if using the restoration trials as an offset will produce satisfactory habitat compensation to address the Project effects to caribou.</p> <p>Additional clarity on the Proponent’s role in the Developing Eco-restoration Together program is required, such as how the outcomes of these programs will result in mitigation measures and offsetting requirements. Additional clarity on the scope of the program should also be provided so that ECCC can understand the objectives and deliverables of the program.</p> <p>See follow-up IR-149-R1A, IR-149-R1B and AD-71 in the Advice to Proponent table.</p> | Not Accepted |

| | | | | | impacts from air traffic, including mitigations related to frequency and timing of flights, will be necessary to evaluate impacts to caribou due to air strip noise. | | | |
| IR-150 | - | ECCC | Wildlife and Wildlife habitat | Section 9.3.5.2.1, Best Management Practices for working in Boreal Woodland Caribou Range in Saskatchewan | <p>Context and Rationale: In the draft EIS Section 9.3.5.2.1, the Proponent states: “Denison proactively initiated research to provide field-based findings on the effectiveness of linear disruption features on predator/prey movements.”</p> <p>“Results will help the development of proactive and meaningful restoration strategies as an ongoing part of the overall Project (Omnia 2022). Additionally, the 2023 field program will support a program that uses the results from the 2021/2022 Caribou Trail Study in long-term reclamation planning. The program will be led by the University of Saskatchewan and is funded by Denison, an Indigenous-owned environmental company, the Northwest Communities Environmental Services (Métis owned), Mitacs, and the Natural Science and Engineering Research Council of Canada through an alliance grant. The Caribou Trail Study and the reclamation plan will culminate with the development of a Woodland Caribou Management Plan.”</p> <p>ECCC is available to support the Proponent through review of study programs should those programs be made available during the review process.</p> <p>ECCC requests to see the 2021/2022 study to further our review of caribou use in the Project area.</p> | Provide the report for 2021/2022 Caribou Trail study for long-term reclamation planning for ECCC review. | | Accepted |
| IR-151 | - | ECCC | Wildlife and Wildlife habitat | Section 9.3.6.4 | <p>Context and Rationale: In the analysis of residual and cumulative effects for woodland caribou, information and analyses on impacts to connectivity and movement across the landscape is lacking.</p> | <p>1. Using available reports and data, provide an analysis of impacts to landscape connectivity for woodland caribou at the LSA and Range scales.</p> <p>2. Determine whether the Project is expected to result in a reduction of connectivity within or between the ranges and provide a rationale for the conclusion. Describe how movement corridor(s) may be affected by Project activities and infrastructure.</p> | <p>This response has not been accepted.</p> <p>There is insufficient information to support the Proponent’s conclusion that there are no impacts to landscape connectivity. Additional information on habitat quality, caribou use of the landscape for different life stages, and important habitat features within the study area is required to understand effects of the Project on habitat connectivity.</p> <p>Provide maps of caribou habitat quality and an assessment of Project impacts to high quality habitat including habitat that may be associated with landscape connectivity.</p> | Not Accepted |
| IR-152 | - | CNSC | Woodland Caribou Residual Effects Evaluation | Section 9.3.6.4, Appendix 9-B | <p>Context: Baseline studies for Woodland caribou include:</p> <ul style="list-style-type: none">• Winter Track Count Survey to assess presence, abundance, feeding activity, and ecosite affiliation;• Pellet Group/Browse Availability Survey to detect presence and abundance of caribou, and frequency of occurrence and abundance of lichen;• Covert Camera Survey to determine presence and use of linear features (roads, trails, and hand-cut lines). | <p>Please provide a summary of available baseline data on habitat use during all seasons and life stages, in particular sensitive stages such as calving, and how habitat use during all seasons and life stages was considered in the residual effect analysis.</p> <p>See also IR-145 and IR-143.</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|--|---|--|--|----------------------|----------|
| | | | | | <p>The Saskatchewan Conservation Strategy for Boreal Woodland caribou [1] states that caribou are very susceptible to predation during the calf-rearing period, and populations are extremely sensitive to even minor changes in mortality rates.</p> <p>Rationale: It is unclear if, or how, any data on seasonal and spatial use of habitat was considered in the residual effect analysis, for example summer/winter home ranges, sensitive life stages including calving (e.g., location of calving sites). It should be noted that the English River First Nation have identified caribou calving areas in the vicinity of the Project footprint.</p> <p>Reference: [1] Saskatchewan Ministry of Environment. 2013. Conservation Strategy For Boreal Woodland Caribou (Rangifer tarandus caribou) in Saskatchewan. Saskatchewan Ministry of Environment. Fish and Wildlife Technical Report 2014.</p> | | | |
| IR-153 | - | CNSC | Woodland Caribou Residual Effects Evaluation | Section 9.3.6.4.1 | <p>Context: According to ECCC (2020), forest fires can directly alter habitat, making it unsuitable for boreal caribou (e.g., through loss of mature conifer stands, loss of lichens and other forage plants, barriers to movement). Boreal caribou generally do not return to burned areas for several decades until the forest is old enough to support lichens and other food sources, although they may make limited use of burned areas to feed on new growth.</p> <p>The residual effects evaluation of alteration and/or habitat loss lists ecosites BS3 and BS7 (regenerating forest types) as available habitat in Table 9.3-22, which represent 43.5% of the Regional Study Area.</p> <p>Rationale: It is unclear whether the ecosites BS3 and BS7 (regenerating forest types) represent suitable habitat for Woodland caribou year-round. More information is required on the habitat quality (e.g., time since last forest fire) and suitability for different life stages of caribou.</p> <p>For conservatism, it is recommended to perform a second residual effect analysis not including regenerating forest ecosites.</p> | <p>1.Please provide further information on the suitability of ecosites BS3 and BS7 for Woodland caribou in different life stages.</p> <p>2. Please provide the results of a residual effect analysis not including ecosites BS3 and BS7 for conservatism.</p> <p>3. If 2 leads to habitat fragmentation, consider connectivity of habitat patches in the residual effect analysis.</p> | | Accepted |
| IR-154 | - | CNSC | Woodland Caribou Alteration and/or Loss of Habitat | Section 9.3.6.4.1 | <p>Context: Lichen, the primary food source for Woodland caribou (up to 70% of the year-round diet), can be exposed to airborne contaminants and dust deposition at distances of 1–40 km (e.g., increased metal concentrations or dust were detected in lichen at distances of 1–40 km from a mine site [1, 2]).</p> <p>Rationale: Further information is requested on how the potential for contamination of the food source “lichen” is reflected in the applied buffers of direct and indirect disturbance for woodland caribou.</p> | <p>1. Please provide additional justification for how the potential for contamination of the food source “lichen” is reflected in the applied buffers for sensory disturbance.</p> <p>See also related IRs: IR-137, IR-148 and IR-156.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends the following:</p> | | Accepted |

| IR-155 | - | ECCC | Wildlife and Wildlife habitat | Section 9.3.6.4.1, Alteration and/or Loss of Habitat | <p>Context and Rationale: In Section 9.3.6.4.1 of the draft EIS, the Proponent presents figure 9.3-14 and table 9.3-22, which “depicts available woodland caribou habitat in the Project study areas” and provide a summary of available Woodland Caribou Habitat in the Project Area, Wildlife Local Study Area, and the Terrestrial Regional Study Area.</p> <p>The Proponent does not provide a biologically relevant explanation on the ecosites that are considered available woodland caribou habitat.</p> <p>According to the amended recovery strategy for Caribou, all habitat within SK1 range has been designated as critical habitat. To align with best current knowledge and the amended recovery strategy, the map and table should show the biophysical attributes, as outlined in Appendix H of the recovery strategy.</p> | <p>1. Provide a biologically relevant explanation about how available caribou habitat was determined or determine available habitat based on new data from the province of Saskatchewan (See IR-145).</p> <p>2. Consider referencing Appendix H of the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020 to define important biophysical features.</p> | <p>This response has not been accepted.</p> <p>The Proponent’s response to IR-155 states “Available woodland caribou habitat was identified in the draft EIS to comprise the ecosites with observations of caribou and caribou sign during the baseline studies. This was done without seasonal differentiation because it was assumed that caribou may use these ecosites during all seasons and life stages.” The methodology used to determine available caribou habitat does not accurately represent use of the documented habitat.</p> <p>The trail camera and pellet survey methods used do not satisfy the IR as they may lead to an underestimation of available caribou habitat.</p> <p>Trail camera and pellet surveys are not normally used to determine available habitat, as they only show presence. Using observations within ecosites to determine what is available habitat for caribou may lead to an underestimation of available habitat. Some smaller or rare ecosites may not have been sampled, leading to their exclusion as available habitat.</p> <p>Additionally, trail cameras were only placed on linear features, which are not representative of the whole landscape. Survey locations and camera trap placement may not provide an accurate representation of the study area or the SK1 range.</p> <p>To adequately determine available caribou habitat, ECCC requires a new habitat-based analysis that captures important biophysical features outlined in Appendix H of the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020.</p> | Not Accepted |
| IR-156 | - | ECCC | Wildlife and Wildlife habitat | Section 9.3.6.4.1 Section 9.3.7.3.1 | <p>Context and Rationale: In Section 9.3.6.4.1 of the draft EIS, the Proponent identified that 142 ha of available caribou habitat within the Project footprint will be directly impacted or lost, while an additional 1,165 ha will be indirectly impacted by Project activities such as sensory disturbance. They assessed the residual and cumulative effect of alteration to habitat for woodland caribou as not significant: “The residual effect of alteration and/or loss of available woodland caribou habitat is not expected to result in a change that will alter caribou habitat integrity to the point where it would not be able to sustain the regional woodland caribou population. Therefore,</p> | <p>Provide a revised assessment of residual and cumulative effects, taking into consideration that the disturbance within the SK1 range is above the disturbance management threshold required for survival and recovery of the species.</p> <p>See also related IRs: IR-137 and IR-154.</p> | <p>This response has not been accepted.</p> <p>Based on the Amended Recovery Strategy for the Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada 2020, the SK1 range is currently at its disturbance threshold. All remaining habitat in this range is considered to be critical habitat.</p> <p>As the development of this Project will result in loss of critical habitat for boreal caribou, the Project will have an impact on boreal caribou.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-------------------------------|---|---|--|---|--------------|
| | | | | | <p>the effect is assessed as not significant.”</p> <p>Section 9.3.7.3.1 of the draft EIS states: “It is not expected that the cumulative effects of alteration and/or loss of habitat will alter the integrity of woodland caribou habitat within the Terrestrial RSA to the point where it is not sustainable or available to contribute to ecological functions. Therefore, the cumulative effects resulting from the Project’s residual effect interacting with residual effects from other projects and activities is predicted to be not significant.”</p> <p>For the residual effect of alteration and/or loss of available caribou habitat (Section 9.3.6.4.1, Table 9.3-24), the Proponent assessed the magnitude as low, the geographic extent as local, the duration as long-term, the frequency as frequent, the reversibility as fully reversible, the context as high and the likelihood as likely. The rationale provided by the Proponent is insufficient to determine the accuracy of these assessments, given the lack of data and the small size of the assessment area. ECCC does not support the residual effects assessment of low magnitude, given the uncertainties related to seasonal use by caribou in the Project area and the current level of disturbance in the SK1 range.</p> <p>For the cumulative effect of alteration and/or loss of available caribou habitat (Section 9.3.7.3.3 , Table 9.3-30), the Proponent assessed the magnitude as moderate, the geographic extent as beyond the RSA, the duration as long-term, the frequency as frequent, the reversibility as fully reversible, the context as high, the likelihood as likely, the significance as not significant and the level of confidence as moderate. The rationale provided by the Proponent is insufficient to determine the accuracy of these assessments, given the lack to data presented for caribou and the small size of the RSA, compared to the SK1 region. ECCC does not support the conclusion of the cumulative effects assessments or for the level of confidence.</p> <p>The Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020 states that the range is currently at the 60% disturbance management threshold. Therefore, any activity likely to result in the alteration or destruction of critical habitat may impact on the species survival and recovery. In addition, the Proponent’s assessment was based on information that was lacking data on calving, wintering and rutting areas, and connectivity and caribou movements. The absence of considerations of the regional context of disturbance does not provide a conclusion based on best available information.</p> | | <p>The assessment does not contain adequate information on habitat quality or representativeness of the RSA to the SK1 range. The Proponent did not consider disturbance in the regional context, therefore their conclusions are not based on the best available information. Considerations of disturbance in a regional context is required to accurately represent residual and cumulative effects to caribou within the SK1 range.</p> <p>The Proponent has not provided sufficient information to support their conclusion of a “not significant” impact to boreal caribou as the Recovery Strategy wasn’t fully considered. Since all remaining habitat in this range is critical habitat, the Project will negatively affect critical habitat necessary for the survival and recovery of the species. The Proponent should provide a revised assessment of residual and cumulative effects, taking into consideration the Recovery Strategy and that the disturbance within the SK1 range is at the disturbance management threshold, and Projects impacts to critical habitat.</p> | |
| IR-157 | - | ECCC | Wildlife and Wildlife habitat | Section 9.3.9 Ungulates, Furbearer and | Context and Rationale: The Proponent has committed to developing a Woodland Caribou Management Plan, which will include a “detailed assessment for the need for habitat offsets.” The Woodland Caribou | Provide the Woodland Caribou Management Plan for review. The plan should clearly demonstrate efforts to avoid and minimize any Project effects and restore on-site any disturbed areas prior to the consideration of | This response has not been accepted. | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-----|----------------------|---|--|---|--|--------|
| | | | | Woodland Caribou Summary | <p>Management Plan will support ECCC’s review of the Proponent’s assessment of residual effects following mitigation and offsetting.</p> <p>This plan should consider ECCC’s Operational Framework for Use of Conservation Allowances (ECCC, 2012). ECCC is available to assist the Proponent in the determination of appropriate offsets that would balance against Project adverse effects after the application of measures to avoid, minimize and restore on-site are adopted.</p> <p>Based on the Amended Recovery Strategy for the Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada 2020, anthropogenic impacts to local caribou populations experience a lag effect, which occurs over extended periods. This lag effect needs to be adequately considered when proposing offsets.</p> <p>ECCC is available to assist the Proponent in understanding how critical habitat is described in the Recovery Strategy and the determination of appropriate offsets that would balance against Project effects based on the predicted impacts to caribou habitat.</p> | <p>offsetting. Details on how severity of disturbance and vulnerability of the species were considered should be explained.</p> <p>See also related: IR-149.</p> <p>Suggestions for mitigation and follow-up measures: ECCC notes that the Woodland Caribou Management Plan should clearly explain efforts to address Project effects, including any contribution to cumulative adverse effects, after it has been determined that all options in the previous steps of the mitigation hierarchy (i.e., avoidance, and minimization,) have been fully considered and applied.</p> <p>In the Woodland Caribou Management Plan, provide details on how the factors outlined in the Operational Framework for Use of Conservation Allowances (ECCC, 2012) were considered in determining the offsetting amounts, including the severity of disturbance and vulnerability of the caribou population. Important factors including time lag (the amount of time from restoration work to when the habitat would be considered caribou habitat) would also need to be considered.</p> <p>ECCC typically recommends a minimum offset multiplier of 4:1 (offset outcome: area disturbed). This is a benchmark ratio applied to a project that is in the lower end of the risk spectrum, such as one with a low severity impact adversely affecting a low vulnerability ecological component. In general, the minimum 4:1 multiplier accounts for time-lags to restoration, uncertainty in outcomes, a precautionary approach, and the adverse impact itself in its specific context. Offset multipliers are variable and determined by project-specific circumstances and associated risks and uncertainties.</p> | <p>The Proponent provided a conceptual Woodland Caribou Monitoring Plan, however, this plan does not include an assessment of the Proponent’s determination of the required amount of habitat offset.</p> <p>ECCC currently recommends a minimum offset multiplier of 4:1 (offset outcome: residual adverse effect) for a project that has a low severity impact of adversely affecting a low vulnerability ecological component. This is a benchmark ratio applied to a project that is in the lower end of the risk spectrum; for example, for a project with a low severity impact adversely affecting a low vulnerability ecological component. In general, the minimum 4:1 multiplier accounts for time-lags to restoration, uncertainty in outcomes, a precautionary approach, and the adverse impact itself in its specific context.</p> <p>Offset multipliers are variable and determined by project-specific circumstances and associated risks and uncertainties.</p> <p>The Proponent provided a conceptual Woodland Caribou Monitoring Plan, however, this plan does not include an assessment of the Proponent’s determination of the required amount of habitat offset.</p> <p>ECCC currently recommends a minimum offset multiplier of 4:1 (offset outcome: residual adverse effect) for a project that has a low severity impact of adversely affecting a low vulnerability ecological component. This is a benchmark ratio applied to a project that is in the lower end of the risk spectrum; for example, for a project with a low severity impact adversely affecting a low vulnerability ecological component. This lag effect needs to be adequately considered when proposing offsets.</p> <p>In the absence of sufficient data or information required to validate the level of risk that this Project is likely to have on the species recovery, the implementation of the mitigation hierarchy and offsetting measures to address Project adverse effects, ECCC’s views are based on the precautionary approach.</p> | |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|----------------------|---|---|---|--|--------------|
| | | | | | | | <p>Thus, ECCC preliminary analysis regarding the likelihood of this Project having an adverse effect on boreal caribou recovery is identified as moderate to high, resulting in a precautionary offsetting requirement that should be in terms of amount, much greater than 4:1. The assumptions of ECCC’s risk assessment include:</p> <ul style="list-style-type: none">• The biophysical attributes required for boreal caribou recovery (i.e. habitat for calving, post-calving, rutting, winter and travel) are present within the study area and will be directly or functionally lost,• Sensory disturbance arising from project activities (e.g. air traffic) will cause functional habitat loss for boreal caribou within important habitat areas required for different life stages. <p>Additionally, lack of information supporting the Proponent’s offsetting plans creates uncertainty and thereby warrants a higher offset ratio.</p> <p>ECCC is available to provide information to the Proponent on how critical habitat is described in the Recovery Strategy and the determination of appropriate offsets that would balance against Project effects based on the predicted impacts to caribou habitat.</p> | |
| IR-158 | - | ECCC | Migratory birds | Section 9.4.1.2, Key Indicators and Measurable Parameters | <p>Context and Rationale: In Section 9.4.1.2 the Proponent outlined key indicators for “Migratory Breeding Birds” which includes Waterbirds and Waterfowl, Upland Game Birds and Migratory Songbirds. These are broad categories, which do not allow for assessment of the variation in habitat requirements or ecology of individual species or guilds.</p> <p>Updated Rationale: The Proponent should identify additional focal species that can serve as indicator species by representing anticipated impacts to a broader guild of species. Indicator species should be demonstrably sensitive to the potential effect of interest, and suitable for inferring effects on other species.</p> <p>Species may be grouped into guilds for assessment based on similarities in ecology or vulnerability to Project effects, such as species at elevated risk of collision with vehicle traffic.</p> <p>By identifying focal species or guilds for each key indicator species within the Migratory Breeding Birds Valued Components (VCs), ECCC would be able to accurately review the Proponent’s assessment of impacts and mitigation measures in order to assess the accuracy of the Proponent’s conclusions and provide expert advice on the mitigation measures.</p> | Identify focal species/guilds for each key indicator species within the Migratory Breeding Birds valued components. Provide an updated analysis of Project effects on migratory birds. | <p>This response has not been accepted.</p> <p>The Proponent did not identify focal species for each key indicator species within the Migratory Breeding Birds valued components. This information is needed to accurately review the Proponent’s assessment of impacts and mitigation measures in order to assess the accuracy of the Proponent’s conclusions and provide expert advice on the mitigation measures.</p> | Not Accepted |
| IR-159 | - | ECCC | Migratory birds | 9.4.3.2.3 Baseline Studies – Migratory Songbirds | <p>Context and Rationale: Information presented in the draft EIS is insufficient to accurately predict Project impacts to breeding birds. The Proponent collected a single year of breeding songbird point counts and aerial waterfowl surveys (including avian species at risk). A single year of surveys in</p> | Supplement breeding bird point count data and aerial waterfowl data collected during 2017 with additional pre-construction field data or existing post-2017 data/modelling to provide a comprehensive baseline that can be used to verify Project impacts during construction and operational phases. | <p>This response has not been accepted.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|----------------------|---|--|---|---|--------------|
| | | | | Appendix 9-B, Section 2.10.2, Results | <p>which birds may be unusually scarce or abundant could severely compromise interpretation of post-construction monitoring data.</p> <p>Additionally, data presented in the draft EIS is from 2017 and ECCC advises that more recent data is needed for a comprehensive baseline to verify Project impacts.</p> <p>Data from the Saskatchewan Conservation Data Centre (HABISask), the Saskatchewan Breeding Bird Atlas and the Boreal avian Modelling project contain information on avian densities and avian species at risk that could supplement field data.</p> <p>The national standard for major projects recommends a minimum of two years of field surveys to be provided, so that temporal variability can be considered when comparing post-construction against baseline records and other available data.</p> <p>Updated Rationale: ECCC recommends that for major projects, a minimum of two years of field surveys should be provided so that temporal variability can be considered when comparing post-construction against baseline records and other available data. More recent data is needed due to landscape changes that may have occurred since 2017 as well as cumulative effects that have occurred in that time. Additionally, if there was an unusually high population density of birds in 2017 due to extraneous circumstances, Project effects may be attributed to a non-existent decline in the population when the discrepancy can be due to natural variability.</p> <p>A more recent baseline will account for interannual variation and any regional effects and will allow for a more accurate review of mitigation and follow-up measures. Data from the Saskatchewan Conservation Data Centre (HABISask), the Saskatchewan Breeding Bird Atlas and the Boreal Avian Modelling project contain information on avian densities and avian species at risk that could supplement field data.</p> | | <p>The Proponent’s response indicated that their opinion is that the data presented in the draft EIS is sufficient and that no updates to the draft EIS are needed.</p> <p>However, a single year of baseline data from 2017 is insufficient to assess Project impacts during the follow-up and monitoring program. Although pre-construction surveys prior to clearing can give a very localized picture of the avian community, it does not provide a baseline within the Regional Study Area (RSA) of the bird community and will be of limited use for comparing construction and operational monitoring data to baseline conditions. Use of more recent data or supplemental data can account for interannual variation and any regional effects and will allow for a more accurate review of mitigation and follow-up measures.</p> <p>See follow-up IR-142-159-167-R1.</p> | |
| IR-160 | - | ECCC | Migratory birds | Section 9.4.3.2.3 Baseline Studies – Migratory Songbirds | <p>Context and Rationale: ECCC advises that the results of the field studies need to be interpreted/analyzed in the context of the study area. The Proponent presents results on areas with highest richness and diversity but does not make a link to habitat that will be lost or experience indirect effects.</p> <p>Updated Rationale: Results regarding the effects of the Project, including a discussion on habitat types that will be lost or indirectly impacted during the life of the Project, and a discussion on the overall impact on the avian community including results from baseline studies as well as other supplemental information as per IR-159 are required to assess the validity of the Proponent’s conclusions and should be used in effects assessment.</p> | <p>Provide results interpreted in the context of Project direct and indirect effects. Include discussion on the habitat types that will be lost or indirectly impacted during the Project and the overall impact on the avian community, using results from the analysis of baseline studies and other supplemental data (as per IR-159).</p> <p>Discussion should support the conclusions of the effects assessment.</p> <p>See also related IRs: IR-161 and IR-162.</p> | <p>This response has not been accepted.</p> <p>The Proponent did not provide the information requested in IR-59. This information is required to assess the accuracy of the effects assessment.</p> | Not Accepted |

| | | | | | | | | |
| IR-161 | - | CNSC | Bird Species at Risk | Section 9.4.3.3 Appendix 10-A (ERA) | <p>Context: For the assessment of effects on Bird Species at Risk (SAR), in the EIS it was decided to use representative species for certain SAR birds:</p> <ul style="list-style-type: none">Olive-sided Flycatcher and Common Nighthawk were selected to represent Barn Swallow.Yellow Rail and Rusty Blackbird were selected as substitutes for Horned Grebe. <p>No further rationale is provided to demonstrate that the identified surrogate species are representative of the Barn Swallow and Horned Grebe in the EIS. For example, do they share a common diet?</p> <p>Moreover, in the residual effects assessment, limited discussion is provided on the conservatism of chosen suitable habitat types for both surrogate and represented species, in the calculation of habitat loss and alteration, as well as change in mortality. For example, how does habitat for Common Nighthawk and Barn Swallow overlap (do they use identical habitat types?) and how does this affect the calculation of habitat loss and alteration used to evaluate the magnitude of residual effect?</p> <p>Finally, in the ERA, Lesser Scaup is the surrogate for Horned Grebe. Yellow Rail is also represented by Lesser Scaup but Rusty Blackbird is represented by Olive-sided Flycatcher.</p> <p>Rationale: It is unclear what criteria were applied to select surrogate species for Barn Swallow and Horned Grebe, and how the chosen surrogates relate to Barn Swallow and Horned Grebe in terms of habitat type and range, nesting, and feeding requirements etc.</p> <p>There is also inconsistency with respect to the use of surrogate species for the Horned Grebe between the EIS and ERA supporting document.</p> | <p>1. Please provide additional information to justify the selection of surrogate species for Barn Swallow and Horned Grebe in the EIS. This should include a description of the similarity of SAR and associated surrogate species and any relevant uncertainties.</p> <p>2. Please provide conservative estimates of habitat loss and alteration for the represented and not directly assessed species (Barn Swallow, Horned Grebe).</p> <p>3. Please provide clarity as to why different surrogate species are used for Horned Grebe between the EIS and ERA.</p> <p>See also related IRs: IR-160 and IR-162.</p> | | Accepted |
| IR-162 | - | ECCC | Migratory birds | Section 9.4.3.3, Bird Species at Risk | <p>Context and Rationale: Not all avian species at risk present in the study area were included as Key Indicators in the avian species at risk (SAR) valued component (VC). Barn swallow and horned grebe were recorded in the study area, but not included as VCs. Additionally, bank swallow may inhabit the Project area. Impacts to Species at Risk Act Schedule 1 listed species need to be identified, avoided, lessened and monitored.</p> <p>In Section 9.4.3.3. the Proponent states: “It is acknowledged that the listed Barn Swallow (<i>Hirundo rustica</i>) and Horned Grebe (<i>Podiceps auratus</i>) could potentially occur in the Terrestrial RSA. Incidental observations occurred during the baseline studies (Appendix 9-B). To focus the effects assessment on a few key species (described in the following) it was decided to use Olive-sided Flycatcher and Common Nighthawk to represent Barn Swallow as well, and to use Yellow Rail and Rusty Blackbird as a substitute for Horned Grebe. Unlike Horned Grebe,</p> | <p>1. Explain how nesting habitat requirements of barn swallow is represented by common nighthawk and olive-sided flycatcher as a VC or assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>2. Explain how nesting habitat requirements of horned grebe are represented by yellow rail and rusty blackbird as a VC, or assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>3. Assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>See also related IRs: IR-160 and IR-161.</p> | <p>This response has not been accepted.</p> <p>Part 1. Of the IR was accepted, however the answer for part 2. And 3. Of the IR are insufficient in order to understand the Proponent’s rationale for using yellow rail and rusty blackbird to represent horned grebe. These species are all associated with wetlands, however, their specific habitat requirements and wetland types differ.</p> <p>Due to differing habitat selection and use, ECCC recommends that each selected VC is given an individual assessment with specific mitigation measures to allow for a more accurate review of the chosen mitigation measures.</p> | Not Accepted |

|--------------|----------------|------|----------------------|---|--|---|--|----------|
| | | | | | <p>Yellow Rail and Rusty Blackbird are also listed provincially.”</p> <p>Barn swallow, bank swallow and horned grebe may have different nesting habitat requirements than the representative species discussed in the draft EIS. An explanation of how differing species are representative of one another is required, or if an explanation cannot be provided, the species should be assessed individually.</p> <p>Updated Rationale: The management plans for these three species demonstrate the variability in their habitat selection.</p> <p>The Management Plan for the Yellow Rail (<i>Coturnicops noveboracensis</i>) in Canada (Environment Canada, 2013) states ”Yellow Rails inhabit shallow wetlands and other wet areas with grass-like vegetation. They breed in wetlands such as damp hay fields or meadows, floodplains, bogs, upper levels of estuaries, salt marshes (Bookhout 1995, Alvo and Robert 1999, COSEWIC 2009), shallow prairie wetlands, and wet montane meadows (Peabody 1922, Sherrington 1994, Popper and Stern 2000). “</p> <p>The Management Plan for the Rusty blackbird (<i>Euphagus carolinus</i>) in Canada (Environment Canada 2015), states: “Rusty Blackbirds tend to select breeding sites with a combination of freshwater bodies with shallow water and emergent vegetation for foraging that are adjacent to wetlands with conifers or tall shrubs with cover for nesting (Matsuoka et al. 2010a, Matsuoka et al. 2010b, Greenberg et al. 2011).”</p> <p>The Management Plan for the Horned Grebe (<i>Podiceps auritus</i>), Western population, in Canada (ECCC, 2022) states: “The Horned Grebe breeds in small (generally 0.5 to 2 ha, but ranging from 0.24 to 18.2 ha), shallow (at least 20 cm deep, but on average 40 cm), and usually fishless, perennial wetlands, but they can also nest on larger lakes with shallow edges and sufficient emergent vegetation. Breeding sites usually contain at least 40% open water with beds of emergent vegetation, such as sedges (<i>Carex</i> spp.), rushes (<i>Juncus</i> spp.) and cattails (<i>Typha</i> spp.) (Faaborg 1976, Kuczynski et al. 2012, Routhier 2012, Stedman 2018).”</p> <p>Due to differing habitat selection and use, ECCC recommends that each selected VC is given an individual assessment with specific mitigation measures. This will allow for a more accurate review of the chosen mitigation measures.</p> | | | |
| IR-163 | - | ECCC | Migratory birds | Section 9.4.3.3.3, Baseline Studies – Avian species at risk VCs | <p>Context and Rationale: The baseline studies and data analysis for species at risk (SAR) birds is insufficient to accurately predict Project effects.</p> <p>ECCC recommends the use of predictive modeling in relation to survey data and habitat attributes to produce distribution and density maps. Sites within the study area that support particularly high densities or diversity of an</p> | Provide additional information, including mapping/modelling of specific habitat requirements for each avian species at risk or provide a justification of models used in the draft EIS. | The additional information presented in the Proponent’s response provided an explanation for the models used in the draft EIS. | Accepted |

|--------------|----------------|------------------|----------------------|--|---|--|--|--------------|
| | | | | | individual species, based on direct observation and, where appropriate, distribution or occupancy models, would greatly improve confidence in Project impact predictions. Additional information on specific habitat use or models of habitat used by SAR would facilitate a more complete analysis of Project effects. | | | |
| IR-164 | - | ECCC | Migratory birds | Section 9.4.4.2.1, Alteration and/or Loss of Habitat – Migratory Breeding Birds | <p>Context and Rationale: The discussion on impacts to migratory songbirds presented by the Proponent is not sufficient to understand the impacts on various guilds of birds (e.g., aerial insectivores, forest birds, wetland birds, habitat specialists).</p> <p>As per IR-158, focal representative species/guilds should be used as key indicators (KI) in the Migratory Breeding Birds Valued Component. A greater level of detail on Project impacts to migratory songbirds with differing habitat requirements is needed for a fulsome assessment of effects.</p> <p>Updated Rationale: A greater level of detail, including a discussion on impacts to different focal species and/or guilds within the Migratory Breeding Birds Valued Component, is required for a more fulsome assessment of effects and identification of mitigation measures. Additionally, mapping detailing important features or habitat types that will be lost due to the Project for different guilds of migratory birds will be required to assess Project effects. This information will be required in order for the Proponent to apply adaptive management, and for ECCC to review the adequacy of these management plans.</p> | <p>1. Provide further discussion on impacts to different focal species/guilds within the Migratory Breeding Birds Valued Component.</p> <p>2. Provide mapping of important features or habitat types that will be lost due to the Project for different guilds of migratory birds.</p> | <p>This response has not been accepted.</p> <p>The Proponent did not provide the information requested in the previous Information Requirement. The discussion of impacts to different focal species/guilds within the Migratory Breeding Birds VC and mapping of important features or habitat types lost for these guilds of birds is required for the Proponent to apply adaptive management, and for ECCC to review the adequacy of these management plans.</p> | Not Accepted |
| IR-165 | - | CNSC ECCC | Birds (all species) | Section 9.4.4.2.2 Section 9.4.5.2.4, Avian Deterrence and Prevention of Entrapment Appendix 10-A (ERA) | <p>Context: On p. 9-364 of the EIS, it is stated that exposure to hazardous materials through contact with contaminated waste ponds could affect avian health and contribute to mortality.</p> <p>However, the ERA places the avian receptors only in waterbodies and locations outside of the Project area (see Figure 5-2 in the ERA), i.e., Whitefish Lake, McGowan Lake, the inlet to Russell Lake, and Kratchkovsky Lake.</p> <p>Further, there are insufficient details on the potential effects of the water quality in the water management and treatment facilities on birds, species at risk, and other wildlife, including the risk of bioaccumulation of contaminants. The Proponent should assess potential effects of water quality from these areas using applicable CCME guidelines.</p> <p>Rationale: It is unclear whether the ecological risk assessment based on the chosen exposure locations is protective and conservative for avian species potentially exposed to contaminated waste ponds on the Project site.</p> <p>While mitigation measures such as physical, visual, and/or auditory deterrents are proposed in Section 9.4.5.2.4, the possibility of avian species</p> | <p>Please perform an ecological risk assessment with avian receptors located at the contaminated waste ponds, including:</p> <p>1. Describe and analyze the possibility of birds, species at risk and other wildlife using the water or waste management facilities and provide an analysis to determine if there is a risk to wildlife that may access these areas.</p> <p>2. Identify the potential toxicity of water management ponds to aquatic migratory birds and species at risk (SAR).</p> <p>3. Describe what measures will be taken if the waters are found to be toxic to migratory birds and SAR.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends that Denison ensure adequate mitigation measures are implemented to minimize the potential for avian exposure to pond waters.</p> | <p>This response has not been accepted.</p> <p>Please provide an explanation for the appropriateness and conservatism of using the Canadian Council of Ministers of the Environment (CCME) water quality guidelines (WQG) for the protection of livestock for avian receptors, or update the tables provided in Attachment IR-165 using the CCME Water Quality Guidelines for the Protection of Aquatic Life.</p> <p>In order to protect migratory birds from the quality of water in the water management pond, it is recommended that the use of the CCME water quality guidelines for the protection of aquatic life to assess potential impacts to aquatic birds from water management facilities because they are more protective than the CCME water quality guidelines for livestock with lower acceptable levels for contaminants. The water quality guidelines for the protection of aquatic life should also be used to compare predicted contaminant concentrations in water management ponds. The FIRT is unable to verify predicted Project impacts to migratory birds using water management ponds as the selected CCME Water Quality Guidelines for livestock do not accurately reflect the exposure levels and pathways experienced by waterfowl and shorebirds.</p> | Not Accepted |

|--------------|----------------|------|----------------------|---|---|---|--|----------|
| | | | | | coming into contact with waste ponds cannot be excluded based on the available information in the EIS. The possibility of birds, species at risk, and other wildlife accessing the water management and treatment facilities for drinking water or other purposes is not discussed in the draft EIS. | | | |
| IR-166 | - | ECCC | Migratory birds | Section 9.4.5.2 Additional Avian Species-specific Mitigation Measures | <p>Context and Rationale: Avian species-specific mitigation measures are not presented in the draft EIS. The Proponent has committed to providing a variety of environmental management plans.</p> <p>Section 9.4.5.2 reads: “Additional mitigation measures specific to the Raptors, Migratory Breeding Birds, and Bird Species at Risk VCs, in accordance with the Migratory Birds Convention Act, and tailored to Project features will be incorporated into various Project management and monitoring plans such as the, erosion and sediment controls, soil and vegetation monitoring, wildlife monitoring, the Decommissioning Plan, air quality monitoring, Spill Response Plan, Radiation Protection Plan, surface water and effluent monitoring, and Waste Management Plan.”</p> <p>Migratory birds, the nests of migratory birds and/or their eggs can be inadvertently harmed or disturbed as a result of many activities, including but not limited to clearing trees and other vegetation, draining or flooding land, or using fishing gear; this is known as incidental take. This inadvertent harming, killing, disturbance or destruction of migratory birds, nests and eggs is prohibited under the MBCA. Incidental take, in addition to harming individual birds, nests or eggs, can have long-term consequences for migratory bird populations in Canada, especially through the cumulative effects of many different incidents. For further details, please refer to the Avoiding Harm to Migratory Birds website at: https://www.canada.ca/en/environment-climate-change/services/avoiding-harm-migratory-birds.html</p> <p>In order to assess the effectiveness of species-specific mitigations and need for additional mitigations ECCC requires details on the species-specific mitigation measures proposed, and the monitoring plans.</p> | Provide details on species-specific mitigations for species at risk (SAR) and other avian species that will include: <ul style="list-style-type: none">• details on what activity restrictions will be implemented for migratory birds and SAR and when they will be applied;• details on mitigations used during regular maintenance activities such as vegetation management (e.g., mowing), access road repair (e.g., aggregate stockpiles), and infrastructure repair;• details on methods used to detect species listed on Schedule 1 of the <i>Migratory Birds Convention Act</i> (e.g., Pileated Woodpecker) and mitigations/setback distances and timing to reduce risk to these species. | | Accepted |
| IR-167 | - | ECCC | Migratory birds | Section 9.4.5.2.1 Work Timing Windows and Habitat Disturbance | <p>Context and Rationale: The Proponent has stated that when it is not practicable to clear outside of the breeding bird window, they will conduct pre-clearing surveys. Section 9.4.5.2.1 states: “Prior to commencing any site clearing (i.e., vegetation clearing and/or soil disturbance) during the nesting season, pre-clearing nest surveys will be conducted at that location within the Project Area.”</p> <p>ECCC does not recommend the use of nest searches or pre-clearing surveys for active bird nests during the breeding season as a mitigation, given the difficulty associated with finding nests reliably and the high likelihood of disturbing nesting birds when searching. Instead, ECCC recommends that</p> | Provide the following information: <ul style="list-style-type: none">• details on how vegetation clearing related to site development will be conducted to minimize risk to migratory birds and species at risk (SAR).• the timing window that will be used for vegetation removal to reduce risk to migratory birds and SAR | Response is accepted, but also see AD-57 in the Advice to Proponent table and follow-up IR-142-159-167-R1. | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|----------------------|---|---|---|--|--------------|
| | | | | | clearing and grubbing activities not be conducted during the breeding bird season. The Migratory Birds Regulations 2022 (MBR 2022) brings new scenarios that need to be considered: <ol style="list-style-type: none">Most migratory birds: - Nests are protected only when they are in use or when live eggs or chicks are present.Migratory birds listed in MBR 2022 Schedule 1: - For the 18 species of migratory birds identified on Schedule 1, the MBR 2022 provide year-round nest protection until they can be deemed abandoned.Migratory birds listed under SARA: - For some SARA listed migratory birds, the residence prohibition (s.33) will protect nests that are not active, but are re-used in subsequent years, and the critical habitat prohibition (s.58) will protect nests that are part of the critical habitat identification. Those prohibitions apply everywhere in Canada and at all times of the year. In these cases, a SARA permit will be required. | | | |
| IR-168 | - | ECCC | Migratory birds | Section 9.4.5.2.4, Avian Deterrence and Prevention of Entrapment | Context and Rationale: The Proponent mentions that avian deterrents will be used on power transmission lines, buildings and other Project infrastructure. However, the Proponent does not mention any deterrents that will be used for deterring birds from the water or waste management facilities. Details on deterrents for all Project components should be identified to assess residual and cumulative impacts to migratory birds. | Provide information on avian deterrents to be used to prevent birds or other wildlife entering water or waste management ponds. 2. Explain how proposed timing of use of deterrents will reduce risk of migratory birds making contact with treatment waters outside of the nesting season (i.e., during migration and stop overuse). 3. Explain which deterrents will be used, which deterrents were considered, and what alternative, adaptive measures will be considered if deterrents are unsuccessful for any Project components. | The Proponent’s response is acceptable. The additional details the Proponent provided on avian deterrents are sufficient to explain how avian deterrents will be used to prevent birds or other wildlife from entering water or waste management ponds, which deterrent will be selected and why, and how they will function during and outside of the nesting season. | Accepted |
| IR-169 | - | ECCC | Migratory birds | Section 9.4.6.3, Residual Effects Evaluation for Migratory Birds, Table 9.4-15 and Map 9.4-11 | Context and Rationale: The analysis of available habitat types for migratory songbirds appears incorrect. In their interpreted ecosite mapping, the Proponent identified 25 different ecosite types. In their table 9.4-15 and map 9.4-11, the Proponent only lists 8 ecosite types that are available migratory songbird habitat. Section 9.4.6 Residual Effects Evaluation for Migratory Songbirds reads: “Considering the baseline data (Appendix 9-B), migratory songbird habitat is described in the following text without species-specific differentiation and referred to as available habitat for migratory songbirds. Based on the baseline study results, 66.8%, 52.2%, and 50.7% of the Project Area, Wildlife LSA, and Terrestrial RSA, respectively, are assumed to provide available habitat for migratory songbirds (Table 9.4-15).” All Project areas, except some anthropogenic features and open water, would be considered available habitat for migratory songbirds. Although | 1. Explain how information in Table 9.4-15 and map 9.4-11 were derived. 2. Explain why other habitat types were not considered as available habitat for migratory songbirds. | This response has not been accepted. In their response to IR-169, the Proponent states, “As per accepted methodology, to appropriately focus the habitat- based effects assessment, as per accepted EA methodology, the most frequently used habitat types (i.e., the ecosites experiencing the highest species richness, highest mean number of breeding songbird pairs, and highest species diversity) within the Project study areas were included as “available habitat” as shown in draft EIS Table 9.4-15 Summary of Available Habitat for Migratory Songbirds in the Project Study Areas and Figure 9.4-11 Available Habitat for Migratory Songbirds.” The methodology used to determine available habitat is not appropriate. The methodology used by the Proponent would be appropriate for the identification of higher quality habitat, but not as a representation of all available habitat. The methods used to determine available habitat may | Not Accepted |

|--------------|----------------|------|----------------------|---|---|---|--|--------------|
| | | | | | some ecosite types may have lower density and diversity, it is expected that all ecosites provide migratory songbird habitat. | | underrepresent rare ecosite types that were not sampled or were sparsely sampled, including ecosite types that may be important for species at risk. Avian habitat mapping/analyses should be corrected to reflect all available habitat to understand the location of habitat and the presence/absence of species. Repeat the analysis of available habitat to include all habitats used by birds, or a. Change mapping and analyses to indicate that areas identified are ecosites with the highest frequency of use, or b. Change mapping and analyses to show relative habitat use. | |
| IR-170 | - | ECCC | Migratory birds | Section 9.4.6.4, Residual Effects Evaluation for Bird SAR, Table 9.4-19 | <p>Context and Rationale: The table and map presented by the Proponent do not appear representative of all available habitat for common nighthawk (CONI). Although CONI do preferentially use open areas such as gravel (often an anthropogenic disturbance) and regenerating forest, as identified in the draft EIS, they also use rock outcrops that can be within forested areas. As this area lies within the pre- Cambrian shield, there are likely rock outcrops that are also available habitat.</p> <p>As aerial insectivores, CONI select nesting areas in close proximity to wetlands or lakes where there is abundant forage.</p> <p>Rationale: Habitat requirements and preferences for all species at risk is required for developing effective mitigations and adaptive management.</p> | 1. Provide an updated table and map that considers all available habitat for common nighthawk. 2. Additionally, as part of environmental management plans the Proponent should include species-specific mitigations that are biologically relevant to all the species at risk for all Project phases and components. | <p>This response has not been accepted.</p> <p>Part 1 of the IR was addressed, however, part 2 has not been addressed. ECCC requires this information to properly assess potential the mitigations and adaptive management for Common Nighthawk.</p> | Not Accepted |
| IR-171 | - | ECCC | Migratory birds | Section 9.4.6.4, Residual Effects Evaluation | <p>Context and Rationale: Section 9.4.6.4 Residual Effects Evaluation for Bird SAR – Common Nighthawk reads: “Progressive reclamation is anticipated to begin during Construction. However, a conservative approach is used, with Common Nighthawk (CONI) habitat in the Project Area considered to be unavailable for the duration of the Project, only becoming available as habitat following Post-Decommissioning (i.e., during the regeneration of vegetation following Decommissioning).”</p> <p>CONI may nest on the roadsides of access roads within the Project area. As such, the Project area should still be considered available habitat for the duration of the Project and appropriate mitigations and adaptive management should be discussed for this species.</p> | Develop mitigation plans appropriate for avoiding collisions of common nighthawks with vehicles, when and where nighthawks are observed foraging near or roosting on gravel roads. Demonstrate how the planned mitigation activities will result in reduced residual effects from this pathway. | | Accepted |
| IR-172 | - | CNSC | Birds (all species) | Section 9.4.6.4.2 | <p>Context: Populations of listed species may be less resilient to changes in mortality.</p> <p>CSA N288.6:22 Clause 7.2.4.3 states that effects on a few individuals of endangered, threatened, or vulnerable species would not be acceptable.</p> <p>The residual effects assessment for “Change in Mortality” for bird species at risk states that Project mitigation measures identified in Section 9.4.5 are</p> | Please provide a discussion on mitigation measures with respect to their effectiveness in minimizing mortality for bird species at risk, for which effects on a few individuals would not be acceptable. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-----------------------------|--|---|---|--|--------------|
| | | | | | <p>expected to limit interactions between bird species at risk and potential sources of direct and indirect mortality. However, the mitigation measures are not discussed with respect to their effectiveness to limit interactions, specifically for bird species at risk.</p> <p>Rationale: It is unclear if the proposed mitigation measures are effective in preventing mortality in bird species at risk for which even only a few deaths could negatively impact the population.</p> | | | |
| IR-173 | - | ECCC | Migratory birds | Section 9.4.8 Monitoring and Follow-up | <p>Context and Rationale: Monitoring and follow up programs are part of adaptive management and implementation of additional mitigations.</p> <p>In Section 9.4.8 the Proponent states: “Considering the Project planning, baseline survey results, and proposed mitigation measures, no follow-up programs are considered to be warranted at this time.”</p> <p>Project impacts related to mortality of birds, such as collisions with the transmission line, mortality along roads and use of waste and water management facilities should be monitored during all phases of the Project and adaptively managed.</p> | <p>Provide details on the follow-up program to monitor impacts to avian mortality. The follow-up plan should include:</p> <ul style="list-style-type: none">• Monitoring of avian use of waste and water facilities• Monitoring of mortality along access roads• Monitoring of mortality related to transmission lines• Monitoring of effectiveness of avian deterrents. | | Accepted |
| IR-174 | - | ECCC | SAR – Bats | Appendix 9-B, Denison Mines Corporation Wheeler River Project, Terrestrial Environment, Wildlife and Vegetation Baseline Inventory, Section 2.1.4 Acoustic Bat Surveys | <p>Context: The Proponent conducted acoustic surveys for bats and confirmed presence of two Species at Risk Act (SARA) schedule 1 listed bat species in the Project area, little brown myotis (<i>Myotis lucifugus</i>) and northern myotis (<i>Myotis septentrionalis</i>). However, the Proponent did not do an effects assessment of either of these bat species.</p> <p>Rationale: Although bats are present in the study area, no work was done to identify hibernaculum or maternal roosting sites. All species at risk that are expected to be present in the Project area should be assessed and species-specific mitigations detailed.</p> | <p>1. Conduct an effects assessment for little brown myotis and northern myotis, including the likelihood that tree clearing during the bat roosting period, is likely to ‘kill’, ‘harm’, or ‘harass’ Little Brown Myotis and Northern Myotis and its ability to carry out its life processes.</p> <p>2. Describe and map locations of suitable myotis hibernacula and/or maternal roost habitat within the Local Study Area and Regional Study Area and explain how these habitats may be affected by Project activities.</p> <p>3. Describe what mitigation measures will be taken to avoid the breeding period for bats.</p> <p>4. Describe any pre-construction/pre- clearing surveys will be conducted to identify any hibernaculum and maternal roosting sites. Describe how monitoring will support adaptive management.</p> | <p>This response has not been accepted.</p> <p>Items 1., 3. And 4. of IR-174 are accepted, however, item 2. Of IR-174, which asked for mapping of suitable myotis habitat, was not addressed.</p> <p>Mapping of suitable habitat or results from baseline studies is required to understand Project impacts to Species At Risk (SAR) bat species. This may include providing mapping of bat acoustic results, including locations along with frequency of detections.</p> <p>See also IR-134 and follow-up 134-R1.</p> | Not Accepted |
| IR-175 | - | CNSC | Provincially Listed Species | Appendix 9-B; section 2.2.2 | <p>Context: Vegetation and wildlife habitat characterization field surveys were completed in 2017, based on which ecosite factsheets were prepared. The factsheets list observations of two provincially listed plant species with a rank of S3 (vulnerable/rare to uncommon; Table 2.4-2) according to the Saskatchewan Conservation Data Centre, which are not discussed in the main EIS document:</p> <ul style="list-style-type: none">• Angle-leaved sundew (<i>Drosera anglica</i>) observed in ecosites BS19, BS20, BS22, BS25• Neat Spike-rush (<i>Eleocharis nitida</i>) observed in ecosite BS25 | <p>1. Please provide a discussion on the potential risks from indirect effects on ecosites with observed rare plant species</p> <p>2. Please provide additional information on the ecosites included in the planned pre-construction listed plant surveys</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends focusing monitoring on ecosites that have known observations of listed plant species outside of the Project Area (e.g., BS19, BS20, BS22, BS25).</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|---|--|---|----------------------|----------|
| | | | | | <p>Table 9.2-12 in section 9.2.6.2.1 of the EIS indicates that there may be indirect disturbance to some of these ecosites (BS19, BS20, BS25). In section 9.2.6.3.1 it is discussed that listed plant species are not likely to return once lost from a specific location.</p> <p>Rationale: Given that not all areas in the revised Project footprint were surveyed for listed plant species in baseline studies, there is uncertainty as to whether any species were missed, in particular those that have been observed in ecosites present in the LSA/RSA (e.g., <i>Drosera anglica</i> and <i>Eleocharis nitida</i>, see also Appendix 2 Table of Appendix 9-B). It should also be noted that rare plant surveys were completed in summer 2017 only (section 2.4.2 of Appendix 9-B), which may underestimate annual rare species that may be dormant in the seed bank in some years due to specific seed emergence requirements.</p> <p>It is acknowledged that the Proponent committed to pre-construction listed plant surveys targeted on ecosites encountered in the Project Area but not previously surveyed, as well as ecosites within the Project Area with high potential to support listed plants.</p> <p>More information is requested on the potential indirect effects on rare plant species as well as the planned pre-construction surveys.</p> | | | |
| IR-176 | - | CNSC | Human Health with respect to radiation exposure | Section 10.1.4.2.1 Section 10.1.6.1.4 Appendix 10-A (ERA) | <p>Context: In section 10.1.4.2.1, the Proponent provides an evaluation of air quality constituents of potential concern to human health. It states: “A screening value for radon gas of 200 becquerels per cubic metre (Bq/m3) was available from Health Canada, which applies to total radon including background sources (Health Canada 2009). The radon concentrations which were predicted are incremental concentrations (i.e., above background) and were therefore compared to the applicable incremental screening value of 60 Bq/m3 for indoor air established by the Canadian Nuclear Safety Commission (CNSC) (Health Canada 2010a; Radiation Protection Regulations. SOR/2000-203).”</p> <p>The 60 Bq/m3 radon concentration value also appears in section 7.1.2 of Appendix 10-A (ERA).</p> <p>Further in section 10.1.6.1.4, it is stated: “Radon dose was calculated separately from the dose due to other radionuclides; however, the predicted radon concentration was compared against the CNSC incremental concentration limit of 60 Bq/m3.”</p> <p>The Radiation Protection Regulations do not stipulate a limit for radon above background for sites licensed by the CNSC. The effective dose limits for Nuclear Energy Workers (NEWs) and persons that are not NEWs are listed in section 13 of these regulations, and in subsection 1(3) of these regulations</p> | <p>The EIS and appendices should be aligned with the Radiation Protection Regulations by:</p> <ol style="list-style-type: none">1. Removing the reference to a 60 Bq/m3 limit.2. Reporting the assessment results as the total dose, from all radionuclides combined including radon progeny, and by comparing this annual effective dose to the effective dose limit. <p>Provide a summary of the conservative assumptions that have been included in the dose calculations.</p> <p>Provide a reference that shows how the radon equilibrium factors were determined.</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-----|---|---|---|--|--|----------|
| | | | | | <p>for the general public.</p> <p>The annual effective dose from all sources associated with the licensed activities and within the scope of the Nuclear Safety Control Act and Regulations must be compared to the applicable effective dose limit. For members of the public this limit is 1 mSv per calendar year.</p> <p>In Section 4.2.5.3 of Appendix 10-A (ERA), there appears to be no reference mentioned for the radon equilibrium factors. These factors are a significant input into the dose calculations for radon.</p> <p>Rationale: The reason for the requested change is to ensure consistency with the Radiation Protection Regulations.</p> | | | |
| IR-177 | - | HC | Change to an environmental component due to radiological contaminants | <p>Section 10.1.4.2.1 (p. 10-22)</p> <p>Appendix 10-A (ERA) : Appendix B Table B.9, Ref. 19-2638</p> <p>Section 6, Table 6.1-1 (p. 6-7)</p> | <p>Context: Section 10.1.4.2.1 states that, “Screening values for radionuclide concentrations in ambient air were not available. All relevant radionuclides were assessed in the HHRA in terms of their contribution to the total radiological dose to human and ecological receptors” (p. 10-22).</p> <p>Section 10 Appendix 10-A (ERA) states that, “No formal screening was conducted for radionuclides. However, since radiation dose to human receptors is of public and regulatory interest, the radionuclides in the uranium-238 decay series are carried forward as COPCs for further assessment” (Appendix 10-A (ERA): Appendix B Ref. 19-2638).</p> <p>Table 6.1-1 lists radionuclides as a key indicator for air quality, but only uranium and radon are considered in Section 6, and Section 10 Table B.9 does not include doses from uranium progeny in air.</p> <p>Rationale: Health Canada recommends using screening values that are available for radionuclides if they are appropriate for the dose and if the screening values have listed assumptions (such as particulate size and worker exposure time that can be adapted to in Denison’s models). Two examples are ICRP 96, which CNSC uses in their regulatory reports to derive reference air quality values for Pb-210, Ra-226, and Th-230 (CNSC: Regulatory Oversight Report for Uranium Mines and Mills in Canada 2019); and Health Canada’s Guidelines for Management of NORM (Health Canada: Canadian Guidelines for the Management of Naturally Occurring Radioactive Materials, 2011).</p> | <p>1. Assess predicted radionuclides in Section 10 Appendix 10-A (ERA) using appropriate available screening values. Alternatively, provide a justification for why a screening wasn’t conducted for radionuclides despite the availability of screening values (e.g., ICRP 96 and NORM Guidelines, 2011).</p> <p>2. Clarify if uranium progenies in air are considered in the atmospheric transport and air quality modelling and are simply not reported, or if they are not included in the models because no screening criteria are available.</p> | Response is accepted, but also see AD-55 in the Advice to Proponent table. | Accepted |
| IR-178 | - | HC | Change to an environmental component due to hazardous contaminants | <p>Section 10.1.4.2.1 (p. 10-22)</p> <p>Section 6.1.4.2, Potential Project Related Effects (p. 6-31)</p> | <p>The Baseline + Project scenario was not provided for radon levels.</p> <p>Context: Section 6.1.4.2 states that the predicted levels for radon were not added to the respective baseline air quality levels (p. 6-31), and further explains that “In all modelled phases of the Project, annual average radon concentrations at receptors beyond the Property Boundary are expected to be indiscernible from background levels.”</p> | <p>1. Provide further information on whether and how baseline radon concentrations in air were determined.</p> <p>2. Include baseline radon concentrations in the predicted total concentrations when comparing to existing guidelines; alternatively, provide a rationale for why baseline concentrations of radon were not included.</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|--|--|--|--|----------|
| | | | | | <p>In Section 10.1.6.1.4, a different approach to evaluating predicted radon levels is mentioned: “the predicted radon concentration was compared against the CNSC incremental concentration limit of 60 BQ/m3”(p. 10-44).</p> <p>Rationale: Without a rationale as to why baseline levels of radon were not included in the assessment, HC cannot fully evaluate the appropriateness of the air quality assessment. While Health Canada is of the opinion that using background radon levels as a screening value is appropriate in this case from a health perspective, different approaches to screening predicted radon levels in different sections appear to be used (i.e., background radon levels vs. CNSC incremental concentration).</p> | 3. Discuss the potential health implications of the project-only increment-over-baseline radon levels | | |
| IR-179 | - | CNSC | Groundwater quality decommissioning objectives. | Section 10.1.4.2.2, Release of Treated Effluent to Whitefish Lake During Decommissioning | <p>Context: It is stated that “This process would continue until the recovered water meets acceptable groundwater quality decommissioning objectives”.</p> <p>Rationale: The information provided does not include groundwater quality decommissioning objectives nor a reference to these objectives.</p> | Please provide groundwater quality decommissioning objectives or a reference to the information. | | Accepted |
| IR-180 | - | CNSC | Human health with respect to hazardous contaminants | Section 10.1.6.1.1, Human Receptors Selection and Characterization | <p>Context: Within the Human Health assessment, offsite receptors during the operation period are only considered downstream of Whitefish Lake. The only identified concern was for Se to the Fisher/Trapper located at Russel Lake. This section cites Indigenous Knowledge as informing the receptor selection and location.</p> <p>Rationale: While the assessment is fairly conservative in the assumptions made on intake and receptor habits, it stands to reason that if the trapper receptor was located closer to the operation, such as at McGowan or Whitefish Lakes, this exceedance of Se could be more pronounced.</p> <p>In terms of maintaining a conservative assessment, if the most vulnerable receptor can be shown to be protected at the point of highest expected COPC concentration, it can be concluded that this receptor would be protected further away from the Project. Considering this, why was the hunter/trapper receptor not also assessed at Whitefish or McGowan Lake? Was Indigenous Knowledge specific in mentioning Whitefish or McGowan Lakes were not used for the activities carried out by identified receptors?</p> | <p>Please provide justification for excluding a receptor from occupancy at lakes closer to the Project during operation (McGowan, Whitefish). Alternatively, conduct a risk assessment to a receptor at these lakes during operation to determine if there is a predicted risk that may require monitoring or mitigation.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends the following:</p> <ul style="list-style-type: none">Assessment of a receptor located closer to the point of effluent release may need to be considered to ensure there are negligible risksIf Se is expected to exceed hazard quotients further upstream, selenium removal technology may be required as part of the effluent treatment process as a mitigation measure. Other COPC’s exceeding an HQ of 1 may also be identified under this process that could require specific monitoring or mitigation measures. | Response is accepted, but also see AD-59 in the Advice to Proponent table. | Accepted |
| IR-181 | - | CNSC | Human Health with respect to radiation exposure | Section 10.1.6.1.4 | <p>Context: In section 10.1.6.1.4, it is stated: “The maximum incremental radon concentration at the camp worker site during Operation was predicted to be 12.4 Bq/m3, which is below the CNSC limit of 60 Bq/m3 for incremental radon.”</p> <p>As per IR-176, there is no such CNSC limit for incremental radon.</p> <p>The camp worker would be considered a person who is not a nuclear energy worker (NEW) and subject to the dose limits of section 13 and 14 of the</p> | <p>The EIS and appendices should be aligned with the Radiation Protection Regulations by:</p> <ol style="list-style-type: none">Removing the reference to a 60 Bq/m3 limit for incremental radon.Revising all references to the ‘public dose limit’ applied to camp workers (non-NEWs) to align with section 13 and 14 of the Radiation Protection Regulations. <p>The Proponent should explain why the radon dose for the camp worker appears as 0.13 mSv/year in one instance and 0.02 mSv/year in another.</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-----|---|---|--|--|---|----------|
| | | | | | <p>Radiation Protection Regulations, not the dose limit for the general public as per subsection 1(3) of the Radiation Protection Regulations. The CNSC has regulatory requirements for the ascertainment and recording of doses of radiation as per section 5 of the Radiation Protection Regulations. Every licensee must ascertain and record the magnitude of exposure to radon progeny, the effective dose and equivalent dose received by and committed to a person who performs duties in connection with any activity that is authorized by the Nuclear Safety and Control Act or is present at a place where that activity is carried on.</p> <p>The camp worker performs duties in connection with the licensed activity and is present at the location where the activity is carried out. Hence, they are not considered to be a member of the general public (who has no connection with the activity)</p> <p>Further, the Proponent indicates that the maximum incremental radon dose to the camp worker was estimated to be 0.13 mSv/year during Operation. The assessment assumes that the camp worker spends 100% of the time indoors. Table 10.1-11 shows the maximum total incremental dose for the camp worker to be 0.02 mSv/year. This appears to be a discrepancy.</p> <p>Table 5.2 in Appendix 10-C provides internal annual dose from radon inhalation. The radon doses to some NEW workers (9.44E-02 mSv/a Driller 1 and 1.03E-01 mSv/a Wellfield Operator 1, 2) here appear less than the radon dose (0.13 mSv/year from section 10.1.6.1.4) to the camp worker, who is a non-nuclear energy worker.</p> <p>Rationale: The reason for the requested change is to ensure consistency with the Radiation Protection Regulations and the environmental impact statement.</p> | <p>The Proponent is also asked to provide the rationale as to why a non-NEW has a higher radon dose than a NEW.</p> | | |
| IR-182 | - | HC | Change to an environmental component due to radiological contaminants | Section 10.1.6.1.4, (p. 10-44) | <p>Context: Section 10.1.6.1.4 states, “The limit is incremental and is exclusive of natural background, such as natural levels of radon and medical exposures. A dose constraint of 0.3mSv/yr was established for the public from all radionuclides and all pathways for the Project, as recommended by Health Canada (2010a). The dose constraint represents a dose lower than the public dose limit that ensures the combined dose from multiple sources does not result in exceedance of the public dose limit. Radon dose was calculated separately from the dose due to other radionuclides; however, the predicted radon concentration was compared against the CNSC incremental concentration limit of 60 BQ/m3” (p. 10-44).</p> <p>Rationale: Calculating radon separately from all radionuclides may underestimate the health risks by not considering combined doses from multiple sources when comparing to the public dose limit constraint of 0.3 mSv/yr recommended by Health Canada (2010a).</p> | <p>1. Provide clarification on how combined doses from all sources would be accounted for in respecting the public dose limit of 0.3 mSV/yr if radon concentrations are being calculated separately.</p> | <p>Response is accepted, but also see AD-65 in the Advice to Proponent table.</p> | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|--|---|---|----------------------|----------|
| IR-183 | - | CNSC | Human Health with respect to radiation exposure | Section 10.2 Appendix 10-C | Context: Exposure scenarios for workers have been identified and high-level summaries of the assumptions and resultant dose estimates have been provided. However, the detailed dose calculations have not been provided. Rationale: The method used to estimate effective, equivalent and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data, for at least the most dose significant scenarios. | Provide the dose calculations for deriving the dose estimates for workers in all exposure scenarios, for at least the most dose significant scenarios. | | Accepted |
| IR-184 | - | CNSC | Human Health with respect to radiation exposure | Section 10.2 Appendix 10-C, 2.0 | Context: It is stated in Appendix 10-C, section 2.0 that: “In addition, the CNSC has proposed a 100 mSv 5-year equivalent dose to lens of eye, in accordance with recent recommendations of the International Commission for Radiological Protection (ICRP, 2012a). This implies an average annual equivalent dose to lens of 20 mSv/a and will be considered as an applicable dose limit for workers.” As per section 14 of the Radiation Protection Regulations, the equivalent dose limit for the lens of an eye for nuclear energy workers (NEWs), effective January 1, 2021, is 50 mSv in a one-year dosimetry period. Rationale: The reason of the requested change is to ensure consistency with the Radiation Protection Regulations. | The EIS and Appendix 10-C should be aligned with the Radiation Protection Regulations regarding the equivalent dose limit for the lens of an eye for NEWs. | | Accepted |
| IR-185 | - | CNSC | Human Health with respect to radiation exposure | Section 10.2.3.2 Appendix 10-C Table 3.10-3.12 | Context: The Geometries for External Exposure Scenarios Modelled in MicroShield for Sources in various locations were provided in tables 3.10-3.12 in appendix 10-C. The doses from those scenarios were omitted. Rationale: The method used to estimate effective, equivalent, and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data. | The Proponent is asked to provide all the necessary information and assumptions required to perform the MicroShield calculations independently and to list the resulting calculated values from the listed scenarios. | | Accepted |
| IR-186 | - | CNSC | Human Health with respect to radiation exposure | Section 10.2.3.2.4 Section 10.2.3.2.6 Section 10.2.4 Appendix 10-C, Section 3.2 | Context: In sections 10.2.3.2.4 and 10.2.3.2.6, as well as section 3.2 of Appendix 10-C, the Proponent has stated that workers in the drying and packaging areas of the processing plant will be required to wear powered air purifying respirators (PAPR) to reduce/eliminate inhalation exposure. Further in section 10.2.4, which elaborates mitigation measures, it is stated: “For the drying and packaging/loading areas of the ISR plant, use of PAPR has been assumed. It will be needed in these areas, and it has been planned in these areas to substantially reduce doses from inhalation of uranium dust. Dust levels in these areas will be monitored and kept ALARA.” The use of respirators appears to be in contradiction of the requirements of section 13 of the Uranium Mines and Mills Regulations, which states: <i>No licensee shall rely on the use of a respirator to comply with the Radiation Protection Regulations unless the use of the respirator (a) is for a temporary or unforeseen situation; and (b) is permitted by the code of practice referred</i> | Provide the rationale for mandating the use of respirators by workers in the drying and packaging areas of the processing plant. Include the demonstration of the application of the hierarchy of control for radiological protection within the design of these areas of the processing plant. Justify that this approach complies with section 13 of the Uranium Mines and Mills Regulations. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|---|--|--|----------------------|----------|
| | | | | | <i>to in the licence.</i> The Proponent is also reminded that respirators should not be the first choice for dose reduction in workplaces. They should only be used when the hierarchy of control (elimination, substitution, engineering, or administrative controls) is not possible. Rationale: At this stage of the Project, the Proponent is expected to identify design improvements to these areas of the ISR plant/processing plant following the hierarchy of control for the radiological protection of workers, as per regulatory requirements and as described in REGDOC-2.7.1, <i>Radiation Protection</i> . | | | |
| IR-187 | - | CNSC | Human Health with respect to radiation exposure | Section 10.2.3.2.4 Section 10.2.3.2.6 Appendix 10-C, Section 3.3, 6.0 | Context: The exposure scenarios and assumptions for the workers in the drying area and the packaging/loading area of the processing plant include the wearing of PAPRs, which is assumed to provide a 1000-fold reduction in dust exposure. Further to reference IR-186, the use of a respirator as well as in worker dose predictions for the Project, appears to contravene section 13 of the Uranium Mines and Mills Regulations, and does not follow the hierarchy of controls for radiological protection of workers as described in REGDOC-2.7.1, Radiation Protection. Rationale: At this stage of the Project, the Proponent is expected to identify design improvements to these areas of the ISR plant/processing plant following the hierarchy of control for the radiological protection of workers, as per regulatory requirements and as described in REGDOC-2.7.1, <i>Radiation Protection</i> . | Modify the exposure scenarios and assumptions (i.e., remove the use of a respirator) for the workers in the drying area and the packaging/loading area of the processing facility. Assess the resultant exposures against CNSC regulatory dose limits and the ALARA principle. Identify mitigation measures as per the hierarchy of control for radiological protection. | | Accepted |
| IR-188 | - | CNSC | Human Health with respect to radiation exposure | Section 10.2.4 | Context: The following is stated in section 10.2.4: “Dust inhalation is also a potentially substantial component of worker dose at the core shack. At this location, PAPR will not be required; however, N95 masks will be used, and dust levels will be monitored here...It may be possible to increase air exchange in the core shack, above the planned six exchanges per hour, should this be necessary. This would also reduce radon exposure in the core shack.” If it is possible to increase air exchanges in the core shack, it is not clear why this was not assessed and incorporated in the design of the core shack. Rationale: It appears that a control measure (e.g., air exchange protocols in the core shack) to reduce the exposure to workers has been identified. However, it is not certain if it has been formally documented to ensure that it is incorporated in the engineered design of the core shack. | Provide details on how the control measures to reduce the exposure to both workers through the air exchange protocols in the core shack have been formally documented to ensure that it is incorporated in the engineered design of the core shack. | | Accepted |

|--------------|----------------|------|--|---|--|---|--|--------------|
| IR-189 | - | CNSC | Woodland Caribou Ecological Model | Appendix 10-A (ERA) | <p>Context: In the ERA (p. C.12, section 2.3.6 Woodland Caribou) it is stated: “For the ecological model a diet comprised of 50% browse, 20% lichen and 30% macrophytes is assumed for the woodland caribou.”</p> <p>In the EIS, section 9.3.3.3.1, it is stated: “Research has shown that up to 70% of the year-round diet of caribou may consist of ground and arboreal lichens.”</p> <p>Rationale: It is unclear whether the assumptions in the ecological model in the ERA regarding Woodland caribou diet are conservative, given only 20% lichen intake in the model. Lichen is known to accumulate COPC such as metals and dust from the atmosphere.</p> | <p>Please provide additional evidence to support that those Woodland Caribou who may have higher consumption rates of lichen as part of their diet, will remain protected. This can be provided through including a second model that assumes 70% lichen in the diet.</p> <p>See also related: IR-138.</p> | <p>This response has not been accepted. Please:</p> <ol style="list-style-type: none">1. Provide a summary table of all hazard quotients for the second woodland caribou model assuming a diet of 70% lichen, 20% browse, and 10% macrophytes, for completeness.2. Clarify if the Appendix 10-A (ERA) will be updated to include the second woodland caribou model. | Not Accepted |
| IR-190 | - | HC | Change to an environmental component due to hazardous contaminants | Appendix 10-A (ERA), Table 3-8 (p. 3.31) and Table 3-9 (p. 3.36) Appendix 6, Table 5 (p. 16) | <p>NO2 criteria is not being consistently compared.</p> <p>Context: Provincial and federal air quality criteria/screening values for NO2 have been used inconsistently.</p> <p>Table 3-9 in Appendix 10-A (ERA) uses the 2015 Saskatchewan Ambient Air Quality Standards (SAAQS) value of 300 µg/m3 to compare the maximum concentrations of NO2 at receptor locations for the 1-hour average period, while Table 5 of Appendix 6 uses the 2025 Canadian Ambient Air Quality Standards (CAAQS) of 79µg/m3 for the same average period time.</p> <p>Rationale: By utilizing the SAAQS screening value for NO2, the maximum concentrations at receptor locations exceed the 1-hour threshold solely during the decommissioning stage (Table 3-9). However, if the 2025 CAAQS are applied, the screening values would be exceeded at receptor locations for all project phases. It is best practice to use the more protective air quality standards to evaluate potential human health risks associated with project activities.</p> | <p>1. Compare the predicted maximum concentrations to the most protective applicable air quality standards available. Alternatively, provide a rationale as to why the SAAQS for NO2 were used rather than the more protective 2025 CAAQS to determine potential exceedances and screen for the need for additional mitigation measures.</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends use of the standards from the 2025 CAAQS for NO2 in future mitigation and follow-up plans.</p> | <p>This response has not been accepted, as the rationale for not applying the CAAQS in the assessment is not accurate.</p> <p>Health Canada acknowledges the commitment to use the 2025 CAAQS for NO₂ in future mitigation and follow-up plans. However, the response to IR-190 did not compare the predicted maximum concentrations to the most protective applicable air quality standards available (i.e., CAAQS), and included the following rationale:</p> <p><i>The CAAQS are applicable to measured ambient air concentrations over a three-year period and are not applicable to modelled results from a single facility; and, Use of the CAAQCs would require a three-year site specific data set.</i></p> <p>The statement is incorrect. The CAAQS are national air quality standards, but they are not restricted to applications within the context of the Air Quality Management System (AQMS). The comparison with CAAQS may be considered in determining the nature and severity of the Project’s impact on air quality levels and the resulting mitigation measures that may be required to maintain good air quality levels or to prevent an exceedance of the CAAQS.</p> <p>The CAAQS are generally calculated for specific multi-year averages and for a particular statistical form so that extreme and unpredictable events do not drive risk management. However, if the data is not available for comparison to a full CAAQS timeframe, Health Canada suggests using model results for at least one calendar year to allow for a basic comparison with the CAAQS statistical form. The modelling results should be able to indicate the frequency of CAAQS exceedances, which can be used in the discussion as to whether any anticipated human health impacts are anticipated.</p> <p>Please see the Advice to the Proponent table for further discussion on the use of CAAQS (AD-69), which also notes that, while being more conservative than the NAAQO, Saskatchewan & Alberta’s screening value do not reflect</p> | Not Accepted |

|--------------|----------------|-----|--|---|--|--|---|--------------|
| | | | | | | | the most recent science, which indicates that there is no apparent threshold for NO ₂ , meaning that health effects may occur at any level of exposure. See also follow-up IR 190-R1. | |
| IR-190 | IR-190-R1 | HC | Change to an environmental component due to hazardous contaminants | Section 6.1.3.2.2 (p. 6-21) Table 6.1-8 (p. 6-22); and, Table 6.1-9 (p. 6-22) Section 6.1.8 (p.6-44) IR-190 Response from Denison | <p>Limitations with the proposed use of passive NO₂ monitoring would not allow comparison of measurement results to the 2025 CAAQS for 1-hour NO₂.</p> <p>Context: In response to IR-190, there was agreement to using the 2025 CAAQS for NO₂ in future mitigation and follow-up plans, which Health Canada supports. However, the proposed air quality monitoring and follow-up plans (Chapter 6.1.8) anticipate continued use passive NO₂ samplers, which do not measure hourly (1-hour) concentrations.</p> <p>Section 6.1.3.2.2 indicates that the assessment makes use of passive samplers to measure NO₂ at two sampling locations. The results from those samplers are presented in tables 6.1-8 and 6.1-9, for a ~30-day sampling period (i.e., a total concentrations for NO₂ in ambient air over ~30 days).</p> <p>While passive samplers provide measurement data for comparison to the annual 2025 CAAQS for NO₂, measurement data for the 1-hour NO₂ standard commonly requires use of an active sampler.</p> <p>Rationale: Health Canada encourages the monitoring of air contaminants when exceedances or near-exceedances of air quality criteria, standards and/or guidance values are predicted or reported, to:</p> <ul style="list-style-type: none">• determine the accuracy of predictions;• help verify whether standards are being met; and,• assist with implementing or modifying mitigation measures. | <p>1. Provide additional details on proposed air quality monitoring for NO₂ that will allow for comparisons to both the 1-hour and annual 2025 CAAQS and how that will be used to support mitigation and follow-up plans. Distinguish between comparisons with measured and modelled monitoring data, as well as use of passive and active samplers.</p> <p>2. If multiple approaches will be used to monitor NO₂ (e.g., use of passive and/or active samplers, modifications due to differences between project phases, etc.), describe their intended contribution to the monitoring objectives and outcomes (e.g., determine the accuracy of predictions; assist with implementing or modifying mitigation measures).</p> | | Follow-Up IR |
| IR-191 | - | HC | Change to an environmental component due to hazardous contaminants | Appendix 10-A (ERA), Table 3-9 (p. 3.36) and Table 3-10 (p. 3.46) Section 6.1.8 (p. 6-44) | <p>Non-threshold substances are not included in screening and monitoring plans.</p> <p>Context: Fine particulate matter (PM_{2.5}) is not being considered further in secondary air quality screening for short and long-term exposure at human and ecological receptors because it is not predicted to exceed the screening values of the Ontario Ambient Air Quality Criteria (OAAQC) or the Canadian Ambient Air Quality Standards (CAAQS) for both annual and 24-hour average periods (Tables 3-9 and 3-10). Furthermore, it is not compared against the baseline for analysis.</p> <p>Table 3-9 indicates that coarse PM (PM₁₀) is predicted to exceed the 24-hour CAAQS during all phases of the Project. However, Appendix 10-A p. 3.46 states that, “There were no exceedances of PM_{2.5} which is generally considered to be a more reliable indicator of potential health effects. However, health effects would be infrequent and reversible, subsiding after</p> | <p>1. Include PM_{2.5} and PM₁₀ in the secondary air quality screening for short and long- term exposure at human receptors.</p> <p>2. Include PM₁₀ and PM_{2.5} in the air quality monitoring plan as they are non- threshold substances.</p> <p>3. Provide a discussion of the significance of predicted exceedances of health- based standards.</p> <p>4. Identify additional mitigation measures to reduce concentrations of non-threshold air contaminants associated with the Project.</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends use of the <u>2025 CAAQS Management Levels</u> to develop mitigation measures that reduce project contributions of non-threshold pollutants (e.g., PM_{2.5}, NO₂).</p> | | Accepted |

|--------------|----------------|------|--|--|---|---|--|--------------|
| | | | | | <p>exposure; therefore, PM10 was not considered for further quantitative assessment in the ERA.”</p> <p>PM10 and PM2.5 were not included in the air quality monitoring plan (Section 6.1.8).</p> <p>Rationale: Particulate matter and NO2 are considered non- threshold pollutants, meaning that health effects can occur at any level of exposure, The CAAQS for PM2.5 PM.10, and NO2 recognize that there is no population health threshold for human health effects; therefore, any increase in exposure will result in an incremental population risk (Environment Canada and Health Canada, 2012; CCME, 2000). The CAAQS values should not be construed as limits to which polluting up to is allowed. In addition, based on the principles of keeping clean areas clean and continuous improvement, proposed mitigation measures should not be confined to meeting the standards but should also be targeted towards reducing population exposure to CACs associated with the proposed project.</p> <p>Furthermore, although health risks associated with PM2.5 are higher than those associated with PM10, both fractions are considered non- threshold pollutants and identified by IARC (2013) as causes of cancer.</p> <p>Reference: [1] International Agency for Research on Cancer (IARC). 2013. IARC monographs on the evaluation of carcinogenic risks to humans. Volume 109. Outdoor air pollution. Lyon: International Agency for Research on Cancer.</p> | | | |
| IR-192 | - | CNSC | Human Health with respect to radiation exposure | Appendix 10-A (ERA), Section 3.1.1.2, including Tables 3-1 and 3-2 | <p>Context: Section 3.1.1.2 in Appendix 10-A (ERA) provides the method of how select constituents including cadmium, chromium, selenium and lead-210 were determined. This section does not mention how the other constituents as listed in Tables 3-1 and 3-2 are determined.</p> <p>The values for Th-230 and U-238 in Table 3-1 are unexpected. Typically, these values should be at equilibrium.</p> <p>Rationale: The technical basis for the selection of constituents of concern is required as part of the environmental and human health risk assessments.</p> | <p>1. Provide the methodology of how all listed constituents are determined.</p> <p>2. Provide the rationale as to why Th-230 and U-238 are not in equilibrium.</p> | | Accepted |
| IR-193 | - | ECCC | Change to an environmental component due to hazardous contaminants | Appendix 10-A (ERA), Section 3.1.1.2 Section 8.2.4.2.3 | <p>Context: Appendix 10-A (ERA) Table 3-1 ‘Screening of Effluent Quality against Surface Water Quality Guidelines for the Wheeler River ERA’ does not include acute water quality thresholds for all COPCs compared against predicted effluent quality. For example, it is stated that the final effluent quality discharge target for uranium is 0.057 mg/L. However, the CCME water short term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe.</p> | <p>1. Provide acute and chronic water quality thresholds for all required COPCs with monitoring required under the MDMER.</p> <p>2. Ensure all water quality thresholds are derived from receiving environment baseline parameters and that these thresholds are consistently applied throughout the draft EIS.</p> | This response has not been accepted, as the Proponent has not included un-ionized ammonia, mercury and phosphorous in Table 3-1 in Appendix 10-A or provided acute and chronic water quality thresholds for all COPCs, including those with monitoring required under the MDMER, in Table 3-1 in Appendix 10-A (ERA). Water quality thresholds derived from receiving environment baseline parameters have not been consistently applied throughout the draft EIS. It is unclear from the current information provided if predicted effluent concentrations exceed acute water quality guidelines, | Not Accepted |

|--------------|----------------|------|----------------------|---|---|---|---|--------------|
| | | | | | <p>All water quality thresholds should be derived from receiving environment parameters, and there are discrepancies between the values used in Appendix 10-A (ERA) Table 3-1 and the values presented in Tables 8.2-8 and 8.2-10 in Section 8.2.4.2.3 of the draft EIS. No selected screening value for TSS has been calculated from baseline conditions. Un-ionized ammonia, which is a regulated Schedule 4 substance under the MDMER, has not been included.</p> <p>Rationale: A review of all modelling results for all COPCs under the MDMER will assist ECCC in understanding the potential risks to the receiving environment.</p> | | <p>indicating effluent may pose the risk of being acutely lethal to aquatic biota at end of pipe.</p> <p>The Proponent should:</p> <ol style="list-style-type: none">1. Update Table 3-1 in Appendix 10-A to include un-ionized ammonia, mercury and phosphorous. Update the risk assessment to incorporate these parameters as needed.2. Update Table 3-1 in Appendix 10-A and Tables 8.2-8 and 8.2-10 in Section 8.2.4.2.3 of the draft EIS to include both acute and chronic water quality thresholds derived from receiving environment baseline parameters and in accordance with IR- 114. | |
| IR-194 | - | ECCC | Aquatic species | Appendix 10-A (ERA), Section 3.1.1.2 and Section 3.1.2.3 | <p>Context: In the ERA, COPCs should be selected for further assessment based upon the following factors:</p> <ol style="list-style-type: none">1. COPC concentrations in effluent that exceed selected water quality guidelines for the protection of aquatic biota, and2. Baseline COPC concentrations in the LSA that exceed selected surface water and sediment quality guidelines for the protection of aquatic biota. <p>However, only COPCs that had concentrations in effluent that exceeded guidelines were assessed further. Baseline concentrations of COPCs in sediment were not considered. In addition to this, not all COPCs that require monitoring under the MDMER had predicted effluent concentrations. From Section 8.2.3.3 Table 8.2-2 of the Aquatic Environment Report, it appears Aluminum in McGowan Lake and Whitefish Lake South and North, and pH in Whitefish Lake North exceed water quality guidelines. Predicted effluent concentrations or near-field surface water concentrations for Aluminum and pH are not provided.</p> <p>Rationale: It is not possible to determine if there is risk from effluent to the receiving environment and aquatic receptors based on the current information provided.</p> | <ol style="list-style-type: none">1. As noted in IR-114, provide the information on predicted effluent quality for COPCs with required monitoring under the MDMER.2. Provide the information on predicted maximum receiving environment surface water concentrations for COPCs with required monitoring under the MDMER in IR-114.3. Update the ERA to assess the risk of any additional MDMER COPC concentrations in effluent that exceed water quality guidelines.4. Update the ERA to assess the risk of COPCs that had elevated baseline water and sediment quality concentrations in the receiving environment. | <p>This response has not been accepted, as the Proponent has not updated the ERA to assess elevated baseline concentrations to delineate potential Project effects from background conditions.</p> <p>The Proponent’s response states: “The ERA followed the guidance in CSA N288.6-22 which does not require COPCs with elevated baseline concentrations to be considered COPCs for further quantitative assessment in the ERA. Clause 6.2.5.9 indicates that constituents with naturally elevated concentrations should be excluded from further consideration as a COPC.”</p> <p>Section 6.2.5.9 of N288.6-22 is specific to the Human Health Risk Assessment, and this statement does not apply to the Ecological Risk Assessment (EcoRA). Section 7 of N288.6-22 is specific to the development of the EcoRA methodology, and in Section 7.2.5.2.6 of N288.6-22 it states: “In addition to screening of effluent and emissions data, concentrations measured in environmental media should be considered, as determined in the EMPs. Maximum concentrations measured in soil, receiving water, or sediment should be compared to screening criteria.” Therefore, COPCs that had elevated baseline water and sediment quality concentrations in the receiving environment should be assessed in the ERA.</p> <p>Additionally, in Section 7.2.5.4.2 of N288.6-22 it is stated: “If COPCs exceed the screening level for one medium, they should be carried forward into the EcoRA for all media that are likely to contribute to exposure. For example, for a given COPC, if a water screening benchmark is exceeded, the same COPC should be carried forward for sediment if its concentration was above the detection limit.” Therefore, if baseline exceedances occur in one media types, they should be carried forward for all media types in the ERA.</p> <p>It is not possible to determine if there is risk from effluent to the receiving environment and aquatic receptors based on the current information provided. Negative effects to biota from naturally elevated background</p> | Not Accepted |

|--------------|----------------|------|--|---|---|--|---|--------------|
| | | | | | | | concentrations of COPCs can be exacerbated by additional input of COPCs from Project effluent into the receiving environment. It is important to characterize and assess those potential effects and delineate potential Project effects from background conditions. Please: 1. Update Table 3-1 in Appendix 10-A to include un-ionized ammonia, mercury and phosphorous. Update the risk assessment to incorporate these parameters as needed. 2. Update the ERA to assess the risk of COPCs that had elevated baseline water quality concentrations in the receiving environment: aluminum, iron, and lead. | |
| IR-195 | - | ECCC | Change to an environmental component due to hazardous contaminants | Appendix 10-A (ERA), Section 3.1.2.1 | <p>Context: Figure 3-2 depicts modelled concentrations of COPCs in the receiving environment surface water during all Project phases. Effluent discharge rates during Operations and Decommissioning are not anticipated to differ significantly. However, COPC concentrations seem to decrease rapidly after the end of the operations period despite effluent releases continuing into the decommissioning phase.</p> <p>Rationale: There has been no information provided on predicted changes in effluent COPC concentrations and discharge rates during the decommissioning phase. It remains unclear how COPC concentrations would decrease so quickly following the end of operations.</p> | 1. Provide further information on modelled maximum COPC concentrations for each individual Project phase with estimated timing for peak concentrations to appear in the receiving environment. 2. Provide further information on predicted effluent quality during the Project decommissioning phase. 3. Update ERA figures and conclusions as needed. | <p>This response has not been accepted. Although the Proponent addressed items 2 and 3, further information on maximum predicted concentrations of COPCs in water quality during various Project stages and how hydrological processes affect COPC concentrations from Project effluent is required based on the information provided in the Proponent’s response to validate the Proponent’s predictions.</p> <p>The Proponent has provided updated tables with modelled maximum COPC concentrations in water and sediment by individual Project phase but did not include the environmental quality guidelines for COPCs which were included in the original tables. The Proponent’s response confirmed the predicted effluent quality during the decommissioning phase. In their response the Proponent states: “Therefore, the modelled maximum COPC concentrations in water are the same for operations and decommissioning phases (which is considered conservative), the same peak concentrations appear annually due to the variation of the monthly local inflow. Since COPCs are accumulated in sediment, the modelled maximum COPC concentrations in sediment appear at the end of each individual Project phase, which are year 20 for the operations and year 25 for the decommissioning in Figure 3-3.”</p> <p>The figures provided in the response support this statement, however, maximum predicted concentrations of COPCs in receiving water quality occur within a year of operations commencing. COPC concentrations in water also return to baseline within one year after decommissioning is complete. However, maximum predicted concentrations of COPCs in sediment quality do not occur until the end of the Project lifecycle due to accumulation over time, which is expected.</p> <p>Rationale: It is unclear how maximum predicted concentrations of COPCs in water quality occur so quickly and decrease so quickly after Project operations commencement and decommissioning respectively. Further</p> | Not Accepted |

|--------------|----------------|------|--|---|---|---|--|--------------|
| | | | | | | | <p>information on the hydrological processes that facilitate this is necessary to validate predictions.</p> <p>Provide further information regarding maximum predicted concentrations of COPCs in water quality during various Project stages and how hydrological processes (i.e. flows, retention time, etc.) facilitate the fast increase and decrease of COPC concentrations from Project effluent. This information should be included in Appendix 10-A, Section 3.1.2.1.</p> | |
| IR-196 | - | ECCC | Change to an environmental component due to hazardous contaminants | Appendix 10-A (ERA), Section 3.1.2.3 | <p>Context: Table 3-6 provides predicted maximum sediment concentrations of COPCs compared to sediment quality guidelines. Several selected sediment screening values are not the most stringent sediment quality guidelines, with no justification provided. Additionally, copper and lead appear to be missing guidelines that are available from the Burnett-Seidel and Liber (2013) study.</p> <p>Rationale: The most stringent guidelines should be used for the sediment quality risk assessment in the ERA. Use of the most stringent guidelines will allow the most protective assessment to analyze risks to the receiving environment, aquatic and terrestrial biota.</p> | <p>1. Provide further information and justification for the selection of less stringent thresholds.</p> <p>2. Update the ERA as needed.</p> | . | Accepted |
| IR-197 | - | ECCC | Aquatic species | Appendix 10-A (ERA), Section 3.2 | <p>Context: It remains unclear if atmospheric deposition from Project related emissions has been incorporated into modelling for the ERA and surface water and sediment quality assessments.</p> <p>Rationale: While expected Project air emissions are unlikely to have direct impacts on the aquatic receiving environment and aquatic biota, this Project effect pathway may have indirect effects through accumulation of COPCs over time or deposition of contaminants that are not expected in effluent, which should be evaluated with predicted emissions data incorporated into water quality modelling predictions.</p> | Incorporate atmospheric deposition from Project-related emissions into water quality modelling and assess any Project related effects to aquatic receptors from this pathway. | <p>This response has not been accepted, as the Proponent has not provided a valid explanation for not incorporating atmospheric deposition from Project-related air emissions into water quality modelling and assessing Project-related effects to aquatic receptors from this pathway.</p> <p>In the Proponent’s response it is stated: “Consistent with CSA N288.1-20, Clause 5.1.5, atmospheric depositions to large water bodies such as lakes, are considered negligible; therefore, the air to surface water pathway has been excluded for the ecological risk assessment. The rationale for exclusion of atmospheric deposition to lakes and rivers is explained in detail in Section G9, Appendix G of the COG DRL Guidance Document (Hart, 2019).” However, both of these documents explicitly apply to human dose rate calculations and models for human end-points from radiation effects of radionuclides; they do not cover non- human biota nor non-radionuclide COPCs or chemical toxicity of radionuclides. Atmospheric deposition rates to large water bodies may be negligible for dose rates to human biota as they are not likely to be directly impacted or in the near-field vicinity. However, this may not be the case for aquatic receptors directly within the receiving environment.</p> <p>A sufficient explanation for exclusion of atmospheric deposition of COPCs to surface water from Project activities has not been provided from an ecological perspective. This Project effect pathway may have effects on the aquatic receiving environment through accumulation of COPCs over time or deposition of contaminants that are not expected in effluent, which should be evaluated with predicted emissions data incorporated into water quality modelling predictions.</p> | Not Accepted |

|--------------|----------------|-----|---|---|---|---|---|--------------|
| | | | | | | | <p>ECCC requires atmospheric deposition from Project-related emissions to be incorporated into water quality modelling and that the Proponent assess any Project-related effects to aquatic receptors from this pathway in order to assess potential effects on the aquatic receiving environment.</p> <p>Incorporate atmospheric deposition from Project- related emissions into water quality modelling and assess any Project-related effects to aquatic receptors from this pathway. Review CSA N288.6, otherwise, provide valid rationale from an ecological perspective for the elimination of this potential Project effects pathway.</p> | |
| IR-198 | - | HC | Change to an environmental component due to radiological contaminants | <p>Appendix 10-A (ERA) Appendix B, Tables B.7 and B.8 Ref. 19-2638</p> <p>Appendix 10-A (ERA), Table 4-3 Ref. 19-2638 (p. 4.17)</p> | <p>Context: Section 10 Appendix 10-A (ERA) contains Table 4-3 (p. 4.17), which lists ingestion rates for traditional foods and includes the category “organs” for Mammals.</p> <p>Tables B.7 and Table B.8 in Section 10 Appendix 10-A (ERA) Ref. 19-2638 provide the predicted concentrations of radionuclides for ecological receptors during the Project phases and during future centuries, respectively. They list the concentrations of radionuclides in moose and in moose organs, which is presented as a single cumulative organ value. Other terrestrial and aquatic animals (such as the black bear and woodland caribou) that are a part of the traditional diet of nearby Indigenous communities have higher concentrations of radionuclides than moose, yet concentrations are not provided for organs of these species.</p> <p>Rationale: While Health Canada is not aware of transfer factors to individual organs, or to organs in animals that are not ruminants, it would be beneficial to have a better understanding of radionuclide concentrations in the organs of other animals that may be consumed by local Indigenous communities.</p> | <p>1. Provide more clarification on how the mammalian organ ingestion rates are calculated (which animals and relative contribution percentages).</p> <p>2. Provide a rationale for why concentrations of radionuclides were not assessed in organs of animals (other than moose) that are consumed as country foods by Indigenous people harvesting in the area.</p> | <p>This response has not been accepted, as the assessment should consider organ meats from different animals if these are consumed by local population, and estimated consumption rates should be confirmed.</p> <p>The response to IR-198 presents the estimated radionuclide concentrations in moose and caribou organ meats (as mass concentrations), where the concentrations of certain radionuclides (U-238, U-234, Pb-210 and Po-210) in caribou organ meat are indeed estimated to be higher than in moose organ meat. However, the response also indicates that moose organ meat consumption represents the large majority of organ meat consumption (~80%), roughly offsetting the higher concentrations in caribou organs. When calculating tissue concentrations of radionuclides, the higher consumption rate of moose organ meat in comparison to caribou organ meat appears insufficient to compensate for the higher estimated concentrations of U-238, U-234, Pb-210 and Po-210 in caribou meat and as a result, exposures to these radionuclides from organ meat consumption may be underestimated. Health Canada recommends assessing moose and caribou organ meat separately (rather than using moose as a proxy) to confirm that COPCs including radionuclides from organ meat consumption have not been underestimated.</p> <p>IR-198 also includes additional information on organ meat consumption rates for the La Plonge and Patuanak communities to estimate dietary exposure via organ consumption, but it is unclear how these relate to the values used in the Draft EIS and ERA (Appendix 10-A). Specifically, Page 4.16 of Appendix 10-A: <i>Environmental Risk Assessment for Wheeler River</i> (September 9, 2022) states:</p> <p><i>“As a conservative approach for this assessment, the Patuanak diet was selected to represent the average traditional foods consumer in the HHRA”</i></p> <p>However, Table 4-4 (p. 4.19) reports an annual organ meat consumption rate of 4.49 kg for the adult average traditional food consumer while the reported daily Patuanak consumption rate for organ meat is 16.2 g (Table 4-3; p.4.17), which equates to an annual rate of 5.91 kg. Health Canada</p> | Not Accepted |

|--------------|----------------|------|---|--|--|--|--|--------------|
| | | | | | | | recommends a rationale be provided for this discrepancy, and if necessary, the correct estimated rate and associated assessment calculations. See also follow-up IR-198-R1. | |
| IR-198 | IR-198-R1 | HC | Change to an environmental component due to radiological contaminants | Annex 1 Response to Information Requests (Denison Mining) – August 18, 2023 IR-198 Response from Denison – COPC Concentrations in Organs (<i>Pages 74, and 354-357 of 419</i>) Appendix 10-A (ERA) | <p><i>Environmental Risk Assessment for Wheeler River</i> (September 9, 2022) does not include an assessment of radionuclides based on their mass concentrations in country foods (the assessment is only based on radionuclide concentrations).</p> <p>Context: As part of the response to IR-198 estimated Pb-210 concentrations in moose organ and caribou organ of 7.15 and 49.4 mg/kg (ww) are reported, respectively. However, Appendix 10-A: <i>Environmental Risk Assessment for Wheeler River</i> (September 9, 2022) does not include an assessment of lead among the non-radionuclide COPCs.</p> <p>Using the organ meat consumption figure from the Patuanak community (16.2 g/day), exposure to Pb-210 from caribou organ meat is estimated at over 11 ug/kg bw per day (based on the response to IR-198) which would be close to 10 times greater than the 95th percentile dietary lead exposure estimates for the general Canadian population consuming retail foods.</p> <p>Rationale: While the abundance of radionuclides may pose a health risk with respect to radioactivity, their presence as chemical contaminants may also have an impact on health. This is demonstrated by the case of Pb-210 described above. Due to their potential toxicological significance to human health, Health Canada recommends assessing arsenic, cadmium, lead and mercury as part of country food assessment, regardless of the method employed to determine COPCs.</p> | <p>1. Provide a rationale on why radionuclide mass concentrations were not assessed for their impact to human health.</p> <p>2. Provide an assessment of Lead (Pb) as a chemical contaminant (non-radionuclide) COPC to better understand potential health risks and inform management, mitigation, monitoring and/or follow-up planning.</p> | | Follow-Up IR |
| IR-199 | - | ECCC | Change to an environmental component due to hazardous contaminants | Appendix 10-A (ERA), Sections 3.2.1 and 3.3.1, Wheeler River Project IMPACT Model | <p>Context: Model calibrated concentrations of selenium, uranium, and lead-210 are under-predicted compared to measured baseline concentrations for water quality in the IMPACT modelling based on Figure 3-2. Calibrated concentrations of cobalt are under-predicted and there is poor agreement between model calibrated and measured concentrations of arsenic, lead-210, polonium-210, and radium-226 for sediment quality in Figure 3-3.</p> <p>Rationale: It is unclear how poor agreement between model calibrated and measured baseline concentrations of COPCs impacts the near-field and far-field modelling predictions of COPCs during all Project phases. It is also unclear why measured concentrations of COPCS could not be used directly as model inputs when there was poor agreement.</p> | <p>1. Provide justification as to why model calibrated concentration inputs of COPCs were preferable for use in predictive modelling of water and sediment quality over measured baseline concentrations.</p> <p>2. Provide a rationale detailing how under- or over-predicted model calibrated COPC concentration inputs influence IMPACT model predictions and uncertainty for water and sediment quality. Provide specific details on how this may impact the risk analysis for parameters that have been highlighted as having poor agreement between calibrated and measured concentrations (i.e., arsenic, selenium, uranium, lead-210, polonium-210, and radium-226).</p> | <p>This response has not been accepted, as the explanation and rationale provided by the Proponent is not sufficient to validate the model performance.</p> <p>Beyond the figures demonstrating modelled versus measured concentrations of COPCs in water and sediment provided in Appendix A, no quantitative statistical metrics validating model performance have been provided by the Proponent. It is also unclear if the geometric mean for each COPC at each monitoring station was calculated as individual inputs per station or if a single geometric mean for each COPC was calculated using all sampling data. Using a single geometric mean of all samples would result in not capturing the variation in concentrations of COPCs between sampling stations such as variation between different lakes. The Proponent’s response provided no additional information that was not already in the EIS to the information request for specific details on how under- or over-predicted model calibrated COPC concentration inputs</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|-----|--|--|---|--|--|--------------|
| | | | | | | | <p>influence IMPACT model predictions and uncertainty for water and sediment quality.</p> <p>Without statistical metrics validating model performance, there is no quantitative evidence to support conclusions of model performance regarding the use of model calibrated concentration inputs of COPCs and conclusions on under- and over-predicted COPC concentration inputs influence on risk assessment conclusions. It is also unclear if the methodology for using the geometric mean of all samples for each COPC has eliminated variation between sample sites for modelling, and how this affects the conclusions of risk.</p> <p>ECCC requires further information on how using geometric mean values of the measured baseline data influences variation between sites and model outputs, as well as quantitative statistical metrics validating model performance to verify the Proponent’s conclusions.</p> <p>Please provide:</p> <p>1. Further information on how using geometric mean values of the measured baseline data influences variation between sites and model outputs.</p> <p>2. Quantitative statistical metrics validating model performance to support conclusions on model calibrated concentration inputs of COPCs and risk assessment conclusions, with particular focus on influence of over- and under-predicted COPC concentration inputs. Include model performance benchmarks for comparison.</p> | |
| IR-200 | - | HC | Indigenous Peoples' health / Socio-economic conditions | Section 10 (p. 4.10) Appendix 10-A (ERA), Table 4-4 (p. 4.19) | <p>Indigenous consultation should be included in the Country Foods analysis.</p> <p>Context: The Proponent obtained country food consumption data through engagement with a single local fisher/trapper and from a dietary survey administered by CanNorth to the English River First Nations (ERFN) in 2017. However, the potential health risks to consumers of traditional food were only assessed using the data obtained from the CanNorth dietary survey. Section 10 of the EIS <i>states the following</i>: “The diet assumptions for the fisher/trapper are conservative and are based on engagement with a local fisher/trapper. The diet of the fisher/trapper is representative of one person, who consumes a unique composition and quantity of traditional foods (e.g., ingestion rate of 175 kg/yr of caribou, equivalent to approximately 2 to 3 servings per day). Most people fishing, hunting, and trapping in the Local Study Area and Regional Study Area would consume traditional foods more consistent with the average traditional foods consumer diet which was developed from the ERFN country foods study. In comparison, the ERFN country foods study in Section 10 Appendix 10-A (ERA) Table 4- 4 indicates a caribou ingestion rate of 2.6 kg/yr (1 to 2 servings per month) and a total game ingestion rate of 21.3 kg/yr” (p. 4.10).</p> | <p>1. Evaluate the suitability of using the 2017 EFRN survey results and consider surveying additional community members (such as local hunters/trappers) to obtain more representative country food consumption rates for use in the traditional foods risk assessment, and for communicating the results to the communities.</p> <p>2. Additionally, consider evaluating consumption patterns (and applicable TRVs) of sensitive or vulnerable populations (e.g., elders, toddlers, women of childbearing age) in the traditional food risk assessment and provide risk levels for these sub-groups separately.</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends providing the community with the opportunity to validate the ERFN 2017 survey results.</p> | <p>This response has not been accepted, as it did not provide the requested information to support the assumption used in the traditional foods risk assessment.</p> <p>The response did state:</p> <p><i>The 2017 report was authored by ERFN and as such there is no need for Denison to ask ERFN to validate their own report.</i></p> <p>The dietary survey administered by CanNorth to the English River First Nations (ERFN) in 2017 was an important resource that contributed to the risk assessment; however, the ERFN’s Information Request (IR-1) raised similar questions about the EIS’s assumptions on Indigenous land use and diet, and the perception that feedback from the local ERFN trapper was not representative of the community’s current and future land use. The response to IR-1 referenced meetings/discussions that were held with the ERFN to better understand how their community uses the area and their diet.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|--|---|--|--|--------------|
| | | | | | Rationale: Health Canada is in general agreement that the dietary habits of the local fisher/trapper may be an outlier and not necessarily representative of most of the local population. However, a rationale has not been provided to demonstrate whether and how the 2017 ERFN dietary survey results are representative of consumption patterns of local Indigenous communities. Also, it is unclear whether or how the ERFN dietary survey results account for the consumption patterns of vulnerable or more sensitive subgroups (e.g., heavy consumers, children and women of child-bearing age) | | The following contradictory clarification was provided in the response to IR-1: [The] <i>ERFN considers the ERFN Trapper’s use of the area as representative of current and future land users and expects that the relationship to the Project area will be continued and strengthened through generations of future use.</i> See follow up IR-200-R1. | |
| IR-200 | IR-200-R1 | HC | Indigenous People” health / Socio-economic conditions | Section 10 (p. 4.10) Appendix 10-A (ERA), Table 4-4 (p. 4.19) IR-200 Response from Denison | The traditional foods risk assessment should be updated to include an “Intense Land User” scenario and consider all relevant sub-groups. Context: See ‘Rationale for Status’ in IR-200 Rationale: Health Canada notes that the response to IR-1 confirms that the use, diet and consumption rates used to assess the “Trapper” receptor are representative of “intensive land users” from the ERFN and possibly others. This change in the assumption is significant and should be integrated into the traditional foods risk assessment. Suggestions and follow-up measures have been provided to assist in responding to this information request, which benefits from the clarity provided in response to IR-1. Health Canada also notes that the response to IR-200 did not consider evaluating consumption patterns (and applicable TRVs) of sensitive or vulnerable populations (e.g., elders, toddlers, women of childbearing age) in the traditional food risk assessment and provide risk levels for these sub-groups separately. | 1. Update assumptions used in the risk assessment to reflect the new information provided in response to IR-1. (e.g., the <i>ERFN Trapper’s use of the area as representative of current and future land users</i>). 2. Update the risk assessment in the EIS and ERA for the “Trapper” receptor (i.e., Intensive Land Users) to account for the representative nature of their described diet (i.e., consumption rates and composition). 3. Update the rationale and decisions related to management, mitigation, monitoring and follow-up. Include a specific discussion for those COPCs that contribute to elevated health risks among “intensive land users” and those raised by Indigenous communities (i.e., selenium, mercury & cadmium). 4. Revise receptor’s descriptor/title from “Trapper” to “Intensive land users” throughout the EIS and ERA to be consistent with proposed revisions made in response to IR-1. Consider evaluating consumption patterns (and applicable TRVs) of sensitive or vulnerable populations (e.g., elders, toddlers, women of childbearing age) in the traditional food risk assessment and provide risk levels for these sub-groups separately. Alternatively, provide a fulsome rationale to justify their exclusion. | | Follow-Up IR |
| IR-201 | - | ECCC | Aquatic species | Appendix 10-A (ERA), Section 5.0 | Context: For the ERA methodology the Proponent followed CSA N288.6-12 for the assessment of risk to aquatic biota from radionuclide and non-radionuclide COPCs. This is the 2012 version, and a more recent 2022 version was publicly released. Rationale: The Proponent should review the most up-to-date version of the standard to ensure no changes to the methodology of the COPC exposure assessment are required for the ERA. | Update the COPC exposure assessment methodology in the ERA using the most recent CSA N288.6-22 standard, as needed. | | Accepted |
| IR-202 | - | CNSC | QA/QC | Appendix 10-A (ERA), Section 6.0- Quality Assurance | Context: This section provides only Quality Assurance (QA) of the ERA, including planning and preparation of the ERA. Rational: The Quality Control (QC) aspects are not included. Both QA and QC aspects provide confidence that ERA results are defensible and fit for use in decision-making. | Please include appropriate QC aspects, as per a Clause 10.2 of the N288.6. | | Accepted |

|--------------|----------------|------|---|---|---|---|---|--------------|
| | | | | | The N288.6 (Clause 10.2) requires that “Appropriate QA/QC requirements shall exist for all aspects of the ERA and should be specified prior to conducting the ERA”. | | | |
| IR-203 | - | CNSC | Sediment Quality and Benthic Invertebrates | Appendix 10-A (ERA), Section 6.2 Future Centuries Sensitivity Analysis | <p>Context: This section of the ERA states “If treated effluent was released at the maximum upper bound discharge rate, the modelled concentrations of all COPCs are expected to be below their corresponding sediment quality guidelines.” It appears from Figure 6-2: “Comparison of maximum concentrations of COPCs in sediment at expected and upper bound discharge rate” that cadmium and vanadium would be over their sediment quality guidelines indicated if maximum upper bound discharge rates are used.</p> <p>Rationale: It is not clear which is correct; the statement that no exceedances of sediment quality guidelines when considering the maximum upper limit effluent release, or the figures indicating there could be exceedances for cadmium and vanadium. This discrepancy in the ERA should be explained and corrected.</p> | Please provide clarity on if cadmium and vanadium are expected to be over the sediment quality guidelines for the maximum upper bound discharge rate scenario. | <p>This response has not been accepted.</p> <p>Although these potential sediment quality exceedances if treated effluent were to be released at the maximum upper bound discharge rate are to be documented in the ERA, the response does not address the potential risk to receptors nor propose any mitigation measures. Please provide additional assessment/justification/mitigation measures for these predicted sediment quality exceedances.</p> | Not Accepted |
| IR-204 | - | CNSC | Human health with respect to hazardous contaminants | Appendix 10-A (ERA), 7.1.1, Non-radiological Human Health Risk Assessment | <p>Context: In the human health risk assessment of the non-radiological COPCs, it was determined that the Project incremental HQ was predicted to remain below 0.2 for all non-carcinogens and all pathways during all phases of the Project, except for selenium for the fisher/trapper at Russell Lake from the fish ingestion pathway.</p> <p>Rationale: Given that the fisher/trapper receptor will likely be exposed to higher concentrations of selenium from the consumption of fish at Russell Lake, there is an elevated risk of selenosis in exposed individuals. This potential for selenosis would be further exacerbated in individuals who consume fish taken from other lakes closer to the mining operation. There is, however, no discussion of mitigation of these risks to exposed individuals.</p> | <p>Please provide a discussion of measures that could be applied to mitigate the risk of selenosis in exposed individuals who consume fish from Russell Lake and other waterbodies closer to the mining operation.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends the following:</p> <ul style="list-style-type: none">• Selenium abatement technologies may be considered to eliminate or reduce selenium in effluent entering the lake system.• If HQs continue to exceed 0.2, then it may be necessary to post fish consumption advisories, in consultation with the Medical Officer of Health for the jurisdiction where the Project is located. | | Accepted |
| IR-205 | - | CNSC | Geology and Groundwater | Section 7, appendix H | <p>Context: In this appendix the analytical concentration of various groundwater samples taken from monitoring wells is reported.</p> <p>Rationale: There is one sample labeled as “Tracer Tank” with no definition available in the current report. It is difficult to judge whether the results presented are relevant to the EIS and how it may impact the findings therein.</p> | Please clarify the definition of “tracer tank”. | | Accepted |
| IR-206 | - | CNSC | Current use of lands and resources for traditional purposes | Section 11 Section 12 Section 15 Section 16 | <p>Context: Impacts to Lands and Resources Use have been identified by Indigenous Nations and communities.</p> <p>Rationale: Additional information is required to demonstrate whether Indigenous Nations and communities were engaged directly by Denison regarding the cumulative effects assessment, significance determination and residual effects, and thus the overall conclusions on potential adverse impacts of the Project on the potential or established Indigenous and/or</p> | Please describe any outstanding or residual issues or concerns raised by Indigenous Nations and communities that Denison was unable to address. In addition, outline any plans to find solutions or continue discussions with the potentially impacted Indigenous Nations and communities. | <p>This response has not been accepted.</p> <p>The IR response directs the FIRT to refer to the response for IR-28. However, this IR response does not directly respond to this IR in question. In IR-28, Denison does discuss how they plan to address the concerns raised by Indigenous Nations and communities, but Denison does not demonstrate whether Indigenous Nations and communities were engaged directly by</p> | Not Accepted |

|--------------|----------------|------|---|--|---|---|---|----------|
| | | | | | treaty rights and effects of changes to the environment on Indigenous peoples, pursuant to paragraph 5(1)(c) of the CEEA 2012. | | Denison regarding the cumulative effects assessment, significance determination and residual effects. CNSC requires Denison to provide this information before the response can be accepted. | |
| IR-207 | - | CNSC | Current use of lands and resources for traditional purposes | Section 11, Perceived Risks to Lands and Resources | <p>Context: The EIS states: “Resource users may also experience changes in their perception of the quality of resources for consumption such as the palatability of fish or wildlife or have apprehensions about the safety of resources for consumption. These changes may affect the patterns of ILRU during all Project phases including Post Decommissioning. The ERFN refer to this indicator as a “psycho-social’ effect, meaning that even if people know their fears are “<i>perceived fears, the fear ... is real and has real impacts on ERFN members’ perception of their overall health and well-being</i>” (ERFN and SVS 2022a).” (p. 11-11)</p> <p>Resource harvesters may experience Project-related disturbances and, depending on how these changes are perceived, it may cause some resource harvesters to avoid the Project Area.</p> <p>Reductions in harvests may occur based on fear or uncertainty about the ongoing quality of country foods. For example, “<i>People stopped picking berries in this area when Key Lake mine was established because of concerns about health impacts</i>” (ERFN and SVS 2022b).</p> <p>Rationale: CNSC’s Generic Guidelines for the Preparation of an EIS state: “The EIS will document specific suggestions raised by Indigenous groups for mitigating the effects of changes to the environment on Indigenous peoples (section 5(1)(c) of CEEA 2012). For the mitigation measures intended to address the effects of changes to the environment for Indigenous peoples, the Proponent must discuss the residual effects with the Indigenous groups prior to submitting the EIS.”</p> <p>These changes may affect the patterns of ILRU during all Project phases including Post Decommissioning.</p> | <p>How does Denison plan to work directly with Indigenous Nations and communities who currently use the potentially impacted areas, including the RSA, to mitigate and monitor the perceived risks and/changes to the RSA?</p> <p>Has Denison had discussions with the potential impacted Indigenous Nations and communities on how fear and avoidance behaviors and related impacts on traditional land use will be mitigated, especially within the RSA?</p> <p>Additional information is needed to determine if Denison has engaged directly with the Indigenous Nations and communities to develop potential mitigation measures to address fear and avoidance impacts, such as a community monitoring program, which could help to reduce the perceived risk to lands and resource use through education, collaboration, and long-term monitoring with Indigenous Nations, in order to build trust.</p> <p>Suggestions for mitigation and follow-up measures: It is recommended that Denison consider engaging with potentially impacted Indigenous Nations and communities on the collaborative development and implementation of a monitoring program to help address concerns about potential impacts on lands and resources as a result of the Project. The program(s) could help to monitor changes over time related the potential perceived risk of contamination of the land from Project activities and subsequent effects on the quality of fish, vegetation, and wildlife resources, which in turn could affect the safety of traditional foods and human health, and impacts on culture practices, and overall community well-being that travel to region yearly.</p> | Response is accepted, but also see AD-60 in the Advice to Proponent table. | Accepted |
| IR-208 | - | CNSC | Indigenous physical and cultural heritage | Tables 11.1-3, 11.1-4 and 11.1-5 Section 11.1.3.2.6 | <p>Context: Black bear is listed as a species hunted by several Indigenous nations, including Pinehouse residents. CNSC participated in an in-person engagement with Pinehouse residents in October 2022 and bears eating waste was identified as a concern for hunting and consumption.</p> <p>Rationale: Perceived risk of eating animals that are contaminated by hazardous or radiological wastes could deter community members from harvesting animals that are normally part of their traditional diet. Fencing for waste was specified as a deterrent for human trespassers, not animals.</p> | Please specify measures that Denison will take to ensure bears and other animals do not scavenge from waste facilities. | | Accepted |

|--------------|----------------|------|---|---|--|---|--|--------------|
| IR-209 | - | CNSC | Indigenous Peoples' health / Socio-economic conditions | Section 12.1.4.2.1 (p. 12-22) Section 12.1.5 Section 12.1.6.2 | Context: KML indicates that working at a mine camp could inhibit community members from participating in cultural activities and sharing them with family and community members, resulting in a loss of cultural knowledge and language, thus impact knowledge transmission (p. 12-22). Rationale: Denison addresses this by briefly identifying culturally sensitive policies which would eliminate residual effects (p. 12-30) | Please provide detailed proposed mitigation measure for KML’s concerns related to loss of cultural knowledge and language should they work for Denison. | This response has not been accepted. Please provide validation that this proposed mitigation measure is considered suitable and has been accepted by KML. | Not Accepted |
| IR-210 | - | CNSC | Current use of lands and resources for traditional purposes | Section 12.1.4.2.2, Potential Effect 2: Change in Traditional Diet, Perceived Suitability of Country Foods (p. 12-26) | Context: The EIS states: “Project activities could change the perceived suitability of country foods. An ecological risk assessment (ERA) was conducted to consider both radiological and toxicological risks to ecological receptors such as terrestrial and aquatic invertebrates, terrestrial and aquatic vegetation, fish, and terrestrial and aquatic mammals and birds. Results for the radiological assessment predicted no exceedances of the radiation dose benchmark for the ecological receptors. For non-radiological COPCs, no exceedances were predicted except for selenium in fish from Russell Lake, based on a conversative dietary assumption for one resource user. The traditional foods diet for the fisher/trapper is conservative as it assumes that their annual fish consumption (183 kg of fish per year) would be obtained from Russell Lake, meaning the exceedance of the benchmark for selenium from fish would only occur if fish were only sourced from this one lake. This one exceedance could potentially change the perceived safety of country foods for community members and make country foods a less desirable part of a traditional diet. <u>Experience from other uranium operations in northern Saskatchewan suggests that resource use will continue despite the potential selenium exceedance. An examination of members of the Hatchet Lake Denesyliné First Nation who live in Wollaston Lake near the Rabbit Lake operation found that over years of being active on the landscape both with and without the presence of the uranium industry, members had developed their own culturally appropriate practice of risk assessment and management based on their relationship with the land. Hatchet Lake Denesyliné First Nation members appear to be more concerned with the direct effects of uranium mining on the local environment and less concerned about uranium mining’s effects on their health through consumption of plants and animals. This is likely due to their high level of confidence in recognizing affected plants and wildlife and avoiding them (Elias et al. 1997).</u> The usage patterns of the ERFN Trapper have similarly allowed for continued use and access to areas proximal to other uranium operations. The ERFN Trapper had a positive relationship with other uranium operations in the ILRU LSA. He also continued to trap (i.e., used his trapline in Fur Block N-18), fish, and opportunistically pick berries, and consumed those resources during operations (KPI Program 2021). Good relationships between Denison and a new trapper who eventually takes over the trapline from the ERFN Trapper would promote continued use.” (p. 12-26) | Given concerns with psycho-social impacts and the influence of perception discussed by ERFN earlier on in the EIS, does Denison have information on the perspectives from Indigenous Nations and communities to validate this conclusion is applicable? | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|--|--|---|---|--------------|
| | | | | | Rationale: The underlined reference suggests that negative perceptions may not prevent traditional resource users from continuing to consume, due to adaptation to potential risks in the environment. | | | |
| IR-211 | - | CNSC | Accidents and Malfunctions | Section 14.6.1, Bounding Scenario 1, Vehicle Accident and Aquatic Release of Radioactivity | <p>Context: Scenario 1 describes a spill of uranium concentrate into the lake. It’s not clear how the ecological risk assessment was performed. It is stated that sediment concentrations in post-remediation conditions are expected to exceed the benthic invertebrate benchmark and that these results indicate that a spill of uranium concentrate could potentially affect benthic invertebrate populations following a spill, but the spatial extent would be limited. For water, it is stated that when evaluating the potential effect, a comparison was made between the results of the estimated short-term water quality 1,892 µg/L (1.892 mg/kg) and the guideline (33 µg/L). This indicates that there may be some aquatic species that could be affected, but the effects are expected to be transient as the water concertation quickly drops to a long-term level of 0.19 µg/L. However, when looking at dose to other receptors, the results of the ecological risk assessment indicated short-term ingestion of contaminated water resulting from an accident would not result in potential risks to grouse, vole, or deer, however rationale for how these receptors were chosen is not provided.</p> <p>Rationale: It’s not clear from the EIS, why the receptors grouse, vole, and deer were chosen to evaluate ecological effects from a potential spill, and why they differ from receptors in the ERA. It is also not clear if the pathway from sediment ingestion/contact was considered for semi-aquatic receptors as they could be exposed to the increased concentrations post-spill. It is also not clear if SARA species exposure to sediment and water post-spill was considered.</p> | Please clarify why grouse, vole, and deer were chosen as receptors for the ecological risk assessment performed for accidents and malfunctions scenario 1 and clarify if the sediment pathway to receptors post-spill was considered, as well as if SARA species were considered. | | Accepted |
| IR-212 | - | HC | Human health with respect to hazardous contaminants | Section 14 (p. 14-3) Appendix 16-C (p. 14 & 15) | <p>The follow-up plan does not sufficiently describe how various parties will be engaged in the design, implementation, and review of monitoring programs.</p> <p>Context: Section 14 of the EIS states that “The overarching fear of contamination from the mine is woven in to almost every other concern noted by participants in the TK study. It is worth acknowledging this concern separately given the potential for mental health impacts related to people’s experiences of fear and anxiety” (p. 14- 3).</p> <p>The commitment regarding monitoring and follow-up activities appears limited to “<i>shar[ing] information in a transparent manner with the General Public, and specifically those Communities of Interest and Nearby Land Users with whom Denison is regularly engaging about the Project. Such an information-sharing program would consider the involvement of the Regulators to make sure the information available addresses the issues identified as concerns</i>” (p. 14).</p> | <p>1. Provide details of how local, provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program.</p> <p>2. Describe the steps that will be taken if there are any exceedances of established benchmarks or deviation from predictions.</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends that the Proponent’s plan for communicating follow-up results (environmental and country foods) aims at, among other things, responding to community concerns regarding country foods to minimize avoidance of this resource. This goes beyond a passive dissemination of information and developing a strategy based on dialogue and the direct involvement of communities in monitoring, surveillance, and risk communication activities.</p> | <p>This response has not been accepted as it does not provide sufficient detail on engagement and adaptive management.</p> <p>The response to IR-212 expresses interest and intent to working with local and Indigenous communities to develop follow-up and monitoring programs, supported by an overview of the intended approach. It also articulates that the detail of follow-up and monitoring plans will be developed as part of the licensing and regulatory phases of the Project’s approval process.</p> <p>As previously indicated, country food safety is not regulated federally unless foods are sold commercially. Certain aspects of country food safety and availability may be covered by provincial regulators. As such, it is unclear whether and how various levels of government and potentially affected communities would be involved in the development of the follow-up and monitoring program for country foods.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|----------------------------|---|--|---|---|----------|
| | | | | | Rationale: Country food safety is not regulated federally unless foods are sold commercially. Certain aspects of country food safety and availability may be covered by provincial regulators. It is unclear whether and how various levels of government and potentially affected communities would be involved in the development of the follow-up and monitoring program. It is also unclear what the information sharing program entails and how it would inform any adaptive management if monitoring results deviated from the prediction | | Additionally, the preliminary monitoring plan should include decision criteria/thresholds/benchmarks for initiating action and what those actions might entail (e.g., inspection of treatment processes, additional sampling, communication with local land users & residents, engagement with interested communities, etc.). HC reiterates its previous IR, with added clarification: 1. Provide details of how local, provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program, for substances in country foods that may represent a potential health risk and/or are of concern to community members and land users (e.g., Mercury/Methylmercury, Selenium, Cadmium and Lead). 2. Describe the decision criteria/thresholds/benchmarks for these substances in country foods and steps that will be taken if there are any exceedances of established benchmarks or deviation from predictions. | |
| IR-213 | - | CNSC | Accidents and Malfunctions | Section 14.5.3 Appendix 14-A | Context: The Proponent states that the assessment of accidents and malfunctions began with the initial identification of hazard scenarios. Hazard scenarios were identified using a systematic approach that considered the existence of sources of hazards and initiating events for the Project in consideration of Project activities and components. The hazard identification was conducted to identify a comprehensive list of potential project-related accident and malfunction scenarios associated with the key project components and activities with further details provided in Appendix 14-A. The initial hazards were then screened qualitatively based on likelihood and consequence to determine overall risk level using a risk matrix approach. Bounding scenarios were then selected from this initial list of hazard scenarios. The results of numerical analyses (RESPEC, 2021) of detailed strip model suggest that the deformation imposed on the cemented steel casing from downward movement of the rock mass may exceed the assumed casing-strain yield limits and the failure limit locally after extracting the uranium ore. However, this potential hazard is not identified in the hazard identification. Rationale: Exceedance of steel casing yield limits and failure limit would either compromise the steel casing integrity or damage the steel casing and result in the leakage of injected solution, which could impact on mine operation and contaminate the surrounding groundwater. | Please include the hazard of steel casing yield or damage in the table of hazard identification evaluation and conduct an initial risk screening and further detailed assessment as required. | | Accepted |
| IR-214 | - | CNSC | Accidents and Malfunctions | Section 14.5.3 Appendix 14-A, section 3.2.3 | Context: Hazard scenarios were identified using a systematic approach that considered the existence of sources of hazards and initiating events for the Project in consideration of Project activities and components. Details for how each of these project components and activities are considered in the | Please clarify or correct all inconsistent and/or inaccurate information in Tables 3-1 to 3-14 in Appendix A of Appendix 14-A. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|---|---|--|--|--------------|
| | | | | | <p>initial hazard scenario identification process are provided in the accidents and malfunctions TSD (see Appendix 14-A; Ecometrix 2022).</p> <p>However, in Table 3-1 to Table 3-14 in Appendix A of Appendix 14-A, the following inconsistencies were identified:</p> <ul style="list-style-type: none">i. consequences for the hazards ID# 1.1, 1.5, 1.7, 14.2 include occupational major injuries; however, the severity (S) is denoted as number 2 that appears to be inconsistent with consequence rating number in Figure 14.5-2ii. Hazard ID# 1.5 has a L=2, but it is described as a highly unlikely event, which is inconsistent with the term in Figure 14.5-2iii. Hazards ID# 3.6 and 3.7 have a L=1, but they are described as low probability event that is inconsistent with the term in Figure 14.5-2iv. Hazards ID# 8.2, 8.3, 9.1, 10.1 to 10.5, 11.1, 11.5 have a L=1, but they are described as unlikely events, which are inconsistent with the term in Figure 14.5-2. Rationale needs to be provided how stockpile erosion is considered to have a L=1v. Hazard ID# 12.1 has a L=2 and S=3, but it’s risk ranking is moderate, which is inconsistent with the term in Figure 14.5-2vi. Hazard ID# 13.3 has a L=2. Based on the operation experience in the similar projects in the northern Saskatchewan, ponds lining failure and leakage is a very likely event. Rationale needs to be provided to support L=2 or change the number for L. <p>Rationale: Inconsistent or inaccurate/incorrect information was included in Accidents and Malfunctions assessment.</p> | | | |
| IR-215 | - | CNSC | Human health with respect to hazardous contaminants | Section 14.6 | <p>Context: One of the potential risks of a uranium mine and mill is a spill of untreated effluent.</p> <p>Rationale: In the EIS, it doesn’t appear that the scenario of a spill of untreated effluent to the environment has been considered.</p> <p>A failure of the piping containing the untreated effluent could result in an uncontrolled release to the environment and could affect the groundwater, soil quality, and terrestrial biota.</p> | Please evaluate and provide the results for a bounding scenario of a spill of untreated effluent or provide justification for its exclusion. | | Accepted |
| IR-216 | - | CNSC | Human Health with respect to radiation exposure | Section 14.6.1 Section 14.6.7 Appendix 14-A | <p>Context: Radiological doses to human receptors, including workers (i.e., driver(s) of the vehicles), from the Bounding Scenarios 1 (Vehicle Accident Including Rollover, Collision, Run Off Road) and 7 (Vehicle Accident Including Rollover, Collision, Run Off Road) have not been assessed.</p> <p>Rationale: An estimate of the effective doses to human receptors, including workers, are required to determine whether the expected doses meet the dose limits set out in the Radiation Protection Regulations.</p> | Provide estimates (including calculations) of the potential radiological doses to human receptors, including workers, resulting from Bounding Scenarios 1 and 7. | <p>This response has not been accepted.</p> <p>In order to accept this response, CNSC staff request that the proponent specify in the EIS that worker health, as it relates to accidents and malfunctions, will be addressed independently and part of the licensing process as required. Please provide proposed text for the revised EIS, for SME review and acceptance.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|----------------------------|--|---|--|--|--------------|
| IR-217 | - | CNSC | Accidents and Malfunctions | Sections 14.6.1 and 14.6.2 | <p>Context: Highway 914 crosses the Wheeler River 10 km southwest of the access road junction. A vehicle accident, including a rollover, collision, or run off road, at or near the bridge could potentially result in a release of uranium concentrate and release of fuels and chemicals into the surface water at this location. Denison believes that a release of uranium concentrate and a release of fuels and chemicals at this location would bound the releases at any other water crossing along the transportation corridor. However, no information on what other water crossings along the transportation corridor exist and how bounding scenarios 1 and 2 would bound the risk of releasing uranium concentrate and fuels and chemicals at other crossings.</p> <p>Rationale: The release of uranium concentrate and fuels and chemicals at water crossings would contaminate the water body at the crossings and pose a risk to the environment and public health.</p> | Please provide information on all water crossings along the transportation corridor and justification why bounding scenarios 1 and 2 would bound the effects of the accidental releases of uranium concentrate and fuels and chemicals at these crossings. | <p>This response has not been accepted.</p> <p>The Proponent has provided information on all water crossings along the transportation corridor. However, it is insufficient for the justification why bounding scenarios 1 and 2 would bound the effects of the accidental releases of uranium concentrate and fuels and chemicals at these crossings.</p> | Not Accepted |
| IR-218 | - | CNSC | Accidents and Malfunctions | Sections 14.6.1.1 and 14.6.1.4 | <p>Context: Table 14.6-1 indicates that the average flow of Wheeler River south of Russel Lake is 17,340 L/s or 17.34 m³/s. This rate is used for uranium dissolution rate calculation. However, in section 14.6.1.4, it states that the average annual flow is 24.3 m³/s. In Table 14.6-3, the last two rows appear to be added wrongly.</p> <p>It also states that sediment quality results are shown in Table 14.6-5 for post-remediation conditions. During minimum flow conditions, the affected volume is expected to be smaller, resulting in a higher sediment concentration. In comparison, higher flow conditions are expected to result in a greater footprint and lower concentrations. However, in Table 14.6-5, the average sediments concentration and porewater concentration appear to be incorrect and switched between average flow and maximum flow.</p> <p>Rationale: Inconsistent/inaccurate information provided in the EIS.</p> | Please clarify and correct the inconsistent information on average flow rate of Wheeler River at the crossing and incorrect information in Table 14.6-3, and average sediment concentration and porewater concentration under average and maximum flow conditions in Table 14.6-5. | <p>This IR has not been accepted as there are two typos in Denison’s response.</p> <p>In the column: Final EIS Update, the wording “Section 14.6.4.1” appears to be “Section 14.6.1.4”; for the <u>Revisions to Appendix 14-A</u>, the wording “average annual low of 24.3m³/s (average flow)” should be “average annual low of 17.3m³/s (average flow)”. Please update this text.</p> | Not Accepted |
| IR-219 | - | CNSC | Accidents and Malfunctions | Sections 14.6.1.1.1 and 14.6.1.4.1; Sections 5.1.1 and 8.1 of Appendix 14-A | <p>Context: When assessing the release characterization of Bounding Scenario 1, the Proponent assumed that 95% of the released uranium concentrate can be recovered from the release location without sufficient justification, and that different water column depths, i.e., 10 cm and 5 cm, and average water depth of 1.2 m at the release location were used without explanation.</p> <p>Rationale: As the recovery rate of the uranium concentrate would have an impact on the assessment of its potential effects, it is necessary to understand how the recovery rate and water level were selected for assessing this bounding scenario.</p> | Provide further rationale for assuming 95% recovery rate and for using different water column depths for uranium concentrate release characterization. | This response has not been accepted as the Proponent’s response does not include rationale for using different water column depths for uranium concentrate release characterization. | Not Accepted |
| IR-220 | - | CNSC | Accidents and Malfunctions | Section 14.6.1.1.1 Appendix 14-A, Section 5.1.1 | <p>Context: The Proponent states that based on drum deformations performed in a previous analysis (McSweeney et al. 2004), if a drum experienced a crush force of 100,000 lbs., then the deformation of the drum would cause the lid to detach from the drum. Using this drum failure mechanism, and assuming the drums weigh 450 kg and are arranged four across in the truck,</p> | Please provide information and/or rationale as to whether drum stacking would impact drum failure at different speeds and confirm whether 55% drum fail for such an accident is still valid. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|----------------------------|---|---|---|--|--------------|
| | | | | | <p>at a speed of 48 km/h, the front 25% of the drums would fail, at 60 km/h to 97 km/h 55% would fail, at 145 km/h 75% would fail, and at ≥193 km/h all would fail. Given that the speed of the truck is likely between 60 km/h to 97 km/h, it was concluded that less than 55% of the drums would fail upon a traffic accident scenario.</p> <p>It is assumed to be 40 drums per shipment, so some stacking or rows of drums should be expected in this scenario. The drums stacked above could be at greater risk of deformation in a traffic accident. It is not clear whether drums stacking was considered in the previous study cited by the Proponent and whether less than 55% fail is still an adequate percentage of drum failures in such traffic accident scenarios if drums stacking is needed.</p> <p>Rationale: Drum failure percentage will impact the release quantity of uranium in such an accident scenario and then impact the consequence assessment. Therefore, the drum failure should be adequately assessed and supported with sufficient information and justification.</p> | | | |
| IR-221 | - | CNSC | Accidents and Malfunctions | Section 14.6.1.3, Appendix 14-A, Section 7.1 | <p>Context: It is projected that there would be about 100 drums packaged per mill operating day. One trip per day for 330 days per year is assumed for the probability evaluation. This means 100 drums per trip, which is inconsistent with description in section 14.6.1.1.1 where assuming 40 drums in one shipment per day.</p> <p>Rationale: Shipments per day will impact the probability evaluation, and number of drums per trip will impact the release of uranium during an accident.</p> | Please clarify the number of shipments per day and number of drums per shipment that are expected and re-calculate the probability as necessary. | | Accepted |
| IR-222 | - | CNSC | Accidents and Malfunctions | Section 14.6.2.4 | <p>Context: Bounding Scenario 2 consists of the aquatic release of fuel and hazardous chemicals due to traffic accidents. The EIS states that amongst the fuels considered for this scenario, the consequences of the release of gasoline and solvents are bounded by the consequences associated with the release of diesel. Both gasoline and solvents are lighter with higher vapour pressure; therefore, they have a shorter half-life in the aquatic environment and a lesser tendency for adsorption to sediments and suspended solids in the water column. There is no other justification provided to show that the release of diesel can bound other chemicals such as sulfuric acid and sodium hydroxide that are heavier than diesel.</p> <p>Rationale: The release of either sulfuric acid or sodium hydroxide during accident could change the water PH significantly at the releasing location, which would post a negative impact on the local environment.</p> | Please provide further justification that the consequences of the release of sulfuric acid and sodium hydroxide can be bounded by the consequences associated with the release of diesel. | <p>This response has not been accepted as the Proponent states that: <i>“Through the hazard identification process (see Appendix 14-A Section 3.0 and Appendix A), the overall risk of the release of acids and bases was characterized as "moderate" and "ALARP" and as such consistent with the A&M assessment methodology was not carried forward further evaluation.”</i></p> <p>This is not the case. In Appendix A, Table 3, item 3.3 identifies that aquatic release of fuel, hazardous chemicals and reagents as having a high risk and further assessment is needed. If the Proponent believes the above statement is true, Appendix A in Appendix 14-A should be revised to reflect such a case.</p> | Not Accepted |
| IR-223 | - | CNSC | Accidents and Malfunctions | Section 14.6.4.1 Appendix 7-A, Appendix K | <p>Context: The EIS states that the 3D strip numerical model predicted that stresses and displacements did not show instability in the altered sandstone or basement rock at the location where a freeze wall would be placed around the Phoenix Deposit boundary (RESPEC 2021). The potential damage to the freeze wall due to mine-induced stresses and displacements under</p> | Please provide information on the stresses and displacements/deformation of the area northeast of the phase 4 ore body from the geomechanical studies to demonstrate the resulted stresses and displacements will not impact on the freeze wall integrity after IRs for geomechanical studies for ore extraction are addressed. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|---|---|--|---|--------------|
| | | | | | <p>this scenario is excluded.</p> <p>Rationale: One outer section of the freeze wall (i.e., north-east freeze wall of the phase 4 mining area) and some internal cross walls are located in the desilicified zone. The RESPEC 2021 report (i.e., Appendix K of Appendix 7-A) appears not to have included the desilicified zone in the geomechanical modeling, nor is provided the stresses and the displacements/deformation of the area northeast of the phase 4 ore body where a significant extent of the desilicified zone exists.</p> | Technical Discussion Required: Yes | | |
| IR-224 | - | CNSC | Human Health with respect to radiation exposure | Section 14.6.5.4 Appendix 14-A | <p>Context: For the Bounding Scenario 5 (Process System and Piping Failure), doses to receptors at distances of 100 and 500 metres (0.25 and 0.01 mSv respectively) are predicted. The assessment also indicated that the dose to the unprotected worker staying inside the processing plant during the spill could exceed the 50 mSv dose limit specified by CNSC if workers did not leave the area quickly after the spill.</p> <p>The Proponent did not provide the dose calculations for deriving the dose estimates.</p> <p>Rationale: The method used to estimate effective, equivalent, and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data.</p> | Provide the dose calculations for deriving the dose estimates for workers and members of the public for Bounding Scenario 5 (Process System and Piping Failure). | | Accepted |
| IR-225 | - | CNSC | Human Health with respect to radiation exposure | Section 14.6.5.4 Appendix 14-A | <p>Context: With the Bounding Scenario 5 (Process System and Piping Failure), the Proponent states that Denison ensures that the process is designed to include control measures to reduce the exposure to both workers and members of the public as low as achievable. The measures would ensure that the processing plant is adequately ventilated, and that spills or leaks are detected by loss of system pressure, observation, or flow imbalance.</p> <p>It is not indicated where these additional measures have been detailed/elaborated within the EIS.</p> <p>Rationale: Control measures to reduce the exposure to both workers and members of the public as low as achievable, that are identified in the assessment of Bounding Scenario 5, must be formally documented to ensure that they are carried over into the engineered design of the processing plant.</p> | Provide details on how the control measures to reduce the exposure to both workers and members of the public, identified in the assessment of Bounding Scenario 5, have been formally documented and incorporated in the engineered design of the processing facility. | <p>This response has not been accepted.</p> <p>In order to accept this response, CNSC staff request that the proponent specify in the EIS that any engineering design control measures identified in Bounding Scenario 5 will be included in the detailed design and will be provided for acceptance by the CNSC during Project licensing. Please provide proposed text for the revised EIS, for SME review and acceptance.</p> | Not Accepted |
| IR-226 | - | CNSC | Accidents and Malfunctions | Sections 14.6.6.1 and 14.6.6.4 | <p>Context: It is stated that in the case of the accident and for a release amount of 1 kg inside the processing plant, the dose to offsite receptors at 200 m from the Project site was calculated to be less than the CNSC public dose limit of 1 mSv. The analysis also indicated that the dose to a worker in a full-face-piece powered air-purifying respirator who stays in the area would be 88 mSv, which exceeds the annual worker dose limit of 50 mSv.</p> <p>Rationale: Section 14.6.6.1 indicates that 2 kg of uranium concentrate could</p> | Please provide the rationale for using a source term of 1 kg rather than 2 kg of uranium concentrate for the dose calculation to offsite receptors and workers. If sufficient rationale cannot be provided, the doses to offsite receptors and workers should be recalculated using 2 kg uranium concentrate, and the results provide. | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|---|---|--|---|--------------|
| | | | | | be released in case of the accident. No rationale is provided why 1 kg rather than 2 kg uranium concentrate is used for dose calculation. If 2 kg is used as the source term, the dose to offsite receptors at 200m and workers in the area would be higher. | | | |
| IR-227 | - | CNSC | Accidents and Malfunctions | Section 14.6.6.1.1 | <p>Context: Bounding Scenario 6 involves a fire and/or explosion within the processing plant, resulting in the release of a large amount uranium to the atmosphere. The airborne source term for this scenario is estimated with equation developed by the United States Department of Energy (USDOE), where the respirable faction is assumed to only include particles of 10 mm and smaller.</p> <p>Rationale: No rationale was provided to support the consideration of only 10 mm and smaller particles. As provided in Table 14.6-3, the particle size of uranium <15 mm is less than 20%. Majority of the uranium particle size is larger than 10 mm. The airborne source term is an important factor for the effects assessment and should be calculated with transparent and justified information/data.</p> | Provide rationale for only considering 10 mm and smaller particles for the respirable fraction. | | Accepted |
| IR-228 | - | CNSC | Human Health with respect to radiation exposure | Section 14.6.6.4 Appendix 14-A | <p>Context: For the Bounding Scenario 6 (Facility Fire and/or Explosion), the predicted dose is less than 1 mSv to a member of the public 200 metres away from the Project site. The analysis also indicated that the dose to a worker in a full-face powered air-purifying respirator who stays in the area would be 88 mSv, which exceeds the annual worker dose limit of 50 mSv.</p> <p>The Proponent did not provide the dose calculations for deriving the dose estimates.</p> <p>Rationale: The method used to estimate effective, equivalent, and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data.</p> | Provide the dose calculations for deriving the dose estimates for workers and members of the public for Bounding Scenario 6 (Facility Fire and/or Explosion). | | Accepted |
| IR-229 | - | CNSC | Human Health with respect to radiation exposure | Section 14.6.6.4 Appendix 14-A | <p>Context: With the Bounding Scenario 6 (Facility Fire and/or Explosion), the Proponent states that Denison would ensure that the design of the plant includes control measures to reduce the exposure to both workers and members of the public to levels that are as low as achievable. The measures would ensure that the processing plant is adequately ventilated.</p> <p>It is not indicated where these additional measures have been detailed/elaborated within the EIS.</p> <p>Rationale: Control measures to reduce the exposure to both workers and members of the public as low as achievable, that are identified in the assessment of Bounding Scenario 6, must be formally documented to ensure that they are carried over into the engineered design of the processing plant.</p> | Provide details on how the control measures to reduce the exposure to both workers and members of the public, identified in the assessment of Bounding Scenario 6, have been formally documented and incorporated in the engineered design of the processing facility. | <p>This response has not been accepted.</p> <p>In order to accept this response, CNSC staff request that the Proponent must specify in the EIS that any engineering design control measures identified in Bounding Scenario 6 such as ventilation will be included in the detailed design and will be provided to the CNSC during Project licensing. Please provide proposed text for the revised EIS, for SME review and acceptance.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|--|---|---|---|----------------------|----------|
| IR-230 | - | CNSC | Accidents and Malfunctions | Section 14.6.7.4 | <p>Context: It is stated that a conservative penetration time of 15 min was applied in the assessment. Based on this assumption, the maximum depth of contamination could be 90 cm (for penetration rate of 0.1 cm/s). It is not clear why the penetration time of 15 minutes is considered conservative as the penetration time would depend on the time needed for the emergency response team to respond.</p> <p>It is also stated that the wide range of the calculated velocities is a result of variation of soil conditions and the slope of the surface. The distance that the groundwater can travel under these extreme (i.e., conservative) conditions ranges from 0.15 m to 100 m. It is not clear how the groundwater travel distance of 0.15m and 100m is calculated.</p> <p>Rationale: The penetration time will influence the penetration depth of the released materials, which in turn, considering the groundwater travel distance, will impact the potential areas and volumes of contaminated soils and shallow groundwater.</p> | Please provide justification for applying 15 minutes of penetration time, and why it is considered conservative. In addition, please provide information on how the groundwater travel distance of 0.15 m and 100 m was obtained. | | Accepted |
| IR-231 | - | CNSC | Accidents and Malfunctions | Sections 14.6.6.4 and 14.6.6.5 | <p>Context: The EIS states that in the unlikely event of an unmitigated accidental release of uranium due to a dryer explosion, doses to the workers are expected to have a moderate effect, while doses to members of the public are expected to have a minor effect. Based on this evaluation, the severity of the consequences of this accident and malfunction scenario is predicted to be moderate. In consideration of both probability and consequences, the overall risk related to Bounding Scenario 6 is predicted to be low.</p> <p>Rationale: When there is an explosion within the process plant, it is likely there will have worker fatality. The severity of the consequences of an explosion would be catastrophic and the risk of Bounding Scenario 6 would be higher.</p> | Please re-evaluate the consequence and the risk of Bounding Scenario 6 by considering the potential worker fatality resulted from an explosion. | | Accepted |
| IR-232 | - | ECCC | Change to an environmental component due to hazardous contaminants | Appendix 14-A, Table 3-7, ID# 7.1 Appendix 14-A, Table 5-5 | <p>Context: The Proponent indicates in Appendix 14-A, Table 3-7 that a release of sulfuric acid is a low consequence event therefore would not require further assessment. However, according to a Safety Datasheet on high concentrated sulfuric acid (ICSC–0362 - SULFURIC ACID, concentrated (> 51% and < 100%) (ilo.org)), the substance is incompatible with certain materials and can give off toxic fumes. Furthermore, it reacts with various metals to produce hydrogen gas, which is explosive.</p> <p>The Proponent provides estimates of chemicals, including sulfuric acid, to be transported to site in Appendix 14-A, Table 5-5. The annual consumption of sulfuric acid is estimated at 15,417 m3, in 617 trucks per year, but the concentration is not stated.</p> <p>Rationale: Given the high reactivity and inherent corrosive nature of sulfuric acid combined with the volume and concentration that may be</p> | <p>1. Provide the volume and the concentration of sulfuric acid that will be stored on site.</p> <p>2. Provide a detailed risk assessment of the fate and behavior of sulfuric acid during a release into the environment.</p> | | Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|--------------|---|---|---|--|---|--------------|
| | | | | | stored on site, ECCC requests that the Proponent provide a detailed risk assessment related to a terrestrial spill of sulfuric acid, specifically at the processing plant. | | | |
| IR-233 | - | HC | Human health with respect to hazardous contaminants | Appendix 14-A, Section 8.7 (p. 8.10) | <p>An effects assessment for a transportation accident scenario involving radioactive materials was not included.</p> <p>Context: The Proponent provided an effects assessment relating to a diesel spill on the ground (Section 14 Appendix 14-A, Section 8.7). However, no information was provided regarding the potential human health effects of a uranium concentrate release at the two locations considered (Section 14 Appendix 14-A p. 8.10).</p> <p>Rationale: An accident involving radioactive material may have an impact on human receptors, based on the proximity of receptors and the proposed response protocols.</p> | <p>1. Assess and describe the potential health effects (chemical and radiological) of a transportation accident involving a uranium concentrate spill at the following locations:</p> <ul style="list-style-type: none">a) km 160 of Hwy 914, which is the location of a cultural camp that has been established by the ERFN.b) km 67 of Hwy 914, which is a gathering location for the Kineepik Métis Local associated with the Northern Village of Pinehouse.c) All other potential sites of importance for the public and Indigenous peoples. | | Accepted |
| IR-234 | | CNSC | Effect of Environment | Section 15.2.2 | <p>Context: Effects of seismic events on the uranium extraction and post decommissioning are not assessed.</p> <p>Rationale: Seismic events could further exacerbate the stability of the voids induced by the uranium extraction, which will result in extra stresses and displacements/deformation in the overlying rock formations. These extra stresses and displacements/deformation could impact on the mine operation and post decommissioning groundwater flow and contaminant transport.</p> | <p>Please provide an assessment of seismic events on the mine-induced voids stability and the resulted effects on the mine operation and post decommissioning.</p> <p>Technical Discussion Required: Yes</p> | | Accepted |
| IR-235 | - | ECCC ERAD | Fish and fish habitat | Section 15.5.2, Expected Environmental Conditions | <p>Context: In this section it is stated that: “Table 15.5-1 and Table 15.5-2 summarize the predicted mean values of the climate variables for the Tomblin Lake regional grid unit, following the RPC4.5 and RCP8.5 scenarios, respectively, as indicated by the Climate Atlas (PCC 2019).”</p> <p>RCP4.5 represents predicted climate conditions of a moderate carbon future.</p> <p>RCP8.5 represents predicted climate conditions under a high carbon future.</p> <p>The values shown in Tables 15.5-1 and 15.5-2 show averages of 25.9 and 26.7 mm for RCP4.5 and 25.9/27.5 mm for RCP8.5. These values do not correspond to the source indicated by the Proponent.</p> <p>Rationale: Based on the Proponent’s description we would expect to find the same values for “Max 1-Day Precipitation (mm)”in the Climate Atlas for RCP4.5 and RCP8.5 scenarios. ECCC was unable to duplicate the results.</p> <p>ECCC queried the Climate Atlas for Tomblin Lake and returned a result of “Region Geikie River.” https://climateatlas.ca/find-local-data</p> | <p>1. Provide the source of the data displayed in Max 1-Day Precipitation (mm) category in Tables 15.5.1 and 15.5-2.</p> <p>2. Provide detailed calculations for the following average values:</p> <ul style="list-style-type: none">25.9 mm 26.7 mm in Table 15.5-1: Predicted Climate Conditions of a RCP4.5 Moderate Carbon Future25.9 mm 27.5 mm in Table 15.5-2: Predicted Climate Conditions of a RCP8.5 High Carbon Future <p>3. Explain how the data shown in Tables 15.5.1 and 15.5.2 were used in the precipitation risk assessment.</p> <p>4. Denote the differences between “mean”, “value/max value”, and “fluctuation”, in the calculation of extreme event risk.</p> <p>5. Compare model derived data against:</p> <ul style="list-style-type: none">1. Natural variability of the observed data.2. Variability in the statistics generated via observation based time series. <p>Technical Discussion Required: Yes</p> | <p>Although responses 1 to 4 have been accepted, this response has not been accepted for the following reasons:</p> <p>5. although PMP is used for design purposes as indicated in Section 8, presenting the variability of observed versus climate model predicted historical precipitation values would provide understanding on the uncertainties associated with climate model projected or historical precipitation (Max 1-day, seasonal or annual) values. Thus, the proponent is recommended to include more clarification in the revised EIS.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------------------|-----------------------|---|---|---|--|--------------|
| | | | | | <p>ECCC then queried the Climate Atlas for Max 1 Day Precipitation (mm). https://climateatlas.ca/data/grid/782/maxdaypr_2030_85/line https://climateatlas.ca/data/grid/782/maxdaypr_2030_45/line</p> <p>The results displayed an array of values ranging from 83.6 mm (2050) to 87.3mm (2092) for a Regional Concentration Pathway RCP8.5 scenario and values ranging from 48.9mm (2050) to 89.5 mm (2083) for an RCP4.5 scenario.</p> <p>These values do not match the averages shown in Tables 15.5-1 and 15.5-2.</p> | | | |
| IR 236 | - | ECCC ERAD | Fish and fish habitat | Section 15.5.2, Expected Environmental Conditions | <p>Context: It is stated that, “Table 15.5-1 and Table 15.5-2 summarize the predicted mean values of the climate variables for the Tomblin Lake regional grid unit...”</p> <p>As per the Proponent’s description, Tomblin Lake was chosen as representative location for Wheeler when Climate Atlas was used as data source.</p> <p>Rationale: In those two tables, for the “Max 1-Day Precipitation (mm)” the historical average is given as 24.1mm. Local time series analysis for the climatic region in which Wheeler Project is located provide averages (for 1-day max precipitation) of approximately 30+ mm.</p> <p>It is the Proponent’s responsibility to keep the required database current and up to date, because the length of the time series influences all derived statistics. Statistical analysis of extreme events is highly dependent of the mean with extreme values reaching values 3 to 4 times higher than the mean.</p> | <p>1. Provide a clear explanation on how the historical mean for 1-Day Max Precipitation was calculated.</p> <p>2. Compare the values obtained via various means (ex: copied from the internet, modeled via some online algorithm, derived from specialty literature), against time series analysis based on observations.</p> <p>Technical Discussion Required: Yes</p> | <p>This response has not been accepted.</p> <p>The Proponent made a correlation between precipitation and the Probable Maximum Precipitation (PMP). However, annual maximum and PMP cannot be correlated as they are two separate concepts that require different statistical methods to verify.</p> <p>The Proponent provided two tables which displayed precipitation data under current, existing, and future climate scenarios for two nearby lakes. These were provided to support the Proponent’s response, however, the calculations used to achieve the table figures within the response or Attachment: IR-236 were not provided. As one value cannot be used to infer the other, reviewing the calculations is required to support the Proponent’s conclusions.</p> <p>Please see the following requests:</p> <p>1. In Table 3 of Attachment: IR-236, the historical mean value (1976 to 2005) for the Maximum 1-Day Precipitation is 24.1 mm and is indicated as measured. However, this estimate appears to be derived from ensembles of climate modeled historical precipitation. Thus, proponent to insert a footnote at Table 3 that indicate the total annual as well as maximum 1-day are estimates based on ensembles of climate modeled historical precipitation. The Proponent needs to provide the calculations that were used to reach the conclusions found within Tables 2 and 3 of Attachment: IR-236. Reviewing the calculation will allow for verification of the Proponent’s conclusions. If the currently used data sources do not allow for accurate representation of their conclusions, the Proponent should use complete regional observational data sources to support the conclusions in Tables 2 and 3.</p> <p>2. The analysis of mean maximum one day and mean annual total precipitation [1976-2005] based on weather station (Climate ID 4063755) at Key Lake is roughly 32mm and 470mm respectively. Thus, include both modeled and observed historical precipitation statistics in the EIS for context.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|-------------------------------------|---|--|--|--|--------------|
| | | | | | | | Measured data should take precedence over modeled data. The Proponent is taking an ensemble of modeled data to "predict" historical data when measured data is available and can validate the models. Without strong justification, it is not appropriate to replace measured data with "predicted" modeled data. | |
| IR-237 | | CNSC | EA follow-up and monitoring program | Appendix 16-C throughout, including Table 1.5-1: Wheeler River Monitoring and Follow-up Program Summary (p. 8-15) | <p>Context: CNSC’s Generic Guidelines for the Preparation of an EIS state: “The EIS should provide discussion on the follow-up program’s requirements, and include:</p> <ul style="list-style-type: none">objectives and structure of the follow-up program and the VCs targeted by the programtabular summary and explanatory text of the main components of the program including:<ul style="list-style-type: none">a description of each monitoring activity under that component<u>which of the two generic program objectives the activity is relevant to (e.g., verify EA predictions, determine effectiveness of mitigation measures)</u>the specific statement from the EA that goes along with that generic objective and will be the focus for that activity (e.g., program objective: verify predicted effects; environmental assessment effect: no potential adverse effects)the specific monitoring objective for that activityplanned schedule<u>roles and responsibilities to be played by the Proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the program results</u><u>possible involvement of independent researchers</u><u>program funding sources</u>information management and reporting (reporting frequency, methods and format)<u>possible opportunities for the Proponent to include the participation of the public and Indigenous groups, during the development and implementation of the program</u> <p><u>The follow-up program plan should be sufficiently described in the EIS to allow independent judgment as to the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures.”</u> (Section 11)</p> <p>Rationale: The Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information, and while some of the aspects detailed in the Generic EIS Guidelines are included, the aspects underlined are missing or appear incomplete.</p> <p>Further, all information from throughout the EIS should be incorporated into this Summary. For example, the EIS notes that: “Groundwater samples will be collected at least monthly and semi-annually in the wells within the</p> | <p>It is recognized that this document will evolve over the planning process and be finalized prior to the EA Decision; however, as plans are developed and revised, CNSC staff expect that updates will be made to this document and provided with any future versions of the EIS.</p> <p>Appendix 16-C Summary of Monitoring and Follow-up Programs must include sufficient details to allow CNSC staff to determine the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures. This includes concrete monitoring plans (sampling locations, frequency, etc.).</p> <p>Additionally, please incorporate any relevant information included in the EIS into this Summary.</p> | <p>This response has not been accepted.</p> <p>Denison has indicated they will update the follow-up program in Appendix 16-C, but this information has not been provided. CNSC reminds Denison that there should be no new information in the final EIS, and that we must review this information before accepting the response to this IR.</p> <p>Please provide an updated version of Table 1-5.1 with detailed information proposed by Denison in the IR response for the next iteration of the FIRT technical review, for SME review and acceptance.</p> | Not Accepted |

| Original IR# | Follow-Up IR # | SME | Project Effects Link | Reference to EIS, appendices, or supporting documentation | Context and Rationale | Information Requirement (IR) | Rationale for Status | Status |
|--------------|----------------|------|---|---|---|---|---|--------------|
| | | | | | freeze wall and on the freeze wall perimeter, respectively” (p. 7-109) and that “At least five to seven multi-well clusters are proposed across the mined area (Figure 7.8-2). Sampling will include KI parameters or the full suite of COPC at different times in the remediation process” (p. 7-111). These details (only examples) are not included in Appendix 16-C. | | | |
| IR-238 | - | CNSC | Current use of lands and resources for traditional purposes | Various sections of the EIS, including: Section 8 Section 9 Section 10 Section 11 Section 12 Section 15 Section 16 Appendix 16-C (p. 3) | Context: The EIS indicates that “further detailed [follow-up and monitoring programs] will be developed as Project designs are finalized that may influence the nature, frequency, and locations of monitoring. In addition, input from regulatory agencies, the public and Indigenous Peoples will be considered.” (Appendix 16-C, p.3) It is not clear in several section(s) of the EIS and the Indigenous Engagement Report, whether Denison has provided the interested Indigenous Nations and communities with the opportunity to participate in the development, implementation, and review of monitoring and mitigation measures, as per the guidance of REGDOC-3.2.2 and CNSC’s Generic EIS Guidelines. Rational: As outlined in Section 11 of CNSC’s Generic Guidelines for the Preparation of an EIS , please include roles and responsibilities to be played by the Proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the monitoring program results as well as possible opportunities for the Proponent to include the participation of the public and Indigenous Nations and communities, during the development and implementation of the program. | Please provide additional information to demonstrate whether Indigenous Nations and communities were engaged directly on the potential mitigation and monitoring measures to address the concerns raised regarding potential impacts of the Project on the potential or established Indigenous and/or treaty rights. Provide a rationale if this engagement has not been completed. As the Project develops, please provide concrete actions Denison will take in the follow-up and monitoring programs to engage Indigenous Peoples to alleviate concerns and incorporate their interests, and when this engagement is planned to take place. | This response has not been accepted. Please provide additional information and updates on engagement activities to the EIS and IER (to date) that demonstrate whether Indigenous Nations and communities have been engaged directly on the potential mitigation and monitoring measures to address the concerns raised regarding potential impacts of the Project on the potential or established Indigenous and/or treaty rights. See also AD-62 in the Advice to Proponent table. | Not Accepted |

Additional Lung Cancer Mortality from PM2.5: Recommended Approach and Sample Calculation

Health Canada, Water and Air Quality Bureau, October 2022

Health Canada (2022) provides a quantitative estimate of the risk of lung cancer associated with exposure to PM2.5 in Canada. The pooled hazard ratio (HR) for lung cancer mortality in the Canadian population is 1.127 (95% CI: 1.085, 1.170) per 10 µg/m3 increase in long-term exposure to ambient PM2.5. The slope coefficient (β) for this relationship is 0.01196, as derived below:

$$e^{(\beta \times 10 \text{ } \mu\text{g}/\text{m}^3)} = \text{pooled hazard ratio per } 10 \text{ } \mu\text{g}/\text{m}^3$$

$$e^{(\beta \times 10 \text{ } \mu\text{g}/\text{m}^3)} = 1.127$$

$$\beta \times 10 \text{ } \mu\text{g}/\text{m}^3 = \ln 1.127$$

$$\beta = (\ln 1.127)/(10 \text{ } \mu\text{g}/\text{m}^3) \text{ `}$$

$$\beta = 0.01196$$

The additional lung cancer mortality (over the baseline rate) from PM2.5 derived from a given source can be determined using the equation below, based on the attributable fraction or (HR-1)/HR (Greco et al. 2020):

$$ALCM = \left[\left(e^{\beta \cdot Exposure} - 1 \right) / e^{\beta \cdot Exposure} \right] \cdot Baseline\ rate \cdot Years$$

ALCM = additional lung cancer mortality cases per 100,000 population

β = 0.01196 (slope coefficient from meta-analysis in Health Canada (2022))

Exposure = estimated PM2.5 exposure concentration from the relevant source(s) (µg/m3) (does not include baseline PM2.5 exposure)

Baseline rate = 45.5 per 100,000 (current Canadian Age Standardized Mortality Rate (ASMR) for lung cancer from Canadian Cancer Statistics Advisory Committee 2021); the Canadian baseline rate is appropriate as the slope coefficient was derived from Canada-wide studies and an updated ASMR of Canada (if available) would be appropriate for use in the calculation

Years = years of project or project phase

Sample calculation:

Project estimates an exposure from relevant source(s) of 0.067 µg/m3 over 50 years of operation

$$ALCM = \left[\left(e^{\beta \cdot Exposure} - 1 \right) / e^{\beta \cdot Exposure} \right] \cdot Baseline\ rate \cdot Years$$

$$ALCM = \left[\left(e^{0.01196 \cdot 0.067} - 1 \right) / e^{0.01196 \cdot 0.067} \right] \cdot 45.5 \cdot 50$$

ALCM = 1.8 additional lung cancer mortality cases per 100,000

Annex 1 Responses to Information Requirements

Federal Indigenous Review Team (FIRT) – Denison’s Responses to Information Requirements for the Wheeler River Project Environmental Impact Statement

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|-----------------------------------|---|--|--|--|--|--|
| IR-01 | English River First Nation (ERFN) | Current use of lands and resources for traditional purposes | General | <p>Context: Denison has not gone far enough in terms of learning from and incorporating information from ERFN provided in the <i>Traditional Knowledge Study and Health and Socio-Economic Study Report</i>. It appears Denison put a disproportionate amount of reliance on the views and interests of one ERFN land user. While we applaud the efforts of Denison to seek feedback from ERFN land users directly and to work closely with such land users, ERFN’s rights and interests in the region of the Project (and the potential of the Project to adversely impact such rights and interests) extend well beyond that of just one land user.</p> <p>Rationale: It is important for the proponent and regulators to understand that while the rights and interests of individual ERFN members are important to consider, the Elders and elected leaders of ERFN represent the collective rights and interests of ERFN as a Nation. The results of the scoping study indicated that ERFN holds firmly established rights to the area where the planned project is located. Numerous studies conducted over several decades have examined ERFN's relationship and connection to land use and occupancy of the region where the proposed mine is located from traditional land use, subsistence harvesting, ecological, and sociocultural and economic perspective.</p> | <p>The draft EIS should be revised to reflect the totality of ERFN TK and land use information.</p> <p>Denison and CNSC must continue to work with ERFN to ensure that impacts on ERFN rights are appropriately and fully considered, mitigated, and accommodated.</p> | <p>Denison has met with ERFN regarding the IR and has gained a better understanding of the specific concern raised in the IR. ERFN's relationship and connection to the land is important. Denison will continue to work with ERFN to refine its understanding of this relationship and will work with ERFN to make sure this is accurately reflected in the final EIS.</p> <p>Despite the passing of the late trapper/resource harvester referred to throughout draft EIS, ERFN has communicated to Denison that ERFN considers his use of the area as representative of current and future land users and expects that the relationship to the Project area will be continued and strengthened through generations of future use. Changes will be made throughout the EIS to reflect that the late ERFN land user is but one of many current and future land users, and should be considered as representative of future land uses and expression of rights.</p> <p>For example, statements about the land being inactive at this time or statements that suggest that other land users are limited or have not provided documented use of the area will be removed and repositioned so as to reflect the importance of the area to ERFN. This may result in the inclusion of additional mitigation and enhancement measures. Denison will continue to work with ERFN on the list of Project elements that ERFN feels required additional refinement or that are sources of concern as the EIS review process continues.</p> | <p>As noted in the IR response, the final EIS will be updated. To support review of the response, a few examples of updates to the draft EIS are provided, with new text in bold, and deleted text in strikethrough:</p> <p>Example 1:</p> <p><i>10.1.6.1.4 Human Health Risk Assessment Results</i> (excerpt only) The ingestion rate for caribou, based on engagement with a local fisher/trapper, was 175 kg/yr of caribou (equivalent to approximately 2 to 3 servings per day). This ingestion rate is conservative compared to an annual caribou ingestion rate of 2.6 kg/yr (1 to 2 servings per month) from the ERFN’s Country Food Study (CanNorth 2017) and 54.4 kg/yr for the total game diet for a high traditional foods consumer in the Boreal Shield as per the First Nations Food, Nutrition and Environment Study for Saskatchewan (Chan et al. 2018). Thus, the local fisher/trapper represents is relatively extreme an intensive land user with respect to local game consumption. Denison recognizes that ERFN considers the fisher/trapper’s use of the area as representative of current and future land users and expects that the relationship to the Project Area will be continued and strengthened through generations of future use.</p> <p>Example 2:</p> <p>10.1.6.2 Residual Effects Characterization (excerpt only)</p> <p>For non-carcinogens, the results of the HHRA predicted no exceedances of the HQ benchmark (HQ<0.2) for human receptors for non-carcinogens (cadmium, copper, chromium, cobalt, molybdenum, uranium, and zinc) during all phases of the Project. The one exception was selenium for the fisher/trapper at Russell Lake, where the incremental Project HQ for the fisher/trapper from fish ingestion (northern pike and white sucker) was predicted to be 0.93. The traditional foods diet assumptions for the fisher/trapper are conservative and are based on engagement with a local fisher/trapper which is representative of one person, who consumes a unique composition and quantity of traditional foods. Most Many people fishing, hunting, and trapping in the Project Area would consume traditional foods more consistent with the average traditional foods consumer diet, which was developed from the ERFN country foods study (CanNorth 2017). Denison recognizes that ERFN considers the fisher/trapper’s use of the area as representative of current and future land users and expects that the relationship to the Project Area will be continued and strengthened through generations of future use.</p> <p>Example 3:</p> <p>11.1.2.1 English River First Nation</p> <p>Indigenous Knowledge (referred to as Traditional Knowledge or TK by the ERFN) was provided by ERFN for consideration in the EIS. This included several reports:</p> <ul style="list-style-type: none">• <i>Wheeler River Project – Summary of Health and Socio-Economic Study Results</i>, which summarizes results from 16 interviews that were conducted for the health and socio-economic topics (ERFN and SVS 2022a). |

¹ Unless otherwise stated, the section noted refers to the draft EIS.
² Where IR contents note “See also related IR(s)”, responses from Denison may be similar or provided in a single detailed response, but it was preferred to keep original IRs distinct.

|--------|---|----------------------|--|---|---|---|--|
| | | | | | | | <ul style="list-style-type: none">• <i>Wheeler River Project - Summary of Traditional Knowledge Study Results</i>, which analyzed and presented results from 21 land use interviews that provided both IK and LK and included details on ERFN’s resource harvesting locations, species harvested, travel routes, cabins and special sites (ERFN and SVS 2022b).• <i>The English River First Nation Country Foods Study Final Report</i>, which conducted in 2016 through funding secured from the First Nations Environmental Contaminants Program to complete a country foods study. The study involved three components: a dietary study, a sampling program, and a human health risk evaluation. The overall study objectives were to examine country food usage by ERFN community members and to assess if the country foods are safe to eat. The involvement of ERFN community members was one of the fundamental goals of the study, which relied heavily on TK to identify what and where to sample (CanNorth 2017a).• <i>The English River First Nation Aboriginal Traditional Knowledge Summary Report</i>, which was compiled by Environment Canada on behalf of ERFN to summarize information for the purposes of recovery of the Woodland boreal caribou population. Ten individuals (mostly Elders) were selected by ERFN to complete TK interviews to understand boreal Caribou in the English River Traditional Territory (ERFN 2011). <p>Local Knowledge also was provided by an ERFN trapper, fisher, and resource harvester (ERFN Trapper) who resided in and conducted resource use in the Project Area. The ERFN Trapper explained the use of the area by outfitters and cabin lease holders, fish and wildlife abundance and distribution, species harvested for traditional use, and navigation and travel along waterbodies and roads. On October 29, 2019, at Denison’s Project exploration camp, the resource user attended a full-day interview. Notes from this interview were finalized on January 2, 2020, with their approval and are used in most ILRU components herein. Unfortunately, prior to the filing of the EIS, the ERFN Trapper passed away. Despite his passing, ERFN considers the ERFN Trapper’s use of the area as representative of current and future land users and expects that the relationship to the Project area will be continued and strengthened through generations of future use.</p> |
| IR-02 | Canadian Nuclear Safety Commission (CNSC) | Mitigation Measures | General Appendix 16-C | <p>Context: Denison’s 2019 Wheeler River Terms of Reference states: “The EIA will also discuss the monitoring programs required to demonstrate regulatory compliance and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders.”</p> <p>The CNSC’s Generic Guidelines for the Preparation of an Environmental Impact Statement (EIS), also state: “The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the proponent intends to implement them and the environmental outcome the mitigation is designed to address.</p> <p>Rationale: The EIS and the Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information. It is not clear which monitoring programs will be employed to demonstrate regulatory compliance, and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders.</p> | CNSC staff expect Denison to provide a comprehensive list of commitments along with the next version of the EIS, including any commitments made to Indigenous Nations and communities and other stakeholders (As committed in the Wheeler River Terms of reference, and as noted in the November 28 th , 2022 email from CNSC staff to Denison: <i>Future Submission of a Commitments Table for Wheeler River EIS</i>). | A list of commitments, including specific commitment or mitigation measures related to Project effects as an outcome of engagement, made in the draft EIS, throughout the Federal information request period and the Provincial comment response period, will be included with the submission of the revised draft EIS. For clarity, this would not include any private, confidential accommodations made under contractual agreements. | No EIS updates are anticipated to address this IR at this time. Denison acknowledges that a comprehensive list of Project-related commitments will be provided for the record as part of the process of finalizing the EIS. |
| IR-03 | CNSC | Site preparation | Section 1.3.2 Temporal Boundaries | <p>Context: The EIS and TSD-ERA provide assessment on the project timeframe, including construction, operation, and decommissioning phases.</p> <p>Rational: The site preparation phase is not included in the timeframe</p> | Please provide an assessment of those facility characteristics and activities that may interact with the environment during the site preparation phase, along with an assessment of their potential effects, in order to reflect the entire lifecycle or provide a rationale for its exclusion. | The EIS phase 'Construction' includes site preparation activities and as such these site preparation activities have been assessed within the EIS and the supporting documentation, including Appendix 10-A. | Section 5.3.4 of the final EIS will be modified as follows: Temporal boundaries are based on the different phases of the Project: Construction (including |

|--------|--|--|--|---|---|---|---|
| | | | Appendix 10-A (ERA) | (EIS and TSD-ERA). As per REGDOC 2.9.1, the sub-section 4.1.1 Complexity of the environmental risk assessment requirements states that “The applicant or licensee shall identify facility characteristics and activities that may interact with the environment during the relevant phase of the facility or activity’s lifecycle (for example, site preparation, construction, operation, and decommissioning.” | | <p>EIS Section 5 Approach and Methodology of the Assessment, Section 5.3.4 outlines the temporal boundaries for the assessment and the Project activity tables used throughout the EIS include elements of site preparation in the Construction phase. The list of key project activities included in the Construction phase are included below; elements related to site preparation are shown in bold:</p> <p>Construction Activities</p> <ul style="list-style-type: none">• Development of access roads and air strip• Site preparation and earthworks; clearing, levelling, and grading of the Project Area• Power generation - generators• Installation of main substation and distribution of power around site• Wellfield and freeze hole drilling; ground freezing• Batch plant operation (concrete); crusher at borrow area• Development of surface infrastructure (camp, operations centre, plants, ponds, pads, and support facilities)• Waste management (composting, domestic and industrial landfill operation, recycling)• Water management (including treatment and site runoff)• Groundwater supply• Surface water withdrawal• Fuel management (e.g., propane for comfort heating; vehicle and aircraft fuel)• On-site and off-site operation of vehicles and transport of materials• Air transportation for workers• Regulatory site inspections• Engagement – site visit from Interested Parties | <p>site preparation), Operation, Decommissioning, and Post-Decommissioning, as described in Table 5.3-3.</p> <p>Section 1.3.2 of Appendix 10-A will be modified in the final EIS as follows:</p> <p>Consistent with the Wheeler River Project EIS, the temporal boundaries of the assessment include the following Project phases: construction (which includes site preparation), operation, decommissioning, and post-decommissioning (Table 1-1).</p> |
| IR-04 | Environment and Climate Change Canada (ECCC) | Fish and fish habitat | Section 2, Project Description Section: Glossary | <p>Context: The Proponent defines ‘clean waste rock’ as “Waste rock generated as sandstone cuttings and core from drilling activities associated with well and freeze hole development that does not have uranium containing materials”.</p> <p>ECCC notes that the use of the term “Clean Waste Rock” could be misunderstood to mean that the waste rock is devoid of any contaminant. Even when the waste rock referred to as “clean waste rock” does not contain uranium materials, it could contain other metals or contaminants that could have adverse environmental effects. It is also not clear whether the “clean waste rock” is characterized for Acid Rock Drainage/Metal Leaching (ARD/ML) given that some portion of the basement rock is to be drilled out to anchor the freeze walls and may have ARD/ML potential.</p> <p>Rationale: The current definition of ‘clean waste rock’ in the draft EIS could lead to inappropriate handling and disposal if it is assumed to be devoid of any metals or other contaminants that might negatively affect the environment.</p> | Provide a clear and more detailed definition of the term ‘clean waste rock’. | <p>Clean waste rock is defined as non-mineralized and non-potentially acid generating (PAG) rock. Clean waste rock will be sent to a storage pad (clean waste rock pad) that is proposed to be lined with an impermeable geomembrane collecting precipitation that will be monitored for quality and would allow for treatment if necessary.</p> <p>The clean waste rock pad is expected to hold approximately 7,800 m³ of clean waste rock.</p> <p>Further characterization and test work are ongoing to confirm the ARD/ML characteristics of this waste rock. From the historically completed testing it is recognized that the non-mineralized mine rock is expected to include both non-PAG and PAG mine rock.</p> <p>The clean waste rock pile is being evaluated for potential segregation of the PAG mine rock. However, it is noted that, as observed in the six field barrel tests on Phoenix mine rock, including four bins that were identified as containing PAG mine rock, no net-acidity was observed over at least the first two years of the field barrel testing. In all barrel tests the pH values were greater than 7 and were producing substantial alkalinity (SRK, 2020). This indicates that the potential lag-time to net-acid generation would be on the scale of years and monitoring/collection/potential treatment could be pursued as conditions at the clean rock pile develop.</p> <p>It is noted that the non-mineralized mine rock is expected to have central tendency (i.e., median) solids contents that are generally similar to the average upper continental crustal abundance contents (Rudnick and Gao, 2014).</p> <p>The field barrel tests have all maintained neutral pH conditions and metals concentrations and their respective loading rates have generally either been stable or decreasing over the test duration (SRK 2020). However, further testing is required to confirm the expected behaviour at field-scale over operational-timescales.</p> <p>It is noted that comparing field barrel leachate concentrations are not directly representative of expected contact water within an at-scale storage pad; however, it is recognized that the clean waste rock pad is of a modest size and that loadings to contact water are expected to be directly correlated with the quantity of rock held within a catchment. Further, the barrel tests were performed on materials that were crushed to less than 1mm, field-scale mine rock of larger grain sizes would be expected to have appreciably lower mass loading rates than the unit rates observed in the field cells.</p> <p>Confirmatory sampling of both the waste rock and drainage at the clean waste rock is planned during both construction and operations.</p> <p>References:</p> <p>Rudnick, R.L. and S. Gao. 2014. Composition of the Continental Crust. Treatise on Geochemistry (Second Edition) Volume 4, 2014, Pages 1-51</p> <p>SRK Consulting Inc. (SRK).2020. Wheeler River On-site Kinetic Leach Tests, Progress Update – Draft. Prepared for Denison Mines Corp. January 2020.</p> | <p>Section 2.2.4.8 of the final EIS will be updated as follows:</p> <p>Clean waste rock (non-mineralized and non-potentially acid generating [PAG] rock) will be generated as sandstone cuttings and core from drilling activities. Based on the current wellfield and freeze wall design, approximately 7,800 m³ of clean waste rock will be generated. Clean waste rock will be stored on a 2,500 m2 single geomembrane liner (Figure 2.2-26) and can be used for road construction and/or concrete production. The clean waste rock will be assayed and tested for PAG during Operations to ensure the material can be reused when required.</p> |
| IR-05 | CNSC | Change to an environmental component due to hazardous contaminants | Section 2.2.1.2 | <p>Context: Water volumes for mud/diamond drilling is listed as minimal as the mud will be re-used. The mud is identified as a mixture of water, clay, and environmentally friendly polymers that clean out the cuttings and help to keep the drilling bit cool.</p> <p>Rationale: Although the mud for drilling will be re-used, there could be environmental impacts should there be an accident while drilling.</p> | Please identify the components of the environmentally friendly polymers for the drilling mud and potential environmental impacts should the mud not be recovered. | Two primary drilling methodologies are planned for the development of the wellfield that will be comprised of monitor, injection, recovery and freeze wells. The two primary forms of drilling are diamond and mud rotary drilling. Diamond drilling will be used for freeze, monitor and small diameter injection wells. Mud rotary drilling will be used for recovery and larger diameter injection wells. Both methodologies employ similar mud management programs as part of the drilling process in that they both use a combination of light polymer and bentonite products to stabilize the subsurface formation during drilling and well installation. | No EIS updates are anticipated to address this IR at this time. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-------------------------|---|---|--|---|--|
| | | | | | | <p>Various products are used at specific depths to stabilize the formation and include Ultra PAC, Sawdust, Prima Seal, Premium Gel, Prairie Drill, KCl, Hyper drill, Hydrated lime, Envirofloc, Caustic Soda, Calcium Chloride, Purevis and bentonite. All products used on the Wheeler River Project are considered environmentally friendly and safe for use for workers as indicated by their respective safety data sheet (SDS) and product data sheet (PDS. The use of drilling muds was addressed within the A&M hazards screening (Table 3-2; in Appendix A of Appendix 14-A) and characterized it as a low risk event.</p> <p>Potential worker safety risks primarily include slipping hazards at the worksite as the products generally create non-adhesive bonds in surfaces that are contacted.</p> <p>All of the products used are routinely landspread on farmer’s fields in the Oil and Gas industry in both Saskatchewan and Alberta at the same quantities or greater proposed for use on the Wheeler River Project. As a vast array and combination of products are used, the specific compositions are not presented herein but are available upon request.</p> | |
| IR-06 | CNSC | Geology and groundwater | Section 2.2.1.4, Wellfield for In Situ Recovery Mining | <p>Context: This Section of the EIS indicates that a tracer test was completed in 2021 and a feasibility field test was initiated in 2022. No information from these tests is included in the EIS and no reporting timelines are provided.</p> <p>Rationale: Guidance from the IAEA (2001) and best practices highlighted by regulatory regimes in other countries such as the United States (IAEA, 2016) and Australia (Geoscience Australia, 2010) indicates that single and multi-well trial (feasibility) testing for mining and remediation techniques should be carried out before a licence for full-scale operations can be granted. This is part of the requirement for proponents to demonstrate to government authorities that all potential risks have been considered during the life of operation and post-remediation of the mine.</p> <p>Additionally, Section 8.5.2 of the Generic EIS Guidelines states: “Units may be characterized as aquifers or aquitards, and unit descriptions should include their geochemical characteristics, vertical and lateral permeabilities, transport mechanism (diffusion versus advection) and the directions of groundwater flow”,</p> <p>And that “The applicant or licensee should present a conceptual and numerical hydrogeological model that discusses the hydrostratigraphy and groundwater flow systems”.</p> <p>Outcomes from the tracer test inform model parameters such as effective porosity (see IR-78), dispersion, and dispersivity (see IR-96). The wellfield leach tests and remediation trails ultimately inform environmental monitoring during site activities, and the source term for the groundwater model. This source term represents the contaminants which flow through the desilicified zone into Whitefish Lake, which represents a source of contamination considered in the ERA.</p> <p>References: [1] International Atomic Energy Agency (IAEA). 2001. Manual of Acid in Site Leach Uranium Mining Technology. IAEA-TECDOC-1239. Vienna. 283 p. [2] International Atomic Energy Agency (IAEA). 2016. In Situ Leach Uranium Mining: An Overview of Operations. IAEA Nuclear Energy Series No. NF-T-1.4. Vienna. 76 p. [3] Commonwealth of Australia (Geoscience Australia). 2010. Australia’s in situ recovery uranium mining best practice guide. ISBN 978-1-921672-95-8. Canberra. 33 p.</p> | <p>1. Please provide a summary of the results of field tests (i.e., tracer tests, wellfield leach tests, and remediation trials) in the EIS, or provide a technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS.</p> <p>2. Please indicate how outcomes from these field tests inform the design of In Situ Recovery. This information should include:</p> <ul style="list-style-type: none">• feasibility of meeting remediation targets.• groundwater flow conditions and validation of flow models.• mobilization of contaminants (e.g., Al, Se or V).• potential for free gas evolution/two-phase flow.• identifying composition of lixiviant and production solutions.• success despite presence of >2% carbonate minerals (siderite, FeCO3) in the ore zone (see Table 4-3 of Appendix 7-A).• site-specific data to parameterize, validate, and refine solute transport models (hydraulic conductivity, effective porosity, dispersivity, diffusion, etc.). <p>3. Please provide further information of proposed operations including % recovery, uranium concentrations, optimal liquid/solid ratios, anticipated reagent consumption, etc.</p> | Please see Attachment IR-06. | <p>The following text will be added to the final EIS, under a new heading, Section 2.2.1.6 ISR Mining-Related Inputs for the EIS:</p> <p>It is important to note that Denison is completing a sequential EA and licensing process for the Project (see Section 1). Detailed ISR mining-related information needed to support licensing and permitting has not been included in the EIS; it will be provided to regulators as part of permitting and licensing.</p> <p>For the EIS, an understanding of ISR design is needed to describe potential effects related to Project activities within the biophysical environment (EIS Part II, Section 6 to 9), human environment (EIS Part III Sections 10 to 13), and accidents and malfunction (Section 14) assessments. Denison used the ISR mine design and the 3D hydrogeology and contaminant transport numerical modelling of the injection and extraction wells to determine the potential interactions between mining activities and the environment. Two key outputs from the ISR mine design and 3D hydrogeology modelling work were used as inputs for the groundwater assessment (Section 7): 1) The extent of mining solution migration away from the injection and recovery well screens, as defined by the mining area (50m above the ore zone and within the freeze wall) and 2) groundwater quality of the mining area following remediation. Monitoring will be completed during operations and decommissioning to confirm these inputs.</p> <p>Importantly, since the mine design includes the freeze wall, movement of mining solution is restricted and contained horizontally during operations. Wellfield pumping provides the hydraulic containment to keep mining solution within the 50 m mining area (see Section 2.2.1.4.2). During the operation phase, and under normal operational conditions there is no interaction between the mining zone and surface water or down gradient groundwater environments, and the groundwater assessment (Section 7) focuses on the post-decommissioning period following removal of the freeze wall, once the groundwater flow paths return to pre-mining conditions. During mining area remediation (see Section 2.3.3.1.1), the freeze wall will remain in place until decommissioning objectives are achieved. Refinement of the mining area decommissioning objectives and associated modelling will be done through updates to the Decommissioning Plan, and will be bounded by the objectives evaluated in the EIS.</p> |
| IR-07 | ECCC | Fish and fish habitat | Section 2.2.1.4.2, Wellfield Operation Section 2.2.1.4.2.2, Secondary Containment of Mining Solution – Pumping | <p>Context: The description in Sections 2.2.1.4.2 and 2.2.1.4.2.2 refer to the differential rates of injection and withdrawal, which implies that more solution will be withdrawn through the recovery well than volume of mining solution injected. According to the description of the site, a freeze wall will create a barrier between the uranium deposit to be mined and outside the isolated area to prevent inflow of groundwater from the sandstone outside the freeze wall. Secondly, it was indicated that the basement rock below the uranium deposit will prevent infusion of groundwater from below.</p> <p>The Proponent stated that inward hydraulic gradient will be created</p> | Clarify where the extra groundwater will come from to sustain this differential rate of injection and withdrawals during operation and if this extra water has been accounted for in the model and the amount of water that ends up in the receiving environment. | <p>The freeze wall will provide hydraulic containment between the internal wellfield and the external regional groundwater system with each well pattern maintaining a minimum 1% 'bleed' to maintain hydraulic gradients towards recovery wells.</p> <p>The "extra" water pumped (i.e., the water pumped in excess of injection) will be derived from stored groundwater within the sandstone units above the ore zone, and from the underlying paleoweathered zone, within each phase of Operation that is surrounded by freeze walls. The volume of stored water was estimated using the calibrated groundwater flow model, which contains 3D volumes for the saturated soil and rock within each of the walled phases, including appropriate porosity values. These volumes of stored water were compared to the volume pumped within each phase of operation, over the expected period of extraction</p> | No EIS updates are anticipated to address this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|---|--|---|--|---|--|
| | | | | <p>by recovering more solution than is being injected. In general, the wellfield will operate to draw a minimum of 1% more solution out of the wellfield compared to solutions injected in. This will help avoid increased subsurface pressures from injection pressure build up within the deposit.</p> <p>Rationale: It is not clear where the extra groundwater will come from that will sustain this differential rate of injection and withdrawals as the freeze wall and bedrock basement will isolate the injection well from groundwater.</p> <p>If it is assumed that there is limited amount of groundwater present in the sandstone layer above the uranium deposit, that amount of groundwater in the sandstone layer is finite and will be exhausted at some point. Therefore, it is not clear where the extra groundwater will come from. If the extra volume of water is not accounted for in the modelling, that would ultimately affect the volume of water that ends up in the receiving environment and likewise the amount of contaminants contained.</p> | | <p>based on the mining plan. The stored volume of water was calculated to be 3.4 (Phase 1) to 9.7 (Phase 4) times the estimated excess pumped volume. In other words, there is ample stored water within each walled phase to supply the excess pumped volume. The excess pumping creates a hydraulic gradient toward the ore zone within each walled phase, which will help to avoid vertical spreading of the UBS during operations. If monitoring during operations indicates water levels are falling quicker than anticipated, additional water could be added within the walled phase, within the Upper Sandstone Aquifer.</p> <p>The volume of water reduction within each phase of operations was evaluated within model simulations presented in Appendix 7C, Section 2.7. The volume reduction within mined phases was found to be minor compared to the volume of water pumped from the Upper Sandstone Aquifer located outside the freeze wall confines and within the regional groundwater system during decommissioning (i.e., pumping at 35.5 m³/hr). The pumping of groundwater for process water results in an order of magnitude more water volume extraction than the estimated volume required to replenish stored water when the freeze walls are thawed.</p> | |
| IR-08 | ECCC | Change to an environmental component due to radiological contaminants | Section 2.2.1.4.2.2 Project Description | <p>Context: This section describes how an inward hydraulic gradient will be created within the mining area as a secondary containment method for control of mining solution. While the process is described, there is no information on contingency measures in place for pump failure or system maintenance solutions. There is also no information on how quickly the hydraulic gradient, and therefore secondary containment, would be compromised if any pumps stopped working. It is also unclear how primary containment (i.e., well design) failure, such as physical/mechanical issues compromising casings, would affect the creation of the hydraulic gradient and secondary containment as well.</p> <p>Rationale: It is important to have contingency planning in place in the event that there are any issues with the hydraulic gradient and secondary containment system for control of the acidic mining solution.</p> <p>There is no information in this section on how the hydraulic gradient (i.e., secondary containment) would be maintained if a well or pump (i.e., Primary containment) experienced problems.</p> | Provide further information regarding how the inward hydraulic gradient system functions, with particular focus on how the hydraulic gradient and secondary containment will be maintained if any wells or pumps were compromised. | <p>The following highlights the three levels of containment that will be in place to mitigate the potential for loss of containment of the mining solution. Mining solution containment was discussed in the draft EIS, Section 2.2.1.4.2 Wellfield Operation. As noted in the IR, the hydraulic gradient created in the mining zone between injection and recovery wells provides for secondary containment.</p> <p>i. Primary Containment (Well Design) The well configuration is designed to make sure fluids, whether injected or extracted, are confined to set depth locations. In the case of most injection and extraction wells, this would refer to the surface injection point and the screened location at the ore zone depth. The cased and sealed well in all other portions of the well design ensure no interaction with groundwater from other formations from surface to the deposit depth, thus preventing dilution from inward fluid flow of formation waters or outward migration from the well. Well integrity is monitored through live pressure monitoring systems in the annulus of the wells for leak detection and scheduled compliance checks via wireline tools of well integrity.</p> <p>ii. Secondary Containment (Hydraulic Gradient) Hydraulic gradients within the wellfield are maintained initially on a per pattern basis comprising of a single extraction well with four injection wells. In this initial stage of wellfield operations, all solutions from the four injection wells are drawn towards the single extraction well. As wellfield development progresses subsequent adjacent patterns are constructed. In these subsequent stages, the fluid from the injection wells is now drawn toward multiple extraction wells, essentially dividing the recovered solution between the number of operating extraction wells. As subsequent progression of wellfield development evolves, the inward hydraulic gradient of fluids injected will be further divided by adjacent extraction wells.</p> <p>In upset conditions, such as pump failure, or during scheduled pump maintenance when a given extraction well would be shut down purposefully, the fluids that would normally be recovered by a particular extraction well would then temporarily be recovered by one of the adjacent extraction wells within the larger extraction well network. This is a standard approach used in ISR mining. When the upset conditions or scheduled maintenance have been completed, the “normal” mining solution recovery pattern would be restored to the original flow path. In this way, and by design, hydraulic containment is maintained at all times.</p> <p>iii. Tertiary Containment (Freeze Wall) The freeze wall provides two main benefits:</p> <ol style="list-style-type: none"> A defined area for the mining process to occur with the establishment of clear ‘no flow’ boundaries being the freeze wall itself. Essentially removes the effects of the regional groundwater system and regional hydraulic gradient within the confines of the freeze wall. In the event of an upset condition, groundwater velocity is essentially null preventing any migration of fluids up or down gradient. This allows time to recover any fluids in a controlled manner while re-establishing operating conditions in what would otherwise be considered a ‘stagnant’ system. | <p>The following text will be added to the final EIS in section 2.2.1.4.2.2 Secondary Containment of Mining Solutions.</p> <p>“In the case of an upset condition, such as pump failure, or scheduled pump maintenance when a given extraction well would be shut down purposefully, the fluids that would normally be recovered by a particular extraction well would then temporarily be recovered by one of the adjacent extraction wells within the larger extraction well network. When the upset conditions or scheduled maintenance have been completed, the “normal” mining solution recovery pattern would be restored to the original flow path. In this way, and by design, hydraulic containment is maintained at all times.”</p> |
| IR-09 | CNSC | Geology and Groundwater | Section 2.2.1.4.2.2 | <p>Context: This section indicates that mining solution within the mining area can primarily be controlled by maintaining an inward hydraulic gradient. The inward hydraulic gradient will be created by recovering more solution than is being injected.</p> <p>Rationale: If, for some reason, the recovered solution is much more than that being injected, an excessive drawdown could be created. If, by accident, mining solution is leaking into the upper sandstone aquifer through crack in injection/recovery well casing at the same time, it would be challenging to remediate the upper sandstone aquifer in dry conditions (due to excessive drawdown).</p> | Please clarify if any measure will be implemented to avoid excessive drawdown and develop contingency measures to address such accident. | <p>The measures that will be implemented to avoid excessive drawdown are as follows:</p> <p>Continuous (real-time) water level monitoring will be implemented for hydraulic head measurements in individual wells as well as the surrounding open aquifer system contained within the boundaries of the freeze wall. These monitor wells will be installed at various depths throughout the mining area (i.e., within the freeze wall) ranging from the shallow groundwater system to the deposit depth and further, through the paleoweathered zone, into basement rock below the deposit and mining horizon. The mining methods operational success and efficiencies are benefitted by maintaining a shallow depth to water to reduce the magnitude of hydrostatic head needed to be applied to pump within each recovery well.</p> <p>In the event that excessive drawdown was identified through the monitoring system, it could be mitigated. Water would be pumped into the overburden aquifer to offset such injection and pumping imbalance. Water sources would include those from both groundwater and surface sources previously assessed.</p> <p>It is noted that leakage of “mining solution” into the upper aquifer is a hypothetical accident</p> | No EIS updates are anticipated to address this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|--|--|--|--|--|--|
| | | | | | | or malfunction that would not be allowed to persist as it would be identified by monitoring. Individual wells will be monitored for integrity and well operation would stop if a leak were detected to prevent or limit migration of fluid outside of the mining zone. Further, all monitor, injection and recovery wells can be retrofitted with down hole pumps to recover solution that may have leaked or migrated in an upset condition. Additional recovery wells can be installed at select depth to further increase recovery if the need should arise. | |
| IR-10 | ECCC | Fish and fish habitat | Section 2.2.1.4.2.3, Tertiary Containment of Mining Solution - Freeze Wall | <p>Context: The Proponent stated that as a tertiary means of containment for the mining area, the uranium deposit is proposed to be surrounded by a freeze wall that extends from the surface to the basement rock, isolating the mining area from regional groundwater. Current plans are for the freeze wall to be a minimum of 10 m thick, be installed 25 m away from the uranium deposit, and extend 30 m into the basement rock (Figure 2.2-6).</p> <p>As explained in Section 2.2.1.4.2.2, mining solution will be injected into the ore zone under pressure and will likely react, not just with the uranium in the ore zone, but also the binding or cementing material in the sandstone. This means that some portion of the sandstone above the uranium layer and perhaps some portions of the freeze wall will dissolve, thereby creating more void than just the thickness of the uranium layer or horizon. The void may affect the integrity of the freeze wall as containment.</p> <p>Rationale: It is not clear how the Proponent will monitor the freeze wall to verify whether portions of the freeze wall are being dissolved in the mining process and how it plans to verify the integrity of the freeze wall as a containment for the mining solution. In addition, if the dissolution reaction of the uranium ore is exothermic, then the heat generated may also affect the integrity of the freeze wall.</p> | <p>1. Explain how the integrity of the freeze wall will be maintained as a means of containment that prevents migration of the mining solution out of the ore zone into the receiving environment.</p> <p>2. Demonstrate that the mining solution injected under pressure will not compromise the integrity of the freeze wall as a containment.</p> <p>3. Demonstrate how both exothermic and chemical reactions of the mining solution used to dissolve the uranium ore will not compromise the integrity of the freeze wall as a containment.</p> <p>Technical Discussion Required: Yes. ECCC would like to better understand the chemical constituents that compose the mining solution and the chemical reactions that it will cause.</p> | Denison met with the FIRT reviewers on April 19, 2023 to discuss the response to IR-10. Greg Newman, from Newmans Geotechnique Incorporated, attended the meeting to provide information on the freeze wall integrity and basis for the design, which relies on site field data and lived experience from several exiting Saskatchewan mining operations. A written response to IR-10, summarizing the material presented by Greg Newman, is included here as Attachment IR-10. | No EIS updates are anticipated to address this IR. |
| IR-11 | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.2.3 Project Description | <p>Context: It is unclear how much contact water may be produced during the drilling of the mine well field during the construction phase of the proposed Project. Figure 2.2-14 indicates that no water will be produced during the drilling process in the construction phase. In Section 2.2.1.2 both mud rotary drilling and diamond drilling are proposed for the creation of wells. Both processes require water, however only mud rotary drilling produces liquid mud that is then reused in the drilling process.</p> <p>Rationale: It is unclear if the liquid mud produced during drilling can be reused indefinitely with further water additions, or if this eventually becomes the clean sand grain cutting and how it will be disposed of (i.e., liquid or solid waste). If the mud produced from drilling is classified as liquid waste and disposed of as contact water, it is not clear if this is accounted for in the site water management plan and water balance during the construction phase. Contact water from well drilling during the construction phase has not been quantified or accounted for in Figure 2.2-1, and therefore it is unclear if proposed infrastructure during the construction phase has the capacity to contain this waste stream in addition to the waste streams currently outlined in Figure 2.2-1.</p> | Provide further information on potential wastewater produced during the construction phase from drilling processes, and if proposed infrastructure can contain any water produced. | A centrifuge will be used for separating out solids during both diamond and mud rotary drilling to recycle fluids. Only solid drill cuttings, not wastewater, will be produced and all muds and waters will be recycled as part of the drilling process. Upon completion of a drilling campaign, all remaining mud and water will be stripped of remaining solids, treated with mud zymes to break down polymers, and injected back down into the mineralized horizon. During active drill campaigns clean water will be held in approved tanks as part of the drill program between well drilling. | No EIS updates are anticipated to address this IR. |
| IR-12 | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.2.3, Project Description | <p>Context: There is not enough information provided within the draft EIS and site water infrastructure designs to determine if the infrastructure will sufficiently contain mine site contact and non-contact water runoff. It is unclear how water management will occur during all proposed Project stages at the Project airstrip, which is located away from the main Project site. No information has been provided regarding water that may come into contact with fuels and oils from machinery on the air strip, how and where that contaminated water will be treated, and how surface runoff around the airstrip will be managed. Additionally, it is unclear if contaminants from heavy machinery on roads have been considered during runoff collection plans throughout the mine Project site. Water management at the airstrip and roads can have impacts on surface water quality and sediment quality and contaminants (e.g., Hydrocarbons) from these sources should be considered in overall site water management plans.</p> <p>In Section 2.2.3.1 a site drainage plan for contact and non-contact water has been provided in Figure 2.2-17, and water balances have been provided for the different Project phases in Figures 2.2-14 to 2.2-16. In Section 2.2.3.4 a volume of 30,000m3 for the process water pond is provided, and it is stated that the process water pond has the capacity to contain Probable Maximum Precipitation (PMP) event estimated to be 483.3mm while allowing for 1.0m of freeboard. However, there are no estimates on the total volume of water that may be drained from the overall site infrastructure (i.e., the well field, processing areas, etc.) during a 24-hr PMP event. Additionally, in Figure 2.2.17 culvert locations are provided, however there is no further information on culvert designs, flow ratings and capacity for PMP events.</p> | <p>1. Provide information on how contact and non-contact water from the site airstrip will be managed. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</p> <p>2. Provide further information on how potential contaminants in runoff from roads have been considered in the site water management. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</p> <p>3. Provide estimated volumes of water to be drained from overall site infrastructure (such as the mine terrace, airstrip, camp area etc.), during a 24-hr PMP event.</p> <p>4. Provide additional information on culvert designs and conveyance capacity for PMP events.</p> | <p>1. and 2. Denison's approach to site water management is keep non-contact water “clean” – that is, the management approach provides that non-contact water does not come into contact with site aspects that may impart constituents/contaminants of concern and that non-contact water mingles with contact water. Contact water is water expected at the wellfield and processing plant terrace (refer to runoff collection arrows shown in draft EIS Figure 2.2-17), and also includes leachate collected from landfills. As such, runoff from the airstrip and site roads is considered non-contact water and will not be actively managed. However, should a spill occur, the spill response plan will be followed. Details of Denison's response plans will be developed to support licensing as part of the Waste Management and Emergency Management and Fire Protection programs.</p> <p>By following best practice and mitigation measures outlined in the EIS, Denison does not anticipate a need to continually manage water at the airstrip or along site roads as the water here will be clean, non-contact runoff. Examples of relevant mitigation measures include:</p> <ul style="list-style-type: none">• Project components including equipment and machinery will be regularly maintained and inspected to make sure they are in good working order.• Fuel storage and distribution infrastructure will be constructed in accordance with applicable legislation requirements.• Fuels will be stored in approved, above-ground, double-walled storage tank(s) equipped with secondary containment in accordance with provincial regulations and standards.• A wash bay will be available to clean items, equipment, and vehicles that may have been in contact with potential contaminants. <p>Refer to Section 14 of the draft EIS for the screening and evaluation of various accident and malfunction scenarios. Should unplanned events or conditions occur, it will be important for Denison to address and respond in an appropriate manner. Details of Denison's response plans will be developed to support licensing as part of the Waste Management and Emergency Management and Fire Protection programs. Additionally, should unexpected water pooling be observed at the airstrip or site roads during Operation, temporary water</p> | No EIS updates are anticipated to address this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------------|-----------------------|--|--|---|---|---|
| | | | | <p>Rationale: In order to be able to understand site water management and flood risk potential, more information needs to be provided regarding the site water infrastructure designs and capture volumes during PMP events. This information will aid ECCC in understanding how contact and non-contact water will be conveyed throughout the site. Runoff from roads and the site airstrip will contain contaminants from vehicles, heavy machinery, aircrafts and de-icing practices. Additional information on the runoff collection systems and expected contaminant concentrations for the site airstrip and roads is needed to determine if the receiving environment and aquatic and terrestrial receptors are protected.</p> | | <p>removal means such as vac trucks or sump pumps could be employed and the areas would be re-graded to minimize water accumulation.</p> <p>3. As indicated in the response to IR-12, points 1 and 2 above, Denison expects contact water requiring management is at the wellfield and processing plant terrace (refer to runoff collection arrows shown in draft EIS Figure 2.2-17). For this area, the volume of water expected during a 24-hour PMP of 493 mm is approximately 37,240 m³. The wellfield runoff pond has been sized appropriately (38,200 m³ with 1 m of freeboard) to contain this volume of water.</p> <p>4. Details related to culvert design and conveyance capacity are being developed as part of ongoing engineering activities. Culverts will be a designed with a sufficient size and length to convey water around the site during a PMP event.</p> | |
| IR-13 | ECCC CNSC | Fish and fish habitat | Section 2.2.4, Waste Management Section 2.2.7.7, Borrow Area Section 2.3.1.3 Site Preparation and Earthworks | <p>Context: The Proponent indicates that a borrow area is planned for an area northeast of the processing plant. The borrow material or overburden will be used during construction for roads, airstrip, pads, and in the batch plant for concrete production needs, during Operation for ongoing maintenance of various Project components and during decommissioning for fill and cover material. Suitable construction fill material will be sourced from the proposed borrow area and any suitable clean sandstone generated during freeze wall and well drilling (Section 2.2.7.7).</p> <p>It was also noted in Sections 2.2.1.3 and 2.2.14 that the freeze wall will be established by drilling over 300 vertical holes from surface to the basement rock. The freeze holes will extend 30 m into the basement rock and will produce waste rock from basement rock (Figure 2.2-6). However, there is no information whether the waste rock from basement rock would potentially be acid generating and/or metal leaching. This means that all the extra 30 m of basement rock should also be characterized for potential ARD/ML to determine use or appropriate disposal.</p> <p>Rationale: ECCC notes that the Proponent did not indicate whether the borrow material and the drill out part of the sandstone layers and basement rock will be tested for Acid rock drainage/metal leaching (ARD/ML) potential before they will be used during construction, operation and decommissioning. ARD/ML is an environmental hazard that will have an adverse effect on waterbodies frequented by fish.</p> <p>Potential acid generating and metal leaching waste rock could pose negative impacts on the environment if they are not managed adequately.</p> | <p>Please provide:</p> <p>1. Information on whether the waste rock from the basement rock is potentially acid generating and metal leaching;</p> <p>a. Confirm that any borrow material to be used for construction will be characterized for potential ARD/ML.</p> <p>b. Confirm that the part of waste rock recovered from the basement rock, will also be tested for potential ARD/ML.</p> <p>2. Criteria for segregating the potential acid generating and metal leaching waste rock, if it exists, from clean waste rock; and,</p> <p>3. A plan to manage the potential acid generating and metal leaching waste rock, if it exists.</p> | <p>1. The waste rock from the basement is potentially acid generating due to localized pyrite mineralization. Select and systematic assays are conducted to characterize pyrite distribution throughout the deposit and adjacent geological units. Rock recovered from basement during drilling will be further characterized prior to or during drilling activities.</p> <p>1a. Borrow pit area selection was based on geotechnical program completed in 2021 which did not identify any potential for ARD/ML. Further explorative works are ongoing part of ongoing Engineering activities and with confirmation of characterization through assays of representative samples.</p> <p>1b. Basement rock will be tested for potential for acid generation. It is expected that a portion will be potentially acid generating. Select and systematic assays are conducted to characterize pyrite distribution throughout the deposit and adjacent geological units.</p> <p>2. All basement rock will be stored on the special waste pad. Waste rock from the sandstone will also be characterized primarily based on geological and geochemical characteristics, and if a portion of the waste rock is potentially acid generating, it will also be stored on the special waste pad. See also response to IR-04</p> <p>3. Clean waste rock will be generated as sandstone cuttings from drilling activities. Clean waste rock will be stored on the clean waste rock pad. The clean waste pile will be assayed and tested for Potential Acid Generation (PAG) during operations to ensure the material can be reused when required. Potentially acid generating waste rock will be stored on the special waste pad. Special waste is defined as mineralized materials that cannot be disposed of in the clean waste pile. It is primarily made of drill cores and cuttings from wellfield construction. A double-lined process water pond with leak detection has been designed to capture water from various areas, including the process precipitates storage pad and special waste pad. The pond will be designed to hold up to 30,000 m³ of water and will be located next to the processing plant. The pond has been designed to hold a probable maximum precipitation event. The pond will be able to receive water from all site ponds and monitoring wells.</p> <p>The ponds that are designed to receive materials recovered during drilling activities are all lined with a leachate collection pond that will be monitored for water quality. The environmental monitoring program that will be presented during licensing will cover characterization of materials placed in the clean and special waste ponds to ensure environmental protection.</p> | <p>Section 2 of the final EIS will be updated per below:</p> <p>2.2.4.7 Special Waste and Special Waste Pad</p> <p>During Operation, the special waste pad is expected to contain special waste that is primarily mineralized core, and cuttings from wellfield development, basement rock, and any waste rock determined to be potentially acid generating (PAG). Special waste from drilling activities is defined as uranium containing materials that cannot be disposed of in the clean waste pile, including PAG waste rock. Special waste will be determined by Denison geologists based on ore zone intersection expectations, and probe reading taken during wellfield drilling activities, and results of systematic assays to characterize the acid generating potential of the waste rock. Based on the current wellfield and freeze wall design, approximately 150 2,000 m³ of special waste rock will be generated.</p> <p>Denison will examine opportunities to reprocess the mineralized core and cuttings generated during wellfield development to recover uranium. This reprocessing may be done by placing the material in tanks with mining solution or placing the material underground into the mining area at the end of a well's production.</p> <p>The special waste pad may be used to temporarily store other materials that may be radioactive (e.g., contaminated soil) prior to final disposal in the industrial landfill or a licensed off-site facility.</p> <p>The special waste pad is estimated to be 2,500 m2 in size and will be constructed with a double composite liner system with leak detection capabilities (Figure 2.2-25). Any contact water coming off the special waste pad will be directed to the wellfield runoff pond (Section 2.2.3.5).</p> <p>2.9.1.3.3 Waste Management Program</p> <p>The Waste Management Program would include requirements and processes to ensure that Denison's activities that involve planning for, handling, transporting, processing, storage, and disposal of wastes are performed in a manner that complies with applicable regulatory and licence requirements and protects workers, the public, and the environment.</p> <p>The Waste Management Program would include identification of waste inventory and the characteristics of the waste (radiological and hazardous non-radiological), waste segregation, waste packaging and transfer requirements, and the plan for storage or disposal of the wastes. The Waste Management Program will detail the plans for waste rock segregation based on mineralized content and acid generating potential.</p> |

|--------|------------|----------------------------|---|--|--|--|---|
| IR-14 | CNSC | Wastes and Decommissioning | Section 2.3.3.1.3 Decontamination, Demolition, and Disposal (p. 2-82) Table 4.3-2: Key Issues and Concerns from English River First Nation (p. 4-33) | <p>Context: The EIS states “Concrete foundations will be left in place. Any portions of concrete foundations remaining above grade will be levelled and rebar will be cut-off at grade. Large slabs will be perforated on a 2-m grid to permit drainage. Concrete slabs will be covered with 0.5 m of development rock or locally stockpiled till.” (p. 2-82)</p> <p>Further, Denison notes that “Concern about responsible authority for restoring the environment, including contaminants when mining concludes. How long will it take to have the environment fully restored and, if Denison is no longer the operator, how will this be completed?” (p. 4-33). This comment status is noted as <i>Complete</i>.</p> <p>Rationale: Permanent structures will remain following decommissioning, according to the excerpt above. It’s unclear how engagement activities influenced Denison’s planned decommissioning approach, or how the comment above has been addressed or received.</p> | How has the proposal to leave these foundations in place been received by the Indigenous Nations and communities during engagement sessions? Have engagement activities influenced Denison’s planned decommissioning approach? Describe in additional detail how the comment from p. 4-33 has been addressed and how this has been received by those who expressed this concern? | <p>Denison understands the importance of demonstrating to the CNSC how issues and concerns raised by Indigenous nations and communities have been resolved, or where this has not been achieved, how Denison can demonstrate its efforts towards doing so and/or rationale for where agreement has not been reached. Please see response to IR-28 for information on how Denison will provide this information as the EA process advances.</p> <p>The option to leave concrete foundations in place will be discussed with Indigenous Nations and communities as decommissioning plans become more defined.</p> <p>The conceptual decommissioning plan (CDP) included in the draft EIS contains the appropriate level of detail for this stage of the Project. As described in Section 2.3.3, the details of the decommissioning plan will evolve and become more specific as the Project advances. The subsequent iteration of the plan is the preliminary decommissioning plan (PDP). The PDP will be submitted to regulators as part of Project licensing and permitting and will provide additional detailed information with respect to site decommissioning. The PDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission. Prior to executing decommissioning activities, Denison shall prepare and submit a detailed decommissioning plan (DDP) to regulators for acceptance, which builds on the PDP. In this case the DDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission and would also be informed by conditions on the ground at the site at that time, operational experience that has been gained and the regulatory landscape at that time. As is highlighted above, the decommissioning plan will evolve over time and the plan will become more refined as the Project advances. Denison is committed to continue to engage with Indigenous Nations and communities to solicit input.</p> <p>The comment in Section 4 on page 4-33: "Concern about responsible authority for restoring the environment, including contaminants when mining concludes. How long will it take to have the environment fully restored and, if Denison is no longer the operator, how will this be completed?" was addressed in the draft EIS in the following manner:</p> <p>- Concern about responsible authority for restoring the environment, including contaminants when mining concludes: Denison is responsible for decommissioning. Denison’s decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure.</p> <p>- How long will it take to have the environment fully restored: Based on best practice and technical studies completed for the Project, the active decommissioning phase is anticipated to be 5 years. The Post-Decommissioning phase extends from the end of physical decommissioning until transfer of the site into the provincial Institutional Control Program (Government of Saskatchewan 2009) or direct release of the land back to the Crown. Post-Decommissioning is expected to last 15 years and during this phase, monitoring will be conducted until the site-specific decommissioning and reclamation objectives for the Project are met.</p> <p>- if Denison is no longer the operator, how will this be completed?: The financial assurance process provides certainty that the Project can be decommissioned as planned. The Project will not be issued an approval to operate until the decommissioning plan and associated cost estimate are accepted by the Minister of Environment and the financial assurance is in place. If Denison is unable to complete the decommissioning for any reason (e.g., bankruptcy), the finances are available for the Province of Saskatchewan to complete the activities as planned. The PDP will include an associated estimate for the decommissioning costs and Denison will provide financial assurance to confirm the identified decommissioning activities can be completed as planned. Updates to the financial assurance are done in conjunction with updates to the decommissioning plan, on a frequency of every five years during operations.</p> <p>References: Government of Saskatchewan. 2009. <i>Institutional Control Program: Post Closure Management of Decommissioned Mine/Mill Properties Located on Crown Land in Saskatchewan</i>. Ministry of Energy and Resources. December 2009.</p> | Refer to IR-28 for information on EIS updates related to issues and concerns. |
| IR-15 | ECCC | Fish and fish habitat | Section 2.2.3.4 Project Description Section 8.1.3.4.2, Aquatic Environment | <p>Context: In Section 2.2.3.4 it is stated that the estimated PMP event for Project infrastructure planning is 483.3mm. In Section 8.1.3.4.2 it is stated that the PMP is 489.3 mm.</p> <p>Rationale: It is unclear which value is the correct PMP value and if Project infrastructure has been planned correctly.</p> | Provide the correct PMP value and verify that Project infrastructure has been designed utilizing the correct value. | <p>The PMP event used for feasibility engineering designs is 493 mm. The PMP value has been extrapolated from Key Lake data presented in the Canadian Climate Program (1994). Denison reviewed the update to the Canadian Climate Program (1994) report provided in Atmospheric Environment Branch (1999) which shows PMP at the approximate Wheeler River Project location at 489.3 mm. Denison retained the higher of the two PMP values, i.e., 493 mm, for design purposes.</p> <p>The PMP value in Section 2 will be updated from 483.3 mm to 493 mm in the final EIS. The PMP value used in Section 8 (489.3 mm) will not be updated because it is less than the design PMP and, as such, was conservative.</p> <p>References: Canadian Climate Program. 1994. Point Probable Maximum Precipitation in Northern Saskatchewan. R.F. Hopkinson Scientific Services Regina Operations Building, Regina Airport. Regina, Saskatchewan. Report No. CSS – R94 – 01. Atmospheric Environment Branch. 1999. Environment Canada Prairie and Northern Region – Point Probable Maximum Precipitation for the Prairie Provinces. Atmospheric Environment Branch, Atmospheric and Hydrologic Sciences Division. Regina, Saskatchewan. Report No. AHSD – R99 – 01.</p> | Section 2.2.3.4 of the final EIS will be updated as follows: “The pond will be surrounded by a 2.0 m berm, have capacity for 0.5 m storage from a probable maximum precipitation (PMP) event estimated to be 483.3 mm 493 mm, and allow for maintenance of 1.0 m of free board.” |

|--------|------------|--|--|---|---|--|--|
| IR-16 | CNSC | Human health with respect to hazardous contaminants | Section 2.2.3.8 | <p>Context: The EIS and technical supporting documents do not provide sufficient justification for the selection of the proposed wastewater treatment systems for the industrial wastewater treatment plant or the domestic wastewater treatment plant.</p> <p>In addition, it is not clear how the upper bound of the industrial wastewater treatment plant effluent quality was obtained.</p> <p>Rationale: Draft REGDOC-2.9.2 formally documents the CNSC’s expectations to licensees for controlling releases to the environment. For proposed new facilities, these expectations include conducting a best available technology and techniques, economically achievable (BATEA) Assessment, and determining key parameters necessary to support the EIS. These include identifying:</p> <ul style="list-style-type: none"> environmental release targets to inform the design of wastewater treatment systems to constrain the quantity and concentration of contaminants and physical stressors released into the environment, the best available technology and techniques through an options analysis; and the anticipated influent characteristics, overall treatment efficiencies, and maximum predicted design release as the output of the assessment. <p>Consideration of the principle of pollution prevention and BATEA is also a requirement of REGDOC-2.9.1.</p> <p>CNSC staff have met with Denison to discuss the expectations in draft REGDOC-2.9.2.</p> | <p>Please provide a summary of the BATEA assessment to justify the selection of the wastewater treatment plant system.</p> <p>As part of the summary, please identify the anticipated environmental release targets used to inform the design, as well as the maximum predicted design release concentrations and loadings to the receiving environment. The maximum predicted design releases should be used in the ERA to demonstrate protection of people and the environment.</p> | <p>Denison is undertaking a sequential EA and licensing process under the NSCA. For context, the EA process for a Project under CEAA 2012 and the Saskatchewan Environmental Assessment Act is long and complex. As such, the inputs and outputs (e.g., effluent quality) needed for the EIS were developed by Denison’s Project engineers early in the EA process to allow for the biophysical and human assessments to advance. An example of one of these outputs is the IWWTP effluent quality. The effluent quality predictions in the EIS provide a bounding scenario of the basis of the assessment of Project effects.</p> <p>As stated in the Draft REGDOC 2.9.2 Denison understands that a BATEA assessment be conducted to determine the predicted design release characteristics as part of the licence application for a new facility or activity.</p> <p>Outside of the EIS process, the Project detailed engineering is progressing, including the design of the IWWTP and associated refinement of effluent quality predictions. Denison is following Draft REGDOC 2.9.2 to arrive at a treatment option that remains within the bounds of the EA, which ultimately predicts no significant impacts to the receiving environment. The maximum design release characteristics for the IWWTP will be provided as part of Denison’s licence application to the CNSC.</p> <p>Denison met with the CNSC specialist from the Health Sciences and Environmental Compliance Division on December 7, 2022 to discuss the approach associated with a sequential EA and Licensing, and it was agreed that the above approach is acceptable.</p> <p>Denison is committed to completing the BATEA and providing the details to the CNSC.</p> | No EIS updates are anticipated to address this IR. |
| IR-17 | CNSC | Human health with respect to hazardous contaminants | Section 2.2.3.8 | <p>Context: It is also acknowledged that Denison stated in meetings with CNSC staff that Denison intends to propose final release targets to the CNSC as part of the licence application submission.</p> <p>Rationale: It is not clear in the submission whether Denison has considered whether any applicable technology-based performance standards exist in Canada or internationally, and would be relevant as effluent discharge targets, in order to ensure principles of pollution prevention are applied. Consideration of this would help ensure that the proposed effluent discharge targets harmonize with existing federal, provincial/territorial, and/or municipal requirements. For example, there are release limits for radium-226, TSS, and pH outlined in the federal Metal and Diamond Mining Effluent Regulations, which have been demonstrated to be achievable in the uranium mine and mill industry.</p> <p>In addition, countries like the United States, where in-situ recovery has been conducted in the past, have specific technology-based limits. These are known as New Source Performance Standards and are identified in US Code of Federal Regulations (US CFR) 40, Chapter 1, Subchapter N, Part 440 - Ore Mining and Dressing Point Source Category. It is not clear whether these have been considered in Denison’s assessment. These should be considered when identifying suitable achievable technologies.</p> | Denison should harmonize their proposed Effluent Release Targets with the technology-based performance standards that exist in the Metal and Diamond Mining Effluent Regulations where applicable, or other suitable international regulations. | <p>Denison appreciates the comment and is committed to meeting all MDMER release targets.</p> <p>The effluent quality predictions in the EIS provide a bounding scenario of the basis of the assessment of Project effects. Denison is undertaking a sequential EA and licensing process under the NSCA. For context, the EA process for a Project under CEAA 2012 and the Saskatchewan Environmental Assessment Act is long and complex. As such, the inputs and outputs (effluent quality) developed for the IWWTP were necessary and determined by Denison’s Project engineers early in the process to allow for the EIS biophysical and human assessments to advance.</p> <p>Proposed effluent release to the environment starts at Operation phase and BATEA information will come with the application for the license to operate. Please also see response to IR-117.</p> <p>The anticipated effluent quality of constituents of potential concern during normal operations presented in the EIS is based primarily on lab tests conducted by Denison with a safety factor of three added. Section 3.1.1.2 of the ERA (Appendix 10-A) states: "The reasonable upper bound treated effluent was derived using a combination of information available from lab tests conducted by Denison as well as derived effluent quality based on not exceeding water and sediment quality guidelines in Whitefish Lake. Effluent treatment feed solution was prepared by leaching drill core material from the Phoenix deposit, and further processing that solution through two steps (process precipitate removal and yellowcake precipitation) prior to effluent treatment testing. Effluent treatment tests incorporated three stages: low pH, high pH, and neutralization. A combination of reagents (iron sulphate, barium chloride, lime, and sulphuric acid) was used to facilitate precipitation of constituents. After each stage, solid-liquid separation was conducted by mixing flocculant with solution to settle solids to the bottom of the test vessel. The supernatant liquid was used for the following stage. The solids were washed, filtered, and dried to determine solids mass generation for mass balance purposes. For each stage, the liquids and solids were assayed for various COPCs. The reasonable upper bound effluent was usually an expected effluent quality from Denison multiplied by a safety factor of three."</p> <p>Denison intends to continue to refine effluent quality predictions as part of the BATEA assessment and licensing phase of the Project (see IR-16). The effluent quality predictions provided in the EIS will continue to bound the assessment, and provide a conservative representation of risk to human health and the environment.</p> | No EIS updates are anticipated to address this IR. |
| IR-18 | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.2.3.9, Project Description Appendix 8-E | <p>Context: In Table 2.2-1 the upper bound Industrial Wastewater Treatment Plant (IWWTP) effluent quality final discharge targets for Constituents of Potential Concern (COPCs) are provided. General parameters (e.g., temperature, pH, etc.), and several Schedule 4 Substances with maximum authorized concentrations (lead, nickel, suspended solids, and un-ionized ammonia) under the Metal and Diamond Mining Effluent Regulations (MDMER) have not been provided in this table. There are several COPCs (aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese) for effluent characterization under Schedule 5 Section 4 of the MDMER that have not been provided in this table. Additionally, no information on water quality guidelines has been provided in this table.</p> <p>Furthermore, it is stated that the final effluent quality discharge target for uranium is 0.057 mg/L. However, the Canadian Council of Ministers of the Environment (CCME) water short term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The</p> | <ol style="list-style-type: none"> Update Table 2.2-1 and Appendix 8-E to include all general parameters required for environmental effects monitoring: pH, temperature, hardness, alkalinity, and conductivity. Update Table 2.2-1 and Appendix 8-E to include missing Schedule 4 Substances under the MDMER with maximum authorized concentrations: lead, nickel, suspended solids, and un-ionized ammonia. Update Table 2.2-1 and Appendix 8-E to include missing Schedule 5 Section 4 parameters required for effluent characterization under the MDMER: aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese. Include all acute and chronic water quality thresholds for each parameter in Table 2.2-1 and Appendix 8-E. | <p>Denison fully understands its obligations with respect to the MDMER and will comply with the MDMER end of pipe effluent discharge criteria and other requirements of the regulations. The lack of the MDMER general parameters and Schedule 4 substances in the draft EIS table 2.2-1 should not be misconstrued to mean Denison was not intending to meet these requirements. Rather these tables were developed based on rigorous screening to identify COPCs and then model these in the receiving environment. Table 2.2-1 in the draft EIS is not reflective of the proposed monitoring parameters during effluent release. Regardless, Denison will update the table; please see the response below.</p> <p>1) Please see attachment IR-18 for updated Table 2.2-1 which is consistent with the updated Table 8.2-10 (as updated for IR-114). Parameters specific to Schedule 4 have been assessed and predicted. Schedule 5 parameters are included where available. As Schedule 5 parameters do not have screening criteria, they will be monitored by Denison consistent with the MDMER upon falling under this regulation.</p> | Table 2.2-1 and Appendix 8-E will be updated in the final EIS; the updated version of the table is provided in attachment IR-18. |

|--------|------------|---|--|--|---|--|--|
| | | | | <p>proposed effluent discharge target for uranium exceeds the acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe.</p> <p>Rationale: ECCC requests the Proponent include the general water quality parameters that influence water quality thresholds, parameters in Schedule 4 and Schedule 5 Section 4 of the MDMER, and their respective water quality guidelines for consideration and transparency.</p> <p>Discharges from the proposed Project will alter water quality in the immediate receiving area, and this may include some sublethal effects on aquatic biota, which must be minimized. It remains the Proponent’s responsibility to adhere to the MDMER to ensure that effluent at the end-of-pipe from all final discharge points be non-acutely lethal and meet requirements for prescribed deleterious substances under Schedule 4 of the regulations.</p> | <p>5. Describe additional mitigation measures that can be considered to minimize impacts to aquatic biota from uranium concentrations in effluent.</p> | <p>2) Please see attachment IR-18 for updated Table 2.2-1 which is consistent with the updated Table 8.2-10 (as updated for IR-114). Parameters specific to Schedule 4 have been assessed and predicted.</p> <p>3) Please see attachment IR-18 for updated Table 2.2-1 which is consistent with the updated Table 8.2-10 (as updated for IR-114). Parameters specific to Schedule 4 have been assessed and predicted. Schedule 5 parameters are included where available. As Schedule 5 parameters do not have screening criteria, they will be monitored by Denison consistent with the MDMER upon falling under this regulation.</p> <p>4) Please see attachment IR-18 for updated Table 2.2-1 which is consistent with the updated Table 8.2-10 (as updated for IR-114). Applicable screening criteria have been updated to identify most applicable acute or chronic thresholds for the protection of aquatic life.</p> <p>5) As noted in response to IR-16 and IR-17 effluent discharge criteria as depicted in the draft EIS provide a bounding scenario of the basis of the assessment of Project effects and final effluent quality will meet prescribe limits developed through licensing and permitting, as informed by the BATEA evaluation process. In that context, it is expected that the uranium concentration in effluent would be lower than assumed for the purpose of the evaluation in the draft EIS and it is understood that uranium concentrations (or concentrations of other constituents) that resulted in acute toxicity would be not be permitted. Accordingly, the need for and types of mitigation measures as might be needed for uranium (or other constituents) would be developed as part of the process of developing final effluent quality limits in the permitting and licensing processes.</p> | |
| IR-19 | ECCC | Change to an environmental component due to radiological contaminants | Section 2.2.4 Project Description | <p>Context: In this section, it is proposed that the IWWTP precipitate pond will have a single geosynthetic composite liner system, which is used for ponds/pads that only store non-radioactive materials.</p> <p>However, from Section 2.2.3.9 on industrial wastewater treatment, it is unclear if the precipitates from the stage three neutralization process that are pumped to the IWWTP precipitates pond will have any residual radioactivity.</p> <p>Rationale: For the protection of the surrounding environment, it is important that any ponds/pads that are expected to store radiological contaminants be designed to have proper controls (i.e., liners with monitoring systems) in place.</p> | <p>1. Confirm the characterization of the precipitates that are to be stored in the IWWTP precipitate pond.</p> <p>2. If radiological constituents are expected within those precipitates, update the draft EIS to ensure the proposed geosynthetic liner system for the IWWTP precipitate pond will be adequate to ensure the protection of the surrounding environment.</p> | <p>1. The IWWTP precipitate pond will contain non-radiological, gypsum-like material. As outlined in Section 2.2.4.5 and 2.2.4.6, any radioactive precipitates generated during the first stage of the IWWTP will be directed to the process precipitate pond, not the IWWTP precipitate pond. Waste segregation and management will be important for Denison during Operation. The Waste Management Program will be established and approved by the CNSC as part of licensing. Denison will conduct regular assays of slurry sent to the IWWTP precipitate pond during Operation to confirm the quality of these precipitates.</p> <p>2. In consideration of the above, radiological constituents are not expected within the IWWTP precipitate pond.</p> | No EIS updates are anticipated to address this IR. |
| IR-20 | NRCan | Fish and fish habitat | Section 2.3.3.1.1 Appendix 7-C | <p>Context: The proponent’s objective for mining area remediation is to restore the groundwater within the confines of the freeze wall to an acceptable remediation target (EIS, sec. 2.3.3.1.1). The proponent’s acceptable decommissioning objectives for groundwater quality are provided in EIS Table 2.3-3 and in Table 3-5 of Appendix 7-C. These objectives were based on laboratory core flood tests performed by flushing samples of ore with groundwater and groundwater amended with sodium hydroxide or sodium bicarbonate. The composition of the remediated groundwater observed in the core flood tests serves as the source term for the post-decommissioning reactive transport modeling presented in section 4 of Appendix 7-C.</p> <p>Rationale: In NRCan’s opinion, it is important for reviewers to be able to assess the level of remediation achieved in order to reach the proponent’s decommissioning groundwater quality objectives. Therefore, the proponent should provide complete water quality data for the pregnant lixiviant that remains in the ore zone after the end of mining and prior to any remediation.</p> | <p>NRCan requests that the proponent revise Table 3-5 of Appendix 7-C to show the water quality in lixiviant remaining in the ore zone at the end of mining, prior to remediation activities.</p> | <p>Please see response to Attachment IR-20, IR-67, IR-69.</p> | In the final EIS, Table 3-5 in Appendix 7-C will be updated. The updated table is provided here as Appendix B to Attachment IR-20, IR-67, IR-69. |
| IR-21 | ECCC | Change to an environmental component due to hazardous contaminants | Section 2.3.3.1.3, Project Description | <p>Context: The decommissioning process for the wellfield and associated infrastructure is discussed, however there is no information provided on the potential risk for subsidence of the ground above the depleted uranium deposit. After the uranium has been dissolved and pumped to the surface, a cavity will be formed in the area where the uranium used to exist. This could destabilize the overlying substrates, causing the ground at the surface to sink in the future. There is currently no information regarding this risk, and how it may alter the overlying environment, surface water features, runoff, or existing nearby waterbodies.</p> <p>Rationale: From a surface water and sediment quality perspective, it is important to understand how potential subsidence in the future post-decommissioning may affect the existing environment. It is currently unclear if there is any risk to the aquatic environment if subsidence were to occur and alter existing waterbodies, create new surface water features, or if there will be any risk to the decommissioned onsite industrial landfill and industrial wastewater treatment plant precipitate pond.</p> | <p>Provide further information on the potential risks from subsidence including the probability of occurrence, how it may affect surface water features, and if there exists any risk to the planned decommissioning of waste management infrastructure.</p> | <p>To clarify, the portion of the deposit being mined is never truly a void and what remains after mining will be a honeycomb texture with water-filled interstices. The mined area is filled with a fluid at all times, whether it be a mining solution, groundwater, or the neutralizing solution. This is different from a more traditional underground operation such as Cigar Lake, where there is physical excavation of the orebody, leaving a temporary air-filled space. Although the uranium ore is high-grade by global standards it is not entirely massive in nature. As such, the uranium will be leached in a 'honeycomb' texture leaving behind a structure of partial intact rock mass with the remaining area being filled by fluid. This retains the pressure balance of the mining zone with the adjacent water-saturated rock masses.</p> <p>Although the above provides context on the absence of true, air-filled voids remaining post-mining, the risk of subsidence has been assessed appropriately (included in the draft EIS as Appendix K to Appendix 7-C; see also draft EIS Section 7 Geology Valued Component - Terrain Morphology and Stability Key Indicator and draft EIS Section 9 Terrain Valued Component - Terrain Morphology Key Indicator and Terrain Stability Key Indicator). The analysis shows there is negligible risk of subsistence and the magnitude of subsistence, if it were to occur, is the range of 7.5 cm at surface. Subsequent to the filing of the draft EIS, Denison undertook additional modelling with refined, more granular inputs including consideration of subunits within the altered zone (RESPEC 2023). With this more refined analysis, the potential surface subsidence has been reduced from 7.5 cm to 2.4 to 2.8 mm (RESPEC 2023 is included here as Attachment: IR-21).</p> <p>Further, this potential subsidence, if it were to occur, would be limited to the footprint directly above the deposit which will not contain any decommissioned waste management infrastructure. Two main Project components containing waste in the Post-Decommissioning</p> | No EIS updates are anticipated to address this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-----------------------|--|---|--|--|--|
| | | | | | | <p>period will be the IWWTP precipitate pond (which will contain non-radioactive gypsum-like material) and the Industrial Landfill. All other wastes will be disposed of off-site. Spatially, the mining area is about 500 m from the IWWTP precipitate pond and about 800 m from industrial landfill.</p> <p>Given the negligible risk and magnitude of surface subsidence (2.4 to 2.8 mm) which would be limited to the footprint directly above the deposit, along with the distance from this area to on-site decommissioning wastes, there is negligible risk for effects of subsidence to the planned decommissioning of waste management infrastructure.</p> | |
| IR-22 | NRCan | Fish and fish habitat | Section 2.10 Appendix 2-C, section 1.1.1.4 | <p>Context: With respect to the choice of In-Situ Recovery (ISR) mining solution, two alternatives were assessed: alkaline and acidic lixivants (Appendix 2-C, sec. 1.1.1.4). In the consideration of technical and economic feasibility of the alternatives (Table 2, Appendix 2-C), the proponent concludes that: Option 1 (alkaline) is not technically feasible based on the uranium deposit geochemistry. Option 2 (acidic) is technically and economically feasible based on the uranium deposit geochemistry and ability to dissolve uranium. Accordingly, the alkaline alternative was not carried forward into the Environmental Assessment (EIS, Table 2.10-1; Appendix 2-C, Table 3).</p> <p>While acidic ISR solutions are widely used internationally (e.g., Kazakhstan), in the United States, where the environmental regulatory regime is more strict, alkaline solutions have been used exclusively since 1970.</p> <p>Rationale: In NRCan's opinion, the proponent should provide a more thorough technical justification for adopting an acidic ISR lixiviant.</p> | <p>In the Alternative Means Assessment (Appendix 2-C), NRCan requests that the proponent provides a more thorough technical justification for selecting an acidic ISR lixiviant rather than a less environmentally problematic alkaline leach used exclusively in the USA.</p> | <p>The following additional information will be added to Appendix 2-C Alternative Means Assessment, Section 1.1.1.4 Mining solution:</p> <p>In 2017, Denison completed core testing at a laboratory in the United States that was familiar with in situ recovery (ISR) mining and processing methods. The two lixiviant or leach solutions were 1) an alkaline solution and 2) an acidic solution. The alkaline solution was comprised of 2,000 ppm sodium bicarbonate and 500 ppm hydrogen peroxide. The sodium bicarbonate is a complexing agent and the hydrogen peroxide is an oxidant. This alkaline leach solution used in the laboratory is similar to lixiviant solutions used for ISR mining in the US. The acidic solution was prepared with sulfuric acid and hydrogen peroxide, in varying concentrations as the testing proceeded. After 30 pore volumes, the alkaline leach had recovered less than 1% of the uranium in the core. For comparison, the acidic leach recovered around 30% of the uranium in the core after 30 pore volumes and just under 90% of uranium was recovered after 120 pore volumes.</p> <p>At the Phoenix deposit, carbonate and organic concentrations are quite low, which makes acid leach for uranium much more amenable at reasonable concentrations. Moreover, the ISR test work completed in 2017 highlighted alkaline leach would be ineffective and uneconomical. An excerpt below from the 2017 ISR laboratory report highlights the challenges with alkaline leach, pointing to the deposit specifics (depth, grade, location) which inhibit the ability to leach via alkaline methods:</p> <ul style="list-style-type: none">• “Bicarbonate is limited in practice by the chemical cost and physical ability (chemical addition rates) to increase wellfield concentrations appreciably above 2-3 g/L as HCO₃.”• “Field oxygen additions are limited by injection well depths (i.e., depth to ore) which, along with injection pressures, determines the maximum concentration of O₂(g) which could be successfully introduced to the wellfield.”• “pH control is critical to prevent potential calcium carbonate (Calcite, CaCO₃) precipitation within the wellbore and/or ore-body.” <p>In 2018, Denison contracted a third-party consultant with expertise in Australia's ISR industry to complete a desktop review of various ISR test work completed for the Phoenix deposit, including the 2017 study described above. The third-party review of the alkaline and acid leach test work noted that for the alkaline bottle roll leach, it was unsurprising that the uranium extraction, 0.8%, was so low. Assuming the formation of the UO₂(CO₃)₂- complex, the sodium bicarbonate consumption by the uranium would be ~188 kg/t, not including any potential bicarbonate consumption by any other phases present in the ore. The amount of sodium bicarbonate added in the test is calculated to be 7.2 kg/t, which was grossly inadequate. It is likely that given sufficient carbonate/bicarbonate and oxidant, alkaline leaching of the ore would technically be feasible, but it is likely in practice that the carbonate consumption would be excessively high. The rate of carbonate leaching is also much slower than acid, and the introduction of oxidant is also more difficult in an alkaline system.</p> <p>Alkaline leach is commonly used in the United States due to the primary components that make up their ore bodies. They are rich in carbonates and organics, which makes uranium quite difficult and costly to mine via acid leach as the acid is consumed by these constituents prior to any uranium being liberated and leached itself. These issues are not of concern with alkaline leach. There is currently one operation in the United States (Lance Uranium Project – Eastern Wyoming) that uses acid leach. The company had switched to acid leach after a failed trial of alkaline leach/mining due to high carbonates in the ore body that were not previously examined in detail.</p> <p>As noted in Table 2 of Appendix 2-C, the alkaline leach option for mining solution was determined to not be technically and economically feasible based on the uranium deposit geochemistry and ability to dissolve uranium.</p> | <p>Appendix 2-C Alternative Means Assessment, Section 1.1.1.4 Mining solution will be updated as follow (additions in bold, deletions in strikethrough):</p> <p>Two options were considered for mining solution: Option 1: alkaline solution and 2. acidic solution.</p> <p>Factors determining the choice between acid or alkaline ISR technology are: composition of the host rock and ores, reagent cost and consumption, the degree of uranium recovery, and the intensity of the process (IAEA 2001). The leach intensity is determined as the sum of the leach duration, solution ratio (liquid/solid), and average uranium concentration in the recovery solution.</p> <p>1. Alkaline solution Alkaline or high-pH mining solutions are used at a number of uranium ISR operations. The mining solution is typically made with carbonate or bicarbonate. The single most important factor in the process is the rock composition within the productive aquifer, and in particular, the concentration of calcium carbonate. Ores with a higher carbonate content normally require alkaline (bicarbonate) leaching.</p> <p>2. Acidic solution Acidic or low-pH mining solutions are used at a number of uranium ISR operations. The acidic mining solution is typically made with dilute sulfuric acid. The single most important factor in the process is the rock composition within the productive aquifer, and in particular, the concentration of calcium carbonate. For economic sulphuric acid leaching, the carbonate content should not exceed 2% CO₂.</p> <p>In 2017, Denison completed core testing at a laboratory in the United States that was familiar with in situ recovery (ISR) mining and processing methods. The two lixiviant or leach solutions were 1) an alkaline solution and 2) an acidic solution. The alkaline solution was comprised of 2,000 ppm sodium bicarbonate and 500 ppm hydrogen peroxide. | IR-23 | CNSC | Alternative Means | Section 2.10.2 Alternative Means Appendix 2-A PD Engagement Tables Appendix 2-C Alternative Means Assessment (p. 3) | <p>Context: There are multiple rows in the Indigenous Tables for Appendix 2-A where comments and concerns raised by Indigenous Nations and communities and other members of the public were taken into consideration in the Alternative Means Assessment. However, it is unclear how these were considered.</p> <p>A few examples:</p> <ul style="list-style-type: none">16-EN-DesNd-101.1: Interested in any future business opportunities that may be available as Denison advances their Wheeler River Project.16-EN-ERFN-100.15: In that territory near the Wheeler River there are a lot of spawning and calving areas for moose, caribou; those creeks are for whitefish spawning. There's lots of heavy muskeg there. A lot of us have been there, and we'd like to know there'll still be access to the area.6-EN-ERFN-100.17: Today because of climate change, things are starting to happen that normally didn't happen. Even the permafrost is now further down. In the Wheeler River area, where there's some permafrost, have your environment guys seen a change? Will there be a change? These are some of the questions that need to be answered in order to come out with a positive spin. <p>Rationale: Appendix 2-C, Alternative Means assessment, states (p.3): "Engagement with Interested Parties naturally included alternatives means and the engagement input was included in the evaluation of alternative means. Refer to the references list below and <i>Appendix 2-A Engagement Database Summary – Project Description</i> for details of engagement information referenced in this alternative means assessment."</p> <p>It is unclear in section 2.10.2 of the EIS, Appendix 2-A or Appendix 2C how the comments documented by Denison have been considered or influenced the alternative means assessment.</p> | Please explain how comments and concerns collected during Denison's engagement sessions were considered or influenced the alternative means assessment. Please include this information in the EIS and/or it's appendices. | <p>Denison's specific engagement initiatives on Project alternatives are outlined in Appendix 2-C for the 1) mining method, 2) freeze design for tertiary containment of mining solution, 3) treated effluent discharge location to surface water, and 4) access road alignment. In addition to these targeted engagement topics, information gathered more broadly during engagement was also considered in Project alternatives through the consideration of general concerns or statements. Two main areas where comments and concerns fed into and informed the Alternatives Assessment are: 1) Appendix 2-C, Section 1.2 Consideration of Technical and Economic Feasibility along with Land Use Screening, and 2) Appendix 2-C, Section 1.4 Evaluation of Alternative Means.</p> <p>The comparative evaluation of alternative means is presented in Appendix 2-C, Table 6 to Table 22. The evaluation considered the relative residual effects of each of the technical and economically feasible alternatives for each of the evaluation criteria identified in Appendix 2-C, Table 5, following the application of mitigation measures described in Appendix 2-C, Table 4. In each case, the preferred alternative and rationale for its selection were identified. In addition, specific input received from Indigenous groups and other Interested Parties that contributed to the selection of the preferred option was highlighted, when applicable. The alternative means assessment provided in the tables in this section was conducted at a screening level, appropriate for the stage of the Project when the alternatives were considered. The assessment considered both quantitative (where possible) and qualitative information as available. The comparative evaluation identified more preferred versus less preferred alternatives.</p> <p>To follow-up on one of the examples listed in the context and rationale section of this IR, 16-EN-DesNd-101.1 was a comment related to interest in business opportunities. As noted in Appendix 2-A, this comment factored into the comparative evaluation of alternative means for waste management, domestic waste disposal in the section outlining input received from Interested Parties. For additional background, two options were under evaluation: Option 1 was collection and disposal off-site by a third-party contractor and Option 2 was collection and disposal in an on-site domestic landfill. The following text is available in Appendix 2-C, Table 17: Waste Management – Domestic Waste Disposal - Alternative Means Assessment:</p> <p>During seven years of engagement activities for the Project, Denison has understood the importance of designing a project that minimizes interactions with the biophysical environment and the importance of continued land use by Indigenous groups. Looking at domestic waste disposal options, the option to transport domestic waste off site to a nearby licensed facility may generate a local economic opportunity (16-EN-DesNd-101.1, 19-EN-VB-132.5, 21-ENSUR-446.48). However, the transport of material off site would increase traffic, which may have a negative effect on traditional land use, infrastructure and services, and wildlife (16-EN-ERFN-100.15) (21-EN-SUR-446.68). Increased traffic would also increase greenhouse gas emissions. Concerns related to climate change were raised during engagement and consultation activities completed by Denison (e.g., 22-EN-ERFN-621.15, 22-EN-SUR-652.57). It should be noted that these concerns pertain to climate change rather than GHG emissions specifically. The concerns included observations of climate-related changes that have been noticed by the English River First Nation (e.g., depth of permafrost; 16-EN-ERFN-100.17) and observations by the English River First Nation Trapper who provided local knowledge in support of the EIS (19-LK-ERFNTrap-134.232). While no specific feedback was received on the domestic waste disposal options, the above provides context on how Denison's fulsome engagement activities have influenced the selection of a preferred alternative for domestic waste disposal.</p> <p>Based on the evaluation of alternative means, a preferred alternative means for each respective Project component or activity was selected. Rationale for the selection based on the comparative evaluation of alternatives is provided and input received by Interested Parties is presented. As shown in the above example, the input received from Interested Parties was an important part of the multifaceted evaluation.</p> | See attachment IR-24 for proposed content for final EIS Section 2.10, which, relative to the draft EIS, includes the addition of Section 2.10.3 Summary of Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Alternative Means Assessment. |
| IR-24 | CNSC | Alternative Means | Section 2.10.2 Alternative Means | <p>Context: While Appendix 2-C (Alternative Means Assessment) is detailed and includes all aspects of the Alternative means assessment that are required, the summary of the analysis and conclusions in Section 2.10.2 of the EIS lacks the level of detail required to understand the methodology used, and how Denison arrived at these conclusions.</p> <p>Rationale: As noted in the Agency's Operational Policy Statement on Addressing "Purpose of" and "Alternative Means" under the CEAA 2012: "If a preferred means is selected, the analysis and the rationale for the choice should be explained from the perspective of the proponent, and be documented in the EIS in sufficient detail to provide context for public and technical comment periods during the project EA, and ultimately to allow the decision maker to understand the choice."</p> | Please summarize the analysis of the alternative means assessment within the body of the EIS, in sufficient detail that a reader of the EIS has adequate information to understand the methodology used, and how Denison arrived at these conclusions. | Additional details from Appendix 2-C will be provided in Section 2.10 of the final EIS. Also, an example of alternative means evaluated for mining method will be added into Section 2.10.2 in the final EIS. It is noted that no new information would be presented in the final EIS Section 2.10.2 beyond that which was presented in the draft EIS Appendix 2-C. | See Attachment IR-24 for proposed updates to Section 2.10.2. |
| IR-25 | CNSC | Current use of lands and resources for traditional purposes | Section 3, Sections 4, Section 5, Section 11 (and all other applicable once Métis Knowledge Use Study is completed) | <p>Context: The EIS states that Denison is currently negotiating an agreement with MN-S and no traditional land use information is included throughout the EIS given no agreement was signed or Traditional land use information was shared at the time the EIS was being drafted.</p> <p>As noted in the EIS Denison has committed that: "As information becomes available from the agreed-upon process between the Métis Nation – Saskatchewan and Denison, it will be incorporated into the final EIS." (p. 11-36)</p> | Please update the revised Draft EIS to reflect the integration of the Métis Use and Knowledge Study in the Draft EIS where applicable, when this study is completed and provided to Denison. | <p>A study agreement was signed with the MN-S to complete a Metis Knowledge Study by the end of October 2023. Denison has met with the MN-S to discuss the next steps and anticipated timeline, however no information has been provided to Denison, to date. When the study is completed within the agreed upon timeframe, Denison will update the final EIS to include relevant information in the assessment.</p> <p>It is important to note that Denison has incorporated Metis land use information and perspectives into the draft EIS, through the funding of the Kineepik Metis Land and Occupancy information along with the KML VEC statement, of which relevant information has been incorporated directly into the draft EIS to determine effects to the human environment.</p> | The final EIS will be updated with applicable information pertaining to the effects assessment from the Metis Knowledge Study when provided within the agreed upon timeframe (end of October 2023). |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|---|---|--|--|--|---|
| | | | | <p>Rationale: More information is required to better understand the issues and concerns, valued components, and current use of lands and resources for traditional purposes by MN-S near the project area.</p> <p>Requirements are detailed in CNSC’s Generic EIS Guidelines, section 8.9: Indigenous land and resource use.</p> | Should this information not be made available to Denison at the time of revising the draft EIS, the next version of the EIS and the response to this IR should provide a status update on discussions and engagement with MN-S and next steps. | | |
| IR-26 | CNSC | Precautionary principle and approach | Section 3.4.8 Lands Taken Up from an Indigenous Perspective (p. 3-14) | <p>Context: Denison states: “Discrepancies among IK and western scientific information provide an opportunity for Denison to take a precautionary approach. Examples of concrete actions to address uncertainty in cases where IK and LK have differing conclusions on predicted Project effects include addressing uncertainty through monitoring and follow-up programs and communicating results of those monitoring and follow-up programs to demonstrate they have been responsive to the IK shared.” (p. 3-14)</p> <p>Rationale: CNSC’s Generic Guidelines for the Preparation of an EIS state: “In documenting the analyses included in the EIS, the proponent will demonstrate that all aspects of the project have been examined and planned in a careful and precautionary manner in order to avoid significant adverse environmental effects.</p> <p>A document by Canada’s Privy Council Office, A Framework for the Application of Precaution in Science-based Decision Making About Risk, sets out guiding principles for the application of precaution to science-based decision making.” (Section 2.5)</p> | Please clarify how the precautionary principle, and the Privy Council Office’s, A Framework for the Application of Precaution in Science-based Decision Making About Risk, sets out guiding principles for the application of precaution to science-based decision making has been considered and incorporated into the EA described in the EIS. | <p>Page 3-14 of the EIS notes that "Discrepancies among IK and western scientific information provide an opportunity for Denison to take a precautionary approach."</p> <p>The precautionary approach to the evaluation of effects is described in Section 5.8.1.2.2 of the EIS, which specifically deals with the confidence of predictions and states:</p> <p>"In this EA, the precautionary approach to the evaluation of potential effects was adopted, recognizing areas of uncertainty and uses conservative assumptions and approaches within the assessment process. Areas of uncertainty in the process and in predictions for each VC are identified and discussed in each VC-specific section, or on a KI-specific basis as applicable."</p> <p>"Confidence predictions are defined as low, moderate, or high. Where a high degree of uncertainty regarding a residual adverse effect is evident, the confidence level may be low. A high level of confidence is assigned to predictions that have direct, site-specific quantitative data to support the predictions. Low or moderate degrees of uncertainty are manageable through monitoring and follow-up programs to confirm the absence, presence, and extent of residual adverse effects."</p> <p>The Privy Council Office’s, A Framework for the Application of Precaution in Science-based Decision Making About Risk was not specifically referred to in making decisions regarding discrepancies among IK and western scientific knowledge. Rather ERFN, KML/Pinehouse, and the YNLR were offered the opportunity to review select sections of EIS prior to its submission to regulators (see Section 4.3.2.1.4 for ERFN; KML/Pinehouse declined the invitation to review the EIS in advance of filing; Section 4.3.4.2.4 for the YNLR). An example of where greater precaution was exercised is found in the conclusions for effects on Indigenous Land and Resource Use, in which the overall confidence rating was moderate based on the communities’ previous experience with the uranium industry, but could not "be considered as high as the Indigenous COIs lack certainty about ISR mining technique" (Section 11.1.6.4).</p> | No EIS updates are anticipated to address this IR. |
| IR-27 | CNSC | Cumulative Effects Analysis | Section 3.4.8 | <p>Context: During an outreach and engagement trip by CNSC in October 2022, an abandoned exploration camp adjacent to the proposed Wheeler River site was observed. This site has not been identified within the EIS as part of the cumulative effects assessment. As noted in section 3.4.8, KML has also raised concerns with Denison related to abandoned camps and industrial waste left with no programs for clean-up.</p> <p>Rationale: Section 9.4.3 of CNSC’s Generic Guidelines for the Preparation of an EIS states that “The applicant shall assess any residual adverse environmental effects of the project in combination with other past, present or reasonably foreseeable projects and/or activities within the study area.”</p> | Please specify why abandoned exploration camps and industrial waste aren’t taken into consideration when completing cumulative effects assessment. | <p>Section 5.9 outlines the general methods and approach for cumulative effects assessments, while each biophysical and human environment assessment provides details on their Valued Component (VC)-specific approach. The inclusion list in Section 5 does include exploration and mining activities, and options for other projects and activities, as appropriate.</p> <p>With this approach the footprint of the abandoned exploration camp was considered within the terrestrial cumulative effects assessment.</p> <p>Section 11 Land and Resource Use notes that existing projects or activities were not considered as part of the cumulative effects assessment because they were captured and assessed within baseline conditions or existing conditions. This approach would include the abandoned exploration camp adjacent to the proposed Wheeler River site.</p> | No EIS updates are anticipated to address this IR. |
| IR-28 | CNSC | Current use of lands and resources for traditional purposes | Section 4, IER and engagement appendices, including: Appendix 2-A Appendix 6-B Appendix 7-B Appendix 8-A Appendix 9-A Appendix 10-B Appendix 11-A Appendix 12-A Appendix 13-A Appendix 14-B | <p>Context: The summary of issues tables do not appear to include all of the key issues identified by the Indigenous Nations and communities.</p> <p>For example, some Indigenous Nations and communities have shared concerns with respect to accident prevention and overall safety on the Key Lake road (Highway 914) due to increased traffic, impacts on treaty rights and section 35 rights due to cumulative impacts, and decommissioning, that were not captured in the issues and concerns and summary tables in Section 4.3.2 and in the IER.</p> <p>The tables in the engagement appendices include a column titled “Response (From Denison)”. The “Response” column does not include responses, but instead points the reader to where this comment or concern was considered. When navigating to the sections referenced, it is often unclear how this information was considered or influenced the assessment.</p> <p>Rationale: Additional detail is required in order to ensure the key issues are all identified and to understand the status of validation for each issue raised and the response provided.</p> | <p>1. Update the summary of issues and concerns tables to include all relevant issues and concerns raised by each of the Indigenous Nations and communities to date, including concerns raised in the Indigenous Knowledge studies provided, additional engagement, and Draft EIS comments.</p> <p>2. Please include a column in the issues and concerns tables to clearly articulate the specific mitigation/monitoring measures that Denison have committed to, or any other measures, in order to address the concerns raised by each Indigenous Nation and community during the engagement process to date.</p> <p>3. Denison must demonstrate that each Indigenous Nation and community has validated that the summary of issues and concerns table reflects their understanding or agreement, and/or a path forward to complete the validation throughout the EIS and the updated IER.</p> <p>Validation must be complete by the time the technical review is complete, prior to submission of a final EIS. Should Denison not be able to fully address issues, concerns or feedback raised by any Indigenous Nation or community, through mitigation and monitoring measures, this should be documented, and a rationale provided.</p> <p>3. Update the response column of the Engagement tables to describe how these were considered in the sections referenced. Consider renaming this column to reflect the nature of the content (i.e., how the information was considered).</p> | Please see response in Attachment IR-28. | <ul style="list-style-type: none">• Section 4 general updates since submission of the draft EIS, including updates to clarify the purpose of the Key Issues and Concerns tables and the Engagement Database Summary tables in various appendices• Table 4.3-2: Key Issues and Concerns from English River First Nation (and corresponding table in the IER)• Table 4.3-3: Key Issues and Concerns from Kineepik Métis Local #9 (and corresponding table in the IER)• Table 4.3-4: Key Issues and Concerns from Sipishik Métis Local #37 (and corresponding table in the IER)• Table 4.3-5: Key Issues and Concerns from Patuanak Métis Local #82 (and corresponding table in the IER)• Table 4.3-6: Key Issues and Concerns from Birch Narrows Dene Nation (and corresponding table in the IER)• Table 4.3-7: Key Issues and Concerns from Lac La Ronge Indian Band (and corresponding table in the IER)• Table 4.3-8: Key Issues and Concerns from A La Baie Métis Local #21 (and corresponding table in the IER)• Table 4.3-9: Key Issues and Concerns from Métis Nation – Saskatchewan (and corresponding table in the IER)• Table 4.3-10: Key Issues and Concerns from Ya’thi Néné Lands and Resources Office (and corresponding table in the IER) |

| IR-29 | CNSC | Current use of lands and resources for traditional purposes | Section 4.3.2 and IER | <p>Context: In this section, Denison includes the engagement with BNDN and includes a summary of issues and concerns table for the Nation. Within the history of interactions (Section 4.3.3.2.1).</p> <p>Rationale: Denison states that they have been providing information on the project to BNDN in 2019, 2021 and again in 2022 and that Denison and BNDN have not responded to date in order to advance further engagement and dialogue.</p> | Please ensure updated information of any additional engagement activities that Denison has completed with BNDN related to understanding their current and traditional land use and potential interests near the proposed project is provided. | <p>Denison is able to provide the following information with respect to engagement with BNDN.</p> <p>Denison had a meeting with BNDN on February 14, 2023, to provide an overview of the Wheeler River Project. During the meeting, BNDN indicated they would share a traditional territory map and land and occupancy information in relation to the Wheeler River Project subject to reaching suitable confidentiality provisions.</p> <p>On April 25, 2023, Denison shared a draft confidentiality agreement with BNDN.</p> <p>On May 10, 2023, Denison met with BNDN again, to discuss a process for engagement going forward. During the meeting, Denison was advised that BNDN had proposed revisions to the confidentiality agreement, which they would provide to Denison. Also identified in the meeting was that Denison’s access to data BNDN previously referenced regarding land use activities in and around the Wheeler River Project would be limited and subject to further funding from Denison to BNDN. Denison continued to request the available site-specific information in order to better understand the potential for adverse impacts to rights from the Wheeler River Project to BNDN in order to potentially adjust engagement approaches with BNDN.</p> <p>On May 11, 2023, Denison was advised to communicate directly with the Chief of BNDN and was provided further information from BNDN that BNDN would connect with Denison in the future to determine next steps together.</p> <p>On June 16, 2023, BNDN contacted Denison to request a meeting toward the latter part of July 2023. Denison responded positively to this request and will be following up with BNDN accordingly.</p> <p>Subject to the development of a specific engagement process between Denison and BNDN, as identified above, Denison is committed to maintaining an open dialogue with BNDN regarding their interests in the Project. Denison will make sure the above information, and any further information in this respect, including potential resolution of issues, will be included in the final EIS and an update to the IER.</p> | Updates will be included in the final EIS Table 4.3-6: Key Issues and Concerns from Birch Narrows Dene Nation (and corresponding table in the IER) as part of response to IR-28. |
| IR-30 | CNSC | Indigenous physical and cultural heritage | Section 4.3.2.1.3, Table 4.3.2 | <p>Context: Concerns were raised during engagement sessions that “Elders are not being consulted as most of the engagement has been through online means and without a translator”.</p> | How has Denison adapted engagement with Elders from the ERFN since receiving this comment on March 31, 2021? | Since receiving the comment about the challenge with virtual engagement activities and associated translation for those requesting it, Denison has incorporated simultaneous Dene translation into the Zoom virtual meeting feature. This was used in a virtual meeting | No EIS updates are anticipated to address this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|---|---|--|---|---|--|
| | | | | Rationale: There’s no indication that a translator has been employed to engage with Elders since 2021 in the engagement Table 4.3.2. | | undertaken for the Athabasca Basin First Nations and Communities, in September 2021. The feedback received was overwhelmingly positive. Going forward, should Denison have to deploy virtual meetings where translations are required, this tool will be deployed again. For all in person meetings, Denison provides a translator, who can assist with anyone requiring discussion to occur in their language. | |
| IR-31 | CNSC | Indigenous Engagement | Section 4.4.2.1.3, Key Engagement Activities (p. 4-88) | Context and Rationale: Regarding the following: “An open house for the general public was planned to be hosted in 2022 on preliminary effects and mitigation, but due to concerns identified by MN-S about hosting a public open house in a community with a significant Métis population, this meeting was postponed by Denison. Denison looks forward to rescheduling the meeting in collaboration with the MN-S.” (p. 4-88) | Please provide an update on the evolution or progress of this engagement with local communities, following collaboration with MN-S (or otherwise). | Denison continues to respect the delegated Duty to Consult to the Metis Nation - Saskatchewan for a number of communities with strong presence of Metis Citizens for engagement about the Wheeler River Project. As such, Denison will follow the Metis Nation - Saskatchewan direction in this regard until such time as this direction changes. Denison is pleased to report that on February 11 and 12, 2023, the MN-S coordinated a meeting for Denison, the CNSC, the Province of Saskatchewan and the Metis Locals from Northern Regions 1 and 3 to provide an overview of the Project and respond to questions and concerns. | Updates will be included in the final EIS accordingly. |
| IR-32 | CNSC | Current use of lands and resources for traditional purposes | Section 5.3 Section 9.0 Terrestrial Environment | Context: Some sections of the EIS (such as Fish and Fish Habitat, Indigenous Lands and resource use) indicate that Indigenous and/or local knowledge was considered when defining the spatial boundaries. However, this is not included in other sections, such as Terrestrial Environment. Rationale: Section 5.2.2 of CNSC’s Generic EIS Guidelines require that spatial boundaries be defined by considering, but not limited to, the following criteria: Community and Indigenous traditional knowledge, ecological and technical considerations. | Please provide any additional details about how any comments or concerns raised were considered in defining the spatial boundaries with Indigenous Nations and communities with respect to spatial boundaries, for the Terrestrial Section and which specific Indigenous Nations and communities were engaged on these topics and how their input and knowledge was incorporated into the EIS. If already presented in the EIS text body, please indicate where this information can be found or link to Section 4 of the EIS or in the IER. | The rationale for the definition of study areas for the purpose of the assessment of the Terrestrial Environment valued components (VCs) is described in Section 9.1.1 of the draft EIS. The Project Area and Local Study Area (LSA) were delineated based on the expected extent of potential direct (footprint) and indirect (sensory disturbance) Project effects; whereas, the Regional Study Area (RSA) considered an 8 km buffer around the Project Area to provide an appropriate spatial scale upon which potential Project effects could be evaluated at the landscape scale where key Terrestrial Environment VCs reside and move within and upon which cumulative effects could be assessed. No specific comments or concerns were raised on the spatial scale of the Terrestrial Environment study areas during engagement activities, though considerable input was solicited / received regarding many of the Terrestrial Environment VCs that helped to contribute how the assessment study areas were defined. This is especially true in consideration of the relatively high number of comments received through engagement regarding wildlife (as represented by ungulates, furbearers, woodland caribou, and birds in the draft EIS) and wildlife use by local and Indigenous people/ communities (see Sections 9.3.3.1.2, 9.3.3.2.2, 9.3.3.3.2, 9.4.3.1.2, 9.4.3.2.2, 9.4.3.3.2 in the draft EIS Appendix 9-A for details). Cumulatively, this input puts high importance on and speaks to the broad knowledge of wildlife in the vicinity of the Project, informing the need to define the RSA to an appropriate spatial extent, as was the case on the draft EIS. In addition, and within the context of the IR, it is appropriate to also consider the assessment of terrestrial environment from the perspective of Land and Resource Use per Section 11 of the draft EIS, since the two (Terrestrial Environment and Land Are Resource Use) are so intimately related. For context the Terrestrial Environment RSA, fits within the Indigenous Land and Resource Use RSA. Section 11 of the EIS is focused on Land and Resource Use and includes consideration for various terrestrial VCs and key indicators (KIs) as resources. With respect to Indigenous Land and Resource Use, the definition of spatial boundaries is offered in Table 11.2-2 which notes that the LSA is inclusive of direct and indirect effects to relevant VCs will occur, including the maximum combined extent of supporting VCs associated with the aquatic, terrestrial, noise, and health LSAs. It is inclusive of trapping, fishing, and travel through and adjacent to the Project Area. The RSA is inclusive of trapping block N-18, which represent a familiar reference for local Indigenous communities and capture the broad land usage patterns of local communities. Trapping blocks are defined regions and have membership that is regulated by a local trapping association and membership is generally only open to local Indigenous community residents though non-Indigenous trappers may also participate as members of the trapping association. If resource use activities were displaced, it is likely this would still occur within the N-18 trapping block area where individual resource users already have familiarity. | No EIS updates are anticipated to address this IR. |
| IR-33 | CNSC | Residual Effect Characterization | Section 5.8.1, Definitions for Residual Effects Characterization and Significance Section 5.8.1.1, Residual Effects Characteristics Section 8, Table 8.3-9: Fish and Fish Habitat - Surface Water Quality | Context: Denison uses specific criteria (Residual Effect Characteristics: Direction, magnitude, geographic extent, duration, frequency, reversibility, context and likelihood) and associated ratings (e.g., adverse/positive, low/moderate/high) for the predicted effects assessment. However, it is unclear whether an aggregation method was used in order to determine whether impacts will be significant or not significant, depending on the combination of rating categories (i.e., weightings that were calculated, use of decision rules). For example, medium term and long term are both used to represent the same time category: “Effects are expected to last between 3 to 38 years (i.e., effects expected during Construction through to the end of post-Decommissioning).” (See table 8.4-13 on p. 8-200 compared to table 8.4-12 on p. 8-199 and table 8.5-9 on p. 8-246). Rationale: The Generic Guidelines state: “The method used to describe the level of the adverse effect should be transparent and reproducible.” In Table 8.3-11, duration was moderate, but again uses same rationale. There is no ‘moderate’ in Table 8.3-8, and by the same rationale, this should be medium-term to be consistent with definitions provided and summary Table 8.3-12. It was noted that all three tables should be deemed medium-term | If an aggregation method was used and ratings (e.g., High, medium, low) were weighted, what weightings were used, how were these calculated? Please also describe any decision rules that informed the determination of significance. If no aggregation was used, how did Denison ensure that results were consistent, given the varying rankings for each of the key criteria, and varying combination? Regarding inconsistencies in ratings, please use consistent terminology for same rating. | Denison did not use an aggregation method with weighted ratings. The assessment approach and methodology was outlined in draft EIS Section 5, Approach and Methodology. Please note that Section 5.8 provided a guide for technical leads to conduct residual effects evaluation; however, Section 5.8 also recognizes that the specific definitions and ratings for some characteristics may be developed on a VC-specific basis as presented in each VC-specific section. Denison reviewed the draft EIS to ensure results were consistent. This included checks on the consistent application of characteristics and ratings along with any supporting rationale. Nevertheless, as pointed out by the CNSC, there appear to be some inconsistencies in Section 8 of the draft EIS. The final EIS will be updated, specifically Section 8 where inconsistencies were highlighted in IR-33 context and rationale text. Importantly, these are effectively editorial issues and do not change the assessment summaries or conclusions. | Ratings for duration and frequency in Section 8 of the final EIS will be updated. Residual effect characteristics and ratings will be consistent between definitions tables and subsequent summary (results) tables within a section. This will include consistent use of the ratings for the residual effect characteristic of duration, as follows: <ul style="list-style-type: none">• Short-term – Less than 3 years (i.e., effect happens during Construction only).• Medium-term – 3 years to 38 years (i.e., effect happens from Construction through to the end of Post-Decommissioning).• Long-term – More than 38 years (i.e., effect extends beyond Post-Decommissioning). |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|--|--|--|--|--|--|
| | | | | based on definitions of ratings outlined in Table 8.3-8. Frequency was also showing up as "continuous" and "continuously" in these tables. | | | <p>This will include consistent use of the ratings for the residual effect characteristic of frequency, as follows:</p> <ul style="list-style-type: none"> Infrequent – Effect occurs several times at sporadic intervals. Frequent – Effect occurs many times on a regular basis. Continuous – Effect occurs continuously. |
| IR-34 | CNSC | Cumulative Effects Analysis | Section 5.9.2.2 (p. 5-41) | <p>Context: Denison identifies the Gryphon deposit as a project that is not reasonably foreseeable. The direct quote from the EIS indicates that the “Development of the Gryphon deposit as an underground mine was evaluated at the prefeasibility level in 2018 but has not advanced to feasibility study or EA. Denison has not announced an intent to proceed with the development of the Gryphon deposit.” (p. 5-41)</p> <p>Rationale: The guidance Assessing Cumulative Environmental Effects under the CEAA, 2012 defines <i>Reasonably Foreseeable</i> as a “physical activity [that] is expected to proceed, e.g. the proponent has publicly disclosed its intention to seek the necessary EA or other authorizations to proceed.”</p> <p>In a press release by Denison Mines (2018: Denison announces decision to advance Wheeler River Project following positive PFS results), Denison publicly disclosed intention to seek the necessary EA for Gryphon to proceed: “After careful consideration of the risks and opportunities associated with permitting and concurrent advancement of project engineering activities, the Company has decided to submit a PD and initiate the EA process in early 2019 for the Phoenix ISR operation, and to bring the Gryphon operation forward, at a later date, as required to achieve the PFS plan of Gryphon first production by 2030.”</p> <p>Further, Denison’s Wheeler River Webpage references a “start of pre-production activities for the Gryphon operation in 2026”</p> | Please update the cumulative effects assessment in the EIS to include the Gryphon deposit as a Present or Reasonably Foreseeable Project. | <p>Denison has not publicly disclosed its intention to seek the necessary EA or other authorizations to proceed with mining the Gryphon deposit on the Wheeler River property at this time and does not meet any of the criteria for a reasonably foreseeable project as per the guidance for Assessment Cumulative Effects under the CEAA 2012 (below). A future physical activity could be considered reasonably foreseeable and should generally be included in the cumulative effects assessment if one or more of the following criteria are met:</p> <ul style="list-style-type: none"> The intent to proceed is officially announced by a proponent. This information could be found in news media, the proponent’s website or via an announcement from the proponent directly to regulatory agencies. The physical activity is under regulatory review (i.e., the application is in process). This can be known, for example, if information about the review or application is available on a government website, or an EA notice has been made public. The submission for regulatory review is imminent. This could be known if the collection of data has already commenced, regulatory authorities have been contacted about information requirements, or through an announcement from the proponent. The physical activity is identified in a publicly available development plan that is approved or for which approval is anticipated (e.g., a wastewater treatment plant in a city’s long term development plan). The physical activity supports – or is consistent with – the long-term economic or financial assumptions and engineering assumptions made for the project’s planning purposes. A physical activity is required in order for the project to proceed (e.g., rail or port transportation facilities, or a transmission line). The economic feasibility of the project is contingent upon the future development. The completion of the project would facilitate or enable the future development. <p>The Gryphon deposit is an exploration phase property and is inherently captured as such in the cumulative effects assessment because the levels of disturbance from these activities to date are captured with the characterization of existing conditions. It would be inappropriate to consider mining of the Gryphon deposit within the cumulative effects assessment as a mining operation as Gryphon cannot be considered a reasonably foreseeable activity. As is widely understood, very few exploration phase projects become operating mines.</p> <p>We note that the press release and the prefeasibility study referenced in the IR were from 2018. The Wheeler River Project Provincial Technical Proposal and Federal Project Description used to initiate the provincial and federal EA processes was submitted in February 2019. This represents Denison’s most recent plans for development and the Project scope does not include underground mining of the Gryphon deposit. Denison acknowledges that, if development of the Gryphon deposit as an underground mine is proposed in the future, this would require additional regulatory review and approval.</p> | No EIS updates are anticipated to address this IR. |
| IR-35 | CNSC | Change to an environmental component due to hazardous contaminants | Section 6, Chemicals of Potential Concern | <p>Context: The use of petroleum products (e.g., propane, gasoline, and diesel) at the Denison Mines Wheeler River site is associated with vehicles and periodic operational testing of emergency generators as well as stationary pumps for emergency power or fire water systems. Thus, the air emissions will contain acrolein.</p> <p>Rationale: This chemical of potential concern (COPC) poses potential risks to human health via inhalation, but acrolein appears to have been missed or deemed insignificant. However, its consideration in the assessment will provide information on the significance of the associated risk.</p> | Please consider acrolein in the assessment or provide a rationale for its exclusion. | An analysis of acrolein risks is provided in Attachment IR-35. | The analysis provided in Attachment IR-35 will be appended in its entirety to Appendix 6-A in the final EIS. |
| IR-36 | CNSC | Other | Section 6, Table 6.1-11 Baseline External Gamma Monitoring | <p>Context: For one of the exposures in the summary table for baseline external gamma monitoring (Table 6.1-11), the cell states "Destroyed in Field".</p> <p>Rationale: No rationale or indication as to why or how it was destroyed is provided.</p> | Please provide any additional info available as to how equipment was destroyed. | Gamma monitor 8 was destroyed in the field by wildlife. | Table 6.1-11 in the EIS will be updated to say "Destroyed in Field by Wildlife" |
| IR-37 | CNSC | Air Quality | Section 6.1.1.1, CALPUFF model | Context: "The Saskatchewan Ministry of Environment (SK MOE) has developed the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) to assist proponents in conducting air dispersion modelling assessments in a consistent manner. The guideline defines the recommended approach for dispersion modelling assessments in Saskatchewan, including model selection, emission source characterization, and the determination of compliance criteria to apply." | Please confirm and provide a summary of the consultation with the Saskatchewan MOE on the use of CALPUFF model for the Wheeler River EIS as per provincial air quality guidelines. | As described in Section B.1 of Appendix 6-A, staff at the Saskatchewan Ministry of Environment (Air Quality Branch) were consulted on the selection of CALPUFF and developing the CALMET meteorological data set, beginning in 2019. The CALMET consultation included an initial discussion about the general approach, and once the CALMET run was completed, two technical memos were produced and reviewed by Ministry staff including: 1) a memo completed in March 2020 summarizing the general CALMET approach and results (e.g., wind roses, temperature data, precipitation data); and 2) a follow-up memo completed in May 2021, which answered specific questions posed by Ministry staff. Ministry staff also completed a review and provided feedback on the CALPUFF model setup in August 2021. | No EIS updates are anticipated to address this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|--|---|---|--|---|--|
| | | | | <p>Rationale: Saskatchewan air quality guideline requires consultation on use of CALPUFF model, where it states" The ministry acknowledges that there will be situations where specialized air dispersion models such as CALPUFF, CALQ3HCR and others may be applicable. The use of specialized models requires consultation with the ministry" OR "Pre-consultation with the ministry must be undertaken prior to the facility conducting specialized modelling (p. 3)." It is not clear if Denison Mines consulted with Saskatchewan MOE on use of CALPUFF model.</p> <p>Noted that Section 6.1.4.2 is again referring to Saskatchewan MOE guidance for justification, but no indication that they consulted with them (a requirement).</p> | | | |
| IR-38 | ECCC | Change to an environmental component due to hazardous contaminants | Section 6.1.4.1, Potential Interactions Between the Project and Valued Component / Key Indicators | <p>Context: In this section, the Proponent identifies primary interactions between Project activities and air quality valued components and their associated key indicators. These primary interactions may result in an adverse effect on the valued component. Among the primary interactions are the use of emergency generators in a backup role should there be an interruption of the provincial electrical grid. However, it is not evident what is the anticipated frequency and duration of interruption to grid power.</p> <p>Rationale: The Proponent states in the conservative operation scenario that while the site will be powered from the provincial grid at the operations stage, the back-up power generators were assumed to be operating under emergency conditions as a worst-case scenario. ECCC acknowledges the positive impact of extending the electrical grid to the Project site with resultant reduction in generator emissions. The impact of an interruption in grid power would be greatest during the winter months when energy use would be greatest and surface-based temperature inversions, which vertically trap emissions, would be strongest.</p> | Provide an evaluation of a worst-case scenario of grid power interruptions (i.e., average aggregate length of power outages) during the winter months for this section of the electrical power grid. | <p>Denison expects an average of six outages per year based on information provided by SaskPower. An outage would be anticipated to last a few hours per event.</p> <p>The air quality assessment conservatively assumed that the generators would be in operation 24/7 to predict worst-case concentrations in all months of the year, including the winter months. Given the above, Denison can confirm it has evaluated an appropriately conservative worst-case scenario for use of the diesel generators in the air quality assessment.</p> | No EIS updates are anticipated to address this IR. |
| IR-39 | ECCC | Change to an environmental component due to hazardous contaminants | Section 6.1.4.2, Potential Project-Related Effects | <p>Context: In this section, the Proponent discusses the approach taken for air dispersion numerical modelling. Using their CALMET data set, the Proponent's CALPUFF model runs indicated exceedances for 24-hour total suspended particulates, 24-hour particulate matter (PM10), 1-hour nitrogen dioxide, and 24-hour uranium concentrations. However, there is no mention of possible diurnal and seasonal occurrences of the exceedances.</p> <p>Rationale: Adequate assessment of the modelling results requires knowledge of the temporal characteristics for the exceedances. For example, wintertime exceedances may be due to strong temperature inversions, especially during the overnight to morning hours. These strong inversions are challenging for numerical models to capture. Exceedances during warmer months may be due to specific wind directions, which transport emissions directly to downwind receptors.</p> | Provide additional information on any diurnal and seasonal influences of the modelled exceedances. | Additional information on diurnal and seasonal influences of the modelled exceedances is provided in Attachment IR-39 in this document. | No EIS updates are anticipated to address this IR. |
| IR-40 | CNSC | Air Quality | Section 6.1.6.2.1, Air quality significance determination | <p>Context: Significance determination was not conducted for air quality due to interconnectedness with other assessment endpoints.</p> <p>Rationale: It is not clear where and how these air quality assessment endpoints were factored into the assessment.</p> | Please provide additional information to demonstrate where and how these air quality assessment endpoints were factored in. | Noted in Section 6.1.1.1 of the draft EIS, Air Quality was identified as an intermediate Valued Component (VC) (i.e., does not have an assessment endpoint). Air quality assessment endpoints and the significance of potential effects of Project-related changes to ambient air quality were considered in Section 9 (Terrestrial Environment), Section 10 (Human Health) and Section 11 (Land and Resource Use). For additional reference, Figure 6.1 2 of the draft EIS is a graphic representation of the main linkages among the Air Quality VC and other VCs, illustrating the flow of assessment information from the Air Quality VC. By way of example, the habitat alteration effects considered for avian and wildlife VC and Key Indicators (KIs) included dust deposition, which could change avian and wildlife use through an indirect effect. | No EIS updates are anticipated to address this IR. |
| IR-41 | CNSC | Air Quality | Section 6.1.6.2.2, Background concentrations | <p>Context: The EIS states that "Conservative regional background concentrations from the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) and based on the La Loche monitoring station were used for particulate matter, NO2, SO2, and CO. The La Loche monitoring station is located near anthropogenic sources, while the Project is in a remote area removed from anthropogenic sources."</p> <p>Rationale: If La Loche monitoring station is located near anthropogenic sources and the project is not, use of this data is not a conservative or realistic representation of background.</p> <p>For a realistic approach, background data considered should be upper 95th percentile (or max if n<10) from an area representative of project location</p> <p>For a conservative approach, background data from an area located even further from anthropogenic sources (if this exists) should be used, or an upper limit of background less than upper 95th should be applied as the background.</p> <p>Upper limit of background is used to screen out COPCs or often subtracted from total to ascertain relative contribution / impact from source, so using a higher upper limit may result in COPCs screening out or appear to have a lower relative contribution. If background was</p> | Please provide additional rationale to justify the appropriateness of La Loche monitoring station concentrations as background for project location. | <p>The Saskatchewan Ministry of Environment requires that background concentration data be added to air model predictions and an accepted set of data is provided in the Saskatchewan Air Quality Modelling Guideline. Following Ministry requirements, the northern regional data set was selected, which is based on monitoring data from the La Loche station. Because the La Loche station is located near anthropogenic sources, the background values are likely higher than background in the Project Area. This means that the total air model predictions (modelled + background) are likely more conservative than would necessarily have been the case had a similar data set been available that was free of any anthropological influence.</p> <p>Further consideration of the use of the La Loche data set is provided in Appendix 6-A, Section 6.0 of the draft EIS.</p> | No EIS updates are anticipated to address this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|--------------------|--|---|---|--|---|---|
| | | | | added to source, then approach used would be conservative. If this is the case, confirmation and reference to where this is discussed in methodology should be provided. | | | |
| IR-42 | Health Canada (HC) | Physical stressors (noise and vibration) | Section 6.2.4.2.2, (p. 6-66) Section 6, Section 6.2.9, (p. 6-72) | <p>Nighttime noise impacts are not adequately considered for human receptors.</p> <p>Context: The EIS states in Section 6.2.9 that, “While the predicted sound levels were less than the guideline values, the increase from baseline was predicted to be noticeable” (p. 6-72). No information is provided on individual noise events occurring during the nighttime period.</p> <p>Rationale: While the increase from baseline is predicted to be noticeable, it is important to also consider that changes to the characteristics of the sound from baseline (e.g., a change in frequency, changes in sound modulation, increased impulsiveness or tonality, or a shift in noise from the daytime to being more at night) may cause noise to be even more noticeable. Consult ANSI S12.9-2005/Part 4, clause A.1.3 for further information.</p> <p>In particular, consideration should be given to potential impacts on sleep, where adverse impacts are reported to begin when sound levels inside bedrooms exceed 30 dBA for continuous noise sources and 45 dBA LMax for discrete noise events (WHO, 1999).</p> | <p>1. Provide a description of the project- related nighttime noise sources that may impact human receptors as well as a qualitative discussion of the resulting potential impacts on perception considering not only changes in sound levels but also sound characteristics (e.g., tonality, impulsivity).</p> <p>2. Confirm whether individual nighttime noise events exceeding 45 dBA LAMax outdoors (or 30 dBA indoors) are expected to occur more than 15 times over the nighttime period at any nearby potentially noise-sensitive human receptor location(s). This may be of particular concern if some construction and/or operations activities occur during sleeping hours.</p> | <p>1. During Construction, the nighttime noise sources that are the highest contributors to sound levels at the nearest human receptor location are expected to be construction equipment (bulldozers, trucks, cement mixing and crusher). During Operation, the primary contributors are truck traffic and drilling in the wellfield. As these are not impulse or tonal sources, no adjustments were made to the source sound levels per ANSI S12.9-2005 Part 4.</p> <p>2. For Construction, the crusher was modelled at its maximum sound output. The diesel-powered equipment (dozers, drill rigs) was adjusted for partial operation. When adjusted to provide maximum sound levels instead, the predictions at the nearest human receptors did not exceed 45 dBA Lmax during the nighttime hours for either Construction or Operation.</p> <p>The draft EIS will be updated to include the additional supporting discussion outlined above.</p> | <p>Section 6.2.4.2.2 will be clarified as follows: The nighttime sound levels were not predicted to exceed the PSL of 36 dBA at any of the identified receptors during Construction or Operation. As with the daytime sound levels, the maximum predicted nighttime sound levels were predicted at the property identified as 302586/Risk2. The predictions at this location were 35.9 dBA and 34.0 dBA for Construction and Operation, respectively, and were similarly primarily attributable to drilling activity in the wellfield, concrete batching (during Construction), and movement of trucks on the access road. During Construction, the nighttime noise sources that were the highest contributors to sound levels at the nearest human receptor location consisted of construction equipment (bulldozers, trucks, cement mixing and crusher operation). During Operation, the primary contributors at night were truck traffic and drilling in the wellfield. As these are not impulse or tonal sources, no adjustments were made to the source sound levels. The crusher was modelled at its maximum sound output, while the diesel-powered equipment (e.g., dozers, drill rigs) were adjusted for partial operation over the respective daytime and nighttime periods. To account for potential issues resulting from equipment operating at maximum levels (as opposed to daytime and nighttime averages), the models were run with the partial operation adjustments removed, for comparison to the Health Canada recommended criteria value of 45 dBA Lmax at night. The predictions at the nearest human receptors did not exceed 45 dBA Lmax for either Construction or Operation."</p> |
| IR-43 | HC | Physical stressors (noise and vibration) | Section 6.2.5, (p. 6-66) Section 6.2.5, (p. 6-71) | <p>Mitigation measures for project-related noise were not identified for the Construction phase.</p> <p>Context: The mitigation measures provided in Section 6.2.5, including a complaint management system is also to be implemented as part of the EMS, are only proposed for the operations phase.</p> <p>However, construction activities are predicted to last more than one year. Construction noise will involve the use of equipment operating at the site, construction of surface facilities, drilling, and partial operation of the freeze plant. It will also include regular truck trips and air traffic for personnel changes.</p> <p>Rationale: It is unclear if listed mitigation measures also apply to the construction phase (or only to the operations phase).</p> | <p>1. Clarify whether mitigation measures and the proposed EMS apply to the Construction phase. If not, identify mitigation measures for noise impacts related to Construction phase activities, and consider applying the EMS to the Construction phase and implementing the community complaints and response procedure from the beginning of construction activities.</p> <p>2. Health Canada suggests that construction noise lasting longer than 1 year be assessed as operational noise, and that noise mitigation measures be applied also to the construction phase. Special consideration should be given to mitigation measures for construction noise that occurs at night, in order to minimize impacts on sleep (i.e., avoiding tonal or impulsive noise sources at night).</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends use of Appendix H of Health Canada (2017), which identifies additional construction noise mitigation measures that could also be considered to reduce project- related noise.</p> | <p>1. Mitigation measures and the proposed EMS apply to both Construction and Operation. As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison will collaborate with English River First Nation (ERFN) and Kineepik Metis Local (KML) on a community specific monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous communities of ERFN and KML will be sharing information in an agreed-upon fashion. If noise from construction activities form part of the interests for each of these Indigenous communities.</p> <p>2. See response to IR-42 regarding nighttime work and potential for sleep disturbance.</p> <p>The draft EIS will be updated to include the above clarifications.</p> | <p>The first paragraph of Section 6.2.5 will be revised to clarify the applicability of mitigation measures as follows: "Strategies to reduce the likelihood and magnitude of the predicted effects include source elimination and utilizing planning measures to counter the conditions that contributed to the predicted effects. Mitigation measures to be applied during both Construction and Operation include:..."</p> <p>The first paragraph of Section 6.2.8 will be revised to clarify the applicability of the EMS as follows: "An EMS will be implemented and include air quality and noise management and monitoring plans to confirm that the Project is compliant with the federal and provincial guidelines that have been adopted for this assessment during both Construction and Operation."</p> |
| IR-44 | HC | Physical stressors (noise and vibration) | Section 6.2.8, (p. 6-71) | <p>The noise complaints resolution and response procedure is not sufficiently described in the EIS.</p> <p>Context: Section 6.2.8 discusses Monitoring and Follow- up. The proponent indicates: “The EMS will also include a community complaints and response procedure” (p. 6-71).</p> <p>Rationale: Details have not been provided regarding how the complaints would be received, addressed or what the timelines will be for providing a response or resolution. It is important to provide information to potentially affected communities in advance of particularly noisy activities. Community consultation and advanced notification of noisy activities has been shown to reduce complaints (see Health Canada, 2017).</p> | <p>1. Provide the details of the noise complaints resolution and response procedure as per Health Canada (2017).</p> <p>2. Consider conducting community consultations and/or implementing an advanced community notification system to pro-actively reduce the probability noise-related impacts and complaints.</p> | <p>1. Denison is undertaking sequential EA and licensing processes with the CNSC. As such, a detailed management system based on the CNSC’s safety and control areas and focused on anticipated compliance verification criteria will be developed over the upcoming months to support licensing activities.</p> <p>Further to this, a framework for monitoring and follow up was presented for each technical EIS discipline in the respective draft EIS section. Environmental monitoring and follow up will fall within the scope of the Environmental Management System (EMS) for which document preparation is ongoing, and as indicated will be fulfilled during licensing. As noted elsewhere in the IR responses the EMS hierarchy will follow a three-tiered system comprising Program, Plan and Procedure level documentation, with detail associates with each becoming more granular and prescriptive at each successive tier.</p> <p>As noted in Section 6.2.8 of the draft EIS, a commitment to have a community complaints and response procedure for noise has been made by Denison. Consistent with Denison’s approach to sequential EA and licensing and as highlighted above the specific details associated with this complaints and response procedure, consistent with provincial and federal guidelines, will be developed at that time. Nevertheless, further information concerning the framework / approach to the community complaints and response procedure is provided below for reference.</p> | No updates to the EIS in response to this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|--|--|--|--|---|---|
| | | | | | | <p>Denison is committed to designing the noise monitoring and follow-up plan and an associated procedure in accordance with provincial and federal guidelines and industry best practice.</p> <p>The plan will identify:</p> <ul style="list-style-type: none">• Project-related noise sources and control measures;• How complaints will be filed, acknowledged, investigated, and resolved, including general timeframes for each phase;• How confidentiality of a complainant’s identity will be respected, if requested, how anonymous complaints can be filed and how assistance for those who may face barriers to the procedure can be accommodated;• How those involved in executing the plan will receive training and be made aware of the plan;• How potentially affected communities will be engaged;• How complaints and their resolutions will be tracked and recorded;• How the performance of the plan will be monitored and evaluated and how this information shall be communicated; and• How the plan will be updated. <p>It is anticipated that the following procedure specific to noise complaints is expected to be applied:</p> <ul style="list-style-type: none">• Each complaint would be logged/recorded and include the following information:<ul style="list-style-type: none">○ the name, address and contact information of the complainant (if provided);○ the time and date of the complaint;○ the nature of the complaint; and○ meteorological conditions at the time of complaint (i.e., wind direction).• Determine the specific cause(s) of the complaint and take short-term and immediate actions to resolve the cause of the complaint;• Provide a prompt response to the complainant (within 24-hours) and follow-up as needed based on the required actions to resolve the complaint; and• Prepare and retain on-site a written report that:<ul style="list-style-type: none">○ identifies the cause of the complaint;○ identifies the actions taken to appropriately deal with the cause of the complaint; and○ identifies any recommendations for remedial measures, and managerial or operational changes to reasonably avoid the recurrence of similar incidents. <p>2. Denison has committed to working with its Indigenous Communities of Interest with reserves and or / residential communities most proximal to the Project (English River First Nation and Kineepik Metis Local), to understand the issues and concerns they have relative to the Project, and resolution of some specific items of interest or concerns may be resolved through the negotiation process of private contractual arrangements or agreements. The noise complaint mechanism will be one area that will be raised specifically with the Indigenous Communities of Interest with reserves and or / residential communities most proximal to the Project (English River First Nation and Kineepik Metis Local).</p> | |
| IR-45 | HC | Change to an environmental component due to hazardous contaminants | Section 6 Air Quality Technical Supporting Document Section 6.3.1 | <p>The carcinogenic risks of diesel exhaust from the project should be assessed.</p> <p>Context: Section 6.3.1 discusses modelled predictions of exceedances for Particulate Matter (PM). TSD p. 22 states: “concentrations of 24-hour PM2.5 are also elevated around the standby generators at the freeze plant, which emit fine particulate matter from combustion of diesel fuel”. However, diesel particulate matter is not evaluated for the whole project in the air quality model or the air quality assessment.</p> <p>Rationale: Health Canada has determined that diesel exhaust is carcinogenic in humans which is consistent with the conclusion of the International Agency for Research on Cancer (IARC), and that diesel exhaust is associated with significant population health impacts in Canada.</p> <p>To characterize the carcinogenic risk of diesel exhaust from a project, HC has published a report (2022)¹ which provides a quantitative assessment of the relationship between ambient PM2.5 exposure and lung cancer risk. Specifically, this report quantifies the increase in risk of lung cancer mortality (over the baseline rate in the Canadian population) due to PM2.5 exposure.</p> <p>This quantitative assessment is considered appropriate to characterize risks from diesel PM given the contribution of diesel exhaust to ambient PM2.5 in Canada, and that the carcinogenicity of diesel exhaust has generally been evaluated based on the respirable PM fraction^{1,2,3}.</p> <p>References: [1] HC. 2022. Lung Cancer and Ambient PM2.5 in Canada: A Systematic Review and Meta-analysis. Available at: https://publications.gc.ca/site/eng/9.907038/publication.html</p> | 1. Evaluate the carcinogenic risk of all potential diesel exhaust from the project based on the approach proposed by Health Canada (2022). Additional guidance ("Additional Lung Cancer Mortality from PM2.5: Recommended Approach and Sample Calculation") is provided as an appendix to this comment table. ¹ | An evaluation of carcinogenic risk of all potential diesel exhaust from the project based on the approach proposed by Health Canada (2022) is provided in Attachment IR-45. | No updates to the EIS in response to this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |

| IR-46 | HC | Physical stressors (noise and vibration) | Appendix 6-A Table A-1 | <p>Low-frequency noise and associated potential human health effects were not assessed.</p> <p>Context: Some equipment that may emit low-frequency noise (LFN) have been listed in Table A-1: Assessment Scenarios and Sound Level Data (Section 6 Appendix A); however, no information describing potential impacts of this type of sound on nearby human receptors are presented.</p> <p>Rationale: Low frequency noise can be associated with the introduction of noticeable vibrations and rattles in nearby structures. Research indicates that annoyance related to noise is greater when low-frequency noise is present (ISO 1996-1:2003). As sound environments are usually characterized using A-weighted decibel levels (dBA) that reflect the frequencies most audible to the human ear, the impacts of low- frequency noise may need to be assessed separately.</p> | <p>1. Clarify whether any project-related activities (construction, operation and/or decommissioning) may produce LFN that could impact off-site human receptors. Evaluate LFN in the noise assessment, if and where applicable. See Appendix C of Health Canada (2017) for a discussion of LFN.</p> | <p>Appendix C.2 of Health Canada (2017) identifies an approach to assessing LFN from ANSI, which states that the energy sum of the 16-63 Hz octave bands should be less than 70 dBZ to avoid rattles due to LFN. The energy sum of the 16-63 Hz octave bands at the nearest human receptors is expected to be well below 70 dBZ (predictions indicate the values are in the order of 44 dBZ at the nearest human receptor).</p> <p>The draft EIS will be updated to include the additional supporting discussion outlined above.</p> | <p>The following paragraph will be appended to the end of Section 5.1 of Appendix 6-E:</p> <p>"In addition to the Ldn and %HA assessment methods, Health Canada (2017) also recommends assessing the potential for low frequency noise (LFN) impacts such as noise-induced vibration or rattles in building structures. The recommended approach from ANSI is to combine the predicted receptor sound levels in the 16 to 63 Hz octave bands and compare the total to a criterion of 70 dBZ. The maximum prediction for this assessment was 44 dBZ, and, therefore, LFN is not predicted to be a concern for the Project."</p> |
| IR-47 | ECCC | Air Quality | Appendix 6-A, A.1 | <p>Context and Rationale: Verification of the following calculation is required for assessing predicted emissions of dust from general construction. It appears the result of 0.70 ton/acre/month is incorrect and should instead be 0.314 ton/acre/month.</p> <p>Appendix 6-A, Appendix A, A.1 (p. A4) TSP Emission Factor for General Construction:</p> $EF\ (TSP) = 0.11\ \frac{\text{ton}}{\text{acre}} \times 1.2\ \frac{\text{ton}}{\text{acre}} \div 0.42\ \frac{\text{ton}}{\text{acre}} = 0.70\ \frac{\text{ton}}{\text{acre}}$ | <p>Explain how the emission factor total suspended particulates (EF (TSP)) result was obtained or rectify if it is incorrect and update the draft EIS to reflect the correction.</p> | <p>The formula incorrectly displayed the wrong units. It is 0.314 ton/acre/month, which converts to 0.70 tonnes/hectare/month. Denison confirms that this was a typographical error, and the result of the calculation is unchanged.</p> | <p>In Appendix 6-A, the formula will be changed to:</p> $EF\ (TSP) = 0.11\ \frac{\text{ton}}{\text{acre}} \times 1.2\ \frac{\text{ton}}{\text{acre}} \div 0.42\ \frac{\text{ton}}{\text{acre}} = 0.314\ \frac{\text{ton}}{\text{acre}} = 0.70\ \frac{\text{tonnes}}{\text{ha}}$ |
| IR-48 | HC | Physical stressors (noise and vibration) | Appendix 6-E, Figure 6.2.3, p. 6-57 | <p>Noise-sensitive receptors are not included on noise contour maps.</p> <p>Context: Noise-sensitive receptors are identified in the acoustic model report in Section 6 Appendix 6-E but not presented on any maps in the atmospheric and acoustic sections of the main report (Figure 6.2-3).</p> <p>Rationale: The noise assessment typically includes a map illustrating modelled noise levels from the project at receptor locations in the study area.</p> <p>Certainty regarding the presence of human receptors in the regional study area is also recommended in order to assess cumulative impacts.</p> | <p>1. For more clarity, identify noise-sensitive receptors on Figure 6.2-3: Noise Assessment Study Area as well as on contour maps showing the baseline and predicted noise levels.</p> | <p>A new figure will be added to Section 6.2 of the final EIS showing the Project Area, Local Study Area, the receptor locations, and nearby land leases (both traditional and recreational). A copy of this new figure has been included with this IR response.</p> <p>As noted in the context and rationale for this IR, Denison included the receptor locations on the contour maps with the predicted noise levels (Appendix 6-E, Figures 8 to 15); as such, no edits to the Appendix 6-E figures are proposed in response to this IR.</p> | <p>A new figure will be added to Section 6.2 and a copy of the figure has been included with this IR response in Attachment: IR-48. The new EIS Figure will be 6.2-4; figure numbering will shift and Figure 6.2.4 Baseline Monitoring Locations for Noise in the draft EIS will become Figure 6.2.5 in the final EIS.</p> |
| IR-49 | HC | Physical stressors (noise and vibration) | Appendix 6-E, 4.0 Table A.1 | <p>The Noise Source Characterization is incomplete.</p> <p>Context: Section 3.0 of the Draft EIS Section 6 Appendix 6- E discusses Source Characterization. There is no detail regarding potential tonal or impulsive noise sources in Section 3.0.</p> <p>Rationale: The draft EIS should include a description of sound source characteristics (e.g., tonal, impulsive, highly impulsive) in order to properly inform the quantitative noise assessment and which assumptions/adjustments need to be applied and to properly evaluate impacts of project noise on health of affected receptors.</p> | <p>1. Identify any tonal, regularly impulsive, highly impulsive, or high-energy impulsive noises likely to be produced during project activities that could be audible at noise sensitive receptors. Furthermore, describe the timing (e.g., hours of night-time activities), frequency and duration of noise events, and their sound characteristics, including frequency spectrum. See Health Canada (2017) for details.</p> | <p>No tonal or impulse sources were identified for either assessment scenario. Construction activity was assumed to occur 24-hours per day as a conservative measure. The frequency spectrum data for each source is included in Table A.1 of Appendix 6-E.</p> <p>Appendix 6-E will be updated to include discussion of ISO 1996-1 adjustments and rational for inapplicability to sources identified.</p> | <p>The following paragraph will be appended to the end of Section 3.0 of Appendix 6-E:</p> <p>"Upon establishing the source sound levels for inclusion in the predictive modelling, the list was reviewed to determine whether there were any sources with special sound characteristics such as tonality or impulse noise. Health Canada (2017) recommends the application of source adjustments in accordance with ISO 1996-1 for such sources as these are associated with increased annoyance. No tonal or impulsive noise sources were identified in the Construction or Operation scenarios."</p> |
| IR-50 | HC | Physical stressors (noise and vibration) | Appendix 6-E, 4.0 Table A.1 | <p>The description of noise modelling does not document or justify the use of sound level adjustments.</p> <p>Context: ISO Standard 9613-2 has been used for the sound level modelling; however, it is unclear if all applicable adjustments have been considered as per ISO 1996-1:2016 (Table A.1).</p> <p>Rationale: When modelling techniques are used to estimate present (baseline) or future (construction and operational) sound levels, these techniques and any accompanying assumptions, including the use of sound level adjustments, it is important to provide appropriate documentation and justification.</p> <p>Note that in situations where more than one source characteristic</p> | <p>1. Clarify whether ISO-1996-1:2016 has been considered in the modelling to account for any applicable sound level adjustments. Adjustments should be considered when calculating Ln (night- time sound level) and Ldn (day-night sound level). In addition, if applicable, adjustments can be applied depending on the noise characteristic (impulsive, highly impulsive, etc.), and because the project location is considered to be in a quiet rural area. See: ISO 1996-1:2016 and Health Canada (2017) for details.</p> | <p>No tonal or impulse sources were identified for the assessment scenario. As discussed in Section 6.2.1.2.1 of the draft EIS, the assessment did include the 10 dBA nighttime penalty inherent in the calculation of Ldn, and also included the HC recommended adjustment of +10 dBA to the Ldn levels to account for the Project location being in a quiet rural area.</p> <p>Appendix 6-E will be updated to include discussion of ISO 1996-1 adjustments and rationale for inapplicability to sources identified. The noted time-of-day and rural adjustments are already discussed in the draft EIS and applied in the assessment.</p> | <p>Appendix 6-E will be updated, per the paragraph outlined in the response to IR-49, which is expected to resolve the comment about tonal and impulse noise.</p> <p>The comment regarding the adjustment to account for the Project being in a quiet rural area was already accounted for in the draft EIS as outlined in Section 6.2.1.2.1.</p> |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-------------------------|--|---|---|---|--|
| | | | | adjustment is applicable (e.g., impulsive or tonal), only the higher of the adjustments is used. However, all time-of-day adjustments and the quiet rural area adjustment are to be added to the highest of the applicable source adjustments. | | | |
| IR-51 | CNSC | Geology and Groundwater | Section 7, Figure 7.8-1 Appendix 7-C | <p>Context: Figure 7.8-1 (p. 7-107, main EIS report) shows monitoring well cluster outside of the freeze wall.</p> <p>Rationale: It is not clear what the targeted hydro-stratigraphic units of each monitoring well cluster are. In addition, it is not clear how the establishment of the freeze wall and any leakage from the brine solution will be monitored. If there is any “window” within the freeze wall (i.e., the freeze wall is not continuous), is there any way to identify that?</p> | <p>Please clarify the targeted hydro-stratigraphic units of each monitoring well cluster in Figure 7.8-1 (p. 7-107, main EIS report).</p> <p>Please clarify how the establishment of a continuous freeze wall will be monitored.</p> | <p>1: The information in the legend of Figure 7.8-1 will be updated to indicate that 2 well clusters target the Lower Sandstone Aquifer and the Intermediate Sandstone Aquitard. The target hydrostratigraphic units for the 4 well clusters are the Lower Sandstone Aquifer, the Intermediate Sandstone Aquitard, the Upper Sandstone Aquifer, and the overburden aquifer.</p> <p>2: The alignment of the freeze wall is located 25 m offset from the lateral extent of the recoverable ore and the freeze wall will grow in thickness both towards the ore and away from the ore. The freeze wall will solidify all liquid porewater and develop into a contiguous impermeable barrier many metres thick. Ground temperature monitoring will be installed through a series of continuous fiberoptic temperature and pressure wells from surface to the depth of impermeable basement rock below the unconformity. Such monitoring wells/systems will be installed on both the ore (inside) and non-ore (outside) sides of the freeze wall to confirm the thickness of frozen ground. There will be sufficient operational controls in place to verify that the freeze plant is operating, to measure the temperature in the ore zone, and to measure the temperature on opposite sides (inside and outside) of the freeze wall so that early detection of any upset conditions can be identified and addressed. Options for addressing issues include: lowering the temperature of the freeze system to draw more heat out; increasing the freeze coolant flow rates in freeze wells nearer to active ISR cells; and/or to adaptively manage the lixiviant injection and recovery rates in cells located nearest to the freeze wall.</p> | <p>1: Figure 7-8.1 has been provided in Attachment IR-51 and will be updated in the final EIS to provide information in the legend on the hydrostratigraphic units being monitored in each well cluster.</p> <p>2: The following text will appear in Section 2 (2.2.1.5 Monitoring Well Network) regarding monitoring to demonstrate a continuous freeze wall.</p> <p>The alignment of the freeze wall is located 25 m offset from the lateral extent of the recoverable ore and the freeze wall will grow in thickness both towards the ore and away from the ore. | IR-52 | ECCC | Fish and fish habitat | Section 7, Geology and Groundwater Appendix 7 | <p>Context: According to the Proponent, “an acidic or low pH mining solution will be used to leach uranium ores from the ground. Mining solution may be a mixture of sulphuric acid, hydrogen peroxide, ferric sulphate, and freshwater (from shallow groundwater well or surface waterbody) or recycled water.</p> <p>Wellfield will consist of a combination of injection and recovery wells, in the general the arrangement of one recovery well in the centre surrounded by four injection wells (5-spot pattern) with about 5 to 10 m between wells. The final wellfield is expected to include approximately 300 wells over an area measuring 90 m wide x 750 m long”.</p> <p>As the components/contaminants mentioned in the description of the hydrogeologic contaminant transport processes above may be transported to Whitesfish Lake through groundwater, the injection and recovery wells should be included in the model.</p> <p>Rationale: The hydrogeologic contaminant transport processes described above are an important part of the proposed Project and it is not clear why numerical modelling results and a sensitivity analysis for the above processes was not presented.</p> | <p>1. Explain why 3D hydrogeology and contaminant transport numerical modelling of the injection and extraction wells was not presented.</p> <p>2. Alternatively, provide simulation results and a sensitivity analysis for the injection and extraction of the acidic solution in the mining area.</p> | <p>Denison used the ISR mine design and the 3D hydrogeology and contaminant transport numerical modelling of the injection and extraction wells to determine the potential interactions between mining activities and the environment. Two key outputs from the ISR mine design and 3D hydrogeology modelling work were used as inputs for the hydrogeologic assessment in the EA. The extent of mining solution migration away from the injection and recovery well screens, as defined by the mining area (50m above the ore zone and within the freeze wall) and groundwater quality of the mining zone following remediation.</p> <p>During the operation phase, and under normal operational conditions there is no interaction between the mining zone and surface or down gradient environment, and the assessment focuses on post removal of the freeze wall, once the groundwater flow returns to pre mining conditions.</p> <p>The injection and recovery wells will be set up such that they are within the confines of the ore itself. Migration of fluids towards the freeze wall and through non ore ground between the ore and freeze wall are minimized because hydraulic gradients will induce preferential flow to recovery wells and away from the freeze wall. If significant excursion of lixiviant were to occur and it were to contact the freeze wall, it is not expected to chemically dissolve the in situ ice and would be contained therein limiting any excursion outside of the mining horizon.</p> <p>Additionally, continuous 3D modelling has been conducted for the purposes of mining operations beginning in 2019 through 2023, which has successfully demonstrated control of the mining solutions and recovered uranium bearing solution to the ore zone depth and not beyond the mining zone within the confines of the freeze wall. Furthermore, modelling had demonstrated that mining solutions will be maintained within the deposit area laterally and not contact the freeze wall, which is located at a 25 m stand-off distance.</p> <p>For more information on how Denison’s extensive field testing and lab informed the design of the ISR mine and the mining zone remediation objectives please see the response to IR-6.</p> | No updates to the EIS in response to this IR. |
| IR-53 | CNSC | Geology and Groundwater | Section 7.3, Table 7.3.-2 Appendix 7-C | <p>Context: The field-based hydraulic conductivity values (referred to as K values hereafter) in Table 7.3-2 (p. 7-32, main EIS report) indicate that the K value ranges of upper and lower sandstone aquifers have a significant overlap with those of the intermediate sandstone aquitard.</p> <p>However, the calibrated K value in Table 2-2 (p. 2.7, Appendix 7-C)) for the intermediate sandstone aquitard is close to the lower end of the field-based K value range, while the calibrated K values for the upper</p> | Please provide additional information to support the representativeness of the calibrated K values (for example, use graph to present the measured K values and the calibrated K values). | The calibrated hydraulic conductivity values are consistent with observed data. The calibrated K value for the intermediate aquitard was 1×10^{-8} m/s, which is in the middle of the range of values reported from point testing within this unit (Range: 10^{-10} to 3.8×10^{-6} m/s), and similar to the geomean value (8.4×10^{-9} m/s). Thus, the calibrated K value is within a factor of 1.2 of, and higher than, the geomean value. The hydraulic conductivity value for the Intermediate Aquitard is similar to that applied by AECL at Cigar Lake (5×10^{-8} m/s). Similarly, the K values applied for the Upper and Lower Sandstone Aquifer units are consistent with the field measured values, particularly for this fractured rock environment. The high end of the | No updates to the EIS in response to this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-------------------------|---|--|---|--|--|
| | | | | <p>and lower sandstone aquifers are close to the upper end of the field-based K value range.</p> <p>Rationale: It is not clear how representative the calibrated K values are of the field-based K values for each hydro-stratigraphic unit, and if the significant difference between the K values for the upper and lower sandstone aquifers and those for the intermediate sandstone aquitard is supported by the geological properties of the corresponding stratigraphy units.</p> <p>It is stated in the report (p. 7-36, main EIS report) that “Vertical fracture or fault zones that hydraulically connect the Local (upper) and Semi-Regional (lower) groundwater flow regimes are present throughout the Athabasca Basin”. But fractures and fault zones are not explicitly considered in the model. There is possibility that these features could increase the hydraulic connection between the upper and lower sandstone aquifer.</p> | | <p>packer tested range of K values varied by 2 orders of magnitude between the aquifer and aquitard units, which is consistent with the definition of aquifer / aquitard differentiation. The interpretation of an aquifer-aquitard-aquifer sequence is consistent with the AECL interpretation of the Athabasca Sandstone at the Cigar Lake mine.</p> <p>When packer testing in fractured rock, the hydraulic conductivity associated with any test depends on whether the packed zone contains a continuous fracture set. However, for the unit as a whole, it is important that the model represent the hydraulic conductivity (or transmissivity) representative of the interconnected fracture network. Thus, it is appropriate that the applied hydraulic conductivity values within the aquifers are consistent with the higher end of tested conductivity values within those units. Within aquitard units, having singular higher conductivity fracture values from packer tests that test local fractures only, does not necessarily indicate large-scale transmissivity.</p> <p>A fault feature is suspected along the western perimeter of the Lower Sandstone Aquifer near Kratchkowsky and Williams Lake, located 1.5 km west of the mine site (also as depicted on the Hydrogeological Conceptual Site Model). This feature was interpreted to exist based on the similarity in groundwater levels between deep and shallow aquifers in that particular area (c.f., water levels along the creek south of Williams Lake and within GWR-029, as well as water levels recorded in open boreholes near Kratchkowsky Lake), as well as geochemistry in GWR-029. The geochemistry and water levels show in the vicinity of GWR-029 are different, however, than conditions within the Lower Sandstone aquifer further east of this area, above and east of the Phoenix deposit.</p> <p>The effect of the fault feature along the western edge of the Lower Sandstone aquifer was incorporated within the numerical model both through enhanced hydraulic conductivity parameters, as required to match observed water levels, and boundary conditions applied to introduce as much inflowing water to the Lower Sandstone Aquifer as the water level data suggest is reasonable.</p> | |
| IR-54 | CNSC | Geology and Groundwater | Section 7.3.1 | <p>Context: EIS states: “The most important associated topographic features in the region are the northwest to southeast trending drumlins and eskers....” This is not the trend shown on the provided maps, nor described elsewhere in the report, e.g., Section 7.3.2.1</p> <p>Rationale: Inaccurate information in the EIS</p> | Please update the EIS where required to accurately describe the topographical features. | Acknowledged. The typo in the draft EIS, Section 7.3.1 will be corrected in the final EIS. | <p>In Section 7.3.1. the text will be updated to say the following:</p> <p>“The most important associated topographic features in the region are the northeast to southwest trending drumlins and eskers...”</p> |
| IR-55 | NRCan | Fish and fish habitat | Section 7.3.3.1; Appendix 7-A, sections 3.4, 3.5, 3.8, 4.2; Appendix 7-C, section 2.8 | <p>Context: According to the proponent's conceptual hydrogeological model (EIS, sec 7.3.3, Figure 7.3-7, Table 7.3-2; Appendix 7-A, sec. 3.4, Table 3-4), the horizontal hydraulic conductivity of the Intermediate Sandstone (Iss) aquitard is 8.4 E-09 m/s based on field measurements. The proponent further assumes a 10:1 anisotropy ratio for the unit (Appendix 7-A, sec. 3.5.1) such that its estimated vertical conductivity is 8.4 E- 10 m/s. Based on this information, structural geology and groundwater quality data, the proponent concludes that the connectivity between the Upper sandstone aquifer and the Intermediate Sandstone aquifer (sic) is limited (EIS sec. 7.3.3.3; Appendix 7-A, sec. 4.4). While acknowledging the paucity of conductivity data and the proponent's attempt to mitigate this by leveraging collateral information on fracture frequency and clay content (Appendix 7-A, sec. 3.3.1), NRCan considers that the hydraulic conductivity assigned to the Iss aquitard is unrealistically low and inconsistent with the following lines of evidence: a) The conductivity value for the Iss is based on the geometric mean of 18 field measurements, 12 of which are from the same borehole (WR-695) located in the Gryphon zone, beyond the domain of the numerical model (Appendix 7-A, Appendix C, Table C-1). If the conductivity data were weighted equally, with one value per borehole, the geometric mean would be approximately 1.5 E-07 m/s, or two orders of magnitude higher; b) The proponent notes that vertical fracture or fault zones that hydraulically connect Upper and Lower aquifer systems are present throughout the Athabasca Basin including in the Phoenix area (EIS, sec. 7.3.3.2.2; Appendix 7-A, sec.3.8.1); c) The proponent notes that groundwater chemistry data (major ions) corroborate the presence of structurally controlled vertical hydraulic connections between the Upper and Lower aquifer systems (EIS, sec. 7.3.3.2.2, sec. 7.3.3.3; Appendix 7-A, 4.3.3); d) Groundwater chemistry data (Appendix 7-A, sec. 4.2, Table 4-1) also indicate the presence of detectable levels of "bomb" tritium (indicating recharge waters < 50 years old) in the Lower Sandstone Aquifer (GWR-025, GWR-008, GWR-033) and in the Iss (GWR-009, GWR-034), outside the area of U mineralization. This is also evidence of vertical hydraulic connection through the Iss. In summary, whereas the proponent conceptualizes the Iss as a very low-permeability unit with localized vertical hydraulic connection (WS Shear), NRCan interprets the Iss as a "leaky" aquitard with pervasive fracture-controlled and much higher vertical hydraulic conductivity.</p> <p>Rationale: The significance of NRCan's alternative interpretation of the Iss hydrostratigraphic unit is that deep groundwaters, including mining-impacted waters, may represent a greater proportion of baseflow discharge to Whitefish Lake than the 1% currently estimated</p> | In the "Parameter Uncertainty Assessment" for the numerical groundwater flow model (Appendix 7-C, sec. 2.8), NRCan requests that the proponent develop a calibrated numerical model with an alternate conceptualization of the Intermediate sandstone as a "leaky" aquitard with a horizontal hydraulic conductivity on the order of 1 E-07 m/s and a much lower anisotropy ratio. This should involve modifying the model lateral boundary conditions to allow for groundwater inflow/outflow across the entire thickness of the Athabasca Sandstone Group rather than just the Lower Sandstone aquifer. | <p>Denison acknowledges the IR from the review and based on feedback from the assessment team who conducted the hydrogeological modelling for the EA the following is provided in response.</p> <p>The viewpoint from the third-party assessment team does not align with the conceptual model proposed by the reviewer; however, an alternative calibrated groundwater flow model with a hydraulic conductivity of 1.0E-7 for the Intermediate Sandstone unit has been developed. This higher hydraulic conductivity scenario allows more water to flow laterally through the Intermediate Sandstone unit. Specified head values applied at the model boundaries are employed, such that the amount of water entering / leaving the domain is only limited by the simulated transmissivity and hydraulic gradients. Under this revised calibration, the simulated flow to Whitefish Lake from the Lower Sandstone aquifer would be 0.57% (i.e., < 1%, similar to the model presented in the draft EIS) of the discharge to Whitefish Lake, and the simulated travel time from the ore zone to Whitefish Lake is approximately 250 years. The results of this revised calibrated scenario, with a hydraulic conductivity of 1.E-07 within the Intermediate Sandstone unit, are very similar to those obtained in the base calibrated model. This is the case because the higher flow through the Intermediate Sandstone unit migrates laterally until it reaches the desilicified zone, where it merges with flow from the Lower Sandstone Aquifer travelling upward toward Whitefish Lake. The additional flow contribution through the ISS contemplated by the reviewer would enhance dilution within the desilicified zone and thereby reduce concentrations reaching Whitefish Lake.</p> | No updates to the EIS in response to this IR. |

| | | | | in the proponent's groundwater flow model (EIS, sec. 7.4.2.1, p.7-51; Appendix 7-C, sec. 2.6.3). | | | |
| IR-56 | CNSC | Geology and Groundwater | Section 7.3.3.2 | <p>Context: It is stated in Section 7.3.3.2 (p. 7-37, main EIS report) that “Exploration boreholes drilled in the Phoenix area, where left unplugged, have the potential to provide preferential flow paths between the Overburden and Upper and Lower Sandstone Aquifers. Exploration holes were reportedly grouted approximately 10 to 20 m above and below the ore zone, resulting in open holes remaining throughout the overlying materials. These portions of the open holes may act as open conduits for groundwater flow through the 400 m of Athabasca Group Sandstone.”</p> <p>Rationale: It is not clear why the exploration boreholes have not been decommissioned.</p> | Please clarify why the exploration boreholes have not been decommissioned and the timeline to decommission the boreholes according to appropriate guidelines/procedures. If it is not decommissioned before the ISR operation, what is the potential impact of the unplugged boreholes on the mining solution migration? | <p>All historic exploration boreholes drilled to date containing a mineralized intersection, with grades higher than 1% U3O8, have been grouted a minimum 25 m above and below the mineralized intersection. The addition of grout to these depths is within the defined depths of the hydrogeologically modelled areas from operational mining scenarios conducted to date. The extent of the mining solution migration (i.e. the mining area) for the purpose on the EA extends 50 meters above the ore zone depth.</p> <p>During Operation, select exploration boreholes will be re-utilized for narrow diameter injection wells that will be developed with monitoring devices for the determination of excursions and water levels. Exploration boreholes not selected for the use of narrow injection wells will be grouted to surface to seal off any remaining conduit. Many of the exploration boreholes previously installed through the desilicified zone that overlies the deposit have collapsed, sealing the zone and acting akin to previous and natural state of the desilicified zone itself.</p> <p>The potential impact of the open, unplugged boreholes was evaluated as part of the numerical model sensitivity simulations performed and presented in Appendix 7-C. In general, while these open boreholes have the potential to create preferential flow paths, they were not found to create a meaningful differences in the groundwater flow paths, or mass transport conditions. This is partially because the simulated groundwater gradients are downward above the ore zone where the open coreholes are most prevalent. Further east, within the desilicified zone, unplugged coreholes are interpreted to have collapsed, such that they do not represent preferential transport pathways in the future</p> | No updates to the EIS in response to this IR. |
| IR-57 | NRCan | Fish and fish habitat | Section 7.3.3.2 Appendix 7-A, sections 3.1.2 and 3.7 Appendix 7-C, section 2.5.2 | <p>Context: The proponent's conceptual model of groundwater flow in the Local Study Area (EIS, sec 7.3.3, Figure 7.3-7) involves an unconfined Upper system hosted by overburden and the Upper sandstone aquifer, and a Lower confined system hosted by the Lower Sandstone Aquifer. The Intermediate Sandstone aquitard acts as a confining unit. Vertical heads gradients are directed downwards west of the Phoenix deposit and upwards beneath surface water receptors including Whitefish Lake (EIS, sec. 7.3.3.2).</p> <p>Using head data from nested monitoring wells (Appendix 7-A, sec. 3.1.2, Table 3-1) the proponent calculates upward gradients in cluster WR-607, between the Lower Sandstone aquifer and the Upper Sandstone aquifer. In cluster LA-5, an upward gradient is calculated between the Upper Sandstone and the overburden unit (Appendix 7-A, Table 3-5). In areas west and south-west of the Phoenix deposit, groundwater is estimated to flow downward under a vertical gradient of approximately 0.015 m/m (Appendix 7-A, p.3-15).</p> <p>Rationale: In NRCan's opinion, the proponent's interpretation of vertical head gradients in the LSA is not fully accurate. For the "Up-Gradient" monitoring well cluster, the tabulated head data (Appendix 7-A, Table 3-1) and data logger hydrographs (Appendix 7-A, Appendix B) indicate a downward gradient (0.014 m/m) from the overburden unit to the Intermediate Sandstone and an upward gradient (0.056 m/m) from the Lower Sandstone to the Intermediate Sandstone. Head data from the "NW" monitoring well cluster indicate a similar pattern of downward (0.016 m/m) and upward (0.014 m/m) gradients converging in the Intermediate Sandstone. In the "Downgradient" and "SE" monitoring well clusters, head observations and data logger hydrographs indicate downward gradients from the shallow aquifer system but essentially equal heads in the Intermediate and Lower Sandstones. This more complex picture of groundwater flow systems in the LSA does not appear to have been captured in the proponent's conceptual model. Given the importance of the baseline hydrogeological regime for predicting the transport and fate of COPCs in the post-decommissioning period, the proponent needs to demonstrate that the numerical groundwater flow model accounts for observed vertical head gradients.</p> | In section 2.5.2 of Appendix 7-C (Calibration Results), the proponent should demonstrate that the numerical groundwater flow model reproduces quantitatively or at least qualitatively the vertical head gradients calculated from observations in the nested monitoring well clusters (Appendix 7-A, Table 3-1). | Please see response in Attachment IR-57. | In the final EIS, Section 2.5.2 of Appendix 7-C will be updated to include information provided in Attachment IR-57. |
| IR-58 | ECCC | Fish and fish habitat | Section 7.3.2.4, Ore Deposit | <p>Context: The Proponent states that the Phoenix ore bodies are long and narrow (approximately 25 to 50 m wide) and are located within or near a graphitic pelite unit. Hydrothermal alteration associated with the ore zone is a discontinuous envelope of clay alteration and a sulphide-cemented rock zone that extends into the overlying sandstone and the underlying basement (Figure 7.3-3). This black, clay-rich zone is approximately 3 m thick on average and locally hydraulically isolates the ore zone from the overlying sandstones and underlying weathered basement rock.</p> <p>Rationale: As indicated by the Proponent, a 3 m black clay rich zone isolates the ore zone from the overlying sandstones and underlying weathered basement rock. It is, however, unclear whether this discontinuous clay layer will prevent downward migration of uranium-bearing solution into the Paleo-weathered basement rock or horizontal flow along the unconformity surface to escape into the</p> | <p>1. Verify that there will be no downward migration of mining solution into the paleo- weathered basement rock or that there is no flow along the unconformity surface.</p> <p>2. If downward migration of the mining solution occurs, explain how it will be mitigated.</p> | <p>1. A portion of the paleoweathered zone is comprised of high grade mineralization of the deposit and will be subject to mining activities controlled by the inward hydraulic gradient induced by pumping. As is discussed in Section 4.1 of Appendix 7-C, potential exists for downward migration of the solubility enhancing fluids used during mining operation and the UBS because of the density and specific gravity of these fluids (greater than that of sea water). However, the downward migration will be limited by the competent unaltered basement rocks below the paleoweathered zone, which is characterized as having very low hydraulic conductivity (Section 2.3 of Appendix 7-C).</p> <p>2. As discussed above, some migration of mining fluids in the paleoweathered zone is expected and groundwater quality in this zone remediated post-mining. The entire thickness of the paleoweathered zone beneath the ore zone was included in the numerical model (Appendix 7-C) as having water quality represented by the "Restored Solution" (Figure 4-1 of Appendix 7-C). That assumption is inherent in the conservative source zone applied to all mass transport simulations. Further conservatism within the numerical model was exclusion of low permeability natural barrier zones (i.e., clays) identified in the geological model for the</p> | No updates to the EIS in response to this IR. |

|--------|------------|-------------------------|---|--|--|--|---|
| | | | | environment. Escape of uranium-bearing solution into the environment will have a negative effect on the receiving environment. | | ore zone - meaning, it was not assumed that these zones would serve to mitigate against migration of mining fluids into the paleoweathered zone. If downward migration of the mining solution were to occur this would be under an upset condition where monitoring wells placed below the mining horizon would collect these solutions via installed groundwater pumps preventing further migration away from the mining horizon. | |
| IR-59 | CNSC | Fish and fish habitat | Section 7.4 Assessment of Project-related Effects, Figure 7.4-2 (p. 7-56) | Context: Figure 7.4-2: Simulated Change in Groundwater Discharge and Flow through Whitefish Lake Over the Life of the Project appears to be missing information. Rationale: Legend is included below the image, but the Legend box is blank. The green dotted line is not represented by anything in the legend. | Please update this Figure to ensure it is complete, and that features are properly indicated in the legend. | Acknowledged. Figure 7-4.2 in the EIS and Figure 2-18 of Appendix 7-C will be replaced for clarity. | The updated figure provided in Attachment IR-59 will replace Figure 7-4.2 in the final EIS and Figure 2-18 of Appendix 7-C. |
| IR-60 | NRCan | Fish and fish habitat | Section 7.4.2.1 Appendix 7-C, section 5.2.1, Appendix B | Context: In the discussion of the limitations of the numerical groundwater flow model (Appendix 7-C, sec. 5.2.1), the proponent invokes the well known modeling principles of "Occam's razor" and "Parsimony" which guided the parametrization of hydraulic conductivity in model layers. The proponent states that hydrogeologic property values were applied uniformly for, among other units, the Lower Sandstone aquifer beyond the immediate area of desilicified materials. However, in the layer parametrization for the Lower Sandstone aquifer (Appendix 7-C, Appendix B, Figure B-5), NRCan notes a large zone of enhanced conductivity (1 E-05 m/s) extending south from Kratchkowsky Lake, which contrasts with the value (2 E-07 m/s) assigned elsewhere outside the desilicified zone. NRCan also notes the extremely detailed parametrization of hydraulic conductivity in the clay cap overlying the ore zone where borehole control is dense (Appendix 7-C, Appendix B, Figure B-6). Rationale: In NRCan's opinion, these model features appear to violate the principle of "Parsimony" and require greater justification supported by field observations. | NRCan requests that the proponent provide justification based on field evidence for the multiple hydraulic conductivity zones assigned to the Lower Sandstone aquifer and the clay cap above the ore zone. | We reaffirm that the hydraulic conductivity zones applied are consistent with the principles of parsimony and Occam's Razor. The hydraulic conductivity along the western portion of the model area within the Lower Sandstone Aquifer reflects the identified fault zone discussed in IR-53. This zone was added to better represent observed water levels within that portion of the model area. Further, this high hydraulic conductivity zone permits additional water inflow into the Lower Sandstone Aquifer than would otherwise exist if a lower hydraulic conductivity zone were applied here, resulting in conservative modelling predictions of flow through the Lower Sandstone Aquifer (which is consistent with the requests in IR-55). The high-resolution representation of the clay cap zones is consistent with other contemporaneous work within the ore zone completed by Petrotek (2020) and subsequently by Denison. This resolution of parameter values is consistent with the high data density contained at the Phoenix ore body. Extensive hydrogeologic core logging and permeameter sampling were conducted on over 3,000 mineralized and lower sandstone drill cores to demonstrate and identify the spatial distribution of the various hydrogeologic units contained within the ore zone itself, for purposes of optimizing mining scenarios and flow pathways for recovery. Each hydrogeological unit has specific hydraulic conductivity values based on this extensive test work in addition to various field packer and pump/injection test work. | No updates to the EIS in response to this IR. |
| IR-61 | CNSC | Geology and Groundwater | Section 7.4.2 | Context: There is no discussion of potential induced seismicity from mining processes. Rationale: Induced seismicity may lead to a loss of process as identified for natural seismicity. | Please provide information on the potential mining-induced seismicity. | Natural seismic activity in Northern Saskatchewan is quite rare with no significant events in recorded history (refer to draft EIS Section 15.2 Seismic Events). Compared to conventional mining techniques, the potential for mining-induced seismicity from ISR mining is quite low. Potential for mining-induced events for the Project could be postulated to occur as the result of a few sources: 1. collapse of cavity voids from leaching, 2. hydraulic fracturing, and, 3. use of permeability enhancement techniques, and each is discussed further below. <ol style="list-style-type: none">Collapse of cavity voids. To clarify, the portion of the deposit being mined is never truly a void (as in a large empty underground cavern); rather, what remains will be a honeycomb textured environment with water filled interstices. The mined area is filled with a fluid at all times, whether it be a mining solution, groundwater, or the neutralizing solution. This is different from a more traditional underground operation such as Cigar Lake where there is physical excavation of the orebody, leaving a temporary air-filled space. Although the uranium ore is high-grade by global standards it is not entirely massive in nature. As such, the uranium will be leached in a 'honeycomb' texture leaving behind a structure of partial intact rock mass with the remaining area being filled by fluid. This retains the pressure balance of the mining zone with the adjacent water-saturated rock masses. In terms of void space creation and collapse of the overlying strata, modelling has demonstrated that only 0.05% by volume of desilicified material immediately overlies the ore zone and would be subject to collapse (RESPEC 2023; included here as Attachment IR-21). This low volume and percentage is determined to not be of significant seismic concern.Hydraulic fracturing. Draft EIS Section 2.2.1.4.2 Wellfield Operation provides a comparison of ISR mining pressures to conventional fracking pressures used in the oil and gas industry. Conventional fracking pressures used in the oil and gas industry can vary; however, common pressures to induce fracturing can range up to 15,000 psi and require injection of fracking fluids of up to 16,000 liter per minute over periods of three to four days. Fracking fluids are comprised of a slurry of water, proppant (generally silica sand), and chemical additives to support and maintain the open fracture system after fracking is conducted. Conversely, ISR mining for the Project is planned at nominal pressures of 100 psi, intermittent pressures of up to 250 psi, and average flow rates of 30 liters per minute within a recovery well. The ISR mining method proposed for the Project is markedly different than fracking. For example, looking at intermittent pressures alone, ISR pressures are anticipated to be 60 times lower than fracking pressures.Permeability enhancement techniques. Draft EIS Section 2.2.1.4.3 Permeability Enhancement outlines the three types of techniques being considered for the Project: mechanical, Propellant, and hydraulic options. Propellants are classified as a low hazard explosive (S.1 special-purpose explosives, low hazard explosives, per Explosive Regulations, section 36). Propellants technically do not explode (like classic mine explosives which detonate) but rather burn through a process called deflagration. Deflagration means the material burns slower than the speed of sound, thus no shock waves are generated. Propellant permeability enhancement methods reach injection pressures of up to 8,000 psi and are near instantaneous over periods of milli seconds. Neither ISR mining or permeability enhancement is expected to produce mining-induced seismicity. | No updates to the EIS in response to this IR. |

|--------|--------------|-------------------------|--|--|--|--|---|
| IR-62 | ECCC | Fish and fish habitat | Section 7.4.2, Potential Project-related Effects | <p>Context: The Proponent indicates that the mining area includes:</p> <ul style="list-style-type: none"> the ‘active mining area’, which is the target ore zone; a zone extending between 11 and 13 m above the active mining area that represents the maximum vertical height over which the injected mining fluids will migrate upwards from the ore zone during active mining; and a zone extending 50 m vertically upwards from the active mining area (that incorporates the active mining area and the 11 to 13 m zone defined in the previous bullet) that was selected to account for potential upset conditions. <p>Rationale: It is not clear to ECCC how the Proponent would be able to limit the mining solution migration within 11 & 13 m above active mining as the maximum vertical height over which the injected mining fluid will migrate. As the mining fluid will be injected under pressure into zones with possible presence of fractures, the pressure may also cause additional fractures and given that the solution is warm/hot will possibly dissolve the other cementing material in the sandstone above, making it difficult to accurately predict where the solution will migrate to.</p> | <p>1. Explain plans to limit the upward migration of mining solution into the overlying layer to 11 and 13m above the ore zone.</p> <p>2. Explain what impacts will occur if the mining solution migrates beyond the predicted height.</p> | <p>1. More detail on engineered controls for containment of mining solution is provided in the draft EIS, Section 2.2.1.4.2 Wellfield Operation; see also the response to IR-08. Continuous monitoring of pump and injection wells will confirm containment of mining solutions to the lower 11 to 13 m above the ore zone during active operations.</p> <p>2. Additional monitoring wells located above this elevation will be installed to make sure this depth is achieved. These monitoring wells can be retrofitted to be pumping wells if needed to provide additional control of mining solutions. Denison has established a conservative mining area of 50 m above the ore zone in the EIS, which will be remediated to acceptable criteria post mining. Additionally, the freeze wall will be in place throughout Operations and will provide horizontal containment of solutions.</p> | No updates to the EIS in response to this IR. |
| IR-63 | CNSC | Geology and groundwater | Section 7.4.2.1, Potential Effect #1: Groundwater Quantity – Construction to Decommissioning Appendix 7-C, Section 2.7, Groundwater Conditions During Mine Operations | <p>Context: The numerical groundwater model described was calibrated to observed water level and stream baseflow data. Table 7.4-3 in the EIS indicates that Denison recognizes the potential for freeze wall operation to impact groundwater quantity. To simulate this impact, the model was adapted to reduce recharge (to 50%) within the freeze wall area, reduce hydraulic conductivity associated with the vertical freeze walls, and simulate pumping within the freeze wall area. Recovery from pumping and effects on discharge to groundwater discharge to Whitefish Lake are discussed in the potential effects section.</p> <p>Rationale: Although this assessment considered drawdown of the water table and discharge to Whitefish Lake, the discussion did not address the potential effects of operating the freeze wall on the local and semi-regional groundwater regimes. What would the pathway be for groundwater to pass around the freeze wall? What is the basis for the parameters selected, e.g., 50% recharge and lower hydraulic conductivity for freeze well? These factors need to be considered when evaluating the potential impacts of freeze well operations on groundwater flow conditions and corresponding receptors.</p> | Please provide a more fulsome discussion on the impact of freeze wall operations on local and semi-regional groundwater regimes and potential receptors. Please provide the rationale for assumptions made for key model parameters (e.g., selection of 50% recharge, hydraulic conductivity value used to represent freeze wall). In addition, please discuss the potential pathways for groundwater flow around the freeze wall, complete with figures demonstrating these pathways. | See response in Attachment IR-63. | The information provided in Attachment IR-63 will be attached to Appendix 7-C in the final EIS. |
| IR-64 | ECCC CNSC | Fish and fish habitat | Section: 7.4.2.2, Potential Effect #2: Terrain Morphology and Stability – Operation Appendix 7-A, Appendix K (p. 12) | <p>Context: The Proponent stated that the geological assessment predicted maximum vertical displacement in altered sandstone immediately above the mining area (17.5 cm). A very minor change in elevation at ground surface (of less than 7.5 cm) was predicted within a discrete and localized area overlying the ore body. The modelling work is considered to provide a worst-case bounding scenario. If subsidence were to occur over the lifetime of the Project, or in the years following mining, the extent of vertical displacement is not expected to exceed that predicted in the modelling, which is based on an assumed volume extraction.</p> <p>Rationale: ECCC notes that the thickness of the ore zone has an average thickness of 5 m with a range of 2 to 17 m, and is 25-50 m wide and that the overburden rock above the ore zone measures about 400 m. Therefore, it is not clear how the Proponent determined that the surface expression of a subsidence on the surface if it occurs will be limited to 7.5 cm and localized. A subsidence greater than 7.5 cm, implies that the void in the ore zone will be narrower, and will affect the amount of water migrating through the zone.</p> <p>It was the recommendation of the consultant who conducted the work in Appendix K that more accurate material properties should be used for future modelling.</p> | <p>Explain:</p> <ul style="list-style-type: none"> Will this be revisited with updated data based on extraction feasibility results? How will the surface expression of a subsidence will be limited to 7.5 cm and localized? <p>Suggestions for mitigation and follow-up measures: ECCC recommends that the Proponent consider implementing remediation measures immediately after mining to prevent subsidence from occurring in the first place.</p> | Subsequent to the filing of the draft EIS, Denison undertook additional modelling with refined, more granular inputs including subunits within the altered zone (RESPEC 2023; included as Attachment IR-21) and the surface subsidence has been reduced from 7.5 cm to 2.4 to 2.8 mm. Denison is not anticipating the need for remediation measures with the surface subsidence being negligible within the context of changes in terrain as it relates to decommissioning objectives. | No updates to the EIS in response to this IR. |
| IR-65 | CNSC | Geology and Groundwater | Section 7.4.2.2 | <p>Context: It is stated the maximum subsidence is 7.5cm based on modeling with an assumed volume extraction. Has subsidence from dewatering/pumping and from lack of inflow of groundwater due to freeze wall been considered?</p> <p>Rationale: Surface facilities and wells may be impacted if there is unaccounted for subsidence.</p> | Please provide additional details for any dewatering/pumping induced subsidence. | <p>No pumping and/or dewatering subsidence is anticipated to occur as the fluid balance will remain relatively stable during Operation with no additional stresses placed on the mining horizon. Refer also to response to IR-07.</p> <p>To clarify, the portion of the deposit being mined is never truly a void and what remains after mining will be a honeycomb texture with water-filled interstices. The mined area is filled with a fluid at all times, whether it be a mining solution, groundwater, or the neutralizing solution. This is different from a more traditional underground operation such as Cigar Lake, where there is physical excavation of the orebody, leaving a temporary air-filled space. Although the uranium ore is high-grade by global standards it is not entirely massive in nature. As such, the uranium will be leached in a 'honeycomb' texture leaving behind a structure of partial intact rock mass with the remaining area being filled by fluid. This retains the pressure balance of the mining zone with the adjacent water-saturated rock masses.</p> | No updates to the EIS in response to this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-------------------------|---|---|--|---|---|
| | | | | | | <p>Although the above provides context on the absence of true, air-filled voids remaining post-mining, the risk of subsidence has been assessed appropriately (included in the draft EIS as Appendix K to Appendix 7-C; see also draft EIS Section 7 Geology Valued Component - Terrain Morphology and Stability Key Indicator and draft EIS Section 9 Terrain Valued Component - Terrain Morphology Key Indicator and Terrain Stability Key Indicator). The analysis shows there is negligible risk of subsistence and the magnitude of subsistence, if it were to occur, is the range of 7.5 cm at surface.</p> <p>Subsequent to the filing of the draft EIS, Denison undertook additional modelling with refined, more granular inputs including consideration of subunits within the altered zone (RESPEC 2023). With this more refined analysis, the potential surface subsidence has been reduced from 7.5 cm to 2.4 to 2.8 mm (RESPEC 2023 is included here as Attachment: IR-21).</p> | |
| IR-66 | CNSC | Geology and Groundwater | Section 7, Table 7.5-1, Row 1, Column 6 | <p>Context: Column 6 in Table 7.5-1 indicates the mitigation measures for a valued component. For Row 1, Geology, there is no description of mitigation measures but only that contingency plans will be developed if based on monitoring.</p> <p>Rationale: Subsidence may impact wells and surface infrastructure.</p> | <p>Please provide additional details on monitoring and contingency plans related to the geological environment (e.g., subsidence), including triggers for implementing such plans.</p> | <p>Please see response to IR-64 for an updated analysis of surface subsidence (2.4 to 2.8 mm at surface; RESPEC 2023 included as Attachment IR-21). The predicted changes at surface related to subsidence is beyond the range of current Lidar technology with resolution at 10 cm. As such, Denison believes the level of risk for subsidence is negligible and that monitoring and contingency plans are commensurate with this low level of risk.</p> <p>Injection and recovery wells will be collared at surface and surveyed regularly to monitor for any changes in collar height over time. This monitoring will be added to Section 7 of final EIS for the Geology VC.</p> | <p>Update to Table 7.5-1 in Section 7 of the final EIS to note that subsidence estimates are in the mm range and mitigation measures are not required. Injection and recovery well collar height monitoring will also be added to Section 7 of the final EIS.</p> |
| IR-67 | CNSC | Geology and groundwater | Section 7.6.2.1 (Remediation Objectives) | <p>Context: Metallurgical testing, including batch reaction, coreflood testing and column tests are mentioned frequently throughout Sections 2 and 7 of the EIS. Outside of the composition of restored solutions from coreflood tests #2B and 3C, results from these various tests are not reported in the EIS or any associated Appendices.</p> <p>Rationale: The results from metallurgical testing are important to a number of items discussed in the EIS, including (but not limited to): evolution of hydrochemistry during remediation, source of salts in Lower Sandstone Aquifer porewaters, process plans, industrial wastewater treatment, estimating composition and volume of process precipitates, and composition of mining fluids and leachate. In particular, the EIS posits that mining area decommissioning objectives are achievable based on metallurgical testing and provides these objectives in Table 2.3-3. CNSC staff need to understand the specifics of this metallurgical testing, given its importance for the development and justification for mining and remediation activities. Denison must also provide information demonstrating that the proposed restoration actions and remediation targets are As Low As Reasonably Achievable (ALARA).</p> | <p>1. Please provide a summary of the results and the analysis of results of the metallurgical tests within the EIS, or provide the technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS. This should include sample information for cores (e.g., mineralogy, location, U content, depth), test conditions (e.g., duration, # of iterations, column length, flow rate, temperature, pressure, sample frequency, influent/effluent composition), as well as results and how they are pertinent to the development of ISR activities.</p> <p>2. Please provide further clarification/justification on how results from two singular coreflood tests (i.e., Coreflood #2B and Coreflood #3C) can justify large-scale remediation activities and targets following solution mining.</p> <p>3. Please provide material demonstrating that the proposed restoration actions and remediation targets are ALARA.</p> | <p>Please see response to Attachment IR-20, IR-67, IR-69.</p> | <p>No updates to the EIS in response to this IR.</p> |
| IR-68 | NRCan | Fish and fish habitat | Section 7.6.2.2.3 Appendix 7-C, sections 3.3, 4.1, 4.4.4 and 4.7 | <p>Context: Sources terms for the COPCs considered in 3D reactive transport modeling are given by the composition of "Restoration Solution #1", which the proponent believes is representative of groundwater quality in the ore zone after remediation at decommissioning (Appendix 7-C, sec. 3.3, Table 3-5; sec 4.0). The proponent considers COPC source terms as "initial conditions" for groundwater quality in the ore zone at the start of the model simulation period. During the simulation, no additional mass of COPCs is transferred to groundwater in the ore zone.</p> <p>Rationale: In NRCan's opinion, this representation of COPC sources is not conservative as it fails to account for various long-term slow mass release processes. These processes could include redissolution of secondary phases formed during ISR mining (e.g., radium-bearing gypsum or barite, jarosite, alunite) and migration of unrecovered lixiviant or restored solution from low-permeability regions or stagnant zones that were not fully swept during mining or remediation. NRCan notes that scenario #2 in the proponent's transport prediction uncertainty analysis (Appendix 7-C, sec. 4.7) does consider an extended source release period for protons (desorption from chlorite). However, in NRCan's opinion, additional modeling scenarios should consider extended-release periods for other COPCs as well.</p> | <p>NRCan requests that the proponent's reactive transport prediction uncertainty analysis (Appendix 7-C, sec. 4.7) consider extended source release periods for additional COPCs.</p> | <p>Please see response in Attachment IR-68, IR-94, IR-97.</p> | <p>No updates to the EIS in response to this IR.</p> |
| IR-69 | NRCan | Fish and fish habitat | Section 7.6.2.2.3 Appendix 7-C, sections 3.1 and 3.2 | <p>Context: For hydrogeological and geochemical assessments in support of ISR projects, the proponent identifies two aspects of primary importance (Appendix 7-C, sec. 3.1). These are a) groundwater remediation (Appendix 7-C, sec. 3.1.1); and b) the assimilative capacity of host rocks downgradient from the ore zone (Appendix 7-C, sec. 3.1.2). According to the proponent, the objective of groundwater remediation at decommissioning is to achieve water quality in the mined zone that does not pose a risk to receptors at the point of exposure. Assimilative capacity refers to the ability of groundwater-rock reactions to naturally sequester or attenuate COPCs migrating from the ore zone during the post-decommissioning period.</p> <p>Rationale: However, in NRCan's opinion, the proponent has neglected to mention the most fundamental aspect for hydrogeological and geochemical assessments in support of ISR projects. That aspect is the</p> | <p>NRCan requests that the proponent provide a detailed description of the expected mineralogical and hydrogeochemical changes occurring within the ore and barrier zones as a result of the injection of acidic lixiviant.</p> | <p>Please see response to Attachment IR-20, IR-67, IR-69.</p> | <p>No updates to the EIS in response to this IR.</p> |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------------|--|--|--|--|--|---|
| | | | | choice of ISR lixiviant and its effects on the mineralogy and hydrogeochemistry of the ore zone during mining operations. The proponent provides information on the pre-mining mineralogy (Appendix 7-C, sec. 3.2.1) and hydrogeochemistry (Appendix 7-C, sec. 3.2.2) but no information on their expected changes as a result of ISR mining. This Information is important when considering source terms in reactive transport modeling. | | | |
| IR-70 | CNSC ECCC | Fish and fish habitat Geology and groundwater | Section 7.6.2.2.3, Evaluation of Geochemical Reactive Transport Appendix 7-C, Section 4.4.2, Sub-Domain Model Hydrogeologic Parameters | <p>Context: The EIS indicates that “changes to hydrogeological conditions within the mining area were considered during development of the 3D sub-domain model. Dissolution of ore within the active mining area is expected to enhance ... hydraulic conductivity”.</p> <p>In Section 4.7 (Prediction Uncertainty Analysis), predictive uncertainty scenarios are provided. For scenario 7, the hydraulic conductivity (K) of the ore zone was increased even further than initial model assumptions. The value used is not indicated in the text.</p> <p>Rationale: A hydraulic conductivity (K) value of 5x10⁻⁶ m/s, which is a factor of five (5) greater than the value assumed for the ore zone, was applied in the base case numerical model to account for this impact. It is unclear from the information provided in Section 7 of the EIS or associated Appendices what the basis of this five-fold increase in K value for the ore zone, and how this was judged to be conservative, or to adequately represent anticipated conditions. This parameter is important as it impacts the rate at which contaminants flow from the ore zone following mining activities. Due to of the dissolution of uranium, larger voids will likely be created, and the hydraulic conductivity may increase by more than a factor of 5 compared to pre-project material. Therefore, a variation of at least one or two orders of magnitude for hydraulic conductivity should be used in the sensitivity analysis. Having a representative, conservative value for hydraulic conductivity is essential for understanding groundwater as a pathway of contaminant transport to Whitefish Lake and potential impacts to aquatic life. The K value used in the predictive uncertainty analysis should be reported.</p> | Please provide a more fulsome discussion on the anticipated impacts of mining on permeability of the ore zone due to mining activities in the EIS or in an Appendix. The value used for scenario 7 of the prediction uncertainty analysis should be provided. The scientific rationale for the use of a K value only a factor of five greater than the value assumed for the ore zone in the 3D regional model should be provided, alternatively, provide simulation results for a more conservative scenario. Specifically, this discussion should address the potential effects of mechanical permeability enhancement with tools, dissolution of ore, gas plugging, chemical plugging, plugging due to ion exchange, and mechanical plugging. | <p>Based on coreflood and column tests performed in the laboratory, a modest increase in the flow rate through the core was observed post-leaching. This is described in more detail in the response to IR-69. Based on the available information, the hydraulic conductivity in the ore zone was raised to be a uniform value of 2E-07 m/s to be represent the effective dissolution of any clay cap materials.</p> <p>However, the post-mining conductivity of the ore zone is not important to the fate and transport of the COPCs in the restored solution towards Whitefish Lake, as it represents a small portion of the flow path. Key parameters controlling transport rates to Whitefish Lake were the hydraulic conductivity of the lower sediments and the desilicified zone. Scenarios 5, 6, and 7 of the parameter uncertainty assessment presented in Section 4.7, Appendix 7-C, systematically explore the highest parameter values consistent with the observed data used for model calibration. As indicated by these scenarios, the geochemical assimilation capacity outweighs the uncertainty in hydraulic conductivity values.</p> | No updates to the EIS in response to this IR. |
| IR-71 | CNSC | Geology and groundwater | Section 7.7.1, Climate Change Considerations | <p>Context: The report states that in a scenario of increased precipitation and decreased/constant evaporation, climate change may result in greater flows in the Wheeler River drainage system and increased recharge to groundwater, which would correspond to increased groundwater discharge to Whitefish Lake. Additionally, it is also stated that climate change was evaluated qualitatively.</p> <p>Rationale: It is not clear why the impacts of increased evapotranspiration associated with higher average temperatures were not considered, even though these are likely outcomes of temperature increases due to climate change in areas such as the Prairies (Climate trends and projections - Canada.ca). It is also not clear why climate change considerations were not assessed quantitatively.</p> | Please provide a discussion on potential effects of increased evapotranspiration, as well as decreased groundwater recharge for the study area. Provide justification for performing qualitative assessment of impacts of climate change rather than a quantitative one. | <p>The experience of the Project team regarding studies of climate change and the impacts on groundwater at other sites generally shows a range of potential positive and offsetting negative impacts. While warmer temperatures will lead to extended periods of summer drought conditions extending into early fall, warmer winters are predicted as well, resulting in less snowpack accumulation, more frequent snowmelt events, and more frequent rainfall during periods when evapotranspiration is negligible. These warmer winter conditions are often simulated to produce enhanced groundwater recharge during late fall, winter, and early spring conditions. In particular, the lack of enhanced snowpack is simulated to result in less severe spring run-off conditions, indicating that more of the winter precipitation that falls will infiltrate. Overall, this is anticipated to result in enhanced groundwater recharge in the mid- to late-century periods.</p> <p>If, however, lower groundwater recharge was to result from climate change, it would reduce the groundwater driving force for mass transport of mining related fluids, and reduce mass loading to receiving water bodies such as Whitefish Lake. In other words, lower groundwater recharge resulting from higher evapotranspiration would result in slower mass transport to the receiving water bodies, reducing the risk of exposure.</p> | No updates to the EIS in response to this IR |
| IR-72 | CNSC | Geology and groundwater | Section 7.8.2, Groundwater Monitoring | <p>Context: Monitoring seems to consider COPCs from surface facilities, and excursion of pumped mine fluid in the Lower Sandstone Aquifer. There does not appear any discussion on how the proposed monitoring program considers potential excursions of brine from freeze wells.</p> <p>Rationale: It is unclear how potential excursions of brine from freeze wells will be monitored. Would this be through the fiber optic cables installed within the freeze well network? Or would it be achieved in the monitoring well clusters? If this is the case, how would an excursion of brine from a freeze well be differentiated from an excursion of mining solution?</p> | Please provide further information regarding how potential excursions of brine from freeze wells will be monitored as part of the proposed groundwater monitoring program. | <p>Loss of freezing to the freeze wall is considered an accident and malfunction, and highly unlikely, although if it occurs, will be signaled earlier by operational monitoring than through monitoring of groundwater quality. Details of the monitoring of the integrity of the freeze wall are provided in IR-51 and include ground temperature monitoring achieved through a series of continuous fiberoptic temperature and pressure wells from surface to the depth of impermeable basement rock below the unconformity. Such monitoring wells/systems will be installed on both the ore (inside) and non-ore (outside) sides of the freeze wall to confirm the thickness of frozen ground and will provide early detection of any upset conditions can be identified and addressed.</p> <p>For more information on the freeze wall integrity see attached technical response IR-10</p> <p>The groundwater monitoring network and plan, as presented in the draft EIS, was designed primarily to detect excursions of mining fluids, but also considers upset conditions related to the freeze wall. The parameters being measured in groundwater include electrical conductivity (EC) and chloride, which is a key indicator of freeze wall brine (CaCl₂), but is not expected to be a key indicator of migration of mining fluids. It is acknowledged that there was an oversight in the description of groundwater monitoring in Section 7.8.2 in not including chloride as a key performance indicator related to freeze wall upset conditions and brine migration; it has, however, been included in the Groundwater Monitoring Plan being developed for Licensing. Groundwater monitoring in wells and well clusters detailed in Figure 7-8.1 of the draft EIS (see IR-51 for updates to Figure 7-8.1) will include sampling for chloride and other key indicator parameters as well as continuous monitoring of EC (and pressure) at target hydrostratigraphic depths. The number of wells targeting the Lower Sandstone Aquifer is highest, with one monitoring well placed every 125 to 150 m distance along the freeze wall. The higher frequency of wells in this hydrostratigraphic unit reflects this as the unit where an upset condition with the freeze wall has the highest potential to allow migration of chemical constituents associated with the mining fluids laterally from the mining zone. Monitoring of</p> | <p>No updates to the EIS in response to this IR.</p> <p>The groundwater monitoring plan that will be submitted for licensing includes chloride and EC as key indicator parameters for demonstrating freeze wall integrity and, under upset conditions, delineating migration of brine in groundwater.</p> |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-------------------------|---|---|---|--|--|
| | | | | | | these key parameters will also occur in wells in the overlying hydrostratigraphic units (Intermediate Sandstone Aquitard, Upper Sandstone Aquifer and Overburden Aquifer). The groundwater monitoring network serves as secondary means to demonstrate freeze wall integrity and, under upset conditions, delineate migration of brine in groundwater. In addition, changes in pressure and temperature will be monitored continuously in vibrating wire piezometers (VWPs) surrounding the freeze wall, again every 125 to 150 m along the freeze wall, and changes would be evaluated in terms of potential to signal a freeze wall upset condition. | |
| IR-73 | CNSC | Geology and groundwater | Section 7.8.2.2, In Situ Recovery Mining Area Appendix 7-A, Appendix C | Context: The EIS recommends that a follow-up study be carried out to supplement available data on hydraulic conductivity in the Desilicified Zone (DSZ). Rationale: Appendix C (Summary of Hydraulic Testing Data and Conductivity Values) of Appendix 7A indicates that only n = 6 hydraulic conductivity values are available for the DSZ, one of which appears unreliable due to a problem with packer sealing. This is relatively few values compared to the Intermediate and Lower Sandstones. Additionally, limited hydraulic head data from boreholes screened in the DSZ is available (GWR-037, GWR-012 and GWR-014; See Figures 16/17 in Appendix 7-A) – most information appears to originate from open core holes. The information presented in its current form is insufficient considering the importance of this zone as a preferential pathway for contaminants following remediation activities, and the heterogeneity of the unit due to intense hydrothermal alteration and fracturing. Further information regarding hydrogeological properties and groundwater flow would aid greatly in validating and refining the numerical groundwater model. | As per the EIS recommendations, please provide additional information to supplement available data on hydraulic conductivity in the DSZ. Please provide the following information as part of the follow-up study: <ol style="list-style-type: none">1. identification of the vertical conductivity (KV) as there is an upward flow component (isotropy was assumed in DSZ for numerical model, this assumption must be verified)2. quantification of the horizontal and vertical flow gradients in the DSZ; and3. identification and mapping of any structures with the potential to influence groundwater flow in the DSZ, such as fracture/fault zones. | The specific information being asked for will be included in the final EIS. The detailed Groundwater Monitoring Plan will be provided to support licensing. The need for additional data within the desilicified zone is recognized and Denison has committed to gathering that data during Construction. In the absence of such data, reasonable and conservative assumptions were made regarding the continuity, hydraulic conductivity, porosity and nature of the geochemically reactive solids of the desilicified zone. Conservatism on multiples levels provides confidence that conditions are likely more favourable than simulated within the draft EIS. | Section 7.8.2.2.1 of the final EIS will be updated to include these follow-up commitments related to the desilicified zone: <ol style="list-style-type: none">1. identification of vertical conductivity;2. quantification of horizontal and vertical flow gradients; and3. identification and mapping of any structures with the potential to influence groundwater flow in the DSZ, such as fractures/fault zones. |
| IR-74 | CNSC | Geology and Groundwater | Section 7.8.2.3 | Context: It is stated in Section 7.8.2.3 (p. 7-113, main EIS report) that, at the Post-Decommissioning Stage, “Excursion are signaled by a change in water quality that is outside of that bounded by modelling predictions”, and “The model predictions spatiotemporally bound COPC concentrations in the subsurface that do not pose a risk to the receiving environment. Water quality that is outside of this bounding is defined as representing a material increase over a meaningful period compared to the predicted values either in rate of change or magnitude of change of COPC concentrations.” Rationale: It is not clear in which locations (e.g., is it in the mining area, or downstream of the mining area, or anywhere else?) the water quality is used to compare with the model predictions to determine if excursion occurs. | Please clarify in which locations the water quality data is used to compare with the model predictions to determine if excursion occurs. | These comparisons refer to conditions at the proposed monitoring well locations. | No updates to the EIS in response to this IR. |
| IR-75 | CNSC | Geology and Groundwater | Appendix 7-A, Appendix K | Context: The geomechanical study showed that the stability of the remnant ore zone and surrounding rock mass is highly sensitive to the magnitude of the material properties. To quantify this risk, the proponent conducted a sensitivity analysis to assess the influence that material properties have on the stability of key stratigraphic layers. The results of the sensitivity analyses suggest that small variations in the cohesion magnitude and angle of internal friction may significantly influence the stability of the altered sandstone, ore zone, and upper and lower clays. Rationale: By considering the potential uncertainties and risks in association with the geomechanical study and the empirically derived rock mass strength parameters and the non-site specific physical parameters of different rock formations used for the modeling, the proponent’s consultant suggests to define a laboratory testing program to address data gaps in the current geotechnical data and increase confidence in the material properties, and use more accurate material properties to model the phased extraction of uranium-enriched rock and assess the associated risks for cavity collapse and failure in the steel casing. CNSC staff concurs with these suggestions. | Please provide a plan to implement recommendations for further detailed geomechanical studies to reduce the uncertainties and risks in association with the stability and deformation analyses of ore zone rock matrix and its overlying rock mass formations and assess their impacts on the mine operation. | Additional conservative modelling scenarios were undertaken to address this (and other IRs). The modelling results show that for altered sandstone properties, both ore zone and immediately surrounding rock is marginally stable (1.0 < factor of safety [FS] < 1.25), and no-failure conditions are apparent. The predicted surface displacement remains approximately 2.4 to 2.8 mm (RESPEC 2023; included here as Attachment IR-21). For desilicified sandstone properties, failure conditions are predicted in 12.6% of the modeled desilicified sandstone volume, which is located within 20 to 35 m of the ore zone. Notable observations from modelling include that, based upon the geological model of the Phoenix deposit, the volume of the desilicified sandstone is approximately 4% of the volume of altered sandstone. Approximately 0.05% volume of altered sandstone is desilicified sandstone that is located immediately above the low-grade ore zone. The vertical displacement of the rock mass immediately above the low-grade ore zone ranges between 42 and 49 cm, and quickly reduces to the range between 0 and 7 cm at a distance of 4 – 5 meters from the low-grade ore zone (RESPEC 2023). | No updates to the EIS in response to this IR. |
| IR-76 | CNSC | Geology and Groundwater | Appendix 7-A, Appendix K (p. 12) | Context: Based on the consultant’s report, the modeled vertical strain is approaching or exceeding the tensile and compressive yield limits for steel casing. Rationale: Failure of steel casing may result in process loss or alter groundwater flow and quality. | Please provide additional details on how casing integrity will be monitored and potential effects mitigated. | The well designs and operational monitoring of the wellfield will mitigate accidental release of mining solution or UBS in the sandstone above the mining area. Each well will have double containment: mining solution will travel inside an inner casing with the outer casing acting as secondary containment for the mining fluids. Wells will be continually monitored for operational parameters such as injection pressures, injection flow rates, and recovery flow rates. This data will be transmitted to the processing plant for remote monitoring through a master control system. Through the master control system, operators will be capable of controlling pumphouse production lines remotely. Wellfield monitoring will facilitate detection of any issues with the injection and recovery wells. Specific to the steel casing for the injection and recovery wells, the conservative estimate of vertical strain in the steel casing passing through the altered sandstone provided in Appendix 7-A of the draft EIS is approaching the tensile and compressive yield limits; however, these estimates are likely an over-estimate of the actual casing strains because of the simplified, conservative assumptions used in the analysis. Altered sandstone within 25 m from the boundary of the mined excavation experiences tensile vertical strain greater than the yield limit (0.0018 strain) such that the vertical strain is relatively higher because of the presence | No updates to the EIS in response to this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------------|--|--|---|--|--|---|
| | | | | | | <p>of upper clay above the ore zone. The altered sandstone around the mined cavity similarly experiences compressive vertical strain greater than the yield limit (–0.0018 strain) for the radial span of 25 m. Where tensile strain exceeds the yield limit there is potential for well failure. These isolated areas that have been identified from the geomechanical study will need further assessment of well designs should a well be placed in these specific sub locations within the deposit area.</p> <p>A network of monitoring wells installed within the freeze wall area will be equipped with pressure instrumentation for the determination of the vertical strain/stresses placed on the formation to do mining zone space creation. This monitoring network is designed to detect if these strains may be approaching their acceptable levels prior to failure. The injection and recovery wells will also be equipped with devices for pressure and temperature that can detect a breach in the well casing if one were to occur. As a preventative measure, annual mechanical integrity testing is conducted on the wells to ensure their containment and compliancy.</p> <p>Active monitoring will allow for operational shutdown if a scenario is approaching a failure mode.</p> | |
| IR-77 | CNSC | Geology and Groundwater | Appendix 7-A, Appendix K Results of a Geomechanical Study Investigating the Influence of Uranium Extraction on Mining-Cavity Stability for the Wheeler River Uranium Project (Revision 1) | <p>Context: It is reported in the appendix K report, within Appendix 7-A, that both phase I scoping analysis and phase II detailed strip model were investigated by numerical modelling. The analysis discussed influence on host rock stability as a result of incremental increase in volumetric extraction and graded conservative treatment of material properties.</p> <p>Rationale: As critical components of a numerical geomechanical simulation, initial and boundary conditions are crucially important to the confidence and reliability of the modelling results. However, this information is absent from the current report. In-situ principal stresses largely affects the stability of the excavated host rock, and the vertical strain and surface subsidence. This information is also absent in current form.</p> | Please provide details on the boundary and initial conditions applied on stress loading and strain for the numerical analysis. In particular, the in-situ principal stresses, which are critical to correct understanding of the excavation disturbance to the host rock, should be provided and justified as appropriate. | <p>Several numerical models were conducted for material properties for altered sandstone. Presuming that the entire altered sandstone to be unconsolidated and desilicified.</p> <p>» For 0.0 MPa cohesion value, the numerical model reached equilibrium for friction angle greater than and equal to 27 degree.</p> <p>» For 0.1 MPa cohesion value, the numerical model reached equilibrium for friction angle greater than and equal to 27 degree.</p> <p>» For 0.5 MPa cohesion value, the numerical model reached equilibrium for friction angle of 20 degree.</p> | No updates to the EIS in response to this IR. |
| IR-78 | CNSC ECCC | Fish and fish habitat Geology and groundwater | Appendix 7-A, Section 3.5.2, Porosity Appendix 7-C, Section 2.3.2.1, Porosity Values | <p>Context: This section of the report outlines the estimated/assumed effective porosity values. The only reference provided is for permeameter testing on rock core samples (Scibek, 2019).</p> <p>Additionally, the report states that “As tracer test results to estimate effective porosity were unavailable at the time of modelling, effective porosity values for the sandstone bedrock and basement units were sourced from literature values”, where literature values are effective porosities from the Cigar Lake study (AECL, 1994), situated approximately 40 km NE of Wheeler River. No on-site Wheeler River field data was used to justify this value. Additionally, in the Cigar Lake study, the authors reported that, because results from tracer tests and pumping tests were unavailable, “a practical approach was adopted, i.e., to use the porosity values obtained from laboratory measurements made on core samples, and to assume that those numbers were close to the average field kinematic (effective) porosity values”.</p> <p>Rationale: The source of reported effective porosity values is unclear from Section 3.5.2 in Appendix A (e.g. literature review, field work, laboratory work).</p> <p>In Section 2.3.2.1 of Appendix 7-C, there is a lack of clarity regarding the effective porosity data used in the numerical model. It appears that no site-specific data derived from tracer tests or pumping tests is used in the numerical model. Given the that effective porosity directly correlates to seepage velocity and by extension transport time and distribution of COPCs in groundwater, it is an important parameter. Given its relative importance for contaminant fate and transport, effective porosity should be based on field measurements, or at the very least accounted for in the sensitivity analysis.</p> | <p>1. Please provide the reference for the data substantiating the assumed effective porosity values reported in Appendix 7-A, and used in the numerical model in Appendix 7-C.</p> <p>2. Please provide information on how the site-specific effective porosity values from tracer tests or pumping tests, were considered in the numerical models. Section 2.2.1.4 of the EIS asserts that tracer tests were carried out in 2021 – this information should thus be available for improving/updating models. Alternatively, provide a sensitivity analysis for the effective porosity in the Desilicified Zone, or contaminant transport simulation results with more conservative effective porosity values.</p> | <p>Effective porosity values applied in the numerical modelling are thoroughly discussed in section 2.3.2.1 and clearly presented in Table 2-4 of Appendix 7-C.</p> <p>Effective porosity values cannot be derived from packer tests, slug tests, or pumping tests. They can be inferred from core, although core is generally a very small sample of the subsurface and is generally limited to total porosity as opposed to the interconnected pore space. In fractured rock environments, the effective porosity is a combination of the fracture porosity and the portion of the total porosity interconnected with the fractures; thus, the effective porosity tends more toward the value of the fracture porosity. Effective porosity is rigorously determined using a successful tracer test; however, the success of a field based tracer test is not easily achieved as much of the tracer volume is often not intersected by downgradient wells. Consequently, most mass transport assessments use literature values for effective porosity (Anderson, Woessner and Hunt, 2015; pg 332). Further, the tracer test performed within a small portion (i.e., 10 m) of the ore zone, was not considered to be informative of the effective porosity values needed for the entire flow path between the ore zone and Whitefish Lake.</p> <p>For this study the effective porosity values applied in the Cigar Lake 3D model were used as a guide. Literature values suggested by Anderson, Woessner and Hunt (2015) would suggest higher values of effective porosity, which would be less conservative (i.e., result in slower groundwater velocities) than applied within this study.</p> <p>Reference: Anderson. M., W. Woessner, and R. Hunt. 2015. Applied Groundwater Modelling. Elsevier Inc.</p> | No update to the EIS in response to this IR. |
| IR-79 | CNSC | Geology and groundwater | Appendix 7-A, Section 4, Groundwater Chemistry | <p>Context: Table 4-1 in Section 4 of Appendix 7-A provides groundwater monitoring results from sampling activities carried out at 26 monitoring wells in 2019, 2020, and 2021. The majority of these wells were only sampled once (n = 8) or twice (n = 17). In some cases (Lower Sandstone Aquifer/Intermediate Sandstone Aquitard), the variability of results between sampling events is quite high. Data for the Paleoweathered Zone is sparse.</p> <p>Rationale: Insufficient information is presented in the EIS and associated Appendices to concretely define baseline groundwater chemistry for the different hydrostratigraphic units. As defined in the CNSC’s Generic Guidelines for the Preparation of an EIS: “Based on the scope of the project, the EIS will present sufficiently detailed baseline information to determine the effects the project could have on the VCs and analyze those effects”. This is particularly important given certain features of the study area (i.e., presence of zones of thermal alteration/desilicification, as well as hydraulically active fractures/faults), and the need to adequately characterize baseline</p> | Please provide the statistical basis (number of samples and variability) by which “baseline” is defined and the justification that the current information is sufficient to adequately characterize groundwater quality. In order to ensure sufficient baseline information is collected, further iterations of sample collection for groundwater monitoring wells in all defined hydrostratigraphic units may be required. In addition, groundwater quality downgradient from the proposed mining area should be further characterized to assess spatial influence of alteration and hydraulically active features, | <p>The statistical basis by which baseline groundwater data has been characterized, that is sample numbers included per hydrostratigraphic unit, median, maximum and minimum values, that describe the variability of the groundwater quality data were presented as Table 4-2 of Appendix 7A and Table 3-4 of Appendix 7C to the EIS. The primary purpose of the groundwater data collected as part of the baseline program is to provide a basis for evaluating the incremental change in groundwater quality with mining activities. The magnitude of any incremental changes in groundwater quality associated with the remediated groundwater, which was the focus of the modelling, was such that deviation in water quality from baseline conditions was possible to identify.</p> <p>Supplemental groundwater monitoring will be ongoing during all phases of the Project. Denison is committed to installing additional wells, with a focus on characterizing pre-mining conditions and monitoring through and post-mining immediately surrounding the freeze wall and downgradient of the mining zone, and will be re-initiating routine sampling that captures seasonal variability in 2024. A N288.7-compliant Groundwater Monitoring Plan is being developed to support permitting and licensing and will guide the aforementioned sampling.</p> | No updates to the EIS in response to this IR. |

|--------|------------|-------------------------|---|--|---|--|---|
| | | | | conditions in the Desilicified Zone downgradient from the proposed mining area. As an example, the US Nuclear Regulatory Commission (NRC) typically requires a minimum of four (4) quarterly samples from (i) surficial aquifers, (ii) production aquifers, (iii) overlying aquifers, and (iv) underlying aquifers to characterize preoperational groundwater quality (E. Striz, pers. comm.). | | | |
| IR-80 | CNSC | Geology and groundwater | Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit | <p>Context: This section provides data for groundwater samples collected during the Cigar Lake analogue study and Millennium Project for further regional context. The previous studies are heavily referenced to support interpretations made for the conceptual site model.</p> <p>Rationale: The Piper Plots in Figure 26 are difficult to interpret (many overlapping circles with variegated colors), and Cigar Lake samples plot predominantly as Na/K-Cl/SO4 groundwater facies. Conversely, samples collected as part of the Phoenix Project (current), plot either as Ca-HCO3 or Ca-SO4/Cl groundwater facies. No explanation is provided for the observed hydrogeochemical differences between groundwater from the Phoenix project and the Cigar Lake analogue study/Millennium Project.</p> | Please provide additional clarity to and interpretation of Figure 26 in Appendix 7-A, including a revision to the Figure to allow for easier interpretation. This could include clear identification of end members, as well as arrows indicating proposed evolution of groundwater chemistry. Further discussion should be provided describing observed differences between groundwater chemistry at the Phoenix project compared to Millennium/Cigar Lake. | Please see response in Attachment IR-80. | Figure 26 of Appendix 7-A of the draft EIS will be separated into Figures 26 and 27, and the Figure numbering updated accordingly in that Appendix. Also, the text on pages 4.17-4.18 and 4.20 of Appendix 7-A of the draft EIS will be updated. These revised figures and text are outlined in Attachment IR-80. |
| IR-81 | CNSC | Geology and groundwater | Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit | <p>Context: The report states in the description of hydrochemistry of the Lower Sandstone Aquifer that, “On the basis of groundwater chemistry and tritium values in that groundwater, the authors (of the Cigar Lake analogue study in 1994) concluded that the groundwater reflected a younger water component that had penetrated to depth along hydraulically active fractures/faults. The same conclusion is made here (in the Wheeler River EIS) for the Phoenix study area – meaning that fracture/fault conditions are such that some areas of the MFa are characterized by younger/recharge groundwaters”.</p> <p>Rationale: Tritium results for most wells in the Lower Sandstone Aquifer (MFa) reported in Table 4-1 of Appendix 7-A exhibit tritium concentrations <15 Bq/L for the 2020 sample, and 0.1 or <0.1 Bq/L for the 2021 sample. Tritium in modern precipitation typically varies from 1 – 3 Bq/L. Conclusions made in the text are not supported by data, especially given that tritium values are not reported in the EIS for local precipitation or surface water. This is important in reinforcing the assumption from the conceptual model that modern meteoric water circulates at depth in the Lower Sandstone Aquifer.</p> | Provide a further discussion on the interpretation of tritium in groundwater, rather than echoing conclusions from the Cigar Lake analogue study. Consideration should be given to the assertion that modern meteoric water circulates at depth in the Lower Sandstone Aquifer. Collection and analysis of stable isotope (e.g., δ2H, δ18O) samples is a cost-effective solution which would greatly improve understanding of groundwater hydrology and support the development of a conceptual model. | Please see response in Attachment IR-81. | No updates to the EIS in response to this IR. |
| IR-82 | CNSC | Geology and groundwater | Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit Appendix 7-C, Section 3.5 | <p>Context: A. In-field measurements of Oxidation-Reduction Potential (ORP) for three (3) out of twenty-six (26) groundwater samples are presented in Table 4-1 of Appendix 7-A. Although sparse, these values are also used to characterize redox conditions for representative groundwaters in Table 3-5 of Appendix 7-C.</p> <p>B. In Section 3.5.5 of Appendix 7-C it is stated that groundwaters in the PHREEQC model were allowed to equilibrate with atmospheric concentrations of oxygen, resulting in oxidizing subsurface conditions. In Section 3.7 of Appendix 7-C it states that input files for 3D reactive transport were generated based on outcomes for PHREEQC modelling. However, in reading Section 4 of Appendix 7-C, it is unclear whether this assumption (equilibration with atmospheric oxygen) was carried forward for the 3D model.</p> <p>C. As per p. 3.49 of Appendix 7-C, “A small amount of reactive pyrite was assumed for the first 500 m of transport away from the ore zone in the model, primarily in the desilicified sediments of the Lower Sandstone Aquifer, and deeper portion of the Intermediate Sandstone Aquitard”.</p> <p>Rationale: A. Given the importance of redox conditions for U mobilization and precipitation/dissolution of minerals (e.g., pyrite/metal oxyhydroxides) and the corresponding influence on contaminant transport from both a modelling and monitoring perspective, these should be further characterized. It should also be noted that the measurement of Oxidative-Reductive Potential (ORP) in natural waters can be complex and difficult due to the variability and disequilibrium of natural systems and issues inherent to electrode calibration (e.g., Schuring et al., 2000). Measurements of redox couples (e.g., As(III)/As(V); Fe(II)/Fe(III); S(-II)/S(VI)) are typically recommended to accurately characterize redox conditions in natural waters (Schuring et al., 2000).</p> <p>B. The assumptions regarding redox conditions for the 3D solute transport model should be clarified.</p> <p>C. The amount of pyrite (e.g., % by weight) assumed for the purposes of modelling should be clarified, given the potential role of pyrite as a reducing agent in limiting the transport of COPCs.</p> <p>Reference:</p> | <ol style="list-style-type: none">1. Provide further discussions and information (i.e., ORP measurements or analytical data for redox couples) on redox conditions at the Phoenix site. Particular focus should be given to the spatial heterogeneity of redox processes. Tools such as the reference provided [2] below provide an example of simplified framework for characterizing redox conditions in aquifers.2. Clarify assumptions regarding initial redox conditions for the 3D solute transport model.3. Provide the % reactive pyrite by weight assumed for models in the text. Justification for proportions used, such as analytical data, should also be provided. <p>Reference: [2] Jurgens, B.C., McMahon, P.B., Chapelle, F.H., and Eberts, S.M., 2009, An Excel workbook for identifying redox processes in ground water: U.S. Geological Survey Open-File Report 2009–1004 8 p.</p> | Please see response in Attachment IR-82. | No updates to the EIS in response to this IR. |

| IR-83 | CNSC | Geology and Groundwater | Appendix 7-A, Section 7.4.2.2 and Appendix K | <p>Context: Leaching of uranium from the ore zone will generate voids within the ore zone, which could fail and collapse. Failure of the voids would cause displacement in overlying rocks, which will lead to the eventual ground subsidence. Based on the developed geological model, a geomechanical study was conducted to assess potential maximum vertical displacement in the overlying rock formations and predict the ground subsidence. While a layer of altered sandstone is modeled above the ore zone, the desilicified zone, a zone that is comprised of completely to partially unconsolidated sands and has very low rock quality, high fracture intensity, and high friability, and low strength in the area overlying and east of the Phoenix deposit, appears not to have been included in the model for geomechanical modeling. The evaluated displacement/deformation in the overlying rock formation and the resulted ground subsidence would not be conservative without including the desilicified zone.</p> <p>Rationale: Stability of the ore zone rock matrix and the potential displacement/deformation in the overlying rock formations when voids in the extracted ore zone collapse are critical for protecting the overlying aquifers, preventing substantial ground subsidence, safeguarding casing integrity, and mitigating plug-off of the remaining ore as well as efficiently mining extraction. The deformed zone in the overlying rock formations will change in hydraulic conductivity that will impact on the assessment of potential effects on groundwater flow and contaminant transport in the zone. Therefore, the rock mass behavior including and above the ore zone should be adequately understood and the potential displacement/deformation should be assessed and quantified with adequately defined geological model.</p> | Please provide details whether and how the desilicified zone is considered in the geomechanical modeling of the detailed strip model. Such details should include figures and the linkage between the geomechanical model including the determination of strength parameters of the desilicified zone and the geological model including information on the core delineation of the desilicified zone. | Information requested here with respect to details of how the desilicified zone is considered in the geomechanical modelling is addressed in IR-75. Details linking the geochemical model with the geological model including core delineation of the desilicified zone above the mining zone is provided in RESPEC (2023), included here as Attachment IR-21. | No updates to the EIS in response to this IR. |
| IR-84 | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: It is stated in Section 2.5.2.4 (p. 2.35, Appendix 7-C) that “In addition to calibrating to water level elevations targets, the model was calibrated to estimates of groundwater discharge to Whitefish Lake. A match between simulated and observed flows helps to support that groundwater recharge rates are reasonable, and to provide validation for water budget assessments. Baseflow calibration targets were developed using point streamflow measurements collected upstream and downstream of Whitefish Lake. Figure 2-10 (p. 2.26, Appendix 7-C) shows the locations of the baseflow calibration targets, and Table 2-7 (p. 2.35, Appendix 7-C) illustrates the model-simulated groundwater discharge rates in relation to the estimated range of baseflow from stream measurements. The simulated baseflow to Whitefish Lake is in good agreement with the estimated representative baseflow”.</p> <p>Rationale: It is not clear in Figure 2-10 (p. 2.26, Appendix 7-C) where the point streamflow measurements were conducted upstream and downstream of Whitefish Lake. Additionally, it is not clear how the groundwater discharge to Whitefish Lake is simulated, since the model domain does not cover the whole Whitefish Lake.</p> | 1) Please clarify in Figure 2-10 where the point streamflow measurements were conducted upstream and downstream of Whitefish Lake. 2) Please clarify how the groundwater discharge to Whitefish Lake is simulated considering that the model domain does not cover the whole Whitefish Lake. | 1) As noted in Table 2-7 of Appendix 7-C of the EIS, under the heading "Surface Water Stations", the surface water stations used to evaluate baseflow to Whitefish Lake are stations SA-6 and SA-2. Both of these stations are demarked in Figure 2-10 of Appendix 7-C, illustrating the portion of Whitefish Lake that is monitored by these stations. 2) Stations SA-6 and SA-7 monitor upstream and downstream hydrologic conditions of the portion of Whitefish Lake adjacent to the Project. The difference in baseflow monitored between these stations is interpreted to be the contribution of groundwater to the portion of Whitefish Lake of interest. Within the report, the discharge between these stations has been referred to as "discharge to Whitefish Lake" although it is acknowledged that this refers strictly to the portion of Whitefish Lake adjacent to the Project. | No updates to the EIS in response to this IR. |
| IR-85 | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: Section 2.7.3 (Appendix 7-C) mentions Wells A, B and C, and Figure 2-17 (p. 2.43, Appendix 7-C) illustrates the predicted drawdown ranges at Well B and Well C.</p> <p>Rationale: It is not clear where Well A, Well B and Well C are located.</p> | Please provide the locations of Well A, Well B and Well C illustrated in a Figure. | These three wells (referred within Appendix 7-C as "A", "B", and "C") are proposed wells to supply water to the mining operations. They are not yet constructed but are planned to be screened within the Upper Sandstone Aquifer. These wells were demarcated as "Freshwater wells" in Figure 2.2-1 of Section 2 of the EIS but were not labelled. Well A is located 200m northwest of the Phase 5 ISR injection area, Well B is located approximately 600 m south of the Phase 5 ISR injection area, while Well C is located 200 m northwest of the Phase 3 ISR injection area. | Figure 2.2-1 has been updated to label the “Freshwater wells” as “A”, “B”, and “C”. The updated figure is included in Attachment IR-85 and will replace the existing Figure 2.2-1 in the final EIS. |
| IR-86 | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: It is stated in Section 2.7.3 (p. 2.41, Appendix 7-C) that “Both the pumping demand and the recharge changes were incorporated into a transient simulation performed using the calibrated groundwater flow model. The model simulation was started at the beginning of mine construction, with initial conditions taken from the calibrated model. The simulation period was extended for 40 years to include the entire period of construction, operation, and decommissioning, and extending through 17 years post decommissioning”.</p> <p>Rationale: It is not clear what is the difference between the calibrated model and transient model in terms of parameters (such as the K values for the mining zone), boundary conditions, etc.</p> | Please clarify the parameters, boundary conditions and any other aspects as used in the transient model that are different from the calibrated model. | As stated in draft EIS Appendix 7-C, Section 2.7.2 (page 2.41) the calibrated, steady-state model was used as the basis for the transient model used to evaluate drawdown during operations. Only conditions immediately within the mining zone were altered within the transient model to reflect the proposed changes during mine operations. All boundary conditions that drive regional groundwater flow were unchanged for the transient model, and all hydrogeologic properties outside of the mining area were left unchanged. Changes made to the hydrogeologic properties were implemented transiently to represent the phased implementation of the freeze wall. Groundwater recharge was changed to reflect alterations to surficial land use and the implication of that land use change to groundwater recharge; transient pumping boundary conditions were incorporated to simulate the planned pumping demand for camp and ISR water requirements. The transient version of the model was used to evaluate changes to the groundwater discharge occurring at Whitefish Lake as documented in Appendix 7-C Section 2.7. | No updates to the EIS in response to this IR. |
| IR-87 | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: In Section 2.8 (p. 2.45, Appendix 7-C) Parameter uncertainty assessment, only parameters for certain zones (part of each specific hydro-stratigraphic unit as shown in Figure 2-19, p. 2.46, Appendix 7-C) related to the pathway from the ore zone toward Whitefish Lake were allowed to vary in order to find combinations of parameter values that met statistical calibration criteria. If each hydro-stratigraphic units within the whole model domain were treated as parameter zones that can have varied hydraulic conductivity values, a different combination of parameter values could be obtained that</p> | It is recommended that the parameter zones in the Parameter uncertainty assessment include hydro-stratigraphic units in the whole model domain to investigate the possible combination of parameter values that could make the groundwater in the mined-out zone more active hydraulically. | As per the reviewer’s request, PEST++IES was applied to generate 50 calibrated realizations wherein all hydraulic conductivity parameter zones were allowed to vary. Of the 50 scenarios generated, the average contribution to Whitefish Lake from the Lower Sandstone Aquifer was 0.73%, with 48 of the 50 scenarios (96%) confirming the calibrated conceptualization. One of those scenarios is documented in the response to IR-55. It is noted that packer tests provide a small-scale sample indication of the representative hydraulic conductivity, but as shown in the literature (Bradbury and Muldoon, 1990), such local tests are rarely representative of large-scale (i.e., macro) hydraulic conductivities. Macro-scale hydraulic | No updates to the EIS in response to this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-------------------------|--|--|---|--|---|
| | | | | <p>meet statistical calibration criteria too.</p> <p>Rationale: The parameter values for parameter zones between the mining area and Whitefish Lake is important in determining the hydraulic connection between the mining area and Whitefish Lake. Parameter values in other parameter zones could also be important. For example, if the K values for the intermediate sandstone aquitard are significantly larger than in the current calibration results, the interaction between the upper sandstone aquifer and the lower sandstone aquifer could be more active, and the mined-out zone could be more active hydraulically and groundwater in the minded-out zone could have a shorter residence time than in the current calibrated model.</p> <p>Additionally, it is noted that Figure 2.19 (p. 2.46, Appendix 7-C) illustrates the parameter zone for the intermediate sandstone aquitard. However, Figure 2.20 (p. 2.49, Appendix 7-C) did not include the intermediate sandstone aquitard in the results.</p> | | <p>conductivities are best determined using long-term pumping tests, or a model and calibrating to observed water level trends.</p> <p>Please note that only parameter sets which are consistent with field observations (i.e., observed water level, baseflow, or geochemical observations) are considered relevant for prediction uncertainty analyses.</p> <p>References: Bradbury K. R., and M.A. Muldoon. 1990. "Hydraulic Conductivity Determinations in Unlithified Glacial and Fluvial Materials." Groundwater and Vadose Zone Monitoring. ASTM STP 1053. D.M. Nielsen and A. I. Johnson Editors., American Society for Testing and Materials. Philadelphia, 1990. pp. 138-151.</p> | |
| IR-88 | CNSC | Geology and Groundwater | Appendix 7-C | <p>Context: The conceptual hydrogeological model includes upper sandstone aquifer, intermediate sandstone aquitard, and lower sandstone aquifer. The desilicified zone above the ore zone have enhanced hydraulic conductivity. The boundary condition for the lower sandstone aquifer on the west (upstream) side was assigned to have specified head, which provide source of water for the lower sandstone aquifer.</p> <p>As a result of the conceptual model setup, the upper sandstone aquifer is hydraulically active and the groundwater residence time within the upper sandstone aquifer is relative short. In contrast, the lower sandstone aquifer (and the ore zone) is hydraulically inactive, and the groundwater residence time in the lower sandstone aquifer is relatively long (as shown in the particle tracking results in Figure 7.6-2 (p. 7-71, main EIS report), and the simulated plume for chloride in Figure 7.6-7(p. 7-86, main EIS report)).</p> <p>It is stated in Section 2.6.4 (Appendix 7-C) that “As noted above in section 2.6.3, it is estimated that 99% of the groundwater discharge to Whitefish Lake is derived from groundwater that has only flowed through shallow deposits (i.e., Overburden and Upper Sandstone Aquifers). Contribution of deep groundwater flow through the Desilicified Zone within the Intermediate Sandstone Aquitard is estimated to be < 1% of the groundwater discharging to Whitefish Lake”. This simulation result is reflective of the conceptual model.</p> <p>Section 7.3.3.3 (p. 7-42) states that “The Lower Sandstone Aquifer is characterized spatially by two types of groundwater. The first groundwater type is most like that observed in the Local Flow System. This reflects hydraulically active fractures and fault systems that allow fresh recharge water to penetrate and mix with deeper waters in the aquifer. The second type of groundwater is within the zone of thermal alteration around the ore zone”.</p> <p>The hydraulic connectivity of the ore zone with the upper sandstone aquifer has important implication on the groundwater restoration. The ore zone is not hydraulically active locally because it is enclosed by a clay zone before the mining operation. But if it is located within a hydraulically active area, or on a groundwater flow pathway that is hydraulically active, the mined-out zone (with much larger porosity and hydraulic conductivity) could become active hydraulically after mining operation is finished.</p> <p>Figure 7.6-7 (p. 7-86, main EIS report) shows that the chloride plume is most persistent within the mined-out mining area. This seems to indicate the mined-out zone is hydraulically inactive after the mining operation is finished.</p> <p>It is stated in Section 7.3.3.2 (p. 7-37, main EIS report) that “Exploration boreholes drilled in the Phoenix area, where left unplugged, have the potential to provide preferential flow paths between the Overburden and Upper and Lower Sandstone Aquifers. Exploration holes were reportedly grouted approximately 10 to 20 m above and below the ore zone, resulting in open holes remaining throughout the overlying materials. These portions of the open holes may act as open conduits for groundwater flow through the 400 m of Athabasca Group Sandstone.” So, there is possibility that the unplugged borehole could increase the hydraulic connection between the upper and lower sandstone aquifer.</p> <p>Rationale: It is important to understand if the larger area containing ore zone is hydraulically active. Additional confidence would be gained if there is any other evidence that support that the area containing the ore zone is not hydraulically active, and groundwater residence time in</p> | <p>It is recommended to conduct the following work to demonstrate if the mined-out zone is hydraulically active:</p> <ol style="list-style-type: none">1. Determine the groundwater residence time in the lower sandstone aquifer and compare it with the simulated residence time in the numerical model.2. Conduct additional particle tracking to demonstrate where groundwater originating from the mined-out zone flow towards (forward tracking) and where groundwater flowing towards the mined-out zone originates from. This would help determine why groundwater in the mined-out zone is not hydraulically active.3. Conduct sensitivity analysis to investigate the effect of higher K values for the intermediate sandstone aquitard and the K and porosity values of the mined-out zone on the plume migration. | <p>1) Denison believes that the best way to determine residence time as part of the EA is with the modelling approached used in the draft EIS. It is unclear how it would be possible to "determine the groundwater residence time within the Lower Sandstone Aquifer" other than by using a model. Available data (e.g., geochemistry) provide an indication of residence time, but not timing that can be compared to modelled results. The groundwater residence time within the Lower Sandstone Aquifer, downgradient of the ore zone, is simulated using the model to be 150 years or greater. Simulated residence time within the Lower Sandstone Aquifer upgradient of the ore zone is approximately 500 years.</p> <p>2) Particle tracking from the "mined-out" ore zone was incorporated within the EIS, as illustrated on Figure 4-4 of Appendix 7-C. The particle traces presented illustrate groundwater migration flow paths, path lengths, travel times, and velocities for water migrating from the mined-out ore zone. Reverse particle tracking indicates flow through the Lower Sandstone Aquifer flowing from upgradient areas flowing into the ore zone.</p> <p>3) The prediction uncertainty analysis (i.e., "sensitivity analysis") presented in Appendix 7-C included an evaluation of the change in the model prediction (i.e., plume migration) with respect to changes in the conductivity of materials along the flow path to the receptor, Whitefish Lake (i.e., Scenarios 4, 5, and 6) as well as regarding the hydraulic conductivity of the mined-out ore zone. As such we feel that the work requested by the reviewer has already been completed and reported upon within the draft EIS. In addition, the uncertainty of the Intermediate Sandstone Aquifer was evaluated (see IR55), where higher hydraulic conductivity within the Intermediate Sandstone Aquifer were found to reduce the proportion of water from the ore zone reaching Whitefish Lake, which would have the effect of further reducing (i.e., diluting) concentrations simulated and presented in the EIS documentation. As such, the conditions documented in the draft EIS are already conservative with respect to the uncertainty in these parameters.</p> | No updates to the EIS in response to this IR. |

|--------|------------|-----------------------|--|---|---|---|--|
| | | | | <p>the lower sandstone aquifer surrounding the ore zone is comparable with the simulated results.</p> <p>Table 2-4 (p. 2.16, Appendix 7-C) shows the effective porosity (0.01-0.05) of the ore body. Figure B7 (p. B.8, Appendix 7-C) shows that the calibrated K values for the mined-out zone is 1x10-6 m/s. Section 3.5.2 (p. 3.24, Appendix 7-C) states that “The same average linear velocity was assumed for the mining area (source zone), following from the discussion in Section 4.4.2, where the hydraulic conductivity value in this zone following mining was set to 5x10-6 m/s, and a porosity of 0.2 is assumed for the ore zone (Table 4-2)”. It is not clear what the justification is for the selection of the porosity and K values for the mined-out area, and whether they are conservative. It is also not clear, what the potential impact on the groundwater flow and COPCs transport would be if the mined-out zones collapse.</p> | | | |
| IR-89 | ECCC | Fish and fish habitat | Appendix 7-C, Numerical Modelling: Post-Decommissioning Evaluation, Section 2.3.1.4, Desilicified Zone | <p>Context: The Proponent states that a hydraulic conductivity value of 5x10-6 m/s was uniformly assigned to the model layers representing the Desilicified Zone. They additionally state that this value is consistent with packer and pumping tests screened in this unit that have interpreted hydraulic conductivity values ranging from 1x10-6 to 3x10-5 m/s (Appendix C), with a geomean of 6.0x10-6 m/s.</p> <p>Considering that the Desilicified Zone is of particular interest because it is the main pathway for the COPC to reach Whitefish lake, and that hydraulic conductivities are not entirely understood, ECCC recommends that a larger range of hydraulic conductivities be simulated to understand potential effects on fish and fish habitat.</p> <p>Rationale: The Desilicified Zone is a critical layer in the hydrogeological model as it represents a key potential pathway of contaminants to Whitefish Lake. The base case hydraulic conductivity value (5x10-6 m/s) is even lower than the geometric mean, not to mention the highest value found. When simulating geochemical processes and contaminant transport within this important pathway a more conservative approach should be employed. Modifying this parameter will affect travel times and distribution of COPC in the subsurface.</p> | <p>1. Provide an in-depth rationale for choosing a value of 5x10-6 m/s as the base case for the hydraulic conductivity, in both the PH REDox EQUilibrium (PHREEQC) and Finite-Element Ground Water Flow (FEFLOW) models.</p> <p>2. Provide a rationale for keeping the sensitivity analysis within one order of magnitude considering the lack of physical data on the Desilicified Zone. Alternatively, provide contaminant transport simulation results with more conservative hydraulic conductivity (e.g., more than 3x10-5 m/s) values in the Desilicified Zone.</p> <p>See also related: IR-96.</p> | <p>1) Application of 5E-6 as the value for hydraulic conductivity within the desilicified zone is appropriate; the values of 5E-6 and 6E-6 are essentially the same number, particularly at the scale over which it is applied. We agree that the hydraulic conductivity of the desilicified zone is an important parameter to the fate and transport of dissolved minerals from the ore zone toward Whitefish Lake; that is why scenarios 4, 5, and 6 were designed to evaluate the prediction uncertainty related to the uncertainty of the desilicified zone, along with other hydraulic conductivity values along the transport migration pathway. Further, we recognize that packer tests provide a small-scale sample indication of the representative hydraulic conductivity, and as shown in the literature (Bradbury and Muldoon, 2000), such local tests are rarely representative of large-scale (i.e., macro) hydraulic conductivities. Macro-scale hydraulic conductivities are best determined using a large-scale pumping test or a model calibrated to observed water levels, which is the approach we completed; the value of 5E-6 for the desilicified zone hydraulic conductivity provides an excellent match to observed water levels and baseflow discharge. In addition, packer tests in fractured rock tend to bias the hydraulic conductivity to be higher than is representative on the large scale, as testing is generally targeted on observed fracture zones. Given all this, we reaffirm that the applied hydraulic conductivity of 5E-6 is representative for the conductivity of the desilicified zone.</p> <p>2) Calibration-constrained uncertainty analyses were performed (i.e., the state of the practice) to evaluate the range of potential hydraulic conductivity values that could exist within the desilicified zone while still maintaining calibration. That analysis is presented in section 2.8 of Appendix 7-C. The most conservative of the parameter scenarios that are consistent with the field observational data were used for the prediction uncertainty analyses presented in Appendix 7-C, section 4.7. Scenarios 4, 5, and 6 explore higher hydraulic conductivity values which are supported by the observation data (i.e., calibration-constrained uncertainty analysis). The range of desilicified-zone hydraulic conductivity incorporated within those scenarios (Figure 2-21) is 1.6 to 3.2 m/d (i.e., 1.8E-5 to 3.7E-5 m/s); 3.2 m/d was the highest conductivity value for the desilicified zone (referred to as the Altered Zone within the Intermediate Aquitard on Figure 2-21) for all 50 calibrated realizations generated using PEST. As such, the EIS presented the prediction uncertainty with the highest hydraulic conductivity values supported by the observation data. It would not be appropriate to test scenarios with even higher values of hydraulic conductivity which would not be supported by the field observed groundwater levels. Thus, we do not feel it is appropriate to test scenarios where the hydraulic conductivity of the desilicified zone is orders of magnitude greater than suggested by field observations.</p> <p>References: Bradbury K. |--------|------------|-------------------------|--|--|---|--|--|
| IR-90 | ECCC | Fish and fish habitat | Appendix 7-C, Section 2.4 and 2.6 | <p>Context: Hydraulic conductivities and hydraulic gradients play an important role in groundwater flow, geochemical modeling, and contaminant transport for the PHREEQC and FEFLOW models. Although there is an important vertical component to the contaminant transport, there is no distinction made between lateral and vertical hydraulic conductivities of hydraulic gradients.</p> <p>Rationale: According to the conceptual model, there is an important vertical aspect to the groundwater flow thus incorporating any vertical hydraulic gradient or hydraulic conductivity information into the calibration would increase confidence in the results.</p> <p>Providing a distinct value for vertical hydraulic conductivity will improve the accuracy of the model in regards to the transport of contaminants to Whitefish Lake through the Desilicified zone, which is important to understand potential impacts to aquatic life.</p> | <ol style="list-style-type: none">1. Explain if the vertical and lateral hydraulic gradients and hydraulic conductivities are assumed to be equivalent.2. Provide a rationale for not distinguishing between vertical and lateral hydraulic gradients.3. Alternatively, provide both lateral and vertical hydraulic gradient estimates and the implications on contaminant transport. | <ol style="list-style-type: none">1. Lateral and vertical hydraulic conductivity values are assigned for every model element within the numerical modelling domain. In most areas, the vertical hydraulic conductivity is assumed to be 1/10th of the lateral hydraulic conductivity due to variability in the depositional environment (i.e., intermittent periods of quiet water deposits, and higher-energy water deposits) and fracturing (typically bedding plane fractures are more prevalent than vertical joints).2. In the case of the desilicified zone the thermal alteration was conservatively assumed to have resulted in equivalent hydraulic conductivity values in the lateral and vertical directions. This conservative assumption within the desilicified zone is designed to over-predict mass transport potential to surface receptors.3. The gradients applied are considered reasonable and defensible. By calibrating to 3D point observations of groundwater levels, and using surface water levels for hydrogeologic boundary conditions, the model has been inherently calibrated to 3-dimensional hydraulic gradients. Thus, lateral and vertical hydraulic gradients are incorporated within the analysis presented. | No updates to the EIS in response to this IR. |
| IR-91 | NRCan | Fish and fish habitat | Appendix 7-C, section 2.5.2 | <p>Context: The numerical model calibration quality plot (Appendix 7-C, sec. 2.5.2.1, Figure 2-13) contains a small error. The vertical (simulated heads) and horizontal (observed heads) axes do not have the same scales (499 to 521 masl versus 499 to 522 masl). Therefore, the line of ideal fit is offset.</p> <p>Rationale: As a result, NRCan notes that observed heads in the 510-512 masl range are underpredicted by the model. NRCan also notes that the calibration statistics (Appendix 7-C, sec.2.5.2.3) are highly leveraged by two data points from open boreholes south of Kratchkowsky Lake where simulated values are largely controlled by the nearby constant-head boundary in the Lower Sandstone aquifer (520 masl).</p> | The proponent should correct the scales on the axes of Figure 2-13 in Appendix 7-C. The proponent should also comment on the effect on calibration of the clustering of most observation wells in the ore zone. | <p>The scales on Figure 2-13 of Appendix 7 have been corrected and included in Attachment IR-91.</p> <p>From a regional perspective, the available groundwater levels are clustered around the Phoenix deposit. However, Denison advanced monitoring well clusters to support hydrogeologic (and hydrochemical) characterization upgradient, downgradient, and cross-gradient to the deposit. Data from all of these wells were used to calibrate the numerical model. It is acknowledged that the hydrogeologic conditions are extrapolated from the available data; this is consistent with the state of the practice.</p> | The corrected Figure 2-13, which will be included in the final EIS, is appended as Attachment IR-91. |
| IR-92 | CNSC | Geology and groundwater | Appendix 7-C, Section 3.2.1, Mineralogical Composition | <p>Context: Table 3-2 summarizes the clay content of the Athabasca Group sandstones and the Paleoweathered Zone. Although minimum, maximum and median values are provided, the number of samples and variability of the dataset are not. Rationale for incorporating illite into reactive transport modelling and excluding kaolinite/dichlorite is provided in the text.</p> <p>From p. 3.29 in Appendix 7-C: “The illite content was based on the normative clay composition determined from site-specific corehole elemental analysis (median illite by mass is 7.68%; Table 3-2) and using portable infra-red mineral analysis indicating median illite content by mass is 13.1% (data not shown)”</p> <p>From p. 3.30 in Appendix 7-C: “Using the minor amount of illite compared to the more dominant chlorite is conservative in that not all sorptive capacity of the clays is accounted for in the simulated paleoweathered zone”. This conservative assumption appears contrary to assumptions for the desilicified zone (DSZ) and Athabasca Group sandstones “Illite was used to represent the total clay content, which varies from 1.74% to 5.85% by mass in the hydrostratigraphic units within the Athabasca Group sandstones and Desilicified Zone”.</p> <p>Rationale: Information is missing in the EIS regarding the clay composition of hydrostratigraphic units. Results from infrared mineral analysis are not reported.</p> <p>The assumption for the solute transport model is that all clays in the downgradient DSZ are illite. However, clay content in the Read Formation (Lower Sandstone Aquifer) downgradient of the ore zone is low in illite (0.42%) compared to kaolinite (0.52%) and dichlorite (1.18%). A value of 3.9% illite clay by weight is used for the DSZ, but Table 3-2 indicates median content is 2.42% illite. It is not clear why illite was used to represent total clay content for the DSZ, as opposed to the conservative assumptions used for the Paleoweathered Zone, nor has any basis or justification been given.</p> | <ol style="list-style-type: none">1. Please provide in Table 3- the number of samples and variability of the datasets used to estimate the clay content of hydrostratigraphic units for the model. Include results from infrared mineral analysis in the text if the information is used to support assumptions for modelling.2. Please provide further information/discussion within the EIS relating to the assumptions of clay content in hydrostratigraphic units for modelling. Provide further justification and rationale as to why total clay content in the Athabasca Group sandstones and Desilicified Zone is assumed to be illite, and how this assumption is conservative. This discussion could include a comparison of the properties (cation exchange capacity, surface area) of illite vs. kaolinite vs. dichlorite for the anticipated range of subsurface conditions (pH, redox, U concentrations, etc.). | Please see response in Attachment IR-92. | <p>The updated version of Table 3-2 (provided in Attachment IR-92) will be included in the final EIS Appendix 7-C.</p> <p>To reflect the discussion in Attachment IR-92 and updates to Table 3-2 of Appendix 7-C, the following text will be included on page 3.29-3.20 of Appendix 7-C in the final EIS:</p> <p>Conceptually, the paleoweathered zone mineral assemblage was made up of 9% clay by mass, as illite, and 25% quartz. The illite content was based on the normative clay composition determined from site-specific corehole elemental analysis (median illite by mass is 9.20%; Table 3-2). Portable infra-red mineral analysis supported the normative clay content in that chlorite is the dominant clay mineral (69.5% relative abundance) followed by illite (median 13.1% relative abundance). The quartz content was based on a regional study by Macdonald (1980) evaluating the mineralogical composition of the weathered bedrock/saprolite regionally. The mineral composition of the paleoweathered zone was conceptualized in this manner because the data set for the project with respect to clay minerals was for the sorptive properties of illite. Using the relatively smaller illite content of the paleoweathered zone compared to the more dominant chlorite content is conservative in that not all sorptive capacity of the clays is accounted for in the simulated paleoweathered zone.</p> |
| IR-93 | CNSC | Geology and Groundwater | Appendix 7-C, Table 3-10: Properties of | <p>Context: In Appendix 7-C, section 3.5.6.2.2 Ion Exchange and Surface Complexation, the consideration of ion exchange and surface complexation and the corresponding parameters and chemical</p> | Please provide additional evidence to justify the model parameter of site density for goethite, applied to the numerical model. If necessary, the reactive transport | Please see response in Attachment IR-93. | The updates to Table 3-10 of Appendix 7-C are detailed in Attachment IR-93 and will be included in the final EIS. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-------------------------|---|---|--|--|--|
| | | | Adsorbing Mineral Phases | <p>reaction are discussed.</p> <p>Rationale: The site density of sorbent Geothite was reported in Table 3-10 to be 1.6E3 mol/kg. Taking into account the specific surface area of 60 m2/g, this equals to 1600/6E4 mol/m2, or 0.0266 mol/m2, 1.6e4 sites/nm2.</p> <p>This value largely overestimates the site density of goethite, which is reported to be in the range of 2~6 sites/nm2. The reference used in the EIS report indicates the similar range of variation for this specific parameter.</p> <p>There are plenty of similar studies on SCM of iron oxides in literature. It is suggested to consult with more than one single study to enhance the reliability of model parameters.</p> <p>The overestimation of sorption site density will directly result in underestimation of the affected COPCs' concentrations in pore fluid. This will result in underestimation of COPC transport plume in the affected underground space, and potentially the dissolved concentrations in the hydrogeological sink.</p> | modelling should be re-run to update the contents presented in the EIS report. | | |
| IR-94 | CNSC | Geology and Groundwater | Appendix 7-C, Numerical modelling: post-decommissioning evaluation, Section 3.5.5, Subsurface Conditions Incorporated | <p>Context: It is reported in this section the assumed subsurface conditions that were applied in the geochemical site conceptual models. Critical phenomenon of pH tail was mentioned. Inclusion and exclusion of corresponding geochemical reactions were discussed briefly.</p> <p>Rationale: It was reported that the residual reduced minerals of uraninite and pyrite were not included in the modelling of the remediated mining area. The argument was based on consideration of the upstream groundwater, passing through the mined zone, will not be oxidizing and groundwater conditions are expected to be similar to pre-mine conditions. However, this ignores the pH tail effect that releases proton H+ sorbed to solid surface during ISR flooding. By ignoring this process, there is a potential risk of underestimating the source terms for some key COPCs. Exclusion of uraninite and pyrite in remediated mining area modelling is contradictory to pH-tail effect. The justification is not sufficient in the current form.</p> | Please provide additional evidence to justify the approach for excluding uraninite and pyrite from the analysis of remediated mining area. This may require the results from additional modelling. | Please see response in Attachment IR-68, IR-94, IR-97. | No updates to the EIS in response to this IR. |
| IR-95 | CNSC | Geology and Groundwater | Appendix 7-C, Table 3-11 | <p>Context: The Table 3-11 reported the Solid-Phase Concentrations and Partitioning Constants for COPCs. Data were both measured and simulated.</p> <p>Rationale: It is unclear how the partition coefficients of various COPCs upon desilicified and paleoweathered rocks were obtained. It was not reported at what pH were these Kd analyzed. Sorption of chemicals on solid phase is known to be pH dependent. It is unclear whether pH influence was considered in the measurement and analysis of apparent partition coefficients.</p> <p>In addition, uptake of metals on clay is highly nonlinear, and always has a maximum capacity. Even with a very strong affinity towards specific metal ions, the sorption will be saturated at elevated concentrations. Therefore, assuming a linear correlation needs to be cautious of the concentration range of target COPC species, and the applicable sorption capacity of the clay mineral.</p> <p>In the current model, only the linear form of sorption is considered, although with discussion of Kd value selection. Additional rationale is needed to justify if the applied methodology is sufficient for assessment.</p> | Please justify the choice of applying a linear form partition coefficient for the modelling and assessment, and whether it provides a conservative approach to the assessment results. Clarity around the experimental conditions during the measurement of partitioning coefficient of various COPCs on the target rocks may help support this assumption. | Please see response in Attachment IR-95. | The updated version of Table 3-11 (provided in Attachment IR-95) will be included in the final EIS Appendix 7-C. |
| IR-96 | CNSC | Geology and groundwater | Appendix 7-C, Section 4.4.4, Sub-Domain Model Transport Boundary Conditions | <p>Context: From the text, "Transport parameters were specified for diffusion (1x10-9 m2/s), longitudinal dispersivity (10 m along the plume trajectory), and transverse dispersivity (5 m)". The source of this information is not provided in Appendix 7-C. It is unclear if the values used are defaults in the modelling software, from literature, from small-scale laboratory tests, or are site-specific values determined through tracer tests.</p> <p>Rationale: The use of a calibrated flow model does not imply that the solute transport model is calibrated. The transport parameters (such as effective porosity, dispersivity and reactive transport parameters) can only be calibrated by matching simulated and observed spatial and/or temporal distributions of a solute. Sensitivity analysis indicates that decreasing longitudinal and transverse dispersivities by a factor of two resulted in exceedances of groundwater criteria for both selenium (Se) and cobalt (Co). Given the clear influence of these values on contaminant transport, it is important that transfer parameter values are justified in the solute transport model. In addition, the influence of large-scale heterogeneity on dispersion and solute transport predictions should be discussed, to identify any uncertainty in the</p> | <p>1. Please provide the source of the numerical value used for diffusion and longitudinal and transverse dispersivity, and provide justification if default values by the model code were used.</p> <p>2. Please provide a discussion on the influence of large-scale heterogeneity on dispersion and solute transport predictions in the modelling report.</p> <p>See also related: IR-89.</p> | Please see response in Attachment IR-96. | No updates to the EIS in response to this IR. |

| | | | | <p>model predictions, and provide confidence that the applied model is adequately representing groundwater flow and solute transport.</p> <p>Further guidance on solute transport modelling can be found in BC MOE (2012) [1].</p> <p>Reference: [1] British Columbia Ministry of the Environment (BC MOE). 2012. Guidelines for Groundwater Modelling to Assess Impacts of Proposed Natural Resource Development Activities. Report no. 194001, 385 p.</p> | | | |
| IR-97 | ECCC | Fish and fish habitat | Appendix 7-C, Figures 4-6, 4-7a, 4-7b, 4-8a, 4-8b, 4-9a, 4-9b | <p>Context: Appendix 7, Figures 4-6, 4-7a, 4-7b, 4-8a, 4-8b, 4-9a, 4-9b present contaminant transport simulations of chloride, selenium, cadmium, and uranium. All simulations use initial condition concentrations at t=0 (or end of mining operations. In the 3D FEFLOW contaminant transport model it is not clear why initial condition concentrations were chosen rather than a constant concentration boundary.</p> <p>It is also unclear if mining activities will cause mobilization of the contaminants beyond the end of operations.</p> <p>Rationale: The choice of boundary conditions may impact the predicted transport of contaminants that reach Whitefish Lake through groundwater, which may have impacts to aquatic life.</p> | <p>1. Explain and clarify if mining operations will mobilize contaminants beyond operations?</p> <p>2. Clarify if the source of contamination, (e.g., uranium, selenium) will cease after operations?</p> <p>3. For the 3D model please provide the rationale for using initial concentrations rather than constant concentration boundary conditions for contaminant concentrations.</p> | Please see response in Attachment IR-68, IR-94, IR-97. | No updates to the EIS in response to this IR. |
| IR-98 | CNSC | Change to an environmental component due to hazardous contaminants | Section 8, Aquatic Environment | <p>Context: It states in EIS in Section 8.3.7.1 (p. 8-151) that "Cameco's Key Lake Operation will overlap spatially and temporally with the Project".</p> <p>Rationale: It is not clear whether there is the possibility that planned Denison discharges would eventually flow into and influence a background reference lake used by Key Lake operation.</p> | Please provide supporting information to demonstrate whether discharges from the proposed operation will not eventually flow into a reference lake used by another existing operation. | <p>Denison understands that Alpha Lake and McGowan Lake are used as reference lakes for a Cameco operation within the area of Denison's proposed project. Denison will communicate with Cameco through the Saskatchewan Mining Association to highlight the timing of the start of the Project as it may relate to Cameco's use of regional lakes for reference lake purposes. McGowan Lake will no longer be suitable as a reference lake for Cameco once the Wheeler River Project starts operating, since it will be downstream of treated effluent release. Alpha Lake (LA-9 in Denison's aquatic baseline studies) will likely be outside of any influence from Denison's activities.</p> <p>Please note that Denison has previously been in communication with the Saskatchewan Ministry of Environment, Environmental Protection Branch regarding the baseline study work Denison completed as part of the Environmental Assessment process and the potential changes to McGowan Lake (a Cameco's reference lake) from the proposed Wheeler Project. Reference: Email from Janna Switzer (Denison) to George Bihun (MOE) on May 12, 2020.</p> | No EIS updates are anticipated to address this IR. |
| IR-99 | CNSC | Aquatic environment | Section 8, Water Quality, Table 8.2-13 | <p>Context: Table 8.2-13 shows the maximum concentration of hazardous and radiological COPC's in surface water throughout the local study area. However, the concentration for all constituents is stated as mg/L.</p> <p>Rationale: It is unusual for radiological COPC's to be displayed in mg/L, radiological constituents are typically displayed in Bq/L</p> | Please use Bq/L when displaying concentration of radiological COPC's. If this was a typographical error in the table, please indicate as such and revise the table to indicate values are indeed in Bq/L. Please also review other tables displaying concentrations of radiological constituents to ensure this error is not repeated in other tables. | The values provided in Table 8.2-13 for radiological COPCs are presented as Bq/L and the units provided in the sub-title (mg/L) are not consistent with the data provided. Table 8.2-13 is consistent with the data provided in Appendix 10-A (Environmental Risk Assessment), which specifies the concentrations as having been measured in Bq/L. Subsequent updates of the EIS will correct this inconsistency. Denison will review the final EIS to ensure this error is not repeated in other tables. | Table 8.2-13 will be revised to ensure the units for radiological parameters are expressed in Bq/L. The revised table is provided in Attachment IR-99. |
| IR-100 | HC | Indigenous Peoples' health / Socio-economic conditions | Section 8, (p. 8-195) Section 8.5.3, Table 8.5-2, (p. 8-226) | <p>Mercury is excluded as a COPC in the assessment. Inadequate consideration of mercury and methylmercury in fish and other country foods, and use of incorrect Hg-related health guideline values can underestimate the risks to human health among country food consumers.</p> <p>Context: Section 8 states “Mercury has not been identified as a COPC for the Project as it is currently not present in the receiving environment (i.e., background condition) at detectable concentrations and will not be produced as part of the mine process; therefore, it will not be discharged to the aquatic environment.</p> <p>However, it is understood that potential nutrient enrichment-related effects are possible and can be linked to increases in mercury in the environment” (p. 8-195).</p> <p>Table 8.5-2 shows that there is mercury present in the tissues of Northern Pike and White Sucker sampled in the waterbodies within the local study area and in Russell Lake. These fish are regularly consumed by nearby communities according to the ERFN 2017 dietary survey.</p> <p>In Section 8.5.3, fish tissue concentrations are compared to Health Canada's human health risk- based maximum permissible mercury concentration (0.5 µg/g wet weight), which is applicable to most species of commercially sold fish rather than country foods.</p> <p>Rationale: It is recommended that mercury be listed as a COPC considering it is in fact present in fish tissue under existing conditions, the significant consumption of fish by the local Indigenous communities, and its toxicological significance to human health.</p> <p>Further, the Health Canada provisional tolerable daily intake (pTDI) value of 0.2 µg/kg/bw/day (Health Canada, 2007) is a more</p> | <p>1. Include mercury (including methylmercury) as a COPC in the assessment given the baseline presence of mercury in sampled fish, the potential increase of methylmercury in receiving waters due to nutrient enrichment resulting from the project, the significant fish consumption by the local population and that country foods, particularly fish, are an important source of dietary exposure to mercury.</p> <p>2. Assess health risks from fish consumption by calculating hazard quotients for baseline and predicted methylmercury levels in country foods using Health Canada's pTDI for methylmercury (Health Canada, 2007).</p> <p>3. Clarify whether mercury data represented throughout the EIS represents total mercury, inorganic mercury or methylmercury.</p> <p>Suggestions for mitigation and follow-up measures: Health Canada recommends including methylmercury in the list of COPCs to be monitored in fish throughout all project phases.</p> <p>See also related Advice to the Proponent: AD-31.</p> | <p>1. The intent is not to include mercury (and methylmercury) as a COPC for the assessment. As indicated in EIS Section 8.4.6.1, Residual Effects Characterization, mercury is not associated with the local geology and is not expected to be released in the effluent at measurable levels and was therefore not identified as a COPC. Denison notes that there is potential for increased methylmercury production in the receiving environment under a certain combination of factors to which the Project may contribute, such as increased nutrient levels in the environment; however, prediction of methylmercury production is not practical. Denison commits to monitoring mercury and methylmercury in the aquatic environment over the life of the Project to determine the potential changes in mercury concentrations in fish tissue over time.</p> <p>2. As the Project advances and operational monitoring is underway, Denison will assess health risks from fish consumption by comparing fish tissue data collected during operation from the monitoring program against Health Canada's mercury guideline of 0.5 ug/g wet weight. This is a human health risk-based maximum permissible concentration.</p> <p>3. Mercury data presented throughout the draft EIS represents total mercury. Denison agrees to included methylmercury as part of the constituents monitored in fish throughout all project phases.</p> | <p>A commitment will be added to Section 8 of the final EIS that as the Project advances, Denison will assess health risks from fish consumption by comparing fish tissue data collected during operation from the monitoring program against Health Canada's mercury guideline of 0.5 ug/g wet weight.</p> <p>It will be clarified in the final EIS that mercury data presented is total mercury.</p> |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-----------------------|--|--|--|---|--|
| | | | | <p>appropriate reference level when evaluating consumption of mercury in fish by Indigenous people, as it allows for the consideration of food consumption patterns in the risk assessment that differ from the general population and is protective of the most sensitive sub-group (i.e., developing foetus).</p> <p>It is important to note that methylmercury, rather than inorganic mercury, is generally the predominant mercury species present in fish and is also the most toxicologically significant form. The assumption of 100% of mercury in fish and other country food items being present as methylmercury ensures that the potential health risks are not underestimated. It is unclear, however, if the mercury data presented throughout the EIS represent total mercury, inorganic mercury or methylmercury.</p> | | | |
| IR-101 | ECCC | Fish and fish habitat | Section 8.1.1.3, Section 8.2.1.3 Aquatic Environment | <p>Context: In Section 8.1.1.3 Spatial and Temporal Boundaries the Project Area, Local Study Area (LSA) and Regional Study Area (RSA) are established as they pertain to surface water quantity. The same is done in Section 8.2.1.3 for surface water quality. In Section 8.1.1.3 Figure 8.1-4, the locations of the Project Area, LSA, RSA and surface water features and monitoring stations are provided.</p> <p>However, the locations of wetlands located near the Project area and within the LSA and RSA have not been provided. The location of wetlands within or near the Project footprint, as well as the other wetlands existing within the LSA can be confirmed from Part II_S9 Terrestrial Environment, Section 9.2.3.3 Figure 9.2.-8, including the wetland classifications. There appears to be at least one shallow open water wetland and several bogs located within the Project Area. There is no consideration of wetlands or potential effects to wetland hydrology, surface water or sediment quality throughout the aquatic environment assessments. There is no baseline information regarding wetlands and their status as fish habitat and ecological function, or assessment of potential effects to flow rates, water levels, water quality, sediment quality, or biota.</p> <p>Rationale: There is currently not enough information provided for ECCC to provide advice on the potential risks of the proposed Project to wetland hydrology, surface water and sediment quality within the LSA. This pathway of effects is important to assess in terms of potential effects to wetland habitat availability and quality due to changes in flow rates, water levels, water quality, sediment transport, sediment quality and potential effects to terrestrial and aquatic receptors. It is necessary to evaluate if changes in groundwater and surface water runoff flows and routing will affect water levels and habitat availability within wetlands. Potential effects from COPCs and radionuclides to surface water and sediment, or potential effects to ecological receptors within wetlands have not been evaluated.</p> | <p>1. Provide baseline information regarding wetland characterization within the Project Area and LSA, including: locations, wetland type, size, water surface elevation, depth, water flow pathways, and the presence of wildlife receptors including presence of fish/fish habitat within the Aquatic Environment section of the draft EIS. If this information is available in annexes or baseline studies, summarize it within the main body of the Aquatic Environment section of the draft EIS with references to respective documents for review.</p> <p>2. Provide baseline information on wetland surface water and sediment quality characterization for wetlands within the Project footprint.</p> <p>3. Provide an assessment of potential effects to wetlands within the LSA and potential effects to ecological receptors during all phases of the proposed Project.</p> <p>4. Provide further information on mitigation measures and monitoring that would be applied for the protection of wetlands.</p> | <p>Responses are numbered as listed in the IR. Figures associated with this IR are provided in Attachment IR-101.</p> <p>1) Below indicates the information that is presented in the draft EIS regarding wetland characteristics. This information was housed within the terrestrial environment component and potential impacts to wetlands as a valued component is further assessed under Section 9.2 of the draft EIS, and specifically Section 9.2.6.4. The following list indicates what information was provided in the draft EIS specific to information request #1. As such, repackaging the available information in Section 8 would be redundant and therefore in Denison’s view unnecessary.</p> <p>a) <i>Locations of Wetlands</i> Section 9, Figure 9.2-8 on page 9-83 of the draft EIS presents a map of the RSA and LSA detailing the locations of various wetland features including bogs and fens.</p> <p>b) <i>Wetland Types</i> Section 9, Figure 9.2-8 on page 9-83, and Table 9.2-8 on pages 9-91 to 9-92 of the draft EIS provides the geographical distribution and listing of the following wetland types within the LSA:</p> <ul style="list-style-type: none">i. BS17 – Black spruce treed bogii. BS18 – Labrador tea shrubby bogiii. BS19 – Graminoid bogiv. BS19/24 – Graminoid bog/Graminoid fenv. BS20 – Open bogvi. BS21 – Tamarack treed fenvii. BS23 – Willow shrubby rich fenviii. BS24 – Graminoid fenix. BS25 – Open fenx. BS27 – Sedge rocky shore (shallow open water) <p>c) <i>Wetland Size</i> Section 9, Table 9.2-8 on pages 9-91 to 9-92 of the draft EIS lists the following wetland types and the cumulative area they encompass within the LSA:</p> <ul style="list-style-type: none">i. BS17 – 18.2 haii. BS18 – 23.3 haiii. BS19 – 2.8 haiv. BS19/24 – 0.8 hav. BS20 – 0.6 havi. BS21 – 1.9 havii. BS23 – 0.6 haviii. BS25 – 0.4 haix. BS27 – 4.2 ha <p>d) <i>Wetland Water Surface Elevation</i> Surface elevations for the wetland have been assessed and the information is summarized below and in the Attachment IR-101 Figure 1 Elevations of wetland features in the LSA.</p> <ul style="list-style-type: none">• Wetlands 1.5 km west of the SSA range from 526-524 masl• Waterbodies and their surrounding wetlands directly to the east of the SSA are at an elevation of between 506 and 500 masl• Waterbodies and surrounding wetlands 2 km east of site are approximately between 499 and 497 masl• Wetlands north of the SSA and in the vicinity of the proposed air strip range from 514-508 masl.• Wetlands situated further north of the SSA in the LSA were at an elevation of approximately 526 masl• Southern wetlands that will interact with the proposed hydro corridor extension for the mine have an elevation of 491masl• Most wetland evaluated south of the SSA had elevations ranging from 491-488 masl <p>e) <i>Wetland Depth</i> – information associated with wetland depth for those in the LSA is not available.</p> | No EIS updates are required for this response. |

|--------|------------|-----------------------|--|--|---|--|---|
| | | | | | | <p>f) <i>Wetland Flow Pathways</i> - Nearly all wetlands are connected or adjacent to rivers and tributaries, and thus flow pathways are discernable in Figure 9.2-8 of the draft EIS.</p> <p>g) <i>Presence of Fish and Fish Habitat</i> For the purposes of this assessment the bogs and fens within the area can be assumed to provide supporting fish habitat to the adjacent lake and river water bodies in the vicinity of the LSA. Section 9.2.6.4.1 of the draft EIS described the estimated change in the aerial extent of wetland due to direct impacts of the Project footprint (see also Figure 9.2-8). The assessment indicated a total loss of 0.5 ha (less than 0.1%) of all wetlands within the Terrestrial RSA.</p> <p>2) As noted in other parts of this IR response, the wetlands within the Project footprint are limited to two areas (i.e., stream crossings along the access road to the airstrip and powerline connection SE of Highway 914 [See Figure 2: Denison Wheeler River Project SSA and Wetland Feature Distribution in Attachment IR-101]) and these wetland areas can be avoided through design and construction mitigations. As such, no direct impact to any wetlands or waterbodies are expected as part of the Wheeler River Project that may impact fish or fish habitat.</p> <p>In regard to baseline information on wetland surface water and sediment quality characterization for wetlands within the Project footprint:</p> <p>a) <i>Surface water quality in wetlands</i> – surface water quality was not specifically sampled in the wetland complexes adjacent to the project footprint during the original baseline assessment. However, surface water quality was sampled and assessed at stream and lake stations situated upstream and downstream of wetland areas. These stations were selected for sampling as they were identified as providing repeatability (i.e., relative water depth) and informative with respect to desired segments of the system. For example, water quality was sampled at SA-4, SA-5, LA-6, SA-6 and LA-5 following the flow path from upstream to downstream, respectively. The water quality at these nodes was inclusive of upstream wetland influences. For further reference to surface water sampling station during baseline, please refer to Figure 8.2-4 of the EIS.</p> <p>b) <i>Sediment quality in wetlands</i> - sediment quality was not specifically sampled in the wetland complexes adjacent to the project footprint during the original baseline assessment. However, sediment quality was sampled and assessed at depositional lake stations situated upstream and downstream of wetland areas. The sediment quality at these nodes would be inclusive of upstream wetland surface water and sediment influences. For further reference to sediment sampling stations during baseline, please refer to Figure 8.2-4 of the EIS.</p> <p>3) For the purposes of this assessment the bogs and fens within the area can be assumed to provide supporting fish habitat to the adjacent lake and river water bodies in the vicinity of the LSA. Section 9.2.6.4.1 of the draft EIS described the estimated change in the aerial extent of wetland due to direct impacts of the Project footprint (see also Figure 9.2-8). The assessment indicated a total loss of 0.5 ha (less than 0.1%) of all wetlands within the Terrestrial RSA</p> <p>However, when further scrutinizing the potential overprinting of wetland features as a result of the Project it is evident that even this loss is avoidable. The interaction of the Project with wetlands is relegated to those areas where stream crossings for access roads and powerline connections are proposed (See Figure 2: Denison Wheeler River Project SSA and Wetland Feature Distribution (Attachment IR-101)).</p> <p>Wetlands associated with stream crossings have been identified to have mitigative designs (clear-span) to ensure no impacts to fish and fish habitat. The hydro-line as shown in Figure 1 will be constructed to avoid direct impacts to fish and fish habitat following best installation practices. As such, no direct impact to any wetlands or waterbodies are expected as part of the Wheeler River Project that may impact fish or fish habitat.</p> <p>As discussed in Section 8.1.6.1 of the EIS, water levels in the ponds and lakes in the vicinity of the of the Project are expected to experience negligible effects, with magnitudes of changes in water levels predicted to be in the sub-centimeter range. As natural fluctuations in lake water levels were approximately 0.4 m from 2011 to 2019, Project-related changes are not expected to be of a magnitude to compromise the Surface Water Quantity VC. It can then be considered a reasonable assumption that any changes to wetland features will have similar sub-centimeter impacts to water levels due to changes in surface flow and/or groundwater and therefore do not pose an indirect effect to water quantity or fish and fish habitat associated with these wetland features.</p> <p>4) As no impact is expected due to overprinting or due to draw down effects by the ISR, additional mitigation measures are not warranted. Updated baseline information on wetland depths and water-levels may be useful in providing a frame of comparative reference to potential changes during the operation, decommissioning and post-decommissioning phases of the project. However, such changes are expected to be less than measurable.</p> | |
| IR-102 | ECCC | Fish and fish habitat | Section 8.1.3.1 Appendix 8-C, including | Context: Only one measured-results dataset for baseline stream flow exists that is relevant to the Project data from the Water Survey of Canada (WSC) station for Wheeler River (06DA005), and the Proponent used constructed records. The Proponent states that data | 1. Provide more information on the extension of Project hydrometric station data using WSC station 06DA005. | Please note: Figures and tables associated with this IR response as noted below are provided in Attachment IR-102. See also response IR-236. | Wording errors in Appendix 8-C, Appendix II, Table 1 will be updated in the final EIS as follows: - SA-2 extension method = Unit Area Runoff with Scaling and Offset |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-----------------------|--|---|---|--|---|
| | | | Appendix II, Table 1 (p. 2) | <p>from 06DA005 was used to extend local hydrometric station records and calculate baseline water quantity metrics. However, this was done through a complex combination of daily data correlation or monthly unit area runoff relationship, with or without offset, where some stations were based off constructed records instead of the real long-term dataset at 06DA005 (see Section 8.1.3.1 and Appendix II of Appendix 8-C, Table 1, p.2 (PDF p. 569)). Appendix 8-C references previous reports in its own appendices, but no equations are shown and there is no description of the accuracy of the fit, or explanation for not referring back to the one dataset (WSC station). Subsequent statistics calculated from these constructed records (e.g., 7Q10 needed for SK water licenses) would be affected by this uncertainty.</p> <p>Rationale: Fish habitat can be altered by changes to depositional and erosional patterns in streams. Confidence in the Proponent’s estimate of baseline water quantity, and by extension Project effects to fish habitat, cannot be established without a complete description of the method applied, as well as a discussion of its accuracy.</p> | <p>2. Discuss the accuracy of any correlations/relationships and justify any deviations from simple unit area runoff relationships in the estimation of baseline water quantity values for the Project hydrometric stations. Constructing records from records that are themselves constructed is not recommended.</p> <p>3. If baseline water quantity metrics need to be revised, discuss (if any) resulting changes to the effects assessment.</p> | <p>1. As mentioned by ECCC and discussed in the draft EIS, baseline hydrometric datasets are available for the Project at various nodes throughout the watershed and these datasets are extended to cover a broader period of record to the Wheeler River station (06DA005) operated by Water Survey Canada. Datasets for local stations measured at the Project cover a range from 2010 to 2019, though the date records are not continuous over this period. There is value in the hydrometric data collected at the Project site and these data should inform the long-term estimates of flow at Project nodes. As such, relationships are established to link 06DA005 first to SA-1 via correlation, than SA-1 to the other stations at the Project via correlation, unit area runoff relationships and unit area runoff relationships with scaled and/or offset influences.</p> <p>The use of 06DA005 solely to extend the record at the Project is reasonable given that it is a direct receiver from the Project watersheds and has a watershed area approximately one order of magnitude larger the SA-1 which is the largest watershed monitored at the Project. Further, trends in the datasets for coincident dates are generally similar and correlated are sufficiently in agreement. 06DA005 is not a perfect proxy for long-term record extension; in particular a flow event in October 2016 results in proportionally greater flow rates than were observed at 06DA005. That said, it is the best available station and incorporates locally and regionally measured data which is standard practice.</p> <p>A wording error in Table 1 of Appendix II of Appendix 8-C indicates that for Assessment Nodes SA-2 and SA-3 the extension method is listed as Unit Area Runoff with Offset. Rather, SA-2 should be listed as Unit Area Runoff with Scaling and Offset and SA-3 should be listed as Unit Area Runoff with Scaling. Also, the source station for SA-5 should be noted as SA-6. These corrections will be made in the final EIS.</p> <p>All record extension methods follow the same equation format (presented below) where the variable Q represents discharge. Correlations may have influence over all five variables while Unit Area Runoff methods may only use one or two. The variable A through E are adjusted to define the fit of the extension method. The fit of the extension method is determined as the summation of the differences between the observed and estimated daily average discharge (or instantaneous measured discharge if the station did not have an installed datalogger) for coincident days in the datasets. Variables A through E are adjusted through a solver algorithm such that the summation of the differences is as near to zero as possible.</p> $Q_{Assessment\ Node} = A \cdot [B + C \cdot (Q_{Source\ Station} + D)^E]$ <p>Table 1 in Attachment IR-102 presents the variable used for each assessment node and indicates the source station for the calculation. In Attachment IR-102 following Table 1, figures 1 to 7 are presented for each assessment node show the estimated hydrograph for the station as well as measured discharges and reported hydrographs as daily average discharge. Figures are not presented for nodes LA-1 and LA-5 as there are no measured discharges immediately at the outlet of those lakes.</p> <p>2. Simple unit runoff relationships from larger watersheds are a reasonable approach when no other data are available for use at a Project. In this approach larger watersheds tend to have attenuation which impacts the timing and magnitude of runoff events When local data are available it is a better approach to understand the relationship of local flow rates within the broader context. As an example, at SA-3 if the unit area relationship is used from 06DA005 direct to that watershed it results in a dramatic under prediction; the measured data indicate that that watershed is capable of generating larger flow rates than would be expected simply based on a unit runoff.</p> <p>Regarding the comment on the use of constructing records based on constructed records, the same methodology is incorporated into developing hydrographs at the Project as is used to estimate flows at 06DA005. The long-term extension of the Project data simply relates the datasets in a manner which is acceptable to the Proponent’s technical experts.</p> <p>Using the record extension methodologies presented in Table 1 of Attachment IR1-2, ensures the data provide a better fit ultimately to 06DA005 as understood within the regional context.</p> <p>3. The proponent is of the professional opinion that the baseline water quantity metrics do not need to be revised and the information presented in the draft EIS and supporting documents is suitable for the intended purpose. As noted in the draft EIS, Section 8.1.6.2, “The confidence in the assessment of predicted effects on hydrology is quite high due to available hydrological data for the LSA. Uncertainty is minimal with the assumptions that water withdrawal and discharge scenarios presented herein represent the bounding case and hydrogeological modelling projections are not changed.”</p> | <p>- SA-3 extension method = Unit Area Runoff with Scaling - Source station for SA-5 = SA-6</p> |
| IR-103 | ECCC | Fish and fish habitat | Section 8.1.3.4 Climate Change Influenced Extreme Events | <p>Context: The Proponent notes that Intensity duration frequency (IDF) curves are used to estimate the size of water management structures around a site and that the IDF curves are often specific to climate monitoring stations.</p> <p>The Proponent used the IDF_CC Tool 5.0 developed by the Institute for Catastrophic Loss Reduction (2021) which generates Intensity Duration Frequency (IDF) curves at ungauged locations in order to estimate future IDF curve values under influences of climate change. This tool generates sub-daily values at ungauged locations by interpolation and distance weighing from gauged locations.</p> <p>Rationale: IDF trends exhibit random behavior at some locations and</p> | <p>Provide the gauged stations used to generate the sub daily duration values found in Table 8.1-6: Baseline of Intensity Duration Frequency data.</p> <p>Technical Discussion Required: Yes</p> | <p>ECCC correctly notes that the tool generates sub-daily values at ungauged locations by interpolation and distance weighing from gauged locations. The closest gauged location to the Project is located 35 km_south southwest at the Key Lake Mine (KLM) and the IDF values at KLM for historical and future scenarios (Tables 1 and 2 below) are substantially lower than those predicted for the Project. The IDF-CC Tool estimated 1:100-year, 24-hour return period events of 79.9 and 88.6 mm during the current and predicted future values, respectively. As per Tables 1 and 2 those values are substantially larger, and more conservative than, the coincident values of 56.4 and 62.0 mm for KLM.</p> <p>The predicted values for the Project are likely strongly influenced by Cree Lake (4061861; 85 km west southwest) and Collins Bay SK (4061620; 130 km northeast). The interpolation may also be influenced by Stony Rapids A (4067PR5; 196 km north). The Cree Lake, Collins Bay SK and Stony Rapids A stations are all substantially higher than KLM; however, the</p> | No EIS updates are anticipated to address this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|------------|-----------------------|--|---|---|---|-------------------------------------|---|---|----|----|----|----|-----|-------|------|------|------|------|------|------|------|--------|------|-------|-------|-------|-------|-------|-------|--------|------|-------|-------|-------|-------|-------|-------|--------|-------|-------|-------|-------|-------|-------|-------|-----|-------|-------|-------|-------|-------|-------|-------|-----|-------|-------|-------|-------|-------|-------|-------|-----|-------|-------|-------|-------|-------|-------|-------|------|-------|-------|-------|-------|-------|-------|-------|------|-------|-------|-------|-------|-------|-------|-------|-----------|---|---|----|----|----|----|-----|-------|------|------|------|------|------|------|------|--------|------|-------|-------|-------|-------|-------|-------|--------|------|-------|-------|-------|-------|-------|-------|--------|-------|-------|-------|-------|-------|-------|-------|-----|-------|-------|-------|-------|-------|-------|-------|-----|-------|-------|-------|-------|-------|-------|-------|-----|-------|-------|-------|-------|-------|-------|-------|------|-------|-------|-------|-------|-------|-------|-------|------|-------|-------|-------|-------|-------|-------|-------|--|
| | | | | correlated behavior at other locations. The choice of gauged locations will infer the statistics for the ungauged locations, including the IDF trends. Without identification of the gauged locations, it is not possible to assess if the modelled data is realistic or not. If the modelled data is not accurate the design of water management structures on the site may not be sufficient resulting in the potential for impacts to the Project from flooding or extreme weather events. | | <p>geography, and likely the climate of KLM, is more similar to those of the Project than from the more distant stations.</p> <p>Despite the potential for the IDF_CC Tool to use weighting factors, the estimates provided by the tool for the purposes of assessing impacts of the project on the surface water hydrology are robust and conservative including in consideration of flooding or extreme weather events.</p> <p><u>IR-103 Table 1: Key Lake (4063753) – Historical IDF</u></p> <table><tr><th>T (years)</th><th>2</th><th>5</th><th>10</th><th>20</th><th>25</th><th>50</th><th>100</th></tr><tr><td>5 min</td><td>5.39</td><td>6.66</td><td>7.11</td><td>7.37</td><td>7.43</td><td>7.56</td><td>7.65</td></tr><tr><td>10 min</td><td>7.46</td><td>10.11</td><td>11.40</td><td>12.39</td><td>12.66</td><td>13.37</td><td>13.94</td></tr><tr><td>15 min</td><td>9.22</td><td>12.44</td><td>13.97</td><td>15.12</td><td>15.42</td><td>16.23</td><td>16.86</td></tr><tr><td>30 min</td><td>11.50</td><td>16.59</td><td>19.20</td><td>21.24</td><td>21.81</td><td>23.36</td><td>24.63</td></tr><tr><td>1 h</td><td>13.72</td><td>18.91</td><td>21.28</td><td>23.00</td><td>23.45</td><td>24.61</td><td>25.49</td></tr><tr><td>2 h</td><td>15.71</td><td>22.25</td><td>26.04</td><td>29.31</td><td>30.29</td><td>33.09</td><td>35.61</td></tr><tr><td>6 h</td><td>21.93</td><td>27.85</td><td>30.92</td><td>33.36</td><td>34.05</td><td>35.92</td><td>37.48</td></tr><tr><td>12 h</td><td>26.57</td><td>33.31</td><td>36.50</td><td>38.87</td><td>39.50</td><td>41.17</td><td>42.46</td></tr><tr><td>24 h</td><td>35.57</td><td>44.63</td><td>48.82</td><td>51.86</td><td>52.67</td><td>54.76</td><td>56.35</td></tr></table> <p><u>IR-103 Table 2: Key Lake (4063753) – 2020 – 2050 Predicted IDF using CMIP6 Raw GCMs and SSP5.85</u></p> <table><tr><th>T (years)</th><th>2</th><th>5</th><th>10</th><th>20</th><th>25</th><th>50</th><th>100</th></tr><tr><td>5 min</td><td>5.80</td><td>7.21</td><td>7.72</td><td>8.03</td><td>8.10</td><td>8.29</td><td>8.41</td></tr><tr><td>10 min</td><td>8.06</td><td>10.96</td><td>12.42</td><td>13.45</td><td>13.78</td><td>14.70</td><td>15.55</td></tr><tr><td>15 min</td><td>9.95</td><td>13.49</td><td>15.21</td><td>16.43</td><td>16.80</td><td>18.04</td><td>18.82</td></tr><tr><td>30 min</td><td>12.47</td><td>17.99</td><td>20.90</td><td>23.10</td><td>23.78</td><td>26.00</td><td>27.69</td></tr><tr><td>1 h</td><td>14.88</td><td>20.51</td><td>23.16</td><td>25.08</td><td>25.68</td><td>27.36</td><td>28.61</td></tr><tr><td>2 h</td><td>16.85</td><td>24.13</td><td>28.27</td><td>31.65</td><td>32.77</td><td>36.06</td><td>39.23</td></tr><tr><td>6 h</td><td>23.50</td><td>30.23</td><td>33.64</td><td>36.05</td><td>36.88</td><td>39.24</td><td>41.27</td></tr><tr><td>12 h</td><td>28.59</td><td>36.18</td><td>39.67</td><td>42.08</td><td>42.85</td><td>44.99</td><td>46.74</td></tr><tr><td>24 h</td><td>38.26</td><td>48.47</td><td>53.03</td><td>56.20</td><td>57.14</td><td>59.86</td><td>62.03</td></tr></table> | T (years) | 2 | 5 | 10 | 20 | 25 | 50 | 100 | 5 min | 5.39 | 6.66 | 7.11 | 7.37 | 7.43 | 7.56 | 7.65 | 10 min | 7.46 | 10.11 | 11.40 | 12.39 | 12.66 | 13.37 | 13.94 | 15 min | 9.22 | 12.44 | 13.97 | 15.12 | 15.42 | 16.23 | 16.86 | 30 min | 11.50 | 16.59 | 19.20 | 21.24 | 21.81 | 23.36 | 24.63 | 1 h | 13.72 | 18.91 | 21.28 | 23.00 | 23.45 | 24.61 | 25.49 | 2 h | 15.71 | 22.25 | 26.04 | 29.31 | 30.29 | 33.09 | 35.61 | 6 h | 21.93 | 27.85 | 30.92 | 33.36 | 34.05 | 35.92 | 37.48 | 12 h | 26.57 | 33.31 | 36.50 | 38.87 | 39.50 | 41.17 | 42.46 | 24 h | 35.57 | 44.63 | 48.82 | 51.86 | 52.67 | 54.76 | 56.35 | T (years) | 2 | 5 | 10 | 20 | 25 | 50 | 100 | 5 min | 5.80 | 7.21 | 7.72 | 8.03 | 8.10 | 8.29 | 8.41 | 10 min | 8.06 | 10.96 | 12.42 | 13.45 | 13.78 | 14.70 | 15.55 | 15 min | 9.95 | 13.49 | 15.21 | 16.43 | 16.80 | 18.04 | 18.82 | 30 min | 12.47 | 17.99 | 20.90 | 23.10 | 23.78 | 26.00 | 27.69 | 1 h | 14.88 | 20.51 | 23.16 | 25.08 | 25.68 | 27.36 | 28.61 | 2 h | 16.85 | 24.13 | 28.27 | 31.65 | 32.77 | 36.06 | 39.23 | 6 h | 23.50 | 30.23 | 33.64 | 36.05 | 36.88 | 39.24 | 41.27 | 12 h | 28.59 | 36.18 | 39.67 | 42.08 | 42.85 | 44.99 | 46.74 | 24 h | 38.26 | 48.47 | 53.03 | 56.20 | 57.14 | 59.86 | 62.03 | |

| IR-104 | ECCC | Fish and fish habitat | Section 8.1.3.4.2 Probable Maximum Precipitation (PMP) Events Appendix 8C | <p>Context and Rationale: The Proponent notes: “The probable maximum precipitation (PMP) event is a design standard value for an extreme rainfall event. The PMP event does not have an estimated return period but is instead based on the theoretical maximum amount of water that a storm could produce based on the maximum persisting dew point.”</p> <p>The Proponent provides a PMP value of 489.3 mm, which is based on data and methodologies available in 1999, taken from the Atmospheric Environment Branch Report (1999), Report Number AHSD-R99-01. The Proponent references Appendix 8C for details. Appendix 8C contains no supplementary information other than what is already provided in Section 8.1.3.4.2.</p> <p>The assumptions and methodologies presented in the report are the results of time series analyses available in 1999. As time series evolve so do the derived statistics. In order to assess potential flood risks and impacts to the Project from flooding, data that is current and representative of the changing climate is needed. The Proponent should explain why they’ve used data from 1999 rather than using up to date data, describe what alternative methods for determining PMP they have considered, and describe how they will support their use of 489.3 mm as a PMP, or describe how they will generate a refreshed PMP. The main factor that influences the statistical data output is the length of the time series hence the reason to keep the statistical data. The PMP values can be substantially (>10%) different if two decades of data is used in the statistical analysis.</p> | <p>1. Provide a revised PMP value (using up to date data) or justify the use of a PMP that is based on data and methodologies from 1999 as opposed to a more recent time series analysis.</p> <p>2. Describe the alternative methods for determining PMP values that were considered. Include descriptions of both “statistical” outcomes and “rational” outcomes as applicable.</p> <p>Technical Discussion Required: Yes</p> | <p>Please see response to IR-15, IR-236 and AD-15. Although there are a variety of methods available to derive a PMP, Denison’s selected PMP for engineering design (i.e., 493 mm; see response to IR-15; based on Canadian Climate Program [1994]) is over 5 times higher than observed and predicted 24 hour precipitation events (both 1 in 100 year, 24 hour return precipitation events and 24-hour maximum precipitation events; see response to AD-15), and as such, Denison is confident that the Project water management infrastructure will be appropriately designed. The PMP included in Section 8 of the draft EIS was 489.3 mm from a more recent publication (Atmospheric Environment Branch [1999]). Denison retained the higher of the two PMP values (i.e., 493 mm) for design purposes.</p> <p>The proponent will address the information requirements in reverse order of the way they are presented.</p> <p>2. The World Meteorological Organization (WMO) issued Manual on Estimation of Probable Maximum Precipitation (PMP) in 2009 (WMO-No. 1045), the third edition of this manual. This document presents several methodologies for estimation of PMP and is preceded by the similar second edition 1986 document titled “Manual for Estimation of Probable Maximum Precipitation (WMO No. 332)”. The 1986 document served as part of the foundation for analyses presented by Atmospheric Environment Branch (1999). WMO indicates that the 2009 document “keeps a majority of the content from the second edition” and newly added content since 1986 is for “directly estimating PMP for the requirements of a given project in a design watershed on probable maximum flood (PMF) in China, the United States of America, Australia and India.” As such, the proponent believes the Atmospheric Environment Branch (1999) analysis remains current within the context of the Project.</p> <p>Atmospheric Environmental Branch (1999) builds upon a similar document produced in 1994 (Canadian Climate Program, 1994). The 1994 text discusses methodology and results of analyses for northern Saskatchewan. Though the author is confident in their assessment, the author does indicate that values estimated through northern Saskatchewan may be “spurious” due to the scarcity of climatological data in the region. The use of the term “spurious” seems to be in reference to predicted PMP values which are substantially higher than those where data are available.</p> <p>Additional analyses would be possible for this assessment; however, climatological data remain scarce in northern Saskatchewan. Though there is uncertainty as to the result of</p> | No changes to the EIS are required. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

|--------|---|--|---|---|---|---|---|
| | | | | | | <p>reassessment of PMP values in the vicinity of the Project, others have completed their own reassessment of PMP values based on locally monitored data which yielded a much smaller result for the PMP. In that situation the proponent opted to stay with a value of 489.3 mm as estimated by Atmospheric Environment Branch (1999) even though it was substantially larger than their reassessed value (NexGen Energy Ltd., 2022).</p> <p>1. Though it is presumed that methodologies have not changed appreciably to justify a reassessment of the PMP, the data scarcity component would also influence the potential for accurate estimation of the design storm. No new stations have been added in northern Saskatchewan with sufficient data record to improve regional observations which play a role in Hopkinson's analyses.</p> <p>Anecdotaly speaking, the estimates of 489.3 mm across the northern Saskatchewan region are considered very high by other practitioners in the industry. This seems to be supported by additional analyses completed for NexGen Energy Ltd. (2022). The acceptance of 489.3 mm or 493 mm as the PMP for the Project falls in line with magnitudes used by existing operators in the area and is likely a conservative estimate.</p> <p>References:</p> <p>Atmospheric Environment Branch. 1999. | IR-105 | Directorate of Fisheries and Oceans (DFO) | Fish and fish habitat | <p>Section 8.1.4.1, Potential interactions between project and valued component/key indicators Surface Water Quantity</p> <p>Section 8.1.4.2.2, Surface Water Taking</p> <p>8.3.4.1, Potential interactions between project and valued component/key indicators</p> | <p>Context: Table 8.1-8 and Table 8.3-6 in the EIS indicates a potential for freeze wall operation to influence groundwater interactions and surface water quantity and as a result, impact fish and fish habitat. Section 8.1.4.2.2 references Section 7 Geology and Groundwater for details on potential impacts. In addition, IR-63 notes the groundwater model does not describe the pathway in which groundwater would pass around the freeze wall during operation and any resulting potential effects on groundwater discharge to Whitefish Lake.</p> <p>Rationale: As per IR-63, the groundwater model analysis is insufficient to make conclusions on the potential effects of the freeze wall on groundwater discharge into Whitefish Lake. DFO requires this information to fully understand if altered groundwater regimes will result in changes to Whitefish Lake water levels and any potential impacts to fish and fish habitat as a result of changing water levels.</p> | <p>1. Provide a more fulsome analysis of the potential impact of freeze wall operations on local and semi-regional groundwater regimes, and subsequently to fish and fish habitat within Whitefish Lake. The analysis should provide a rationale of how the scope of the groundwater model is relevant to and able to detect changes at the scale of fish and fish habitat.</p> <p>2. If impacts to fish and fish habitat in Whitefish Lake are predicted to occur due to changes in the groundwater regime, describe any mitigation measures that could be used to avoid these impacts.</p> <p>3. If impacts are predicted that cannot be avoided, characterize residual effects on fish and fish habitat.</p> | <p>Please refer to the disposition for IR-63 for a fulsome explanation of the minor impact that the freeze wall will have on the area and regional groundwater flows. It was concluded that the freeze-walled area is a relatively small disruption to the regional groundwater flow system.</p> <p>Potential indirect impact to the surface water hydrology at Whitefish Lake as a result of project induced changes to the hydrogeology of the area was considered as part of Section 8.1 and discussed in Appendix 8-C. The project impacts were inclusive of changes in groundwater contributions to LA-5 as listed in Table 4-1 of Appendix 8-C. The analysis included the most up to date information during the preparation of the EIS and which indicated a potential loss in contribution of 4-6 L/s of groundwater reporting to LA-5 through the operation and decommissioning phase. This input is anticipated to return to pre-disturbance conditions for Post-Decommissioning. More recent calculations of the potential loss of groundwater contribution to Whitefish Lake as 9.9 L/s. This change is within the same magnitude of that previously modelled and therefore is not likely to constitute a change in the assessment of significant effects for the aquatic environment.</p> <p>Recent modelling using a loss of 9.9 L/S indicates that the majority of this change is due to dewatering of the ISR area and not due to the freeze wall itself. As indicated in Attachment IR-63, the groundwater flow contours will locally deviate from their original paths due to the installation of the freeze wall and the pumping, yet this will not impact the larger spatial migration of groundwater to the lake. Furthermore, groundwater discharge distribution (i.e., seeps and upwellings) will continue to occur in a similar pattern during pumping as to pre-pumping. This indicates that while the overall groundwater discharge rate is reduced, the areas of primary groundwater discharge will remain unchanged. As such, fish which utilize LA-5 for critical life-history periods (namely Northern Pike) will not be impacted due to changes in groundwater interactions directly, or indirectly due to reductions in surface water levels or flow. As such, additional mitigation measures outside that currently proposed in the draft EIS are not suggested.</p> | Based on the response no revisions to the EIS are needed. |
| IR-106 | CNSC | Change to an environmental component due to hazardous contaminants | Section 8.1.4.2.3, Surface Water Discharge | <p>Context: It is stated in this section under construction that all site contact water will be held in the Clean Waste Rock Pond.</p> <p>Rationale: It is unclear from this section what will happen to the contact water held in the Clean Waste Rock Pond, and whether it will be removed from site or released at a later time. What is the contingency plan if more contact water is produced during construction than the Clean Waste Rock Pond has capacity for.</p> | <p>Please indicate what will happen to the contact water stored in the Clean Waste Rock Pond during construction activities, will it be released after the wastewater treatment plant is installed? Further, please describe the contingency plan if contact water produced exceeds estimates and will exceed the volume of the clean waste rock pond?</p> | <p>During Construction, no effluent is expected to be released to the aquatic environment. Contact water stored in the Clean Waste Rock Pond during Construction will be held onsite until the Industrial Wastewater Treatment Plant (IWWTP) is commissioned. At that time the water from the pond would be conveyed to the IWWTP, treated, and released to Whitefish Lake per permit / license requirements.</p> <p>The sequence for Construction activities will occur in a logical manner based on Project execution plans. For example, construction of the wellfield runoff pond will be prioritized during the early part of Construction and it will able to hold 38,200 m³ of water. This will provide contingency and additional water storage capacity if contact water produced exceeds estimates or the volume available in the Clean Waste Rock Pond.</p> <p>Other secondary contingency measures are also available should the volume of water requiring management exceed site infrastructure storage volume. This could include use a hydrovac for offsite disposal.</p> | No changes to the EIS are required. |
| IR-107 | CNSC ECCC | Aquatic environment | Section 8.2.3.3, Existing Surface Water Quality | <p>Context: Under the methodology and metrics section (8.2.3.1) it is stated baseline water quality was sampled in 2016, 2018, and 2019. Looking at the data in Appendix A of Appendix 8D it seems that some waterbodies have little data available for baseline characterization. For example, Whitefish Lake only has 3 and 5 samples taken between its two sample stations, with sampling frequency seeming intermittent.</p> <p>Rationale: The amount of data available for baseline water quality</p> | <p>Please clarify what data quality objectives were used for the baseline characterization data. Please provide justification whether the number of datapoints collected with inconsistent frequency in baseline surface water characterization is sufficient to meet data quality objectives and to adequately characterize the baseline, and whether Denison is confident that the data collected is enough for a robust water quality baseline characterization.</p> | <p>Surface water quality was sampled through 2016, 2018, and 2019 on a monthly basis which is generally consistent with federal requirements for assessing potential impacts through EA. Hydrological assessment has occurred from 2011 to 2019. Mean Annual Discharge (MAD) (m³/s) as measured at the Water Survey Canada (WSC) Wheeler River Watershed Station (06DA005) during 2016, 2018 and 2019 was 17.07, 17.34 and 19.23, respectively, all of which were slightly above the 43 year (1977 to 2019) average of 16.82. The MAD in 2016 and 2018 can be considered near average, with 2019 being considered an average-high flow year, but well below the maximum observed for the timeseries (27.62 m³/s). Since this period, there</p> | No changes to the EIS are required. |

|--------|------------|--|--|---|--|---|---|
| | | | | <p>characterization does not seem sufficient to adequately characterize the baseline and the variation it would experience. An effective baseline characterization is vital to ensure water quality is indeed not being affected by the project. In addition, it is not clear if data quality objectives were applied to determine baseline information was adequate.</p> <p>To meet CEAA 2012 requirements, and CNSC expectations outlined in REGDOC 2.9.1, Environmental Principles Assessments and Protection Measures, the applicant is required to complete a characterization of the baseline environment.</p> <p>As described in REGDOC 2.9.1 Appendix B.2, Characterization of the Baseline Environment for Environmental Assessment Under CEAA 2012, the “baseline information should be sufficient to support the use of an aquatic dispersion model to conduct the site-specific ERA and to support an assessment of the effects of the environment on the facility or activity”</p> <p>In addition, the “applicant or licensee should include an assessment of any limitations or gaps in the quality and extent of baseline data and methods, as well as the method(s) by which they have been addressed.”</p> | <p>Suggestions for mitigation and follow-up measures: CNSC recommends that additional water samples are collected and analyzed at a consistent frequency to ensure a robust baseline</p> | <p>have been no land use changes within the area that would constitute a major change in water quality.</p> <p>Baseline water quality samples were collected during years of average to average-high flows in the Wheeler River system and therefore representative of background conditions for assessment of potential impacts in the EIS. Additional conservatism was included in the impact assessment by using the 95th percentile values for baseline parameter concentrations when modelling potential effluent effects. As such, the surface water quality data collected are suitable for the intended purpose of assessing potential impacts and the additional conservativisms that were included as part of the assessment were precautionary.</p> <p>Given the above, Denison feels strongly that the baseline water quality data collected are suitable for the purposes of the EIS and the application of additional conservativisms in the use of the data provide a conservative (i.e., protective) framework for evaluating potential effects.</p> <p>Denison commits to the collection of additional surface water quality baseline data prior to project development starting to ensure updated baseline information is available for identification of any changes that might influence estimates of Project impacts. These data will be used to support permitting and licensing through updates to the ERA.</p> | |
| IR-108 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.3.3 Aquatic Environment | <p>Context: Tables 8.2-2 and 8.2-3 provide summaries of the baseline surface water quality in the LSA. No justifications for the selection of water quality guidelines have been provided. COPCs that require calculations based on other parameters such as hardness, pH, or temperature to derive guidelines (i.e., ammonia, cobalt, zinc, etc.) should be indicated within the table, with a note specifying the parameter values used in the calculations, so that thresholds may be confirmed. No baseline data for un-ionized ammonia has been provided, which is a Schedule 4 substance requiring monitoring under the MDMER. For cobalt, manganese, and vanadium, Federal Environmental Quality Guidelines (FEQGs) and/or CCME Canadian Water Quality Guidelines (CWQGs) for the Protection of Aquatic Life have not been included. A guideline of 26 mg/L has been provided for molybdenum as a Saskatchewan Environmental Quality Guidelines (SEQG), however the actual SEQG is 31 mg/L and the CCME CWQG is 0.073 mg/L.</p> <p>Rationale: In order to assess potential changes to surface water quality from Project related activities, ECCC requires that data on all parameters that require MDMER effluent and receiving environment monitoring be provided for assessment, including accurate water quality guidelines where available.</p> | <p>1. Update Tables 8.2-2 and 8.2-3 to include all COPCs that require effluent characterization and receiving environment monitoring under the MDMER.</p> <p>2. Update Tables 8.2-2 and 8.2-3 to include missing or corrected water quality guidance thresholds, and information on values used to derive thresholds for COPCs that are dependent on general parameters.</p> | Please see Attachment IR-108. | Tables 8.2-2 and 8.2-3 will be updated in the final EIS, per Attachment IR-108. |
| IR-109 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.1.1 Aquatic Environment | <p>Context: In this section it is stated “Treated water from the IWWTP will be pumped to the three Effluent Monitoring and Release Ponds (each 3,300 m³). These ponds will be designed to hold effluent for 72 hours for testing before discharge to the environment” (p. 8-75). It is unclear what procedure will be followed if effluent in monitoring ponds does not meet discharge requirements following testing.</p> <p>Additionally, it is also stated that “Treated water in the Effluent Monitoring and Release Ponds will be monitored prior to release to a surface waterbody or injected into groundwater via deep well injection.” However, the MDMER pursuant to the Fisheries Act requires all mine effluent and seep. from the mine site that contain deleterious substances be discharged through a final discharge point.</p> <p>Rationale: In order to fully understand effluent management, more information is required regarding the procedure for managing effluent in monitoring ponds that does not meet discharge requirements. It is unclear how effluent that does not meet discharge requirements will be managed if it needs re-treatment and re-testing prior to discharge.</p> <p>ECCC reminds the Proponent that Project effluent from all final discharge points must meet federal legislation requirements.</p> | Provide further information regarding management of effluent in monitoring ponds that does not meet the requirements for discharge under the MDMER. | Section 2 Project Description, Section 2.2.3.9 Treated Effluent Monitoring and Release Ponds of the draft EIS outlines Denison's commitment to test effluent prior to discharge to Whitefish Lake, to ensure it meets federal and provincial discharge limits. Any pond not meeting the criteria will be recycled back to the Industrial Wastewater Treatment Plant via the process water pond. | No EIS updates are anticipated to address this IR. |
| IR-110 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.1.1 Aquatic Environment Appendix 8-E, Section 2.1 | <p>Context: It is stated that the diffuser at the final effluent discharge point will be located in approximately 3m of water. However, in Figure 8.2-5 displaying the location of the proposed diffuser and lake bathymetry, the diffuser location seems to be located in 2-2.5m of water. A similar image in Figure 1 Section 2.0 of Appendix 8-E also indicates that the diffuser seems to be located in 2-2.5m of water. Additionally, while thermal effects are unlikely, this cannot be confirmed until a more detailed diffuser design is provided for review.</p> <p>Rationale: The Proponent should confirm the location and depth of the proposed diffuser in order to confirm that modelling predictions for effluent discharged into the receiving environment are accurate.</p> | <p>Provide confirmation of the diffuser depth and location.</p> <p>ECCC requests the opportunity to review the finalized diffuser design once it is available.</p> | The diffuser will be placed at a depth between 2.5 and 3 m. The mapping provided in the draft EIS and Appendix 8-E is based on coarse bathymetric information, which will be supplemented with more robust bathymetric surveys to support final siting and design associated with permitting and licensing. | No EIS updates are anticipated to address this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------|-------------------|--|---|--|--|---|--|-------------------|--|--|--|--------------------|--|--|--|--|-----------|---------|---------|---------|-----------|---------|---------|---------|-----------|-----|-----|-----|-----|----|----|----|----|------|--|-----|-----|-----|--|----|----|----|------|--|-----|-----|-----|--|----|----|----|------|--|-----|-----|-----|--|----|----|----|------|--|-----|-----|-----|--|----|----|----|------|--|-----|-----|-----|--|----|----|----|------|--|-----|-----|-----|--|----|----|----|------|--|-----|-----|-----|--|----|----|----|------|--|-----|-----|-----|--|----|----|----|-------------------|--|----|----|----|--|----|----|---|--|
| IR-111 | CNSC | Fish and fish habitat | Section 8.2.4.2.2, Controlled Discharge | <p>Context: This section of the EIS indicated that the scenario was assessed using a conservative assumption of a continuous freshwater withdrawal rate of 40.5 m3/hr, and a continuous effluent discharge rate of 81.0 m3/hr.</p> <p>Rationale: The withdrawal rate assessed is half of the effluent rate, it is unclear from the text where the other half of the volume of effluent is coming from, if not drawn from the lake.</p> | Please clarify where the other half of the total volume of effluent discharged is from in the water balance between water intake and effluent. | Process water will be drawn from both groundwater and surface water (when required). The 81.0 m³/hr discharge rate conservatively assumes withdrawal from both sources at the maximum proposed rates. Please refer to Section 2.2.3 and specifically Figures 2.2-14, 2.2-15 and 2.2-16 of the draft EIS which depict the water balance for the Project for each of Construction, Operation and Decommissioning phases. | No EIS updates are anticipated to address this IR. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| IR-112 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.2.2, Aquatic Environment Appendix 8-E, Section 1.2.1 Appendix 10-A (ERA), Section 3.1 | <p>Context: This section of the EIS states that, “for the purpose of assessing the scenario of greatest potential effects, the Project was assessed as having a continuous freshwater withdrawal rate of 40.5 m³/hr and a continuous effluent discharge rate of 81.0 m³/hr.” (p. 8-21)</p> <p>However, several sentences later it is stated that, “The approach to assessing Project-related effects on the Surface Water Quality VC was conservative for the following reasons: The assessment was based on a continuous (year-round) discharge rate at an expected average effluent discharge of 0.0101 m3/s (or 36.5 m3/hr) throughout Construction, Operation, and Decommissioning...”</p> <p>This is a continuous theme throughout Section 8, Aquatic Environment, where the discharge rate for the surface water quality assessment changes between 36.5 m3/hr and 81.0 m3/hr. However, in Appendix 10-A (ERA) the 36.5 m3/hr discharge rate is the only value used for the near and far-field modelling.</p> <p>It should be made clear in the main body of the draft EIS that the average effluent discharge rate of 36.5 m3/hr has been used as the input for the near- and far-field modelling for effluent, surface water and sediment quality predictions. The maximum upper bound discharge rate is 81 m3/hr; however, modelling for effluent, surface water and sediment quality was not completed for this discharge rate.</p> <p>Rationale: It remains unclear throughout the draft EIS that all predictions of COPC concentrations in effluent, and receiving environment surface water and sediment are based upon the effluent discharge rate of 36.5 m3/hr, and not the maximum upper bound discharge rate of 81 m3/hr. All conclusions about risk to the environment and aquatic and terrestrial biota must make this clear. If the Proponent wishes to make conclusions based on the maximum upper bound discharge rate of 81 m3/hr, modelling needs to be conducted using this rate of discharge.</p> | <p>1. Confirm that the surface water quantity, quality, and aquatic biota risk assessments and modelling, were conducted using the discharge rate for 36.5 m3/hr within the draft EIS.</p> <p>2. Revise any statements or conclusions in the draft EIS to improve clarity about the usage of the maximum upper bound discharge rate of 81 m3/hr. Remove statements regarding use of the discharge rate of 81 m3/hr during modelling and risk assessments to the receiving environment as needed.</p> | <p>1. Denison confirms that the surface water quantity, quality, and aquatic biota risk assessments presented in the draft EIS and ERA (Appendix 10A) were conducted using the discharge rate for 36.5 m³/hr.</p> <p>2. Denison provides the following summary to clarify effluent discharge rates and identify updates to the final EIS:</p> <ul style="list-style-type: none">Section 8.2.4.2.2 of the EIS will be modified (see details in EIS Updates column).Appendix 8-E used an effluent discharge rate of 36.5 m³/hr, which is correct. No changes required.Appendix 10-A used an effluent discharge rate of 36.5 m³/hr in the modelling and ERA results; however, in Section 6.2 of the ERA in Appendix 10-A, a sensitivity analysis was conducted to assess the effects on surface water and sediment when the effluent discharge rate is increased to the upper bound discharge rate of 81 m³/hr. No changes required. | <p>The sentence in Section 8.2.4.2.2 will be updated in the final EIS as follows:</p> <p>Denison does not intend to include constant freshwater withdrawal or effluent discharge throughout Operation; however, for the purpose of assessing the scenario of greatest potential effects, the Project was assessed as having a continuous freshwater withdrawal rate of 40.5 m³/hr and a continuous effluent discharge rate of 81.0 36.5 m³/hr.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| IR-113 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.2.3 and Section 8.4.7.6, Aquatic Environment | <p>Context: No quantitative assessment of climate change has been conducted. Representative concentration pathways (RPC) projections for climate change have not been integrated with near-and far-field modelling to assess impacts to surface water quality or sediment quality in the future.</p> <p>Rationale: Changes in air and water temperatures, precipitation, snow melt, ice formation, etc., due to climate change can all influence COPC concentrations in surface water and sediment. It is not possible to assess the potential impacts from climate change on predicted surface water and sediment COPC concentrations with the current information.</p> | Provide a quantitative analysis of the potential impacts of predicted COPCs from mine effluent to surface water and sediment quality with climate change scenarios for the Project lifespan incorporated into modelling. Include modelling predictions regarding the influence of changes to air and water temperatures, precipitation, snow melt, ice formation, etc., on COPC concentrations in surface water and sediment. | <p>Section 8.1.3.4 (and Appendix 8-C) provides a quantitative assessment of the potential changes in surface water quantity due to climate change. The 1:100 year, 24-hour return period rainfall events for the baseline and climate change influenced IDF curves are 79.9 mm and 88.6 mm, respectively. The PMP for the Project is estimated to be 493 mm (refer to IR-15 and AD-15) which is well above both 24-hour maximum precipitation and 1:100, 24 hour return precipitation events. The PMP is very conservative (e.g., assumes effectively a full year of precipitation in one event) under both existing and future conditions (climate change). The potential impacts of climate change to precipitation and therefore flows was summarized in Appendix 6-C, Table 10 with the total annual precipitation and the maximum 1-day events being variable over the next four decades (Table 1). Regardless, the climate change scenario indicates a potential increase in event based assimilative capacity in the receiving environment.</p> <p>TABLE 1- Existing and Predicted Precipitation Data for Key Lake (provided in EIS, Appendix 6-C, Table 10)</p> <table><tr><th>Year</th><th colspan="4">Total Annual (mm)</th><th colspan="4">Maximum 1-day (mm)</th></tr><tr><td></td><td>Measure d</td><td>RCP 2.6</td><td>RCP 4.5</td><td>RCP 8.5</td><td>Measure d</td><td>RCP 2.6</td><td>RCP 4.5</td><td>RCP 8.5</td></tr><tr><td>2011-2020</td><td>455</td><td>518</td><td>509</td><td>508</td><td>48</td><td>29</td><td>27</td><td>27</td></tr><tr><td>2030</td><td></td><td>528</td><td>503</td><td>537</td><td></td><td>27</td><td>24</td><td>26</td></tr><tr><td>2040</td><td></td><td>487</td><td>498</td><td>514</td><td></td><td>28</td><td>29</td><td>24</td></tr><tr><td>2050</td><td></td><td>504</td><td>524</td><td>520</td><td></td><td>26</td><td>29</td><td>33</td></tr><tr><td>2060</td><td></td><td>513</td><td>515</td><td>523</td><td></td><td>26</td><td>33</td><td>26</td></tr><tr><td>2070</td><td></td><td>527</td><td>534</td><td>568</td><td></td><td>29</td><td>31</td><td>28</td></tr><tr><td>2080</td><td></td><td>539</td><td>551</td><td>547</td><td></td><td>30</td><td>33</td><td>28</td></tr><tr><td>2090</td><td></td><td>543</td><td>545</td><td>548</td><td></td><td>31</td><td>32</td><td>35</td></tr><tr><td>2100</td><td></td><td>546</td><td>535</td><td>559</td><td></td><td>23</td><td>25</td><td>28</td></tr><tr><td colspan="2">Overall Increase:</td><td>28</td><td>26</td><td>51</td><td></td><td>-6</td><td>-2</td><td>1</td></tr></table> <p>To mitigate the potential for unplanned release of deleterious substances into the surface water environment even during the next 40 years of climate change, the PMP of 493 mm was</p> | Year | Total Annual (mm) | | | | Maximum 1-day (mm) | | | | | Measure d | RCP 2.6 | RCP 4.5 | RCP 8.5 | Measure d | RCP 2.6 | RCP 4.5 | RCP 8.5 | 2011-2020 | 455 | 518 | 509 | 508 | 48 | 29 | 27 | 27 | 2030 | | 528 | 503 | 537 | | 27 | 24 | 26 | 2040 | | 487 | 498 | 514 | | 28 | 29 | 24 | 2050 | | 504 | 524 | 520 | | 26 | 29 | 33 | 2060 | | 513 | 515 | 523 | | 26 | 33 | 26 | 2070 | | 527 | 534 | 568 | | 29 | 31 | 28 | 2080 | | 539 | 551 | 547 | | 30 | 33 | 28 | 2090 | | 543 | 545 | 548 | | 31 | 32 | 35 | 2100 | | 546 | 535 | 559 | | 23 | 25 | 28 | Overall Increase: | | 28 | 26 | 51 | | -6 | -2 | 1 | No EIS updates are anticipated to address this IR. |

|--------|------------------|--|---|--|--|--|--|
| | | | | | | used for water management engineering designs. During a PMP, water requiring management will report to the wellfield runoff pond which will be sized to accommodate a PMP event at the site. This pond has been sized to 38,200 m ³ (excluding a freeboard of 1 meter). From the wellfield runoff pond, water will then be sent to the process water pond for treatment if required. In Section 2.8 Project Design Features, Denison notes that “Ponds will be designed to maintain a minimum freeboard of at least 1.0 m to allow for continued functioning during a probable maximum precipitation (PMP) event.” As such, the project has been designed to manage water during PMP and greater, and therefore mitigation of potential impacts to water quality due to climate change has been initially included as part of the EIS. As a result, it is Denison's opinion that a quantitative assessment of potential impacts to surface water quality is not warranted as it is likely to indicate improved results from the conservative assessment of potential water quality changes during operation and decommissioning phases. Continued monitoring of background, effluent and receiver water quality will be undertaken and provide the ability for adaptive management throughout the life of the mine in association with potential climatic changes to the local and regional area. | |
| IR-114 | ECCC CNSC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.2.3 and Section 8.2.4.2.4 | <p>Context: Tables 8.2-9, 8.2-10 and 8.2-13 demonstrate predicted maximum effluent concentrations of COPCs and maximum predicted receiving environment concentrations in the near- and far-field. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, TSS and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization.</p> <p>For zinc, it is unclear how guidelines have been calculated when CCME thresholds can only be derived with hardness values <250 mg/L. Additionally, water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations.</p> <p>Mercury has been identified as a COPC of interest to Indigenous groups for the proposed Project. Table 8.2-8 indicates that background concentrations of mercury in LA-5 are low, and predicted effluent concentrations are also low. However, no information has been provided on background methylmercury concentrations or expected atmospheric deposition of mercury from Project related emissions. Predicted effluent concentrations of 3915 mg/L of sulphate are quite high, and sulphate is known to increase mercury methylation rates in aquatic environments.</p> <p>Rationale: A review of all modelling results for all COPCs under the MDMER will assist ECCC in understanding the potential risks to the receiving environment. ECCC recommends the use of the most stringent guidelines for the protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds.</p> <p>Increased sulphate availability can lead to increased methylation rates of mercury and methylmercury in sediment and surface water. Methylmercury is a toxin that can bioaccumulate within the food chain and present risks to aquatic biota and wildlife consuming aquatic biota. Potential changes to methylmercury concentrations in water quality, sediment and fish tissues should be assessed due to the proposed sulphate loadings in effluent.</p> <p>Additionally, in accordance with the MDMERs, Denison will be required to demonstrate that their effluent quality meets the limits in the MDMER. Denison is expected to provide the predicted effluent quality for lead, nickel, and un-ionized ammonia to demonstrate compliance with the MDMERs.</p> | <ol style="list-style-type: none">1. Update all tables to include all COPCs with required monitoring under the MDMER including acute and chronic thresholds.2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota.3. Provide baseline data on the concentrations of methylmercury in surface water, sediment and fish tissues (i.e., large-bodied sports fish and small-bodied forage fish) in the LSA and RSA receiving environment to establish a baseline prior to potential Project impacts.4. Provide an assessment of risk from methylmercury to ecological receptors due to changes in sulphate concentrations in effluent, and potential deposition of mercury from Project related atmospheric emissions in the receiving environment. | See response in Attachment IR-114. | Tables 8.2-9, 8.2-10, and 8.2-13 will be updated in the final EIS. The updated tables are provided in Attachment IR-114. |
| IR-115 | ECCC | Fish and fish habitat | Section 8.2.4.2.3 Aquatic Environment Appendix 10-A (ERA), Section 3.1.1.1 | <p>Context: Table 8.2-8 demonstrates baseline concentrations of COPCs in LA-5 South Whitefish Lake, their respective water quality guidelines from applicable sources, and proposed Project thresholds. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, Total Suspended Solids (TSS) and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization. Water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations. The water quality objective selected for molybdenum is the 31 mg/L SEQG rather than the CCME guideline of 0.073 mg/L.</p> <p>Rationale: ECCC recommends the use of guidelines that will ensure the protection of aquatic biota. All water quality thresholds should be</p> | <ol style="list-style-type: none">1. Update Table 8.2-8 to include all COPCs with required monitoring under the MDMER.2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.3. Provide additional information to justify the use of the selected water quality guideline for molybdenum. | <ol style="list-style-type: none">1. Table 8.2-8 has been updated and provided in Attachment IR-1152. Denison believes that the water quality thresholds used in the assessment (Section 8.2.4.2.3, Aquatic Environment; Appendix 10-A (ERA), Section 3.1.1.1) were appropriate and reflect levels that are protective of aquatic life. The predictive water quality analysis considered the effects of toxicity modifying factors, such as hardness, on water quality. Specifically, the analysis considered induced hardness - that is hardness that is derived from or includes contributions from on site sources and in this case discharge from the IWWTP. It is a reasonable in this case to utilize induced hardness since the water quality assessment directly considers the potential effect of IWWTP discharge on the receiving environment. The hardness added to the receiver from the discharge represents a constant source during periods of discharge. The effluent hardness value used in the analysis was derived from bench scale testing and is considered to be a reasonable estimate of expected hardness in effluent. With that in mind, the predictive water quality analysis reflects the water quality conditions that are anticipated to prevail in the receiver and therefore presents an appropriate platform on which to base the effects assessment. | Table 8.2-8 of the draft EIS will be replaced per the IR response as indicated. |

|--------|------------|--|---|--|--|---|---|
| | | | | derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds. | | <p>3. Denison has selected the Saskatchewan specific guideline for molybdenum of 31 mg/L to be the most appropriate for the Project. It was derived from recent data following the CCME (2007) protocol. The molybdenum water quality objective based on the 5th percentile (HC5) of the species sensitivity distribution (SSD) according to the CCME protocol; 18 data points for 12 different species were used, mainly EC10 data (WSA, 2017). The CCME guideline is identified as an interim guideline and was based on multiplying the lowest chronic toxicity value, the 28-d LC50 of 0.73 mg/L for rainbow trout (O. mykiss), by a safety factor of 0.1. This original study by Birge (1978) has not been reproducible, either using the original methods or using standard methods (Davies et al. 2005). No changes to the EIS are proposed in this regard.</p> <p><u>References:</u> Birge, W.J. 1978. Aquatic Toxicology of Trace Elements of Coal and Fly Ash. | IR-116 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.4.2.5, Section 8.4.4.2.5 and Section 8.5.4.2.3 | <p>Context: Tables 8.2-14, 8.4-9 and 8.5-5 demonstrate predicted mass flux (in mg/s) of COPCs in groundwater during the future centuries scenario. The table does not provide any information on actual surface water concentrations of COPCs or accumulation in concentrations over time. It is not possible to determine what the COPC concentrations in surface water and sediment will be during the future centuries scenario with the current information.</p> <p>Additionally, only a subset of parameters have been provided in this table based on parameters that were elevated in effluent after treatment. Groundwater may have a variety of different COPCs with elevated concentrations as it will migrate directly from the ore body area and not receive treatment.</p> <p>Rationale: It is not possible for ECCC to assess the predicted concentrations of COPCs in surface water and sediment, and therefore risk to aquatic biota during the future centuries scenario with the provided information.</p> | <p>1. Provide the predicted water and sediment quality concentrations of COPCs in the receiving environment for the future centuries scenario.</p> <p>2. Include data for a greater suite of COPCs that were assessed as having potential to be at elevated concentrations in groundwater.</p> | See response in Attachment IR-116. | The EIS will be updated with the information provided in Attachment IR-116. Specifically, Table 8.2-14 and Table 8.4.9 of the EIS will be replaced by Table 1 of Attachment IR-116 and Table 8.5.5 will be replaced by Table 2 of Attachment IR-116.. |
| IR-117 | CNSC | Human health with respect to hazardous contaminants | Section 8.2.4, Table 8.2-9 | <p>Context: CNSC staff note that some of the effluent quality predictions in the EIS are quite high for a uranium mine and mill facility compared to the existing facilities.</p> <p>For example, the upper bound effluent quality of molybdenum is 2.5 mg/L. In 2021, the highest monthly mean concentration at the existing uranium mine and mill facilities is 0.213 mg/L.</p> <p>Also, the upper bound effluent quality of copper is 0.022 mg/L. In 2021, the highest monthly mean concentration at the existing uranium mine and mill facilities is 0.002 mg/L.</p> <p>Rationale: Surface water quality models should be based on the anticipated effluent quality. From discussions with Denison, it appears that the effluent quality predictions may change based on the results of more bench scale tests that are still being conducted and continued optimization of the design of the water treatment plant.</p> | <p>Please provide the anticipated effluent quality of the constituents of potential concern during normal operations.</p> <p>Once Denison has refined the effluent quality predictions, Denison is expected to update the inputs into the surface water quality model.</p> | <p>The anticipated effluent quality of constituents of potential concern during normal operations presented in the draft EIS is based primarily on lab tests conducted by Denison with a safety factor of three added. Section 3.1.1.2 of the ERA (Appendix 10-A) states: "The reasonable upper bound treated effluent was derived using a combination of information available from lab tests conducted by Denison as well as derived effluent quality based on not exceeding water and sediment quality guidelines in the middle part of Whitefish Lake. Effluent treatment feed solution was prepared by leaching drill core material from the Phoenix deposit, and further processing that solution through two steps (process precipitate removal and yellowcake precipitation) prior to effluent treatment testing. Effluent treatment tests incorporated three stages: low pH, high pH, and neutralization. A combination of reagents (iron sulphate, barium chloride, lime, and sulphuric acid) was used to facilitate precipitation of constituents. After each stage, solid-liquid separation was conducted by mixing flocculant with solution to settle solids to the bottom of the test vessel. The supernatant liquid was used for the following stage. The solids were washed, filtered, and dried to determine solids mass generation for mass balance purposes. For each stage, the liquids and solids were assayed for various COPCs. The reasonable upper bound effluent was usually an expected effluent quality from Denison multiplied by a safety factor of three." The derived effluent quality based on not exceeding a water and sediment quality guideline was only used for a handful of constituents. The ERA will be revised to remove lead-210 from the list of constituents that used the derived effluent quality, as the concentration was based on Denison lab tests. In addition, Section 3.1.1.2 of Appendix 10-A will be modified to state: "The derived effluent quality was used for a handful of constituents including cadmium, chromium, and selenium".</p> <p>Denison intends to continue to refine effluent quality predictions as part of the BATEA assessment and licensing phase of the Project. The effluent quality predictions provided in the EIS will continue to bound the assessment and provide a conservative representation of risk to human health and the environment. No changes to the EIS are proposed in this regard. See also responses to IR-16 and IR-18.</p> | <p>Revisions to the draft EIS and ERA (Appendix 10-A) will be made per the IR response as indicated below.</p> <p>Section 10.1.4.2.2 of the EIS and Section 3.1.1.2 of the ERA (Appendix 10-A) will be revised to remove lead-210 from the list of constituents that used the derived effluent quality, as the concentration was based on Denison lab results. The text in both sections will read "The derived effluent quality was used for a handful of constituents including cadmium, chromium, and selenium."</p> |
| IR-118 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.2.6.1, Section 8.4.6.1 and Section 8.5.6.1, Aquatic Environment | <p>Context: It is unclear if Tables 8.2-16, 8.4-12, 8.5-7 and 8.5-8 take into consideration potential effects from groundwater seepages of COPCs to surface water and sediment quality in the future centuries scenario. No information regarding the future centuries scenario has been provided in the rationale summary for ratings.</p> <p>Rationale: Groundwater seepage of COPCs may have future impacts to surface water quality, sediment quality and aquatic receptors; however, the extent of residual effects is unclear without further information.</p> | Provide further information regarding how groundwater seep. of COPCs may have future impacts to surface water quality, sediment quality, and aquatic receptors, and any residual effects that may persist. | It can be confirmed that Tables 8.2-16, 8.4-12, 8.5-7 and 8.5-8 did take into consideration potential effects from groundwater seepages of COPCs to surface water and sediment quality in the future centuries scenario. Ground water contributions to surface water as a result of excursions or migration from the shallow groundwater aquifer to Whitefish Lake was well documented in Section 7 and Appendix 7-C. For the COPCs identified in the effluent, the predicted mass flux from groundwater into Whitefish Lake Middle starting 200 years after the Project phases, during the future centuries, was input to the IMPACT model to predict the water and sediment concentrations over time at the exposed locations. The COPCs in groundwater will be released to Whitefish Lake Middle at a predicted mass flux as shown in Table 3-4 (Appendix 7-C) The results of the predictive modelling were then used to support | No EIS updates are anticipated to address this IR. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-----------------------|--|--|---|--|---|
| | | | | | | the environmental risk assessment to assess potential impacts and risks to surface water, sediment and aquatic biota. The IMPACT model scenario for the future centuries was undertaken specifically to investigate the potential for groundwater migration to Whitefish Lake in future centuries to impact the aquatic environment of Whitefish Lake. For each medium or receptor (i.e., surface water, sediment or aquatic biota) no risk was identified during the future centuries period (Appendix 10-A). Additional information concerning potential impacts of groundwater interactions with Whitefish Lake are provided in IR-116. | |
| IR-119 | CNSC | Fish and fish habitat | Section 8.3.1.2, Table 8.3-1, Sediment quality | <p>Context: Sediment quality isn't considered a key indicator for fish and fish habitat, but the accumulation of contaminants in sediment porewater without habitat alteration is similar to the key indicator 'change in surface water quality from baseline conditions' that is considered.</p> <p>Rationale: It is not clear whether sediment was just considered for physical disturbance, and why chemical changes are missing from key indicator list for fish and fish habitat.</p> | Please provide the rationale for exclusion of sediment quality from the key indicator list for fish and fish habitat. | <p>Sediment quality was not included as an indicator for the Fish and Fish Habitat VC, rather Sediment Quality and Benthic Invertebrates were elevated to VCs within the EIS (Section 8.4). In the draft EIS Section 8.4.1.1, Sediment Quality VC was identified as having interrelations or linkages to Benthic Invertebrates (VC) as their medium of support to life-cycles as well as the Fish and Fish Health VC. Specifically, the sediment that benthic invertebrates inhabit as the medium responsible for their ability to carry out their life processes. Benthic invertebrates provide an important forage base for fish species. Aquatic sediments and benthic invertebrates (food supply) are inferred as part of the definition of fish habitat under subsection 2(1) of the Fisheries Act, 1985 (Government of Canada 2019).</p> <p>Alterations to Sediment Quality in an aquatic environment can directly affect Fish and Fish Habitat and this was taken into consideration both with respect to physical and chemical changes. Under Section 8.4.1.2 and Table 8.4.1, key indicators and measurable parameters for sediment quality were provided and included:</p> <ul style="list-style-type: none">- Sediment quantity and physical quality (particle size) from baseline conditions- Change in sediment quality (chemical) from baseline concentrations <p>The results of the assessment of potential effects and significance of those effects for sediment quality as a VC are directly translatable to Fish and Fish Habitat as identified in Sections 8.3.1.1 and 8.4.1.1. As such, providing the same assessment within both sections is considered redundant.</p> | No EIS updates are anticipated to address this IR. |
| IR-120 | CNSC | Aquatic species | Section 8.3.3 and 8.5, Aquatic Environment | <p>Context: Although downstream impacts are not predicted by Denison it is important from an ecosystem perspective to establish baseline locations to monitor for potential cumulative effects to the aquatic environment due to the Key Lake and Wheeler River Operations to ensure the aquatic environment is being protected from cumulative impacts.</p> <p>Denison should consider adding a far-field exposure location and collecting baseline aquatic ecosystem baseline data in Russell Lake including:</p> <ul style="list-style-type: none">• Water quality/chemistry• Sediment chemistry/quality• Benthic invertebrate chemistry /community• Large-bodied fish tissue/chemistry <p>Rationale: Russell Lake is identified as part of the RSA for the aquatic environment, but it appears that no detailed aquatic baseline data was completed in far-field location in Russell Lake. In addition, several Indigenous Nations and communities and local resource users have indicated that Russell Lake is an important body of water both culturally for traditional use and was once used as commercial fishery.</p> | <p>If Denison has not collected baseline aquatic studies in the far-field downstream receiving environment of Russell Lake, please provide a rationale for why.</p> <p>If a far-field Russell Lake location was sampled as part of baseline data collection, more information about the process and results with regards to sampling at Russell Lake should be included in the EIS. This information would be valuable to help determine potential cumulative effects downstream in the Russell Lake drainage system (due to the Key Lake Operation) which has been identified as a key concern and area of interest by several Indigenous Nations and communities.</p> | <p>Aquatic baseline surveys were conducted at two stations (LAB-1 and LAB-2) in Russell Lake and were considered 'far-field' stations in relation to the proposed mining plan for the Wheeler River Project. Data collection methods and results are presented in the draft EIS throughout the applicable subsections of Section 8.</p> <ul style="list-style-type: none">• Section 8.2 details the Surface Water Quality methods and results,• Sections 8.3 and 8.5 detail fish habitat, community, and health methods and results; and• Section 8.4 details sediment quality and benthic invertebrate community and chemistry methods and results. <p>A breakdown of where specific processes and results are located for each of these components is presented below:</p> <p><u>Surface Water Quality/Chemistry:</u> Surface Water Quality was sampled in Russell Lake. Methods and metrics are presented in Section 8.2.3.1. Water was sampled in Russell Lake and presented in Table 8.2-2 (Pages 8-60 to 8-62) of Section 8.2.3.3 of the EIS report, and summarized in Table 8.2-4. Surface Water predicted maximum Constituents of Potential Concern for the Russell Lake Inlet (LAB-1) are presented in Table 8.2-13 of Section 8.2.4.2.4. Cumulative effects are also assessed in Section 8.2.7. Detailed baseline summary data is presented in Appendix 8-D of the report in Table 3-3.</p> <p><u>Sediment Quality/Chemistry:</u> Sediment was sampled in Russell Lake, and the sample methodology is presented in Section 8.4.3.1. Sediment grain size results are summarized in Table 8.4-2 in Section 8.4.3.2.1, and full data is presented in Appendix 8-D, Table 3-4. Sediment chemistry was summarized in Table 8.4-3, and full data is in Appendix 8-D, Table 3-5.</p> <p><u>Fish Habitat, Tissue Chemistry, and Community:</u> Russell lake is not clearly indicated in the initial list of sample areas presented in Section 8.3.3 or Section 8.5.3; however, habitat information is presented in the Fish Habitat table (Table 8.3-4) of Section 8.3.3.2, and both Russell Lake sample locations (LAB-1 and LAB-2) and their associated fish community data are presented in the fish community map (Figure 8.3-6). Fish community and information is also presented in Table 8.3-4. Baseline fish community information is presented in Appendix 8-D of the report in Table 3-9. Fish chemistry summary data (Mean, Max, Min) for Northern Pike and White Sucker bone and tissue samples is presented in Table 8.5-2 of Section 8.5.3 of the Draft EIS. Detailed fish tissue data summary is presented in Appendix 8-D of the report in Table 3-10.</p> <p><u>Benthic Invertebrate Chemistry and Community:</u> Benthic invertebrates were sampled in Russell Lake, and the sample methodology is presented in Section 8.4.3.1. Benthic invertebrate endpoints are summarized in Table 8.4-4 of Section 8.4.3.2.4, and benthic invertebrate chemistry is summarized in Table 8.4-5. Detailed baseline benthic invertebrate community and chemistry data is presented in Appendix 8-D of the report in Table 3-8, and community data in Tables 3-7A to 3-7D.</p> <p>Also, refer to Cumulative Effects sections (Section 8.X.7) within each part of the Aquatic Environment assessment in the draft EIS for a discussion of potential cumulative effects in Russell Lake. (i.e., Section 8.2.7 for surface water quality; Section 8.3.7 for fish and fish habitat, 8.4.7 for sediment quality and benthic invertebrates, and 8.5.7 for fish health).</p> | No updates to the draft EIS are needed based on this IR response. |
| IR-121 | CNSC | Fish and fish habitat | Section 8.3.3.1, Methodology and Metrics | <p>Context: In the description of methodology for fish communities and spawning surveys, there's no mention that could be found for an any evaluation of fish condition, other than sexual condition.</p> | Please provide reference to where fish condition is considered or provide a justification for its exclusion. | Field work was conducted by aquatic biologists that are familiar with the identification of fish condition and abnormalities as it pertains to fish sampling protocols and the MDMER EEM guidance and protocols. As such, the lack of record of such gross abnormalities is reflective of fish populations of good condition. Any supplemental baseline surveys or future | No updates to the draft EIS are needed based on this IR response. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|---|--|--|--|--|---|
| | | | | Rationale: Exposure to other pre-existing stressors could result in abnormal conditions or deformation(s) in existing population, but the extent of existing conditions should be evaluated to ascertain whether the rate is increasing as a result of proposed activities once in operation. | | environmental effects monitoring will include documentation of fish condition and abnormalities. | |
| IR-122 | CNSC | Fish and fish habitat | Section 8.3.8, Monitoring and Follow-up | Context: Section 8.3.8 of the EIS states: "Changes in fish communities/populations will be assessed through comparison of Construction, Operation, and Decommissioning results to pre-development." Rationale: Tracking changes in fish communities / populations in reference lakes over time should be conducted, as reference lakes can be used to differentiate natural temporal variation with potential project impacts. | Please include reference lakes, and if it is provided, please reference where in the EIS these are discussed. If there are no reference lakes, these should be included in the monitoring program. | The preparation of a study design under the MDMER EEM program strives to ensure that a single reference area or multiple reference areas are as representative of a control condition as possible. Best practice is to undertake an analysis of candidate reference areas using the existing baseline information and investigate their utility as controls prior to project development. A preliminary EEM study can be completed prior to the commencement of ISR operations that will allow for a Before-After-Control-Impact study design, that will provide the ability to monitor change not only in the exposure areas, but in the reference areas, thereby allowing for a reasonable assessment of potential mine related impacts. | No updates to the draft EIS are needed based on this IR response. |
| IR-123 | ECCC | Change to an environmental component due to radiological contaminants | Section 8.4.3.2.3, Aquatic Environment Appendix 8-D, Table 3-5 | Context: Table 8.4-3 provides a summary of the baseline concentrations of COPCs in sediments in the LSA. Sediment quality thresholds and justification for the selection of those thresholds have not been provided. Table 3-5 in Appendix 8-D does provide benchmarks but the selection of benchmarks is not discussed, and the most stringent guidelines are not used for some COPCs. Additionally, there is no data provided for sediment concentrations of mercury, which is a COPC that requires surface water quality monitoring and effluent characterization under the MDMER. Rationale: Further information should be provided regarding any exceedances of sediment quality thresholds in baseline concentrations of COPCs, which should be recommended for further assessment of risk due to effluent discharges. | 1. Provide sediment quality thresholds and justification for the selection of those thresholds for comparison against measured baseline COPC concentrations in the LSA. 2. Provide data on baseline concentrations of mercury in sediment. 3. Identify any COPCs with baseline concentrations that exceed sediment quality thresholds in the LSA. | 1) Please see Attachment IR-123, Table 1, for a summary of baseline sediment concentrations and their respective screening criteria. As indicated in Appendix 10-A Section 3.1.2.3, “Burnett-Seidel and Liber (2013) was selected as the preferred source for the Project thresholds in the sediment quality assessment, as the reported NE2 and REF values are specifically applicable to Saskatchewan waterbodies.” Burnett-Seidel and Liber (2013) was used even if higher than CCME quality guidelines or Thompson et al (2005). In some instances, the NE2 value was lower than the REF value from Burnett-Seidel and Liber (2013). In those instances, the REF value was still used, as screening values should not be lower than background concentrations. 2) Mercury was not analyzed specific to sediments within the LSA during the initial baseline data collection period. Analysis of mercury at a low-level in sediment was not considered necessary for two reasons: 1. mercury is not associated with the uranium mining and milling process and 2. water quality sampling within the LSA indicated levels of mercury below detection at an acceptable level of detection (i.e., 0.00001 to 0.0000001 mg/L). Denison will collect background information pertaining to sediment total and methyl mercury from LSA lakes and streams prior to site development. 3) Please see Table 1 of Attachment IR-123 for a summary of baseline sediment concentrations and their respective screening criteria. One sample concentration for Cadmium of 0.7 µg/g (LAB-2-3) at Russell Lake exceeded the CCME ISQG of 0.6. Another value of 0.6 µg/g (LAB-2-CORE) at Russell Lake equaled to the CCME ISQG of 0.6. All other samples had cadmium concentrations below any screening criteria. References: Burnett-Seidel, C., Liber, K., 2013. Derivation of no-effect and reference-level sediment quality values for application at Saskatchewan uranium operations. Environ. Monit. Assess. 185, 9481–9494. Thompson, P.A., Kurias, J., Mihok, S., 2005. Derivation and use of sediment quality guidelines for ecological risk assessment of metals and radionuclides released to the environment from uranium mining and milling activities in Canada. Environ. Monit. Assess. 110, 71–85. | No updates to the draft EIS are needed based on this IR response. |
| IR-124 | ECCC | Change to an environmental component due to hazardous contaminants | Section 8.4.4.2.3, Aquatic Environment | Context: Table 8.4-7 provides maximum concentrations of surface water COPCs in sediment. The following COPCs, which are required to evaluate the risk from effluent to sediment quality, were not evaluated: <ol style="list-style-type: none">COPCs that have monitoring requirements in receiving environment surface water and effluent under the MDMER,COPCs that exceed water quality guidelines in effluent, and,COPCs that have baseline concentrations that exceed sediment quality thresholds in the receiving environment. Rationale: Due to the lack of information on COPCs with baseline concentrations that exceed sediment quality guidelines, and COPCs that require monitoring under the MDMER, a determination on risk to sediment quality and aquatic biota cannot be made. | 1. Provide the information on baseline exceedances of COPCs in sediment. 2. Provide an assessment of risk for any COPCs that have baseline exceedances of sediment quality thresholds in the receiving environment. 3. Provide an assessment of risk from any COPCs that require monitoring in the receiving environment and effluent under the MDMER. Please include any COPCs in effluent that will exceed water quality guidelines. | 1) The information on the baseline exceedance of COPCs in sediment are provided as part of Attachment IR-123. The table indicates that only the maximum concentration of cadmium exceeded the CCME ISQG on one occasion when assessing all sediment samples over the course of baseline surveys in the LSA. 2) Only one sample concentration for Cadmium of 0.7 µg/g (LAB-2-3) at Russell Lake exceeded the CCME ISQG of 0.6 within the RSA. Another value of 0.6 µg/g (LAB-2-CORE) at Russell Lake equals to the CCME ISQG of 0.6. All other samples had cadmium concentrations below any screening criteria. Cadmium was included as one of the constituents identified as a COPC under the non-radiological Ecological Risk Assessment (Appendix 10-A). No significant adverse effect on either aquatic or terrestrial populations or communities, as a result of releases from the Project, are predicted during the Project phases or during the future centuries. All estimated total HQs for all COPCs (arsenic, cadmium, chromium, cobalt, copper, molybdenum, selenium, uranium, zinc, chloride, and sulphate) for all ecological receptors are predicted to remain below the HQ benchmark of 1. 3) Denison has provided an analysis of the parameters that are identified under MDMER Schedule 4 and therefore have specified effluent discharge criteria. Schedule 5 parameters will be monitored as per the MDMER once under this regulation (i.e., meeting regulated criteria of discharge to the environment [50 m3/day). Please refer to Table 8.2-13 of attachment IR-114. In these cases, COPCs including Schedule 4 parameters were below screening criteria. | Changes suggested for Table 8.2-13 as consistent with IR-114. |
| IR-125 | CNSC | Fish and fish habitat | Section 8.5, Aquatic Environment and Fish health | Context: Indigenous Knowledge studies and information collected in relation to the Project clearly identified the importance of water quality and fish health to local Indigenous peoples and is discussed throughout the Draft EIS. For example: <ul style="list-style-type: none">“Russell is one lake where I commercially fish. How will this effluent impact the water quality, fish health? Will I be able to sell fish from here? If there is going to water” pollution, I just want to know” (19-LK-ERFNTrip-134.255) ”“How are you going to protect the water quality? We are concerned about mercury in fish, other animals, etc. Is there mercury or arsenic in the uranium solution?” (p. 8-53) | One of the many mitigation measures mentioned throughout the aquatic environment section states: “Denison will work with the associated communities to develop and implement the Project-specific monitoring programs and a framework to share the results for the purpose of assessing the performance of the water management system.” (p.10-32) Has Denison considered the collection of additional baseline fish tissue species that are of importance to Indigenous Nations and communities and local cabin owners from | Fish tissue chemistry (bone and muscle) was collected for Northern Pike and White Sucker and presented in Table 8.5-2 of Section 8.5.3. Tissue was not collected for Walleye or Lake Whitefish, however, the tissue analysis of Northern Pike and White Sucker would be key indicators for the fish community in Russel Lake. Northern Pike is a piscivorous top predator much like Walleye, which would address concerns of bioaccumulation of mercury and other metals of concern. White Sucker is a generalist bottom feeding species that is often used to assess metal concentrations at a lower trophic level of the food chain. This information provides an initial baseline understanding of the tissue metal concentrations for the fish of Russell Lake. The outcomes of the impact assessment demonstrated there will be no expected impact to Russell Lake with respect to water quality, sediment quality or fish and fish habitat. As | No updates to the draft EIS are needed based on this IR response. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates | | | | | | |
|-----------------|-----------------------|---|--|--|--|--|---|-----------------|-----------------------|------|-------|------|-------|
| | | | | Rationale: Several Indigenous Nations and communities and local resources users have indicated Russell Lake is an important body of water both culturally for traditional use and was used as commercial fishery in the past and from an aquatic ecosystem perspective. | Russell Lake? Assuming the species would be walleye (commercially and recreationally) and lake white whitefish that is traditionally an important species consumed. Please provide more information on the engagement to date on the development of the Surface Water Management Program and Monitoring program that Denison is developing and engagement to date with interested Indigenous Nations and communities in the region on fish and fish health. | discussed in the response to IR-120 and this IR, historic information from Russell Lake is available, but may require supplementation prior to project development to monitor potential changes to the aquatic environment in the lake. Engagement on licensing requirements, such as the development of the environmental monitoring program and the associated surface water quality and monitoring regime will occur in later in 2023 and 2024. As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Metis Local on monitoring regimes, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. Denison expects that important country foods harvested for food and cultural purposes (i.e moose, fish species, etc), surface water quality, and other areas of interest will form part of this monitoring program, including the potential to report on wildlife-vehicle mortality or other such areas of potential concern as they evolve over time. It is expected that the data collected through such monitoring regimes as described above would also be relevant to other Indigenous nations who may have interest in the Project. | | | | | | | |
| IR-126 | ECCC | Aquatic species | Section 8.5.3 Appendix 10-A (ERA), Section 5.3.1.1.8 | Context: The Proponent has used the US Environmental Protection Agency (US EPA) guidelines for the assessment of selenium fish tissue concentrations in Section 8.5.3 of the draft EIS and in the Environmental Risk Assessment (ERA) in Appendix 10-A (ERA) of Section 10. Rationale: ECCC’s Federal Environmental Quality Guidelines of 6.7 ug/g dry weight fish whole body tissue for selenium should be used, as it is more protective than the US EPA guidelines. | Update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA (Appendix 10-A (ERA) in Section 10) as needed using ECCC’s FEQG. | Denison is aware of the ECCC Federal Environmental Quality Guideline for selenium in fish. The ECCC FEQG is for fish tissue egg-ovary and whole-body. Denison selected the US EPA guideline over the ECCC guideline since US EPA provides guidelines for fish tissue muscle as well. The fish assessed in the ERA were large-bodied fish including northern pike and white sucker. A fish tissue muscle TRV is appropriate for assessment of large-bodied fish; therefore, the US EPA selenium fish tissue muscle benchmark was preferred over the whole body value from ECCC. | No updates to the draft EIS are needed based on this IR response. | | | | | | |
| IR-127 | CNSC | Aquatic environment | Appendix 8-E, Section 1.2.1, Hydrological Inputs | Context: Within this section it states that the 7Q10 low flow rate used in the mixing assessment “was provided verbally to Ecometrix by NewFields Canada during a project meeting on 26 April 2022” Rationale: The statement that this value was provided verbally is not an infallible method of communicating data, as the value could have been misheard, misremembered, or recorded improperly. | Please verify that the 7Q10 value used in the assessment is the correct value determined by NewFields. | The value used in the assessment (0.616 m³/s) is the correct value determined by NewFields. The value was calculated by NewFields as the inflow from SA-6 to Whitefish Lake and therefore considered representative of the flow in the northern basin of LA-5. This value will be specifically updated in Appendix 8-C (Table 3-3: 7Q10 Estimated Discharge) and Appendix 8-E (Section 1.2.1 to be changed to reference Appendix 8-C, Table 3-3) for clarity. | Appendix 8-C Table 3-3:7Q10 Estimated Discharge will be updated as shown below. TABLE 3-3: 7Q10 ESTIMATED DISCHARGE <table><tr><th>Assessment Node</th><th>7Q10 Flow Rate (m³/s)</th></tr><tr><td>LA-1</td><td>0.874</td></tr><tr><td>LA-5</td><td>0.616</td></tr></table> <small>Note: m³/s = cubic meters per second</small> | Assessment Node | 7Q10 Flow Rate (m³/s) | LA-1 | 0.874 | LA-5 | 0.616 |
| Assessment Node | 7Q10 Flow Rate (m³/s) | | | | | | | | | | | | |
| LA-1 | 0.874 | | | | | | | | | | | | |
| LA-5 | 0.616 | | | | | | | | | | | | |
| IR-128 | CNSC | Current use of lands and resources for traditional purposes | Section 9 Various pages in section 11.1, Land and Indigenous Resource Use Section 12 Section 14 | Context: The increased road traffic (14-18 trucks per day during construction/operations) may have indirect impact on ungulates, furbearers and wood land caribou presence/absence for traditional and subsistence hunting have been raised to CNSC staff when meeting with Indigenous Nations and communities and are presented in the EIS. Rationale: The increased traffic and therefore dispersal of game (moose, woodland caribou) due to increased traffic has been raised as a concern with respect to increased mortality on wildlife and decreased ability to practice traditional rights. | How have the potential residual impacts with respect to increased traffic and noise (due to current and future operations) been communicated to Indigenous Nations and communities who use the road #914 for cultural and traditional activities (such as moose harvesting, berry picking and small game and birds)? Please provide any additional information on the engagement that has taken place to date with Indigenous Nations and communities with respect to concerns and potential impacts on current use of lands and resources due to increased road traffic, and any mitigation measures proposed by Indigenous Nations and communities to minimize the potential impacts. | The potential residual impacts with respect to increased traffic and noise were communicated to ERFN and KML during engagment and through pre review of the EIS and have documented their regular use of the road. Proposed mitigation measures in relation to vehicle traffic were also communicated. Please see draft EIS, Section 4 record of consultation (ROC) 618, 619 and 620. The findings in relation to the potential for residual impacts as a result of change in traffic will be shared again in future engagement activities, expected in late September and early October 2023. Any additional input will be integrated into the final EIS, as part of the commitment made under IR-28. As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has collaborated with ERFN and KML to develop additional mitigation measures specific to these Communities. These include: 1) Assisting ERFN to provide clear highway identification for the location for the Mawdsley Reserve, where many cultural camp activities occur 2) The same is offered to KML; however, the current km 67 Culture Camp for KML was burned in the May 2023 forest fires, and so this will be executed in the future at such time as KML selects a new location. 3) The commitment by Denison to slow truck traffic down for a minimum of 2.5 km on either side of the culture camp(s) to 40 km/hr, during the months of September and October. 4) To communicate this new slowing protocol to Denison's contractors and other operators in the area, to inspire best practice for other operators in the area. | The EIS will be updated to reflect the additional mitigations to which Denison has committed, per the IR response. Specifically, the following will be added to the text of Section 11.1.5.3 and 12.3.5 within the context of traffic mitigation <u>Traffic</u> <ul style="list-style-type: none">Assist ERFN to provide clear highway identification for the location for the Mawdsley Reserve.If requested, assist KML to provide clear highway identification at the km 67 Culture Camp or other selected location.Require Denison truck traffic to slow to 40km/hr for a minimum of 2.5 km on either side of the culture camp(s), during the months of September and October.Communicate the slowing protocol to Denison's contractors and other operators in the area, to encourage best practice for other operators in the area. | | | | | | |
| IR-129 | CNSC | Current use of lands and resources for traditional purposes | Section 9 Section 10 Section 11, including Section 11.1.4.3.1 (p. 11-46) Section 12 Section 16 | Context: ERFN indicated they are concerned about declining moose populations from an influx of hunters; more people may be accessing the area year after year, and worried populations may be affected by the Project (21-EN-ERFN-473.13). Further, the EIS highlights that: “Vehicle collisions are the most likely source of direct mortality for moose. Effective mitigation measures (e.g., breaks in snowbanks; speed limits; and exclusion fencing around contaminated waste pads and ponds) will be implemented to reduce moose mortality.” (p. 11-46) Rationale: The Technical Guidance for Assessing the Current Use of Lands and Resources for Traditional Purposes under CEAA 2012 notes: “The views of affected Aboriginal groups on mitigation be considered and included in the EIS. This could assist in ensuring that the environmental effects on the current use of land and resources for traditional purposes are at an acceptable level for the community.” Sources for indirect moose mortality (e.g., increased hunter access, changes to health due to sensory disturbances, changes to predator-prey dynamics) may result in mortality outside the Wildlife LSA. The | Please provide additional information on the discussions Denison has had with Indigenous Nations and communities on how to mitigate any residual project impacts on their traditional harvesting activities of large game such as moose. More information is required to determine if Denison has engaged directly with ERFN/KML and other Indigenous Nations who utilize the area to harvest moose to determine current baseline harvest numbers that provide subsistence, continued cultural identity and community well-being, as well as discussions on how the project could potentially impact moose populations and the harvesting of moose for traditional practices. | Potential project related changes to moose are detailed in Section 9 of the EIS, and include potential changes associated with vegetation removal and/or ground disturbance (i.e., loss of habitat), sensory disturbances, and vehicular collisions. Mitigations to minimize these potential effects include minimizing the extent of the Project area and associated disturbances to the extent practicable, standard mitigation measures to minimize air emissions, dust, light and noise, exclusion fencing around waste pads and ponds, and measure to minimize direct mortality through vehicular collisions through driver training and safety practices. Baseline harvest information was shared by the Indigenous Communities of Interest through Indigenous and traditional knowledge studies which were considered by all discipline leads in the assessment process. Information on moose is specifically documented in: <ul style="list-style-type: none">Wheeler River Project - Summary of Traditional Knowledge Study Results (ERFN and SVS 2022b)English River First Nation Country Foods Study Final Report (CanNorth 2017a)Land use and occupancy maps shared with Denison by the Kineepik Metis localKineepik Valued Ecosystem Components – KML Pre-statement for Denison (KML 2022) Although Denison understands these documents are not representative of the complete extent of Indigenous moose harvest, recorded harvests proximal to the Project are document | No updates to the draft EIS are needed based on this IR response. | | | | | | |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|----------|------------|--|--|---|--|---|--|
| | | | | <p>residual effect of change in moose mortality is likely to occur. Although mitigation measures are expected to reduce, but not fully eliminate, the residual effect on moose.</p> <p>The potential residual impact on the moose and other large game populations in the broader regional study area may potentially impact Indigenous treaty rights, culture, and community well-being if the harvesting of moose and large game declines due to increased traffic, noise, and vehicle mortality or increased outside hunting pressure.</p> | | <p>in Section 11.1.4.3.1 of the EIS, and further harvest in the local and regional study areas are noted in each. Moose is central to the traditional diets of these communities, and as noted in the English River First Nation Country Foods Study Final Report (CanNorth 2017) were the most commonly consumed species by ERFN citizens. Interest and concerns about the Project’s potential interactions with moose populations are also noted in the engagement record, for example the engagement record notes that, for ERFN, moose is a [hunting and food] mainstay and there is concern for how moose would be impacted.</p> <p>To address potential concerns specific to Project related effects to wildlife species of interest to the Indigenous Communities of Interest, Denison has committed to collaborating with ERFN and KML on a monitoring regime suited to each of their interests and needs. As part of this program, Denison and KML will be sharing information in an agreed-upon fashion, about agreed-upon species of interest. Denison expects that important country foods harvested for food and cultural purposes (i.e., moose, fish species, etc.), surface water quality, and other areas of interest will form part of this monitoring programing, including the potential to report on wildlife-vehicle mortality or other such areas of potential concern as they evolve over time. It is expected that the data collected through such monitoring regimes, as described above, would also be relevant to other Indigenous First Nations who may have interest in the Project.</p> | |
| JSIR-130 | CNSC | Physical stressors (noise and vibration) on wildlife | Section 9, Terrestrial Environment | <p>Context: Sensory disturbances such as noise have been identified as stressors for selected wildlife (Ungulates, Furbearers, and Woodland Caribou), birds and amphibians in the project area. However, there is no consideration of impacts from vibrations on these species. Also, impacts of noise and vibration on reptiles have not been assessed in the project area.</p> <p>Rationale: While noise has been qualitatively assessed for selected wildlife, birds, and amphibians, there is no consideration of project-related vibrations as a sensory disturbance/physical stressor. Sensitive terrestrial species (specifically, herpetofauna, amphibians, invertebrates, and caribou) can be impacted by vibrations emanating from the operation of heavy machinery, blasting activities, and other anthropogenic activities at the project site.</p> <p>Also, impacts of physical stressors (noise and vibration) on reptiles were not assessed. These species should be included in this assessment due to their sensitivity to noise and vibrations.</p> | <p>Please provide a discussion of impacts of physical stressors (specifically vibrations) on wildlife, birds, and amphibians in the project area. Specific mitigation measures and/or monitoring for impacts from project-related vibrations should be considered, as appropriate.</p> <p>Also, include reptiles in the assessment of project-related noise and vibrations as sensory disturbance/physical stressor, or a justification for their exclusion.</p> | <p>Vibration is a sensory disturbance that may affect some species and is inherently accounted for in the effects assessment by way of consideration of the sensory disturbance buffers that are recognized as areas of altered habitat (i.e., zone of influence) that may not be used as a result of the Project.</p> <p>Consideration of Project-related vibrations are considered in the responses to IR-46 within the context of vibrations generated by Low Frequency Noise (LFN). Unlike a conventional mining operation, vibration derived from LFN by the proposed operation is not expected. By extension, vibration related sensory disturbance outside the sensory disturbance buffer for habitat alteration already considered in the assessment would not be expected. Nevertheless, in response to the IR, specific mention of vibration will be added in the EIS where sensory disturbance is defined to provide further context to the assessment.</p> <p>Reptiles were not identified as a VC as part of the initial community consultations when the VCs were selected, and their ranges do not typically extend into northern Saskatchewan, and therefore, were not included in the effects assessment. Also, the potential for occurrence of reptiles within the Project footprint is expected to be low.</p> | <p>In the final EIS, discussion of habitat alteration in Sections 9.3 and 9.4 will be updated to include consideration of vibrations.</p> <p>For example: “Habitat alteration through sensory disturbance effects (such as noise, dust deposition, vibrations, and artificial light) is expected to result in reduced habitat quality and effectiveness near Project components and infrastructure reaching beyond the Project Area into the Wildlife LSA.”</p> |
| IR-131 | CNSC | Migratory birds, Wildlife and Wildlife Habitat | Section 9, Terrestrial Environment | <p>Context and Rationale: As per the requirement outlined in Section 79 of the Species at Risk Act (SARA): <i>The person must identify the adverse effects of the project on the listed wildlife species and its critical habitat and, if the project is carried out, must ensure that measures are taken to avoid or lessen those effects and to monitor them. The measures must be taken in a way that is consistent with any applicable recovery strategy and action plans. This is accomplished by ensuring that the Proponent has identified, avoided, lessened and will monitor effects to species at risk.</i></p> <p>As per the CNSC’s Generic Guidelines for the Preparation of an EIS pursuant to the Canadian Environmental Assessment Act, 2012: <i>“The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the proponent intends to implement them and the environmental outcome the mitigation is designed to address. The EIS will describe mitigation measures in relation to species and/or critical habitat listed under the Species at Risk Act (SARA). These mitigation measures will be consistent with any SARA permit, applicable recovery strategy and/or action plan”.</i></p> <p>The draft EIS neither lists the adverse effects to all listed schedule 1 SARA species, nor outlines the measures that will be taken to avoid or lessen these effects. The Proponent references that additional species-specific mitigations will be detailed in environmental management plans but has not provided those plans for review.</p> | <p>Identify all species at risk listed on Schedule 1 of the Species at Risk Act and their critical habitat that are likely to be affected by the Project and describe how they may be adversely affected by the Project. Describe what measures will be taken to avoid or lessen the effects of each Project activity and stage, and how these effects will be monitored to ensure they are avoided or minimized.</p> | <p>As Key Indicators of Valued Components, the EIS includes terrestrial wildlife and avian species that may occur in the Project study areas and are listed on Schedule 1 of the federal Species at Risk Act. Project effects on these species and their habitats are described and assessed, and mitigation measures are included to avoid or reduce the potential for adverse effects on these species and their habitats. The Project effects and associated mitigation measures described in the draft EIS are broadly applicable to SAR species that occupy the same ecological niches.</p> <p>In response to the IR further information has been developed that is specific to SAR and included as Attachment IR-131. This includes a listing of all SAR species potentially occurring in the Project study areas, with links to applicable and appropriate mitigation measures described in the EIS. It is proposed the content of Attachment IR-131 will be added as a new appendix (Appendix 9-D) to Section 9 of the final EIS. The information provided in the SAR appendix includes a summary of the life history requirements, the expected Project effects, proposed mitigation measures, and anticipated residual effects on these listed species.</p> | <p>A new SAR appendix (new Appendix 9-D) will be added to Section 9 of the final EIS. It has been included here as Attachment IR-131.</p> |
| IR-132 | ECCC | Wildlife and Wildlife habitat | Section 9, Terrestrial Environment | <p>Context and Rationale: ECCC has identified that three species at risk arthropods (yellow banded bumble bee, transverse lady beetle, and nine-spotted lady beetle) have ranges overlapping the Project area and these were not mentioned in the draft EIS.</p> | <p>1. Conduct an effects assessment for arthropod species at risk.</p> <p>2. Explain what mitigation measures will be used to minimize potential effects.</p> | <p>Consideration of the three arthropod species at risk are included in Attachment IR-131.</p> | <p>A new SAR appendix (new Appendix 9-D) will be added to Section 9 of the final EIS. It has been included here as Attachment IR-131.</p> |
| IR-133 | ECCC | | Section 9, Terrestrial Environment | <p>Context and Rationale: There is potential for some species at risk (e.g., myotis species, barn or bank swallows, common nighthawk) to be attracted to and use mine infrastructure (buildings, roads etc.) once constructed for nesting, roosting, or foraging.</p> <p>Details on mitigation measures and adaptive management with respect to attraction to Project components should be identified to assess residual and cumulative impacts to species at risk.</p> | <p>For all Project phases, describe the mitigation measures and adaptive management to prevent and minimize effects on species at risk that may utilize mine infrastructure.</p> | <p>Specific exclusion measures will be added to the mitigation measures in Sections 9.3.5 and 9.4.5 of the EIS. These measures will be designed and appropriately applied to prevent or reduce access to Project infrastructure for roosting, nesting, and foraging, and are expected to address adverse Project-related effects on myotis species, barn and bank swallows, and common nighthawk.</p> <p>If bird nests (or tree cavities) should be encountered, any subsequent activities will be conducted in accordance with the 2022 Migratory Birds Regulations.</p> <p>The results of mitigation measures implemented, and any associated wildlife observations will be considered in an adaptive management process to determine if/when/where additional mitigation measures may be required.</p> | <p>The below exclusion measures will be added to Sections 9.3.5.2.5 and 9.4.5.2.4 in the final EIS:</p> <p>Buildings and other Project infrastructure will be designed and maintained to exclude birds (e.g., barn swallows) and bats as much as possible. This would include installing solid barriers (e.g., corner slope panels, wooden panels) or flexible barriers (e.g., netting, tarps or geotextiles) under roof eaves or other exterior surfaces.</p> |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|--|--|---|---|---|--|
| IR-134 | ECCC | Wildlife and Wildlife habitat | Section 9, Terrestrial Environment | <p>Context and Rationale: The draft EIS states in multiple places that vegetation clearing may occur year-round.</p> <p>In order to correspond with the timing of emergence from hibernation, tree clearing should not be conducted during the bat roosting period. If maternity roost trees are removed after pregnant females have established a roost area, there is a higher likelihood of abortion than there would be otherwise.</p> <p>Species-specific mitigations are required to protect bat SAR.</p> | Provide important roosting dates for bat species at risk in the Project area. | <p>Maternity roosts are used by pregnant females in late spring (April/May) either alone or in small groups. Females and their offspring roost in groups in nursery colonies in late summer/early fall prior to hibernation. Denison will adjust the activity timing windows to include the April/May maternity roosting period and the July/August nursery roosting period, to the extent practicable. Pre-construction surveys will identify all sensitive wildlife habitat features, including potential roosting trees (e.g., hollow trees, trees with defects, trees with cavities, and tree stumps). Should potential roosting trees be detected, consultations with the regulators will be initiated, and appropriate mitigation measures will be designed and implemented.</p> <p>This information above is provided in Attachment IR-131. This new SAR appendix (new Appendix 9-D) will be added to Section 9 of the final EIS.</p> | A new SAR appendix (new Appendix 9-D) will be added to Section 9 of the final EIS. It has been included here as Attachment IR-131. |
| IR-135 | ECCC | Migratory birds, Wildlife and Wildlife Habitat | Section 9, Terrestrial Environment | <p>Context and Rationale: The mitigation measures for birds and wildlife presented in the draft EIS are very general. Additional detail is required for a complete assessment of residual and cumulative Project effects to birds and wildlife.</p> <p>The Proponent has committed to providing a number of plans including, a Decommissioning Plan, a Spill Response Plan, a Waste Management Plan, a Surface Water Monitoring Plan, a Remediation and Closure Plan, a Radiation Protection Plan, a Soil and Vegetation Monitoring Plan, a Wildlife Monitoring Plan, and a Woodland Caribou Management Plan. In order to assess potential affects to migratory birds and wildlife from Project related activities, ECCC requires details on species-specific mitigation measures, and monitoring plans.</p> | <p>The following information should be included in the various plans and should be provided for review during the environmental assessment:</p> <ol style="list-style-type: none"> For all Project phases, describe the species-specific mitigation measures and responses to prevent and minimize effects on migratory birds or species at risk (SAR) birds and mammals that may utilize mine infrastructure. Explain how light pollution will be managed and what specific mitigation measures will be used to minimize effects to migratory birds and SAR birds and mammals. Provide details on what methods will be used for erosion control and how they will prevent sediment from entering waters frequented by migratory birds or SAR. Explain what actions will be taken if the erosion control measures are not successful. Provide details on noise and other sensory disturbance monitoring and mitigations if noise levels surpass thresholds. Describe time windows and species- specific mitigations related to maintenance activities such as vegetation management, road or building repair and stream crossing replacements. | <p>As noted in the draft EIS Section 1.7.5, Licensing and Permitting, the Project is proceeding through a sequential EA and licensing process. The IR refers to “plans” and that these plans should be provided in the environmental assessment for review. Commitments to develop such plans, and in some cases conceptual level information regarding a number of the proposed plans has been provided in the draft EIS. Given the sequential process to which Denison has committed to, it is Denison’s opinion that the level of information provided in the draft EIS and its supporting documents (including supplemental information provided in response to the IRs) is appropriate at this stage of the Project. It is planned that further detail will be developed and provided during licensing and permitting and that this information will be available for review at that time. Denison understands that the Project cannot move forward until the appropriate Program / Plan / Procedure documentation is in place and has received approval through the regulatory process. Denison believes that this context (that is, that the detailed “plan” information needed to support licensing and permitting has not be included in the EIS) is valuable in considering this IR, as well as other IRs with a similar theme.</p> <ol style="list-style-type: none"> The mitigation measures referenced to in Part 1 of the IR are considered in the response to IR-133 and the reviewer is referred there for additional information. Specific exclusion measures will be added to Sections 9.3.5 and 9.4.5 to prevent or reduce access to Project infrastructure, as noted in the response to IR-133 (and in the adjacent column). Means to manage light pollution and specific mitigation measures to minimize the potential for adverse effects on migratory birds and SAR birds and mammals will be added to Section 9.4.5.2.5 of the EIS as noted in the adjacent column. Erosion control measures have been identified in Section 8, Aquatic Environment, of the draft EIS. These same proven mitigation measures will be effective at mitigating adverse effects on waters frequented by migratory birds or SAR. For completeness, the erosion control measures from Section 8, Aquatic Environment, of the draft EIS will be added to Sections 9.3.5 and 9.4.5 of the draft EIS, as highlighted in the adjacent column. Proposed mitigation measures related to noise and sensory disturbance outlined in Section 6.2.5 of the draft EIS are considered to be adequate and appropriate to limit/localize potential adverse effects on wildlife and wildlife habitat, and include the following: <ul style="list-style-type: none"> not using the concrete batching plant and crusher during nighttime hours, where possible; locating the concrete batching operation as far away from sensitive wildlife features as possible; directing the generator discharge openings away from sensitive features; making use of available on-site obstructions to control sound exposure at sensitive areas (i.e., locate sources behind buildings); and collecting sound level measurements from the identified sources once they are operating and determining whether the actual effect is lower than that which was modelled. <p>Regarding monitoring, as outlined in Section 6.2.8 of the draft EIS, an EMS will be implemented and include noise monitoring plans to confirm that the Project is compliant with the federal and provincial guidelines. Sound levels will be monitored on a continuous basis using calibrated Class 1 sound level meters and data loggers, calibrated to a National Institute of Standards and Technology traceable standard within one year of its use in the program, and field calibrated using a Class 1 acoustic calibrator. Where possible, the sound level meters will utilize the same monitoring locations as were used in the baseline program to allow direct comparison and may be expanded to include the location of the nearest sensitive receptor where access is granted. Should monitoring show noise levels surpass modelled sound levels, Denison will implement corrective action to identify noise sources and reduce sound levels. Details of noise monitoring and an adaptive management process for the Project will be developed to support Project permitting and licensing.</p> <p>5. Information related to timing windows and species as it concerns Project activities has been provided in response to IR-134. As noted in the response to IR-134, Denison will schedule Project activity timing windows to appropriately consider all Valued Components and SAR requirements/sensitivities. For reference, additional information that will be added to the final EIS is described in the response to IR-134.</p> | <p>EIS updates in response to IR-135, part 1 are outlined in EIS Updates for IR-133.</p> <p>Section 9 of the final EIS will be updated to address the response to IR-135, part 2 as follows:</p> <p>Proposed mitigation measures related to light pollution will be added to Section 9.4.5.2.5. This includes using low lighting and/or task lighting (e.g., downturned shaded fixtures to prevent sky-lighting or bird disorientation), putting building lighting on sensors or timers, and potentially using a higher lumen/watt ratio on all new buildings or building expansions.</p> <p>Section 9 of the final EIS will be updated to address the response to IR-135, part 3 as follows:</p> <p>Erosion control measures that are designed to prevent sediment from entering waters frequented by migratory birds or SAR include (but not limited to) the installation of silt fence, straw wattles, and/or erosion control blankets to prevent erosion and limit sediment transport. Additionally, vegetated barriers will be maintained between Project components and wetland features, as much as practical. Further information on erosion and sediment control measures will be provided in the applicable management plans which will be developed to support Project permitting and licensing. Routine inspections and management would be completed to document the effectiveness of the erosion control measures, and any required /replacement of these structures would be completed as required.</p> <p>Section 9 of the final EIS will be updated to address the response to IR-135, part 4 as follows:</p> <p>Proposed mitigation measures related to noise and sensory disturbance outlined in Section 6.2.5 of the EIS are considered to be adequate and appropriate to limit/localize potential adverse effects on wildlife and wildlife habitat.</p> <p>The proposed monitoring related to noise and sensory disturbance outlines in Section 6.2.8 of the EIS are considered to be adequate and appropriate to monitor changes in sound levels.</p> <p>EIS updates in response to IR-135, part 5 are outlined in EIS Updates for IR-134.</p> |
| IR-136 | CNSC | Soil Salvage Monitoring | Section 9.1.8.2 | <p>Context: The proponent plans to salvage and stockpile soil and organic matter/peat in order to use it in reclamation activities during decommissioning. Periodic monitoring of the stockpiles is proposed to be conducted to verify that soil and organic matter/peat are delineated, stripped, handled, and stockpiled as recommended, and to evaluate the stability of salvaged soil, e.g., in relation to potential erosion and/or degradation. It is unclear whether monitoring includes soil quality in terms of concentrations of COPCs.</p> | Please clarify if COPC concentrations monitoring is planned to be performed for stockpiled soil and organic matter/peat. | Per the Residual Effects Characterization: "Predicted changes in concentrations of COPCs (i.e., soil quality) associated with open-source dust, process-source dust and process emissions are expected to be within acceptable health and safety guidelines; no threshold exceedances are predicted." Monitoring of COPCs in soil stockpiles during the life of the Project is not presently being considered, but the need for such monitoring could be revisited within the context of monitoring of sources that could contribute to COPCs to stockpiled soil and organic matter/peat. For example, if source monitoring data exceed predictions | No updates to the draft EIS are needed based on this IR response. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|---|---|--|---|--|---|
| | | | | <p>Rationale: It is expected that project-related activities (road and airport traffic, drilling) can result in open-source (i.e., fugitive) dust and process-source dust (incl. radionuclides), which can accumulate and result in changes in soil quality of the stockpiled soil and organic matter/peat as described in Sections 9.1.4.2.2 and 9.1.4.2.3).</p> | | <p>presented in the EA that may provide rationale for sampling and analysis of COCPs in stockpiled materials.</p> <p>A soil salvage monitoring program/protocol (or equivalent) is expected to verify soil salvage volumes and reclamation suitability. Denison is proposing to support reclamation trials/research at the Project to inform and refine the revegetation strategy. It is understood that reclamation trials/research will include investigations into soil conditions, preparation techniques and amendment strategies (to the standard of the day). These ancillary investigations may include analysis of COCPs, although this is not expected at this time, but as highlighted above would be considered as may be warranted.</p> | |
| IR-137 | ECCC | Migratory birds, Wildlife and Wildlife Habitat, Vegetation and Wetlands | <p>Section 9.2.1.3, Spatial and Temporal Boundaries for Vegetation and Ecosystems, Listed Plant Species and Wetlands</p> <p>Section 9.3.1.3.1, Spatial Boundaries for Ungulates, Furbearers and Woodland Caribou</p> <p>9.4.1.3.1, Spatial Boundaries for Raptors, Migratory Breeding Birds, and Bird Species at Risk</p> | <p>Context and Rationale: The CNSC’s Generic Guidelines for the Preparation of an EIS Pursuant to the Canadian Environmental Assessment Act, 2012 states that: “The EIS will describe the spatial boundaries, including local and regional study areas, for each VC to be used to assess the potential adverse environmental effects of the Project and provide a rationale for each boundary.</p> <p>Spatial boundaries will be defined taking into account the appropriate scale and spatial extent of potential environmental effects, community knowledge and Indigenous knowledge, current or traditional land and resource use by Indigenous groups, ecological, technical, social and cultural considerations.”</p> <p>The information provided in the EIS does not enable a biologically relevant assessment of the Project’s effects.</p> <p>The Proponent did not provide rationale for the selection of study areas for individual vegetation, wildlife or migratory bird valued components (VC). Different VCs may have different spatial boundaries for the LSA and/or RSA. For wildlife and bird VCs, the LSA is defined as a 1.7-km buffer from the Project area, and the RSA is defined as a 6.6-km buffer around the LSA. There is no information on how the spatial boundaries were derived.</p> <p>Specific to Woodland Caribou, boreal population (hereafter referred to as boreal caribou):</p> <p><u>Project Footprint:</u> In a scientific assessment of critical habitat (Environment Canada, 2011) [1] ECCC demonstrated that the application of a 500-m buffer to mapped anthropogenic features best represents the combined effects of increased predation and avoidance on caribou population trends at the national scale. Adding a 500-m buffer to the Project footprint is required to represent functional habitat loss.</p> <p>The draft EIS does not appear to use a buffer for their Project area. The draft EIS (Section 9.3.1.3.1) states: “Project Area: the area within which the Project and all components/activities are located (i.e., the area of maximum physical disturbance). The Project Area covers 169.6 ha and is not VC-specific, but consistent throughout the EA.” (p. 9-168)</p> <p><u>LSA:</u> The defined LSA for boreal caribou has to consider avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance. This required information is not detailed in the draft EIS.</p> <p>Adverse effects of Projects including predator and prey access to undisturbed areas, reduction in connectivity, and sensory disturbance to individual boreal caribou can vary and extend several kilometers depending on Project activities and ecological context. At minimum, the LSA should capture the above- mentioned effects. For boreal caribou, the Project footprint should be defined as the immediate area to be cleared, plus a 500-m buffer to represent functional habitat loss. Following this guidance, the LSA should be defined as a buffer of the Project footprint with the 500-m buffer.</p> <p><u>RSA:</u> The Amended Recovery Strategy for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada states: <i>Mitigation of adverse effects from individual projects/activities will require a coordinated approach and management of cumulative effects within and among ranges. A cumulative effects assessment is essential to position the proposed project/activity in the context of all current and future development activities. The cumulative effects assessment will:</i></p> <ul style="list-style-type: none">• <i>Assess the impact of all disturbances (anthropogenic and natural) at the range-scale;</i>• <i>Monitor habitat conditions, including the amount of current disturbed and undisturbed habitat, and amount of habitat being restored;</i>• <i>Account for planned disturbances; and</i>• <i>Assess the distribution of disturbance in large ranges for risk of range retraction in parts of the range.</i> | <p>Provide a biologically relevant rationale for the delineated study boundaries (LSA and RSA) for all different valued components. Include the following information:</p> <ul style="list-style-type: none">• Descriptions of how the RSA and LSA boundaries were derived for all VCs. <p>Specific to boreal caribou:</p> <p><u>Project Footprint:</u></p> <ul style="list-style-type: none">• Include a 500-m buffer of area of maximum physical disturbance to represent functional habitat loss for boreal caribou <p><u>LSA:</u></p> <ul style="list-style-type: none">• Include a description of how the LSA takes into account boreal caribou avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance to individuals. <p><u>RSA:</u></p> <ul style="list-style-type: none">• Include a description of how the RSA used in the draft EIS is an accurate representation of the SK1 boreal caribou range; or• Re-do the assessment with the RSA at the scale of the range <p>See also related IRs: IR-154 and IR-156.</p> | <p>The Project Area was delineated to capture all direct, and most indirect, likely adverse effects on caribou; as this is the zone of influence most likely to affect caribou in the vicinity of the Project (i.e., in the vicinity of human activity, equipment use and vehicle use). The Project Area (169.6 ha) is the direct footprint of proposed Project infrastructure (74.8 ha) with a buffer applied, thereby representing the area of maximum physical disturbance. The Project Area is not VC-specific, but consistent throughout the EIS.</p> <p>The Wildlife LSA was designed to capture the majority of the Project effects. The LSA extends beyond Project Area of the site to include a reasonable estimation of where sensory disturbance from Project-related activities would extend and where effects on wildlife including caribou are most likely to occur. That is the primary rationale for selection of the spatial extent of the LSA – Denison believes this is an appropriate spatial scale that applies broadly to the wildlife VCs as a whole given the perceived mechanism of VC-Project interaction.</p> <p>Importantly, as noted in draft EIS Section 9.3.6.4, in the caribou assessment, the Project Area had a 500 m buffer applied to account for indirect effects/habitat alteration; this area is within the wildlife LSA (refer to Figure 9.3-14 for a map showing the spatial areas). The 500 m buffer for habitat alteration for caribou was selected in accordance with ECCC’s (2020) assessment of disturbed areas, which buffered (500 m) anthropogenic disturbances to evaluate woodland caribou habitat. The alteration of available woodland caribou habitat is quantified in this EIS by applying a buffer of 500 m around the Project Area in which Project effects in the form of sensory disturbance are likely to affect available woodland caribou habitat and make it functionally unavailable for use.</p> <p>Boreal caribou occur as one continuous population across the SK1 range, including within the Terrestrial RSA. It was decided to not use the entire SK1 range as an assessment area (e.g., due to the dilution factor) and instead use the Terrestrial RSA to appropriately and adequately assess residual and cumulative effects in proportion to the Project. It was deemed to be not feasible to use a large area like the SK1 range to assess residual Project effects because this would provide inappropriate context or "dilute" the adverse effects of the Project on the caribou that have a home range that overlaps with the RSA.</p> <p>The cumulative effect assessment of the draft EIS compares the Project-specific habitat effects (i.e., the Project Area plus a 500 m buffer to account for sensory disturbance) at the scale of the SK1 range (as the applicable management unit for portion of the woodland caribou population that uses the Terrestrial RSA). The result showed that the Project is expected to add 0.001% of anthropogenic disturbance at the scale of the SK1 Boreal Shield Woodland Caribou Management Unit (Section 9.3.7.3.3 of the EIS).</p> <p>References: Environment and Climate Change Canada (ECCC). 2020. Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada. Species at Risk Act Recovery Strategy Series. Environment and Climate Change Canada, Ottawa. xiii + 143pp.</p> | No updates to the draft EIS are needed based on this IR response. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|--|--|--|--|---|---|
| | | | | <p>The proposed Project’s cumulative effects for boreal caribou are possible at the scale of the SK1 boreal caribou range. The RSA used for boreal caribou for this Project is only 40,173.6 ha, compared to the SK1 range, which is 18,034,870 ha. As such, it is too small to capture cumulative effects to this species and does not follow the Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada (Environment Canada, 2011) or the Amended Recovery Strategy for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada.</p> <p>Reference: [1] Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada (Environment Canada, 2011).</p> | | | |
| IR-138 | CNSC | COPC in Lichen | Section 9.2.4.2.2 Appendix 10-A (ERA) | <p>Context: A quantitative assessment using modelling dispersion and uptake of COPCs in the environment was completed for the Project as part of the ERA, to support conclusions drawn in the EIS. In Appendix 10-A (ERA), COPCs in plant tissue was estimated for lichen. Table 5-5 of the ERA (p. 5.24) named “Complete Exposure Pathways for All Selected Ecological Receptors to be Assessed using the IMPACT Model” lists the exposure pathway for lichen as direct contact on soil.</p> <p>Rationale: Airborne COPC can deposition on lichen and subsequently enter the food chain; therefore, the “contact with air” pathway should be considered. In fact, lichen species are frequently used to monitor the deposition and accumulation of airborne contaminants (e.g., dust, metals). It is also noted that based on sampling results of the 2017 baseline studies, lichen frequently contain higher concentrations of COPC than blueberry (compare Table 9.2-6 and Table 9.2-7 in the EIS), especially at sampling sites with elevated concentrations (e.g., RSV9 and RSV10).</p> | <p>Please include the exposure pathway of direct deposition (dry and wet) of airborne contaminants on lichen in the quantitative ERA, or justify why this exposure pathway was not considered.</p> <p>See also related: IR-189.</p> | <p>Denison agrees that the air to lichen pathway is the primary exposure route for lichen. The ERA (Appendix 10-A) modelled the deposition of air to lichen as an exposure pathway and considered the uptake from soil to lichen as negligible. This will be clarified in Table 5-5: Complete Exposure Pathways for All Selected Ecological Receptors to be Assessed using the IMPACT Model. In the column "Environmental media" for lichen, "On soil" will be replaced by "air". Additionally, the conceptual site model shown in Figure 5-1 of the ERA will be updated to include a pathway arrow from air to lichen.</p> | <p>Minor change. In Table 5-5 of Appendix 10-A, the column "Environmental media" for lichen, "On soil" will be replaced by "air". Additionally, the conceptual site model shown in Figure 5-1 of the ERA will be updated to include a pathway arrow from air to lichen.</p> |
| IR-139 | ECCC | Change to an environmental component due to hazardous contaminants | Section 9.2.5.2.7, Waste and Hazardous Materials Management | <p>Context: In this section, the Proponent outlines various measures to mitigate air emissions, including implementation of the air quality programs within the Environmental Management System, regular maintenance and inspection of equipment, and elimination of unnecessary idling of equipment. However, the intention to use industry-standard emission control systems has not been substantiated.</p> <p>Rationale: For the protection of air quality, it is important to specify the emission standards that equipment will have (e.g., Tier 3 or Tier 4 engines). Vehicles and equipment with Tier 4 engines have much lower emissions of contaminants than those with Tier 3 engines. If non-Tier 4 engines are used, ECCC recommends that best management practices are followed, including proper maintenance of the engine and anti-idling measures.</p> | <p>Confirm if vehicles and equipment will be equipped with Tier 4 engines where feasible.</p> | <p>Denison confirms that vehicles and equipment will be equipped with Tier 4 engines where feasible.</p> | <p>No updates to the draft EIS are needed based on this IR response.</p> |
| IR-140 | CNSC | Change in the Areal Extent of Wetlands | Section 9.2.6.4 | <p>Context: Predicted residual effects on the areal extent of wetlands include the direct effect of loss of wetlands and several indirect effects of alteration of wetlands. As stated in the EIS, wetlands can exhibit low resilience and high susceptibility to disturbance. At the same time, wetlands tend to support a high species diversity, and are considered to have a moderate to high potential to support listed plant species. Lastly, wetlands are rare on the landscape compared to terrestrial ecosites (see Table 9.2-5).</p> <p>Rationale: Several wetland ecosites (BS19/24, BS25, BS27) occur only in small areas (< 30 ha) in the RSA but are predicted to experience disturbance of 6-64%, most notably the ecosite BS19/24 where 0.8 of 1.2 ha are predicted to be disturbed. It is noted that wetlands are scattered throughout the landscape as shown in Figure 9.2-8. More information is requested regarding the ecological impact of this disturbance.</p> | <p>1. Please provide a discussion on the ecological impact of disturbance to rare wetland ecosites.</p> <p>2. Please provide information on whether adequate other habitat is available for species impacted in these disturbed sites in close proximity, taking into account the home ranges of susceptible species.</p> <p>3. Please provide additional information on whether wetland connectivity is maintained through the landscape within the LSA/RSA.</p> <p>See also related: IR-141.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends that Denison conduct monitoring of species present in wetlands before and after disturbance, with a focus on listed plant species.</p> | <p>1. As described in footnote 3 of Table 9.2-8 and table 9.2-16 of the draft EIS, the ecosite BS19/24 is not a unique ecosystem and is instead an artifact of mapping uncertainty, as baseline mappers were unable to distinguish between BS19 (graminoid bog) and BS24 (graminoid fen) ecosites within these areas due to a lack of available information (e.g., soil information, vegetation field plots, water quality data). If all BS19, BS24 and BS19/24 were combined into a single combined "graminoid peatland" category, only 2.1% (3.6 ha of 170.7 ha) would be expected to be indirectly disturbed. No direct disturbance on wetland ecosites BS19/24, BS25, or BS27 is anticipated. Indirect disturbance with the potential to adversely affect these ecosites includes the introduction and/or proliferation of invasive plants, edge effects, changes to water quantity and quality, and dust deposition during all Project phases (further described in Section 9.2.4.2.1). Wetland ecosites BS19/24 (graminoid bog/fen) and BS25 (open fen) are peatland ecosystems typically characterized by high water tables (i.e., a very moist or very wet moisture regime), while BS27 (sedge rocky shore) is a sparsely vegetated ecosystem predominated by rocky substrates, typically occurring adjacent to lakes and ponds (McLaughlan et al. 2010). Because these ecosystems rely on high water tables and existing water bodies, alteration of water quantity would be expected to have the highest potential to be the most effective mitigation to sustain these wetland ecosites within the Terrestrial LSA throughout the Project lifespan.</p> <p>2. No listed plant species have historically been observed to be associated with ecosites BS19/24 (graminoid bog/fen), BS25 (open fen), or BS27 (sedge rocky shore). As described in Table 2.4.4 of Appendix 9-B of the EIS, populations of the listed plant Alaskan clubmoss were observed to be associated with open Jack pine stands and transitional areas between upland and wetland/riparian areas. As stated in Section 2.2.2 of Appendix 9-B of the EIS the listed plants angle-leaved sundew and neat spike-rush were not observed in ecosites BS19/24, BS25 or BS27 either (see also the response to IR-175). With regard to wildlife, ecosites BS19/24, BS25, and BS27 are not limiting habitats for ungulates, furbearers, woodland caribou, raptors, or migratory breeding birds (as described in Sections 9.3 and 9.4 of the EIS) in the Terrestrial RSA. In fact, these ecosites were observed to exhibit low species richness and species diversity for breeding and migratory songbirds (Section 9.4.3.2.3). For bird species at risk, ecosites BS19/24 and BS25 are considered to provide suitable habitat for Short-eared Owl, Yellow Rail, and Rusty Blackbird; however, these ecosites are not anticipated to be limiting. Up to 2.9% of available Short-eared Owl habitat and up to 2.4% of Yellow Rail and Rusty</p> | <p>1. Section 9.2.6.4.1 will be updated to include the following: As noted in footnote 3 of Table 9.2-8 and table 9.2-16 of the draft EIS, the ecosite BS19/24 is not considered a unique ecosystem and is instead an artifact of mapping uncertainty, as it was not possible to distinguish between BS19 (graminoid bog) and BS24 (graminoid fen) ecosites within these areas during the wetland mapping process due to a lack of available information (e.g., soil information, vegetation field plots, water quality data). If all BS19, BS24 and BS19/24 were combined into a single combined "graminoid peatland" category, only 2.1% (3.6 ha of 170.7 ha) would be expected to be indirectly disturbed. However, no direct disturbance on wetland ecosites BS19/24, BS25, or BS27 is anticipated. Indirect disturbance associated with the potential to adversely affect these ecosites includes the introduction and/or proliferation of invasive plants, edge effects, changes to water quantity and quality, and dust deposition during all Project phases (as described in Section 9.2.4.2.1). Wetland ecosites BS19/24 (graminoid bog/fen) and BS25 (open fen) are peatland ecosystems typically characterized by high water tables (i.e., a very moist or very wet moisture regime), while BS27 (sedge rocky shore) is a sparsely vegetated ecosystem predominated by rocky substrates, typically occurring adjacent to lakes and ponds (McLaughlan et al. 2010). Because these ecosystems rely on high water tables and existing water bodies, alteration of water quantity would be expected to have the highest potential to</p> |

|--------|--------------|-------------------------------|--|--|---|---|--|
| | | | | | | <p>Blackbird habitat within the Terrestrial RSA may be altered or lost as a result of the Project during all Project phases (Section 9.4.6.4.1).</p> <p>3. Surface drainage continuity and hydrologic connectivity is expected to be maintained across the Project Area with the engineering, construction and maintenance of surface water management features (e.g., culverts and ditches) as appropriate and as per Project design specifications along access roads and facility sites. A post-construction monitoring program will be developed to document the performance of surface water management structures adjacent to wetlands to evaluate areas (if any) where additional surface water management is considered to be necessary to maintain natural drainage. The monitoring program is expected to verify the presence and condition of surface water management structures, including any areas of water impoundment (e.g., upgradient of a road), erosion, or dead or dying vegetation. Culverts will be regularly inspected to identify where maintenance, repair, upgrade, and/or replacement is necessary to maintain natural surface drainage and the resultant wetland connectivity. This post-construction surface water management monitoring program is expected to identify issues (if any) in a timely manner and allow the adaptive management process, in consideration of the vegetation monitoring results, as vegetation species composition can be a lagging indicator of hydrologic change.</p> | <p>cause an adverse effect, and thus maintenance of wetland hydrology is expected to be the most effective mitigation to sustain these wetland ecosites within the Terrestrial LSA throughout the Project lifespan.</p> <p>2. No updates to EIS required.</p> <p>3. Section 9.2.5.2.3 will be updated to include the following: Hydrologic connectivity is expected to be maintained across the Project Area with the engineering, construction and maintenance of surface water management features (e.g., culverts and ditches) as appropriate and as per Project design specifications along access roads and facility sites. A post-construction surface monitoring program will be developed to document the performance of surface water management structures adjacent to wetlands to evaluate areas (if any) where additional surface water management is considered to be necessary to maintain natural drainage. The monitoring program is expected to verify the presence and condition of surface water management structures, including any areas of water impoundment (e.g., upgradient of a road), erosion, or dead or dying vegetation. The monitoring program is expected to identify issues (if any) in a timely manner and allow the adaptive management process, in consideration of the vegetation monitoring results, as vegetation species composition can be a lagging indicator of hydrologic change. Culverts will be regularly inspected to identify where maintenance, repair, upgrade, and/or replacement is necessary to maintain natural surface drainage and the resultant wetland connectivity.</p> |
| IR-141 | ECCC | Wetlands | Section 9.2.6.4.1 | <p>Context and Rationale: The Proponent states that: “Direct loss of wetlands has been mitigated by reducing the size of the Project Area to the extent practicable during Project design.</p> <p>However, up to 0.5 ha (less than 0.1%) of all wetlands within the Terrestrial RSA are anticipated to be removed from the Project Area during Construction (Table 9.2-16).”</p> <p>Information is not provided on whether wetlands in the terrestrial RSA are considered ecologically, economically or socially important to the region. Information on the regional importance of the wetlands that will be lost is needed in order to assess effects, including a wetland compensation plan if the wetlands are considered regionally important.</p> | <p>1. Provide information that accounts for whether wetlands are considered ecologically, economically and socially important to the region.</p> <p>2. If the above is affirmative provide a wetland compensation plan to offset the loss. Consistent with the Operational Framework For Use of Conservation Allowance [1] a minimum ratio of 2:1 should be the starting point when determining the amount to be offset.</p> <p>[1] Available at : https://publications.gc.ca/site/eng/9.696852/publication.html</p> <p>See also related: IR-138.</p> | <p>During engagement activities, no specific comments or concerns were raised that would suggest wetlands near the Project are considered to be particularly ecologically, economically, and socially important to the region. Drainage in the Wheeler Upland Landscape Area of the Athabasca Plain Ecoregion is very weakly developed, and with numerous poorly drained wetland areas in lower landscape positions (Acton et al. 1998). This pattern is reflected in the Terrestrial RSA, where wetlands and water bodies are commonly scattered, comprising 16.6% of all mapped ecosystems (Section 9.2.3.3; Figure 9.2-8 of the draft EIS). Wetlands in this region provide ecological, economic, and social functions and values, and Denison has appropriately considered this during Project planning (i.e., avoidance to the extent practical). The Project Area has been reduced to the extent practicable, and the Project footprint has been sited to avoid wetlands to the extent feasible (Figure 9.2-8). Where wetland avoidance was not feasible, mitigation measures have been designed to reduce disturbance and maintain surface water connectivity (Section 9.2.5; see also response to IR-140 and IR-101). A small area of direct wetland disturbance is anticipated (0.5 ha; less than 0.1% of all wetlands within the Terrestrial RSA), predominantly associated with access road development. This area includes 0.4 ha of BS17 (black spruce treed bog), <0.1 ha of BS18 (Labrador tea shrubby bog), and <0.1 ha of BS23 (willow shrubby rich fen). These areas of direct wetland disturbance are small and located adjacent to existing access routes, and mitigation measures to maintain surface water connectivity across access roads will be implemented and monitored (see response to IR-140). The re-establishment of appropriate hydrologic conditions during Decommissioning is expected to lead to the re-establishment of wetland ecosystems within these directly disturbed areas. As such, it is Denison's opinion that a wetland compensation plan is not warranted.</p> | <p>No updates to the draft EIS are needed based on this IR response.</p> |
| IR-142 | ECCC CNSC | Wildlife and Wildlife habitat | Section 9.3.3.2.1 Scientific Literature Review – Wolverine Section 9.3.5 Mitigation Measures Section 9.3.6 Residual Effects Evaluation | <p>Context: The Proponent did not conduct any field work to identify potential wolverine dens in the Project area and therefore did not present any mitigations for the potential impacts to wolverine dens.</p> <p>In Section 9.3.3.2.1, the Proponent states: “Denning females are sensitive to disturbance during denning season in February to April and may abandon their dens and, in some cases, their litter, which may decrease their reproductive success. ”</p> <p>In Section 9.3.6, the Proponent states: “In the Project Area, 145.0 ha or 100% of available wolverine habitat is assumed to be removed and will not be available to wolverine for the duration of the Project (Table 9.3-13). Similarly, 145.0 ha (3.4%) of available wolverine habitat within the Wildlife LSA is anticipated to be removed, all from the Project Area, during site clearing in Construction. In the Terrestrial RSA, up to 0.5% (145.0 ha; from the Project Area) of available wolverine habitat is anticipated to be removed during site clearing in Construction.”</p> <p>The residual effect assessment estimates that 8.2% of available wolverine habitat within the Terrestrial RSA may be altered or lost</p> | <p>1. Please provide additional information on whether the lost and/or altered wolverine habitat overlaps with wolverine home ranges.</p> <p>2. Describe any important wolverine habitat feature (i.e., dens) that may be lost as a result of the Project.</p> <p>3. Assess the need for pre- construction/pre-clearing surveys to identify any wolverine denning sites.</p> <p>4. Please provide additional information on whether the remaining, available, undisturbed wolverine habitat size is suitable to maintain populations.</p> | <p>1. While wolverine were not observed during baseline studies for the Project, it is assumed that the Project (Project Area, LSA) may overlap with wolverine home ranges. As described in the EIS, wolverine occur in low densities across all forest stand and vegetation types but are generally absent from areas of human development and activities.</p> <p>2. No wolverine dens were identified during any of the baseline studies. It is not anticipated that wolverine denning sites will be lost and/or altered because there are no specific landscape features typically used by wolverine as potential denning sites located in the Project footprint. Further, much of the proposed Project footprint will be developed within previously disturbed areas, including roads and cutlines.</p> <p>3. Pre-construction surveys will be completed to identify all sensitive wildlife habitat features, including wolverine denning sites.</p> <p>4. Most of the Project footprint is already disturbed through previous exploration activities. The total expected direct habitat loss of 169.6 ha includes the already disturbed areas. In the Terrestrial RSA, 8.2% of available wolverine habitat may be altered or lost; this includes 0.5% that will be cleared within the Project Area during Construction, and an additional 7.7% that may be altered through indirect effects (sensory disturbance). The magnitude of this effect was characterized as being "moderate" and the residual effect is not expected to result in a</p> | <p>1. No updates to the draft EIS are needed based on this IR response.</p> <p>2. No updates to the draft EIS are needed based on this IR response.</p> <p>3. Section 9.3.5.2.4 Work Timing Windows (third bullet will be updated to include): Pre-construction wildlife clearance surveys will be conducted within the Project Area in accordance with a wildlife monitoring plan and the draft Caribou Mitigation Plan. This would include surveying for important wildlife features that would include wolverine den sites.</p> <p>4. No updates to the draft EIS are needed based on this IR response.</p> |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-------------------------------|--|---|---|---|---|
| | | | | (Table 9.3-20). Rationale: As Wolverine is a Species at Risk Act Schedule 1 listed species, effects need to be identified, avoided, lessened and monitored. Mitigations, such as setback distances, should be used to protect important habitat features, such as dens. Wolverine occupy large home ranges and, therefore, need vast tracts of undisturbed land to maintain viable populations. The species avoids most human footprint types and linear features. | | change that will alter wolverine habitat integrity to the point where it would not be able to sustain the regional populations of wolverine. This considers that no wolverine were observed during the baseline investigations, the small Project footprint, and the typically large size of a wolverine home range. | |
| IR-143 | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3, Baseline Studies | Context and Rationale: The baseline caribou data is insufficient to understand potential Project impacts to this species. Presence/absence detection was provided by camera traps, incidental observations, winter track and pellet survey. Additional information and analyses on caribou use of the landscape during all life stages of the Project area is required to assess impacts and to determine significance of impact from the Project to caribou. | Provide details on the baseline caribou data including: <ul style="list-style-type: none">Revision of map 9.3-8 to include all observations, categorized by type, season and year (see also IR-145); andDescription of seasonal use of the LSA, RSA and caribou range.Description of Project areas used by caribou.Description of future studies planned to assess habitat use by caribou. Include specific details on how many additional years of aerial surveys will be completed to assess the caribou baseline conditions. Utilizing additional data noted above and specified in IR-145, explain how caribou use of the area could be affected by the Project throughout all seasons and life stages (e.g., calving, post-calving, rutting, wintering). See also related: IR-152. | The baseline data collection program was not specifically designed to collect seasonal caribou habitat use but to document caribou presence in the Project Area, Wildlife LSA and Terrestrial RSA. Based on this information, the EIS assumed caribou to be present in the study areas throughout all seasons and life stages. It should be noted that discrete calving areas have not been documented for the SK1 range. As described in the EIS, caribou may use open fen and treed bog habitat types for calving during the spring/summer period. Information from IK was included in the EIS, including potential calving areas in the Terrestrial RSA. Additional wildlife camera data have been obtained and analyzed to further describe seasonal use of the Project study areas. Updated Figure 9.3-8 (included in Attachment IR-143) provides the caribou sightings from baseline studies and updated to reflect seasonality of all sightings, where such data are available. There is insufficient information to provide further explanation on how caribou use of the area could be affected by the Project throughout all seasons and life stages (e.g., calving, post-calving, rutting, wintering)); however, the EA appropriately addressed direct and indirect effects on caribou and their habitat. Denison’s intent is to develop the specific details related to environmental monitoring in general, and Caribou specifically, as part of licensing. A conceptual framework for monitoring and follow up was presented for each technical EIS discipline in the respective draft EIS section (see Section 9.3.9 for terrestrial wildlife). Environmental monitoring and follow up will fall within the scope of the Environmental Management System (EMS) for which document preparation is ongoing as indicated will be fulfilled during licensing. As noted elsewhere in the IR responses the EMS hierarchy will follow a three-tiered system comprising Program, Plan and Procedure level documentation, with detail associates with each becoming more granular and prescriptive at each successive tier. At this time no aerial surveys are planned. Denison approached the Province with proposals for aerial surveying for the purpose of the baseline program in 2016/2017 but the Province would not provide Denison with permits for aerial surveys. Based on recent discussion with the Province this position has not changed, nor is it Denison’s understanding that it is likely to. | Applicable sections of Section 9.3.3.3 will be updated in the final EIS to include a description of seasonal use of the RSA. This would include: Wildlife Camera Study Wildlife camera locations were spread across three categories of linear features in mature and regenerating forest types: road (a maintained or seasonally accessible road supporting traffic), trail/rough road (a cleared disturbance over 2 m in width), and hand-cut line (a cleared disturbance under 2 m in width) (Appendix 9-B). Trails/rough roads and roads had the highest frequency of wildlife detection, with woodland caribou being the second most commonly photographed species (after snowshoe hare). Of the 34 caribou observations that were recorded, most were documented in the winter, with one observation from the spring and one in the summer. Seven data points had no date associated with the observations. Of the winter observations that were documented, seven occurrences were located in the northern portion of the RSA and the remainder located in the eastern portion of the RSA (Figure 9.3-8). Figure 9.3-8 included in Attachment IR-143 has been updated to include additional camera data on caribou presence and seasonal use and will replace Figure 9.3-8 in the draft EIS The Conceptual Caribou Mitigation Plan is included with the IR response package (Attachment IR-149). This Plan includes description of ongoing studies to assess linear feature use by caribou and will be included in the final EIS as new Appendix 9-E. |
| IR-144 | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3, Baseline Studies – map 9.3-8 | Context and Rationale: The mapping of caribou observations during baseline studies provided in Figure 9.3-8, “Caribou Sign Observations in the Wildlife Study Areas,” is insufficient to enable conclusions to be drawn. ECCC is not able to review the spatial aspect of caribou observations without a map of all available observations. Additional information is available, as stated in Section 9.3.3.3.3: <i>“A total of 200 observations were made between 2017 and 2019 and recorded as either caribou sign (i.e., tracks, pellets, and evidence of feeding activity based on ground feeding craters and arboreal feeding evidence) or photographs (collected through the wildlife camera study) to document caribou presence in the LSA and RSA. Most observations occurred in the Terrestrial RSA, with observations concentrated in the north and southeast portions.</i> <i>Three observations occurred in the southeast portion of the Wildlife LSA, and no caribou sign was observed in the Project Area. Figure 9.3-8 provides an overview of some caribou sign observed during the baseline studies.”</i> | Update map 9.3-8 to show all caribou observations during baseline studies, broken down by type of observation (camera, incidental, pellet, track) and season/year when the observation was made. Include additional data from the Province of Saskatchewan (see also IR-145) to help characterize caribou use on a spatial map. | Refer to the Attachment IR-143 for the updated version of Figure 9.3-8. Denison acquired data from the Province of Saskatchewan which has been included in Attachment IR-145. As shown in the figure, the data is not available in a format that can be imported for analysis and incorporated into a spatial map. The data does not specify seasonality of the observations. Regardless, this data relates to the information provided by McLoughlin (2019 and 2021) and confirms caribou have been previously documented within the RSA, particularly in the eastern portion. References: McLoughlin, P. D. 2021. Associate Professor, University of Saskatchewan, Saskatoon, SK. Personal Communication. January 2021. McLoughlin, P. D., C. Superbie, K. Stewart, P. Tomchuk, B. Neufeld, D. Barks, T. Perry, R. Greuel, C. Regan, A. Truchon-Savard, S. Hart, J. Henkelman, and J. F. Johnstone. 2019. Population and habitat ecology of boreal caribou and their predators in the Saskatchewan Boreal Shield. Final Report. Department of Biology, University of Saskatchewan, Saskatoon. 238 pp. | No updates to the draft EIS are needed based on this IR response. |
| IR-145 | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3, Woodland Caribou | Context and Rationale: The Proponent has not provided sufficient information on how caribou use the landscape, including identification of areas for different life stages of caribou (calving, post-calving, rutting and wintering). The University of Saskatchewan published a report entitled Population and habitat ecology of boreal caribou and their predators in the Saskatchewan Boreal Shield. This report contains information on habitat types that are used during different life stages. Additionally, Appendix H of the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 20202 [1] details habitat characteristics required by boreal caribou to carry out life processes necessary for survival and recovery. | 1. Provide, based off existing literature or available data and the Amended Recovery Strategy for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada: <ul style="list-style-type: none">information on known important habitat features or biophysical attributes in Project areas for different caribou life stages (calving, post-calving, rutting, wintering),a map(s) of the type and spatial extent of important caribou habitat features or biophysical attributes of the study areas as defined in Appendix H of the Recovery Strategy,<ul style="list-style-type: none">mapping should be at the RSA/LSA level as well as larger-scale mapping at the scale of the Project footprint. | Denison considers the EA to be a planning and decision-making tool that assesses the potential effects of the Project in a careful and precautionary manner and integrates results of engagement with Indigenous nations and communities. As such, the EA is a process for identifying the Project’s potential interactions with the biophysical and human environment, predicting potential adverse effects, identifying mitigation measures, and evaluating residual and cumulative effects remaining after mitigation. The EA also outlines the proposed efforts for monitoring and reporting to verify compliance with the terms and conditions of EA approval and to assess the accuracy and effectiveness of predictions and mitigation measures presented in the EA. Denison views the EIS as an important planning tool that will be used to support future activities and represents one stage in the rigorous overall approvals process for a uranium mining facility in Canada. Denison is completing a sequential EA and licensing process for the Project. In the EIS, a framework for the Environmental Management System (EMS) is provided along with a clear commitment for Denison to include Project design and | The map included in Attachment IR-145 along with supporting text will be added to Section 9.3.3.3 of the final EIS. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|-------------------------------|---|--|--|---|--|
| | | | | <p>The scientific literature review (Section 9.3.3.3.1) on Woodland Caribou states: “While calving areas have not been documented within the SK1 range, it is recognized that caribou may use open fen and treed bog habitat types for calving during the spring/summer period. In Saskatchewan, caribou habitat used during the calving season in the SK2 range demonstrated a strong selection for treed muskegs, but avoidance of jack pine, mixed hardwood stands, and roads (Dyke 2008).”</p> <p>ECCC is not able to verify the Proponent’s effects assessment without sufficient information on important habitat or biophysical attributes for caribou within the study areas.</p> <p>[1] https://www.canada.ca/en/environment-climate-change/services/species-risk-public-registry/recovery-strategies/woodland-caribou-boreal-2020.html#toc0</p> | <p>2. Assess the potential direct and indirect effects based on additional information on caribou from bullet A above.</p> <p>See also related IRs: IR-143 and IR-152.</p> <p>Suggestions for mitigation and follow-up measures: ECCC recommends that the Proponent contact the Province of Saskatchewan to enquire about obtaining caribou telemetry data in the Project area. The data can be analyzed to determine important habitat features in the Project area.</p> | <p>species-specific mitigation measures into the EMS documents as they are developed / as the Project proceeds through the licensing and permitting phases.</p> <p>The selection of valued components (VC), with key indicators (KI), and associated measurable parameters is an important part of scoping in each biophysical and human environment assessment. Woodland caribou were selected as a VC in the Terrestrial Environment assessment for a variety of reasons including a recognition of caribou as an important cultural and subsistence species, the conservation status of caribou, and that Project activities and infrastructure may affect woodland caribou populations. For the woodland caribou VC, the KI selected was also woodland caribou. The measurable parameters for the caribou VC/KI were: 1. amount of habitat that may be altered or lost relative to its availability in the Terrestrial RSA; and, 2. woodland caribou mortalities directly or indirectly attributable to the Project.</p> <p>The main Project interactions identified in the caribou assessment were: direct habitat loss, sensory disturbance, collisions with Project vehicles and equipment, and harvest and/or predation. Accordingly, the potential effects evaluated for caribou were: 1. amount of habitat that may be altered or lost relative to its availability in the Terrestrial RSA; and, 2. mortalities directly or indirectly attributable to the Project. Denison undertook the evaluation and assessment of potential effects on caribou in a conservative fashion to provide confidence in the assessment conclusions. For instance, where granular data concerning seasonal distribution and specific landscape uses were not available the approach was to assume the caribou at all life stages were present during all seasons. Additionally, the caribou assessment used conservative assumptions to categorize ‘available’ habitat. Denison also committed to important mitigation measures such as pre-clearance surveys, among other things.</p> <p>The EIS has demonstrated that the Project, as proposed and assessed, is predicted to minimize the potential for environmental adverse effects on caribou and their habitat before any Project specific construction occurs. The conclusions of the assessment predicted that the likely residual effects of the Project on caribou were not significant.</p> <p>The EIS uses "available caribou habitat" as a basis to assess the Project effects. Available habitat was determined as the ecosites in which caribou / caribou sign were detected most frequently during the baseline studies, and the EIS used a precautionary approach by assuming caribou use of these areas during all seasons and life stages.</p> <p>Subsequent to filing of the draft EIS and as committed to ECCC during an April 20, 2023 meeting between Denison and ECCC, Figure 9.3-8 has been updated (included in Attachment IR-143) to address seasonal use by caribou within the terrestrial study areas.</p> <p>In May 2023, Denison received caribou data from the Province of Saskatchewan that included both incidental observations and telemetry point data within the terrestrial study areas. These data were provided to Denison as a figure, and this figure has been included herein as Attachment IR-145. The information made available to Denison by the Province was not broken down to reflect the timing (seasonality) of the reported data and therefore does not specifically contribute to the description of seasonal use of the Project study areas by caribou.</p> <p>For reference, and based on the data that have been made available, the conservative assessment approach utilized in the draft EIS of assuming caribou presence in the terrestrial study areas throughout all seasons will not be changed.</p> | |
| IR-146 | ECCC | Wildlife and Wildlife habitat | Section 9.3.3.3.1, Woodland Caribou, Scientific Literature Review - Predation | <p>Context and Rationale: The information on impacts of predation and apparent competition for caribou in relation to the proposed Project are insufficient.</p> <p>In the section on caribou predators (9.3.3.3.1), the Proponent provided details on densities of wolves and their overlap with caribou and speaks of apparent competition. The Proponent did not examine other predators, such as black bear.</p> <p>The analysis on impacts of predation and apparent competition is insufficient since known predators have been omitted without explanation from the assessment of effects. ECCC is not able to verify the Proponent’s effects assessment since important species have not been considered in the assessment.</p> | <p>Provide further information and analyses on all potential predators of caribou, including impacts from apparent competition.</p> | <p>Effects from predation as a factor contributing to indirect mortality are discussed and qualitatively assessed in the EIS. Section 9.3.3.3 describes current knowledge of caribou mortality in or around the Project study areas (i.e., the existing studies describe wolf predation and hunting). It is acknowledged that black bear may also prey on caribou; however, this would be expected to follow the same effect pathways and is included in the qualitative indirect mortality assessment. Effects of apparent competition are included in the EIS and are part of the qualitative indirect mortality assessment.</p> | <p>In the final EIS, 9.3.3.3.1 Scientific Literature Review Denison will replace Predation section with the following:</p> <p>Predation McLoughlin et al. (2019) observed that mortality of adult caribou occurred mostly during the snow-free season; however, mortality could not be confirmed for most of the caribou, with only the fate of 1 of 94 collared caribou confirmed in the four years of the study (which had been harvested by a hunter).</p> <p>Relatively low predator (e.g., wolf and black bear) densities in their study area were documented by McLoughlin et al. (2019), with other prey species, such as moose, also occurred at relatively low densities (i.e., 45.7 moose/1,000 km²). While the effect on adult caribou survival by black bear is anticipated to be marginal compared to that by wolves, they may still be a predator of caribou calves and potentially a limiting factor to recruitment (McLoughlin et al. 2019).</p> <p>McLoughlin et al. 2019 noted that there was spatial separation between caribou and wolves as well as black bear, although this was found to be variable amongst individuals. Caribou did not seem to avoid existing linear features (such as roads, trails, and transmission lines) in the area, while wolves established their territories away from linear features. Unlike caribou, who preferred mature conifer stands, wolves selected</p> |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|----------------------|--|--|--|---|--|
| | | | | | | | <p>for wetlands and patches of deciduous-mixed forest, avoiding stands of mature conifers. Black bears also used mixed-wood forests but particularly in the summer and fall they selected for jack pine stands <40 years. (McLoughlin et al. 2019).</p> <p>While predation is believed to be the limiting factor for woodland caribou, Neufeld et al. (2021) suggested that habitat- or disturbance-mediated apparent competition only plays a minor role in the Saskatchewan woodland caribou population. Habitat or disturbance-mediated apparent competition occurs when natural (e.g., forest fires) and anthropogenic (e.g., human development or activities) disturbances increase the abundance of other ungulates, which in turn may increase predator densities, which then increases predation risk to caribou. Neufeld et al. (2021) concluded that Northern Shield and Taiga ecoregions are of low productivity where caribou may compete with only one ungulate species (i.e., moose) and therefore, caribou and wolf dynamics do not follow general habitat- or disturbance-mediated apparent competition models.</p> |
| IR-147 | ECCC | SAR - Boreal Caribou | <p>Section 9.3.4.2.1, Alteration and/or Loss of Habitat</p> <p>In Section 9.3.4.2.1 the Proponent states that: “Following decommissioning and reclamation, wildlife habitat is expected to recover to baseline conditions.”</p> <p>A more thorough explanation regarding post-decommissioning landscape is required to assess Project impacts.</p> | <p>Context and Rationale: The process of in-situ recovery mining will likely create changes to the surface topography and potential ground subsidence as well as changes to groundwater elevations. These changes can affect the plant communities and ecosite types.</p> | <p>1. Provide further rationale and/or analysis regarding the return of wildlife habitat to baseline conditions post-decommissioning. Incorporate other environmental impacts including:</p> <ul style="list-style-type: none">Ground subsidence and impacts on wildlife habitatChanges to aquifers and impacts on wildlife habitat <p>2. Describe reclamation activities/measures, including temporal information that will be implemented to help in the recovery to baseline conditions.</p> | <p>1. The risk of ground subsidence has been assessed as part of the draft EIS (see Appendix K to Appendix 7-C). Subsequent to the filing of the draft EIS, Denison undertook additional modelling with refined, more granular inputs including consideration of subunits within the altered zone (RESPEC 2023). With this more refined analysis, the potential surface subsidence has been reduced from 7.5 cm to 2.4 to 2.8 mm (RESPEC 2023 is included here as Attachment: IR-21). Overall, the analysis shows there is negligible risk of subsidence and the magnitude of subsidence, if it were to occur, is in the range of millimeters at surface. Further, this potential subsidence would be limited to the footprint directly above the deposit.</p> <p>In consideration of the above, with specific reference to the expected level of ground subsidence, no effects on wildlife habitat nor aquifers that support wildlife habitat are expected. Moreover, Denison does not foresee that ground subsidence would be a risk to the success of wildlife habitat restoration / reclamation during Post-Decommissioning, within the context (potential for adverse effects on wildlife habitat and/or changes to aquifers that may adversely affect wildlife habitat) raised by the IR.</p> <p>As outlined in Section 2.3.3 of the draft EIS, as part of the Conceptual Decommissioning Plan (CDP), reclamation activities, including replanting, will take place once the asset removal, decontamination, demolition, and disposal are completed, and the site has been cleared and leveled. Notwithstanding the execution of major decommissioning activities, Denison will look for opportunities to proactively reclaim inactive areas of the Project site as is possible in a timely manner and without delay. Progressive reclamation is considered in more detail below.</p> <p>Future discussions will be held with Indigenous and general public Interested Parties to determine the amount of access to the area they wish to maintain in the future (post-decommissioning). Based on the results of these discussions, roads associated with the Project site that are no longer needed will be graded and scarified to promote natural revegetation. Access roads or trails required for post-closure monitoring or deemed useful by Interested Parties may be left to facilitate continued access. Access to the site may be restricted by gates and/or berms for safety. Laydown areas will be scarified, covered with 0.5 to 1.0 m of stockpiled overburden, and vegetated with native, self-sustaining species. The footprints of other infrastructure, such as the camp, will be scarified and vegetated with native, self-sustaining species as required. The topsoil and brush stockpiled during pre-construction activities will be used during reclamation. Lessons learned from progressive decommissioning and any site-specific reclamation studies will be incorporated into the detailed reclamation design. Additionally, information from other northern Saskatchewan mine sites will be examined to help Denison select the reclamation tools, including revegetation options, that will contribute towards decommissioning success.</p> <p>2. Specific details concerning reclamation activities / measures, including detailed temporal information for restoration will be developed as part of future updates to the decommissioning plan. The CDP included in the draft EIS contains information related to site restoration; see also the Conceptual Caribou Mitigation Plan provided in Attachment IR-149. The CDP contains the appropriate level of detail for this stage of the Project. Briefly, the three main physical decommissioning activities include:</p> <ul style="list-style-type: none">mining area remediation;asset removal; anddecontamination, demolition, and disposal. <p>Physical decommissioning activities are followed by reclamation. The expected duration for decommissioning is 5 years (from year 18 to 23 of the Project).</p> <p>Importantly, during physical decommissioning, the majority of Project components are scheduled to be removed from site which is expected to facilitate reclamation activities. Also, because of the selected mining method, there are no large site aspects, such as waste rock</p> | <p>No updates to the draft EIS are needed based on this IR response.</p> |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|--------------|-------------------------------|--|---|--|---|---|
| | | | | | | <p>piles or tailings management facilities, for which large scale and potentially complex reclamation strategies are needed.</p> <p>Denison has committed to progressively reclaim areas no longer necessary to support/facilitate Operations to limit the amount of disturbance at any given time. Reclamation of inactive areas will take place when/as these areas become available. The progress and success of these activities will be assessed annually. Progressive reclamation and ecosystem-based revegetation will be conducted on disturbed areas as soon as safely and logistically practicable with the use of suitable/appropriate native vegetation species and in accordance with the Reclamation and Closure Plan.</p> <p>As described in Section 2.3.3 and outlined above, the details of the decommissioning plan, including site restoration, will evolve and become more specific as the Project advances. The subsequent iteration of the decommissioning plan will be the preliminary decommissioning plan (PDP). The PDP will be submitted to regulators as part of Project licensing and permitting and will provide additional detailed information with respect to site decommissioning, including site restoration. The PDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission. Prior to executing decommissioning activities, Denison shall prepare and submit a detailed decommissioning plan (DDP) to regulators for acceptance, which builds on the PDP. In this case the DDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission and would also be informed by conditions on the ground at the site at that time, operational experience that has been gained and the regulatory landscape at that time. As is highlighted above, the decommissioning plan, including site restoration, will evolve over time and the plan will become more refined as the Project advances.</p> | |
| IR-148 | ECCC | Wildlife and Wildlife habitat | Section 9.3.4.2.1, Alteration and/or Loss of Habitat | <p>Context and Rationale: ECCC analyzes disturbance for caribou at the range level, in this case within the SK1 range. However, the Proponent did not provide an adequate assessment of total disturbance at the range level. The draft EIS (Section 9.3.4.2.1 p. 9-211) reads: “The SK1 Boreal Shield Woodland Caribou Management Unit has relatively low levels of anthropogenic disturbance and was exposed to large fire disturbances in the past 40 years (ECCC 2019). Environment and Climate Change Canada (2019) identified this caribou population as being self-sustaining at a threshold of 40% undisturbed habitat with the total anthropogenic disturbance not exceeding 5% of their habitat. The current anthropogenic disturbance levels (without areas burnt by past forest fires) for the study areas are below this threshold (with the exception of the already disturbed Project Area) and are estimated as: 24.8 ha (14.6%) for the Project Area, 168 ha (3.5%) for the Wildlife LSA, and 599 ha (1.5%) for the Terrestrial RSA.”</p> <p>Analysis of habitat disturbance should be calculated at the range level in order to assess impacts and determine significance.</p> <p>Analysis should be consistent with the methodology described in the document Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada (Environment Canada, 2011) [1].</p> <p>[1]https://publications.gc.ca/site/eng/401605/publication.html, p. 28/41</p> | <p>Provide the following in order to support analysis of habitat disturbance:</p> <ol style="list-style-type: none">1. Calculation of total disturbance including natural and anthropogenic disturbance at the range level.2. Description of effects on existing habitat at the scale of the range (for < 40% undisturbed habitat in the SK1). Include:<ul style="list-style-type: none">• an account (and GIS file if available) of existing habitat affected, using the following formula: (Project footprint + 500m buffer) - overlapping (permanent alteration(s) + 500m buffer)3. A map of the SK1 range showing all disturbed and undisturbed habitat, including predicted disturbance (direct and indirect) resulting from the Project.4. Description of whether the Project is expected to compromise the ability of the range to be restored to the undisturbed habitat threshold, and provide a rationale for the conclusion. <p>See also related: IR-154.</p> | <p>1., 2., and 3.: This calculation (for Project Area + 500 m buffer) is provided for the Project at the SK1 range level in the Cumulative Effects Assessment (see Section 9.3.7.3.3). Project-specific values are provided as they add to the known existing reported anthropogenic disturbance in the SK1 range and the result shows that the Project would be adding 0.001% of anthropogenic disturbance at the scale of the SK1 Boreal Shield Woodland Caribou Management Unit (refer to response to IR-137). Existing anthropogenic disturbance was mapped at the scale of the Terrestrial RSA (i.e., the assessment area - see Figure 9.3-15); the mapping was not extended to the entire SK1 range because: (1) this was not determined to be the assessment area (explained in response to IR-137) and (2) shapefiles are not publicly available for all developments in the SK1 range.</p> <p>4. The Project is not expected to compromise the ability of the range (i.e., SK1 range) to be restored to the undisturbed habitat threshold. This opinion is based on the small amount of disturbance (i.e., 0.001%) of anthropogenic disturbance and Denison’s commitment to progressive reclamation as well as final reclamation as part of the Decommissioning phase. Also considered was the ecology of the boreal forest which is influenced, primarily by forest fires that continue to “reset” the seral stage of forest, typically at a much larger scale than that of the Project Area. The reclamation efforts will be monitored, and deficiencies noted and addressed appropriately in a timely manner, so that lands are returned to comparable land use capability and habitat (i.e., regenerating forest), that existed prior to the Project. The Project is not expected to adversely affect the habitat within the SK1 range to the extent that the range/habitat is unable to support caribou.</p> | No updates to the draft EIS are needed based on this IR response. |
| IR-149 | ECCC CNSC | Wildlife and Wildlife habitat | Section 9.3.5.2, Additional Wildlife- specific Mitigation Measures | <p>Context: The EIS describes that ongoing research is performed to inform the development of a Woodland Caribou Management Plan. This includes studies on the effectiveness of linear disruption features on predator/prey movements, and a field program for long-term reclamation planning. Moreover, it is stated that the Plan will include a detailed assessment of the need for habitat offsets.</p> <p>The draft EIS Section 9.3.5.2 states: “A wildlife monitoring plan and a Woodland Caribou Management Plan will be developed to address wildlife-specific mitigation measures based on proven and accepted mitigation following standard industry guidelines and BMPs. The plans will provide guidance to avoid or minimize potential adverse effects of the Project on wildlife and wildlife habitat, including monitoring and follow-up programs, as appropriate. It will be in place during all phases of the Project and will be subject to ongoing review and revision as required. If monitoring identifies a need for additional or revised mitigation measures, a process of adaptive management (as described in the plan) will be triggered.”</p> <p>Rationale: The draft EIS does not present sufficient species-specific mitigation measures for boreal caribou. ECCC is not able to assess potential residual impacts to caribou without specific mitigations.</p> <p>Since the Woodland Caribou Management Plan is still under development, it is difficult to judge whether the measures will be adequate to mitigate and/or offset potential project effects on Woodland caribou and its critical habitat.</p> | <p>Provide the Woodland Caribou Management Plan, to demonstrate effective mitigation of potential project effects, along with wildlife-specific mitigation measures for review.</p> <p>The Plan should be informed by and consistent with the Boreal Caribou Recovery Strategy and demonstrate that avoidance and minimization measures will be applied to mitigate for predicted Project effects to boreal caribou and its critical habitat prior to considering offsetting measures. That is, the Plan should follow the mitigation hierarchy and information should be provided as outlined below:</p> <ol style="list-style-type: none">1. AVOID: Describe all measures that will be taken to avoid effects to boreal caribou and avoid the destruction or alteration boreal caribou critical habitat.2. MINIMIZE: Describe all measures that will be taken to minimize the effects to boreal caribou and minimize the destruction of boreal caribou critical habitat.3. RESTORE ON-SITE: describe the measures that will be taken to restore disturbed areas of the project, related to construction, operation and maintenance, on boreal caribou critical habitat, remaining after considering the avoidance and minimization measures.4. Characterize the risk of the adverse effects that are likely to result from the project on boreal caribou and its critical habitat after avoidance minimization, and onsite restoration measures have been considered. | <p>Denison considers the EA to be a planning and decision-making tool that assesses the potential effects of the Project in a careful and precautionary manner and integrates results of engagement with Indigenous nations and communities. As such, the EA is a process for identifying the Project’s potential interactions with the biophysical and human environment, predicting potential adverse effects, identifying mitigation measures, and evaluating residual and cumulative effects remaining after mitigation. The EA also outlines the proposed efforts for monitoring and reporting to verify compliance with the terms and conditions of EA approval and to assess the accuracy and effectiveness of predictions and mitigation measures presented in the EA. Denison views the EIS as an important planning tool that will be used to support future activities and represents one stage in the rigorous overall approvals process for a uranium mining facility in Canada. Denison is completing a sequential EA and licensing process for the Project. In the EIS, a framework for the Environmental Management System (EMS) is provided along with a clear commitment for Denison to include Project design and species-specific mitigation measures into the EMS documents as they are developed / as the Project proceeds through the licensing and permitting phases.</p> <p>The selection of valued components (VC), with key indicators (KI), and associated measurable parameters is an important part of scoping in each biophysical and human environment assessment. Woodland caribou were selected as a VC in the Terrestrial Environment assessment for a variety of reasons including a recognition of caribou as an important cultural and subsistence species, the conservation status of caribou, and that Project activities and infrastructure may affect woodland caribou populations. For the woodland caribou VC, the KI selected was also woodland caribou. The measurable parameters for the caribou VC/KI were: 1. amount of habitat that may be altered or lost relative to its availability in the Terrestrial RSA; and, 2. woodland caribou mortalities directly or indirectly attributable to the Project.</p> <p>The main Project interactions identified in the caribou assessment were: direct habitat loss, sensory disturbance, collisions with Project vehicles and equipment, and harvest and/or predation. Accordingly, the potential effects evaluated for caribou were: 1. amount of habitat that may be altered or lost relative to its availability in the Terrestrial RSA; and, 2. mortalities</p> | The Conceptual Caribou Mitigation Plan, provided in Attachment IR-149, will be included in the final EIS as a new appendix (Appendix 9-E) to Section 9. |

|--------|------------|--|---|---|--|--|---|
| | | | | | <p>5. OFFSET: Describe the measures that will be implemented outside the Designated Project area to mitigate adverse effects, destruction or alteration of boreal caribou critical habitat by the Designated Project during construction and operation.</p> <p>6. Characterize the risk of the adverse effects that are likely to result from the project on boreal caribou and its critical habitat after avoidance, minimization, onsite restoration, and offset measures have been considered.</p> <p>Describe all relevant uncertainties on the effectiveness of the measures to address adverse effects on boreal caribou and the rationale for the selected measure, in light of the mitigation hierarchy.</p> <p>See also related IRs: IR-149 and IR-157.</p> | <p>directly or indirectly attributable to the Project. Denison undertook the evaluation and assessment of potential effects on caribou in a conservative fashion to provide confidence in the assessment conclusions. For instance, where granular data concerning seasonal distribution and specific landscape uses were not available the approach was to assume the caribou at all life stages were present during all seasons. Additionally, the caribou assessment used conservative assumptions to categorize ‘available’ habitat. Denison also committed to important mitigation measures such as pre-clearance surveys, among other things.</p> <p>The EIS has demonstrated that the Project, as proposed and assessed, is predicted to minimize the potential for environmental adverse effects on caribou and their habitat before any Project specific construction occurs. The conclusions of the assessment predicted that the likely residual effects of the Project on caribou were not significant.</p> <p>Denison met with ECCC representatives on April 20, 2023, and agreed to provide a conceptual caribou mitigation plan as part of the IR response package, and also include the conceptual plan in the final EIS. As such, the Project’s Conceptual Caribou Mitigation Plan is provided as Attachment IR-149 and will be included in the final EIS.</p> <p>The framework for the Conceptual Caribou Mitigation Plan (the Plan) was developed during discussions between Denison and Saskatchewan Ministry of Environment (ENV) in May and June 2023. The Plan is an evergreen document. It will be consistent with the management goals of ENV for the SK-1 caribou conservation unit and will be developed/refined in consultation with local communities including English River First Nation and Kineepik Métis Local in Pinehouse and ENV. Since the boreal caribou range plan for SK-1 is under development, it is understood that this Plan will be updated as more information becomes available. The conceptual nature of the Plan at this time is in part due to the absence of range plan priorities and reflects Denison’s commitment to continue to work with ENV to meet the management objectives and management strategies for the SK1 range. This approach acknowledges that the responsibility for woodland caribou management lies with the Province of Saskatchewan. Broadly, the province is responsible for developing range plans or management plans which build on the federal recovery strategy by setting goals and objectives for maintaining sustainable population levels. The EIS has demonstrated that the Project, as proposed and assessed, is predicted to minimize the potential for environmental adverse effects on caribou and their habitat before any Project specific construction occurs. The conclusions of the assessment predicted that the likely residual effects of the Project on caribou were not significant.</p> | |
| IR-150 | ECCC | Wildlife and Wildlife habitat | Section 9.3.5.2.1, Best Management Practices for working in Boreal Woodland Caribou Range in Saskatchewan | <p>Context and Rationale: In the draft EIS Section 9.3.5.2.1, the Proponent states: “Denison proactively initiated research to provide field-based findings on the effectiveness of linear disruption features on predator/prey movements.”</p> <p>“Results will help the development of proactive and meaningful restoration strategies as an ongoing part of the overall Project (Omnia 2022). Additionally, the 2023 field program will support a program that uses the results from the 2021/2022 Caribou Trail Study in long-term reclamation planning. The program will be led by the University of Saskatchewan and is funded by Denison, an Indigenous-owned environmental company, the Northwest Communities Environmental Services (Métis owned), Mitacs, and the Natural Science and Engineering Research Council of Canada through an alliance grant. The Caribou Trail Study and the reclamation plan will culminate with the development of a Woodland Caribou Management Plan.”</p> <p>ECCC is available to support the Proponent through review of study programs should those programs be made available during the review process.</p> <p>ECCC requests to see the 2021/2022 study to further our review of caribou use in the Project area.</p> | Provide the report for 2021/2022 Caribou Trail study for long-term reclamation planning for ECCC review. | The report titled <i>Pilot Program: Linear Feature Mitigation Interim Report- Status Update and Preliminary Results</i> is included as attachment IR-150. | No EIS updates in response to this IR. |
| IR-151 | ECCC | Wildlife and Wildlife habitat | Section 9.3.6.4 | <p>Context and Rationale: In the analysis of residual and cumulative effects for woodland caribou, information and analyses on impacts to connectivity and movement across the landscape is lacking.</p> | <p>1. Using available reports and data, provide an analysis of impacts to landscape connectivity for woodland caribou at the LSA and Range scales.</p> <p>2. Determine whether the Project is expected to result in a reduction of connectivity within or between the ranges and provide a rationale for the conclusion. Describe how movement corridor(s) may be affected by Project activities and infrastructure.</p> | <p>To appropriately focus the EA, using an accepted/proven methodology, the EIS considers two effects: (1) alteration and/or loss of habitat and (2) change in mortality.</p> <p>Effects on movement corridors were not assessed specifically as this is not an infrastructure project that is expected to affect movement patterns across the landscape (i.e., landscape connectivity is not expected to be affected). This also considers the life stages and biology of woodland caribou, including their movement patterns. A “wildlife corridor” ~6 km south of the Project Area (as depicted in Figure 4. Map B, page 16 of ERFN and SVS 2022) was identified by IK that was appropriately considered in the assessment, as this feature overlaps with the Terrestrial RSA. However, this feature was not expressly discussed in the residual effects assessment because there is no anticipated spatial overlap of those areas with direct or indirect Project effects. Further, the effect of habitat alteration does consider changes in species' habitat use, including movement. This approach was appropriate considering the small Project Footprint, the progressive reclamation, the baseline data, the available Indigenous Knowledge and the biology of caribou (e.g., no large-scale movement patterns) potentially using portions of the Terrestrial RSA.</p> | No updates to the draft EIS are needed based on this IR response. |
| IR-152 | CNSC | Woodland Caribou Residual Effects Evaluation | Section 9.3.6.4, Appendix 9-B | <p>Context: Baseline studies for Woodland caribou include:</p> <ul style="list-style-type: none">Winter Track Count Survey to assess presence, abundance, feeding activity, and ecosite affiliation;Pellet Group/Browse Availability Survey to detect presence and abundance of caribou, and frequency of occurrence and abundance of lichen; | <p>Please provide a summary of available baseline data on habitat use during all seasons and life stages, in particular sensitive stages such as calving, and how habitat use during all seasons and life stages was considered in the residual effect analysis.</p> <p>See also IR-145 and IR-143.</p> | Refer to the responses to IR 143 and IR 145. | No updates to the draft EIS are needed based on this IR response. |

| Ref. # | Department | Project Effects Link | Reference to EIS, appendices, or supporting documentation ¹ | Context and Rationale | Information Requirement (IR) ² | Denison Response | Final EIS Updates |
|--------|------------|--|--|--|---|--|--|
| | | | | <ul style="list-style-type: none">Covert Camera Survey to determine presence and use of linear features (roads, trails, and hand-cut lines). <p>The Saskatchewan Conservation Strategy for Boreal Woodland caribou [1] states that caribou are very susceptible to predation during the calf-rearing period, and populations are extremely sensitive to even minor changes in mortality rates.</p> <p>Rationale: It is unclear if, or how, any data on seasonal and spatial use of habitat was considered in the residual effect analysis, for example summer/winter home ranges, sensitive life stages including calving (e.g., location of calving sites). It should be noted that the English River First Nation have identified caribou calving areas in the vicinity of the project footprint.</p> <p>Reference: [1] Saskatchewan Ministry of Environment. 2013. Conservation Strategy For Boreal Woodland Caribou (Rangifer tarandus caribou) in Saskatchewan. Saskatchewan Ministry of Environment. Fish and Wildlife Technical Report 2014.</p> | | | |
| IR-153 | CNSC | Woodland Caribou Residual Effects Evaluation | Section 9.3.6.4.1 | <p>Context: According to ECCC (2020), forest fires can directly alter habitat, making it unsuitable for boreal caribou (e.g., through loss of mature conifer stands, loss of lichens and other forage plants, barriers to movement). Boreal caribou generally do not return to burned areas for several decades until the forest is old enough to support lichens and other food sources, although they may make limited use of burned areas to feed on new growth.</p> <p>The residual effects evaluation of alteration and/or habitat loss lists ecosites BS3 and BS7 (regenerating forest types) as available habitat in Table 9.3-22, which represent 43.5% of the Regional Study Area.</p> <p>Rationale: It is unclear whether the ecosites BS3 and BS7 (regenerating forest types) represent suitable habitat for Woodland caribou year-round. More information is required on the habitat quality (e.g., time since last forest fire) and suitability for different life stages of caribou.</p> <p>For conservatism, it is recommended to perform a second residual effect analysis not including regenerating forest ecosites.</p> | <p>1. Please provide further information on the suitability of ecosites BS3 and BS7 for Woodland caribou in different life stages.</p> <p>2. Please provide the results of a residual effect analysis not including ecosites BS3 and BS7 for conservatism.</p> <p>3. If 2 leads to habitat fragmentation, consider connectivity of habitat patches in the residual effect analysis.</p> | <p>1. Caribou were observed within these regenerating ecosites (BS3 and BS7) during baseline studies and therefore, to be inclusive of all life stages, they were included in the "available habitat" for woodland caribou.</p> <p>2. The EIS followed a conservative approach by including these ecosites in the available year-round habitat to appropriately inform the effects assessment. No additional analysis related to connectivity of habitat patches is considered to be warranted for the Project, considering the baseline data, available Indigenous Knowledge and the biology of the caribou potentially using portions of the Terrestrial RSA</p> <p>3. Effect on habitat connectivity and fragmentation were considered in the habitat-based effects assessment within the context of habitat loss/alteration. The effects assessment considered that the project footprint had been previously disturbed/fragmented and connectivity altered. The assessment appropriately considered effects on wildlife habitat at the LSA and RSA levels</p> | No updates to the draft EIS are needed based on this IR response. |
| IR-154 | CNSC | Woodland Caribou Alteration and/or Loss of Habitat | Section 9.3.6.4.1 | <p>Context: Lichen, the primary food source for Woodland caribou (up to 70% of the year-round diet), can be exposed to airborne contaminants and dust deposition at distances of 1–40 km (e.g., increased metal concentrations or dust were detected in lichen at distances of 1–40 km from a mine site [1, 2]).</p> <p>Rationale: Further information is requested on how the potential for contamination of the food source “lichen” is reflected in the applied buffers of direct and indirect disturbance for woodland caribou.</p> <p>References: [1] Watkinson et al. (2021). Effects of dust deposition from diamond mining on subarctic plant communities and barren-ground caribou forage. Journal of Environmental Quality 50(4): 990-1003. doi: 10.1002/jeq2.20251. [2] Chen et al. (2017). Does dust from arctic mines affect caribou forage? Journal of Environmental Protection 8(3): 258-276. doi: 10.4236/jep.2017.83020.</p> | <p>1. Please provide additional justification for how the potential for contamination of the food source “lichen” is reflected in the applied buffers for sensory disturbance.</p> <p>See also related IRs: IR-137, IR-148 and IR-156.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends the following:</p> <ul style="list-style-type: none">COPC in Lichen monitoring is recommended in transects from the Project site to assess COPC concentrations and confirm whether the chosen buffer is conservative. | <p>Potential effects on caribou as the result of exposure to COPCs, including dietary pathways inclusive of lichen, were assessed as part of the Ecological Risk Assessment (ERA) (see draft EIS, Appendix 10-A). Hazard Quotients (HQs) associated with the exposure pathways analyses were below the benchmark of 1 for all COPCs.</p> <p>The reviewer is referred to Appendix 10-A, as well as the responses to IRs 138 and 189 for additional information.</p> | No updates to the draft EIS are needed based on this IR response. |
| IR-155 | ECCC | Wildlife and Wildlife habitat | Section 9.3.6.4.1, Alteration and/or Loss of Habitat | <p>Context and Rationale: In Section 9.3.6.4.1 of the draft EIS, the Proponent presents figure 9.3-14 and table 9.3-22, which “depicts available woodland caribou habitat in the Project study areas” and provide a summary of available Woodland Caribou Habitat in the Project Area, Wildlife Local Study Area, and the Terrestrial Regional Study Area.</p> <p>The Proponent does not provide a biologically relevant explanation on the ecosites that are considered available woodland caribou habitat.</p> <p>According to the amended recovery strategy for Caribou, all habitat within SK1 range has been designated as critical habitat. To align with best current knowledge and the amended recovery strategy, the map and table should show the biophysical attributes, as outlined in Appendix H of the recovery strategy.</p> | <p>1. Provide a biologically relevant explanation about how available caribou habitat was determined or determine available habitat based on new data from the province of Saskatchewan (See IR-145).</p> <p>2. Consider referencing Appendix H of the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020 to define important biophysical features.</p> | <p>Available woodland caribou habitat was identified in the draft EIS to comprise the ecosites with observations of caribou and caribou sign during the baseline studies. This was done without seasonal differentiation because it was assumed that caribou may use these ecosites during all seasons and life stages. Section 9.3.6.4.1 of the draft EIS describes these habitat types. A reference to Appendix H of the 2020 Amended Recovery Strategy and important biophysical features will be added to Section 9.3.6.4.1. in the final EIS.</p> <p>Please see the response to IR-145 related to the acquisition of data received from the Province of Saskatchewan.</p> | Per the IR response, Section 9.3.6.4.1 in the final EIS will be updated to add: “To be conservative, the environmental assessment assumed caribou use of all habitat types during all seasons, as appropriate. This is expected to appropriately address all of the biophysical features outlined in Appendix H of the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020.” |
| IR-156 | ECCC | Wildlife and Wildlife habitat | Section 9.3.6.4.1 Section 9.3.7.3.1 | <p>Context and Rationale: In Section 9.3.6.4.1 of the draft EIS, the Proponent identified that 142 ha of available caribou habitat within the Project footprint will be directly impacted or lost, while an additional 1,165 ha will be indirectly impacted by Project activities such as sensory disturbance. They assessed the residual and cumulative effect of alteration to habitat for woodland caribou as not</p> | <p>Provide a revised assessment of residual and cumulative effects, taking into consideration that the disturbance within the SK1 range is above the disturbance management threshold required for survival and recovery of the species.</p> <p>See also related IRs: IR-137 and IR-154.</p> | <p>The EA appropriately assessed the residual effects and the cumulative effects within the RSA, as per standard, accepted EA methodology.</p> <p>As described in Section 9.3.7.3.3 of the draft EIS, ECCC identified the caribou population in the SK1 range as being self-sustaining at a threshold of 40% undisturbed habitat and recommended that total anthropogenic disturbance in that range should not exceed 5% with</p> | No updates to the draft EIS are needed based on this IR response. |
