Context and Rationale	<p><b>Context:</b> The Proponent stated that as a tertiary means of containment for the mining area, the uranium deposit is proposed to be surrounded by a freeze wall that extends from the surface to the basement rock, isolating the mining area from regional groundwater. Current plans are for the freeze wall to be a minimum of 10 m thick, be installed 25 m away from the uranium deposit, and extend 30 m into the basement rock (Figure 2.2-6).</p> <p>As explained in Section 2.2.1.4.2.2, mining solution will be injected into the ore zone under pressure and will likely react, not just with the uranium in the ore zone, but also the binding or cementing material in the sandstone. This means that some portion of the sandstone above the uranium layer and perhaps some portions of the freeze wall will dissolve, thereby creating more void than just the thickness of the uranium layer or horizon. The void may affect the integrity of the freeze wall as containment.</p> <p><b>Rationale:</b> It is not clear how the Proponent will monitor the freeze wall to verify whether portions of the freeze wall are being dissolved in the mining process and how it plans to verify the integrity of the freeze wall as a containment for the mining solution. In addition, if the dissolution reaction of the uranium ore is exothermic, then the heat generated may also affect the integrity of the freeze wall.</p>
Information Requirement	<ol style="list-style-type: none"> <li>1. Explain how the integrity of the freeze wall will be maintained as a means of containment that prevents migration of the mining solution out of the ore zone into the receiving environment.</li> <li>2. Demonstrate that the mining solution injected under pressure will not compromise the integrity of the freeze wall as a containment.</li> </ol>

	<p>3. Demonstrate how both exothermic and chemical reactions of the mining solution used to dissolve the uranium ore will not compromise the integrity of the freeze wall as a containment.</p> <p>Technical Discussion Required: Yes. ECCC would like to better understand the chemical constituents that compose the mining solution and the chemical reactions that it will cause</p>
--	--

Response:

The general theme of the comments and questions stated above seem to be related to:

- verification of the freeze wall extents;
- response of the freeze wall to potential chemical interaction with the lixiviant;
- response of the freeze wall to induced hydraulic or lithostatic stress; and
- response of the freeze wall to potential exothermic processes related to ISR.

The alignment of the freeze wall is located 25 m offset from the lateral extent of the recoverable ore and the freeze wall will grow in thickness both towards the ore and away from the ore. The freeze wall will solidify all liquid porewater and develop into a contiguous impermeable barrier many metres thick. Ground temperature monitoring will be installed on both the ore and non-ore sides of the freeze wall to confirm the thickness of frozen ground and to validate thermal finite element models of the entire area. Thermal models can very accurately represent real conditions because ground thermal properties used in the analyses only vary by a factor of two to four across all ground types, unlike hydraulic or strength properties, which can vary by many orders of magnitude across relatively short distances.

The figures below are an example of field data validating modelled predictions for a shaft freeze wall at depth.

**Figure 1: Illustration of a calibrated FEM model for freezing in clay (left) and rock (right). Temperatures were measured offset from the freeze wall pipe locations and compared with model predictions at the same location.**

The injection and recovery wells will be set up such that they are within the confines of the ore itself and migration of fluids towards the freeze wall and through non ore ground between the ore and freeze wall should be minimized because hydraulic gradients will induce preferential flow to recovery wells and away from the freeze wall. Having said that, if significant excursion of lixiviant were to occur and it were to contact the freeze wall, it is not expected to chemically dissolve the in situ ice. The freezing point depression of the lixiviant proposed for this project was determined to be  $-1^{\circ}\text{C}$  and, as such, it would freeze off and become immobile before significant volume could negatively impact the freeze wall. If the lixiviant were to dissolve some of the host soil / rock binding material at the freeze wall surface, it would occupy the resulting void space, but then freeze off, which would halt further migration within the freeze wall.

Freeze walls, when fully developed, are capable of withstanding significant external pressures because the ice in the pore voids greatly improves the bulk strength of the soil. For example, in the province of Saskatchewan, ground freezing is used to support the sinking of deep potash mine shafts, which must penetrate through the Mannville formation at a depth between 400 and 500 m below surface. The Mannville formation is often described as saturated, unconsolidated beach sand and it would not support shaft excavation in a thawed state. Freezing is used to create a structural and impermeable wall up to 5 m thick, which can resist a stress gradient driven by full hydrostatic and/or lithostatic pressures on the outside of the wall, and an open to atmosphere excavation within the shaft. This loading condition is much more extreme than any condition the freeze walls at the Phoenix deposit will experience because the interior side of the freeze wall where active ISR mining is occurring is not open to atmosphere and is fluid filled in the same way that the regional groundwater system is on the exterior side of the freeze wall, creating a balanced pressure system, where loading is equal on both the interior and exterior sides.. While freeze walls are very strong when fully developed, they are also plastic in nature. This means that they can slowly deform without failing in response to localized ground deformations. As the freeze wall deforms towards a lower stress zone, it maintains its thickness and integrity. While the above example referred to potash shafts, other examples can be drawn from the experience at the McArthur River or Cigar Lake uranium mines. At McArthur River, open stopes are generated directly adjacent to a freeze wall that is a nominal 4 m thick. At Cigar Lake, open mine cavities 10 m high and several metres in diameter commonly exist within the frozen ground. Neither site has had a breach of the freeze wall during mining activity. Given that the freeze wall at Denison will be much thicker than at McArthur River and that it will be located up to 25 m from the ore zone, it is not anticipated that it will be exposed to a stress environment that will put it at risk.

The leaching process has the potential to be exothermic and generate heat, which may flow toward the freeze wall. In this instance, there is low sulphur content in the ore zone and the exothermic reaction will be minimal. Despite this, all thermal modelling in support of the freeze design assumed that the freeze wall had to develop and be sustained in the presence of an ore zone that generated a nominal amount of heat—sufficient enough to sustain a minimum temperature of  $10^{\circ}\text{C}$  even though it would naturally tend to cool below this in response to the freeze system. It is understood that the lixiviant may be heated as part of the pre-injection process, so some accounting for heat in the ore zone was included in the analysis to date. Should the lixiviant generate more exothermic reaction than predicted, there is a very low risk of it degrading the freeze wall in any significant amount. Referring back to the potash mine shaft freezing illustration, it is not uncommon for in shaft excavation activity and concrete work to

generate temperatures between 30 and 60°C that act on a freeze wall only 5 m thick and only a few metres away from the exposed shaft wall. In this extreme case, the freeze wall is more than capable of removing the generated heat. The physics of heat flow are such that heat generated by the ISR process would be free to flow towards the freeze wall; however, most of it would flow to the coldest location (e.g., the actual freeze pipes at the mid-point of the wall thickness) before it is manifested as an observable significant rise in ground temperature. Even if the heat were to warm the ore side of the freeze wall, it would not impact the non-ore side of the wall (which is where half of the total wall thickness resides). This heat may penetrate to the center of the wall but if the refrigeration plant is operating, that heat can not then flow “up gradient” on the non-ore side of the wall and thaw that side.

The concentration of the lixiviant (max ~8% sulfuric acid conc.) has a freezing point of ~-4°C. The lixiviant itself will not react chemically with the freeze wall, other than having a slightly different freezing point than formation water. The main reaction expected is dissolution of uraninite with the combination of sulfuric acid, hydrogen peroxide, and ferric iron. This reaction is exothermic, but there are several natural mitigating factors of the wellfield that aid in minimizing heat transport to the freeze wall:

- The wellfield will have flexibility in terms of reagent concentrations being added. With the bulk of the uranium being contained within a higher-grade core (interior to the deposit), the exterior of the deposit will see either lower injection/recovery flows or lower concentrations of lixiviant to be efficient with reagent consumption. Whether the concentration or flow is reduced, this limits the reaction rate and therefore total heat generation at the extremities of the deposit.
- There is no refortification of reagents underground compared to typical uranium tank leaching. This prevents additional heat generation from dilution of sulfuric acid or hydrogen peroxide.
- The heat capacity of lixiviant/UBS should be higher than the ore in the deposit, which means the UBS solution will carry the majority of the heat to surface rather than keeping the heat of reaction at depth.
- In the event the freeze wall thickness monitoring network detected an actionable thinning to the freeze wall, the concentration of lixiviant could be decreased which would reduce the heat generated per m<sup>3</sup> of lixiviant and re-establish the desired freeze wall thickness.

To summarize the risk of the degradation of the freeze wall due to exothermic reaction, it is almost impossible—with the freeze plant operating—to practically add sufficient sustained heat to thaw the proposed freeze wall to the point hydraulic containment is compromised. Sufficient operational controls will be in place to verify the freeze plant is operating, to measure the temperature in the ore zone, and to measure the temperature on adjacent sides of the freeze wall so that early detection of any upset conditions can be identified and addressed. Options for addressing issues are to lower the temperature of the freeze system to draw more heat out, to increase the freeze coolant flow rates in freeze wells nearer to active ISR cells, or to adaptively manage the lixiviant injection and recovery rates in cells located nearer the freeze wall.

Project effects link	Change to an environmental component due to hazardous contaminants
Reference to EIS, appendices, or supporting documentation	Section 2.2.3.9, Project Description Appendix 8-E
Context and Rationale	<p><b>Context:</b> In Table 2.2-1 the upper bound Industrial Wastewater Treatment Plant (IWWTP) effluent quality final discharge targets for Constituents of Potential Concern (COPCs) are provided. General parameters (e.g., temperature, pH, etc.), and several Schedule 4 Substances with maximum authorized concentrations (lead, nickel, suspended solids, and un-ionized ammonia) under the Metal and Diamond Mining Effluent Regulations (MDMER) have not been provided in this table. There are several COPCs (aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese) for effluent characterization under Schedule 5 Section 4 of the MDMER that have not been provided in this table. Additionally, no information on water quality guidelines has been provided in this table.</p> <p>Furthermore, it is stated that the final effluent quality discharge target for uranium is 0.057 mg/L. However, the Canadian Council of Ministers of the Environment (CCME) water short term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe.</p> <p><b>Rationale:</b> ECCC requests the Proponent include the general water quality parameters that influence water quality thresholds, parameters in Schedule 4 and Schedule 5 Section 4 of the MDMER, and their respective water quality guidelines for consideration and transparency.</p> <p>Discharges from the proposed Project will alter water quality in the immediate receiving area, and this may include some sublethal effects on aquatic biota, which must be minimized. It remains the Proponent's responsibility to adhere to the MDMER to ensure that effluent at the end-of-pipe from all final discharge points be non- acutely lethal and meet requirements for prescribed deleterious substances under Schedule 4 of the regulations.</p>
Information Requirement	1. Update Table 2.2-1 and Appendix 8-E to include all general parameters required for environmental effects monitoring: pH, temperature, hardness, alkalinity, and conductivity.

	<p>2. Update Table 2.2-1 and Appendix 8-E to include missing Schedule 4 Substances under the MDMER with maximum authorized concentrations: lead, nickel, suspended solids, and un-ionized ammonia.</p> <p>3. Update Table 2.2-1 and Appendix 8-E to include missing Schedule 5 Section 4 parameters required for effluent characterization under the MDMER: aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese.</p> <p>4. Include all acute and chronic water quality thresholds for each parameter in Table 2.2-1 and Appendix 8-E.</p> <p>5. Describe additional mitigation measures that can be considered to minimize impacts to aquatic biota from uranium concentrations in effluent.</p>

Reference to EIS, appendices, or supporting documentation	Section 2.3.3.1.1 Appendix 7-C
Context and Rationale	<p><b>Context:</b> The proponent's objective for mining area remediation is to restore the groundwater within the confines of the freeze wall to an acceptable remediation target (EIS, sec. 2.3.3.1.1). The proponent's acceptable decommissioning objectives for groundwater quality are provided in EIS Table 2.3-3 and in Table 3-5 of Appendix 7-C. These objectives were based on laboratory core flood tests performed by flushing samples of ore with groundwater and groundwater amended with sodium hydroxide or sodium bicarbonate. The composition of the remediated groundwater observed in the core flood tests serves as the source term for the post-decommissioning reactive transport modeling presented in section 4 of Appendix 7-C.</p> <p><b>Rationale:</b> In NRCan's opinion, it is important for reviewers to be able to assess the level of remediation achieved in order to reach the proponent's decommissioning groundwater quality objectives. Therefore, the proponent should provide complete water quality data for the pregnant lixiviant that remains in the ore zone after the end of mining and prior to any remediation.</p>
Information Requirement	NRCan requests that the proponent revise Table 3-5 of Appendix 7-C to show the water quality in lixiviant remaining in the ore zone at the end of mining, prior to remediation activities.

Project effects link	Geology and groundwater
Reference to EIS, appendices, or supporting documentation	Section 7.6.2.1 (Remediation Objectives)
Context and Rationale	<p>Context: Metallurgical testing, including batch reaction, coreflood testing and column tests are mentioned frequently throughout Sections 2 and 7 of the EIS. Outside of the composition of restored solutions from coreflood tests #2B and 3C, results from these various tests are not reported in the EIS or any associated Appendices. Rationale: The results from metallurgical testing are important to a number of items discussed in the EIS, including (but not limited to): evolution of hydrochemistry during remediation, source of salts in Lower Sandstone Aquifer porewaters, process plans, industrial wastewater treatment, estimating composition and volume of process precipitates, and composition of mining fluids and leachate. In particular, the EIS posits that mining area decommissioning objectives are achievable based on metallurgical testing and provides these objectives in Table 2.3-3. CNSC staff need to understand the specifics of this metallurgical testing, given</p>

	its importance for the development and justification for mining and remediation activities. Denison must also provide information demonstrating that the proposed restoration actions and remediation targets are As Low As Reasonably Achievable (ALARA).
Information Requirement	1. Please provide a summary of the results and the analysis of results of the metallurgical tests within the EIS, or provide the technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS. This should include sample information for cores (e.g., mineralogy, location, U content, depth), test conditions (e.g., duration, # of iterations, column length, flow rate, temperature, pressure, sample frequency, influent/effluent composition), as well as results and how they are pertinent to the development of ISR activities. 2. Please provide further clarification/justification on how results from two singular coreflood tests (i.e., Coreflood #2B and Coreflood #3C) can justify large-scale remediation activities and targets following solution mining. 3. Please provide material demonstrating that the proposed restoration actions and remediation targets are ALARA.

Number	IR-69
Dept.	NRCAN
Project effects link	Fish and fish habitat
Reference to EIS, appendices, or supporting documentation	Section 7.6.2.2.3  Appendix 7-C, sections 3.1 and 3.2
Context and Rationale	<p><b>Context:</b> For hydrogeological and geochemical assessments in support of ISR projects, the proponent identifies two aspects of primary importance (Appendix 7-C, sec. 3.1). These are a) groundwater remediation (Appendix 7-C, sec. 3.1.1); and b) the assimilative capacity of host rocks downgradient from the ore zone (Appendix 7-C, sec. 3.1.2). According to the proponent, the objective of groundwater remediation at decommissioning is to achieve water quality in the mined zone that does not pose a risk to receptors at the point of exposure. Assimilative capacity refers to the ability of groundwater-rock reactions to naturally sequester or attenuate COPCs migrating from the ore zone during the post-decommissioning period.</p> <p><b>Rationale:</b> However, in NRCAN's opinion, the proponent has neglected to mention the most fundamental aspect for hydrogeological and geochemical assessments in support of ISR projects. That aspect is the choice of ISR lixiviant and its effects on the mineralogy and hydrogeochemistry of the ore zone during mining operations. The proponent provides information on the pre-mining mineralogy (Appendix 7-C, sec. 3.2.1) and hydrogeochemistry (Appendix 7-C, sec. 3.2.2) but no information on their expected changes as a result of ISR mining. This information is important when considering source terms in reactive transport modeling.</p>
Information Requirement	NRCAN requests that the proponent provide a detailed description of the expected mineralogical and hydrogeochemical changes occurring within the ore and barrier zones as a result of the injection of acidic lixiviant.

Response:

It is also important to note that Denison is completing a sequential EA and licensing process for the Project (see draft EIS Section 1). Detailed ISR mining-related information needed to support licensing

and permitting has not been included in the EIS; it will be provided to regulators as part of permitting and licensing.

For the EIS, an initial understanding of the mining area remediation was needed to initiate the assessment of migration of constituents of potential concern in groundwater out of this area in the post-decommissioning period. The findings and conclusions of the EIS were also used, in turn, to inform and bound the engineering and feasibility work. The coreflood 2b and 3c, plus the Pre-Feasibility work (Denison, 2018) on mining area remediation (Section 2 (decommissioning section), Section 7, Appendix 7-C) was used in the draft EIS. This IR response provides additional information to support the selection of these studies.

#### Response to #1

### **1.0 Summary of Test Work**

This response is focused on the metallurgical test work done to support an understanding of the:

- a) mineralogy and hydrogeochemical changes in the ore and barrier zones as a result of the lixiviant (mining solution) injections (see IR-69);
- b) the composition of the uranium bearing solution (UBS) at the end of mining and prior to any remediation (see IR-20); and
- c) water quality and secondary mineral phases formed during remediation of the ore zone (IR67; this IR).

Metallurgical testing completed, the objectives and results of the work, and the information carried forward for discussion in this response are summarized in Table 1.

Further details on the metallurgical testing, including the sample information for cores (e.g., mineralogy, location, U content, depth), test conditions (e.g., duration, # of iterations, column length, flow rate, temperature, pressure, sample frequency, influent/effluent composition) are provided in the sections below. All data presented herein are from the metallurgical test programs used to support the 2018 Prefeasibility Study (Denison 2018) and the Feasibility Study (Denison 2023).

Table 1: Summary of Metallurgical Testing

Years	Description	Objective	Results	Information informing IR-20, IR-67 and IR-69
2017-2018	Batch leach tests and bottle roll/agitation leach tests	Early testing of leaching with alkaline and acidic based lixivants	Supported decision for Acid Leaching	No discussion herein; very preliminary testing.
	A column leach test conducted using sulfuric acid followed, which also included simulated groundwater restoration tests.	Initial column test with acid leaching and evaluation of groundwater remediation	Early indication of groundwater remediation needs	Water Quality of UBS at the end of mining and Restoration Phase/flushing solution (groundwater remediation)
2021	Column leach tests on blended crushed ore	Test leach recoveries on a range of feed grades. Determine potential recovery and generate a representative sample for process plant testing.	Operationally, the feed sample for Column 1 is was verified as a reasonable blend to represent ISR wellfield production of UBS. Groundwater remediation with groundwater and alkaline solutions	Water Quality of UBS at the end of mining and Restoration Phase/flushing solution (groundwater remediation). Mineralogy.
2022	Column leach and remediation tests on crushed and screened core from individual hydrogeologic units	<ul style="list-style-type: none"><li>•Develop information to support geochemical modelling of the deposit, including leaching and neutralization phases.</li><li>•Generate a detailed chemical and mineralogical characterization of the dominant hydrogeological units(HGUs) within the ore zone</li><li>•Evaluate behaviour of different HGUs during ISR and neutralization, in particular those hosting the majority of the resource.</li><li>•Compare the efficacy of neutralization of different HGUs, with the use of dilute sodium hydroxide</li></ul>	Uranium leachability was found to vary amongst the HGUs. Also, there were some indications of an HGU ("2A") to be avoided during operations to prevent clay mobilization.	Water Quality of UBS at the end of mining.
2018	Static uranium ore dissolution (jar) test on intact core	Room temperature, 1,138 hours (48 days) exposure of drill core to concentrated sulphuric acid (35 g/L) in a very slow-motion shaker.	Provided visual indication that with sufficient soak time, lixiviant will penetrate into intact high grade uranium pieces. The incomplete recoveries at the end of the tests can be attributed largely to requiring longer residence time	No discussion herein; testing limited to visual information.
2018-2022	Coreflood tests on intact core in 2018 to 2022	Simulate the in situ field conditions, to understand and develop the lixiviant conditions necessary for successful full-scale ISR. Objectives were to: evaluate the rate of uraninite dissolution and changes in permeability of the core with leaching; generate laboratory scale test results applicable to planning the 2022 field test; and delineate a life-of-well-pattern production profile.	<p>Results were inconsistent in the early work (Coreflood 1 to 3C) due to highly variable reagent dosages in this pioneering work. Coreflood 4 and 5 (2021-ongoing).</p> <p>In Coreflood 4, as uranium mass gradually leached away, there was a mild trend of increasing flow rate at the same pressure, indicating permeability increase. Lessons learned from past testing, particularly with respect to reagent adjustments, were put into practice with this testing to enable completion of the longest test run to support the feasibility work. In total, 51.8% of the initial dry mass of the sample was removed by leaching; 50% of this was the result of uranium leaching. Feed grade was 26.66% U3O8.</p> <p>In Coreflood 5 is ongoing and is focused on HGU 2B, which has the majority of contained uranium, highest grade and highest natural permeability. The methodology was different from the other coreflood tests in that the flow was directed through a pencil hole in core. Cumulative recovery at end of February 2023 was 33%.</p>	Water Quality of UBS at the end of mining and Restoration Phase/flushing solution (groundwater remediation). Mineralogy.
2022	Feasibility field test (FFT) leaching and remediation in 2022	The FFT was a full-scale proof of concept in an ISR method; to demonstrate injection of lixiviant and recovery of UBS from the CSW test pattern. Injection was into 1 well (GWR-041).	After pH below 3 was achieved in GWR-041, active leaching of uranium began. UBS grade from GWR-041 rose while pH declined. Uranium grade trended upwards to 25 g/L over four days, while injection pressure decreased. This suggests that leaching played a role in reducing resistance to flow. A peak sample grade of 43 g/L U was collected from GWR-041 after a further three days, so the acid injection phase was ended (on October 12). A global leaching recovery curve could be developed using the field testing and coreflood tests.	No discussion included herein.

### **1.1 2018 Column Leach and Groundwater Restoration Test**

In early 2018, a column leach test with acid lixiviant was performed. The core material used for testing came from three drill holes. Select intervals of overlying very low-grade sandstone was blended with very high-grade intervals to create a composite feed grade of 24.2% U. Details on the core material used in the leach tests are provided in Appendix A to this response, in Table A1.

A total of 137 pore volumes (PVs) of uranium bearing solution (UBS) was generated at flow rate ranging between 2 to 4 PV/d. A 90% recovery was achieved with a peak individual sample uranium grade of 27.4 g/L and average UBS grade of 8.4 g/L U. Following the leaching, the column was flushed with simulated groundwater to simulate groundwater restoration. Analytical results from the first pore volume of water removed from the column during the restoration phase are incorporated into the range in UBS composition at the end of mining presented in Table IR-20, IR-67, IR-69-2.

*Table 2 addresses IR-20. This table summarizes information from the metallurgical testing with respect to composition of the UBS at the end of mining, prior to remediation.* See further discussion below in Section 1.3.

Flushing of the column with simulated groundwater (Phase 1 of restoration) was continued for 84 pore volumes. Phase 2 (RPV 84-108) circulated simulated ore zone water quality fortified with 1 g/L Bicarbonate [from  $\text{NaHCO}_3$ ]. The test simulated the operation of a Reverse Osmosis (RO) water treatment step where solution exiting the column would be treated prior to being re-introduced. Phase 3 (RPV 108-114) re-established injection of simulated groundwater quality. The objective of this phase was to displace the bicarbonate and to ensure ground water stability once the circulation of fluid is halted. Analytical results for groundwater collected during this restoration process are shown in Table 9 and Table 10. Information presented in those tables is discussed further in Section 2.0.

### **1.2 Column and Coreflood Tests**

The following were common to all column and coreflood tests performed:

- The pore volume was determined by pumping water (deionized water, site groundwater) into each column or core until filled.
- Temperature was controlled to 10°C by placing the apparatus in a walk-in cooler.
- An online UBS or Remediation/Flushing Solution sample was taken daily.

Table 2:UBS Chemistry at end of Leaching (Mining)

Test	Units	Coreflood 2B (2021)	Coreflood 3C	Number of Samples	Range of Values of UBS constituent concentrations across Metallurgical tests from 2018-2021 representative of End of mining conditions		Baseline Ore Zone Groundwater Chemistry

Notes

* Analytical results for radionuclides are limited. The ranges of radionuclide concentrations (Bq/L) provided are considered conservative because they reflect composite samples collected over the ISR leaching period in the 2021 column samples, not UBS at the end of mining	
	Analytical results for Coreflood 2B and 3C are provided (in addition to the range of UBS Constituent Concentrations) because results from the remediation portion of these tests was used for development of the Restored Solutions modelled in the draft EIS (Appendix 7-C)
	Used to highlight baseline groundwater quality in the ore zone for comparison with UBS Composition at end of mining.

## 2021 UBS Column Tests

The objective of the 2021 column tests was to test leach recoveries on a range of feed grades. Four samples were generated from nine drill holes, all proximal to the WS Shear where most of the resource lies. The samples contain varying amounts of uraninite, sulphides, clay and iron and represent blends of the various hydrogeologic units within the deposit (HGUs). Samples were crushed to -10 mm. Columns with a diameter of ~100 mm were packed with the samples. Four column tests were conducted, with details for each sample listed in Table 3.

The 2021 column tests used the full-size distribution of crushed core and achieved relatively high mineral liberation in contact with lixiviant. This results in relatively rapid leach kinetics compared to intact core. The initial flow rate was calculated based on a retention time of eight hours (3 column pore volumes per day (PV/d)).

Table 1: Summary of Samples for Column Test 1 to 4

Column No.	Sample ID	Mass (g)	Feed U <sub>3</sub> O <sub>8</sub> (wt%) <sup>a</sup>	HGUs in Blend <sup>b</sup>	Hole IDs	Number of PVs - Leaching	Number of PVs - Remediation
1	Sample A	27,338	48.1	2A/B/C/D	GWR-10, 16, 19, 21	116	6.7 (D.I. Water)
2	Sample B	18,619	46.1	2B	GWR-10, 19, 23, 26	120.4	16.5 (Site GW, 10g/L NaOH Solution)
3	Sample D	9,180	1.8	2A/C/D/E	GWR-15, 16, 19, 26	14.7	15.5 (Site GW, 10g/L NaOH Solution)
4	Samples C&E	8,742	26.9	2A/C/D/E	GWR-01, 19, 22	29.7	11.2 (Site Water, 1.5g/L NaHCO <sub>3</sub> )

Notes

<sup>a</sup> Back Calculated

<sup>b</sup> HGUs = Hydrogeological Units in the Ore Zone

A single pass flow of dilute sulfuric acid and hydrogen peroxide lixiviant was run between 22 to 38 days. Lixiviant strength was generally decreased over the course of each run. UBS composition from each of the column leach tests at the end of leaching is shown in Table 2.

On completion of the leaching tests, each column was flushed with water (de-ionized water or groundwater) and for columns #2, #3 and #4, neutralization of groundwater was evaluated using alkaline solutions. Solutions used and porewater volumes flushed are summarized in Table 3. Analytical results for solution composition during the remediation phase are included in Table 9 and Table 10.

Mineralogy of the column samples pre-testing were analyzed by XRD and QEMSCAN; the mineral assemblages aligned with the overall understanding of the ore zone mineralogy, provided as Table IR-20, IR-67, IR-69-A2 (Appendix A to this response). XRD results for the fine particles are provided as Table 4. These results show the formation of secondary sulphate minerals during the uranium ore leaching process. The other mineral phases are associated with the (pre-mining) ore zone mineralogy, provided in the draft EIS as Table 3-1 of Appendix 7-C, and provided herein in Appendix A as Table 2.

Table 4: XRD Results for Fine Particles in UBS, Column Experiments #1 to #4 (2021)

Mineral Phase	Column #1	Column # 2	Column #3	Column #4
Anglesite	18.1	9.8	-	6.6
Anhydrite	7	-	-	-
Biotite	-	38	24.2	8.3

Secondary Minerals

## 2022 Column Leaching and Remediation Tests

A suite of 5 column leaching tests was undertaken to support remediation planning. Whereas core flood testing may more realistically represent the ISR conditions with respect to operational conditions (i.e., using intact core and pressure applied), this phase of column testing used crushed material to accelerate the testing process and, thus, provide key information on the remediation phase and prepare for the (2022) field feasibility study.

The 2022 column testing program consisted of five 100mm diameter columns loaded with samples from different HGUs providing characterization of ore variability. The samples were selected from a blend of assay sample splits of fresh core from GWR-054 through GWR-061, supplemented by preserved core from GWR-016, GWR-022 and GWR-024 stored frozen by Denison. The hole locations are shown Figure 1 ranging along the length of the deposit. Intervals from five to eight different drill holes were composited to meet required sample mass and/or to meet representativeness for each HGU.

The samples were hand crushed to minimize fines generation, to a maximum size of 30 mm. Minimum size fraction was +0.212 mm by wet screening out fines. This was designed to promote flow through the column and minimize exposed mineral surface area. Overall procedures were like 2021 column tests. The lixiviant was a mixture of sulphuric acid and hydrogen peroxide and was prepared using Wheeler River groundwater. Lixiviant was injected upwards in essentially flooded plug flow conditions. The flow rate was calculated based on ~0.67 measured column PV/d. Test parameter variables were minimized, so the differences between HGUs could be distinguished.

Initially, all five columns were fed lixiviant from a common tank. The low-grade columns 2A and 2E were run until fully leached. From that point forward, 2A and 2E were fed from a separate tank to perform groundwater flush and neutralization. A summary of details of the column tests including pore volumes during leaching, during post-leaching flushing with groundwater, and during neutralization are provided in Table 5.

UBS composition at the end of the leaching period is provided in Table 2, and groundwater quality following the groundwater flushing and neutralization is provided in Table 9 and Table 10.

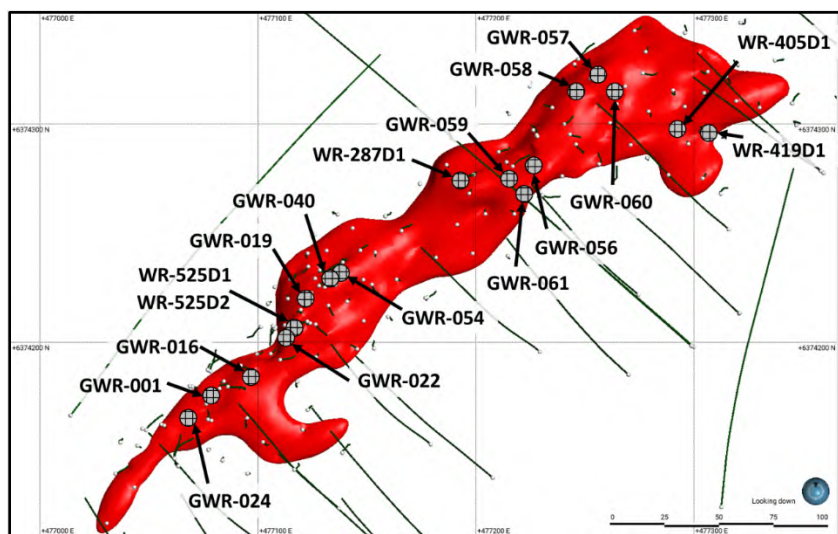

Figure 1: Metallurgical Hole Locations for 2022 Column Leach Testing

Table IR-20, IR-67, IR-69-2: 2022 Column Leach Testing Details

Columns	2a	2b	2c	2d	2e
Estimated Grade (wt % U <sub>3</sub> O <sub>8</sub> )	5.0%	58.3%	41.3%	46.1%	1.6%
	Numbers of Pore Volumes				
Phase 1: Groundwater equilibration	2.9	3.1	3.0	2.8	3.1
Phase 2: In-Situ Recovery (ISR)	20.8	66.7	64.1	62.4	19.4
Phase 3: Groundwater Flushing	15.0	16.2	15.1	11.6	14.9
Phase 4: Neutralization	4.4	4.2	11.0	2.6	3.7
Total Pore Volumes	43.1	90.3	93.1	79.4	41.1
pH at end of Phase 2	0.93	0.95	0.91	0.91	0.95
pH at end of Phase 4	9.53	7.1	3.8	7.22	7.87

QEMSCAN was done on the column pre-testing and at the end of the flushing period. The results are presented as Table 6. Mineral phases that reflect basement-derived materials in the ore zone residuals include biotite, spodumene, petalite and garnet.

Table 6: 2022 Column Leach Test QEMSCAN results

QEMSCAN	Column 2a		Column 2b		Column 2c		Column 2d		Column 2e

## 2018-2022 Coreflood Tests

Core testing machines (CTM) were typically used to study in situ oil recovery processes, for flooding uranium deposit drill core with lixiviant to simulate ISR conditions on a micro scale which are referred to as coreflood tests. All drill cores tested were from vertically oriented drill holes allowing the flow from end to end of the coreholder to simulate flow in the vertical direction of the deposit. This is tangential to the intended predominantly horizontal flow path between wells in situ.

From late 2019 to mid-2021, coreflood tests numbered 1, 2A, 2B, 3A, and 3C were performed. The main objective was to simulate the in situ field conditions, to understand and develop the lixiviant conditions necessary for successful full-scale ISR. Priority was placed on testing a large number of samples over short durations. Tests were ended early, so, uranium recoveries were low relative to later testing (generally < 10%). Results for Coreflood 2B and 3C are discussed further herein.

### Coreflood 2B and 3C

Details for the testing of Coreflood 2B and 3C are provided in Table 7.

Table 7: 2021 Coreflood Test Details

Coreflood	2B		3C	
Corehole	GWR-024		GWR-019	
Core Dimensions (average diameter, average length), in mm	60 x100		78*70	
Core Pore volume (mL)	36.9		53.1	
Estimated Grade (wt % U3O8)	24		70.7	
	Number of Pore Volume	pH (at end of Leaching or Remediation Phase)	Number of Pore Volume	pH (at end of Leaching or Remediation Phase)
In-Situ Recovery (ISR)	34.4	2.1	82.7	0.98
Groundwater Flushing	22.7	1.91	91.6	2.83
Neutralization with NaOH	55.6	11.92	-	-
Neutralization with NaHCO <sub>3</sub>	-	-	62.4	6.87
Post-Neutralization Groundwater Flush	9.3	11.47	17.2	6.43
Total Pore Volumes	122	-	253.9	-

The UBS composition at the end of leaching for Coreflood 2B and 3C is provided in Table 2. The analytical results for these samples were provided in Table 2 because Corefloods 2B and 3C were the primary basis for the development of the restored solutions. UBS composition during flushing for these coreflood tests is discussed further in Section 2.0 and is summarized in Table 9 and Table 10.

At the end of testing, the core from Coreflood 2B was frozen. The frozen core was cut in the middle into two sides. XRD, QEMSCAN and SEM was done on one half of the sample, on the inside cut. The XRD results indicated:

- 19.5 wt% Kaolinite
- 26.7 wt % Montmorillonite
- 45.3 wt % Dickite
- 2.9 % Fluorite
- 5.6 % Pyrite

The cumulative uranium recovery for core 2B was low, and thus the sample (post-leaching) has a mineralogical composition comparable to that of the unmined ore zone. The portion of the sample that underwent mineralogical analysis was also rich in clay minerals. The QEMSCAN results are shown in Figure 2. The SEM image (not shown) shows the presence of uraninite, pyrite, and sphalerite.

The QEMScan shows a minor amount of mineral phase suggestive of a small amount of jarosite (“Fe-Al-Si-S”) closely associated with pyrite. This suggests formation of oxidation products/secondary minerals in the core with exposure to lixiviant.

Figure 2: Coreflood 2, QEMSCAN

#### **Coreflood 4**

The Coreflood 4 sample was taken from a high-grade segment of HGU 2C from hole GWR-040, which is the middle CSW in the planned field feasibility test (FFT) well pattern. Thus, it was an excellent candidate to correlate with subsequent FFT results.

Coreflood 4 feed sample side view is shown in Figure 3. Near-horizontal mineral banding is evident.

Figure 3: Coreflood 4 Feed Sample Side View, Prior to Placement in Coreflood Machine

Coreflood 4 ran for a total of 113 PVs over 391 days, with life-of-test average UBS grade of 18.7 g/L U and reagent consumptions of 2.78 kg H<sub>2</sub>SO<sub>4</sub> and 0.35 kg H<sub>2</sub>O<sub>2</sub> per kg U. Part of the difficulty of production ramp-up of Coreflood 4 was due to the flow constraint of low micro scale permeability through the intact core, particularly with generally lower permeability in the vertical flow direction of coreflood samples. As uranium mass gradually leached away, there was a mild trend of increasing flow rate at the same pressure, indicating permeability increase.

In total, 51.8% of the initial dry mass of the sample was removed by leaching. Just over half of the mass loss is accounted for by uranium leaching, and the remainder is accounted for by gangue mineralization leaching. The feed grade was back calculated from measurements of the total uranium in UBS collected throughout the test plus leach residue sections. Feed grade was 26.66% U<sub>3</sub>O<sub>8</sub>, and final recovery was 97.1%. Coreflood 4 is the most comprehensive simulation of ISR for the Phoenix FS, with the highest recovery demonstrated from an intact core to date.

Coreflood 4 provides the most information about the mineralogical and hydrogeochemical changes that are occurring in the ore zone during mining. Post-leaching, the core leached in Coreflood 4 was cut into segments, as shown in Figure 4, assayed and visually examined (photographed) for changes to the core due to leaching. The mineralogy of each section was determined.

Figure 4: Coreflood 4 Cut Sections and Direction of Flow

Coreflood 4 feed side puck (Section 4), inlet face view is shown in Figure 5. The feed end was deeply eroded, nearly through to the discharge side of the section.

Figure 5: Coreflood 4 Feed Side Puck (Section 4), Inlet Face View

Coreflood 4 middle (Section 2), centre longitudinal cut face view is shown in Figure 6. It was strongly bleached throughout, with cracks that appeared after drying.

Figure 6: Coreflood 4 Middle (Section 2), Centre Longitudinal Cut Face View

Coreflood 4 discharge end puck (Section 1), inlet face view, dried, is shown in Figure 7. It was strongly bleached across the entire cross-section.

Figure 7: Coreflood 4 Discharge End Puck (Section 1), Inlet Face View, Dried

XRD for each of the sections is given in Table 8. Mineral phases that reflect basement-derived materials in the ore zone residuals include anorthite.

Table 8: XRD Results for Coreflood 4 Core Sections

Mineralogical Composition Post-Extraction	D-CF4A-1	D-CF4A-2	D-CF4A-3	D-CF4A-4
Location/section in the coreflood column	Discharge End	Midsection	Midsection	Feed End
Kaolinite (Al <sub>2</sub> Si <sub>2</sub> O <sub>9</sub> H <sub>4</sub> )	74.7	22.1	38.3	43.8
Pyrite (FeS <sub>2</sub> )	17.9	20	12.4	16
Chamosite (Mg <sub>2.518</sub> Fe <sub>2.482</sub> Al <sub>1.25</sub> Si <sub>3.80</sub> H <sub>10</sub> ) (Chlorite Group)	7.3	5.8	1.4	--
Gypsum (CaSO <sub>4</sub> H <sub>2</sub> O)	--	7.5	4.5	4.8
Barite (BaSO <sub>4</sub> )	--	1.6	0.7	--
Anorthite (CaSi <sub>2</sub> Al <sub>2</sub> O <sub>8</sub> )	--	30.7	31.8	--
Goethite (FeO <sub>2</sub> H)	--	12.4	10.9	4.3
Anglesite (PbSO <sub>4</sub> )	--	--	--	31.1

### 1.3 Composition of the UBS remaining in the Ore Zone at the end of Mining (IR-20)

The analytical results for the UBS composition in Coreflood 2B and 3C are shown in Table 2 along with a range of UBS composition that was developed from the relevant analytical results for a total of 13 samples from across the column and coreflood tests. The ranges of values for constituents of potential concern (COPCs), as defined in Appendix 7-C of the draft EIS, are provided in Table 2. Uranium and other COPC concentrations generally vary by 2-3 orders of magnitude. There is expected variability in the UBS composition because of the nature of the deposit, which has been captured in the conditions of the metallurgical testing, and the nature of the testing (e.g., core vs. crushed rock, test duration, lixiviant composition, etc.). The analytical results were given explicitly for Coreflood 2B and 3C because of the use of results from these coreflood tests to develop the restored solutions, which is discussed further in Section 2.0.

***The range of UBS composition at the end of mining has been included in Table 3-5 of Appendix 7-C as was requested as part of IR-20, such that UBS quality at the end of mining and remediated conditions (represented by the Restored Solutions) can be compared. The updated Table 3-5 has been added to this response as Appendix B.***

### 1.4 Mineralogical and Hydrogeochemical Changes to the Ore Zone with Mining (IR-69)

Understanding of changes in the mineralogy of the ore zone with mining are informed by the XRD results from Coreflood 4, as this test was terminated at the completion of the ISR process, and QEMSCAN results for the 2022 columns, because these tests provide quantitative information on the mineral assemblage following mining and with remediation. The following conclusions are made with respect to changes in the mineralogy in the ore zone with mining:

- The mining process is effective as leaching uraninite from the ore zone and also results in partial dissolution of sulphide minerals (pyrite, sphalerite, galena, etc.);
- Secondary sulphate minerals are formed as a result of the mining process. The associated equations are shown in Appendix A. Jarosite minerals were suggested surrounding pyrite particles in the QEMSCAN of Coreflood 2, but were not detected in any of the other post-mining residuals. Gypsum and barite were detected in XRD but not present at quantifiable levels in association with the 2022 column residuals. Formation of anglesite is shown by XRD and QEMSCAN in post-mining residuals.

- The elevated concentration of aluminum in solution evidences clay mineral dissolution, but overall the relative abundance of clays in the ore zone increases with ISR mining, as would be expected with ore dissolution.

The hydrochemistry of the ore zone post-mining is presented in Table 2. Consistent with the dissolution of parent minerals and the pH of the UBS, most COPCs concentrations in the UBS at the end of mining are elevated with respect to baseline groundwater conditions in the ore zone.

## 2.0. Composition of the Restored Solutions (Addresses Question #2 of IR-67)

The restored solutions were developed using the metallurgical data that were available when conditions in Post-Decommissioning were being conceptualized in 2020-2021 for numerical modelling and effects assessment (Appendix 7-C of the draft EIS). This included the early results on acid leaching of the core (2018) and Coreflood 2B and 3C results. At that time, the coreflood tests provided the most detailed information from which to develop the chemistry of the Restored Solutions #1 and #2, using the remediation portion of the tests. From the results of that testing, “Restored Solution #1” and “Restored Solution #2” (Table 3-5) were developed to represent the bounding scenarios for groundwater quality considered in the reactive transport model to evaluate the potential for environmental effects following remediation of the mining area. As is discussed further below, these solution compositions were developed to reflect remediation of the ore zone through flushing and neutralization, without over-neutralization – meaning, base addition past circumneutral conditions to alkaline conditions.

Since that time, more information from the column and coreflood tests has become available that supports the composition of the Restored Solutions put forward in the draft EIS as being representative of porewater within the mining zone with remediation.

When developing the restored solutions for the draft EIS, the approach was generally to select concentrations for any given element/parameter that represented a low to mid-range value for the COPC from the metallurgical testing solutions, to be conservative with respect to evaluating potential effect, but also to reflect the goal of the remediation (to align with ALARA, as is discussed below). For dissolved uranium, the concentration in Restored Solutions #1 and #2 were set to upper bounds of 100 mg/L and 30 mg/L, respectively. In some cases, like Co and Ni, the values selected for modelling were identified to be on the high end upon subsequent metallurgical testing. Thus, the concentrations for these elements modelled are conservative with respect to anticipated pore water concentrations of these elements post-remediation.

The basis of the selected concentrations for Restored Solution #1, which was the solution modelled in Appendix 7-C of the draft EIS, is provided below in Table 9. As Restoration Solution #1 contains the higher remaining concentrations, and lower pH (i.e., differs more from baseline conditions in the ore zone), this solution was carried forward for geochemical reactive transport modelling to evaluate environmental effects.

Notes

<sup>a</sup> Data Available when developing the Restored Solutions for the modelling in Appendix 7-C of the EIS

<sup>b</sup> Arithmetic average values, calculated using detected measurements or where all values were non-detect, assumed the detection limit. pH value is the median, not the arithmetic average.

Limited data set meant that PFS groundwater flushing data at pH 5.8 was also considered in setting this value, with a Th-230 concentration of 2.62E-07 mg/L and a Ra-226 value of 1E-05 mg/L (see Table IR-67-10)

Notes

Data Available when developing the Restored Solutions for the modelling in Appendix 7-C of the EIS

Data Available when developing the Restored Solutions for the modelling in Appendix 7-C of the EIS, but not considered in the development of Restored Solution #2 as pH was alkaline

<sup>a</sup> Arithmetic average values, calculated using detected measurements or where all values were non-detect, assumed the detection limit. pH value is the median, not the arithmetic average.

### 3.0. Remediation of Mining Area within the context of ALARA (Addresses Question #3 of IR-67)

Section 2.2.3 of the draft EIS presents the conceptual decommissioning plan (CDP). As part of the CDP, and as highlighted in Section 2.3.3.1.1 of the draft EIS, remediation of the mining area will continue until recovered water reaches and is demonstrated to be stabilized (maintained) at acceptable mining area decommissioning objectives. Such decommissioning objectives consider protection of plausible downgradient water uses. For the purpose of the assessment "plausible use" has been determined to be the protection of aquatic life in Whitefish Lake, since numeric 3D groundwater modelling has indicated that Whitefish Lake is where groundwater associated with the remediated mining area will discharge to. It is within this frame of reference therefore that the ALARA concept should be considered. That is, ALARA can be defined for the purpose of the remediation of the mining area to the extent that subsequent discharge of groundwater to Whitefish Lake does not adversely affect aquatic biota in the lake.

The metallurgical testing done to date evidences an amelioration of UBS quality post-mining with flushing using groundwater and base (hydroxide or bicarbonate) to a restored solution of pH in the range of 4.5-5.5. The intent of the remediation approach is to raise the pH consistently but incrementally, so as to avoid over-neutralizing and yielding an alkaline solution. Alkaline pH conditions favour the formation of precipitates that are not desired from a physical (clogging) or chemical standpoint (secondary solids formed in place of removal of COPCs in the dissolved-phase from the subsurface). Potential environmental effects were thus evaluated based on plausible use, as defined above, at a pH and groundwater conditions that were shown to be achievable through groundwater flushing and addition of base without the risk of over-neutralization. Restoration Solution #1 contains the higher remaining concentrations, and lower pH (i.e., differs more from baseline conditions in the ore zone) and was carried forward for geochemical reactive transport modelling to evaluate environmental effects.

It is noted that the freeze wall will remain in place during mining area remediation (see draft EIS Section 2.3.3.1.1), until decommissioning objectives are achieved to ensure there is no loss of tertiary control of the mining fluid (even in a diluted state). Refinement of the mining area decommissioning objectives and associated modelling will be done as the Project progresses through updates to the Decommissioning Plan; nevertheless, the objectives as they may evolve will be bound by the objectives evaluated in the EIS, which as shown are protective of aquatic biota in Whitefish Lake. The final acceptable mining area decommissioning objectives will be developed prior to initiation of groundwater remediation, as part of the Detailed Decommissioning Plan (DDP).

Project effects link	Change to an environmental component due to hazardous contaminants
Reference to EIS, appendices, or supporting documentation	Section 2.3.3.1.3, Project Description
Context and Rationale	<p>Context: The decommissioning process for the wellfield and associated infrastructure is discussed, however there is no information provided on the potential risk for subsidence of the ground above the depleted uranium deposit. After the uranium has been dissolved and pumped to the surface, a cavity will be formed in the area where the uranium used to exist. This could destabilize the overlying substrates, causing the ground at the surface to sink in the future. There is currently no information regarding this risk, and how it may alter the overlying environment, surface water features, runoff, or existing nearby waterbodies.</p> <p>Rationale: From a surface water and sediment quality perspective, it is important to understand how potential subsidence in the future post-decommissioning may affect the existing environment. It is currently unclear if there is any risk to the aquatic environment if subsidence were to occur and alter existing waterbodies, create new surface water features, or if there will be any risk to the decommissioned onsite industrial landfill and industrial wastewater treatment plant precipitate pond.</p>
Information Requirement	Provide further information on the potential risks from subsidence including the probability of occurrence, how it may affect surface water features, and if there exists any risk to the planned decommissioning of waste management infrastructure.

### Response:

**Date:** July 14, 2023

**Subject:** Results of a Geomechanical Study Investigating the Stability of the Rock Mass in Response to In Situ Recovery of Uranium-Enriched Rock for the Wheeler River Uranium Project

Denison Mines Corporation (Denison), a uranium exploration and development company, has a flagship Wheeler River Uranium project. This project is the largest undeveloped in situ recovery (ISR) uranium project in Northern Saskatchewan's eastern Athabasca Basin. The project site is located approximately 35 kilometers (km) north-northeast of the Cameco Corporation (Cameco) Key Lake operation and 35 km southwest of the Cameco McArthur River operation in the eastern Athabasca Basin. Denison proposes developing the Phoenix deposit in this region.

At the Phoenix deposit, Denison plans to drill the set of injection/recovery wells for ISR of uranium-enriched rock through leaching with a freeze wall isolating the operations from the surrounding rock mass. In response to the leaching process, the remnant ore zone may displace or fail and may no longer be able to support the overburden load while causing instability in the surrounding rock mass because of the stress redistribution. Denison, therefore, has requested a geomechanical study to analyze the geomechanical stability of the rock mass around the excavation and freeze wall from the leaching process. This memorandum documents the geomechanical study and briefly discusses the study objectives and approach, significant results, and conclusions.

## STUDY OBJECTIVES AND APPROACH

In a recent geomechanical study [Vining et al., 2023], RESPEC Company, LLC (RESPEC) developed a three-dimensional (3D) strip model of a specific geological section where maximum ore extraction is planned to investigate the stability of the mined cavity and estimate the surface disturbance. The boundary conditions of the strip numerical model assumed an infinite array of the modeled cross-section, where ore extraction is maximum, along the length of the Phoenix deposit. Considering the boundary conditions of the strip model and presuming the average material properties of key stratigraphic layers, the numerical model predicted surface displacement of approximately 7.5 centimeters (cm) and marginal stability of the rock mass limited to the extent of 16 meters (m) from the top extent of mined excavation.

The primary objectives of the current study are evaluating the geomechanical stability of the rock mass around the excavation and proposed freeze wall in response to the in situ leaching operations in Zone A of the Phoenix deposit. To achieve the desired objectives, RESPEC modified the previously developed 3D strip model [Vining et al., 2023] to create a full-scale 3D model using the structural finite difference program *FLAC3D* [Itasca Consulting Group, Inc., 2021] while presuming the similar, average material properties of key stratigraphic layers. Considering the computational time and analysis effort, creating a numerical model that extends across the entire extent of Zone A is impractical. Because the *FLAC3D* program imposes a plane of symmetry along its boundaries, RESPEC, in consultation with Denison, simulated the half-length of Zone A, and the modeling domain encompasses the Phoenix deposit's northeast extent, as shown in Figure 1. The vertical extent of the 3D model is assumed to be 1,000 m below ground surface (bgs), and the lateral boundary is approximately 135 m away from the extent of the low-grade ore zone. The model boundaries located far away from the excavation boundaries isolated the influence of model boundaries on the excavation response. The kinematic boundary conditions of the numerical model prevent normal (horizontal) displacements along the four vertical boundaries of the model and vertical displacements of the bottom boundary. These constraints allow the interior portion of the model to move freely. In situ stress data were not available for the Phoenix deposit. The vertical stress was assumed to be lithostatic (i.e., equal to the weight of the overburden) and determined as a function of depth from the weight of the overburden. In rock mass, the horizontal stress is considered isotropic (i.e., maximum and minimum horizontal stress equal to the vertical stress). For instance, at the depth of 400 m bgs, the average in situ vertical stress is approximately 10 megapascals (MPa).

Denison provided the AutoCAD drawings of key stratigraphic layers in the Phoenix deposit, which were used to develop the 3D structural model. Table 1 summarizes these stratigraphic layers. Figure 2 presents the elevation view of the 3D model, which illustrates the continually changing elevations and thicknesses of the rock layers, for example, upper and lower clay, sandstone with sulfide, and altered basement. Except for the desilicified sandstone and sandstone with sulfide, the modeled stratigraphic units and their material properties are consistent with the 3D strip model in the previous geomechanical study [Vining et al., 2023]. In consultation with Denison, RESPEC assumed the Mohr-Coulomb property of sandstone with sulfide was similar to altered sandstone and the desilicified sandstone was similar to sand [Terzaghi and Peck, 1967].

Random rock removal was adopted to represent the in situ leaching process in the numerical model. Rock removal included the instantaneous excavation of 30 percent of rock by volume from the high-grade ore zone and 3 percent from the low-grade ore zone. According to Denison, high- and low-grade ore zones are based on the uranium grade and encompass different stratigraphic layers (e.g., upper clay, lower clay, ore zone) within the Phoenix deposit. Denison plans to adopt the freeze wall design for ISR of uranium-enriched rock; therefore, RESPEC explicitly modeled the freeze wall, which

was 20 m thick and located at a distance of 15 m from the extent of the low-grade ore zone. Figure 3 presents the vertical extent of the high- and low-grade ore zones on the vertical plane and surrounding freeze wall.

In the numerical simulation, the pressure at the excavation surface was maintained at a pressure equivalent to a wellhead pressure of 0 MPa with a freshwater gradient of 0.01 MPa/m. Considering that the overlying sandstone is fractured and permeable, and the elevation of the potentiometric surface is near the ground level, RESPEC also simulated the influence of porewater pressure on the predicted stresses and displacement, which is consistent with the previous study [Vining et al., 2023].

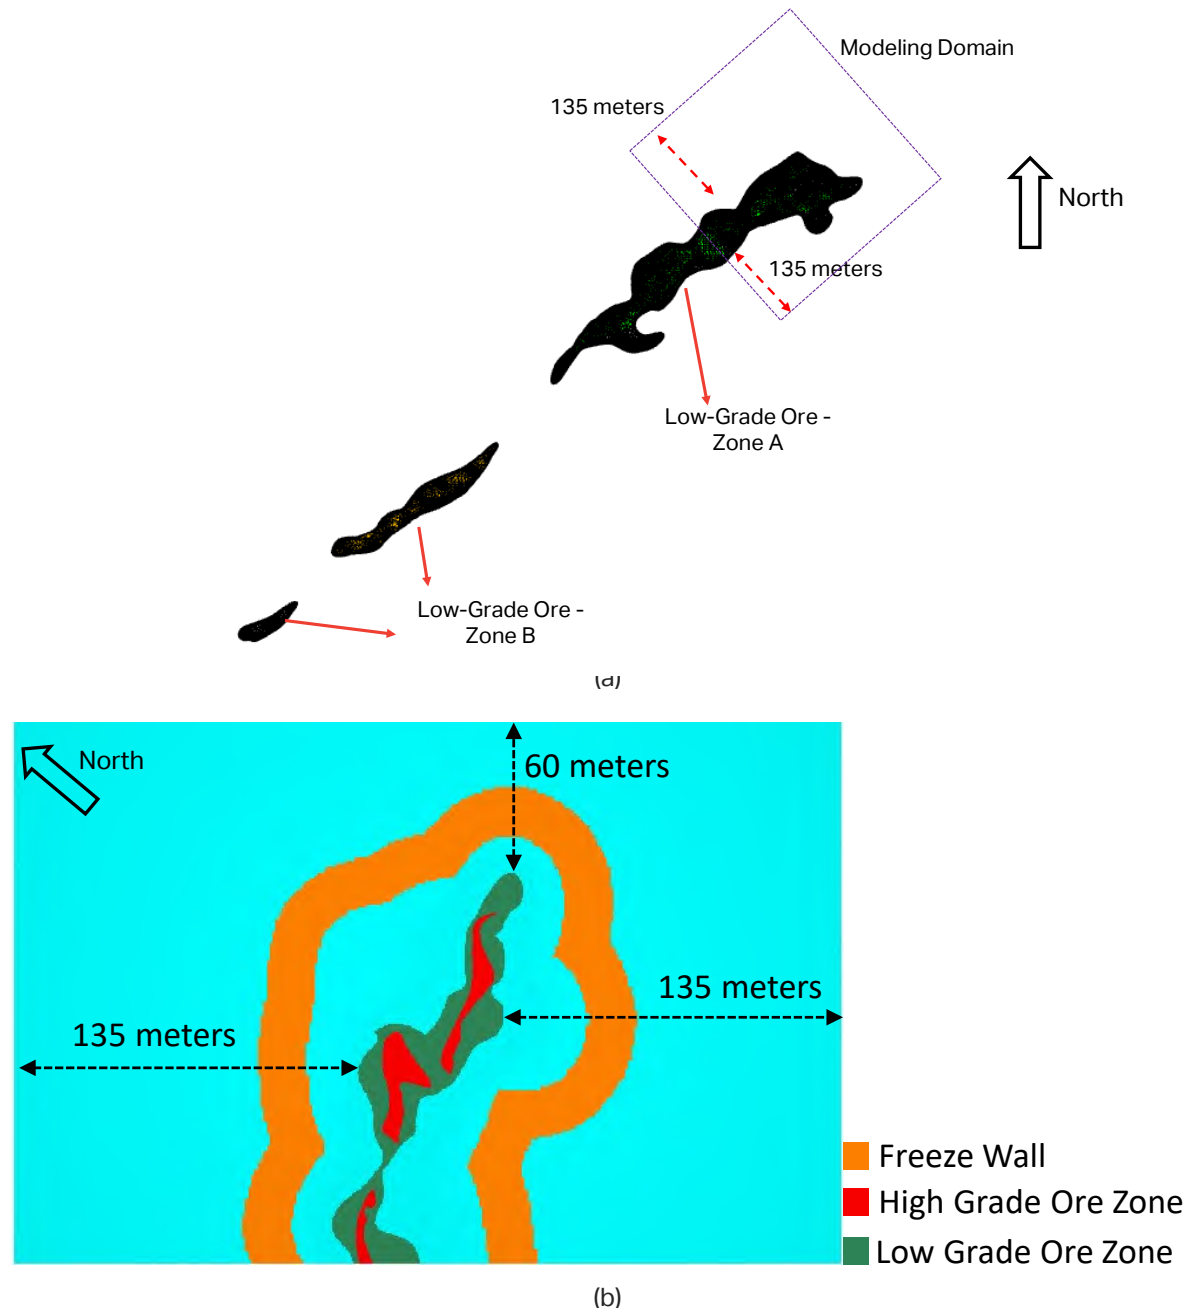

Figure 1. Plan View of the (a) Low-Grade Ore in Zone A and Zone B of the Phoenix Deposit and (b) Extent of Modeling Domain.

Table 1. Average Material Properties

Stratigraphy	Cohesion (MPa)	Friction Angle (degree)	Rock-Mass Compressive Strength (MPa)	Tensile Strength (MPa)	Rock-Mass Modulus (MPa)	Poisson's Ratio (—)	Density (g/cc)
Overburden	1.44	26.93	4.84	4.7	2,241.65	0.20	2.6
Stiff Sandstone	1.44	26.93	4.84	4.7	2,241.65	0.20	2.6
Altered Sandstone	1.07	22.54	3.39	1.0	1,363.76	0.25	2.1
Sandstone with Sulfide	1.07	22.54	3.39	1.0	1,363.76	0.25	2.1
Desilicified Sandstone	0.0	30.0	0.0	0.0	1,363.76	0.25	2.1
Upper Clay	0.03	16.6	0.12	0.20	55.17	0.28	1.7

Figure 2. Elevation View of the Numerical Model Illustrating Changing Elevation of Different Stratigraphic Units Represented in the Structural Model.

Figure 3. Elevation View of the Numerical Model Illustrating the Relative Location of the Freeze Wall to the High- and Low-Grade Ore Zones in Zone A of the Phoenix Deposit.

## RESULTS

The numerical model-predicted stresses and displacements were scrutinized to assess the surface subsidence and the stability of the remaining ore zone, surrounding rock mass, and freeze wall. The outcomes of the numerical simulation are discussed in the following subsections.

### ROCK STABILITY

RESPEC simulated the rheological behavior of rock presuming the Mohr-Coulomb constitutive model for each stratigraphic unit to analyze the stress redistribution in case of failure of the remnant rock around the excavation. In the post-simulation analysis, the Mohr-Coulomb Factor of Safety (MCFS) was determined to quantify the competency of the rock mass based on the predicted stress fields. The MCFS value greater than, equal to, or less than 1.0 quantifies the material as not failing, at failure, or failed, respectively. The potential for tensile fracturing in the rock mass was also analyzed using the least compressive principal stress (LCPS). The magnitude of LCPS will be positive at locations where a tensile stress component exists in any direction. Site-specific strength properties of the rock after freezing were unavailable at the time of the study; therefore, RESPEC took a conservative approach and assumed that the properties of the freeze wall were similar to the host rock.

Figures 4 and 5 present the MCFS contour and LCPS contour, respectively, on a horizontal plane passing through the depth of 390, 399, 406, and 413 m bgs. Figures 6 and 7 present the MCFS and LCPS contour on multiple vertical planes. MCFS contour (Figures 4 and 6) presents that the failure conditions (i.e., red contour) are limited within the close proximity (i.e., 5 to 8 m) of the low-grade ore zone, and its lateral extent varies with the depth of the ore zone below the ground surface. However, the MCFS is always greater than 2.50 within the modeled extent of the freeze wall. LCPS contour (Figures 5 and 7) presents that the marginally compressive stress conditions (i.e., yellow and red contours) are predicted within the extent of the low-grade ore zone, and compressive stresses greater than 5 MPa are predicted within the proposed extent of the freeze wall. Figure 8 quantifies the failure volume predicted within the different stratigraphic units. Within the modeled domain of Zone A, the predicted failure volume was approximately 8, 22, 41, and 26 percent of the modeled volume of sandstone with sulfide, upper clay, ore zone, and lower clay, respectively. However, the failure volume is less than 0.02 percent of the modeled volume of stiff or altered sandstone, desilicified sandstone, and altered and stiff basement rock. Additionally, 0 percent failure volume is predicted within the freeze wall.

Figure 6. Plot of Mohr-Coulomb Factor of Safety Values on Multiple Vertical Planes.

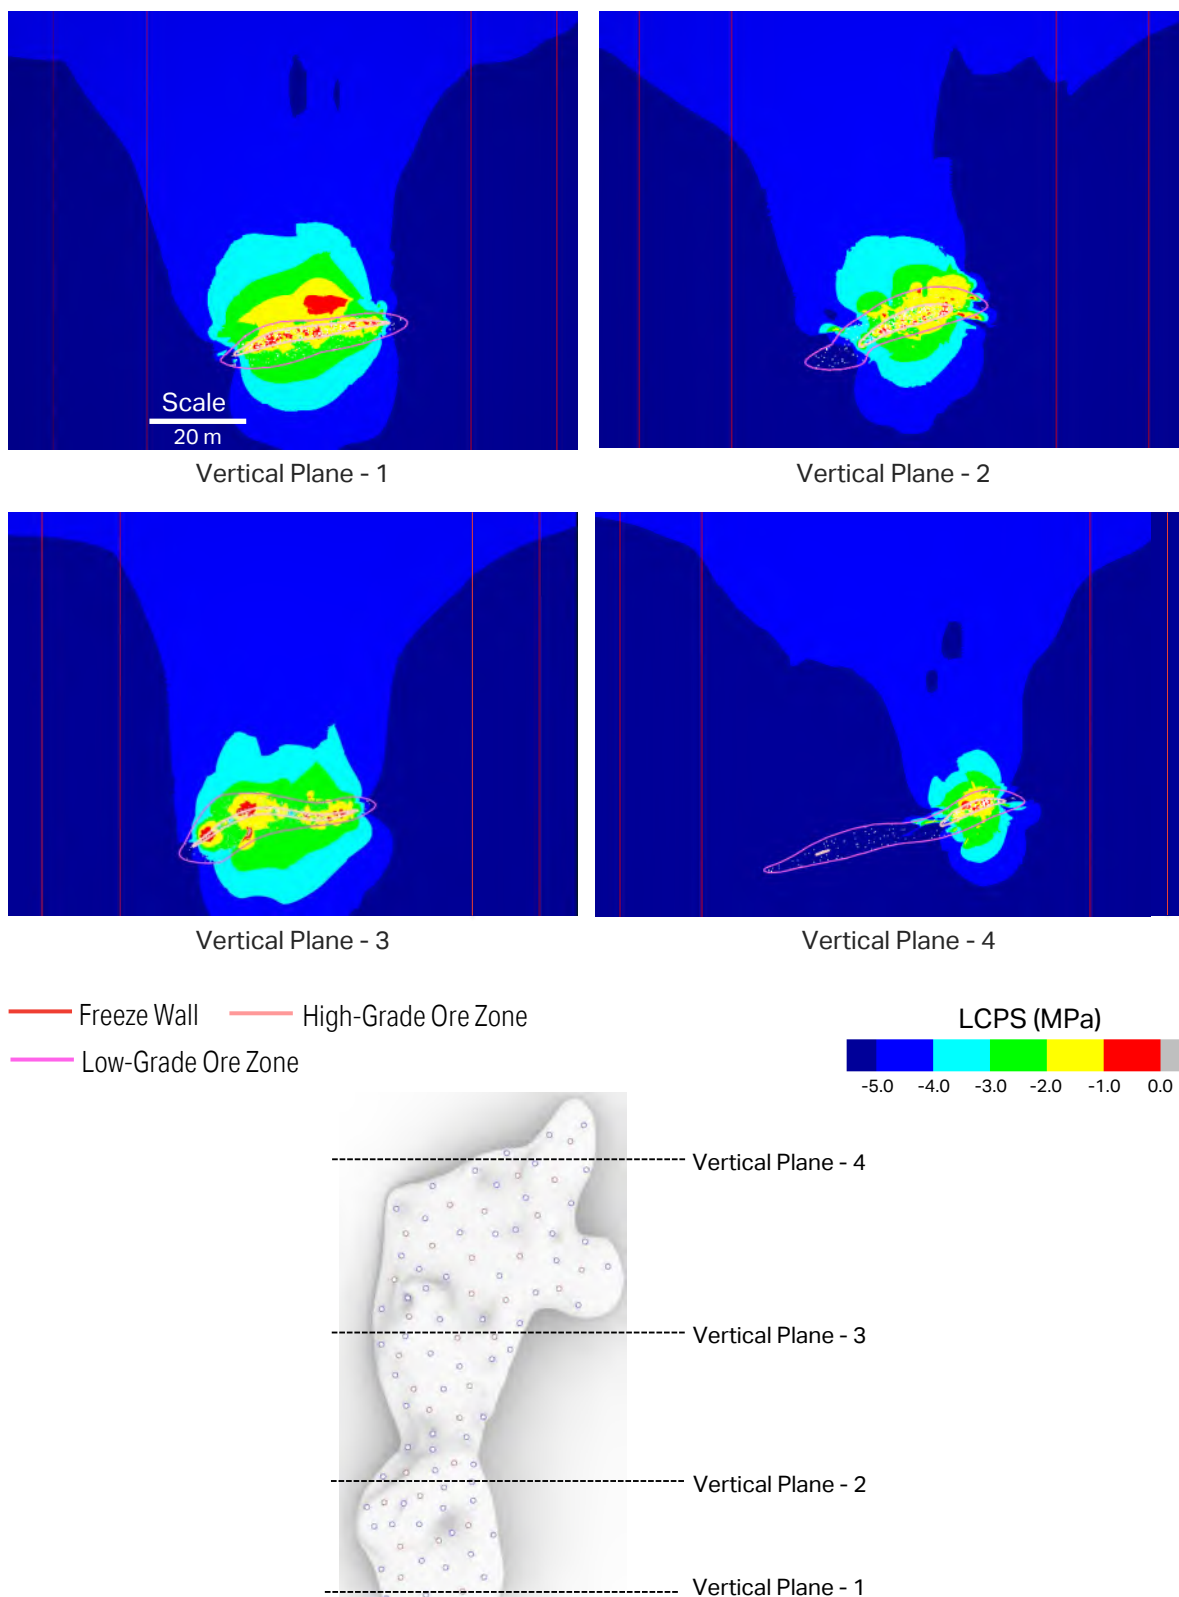

Figure 7. Plot of Least Compressive Principal Stress Values on Multiple Vertical Planes.

Figure 8. Failure Volume in Different Stratigraphic Units.

### SURFACE SUBSIDENCE

In response to the proposed leaching process, the surrounding host rock will displace into the mined cavity, which manifests as subsidence at the ground surface. The numerical model predicted the negligible vertical displacement of approximately 2.5 millimeters (mm) on the ground surface. Figure 9 presents the contours of vertical displacement predicted on a vertical plane passing through the modeling domain's southern boundary. The contour on the vertical plane presents that the vertical displacement of the rock mass immediately above the low-grade ore zone ranges between 42 and 49 cm and quickly reduces to the range between 0 and 7 cm at a distance of 4 to 5 m from the low-grade ore zone. The current study's numerical model-predicted surface subsidence is significantly smaller than the surface subsidence of 7.5 cm predicted in the previous geomechanical study [Vining et al., 2023], which is likely attributed to the difference in the modeling domain and boundary conditions between the two models. In the previous study, the 3D strip model presumed an infinite array of modeled cross sections and corresponding excavation of uranium-enriched rock; in the current study, the full-scale model included the representative extent of Zone A at the Phoenix deposit.

Figure 9. Contour of Vertical Displacement After the Proposed Volumetric Extraction on a Vertical Plane Passing Through the Modeling Domain's Southern Boundary.

## CONCLUSIONS

The study objective was to better understand the anticipated response of the surrounding rock mass, particularly the freeze wall, after proposed volumetric rock extraction from the high- and low-grade ore zone. The significant outcomes from this study are as follows:

- / **The geomechanical numerical model predicted stability against shear or tensile failure within the proposed extent of the freeze wall.** Considering the average estimate of the material properties of modeled stratigraphic layers, the predicted failure conditions in the rock mass are limited to 5 to 8 m of the extent of the low-grade ore zone. Within the proposed extent of the freeze wall, the MCFS values are greater than 2.50, and the magnitude of LCPS is greater than 5 MPa in compression, indicating the limited potential of instability in the freeze wall.
- / **The numerical model predicted vertical displacement at the surface in response to the proposed volumetric extraction is negligible.** The vertical displacement of the rock mass near the modeling domain's southern extent is at a maximum immediately above the low-grade ore zone, ranging between 42 and 49 cm, which reduces to the range between 0 and 7 cm at a distance of 4 to 5 m from the low-grade ore zone. At the ground surface, the average vertical displacement is approximately 2.5 mm.

Context and Rationale	<p>Context: While Appendix 2-C (Alternative Means Assessment) is detailed and includes all aspects of the Alternative means assessment that are required, the summary of the analysis and conclusions in Section 2.10.2 of the EIS lacks the level of detail required to understand the methodology used, and how Denison arrived at these conclusions.</p> <p>Rationale: As noted in the Agency’s Operational Policy Statement on Addressing “Purpose of” and “Alternative Means” under the CEAA 2012: “If a preferred means is selected, the analysis and the rationale for the choice should be explained from the perspective of the proponent, and be documented in the EIS in sufficient detail to provide context for public and technical comment periods during the project EA, and ultimately to allow the decision maker to understand the choice.”</p>
Information Requirement	<p>Please summarize the analysis of the alternative means assessment within the body of the EIS, in sufficient detail that a reader of the EIS has adequate information to understand the methodology used, and how Denison arrived at these conclusions.</p> <p>Note: In addition to the adding text to summarize, Table 6 in Appendix 2-C could be useful to understanding table 2.10.1 in the EIS.</p>

### Response:

*Revised text for final EIS, Section 2.10.2.*

#### **2.10.2 Alternatives Means Assessment**

Denison first evaluated production potential from the Project in 2010. Since that time, the Project has undergone significant design and review stages and has naturally evolved into the Project described and assessed in this EIS. Appendix 2-C provides details related to the alternative means assessment framework employed and the results of the alternatives assessment for key Project components and activities; this section of the EIS provides a summary of Appendix 2-C.

Alternative means are the various ways Denison considered to implement Project components and activities. During the planning process, it is common to consider various means by which to fulfill a specific aspect of the Project.

A systematic assessment of these alternatives was used to select preferred alternatives that are carried forward as Project design elements in a manner consistent with Canadian Environmental Assessment Agency's operational policy statement (Canadian Environmental Assessment Agency 2015). These preferred alternatives ultimately become the basis upon which potential Project-related effects are evaluated in the EIS. The preferred alternatives have been presented in the preceding section of this Project Description. The documentation of this systematic alternative assessment provides transparency and traceability with respect to decision making on Project design. It also documents how input received by Indigenous groups and other Interested Parties has been considered in the design/planning process.

The alternative means assessment has been carried out in a stepwise fashion as follows (Figure 2.10-1):

1. Identification of Alternative Means: Project components for which alternate means were considered are identified;
2. Consideration of Technical Feasibility, Economic Feasibility, and Land Use Factors: the technical and economic feasibility of these alternate means is considered along with a specific screening for land use intensity and importance. Only alternate means that are deemed technically feasible, economically feasible, and passed the land use screening are carried forward in the evaluation.
3. Potential Residual Effects Associated the Alternative Means: the potential residual effects of each alternative, in consideration of mitigation, are described; and,
4. Evaluation of Alternative Means: a comparative evaluation of alternative means that considers the potential residual effects for each alternative relative to various assessment criteria and indicators.

A description of the above four steps along with an example from Appendix 2-C (for Mining - Method) is provided in the following sections.

#### **2.10.2.1 Identification of Alternative Means**

Several Project components and activities had alternate means or options considered:

- Mining
  - Method
  - Freeze design for tertiary containment of mining solution
  - Permeability enhancement

- Mining solution
- Processing
  - Location of processing
  - On-site processing method
- Water management
  - Freshwater supply
  - Drinking water
  - Treated effluent discharge location
  - Treated effluent discharge location to surface water
- Waste management
  - Organic waste disposal
  - Process precipitate management
  - Domestic waste disposal
- Access and transportation
  - Access road alignment
  - Stream crossing structures
  - Worker transportation
- Power
  - Primary power supply
- Support facilities
  - Camp location optimization

For each Project component or activities listed above, a variety of options were considered. For example, the options considered under Mining – Method included:

- Option 1: Open pit
- Option 2: Jet boring
- Option 3: Surface boring
- Option 4: Micro tunnel boring
- Option 5: ISR

#### **2.10.2.2 Consideration of Technical Feasibility, Economic Feasibility, and Land Use Factors**

Alternative means considered in an EIS must be technically and economically feasible (CEAA 2015).

Denison integrated an additional category at this early stage in the alternative means assessment framework: land use screening. Although technical feasibility can include land use considerations, Denison opted to include land use separately to provide greater transparency on the approach taken and also in recognition of the importance of local land use that has been communicated by interested parties. In conjunction with screening for technical and economic feasibility, an initial evaluation was conducted to review Indigenous and other land use in the area to identify alternative means that may interact with areas of high land use intensity or areas of cultural importance (e.g., known gravesites). Consideration was given to information made available to Denison in the early stages of project planning. Note that subsequent, additional consideration of engagement information, including Indigenous and other land and resource use is completed at later stages in the alternatives means assessment framework (Section 2.10.2.4). The purpose of considering land use information at this stage was to identify land use that could compromise the feasibility of the Project and screen an alternative means out from additional evaluation.

For each Project component or activity, a consideration of the technical, economic, and land use characteristics of each alternative was considered. The purpose of this step in the alternative means assessment framework is to identify feasible alternatives for further assessment and to eliminate those alternative means that are not considered to be feasible from a technical, economic, or land use lens. Only those alternatives that are deemed technically and/or economically feasible and avoided interaction with areas of high intensity or high importance land use, are carried forward for further assessment.

For example, at this step in the alternative means assessment framework Option 1 Open pit mining (under Mining – Method) was screened out due to economic factors. For Mining – Methods, the remaining four options were carried forward for further assessment.

#### **2.10.2.3 Potential Residual Effects Associated the Alternative Means**

For all alternative means carried forward from the previous step, the expected residual effects following application of mitigation measures were considered. This step in the alternative means assessment framework identifies the potential residual effects which are then brought forward to the evaluation of alternative means. Again, as an example, the information related to Mining - Method (from Appendix 2-C, Table 4) is summarized here in **Table 2.10-1**.

#### **2.10.2.4 Evaluation of Alternative Means**

Detailed comparative evaluations of alternative means is presented in Appendix 2-C, Table 6 to Table 22. These evaluations considered the relative residual effects of each of the technical and economically feasible alternatives for each of the evaluation criteria identified in **Table 2.10-2** (same as Table 5 from Appendix 2-C), following the application of mitigation measures (described in Appendix 2-C Table 4).

By way of example (refer to Appendix 2-C for details), a detailed evaluation of Mining – Method from Appendix 2-C has been provided here as **Table 2.10-3**.

Based on the above alternative means assessment process, a preferred alternative means for each respective Project component or activity evaluated was selected. Rationale for the selection based on the comparative evaluation of alternatives is provided in Appendix 2-C including input received by Indigenous groups and other Interested Parties.

For reference, the alternative means assessment is conducted at a screening level, appropriate for the stage of the Project when the alternatives were considered. The assessment considered both quantitative (where possible) and qualitative information as available. The comparative evaluation identified more preferred versus less preferred alternatives. The preferred alternative(s) was selected and evaluated in much greater detail in the EA. A summary of the alternative means carried forward into the EA is provided in **Table 2.10-4**.

### **2.10.3 Summary of Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Alternative Means Assessment**

As described above, Indigenous Knowledge, local knowledge, and engagement has influenced the alternative means assessment, specifically in step 2 (Consideration of Technical Feasibility, Economic Feasibility, and Land Use Factors) and step 4 (Evaluation of Alternative Means) of the alternative means assessment framework.

Alternative means considered in an EIS must be technically and economically feasible (CEAA 2015). Denison opted to integrate an additional category at this early stage in the alternative means assessment framework: land use screening. Denison included land use separately to provide greater transparency on the approach taken and also in recognition of the importance of local land use that has been communicated by Interested Parties. At this step in the alternative means assessment framework, an option for treated effluent discharge location was eliminated due to land use screening in conjunction with technical considerations.

Denison's specific engagement initiatives on Project alternatives are outlined in Appendix 2-C for the 1) mining method, 2) freeze design for tertiary containment of mining solution, 3) treated effluent discharge location to surface water, and 4) access road alignment. In addition to these targeted engagement sessions, information gathered more broadly during engagement was also considered in Project alternatives through the consideration of general concerns or statements. The comparative evaluation of alternative means includes specific input received from

Indigenous groups and other Interested Parties that contributed to the selection of the preferred option, when applicable. Refer to the row titled *Input received from Interested Parties* in **Table 2.10-3** below for an example of how engagement influenced the selection of mining method.

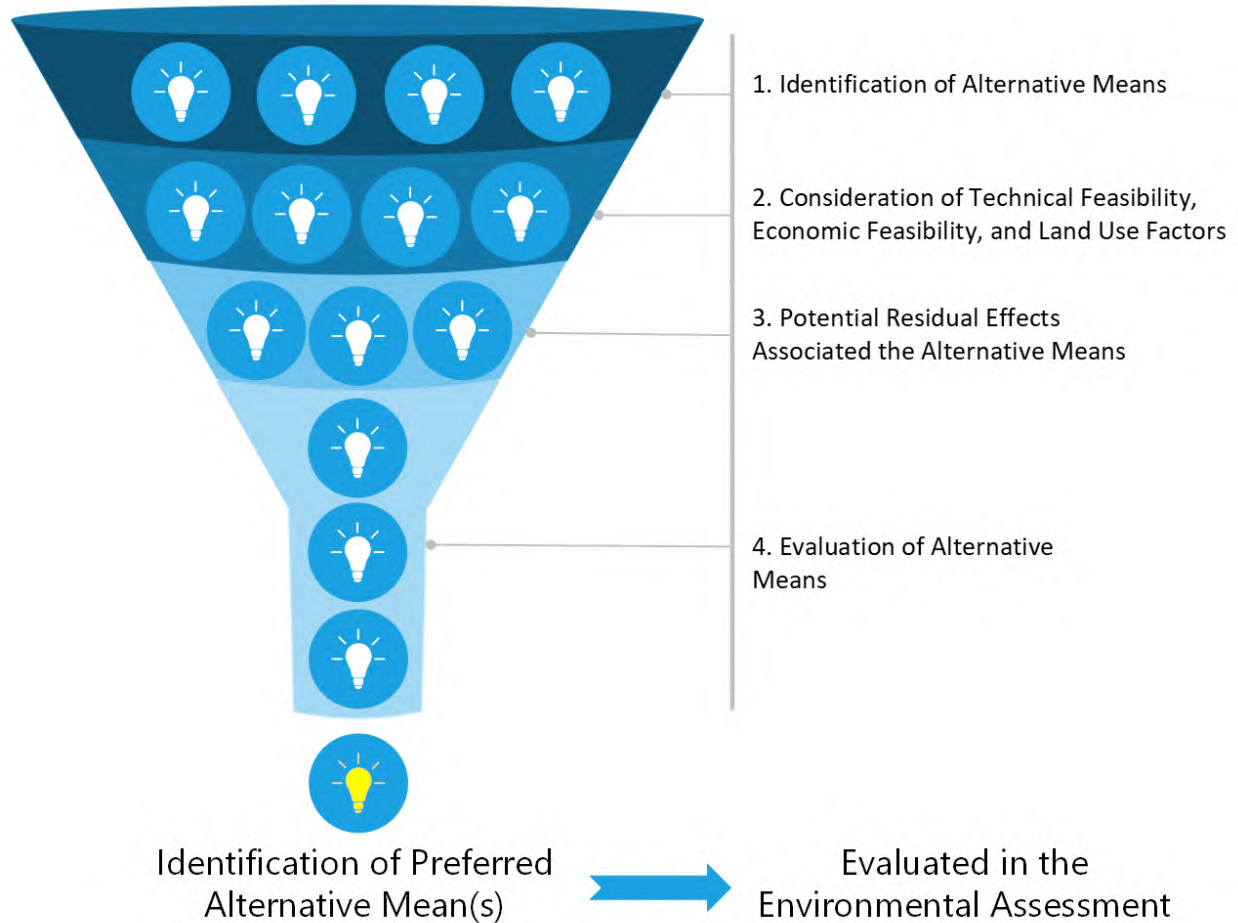

Figure 2.10-1: Alternative Means Assessment Framework for the Project

**Table 2.10-1: Mitigation Measures and Residual Effects for Mining - Method (Excerpt from Appendix 2-C Table 4)**

Project Component		Alternative Means Carried Through after Screening for Technical, Economic, and Land Use Factors	Mitigation Measures	Residual Effects
Mining	Method	Option 2: Jet Boring	Through design and monitoring, make sure emissions from ventilation meet applicable air quality emissions criteria  Any water associated with workings and mining activities meets applicable discharge quality criteria prior to release  Limit any surface development to extent practical and avoid areas of significance  Follow best management practices and standards for waste characterization and management, containment of hazardous material, liner designs, fuel management	Effects to local geology by development of underground workings  Effects on local vegetation, soil, bird, and wildlife habitat as a result of clearing required to develop surface infrastructure to support mining  Effects on air quality via emissions from ventilation of underground workings  Effects on groundwater quantity and flow paths based on need to dewatering underground mine workings  Effects to surface water quality and surface water related receptors whereby mine water is released to local surface water features
		Option 3: Surface Boring	Through design and monitoring, make sure emissions from ventilation meet applicable air quality emissions criteria  Any water associated with workings and mining activities meets applicable discharge quality criteria prior to release  Limit any surface development to extent practical and avoid areas of significance  Follow best management practices and standards for waste characterization and management, containment of hazardous material, liner designs, fuel management	Effects to local geology by development of underground workings  Effects on local vegetation, soil, bird, and wildlife habitat as a result of clearing required to develop surface infrastructure to support mining  Effects on air quality via emissions from ventilation of underground workings  Effects on groundwater quantity and flow paths based on need to dewatering underground mine workings  Effects to surface water quality and surface water related receptors whereby mine water is released to local surface water features
		Option 4: Micro Tunnel Boring	Through design and monitoring, make sure emissions from ventilation meet applicable air quality emissions criteria  Any water associated with workings and mining activities meets applicable discharge quality criteria prior to release  Limit any surface development to extent practical and avoid areas of significance	Effects to local geology by development of underground workings  Effects on local vegetation, soil, bird, and wildlife habitat as a result of clearing required to develop surface infrastructure to support mining  Effects on air quality via emissions from ventilation of underground workings  Effects on groundwater quantity and flow paths based on need to dewatering underground mine workings

Project Component		Alternative Means Carried Through after Screening for Technical, Economic, and Land Use Factors	Mitigation Measures	Residual Effects
			Follow best management practices and standards for waste characterization and management, containment of hazardous material, liner designs, fuel management	Effects to surface water quality and surface water-related receptors whereby mine water is released to local surface water features
		Option 5: ISR	Through design and monitoring, make sure emissions from ventilation meet applicable air quality emissions criteria  Any water associated with workings and mining activities meets applicable discharge quality criteria prior to release  Limit any surface development to extent practical and avoid areas of significance  Follow best management practices and standards for waste characterization and management, containment of hazardous material, liner designs, fuel management	Effects to local geology by development of ISR mining area  Effects on local vegetation, soil, bird, and wildlife habitat as a result of clearing required to develop surface infrastructure to support ISR mining  Effects on groundwater quantity and flow paths based on development of ISR wellfield (injection and recovery well systems)  Effects on groundwater quality by introduction of ISR mining solutions to the mining area  Effects to surface water quality and surface water related receptors whereby mine water is released to local surface water features

**Table 2.10-2: Detailed Alternatives Means Assessment Evaluation Criteria and Metrics (same as Table 5 in Appendix 2-C)**

Criteria	Section	Valued Component	Indicator	Metric
Biophysical Environment	Atmospheric and Acoustic Environment	Air quality	Changes in air quality, including concentrations of dust, combustion products, uranium, metals and/or radionuclides	Alternatives that minimize changes in air quality and effects on ecological and human receptors are preferred.
		Noise	Changes in sound levels	Alternatives that minimize the increase in sound levels, and subsequent effects on wildlife and human receptors, are preferred.
	Geology and Groundwater	Geology	Changes in geology	Alternatives that avoid or minimize effects on geology are preferred
		Groundwater quantity	Changes in groundwater levels, groundwater flow patterns, and discharge rates to local surface water bodies	Alternatives that minimize interaction with groundwater quantity are preferred.
		Groundwater quality	Changes in concentrations of physical and chemical parameters in groundwater with consideration of discharge to local surface water bodies	Alternatives that minimize changes in groundwater quality, in the context of groundwater discharge to surface water bodies, are preferred.
	Aquatic Environment	Surface Water Quantity	Changes in surface water quantity through water taking, surface water discharge, and project overprinting of drainage areas (footprints)	Alternatives that minimize Project footprint, as well as surface water intake and release to surface water bodies, are preferred.
		Surface Water Quality	Changes in physical and chemical parameters of surface water quality can result from discharge of treated effluent to surface water bodies and land disturbance and clearing can mobilize solids into the aquatic environment	Alternatives that minimize Project footprint and changes in surface water quality and effects on fish, and other ecological receptors, are preferred.
		Fish and Fish Habitat	Changes in fish and fish habitat may develop from Project overprinting of fish habitat (habitat alteration or loss), changes in surface water quantity, surface water quality (physical and chemical parameters), sediment quality, or benthic invertebrates	Alternatives that minimize interaction with fish and fish habitat are preferred.
		Sediment Quality	Changes in sediment quality mainly from discharge of treated effluent to surface water bodies	Alternatives that minimize effects on sediment quality are preferred.
		Benthic Invertebrates	Changes in benthic invertebrate communities and quality from uptake of chemical parameters	Alternatives that minimize effects on benthic invertebrates are preferred.

Annex 1 – FIRT IR Table – Technical Review of the **Wheeler River Project** draft EIS  
Denison Response – August 18<sup>th</sup>, 2023

Criteria	Section	Valued Component	Indicator	Metric
		Fish Health	Changes in fish health mainly from discharge of treated effluent to surface water bodies	Alternatives that minimize effects on fish health are preferred.
	Terrestrial Environment	Terrain	Changes to terrain	Alternatives that minimize interaction with terrain are preferred.
		Soil	Changes in soil quantity or quality	Alternatives that minimize loss or alteration of soil quantity, and minimize changes in soil quality, are preferred.
		Organic matter/peat	Loss of organic matter/peat	Alternatives that minimize loss or alteration of organic matter/peat are preferred.
		Vegetation and Ecosystems	Change in areal extent of vegetation habitat types and ecosystems	Alternatives that minimize loss vegetation and ecosystems are preferred.
		Listed Plant Species	Change in number of listed plant species	Alternatives that minimize direct and indirect effects on listed plant species are preferred.
		Wetlands	Change in areal extent of wetlands	Alternatives that minimize loss or alteration of wetlands are preferred.
		Ungulates	Changes in ungulate habitat (loss and/or alteration) and indirect or direct mortality of individuals	Alternatives that minimize ungulate habitat loss or alteration and minimize ungulate mortality are preferred.
		Furbearers	Changes in furbearer habitat (loss and/or alteration) and indirect or direct mortality of individuals	Alternatives that minimize furbearer habitat loss or alteration and minimize furbearer mortality are preferred.
		Woodland caribou	Changes in woodland caribou habitat (loss and/or alteration) and indirect or direct mortality of individuals	Alternatives that minimize woodland caribou habitat loss or alteration and minimize woodland caribou mortality are preferred.
		Raptors	Changes in raptor habitat (loss and/or alteration) and indirect or direct mortality of individuals	Alternatives that minimize raptor habitat loss or alteration and minimize raptor mortality are preferred.
		Migratory breeding birds	Changes in migratory breeding bird habitat (loss and/or alteration) and indirect or direct mortality of individuals	Alternatives that minimize migratory breeding bird habitat loss or alteration and minimize migratory breeding bird mortality are preferred.
		Bird species at risk	Changes in bird species at risk habitat (loss and/or alteration) and indirect or direct mortality of individuals	Alternatives that minimize bird species at risk habitat loss or alteration and minimize bird species at risk mortality are preferred.

Annex 1 – FIRT IR Table – Technical Review of the **Wheeler River Project** draft EIS  
Denison Response – August 18<sup>th</sup>, 2023

Criteria	Section	Valued Component	Indicator	Metric
Human Environment	Human Health	Human Health	Changes in human health from exposure to non-radiological and radiological constituents in air, water, and food	Alternatives that minimize negative changes in human health are preferred.
		Worker Health	Worker conventional health and safety and radiation exposure	Alternatives that reduce conventional health and safety risks and radiation exposure are preferred.
	Land and Resource Use	Indigenous Land and Resource Use	Changes in the area of land available for Indigenous land and resource use, as well as resource availability, and perceived suitability of land and resources for safe use	Alternatives that minimize negative changes in Indigenous land and resource use are preferred.
		Other Land and Resource Use	Changes in the area of land available for non-Indigenous land and resource use, as well as resource availability, and perceived suitability of land and resources for safe use	Alternatives that minimize negative changes in other land and resource use are preferred.
		Heritage Resources	Change in the number of known archaeological resources	Alternatives that minimize direct or indirect alteration or loss of archaeological resources are preferred
	Quality of Life	Cultural Expression	Changes to knowledge transmission and traditional diet, including perceived changes in the suitability and safety of resources that support a traditional diet	Alternatives that minimize direct or indirect adverse effects on cultural expression are preferred.
		Community Well-being	Change in income of local workers and community cohesion	Alternatives that minimize direct or indirect adverse effects on community well-being are preferred.
		Infrastructure and Services	Changes in traffic, community infrastructure and services	Alternatives that minimize direct or indirect adverse effects on infrastructure and services are preferred.
	Economics	Economy	Changes in participation in the traditional economy	Alternatives that minimize direct or indirect adverse effects on economy are preferred.
Other Evaluation Factors				
Criteria			Metric	
Technical Factors	Complexity of design, construction, operation, and decommissioning		Simple or straightforward designs, construction techniques, and operational procedures based on tested and proven technologies are preferred. Alternatives that are more amenable to decommissioning and/or reclamation are preferred.	
Cost Factors	Capital, operating, and decommissioning costs		Lower capital costs are preferred to reduce the pre-production costs and influence the project economic viability. Lower operational costs are preferred to maintain project economics. Lower decommissioning costs are preferred to reduce long term liabilities	

**Table 2.10-3: Mining – Methods - Alternative Means Assessment (same as Table 6 in Appendix 2-C)**

Table Criteria	Section	Valued Component	Option 2: Jet Boring	Option 3: Surface Boring	Option 4: Micro Tunnel Boring	Option 5: ISR
Biophysical	Atmospheric and Acoustic Environment	Air quality	Less preferred option. Air quality on surface would be influenced by slurry handling, radon gas, radioactive dust in vent exhaust, dust from surface stockpiles including clean waste rock. Air quality in the mine workings would be managed with ventilation.	More preferred option. Size of mine rock stockpiles and their influence on air quality would be similar to Option 5. Changes in concentrations of radon in air from well development would be similar to option 5.	Less preferred option. Air quality in the mine workings would be managed with ventilation. Air quality on surface would be influenced by hoisted cuttings or slurry, radon gas, radioactive dust in vent exhaust, dust from surface stockpiles including clean waste rock.	More preferred option. Size of mine rock stockpiles and their influence on air quality would be similar to Option 3. Changes in concentrations of radon in air from well development would be similar to option 3.
		Noise	No appreciable difference was identified among the alternatives for changes in noise. Continual noise from surface ventilation fans and noise from mobile equipment. Similar to Option 4.	No appreciable difference was identified among the alternatives for changes in noise. No fans, noise from production drilling from surface includes compressors and mobile equipment would be continual.	No appreciable difference was identified among the alternatives for changes in noise. Continual noise from surface ventilation fans and noise from mobile equipment. Similar to Option 2.	No appreciable difference was identified among the alternatives for changes in noise. No fans, noise from surface drilling equipment includes compressors and mobile equipment would be intermittent as drilling is done only as required.
	Geology and Groundwater	Geology	Less preferred option for changes to geology, compared to options 3 and 5.	More preferred option for geology compared to options 2 and 4 since this is a surface method requiring less excavation.	Less preferred option for changes to geology, compared to options 3 and 5.	More preferred option for geology compared to options 2 and 4 since this is a surface method requiring less excavation.
		Groundwater quantity	Less preferred compared to option 3. Volume of groundwater management during mining would be similar to Option 4.	Preferred option with smallest interaction on groundwater quantity compared to options 2, 4 and 5.	Less preferred compared to option 3. Volume of groundwater management during mining would be similar to Option 4.	Less preferred compared to option 3. Use of ground freezing temporarily interacts with groundwater flow during operations.
		Groundwater quality	No appreciable difference was identified among the alternatives for changes to groundwater quality. Groundwater quality would interact with mine workings in a limited way due to groundwater management during mining.	No appreciable difference was identified among the alternatives for changes to groundwater quality.	No appreciable difference was identified among the alternatives for changes to groundwater quality. Groundwater quality would interact with mine workings in a limited way due to groundwater management during mining.	No appreciable difference was identified among the alternatives for changes to groundwater quality. Mining area remediation during decommissioning would mitigate effects on groundwater quality.

Denison Response – August 18<sup>th</sup>, 2023

Table Criteria	Section	Valued Component	Option 2: Jet Boring	Option 3: Surface Boring	Option 4: Micro Tunnel Boring	Option 5: ISR
	Aquatic Environment	Surface Water Quantity	Less preferred than options 3 and 5. The volume of water requiring treatment and release would be high, because of the groundwater management required for mine development. This could result in a larger effect on the aquatic environment. Quality of treated effluent expected to be similar among all four options.	More preferred option compared to options 2 and 4. The volume of water needed treatment and release to a surface waterbody would be minimal, and as such, this option would have a smaller effect on the aquatic environment. Quality of treated effluent expected to be similar among all four options.	Less preferred than options 3 and 5. The volume of water requiring treatment and release would be high, because of the groundwater management required for mine development. This could result in a larger effect on the aquatic environment. Quality of treated effluent expected to be similar among all four options.	More preferred option compared to options 2 and 4. The volume of water needed treatment and release to a surface waterbody would be minimal, and as such, this option would have a smaller effect on the aquatic environment. Quality of treated effluent expected to be similar among all four options.
		Surface Water Quality				
		Fish and Fish Habitat				
		Sediment Quality				
		Benthic Invertebrates				
		Fish Health				
	Terrestrial Environment	Terrain	This option is less preferred as it may result in a greater potential effect (loss) of terrain, soil, organic matter/peat, vegetation, listed plant species, wetlands and related loss and alteration of wildlife habitat. Largest amount of disturbance due to underground waste rock creating stockpiles of acid generating, contaminated and clean waste rock. Footprint estimated to be similar to Option 4 and double the total disturbance of Option 5.	Direct surface footprint/mining disturbance expected to be the second lowest of the four options. This option is more preferred than option 2 and 4, similar to option 5 with regard to potential effects on the terrestrial environment.	This option is less preferred as it may result in a greater potential effect (loss) of terrain, soil, organic matter/peat, vegetation, listed plant species, wetlands and related loss and alteration of wildlife habitat. Largest amount of disturbance due to underground waste rock creating stockpiles of acid generating, contaminated and clean waste rock. Footprint estimated to be similar to Option 2 and double the total disturbance of Option 5.	Direct surface footprint/mining disturbance expected to be the lowest of the four options. This option is more preferred than option 2 and 4, similar to option 3 with regard to potential effects on the terrestrial environment.

		Bird species at risk				
Human Environment	Human Health	Human Health	Less preferred. Potential exposure to non-radiological and radiological constituents in air, water, and food may be higher with this option compared to options 3 and 5 due to 1. changes in air quality from mine	More preferred compared to option 2 and 4 due to smaller changes in air quality and smaller volume of treated effluent release	Less preferred. Potential exposure to non-radiological and radiological constituents in air, water, and food may be higher with this option compared to options 3 and 5 due to 1. changes in air quality from mine rock,	More preferred compared to option 2 and 4 due to smaller changes in air quality and smaller volume of treated effluent release

Annex 1 – FIRT IR Table – Technical Review of the **Wheeler River Project** draft EIS  
Denison Response – August 18<sup>th</sup>, 2023

Table Criteria	Section	Valued Component	Option 2: Jet Boring	Option 3: Surface Boring	Option 4: Micro Tunnel Boring	Option 5: ISR
			rock, slurry handling, and mine ventilation and 2. larger volume of treated effluent release to the aquatic environment.		slurry handling, and mine ventilation and 2. larger volume of treated effluent release to the aquatic environment.	
		Worker Health	No appreciable difference was identified between alternatives because with application of mitigation measures and monitoring, all options would protect worker health and maintain radiation exposure within limits for nuclear workers. Within this context, underground work is higher risk than surface due to confined working area with heavy equipment underground and higher contaminates in underground atmosphere compared to open air conditions on surface.	No appreciable difference was identified between alternatives because with application of mitigation measures and monitoring, all options would protect worker health and maintain radiation exposure within limits for nuclear workers. Surface operation with specialized surface equipment to drill horizontal cavities at ore depth. Physical ore cuttings will need to be rehandled on surface to either slurry for wet transport or dewater for dry transport increasing dose relative to Option 5 (which has a fraction of the drill cuttings to handle). Good conventional H&S as there is minimal mobile surface equipment.	No appreciable difference was identified between alternatives because with application of mitigation measures and monitoring, all options would protect worker health and maintain radiation exposure within limits for nuclear workers. Within this context, this option has potentially the highest dose as workers will have greater potential exposure to radiation while servicing equipment that is working within the ore zone. Underground work is higher risk than surface due to confined working area with heavy equipment underground and higher contaminates in underground atmosphere compared to open air conditions on surface.	No appreciable difference was identified between alternatives because with application of mitigation measures and monitoring, all options would protect worker health and maintain radiation exposure within limits for nuclear workers. Lowest dose of the four mining options evaluated in terms of dose associated with drill cuttings. The main contributor to worker dose would be radon associated with drilling the ISR wells. Surface piping of UBS, pumphouses, and well maintenance will also be a source of dose during pipeline repairs and inspection of equipment.
	Land and Resource Use	Indigenous Land and Resource Use	Less preferred compared to options 3 and 5 because of larger potential changes in resource availability linked to: 1. Larger footprint (changes to terrestrial environment) and 2. Higher volume of treated effluent (changes to aquatic environment). For all options, the area immediately around the mining activity would not be available for Indigenous land and resource use activities during operations for safety reasons. Perceived suitability of land and	More preferred compared to options 2 and 4 because of smaller potential changes in resource availability linked to: 1. smaller footprint (and changes to terrestrial environment) and 2. lower volume of treated effluent (and changes to aquatic environment). Perceived suitability of land and resources for safe use expected to be similar for all options.
		Heritage Resources	Less preferred compared to options 3 and 5. Larger area of surface disturbance increases potential interaction with archaeological resources.	More preferred compared to options 2 and 4. Smaller area of surface disturbance reduces potential interaction with archaeological resources.	Less preferred compared to options 3 and 5. Larger area of surface disturbance increases potential interaction with archaeological resources.	More preferred compared to options 2 and 4. Smaller area of surface disturbance reduces potential interaction with archaeological resources.
	Quality of Life	Cultural Expression	No appreciable difference was identified between alternatives for changes to knowledge transmission and traditional diet, including perceived changes in the suitability and safety of resources that support a traditional diet.			
		Community Well-being	No appreciable difference was identified between alternatives for change in income of local workers and community cohesion.			
		Infrastructure and Services	No appreciable difference was identified between alternatives for changes in traffic, community infrastructure and services.			
	Economics	Economy	No appreciable difference was identified between alternatives for changes in participation in the traditional economy.			

Other Evaluation Factors					
Criteria		Option 2: Jet Boring	Option 3: Surface Boring	Option 4: Micro Tunnel Boring	Option 5: ISR
Technical Factors	Complexity of design, construction, operation, and decommissioning	<p>Potential advantages: technology currently in use in Canadian uranium industry; mine layouts do not require development at or above the unconformity; remote system – safe for radiological risks.</p> <p>Potential technical weaknesses: Long duration development timeline; low production rate with limited ability to increase; currently used at only one mine with limited experience outside of that operation; may require extensive research and development; high technical risk including underground operating risks, inflow risk, design and operating risk; may require bulk freezing approach versus perimeter freeze design as assumed in the PEA. This would increase freeze cost and time significantly.</p>	<p>Potential advantages: technology in widespread use in oil and gas industry; reduced safety and environmental risks with elimination of underground excavations; completely remote system – safe for radiological risks; reduced number of employees on site; short timeframe to production (weeks); good production rate with scalability; similar technique under evaluation in Canadian uranium industry (Orano’s SABRE mining method).</p> <p>Potential technical weaknesses: Drilling accuracy is paramount and needs additional testing; not currently in use in Canadian uranium industry.</p>	<p>Potential advantages: technology in widespread use in civil / municipal applications; remote system – safe for radiological risks under normal operating conditions; self-supported tunnels, thus risk of ground failure or inflow in tunnels reduced; simple concept and operation, variety of knowledgeable contractors/personnel; moderate production rate (approximately 4M lbs/yr per machine); ability to apply multiple units (scalability).</p> <p>Potential technical weaknesses: Recovery of ore may be limited to 90% at best due to configuration of the tunnels; congested working space in the launch stations; not currently in use in Canadian uranium industry.</p>	<p>Potential advantages: technology in widespread use in international uranium operations (USA, Kazakhstan, Australia); reduced safety and environmental risks with elimination of underground excavations; completely remote system – safe for radiological risks; reduced number of employees on site; short timeframe to production (months); reduced technical risk with majority of remaining risks tested during feasibility stage; toll milling not required.</p> <p>Potential technical weaknesses: Not currently in use in Canadian uranium industry; mining solution permeability requires additional testing to increase confidence; low production rate – based on production rate at US operations (future testing may allow for higher production rates).</p>

Other Evaluation Factors					
Criteria		Option 2: Jet Boring	Option 3: Surface Boring	Option 4: Micro Tunnel Boring	Option 5: ISR
Cost Factors	Capital, operating, and decommissioning costs	Option 2 has high operating cost relative to the grade of the ore body, high capital costs and long duration development timeline, although the technology is in use at an existing uranium operation in Canada.	Option 3 has low capital and operating costs compared to jet boring.	Option 4 has the lowest ore recovery and high capital costs and long duration development timeline. Technology is commonly used in civil engineering.	Option 5 has low capital and operating costs. The technology is in widespread use at international uranium operations. ISR mining operations often have comparatively low capital and operating costs, as well as shorter timelines to first production and greater flexibility to allow production to be scaled to meet market demands.
<p>Input received from Interested Parties:</p> <p>Denison discussed potential mining methods early in the engagement process. As part of the engagement program for the Project, Denison organized a series of in-person workshops with Indigenous and non-Indigenous communities of interest (COI) and other Interested Parties in 2018. The workshops gathered community and student input in relation to potential mining methods for the Phoenix deposit. Given the history of uranium mining in the Athabasca Basin, there is a wealth of knowledge on various mining methods, and Denison sought input for which method would be best suited to efficiently and safety mining the Phoenix deposit.</p> <p>The following mining methods were evaluated for effectiveness in mining the Phoenix deposit at the Project: Jet Boring, Surface Boring, Micro Tunnel Boring and In Situ Recovery. There was no specific engagement data collected related to surface boring or micro tunnel boring. Workshop participants noted that while jet boring was a relatively well-known method of mining, the high economic costs may make it undesirable for the Phoenix deposit (18-EN-VPL-2.38) (18-EN-ERFN-5.44). ISR mining is new to northern Saskatchewan and Canada. Some workshop participants were unsure how to evaluate the potential benefits and/or drawbacks of this mining method (18-EN-VILX-3.69), however other participants were confident in the method, saying they know it works in other locations, there are minimal waste streams, and method is more economically feasible than other methods (18-EN-VILX-3.68). A participant in the Village of Beauval workshop preferred the small footprint and lesser environmental impacts of ISR and viewed this method as a new opportunity for northern Saskatchewan (18-EN-VB-4.51). New opportunities are welcomed in the area, as they can support local businesses, provide training and learning opportunities, and keep money within the local economy (16-EN-MLA-109.26).</p>					
<p>Selected alternative for mining method = Option 5: ISR</p> <p>Rationale: Mining methods were evaluated through an increasingly rigorous process and considered factors such as: safety, environment, production rates, capital costs, operating costs, schedule, operational flexibility, and risk. The top four mining methods considered for the Phoenix deposit were: jet boring, surface boring, micro tunnel boring, and ISR. Independent preliminary economic assessment or class 5 level assessments were completed on each of these four options in 2017. The parameters evaluated included safety, environmental impacts, radiological safety, capital cost, operating cost, development timeframe, production rate, economic results (net present value, internal rate of return), regulatory risk, technology risk, equipment and contractor availability, and operating flexibility; this information has been summarized above in the alternatives means assessment cells. In addition, workshops were held in local Indigenous and non-Indigenous communities to capture community input into the selection of a preferred mining method once the options were narrowed down. Ultimately, based on the alternatives evaluated and feedback from Communities of Interest, Denison included the ISR method in the prefeasibility study (PFS; Denison 2018) and this mining method was selected as the basis for the EA.</p>

## Attachment: IR-28

Number	IR-28
Dept.	CNSC
Project effects link	Current use of lands and resources for traditional purposes
Reference to EIS, appendices, or supporting documentation	<p>Section 4, IER and engagement appendices, including:</p> <ul style="list-style-type: none"> <li>• Appendix 2-A</li> <li>• Appendix 6-B</li> <li>• Appendix 7-B</li> <li>• Appendix 8-A</li> <li>• Appendix 9-A</li> <li>• Appendix 10-B</li> <li>• Appendix 11-A</li> <li>• Appendix 12-A</li> <li>• Appendix 13-A</li> <li>• Appendix 14-B</li> </ul>
Context and Rationale	<p><b>Context:</b> The summary of issues tables do not appear to include all of the key issues identified by the Indigenous Nations and communities.</p> <p>For example, some Indigenous Nations and communities have shared concerns with respect to accident prevention and overall safety on the Key Lake road (Highway 914) due to increased traffic, impacts on treaty rights and section 35 rights due to cumulative impacts, and decommissioning, that were not captured in the issues and concerns and summary tables in Section 4.3.2 and in the IER.</p> <p>The tables in the engagement appendices include a column titled “Response (From Denison)”. The “Response” column does not include responses, but instead points the reader to where this comment or concern was considered. When navigating to the sections referenced, it is often unclear how this information was considered or influenced the assessment.</p> <p><b>Rationale:</b> Additional detail is required in order to ensure the key issues are all identified and to understand the status of validation for each issue raised and the response provided.</p>
Information Requirement	<p>1) Update the summary of issues and concerns tables to include all relevant issues and concerns raised by each of the Indigenous Nations and communities to date, including concerns raised in the Indigenous Knowledge studies provided, additional engagement, and Draft EIS comments.</p>

	<p>2) Please include a column in the issues and concerns tables to clearly articulate the specific mitigation/monitoring measures that Denison have committed to, or any other measures, in order to address the concerns raised by each Indigenous Nation and community during the engagement process to date.</p> <p>3) Denison must demonstrate that each Indigenous Nation and community has validated that the summary of issues and concerns table reflects their understanding or agreement, and/or a path forward to complete the validation throughout the EIS and the updated IER.</p> <p>Validation must be complete by the time the technical review is complete, prior to submission of a final EIS. Should Denison not be able to fully address issues, concerns or feedback raised by any Indigenous Nation or community, through mitigation and monitoring measures, this should be documented, and a rationale provided.</p> <p>4) Update the response column of the Engagement tables to describe how these were considered in the sections referenced. Consider renaming this column to reflect the nature of the content (i.e., how the information was considered).</p>
--	--

Response:

This response has broken up information into two sections – the information requirement in relation to Section 4 and the associated related sections in the Indigenous Engagement Report (IER), and the engagement appendices that are associated with various sections of the EIS.

**Section 4 and the IER: Context**

Engagement with Indigenous and non-Indigenous Communities of Interest and Other Communities has been ongoing since 2016 and has evolved over time. Some changes have occurred from the beginning of engagement activities in 2016 to today, such as:

- early engagement occurring with the Northern Village of Pinehouse Lake, to the current state where Kineepik Métis Local #9 (KML) now generally represents the interests of the Métis citizens of the Northern Village of Pinehouse Lake together, along with general non-Indigenous residents;
- the Duty to Consult delegated to the Métis Nation – Saskatchewan from the A La Baie Métis Local #21, the Sipishik Métis Local #37, Patuanak Métis Local #82, and the Sled Lake / Dore Lake Métis Local #67; and
- interest expressed in the Project by Peter Ballantyne Cree Nation, who had not been previously identified by Denison, the CNSC nor the Province of Saskatchewan as having potential interests in the Project.

**Section 4 and the IER: Interests, Issues and Concerns**

Denison has worked to adapt to the changes as they have arisen. As such, we recognize that some of the *Interests, Issues and Concerns* tables (“Issues Tables”) can be further updated with new information

about potential issues that have arisen in relation to the Project, of which both the issue and Denison's response to the issue will be further subject to validation by the Indigenous Nation or community.

It is important to note that not all issue or concern raised by an Indigenous nation or community will necessarily have a specific mitigation measure and/or monitoring associated with Denison's response—but mitigation and monitoring measures will be included where it makes sense to do so.

In respect of understanding and enhancing the identification of issues by an Indigenous nation or community, we can advise the CNSC that presently we have:

- 1) reviewed each Issues Table to determine any engagement data gaps evident as presented in the draft EIS, which may have occurred due to the changing nature of engagement over time as specified above;
- 2) updated each Issues Table with the key issues raised by the Indigenous Nation and community as a result of comments made on the draft EIS;
- 3) have developed a plan for validation and positive resolution of the Issues Table with each Indigenous Nation and community and are presently seeking confirmation with each group accordingly; and
- 4) (in the near future) seek confirmation on acceptable path forward in relation to validation of issues and/or resolution, where it is mutually agreed upon. Where it is not mutually agreed upon, Denison will identify a proposed rationale for potential next steps.

As an important note on this, Denison received permission to use three Indigenous Knowledge reports in the EIS, to provide additional comprehensive information in relation to the relationship to the land and connection to the environment from the Indigenous nations who shared this information. Information from these reports was used accordingly in the draft EIS to inform the environmental assessment and methodology. At the request of these Indigenous nations, these reports have been provided to the regulators under confidential cover. Denison did not carry forward items into the draft EIS that were outside the scope of the agreed-upon nature of the information exchange between Denison and the Indigenous nation. As such, at the time, Denison did not bring forward concerns raised in these reports through to Section 4 of the draft EIS.

Each of the Indigenous nation for whom these reports were prepared has now provided publicly available comments on the draft EIS where they have summarized their own issues and concerns about the Project, *some* of which arise from the confidential materials they have provided to the regulator. As such, Denison can now confidently update the Issues Table with these comments provided on the public record, which will enable a transparent accounting of issues from the worldview.

#### **Section 4 and the IER: Clear Documentation in Issues Tables**

Denison understands the importance of demonstrating to the CNSC how issues and concerns raised by Indigenous nations and communities have been resolved, or where this has not been achieved, how Denison can demonstrate its efforts towards doing so and/or rationale for where agreement has not been reached.

We can advise that the steps identified above have been successfully achieved with KML, and as such, Appendix A to this submission includes the Issues Table that will be inserted into the final EIS for KML (Table 4.3-3: Key Issues and Concerns from Kineepik Métis Local #9 [and corresponding table in the IER])

and serves as an example of the Issues Table that will be generated for all the other Indigenous nations and communities.

In this table Denison has added additional information in relation to *How Comment was Addressed / Considered in the Draft EIS* as requested by the CNSC, including any specific mitigation and/or monitoring measures pertinent if appropriate. Additionally, the *Status* column includes whether the issue is complete or ongoing, and the *Justification of Status* column now includes the evidence to support the status conclusion, and if necessary, additional details are provided in the *Ongoing Resolution of Concerns (if Required)* column. The *Ongoing Resolution of Concerns* column will outline the planned process to be followed with the Indigenous nation or community in respect of validation and/or resolution of the issue.

It is Denison's objective to successfully validate and resolve concerns with Indigenous nations and communities prior to the finalization of the EIS. As per Denison's outlined engagement strategy, a focussed approach will occur, first with respect to Indigenous and non-Indigenous Communities of Interest, and then with other Interested Parties.

Where Denison is unable to demonstrate that positive validation and resolution have been attained, clear information will be provided in the relevant table for the Indigenous nation or community in Section 4 of the final EIS (and if required, the IER) outlining the efforts undertaken to do so, planned next steps, or clear rationale for why a positive resolution has not been found to date.

#### **Section 4 and the IER: Planned Engagement and Next Steps**

Denison understands the importance of outlining to the CNSC the planned engagement activities to occur with Indigenous nations and communities. As identified above, part of engagement activities is in relation to positive validation and resolution of key issues. Additionally, Denison will be undertaking additional engagement activities that are outlined as follows as of June 30, 2023.

#### **English River First Nation ("ERFN")**

##### **Interests, Issues and Concerns:**

- 1) Denison has reviewed ERFN comments provided on the draft EIS.
- 2) Issues Table from Section 4 of draft EIS will be revised according to the example found in Appendix A of this IR and updated with summarized draft EIS comments—for the final EIS.
- 3) Discussions are actively occurring with ERFN regarding a process to resolve issues and concerns raised about the draft EIS, as well as successful validation of Denison's responses to historical issues and concerns raised since engagement commenced 2016. Items of interest raised by regulators will be included as part of this process.
- 4) Status of successful validation by ERFN of Denison responses to Issues Table—in progress.

##### **Engagement activities**

- 1) Site tour is planned for summer 2023 with ERFN Leadership, Technical team and Members.
- 2) Community and Leadership engagement—planned for fall 2023 to discuss:
  - a. mitigation, monitoring and residual effects
  - b. forthcoming licensing actions

##### **Future Documentation in updated EIS and updated IER**

- 1) All records per the above will be updated in Section 4 of the EIS and the associated section in the IER.

### **Kineepik Métis Local #9 (“KML”)**

#### **Interests, Issues and Concerns:**

- 1) Denison has reviewed KML comments provided on the draft EIS.
- 2) Issues, Interests and Concerns table from Section 4 of draft EIS was revised according to Appendix A of this IR to be updated with summarized draft EIS comments—for the final EIS.
- 3) Discussions actively occurring with KML regarding process to resolve issues and concerns raised about the draft EIS, as well as successful validation of Denison's responses to historical issues and concerns raised since engagement commenced 2016. Items of interest raised by regulators were included as part of this process.
- 4) On June 10, 2023, Denison received positive validation that Denison's responses to KML issues, as described in the Issues Table, were acceptable to KML.
- 5) Status of successful validation by KML of Denison responses to KML Issues Table—**complete**.

**\*\*It is important to note that KML and the Northern Village of Pinehouse are working on the above matters together as a collective\*\***

#### **Engagement activities**

- 1) Site tour is planned for summer 2023 with KML Leadership, Technical team and Citizens.
- 2) Community and Leadership engagement—planned for fall 2023 to discuss:
  - c. mitigation, monitoring and residual effects
  - d. forthcoming licensing actions

#### **Future Documentation in updated EIS and updated IER**

- 1) All records per the above will be updated in Section 4 of the final EIS and the IER.

### **Ya'thi Nene Lands and Resources Office (“YNLR”) (Representing the Athabasca Basin First Nations and the Athabasca Basin Communities)**

#### **Interests, Issues and Concerns:**

- 1) Denison has reviewed YNLR comments provided on the draft EIS.
- 2) Issues Table from Section 4 of the draft EIS will be revised according to the example found in Appendix A of this IR and updated with summarized draft EIS comments—for the final EIS.
- 3) Discussions are actively occurring with YNLR regarding the process to resolve issues and concerns raised about the draft EIS, as well as successful validation of Denison's responses to historical issues and concerns raised over time.
- 4) Status of successful validation by YNLR of Denison responses to YNLR Issues, Interests and Concerns—**in progress**.

#### **Engagement activities**

- 1) Undertook in-person community meetings in January 2023 in coordination with the YNLR in Black Lake, Fond du Lac, Hatchet Lake and Uranium City.
- 2) Coordinating process for additional engagement with YNLR for fall 2023 as they deem appropriate to discuss:
  - a) mitigation, monitoring and residual effects
  - b) forthcoming licensing actions

#### **Future Documentation in updated EIS and updated IER**

- 1) All records per the above will be updated in Section 4 of the final EIS and the IER.

### **Métis Nation – Saskatchewan (“MN-S”)**

#### **Interests, Issues and Concerns:**

- 1) Denison has reviewed MN-S comments provided on the draft EIS.
- 2) Issues Table from Section 4 of the draft EIS will be revised according to the example found in Appendix A of this IR and updated with summarized draft EIS comments—for the final EIS.

- 3) Denison has offered to meet to discuss the process toward resolution of draft EIS comments with MN-S as well as successful validation of Denison's responses to historical issues and concerns raised over time.
- 4) MN-S and Denison met on June 12, 2023, to provide a status update on completion of deliverables with respect to Capacity Funding Agreement, and in particular, the Métis Knowledge Study. MN-S outlined steps being followed in respect of this work. Denison indicated its willingness to meet regularly to support the efforts of MN-S in this regard. A tentative meeting has been set for the week of June 26-29, 2023.
- 5) Status of successful validation by MN-S of Denison responses to MN-S Issues, Interests and Concerns—in progress.

**Engagement activities**

- 1) Undertook in-person community NR1 and NR3 meetings in February 2023, as coordinated and led by MN-S.
- 2) Will take direction from MN-S about coordinating additional meetings with MN-S as they deem appropriate to discuss matters of interest.

**Future Documentation in updated EIS and updated IER**

- 1) All records per the above will be updated in Section 4 of the final EIS and the IER.

**Birch Narrows Dene Nation (“BNDN”)**

**Interests, Issues and Concerns:**

- 1) Denison has reviewed BNDN comments provided on the draft EIS.
- 2) Issues Table from Section 4 of the draft EIS will be revised according to the example found in Appendix A of this IR and updated with summarized draft EIS comments—for the final EIS.
- 3) Denison has requested the BNDN traditional territory map along with relevant land and occupancy information in relation to the Wheeler River Project, as indicated by BNDN as existing. To facilitate this, Denison has shared a proposed confidentiality agreement with BNDN to facilitate the sharing of such information.
- 4) Discussions are actively occurring with BNDN regarding the process to resolve issues and concerns raised about the draft EIS, as well as successful validation of Denison's responses to historical issues and concerns raised over time.
- 5) Status of successful validation by BNDN of Denison responses to BNDN Issues, Interests and Concerns—in progress.

**Engagement activities**

- 1) Denison had a meeting with BNDN on February 14, 2023, to provide an overview of the Wheeler River Project. During the meeting, BNDN indicated they would share a traditional territory map and land and occupancy information in relation to the Wheeler River Project subject to reaching suitable confidentiality provisions.
- 2) On April 25, 2023, Denison shared a draft confidentiality agreement with BNDN.
- 3) On May 10, 2023, Denison met with BNDN, to discuss the process going forward. During the meeting, Denison was advised that BNDN had proposed revisions to the confidentiality agreement, which they would provide to Denison. Also identified in the meeting was that Denison's access to data BNDN has referenced regarding land use activities in and around the Wheeler River Project would be limited and subject to additional funding from Denison to BNDN. Denison continued to request the available site-specific information to better understand the potential for adverse impacts to rights from the Wheeler River Project to BNDN to potentially adjust engagement approaches with BNDN.

- 4) On May 11, 2023, Denison was advised to communicate directly with the Chief of BNDN and was provided additional information from BNDN that BNDN would connect with Denison in the future to determine next steps together.
- 5) On June 16, 2023, BNDN contacted Denison to request a meeting toward the latter part of July 2023. Denison responded positively to this request and will be following up with BNDN accordingly.
- 6) Subject to process set between Denison and BNDN as identified above, engagement process to be determined.

**Future Documentation in updated EIS and updated IER**

- 1) All records per the above will be updated in Section 4 of the final EIS and the IER.

**Peter Ballantyne Cree Nation (“PBCN”)**

**Interests, Issues and Concerns:**

- 1) Denison has reviewed PBCN comments provided on the draft EIS.
- 2) Issues Table from Section 4 of the draft EIS will be revised according to the example found in Appendix A of this IR and updated with summarized draft EIS comments—for the final EIS.
- 3) Denison has requested PBCN traditional territory map along with relevant land and occupancy information in relation to the Wheeler River Project.
- 4) To facilitate this, PBCN has directed Denison to access the traditional territory map in a confidential fashion from the CNSC.
- 5) On May 30, 2023, Denison has made this request of the CNSC.
- 6) Per below, Denison intends to provide materials to PBCN responding to the concerns raised in the EIS.
- 7) Status of successful validation by PBCN of Denison responses to PBCN Issues, Interests and Concerns—in progress.

**Engagement activities**

- 1) Denison had a meeting with PBCN on May 16, 2023, to provide an overview of the Wheeler River Project. During the meeting, PBCN indicated they would share a traditional territory map and had land and occupancy information in relation to the Wheeler River Project. PBCN indicated they desired another meeting to discuss their interests in the Wheeler River Project further. During this meeting Denison and PBCN acknowledged the challenges of meeting immediately, but committed to doing so.
- 2) As of June 30, 2023, Denison and PBCN have not met, but have intent to do so. Generally, the purpose of the next meeting would be for PBCN to provide more detail on their interests in the Wheeler River Project, and Denison would provide responses to the high-level issues raised by PBCN in their draft EIS comments.

**Future Documentation in updated EIS and updated IER**

- 1) All records per the above will be updated in Section 4 of the final EIS and the IER.

**Lac La Ronge Indian Band (“LLRIB”)**

**Interests, Issues and Concerns:**

- 1) Denison has reviewed comments provided on the draft EIS.
- 2) Issues Table from Section 4 of the draft EIS will be revised according to the example found in Appendix A of this IR and updated with summarized draft EIS comments—for the final EIS:
  - a) Denison has confirmed that the Wheeler River Project is not located within the Lac La Ronge Indian Band Traditionally Occupied Territory as described in <https://pubsaskdev.blob.core.windows.net/pubsask-prod/86730/86730-English.pdf> (page 84) (email to Ty Roberts, LLRIB - date February 14, 2023).

- b) Denison has confirmed that the Trapping furblock in which the Wheeler River Project is located is N-18 (ERFN) (email to Ty Roberts, LLRIB - date February 14, 2023).
- 3) Per below, Denison is providing materials to LLRIB responding to the concerns raised on the Project in relation to the draft EIS.
- 4) Status of successful validation by LLRIB of Denison responses to LLRIB Issues, Interests and Concerns–**in progress**

**Engagement activities**

- 1) Denison will send correspondence to LLRIB regarding the issues raised in the letter sent to the CNSC on the draft EIS in the coming months. In this correspondence, Denison will reiterate its interest in participating in a meeting of the LLRIB Land and Resources Board at a time that is mutually convenient. Denison has also requested the information from the LLRIB that indicates there is some trapping activity near the Project, to better understand the nature of these activities in relation to the Project.
- 2) As of June 30, 2023, Denison and LLRIB have not met, but have intent to do so at a mutually convenient time.

**Future Documentation in updated EIS and updated IER**

- 1) All records per the above will be updated in Section 4 of the final EIS and the IER.

**Prince Albert Grand Council (“PAGC”)**

**Interests, Issues and Concerns:**

- 1) Denison has reviewed comments provided on the draft EIS.
- 2) Issues Table from Section 4 of the draft EIS will be revised according to the example found in Appendix A of this IR and updated with summarized draft EIS comments–for the final EIS.
- 3) Per below, Denison is providing materials to PAGC responding to the concerns raised on the Project in relation to the draft EIS.
- 4) Status of successful validation by PAGC of Denison responses to PAGC Issues, Interests and Concerns–**in progress**.

**Engagement activities**

- 1) Denison will be sending correspondence to PAGC regarding the issues raised in the draft EIS with a response to issues raised by PAGC.
- 2) Based on the outcome of the effort above, Denison will undertake next steps accordingly.

**Future Documentation in updated EIS and updated IER**

- 1) All records per the above will be updated in Section 4 of the final EIS and the IER.

**Northern Village of Beauval & Northern Village of Ile a la Crosse (“NVB” & “NVILX”)**

**Interests, Issues and Concerns:**

- 1) No comments were received on the draft EIS by these Interested Parties.
- 2) The format of the Issues Tables for NVB and NVILX will be formatted according to Appendix A of this IR–for the final EIS.
- 3) Denison will develop a process with NVB and NVILX in relation to the Issues Tables for each of these Interested Parties to seek successful validation by NVB and NVILX of Denison responses to NVB and NVILX Issues, Interests and Concerns.
- 4) Status of successful validation by NVB and NVILX of Denison responses to NVB and NVILX Issues, Interests and Concerns–**in progress**.

**Engagement activities**

- 1) Community and Leadership engagement–planned for fall 2023 to discuss:
  - a) mitigation, monitoring and residual effects

b) forthcoming licensing actions

**\*\*NVILX subject to discussions with MN-S\*\***

**Future Documentation in updated EIS and updated IER**

1) All records per the above will be updated in Section 4 of the final EIS and the IER.

**Section 4 and the IER: Updates Planned for the Final EIS**

The following will be updated for the final EIS:

- Section 4 general updates since submission of the draft EIS, including updates to clarify the purpose of the Key Issues and Concerns tables and the Engagement Database Summary tables in various appendices
- Table 4.3-2: Key Issues and Concerns from English River First Nation (and corresponding table in the IER)
- Table 4.3-3: Key Issues and Concerns from Kineepik Métis Local #9 (and corresponding table in the IER)
- Table 4.3-4: Key Issues and Concerns from Sipishik Métis Local #37 (and corresponding table in the IER)
- Table 4.3-5: Key Issues and Concerns from Patuanak Métis Local #82 (and corresponding table in the IER)
- Table 4.3-6: Key Issues and Concerns from Birch Narrows Dene Nation (and corresponding table in the IER)
- Table 4.3-7: Key Issues and Concerns from Lac La Ronge Indian Band (and corresponding table in the IER)
- Table 4.3-8: Key Issues and Concerns from A La Baie Métis Local #21 (and corresponding table in the IER)
- Table 4.3-9: Key Issues and Concerns from Métis Nation – Saskatchewan (and corresponding table in the IER)
- Table 4.3-10: Key Issues and Concerns from Ya'thi Néné Lands and Resources Office (and corresponding table in the IER)
- Table 4.4-1: Key Issues and Concerns from the Northern Village of Pinehouse
- Table 4.4-2: Key Issues and Concerns from the Northern Village of Beauval
- Table 4.4-3: Key Issues and Concerns from the Northern Village of Île-à-la-Crosse

A new table will also be included for Peter Ballantyne Cree Nation in the final EIS and in the IER.

### **Engagement Database Summary Tables in Various Appendices: Context**

Denison's overall approach to respecting the information shared with Denison, as a result of engagement interactions from 2016 onwards, was to aspire to interweave the data outcomes throughout the entire assessment, rather than providing a single summary chapter in the draft EIS. To do this, Denison's Subject Matter Experts reviewed the over 2,000 lines of engagement data collected from 2016 onwards, and determined what and which information could meaningfully inform their assessment approach. This resulted in engagement data being reflected throughout the entire draft EIS, informing almost all aspects of the assessment. To make sure the reviewer could reasonably understand the context in which the engagement data was collected, Denison created an Engagement Database Summary Table as an Appendix item for each section of the draft EIS where engagement data were used. Each Engagement Database Summary Table identifies the *Unique ID* referenced in the chapter, the *Record of Contact* ("ROC") number that can be used to look up the original source materials in the EIS Appendix 4-A: Supporting Materials, the *Event Type*, the *Date*, the *Event Summary*, the *Interested Parties* with which the engagement occurred, the *Comment* made, and the *Response* from Denison. Denison has now added a final column called *Context*, which provides specifics about how the comment was used in the section.

It is important to note that not all issues or concern raised by an Indigenous nation or community will necessarily have a specific mitigation measure and/or monitoring associated with Denison's response, but mitigation and monitoring measures will be included where it makes sense to do so.

It is also important to note that these engagement data are not intended to be representative of the Indigenous nation or community perspective, as the comment may have been made by an individual from the Indigenous nation or community, and not specifically by the leadership. The Issues Tables (as discussed in this IR) are those Tables that summarize the collective interests, issues and concerns by the leadership, which Denison has identified will be subject to the validation process as outlined above. These appendices are simply intended to provide transparency around the engagement data points that had been used in the draft EIS in some manner, and are, therefore, not part of the validation process designed for Indigenous nations and communities.

### **Engagement Database Summary Tables in Various Appendices: Updates Planned for the Final EIS**

Please see Appendix B to this IR for an example of the new format for the Engagement Appendices. The following in the EIS will be updated:

- Section 2 Project Description – Appendix 2-A: Engagement Database Summary Table for Project Description
- Section 6 Atmospheric and Acoustic Environment – Appendix 6-B: Engagement Database Summary Table for Project Description
- Section 7 Geology and Groundwater – Appendix 7-B: Engagement Database Summary Table for Geology and Groundwater
- Section 8 Aquatic Environment – Appendix 8-A: Engagement Database Summary Table for Aquatic Environment
- Section 9 Terrestrial Environment – Appendix 9-A: Engagement Database Summary Table for Terrestrial Environment
- Section 10 Human Health – Appendix 10-B: Engagement Database Summary Table for Human Health

- Section 11 Land and Resource Use – Appendix 11-A: Engagement Database Summary Table for Land and Resource Use
- Section 12 Quality of Life – Appendix 12- A: Engagement Database Summary Table for Quality of Life
- Section 13 Economics – Appendix 13-A: Engagement Database Summary Table for Economics
- Section 14 Accidents and Malfunctions – Appendix 14-B: Engagement Database Summary Table for Accidents and Malfunctions
- Section 15 Effects of the Environment – Appendix 15-A: Engagement Database Summary Table for Effects of the Environment on the Project

## Appendix A

Topic	Summary of the Issue, Interest, or Concern	Reference	Denison Response & How Comment was Addressed/Considered in the Draft EIS	Status	Justification of Status	Ongoing Resolution of Concerns (if required)
<b>Monitoring</b>	<p>Interest in information and direct participation in monitoring baseline and effects.</p> <p>Concern that project should have independent monitoring for the Project and that information from this be shared with communities.</p>	ROC 2 ROC 105 ROC 444	<p>An Environmental Protection Program will be established to provide an overarching framework for key environmental monitoring and management plans and to ensure a means to demonstrate compliance with applicable environmental regulatory requirements and other performance targets that Denison may set. The program would be developed in a manner that aligns with the ISO 14001 EMS Standard. Aspects of the Environmental Protection Plan will include:</p> <ul style="list-style-type: none"> <li>-Management and Monitoring of Emissions</li> <li>-Liquid Effluent Monitoring Plan</li> <li>- Air Emissions Monitoring Plan</li> <li>- Groundwater Monitoring Plan</li> <li>- Environmental Monitoring Plan</li> <li>- Woodland Caribou Management Plan</li> </ul> <p>As the Indigenous Community of Interest with a residential community most proximal to the Project, Denison has committed to collaborating with Kineepik Métis Local on a community specific monitoring regime, suited to their interests and needs in order to provide transparent information to discourage avoidance of the area and alleviate perceived concerns about potential impacts. As part of this program, Denison and KML will be sharing information in an agreed-upon fashion, about agreed-upon species of interest. Denison expects that important country foods harvested for food and cultural purposes (i.e moose, fish species, etc), surface water quality, and other areas of interest will form part of this monitoring program, including the potential to report on wildlife-vehicle mortality or other such areas of potential concern as they evolve over time.</p> <p>See Section 16 for a summary of monitoring and follow-up programs.</p>	<b>Complete</b> (based on KML acceptance of Response)	<ul style="list-style-type: none"> <li>• Draft table sent by email from Denison on <b>June 7, 2023</b></li> <li>• Confirmation of positive validation by KML received by email on <b>June 10, 2023</b></li> </ul>	N/A General discussions to continue as part of ongoing dialogue
<b>Economics</b>	Concern and interest in economic opportunities associated with Project and education and training to facilitate access and participation by community members.	ROC 62 ROC 105 ROC 388 ROC 444 ROC 620 ROC 623	Denison has estimated a workforce of 300 during the two-year Construction phase and 180 during the Operation phase. Mineral sector positions are typically considered to be higher paying than many other industrial positions. Residents and communities in the LSA (ERFN (including Indian Reserve Wapachewunak 192D and Indian Reserve La Plonge 192) and Patuanak, Northern Hamlet (Patuanak); Pinehouse Lake, Northern Village; and Beauval, Northern Village) will	<b>Complete</b> (based on KML acceptance of Response)	<ul style="list-style-type: none"> <li>• Draft table sent by email from Denison on <b>June 7, 2023</b></li> </ul>	N/A General discussions to continue as part of ongoing dialogue

			<p>supporting activities. Mineral sector positions are typically considered to be higher paying than many other industrial positions. Residents and communities in the LSA will be given first priority for employment and training and business opportunities, followed by Indigenous and / or other communities in the RSA.</p> <p>The Agreement negotiated between Denison and KML outlines specific commitments for KML participation in economic opportunities associated with the Project, including business opportunities as deemed appropriate by KML.</p> <p>See Section 13 for a summary of local, provincial, and federal Project benefits and Denison's approach to employment, training, and business participation opportunities for communities.</p>		<ul style="list-style-type: none"> <li>Confirmation of positive validation by KML received by email on <b>June 10, 2023</b></li> </ul>	
<b>Engagement</b>	<p>Interest in implementation of appropriate engagement process activities.</p> <p>Concern was raised over the approach to consultation with others (other communities) and questions raised on whether a Collaborative Agreement was possible during operations.</p>	ROC 106 ROC 114 ROC 118 ROC 135 ROC 388 ROC 444	<p>Denison has identified key objectives respecting Indigenous engagement associated with the Project:</p> <ul style="list-style-type: none"> <li>-Build and maintain authentic relationships based on a foundation of trust, good faith, and transparency.</li> <li>-Create a respectful dialogue process that promotes communication and collaboration among Denison and Indigenous communities, in a timely and accurate fashion.</li> <li>-Understand how the proposed development of the Project may affect the interests of Indigenous peoples (including Indigenous and/or Treaty Rights), and work with Indigenous peoples to avoid, mitigate, or otherwise address effects, while also collaborating to maximize potential positive effects.</li> </ul> <p>Engagement activities for the Project can and will evolve over time, as information is gathered that is pertinent to Denison's understanding of the Interested Parties and their relationship to, and interest in, the Project. At present, Denison has an Exploration Agreement with KML and continues to engage with KML and NVP with respect to the Wheeler River Project.</p>	<b>Complete</b> (based on KML acceptance of Response)	<ul style="list-style-type: none"> <li>Draft table sent by email from Denison on <b>June 7, 2023</b></li> <li>Confirmation of positive validation by KML received by email on <b>June 10, 2023</b></li> </ul>	N/A General discussions to continue as part of ongoing dialogue

## Appendix A

Topic	Summary of the Issue, Interest, or Concern	Reference	Denison Response & How Comment was Addressed/Considered in the Draft EIS	Status	Justification of Status	Ongoing Resolution of Concerns (if required)
			<p>The Agreement negotiated between Denison and KML is demonstrative of Denison's responsiveness to the request from KML for such an agreement.</p> <p>See Section 4 for additional information on the consultation process.</p>			
<b>Cumulative Effects</b>	Concern was expressed over cumulative effects in the region.	ROC 105	<p>Denison conducted a cumulative effects assessment, which included the Highway 914 extension project, on categories:</p> <ul style="list-style-type: none"> <li>-The Atmospheric and Acoustic Environment.</li> <li>-Geology and Groundwater.</li> <li>-The Aquatic Environment.</li> <li>-The Terrestrial Environment.</li> <li>-Human Health.</li> <li>-Land and Resource Use.</li> <li>-Quality of Life.</li> <li>-Economics.</li> </ul> <p>Denison respects and understands KML's concern about the cumulative effects in the region, particularly in relation to access to traditional lands and resources in correlation with industrial and mining developments. The residual effects of the Project are expected to interact with the residual effects of other projects and activities in the ILRU RSA, resulting in potential cumulative effects to Indigenous land use activity in the area. This is largely due to the proposed Highway 914 extension project.</p> <p>See Section 16 for a summary of the cumulative effects assessments for each category above.</p>	<b>Complete</b> (based on KML acceptance of Response)	<ul style="list-style-type: none"> <li>• Draft table sent by email from Denison on <b>June 7, 2023</b></li> <li>• Confirmation of positive validation by KML received by email on <b>June 10, 2023</b></li> </ul>	N/A General discussions to continue as part of ongoing dialogue
<b>Project Description</b>	Interest in information about current market conditions and overall viability of the Project.	ROC 105	Denison has identified that there is current and future market demand for uranium, the primary raw material for nuclear fuel generation. The Project can address gaps in annual global uranium supply and the use of uranium in nuclear power plants can contribute to net-zero goals, and this can be achieved while making a meaningful contribution to the Canadian economy. The Project was considered in relation to technical feasibility, economic feasibility, and land use criteria to determine viability of the Project.	<b>Complete</b> (based on KML acceptance of Response)	<ul style="list-style-type: none"> <li>• Draft table sent by email from Denison on <b>June 7, 2023</b></li> <li>• Confirmation of positive</li> </ul>	N/A General discussions to continue as part of ongoing dialogue

18-EN-VILX-3.32	3	Workshop	2018-01-17	As part of the engagement program for the Wheeler River Project, Denison organized a workshop in Ile a la Crosse for community and A La Baie Métis members to attend. The workshop gathered community and student input in relation to road alignment options, treated effluent discharge locations, and mining methods.	Village of Ile a la Crosse	Need to understand impact on groundwater and lakes.	<p>Denison considered this in section:</p> <p>Assessment of Project Related Effects, Potential Project Related Effects, Change in Areal Extent of Habitat Types, Number of Listed Plants, and Areal Extent of Wetlands</p> <p>And in section:</p> <p>Assessment of Project Related Effects, Potential Project Related Effects, Change in the Concentrations of Constituents of Potential Concern in Vegetation</p>	<p><b>How comment was used in this section:</b></p> <p>The context in which this comment was used within the terrestrial section of the EIS serves as a local perspective, documented as coming from an individual who attended workshop in Ile a la Crosse in the year 2018, which reiterates the importance of groundwater and lakes, thereby providing further validity to the inclusion of water quality and water quantity as a potential pathway of influence in terms of areal extent of habitat types, number of listed plants, the areal extent of wetlands, and changes in the concentrations of constituents of potential concern in vegetation.</p> <p><b>How comment would be answered through EIS information:</b></p> <p>Groundwater impacts were assessed in Section 7 titled Geology and Groundwater. Impacts to lakes were assessed in Section 9 titled Aquatic Environment. Section 7 and 9 provide details to support the conclusion that there is no significant impact in terms of groundwater or lakes.</p>
20-LK-LEASESUR-267.67	267	Survey	2020-02-01	Denison sent all known local cabin and lodge leaseholders a survey in the mail to be completed regarding their interests in Wheeler River. Denison received 6 responses from the survey, which has informed it's understanding of leaseholder uses in the area and interests regarding elements to be assessed as part of the environmental assessment.	Leaseholder, Wheeler River Lodge	Concerns over fishing and hunting pressure [from the mine and people accessing the area].	<p>Denison considered this in section:</p> <p>Cumulative Effects, Potential Cumulative Effects</p>	<p><b>How comment was used in this section:</b></p> <p>The context in which this comment was used within the terrestrial section of the EIS serves as a local perspective, documented as coming from a leaseholder who completed a survey in in the year 2020, which reiterates the importance of land use activities, thereby providing further validity to the inclusion of increased access to the terrestrial RSA as a potential pathway for cumulative effects in terms of invasive plant introduction and increased dust deposition.</p> <p><b>How comment would be answered through EIS information:</b></p> <p>Both fishing and hunting were assessed in Section 11 titled Land and Resource Use. The assessment considers both terrestrial and aquatic resource availability, as well as the health and abundance of resource, in terms of both Indigenous Land and Resource Use and Other Land and Resource Use. The assessment in Section 11 additionally incorporates increased access owing to the extension of highway 914 as part of the cumulative effects assessment while existing projects were captured and assessed within baseline conditions. Section 11 provides details to support the conclusion that there is no significant impact in terms of fishing and hunting.</p>

## Appendix B

### Section 11: Engagement Database Summary Table – Indigenous Land and Resource Use

#### Examples

Unique ID	ROC	Event Type	Date	Event Summary	Interested Parties	Comments (from interested party)	Response (from Denison)	Context
18-EN-ERFN-5.1	5	Workshop	2018-05-03	<p>As part of the engagement program for the Wheeler River Project, Denison organized a workshop for ERFN at their Patuanak Reserve location for ERFN and Patuanak members to attend. The workshop aimed to gather community input in relation to road alignment options, treated effluent</p> <p>discharge locations, and mining methods. The meeting had been delayed many times, and was held in the Health Clinic because there was a regional power outage.</p>	English River First Nation	<p>I always come from the elders' perspective. Since 1906, the area where you're working has been Treaty 10 land. Those lands were the primary area of ERFN and contain burial sites and birth sites of ERFN members. The Dené name of the Wheeler River, Russell Lake and Cree Lake all come from the Denésuliné of English River. The elders have always expressed that it's a primary area of ERFN. One of our late elders was born north of there in 1922. Our traditional gathering place is there.</p>	<p>Denison considered this in section:</p> <p>Existing Environment, Contemporary Indigenous Land and Resource Use in the Region, English River / Patuanak</p>	<p><b>How comment was used in this section:</b></p> <p>The context in which this comment was used within the land and resource use section of the EIS serves as a local perspective, documented as coming from a member of English River First Nation who attended a workshop in the year 2018. Existing conditions are based on available information and are accompanied by supporting information including available IK, LK, and results of engagement activities of specific relevance to the particular VC/KI. As such, the direct quote was incorporated into the characterization of the existing environment as it relates to occupancy, cultural sites, and navigation pertinent to English River First Nation.</p> <p><b>How comment would be answered through EIS information:</b></p> <p>English River First Nation is categorized as an Indigenous Community of Interest. Detail on Indigenous COI criteria is provided in detail in EIS Section 4 titled Engagement. Consideration of ERFN territory, as well as ERFN perspectives, has been interwoven throughout the EIS wherever pertinent.</p> <p>Potential impacts to heritage resources were assessed in Section 11 in the subsection titled Heritage Resources. Section 11 provides details to support the conclusion that there is no significant impact in terms of heritage resources. This section also provides detail on the Heritage Resource Management Plan.</p>

### Section 13: Engagement Database Summary Table – Economics

#### Examples

Unique ID	ROC	Event Type	Date	Event Summary	Interested Parties	Comments (from interested party)	Response (from Denison)	Context
21-EN-VPL-444.16	444	Virtual Meeting	2021-02-11	Denison hosted a virtual meeting for the municipality of Pinehouse Lake. The public meetings were focused on the Project generally, and did not seek input or comments on the distinct interests of the Métis in respect of the Project or Métis land use. This was expressly stated at the outset of each of the public meetings. Included in the discussion was an overview on the Valued Components for the Wheeler River Project, with a request to provide feedback to Denison via an online survey with specific questions pertaining to Valued Components.	Village of Pinehouse Lake	Will there be opportunities for people from Pinehouse to be employed?	<p>Denison considered this in section:</p> <p>Existing Environment, Key Indicator: Employment and Training, Employment Rate</p>	<p><b>How comment was used in this section:</b></p> <p>The context in which this comment was used within the economics section of the EIS serves as a local perspective, documented as coming from a resident of Pinehouse Lake who attended a virtual meeting in the year 2021, which reiterates the importance of employment, thereby providing further validity to the inclusion of employment and training as a key indicator and additionally providing substance to the characterization of local perspectives on the existing environment as it relates to an emphasis on employment.</p> <p><b>How comment would be answered through EIS information:</b></p> <p>Denison has estimated a workforce of 300 during the two-year Construction phase and 180 during the Operation phase. Mineral sector positions are typically considered to be higher paying than many other industrial positions. Residents and communities in the LSA (ERFN (including Indian Reserve Wapachewunak 192D and Indian Reserve La Plonge 192) and Patuanak, Northern Hamlet (Patuanak); Pinehouse Lake, Northern Village; and Beauval, Northern Village) will be given first priority for employment, training, and business opportunities, followed by residents and communities in the RSA (Northern Saskatchewan Administrative District).</p> <p>Employment was assessed in Section 13 which provides detail related to all facets of the Economic assessments including detail on how the Project will create employment opportunities and increase income for workers and businesses in the LSA, RSA and beyond the RSA during all phases of the Project.</p>

## Attachment: IR-35

Number	IR-35
Dept.	CNSC
Project effects link	Change to an environmental component due to hazardous contaminants
Reference to EIS, appendices, or supporting documentation	Section 6, Chemicals of Potential Concern
Context and Rationale	<p><b>Context:</b> The use of petroleum products (e.g., propane, gasoline, and diesel) at the Denison Mines Wheeler River site is associated with vehicles and periodic operational testing of emergency generators as well as stationary pumps for emergency power or fire water systems. Thus, the air emissions will contain acrolein.</p> <p><b>Rationale:</b> This chemical of potential concern (COPC) poses potential risks to human health via inhalation, but acrolein appears to have been missed or deemed insignificant. However, its consideration in the assessment will provide information on the significance of the associated risk.</p>
Information Requirement	Please consider acrolein in the assessment or provide a rationale for its exclusion.

### Response:

The air quality assessment in the draft EIS considered combustion emissions (i.e., NO<sub>x</sub>, SO<sub>2</sub>, CO, and fine particulate matter) from diesel-powered equipment/vehicles and the standby diesel generators. While acrolein is a component of diesel exhaust, it was not identified as a contaminant of potential concern (COPC) given that the use of diesel equipment/vehicles and generators at the Wheeler River Project will be limited. To demonstrate this, a quantitative screening level assessment of acrolein emissions from diesel combustion was carried out here to address this IR. Because there is no acrolein criterion or standard in Saskatchewan, Ambient Air Quality Criteria (AAQC) from Ontario were used. These criteria have also been adopted in Alberta. The screening level assessment is described in the following text.

Using the nitrogen oxide (NO<sub>x</sub>) results from the air quality modelling assessment in Appendix 6-A, 1-hour and 24-hour dispersion factors (i.e., µg/m<sup>3</sup> per g/s emitted) were calculated for each assessment scenario. A dispersion factor was calculated for both the worker camp receptor, and the off-property receptor with the highest predicted NO<sub>x</sub> concentration. These dispersion factors were then applied to estimates of acrolein emissions to predict 1-hour and 24-hour concentrations of acrolein at both locations. The acrolein emission rate from the standby diesel generators were estimated using fuel flow

rates from manufacturer’s specifications and emission factors from Chapters 3.3 and 3.4 of the U.S. EPA AP-42 Compilation of Emission Factors, depending on the generator size. For mobile equipment and vehicles, a ratio of acrolein to non-methane hydrocarbons (NMHC) was applied to the total HC emission factors (see Section A.9 and A.10 of Appendix 6-A), conservatively assuming total HC equals NMHC. The ratio of acrolein to NMHC was obtained from the U.S. EPA document “*Speciation Profiles and Toxic Emission Factors for Non-road Engines in MOVES3*” (2022) and assumed Tier II engines. The site-wide emission rates for acrolein were estimated to be 1.89E-03 g/s for Construction, 1.04E-03 g/s for Operation, and 1.53E-03 g/s for Decommissioning. In all scenarios, the generators were assumed to operate 24-hours per day and increased equipment usage during Construction and Decommissioning resulted in higher acrolein emissions compared to the Operation scenario.

The results of the screening level assessment are outlined in the table below. Calculated acrolein concentrations are compared against Ontario AAQC, which are based on health as the limiting effect. As can be seen in the table, acrolein concentrations are expected to be well below the applicable criteria for all scenarios. The highest estimated concentrations will occur for the Decommissioning scenario and are 6.7% of the 24-hour AAQC, and 1.8% of the 1-hour AAQC at the worker camp. At the maximum off-property receptor, the estimated acrolein concentrations for Decommissioning are predicted to be 0.9% and 2.0% of the 1-hour and 24-hour AAQC, respectively.

Based on the results of the screening level assessment, acrolein is not considered a COPC.

#### Calculated Dispersion Factors and Resulting Acrolein Concentrations

Scenario	Averaging Period	Ontario AAQC (µg/m³)	Emission Rate (g/s)	Dispersion Factor <sup>[1]</sup> (µg/m³ per g/s)		Concentration <sup>[2]</sup> (µg/m³)		% of Ontario AAQC	
				Camp Receptor	Max Off-Property Receptor	Camp Receptor	Max Off-Property Receptor	Camp Receptor	Max Off-Property Receptor
Construction	1-hour	4.5	1.89E-03	25.5	24.9	4.84E-02	4.71E-02	1.1%	1.0%
	24-hour	0.4		9.2	5.0	1.75E-02	9.56E-03	4.4%	2.4%
Operations	1-hour	4.5	1.04E-03	37.5	23.6	3.91E-02	2.47E-02	0.9%	0.5%
	24-hour	0.4		12.9	5.3	1.35E-02	5.55E-03	3.4%	1.4%
Decomm.	1-hour	4.5	1.53E-03	54.1	26.2	8.29E-02	4.01E-02	1.8%	0.9%
	24-hour	0.4		17.4	5.2	2.66E-02	8.02E-03	6.7%	2.0%

**Notes:**

[1] Based on the incremental NOx predictions at the worker camp receptor and the off-property receptor where maximum NOx concentrations were predicted.

[2] Concentrations are incremental and do not include the addition of a background. Background is expected to be negligible.

Project effects link	Change to an environmental component due to hazardous contaminants
Reference to EIS, appendices, or supporting documentation	Section 6.1.4.2, Potential Project- Related Effects
Context and Rationale	<p><b>Context:</b> In this section, the Proponent discusses the approach taken for air dispersion numerical modelling. Using their CALMET data set, the Proponent’s CALPUFF model runs indicated exceedances for 24- hour total suspended particulates, 24-hour particulate matter (PM10), 1-hour nitrogen dioxide, and 24-hour uranium concentrations. However, there is no mention of possible diurnal and seasonal occurrences of the exceedances.</p> <p><b>Rationale:</b> Adequate assessment of the modelling results requires knowledge of the temporal characteristics for the exceedances. For example, wintertime exceedances may be due to strong temperature inversions, especially during the overnight to morning hours. These strong inversions are challenging for numerical models to capture. Exceedances during warmer months may be due to specific wind directions, which transport emissions directly to downwind receptors.</p>
Information Requirement	Provide additional information on any diurnal and seasonal influences of the modelled exceedances.

### Response:

The draft EIS aggregated the total number of exceedances predicted over the one-year CALMET data set to determine the maximum frequency of exceedances. While information on diurnal and seasonal patterns of exceedances is useful for developing air emissions management and monitoring plans, the total number of exceedances was required to identify and evaluate potential residual effects in the EIS.

Information regarding the presence of inversions in the CALMET data set was presented during the Meteorology Technical Meeting held on January 27, 2023. As shown in the figures below, stable conditions (PG stability class categories E and F) occur about 24% of the time and are most prominent during December (33% of the time).

In addition to the previous information, the temporal patterns of the predicted exceedances for 1-hour NO<sub>2</sub>, and 24-hour TSP, PM<sub>10</sub>, and uranium for each of the assessment scenarios have been evaluated at the camp receptor and at the receptor with the maximum predicted concentration. The results of this analysis are presented in a series of figures below. While NO<sub>2</sub> exceedances are limited (i.e., < 5% of the time), some temporal patterns do emerge. Namely, 1-hour NO<sub>2</sub> exceedances are primarily expected to occur during the coldest months (January, February, and December) and during the morning and overnight hours when inversions are more likely to occur. For 24-hour TSP and PM<sub>10</sub>, exceedances are predicted to be most frequent during the May to October period, corresponding to higher emission rates compared to the November to April period (see Section 4.0 of Appendix 6-A). Being that there are so few 24-hour uranium exceedances, no obvious temporal pattern was identified, but the months with the highest number of exceedances at the camp receptor are expected to be April, October, and

December and only one exceedance is predicted from May to September. This suggests that exceedances of the 24-hour uranium criteria are more likely to occur during the colder months, possibly due to the increased presence of inversions.

The aforementioned information will be considered as mitigation and monitoring plans are developed.

Project effects link	Change to an environmental component due to hazardous contaminants
Reference to EIS, appendices, or supporting documentation	Section 6 Air Quality Technical Supporting Document Section 6.3.1
Context and Rationale	<p>The carcinogenic risks of diesel exhaust from the project should be assessed.</p> <p>Context: Section 6.3.1 discusses modelled predictions of exceedances for Particulate Matter (PM). TSD p. 22 states: "concentrations of 24-hour PM2.5 are also elevated around the standby generators at the freeze plant, which emit fine particulate matter from combustion of diesel fuel". However, diesel particulate matter is not evaluated for the whole project in the air quality model or the air quality assessment.</p> <p>Rationale: Health Canada has determined that diesel exhaust is carcinogenic in humans which is consistent with the conclusion of the International Agency for Research on Cancer (IARC), and that diesel exhaust is associated with significant population health impacts in Canada.</p> <p>To characterize the carcinogenic risk of diesel exhaust from a project, HC has published a report (2022)<sup>1</sup> which provides a quantitative assessment of the relationship between ambient PM2.5 exposure and lung cancer risk. Specifically, this report quantifies the increase in risk of lung cancer mortality (over the baseline rate in the Canadian population) due to PM2.5 exposure.</p> <p>This quantitative assessment is considered appropriate to characterize risks from diesel PM given the contribution of diesel exhaust to ambient PM2.5 in Canada, and that the carcinogenicity of diesel exhaust has generally been evaluated based on the respirable PM fraction<sup>1,2,3</sup>.</p> <p>References:</p> <p>[1] HC. 2022. Lung Cancer and Ambient PM2.5 in Canada: A Systematic Review and Meta-analysis. Information Requirement	1. Evaluate the carcinogenic risk of all potential diesel exhaust from the project based on the approach proposed by Health Canada (2022). Additional guidance ("Additional Lung Cancer Mortality from PM2.5: Recommended Approach and Sample Calculation") is provided as an appendix to this comment table.[i]
	[i] Additional Lung Cancer Mortality from PM2.5: Recommended Approach and Sample Calculation
	Health Canada, Water and Air Quality Bureau, October 2022
	Health Canada (2022) provides a quantitative estimate of the risk of lung cancer associated with exposure to PM2.5 in Canada. The pooled hazard ratio (HR) for lung cancer mortality in the Canadian population is 1.127 (95% CI: 1.085, 1.170) per 10 µg/m³ increase in long-term exposure to ambient PM2.5. The slope coefficient (β) for this relationship is 0.01196, as derived below:
	$e^{(\beta \times 10 \mu\text{g}/\text{m}^3)} = \text{pooled hazard ratio per } 10 \mu\text{g}/\text{m}^3$
	$e^{(\beta \times 10 \mu\text{g}/\text{m}^3)} = 1.127$
	$\beta \times 10 \mu\text{g}/\text{m}^3 = \ln 1.127$
	$\beta = (\ln 1.127)/(10 \mu\text{g}/\text{m}^3) \text{ ,}$
	$\beta = 0.01196$
	The additional lung cancer mortality (over the baseline rate) from PM2.5 derived from a given source can be determined using the equation below, based on the attributable fraction or (HR-1)/HR (Greco et al. 2020):
	$ALCM = \left[ \frac{(e^{\beta \cdot \text{Exposure}} - 1)}{e^{\beta \cdot \text{Exposure}}} \right] \cdot \text{Baseline rate} \cdot \text{Years}$

ALCM = additional lung cancer mortality cases per 100,000 population
β = 0.01196 (slope coefficient from meta-analysis in Health Canada (2022))
Exposure = estimated PM2.5 exposure concentration from the relevant source(s) (µg/m3) (does not include baseline PM2.5 exposure)
Baseline rate = 45.5 per 100,000 (current Canadian Age Standardized Mortality Rate (ASMR) for lung cancer from Canadian Cancer Statistics Advisory Committee 2021); the Canadian baseline rate is appropriate as the slope coefficient was derived from Canada-wide studies and an updated ASMR of Canada (if available) would be appropriate for use in the calculation
Years = years of project or project phase
Sample calculation:

	<p>Project estimates an exposure from relevant source(s) of 0.067 µg/m<sup>3</sup> over 50 years of operation</p> $ALCM = \left[ \frac{(e^{\beta \cdot Exposure} - 1)}{e^{\beta \cdot Exposure}} \right] \cdot Baseline\ rate \cdot Years$ $ALCM = \left[ \frac{(e^{0.01196 \cdot 0.067} - 1)}{e^{0.01196 \cdot 0.067}} \right] \cdot 45.5 \cdot 50$ <p>ALCM = 1.8 additional lung cancer mortality cases per 100,000</p> <p><b>References:</b></p> <p>[1] Canadian Cancer Statistics Advisory Committee in collaboration with the Canadian Cancer Society, Statistics Canada and the Public Health Agency of Canada. --	---

Response:

#### **Sources of Diesel Emissions from the Project**

The Project-related atmospheric releases considered in the Environmental Risk Assessment (ERA) in the draft EIS Appendix 10-A were consistent with the air emissions inventory detailed in the Air Quality Assessment (draft EIS Section 6 and Appendix 6-A). The emissions will vary over time based on the schedule of Project activities and the air quality assessment scenarios were developed based on the year with the maximum activity occurring in each Project phase. There are several combustion sources at the site, which would be expected to contribute diesel emissions during the relevant phases of the Project. Combustion sources at the site include:

- diesel generators;
- propane heaters; and
- diesel and gasoline combustion associated with construction equipment and vehicles utilizing the on-site roads.

These combustion sources would contribute particulate matter (PM<sub>10</sub> and PM<sub>2.5</sub>), NO<sub>x</sub>, SO<sub>2</sub> and CO to the atmospheric environment. Concentrations of these parameters were predicted in the Air Quality TSD

(Appendix 6-A) at several receptor locations within the Local Study Area and were used as surrogates for diesel emissions from the Project. It is important to note that scoping of the air quality assessment followed a conservative approach. For instance, and of relevance to this IR, although Denison expects the site will be powered by the provincial grid during Operations, the air quality assessment conservatively assumed that the back-up diesel generators would run continuously (24/7) during Operation and Decommissioning in order to predict worst-case concentrations and bound the evaluation of Project residual effects.

#### **Assessment of Diesel Emissions in the ERA**

Particulate matter, of which diesel particulate matter would be a subset and in particular a subset of or associated with the PM<sub>2.5</sub> fraction, was assessed in the ERA in Appendix 10-A based upon predicted concentrations at receptor locations as documented in the Air Quality Assessment (EIS Section 6 and Appendix 6-A). As discussed in Section 3.2.1.3.2 of the ERA (Appendix 10-A), predicted concentrations of particulate matter (including TSP and PM<sub>2.5</sub>) during Construction, Operation, and Decommissioning all met their respective annual screening values of 60 µg/m<sup>3</sup> for TSP and 8.8 µg/m<sup>3</sup> for PM<sub>2.5</sub>. Exceedances were predicted for TSP and PM<sub>10</sub> of the 24 hour screening values in all Project Phases, attributable to fugitive dust from earthworks and unpaved roads and not operation of generators. There were, however, no exceedances of the 24 hour screening value for PM<sub>2.5</sub>, the fraction of particulate matter most likely to be associated with diesel emissions.

#### **Assessment of Diesel Emissions using HC New Approach**

The method recommended by HC in this IR was used to calculate the additional lung cancer mortality (ALCM) over the baseline rate from PM<sub>2.5</sub> using the predicted PM<sub>2.5</sub> concentrations presented in the EIS. The same human receptor locations assessed in the ERA (Risk2 through Risk5, Table 3-7 in Appendix 10-A) were considered including the residency times for each receptor type consistent with Table 4-2 in Appendix 10-A, and shown in Table IR45-1 below.

**Table IR45-1: Summary of Human Receptor Locations and Residency Assumptions**

Receptor ID	Receptor Location Description	Receptor Type	Residency Assumption
Risk2	Human Location Trapper	Fisher/Trapper	50% at Risk2, 50% at Risk5
Risk3	Human Location Camp Worker	Camp Worker	50% at Risk3, 50% at Risk5
Risk4	Human Location Seasonal Resident	Seasonal Resident	30% at Risk2, 70% at Risk5

Baseline concentrations for PM<sub>2.5</sub> are 3.1 µg/m<sup>3</sup>. The following equation (Greco et al., 2020) was used to calculate the ALCM.

$$ALCM = \left[ \frac{(e^{\beta \cdot Exposure} - 1)}{e^{\beta \cdot Exposure}} \right] \cdot Baseline\ rate \cdot Years$$

Where  $\beta = 0.01196$

Exposure = estimated PM<sub>2.5</sub> exposure concentration with background removed

Baseline rate = 45.5 per 100,000

Years = years of project or project phase (construction = 2 years, operation = 15 years, decommissioning = 5 years)

The exposure concentrations for PM<sub>2.5</sub> were scaled to consider the fraction attributable to diesel sources, consistent with Section 4.0 in Appendix 6-A (Construction = 22.8%, Operation = 26.8%, and Decommissioning = 36.2%). Considering these assumptions, the following table provides the ALCM for each project phase:

**Table IR45-2: Summary of Additional Lung Cancer Mortality Rates at Human Receptor Locations**

Receptor ID	Construction	Operation	Decommissioning
Risk2	0	0	0
Risk3	0	0	0
Risk4	0	0	0

Note: Results are interpreted per 100,000 people.

As shown above, the risks for the general public at Risk2, Risk 3 and Risk4 demonstrate that no additional lung cancer mortality cases are expected per 100,000 population as a result of exposure to diesel particulate matter (using PM<sub>2.5</sub> as a surrogate) due to the Project. Therefore, there is unlikely to be an increased incidence of lung cancer mortality due to exposure to diesel particulate matter generated by the Project activities.

#### **Mitigation measures to limit diesel emissions and exposure**

Various mitigation measures will be implemented to control or reduce the impacts to the atmospheric environment from the Project. These include administrative and physical controls based on best industry practices, as listed below and outlined in the draft EIS Section 6 and Appendix 6-A and in IR responses:

##### **Administrative controls**

- Create and implement a dust management plan, including the application of water and/or chemical suppressant to control fugitive dust, in addition to other operational strategies to assist in dust control;
- Planning vehicle and equipment routes to minimize travel distances, where possible; and
- Employ standard operating procedures and complete regular inspections of equipment machinery to ensure it is in good working order.
- Vehicles and equipment will be equipped with Tier 4 engines where feasible (IR-139).

##### **Physical controls**

- Avoid dust-generating activities (e.g., earthworks, material handling) during dry or high wind conditions;
- Avoid dropping material from height;

- Ensure all exhausts (e.g., mobile equipment, generators) are in good working condition;
- Turn off vehicles and equipment when not being used;
- Minimize or reduce vehicle and equipment speed by enforcing speed limits;
- Apply water at least twice per day to unpaved roads and surfaces; and
- Maintain unpaved road surfaces via grading or other maintenance practices to reduce the amount of silt (i.e., fines) present in the roadbed material.

### Conclusions

Considering PM<sub>2.5</sub> as a surrogate for diesel particulate matter, the modelled concentrations of PM<sub>2.5</sub> are not expected to result in any additional lung cancer mortality cases per 100,000 at the receptor locations that are relevant for members of the public (i.e., hunters, trappers, fishers, recreational users, seasonal residents) and the camp worker. The overall risk is expected to be negligible; however, monitoring of particulate matter will be carried out throughout the Project and compared to risk-based criteria. Therefore, no further Project controls beyond those identified are proposed for the protection of human health due to diesel particulate matter.

Project effects link	Fish and fish habitat
Reference to EIS, appendices, or supporting documentation	Section 7.3.3.2 Appendix 7-A, Sections 3.1.2 and 3.7, Appendix 7-C, section 2.5.2
Context and Rationale	<p><b>Context:</b> The proponent's conceptual model of groundwater flow in the Local Study Area (EIS, sec 7.3.3, Figure 7.3-7) involves an unconfined Upper system hosted by overburden and the Upper sandstone aquifer, and a Lower confined system hosted by the Lower Sandstone Aquifer. The Intermediate Sandstone aquitard acts as a confining unit. Vertical heads gradients are directed downwards west of the Phoenix deposit and upwards beneath surface water receptors including Whitefish Lake (EIS, sec. 7.3.3.2).</p> <p>Using head data from nested monitoring wells (Appendix 7-A, sec. 3.1.2, Table 3-1) the proponent calculates upward gradients in cluster WR-607, between the Lower Sandstone aquifer and the Upper Sandstone aquifer. In cluster LA-5, an upward gradient is calculated between the Upper Sandstone and the overburden unit (Appendix 7-A, Table 3-5). In areas west and south-west of the Phoenix deposit, groundwater is estimated to flow downward under a vertical gradient of approximately 0.015 m/m (Appendix 7-A, p.3-15).</p> <p><b>Rationale:</b> In NRCAN's opinion, the proponent's interpretation of vertical head gradients in the LSA is not fully accurate. For the "Up-Gradient" monitoring well cluster, the tabulated head data (Appendix 7-A, Table 3-1) and data logger hydrographs (Appendix 7-A, Appendix B) indicate a downward gradient (0.014 m/m) from the overburden unit to the Intermediate Sandstone and an upward gradient (0.056 m/m) from the Lower Sandstone to the Intermediate Sandstone. Head data from the "NW" monitoring well cluster indicate a similar pattern of downward (0.016 m/m) and upward (0.014 m/m) gradients converging in the Intermediate Sandstone. In the "Downgradient" and "SE" monitoring well clusters, head observations and data logger hydrographs indicate downward gradients from the shallow aquifer system but essentially equal heads in the Intermediate and Lower Sandstones. This more complex picture of groundwater flow systems in the LSA does not appear to have been captured in the proponent's conceptual model. Given the importance of the baseline hydrogeological regime for predicting the transport and fate of COPCs in the post-decommissioning period, the proponent needs to demonstrate that the numerical groundwater flow model accounts for observed vertical head gradients.</p>
Information Requirement	In section 2.5.2 of Appendix 7-C (Calibration Results), the proponent should demonstrate that the numerical groundwater flow model reproduces quantitatively or at least qualitatively the vertical head gradients calculated from observations in the nested monitoring well clusters (Appendix 7-A, Table 3-1).

### **Response:**

Vertical gradients are presented in Table 3-5, Section 3.7 of Appendix 7-A, while Table 3-1 presents water levels observed at individual groundwater monitoring wells. Discussion of

vertical gradients is limited to groups of wells which are close together (e.g., GWR-036 and GWR-037 which are approximately 10 m apart) rather than clusters of wells which are further apart (e.g., the upgradient cluster, where wells are approximately 400 m apart).

Vertical gradients are implicitly calculated as water levels from all observation wells are incorporated as calibration targets using their coordinates in 3D space. Recognizing that all water level observations are subject to human error, and as such values that are very close to one another (e.g., as observed at GWR-008 and GWR-009) are treated as essentially the same value.

As requested, the table below presents observed and simulated vertical gradients at the well clusters presented in Table 3-1, Appendix 7-A. Observed static water levels are presented as there were issues with the barometric pressure correction for transient water levels.

Cluster	Well	Unit	Observed Water Level (static)	Simulated Water Level	Screen mid-point Elevation	Observed Gradient	Simulated Gradient	Notes
<b>NW</b>	GWR-003	OVB	503.97	503.87	467.8			
	GWR-027	ISA	500.91	501.00	246.3	0.0065	0.0061	
	GWR-025	LSA	502.34	502.40	146.3	-0.0058	-0.0057	
<b>SE</b>	GWR-007	OVB	514.12	503.48	515.2			perched aquifer at GWR-007 impacts gradient calculation
	GWR-009	ISA	502.20	502.57	285.5	0.0231	0.0018	
	GWR-008	LSA	502.40	502.37	166.2	-0.0007	0.0007	
<b>Up-gradient</b>	GWR-006	OVB	514.70	515.81	504.75			
	GWR-028	ISA	511.00	510.40	241	0.0073	0.0107	
	GWR-029	LSA	514.80	515.07	172.25	-0.0158	-0.0194	
<b>Down-gradient</b>	GWR-005	OVB	501.99	500.94	382.55			
	GWR-014	ISA	501.60	501.21	348.05	0.0010	-0.0007	
	GWR-012	LSA	501.27	501.40	166.5	0.0009	-0.0005	

As indicated in this table, the model provides an excellent representation of the observed gradients estimated using these monitoring well clusters.

- At the northwest (NW) cluster, the observed and simulated gradients are virtually identical.
- At the southeast (SE) cluster, the gradient from the shallow overburden (OVB) to the intermediate sandstone aquitard (ISA) is under-estimated in the model, however the water level at GWR-007 is believed to be perched above the regional water table, and therefore not a good representation of vertical gradients; regardless both the model and observed data indicate a downward vertical gradient. The gradient between the ISA and the lower sandstone aquifer (LSA) is negligible, which is replicated by the model.
- At the up-gradient cluster, the observed are very well represented by the simulated gradients, including the flow directions.

- At the down-gradient cluster, the gradient between the ISA and the LSA is negligible, which is replicated by the model. The gradient between the OVB and ISA is observed to be downward but given the location of GWR-005 at the shore of Whitefish Lake, the natural hydraulic gradient is expected to generally be upward, as simulated.

Project effects link	Geology and groundwater
Reference to EIS, appendices, or supporting documentation	Section 7.4.2.1, Potential Effect #1: Groundwater Quantity – Construction to Decommissioning; Appendix 7-C, Section 2.7, Groundwater Conditions During Mine Operations
Context and Rationale	<p><b>Context:</b> The numerical groundwater model described was calibrated to observed water level and stream baseflow data. Table 7.4-3 in the EIS indicates that Denison recognizes the potential for freeze wall operation to impact groundwater quantity. To simulate this impact, the model was adapted to reduce recharge (to 50%) within the freeze wall area, reduce hydraulic conductivity associated with the vertical freeze walls, and simulate pumping within the freeze wall area. Recovery from pumping and effects on discharge to groundwater discharge to Whitefish Lake are discussed in the potential effects section.</p> <p><b>Rationale:</b> Although this assessment considered drawdown of the water table and discharge to Whitefish Lake, the discussion did not address the potential effects of operating the freeze wall on the local and semi-regional groundwater regimes. What would the pathway be for groundwater to pass around the freeze wall? What is the basis for the parameters selected, e.g., 50% recharge and lower hydraulic conductivity for freeze well? These factors need to be considered when evaluating the potential impacts of freeze well operations on groundwater flow conditions and corresponding receptors.</p>
Information Requirement	Please provide a more fulsome discussion on the impact of freeze wall operations on local and semi-regional groundwater regimes and potential receptors. Please provide the rationale for assumptions made for key model parameters (e.g., selection of 50% recharge, hydraulic conductivity value used to represent freeze wall). In addition, please discuss the potential pathways for groundwater flow around the freeze wall, complete with figures demonstrating these pathways.

### Response:

The impact of the freeze wall on the local and semi-regional groundwater flow regimes is minor. The footprint of the freeze walled area represents < 0.04% of the area of the regional groundwater flow model, and as such the freeze walled area is a relatively small disruption to the regional groundwater flow system.

The effect of the freeze wall was simulated using the regional groundwater flow model, with results shown below. Hydraulic conductivity of the freeze wall was simulated as a reduction of the baseline hydraulic conductivity by four (4) orders of magnitude, which was consistent with expected hydraulic conductivity changes as reported by

Newmans (2020). The recharge reduction on top of the ore zone was estimated at 50% of the pre-development recharge based on the expected regrading and surface drainage at the site to accommodate all of the surficial operations. The simulated effect of the active freeze walls is illustrated through Figures 1 and 2, which illustrate the change in groundwater flow paths resulting from the freeze wall and operational groundwater pumping.

Figure 1 illustrates the pre-mining (and pre-pumping) groundwater flow paths toward Whitefish Lake. The particle traces shown were released at Whitefish Lake and tracked backward in time / space to their recharge area. The provide an understanding of the west-east groundwater flow toward Whitefish Lake, with local recharge creating the driving force for that groundwater flow. On this figure, the groundwater level contours are shown in black, while the flowlines (particle traces) are shown in blue. Note the flowlines closest to the pumping wells (red circles) and the ore body (light brown outline). The colours in the background reflect the shallow hydraulic conductivity zones, which help to explain inflections in the hydraulic head contours and flowlines.

Figure 1: Groundwater Flow Paths Pre-Mining

Figure 2 illustrates the same groundwater flow paths toward Whitefish Lake during mining operations, while pumping was occurring (at red circles) and the freeze walls for phases 1 through 5 are in place. From this figure, the effect of the freeze walls can be seen to be limited to the immediate area around the freeze walls. The addition of the freeze walls creates a cluster of water level contours consistent with the freeze wall locations, representing the change in water levels between the area inside and outside of the freeze wall. Note that the water levels outside the freeze wall are simulated to be relatively unchanged during freeze wall operations.

Also evident on this figure are the water level drawdown contours, which deflect around the pumping wells (3 red circles). Note the additional level of drawdown experienced at wells simulated to pump from the lower hydraulic conductivity zone (i.e., green area, as opposed to the yellow area).

The flowlines in Figure 2 indicate how the groundwater flow patterns will change due to the addition of the freeze wall and the onsite pumping. Flowlines are noted to travel around the freeze wall and in between the pumping wells to discharge at the lake. The pumping wells will capture water flowing from the west which would otherwise discharge to Whitefish Lake.

Figure 2: Groundwater Flow Paths During-Mining

Post mining, the groundwater flow path patterns would return to a condition similar to that simulated for pre-mining.

Reference to EIS, appendices, or supporting documentation	Section 7.6.2.2.3 Appendix 7-C, sections 3.3, 4.1, 4.4.4 and 4.7
Context and Rationale	Context: Sources terms for the COPCs considered in 3D reactive transport modeling are given by the composition of "Restoration Solution #1", which the proponent believes is representative of groundwater quality in the ore zone after remediation at decommissioning (Appendix 7-C, sec. 3.3, Table 3-5; sec 4.0). The proponent considers COPC source terms as "initial conditions" for groundwater quality in the ore zone at the start of the model simulation period. During the simulation, no additional mass of COPCs is transferred to groundwater in the ore zone. Rationale: In NRCAN's opinion, this representation of COPC sources is not conservative as it fails to account for various long-term slow mass release processes. These processes could include redissolution of secondary phases formed during ISR mining (e.g., radium-bearing gypsum or barite, jarosite, alunite) and migration of unrecovered lixiviant or restored solution from low-permeability regions or stagnant zones that were not fully swept during mining or remediation. NRCAN notes that scenario #2 in the proponent's transport prediction uncertainty analysis (Appendix 7-C, sec. 4.7) does consider an extended source release period for protons (desorption from chlorite). However, in NRCAN's opinion, additional modeling scenarios should consider extended-release periods for other COPCs as well.
Information Requirement	NRCAN requests that the proponent's reactive transport prediction uncertainty analysis (Appendix 7-C, sec. 4.7) consider extended source release periods for additional COPCs.

Reference to EIS, appendices, or supporting documentation	Appendix 7-C, Numerical modelling: post-decommissioning evaluation, Section 3.5.5, Subsurface Conditions Incorporated
Context and Rationale	<p><b>Context:</b> It is reported in this section the assumed subsurface conditions that were applied in the geochemical site conceptual models. Critical phenomenon of pH tail was mentioned. Inclusion and exclusion of corresponding geochemical reactions were discussed briefly.</p> <p><b>Rationale:</b> It was reported that the residual reduced minerals of uraninite and pyrite were not included in the modelling of the remediated mining area. The argument was based on consideration of the upstream groundwater, passing through the mined zone, will not be oxidizing and groundwater conditions are expected to be similar to pre-mine conditions. However, this ignores the pH tail effect that releases proton H<sup>+</sup> sorbed to solid surface during ISR flooding. By ignoring this process, there is a potential risk of underestimating the source terms for some key COPCs. Exclusion of uraninite and pyrite in remediated mining</p>

	area modelling is contradictory to pH-tail effect. The justification is not sufficient in the current form.
Information Requirement	Please provide additional evidence to justify the approach for excluding uraninite and pyrite from the analysis of remediated mining area. This may require the results from additional modelling.

Context and Rationale	<p>Context: Appendix 7, Figures 4-6, 4-7a, 4-7b, 4-8a, 4-8b, 4-9a, 4-9b present contaminant transport simulations of chloride, selenium, cadmium, and uranium. All simulations use initial condition concentrations at t=0 (or end of mining operations. In the 3D FEFLOW contaminant transport model it is not clear why initial condition concentrations were chosen rather than a constant concentration boundary.</p> <p>It is also unclear if mining activities will cause mobilization of the contaminants beyond the end of operations.</p> <p>Rationale: The choice of boundary conditions may impact the predicted transport of contaminants that reach Whitefish Lake through groundwater, which may have impacts to aquatic life.</p>
Information Requirement	<ol style="list-style-type: none"> <li>1. Explain and clarify if mining operations will mobilize contaminants beyond operations?</li> <li>2. Clarify if the source of contamination, (e.g., uranium, selenium) will cease after operations?</li> <li>3. For the 3D model please provide the rationale for using initial concentrations rather than constant concentration boundary conditions for contaminant concentrations.</li> </ol>

#### **Response IR-68, IR-94 and Questions 1-3 for IR-97:**

In general, the ISR mining process will be sufficiently aggressive, chemically and through permeability enhancement, to access and remove most dissolvable mineral phases within the ore deposit during the mining operation. Metallurgical testing indicates that the mineralogy of the ore zone post-remediation (see IR-67 response) is made up of clay minerals, unreacted sulfide minerals (including pyrite, galena and chalcopyrite) and a small number of secondary mineral phases, discussed further below.

The decision made in the EIS to model geochemical reactive transport of the restored solution in the pore water of the mining zone post-remediation (i.e., initial conditions) and not a long-term contributions of COPCs from the ore zone for the following reasons:

- Uraninite that is not accessible to the mining process will represent residuals in very low permeability zones that will, likewise, have limited contact with groundwater in the future.

- As was discussed in the draft EIS (page 3.30 of Appendix 7-C), groundwater from the Athabasca sandstone that will flow through the ore zone following removal of the freeze wall will not be oxidizing (groundwater is anoxic and free of oxidants (e.g., O<sub>2</sub>, Fe<sup>3+</sup>), and thus, further oxidative dissolution of the reduced, low-solubility uraninite and sulphide minerals is not expected.
- Diffusion of UBS (containing U, Se and other COPCs), and lixiviant into the rock matrix may occur. However, the process of diffusion into the matrix will be limited over the relatively short timespan of mining in each zone (<10 years). Back-diffusion from the matrix of COPCs will be a slow process and will have a low mass flux rate.

The use of initial conditions in the model continues to be considered as sufficiently bounding for evaluation of potential effects in the EIS.

#### Secondary Minerals – Response to IR-68

The metallurgical testing to date suggests that secondary minerals may form in the ore zone during the operation, including jarosite (KFe<sub>3</sub>(SO<sub>4</sub>)<sub>2</sub>(OH)<sub>6</sub>), gypsum (CaCO<sub>3</sub>•2H<sub>2</sub>O), barite (BaSO<sub>4</sub>; which could be Ra-bearing) and anglesite (PbSO<sub>4</sub>), with XRD evidence for these mineral phases in metallurgical testing at the end of the leaching period, and being flushed out of the mining areas as particulates in the UBS (see details in response to IR-67). Jarosite, gypsum and barite, however, were not identified in a QEMSCAN quantitative analysis on similar materials in the 2022 column leach tests that were designed to inform the understanding of mineralogy and solution composition in the mining area with remediation. Anglesite was present in quantifiable concentrations as mineral phase in the solid-phase residuals of those column tests.

Dissolution of anglesite has the potential to be a longer-term source of Pb from the ore zone, post-decommissioning. Testwork is ongoing to refine understanding of expected concentrations and distribution of Pb phases – meaning anglesite and galena – post-mining and post-remediation. Information from that test work will then be used to direct testing and monitoring during the operational phases.

Beyond the bounding scenario presented in the EIS, additional modelling of a Pb source over the long-term is not considered warranted at this time, for the following reasons:

1. Pb has a high affinity to sorb to clay minerals and iron oxide phases along the transport path. The assimilative capacity of the system, as modelled, will mitigate against maximum Pb concentrations at Whitefish Lake above those modelled in the EIS scenario.
2. Without further understanding of the reactivity of the anglesite – meaning, kinetic factors that may affect dissolution to solubility limits, modelling anglesite dissolution to thermodynamic equilibrium is expected to be overly conservative.
3. Mineral phases in the ore zone, including clay minerals and Fe oxides have the potential to sorb Pb mobilized from anglesite dissolution. Ongoing analysis of the results of the metallurgical testing and further test work will support refinement of that sorptive capacity and understanding of the potential for a long-term source of Pb from the remediated ore zone.

Context and Rationale	Context: This section provides data for groundwater samples collected during the Cigar Lake analogue study and Millennium Project for further regional context. The previous studies are heavily referenced to support interpretations made for the conceptual site model. Rationale: The Piper Plots in Figure 26 are difficult to interpret (many overlapping circles with variegated colors), and Cigar Lake samples plot predominantly as Na/K-Cl/SO <sub>4</sub> groundwater facies. Conversely, samples collected as part of the Phoenix Project (current), plot either as Ca-HCO <sub>3</sub> or Ca-SO <sub>4</sub> /Cl groundwater facies. No explanation is provided for the observed hydrogeochemical differences between groundwater from the Phoenix project and the Cigar Lake analogue study/Millennium Project.
Information Requirement	Please provide additional clarity to and interpretation of Figure 26 in Appendix 7-A, including a revision to the Figure to allow for easier interpretation. This could include clear identification of end members, as well as arrows indicating proposed evolution of groundwater chemistry. Further discussion should be provided describing observed differences between groundwater chemistry at the Phoenix project compared to Millennium/Cigar Lake.

### Response to #1

Figure 26 of the draft EIS was presented as two panels (panel “a” and panel “b”) in Appendix 7-A to the EIS. To support visual clarity and additional interpretation, Figure 26 has been split into two figures:

Figure 26: Hydrochemical Type: Groundwaters for the Wheeler River Project

Figure 27: Hydrochemical Type: Groundwaters for the Wheeler River, Cigar Lake and Millennium Projects

The figure numbering in Appendix 7-A of the draft EIS will be updated accordingly.

The revised Figures 26 and 27 are provided below. The figures have been updated to include visual support on the Piper plots to the interpretations of groundwater chemistry that are detailed in Section 4.3.3 of Appendix 7-A of the EIS. In addition, the text in Section 4.3.3. of Appendix 7-A of the ESI will be updated to provide additional clarity on the interpretations shown in the Piper plots. The new text is provided herebelow with additions shown in blue. .

On page 4-21... The Lower Sandstone Aquifer is characterized by two distinct hydrochemical types. The first is groundwater with low mineralization. The second groundwater type is much more highly

mineralized water that has Cl<sup>-</sup> as a dominant anion. The distinct nature of the two groundwater types is shown in Figure 25 through comparison of Stiff diagrams for GWR-029 and GWR-012. The mineralization at GWR-012 is much higher than that at GWR-029, and Cl<sup>-</sup>, versus HCO<sub>3</sub><sup>-</sup>, is the dominant anion. The mineralization and groundwater major ion composition of GWR-029 is much more similar to overburden well GWR-006 (shown in Figure 24) than to GWR-012. In the Piper plot shown in Figure 26, the distinct geochemical types are evidenced by:

- clustering of groundwater for 3 wells in the Lower Sandstone aquifer with samples from the Intermediate Sandstone Aquitard and local groundwater flow system. This hydrochemical type (dominantly in the Ca/Mg-HCO<sub>3</sub> quadrant of the central diamond of the Piper Plot) is shown within the purple circle; versus
- the other three wells from Lower Sandstone Aquifer, that show a higher relative dominance of Cl<sup>-</sup> as an anion. This shifts the hydrochemical type of the groundwater to the upper portion of the central diamond in the Piper plot, as shown by the purple arrows in Figures 26. This represents the contribution of leaching of halide salts into the groundwater as it moves along the flow path.

These same two distinct hydrochemical types were also observed in the MFa at Cigar Lake.

**On page 4.18 - 4.19....** The higher mineralization groundwater with Cl<sup>-</sup> as the dominant anion was observed at Cigar Lake in groundwater collected from a monitoring well located within the zone of thermal alteration and in the inferred downgradient direction of the ore zone. This sample is shown in Figure 27 as “CL-LS-Out” and is of Na-Cl-HCO<sub>3</sub> type. The reasons for the hydrochemical type observed in that monitoring well, and specifically for the source of chloride to the water, was evaluated in some detail in the Cigar Lake studies. One possible explanation explored was that the groundwater reflected mixing of groundwater in the MFa with groundwater from the basement rock. Groundwater in the basement rock is known to be of Na-Cl type, and this is shown in Figure 27 by samples collected from monitoring wells installed in the Basement at Millennium (“Millennium-Bsmt”). This sample represents one endmember hydrochemical type for the basement rock of Na-Cl type. However, the potential for the relatively elevated chloride proportion of anions in groundwater in the MFa to be a result of mixing with groundwater from the basement rocks was ruled out at Cigar Lake as groundwater flow conditions in the MFa were identified as dominantly horizontal, with a component of downward flow to the altered basement.

**On page 4.21...** The paleoweathered zone was sampled at Cigar Lake; analytical results are provided in Appendix J, as samples 199B and 199D. Sample 199D has been referred to in Figure 27 as “CL-Alt-Bsmt”. The hydrochemical type of the Cigar Lake paleoweathered zone is Na-Cl-HCO<sub>3</sub> and of GWR-031 for the Phoenix deposit is a more mixed hydrochemical type (Na-Ca-Mg-Cl-HCO<sub>3</sub>-SO<sub>4</sub>). In the Cigar Lake study, the hydrochemistry of the sample in the paleoweathered zone was explained by recharge of the basement waters from the overlying flow regime in the Lower Athabasca Sandstones. Evolution of the groundwater chemistry in the paleoweathered zone is aligned with this flow path. The groundwater quality in the paleoweathered zone represents an intermediate along the hydrochemical evolution of groundwater from the hydrochemical type of the Athabasca Group Sandstone hydrogeological units (Ca-Na-HCO<sub>3</sub> to Na-Ca-HCO<sub>3</sub> type) to one endmember in basement rock (NaCl type). This evolution is a result of water-rock interactions within basement aquitard (including the paleoweathered zone) and is

most clearly visualized in the Piper plot by shifts in relative abundance of anions, shown with gold arrows in Figure 27. The difference in hydrochemical types between groundwater from the paleoweathered zone at Cigar Lake (Na-Cl-HCO<sub>3</sub> type) and associated with the Phoenix deposit (Na-Ca-Mg-Cl-HCO<sub>3</sub>-SO<sub>4</sub>) is likely due to the screened interval of the well, which spans the ore zone, and the paleoweathered zone (Appendix A). Groundwater chemistry in GWR-031 is likely influenced by the hydrochemistry of the ore zone.

## Attachment: IR-81

Number	IR-81
Dept.	CNSC
Project effects link	Geology and Groundwater
Reference to EIS, appendices, or supporting documentation	Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit
Context and Rationale	The report states in the description of hydrochemistry of the Lower Sandstone Aquifer that, “On the basis of groundwater chemistry and tritium values in that groundwater, the authors (of the Cigar Lake analogue study in 1994) concluded that the groundwater reflected a younger water component that had penetrated to depth along hydraulically active fractures/faults. The same conclusion is made here (in the Wheeler River EIS) for the Phoenix study area – meaning that fracture/fault conditions are such that some areas of the MFa are characterized by younger/recharge groundwaters”. Rationale: Tritium results for most wells in the Lower Sandstone Aquifer (MFa) reported in Table 4-1 of Appendix 7-A exhibit tritium concentrations <15 Bq/L for the 2020 sample, and 0.1 or <0.1 Bq/L for the 2021 sample. Tritium in modern precipitation typically varies from 1 – 3 Bq/L. Conclusions made in the text are not supported by data, especially given that tritium values are not reported in the EIS for local precipitation or surface water. This is important in reinforcing the assumption from the conceptual model that modern meteoric water circulates at depth in the Lower Sandstone Aquifer.
Information Requirement	Provide a further discussion on the interpretation of tritium in groundwater, rather than echoing conclusions from the Cigar Lake analogue study. Consideration should be given to the assertion that modern meteoric water circulates at depth in the Lower Sandstone Aquifer. Collection and analysis of stable isotope (e.g., $\delta^2\text{H}$ , $\delta^{18}\text{O}$ ) samples is a cost-effective solution which would greatly improve understanding of groundwater hydrology and support the development of a conceptual model.

### Response:

#### **$\delta^2\text{H}$ , $\delta^{18}\text{O}$ Isotopes in Groundwater**

Analysis of  $\delta^2\text{H}$ ,  $\delta^{18}\text{O}$  Isotopes in groundwater was not performed for the Wheeler River Project baseline work at Ecometrix’s recommendation. Based on our review of the sampling and analysis of isotope data from neighbouring sites, our interpretation was that similar additional sampling at the Wheeler River Project would not add sufficient value. Other projects in the region including Cigar Lake (AECL, 1994) and Millenium (Devine, 2016) analyzed  $\delta^2\text{H}$ ,  $\delta^{18}\text{O}$  isotopes in groundwater. At Cigar Lake, stable isotopes of water were measured in all Athabasca Group Sandstone units (“upper”, “lower”, “altered sandstone”), the ore zone, and the altered basement. The results were (quoted from AECL, 1994):

- “The waters from the glacial overburden all plot on or near the Cigar Lake meteoric water line...indicating their meteoric origin”;

- “deep groundwaters also plot entirely within the envelope, suggesting that the variations in the isotopic signatures observed for the groundwaters result entirely from variation in meteoric water compositions. The simplest explanation for these isotopic trends is that they reflect (moving) averaged meteoric water compositions of the Cigar Lake area”; and
- “[W]aters from the three [groundwater flow] regimes [in the Athabasca Sandstone group units], basement and mineralization have similar low temperature meteoric  $\delta^2\text{H}$ ,  $\delta^{18}\text{O}$  values”

Devine, 2016 analyzed stable isotopes in groundwater for shallow groundwater (of depth < 50 m; groundwater in overburden and upper MFd) at the Millenium and McArthur River Projects. It was concluded that “Oxygen and H isotope compositions reveal that the groundwater sampled was meteoric water and has the same  $\delta^{18}\text{O}$  and  $\delta^2\text{H}$  as Saskatoon precipitation”.

The potential for analysis of stable isotopes in groundwater to add value to the development of the CSM for the Pheonix project was, as such, considered low.

### **Tritium in Groundwater**

The potential for tritium to support development of the CSM for the Wheeler River program was evaluated using the available information. The conclusion was that, beyond alignment between some samples in the overburden and the upper sandstone aquifer, tritium concentrations in groundwater do not provide a robust means of ageing groundwater in the subsurface at the Site. The reasons for this, and information supporting that conclusion are presented below.

Two tables have been presented in this IR to support the discussion below.

- a) Table IR-81-1: Provides tritium concentrations in precipitation over time since the 1950s. The source of the tritium data for Canadian locations, including Churchill, Fort Smith and Ottawa, was from the International Atomic Energy Agency Global Network of Isotopes in Precipitation database (GNIP; <https://nucleus.iaea.org/wiser>). Tritium concentrations over time due to radioactive decay were calculated for examination against tritium concentrations in groundwater concentrations for the Wheeler River Project.
- b) Table IR-87-2: Provides tritium concentrations measured in groundwater under baseline conditions for the Wheeler River Project. The tritium concentrations highlighted in yellow/orange were analyzed at the André E. Lalonde AMS Laboratory, University of Ottawa. The detection limit of < 15 Bq/L at the Saskatchewan Research council does not support interpretation of tritium concentrations with respect to groundwater flow conditions, considering the discussion below. The detection limit at the University of Ottawa is 0.8 TU (0.095 Bq/L). Tritium values measured in groundwater samples in 2021 at the University of Ottawa were examined further in the context of ageing groundwater for the Project.

Tritium concentrations in groundwater measured for the Wheeler River Project must consider several factors. These include:

- a) Tritium concentrations in groundwater can be used to identify recharge to mostly granular aquifers in the last approximately 68-70 years, since the early 1950s (Cherry et al., 2004); water recharged prior to that time will have tritium values below analytical detection limits. This is

shown in Table IR-81-1, where groundwater recharged prior to 1952, extrapolated out more than 60 years, has tritium values that are below the analytical detection limit of 0.1 Bq/L.

- b) Maximum tritium concentrations in the precipitation, associated with “bomb tritium” were observed in the early 1960s. At the present time, tritium concentrations in groundwater recharged at that time would be in the range of 14 Bq/L to 53 Bq/L. Values this high were not observed in groundwater at the Wheeler River Project in 2021, and only in one instance in 2020, which is discussed further below.
- c) Tritium concentrations in precipitation have stabilized from historically high “bomb tritium” values to values of approximately 9-25 Tritium Units (TU), equivalent to 1.1 – 3.0 Bq/L, in the last approximately 20 years (as noted by the CNSC review).
- d) Tritium concentrations may reflect the influence of drilling fluids, which is generally other groundwater from the site.
- e) Tritium is produced within the uranium ore deposits of the Athabasca region; this is evidenced by tritium concentrations at GWR-032 (Table IR-87-1) that were measured to be 950 Bq/L (2020) and 1800 Bq/L (2021) and are higher than can be explained by “bomb tritium” (Table IR-87-3). Tritium production in the ore zone is primarily by neutron capture by <sup>6</sup>Li (AECL, 1994). The groundwater sample from the paleoweathered zone (GWR-031; 910 Bq/L) are also considered to be reflecting tritium generation associated with the deposit.

It is our opinion, based on the above considerations and the discussion that follows, that measurement and analysis of tritium data at the Wheeler River Project is limited in value to conceptual model development, and the current data suggests it raises more questions than can be answered. Tritium concentrations in groundwater will continue to be measured as part of the routine groundwater sampling, to further evaluate the usefulness of this approach for refining the conceptual site model developed for the Wheeler River Project.

Table IR-81-2: Calculated Tritium Concentrations in Groundwater based on time period of recharge

Time Periods of Interest for recharge	Tritium concentrations in precipitation		Half-Lives of Tritium				
			1	2	3	4	5
			Years Elapsed				
			12.3	24.6	36.9	49.2	61.5
	TU	Bq/L <sup>a</sup>	Tritium concentration measured in Groundwater (Bq/L) <sup>b,c</sup>

### **Overburden and Groundwater Wells in the uppermost Upper Sandstone Aquifer**

There are three wells monitored as part of the baseline program that are installed in overburden materials: GWR-006, GWR-003 and GWR-005. Two other wells are installed in the uppermost Athabasca Sandstone Group unit (MFd) immediately beneath the overburden. These wells are GWR-036, GWR-035. Tritium values in groundwater wells installed in the overburden and upper sandstone ranged from <0.1 Bq/L to 1.1 Bq/L. Tritium concentrations were 1.1 Bq/L in GWR-003, 0.8 Bq/L in GWR-036 and 0.8 Bq/L in GWR-035. These tritium concentrations in groundwater sampled in these wells is considered to have been recharged in the last 12-25 years. To check alignment between these results and the 3D hydrogeological model, particle tracking was done to estimate minimum groundwater residence times (in years) at each well cluster location. For the overburden unit, the particle tracking results indicated minimum residence times of between 0.5 and 20 years.

Tritium concentrations were at or below the detection limit of 0.1 Bq/L at GWR-006 and GWR-005. Monitoring well GWR-006 is very shallow (screened from 9-15 mbgs), whereas GWR-005 is the deepest of the overburden wells, with a screened interval from 117-123 mbgs. It is considered plausible that the low tritium values reflects the potential for longer residence groundwater times due to heterogeneity in hydraulic conductivities of till material in the overburden. However, tritium concentrations in snow are also lower than in precipitation (AECL, 1994). Thus, it is possible that in the localized areas to those groundwater monitoring wells, materials are lower hydraulic conductivity, and the tritium concentrations are relatively more influenced by snowmelt. Longer residence times in the overburden materials in wells GWR-006 and GWR-005 is supported by higher specific conductance in those wells GWR-003 and GWR-036. Field-measured specific conductance values in GWR-006 and GWR-005 were approximately 150 µS/cm in 2021, whereas values at GWR-003 and GWR-036 were < 75 µS/cm in 2021 (Table 3-2 of Appendix 7-A to the EIS).

### **Deeper Groundwater**

Interpretation of tritium values for “ageing” of groundwater was considered inappropriate beyond the shallowest units at the Site. This is because of the relatively low values of tritium in the groundwater in all but the ore zone, and the numerous confounding factors/complexities. Several tritium concentrations are within 1-3 times the analytical detection limits and are thus considered at the limits of interpretability.

One possible confounding factor at low tritium concentrations is contamination of the sample with drilling fluids. Influence of drilling fluids is possibly a factor in the tritium concentrations observed in groundwater well GWR-014. In that well, tritium values in 2020 were measured as 16 Bq/L at SRC. This is the highest value of tritium detected in groundwater in the Athabasca Sandstone hydrogeologic units and was not reproduced when the well was sampled in 2021; the tritium concentration fell significantly to 0.13 Bq/L. The higher relative concentration of tritium in that well is not considered to reflect “bomb tritium” because of the significant change upon resampling, and it is considered possible that the groundwater quality in that well was influenced by drilling fluids/well construction materials, which was also noted for this well in terms of groundwater quality in the Baseline Report (Appendix 7-A of the EIS). Influence of drilling fluids is also considered the likely explanation for the tritium concentration of 1.2

Bq/L in monitoring well GWR-034. As was noted in the Baseline Report, the water quality in GRW-034 is considered to reflect influence from drilling fluids and additives and is not considered reliable.

Tritium concentrations in groundwater will continue to be measured as part of the routine groundwater sampling, to further evaluate the usefulness of this approach for refining the conceptual site model developed for the Wheeler River Project.

## Attachment: IR-82

Number	IR-82
Dept.	CNSC
Project effects link	Geology and groundwater
Reference to EIS, appendices, or supporting documentation	Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit Appendix 7-C, Section 3.5
Context and Rationale	<p>Context: A. In-field measurements of Oxidation-Reduction Potential (ORP) for three (3) out of twenty-six (26) groundwater samples are presented in Table 4-1 of Appendix 7-A. Although sparse, these values are also used to characterize redox conditions for representative groundwaters in Table 3-5 of Appendix 7-C.</p> <p>B. In Section 3.5.5 of Appendix 7-C it is stated that groundwaters in the PHREEQC model were allowed to equilibrate with atmospheric concentrations of oxygen, resulting in oxidizing subsurface conditions. In Section 3.7 of Appendix 7-C it states that input files for 3D reactive transport were generated based on outcomes for PHREEQC modelling. However, in reading Section 4 of Appendix 7-C, it is unclear whether this assumption (equilibration with atmospheric oxygen) was carried forward for the 3D model.</p> <p>C. As per p. 3.49 of Appendix 7-C, “A small amount of reactive pyrite was assumed for the first 500 m of transport away from the ore zone in the model, primarily in the desilicified sediments of the Lower Sandstone Aquifer, and deeper portion of the Intermediate Sandstone Aquitard”.</p> <p>Rationale: A. Given the importance of redox conditions for U mobilization and precipitation/dissolution of minerals (e.g., pyrite/metal oxyhydroxides) and the corresponding influence on contaminant transport from both a modelling and monitoring perspective, these should be further characterized. It should also be noted that the measurement of Oxidative-Reductive Potential (ORP) in natural waters can be complex and difficult due to the variability and disequilibrium of natural systems and issues inherent to electrode calibration (e.g., Schuring et al., 2000). Measurements of redox couples (e.g., As(III)/As(V); Fe(II)/Fe(III); S(-II)/S(VI)) are typically recommended to accurately characterize redox conditions in natural waters (Schuring et al., 2000).</p> <p>B. The assumptions regarding redox conditions for the 3D solute transport model should be clarified.</p> <p>C. The amount of pyrite (e.g., % by weight) assumed for the purposes of modelling should be clarified, given the potential role of pyrite as a reducing agent in limiting the transport of COPCs.</p> <p>Reference:  [1] Schuring J.; Schulz, H. D.; Fischer, W.R.; Bottcher, J.; and Duijnisveld, M.H.W. 2000. Redox: Fundamentals, Processes and Applications. Springer: Berlin.</p>
Information Requirement	1. Provide further discussions and information (i.e., ORP measurements or analytical data for redox couples) on redox conditions at the Phoenix site. Particular focus should be given to the spatial heterogeneity of redox processes. Tools such as the reference provided [2]

	<p>below provide an example of simplified framework for characterizing redox conditions in aquifers.</p> <p>2. Clarify assumptions regarding initial redox conditions for the 3D solute transport model.</p> <p>3. Provide the % reactive pyrite by weight assumed for models in the text. Justification for proportions used, such as analytical data, should also be provided.</p> <p>Reference:  [2] Jurgens, B.C., McMahon, P.B., Chapelle, F.H., and Eberts, S.M., 2009, An Excel workbook for identifying redox processes in ground water: U.S. Geological Survey Open-File Report 2009–1004 8 p.</p>

### Response to #1

Redox conditions within the different hydrostratigraphic units at the site, which addresses spatial heterogeneity, was provided as part of Section 4.3.3 of Appendix 7-A of the draft EIS. As was noted by the CNSC reviewer in this IR (IR-82), the measurement of ORP in the system is qualitative at best, and this is also true of field-measured dissolved oxygen, which, upon exposure of groundwater to the atmosphere will quickly equilibrate with atmospheric oxygen. For the project, where concentrations of nitrate are low in all hydrostratigraphic units, the primary indicators of redox conditions are dissolved iron and sulphate concentrations. At the circumneutral pH range observed in groundwater in all hydrostratigraphic units at the site, concentrations of dissolved iron in groundwater above approximately 0.1 mg/L indicate definitively that the system is anoxic. Ferric oxyhydroxide solid control dissolved ferric iron ( $\text{Fe}^{3+}$ ) concentrations to values less than 0.1 mg/L in near neutral pH water, whereas ferrous iron ( $\text{Fe}^{2+}$ ) is very soluble and mobile in groundwater that is anoxic. The presence of sulphate and qualitative absence of detectable sulphide (based on absence of odour;  $\text{H}_2\text{S}_{(\text{g})}$ ) can typically be detected by odour down to 10  $\mu\text{g/L}$  in the groundwater is also an indicator that the system is not currently highly reducing. Sulphate reduction is typically tied to organic matter oxidation and the system does not appear to have organic carbon sources at this time.

As discussed in Section 4.3.3. of Appendix 7A of the draft EIS, the exception to the above is within the ore zone, where more reducing conditions are evidenced by the mineralogy and the persistence of sulphide minerals and uraninite for more than 1 billion years. In this zone, any oxidant will be scavenged by pyrite, maintaining a reducing environment. This is reflected qualitatively by the ORP measurements in the ore zone which was measured to be -265 mV (page 4.20 of Appendix 7A of the draft EIS).

The technical team acknowledges that there are other redox pairs or species, and specifically As(V)/As(III) and the measurement of dissolved reduced sulphur species sulphide species, that may support the interpretation of redox in groundwater. Holm (1989) concluded on the basis of his work calculating redox potentials from As(V)/As(III), Fe(III)/Fe(II) that the arsenic redox pairs provides supplementary information to that provided by dissolved iron, but is considered qualitative in nature. For the As(V)/As(III) pair, the solution phase speciation of the arsenic ions also has to be considered and may affect the accuracy of calculation of redox potentials from their analytical quantification in groundwater.

It is generally understood that groundwaters are typically not at redox equilibrium (e.g., Lindberg and Runnells, 1984). Thus, in this work, our primary reliance on the concentrations of dissolved iron and sulphate in the groundwater, as well as the mineralogy of the system was considered adequately robust for interpretation of baseline redox conditions in the hydrostratigraphic units for the Wheeler River project. Use of tools like the Jurgen et al., (2009) excel spreadsheet referenced by the CNSC reviewer requires careful consideration and qualification of the results provided, as it based on measured redox indicator ion concentrations and empirical relationships between them. The tool was applied to the available data on groundwater and returns interpretation that is aligned with what was discussed in the draft EIS and herein.

#### Response to #2

The redox conditions assumed for the 3D modelling, using PiChem, were the same for all scenarios as in the 1D modelling in PHREEQC. This includes the equilibration of the groundwater with atmospheric concentrations of oxygen for most of the modelling scenarios. The one exception was the “Redox Scenario” (page 3.48 of Appendix 7-C of the EIS), in which the solution was equilibrated with pyrite, resulting in reducing conditions controlled by the iron sulphide mineral.

It is noted that this equilibration of the groundwater solutions with atmospheric concentrations of oxygen affects only the speciation of elements that are redox sensitive and is a modelling approach that is used to force redox sensitive species to be in their most oxidized form. As noted above, groundwaters are seldom at equilibrium with respect to the speciation of redox sensitive species and thus, using thermodynamic considerations alone can results in elements being present in the model as species that are not observed in the environment. This was mitigated by forcing the conditions in the model to oxidized conditions. As was discussed in Appendix 7-C of the draft EIS (page 3.29), this is a conservative approach because the important redox-active constituents of concern are more mobile in their oxidized forms, including uranium as U(VI).

#### Response to #3

The “Redox” scenario model (page 3.48 of Appendix 7-C of the draft EIS) was run iteratively to evaluate the minimum amount of pyrite that would be required to reduce dissolved-phase U(VI) associated with remediation of the mining zone (i.e., the restored solutions). As was outlined on page 3.49 of Appendix 7-C of the draft EIS, the information available included quantification of total iron through wet chemical extraction in core samples, and observations recorded by Denison personnel during core logging. Specifically, pyrite was observed associated with hydrothermally altered materials between an approximate depth interval of 240-390 mbgs (page 3.49 of Appendix 7-C of the draft EIS).

Total (wet chemical) extraction of iron content of the core materials does not provide speciation of iron. The maximum, minimum, and median total iron concentration, expressed as Fe<sub>2</sub>O<sub>3</sub> weight %, in the MFa are provided in Table 3-2 of Appendix 7-C of the draft EIS. Not indicated in that table is that these statistics are based on 10,436 elemental analyses of core samples. *(Noted is that as part of the response to IR-92, Table 3-2 is being updated to indicate the total number of samples from which the statistics were derived).*

A sample from the MFa downgradient of the mining zone was recently submitted to the Saskatchewan Research Council (SRC) for analysis of total iron and mineralogy by XRD. The sample was taken from location GWR-062 (located within Phase 1 of mining) at a depth of 398.7 mbgs in sandstone and was

named “Altered Pyrite”. The total iron content of the sample was determined in the whole rock assay (by lithium metaborate fusion) to be 13% by weight; the analytical results are provided in Appendix A. The certification of analysis for the whole rock assay is attached to this IR. Pyrite and marcasite were identified as the iron phases in the sample by XRD; the XRD results are attached to this IR in Appendix A.

*Pyrite Content Assumed in the “Redox Scenario”*

In the numeric model for the sensitivity “Redox Scenario”, the total iron content was considered was the median value in the MFA. The Median total iron value in the MFA is 1.4 wt % (1.4 g) of  $\text{Fe}_2\text{O}_3$  per kg of sediment/rock, which is equivalent to 0.0175 moles of Fe per kg of soil. Because of the stoichiometry of pyrite ( $\text{FeS}_2$ ), this is equivalent to 0.0175 moles of pyrite per kg of soil. This value was then converted to moles of Fe per litre of water, as is the convention for PHREEQC. To do this conversion, it was assumed that the groundwater flow was predominantly through the desilicified/hydrothermally altered portion of the MFA, with a porosity of 0.2 and a bulk density of  $2.12 \text{ g/cm}^3$ . The total moles of pyrite per litre of soil was calculated as 0.186 moles/L.

Determined through the reactive transport modelling in PHREEQC was that only 0.0001 moles of pyrite per litre of water was required to oxidize the mass of U(VI) transported from the mining zone. This amount of pyrite represents 0.054% of the median total moles of iron present in the MFA.

The pyrite content measured in the “Altered pyrite” sample by XRD, presented herein, exceeds that assumed in the reactive transport modelling.

## Attachment: IR-91

Number	IR-91
Dept.	NRCan
Project effects link	Fish and fish habitat
Reference to EIS, appendices, or supporting documentation	Appendix 7-C, section 2.5.2
Context and Rationale	<p>Context: The numerical model calibration quality plot (Appendix 7-C, sec. 2.5.2.1, Figure 2-13) contains a small error. The vertical (simulated heads) and horizontal (observed heads) axes do not have the same scales (499 to 521 masl versus 499 to 522 masl). Therefore, the line of ideal fit is offset.</p> <p>Rationale: As a result, NRCan notes that observed heads in the 510-512 masl range are underpredicted by the model. NRCan also notes that the calibration statistics (Appendix 7-C, sec.2.5.2.3) are highly leveraged by two data points from open boreholes south of Kratchkowsky Lake where simulated values are largely controlled by the nearby constant-head boundary in the Lower Sandstone aquifer (520 masl).</p>
Information Requirement	The proponent should correct the scales on the axes of Figure 2-13 in Appendix 7-C. The proponent should also comment on the effect on calibration of the clustering of most observation wells in the ore zone.

Supporting figure to the response provided in table:

## Attachment: IR-92

Number	IR-92
Dept.	CNSC
Project effects link	Geology and Groundwater
Reference to EIS, appendices, or supporting documentation	Appendix 7-C, Section 3.2.1, Mineralogical Composition
Context and Rationale	<p>Context: Table 3-2 summarizes the clay content of the Athabasca Group sandstones and the Paleoweathered Zone. Although minimum, maximum and median values are provided, the number of samples and variability of the dataset are not. Rationale for incorporating illite into reactive transport modelling and excluding kaolinite/dichlorite is provided in the text.</p> <p>From p. 3.29 in Appendix 7-C: “The illite content was based on the normative clay composition determined from site-specific corehole elemental analysis (median illite by mass is 7.68%; Table 3-2) and using portable infra-red mineral analysis indicating median illite content by mass is 13.1% (data not shown)”</p> <p>From p. 3.30 in Appendix 7-C: “Using the minor amount of illite compared to the more dominant chlorite is conservative in that not all sorptive capacity of the clays is accounted for in the simulated paleoweathered zone”. This conservative assumption appears contrary to assumptions for the desilicified zone (DSZ) and Athabasca</p> <p>Group sandstones “Illite was used to represent the total clay content, which varies from 1.74% to 5.85% by mass in the hydrostratigraphic units within the Athabasca Group sandstones and Desilicified Zone”.</p> <p>Rationale: Information is missing in the EIS regarding the clay composition of hydrostratigraphic units. Results from infrared mineral analysis are not reported. The assumption for the solute transport model is that all clays in the downgradient DSZ are illite. However, clay content in the Read Formation (Lower Sandstone Aquifer) downgradient of the ore zone is low in illite (0.42%) compared to kaolinite (0.52%) and dichlorite (1.18%). A value of 3.9% illite clay by weight is used for the DSZ, but Table 3-2 indicates median content is 2.42% illite. It is not clear why illite was used to represent total clay content for the DSZ, as opposed to the conservative assumptions used for the Paleoweathered Zone, nor has any basis or justification been given.</p>
Information Requirement	<ol style="list-style-type: none"> <li>1. Please provide in Table 3- the number of samples and variability of the datasets used to estimate the clay content of hydrostratigraphic units for the model. Include results from infrared mineral analysis in the text if the information is used to support assumptions for modelling.</li> <li>2. Please provide further information/discussion within the EIS relating to the assumptions of clay content in hydrostratigraphic units for modelling. Provide further justification and rationale as to why total clay content in the Athabasca Group sandstones and Desilicified Zone is assumed to be illite, and how this assumption is</li> </ol>

	conservative. This discussion could include a comparison of the properties (cation exchange capacity, surface area) of illite vs. kaolinite vs. ditrichlorite for the anticipated range of subsurface conditions (pH, redox, U concentrations, etc.).
--	---

#### Response to #1

Table 3-2 in Appendix 7C of the draft EIS has been updated to indicate the number of samples analyzed and arithmetic average and (one) standard deviation values as a measure of sample variability, in addition to the maximum, median and minimum values that had already been provided. Results from Portable Infrared Mineral Analyzer (PIMA) have also been included for the paleoweathered zone. The updated Table 3-2 is included on the next page.

Note that in Table 3-2 in Appendix 7C of the draft EIS, the normative clay content for kaolinite, illite and ditrichlorite in the paleoweathered zone had been entered erroneously as the % of total clay and had not been converted to wt% in the sediment/rock. This was corrected and the updated values represent wt% of kaolinite, illite and ditrichlorite in the sediment/rock.

#### Response to #2

Unlike the iron oxide minerals goethite and ferrihydrite and gibbsite, for which there is an existing compilation of thermodynamic surface complexation constants for sorption of metals, metalloids, and anions to a single, laboratory-produced mineral phase (Dzombak and Morel, 1991; Mathur and Dzombak, 2006; Karamalidis and Dzombak, 2006), such a compilation does not exist for clay minerals. Rather, to develop the database of surface complexation constants for metals and metalloids to illite clay for the modelling work presented in Appendix 7-C of the draft EIS took an extensive review of the literature to make decisions on the most defensible constants to include in the work. For kaolinite, a similarly comprehensive databased could have been developed, but not for chlorite, where the number of studies identified in the literature for sorption characteristics is much more limited.

The decision was made to use illite to represent the clays present in the Athabasca Sandstone group units because:

- for the reasons give above and the discussion provided below, it was not practicable to develop a database of surface complexation constants for more than one clay mineral phase;
- using the updated Table 3-2 provided as part of this IR response, the median illite content (weight %, based on normative clay calculations) of the Athabasca Sandstone Group units is, with only one exception, always more than twice (2x) the median kaolinite content, and three times (3x) the median chlorite content. The exception is the “MFa in downgradient DSZ”, where the median illite content is lower, than the median kaolinite and chlorite contents.

In the model, the choice was made to represent the clays assemblage as a whole as 3.9% illite/kg of sediments/rock (wt %, based on normative clay calculations). Median normative clay contents in the Athabasca Sandstone Units (MFa, MFb, MFC, and MFD) and overburden materials ranged from 1.74-5.85 wt %, and for the locations downgradient of the mining zone (“Downgradient Desilicified Zone, All Units”) was 4.14 %. The robustness of selection of illite to represent the clay assemblage is discussed here below using CEC as an important characteristic of the sorption behaviour of the clays present in the system (illite, kaolinite and chlorite).

Updated Table 3-2 in Appendix 7-C of the draft EIS: CaO, Fe Oxide and Clay Contents of the Athabasca Group Sandstones and Paleoweathered Zone

Notes

<sup>a</sup> Iron oxide content for the paleoweathered zone is % Hematite (vs. total iron as Fe<sub>2</sub>O<sub>3</sub>)  
<sup>b</sup> Normative clay values for predominantly basement-hosted paleoweathered zone may be erroneous due to variable host lithology chemistry  
<sup>c</sup> The number of samples analyzed by PIMA for the paleoweathered zone was 9 (i.e., n= 9)  
<sup>d</sup> Kaolinite was only detected in 3 samples in the paleoweathered zone using PIMA, and was "0" in all other samples. A. Median, average and standard deviation values were not calculated.  
<sup>e</sup> Dravite was only detected in 1 sample in the paleoweathered zone using PIMA, and was "0" in all other samples. A. Median, average and standard deviation values were not calculated.

### Cation Exchange Capacity (CEC) in the Overburden and Athabasca Sandstone Group Units

Literature ranges for cation exchange capacity for kaolinite, illite and chlorite are shown below in Table IR-92-1. Because there is a range of CEC values for each clay mineral in the literature, the maximum and minimum CEC value in the range provided in the literature was used to evaluate the CEC of the overburden and Athabasca Sandstone Group units for the Wheeler River Project. The range of calculated CECs based on the clay mineral assemblage in each sample is given in Table IR-92-2. Note that the number of samples used for each of the lithologic units is the same as that provided in the updated Table 3-2.

In Table IR-92-2, the “Kaolinite+Illite+Dichlorite CEC – Minimum” and “Kaolinite+Illite+Dichlorite CEC- Maximum” were calculated in the following way, to estimate the range of CEC that may be expected by lithologic unit.

*Kaolinite + Illite + Dichlorite CEC – Minimum*

$$= \frac{\text{wt\% kaolinite } \left(\frac{\text{kg}}{\text{kg}}\right)}{100} * 10 \frac{\text{meq}}{\text{kg}} + \frac{\text{wt\% illite } \left(\frac{\text{kg}}{\text{kg}}\right)}{100} * 100 \frac{\text{meq}}{\text{kg}} + \frac{\text{wt\% dichlorite } \left(\frac{\text{kg}}{\text{kg}}\right)}{100} * 14 \text{ meq/kg}$$

*Kaolinite + Illite + Dichlorite CEC – Maximum*

$$= \frac{\text{wt\% kaolinite } \left(\frac{\text{kg}}{\text{kg}}\right)}{100} * 150 \frac{\text{meq}}{\text{kg}} + \frac{\text{wt\% illite } \left(\frac{\text{kg}}{\text{kg}}\right)}{100} * 400 \frac{\text{meq}}{\text{kg}} + \frac{\text{wt\% dichlorite } \left(\frac{\text{kg}}{\text{kg}}\right)}{100} * 100 \text{ meq/kg}$$

This was then compared to the CEC used in the reactive transport modelling presented in Appendix 7-C of the draft EIS. The CEC of illite assumed was 225 meq/kg (Baeyans and Bradbury, 2009), which is a value intermediate to range in the literature sources (Table IR-92-1). At 3.9% illite, which was the illite content assumed in the base case of the modelling scenarios, the CEC assumed for the overburden and Athabasca Sandstones was (3.9 wt % (kg/kg)/100 \* 225 meq/kg = 8.87 meq/kg of sediments/bedrock). In the modelling sensitivity analysis, 1/10 of the reactive phases, including illite, were assumed to be accessible to solution, so that the CEC of the bedrock/sediments was assumed to be 0.887 meq/kg.

The CEC values evaluated in the modelling (0.887 and 8.87 meq/kg) are within the range of median CECs that are represented for the lithologic units for the project. Because groundwater movement from the mining zone is understood to be preferentially through the desilicified zone (DSZ), as presented in Appendix 7-C of the draft EIS, it is important that the CEC assumed in the model is reflective of conditions in that unit. The calculated CEC for the “Downgradient Desilicified Zone, All Units” ranged from 2.7-11.8 meq/kg (Table IR-92-2). The CEC value assumed in the base case of the model (8.87 meq/kg) is intermediate to this range, and the sensitivity analysis value of 0.887 meq/kg is reflective of not all cation exchange sites being accessible for reaction with constituents in groundwater.

Further, three core samples from the desilicified zone at depth were submitted for CEC analysis. Details of the samples, the normative clay content, and the measured CEC using the ammonium-saturation method are provided in Table IR-92-3.

Table IR-92-1: CEC values from the Literature

Clay Mineral	Cation Exchange Capacity (meq/kg)		
	Kaolinite	Illite	(DiTri)Chlorite

### The Paleoweathered Zone

Conceptually, the paleoweathered zone mineral assemblage was made up of 9% clay by mass, as illite, and 25% quartz, as was described on page 3-29 of Appendix 7-C of the draft EIS. For the paleoweathered zone, there is a smaller dataset and the normative clay content in this unit can be inaccurate due to the host (basement) mineralogy. This is because the normative clay percentages for kaolinite, illite, dravite and chlorites are calculated from the bulk total geochemical composition of the sandstones using an in-house set of linear equations that govern the distribution of oxides into minerals of interest. Key oxide inputs are  $\text{Al}_2\text{O}_3$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{K}_2\text{O}$ , and  $\text{MgO}$  in percent and B in ppm. Unlike the sandstones, that contain little parent basement rock material, calculation of clay content in samples from the paleoweathered zone – because this unit is basement-hosted – can be influenced by the presence of parent rock material that has the same/similar chemical composition. In the paleoweathered zone, portable infrared mineral analysis (PIMA) was used to support the information from the normative clay content in terms of the relative abundance of the clay mineral phases. PIMA does not quantify the total clay in the rock sample (i.e., clay as a wt% of rock), but it does provide the relative abundances of the clay minerals present.

The conceptualization of the paleoweathered zone with respect to reactive mineral phases in the numeric modelling presented in Appendix 7-C of the draft EIS is considered conservative and robust based on the alignment of the following:

- The normative clay content, which as shown in the updated Table 3-2 presented above in this IR has a median value of 47.1 wt % clay content, with median illite and chlorite contents of 9.20 wt %, and 35.3 wt %, respectively.

- The PIMA results, presented in the updated Table 3-2. The PIMA results support the normative clay content results in that the dominant clay is chlorite (median of 69.5% relative abundance) followed by illite (median 13.1% relative abundance).
- Characteristics of the paleoweathered zone have been discussed for the Cigar Lake program (AECL, 1994) and for other study areas in the Athabasca Basin by Macdonald (1980) and by Wilson (1986). Macdonald (1980) studied the Precambrian regolith in areas of the Athabasca Basin that were not mineralized – meaning away from areas of hydrothermal alteration. The mineralogy of the regolith depended on the depth in the regolith and on the specific parent basement rock (Meta-arkose, meta-semipelite, and meta-pelite). The quartz content of the regolith ranged from 5-40 volume % with values generally close to 25 volume %.
- In Wilson (1996), the author identifies zones of hydrothermal alteration overprinting the regolith that are dominated by quartz, illite, and kaolinite.
- In the Cigar Lake study (AELC, 1994) the paleoweathered zone beneath the ore body is described in the following way: *“A noticeable feature is the funnel-shaped zone of hydrothermally altered basement rock which also overprints the older regolithic alteration immediately underneath the unconformity. This hydrothermal alteration is characterized by a weakening of the rock strength through shearing and foliation dominated by clay-mineral development”*.

#### *Support from CEC and XRD Analyses*

Using the same calculation method as above, the CEC of the paleoweathered materials would be 20.25 meq/kg assuming 9% wt% illite.

Recently, a composite sample of 4 core samples taken from the paleoweathered zone (“PW-Feed”) was analyzed by XRD for mineralogy and the CEC was measured. Details of the samples included in the “PW-Feed” sample are provided below in Table IR-92-4. The CEC for PW-Feed is also included in that table, and was 72 meq/kg, and is aligned with a higher content of illite in the PW-Feed sample than is assumed for the numerical modelling and suggests a contribution to the CEC from the chlorite. The XRD results are provided as Appendix A of this IR response. The results indicate that the mineralogical makeup of PW-feed is: 24.4 wt% quartz (which aligns very well with the assumptions of 25 wt% in the conceptualization), 31.4 wt% illite, and 40.5 wt% chlorite. There is also a small amount of basement rock/parent material present in the sample (3.7wt% biotite).

The measured CEC was substantively (~3x) higher than assumed in the numeric model. It was understood in representing the clay mineral phases in the paleoweathered zone by 9% illite that the sorptive capacity may be underestimated. The decision was made to take a conservative approach because the dataset of surface complexation constants developed for the project was for illite, and it was considered inappropriate to apply the same sorptive reactivity to the much larger relative content of chlorite in this zone. The results of the XRD and the measured CEC provide support to the approach in the reactive transport modelling of assuming illite as the sorptive clay mineral as a conservative one.

Table IR-92-4: Measured CEC for PW-Feed Sample

Sample Name	Corehole Location	CEC (meq/kg)
PW-1	GWR-054	-
PW-2	GWR-061	-
PW-3	GWR-057	-
PW-4	GWR-060	-
PW-Feed	Composite of PW-1 through PW-4	72

#### Changes to the draft EIS text

To reflect the discussion above and updates to Table 3-2 of Appendix 7-C of the draft EIS, the following changes will be made to the text on page 3.29-3.20 of Appendix 7-C of the EIS.

Conceptually, the paleoweathered zone mineral assemblage was made up of 9% clay by mass, as illite, and 25% quartz. The illite content was based on the normative clay composition determined from site-specific corehole elemental analysis (median illite by mass is 9.20%; Table 3-2). Portable infra-red mineral analysis supported the normative clay content in that chlorite is the dominant clay mineral (69.5% relative abundance) followed by illite (median 13.1% relative abundance). The quartz content was based on a regional study by Macdonald (1980) evaluating the mineralogical composition of the weathered bedrock/saprolite regionally. The mineral composition of the paleoweathered zone was conceptualized in this manner because the data set for the project with respect to clay minerals was for the sorptive properties of illite. Using the relatively smaller illite content of the paleoweathered zone compared to the more dominant chlorite content is conservative in that not all sorptive capacity of the clays is accounted for in the simulated paleoweathered zone.

## Attachment IR-92 Appendix A

Note the following on the XRD results for the PW-Feed sample:

- Chlinochlore is part of the chlorite group of minerals.
- The diffraction patterns for illite and muscovite are nearly identical, and thus, muscovite is interpreted as illite in this sample.

Project effects link	Geology and Groundwater
Reference to EIS, appendices, or supporting documentation	Appendix 7-C, Table 3-10: Properties of Adsorbing Mineral Phases
Context and Rationale	<p><b>Context:</b> In Appendix 7-C, section 3.5.6.2.2 Ion Exchange and Surface Complexation, the consideration of ion exchange and surface complexation and the corresponding parameters and chemical reaction are discussed.</p> <p><b>Rationale:</b> The site density of sorbent Goethite was reported in Table 3-10 to be 1.6E3 mol/kg. Taking into account the specific surface area of 60 m<sup>2</sup>/g, this equals to 1600/6E4 mol/m<sup>2</sup>, or 0.0266 mol/m<sup>2</sup>, 1.6e4 sites/nm<sup>2</sup>.</p> <p>This value largely overestimates the site density of goethite, which is reported to be in the range of 2~6 sites/nm<sup>2</sup>. The reference used in the EIS report indicates the similar range of variation for this specific parameter.</p> <p>There are plenty of similar studies on SCM of iron oxides in literature. It is suggested to consult with more than one single study to enhance the reliability of model parameters. The overestimation of sorption site density will directly result in underestimation of the affected COPCs' concentrations in pore fluid. This will result in underestimation of COPC transport plume in the affected underground space, and potentially the dissolved concentrations in the hydrogeological sink.</p>
Information Requirement	Please provide additional evidence to justify the model parameter of site density for goethite, applied to the numerical model. If necessary, the reactive transport modelling should be re-run to update the contents presented in the EIS report.

### Response:

The value provided in Table 3-10 for site density on goethite was a typographical error. The correct value for the density of reactive sites for goethite is 0.203 moles/kg. This value is derived below.

Equation for site density on goethite per kg of goethite:

$$\text{Site Density} \left( \frac{\text{mole sites}}{\text{kg Goethite}} \right) = \text{Site Density} \left( \frac{\text{mole sites}}{\text{mole Fe}} \right) \times \text{MW Goethite} \left( \frac{\text{g}}{\text{mol}} \right) \times 1000 \left( \frac{\text{g}}{\text{kg}} \right)$$

$$\text{Site Density} \left( \frac{\text{mole sites}}{\text{kg Goethite}} \right) = 0.018 \left( \frac{\text{mole sites}}{\text{moles Fe}} \right) \times 88.8517 \left( \frac{\text{g}}{\text{mol}} \right) \times 1000 \left( \frac{\text{g}}{\text{mol}} \right)$$

$$\text{Site Density} \left( \frac{\text{mole sites}}{\text{kg Goethite}} \right) = 0.203 \left( \frac{\text{mol}}{\text{kg}} \right)$$

The values for site density of 0.018 mole sites/mole Fe and the was given by Mathur and Dzombak (2006). The formula of goethite is FeOOH (also given by Mathur and Dzombak, 2006) and has a molecular weight ("MW") of 88.8517 g/mol.

The corrected table 3-10 is provided here below. Noted is that the value for site density for quartz has also been corrected. Please see the discussion below.

Table 3-10: Properties of Adsorbing Mineral Phases

Sorbent Phase	Site Density (mol/kg)	Specific Area (m <sup>2</sup> /g)	Reference
Goethite (FeOOH)	0.203	60	Mathur and Dzombak, 2006
Quartz (SiO <sub>2</sub> )	0.00118	0.31	Prikryl et al., 2001
Illite	Strong Sites: 0.002 (metals and protons sorb); Weak Sites: 0.04 (protons only sorb)	97	Bradbury and Baeyans, 2009

### Properties of Sorbent Phases used in PHREEQC/piChem modelling

The erroneous values reported in Table 3-10 were not used in the modelling. Below, example calculations are given for goethite to derive the total number of binding sites, in moles, for the mineral phase. The total number of sites for the clay, quartz and goethite were provided in the example PHREEQC file given in Appendix E of Appendix 7C of the EIS.

In PHREEQC, the default assumption is that a reaction occurs within 1L of the aqueous phase. This aqueous phase is pore water in the calculations of geochemical reactive transport through rocks and soils. Thus, the total moles of reactive sites associated with goethite (and other reactive phases) is expressed as that which is present in contact with 1L of pore water.

For total density of reactive sites on the goethite surface in the model, the following information was used:

- Site density: 0.018 mole of sites/mole Fe
- Fe<sub>2</sub>O<sub>3</sub> content of sediment/rock: 0.29 wt % in whole rock (from rock core)  
(equivalent to 2.9 g/kg in whole rock)
- MW of Fe<sub>2</sub>O<sub>3</sub> 159.6882
- MW of FeOOH (goethite) 88.8517
- Specific Area of goethite 60 m<sup>2</sup>/g
- (Rock) Effective Porosity 0.2 (Desilicified Zone; Appendix 7C, Table 2-4)
- Bulk Density of sediment/rock 2.12 g/cm<sup>3</sup> (calculated) (equivalent to 2.12 kg/L)
- Density of quartz 2.65 g/cm<sup>3</sup>

### Step 1: Total moles of reactive sites on goethite per kg of soil

*Total moles reactive sites on goethite per kg of soil*

$$= \text{mass Fe}_2\text{O}_3 \left( \frac{\text{g}}{\text{kg soil}} \right) \div \text{MW Fe}_2\text{O}_3 \left( \frac{\text{g}}{\text{mol}} \right) \times 2 \left( \frac{\text{mole Fe}}{\text{mole Fe}_2\text{O}_3} \right) \times 0.018 \left( \frac{\text{mole reactive sites}}{\text{mole Fe}} \right)$$

$$\text{Total moles reactive sites on goethite per kg of soil} = 2.9 \left( \frac{\text{g}}{\text{kg soil}} \right) \div 159.6882 \left( \frac{\text{g}}{\text{mol}} \right) \times 2 \left( \frac{\text{mole Fe}}{\text{mole Fe}_2\text{O}_3} \right)$$

$$\text{Total moles reactive sites on goethite per kg of soil} = 0.000654 \left( \frac{\text{moles reactive sites}}{\text{kg soil}} \right)$$

## Step 2: Bulk Density of the sediment/soil

Quartz is the predominant mineral present in the Athabasca Sandstones. Thus, the bulk density of the sediment/rock was first calculated for the modelling purposes using the density of quartz, for a given effective porosity.

Density of Quartz ( $\rho_{\text{quartz}}$ ) = 2.65 kg/L (Appelo and Postma)

Effective porosity ( $\epsilon$ ) = 0.2 (Desilificied zone, as above)

$$\text{Bulk Density of Soil} \left( \frac{\text{kg}}{\text{L}} \right) = \frac{(1 - \epsilon)}{\left( \frac{1}{\rho_{\text{quartz}} \left( \frac{\text{kg}}{\text{L}} \right)} \right)}$$

$$\text{Bulk Density of Soil} \left( \frac{\text{kg}}{\text{L}} \right) = \frac{1 - 0.2 \text{ (unitless)}}{\frac{1}{2.65 \left( \frac{\text{kg}}{\text{L}} \right)}}$$

$$\text{Bulk Density of soil} = 2.12 \text{ kg/L}$$

## Step 3: Reactive sites per 1L of aqueous solution (groundwater)

*Total moles reactive sites on goethite per 1L porewater*

$$\begin{aligned} &= \text{Total moles of reactive sites on goethite per kg of soil} \left( \frac{\text{moles}}{\text{kg}} \right) \times \text{soil bulk density} \left( \frac{\text{kg}}{\text{L}} \right) \\ &\div \text{soil effective porosity (unitless)} \end{aligned}$$

*Total moles of reactive sites on goethite per 1L porewater*

$$= 0.000654 \left( \frac{\text{moles reactive sites}}{\text{kg soil}} \right) * 2.12 \div 0.2$$

$$\text{Total moles of reactive sites on goethite per 1L pore water} = 0.00693 \text{ moles/L}$$

This is the value for reactive sites on goethite provided in the example PHREEQC File “**#PHREEQC Input File\_Transport\_PWZ\_DSZ and Sediments2\_Chlorite2.phr**” provided in Appendix E of Appendix 7-C of the EIS. Goethite in the model was indicated by “Hfo\_”. The values “60” and “32.4” are the specific surface area of goethite (60 m<sup>2</sup>/g) and mass of goethite in contact with 1 L of porewater, respectively. The specific area and mass of goethite are not used in the model calculations, as the reactive sites are provided as the absolute number of moles (0.00693 moles reactive sites per 1 L of porewater).

(Excerpted from the PHREEQC input file provided)

Context and Rationale	<p><b>Context:</b> The Table 3-11 reported the Solid-Phase Concentrations and Partitioning Constants for COPCs. Data were both measured and simulated. Rationale: It is unclear how the partition coefficients of various COPCs upon desilicified and paleoweathered rocks were obtained. It was not reported at what pH were these K<sub>d</sub> analyzed. Sorption of chemicals on solid phase is known to be pH dependent. It is unclear whether pH influence was considered in the measurement and analysis of apparent partition coefficients. In addition, uptake of metals on clay is highly nonlinear, and always has a maximum capacity. Even with a very strong affinity towards specific metal ions, the sorption will be saturated at elevated concentrations. Therefore, assuming a linear correlation needs to be cautious of the concentration range of target COPC species, and the applicable sorption capacity of the clay mineral.</p> <p>In the current model, only the linear form of sorption is considered, although with discussion of K<sub>d</sub> value selection. Additional rationale is needed to justify if the applied methodology is sufficient for assessment.</p>
Information Requirement	Please justify the choice of applying a linear form partition coefficient for the modelling and assessment, and whether it provides a conservative approach to the assessment results. Clarity around the experimental conditions during the measurement of partitioning coefficient of various COPCs on the target rocks may help support this assumption.

### Response:

Solid-liquid partition coefficients (K<sub>d</sub> values) were not used in the geochemical reactive transport modelling for groundwater except for the lake bottom sediments of Whitefish Lake, as described in Appendix 7-C, Sections 4.5.1 and 4.5.6.2.3 of the draft EIS. The lake bottom sediments are encountered only at the very end of the (much longer; approximately 1000 m) transport pathway from the mining area to Whitefish Lake and were conceptualized as a 1 m zone between the overburden soils and the lake (page 4.6 of Appendix 7-C of the draft EIS).

For reactive transport of groundwater through all subsurface hydrogeologic units (paleoweathered zone, Athabasca Group Sandstone units, and overburden materials), the geochemical code PHREEQC was incorporated for geochemical reactive transport modelling, and sorption reactions included cation exchange and adsorption of constituents from solution to reactive sites at the surface of mineral phases as surface complexes (i.e. using the Surface Complexation Model). The Surface Complexation Model accounts for:

- non-linear sorption of metals and other constituents

- competition amongst these constituents for reactive sites at mineral surfaces
- pH-dependent sorption.

$K_d$  values were presented in Appendix 7-C, Section 3.5.6.2.3 of the draft EIS as a check on the reasonableness of the modelled. COPC adsorption that was conceptualized in the model as occurring at quartz, illite and goethite mineral surfaces. It was important, *as a check*, to demonstrate that modelled sorption to these surfaces was not overpredicting COPC concentrations in the solid phase under initial/baseline conditions. To do this, measured concentrations of COPCs in core material were compared to predicted solids concentrations in the model. Further, using concentrations of COPCs in representative groundwater,  $K_d$  values were calculated from both the measured COPC concentrations and those modelled.

#### **Supplemental Information – calculation of $K_d$ s**

Information supplemental to the response above is presented herein to detail how the  $K_d$  values provided in Appendix 7-C, Section 3.5.6.2.3 and Table 3-11 of the draft EIS were calculated.

The  $K_d$  (L/kg) is calculated as the solid phase concentration of an element, divided by the dissolved-phase concentration of that element.

##### *Measured Solid-Phase COPC Concentrations:*

- “Desilicified Zone” refers to solid phase elemental concentrations in core from wells indicated in Figure 3-1 of Appendix 7-C of the draft EIS. Elemental concentrations were measured on total and partial digestions. The total number of samples used in the calculation of the maximum, minimum and median values of the solid phase concentrations was 1,459 for samples for which total digestion results were presented. This includes all elements presented other than arsenic (As) and selenium (Se). For these elements, only partial digestion results were available. The total number of samples used to calculate maximum, minimum and median solid phase concentrations for As and Se was 843.
- Elemental Analysis for the Paleoweathered Zone represents a total of 108 samples, as provided in Appendix E of Appendix 7C, Table E-1.

*Measured Solution-Phase Concentrations:* Representative groundwater concentrations of COPCs were those used in the model, and are presented in Appendix 7-C, Table 3-5.

An example  $K_d$  calculation is provided here below for chromium in the Desilicified Zone, using the measured median solid-phase concentration and the Cr concentration in groundwater:

$$K_d \text{ (L/kg)} = \frac{\text{Median Solid phase Cr concentration (total digestion; mg/kg)}}{\text{Concentration of Cr in Representative Solution for Desilicified Zone (mg/L)}}$$

$$K_d \text{ (L/kg)} = 8 \text{ mg/kg} \div 0.0005 \text{ mg/L}$$

$$K_d \text{ (L/kg)} = 1.6 \times 10^4 \text{ L/kg}$$

Calculating  $K_d$  values in this way is appropriate because it is calculated using measured data. Thus, no assumptions were made with respect to pH. The pH of groundwater in the system is circumneutral (i.e., pH = 6-7) and the measured solid-phase concentrations are from rock material that was in equilibrium with the groundwater when collected and analyzed.

In the PHREEQC and, likewise, piChem models, solid phase concentrations are yielded by assuming equilibrium occurs between the solution phase concentrations of COPCs, which are the inputs to the model, and the sorbing phases. As is described in Appendix 7C, Section 3.5.6.2.3, within the model the solid sorbent phases (quartz, illite and goethite) are “pre-loaded” (pre-equilibrated) with COPCs to bring the solid phase concentrations into equilibrium with the dissolved phase, groundwater, concentrations before the transport simulation is started. Outside of the model, an “Apparent  $K_d$ ” was then calculated by dividing the modelled solid phase concentration for each COPC by its solution phase concentration. These  $K_d$  values are referred to as “apparent” because they are modelled and because they are derived from the modelled concentrations metals sorbed to mineral surfaces and the modelled solution phase concentrations of those metals; they do not account, for example, for metals that are present within the crystal structure of the minerals in the bedrock.

The  $K_d$ s derived from the core and groundwater data were compared to the Apparent  $K_d$ s. For the majority of the COPCs and for both the Desilicified and paleoweathered zones, the modelled solid phase concentrations and apparent  $K_d$  values were below those measured, and calculated from measured values, respectively. This indicates that the model is not overpredicting solid-phase concentrations based on sorption, nor are the apparent  $K_d$  values exceeding those reported in the literature.”

It was noted that there a few were minor transcription errors in the results presented for the Desilicified Zone in Table 3-11 of Appendix 7-C. None of the corrections affect the interpretation above. The corrected table is given here (below), and will be updated in the final EIS.

Table 3-11: Solid-Phase Concentrations and Partitioning Constants for COPCs, measured and simulated (Updated)

Context and Rationale	<p><b>Context:</b> From the text, “Transport parameters were specified for diffusion (<math>1 \times 10^{-9}</math> m<sup>2</sup>/s), longitudinal dispersivity (10 m along the plume trajectory), and transverse dispersivity (5 m)”. The source of this information is not provided in Appendix 7-C. It is unclear if the values used are defaults in the modelling software, from literature, from small-scale laboratory tests, or are site-specific values determined through tracer tests.</p> <p><b>Rationale:</b> The use of a calibrated flow model does not imply that the solute transport model is calibrated. The transport parameters (such as effective porosity, dispersivity and reactive transport parameters) can only be calibrated by matching simulated and observed spatial and/or temporal distributions of a solute. Sensitivity analysis indicates that decreasing longitudinal and transverse dispersivities by a factor of two resulted in exceedances of groundwater criteria for both selenium (Se) and cobalt (Co). Given the clear influence of these values on contaminant transport, it is important that transfer parameter values are justified in the solute transport model. In addition, the influence of large-scale heterogeneity on dispersion and solute transport predictions should be discussed, to identify any uncertainty in the model predictions, and provide confidence that the applied model is adequately representing groundwater flow and solute transport. Further guidance on solute transport modelling can be found in BC MOE (2012) [1].</p> <p>Reference: [1] British Columbia Ministry of the Environment (BC MOE). 2012. Guidelines for Groundwater Modelling to Assess Impacts of Proposed Natural Resource Development Activities. Report no. 194001, 385 p.</p>
Information Requirement	<p>1. Please provide the source of the numerical value used for diffusion and longitudinal and transverse dispersivity, and provide justification if default values by the model code were used.</p> <p>2. Please provide a discussion on the influence of large- scale heterogeneity on dispersion and solute transport predictions in the modelling report.</p> <p>See also related: IR-89</p>

### **Response Part 1:**

The transport parameters applied in the model were not calibrated and that is why they were: a) selected to be conservative, and b) why more conservative parameters were selected for prediction uncertainty analyses.

Diffusion rates are unknown, as is commonly the case at most sites, and so a representative literature value was selected. Matrix diffusion of mass into lower permeability zones is considered the most relevant area for diffusion; migration to Whitefish Lake is advection-dominated such that diffusion along

the flow path would not appreciably enhance transport timing. Matrix diffusion was accounted for in the set-up of transport simulation parameters using PHREEQC.

Longitudinal and transverse dispersivity rates can vary greatly and are generally scale dependent. Literature references for dispersivity are noted below and used to estimate longitudinal and transverse dispersivity rates for the plume, which is estimated to have a length of 0.9 to 1.7 km. Graphic representation of the values suggested by the literature are appended.

- Gelhar et al. (1992), as quoted in the B.C. guidance (BC MOE, 2012), suggests a representative longitudinal dispersivity of approximately 40 m (with a range from 10 to 150 m), and a transverse dispersivity of 5 m.
- Neuman (1995) suggests a “best fit” longitudinal dispersivity of 350 m to be consistent with field observed values (note the range of model-calibrated values was 10 to 350 m).
- Schulze-Makuch (2005), suggests a best fit value for sandstone units of 10 to 20 m.
- Chapman et al (2014) found a longitudinal dispersivity for a site in a similar fractured sandstone environment to be 10 m for a plume 1.2 km in length. Martin et al. (2019) found the equivalent longitudinal dispersivity appropriate under dual porosity and EPM simulations was 10.7 m for the same site.

Recognizing all of this, the longitudinal dispersivity applied (i.e., 10 m) is considered reasonable, and the more conservative value of 5 m represents a reasonable lower bounding limit. Similarly, the literature supports the transverse dispersivity value of 5 m applied. It was noted that minor exceedances were noted under the lower dispersivity simulations; however, these simulations more importantly also contain conservative geochemical assumptions, such that we feel such breakthrough is unlikely.

## **Response Part 2:**

As noted in the literature (e.g., Neuman et al., 2003; Neuman, 2006) dispersivity is expected to increase as a plume encounters heterogeneities of increasing length-scales. This is the foundation of scale-dependent dispersivity. As such, large-scale heterogeneity will enhance dispersion of the plume, and reduction of solute concentrations, as the plume gets larger and encounters heterogeneities of increasing length-scales. At the Phoenix site, an example of such large-scale features is the desilicified zone, wherein dispersion is simulated to play a role in reducing transported solute concentrations. The dispersion of solute concentrations is coupled with geochemical reactions along the plume trajectory. The plume dispersion exposes concentrations to a greater surface area of the geologic materials, which enhances the ability of geochemical processes to curtail plume migration.

Context and Rationale	<p>Context: Table 8.2-13 shows the maximum concentration of hazardous and radiological COPC's in surface water throughout the local study area. However, the concentration for all constituents is stated as mg/L.</p> <p>Rationale: It is unusual for radiological COPC's to be displayed in mg/L, radiological constituents are typically displayed in Bq/L.</p>
Information Requirement	Please use Bq/L when displaying concentration of radiological COPC's. If this was a typographical error in the table, please indicate as such and revise the table to indicate values are indeed in Bq/L. Please also review other tables displaying concentrations of radiological constituents to ensure this error is not repeated in other tables.

Revised Table 8.2-13 to support response in IR table:

## Attachment: IR-101

Number	IR-101
Dept.	ECCC
Project effects link	Fish and fish habitat
Reference to EIS, appendices, or supporting documentation	Section 8.1.1.3, Section 8.2.1.3 Aquatic Environment
Context and Rationale	<p><b>Context:</b> In Section 8.1.1.3 Spatial and Temporal Boundaries the Project Area, Local Study Area (LSA) and Regional Study Area (RSA) are established as they pertain to surface water quantity. The same is done in Section 8.2.1.3 for surface water quality. In Section 8.1.1.3 Figure 8.1-4, the locations of the Project Area, LSA, RSA and surface water features and monitoring stations are provided.</p> <p>However, the locations of wetlands located near the Project area and within the LSA and RSA have not been provided. The location of wetlands within or near the Project footprint, as well as the other wetlands existing within the LSA can be confirmed from Part II_S9 Terrestrial Environment, Section 9.2.3.3 Figure 9.2.-8, including the wetland classifications. There appears to be at least one shallow open water wetland and several bogs located within the Project Area. There is no consideration of wetlands or potential effects to wetland hydrology, surface water or sediment quality throughout the aquatic environment assessments. There is no baseline information regarding wetlands and their status as fish habitat and ecological function, or assessment of potential effects to flow rates, water levels, water quality, sediment quality, or biota.</p> <p><b>Rationale:</b> There is currently not enough information provided for ECCC to provide advice on the potential risks of the proposed Project to wetland hydrology, surface water and sediment quality within the LSA. This pathway of effects is important to assess in terms of potential effects to wetland habitat availability and quality due to changes in flow rates, water levels, water quality, sediment transport, sediment quality and potential effects to terrestrial and aquatic receptors. It is necessary to evaluate if changes in groundwater and surface water runoff flows and routing will affect water levels and habitat availability within wetlands. Potential effects from COPCs and radionuclides to surface water and sediment, or potential effects to ecological receptors within wetlands have not been evaluated.</p>
Information Requirement	1) Provide baseline information regarding wetland characterization within the Project Area and LSA, including: locations, wetland type, size, water surface elevation, depth, water flow pathways, and the presence of

	<p>wildlife receptors including presence of fish/fish habitat within the Aquatic Environment section of the draft EIS. If this information is available in annexes or baseline studies, summarize it within the main body of the Aquatic Environment section of the draft EIS with references to respective documents for review.</p> <ol style="list-style-type: none"><li>2) Provide baseline information on wetland surface water and sediment quality characterization for wetlands within the Project footprint.</li><li>3) Provide an assessment of potential effects to wetlands within the LSA and potential effects to ecological receptors during all phases of the proposed Project.</li><li>4) Provide further information on mitigation measures and monitoring that would be applied for the protection of wetlands.</li></ol>

Attachment IR-101 Figure 2: Denison Wheeler River Project SSA and Wetland Feature Distribution

## Attachment: IR-102

Number	IR-102
Dept.	ECCC
Project effects link	Fish and fish habitat
Reference to EIS, appendices, or supporting documentation	8.1.3.1 Appendix 8-C, including Appendix II, Table 1 (p. 2)
Context and Rationale	<p><b>Context:</b> Only one measured-results dataset for baseline stream flow exists that is relevant to the Project data from the Water Survey of Canada (WSC) station for Wheeler River (06DA005), and the Proponent used constructed records. The Proponent states that data from 06DA005 was used to extend local hydrometric station records and calculate baseline water quantity metrics. However, this was done through a complex combination of daily data correlation or monthly unit area runoff relationship, with or without offset, where some stations were based off constructed records instead of the real long-term dataset at 06DA005 (see Section 8.1.3.1 and Appendix II of Appendix 8-C, Table 1, p.2 (PDF p. 569)). Appendix 8-C references previous reports in its own appendices, but no equations are shown and there is no description of the accuracy of the fit, or explanation for not referring back to the one dataset (WSC station). Subsequent statistics calculated from these constructed records (e.g., 7Q10 needed for SK water licenses) would be affected by this uncertainty.</p> <p><b>Rationale:</b> Fish habitat can be altered by changes to depositional and erosional patterns in streams. Confidence in the Proponent's estimate of baseline water quantity, and by extension Project effects to fish habitat, cannot be established without a complete description of the method applied, as well as a discussion of its accuracy.</p>
Information Requirement	<ol style="list-style-type: none"> <li>1. Provide more information on the extension of Project hydrometric station data using WSC station 06DA005.</li> <li>2. Discuss the accuracy of any correlations/relationships and justify any deviations from simple unit area runoff relationships in the estimation of baseline water quantity values for the Project hydrometric stations. Constructing records from records that are themselves constructed is not recommended.</li> <li>3. If baseline water quantity metrics need to be revised, discuss (if any) resulting changes to the effects assessment.</li> </ol>

## Attachment: IR-108

Number	IR-108
Dept.	ECCC
Project effects link	Fish and fish habitat
Reference to EIS, appendices, or supporting documentation	Section 8.2.3.3 Aquatic Environment
Context and Rationale	<p>Context: Tables 8.2-2 and 8.2-3 provide summaries of the baseline surface water quality in the LSA. No justifications for the selection of water quality guidelines have been provided. COPCs that require calculations based on other parameters such as hardness, pH, or temperature to derive guidelines (i.e., ammonia, cobalt, zinc, etc.) should be indicated within the table, with a note specifying the parameter values used in the calculations, so that thresholds may be confirmed. No baseline data for un-ionized ammonia has been provided, which is a Schedule 4 substance requiring monitoring under the MDMER. For cobalt, manganese, and vanadium, Federal Environmental Quality Guidelines (FEQGs) and/or CCME Canadian Water Quality Guidelines (CWQGs) for the Protection of Aquatic Life have not been included. A guideline of 26 mg/L has been provided for molybdenum as a Saskatchewan Environmental Quality Guidelines (SEQG), however the actual SEQG is 31 mg/L and the CCME CWQG is 0.073 mg/L.</p> <p><u>Rationale:</u> In order to assess potential changes to surface water quality from Project related activities, ECCC requires that data on all parameters that require MDMER effluent and receiving environment monitoring be provided for assessment, including accurate water quality guidelines where available.</p>
Information Requirement	<p>1. Update Tables 8.2-2 and 8.2-3 to include all COPCs that require effluent characterization and receiving environment monitoring under the MDMER.</p> <p>2. Update Tables 8.2-2 and 8.2-3 to include missing or corrected water quality guidance thresholds, and information on values used to derive thresholds for COPCs that are dependent on general parameters.</p>

### Response:

Tables 8.2-2 and 8.2-3 will be updated in the final EIS to include 1) all COPCs that require effluent characterization and receiving environment monitoring under the MDMER and 2) missing or corrected water quality guidance thresholds, and information on values used to derive thresholds for COPCs that are dependent on general parameters. The updated EIS tables are provided below for completeness.

**Notes:**

Green-highlighted cells indicate values that fall below the analysis detection limit.

Bold values indicate metrics that exceed benchmark values.

Italicized values include a temperature point estimated from an adjacent water body taken in the same season

Blank cells in the "benchmark" column indicate parameters without a prescribed benchmark at this time

SEQG – Saskatchewan Environmental Quality Guidelines – Water Quality Guidelines for Freshwater Aquatic Life.

CWQG – Canadian Council of Ministers of the Environment – Canadian Water Quality Guidelines for the Protection of Aquatic Life.

SSWQO – Saskatchewan Surface Water Quality Objectives.

DOC – Dissolved organic carbon.

TDS – Total dissolved solids.

TKN – Total Kjeldahl Nitrogen.

TOC – Total organic carbon.

TSS – Total suspended solids.

**Notes:**

Green-highlighted cells indicate values that fall below the analysis detection limit.

Bold values indicate metrics that exceed benchmark values.

Italicized values include a temperature point estimated from an adjacent water body taken in the same season

Blank cells in the "benchmark" column indicate parameters without a prescribed benchmark at this time

SEQG – Saskatchewan Environmental Quality Guidelines – Water Quality Guidelines for Freshwater Aquatic Life.

CWQG – Canadian Council of Ministers of the Environment – Canadian Water Quality Guidelines for the Protection of Aquatic Life.

SSWQO – Saskatchewan Surface Water Quality Objectives.

DOC – Dissolved organic carbon.

Denison Response – August 18<sup>th</sup>, 2023

TDS – Total dissolved solids.

TKN – Total Kjeldahl Nitrogen.

TOC – Total organic carbon.

TSS – Total suspended solids.

## Attachment: IR-114

Number	IR-114
Dept.	ECCC, CNSC
Project effects link	Fish and Fish Habitat
Reference to EIS, appendices, or supporting documentation	Section 8.2.4.2.3 and Section 8.2.4.2.4
Context and Rationale	<p>Context: Tables 8.2-9, 8.2-10 and 8.2-13 demonstrate predicted maximum effluent concentrations of COPCs and maximum predicted receiving environment concentrations in the near- and far-field.</p> <p>General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, TSS and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization.</p> <p>For zinc, it is unclear how guidelines have been calculated when CCME thresholds can only be derived with hardness values &lt;250 mg/L. Additionally, water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations.</p> <p>Mercury has been identified as a COPC of interest to Indigenous groups for the proposed Project. Table 8.2-8 indicates that background concentrations of mercury in LA-5 are low, and predicted effluent concentrations are also low. However, no information has been provided on background methylmercury concentrations or expected atmospheric deposition of mercury from Project related emissions. Predicted effluent concentrations of 3915 mg/L of sulphate are quite high, and sulphate is known to increase mercury methylation rates in aquatic environments.</p> <p>Rationale: A review of all modelling results for all COPCs under the MDMER will assist ECCC in understanding the potential risks to the receiving environment. ECCC recommends the use of the most stringent guidelines for the protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds.</p>

	<p>Increased sulphate availability can lead to increased methylation rates of mercury and methylmercury in sediment and surface water.</p> <p>Methylmercury is a toxin that can bioaccumulate within the food chain and present risks to aquatic biota and wildlife consuming aquatic biota. Potential changes to methylmercury concentrations in water quality, sediment and fish tissues should be assessed due to the proposed sulphate loadings in effluent.</p> <p>Additionally, in accordance with the MDMERs, Denison will be required to demonstrate that their effluent quality meets the limits in the MDMER. Denison is expected to provide the predicted effluent quality for lead, nickel, and un-ionized ammonia to demonstrate compliance with the MDMERs.</p>
Information Requirement	<ol style="list-style-type: none"> <li>1. Update all tables to include all COPCs with required monitoring under the MDMER including acute and chronic thresholds.</li> <li>2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota.</li> <li>3. Provide baseline data on the concentrations of methylmercury in surface water, sediment and fish tissues (i.e., large-bodied sports fish and small-bodied forage fish) in the LSA and RSA receiving environment to establish a baseline prior to potential Project impacts.</li> <li>4. Provide an assessment of risk from methylmercury to ecological receptors due to changes in sulphate concentrations in effluent, and potential deposition of mercury from Project related atmospheric emissions in the receiving environment.</li> </ol>

Response:

1) Please see updated Tables 8.2-9 and 8.2-10 from the draft EIS below. Water quality predictions for the well mixed portion of LA-5 for each of the three flow scenarios (described in Section 8.2.4.2.3 and Table 8.2-7 of the draft EIS) are provided in the updated Table 8.2-10 below. Predicted site discharge concentrations that exceed respective receiver WQOs are bolded. Chloride, sulphate, TDS, arsenic, cadmium, chromium, cobalt, copper, selenium, and uranium, thorium-230, radium-226, lead-210, and polonium-210 predicted discharge concentrations are above receiver WQOs. However, under all three flow scenarios, the predicted water quality for all constituents is below respective WQOs within the well mixed portion of LA-5, indicating that sufficient dilution is present within LA-5 to meet objectives. Updated Table 8.2-13 is provided below. Water quality predictions have been added for MDMER constituents listed under Schedule 4 and Schedule 5. There are no predicted exceedances of water quality guidelines for any of the COPCs during Construction, Operation, or Decommissioning

2) The predictive water quality analysis considered the effects of toxicity modifying factors, such as hardness, on water quality. Specifically, the analysis considered induced hardness - that is hardness that is derived from or includes contributions from on site sources and in this case discharge from the IWWTP. It is reasonable in this case to utilize induced hardness since the water quality assessment directly considers the potential effect of IWWTP discharge on the receiving environment. The hardness added to the receiver from the discharge represents a constant source during periods of discharge. The

effluent hardness value used in the analysis was derived from bench scale testing and is considered to be a reasonable estimate of expected hardness in effluent. With that in mind, the predictive water quality analysis reflects the water quality conditions that are anticipated to prevail in the receiver and therefore presents an appropriate platform on which to base the effects assessment.

3) The table below (IR-114 Table 1) shows a summary of baseline concentrations of total mercury in surface water within the LSA. Sediment was not analyzed for mercury during previous baseline surveys. Baseline water quality in the LSA and RSA showed no indication of total mercury present above detectable limits and as such, the potential for methyl-mercury to be detected was unlikely. Generally, 60 to 95% of total mercury concentrations in fish muscle tissues are present in the form of methyl-mercury. Table 8.5-2 of Section 8.5 of the EIS provides a full summary of tissue constituent concentrations for key species from the Icelander River and Russell Lake. A conservative approach of assuming 95% of mercury in the tissues is present in the methylated form could be used for comparative purposes. These data supplemented with more current baseline data for water, sediment and fish tissues specific to total and methyl-mercury prior to the onset of site development will provide a robust database for comparative purposes during the subsequent development and operation on site.

4) Consistent with CSA N288.1-20, Clause 5.1.5, atmospheric depositions to large water bodies such as lakes, are considered negligible; therefore, the air to surface water pathway has been excluded for the ecological risk assessment. The rationale for exclusion of atmospheric deposition to lakes and rivers is explained in detail in Section G9, Appendix G of the COG DRL Guidance Document (Hart, 2019). Typical transfer parameters from source to air and source to water are on a similar magnitude to each other. The transfer parameter from air to water is orders of magnitude lower indicating that atmospheric deposition to the lake would have a negligible effect. Rationale on the exclusion of the air to water pathway can be included in the ERA in Appendix 10-A. The following statement will be added to Section 2.2 in Appendix A to Appendix 10-A "Atmospheric deposition to Whitefish Lake is considered negligible. This is consistent with the COG DRL guidance (COG, 2019) which shows (assuming a modest flow rate for a lake of 0.1 m/s and an assumed water depth of 10 m) that the transfer of constituents from the atmosphere to large bodies of water (including lakes and rivers) is considered negligible."

As baseline surface water did not identify measurable concentrations of total mercury in the LSA or RSA (See IR-114 Table 1 below) and deposition to large water bodies such as lakes is not likely to contribute to the methyl mercury concentration in the Wheeler River receiving waters, it is most reasonable to conclude that changes in total and methyl mercury can be adequately monitored in relation to sulphate inputs. Denison will undertake monitoring of total and methyl mercury as it relates to the discharge of sulphate to Whitefish Lake.

2. The reporting locations are: "LA-1", "LA-1-Bottom", "LA-5", "LA-6", "LAB-1", "LAB-2", "SA-1", "SA-2", "SA-3", "SA-6".

## Attachment: IR-115

Number	IR-115
Dept.	ECCC
Project effects link	Fish and Fish Habitat
Reference to EIS, appendices, or supporting documentation	Section 8.2.4.2.3 Aquatic Environment Appendix 10-A (ERA), Section 3.1.1.1
Context and Rationale	<p>Context: Table 8.2-8 demonstrates baseline concentrations of COPCs in LA-5 South Whitefish Lake, their respective water quality guidelines from applicable sources, and proposed Project thresholds. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, Total Suspended Solids (TSS) and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization. Water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations. The water quality objective selected for molybdenum is the 31 mg/L SEQG rather than the CCME guideline of 0.073 mg/L.</p> <p>Rationale: ECCC recommends the use of guidelines that will ensure the protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds.</p>
Information Requirement	<ol style="list-style-type: none"> <li>1. Update Table 8.2-8 to include all COPCs with required monitoring under the MDMER.</li> <li>2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.</li> <li>3. Provide additional information to justify the use of the selected water quality guideline for molybdenum.</li> </ol>

### Table to support response:

Table 8.2-8 has been updated and provided below.

## Attachment: IR-116

Number	IR-116
Dept.	ECCC
Project effects link	Change to an environmental component due to hazardous contaminants
Reference to EIS, appendices, or supporting documentation	Section 8.2.4.2.5, Section 8.4.4.2.5 and Section 8.5.4.2.3
Context and Rationale	<p>Context: Tables 8.2-14, 8.4-9 and 8.5-5 demonstrate predicted mass flux (in mg/s) of COPCs in groundwater during the future centuries scenario. The table does not provide any information on actual surface water concentrations of COPCs or accumulation in concentrations over time. It is not possible to determine what the COPC concentrations in surface water and sediment will be during the future centuries scenario with the current information.</p> <p>Additionally, only a subset of parameters have been provided in this table based on parameters that were elevated in effluent after treatment. Groundwater may have a variety of different COPCs with elevated concentrations as it will migrate directly from the ore body area and not receive treatment.</p> <p>Rationale: It is not possible for ECCC to assess the predicted concentrations of COPCs in surface water and sediment, and therefore risk to aquatic biota during the future centuries scenario with the provided information.</p>
Information Requirement	<p>Information Requirement:</p> <ol style="list-style-type: none"> <li>1. Provide the predicted water and sediment quality concentrations of COPCs in the receiving environment for the future centuries scenario.</li> <li>2. Include data for a greater suite of COPCs that were assessed as having potential to be at elevated concentrations in groundwater.</li> </ol>

### Response:

- 1) The maximum concentrations of COPCs in surface water and sediment during the Future Centuries period are provided in IR-116 Table 1 and IR-116 Table 2, respectively.
- 2) The suite of COPCs that are provided in IR-116 Table 1 and IR-116 Table 2 are generally inclusive of those that have the potential for elevated concentrations in groundwater. However, estimates for pH, iron and manganese have not currently been modelled. These three parameters were identified in

Section 7.6.2.2.3 and Appendix 7-C as having the potential to be present in groundwater above the groundwater quality screening criteria (see Table 7.6-1 in the EIS and Table 3-4 in Appendix 7-C [existing conditions groundwater quality]).

During future centuries, groundwater that may reach Whitefish Lake is estimated to have a pH ranging from 6.39 to 6.47, which is slightly below the screening criteria of 6.5 to 9. However, the range predicted is within the range of the local groundwater flow system of 5.9 to 7.5 (median of 6.5, as provided in Table 3-4 of Appendix 7-C). Therefore, no change from the current existing conditions is expected during future centuries.

During future centuries, groundwater that may reach Whitefish Lake is estimated to have an iron concentration ranging from 0.0065 mg/L and 2.91 mg/L. The upper range of concentrations will exceed the Groundwater quality guideline of 0.3 mg/L. However, the range predicted is within the range of dissolved iron concentrations measured for groundwater in the local groundwater flow system, of 0.01 mg/L to 4.8 mg/L (median of 0.41). Therefore, no change from the current existing conditions is expected.

During future centuries, groundwater that may reach Whitefish Lake is estimated to have a manganese concentration ranging from 0.279 mg/L and 0.289 mg/L. The range of predicted concentrations will exceed the Groundwater quality guideline of 0.230 mg/L. However, the range predicted is only marginally above that of the local groundwater flow system of 0.04 mg/L and 0.2 mg/L (median of 0.1) and within a similar magnitude.

Arsenic concentrations in sediment have also been predicted based on mass-flux in a conservative manner and indicate potential exceedance of the CCME ISQG.

The modelled predictions of the future centuries groundwater are highly conservative. Continued monitoring of groundwater through the period of construction and initial operation will allow for refinement of the predictions for the future centuries scenario, thereby providing information for adaptive management.

IR-116 Table 1: Maximum Concentration of Surface Water Constituents of Potential Concern in Surface Water During Future Centuries

Constituent	Unit	Kratchkowsky Lake (LA-7)	Whitefish Lake North (LA-6)	Whitefish Lake Middle (LA-5 North)	Whitefish Lake South (LA-5 South)	McGowan Lake (LA-1)	Icelander River	Russell Lake Inlet	Screening Concentration	Source of Screening Concentration

## Attachment: IR-123

Number	IR-123
Dept.	ECCC
Project effects link	Change to an environmental component due to radiological contaminants
Reference to EIS, appendices, or supporting documentation	Section 8.4.3.2.3, Aquatic Environment Appendix 8-D, Table 3-5
Context and Rationale	<p><b>Context:</b> Table 8.4-3 provides a summary of the baseline concentrations of COPCs in sediments in the LSA. Sediment quality thresholds and justification for the selection of those thresholds have not been provided. Table 3-5 in Appendix 8-D does provide benchmarks but the selection of benchmarks is not discussed, and the most stringent guidelines are not used for some COPCs. Additionally, there is no data provided for sediment concentrations of mercury, which is a COPC that requires surface water quality monitoring and effluent characterization under the MDMER.</p> <p><b>Rationale:</b> Further information should be provided regarding any exceedances of sediment quality thresholds in baseline concentrations of COPCs, which should be recommended for further assessment of risk due to effluent discharges.</p>
Information Requirement	<ol style="list-style-type: none"> <li>1. Provide sediment quality thresholds and justification for the selection of those thresholds for comparison against measured baseline COPC concentrations in the LSA.</li> <li>2. Provide data on baseline concentrations of mercury in sediment.</li> <li>3. Identify any COPCs with baseline concentrations that exceed sediment quality thresholds in the LSA.</li> </ol>

Table 1 is provided below to support the text response to IR-123 in the IR table:

## Attachment: IR-131

Number	IR-131
Dept.	CNSC
Project effects link	Migratory birds, Wildlife and Wildlife Habitat
Reference to EIS, appendices, or supporting documentation	Section 9, Terrestrial Environment
Context and Rationale	<p>Context and Rationale: As per the requirement outlined in Section 79 of the Species at Risk Act (SARA): The person must identify the adverse effects of the project on the listed wildlife species and its critical habitat and, if the project is carried out, must ensure that measures are taken to avoid or lessen those effects and to monitor them. The measures must be taken in a way that is consistent with any applicable recovery strategy and action plans. This is accomplished by ensuring that the Proponent has identified, avoided, lessened and will monitor effects to species at risk.</p> <p>As per the CNSC's Generic Guidelines for the Preparation of an EIS pursuant to the Canadian Environmental Assessment Act, 2012: "The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the proponent intends to implement them and the environmental outcome the mitigation is designed to address. The EIS will describe mitigation measures in relation to species and/or critical habitat listed under the Species at Risk Act (SARA). These mitigation measures will be consistent with any SARA permit, applicable recovery strategy and/or action plan".</p> <p>The draft EIS neither lists the adverse effects to all listed schedule 1 SARA species, nor outlines the measures that will be taken to avoid or lessen these effects. The Proponent references that additional species-specific mitigations will be detailed in environmental management plans but has not provided those plans for review.</p>
Information Requirement	Identify all species at risk listed on Schedule 1 of the Species at Risk Act and their critical habitat that are likely to be affected by the Project and describe how they may be adversely affected by the Project. Describe what measures will be taken to avoid or lessen the effects of each Project activity and stage, and how these effects will be monitored to ensure they are avoided or minimized.

### Response:

A new appendix to the final EIS (Appendix 9-D Species At Risk) is included below.

A circular frame containing a scenic landscape. In the foreground, there are tall, dark green evergreen trees. Behind them is a calm blue lake. In the middle ground, there is a strip of yellowish-brown reeds or grasses. The background is a dense forest of green trees, with a range of mountains visible in the distance under a clear blue sky.

VC	Valued Component

# 1 Introduction

## 1.1 Background

On October 21, 2022, Denison Mines Corp. (Denison) submitted a draft Environmental Impact Statement (EIS) for the proposed Wheeler River Project (the Project). Based on their initial review, the Canadian Nuclear Safety Commission indicated that the submission contained the required information to proceed with the Federal-Indigenous Review Team (FIRT) technical review of the draft EIS. On March 20, 2023, the FIRT provided Denison with a list of information requests (IRs) for Denison to respond to and eventually submit a final EIS document.

This Appendix provides additional information to address several IRs provided by Environment and Climate Change Canada (ECCC) as part of the initial round of Federal Indigenous Review Team (FIRT) comments. These IRs were related to 16 wildlife species at risk (SAR) listed under Schedule 1 of the federal *Species at Risk Act* (SARA). The draft EIS approach was conservative in that it considered appropriate representative species as Valued Components (VCs) and Key Indicators (KIs) in sections 9.3 Ungulates, Furbearers, and Woodland Caribou and 9.4 Raptors, Migratory Breeding Birds, and Bird SAR. Of the 16 wildlife SAR listed in Table 1.1, seven had been included as VCs or KIs in the EIS after a thorough scoping process (refer to Section 1.2 for additional information).

Nine of the sixteen were not included as individual VCs or KIs but are considered important from a regulatory perspective. The SARA-listed species identified by ECCC are listed in Table 1.1. Those noted in bold font indicate those for which further assessment is provided in this appendix.

**Table 1.1 Wildlife Species at Risk Listed by Environment and Climate Change Canada**

Common Name	Scientific Name	Discussed in the draft EIS
Nine-spotted lady beetle	<i>Coccinella ovemnotata</i>	No
Transverse lady beetle	<i>Coccinella transversoguttata</i>	No
Yellow-banded bumble bee	<i>Bombus terricola</i>	No
Northern leopard frog	<i>Lithobates pipiens</i>	No
Little brown myotis	<i>Myotis lucifugus</i>	No
Northern myotis	<i>Myotis septentrionalis</i>	No
Wolverine	<i>Gulo gulo</i>	Yes
Woodland caribou	<i>Rangifer tarandus caribou</i>	Yes
Bank Swallow	<i>Riparia riparia</i>	No
Barn Swallow	<i>Hirundo rustica</i>	No
Common Nighthawk	<i>Chordeiles minor</i>	Yes
Horned Grebe	<i>Podiceps auritus</i>	No
Olive-sided Flycatcher	<i>Contopus cooperi</i>	Yes
Rusty Blackbird	<i>Euphagus carolinus</i>	Yes

Common Name	Scientific Name	Discussed in the draft EIS
Short-eared Owl	<i>Asio flammeus</i>	Yes
Yellow Rail	<i>Coturnicops noveboracensis</i>	Yes

Of the 16 species listed in Table 1.1, seven had been included as VCs or KIs in the EIS after a thorough scoping process, as summarized below.

## 1.2 Valued Component Selection

The VCs considered in the effects assessment for the Project are aspects of the biophysical and human environments that were considered to be likely to be affected (adversely or positively) by the Project. The VCs reflect identified scientific, local knowledge, and Indigenous Knowledge, and community interests regarding the Project and its potential effects. The potential effects are typically identified early in the environmental assessment process as a result of questions and concerns raised through engagement with Indigenous and community groups, government departments and agencies, and the general public.

Denison reviewed and considered all received input to develop a VC list that reflects the key environmental, socio-economic, heritage, and human health components and interests to appropriately focus the EA.

The initial VCs selected to represent bird SAR in the habitat-based assessment that were provided in the Terms of Reference (Denison 2019) were evaluated, consolidated, and organized to allow for the logical assessment of Project effects, and are presented in Table 1.2 and Table 1.3, which formed the basis for the subsequent VC-specific assessment.

**Table 1.2 Wildlife Species at Risk Valued Component and Rationale for their Inclusion in the Habitat-based Environmental Assessment for the Denison Wheeler River Project**

Valued Component	Rationale
<b>Biophysical Environment</b>	
<b><i>Terrestrial Environment</i></b>	
Furbearers	Project activities and infrastructure may affect local furbearer populations, including species at risk (SAR), resulting in non-compliance with permit conditions (e.g., <i>Species at Risk Act</i> [SARA; Government of Canada 2022], <i>The Wildlife Act 1998</i> [Government of Saskatchewan 2020]).
Woodland Caribou	Project activities and infrastructure may affect woodland caribou populations, resulting in non-compliance with permit conditions (e.g., SARA [Government of Canada 2022], <i>The Wildlife Act, 1998</i> [Government of Saskatchewan 2020]).
Bird Species at Risk	Project activities and infrastructure may affect bird SAR (specifically disturbance and/or destruction of eggs, young, and adults) resulting in non-compliance with regulatory requirements (e.g., SARA [Government of Canada 2022], <i>Migratory Birds Convention Act 1994</i> [Government of Canada 2017], <i>Saskatchewan Activity Restriction Guidelines for</i>

Valued Component	Rationale
	<i>Sensitive Species</i> [Government of Saskatchewan 2017], <i>The Wildlife Act 1998</i> [Government of Saskatchewan 2020]).

**Table 1.3 Valued Components, Key Indicators, and Measurable Parameters for the Wildlife Component included in the Habitat-based Environmental Assessment for Denison Wheeler River Project**

Valued Component	Key Indicator	Measurable Parameter
Furbearers	Wolverine	Amount of habitat (km <sup>2</sup> ) (not necessarily occupied) that may be altered or lost relative to its availability in the Regional Study Area (RSA). The number of wolverine mortalities directly or indirectly attributable to the Project.
Woodland Caribou	Woodland caribou	Amount of habitat (km <sup>2</sup> ) (not necessarily occupied) that may be altered or lost relative to its availability in the RSA. The number of woodland caribou mortalities directly or indirectly attributable to the Project.
Bird Species at Risk	Common Nighthawk	Percentage of habitat for Common Nighthawk altered/lost directly or indirectly as a result of Project activities. The number of Common Nighthawk mortalities directly or indirectly attributable to the Project.
	Rusty Blackbird	Percentage of habitat for Rusty Blackbird altered/lost directly or indirectly as a result of Project activities. The number of rusty blackbird mortalities directly or indirectly attributable to the Project
	Olive-sided Flycatcher	Percentage of habitat for Olive-sided Flycatcher altered/lost directly or indirectly as a result of Project activities. The number of Olive-sided Flycatcher mortalities directly or indirectly attributable to the Project
	Short-eared Owl	Percentage of habitat for Short-eared Owl altered/lost directly or indirectly as a result of Project activities. The number of Short-eared Owl mortalities directly or indirectly attributable to the Project.
	Yellow Rail	Percentage of habitat for Yellow Rail altered/lost directly or indirectly as a result of Project activities. The number of Yellow Rail mortalities directly or indirectly attributable to the Project.

The five bird species identified in Table 1.3 were selected as SAR VCs for the habitat-based EA in consideration of information/responses received during extensive Indigenous and community engagement completed by Denison, and they represent wildlife species of local importance. For these five species, additional information is not be provided in this Appendix. Rather, the reader is referred to the applicable sections in the EIS where appropriate information on existing conditions (Section 9.4.3.3), potential project-related effects (Section 9.4.4), mitigation measures (Section 9.4.5), residual effects and their significance (Section 9.4.6), and cumulative effects (Section 9.4.7) is provided.

## 2 Supplemental Information

---

As requested by ECCC, the following subsections provide supplemental information for the remaining nine species listed in Table 2.1 that were not included as VCs or KIs in the EIS. For these nine species, a brief overview of life history requirements (existing environment), a discussion on the effects assessment and mitigation measures, and a summary of residual and cumulative effects are included.

**Table 2.1 Wildlife Species At Risk Considered in the Wheeler River Project Environmental Impact Statement**

Common Name	Scientific Name	Provincial Status	Federal Status <sup>1</sup>	Preferred Habitat	Documented Occurrence in the Local Study Area <sup>2</sup>	Reference in the Environmental Impact Statement (EIS)
<b>Arthropods</b>						
Nine-spotted lady beetle	<i>Coccinella novemnotata</i>	S4	Endangered	Habitat generalist – uses a diverse range of habitats and consumes a variety of prey. See Section 2.1.1 for further details.	Unlikely LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Not included as a Valued Component (VC) in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.
Transverse lady beetle	<i>Coccinella transversoguttata</i>	S4	Special Concern	Habitat generalist – uses a diverse range of habitats and consumes a variety of prey. See Section 2.1.2 for further details.	Unlikely LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Not included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.
Yellow-banded bumble bee	<i>Bombus terricola</i>	S4	Special Concern	Habitat generalist – uses a variety of habitats and consumes nectar and pollen from many different flowering plants. See Section 2.1.3 for further details.	Unlikely LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Not included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.
<b>Amphibians</b>						
Northern leopard frog	<i>Lithobates pipiens</i>	S3	Special Concern	Three district habitats: (1) overwintering waterbodies that are cold, well oxygenated, and do not freeze to bottom; (2) breeding and larval waterbodies with	LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific	Not included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in this Appendix.

<b>Terrestrial Wildlife Species</b>						
Wolverine	<i>Gulo gulo</i>	S2	Special Concern	See Section 9.3.3.2 of the EIS for details.	LSA is located within COSEWIC range; no observations in SKCDC and no Project-specific observations to date.	Included as a Key Indicator (KI) of the Furbearer VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Woodland caribou	<i>Rangifer tarandus caribou</i>	S3	Threatened	See Section 9.3.3.3 of the EIS for details.	Documented within the RSA during the baseline field program (Appendix 9-C)	Included as a VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
<b>Avian Species</b>						
Bank Swallow	<i>Riparia riparia</i>	S4B, S5M	Threatened	Nesting colonies are typically characterized by steep embankments with a sand, silt, or clay substrate that can be easily excavated for burrows. They are often adjacent to slow-moving or still waterbodies and may occur in natural habitats or in anthropogenic features. Bank Swallows are aerial insectivores that forage over a variety of open habitats. See Section 2.4.1 for further details.	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Not included as a KI of the Bird Species at Risk (SAR) VC in the EIS (Common Nighthawk was used as a surrogate species). A review of life history requirements and discussion on effects assessment are included in this Appendix. Any new species-specific mitigation measures identified in this appendix will be added to the final EIS (Section 9.4.5).
Barn Swallow	<i>Hirundo rustica</i>	S4B	Threatened	Breeding habitat typically requires a suitable nesting site with a vertical or horizontal surface underneath a roof of	Documented during the breeding bird surveys as part of the baseline field	Not included as a KI of the Bird SAR VC in the EIS (Common Nighthawk was used as a surrogate species). A review of life history

				some sort, open areas for foraging, and a waterbody with mud for nest building. Anthropogenic features such as barns, houses, bridges, and culverts are commonly used nesting sites. See Section 2.4.2 for further details.	program as present in the LSA (Appendix 9-C), and previously observed in the RSA (SKCDC 2023)	requirements and discussion on effects assessment are included in this Appendix. Any new species-specific mitigation measures identified in this appendix will be added to the final EIS (Section 9.4.5).
Common Nighthawk	<i>Chordeiles minor</i>	S4B	Special Concern	See Section 9.4.3.3 of the EIS for details.	Documented during the baseline field program as present in the LSA (Appendix 9-C), and previously observed in the RSA (SKCDC 2023)	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Horned Grebe	<i>Podiceps auritus</i>	S5B	Special Concern	Breeding habitat consists of small to medium-sized freshwater lakes, ponds, and marshes that are shallow with open water (at least 40%), emergent vegetation, anchorage for nests, and concealment for nests and young. See Section 2.4.3 for further details.	Documented during the baseline field program as present in the LSA (Appendix 9-C).	Not included as a KI of the Bird SAR VC in the EIS (Yellow Rail was used as a surrogate species). A review of life history requirements and discussion on effects assessment are included in this Appendix. Any new species-specific mitigation measures identified in this appendix will be added to the final EIS (Section 9.4.5)..
Olive-sided Flycatcher	<i>Contopus cooperi</i>	S4B	Special Concern	See Section 9.4.3.3 of the EIS for details.	Documented during the baseline field program as present in the LSA (Appendix 9-C), and previously observed in the RSA (SKCDC 2023)	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.

Common Name	Scientific Name	Provincial Status	Federal Status <sup>1</sup>	Preferred Habitat	Documented Occurrence in the Local Study Area <sup>2</sup>	Reference in the Environmental Impact Statement (EIS)
Rusty Blackbird	<i>Euphagus carolinus</i>	S3B, SUN	Special Concern	See Section 9.4.3.3 of the EIS for details.	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Short-eared Owl	<i>Asio flammeus</i>	S3B, S2N	Special Concern	See Section 9.4.3.3 of the EIS for details.	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.
Yellow Rail	<i>Coturnicops noveboracensis</i>	S3B	Special Concern	See Section 9.4.3.3 of the EIS for details.	LSA is located within COSEWIC range; no historical observations documented by the SKCDC (2023) and no Project-specific observations to date.	Included as a KI of the Bird SAR VC in the EIS. A review of life history requirements and discussion on effects assessment are included in the EIS (Section 9.3). Additional information for this species is not provided in this Appendix.

Note: shaded rows indicate SAR was included as a VC or KI in the draft EIS

- 1 Schedule 1 under the *Species at Risk Act*.
- 2 Potential for Occurrence – based on known species occurrence data from Saskatchewan Conservation Data Centre (2023), Omnia (Appendix 9-C), Birds of Saskatchewan (2019), and Atlas of Saskatchewan Birds (Smith 1996) and/or presence of suitable habitat.

## 2.1 Arthropods

### 2.1.1 Nine-Spotted Lady Beetle

The nine-spotted lady beetle is a small beetle species found across southern Canada and the continental United States (COSEWIC 2016a). Its northern range limit in Saskatchewan is reported to occur near Lake Athabasca (COSEWIC 2016a). Based on records provided by the Saskatchewan Conservation Data Centre Hunting, Angling and Biodiversity of Saskatchewan (HABISask) database (SKCDC 2023), there are no historical observations of this species documented in the Regional Study Area (RSA).

Source: COSEWIC (2016a).

The nine-spotted lady beetle is a habitat generalist that uses a diverse range of habitats (e.g., open to semi-open forests, grasslands, riparian areas) and consumes a variety of prey (e.g., many species of arthropods [particularly aphids], sap, nectar and pollen) (COSEWIC 2016a). Being a habitat generalist allows the nine-spotted lady beetle to exploit seasonally available prey sources, with prey availability influencing the species' distribution more than habitat availability (COSEWIC 2016a).

The nine-spotted lady beetle has four life stages (i.e., egg, larva, pupa, and adult) and may produce two generations per year (i.e., spring and fall) depending on regional climate conditions (COSEWIC 2016a). Lady beetles, in general, are highly mobile and may undertake short (few hundred metres) and long-distance (18 to 120 km) movements (COSEWIC 2016a). The nine-spotted lady beetle is not migratory nor does it display strong site fidelity (COSEWIC 2016a). The nine-spotted lady beetle overwinters in aggregations in well-ventilated habitats (e.g., in rock crevices, grass tussocks, or leaf litter, or under stones or tree bark), becoming active in the early spring when temperatures start to increase (COSEWIC 2016a).

The nine-spotted lady beetle is federally listed under Schedule 1 of SARA as Endangered (Government of Canada 2023) and is designated as an S4 species in Saskatchewan (i.e., Apparently Secure) (Saskatchewan Conservation Data Centre 2023). The species has undergone significant population declines in Canada since 1975, going from one of the more common lady beetles collected to being rarely collected relative to other lady beetles, despite comprehensive and targeted surveys (COSEWIC 2016a). Reasons for these population declines are currently unknown but are thought to be driven by competition, predation, and introduced diseases from non-native species (including non-native lady beetles), agricultural pesticide use to control aphids, habitat loss via urban expansion, and other human disturbances (COSEWIC 2016a).

### 2.1.2 Transverse Lady Beetle

The transverse lady beetle is a small beetle species found across the United States and Canada, including all provinces and territories (COSEWIC 2016b). The species is a habitat generalist and uses similar habitat types and consumes similar prey as the nine-spotted lady beetle, which means it is also able to exploit seasonally available prey sources (COSEWIC 2016b). According to the information from the HABISask database, there are no historical observations of this species documented in the RSA.

Source: COSEWIC (2016b).

The transverse lady beetle has four life stages (i.e., egg, larva, pupa, and adult) and may produce two generations per year (i.e., spring and fall) depending on regional climate conditions (COSEWIC 2016b). Lady beetles in general are highly mobile and may undertake short (few hundred metres) and long-distance (18 to 120 km) movements (COSEWIC 2016b). The transverse lady beetle is not migratory nor does it display strong site fidelity (COSEWIC 2016b). The transverse lady beetle overwinters in aggregations in well-ventilated habitats (e.g., in rock crevices, grass tussocks, or leaf litter, or under stones or tree bark), becoming active in the early spring when temperatures start to increase (COSEWIC 2016b).

The transverse lady beetle is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S4 species in Saskatchewan (i.e., Apparently Secure) (Saskatchewan Conservation Data Centre 2023). The species was once abundant across its range in Canada and was one of the most common lady beetles collected; however, since 1986, the species is now absent, below detection limits, or present in low numbers in many parts of its range (COSEWIC 2016b). The transverse lady beetle has not been detected in Saskatchewan since 2001 (COSEWIC 2016b). Reasons for these population declines are currently unknown but are thought to be driven by the same factors listed for the nine-spotted lady beetle in Section 2.1.1.

### 2.1.3 Yellow-banded Bumble Bee

The yellow-banded bumble bee is a medium-sized bumble bee species found throughout eastern North America, from eastern British Columbia (BC) to Newfoundland and Labrador and from the northern United States up to the southern portion of the territories (COSEWIC 2015). The species is a habitat generalist (e.g., boreal habitats, mixed woodlands, montane meadows) and consumes nectar and pollen from many different flowering plants (COSEWIC 2015). According to the information from the HABISask database, there are no historical observations of this species documented in the RSA.

Source: COSEWIC (2015).

The yellow-banded bumble bee has four life stages (i.e., egg, larva, pupa, and adult) and produces one generation per year, with mated queens establishing new colonies each year (COSEWIC 2015). After overwintering underground in loose soil or decomposing organic material, the mated queens emerge in the spring and search for potential nest sites, which are typically located underground in existing cavities (e.g., abandoned rodent burrows, rotten logs, openings in dead wood, and grassy hummocks) (COSEWIC 2015). Once a queen has found a suitable nest site, she forages for nectar and pollen and then returns to her nest site to lay eggs, which will develop into her future workers (i.e., unmated daughters that do not typically reproduce) (COSEWIC 2015). After the initial eggs hatch and the larva and pupa develop into adult workers, the workers take over nest and brood care, foraging duties, and colony protection while the queen continues to lay eggs (COSEWIC 2015). Males and potential queens are produced by late summer once the colony reaches maximum worker production, at which point they leave the colony and mate (COSEWIC 2015). All males and workers die by fall while the mated queens hibernate through the winter in suitable overwintering sites (COSEWIC 2015).

The yellow-banded bumble bee is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S4 species in Saskatchewan (i.e., Apparently Secure)

(Saskatchewan Conservation Data Centre 2023). Prior to the 1990s, the yellow-banded bumble bee was one of the more common bumble bees collected in eastern and boreal Canada (COSEWIC 2015, Environment and Climate Change Canada 2022a). Population declines started to occur in the early 1990s, with an average rate of decline of 66.5% in proportional abundance across central and southern Canada between 1992 and 2011 (COSEWIC 2015, Environment and Climate Change Canada 2022a). The species is no longer found at several historical collection sites (COSEWIC 2015).

The status of the yellow-banded bumble bee in boreal habitats and Arctic regions is unknown (COSEWIC 2015, Environment and Climate Change Canada 2022a). Reasons for these population declines are currently unknown but are thought to be driven by introduced diseases from managed bumble bee species, agricultural pesticide use, habitat loss via urban and agricultural expansion, and climate change (COSEWIC 2015). The species' unique type of sex determination, where colonies must reach maximum worker production to produce males and potential queens, has been identified as a limiting factor (COSEWIC 2015, Environment and Climate Change Canada 2022a).

## 2.2 Amphibians

### 2.2.1 Northern Leopard Frog

The northern leopard frog is found across most of west-central and northeastern North America (COSEWIC 2009a). The species is widespread in Canada, ranging from southeastern BC to Labrador, and from southcentral Northwest Territories (COSEWIC 2009a, NCC 2023).

Source: COSEWIC (2009a).

Three distinct habitats are used by the northern leopard frog on an annual basis: (1) overwintering waterbodies that are cold, well oxygenated, and do not freeze to bottom (e.g., rivers, streams, deep lake ponds and creeks, and spillways below dams); (2) breeding and larval waterbodies with shallow, open habitats (e.g., ponds, lakeshores, marshes, and slow-moving streams; may be permanent or semi-permanent), neutral pH, well vegetated, and no fish; and (3) summering areas in shallow marshes, moist upland meadows, forests and grasslands where grass height is less than 1 m (COSEWIC 2009a, NCC 2023). These habitats must be in proximity with suitable dispersal corridors interconnecting them (e.g., riparian areas and waterways) as the species is not capable of long-distance movements (COSEWIC 2009a, Environment Canada 2013).

Northern leopard frogs emerge from their overwintering waterbodies in early spring shortly after ice off (COSEWIC 2009a). The breeding season extends from mid-April to June, with exact timing dependent on location and latitude (COSEWIC 2009a). Females lay several thousand eggs, attaching them to submerged vegetation, which develop into tadpoles within two weeks depending on water temperatures (COSEWIC 2009a). The tadpoles in turn develop into small frogs over a two-to-three-month period, after which they migrate to their summering areas and forage on a variety of arthropods, worms, and snails, sometimes preying on small birds and smaller frogs (COSEWIC 2009a).

Three populations are recognized for the northern leopard frog in Canada: the Rocky Mountain, the Western Boreal/Prairie, and the Eastern (COSEWIC 2009a, NCC 2023). The Western Boreal/Prairie population is found in Alberta, Saskatchewan, Manitoba, and the Northwest Territories (COSEWIC 2009a,

NCC 2023). The Western Boreal/Prairie population is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S3 species in Saskatchewan (i.e., Vulnerable) (Saskatchewan Conservation Data Centre 2023).

Population data are limited for the northern leopard frog in Canada (COSEWIC 2009a, Environment Canada 2013). Large-scale population declines occurred in the early 1970s, with populations in western Canada (i.e., BC and Alberta) most dramatically affected (COSEWIC 2009a). Information is lacking on the current status of northern leopard frog populations in Saskatchewan (COSEWIC 2009a, Environment Canada 2013).

Threats to the northern leopard frog include emerging diseases (e.g., *Chytridiomycosis*), introduced non-native species, habitat loss and fragmentation, environmental contamination, and increased frequency and severity of droughts (COSEWIC 2009a). The species' specific habitat requirements and vulnerability to diseases and prolonged periods of drought have been identified as limiting factors (Environment Canada 2013).

## 2.3 Bats

### 2.3.1 Little Brown Myotis

The little brown myotis is a small bat species found across North America, including across Canada south of the treeline (COSEWIC 2013a). The species is considered a short-distance regional migrant between its summer and winter ranges, with the distance travelled dependent on the location of suitable overwintering hibernacula (COSEWIC 2013a).

Habitat for the little brown myotis is composed of (1) overwintering hibernacula that are sufficiently cool and humid and (2) summering areas that provide foraging areas and suitable locations for roosting and maternity colonies (COSEWIC 2013a). Hibernacula and maternity sites are the main limiting habitat features for this species (COSEWIC 2013a). Hibernacula occur in parts of caves, mines, and buildings that have stable and specific temperature (-4 to 13°C) and humidity (>80%) conditions (COSEWIC 2013a). Maternity sites occur in large-diameter trees, rock crevices, buildings, and bat houses that offer warm and relatively stable microclimate conditions that allow females to avoid going into torpor so they can focus on caring for their young (COSEWIC 2013a, Slough and Jung 2020). Males are more versatile in their summer roosting requirements and use tree cavities, raised bark, foliage, rock crevices, buildings, and bridges with a broader range of microclimate conditions (COSEWIC 2013a, Johnson et al. 2019). Foraging areas for the little brown myotis include a variety of habitats situated close to roosting and maternity sites, including over water (e.g., wetlands, lakes, ponds, and rivers), along riparian areas and forest edges, and in forest gaps (COSEWIC 2013a).

The little brown myotis is federally listed under Schedule 1 of SARA as Endangered (Government of Canada 2023) and is designated as an S4B, S4N species in Saskatchewan (i.e., Apparently Secure breeding population, Apparently Secure non-breeding population) (Saskatchewan Conservation Data Centre 2023).

Source: COSEWIC (2013a).

The current size of the little brown myotis population in Canada is unknown. Prior to the arrival of White-nose Syndrome in 2010, the population in Canada was estimated to be over one million individuals (COSEWIC 2013a, Environment and Climate Change Canada 2018). White-nose Syndrome is a disease that causes high rates of mortality among hibernating bats, and it has been identified as the main threat for bat populations in Canada (COSEWIC 2013a). Other threats to the little brown myotis include habitat loss, colony eradication, chemical contamination, and wind turbines (COSEWIC 2013a).

### 2.3.2 Northern Myotis

The northern myotis is a small bat species found across North America, including across Canada south of the treeline (COSEWIC 2013a). The species is considered a short-distance regional migrant between its summer and winter ranges, with the distance travelled dependent on the location of suitable overwintering hibernacula (COSEWIC 2013a).

Habitat for the northern myotis is composed of (1) overwintering hibernacula that are sufficiently cool and humid and (2) summering areas that provide foraging areas and suitable locations for roosting and maternity colonies (COSEWIC 2013a). Hibernacula and maternity sites are the main limiting habitat features for this species (COSEWIC 2013a). Hibernacula occur in parts of caves, mines, and buildings that have stable and specific temperature (0.6 to 14°C) and humidity (>80%) conditions (COSEWIC 2013a). Summer roosting trees are typically found in mature to old-growth forests, swamps, and riparian areas, although retained older trees and snags in younger forests may occasionally provide suitable roosting habitat (Environment and Climate Change Canada 2018). Females strongly prefer tall, large-diameter trees (both living and dead, typically deciduous) with early- to mid-decay for maternity sites (COSEWIC 2013a, Environment and Climate Change Canada 2018). Anthropogenic features (e.g., barns) may occasionally be used as maternity sites in fragmented landscapes with few potential roost trees (Environment and Climate Change Canada 2018). Maternity sites that maintain warm and relatively stable microclimate conditions are important to reproductive females and young as they allow more energy to be directed toward growth and development (Caceres and Barclay 2000, COSEWIC 2013a). Males are more versatile in their summer roosting requirements; they most frequently roost under exfoliating, raised bark but may also roost in the cavities and crevices of trees and snags with early- to mid-decay (Jung et al. 2004, COSEWIC 2013a).

Source: COSEWIC (2013a).

The northern myotis is well adapted to flying in areas of dense or structurally complex vegetation where it catches flying insects on the wing or feeds by gleaning prey from foliage (Caceres and Barclay 2000, Henderson and Broders 2008). The species typically forages within the interior of mature to old-growth deciduous and mixedwood forests, but may also forage in forest gaps, along forest edges and riparian areas, and over rivers (Henderson and Broders 2008, COSEWIC 2013a).

The northern myotis is federally listed under Schedule 1 of SARA as Endangered (Government of Canada 2023) and is designated as an S3 species in Saskatchewan (i.e., Vulnerable) (Saskatchewan Conservation Data Centre 2023). The current size of the northern myotis population in Canada is unknown. Prior to the arrival of White-nose Syndrome in 2010, the population in Canada was estimated to be over one million individuals (COSEWIC 2013a, Environment and Climate Change Canada 2018). White-nose Syndrome has

been identified as the main threat for northern myotis populations in Canada (COSEWIC 2013a). . Other threats to the northern myotis include habitat loss, colony eradication, chemical contamination, and wind turbines (COSEWIC 2013a)

## 2.4 Avian Species

### 2.4.1 Bank Swallow

The Bank Swallow is a small songbird that occurs on every continent (except Antarctica and Australia), breeds throughout Canada, and winters primarily in South America (COSEWIC 2013b). Nesting colonies are typically characterized by steep embankments with a sand, silt, or clay substrate that can be easily excavated for burrows (COSEWIC 2013b, Government of Canada 2019a). These steep sand, silt, or clay embankments are frequently subject to erosion or slumping (COSEWIC 2013b, Garrison and Turner 2020).

Nesting colonies are often adjacent to slow-moving or still waterbodies (e.g., low gradient rivers or lakes) and may occur in natural habitats or in anthropogenic features (e.g., quarries or road cuts) (COSEWIC 2013b, Government of Canada 2019a, Garrison and Turner 2020). Colony size can range from less than half a dozen burrows to hundreds or thousands of burrows (COSEWIC 2013b, Government of Canada 2019a). Individual burrows within colonies may be recolonized in subsequent years if the integrity of the colony remains intact (i.e., does not erode and collapse) (Garrison and Turner 2020). Bank Swallows are aerial insectivores that forage over a variety of open habitats such as lakes, ponds, rivers, wetlands, grasslands, and agricultural areas (COSEWIC 2013b, Garrison and Turner 2020).

The Bank Swallow is federally listed under Schedule 1 of SARA as Threatened (Government of Canada 2023) and is designated as an S4B, S5M species in Saskatchewan (i.e., Apparently Secure breeding population, Secure aggregating transient population [migrants]) (Saskatchewan Conservation Data Centre 2023). The most recent breeding population estimate for Canada is 2.4 million individuals (Environment and Climate Change Canada 2022b). Based on Breeding Bird Survey (BBS) data collected between 1970 and 2019, the Bank Swallow population in Canada has declined at a rate of 5.3% per year, for an overall decline of 98.0% (Environment and Climate Change Canada 2022b). The long-term population decline appears to be driven by several threats acting cumulatively, including loss of nesting and foraging habitats, incidental take during anthropogenic activities (e.g., aggregate extraction and erosion control), large-scale declines in aerial insect populations, and climate change (COSEWIC 2013b). Bank Swallows are also particularly vulnerable to collisions with vehicles partly due to the attraction of individuals to intraspecific carcasses; one swallow hit by a vehicle could attract several individuals to a road, potentially resulting in subsequent collisions and large mortality events (COSEWIC 2013b, Garrison and Turner 2020).

Although colonial nesting may provide advantages (e.g., predation protection and assistance with thermoregulation), it has been identified as a limiting factor for the Bank Swallow, potentially making

Source: COSEWIC (2013b).

them more vulnerable to natural events or anthropogenic activities, which may result in mass mortality events (Environment and Climate Change Canada 2022b).

## 2.4.2 Barn Swallow

The Barn Swallow is a medium-sized songbird that occurs on every continent (except Antarctica), breeds throughout Canada, and winters in the southern United States, Mexico, and southwards (COSEWIC 2021). Breeding habitat typically requires a suitable nesting site with a vertical or horizontal surface underneath a roof of some sort, open areas for foraging (e.g., grasslands, fields, wetlands, and shorelines), and a waterbody with mud for nest building (Government of Canada 2019b, Brown and Brown 2020, COSEWIC 2021).

Historically, suitable nesting sites were likely provided by caves, cliff faces, rock ledges, tree branches, and hollow trees (Brown and Brown 2020, COSEWIC 2021). Today, nesting sites are usually located within agricultural and rural areas, and along roads and highways (Brown and Brown 2020, COSEWIC 2021). Anthropogenic features such as barns, houses, bridges, and culverts are commonly used for nesting sites (COSEWIC 2021). Barn Swallows nest in colonies or independently and typically return to the same nesting sites each year and may reuse old nests (Government of Canada 2019b, Brown and Brown 2020, COSEWIC 2021).

The Barn Swallow is federally listed under Schedule 1 of SARA as Threatened (Government of Canada 2023) and is designated as an S4B species in Saskatchewan (i.e., Apparently Secure breeding population) (Saskatchewan Conservation Data Centre 2023). An estimated 6.4 million individuals currently breed in Canada, with over 60% of the population breeding throughout the prairie provinces (COSEWIC 2021). Based on BBS data collected between 1970 and 2019, the Barn Swallow population in Canada has declined at a rate of 2.34% per year, for an overall decline of 68.6% (COSEWIC 2021). Intensification of agriculture, loss of nesting sites, large-scale declines in aerial insect populations, and climate change are cited as the most imminent threats for the Barn Swallow, and its dependence on aerial insects for prey and low post-fledging survival rates are cited as limiting factors for the species (COSEWIC 2021). The repeated use of anthropogenic features for nesting makes Barn Swallows vulnerable to incidental take, especially if the anthropogenic features require routine maintenance. In addition, their frequent use of anthropogenic features for nesting makes Barn Swallows vulnerable to entrapment (e.g., buildings, pipes, vents, other enclosed spaces) as they search for potential locations to build a nest (COSEWIC 2021).

## 2.4.3 Horned Grebe

The Horned Grebe is a small waterbird that occurs in North America and Eurasia (COSEWIC 2009b). Within North America, the species breeds across western Canada from BC and Yukon across to the Magdalen Islands in Quebec and winters along the Pacific and Atlantic coasts (COSEWIC 2009b).

Breeding habitat for the Horned Grebe consists of small to medium-sized freshwater lakes, ponds, and marshes that are shallow with open water (at least 40%), emergent vegetation,

Source: COSEWIC (2021).

Source: COSEWIC 2009b

anchorage for nests, and concealment for nests and young (COSEWIC 2009b, Stedman 2020). Horned Grebes use a range of waterbody sizes for breeding, but typically prefer waterbodies between 0.3 and 2.0 ha in size (COSEWIC 2009b). Most pairs are solitary, but loose colonies of up to 20 pairs have been found on larger waterbodies with abundant food resources (COSEWIC 2009b, Stedman 2020). Nests are typically located in shallow water near shore on a floating or emerging mass of vegetation (COSEWIC 2009b). Horned Grebes are diving birds that feed on a variety of aquatic arthropods and fish (COSEWIC 2009b, Stedman 2020).

The Western population of the Horned Grebe is federally listed under Schedule 1 of SARA as Special Concern (Government of Canada 2023) and is designated as an S5B species in Saskatchewan (i.e., Secure breeding population) (Saskatchewan Conservation Data Centre 2023). An estimated 200,000 to 500,000 individuals occur in the Western population, with most breeding in southern Alberta and Saskatchewan (COSEWIC 2009b, Environment and Climate Change Canada 2022c). Based on BBS data collected between 1970 and 2019, the Western population of the Horned Grebe in Canada has declined at a rate of 1.7% per year, for an overall decline of 57.0% (Environment and Climate Change Canada 2022c). The reasons for this population decline are unknown. Probable threats include permanent habitat loss, temporary loss of habitat during droughts, eutrophication and degradation of habitat due to fertilizers, predator expansion on the prairies, Type E botulism in the Great Lakes, entanglement in commercial fishing gear, climate change and extreme weather, and oil spills on wintering grounds (COSEWIC 2009b).

### 3 Mitigation Measures

---

The Project will require the construction, operation, and decommissioning of several components (as described in Section 2 of the EIS). Expected interactions between these Project components and activities and the wildlife VCs and their associated KIs are summarized by Project phase and activity in Tables 9.3-6 and 9.4-5 of the EIS. Based on the timing and nature of interactions identified in Tables 9.3-6 and 9.4-5 of the EIS, the following adverse effects on the wildlife VCs, including SAR, are likely to occur during the lifetime of the Project:

- alteration and/or loss of habitat; and
- change in mortality.

These potential effects apply to Wildlife SAR as well. The potential effects are described in Sections 9.3.4.2 and 9.4.4.2 of the EIS for each Project phase as they may affect the wildlife VCs and associated KIs.

Mitigation in this EIS is defined as the elimination, reduction, or control of potential adverse effects of the Project on the environment throughout all Project phases. Project-specific mitigation measures include: Project design; implementation of best management practices; development of management plans; implementation of emergency response programs; and provision of training, education and awareness (Denison 2020). Mitigation measures for each potential effect are described in Sections 9.3.5 and 9.4.5 of the EIS. The following subsections summarize mitigation measures that will be implemented to avoid or minimize adverse effects on the Wildlife SAR.

#### 3.1 Project Design Measures

Potential adverse effects on Raptors, Migratory Breeding Birds, and Bird SAR VCs will be avoided or minimized to the extent practical through Project design. All of the Project design measures listed here are consistent with those presented in Section 9 of the EIS (i.e., there are no new Project design measures proposed in this appendix):

- The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent practicable resulting in reduced habitat disturbance and noise propagation.
- Much of the proposed footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.
- The powerline to the main substation at the site is relatively short (i.e., approximately 7 km) and will be constructed from the existing provincial power line adjacent to Highway 914.
- During Operation, progressive reclamation activities will be completed where possible, and the progress and success of these activities will be assessed annually.
- Cleared brush will be stockpiled when possible, to be used in progressive reclamation.
- Ongoing decommissioning of Project components will be completed when possible.
- Dust deposition on vegetation and waterbodies (including potential deposition of trace metals and radionuclides) will be reduced by:
  - directing processing plant exhaust from drying and packaging areas through a stack prior to release outside of the building;
  - designing the stack height based on results of air dispersion modelling to be an appropriate height for optimal dispersion;

- controlling access to the property with both a north and south security gate (the north gate is on a decommissioned road and the south gate is manned);
  - making a wash bay available to clean items, equipment and vehicles that may have been in contact with potentially contaminated materials. Contaminated water from the wash bay will be collected in a sump tank and routed to the water treatment plant for treatment and discharge;
  - conducting radiological clearance scanning as required for any items, equipment, and vehicles leaving the Project Area; and.
  - watering and traffic controls on roads.
- Battery-powered light vehicles and mobile equipment, and an AC powered dual rotary drill for ISR wellfield development instead of a traditional diesel-powered unit, will be employed, where practical, to reduce air emissions and noise levels and improve energy efficiency.
  - The main sources of noise will be related to transport of people and goods, drilling of holes for the freeze wall and wellfield, operation of the batch plant, operation of the processing plant, and operation of the pumphouses. The use of high-quality, low sound emission equipment and regular maintenance will reduce noise associated with Project activities.
  - Bulk storage tanks for processing chemicals such as sulphuric and/or hydrochloric acid, sodium hydroxide, and hydrogen peroxide will sit inside appropriately designed and sized secondary containment basins, physically separated from the containment basins for other chemical systems.
  - Surface pipelines will be designed to have secondary containment or catchment and have leak detection systems in place at key locations.
  - A freeze wall will be established around the uranium deposit to reduce groundwater disturbance.
  - Mining solution and process water will be reused throughout the mining process, reducing water use requirements to the extent feasible and reducing the volume of treated effluent requiring discharge. Make-up water will be preferentially sourced from site runoff where possible.
  - Double-walled, high-density polyethylene or equivalent piping will be used in the wellfields and will be freeze protected and secured to minimize pipe movement.
  - Contaminated wastes (e.g., mineralized drill cuttings, solid impurities removed from mining solution, dewatered reject solids) will be properly contained on a double lined waste pad with leak detection capabilities and an associated monitoring program. An adjacent pond will be used to collect runoff from the pad and water in the waste pond will be piped to the water treatment plant. Such waste will be disposed of either on site or off site at an approved facility.
  - The ISR wellfield and processing plant will be designed to re-use most of the solutions inside each circuit; any excess water will be released to a surface water body once acceptable water quality is achieved. All treated effluent released to surface water will meet federal and provincial regulatory discharge limits.
  - All contaminated areas, such as waste ponds and pads, and the domestic landfill will be fenced to avoid contact with workers and wildlife. Fences will be monitored and maintained.

## 3.2 General Mitigation Measures for Wildlife Species at Risk

Mitigation measures specific to the Wildlife SAR, in accordance with the *Migratory Birds Convention Act* and tailored to Project features will be incorporated into various Project management and monitoring plans such as the erosion and sediment controls, soil and vegetation monitoring, wildlife monitoring, the Decommissioning Plan, air quality monitoring, Spill Response Plan, Radiation Protection Plan, surface water and effluent monitoring and Waste Management Plan.

The management plans within the Environmental Management System (EMS) will provide specific mitigation measures based on proven and accepted mitigation measures following standard industry guidelines and best management practices. The EMS will provide guidance to avoid or minimize potential adverse effects of the Project on avian species and their habitat, including monitoring and follow-up programs, as appropriate. It will be in place during all phases of the Project and will be subject to ongoing review and revision as required. If monitoring identifies a need for additional or revised mitigation measures, a process of adaptive management (as described in the plan) will be triggered. The Project management plans provide direction on monitoring and adaptive management so that responses are timely and effective.

The following subsections provides a description of the mitigation measures that will be applicable during all Project phases and expected to be effective immediately following implementation. Additional mitigation measures specific to the Wildlife SAR that were not included or that were revised from what was described in the draft EIS are provided in **bold text**.

### 3.2.1 Work Timing Windows and Habitat Disturbance

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the nesting season, when practical. **The nesting season for many Wildlife SAR in Saskatchewan spans a period from March 15 to August 31; however, the dates differ for certain species. The Wildlife Management Plans within the EMS will provide details on nesting windows for avian species, as well as other sensitive time periods (e.g., caribou calving periods) occurring in the Terrestrial RSA based on the Saskatchewan Activity Restriction Guidelines for Sensitive Species (SARGSS), which were established to support the avoidance of sensitive species' habitats during sensitive periods (SK MOE 2017).**
- Prior to commencing any site clearing (i.e., vegetation clearing and/or soil disturbance) during the nesting and breeding season, pre-disturbance wildlife clearance surveys will be conducted by a Qualified Professional (QP) at that location within the Project Area to identify sensitive species and habitat features (e.g., nests as well as roosts and hibernacula used by bat species).
- Active and/or suspected breeding and roosting locations identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) in accordance with the level of the disturbance and species until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations). If guidelines cannot be met, due to safety or operational concerns, SK MOE will be contacted for advice on the appropriate response to the situation.

### 3.2.2 Wildlife Education and Awareness

- Employees and contractors will be provided with wildlife education and awareness training, including education about potential Wildlife SAR issues on site and training on the mitigation measures to avoid or minimize potential adverse Project effects on Wildlife SAR and their habitats.
- Employees and contractors will be educated on waste management policies that limit human-avian interactions.
- Designated employees will be trained in appropriate avian deterrent techniques to minimize avian interactions with the Project.
- **Employees and contractors will be requested to report avian observations on site, injured or dead birds (which will be reported to SK MOE). Avian encounters and outcomes will be monitored, and logbooks will be used to record observations. Logbooks and reports will be available to employees.**

### 3.2.3 Wildlife and Habitat Protection

- Personal firearms will be prohibited for employees and contractors within the Project Area to prevent hunting activities.
- If any individual were seeking access around the Project area to undertake Aboriginal and/or Treaty Rights, Denison staff would facilitate this, provided it were safe to do so given activities in the area.
- Policies will be implemented prohibiting employees and contractors from feeding, approaching, or harassing avian species within the Project Area.
- To support habitat regeneration, progressive reclamation and ecosystem-based revegetation will be conducted on disturbed areas as soon as practicable in accordance with the Reclamation and Closure Plan.

### 3.2.4 Wildlife Deterrence and Prevention of Wildlife Entrapment

- **Buildings and other Project infrastructure will be designed and maintained to exclude birds (e.g., barn swallows) and bats as much as possible. This would include installing solid barriers (e.g., corner slope panels, wooden panels) or flexible barriers (e.g., netting, tarps or geotextiles) under roof eaves or other exterior surfaces.**
- **Physical, visual, and/or auditory deterrents will be used to discourage bird and bat use of buildings and other Project infrastructure (e.g., water or waste treatment ponds) for refuge, shelter, breeding, and roosting, and to deter birds and bats from potentially becoming entrapped.**
- **Noise emitting Project activities will be managed to minimize sensory disturbance of wildlife SAR species, especially during sensitive time periods (i.e., breeding and nesting).**
- Low sound emission equipment, regular maintenance of equipment, and the use of silencers or mufflers (whenever practical) will be used to reduce noise associated with Project activities, to the extent practical.
- **Directed lighting or light shielding, rather than broad lighting, will be implemented to minimize sensory disturbance on the wildlife SAR, and lighting will be focused on work sites and not surrounding areas.**

- Dust generation and subsequent deposition on vegetation and in waterbodies (including potential deposition of trace metals and radionuclides) will be limited through dust suppression techniques such as road watering and traffic management.

### 3.2.5 Road and Traffic Management

- Traffic and access control measures will be implemented will include reducing traffic volume by scheduling truck convoys, using high-volume haul trucks, and restricting public access to the Project site and roads (e.g., private vehicles, snowmobiles, all-terrain vehicles, and foot traffic). It is important to note that if any individual were seeking access around the Project area to undertake Aboriginal and / or Treaty Rights, Denison staff would facilitate this, provided it were safe to do so given activities in the area.
- Appropriate road signage will be installed (e.g., speed limits) along Project roads to raise awareness and minimize the potential for wildlife SAR-vehicle collisions.
- Wildlife will have the right-of-way on Project roads, unless it is unsafe to stop (i.e., if a collision is imminent). Vehicles will not be used to encourage wildlife to move off Project roads.
- Processes will be implemented for employees and contractors to slow down and/or stop vehicles/equipment to allow animals to move away or off the road before resuming normal road speeds for the area.
- Employees and contractors will report and communicate the location and circumstances of any roadkill observed on or alongside Project roads. Large-bodied wildlife carcasses found will be reported to SK MOE and disposed of as directed to discourage avian scavengers.
- **Vegetation management, such as mowing and brush cutting, will be implemented along Project roads to reduce site attractiveness for wildlife SAR and maintain appropriate sightlines for drivers to minimize wildlife-vehicle collisions.**
- Alternative measures on Project roads for de-icing and winter traction (e.g., sand, gravel) or dust suppression (e.g., water) will be implemented, whenever practicable.
- Appropriately sized gaps in the roadside snowbanks during winter will be maintained to facilitate wildlife crossing and escape thereby reducing the risk of wildlife-vehicle collisions.
- New Project site and access roads will be designed to minimize sightlines for predators, whenever practicable, while still maintaining general road safety.
- Ditches and culverts along Project roads will be designed and maintained to minimize pooling of water. Roadside pools that form may attract wildlife.

### 3.2.6 Waste and Hazardous Materials Management

- A "no littering policy" for employees and contractors will be implemented within the Project Area.
- **Vegetation management will be incorporated in the vicinity of waste ponds to discourage wildlife SAR use of potentially affected vegetation.**
- Waste will be collected and temporarily stored in wildlife-proof containers to avoid attracting scavengers and with that increase the risk for human-wildlife interact.
- The wildlife-proof containers will be inspected regularly for evidence of avian presence (e.g., gull species) or access to waste disposal facilities. If evidence of avian presence or access to waste disposal facilities is detected, modified systems will be implemented and/or off-site waste disposal frequencies will be increased.
- The use of hazardous materials will be limited as much as possible.

- Hazardous materials will be handled, stored, and disposed of appropriately and in accordance with a Waste Management Plan to avoid attracting avian scavengers (e.g., wildlife-proof containers, exclusion fencing).
- Physical deterrents (e.g., fencing) will be employed around contaminated areas (e.g., waste ponds and waste pads), the domestic landfill, or hazardous materials storage areas to discourage wildlife use.
- Appropriate hazardous materials management practices will be implemented in accordance with industry guidelines and a Waste Management Plan to minimize the risk of accidental spills or leakage.
- Appropriate spill response kits will be positioned adjacent to areas where hazardous materials are stored in accordance with the Spill Response Plan.
- A minimum 100 m distance from any waterbody will be maintained for fuel storage, refueling activities, or equipment servicing in accordance with the Spill Response Plan.
- Appropriate fuel, chemical, and materials management practices will be followed in accordance with the Spill Response Plan to minimize the risk of accidental spills or leakage of diesel fuel, other hydrocarbons, and other hazardous materials.
- Air emissions will be reduced to the extent practical through implementation of an air quality monitoring plan within the EMS.
- All vehicles and equipment will be equipped with industry-standard emission control systems; unnecessary idling of vehicles will be prohibited.
- Vehicles and equipment will be maintained in good working condition (e.g., no leaks) and furnished with industry-standard spill response kits.
- Mitigation measures to reduce the potential for dispersion of radiological contaminants of potential concern to vegetation will be implemented in accordance with the Radiation Protection Plan.
- Education on and enforcement of proper waste and hazardous materials management practices will be provided to employees and contractors.

### 3.3 Species-Specific Mitigation Measures for Wildlife Species at Risk

The following provides a summary of the species-specific mitigation measures that will be implemented during Project activities. Mitigation measures specific to the Wildlife SAR that were not included or that were revised from what was described in the draft EIS are provided in **bold text**. These will be added to the final EIS.

#### 3.3.1 Arthropod Species

- Mitigation measures designed for the Soil and Organic Matter / Peat (Section 9.1.5) and Vegetation and Ecosystems (Section 9.2.5) VCs are expected to mitigate adverse effects on the arthropod species that are considered SAR (i.e., nine-spotted lady beetle, transverse lady beetle, and yellow-banded bumble bee) primarily related to limiting the loss and/or disruption of suitable habitat for these species. These include:
  - The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent safely practicable resulting in reduced habitat disturbance and noise propagation.

- Much of the proposed Project Footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.
- During Operation, progressive reclamation will be completed where possible, and the progress and success of these activities will be assessed annually.
- **Herbicide use as part of vegetation management will be limited to the immediate Project Footprint and applied by licensed professional applicators, when necessary, to limit the potential for adverse effects on arthropod species.**

### 3.3.2 Amphibian Species

- Mitigation measures designed for the Wetlands VC (Section 9.2.5) are expected to mitigate adverse effects on the northern leopard frog primarily related to limiting the loss and/or disruption of suitable habitat for these species. These include:
  - The Project Area (i.e., the area of maximum physical disturbance) has been reduced to the extent safely practicable resulting in reduced habitat disturbance and noise propagation.
  - Much of the proposed Project Footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.
  - During Operation, progressive reclamation will be completed where possible, and the progress and success of these activities will be assessed annually.
- **Pre- disturbance wildlife clearance surveys will be conducted to identify site-specific habitat features (e.g., amphibian breeding ponds) and implement the setbacks and/or timing windows (that will be defined in the Wildlife Management Plan).**
- **Locations of site-specific habitat features used by amphibians will be communicated to Project personnel and the requirement to limit disturbance in these areas will be implemented.**
- **Appropriate setback and buffer distances from wetland features where amphibians are known to occur will be implemented and maintained under the direction of a wildlife QP.**
- **Vehicle traffic and construction activities will be restricted to the approved access routes and work areas and will not cross or enter a watercourse or wetland.**

### 3.3.3 Bat Species

- Vegetation clearing activities will occur outside of roosting periods, when practical.
- **Pre- disturbance wildlife clearance surveys will be completed to identify site-specific habitat features such as maternal roosting sites and hibernacula used by bat species. If features are identified in the Project Footprint, appropriate setbacks and/or timing windows will be implemented in accordance with the SARGSS (SK MOE 2017 (that will also be defined in the Wildlife Management Plan).**
- **In the event a maternal roosting site is identified on the Project Footprint, exclusionary methods (e.g., installing a one-way bat exit) will be implemented following the summer maternity roost season. This installation would allow for bats to leave but not the ability to re-enter the roosting site.**

- Locations of these site-specific habitat features used by bats will be communicated to the appropriate Project personnel and the requirement to limit disturbance in these areas will be implemented.
- Specific exclusion methods will be added as mitigation measures (Section 9.4.5 of the final EIS) to prevent access to buildings and other infrastructure.

### 3.3.4 Avian Species

- Site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the nesting season, when practical. The breeding and nesting season for most avian species in Saskatchewan typically spans a period from March 15 to August 31; however, the dates differ for certain species.
- In the event Project activities such as vegetation clearing and/or soil disturbance are required during the breeding and nesting season, pre-disturbance wildlife clearance surveys will be conducted by a QP at that location within the Project Area before activities commence to identify the presence of avian SAR and/or their nests.
- Active and/or suspected breeding and roosting locations identified during the pre-disturbance wildlife clearance surveys will be protected with a no-disturbance setback buffer consistent with regulatory guidelines (e.g., the 2017 SARGSS [SK MOE 2017]) for other grebe species (as there is currently no activity restriction guidelines for horned grebe in Saskatchewan) in accordance with the level of the disturbance and species until the young have successfully fledged, the nest is confirmed as no longer active (e.g., abandoned or depredated), or the nesting window has passed (for suspected nest locations).
- Locations of nesting sites used by bank swallows, barn swallows, and horned grebe will be communicated to appropriate Project personnel and the requirement to limit disturbance in these areas will be implemented.
- Deterrents designed to discourage or prevent barn swallows from using buildings and other Project infrastructure have been described in Section 3.2.4 of the EIS.
- Buildings and other Project infrastructure will be designed and maintained to exclude birds (e.g., barn swallows) and bats as much as practical. This would include installing solid barriers (e.g., corner slope panels, wooden panels) or flexible barriers (e.g., netting, tarps or geotextiles) under roof eaves or other exterior surfaces.

## 4 Residual and Cumulative Effects Summary

---

The approach to assessing residual Project effects on wildlife VCs followed the methodology outlined in Section 5.8 of the EIS, which included a habitat-based approach. For each VC and associated KI, each residual effect was assessed in the context of the Project activities that will occur within each Project phase. Each residual effect was then characterized based on the combined predicted residual effect for all phases. See Sections 9.3.6 and 9.4.6 of the EIS for specific details regarding the residual effects assessment for wildlife VCs (i.e., residual effect characterization and significance determination). A summary of the environmental assessment considerations and determination for predicted residual effects for Wildlife SAR is provided in Table 4.1. Mitigation measures specific to the Wildlife SAR that were not included or that were revised from what was described in the draft EIS are provided in bold text. These will be added to the final EIS.

The cumulative effects assessment (CEA) followed standard methodology as per provincial (e.g., Guidelines for an Environmental Assessment under the [Saskatchewan] *Environmental Assessment Act* 1980) and federal (e.g., Assessing Cumulative Environmental Effects under the *Canadian Environmental Assessment Act 2012*) guidance, and is discussed in detail in Section 5.9 of the EIS. Similar to the residual effects assessment, the CEA included a habitat-based approach. See Sections 9.3.7 and 9.4.7 of the EIS for specific details regarding the CEA for wildlife VCs. A summary of the significance determination of the cumulative effects on Wildlife SAR is provided in Table 4.2.

**Table 4.1 Summary of the Environmental Assessment Considerations and Determination for Predicted Residual Effects for Wildlife Species At Risk**

Component	Wildlife SAR	Measurable Parameters	Project Activities Resulting in Primary Interactions	Project Phase	Species-Specific Mitigation Measures <sup>1</sup>	Predicted Residual Effect	Significance

## Attachment: IR-143

Number	IR-143
Dept.	ECCC
Project effects link	Wildlife and Wildlife habitat
Reference to EIS, appendices, or supporting documentation	Section 9.3.3.3, Baseline Studies
Context and Rationale	<p><b>Context and Rationale:</b> The baseline caribou data is insufficient to understand potential Project impacts to this species. Presence/absence detection was provided by camera traps, incidental observations, winter track and pellet survey.</p> <p>Additional information and analyses on caribou use of the landscape during all life stages of the Project area is required to assess impacts and to determine significance of impact from the Project to caribou.</p>
Information Requirement	<p>Provide details on the baseline caribou data including:</p> <ul style="list-style-type: none"> <li>• Revision of map 9.3-8 to include all observations, categorized by type, season and year (see also IR-145); and</li> <li>• Description of seasonal use of the LSA, RSA and caribou range.</li> <li>• Description of Project areas used by caribou.</li> <li>• Description of future studies planned to assess habitat use by caribou. Include specific details on how many additional years of aerial surveys will be completed to assess the caribou baseline conditions.</li> </ul> <p>Utilizing additional data noted above and specified in IR-145, explain how caribou use of the area could be affected by the Project throughout all seasons and life stages (e.g., calving, post-calving, rutting, wintering).</p> <p>See also related: IR-152.</p>

Dept.	ECCC CNSC
Project effects link	Wildlife and Wildlife habitat
Reference to EIS, appendices, or supporting documentation	Section 9.3.5.2, Additional Wildlife- specific Mitigation Measures
Context and Rationale	<p><b>Context:</b> The EIS describes that ongoing research is performed to inform the development of a Woodland Caribou Management Plan. This includes studies on the effectiveness of linear disruption features on predator/prey movements, and a field program for long-term reclamation planning. Moreover, it is stated that the Plan will include a detailed assessment of the need for habitat offsets.</p> <p>The draft EIS Section 9.3.5.2 states: “A wildlife monitoring plan and a Woodland Caribou Management Plan will be developed to address wildlife-specific mitigation measures based on proven and accepted mitigation following standard industry guidelines and BMPs. The plans will provide guidance to avoid or minimize potential adverse effects of the Project on wildlife and wildlife habitat, including monitoring and follow-up programs, as appropriate. It will be in place during all phases of the Project and will be subject to ongoing review and revision as required. If monitoring identifies a need for additional or revised mitigation measures, a process of adaptive management (as described in the plan) will be triggered.”</p> <p><b>Rationale:</b> The draft EIS does not present sufficient species-specific mitigation measures for boreal caribou. ECCC is not able to assess potential residual impacts to caribou without specific mitigations.</p> <p>Since the Woodland Caribou Management Plan is still under development, it is difficult to judge whether the measures will be adequate to mitigate and/or offset potential project effects on Woodland caribou and its critical habitat.</p>
Information Requirement	<p>Provide the Woodland Caribou Management Plan, to demonstrate effective mitigation of potential project effects, along with wildlife-specific mitigation measures for review.</p> <p>The Plan should be informed by and consistent with the Boreal Caribou Recovery Strategy and demonstrate that avoidance and minimization measures will be applied to mitigate for predicted Project effects to boreal caribou and its critical</p>

	<p>habitat prior to considering offsetting measures. That is, the Plan should follow the mitigation hierarchy and information should be provided as outlined below:</p> <ol style="list-style-type: none"> <li>1. AVOID: Describe all measures that will be taken to avoid effects to boreal caribou and avoid the destruction or alteration boreal caribou critical habitat.</li> <li>2. MINIMIZE: Describe all measures that will be taken to minimize the effects to boreal caribou and minimize the destruction of boreal caribou critical habitat.</li> <li>3. RESTORE ON-SITE: describe the measures that will be taken to restore disturbed areas of the project, related to construction, operation and maintenance, on boreal caribou critical habitat, remaining after considering the avoidance and minimization measures.</li> <li>4. Characterize the risk of the adverse effects that are likely to result from the project on boreal caribou and its critical habitat after avoidance minimization, and onsite restoration measures have been considered.</li> <li>5. OFFSET: Describe the measures that will be implemented outside the Designated Project area to mitigate adverse effects, destruction or alteration of boreal caribou critical habitat by the Designated Project during construction and operation.</li> <li>6. Characterize the risk of the adverse effects that are likely to result from the project on boreal caribou and its critical habitat after avoidance, minimization, onsite restoration, and offset measures have been considered.</li> </ol> <p>Describe all relevant uncertainties on the effectiveness of the measures to address adverse effects on boreal caribou and the rationale for the selected measure, in light of the mitigation hierarchy.</p> <p>See also related IRs: IR-149 and IR-157.</p>

## Acronyms and Abbreviations

Term	Definition
Anthropogenic	Caused or produced by humans
BSCs	biological soil crusts
Boreal Caribou	The boreal ecotype of woodland caribou occurs within the boreal forest of Canada. These non-migratory caribou form small aggregations throughout the year and disperse for solitary calving.
Committee on the Status of Endangered Wildlife in Canada (COSEWIC)	A committee made up of experts from academic, government and non-government organizations that assess the conservation status of wildlife species that may be at risk of extinction in Canada.
Critical Habitat	The habitat that is necessary for the survival of a listed wildlife species and is identified as the species critical habitat in the recovery strategy or action plans for the species.
DERT Project	Developing Eco-Restoration Together Project
Disturbed habitat (per ECCC 2020)	Habitat showing: i) anthropogenic disturbance visible on Landsat at a scale of 1:50,000, including habitat within a 500 m buffer of the anthropogenic disturbance; and/or ii) fire disturbance in the last 40 years, as identified in data from each provincial and territorial jurisdiction (without buffer).
ECCC	Environment and Climate Change Canada
EA	environmental assessment
EIS	environmental impact statement
EMS	environmental management system
ENV	Saskatchewan Ministry of Environment
ha	hectare
Local Populations (ECCC 2020)	Group of boreal caribou occupying a defined area distinguished spatially from areas occupied by other groups of boreal caribou. Local population dynamics are driven primarily by local factors affecting birth and death rates, rather than immigration or emigration among groups. In this recovery strategy, “local population” refers to a group of boreal caribou occupying any of the three types of boreal caribou ranges (i.e., conservation unit, improved conservation unit, local population unit).

Plan	Conceptual Caribou Mitigation Plan
Project	Wheeler River Project
Range (per ECCC 2020)	<p>The geographic area occupied by a group of individuals that are subject to similar factors affecting their demography and used to satisfy their life history processes (e.g., calving, rutting, wintering) over a defined time frame.</p> <p>Environment and Climate Change Canada (2011) identified three types of boreal caribou ranges categorized based on the degree of certainty in the delineated range boundaries (i.e., conservation unit, improved conservation unit, local population unit).</p>
Recovery strategy	A planning document that identifies what needs to be done to stop or reverse the decline of a species.
SARA	Species at Risk Act
Self-sustaining local population (ECCC 2020)	A local population of boreal caribou that on average demonstrates stable or positive population growth over the short-term ( $\leq 20$ years) and is large enough to withstand stochastic events and persist over the long-term ( $\geq 50$ years), without the need for ongoing active management intervention.
Threatened species	A wildlife species that is likely to become endangered if nothing is done to reverse the factors leading to its extirpation or extinction.
Undisturbed habitat (per ECCC 2020)	Habitat not showing any: i) anthropogenic disturbance visible on Landsat at a scale of 1:50,000, including habitat within a 500 m buffer of the anthropogenic disturbance; and/or ii) fire disturbance in the last 40 years, as identified in data from each provincial and territorial jurisdiction (without buffer). Disturbance within the 500 m buffer would result in a reduction of the undisturbed habitat.

# 1 Introduction

---

The Wheeler River Project (the Project) environmental impact statement (EIS) evaluates and assesses potential Project-related effects on the Boreal population of woodland caribou (*Rangifer tarandus caribou*; referred to herein as caribou or boreal caribou) following standard environmental assessment (EA) methodology. The assessment of potential effects considered both direct (i.e., habitat loss) and indirect effects (i.e., habitat alteration) on caribou and their habitat, while assuming that caribou were present year-round and during all of their life stages (i.e., calving, rearing, mating, over wintering). In this way, the EIS took a precautionary or conservative approach to understanding/addressing the likely residual effects (i.e., effects remaining after mitigation measures were considered) of the Project on caribou and their habitat and is using this approach as a planning tool to inform/support future Project-related regulatory approvals processes and follow-up monitoring. The EIS has demonstrated that the Project, as proposed and assessed, is predicted to minimize the potential for environmental adverse effects on caribou and their habitat before any Project specific construction occurs. The conclusions of the assessment predicted that the likely residual effects of the Project on caribou were not significant.

This Conceptual Caribou Mitigation Plan (the Plan), developed proactively by Denison, has a different objective than the EIS. The Plan builds on the assessment of potential Project effects and commitments to mitigate such effects made in the EIS and is expected to be advanced with ongoing consultation with the Saskatchewan Ministry of Environment (ENV), as ENV finalize the caribou range plan for SK1. The EIS is a conservative planning tool, whereas the Plan is a practical, living document designed to define management works associated with caribou. The Plan is not a requirement for EA determination but is provided as a guidance document to help Denison proactively describe and inform the development and implementation of appropriate mitigation measures related to caribou and their habitat.

The Plan is an evergreen document. It will be consistent with the management goals of ENV for the SK-1 caribou conservation unit, and will be developed/refined in consultation with local communities including English River First Nation and Kineepik Métis Local in Pinehouse and regulators (e.g., ENV). As noted above, the boreal caribou range plan for SK-1 is under development and it is understood that this Plan will be updated as more information becomes available. The conceptual nature of the Plan is in part due to the absence of range plan priorities and reflects Denison's commitment to continue to work with the province to meet the management objectives and management strategies for the SK1 range.

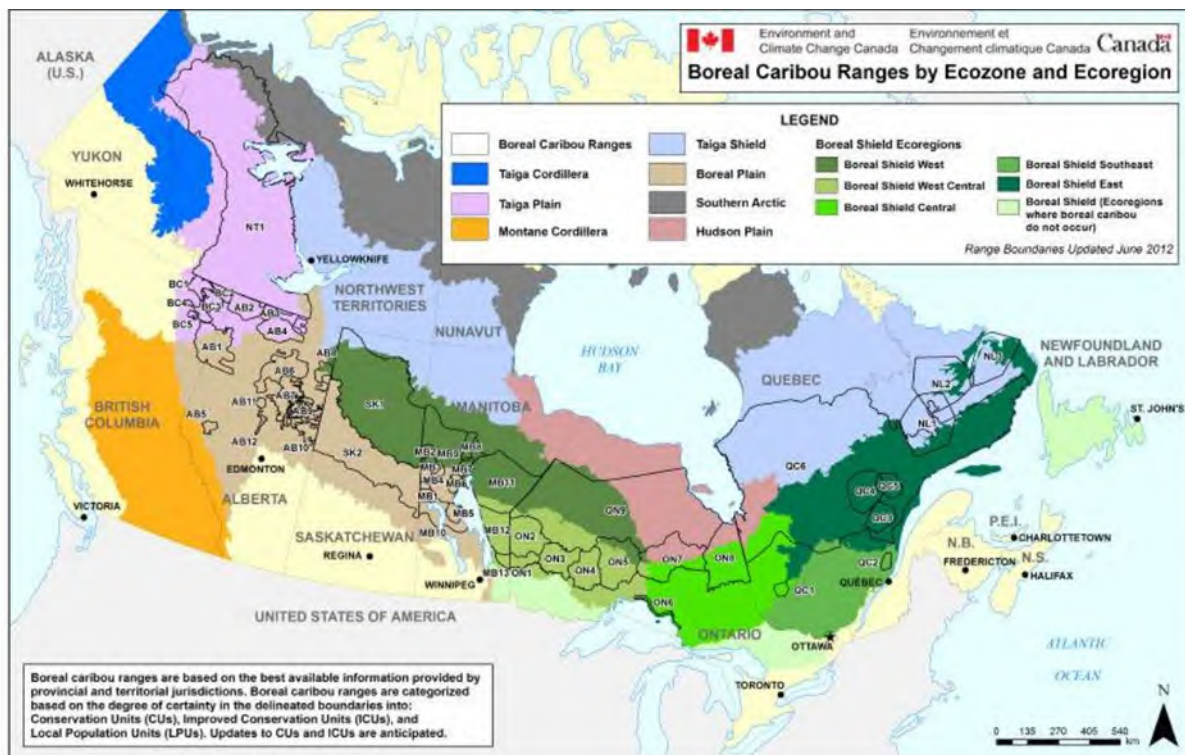

## 2 Guidance and Regulatory Framework

A brief review highlighting federal and provincial considerations of boreal caribou is provided below for reference.

### 2.1 Federal

Boreal caribou have been designated as *threatened* under the federal *Species at Risk Act* (SARA). Environment and Climate Change Canada (ECCC) released amended recovery strategy for woodland caribou in 2020 (ECCC 2020). A recovery strategy is a planning document that identifies what should be done to stop or reverse the decline of a species.

The Project is located in the Boreal Shield West ecoregion of the Boreal Shield ecozone. The Boreal Shield West ecoregion stretches from Alberta to Ontario (Figure 2-1).

**Figure 2-1: Boreal Caribou Distribution Across Ecozones and Ecoregions in Canada (source: ECCC 2020)**

The SK1 range comprises more than 18,000,000 hectares (ha) and is characterized by high fire disturbance and low anthropogenic disturbance (ECCC 2020). The likelihood of caribou self-sustainability in the boreal shield range in SK1 is “likely” (ECCC 2020). For SK1, the amended recovery strategy (ECCC 2020) identifies 40% undisturbed habitat in the range as the disturbance management threshold, which provides a measurable probability (71%) for the local population to be self-sustaining. This threshold is considered a minimum threshold because at 40% undisturbed habitat there remains a risk (29%) that the SK1 local population cannot be self-sustaining. Disturbed habitat (ECCC 2020) is habitat showing: i) anthropogenic disturbance visible on Landsat at a scale of 1:50,000, including habitat within a 500 m buffer of the

anthropogenic disturbance; and/or ii) fire disturbance in the last 40 years, as identified in data from each provincial and territorial jurisdiction (without buffer). Undisturbed habitat (ECCC 2020) is habitat not showing any: i) anthropogenic disturbance visible on Landsat at a scale of 1:50,000, including habitat within a 500 m buffer of the anthropogenic disturbance; and/or ii) fire disturbance in the last 40 years, as identified in data from each provincial and territorial jurisdiction (without buffer). Disturbance within the 500 m buffer would result in a reduction of the undisturbed habitat.

Studies (e.g., McLoughlin et al. 2019) indicate that the SK1 local caribou population is likely self-sustaining at current levels of disturbance (60% total disturbance), with a 71% probability of persistence. Environment and Climate Change Canada's analyses also indicate that the SK1 local population is sensitive to small increases anthropogenic disturbance and sensitive to small decreases in adult survival. For these reasons, a higher probability of persistence was selected for critical habitat identification in SK1 (71%) than was selected for the other 50 ranges across Canada (60%) (ECCC 2019).

The precise location of the 40% undisturbed habitat within the range is expected to vary over time. The habitat within the SK1 range should exist in an appropriate spatial configuration such that boreal caribou can move throughout the range and access required habitat when needed. The key to this habitat delineation is achieving and maintaining an overall, ongoing range condition that allows for the dynamic habitat supply system, containing the biophysical attributes upon which caribou depend, to remain sustainable. It is this dynamic habitat supply system within the SK1 range that is the habitat condition considered to be necessary for the caribou.

## 2.2 Provincial

The responsibility for woodland caribou management lies with the Province of Saskatchewan. Broadly, the province is responsible for developing range plans or management plans which build on the federal recovery strategy by setting goals and objectives for maintaining sustainable population levels.

The Saskatchewan Conservation Data Centre (SK-CDC) is responsible for evaluating and assigning a conservation rank to each taxon, resident or transient, found in the province. Woodland caribou's subnational or S-rank conservation rank is S3. This ranking indicates that, provincially, the species is vulnerable/rare to uncommon which is associated with a moderate risk of extinction or extirpation due to a restricted range, relatively few populations, recent and widespread declines, threats, or other factors. Currently, the caribou population in SK-1 is stable (ENV 2023) and the range plan is under development. Engagement is a key component of the range plan process and will be completed with representatives from First Nation, Métis, industry, non-governmental organizations, and communities.

The provincial goal is to sustain and enhance woodland caribou populations, and maintain the ecosystems they require, throughout their current range (ENV 2013). Through the woodland caribou range assessment and range planning program, the province is:

- Gaining a better understanding of woodland caribou ecology;
- Working toward meeting objectives identified in provincial and federal strategies; and
- Improving how the province manages the species and related habitat.

The province's woodland caribou range assessment and range planning program incorporates two key components:

- Woodland caribou range assessment, which enhances the understanding of woodland caribou populations and their interactions with the environment; and
- Woodland caribou range planning, which provides a framework, strategies and objectives that allow for better decisions involving habitat management and self-sustaining caribou populations.

Although the management objectives and management strategies for caribou in SK1 are not yet defined, Denison is committed to working with ENV as the range plan is developed. The Plan will be updated as the Project advances so that it aligns with the conservation objectives as determined by the province as the primary steward of caribou in the province.

## 3 SK 1 Caribou Population – Background Information

---

Background information concerning the condition of the SK 1 caribou population is provided below.

### 3.1 Population Trends

The SK1 Boreal Shield management unit contains high-quality conifer-dominated caribou habitat with greater than 40-year-old stands of jack pine and black spruce forests suitable for lichen colonization, black spruce swamps, and open muskegs supporting relatively high densities of caribou, at 36.9 caribou/1,000 km<sup>2</sup> or approximately 4,000 caribou across the SK1 Boreal Shield Woodland Caribou Management Unit (McLoughlin et al. 2019).

Research has shown that up to 70% of the year-round diet of caribou may consist of ground and arboreal lichens. If the quantity of available lichen forage is low, caribou can exist without relying entirely on lichens (McLoughlin et al. 2019). Due to their physiology, lichens are resilient to periods of drought and cold temperatures, but because of their slow growth rate, exhibit a slow recovery time after depletion and fire events. In the SK1 range, McLoughlin et al. (2019) found that stand types with the highest potential for adequate lichen biomass for caribou are jack pine and poorly drained black spruce sites.

McLoughlin et al. (2019) observed that, from 2014 to 2018, the caribou population exhibited a high average adult female survival rate and moderate recruitment (0.192 calves per cow in March), ranging from a low of 0.134 calves/cow in March 2016 to 0.244 calves/cow in March 2018. These demographic parameters led the authors to assess the SK1 Boreal Shield caribou population as being stable at the time of their study (McLoughlin et al. 2019).

While calving areas have not been documented within the SK1 range, it is recognized that caribou may use open fen and treed bog habitat types for calving during the spring/summer period. In Saskatchewan, caribou habitat used during the calving season in the SK2 range demonstrated a strong selection for treed muskegs, but avoidance of jack pine, mixed hardwood stands, and roads (Dyke 2008).

Neufeld et al. (2021) summarized results from aerial surveys over a period of eight years in an 87,193 km<sup>2</sup> study area in the Athabasca Plain and Churchill River Upland ecoregions in the north, that are inclusive of the Terrestrial RSAs that were used in the EIS. During 11 of 16 aerial caribou surveys conducted between 2008 and 2015, woodland caribou were detected in the surveyed areas. The average density of the 16 surveys was estimated at 36.9 caribou/1,000 km<sup>2</sup> (95% CI = 26.7 to 47.2 caribou/1,000 km<sup>2</sup>). Across the Neufeld et al. (2021) study area and all years, estimated caribou densities were higher in comparison to averages reported for most other boreal woodland caribou ranges in Canada (i.e., caribou density reported in other areas ranged 4.3 to 18.7/1,000 km<sup>2</sup>) indicating that caribou can tolerate natural disturbance. One exception to the relatively high caribou densities in northern Saskatchewan was noted: the 2,285 km aerial the Millennium Project in March 2014, 10 km west of the Terrestrial RSA, resulted in lower woodland caribou densities at 5 caribou/1,000 km<sup>2</sup> (Neufeld et al. 2021).

Eight of the sixteen caribou surveys reported the ratios of male to female and calf to female in their results with the average male:female ratio calculated at 0.571 (95% CI = 0.444 to 0.699) and calf:female at 0.195 (0.158 to 0.232). Again, the 2014 Millennium survey reported a different male:female ratio, outside the reported range (1.6), concurring with the reported low caribou densities.

## 3.2 Predation

In addition to relatively low predator densities in their study area, McLoughlin et al. (2019) found some spatial separation between caribou and wolves. Caribou did not seem to avoid existing linear features (such as roads, trails, and transmission lines) in the area, while wolves established their territories away from linear features. Unlike caribou, who preferred mature conifer stands, wolves selected for wetlands and patches of deciduous-mixed forest, avoiding stands of mature conifers. Other prey species, such as moose, also occurred at relatively low densities (i.e., 45.7 moose/1,000 km<sup>2</sup>) (McLoughlin et al. 2019).

McLoughlin et al. (2019) observed that mortality of adult caribou occurred mostly during the snow-free season and only 1 of 94 collared caribou was harvested by a hunter during the four years of the study.

While predation is believed to be a key limiting factor for woodland caribou (Bergerud 1974; Stuart-Smith et al. 1997, DeMars et al. 2011 from ECCC 2020), Neufeld et al. (2021) suggested that habitat- or disturbance-mediated apparent competition only plays a minor role in the Saskatchewan woodland caribou population. Habitat- or disturbance-mediated apparent competition occurs when natural (e.g., forest fires) and anthropogenic (e.g., human development or activities) disturbances increase the abundance of other ungulates, which in turn may increase predator densities, which then increases predation risk to caribou. Neufeld et al. (2021) concluded that Northern Shield and Taiga ecoregions are of low productivity where caribou may compete with only one ungulate species (i.e., moose) and therefore, caribou and wolf dynamics do not follow general habitat- or disturbance-mediated apparent competition models.

## 3.3 Harvest

Indigenous peoples in Saskatchewan have an inherent right to harvest woodland caribou for subsistence purposes (ENV 2013). No other harvest of woodland caribou is currently permitted. Under provincial and federal recovery planning and effective species management, self-sustaining caribou populations will support long-term subsistence use of the species and protect treaty rights. Subsistence harvest levels are assumed to be low but actual numbers are not available because most communities or Indigenous groups are not collecting and/or publishing this information.

## 4 No Net Loss and Mitigation Hierarchy

A generic biodiversity mitigation hierarchy (OECD 2016) to achieve no net loss is provided in Figure 4-1. As shown in the hierarchy, an offset can be used to achieve no net loss if residual effects remain following efforts to avoid, minimize, and restore potential project effects. This generic hierarchy is generally consistent with the approach of ENV to manage effects on caribou and their habitat.

The balance of Section 4 of this Plan outlines Denison's approach to avoid, minimize, and restore caribou habitat per commitments made in the draft EIS associated with the Wheeler River Project.

**Figure 4-1: Generic No Net Loss and Mitigation Hierarchy (modified from OECD 2016)**

### 4.1 Avoid

Potential adverse effects on the caribou have been avoided to the extent possible through Project design, including:

- Selection of in-situ recovery (ISR) mining avoids some direct and indirect effects compared to conventional underground or open-pit mining methods. ISR mining avoids the need for spatially expansive infrastructure such as waste rock piles and tailings management facilities reducing the Project footprint (i.e., avoids direct effects on caribou and their habitat). ISR mining also reduces the potential for interactions between caribou and Project components / activities as it concerns sensory disturbance as it is inherently a less intensive form of mining with reduced noise/light/vibration generation (i.e., avoids indirect effects on caribou and their habitat).

- Site clearing and other works that involve disturbance of vegetation and/or soil will be completed during least-risk timing windows for caribou (for example, outside of wintering/calving period from April 1-July 31, per ENV 2013), where practical, to avoid disturbance during sensitive time periods.
- Pre-disturbance wildlife surveys will be completed to identify caribou presence and work will be postponed if caribou are present.

## **4.2 Minimize**

Additional mitigation measures to minimize effects on caribou and their habitat and tailored to Project features have been incorporated into the various Project management and monitoring plans within the Environmental Management System (EMS) including but limited to erosion and sediment controls, soil and vegetation monitoring, Decommissioning Plan, air quality monitoring, fuel spill control and response, Radiation Protection Plan, surface water and effluent monitoring, and Waste Management Plan.

The Project's EMS plans provide direction on monitoring and adaptive management so that issues are identified and mitigation measures are developed and implemented in a timely and effective manner. Mitigation measures specific to caribou are applicable during all Project phases, within all seasons and expected to be effective following appropriate implementation. Examples of the measures to minimize Project effects on wildlife in general, and caribou in particular, are highlighted below.

### **4.2.1 Disturbance Footprint**

- Siting Project components in close proximity to the ISR mining area minimizes indirect effects on caribou and their habitat. The Project components are also west of the known home range of woodland caribou (based on tracking data received by the Ministry of Environment; Figure 4-2), although the absence of data does not mean the absence of caribou and Denison has observed caribou in the area. . Appropriate siting is anticipated to minimize the potential for interactions with woodland caribou and Project activities.
- The Project footprint (i.e., the area of maximum physical disturbance) has been reduced to the extent safely practicable, resulting in limited/minimal habitat loss/disturbance and noise propagation.
- Portions of the proposed Project footprint will be developed within previously disturbed areas, including roads currently used for exploration activities, thereby minimizing additional habitat disturbance.

# Denison-Wheeler Study Area - Woodland Caribou Location Data

RSA Boundary		
Data Type	Years	Number of Locations

NOTE: Absence of data does not mean absence of woodland caribou.

**Figure 4-2 Saskatchewan Ministry of Environment Woodland Caribou Location Data Provided to Denison**

#### **4.2.2 Wildlife and Habitat Protection**

- Project activities have been assessed for their potential to disturb or remove wildlife and/or wildlife habitat (e.g., site clearing, soil disturbance) to determine potential effects on wildlife and wildlife habitat and the assessment, including proposed mitigation measures, for the Project will guide Project activities.
- Pre-disturbance wildlife clearance surveys will be conducted within the Project Area; results of the clearance surveys will inform the development and implementation of appropriate mitigation (e.g., delay of work) to address the identified issue (e.g., presence of caribou).
- Personal firearms for employees and contractors will be prohibited within the Project Area to prevent hunting activities.
- Policies will be implemented prohibiting employees and contractors from feeding, approaching, or harassing wildlife species within the Project Area.
- To support wildlife habitat regeneration, progressive restoration including ecosystem-based revegetation will be conducted on disturbed areas as soon as practicable in accordance with the Decommissioning Plan.

#### **4.2.3 Wildlife Deterrence and Prevention of Wildlife Entrapment**

- In addition to installing secure fencing around all contaminated areas to prevent accidental contaminant exposure, buildings and other Project components will be designed and maintained to exclude wildlife from using buildings for refuge or shelter, and to deter wildlife from potentially becoming entrapped.

#### **4.2.4 Sensory Disturbance**

- Noise emitting Project activities will be managed to minimize sensory disturbance of wildlife, especially during sensitive time periods, such as calving. This would include:
  - locating excessive noise generating activities such as the concrete batching operation as far away from sensitive wildlife locations as possible;
  - directing the generator discharge openings away from sensitive locations; and
  - making use of available on-site obstructions to control sound exposure at sensitive areas (i.e., locate sources behind buildings).
- The main sources of noise will be related to transport of people and goods, drilling of holes for the freeze wall and wellfield, operation of the batch plant, operation of the processing plant, and operation of the pumphouses. Low sound emission equipment and the use of silencers or mufflers (whenever practical) will be used to reduce noise associated with Project activities. There will be regular maintenance of equipment to ensure it is in proper working order and not emitting noise unduly.

- Lighting will be focused on work sites and not surrounding areas, to minimize light trespass and other light-related pollution sources.
- Facilities will be illuminated only to meet standards set for the protection of workers to avoid over-illumination.
- Battery-powered, light vehicles and mobile equipment, and an AC powered dual rotary drill will be used for ISR wellfield development instead of a traditional diesel-powered unit, where practical, to reduce air emissions and noise levels and improve energy efficiency.
- Fugitive dust sources that could lead to deposition of dust on vegetation and waterbodies (including potential deposition of trace metals and radionuclides) will be reduced by:
  - dust suppression techniques on site roadways, such as road watering and traffic management;
  - directing processing plant exhaust from drying and packaging areas through a stack prior to release outside of the building;
  - designing the stack height based on results of air dispersion modelling to be an appropriate height for optimal dispersion;
  - making a wash bay available to clean items, equipment, and vehicles that may have been in contact with potentially contaminated materials. Contaminated water from the wash bay will be collected in a sump tank and routed to the water treatment plant for treatment and discharge; and,
  - conducting radiological clearance scanning as required for any items, equipment, and vehicles leaving the Project Area.

#### **4.2.5 Road and Traffic Management**

- Traffic and access control measures will be implemented, including managing traffic volume by scheduling truck convoys, using high-volume haul trucks, and restricting public access (e.g., private vehicles, snowmobiles, all-terrain vehicles, and foot traffic) to the Project site and roads with both north and south security access gates. It is important to note that if any individual were seeking access around the Project area to undertake Aboriginal and / or Treaty Rights, Denison staff would facilitate this, provided it was safe to do so given Project activities in the area.
- Appropriate road signage will be installed (e.g., speed limits, identification of wildlife crossings and areas of high activity) along Project roads to minimize the risk of wildlife-vehicle collisions.
- Speed limits will be implemented to reduce the risk of wildlife-vehicle collisions.
- Wildlife will have the right-of-way on Project roads, unless it is unsafe to stop (i.e., if a collision is imminent). Vehicles will not be used to encourage caribou to move off Project roads and processes will be implemented for employees and contractors to slow down and/or stop vehicles/equipment to allow caribou to move away or off the road before resuming normal road speeds for the area.

- Road watering and regular road maintenance to limit dust dispersion.
- Employees and contractors will report and communicate the location and circumstances of any roadkill observed on or alongside Project roads. Large-bodied wildlife carcasses found will be promptly reported to ENV and disposed of as directed to prevent scavenging.
- Vegetation along Project roads will be managed to reduce attractiveness to wildlife (e.g., forage plants) and maintain appropriate sightlines for drivers to minimize wildlife-vehicle collisions.
- Alternative measures on Project roads for de-icing and winter traction (e.g., sand, gravel) or dust suppression (e.g., water) will be implemented, whenever practicable, to limit the use of specialty chemicals and potential exposure of wildlife including caribou to them.
- Appropriately sized gaps in the roadside snowbanks during winter will be maintained to facilitate caribou crossing and escape and, with that, reducing their risk of vehicle collisions.
- New Project site and access roads will be designed to minimize sightlines for predators, whenever practicable, while still maintaining general road safety.
- Ditches and culverts along Project roads will be designed and maintained to minimize pooling of water as roadside pools may attract caribou.

#### **4.2.6 Water Management, Waste Management, Emissions, and Hazardous Materials Management**

- Education on and enforcement of proper water, waste, emissions and hazardous materials management practices will be provided to employees and contractors.
- A freeze wall will be established around the uranium deposit to reduce potential for groundwater disturbance or contamination mitigating the likelihood of exposure of caribou to contaminants in local areas of groundwater discharge to surface.
- The ISR wellfield and processing plant will be designed to re-use most of the solutions inside each circuit, reducing water use requirements to the extent feasible. Make-up water will be preferentially sourced from site runoff (instead of freshwater) where possible.
- Contaminated wastes (e.g., mineralized drill cuttings, process precipitates) will be temporarily stored on double lined pads with leak detection capabilities and an associated monitoring program until final disposal at an approved facility. An adjacent pond will be used to collect contact water from these pads.
- All contact water will be routed to the Industrial Wastewater Treatment Plant for treatment and eventual release to the environment. All treated effluent released to surface water will meet federal and provincial regulatory discharge limits. This will mitigate exposure of caribou to Project-related contaminants released to the environment.

- Surface pipelines will be designed to have secondary containment or catchment and have leak detection systems in place at key locations to mitigate the likelihood of the release of such chemicals to the environment that could result in exposure of caribou to the chemicals.
- Double-walled high-density polyethylene (HDPE) or equivalent piping will be used in the wellfields and will be freeze protected and secured to minimize pipe movement to mitigate the likelihood of the piping failure and the associated release of wellfield chemicals to the environment that could result in exposure of caribou to the chemicals.
- Denison is proposing to segregate and compost organic wastes on site in a composting system, reducing the volume of material in the domestic landfill generating odours and thereby minimizing wildlife attractants.
- Domestic waste will be collected and temporarily stored in wildlife-proof containers to avoid attracting wildlife and reduce the risk for human-wildlife interactions. The wildlife-proof containers will be inspected regularly for evidence of wildlife presence or access to waste disposal facilities. If evidence of wildlife presence or access to waste disposal facilities is detected, modified systems will be implemented and/or off-site waste disposal/incineration frequencies will be increased.
- A "no littering policy" for employees and contractors will be implemented within the Project Area.
- Air emissions will be reduced to the extent practical through implementation of the development of air emissions management and monitoring plans within the EMS.
- All vehicles and equipment will be equipped with industry-standard emission control systems; unnecessary idling of vehicles will be prohibited to reduce emissions.
- The use of hazardous materials will be limited as much as possible.
- Appropriate hazardous materials management practices will be implemented in accordance with industry guidelines to minimize the risk of accidental spills or leakage. This will mitigate the likelihood of release to the environment that could result in exposure of caribou to the hazardous materials.
- Hazardous materials will be handled, stored, and disposed of appropriately and in accordance to avoid attracting wildlife (e.g., wildlife-proof containers, exclusion fencing) to mitigate the likelihood of exposure of caribou to hazardous materials.
- Physical deterrents (e.g., fencing) will be employed around contaminated areas (e.g., waste ponds and waste pads), the domestic landfill, or hazardous materials storage areas to discourage wildlife use / interaction. The deterrents will be monitored and maintained .
- Appropriate spill response kits will be positioned adjacent to areas where hazardous materials are stored in accordance with the Spill Response Plan to mitigate the likelihood of

the release of hazardous material to the environment that could result in exposure of caribou to the material.

- A minimum 100 m distance from any waterbody will be maintained for fuel storage, refueling activities, or equipment servicing in accordance with the Spill Response Plan. This will mitigate the likelihood of a fuel spill to water that could result in exposure of caribou to fuel.
- Appropriate fuel, chemical, and materials management practices will be followed in accordance with the Spill Response Plan to minimize the risk of accidental spills or leakage of diesel fuel, other hydrocarbons, and other hazardous materials and mitigate the likelihood of exposure of caribou to such chemicals.
- All vehicles and equipment will be maintained in good working condition (e.g., no leaks) and furnished with industry-standard spill response kits.

#### **4.2.7 Wildlife Education**

- Employees and contractors will be provided with wildlife education and awareness training, including education about potential caribou issues on site and training on the mitigation measures summarized with the EMS and specifically in this Plan to avoid or minimize potential Project effects on caribou and caribou habitat.
- Employees and contractors will be educated on waste and hazardous waste management practices / policies that limit human-wildlife interactions and the potential exposure of wildlife to those wastes.
- Designated employees will be trained in appropriate wildlife deterrent techniques to minimize wildlife interactions with the Project.
- Employees and contractors will be requested to report wildlife observations, including prompt reporting of caribou observations and immediate communication to on-site staff. Wildlife encounters and outcomes will be monitored, and logbooks will be used to record wildlife observations. Logbooks and reports will be available to employees. Incidental observations recorded by staff will be entered into Species Detection Loadforms and submitted to the Saskatchewan Conservation Data Centre annually.

### **4.3 Restore**

The temporal bounds for the Project as stated in the EIS are years 1 to 3 for construction, years 3 to 18 for operation, years 18 to 23 for decommissioning, and fifteen years of post-decommissioning monitoring and inspections from years 23 to 38. Importantly, during physical decommissioning the majority of Project components are scheduled to be removed from site which is expected to facilitate restoration activities. Also, because of the selected ISR mining method, there are no large, permanent Project components, such as waste rock piles or tailings management facilities, for which large scale and potentially complex restoration strategies are needed.

Denison's decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure. The Project's Conceptual Decommissioning Plan (CDP) is included in the draft EIS. The details of decommissioning and restoration will be refined over time as the Project proceeds. A Preliminary Decommissioning Plan (PDP) will be developed by Denison to support licensing and permitting applications. Prior to executing decommissioning activities, Denison will prepare and submit a Detailed Decommissioning Plan (DDP) to regulators for their review and acceptance, which builds on the PDP.

The CDP outlines plans for physical decommissioning (mining area remediation; asset removal; and decontamination, demolition, and disposal), followed by restoration. A summary of the CDP is provided here.

- Ongoing decommissioning of Project components will be completed when possible.
- Denison has committed to progressively restore areas no longer necessary to support/facilitate Operations to limit the amount of disturbance at any given time. Restoration of inactive areas will take place when/as these areas become available. The progress and success of these activities will be assessed regularly at a schedule commensurate with the expectations of the activities per the decommissioning plan. Progressive restoration including ecosystem-based revegetation will be conducted on disturbed areas as soon as safely and logistically practicable with the use of suitable/appropriate native species and in accordance with the decommissioning plan.
- Once the asset removal, decontamination, demolition, and disposal are completed, and the site has been cleared and leveled, restoration activities, including planting, will take place. Currently this would largely be with jack pine seedlings, but the mix of plants will depend on location and available species. Restoration activities monitored until it is deemed self-sustaining and viable wildlife habitat.
- Future discussions will be held with Indigenous and general public Interested Parties to determine the amount of access to the area they wish to maintain in the future (post-decommissioning). Based on results of these discussions, transportation corridors including roads or trails associated with the Project site that are no longer needed will be graded, scarified, and vegetated with native, self-sustaining species as required. Access to facilitate safe post-closure monitoring or requested by appropriate Interested Parties (e.g., to facilitate land use) may be left in place. Access to the site may be restricted by gates and/or berms.
- Laydown areas will be scarified, covered with 0.5 to 1.0 m of stockpiled overburden, and vegetated with native, self-sustaining species. The footprints of other infrastructure, such as the camp, will be scarified and vegetated with native, self-sustaining species as required. The topsoil and brush stockpiled during pre-construction activities will be used during restoration.
- Lessons learned from progressive decommissioning and any site-specific restoration studies will be incorporated into the DDP. Additionally, information from other northern Saskatchewan mine

sites will be examined to help Denison select the restoration tools, including revegetation options, that will contribute towards decommissioning success.

Closure of the entire Project will be completed in accordance with provincial and federal regulations and guidance documents with the fundamental considerations being to confirm physical and chemical stability of the site to protect human health and the environment.

Progressive decommissioning and restoration will be completed throughout the life of the Project, whenever feasible, and reported to the regulatory agencies as part of the annual reporting requirements throughout Operation. Associated activities will focus on the decontamination, demolition, and disposal of unused buildings and infrastructure, as well as the removal of unused equipment and machinery. Progressive decommissioning and restoration are expected to continue and result in positive effects as revegetation is continued and regeneration occurs. Following decommissioning and restoration, wildlife habitat is expected to recover to baseline conditions.

## 5 Habitat Loss Calculation

### 5.1 Habitat Loss in Context of the Disturbance Management Threshold for SK1

To support the Plan with respect to the calculation of habitat loss, a mapping exercise was completed to provide context on the Project-related habitat loss in consideration of the woodland caribou range (SK1) disturbance management threshold (ECCC 2020).

#### 5.1.1 Approach

First the Project infrastructure footprint area was delineated and estimated to be 80 ha. Next, a 500 m buffer was applied to the Project footprint, resulting in a total potential disturbance area of 1,350 ha. This is consistent with the approach for determining direct and indirect effects, as outlined in ECCC (2020).

Finally, an analysis was undertaken to quantify the amount of caribou habitat that is currently disturbed within the Project footprint + 500 m buffer. According to ECCC (2020), there are two contributors to disturbed habitat in SK1: 1. anthropogenic disturbance + 500 m buffer and 2. fire disturbance in the last 40 years, without a buffer. The two factors for disturbed habitat were considered as follows:

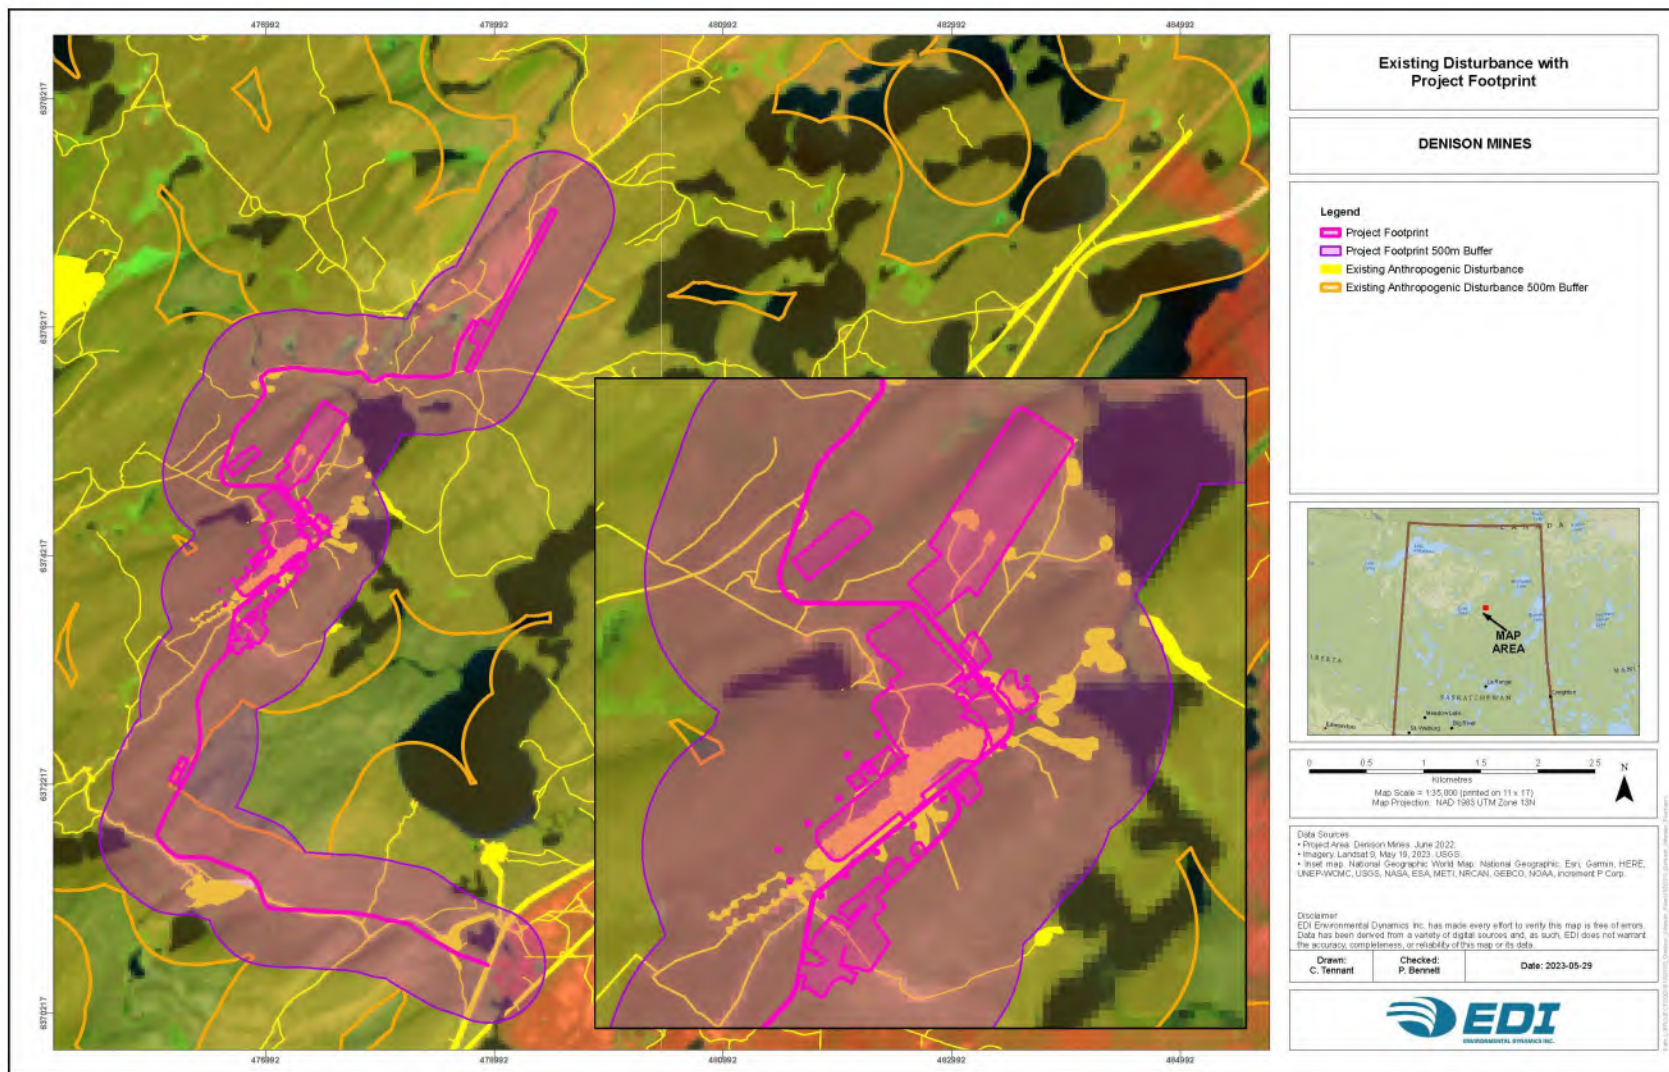

1. Existing anthropogenic disturbance + 500 m: For anthropogenic disturbance calculations to inform the Plan, mapping was completed and evaluated to determine the existing anthropogenic disturbance. Although the EIS considered anthropogenic disturbances on IKONOS imagery at the 1:5,000 scale, the mapping exercise to support habitat loss calculations in the Plan used anthropogenic disturbances visible on Landsat at the 1:50,000 scale, to be consistent with the definitions of disturbed habitat from the amended recovery strategy (ECCC 2020).
2. Fire disturbance in the last 40 years, without buffer: To determine ecosites that were in a regenerating phase or having experienced fire disturbance in the last 40 years, the ecosites BS3/BS7-Jack pine-blueberry/Black spruce-blueberry/lichen were used, based on previous ecosite classification work completed to support the EIS.

#### 5.1.2 Results

As shown in Table 5-1 and Figure 5-1, the proposed Project footprint + 500 m buffer is almost entirely located within existing, buffered anthropogenic disturbance. This means the Project footprint + 500 m buffer is located within already disturbed habitat, according to ECCC (2020). Additionally, the mapping exercise shows that approximately half of the Project footprint + 500 m buffer is located within regenerating forest, i.e., forest burned less than 40 years ago (Figure 5-2).

**Table 5-1: Existing Disturbed Habitat within Buffered Project Footprint**

Area within Project Footprint + 500 m buffer (1,350 ha)	
Existing anthropogenic disturbance (+ 500 m buffer)	1,298 ha
Regenerating forest (fire disturbance in the last 40 years; no buffer)	730 ha

**Figure 5-1: Proposed Project Footprint (+ 500 m buffer) with Existing Anthropogenic Disturbance (+ 500 m buffer) Visible on Landsat at 1:50,000**

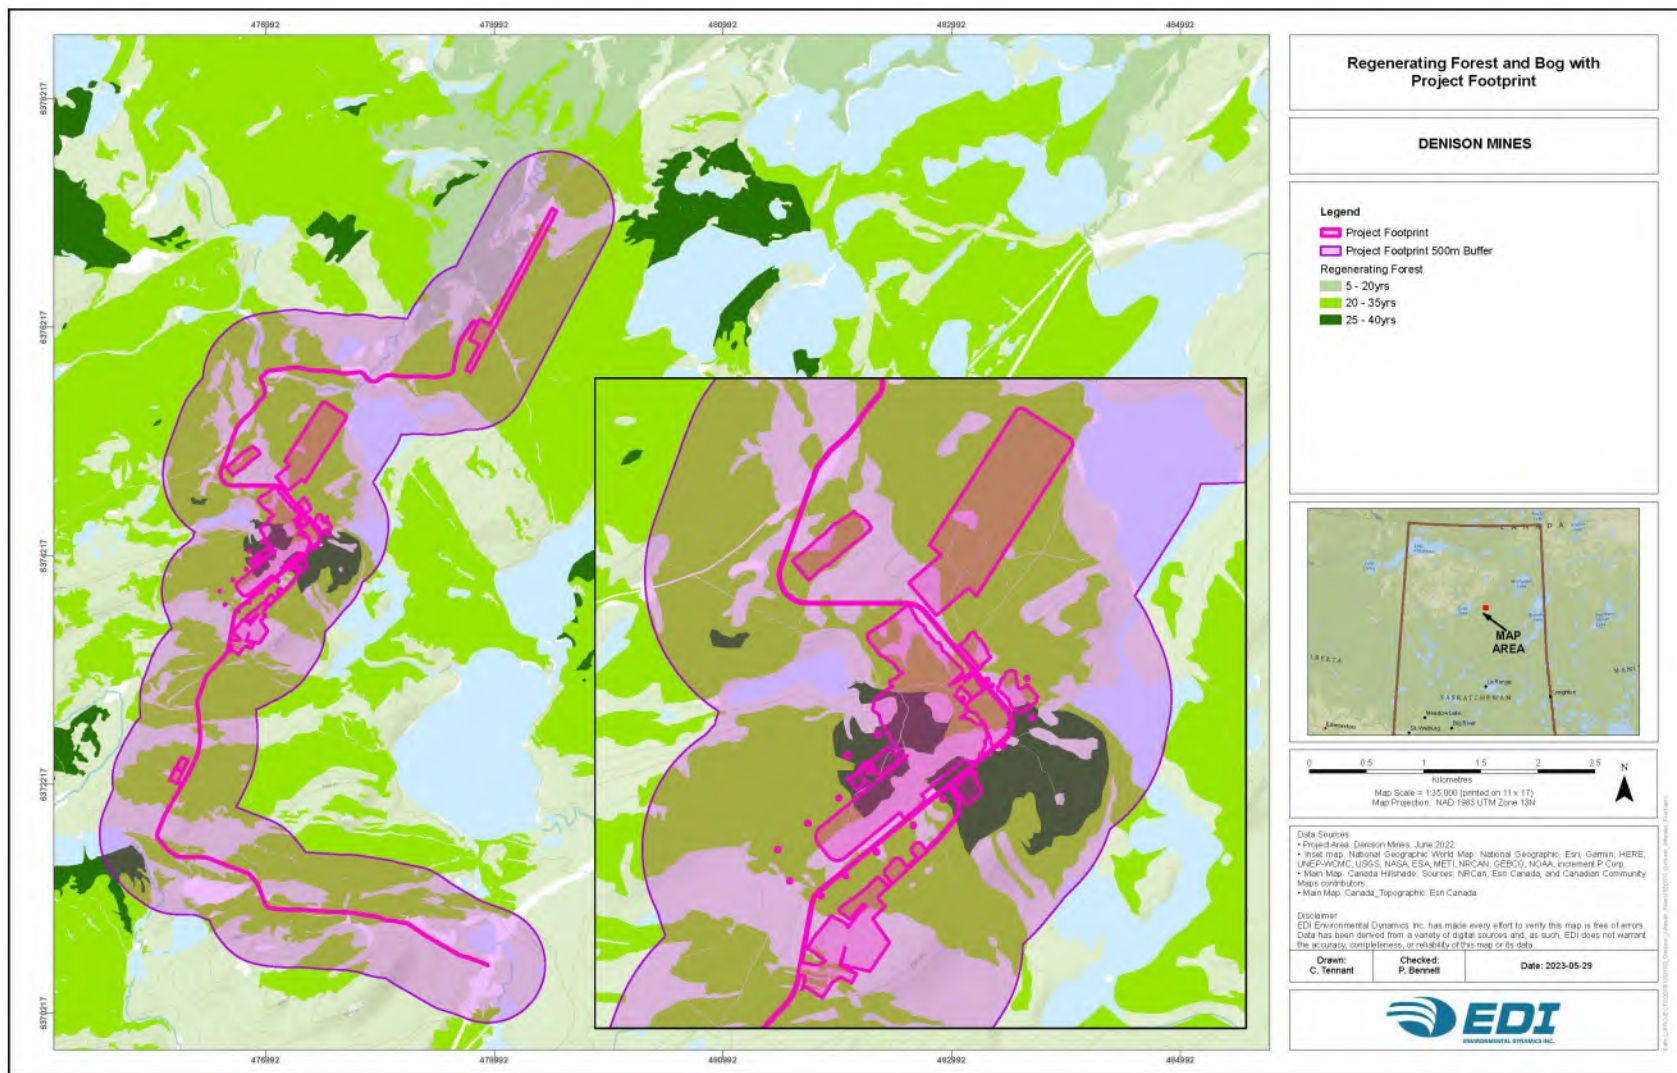

Figure 5-2: Proposed Project Footprint (+ 500 m buffer) with Regenerating Forest

Based on the above analysis using ECCC (2020) criteria, should the Project proceed, the disturbance management threshold for SK1 range would remain unchanged.

Additionally, ECCC (2020) identified the caribou population in the SK1 range as being self-sustaining at a threshold of 40% undisturbed habitat and recommended that total anthropogenic disturbance in the SK1 Boreal Shield range should not exceed 5% with the remainder (i.e., 55%) being attributed to natural disturbance (while maintaining a minimum of 40% undisturbed habitat in the range). ECCC (2020) calculated that approximately 58% of the SK1 Boreal Shield range is currently affected by past forest fires and 3% of the range is affected by anthropogenic disturbances. For additional context, the size of the SK1 Boreal Shield range is estimated at 18,034,870 ha (ECCC 2020). The Project footprint + 500 m buffer (1,350 ha) would represent an estimated Project-related disturbance of 0.007% at the scale of the SK1 Boreal Shield Woodland Caribou Management Unit.

## 5.2 Direct Loss Calculation

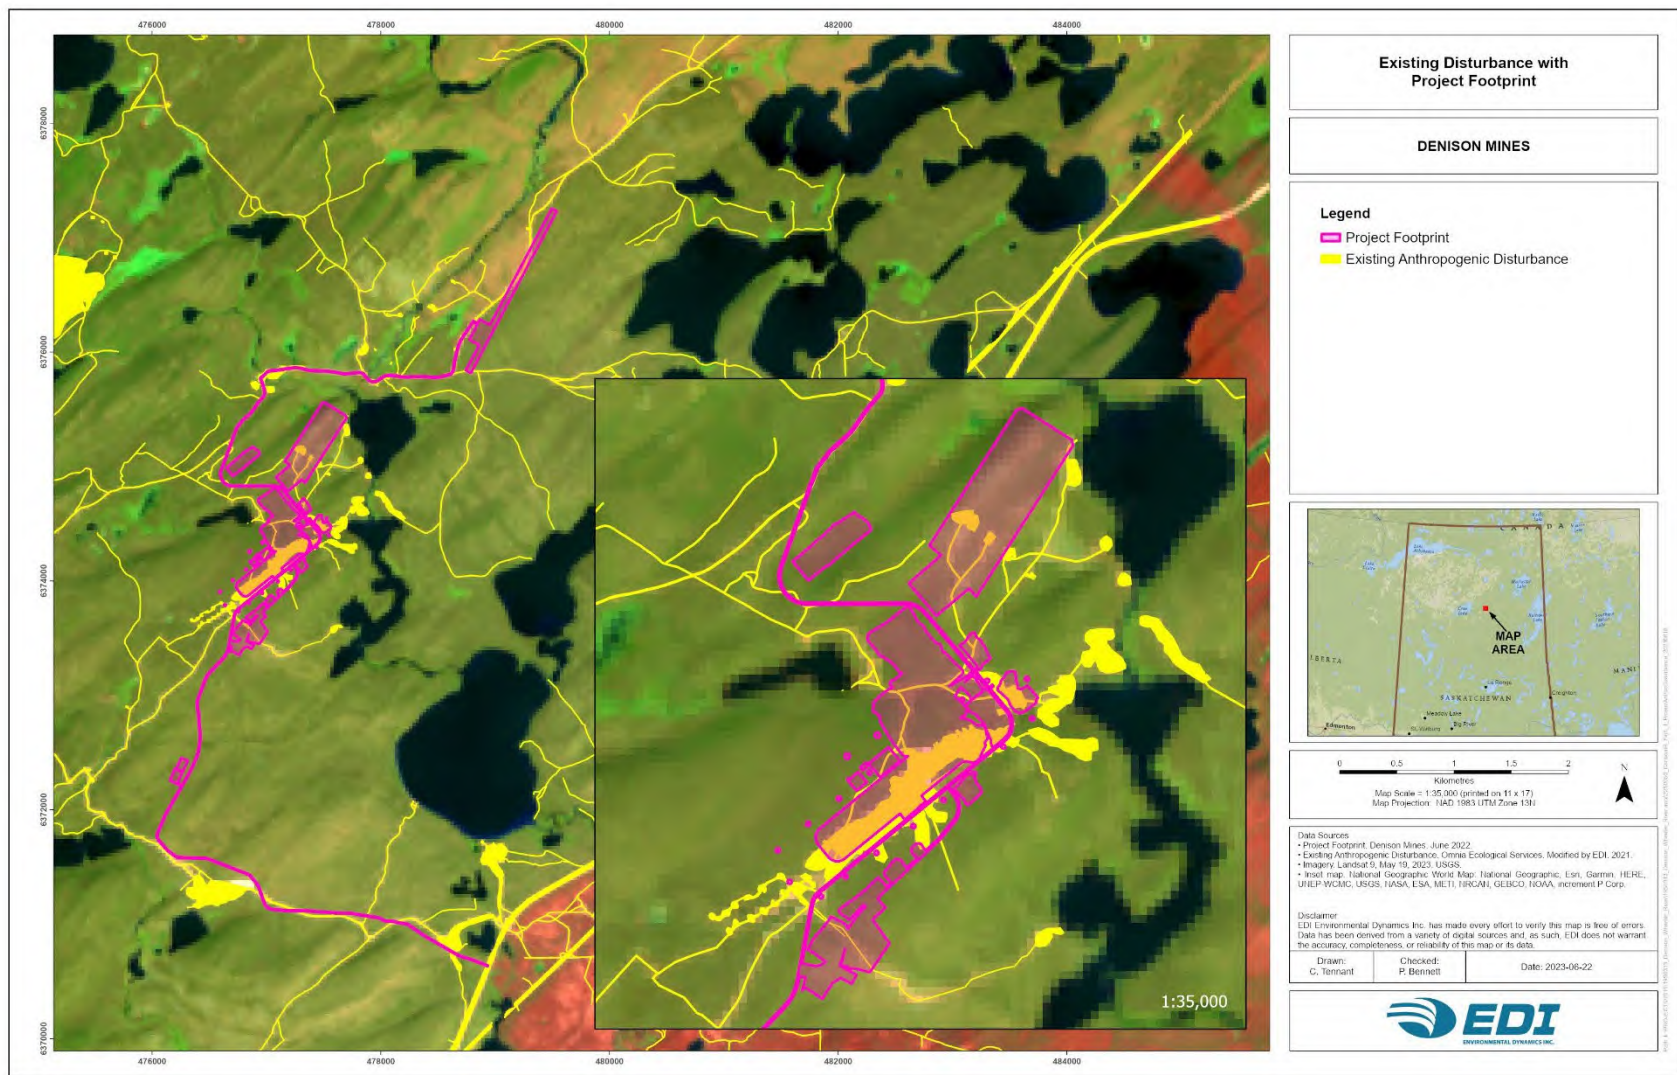

The Project infrastructure footprint has been delineated and the area was determined to be 80 ha. Of this area, 12 ha are comprised of previously disturbed land resulting from past activities (e.g., access, exploration camp and laydown areas). The remainder of the Project footprint is comprised of regenerating forest (forest less than 40 years old) habitat which is typically considered to be low quality habitat for caribou (Figure 5.3).

**Table 5-2: Land Cover Types within the Project Footprint**

Total Area	
Project footprint	80 ha
Existing anthropogenic disturbance	12 ha
Regenerating forest habitat (i.e., low quality caribou habitat)	68 ha

Denison understands that the Project will likely result in a limited residual effect on caribou and their habitat within the RSA; however, these effects are considered to be small in a relative sense when considered in the context of the SK1 range, as described in Section 5.1.

**Figure 5-3: Proposed Project Footprint with Existing Anthropogenic Disturbance Visible on Landsat at 1:50,000**

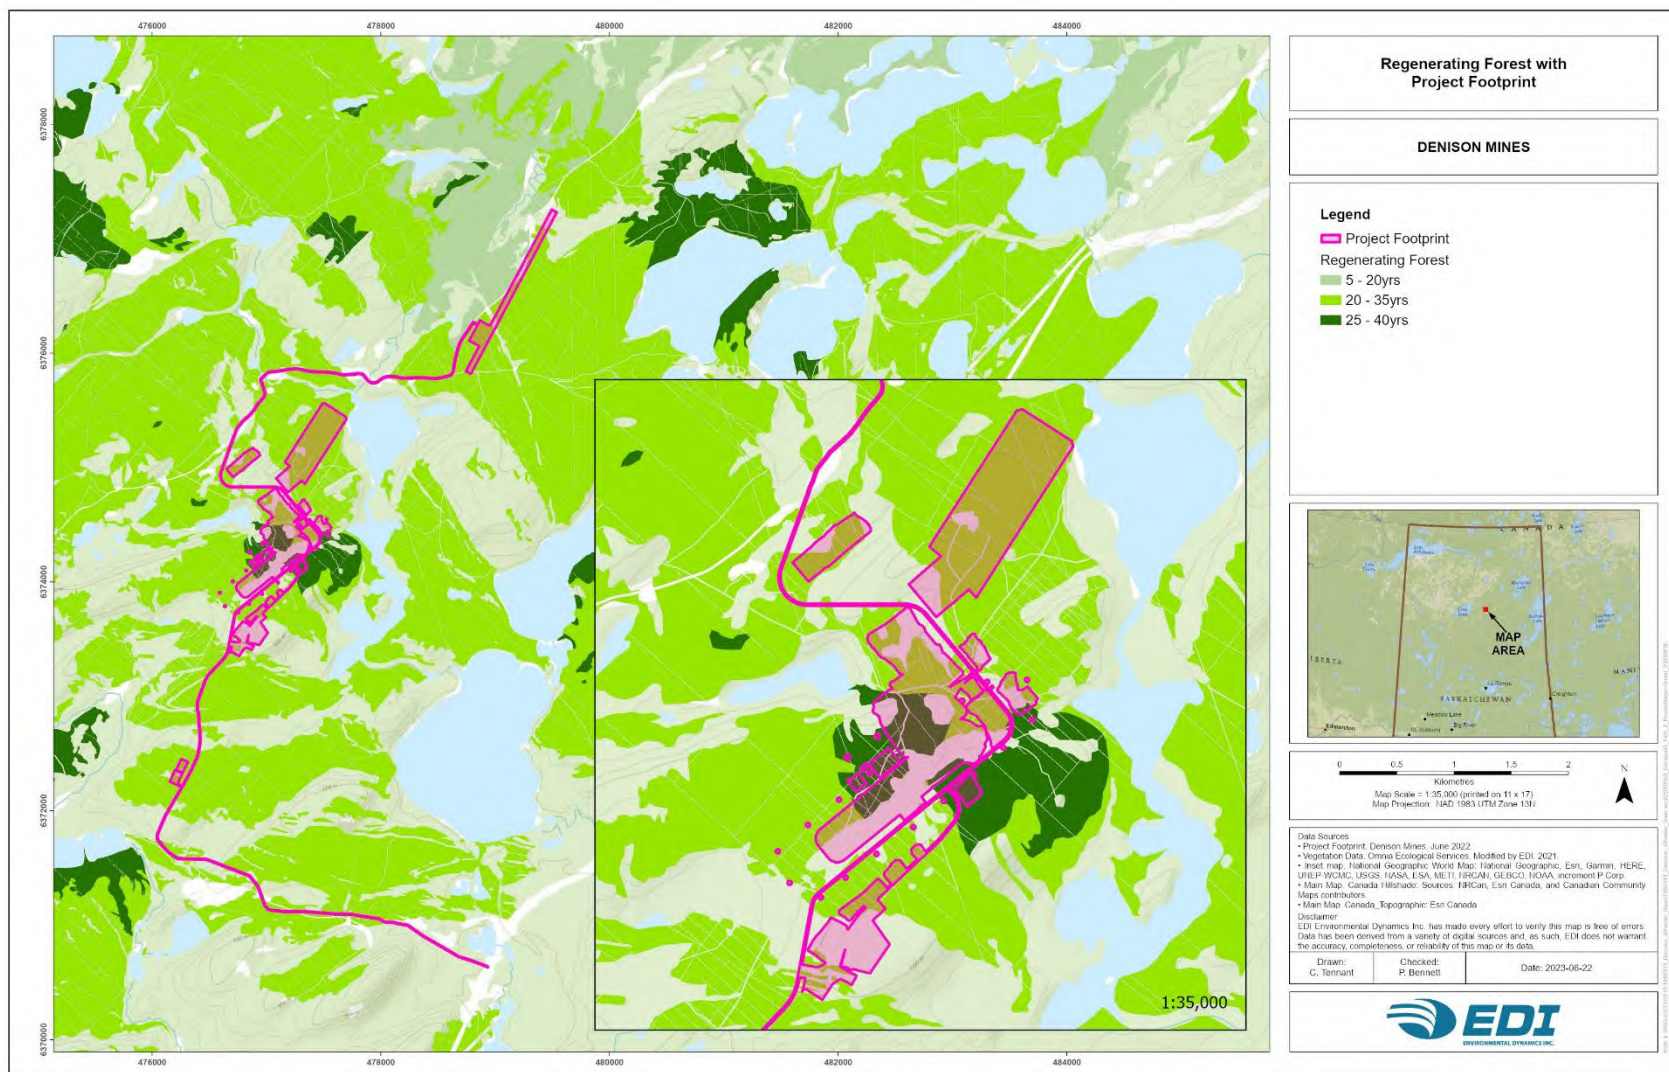

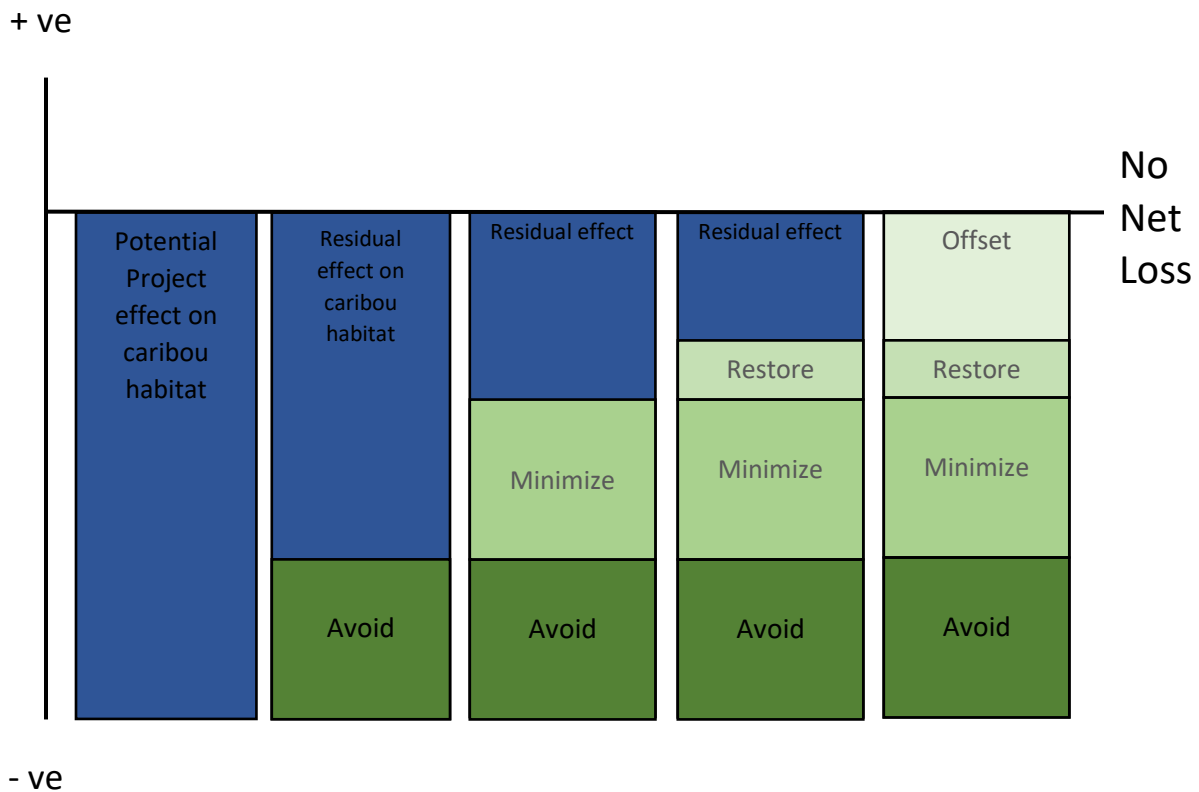

Figure 5-4: Proposed Project Footprint with Regenerating Forest

It is Denison's understanding that currently there are no provisions/requirements for caribou habitat offset by the ENV for projects within the SK1 range. Denison recognizes the importance of woodland caribou to Indigenous groups, the general public, other Interested Parties in Saskatchewan, and Canada. As such, as part of this Plan, Denison is proposing to continue to work with ENV to determine an appropriate offset based on the habitat loss as a result of the Project. Denison expects that the proposed offset calculations would likely include aspects of additionality, temporal considerations, spatial considerations, and other aspects, depending on the expectations/requirements of the caribou habitat offset process that the ENV is currently refining/finalizing. The proposed offset calculations are expected to be refined through ongoing communications with ENV to appropriately address issues at the provincial level related to caribou and habitat.

Future versions of the Plan will include detailed options to develop and advance restoration work and initiatives to provide responsible, proactive environmental stewardship. These offsets (Figure 5-5) are expected to be further refined/defined through Plan updates as the Project proceeds and consultations with ENV advance. Some initial options are presented at a conceptual level in Section 6.

**Figure 5-5: Wheeler River Project Conceptual Caribou Mitigation Plan to Achieve No Net Loss**

## 6 Offset Framework

---

This section provides a discussion on offset options will become more defined as the Plan advances, in consultation with ENV. This is expected to offset residual effects over the life-of-the-Project and enhance the restoration activities occurring within the Project footprint to result in no net loss of habitat within the RSA as a result of the Project.

### 6.1 Conceptual Offset Opportunities

An opportunity that Denison has proactively identified is a combined linear feature mitigation and restoration option. Denison has implemented a practical and experimental pilot study to investigate the design, implementation, testing, and monitoring of several functional and structural habitat mitigation options. This opportunity involves two components: 1) applying treatments to address (i.e., reduce) lines-of-sight and discourage linear feature use by both caribou and their predators, and 2) restoration focused on re-establishing terrestrial lichen communities co-established with a biological soil crust (BSC) component.

Importantly, to complete this pilot program, Denison has partnered with the University of Saskatchewan and Northwest Communities Environmental Services (an Indigenous-owned environmental company) under the Developing Eco-Restoration Together (DERT) program. This unique project aims to co-create ecological restoration practices that centre Indigenous peoples, worldviews, and values while also braiding knowledge from the land, Indigenous knowledge, and western science. The project is supported by the three partners but is ultimately guided by the Indigenous Project Advisory Board, and the Community Liaison/Education Coordinator. Through restoration trials, community engagement, and various planting techniques, Denison, with their partners are seeking to return ecosystem functions in areas where they have been previously disturbed (e.g., exploration cutlines). Through collaboration with community members, University of Saskatchewan, industry partners, two graduate students, and local youth, this project is expected to ultimately inform the creation of a framework for effective restoration practices in northern Saskatchewan that centre on caribou and Indigenous communities.

#### 6.1.1 Caribou Trail Study

Wildlife, particularly bears, wolves, and woodland caribou, are using anthropogenic linear features to move throughout their habitat with greater ease. This can result in increased chance encounters between predators and prey and could contribute to the reduction in woodland caribou populations (Omnia 2022). Denison is conducting research on the use of linear features predators and prey in the Athabasca Basin to collect relevant data to inform an effective plan designed to disrupt the current risk related to predator/prey movements/interactions.

Currently, ENV has no guidelines or protocols for assessing the status of disturbance features or for evaluating the need for linear feature mitigation. Denison proactively initiated research to collect field-based findings on the effectiveness of linear disruption features on predator/prey movements in the vicinity of the Project. This field program was designed and implemented to deploy and monitor the effectiveness of five linear feature treatments across nine locations. Treatment types include, seeding and/or planting of jack pine, spreading coarse woody debris, tree tipping, constructing biodegradable fencing, and earth/debris mounding. Methods vary by location but have a common goal: to discourage prolonged disturbance and encourage new growth in areas of disturbance (Omnia 2022). Each

treatment area is monitored by game cameras year-round to determine how wildlife interact with the created physical and visual barriers. All treatments are temporary and biodegradable with the purpose of reducing trail use in the near-term so that the forest can regenerate naturally.

Preliminary results are encouraging and indicate that bear use of treated lines was reduced by 43% compared to untreated lines, caribou use was reduced by 95%, and wolf and moose use was reduced by approximately 94%. Overall, use of treated lines by species of interest was reduced by approximately 83% when compared to baseline monitoring rates. These successful preliminary results will guide future work to define potential offset options associated with linear feature mitigation and restoration.

### **6.1.2 Biological Soil Crust Research**

To support restoration planning, additional research will be designed to investigate BSCs and conducted by a soil science graduate student at the University of Saskatchewan. This research is expected to contribute to the goals of the Developing Eco-Restoration Together Project. BSCs are communities of lichen, bryophytes, cyanobacteria, and microorganisms found in the top layer of the soil (Heindel et al. 2019). These surface soil mats are rich in diversity, and play an important role in the broader ecosystem, especially in locations with extreme climate, little moisture, and nutrient-poor soil (Cowden et al., 2022). Research on BSCs has been focused on desert regions, and this research provides insight to BSC's role in boreal ecosystems, specifically in northern Saskatchewan. By gaining a better understanding of how to support BSC establishment and growth, it is expected that the findings can inform restoration activities that would ultimately benefit caribou.

Sampling of BSCs within the region will be based on a fire chronosequence. This is expected to provide a foundation to better understand the functions and species present in BSCs, and how they develop post-disturbance (Coxson and Marsh 2001). Understanding how these communities develop and interact is important, especially considering the gap in knowledge on soil microbial communities, non-vascular species, and their role in restoration techniques.

A critical element in supporting caribou populations is the consideration of caribou forage lichens. Due to the slow-growing nature of lichens, it can be difficult to include them in restoration activities (McMullin and Rapai 2020). Denison is planning to focus on caribou forage, primarily through transplanting and propagation of the appropriate lichen species. Natural regrowth of lichen communities after fires takes place in a complex setting, where BSCs and bryophyte communities stabilize soil surfaces, providing habitats where lichen propagules can establish and grow (Coxson and Marsh 2001). Denison hypothesizes that reestablishment of terrestrial lichen communities will have a better chance of success where these supporting BSC components can be co-established at the same time. The findings from the BSC research within post-fire environments is expected to support lichen communities, restoration activities for the DERT project, and ultimately caribou and caribou habitat within the Wheeler River Project area.

## 7 Monitoring and Adaptive Management Framework

An adaptive management framework will be developed to support the implementation of this Plan (Figure 7-1). In this context the adaptive management framework provides the means for the integration of Plan scope, management, and monitoring to systematically evaluate assumptions to adapt and learn. In practical terms the framework will consider the outcomes of actions taken/implemented, whether they have been successful and, if not, how can such actions be adapted to increase the likelihood of success. Outcomes of the Plan would be measured by establishing performance indicators as the way to define and measure progress toward achieving the objectives.

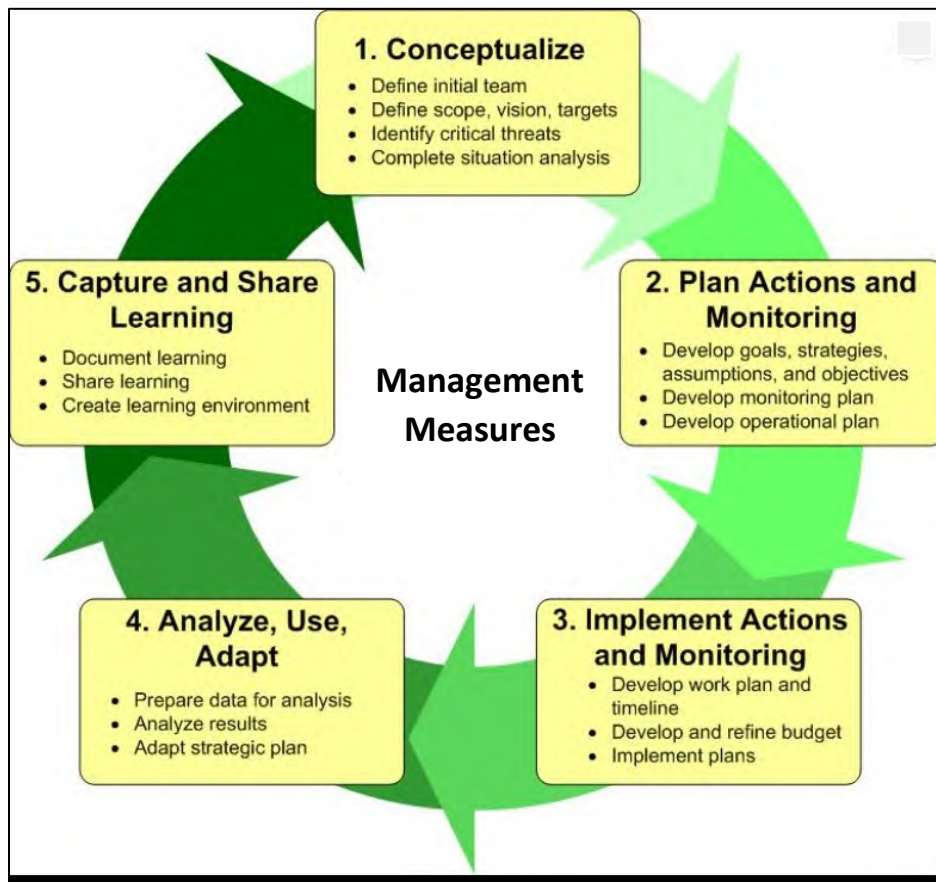

Figure 7-1: Adaptive Management Cycle

## 1 INTRODUCTION

Federal and provincial planning documents and woodland caribou (*Rangifer tarandus caribou*) population assessments have indicated that much of the Saskatchewan woodland caribou population is at risk from landscape-level disturbance. There exist no guidelines for evaluating reclamation requirements or outlining what the criteria for reclamation are. Omnia Ecological Services (Omnia) has been engaged by Denison Mines Corporation (Denison) to continue to support the project application (e.g., assessment of impacts and regional mapping/inventory) with respect to reclamation/offset planning to assist with developing potential woodland habitat reclamation selection and criteria protocol through the use of cost effective and practical functional habitat restoration/mitigation options. If successful, these mitigation techniques could be deployed at a larger scale within the SK Boreal Shield and may assist government in developing mitigation/reclamation criteria.

A pilot project of potential mitigation options to disrupt predator-prey movement patterns on linear features by creating a physical, visual, and/or line-of sight barriers has been deployed at 12 sites within the Wheeler River study area ([Figure 1](#)). Detailed background information and full details of site-specific treatments, including preliminary planning and consultation, can be accessed in Omnia (2022). Also included in that report are preliminary findings from the first five months of monitoring.

The objectives of this interim report are to outline preliminary results gathered from monitoring data thus far (year 1) and outline program follow-up requirements and recommendations for future consideration.

## 2 MONITORING

A site visit was completed in May 2022 as part of the planned bi-annual inspection/data collection with the following objectives:

- Revisit and check the status of all 12 treatment sites.
- Make any repairs or modifications as required.
- Remove and replace covert camera memory cards to collect wildlife use data collected since deployment.
- Replace covert camera batteries to support ongoing monitoring.
- Measure height and assess health status of planted Jack pine seedlings.

### 2.1 Methods

The linear feature mitigation sites were visited from May 24-25, 2022. Photographs were taken at each site and notes were taken on overall conditions of the installation, durability, effect of snow cover/melt, issues encountered, and modifications or repairs conducted. Any signs of wildlife use in the area were also noted (i.e., tracks, pellets). Covert camera cards were replaced and camera setups were adjusted where required to prevent unnecessary false trigger events (such as from burlap flapping in the wind). All camera batteries were replaced. Camera photographs were retrieved and analyzed for wildlife use along the 12 treated linear features (LFs) and six reference/untreated parallel linear features.

For treated and untreated LFs, each wildlife trigger event was characterized as a “use” event if the animal appeared to be travelling on the line and/or displaying non-avoidance behavior, such as approaching/interacting with the burlap or other treatment features. Behavior such as crossing the LF, traveling in the adjacent forest, or paralleling the LF was characterized as “non-use” of the LF. Cameras were programmed to take five photographs per trigger event, often allowing for movement trajectory to be determined. However, if field of view was limited, body language and movement cues of the animals were used to best determine appropriate categorization, such as angle of head/body, no assumption of sharp turns, etc. Photograph analysis findings were compared to results gathered from multi-year baseline linear feature camera monitoring across the project area, and between treated and reference sites. Effects of treatments on wildlife use of LFs was then analyzed across all species of interest and between individual species types.

Each seedling that was planted when treatments were installed in July 2021 was measured for height, and a relative health score was assigned to each seedling: 1=healthy, 2=average, 3=poor 4=dead/missing. Evidence of browsing events by wildlife were also recorded.

## 2.2 Results

### 2.2.1 Treatment Visits

[Table 1](#) summarizes the overall status of the treatment types, wildlife sign observations and modifications completed. Coarse woody debris (CWD) treatments maintained reasonable coverage and withstood snow pack/snowmelt ([Photograph 1](#)). Tree hinging/structures treatments were holding up very well and only a few structures/tree hinges had fallen over and needed reinforcing ([Photograph 2](#)). Needles on the trees that were hinged were yellowing but remained intact ([Photograph 3](#)). Trench and pile treatments were holding up very well and didn't appear compressed following the winter snow ([Photographs 4](#)). Burlap installations, both on their own and when combined with other treatment types, required minimal repairs ([Photograph 5](#)).

Repairs consisted of:

- Replacement of ripped/ deteriorating burlap panels
- Replacing wooden lath ripped off by a bear (Site 10, [Photograph 6](#))
- Adding screws and staples to reinforce, where required

### 2.2.2 Wildlife Photograph Analysis

#### *Overall*

Photographs were analyzed from 18 different cameras totaling 4,861 camera days. One hundred-ninety-four (194) detections were recorded of 13 different species, averaging four detections per 100 cameras nights. The most commonly detected species from all cameras, treatment and reference, was snowshoe hare with 56 detections, followed by woodland caribou with 44 detections, and black bear with 25 detections ([Table 2](#)). [Table 2](#) summarizes the detections rates of species of interest (caribou, moose, black bear, wolf) by treatment type / reference linear feature. Detection rates of species of interest and human (ATV) use were compared with baseline covert camera results from multi-year linear feature monitoring conducted in the Denison Wheeler

River study area ([Table 2a](#)). Results were separated into desired non-use and use of linear feature type (treated versus untreated monitoring/reference trails). The results for trails (approximately 5m wide) were included for direct comparison and data from hand-cut lines and roads were excluded. A similar comparison was completed for treatments where no burlap was present, either on its own or in combination with other blocking techniques ([Table 2b](#)). This was to assess for trends without the potential wildlife attractant effects of the burlap. When treatments including burlap were included in the analysis, detection rates of all species of interest on treated lines are less than those of multi-year linear feature monitoring in the area. Bear use of treated lines was reduced with 61% compared with untreated lines, moose use was reduced with a 92%, and caribou use was reduced with 94% ([Table 2a](#)). No wolves were detected using treated lines. Overall use of treated lines by species of interest was reduced by approximately 85% when compared to monitoring rates. When installations including burlap are excluded from analysis, the reduction in detection rates along the treated sites are even more pronounced. No bears or wolves were observed using treated lines, while only a single caribou and moose were detected using treated lines.

#### *Treatment Sites*

[Figures 2 and 3](#) highlight the relative effectiveness of the individual treatment types on wildlife species of interest detections and their use of the treated linear features. Non-use of the treated line by wildlife via travel in the adjacent forest, crossing, or paralleling the line was the desired effect and was therefore rated as positive. Use of a treated LF via traveling down the line/interacting with the treatment features was an undesired effect and was therefore rated as negative.

[Figure 2](#) shows the results of the treatments for all species of interest combined. CWD treatment sites had the most wildlife detections (20) of three species, (bear, caribou and moose) and all interactions were positive (non-use of the line). Tree hinging/structures had ten detections of bear and caribou, 92% of these interactions were rated as positive. Trench and pile treatments had three moose detections; two thirds positive. Trench and pile + burlap had a split response between bears (all use) and moose (all non-use). CWD + burlap and burlap only had all negative interactions.

[Figure 3](#) shows the results of the treatments for each species of interest. Caribou showed positive interactions (avoidance) with CWD and tree hinging/structures (100% and 83% of detections, respectively) and a negative interaction with burlap (100% of detections). Moose response to CWD and trench and pile + burlap was 100% positive, and was two-thirds positively associated with trench and pile. Black bears responded positively to CWD and tree hinging/structures, and negatively to CWD + burlap, trench and pile + burlap, and burlap only. Wolf responded negatively to burlap.

Figure 2. Wildlife detections by treatment type, all species combined (caribou, moose, black bear and wolf). Green/positive indicates desired avoidance of the treated LF; red/negative indicates undesired use of treated LF.

Figure 3. Caribou, moose, black bear and wolf detections by treatment type. Green/positive indicates desired avoidance of the treated LF; red/negative indicates undesired use of treated LF.

### 2.2.3 Seedling Health Assessment

A total of 476 seedlings were counted and measured, out of the initial 500 planted. Seedling height averaged 15cm (range 12-18cm) when planted and average height when measured in May 2022 was 18.8 cm ([Table 4.](#)). Average health status was 1.8. [Photograph 7](#) illustrates representative examples of each health status, ranging from 1-4, healthy, average, poor, and dead, respectively. Mortality/loss averaged 4.8%.

## 3 SUMMARY PRELIMINARY CONCLUSIONS – Year 1

- Detection rates of all species of interest on treated lines (including burlap) are less than those of multi-year linear feature monitoring in the area (bears 61% reduction, moose 92% reduction and caribou 94% reduction; no wolves). When burlap is removed from analysis, the frequency of detection on treated lines is further reduced (no bears or wolves; only 1 caribou and 1 moose)
- CWD, tree hinging/structures, and trench & pile treatments elicited all/mostly positive avoidance responses from species of interest.
- Burlap, when used alone or in combination with other treatments, elicited the most negative responses from species of interest. Although preliminary, early results indicate that burlap may act as an unwanted attractant for curious wildlife or is not perceived as a barrier to species movement ([Photograph 8](#)).
- Burlap remains the most labor-intensive treatment in terms of maintenance and repairs required.
- Overall planted seedling health was strong and growth progression is promising.

## 4 NEXT STEPS

- Continuation of multi-annual site visits to monitor the status of treatment types, make repairs or adjustments as necessary.
- Continuation of multi-annual inspection/service and data collection of covert cameras and analysis of covert camera photographs.
- Assess potential impacts of a 2022 forest fire on several treatment locations/cameras and determine suitability for continued monitoring and/or redeployment.
- Analysis of potential snow depth/weather effects on wildlife activity over time are anticipated as more winter data is collected.
- Evaluate seedling status once again in 2023 to ensure status.
- Verify tree-hinge/structure counts to ensure replicability at other sites.
- Quantify coarse woody debris (CWD) stem counts and volume estimates to ensure replicability at other sites.
- Monitoring is ongoing and an increased monitoring period, and associated sample size, will facilitate further analysis, including potential use of statistics.

## TABLES

**Table 1. Summary of treatment status, observations, and modifications.**

<b>Treatment</b>	<b># Linear Features</b>	<b>Overall</b>	<b>Wildlife Sign</b>	<b>Modifications</b>
CWD	2	Holding up well after snow melt, minor compression	Faint caribou tracks at start of treatment, appear to deflect away from treatment; other caribou tracks on edge	none
CWD + Burlap	1	CWD holding up well, burlap corners lifted	none	reinforced burlap
Tree Hinging/ Structures	3	In great shape; needles on tree hinges yellowing but intact	none	Lifted/ reinforced a few structures/hinges that had fallen
Trench & Pile	2	Holding up very well, no compression	moose tracks avoid treatment and stay on parallel trail	none
Trench & Pile + Burlap	1	Trenches in good shape, burlap had a few holes	none	replaced 2 burlap panels
Burlap	3	Repairs made in December 2021 held up well, minor repairs needed	none	reinforced stakes pulled off by a bear, added more screws/ fixed burlap holes where needed

## Attachment: IR-165

Number	IR-165
Dept.	CNSC ECCC
Project effects link	Birds (all species)
Reference to EIS, appendices, or supporting documentation	<p>Section 9.4.4.2.2</p> <p>Section 9.4.5.2.4, Avian Deterrence and Prevention of Entrapment</p> <p>Appendix 10-A (ERA)</p>
Context and Rationale	<p><b>Context:</b> On p. 9-364 of the EIS, it is stated that exposure to hazardous materials through contact with contaminated waste ponds could affect avian health and contribute to mortality.</p> <p>However, the ERA places the avian receptors only in waterbodies and locations outside of the Project area (see Figure 5-2 in the ERA), i.e., Whitefish Lake, McGowan Lake, the inlet to Russell Lake, and Kratchkowsky Lake.</p> <p>Further, there are insufficient details on the potential effects of the water quality in the water management and treatment facilities on birds, species at risk, and other wildlife, including the risk of bioaccumulation of contaminants. The Proponent should assess potential effects of water quality from these areas using applicable CCME guidelines.</p> <p><b>Rationale:</b> It is unclear whether the ecological risk assessment based on the chosen exposure locations is protective and conservative for avian species potentially exposed to contaminated waste ponds on the Project site.</p> <p>While mitigation measures such as physical, visual, and/or auditory deterrents are proposed in Section 9.4.5.2.4, the possibility of avian species coming into contact with waste ponds cannot be excluded based on the available information in the EIS. The possibility of birds, species at risk, and other wildlife accessing the water management and treatment facilities for drinking water or other purposes is not discussed in the draft EIS.</p>
Information Requirement	Please perform an ecological risk assessment with avian receptors located at the contaminated waste ponds, including:

	<p>1. Describe and analyze the possibility of birds, species at risk and other wildlife using the water or waste management facilities and provide an analysis to determine if there is a risk to wildlife that may access these areas.</p> <p>2. Identify the potential toxicity of water management ponds to aquatic migratory birds and species at risk (SAR).</p> <p>3. Describe what measures will be taken if the waters are found to be toxic to migratory birds and SAR.</p> <p>Suggestions for mitigation and follow-up measures: CNSC recommends that Denison ensure adequate mitigation measures are implemented to minimize the potential for avian exposure to pond waters.</p>
--	--

Response:

**Water Management Context and Risk of Exposure**

Details on water management and treatment facilities are provided in Section 2 Project Description, Section 2.2.3 Water Management. Importantly, the Project does not include a tailings management facility because of the nature of the proposed mining and processing methods. A summary of water management plans is provided herein; please refer to the marked-up Figure 2.2-15 below.

Clean, non-contact runoff will be diverted around Project components where possible. Contact water will be collected in various ponds and routed to the process water pond (shown in yellow in figure below). These contact water management ponds have been designed to manage event driven runoff and are not intended to be “wet” ponds. That is, the contact water ponds are not designed to hold standing water for long periods of time; rather, they would contain / manage runoff volumes up to the design event and subsequently be pumped down to ensure ongoing management capacity. As a result, the quality of water in these ponds is expected to be relatively good as it would largely comprise precipitation and runoff from natural surfaces.

Additionally, given the design basis of the contact water management ponds (i.e., they are not wet ponds that are meant to hold water at all times), birds and wildlife are not likely to interact with them in a material fashion from a contaminant exposure perspective.

Considering the Project design, the ponds with potential to contain water for any period of time in consideration of potential temporary use by avian species are:

- the process water pond, and the
- effluent monitoring and release ponds.

Process water pond

The process water pond can hold up to 30,000 m<sup>3</sup> of water. It will be a central pond collecting water from a variety of areas, including:

- water from the wash bay (shown in green in figure below),

- water from the domestic wastewater treatment plant,
- water from the dewatering of IWWTP precipitates (non-radioactive, gypsum type material), and
- precipitation-related contact water (shown in yellow in figure below; includes water from the wellfield runoff pond, clean waste rock pond, process precipitate pond, and landfill leachate collection [which is expected to be primarily surface contact water during the Operation phase]).

Water in the process water pond can be used directly in the processing plant or be directed to the industrial wastewater treatment plant (IWWTP) for treatment prior to release to Whitefish Lake. The majority of the flows into the process water pond during Operation (approximately 61% or 10.7 m<sup>3</sup>/hour out of total 17.5 m<sup>3</sup>/hour) are contact waters. As noted above, the quality of the contact water is expected to be relatively good given its sources. As such, a screening was conducted to evaluate the main non-contact water input to the pond, namely the water from the IWWTP precipitate pond. This input represents about 20% of the expected inflow to the process water pond and using this as an estimate for quality of the entire pond is considered conservative.

#### Effluent monitoring and release ponds

The effluent monitoring and release ponds will receive treated water from the IWWTP. Each of the three ponds will have capacity for 3,300 m<sup>3</sup> of water and a composite liner system. The ponds have been designed to hold effluent for a period of 80 hours for testing before discharge to the environment. Having three ponds allows for increased operational flexibility, as one pond can be undergoing maintenance when required. A minimum of two ponds are required to be operational at all times to make sure all effluent released to surface water meets federal and provincial discharge limits. Each pond will be operated with the following stages: 1) filling, 2) holding while awaiting quality confirmation; and 3) releasing to Whitefish Lake once water quality is confirmed to meet discharge limits. There is potential for wildlife to be in contact for short periods of time with the ponds during the holding stage. Table 2.2-1 outlines the upper bound effluent quality proposed for the Project.

In addition to the above that considers where exposure to water management facilities could reasonably occur on the Project site, the following is also relevant as it concerns the likelihood that such exposure would occur. During construction and operations, bird and other wildlife species are expected to avoid the Project Area and Local Study Area (LSA) because of sensory disturbance from project activities that generate noise, artificial light, vibration, dust, etc. and the presence of workers (Adams et al. 2019, Habib et al., 2007; Narins, 1990). While some habituation to sensory disturbance is anticipated that could result in individuals of some species returning to the LSA, generally it is expected that many individuals will be displaced into available habitat elsewhere outside the LSA in the Regional Study Area (RSA). The LSA is not within a major flyway and the LSA currently provides limited waterfowl habitat relative to the neighbouring parts of the RSA. Overall, based on these considerations we characterize the likelihood of bird and other wildlife species exposures to water management facilities on the site as low.

#### **Potential Toxicity to Aquatic Migratory Birds and Species at Risk (SAR)**

A comparison of the expected water quality from the IWWTP precipitate pond, a conservative representation of the process water pond, to the Canadian Council of Ministers of the Environment (CCME) water quality guidelines (WQG) for the protection of livestock and considered protective of

animals potentially exposed to contaminated waste ponds on the Project site was completed. This comparison shows that the expected IWWTP precipitate pond water quality was below the CCME WQG for the protection of livestock for most constituents except selenium (**Table IR 165-1**), and as such, risks to birds, species at risk and other wildlife that may contact or ingest this water are not expected for those constituents below the CCME WQG protective of livestock.

Oviparous birds and fish are the most sensitive to selenium in aquatic environments with toxicity to birds and fish being associated with organic selenium primarily in the diets and tissues of exposed biota.<sup>3</sup> Selenium toxicity to these organisms is manifested through the maternal transfer of selenium which may cause embryotoxicity and teratogenicity<sup>4</sup>. Considering the mitigation measures described below to deter avian use of the ponds, including vegetation management such as managing areas around the waste ponds being free of vegetation to limit the attraction of waterfowl and other wildlife to these areas for foraging and/or breeding, potential risks to avian birds exposed to selenium at this pond would be low.

A CCME WQG protective of livestock was not available for antimony, barium, iron, manganese, silver, strontium, tin and titanium. Potential risks to avian species are unlikely for silver and titanium as these parameters were not detected in the IWWTP precipitate pond. Avian species and wildlife are not expected to be at increased risk for antimony, barium, iron, manganese, strontium and tin because the IWWTP precipitate pond water concentrations for these parameters represents about 20% of the expected inflow to the process, and the mitigation measures, discussed below, to deter avian species and wildlife from these ponds, will reduce the receptor's exposure to these constituents.

Zinc, dissolved	mg/L	0.0027	50

Notes:

NV – no CCME WQG

a- lowest value between the sheep, cattle, swine and poultry value

**Bold indicates that the predicted water quality exceeds the CCME WQG for protection of livestock.**

A comparison of the proposed effluent quality in Table 2.2-1 of the EIS to the CCME WQG for the protection of livestock was also completed. This comparison shows that the proposed effluent quality was below the CCME WQG protective of livestock for most constituents except molybdenum and sulphate (**Table IR 165-2**). As such, birds, species at risk and other wildlife that may contact or ingest the proposed effluent quality are not expected to be at increased risk for those constituents below the CCME WQG protective of livestock.

**Table IR165-2: Comparison of Proposed Effluent Quality to the CCME WQGs for the Protection of Livestock**

Constituent	Unit	Proposed Effluent Quality	CCME Protection of Livestock
<b>General Chemistry</b>			
Chloride	mg/L	600	NV
Sulphate	mg/L	3915	<b>1000</b>
Total Dissolved Solids	mg/L	6420	NA
<b>Metals and Metalloids (Dissolved)</b>			
Arsenic	mg/L	0.006	0.025
Cadmium	mg/L	0.0018	0.08
Chromium	mg/L	0.025	0.05
Cobalt	mg/L	0.003	1
Copper	mg/L	0.022	0.5 <sup>a</sup>
Molybdenum	mg/L	2.5	<b>0.5</b>
Selenium	mg/L	0.042	0.05
Uranium	mg/L	0.057	0.2
Zinc	mg/L	0.042	50
<b>Radionuclides</b>			

Constituent	Unit	Proposed Effluent Quality	CCME Protection of Livestock

Polonium-210	Bq/L	0.15	7 <sup>b</sup>

Notes:

NV – no CCME WQG

NA- not applicable.

a - lowest value between the sheep, cattle, swine and poultry value

b - US DOE Standard (2019) for aquatic biota, including riparian animals

**Bold indicates that the proposed effluent quality exceeds the CCME WQG for protection of livestock.**

For molybdenum and sulphate increased risks to avian species and wildlife exposed to effluent in the ponds are not expected as the mitigation measures, discussed below, to deter avian species and wildlife from the ponds, will reduce the potential receptor's exposure to these constituents.

A CCME WQG protective of livestock was not available for chloride and for the radionuclides. Avian species and wildlife are not expected to be at increased risk to those constituents without a CCME WQG protection of livestock because the mitigation measures, discussed below, to deter avian species and wildlife from the ponds, will reduce the receptor's exposure to these constituents.

A comparison of the proposed effluent quality for radionuclides to the US Department of Energy (DOE) Standard<sup>5</sup> for *a graded approach for evaluating radiation doses to aquatic and terrestrial biota* (Table IR165-2), that is protective of wildlife exposed to radionuclides, suggests that wildlife are not expected to be at increased risks to these radionuclides, as the proposed effluent quality for these radionuclides were below the US DOE Standard. As such, increased risk are not expected to avian species, species at risk and other wildlife exposed to constituents in contaminated waste ponds on the Project site.

## Mitigation Measures

Mitigation measures outlined in the draft EIS to minimize the potential for avian exposure to pond water include:

- Employees and contractors will be provided with wildlife education and awareness training, including education about potential avian issues on site and training on the mitigation measures to avoid or minimize potential adverse Project effects on avian species and their habitat.
- Employees and contractors will be educated on waste management policies that limit human-avian interactions.
- Designated employees will be trained in appropriate avian deterrent techniques to minimize avian interactions with the Project.

<sup>5</sup> US Department of Energy. 2019. DOE Standard: A Graded Approach for Evaluating Radiation Doses to Aquatic and Terrestrial Biota. U.S. Department of Energy, Washington, DC. DOE-STD-1153-2019.

- Employees and contractors will be requested to report avian observations on site, injured or dead birds (which will be reported to SK MOE). Avian encounters and outcomes will be monitored, and logbooks will be used to record observations. Logbooks and reports will be available to employees.
- Physical, visual, and/or auditory deterrents and exclusion measures will be employed around hazardous materials to discourage avian use, as required.
- Vegetation management will be incorporated in the vicinity of waste ponds to discourage avian use of potentially affected vegetation.

Adaptive management will be a component of the wildlife management plan which will be developed to support licensing. If birds are observed on site ponds, additional deterrent techniques could be employed. Examples of other deterrent options to dissuade birds from landing on ponds under an adaptive management framework are provided here:

- Visual deterrents: Reflective tape/flagging could be properly and appropriately installed on infrastructure and/or over the ponds. Predator decoys (i.e., plastic hawks, owls) could be strategically installed on visible high points, such as building roofs and fence posts. Brightly coloured flags flown from posts and/or inflatable tube dancers could be installed along the perimeter of the ponds and/or on the facilities, as appropriate. Inflatable tube dancers are similar to scarecrows, but determined to be more effective (Lukas et al. 2020<sup>6</sup>) likely resulting from the constant motion caused by the wind. A combination of the above visual deterrents would be expected to provide the best results.
- Auditory deterrents: Ultrasonic deterrent systems create a “net” that has been shown to repel birds from an area (Ezeonu et al. 2012<sup>7</sup>). Propane cannons are another effective method shown to deter birds. The use of propane cannons has been more widely studied and are recommended over ultrasonic deterrent systems. Propane cannons have been shown to be more effective when paired with a radar-activated on-demand system that fires cannons when birds are entering the area (Ronconi and Cassady St. Clair, 2006<sup>8</sup>), as birds can habituate to a timely, consistent firing/noise event.

## Attachment: IR-183 to 187

Number	IR-183
Dept.	CNSC
Project effects link	Human Health with respect to radiation exposure
Reference to EIS, appendices, or supporting documentation	Section 10.2 Appendix 10-C
Context and Rationale	<p>Context: Exposure scenarios for workers have been identified and high-level summaries of the assumptions and resultant dose estimates have been provided. However, the detailed dose calculations have not been provided.</p> <p>Rationale: The method used to estimate effective, equivalent and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data, for at least the most dose significant scenarios.</p>
Information Requirement	Provide the dose calculations for deriving the dose estimates for workers in all exposure scenarios, for at least the most dose significant scenarios.

Number	IR-184
Dept.	CNSC
Project effects link	Human Health with respect to radiation exposure
Reference to EIS, appendices, or supporting documentation	Section 10.2 Appendix 10-C, 2.0
Context and Rationale	<p>Context: It is stated in Appendix 10-C, section 2.0 that: “In addition, the CNSC has proposed a 100 mSv 5-year equivalent dose to lens of eye, in accordance with recent recommendations of the International Commission for Radiological Protection (ICRP, 2012a). This implies an average annual equivalent dose to lens of 20 mSv/a and will be considered as an applicable dose limit for workers.”</p> <p>As per section 14 of the Radiation Protection Regulations, the equivalent dose limit for the lens of an eye for nuclear energy workers (NEWs), effective January 1, 2021, is 50 mSv in a one-year dosimetry period.</p>

	Rationale: The reason of the requested change is to ensure consistency with the Radiation Protection Regulations.
Information Requirement	The EIS and Appendix 10-C should be aligned with the Radiation Protection Regulations regarding the equivalent dose limit for the lens of an eye for NEWs.

Number	IR-185
Dept.	CNSC
Project effects link	Human Health with respect to radiation exposure
Reference to EIS, appendices, or supporting documentation	Section 10.2.3.2 Appendix 10-C Table 3.10-3.12
Context and Rationale	Context: The Geometries for External Exposure Scenarios Modelled in MicroShield for Sources in various locations were provided in tables 3.10-3.12 in appendix 10-C. The doses from those scenarios were omitted.  Rationale: The method used to estimate effective, equivalent, and committed dose is required to be verified. Sample dose calculations should be included, to confirm use of acceptable input data.
Information Requirement	The proponent is asked to provide all the necessary information and assumptions required to perform the MicroShield calculations independently and to list the resulting calculated values from the listed scenarios.

Number	IR-186
Dept.	CNSC
Project effects link	Human Health with respect to radiation exposure
Reference to EIS, appendices, or supporting documentation	Section 10.2.3.2.4, Section 10.2.3.2.6, Section 10.2.4 Appendix 10-C, Section 3.2
Context and Rationale	Context: In sections 10.2.3.2.4 and 10.2.3.2.6, as well as section 3.2 of Appendix 10-C, the proponent has stated that workers in the drying and packaging areas of the processing plant will be required to wear powered air purifying respirators (PAPR) to reduce/eliminate inhalation exposure.

	<p>Further in section 10.2.4, which elaborates mitigation measures, it is stated: “For the drying and packaging/loading areas of the ISR plant, use of PAPR has been assumed. It will be needed in these areas, and it has been planned in these areas to substantially reduce doses from inhalation of uranium dust. Dust levels in these areas will be monitored and kept ALARA.”</p> <p>The use of respirators appears to be in contradiction of the requirements of section 13 of the Uranium Mines and Mills Regulations, which states: No licensee shall rely on the use of a respirator to comply with the Radiation Protection Regulations unless the use of the respirator (a) is for a temporary or unforeseen situation; and (b) is permitted by the code of practice referred to in the licence.</p> <p>The proponent is also reminded that respirators should not be the first choice for dose reduction in workplaces. They should only be used when the hierarchy of control (elimination, substitution, engineering, or administrative controls) is not possible.</p> <p>Rationale: At this stage of the project, the proponent is expected to identify design improvements to these areas of the ISR plant/processing plant following the hierarchy of control for the radiological protection of workers, as per regulatory requirements and as described in REGDOC-2.7.1, Radiation Protection.</p>
Information Requirement	<p>Provide the rationale for mandating the use of respirators by workers in the drying and packaging areas of the processing plant.</p> <p>Include the demonstration of the application of the hierarchy of control for radiological protection within the design of these areas of the processing plant.</p> <p>Justify that this approach complies with section 13 of the Uranium Mines and Mills Regulations.</p>

Number	IR-187
Dept.	CNSC
Project effects link	Human Health with respect to radiation exposure
Reference to EIS, appendices, or supporting documentation	<p>Section 10.2.3.2.4, Section 10.2.3.2.6</p> <p>Appendix 10-C, Section 3.3, 6.0</p>

Context and Rationale	<p>Context: The exposure scenarios and assumptions for the workers in the drying area and the packaging/loading area of the processing plant include the wearing of PAPRs, which is assumed to provide a 1000-fold reduction in dust exposure.</p> <p>Further to reference IR-186, the use of a respirator as well as in worker dose predictions for the project, appears to contravene section 13 of the Uranium Mines and Mills Regulations, and does not follow the hierarchy of controls for radiological protection of workers as described in REGDOC-2.7.1, Radiation Protection.</p> <p>Rationale: At this stage of the project, the proponent is expected to identify design improvements to these areas of the ISR plant/processing plant following the hierarchy of control for the radiological protection of workers, as per regulatory requirements and as described in REGDOC-2.7.1, Radiation Protection.</p>
Information Requirement	<p>Modify the exposure scenarios and assumptions (i.e., remove the use of a respirator) for the workers in the drying area and the packaging/loading area of the processing facility.</p> <p>Assess the resultant exposures against CNSC regulatory dose limits and the ALARA principle.</p> <p>Identify mitigation measures as per the hierarchy of control for radiological protection.</p>

### **Summary of IRs 183 to 187 and Responses:**

**IR-183 (CNSC):** Provide the dose calculations for deriving the dose estimates for workers in all exposure scenarios, for at least the most dose significant scenarios.

**Response:** *Example dose calculations are provided in Appendix A of the Worker Dose Assessment, which is Appendix 10-C of the EIS. As noted in response to IRs 185, 186, and 187, some revisions to Appendix A are detailed in an attached memo.*

**IR-184 (CNSC).** As per section 14 of the Radiation Protection Regulations, the equivalent dose limit for the lens of an eye for nuclear energy workers (NEWs), effective January 1, 2021, is 50 mSv in a one-year dosimetry period. The EIS and Appendix 10-C should be aligned with the Radiation Protection Regulations regarding the equivalent dose limit for the lens of an eye for NEWs.

**Response:** *The text cited by the reviewer from Section 2.0 of Appendix 10-C about a proposed additional limit for 5-year equivalent dose to lens of eye will be deleted to be consistent with the Regulation.*

**IR-185 (CNSC).** The proponent is asked to provide all the necessary information and assumptions required to perform the MicroShield calculations independently and to list the resulting calculated values from the listed scenarios.

**Response:** *The source radiochemistries, geometries, and distance/time assumptions that are inputs to the external dose calculation are provided in the Worker Dose Assessment, which is Appendix 10-C of the EIS.*

*The calculation of external dose is detailed in Appendix A (Table A.3) of the Worker Dose Assessment. This calculation uses dose rates at distance as output from MicroShield. As we have noticed several typos in Table A.3, and have changed inputs for drying and packaging in response to IR-186, a revised table is provided (see Table A.3 below).*

**IR-186 (CNSC).** Provide the rationale for mandating the use of respirators by workers in the drying and packaging areas of the processing plant. Include the demonstration of the application of the hierarchy of control for radiological protection within the design of these areas of the processing plant. Justify that this approach complies with section 13 of the Uranium Mines and Mills Regulations.

**Response:** *We had used a very conservative dust level in drying and packaging areas (representing equipment sources of dust to the exhaust system). While the hazard cannot be eliminated or substituted, engineering controls will minimize the pathway. As a primary engineering control, the equipment and exhaust will be in a negative pressure enclosure. Under normal operation, workers will not be inside the enclosure. To support a more realistic exposure assessment for drying and packaging, a conservative design estimate for potential dust levels in the main room has been obtained. It is anticipated that workers in these areas will not require PAPR under normal circumstances. As an administrative control, dust levels in the room will be monitored, and individual worker exposures will be monitored and managed. PAPR will be available if needed as a control of last resort. The approach will respect the hierarchy of control and will comply with Section 13 of the Uranium Mines and Mills Regulations. A new worker exposure assessment has been completed for drying and packaging areas, using the design estimate for dust levels in the main room, a revised time spent in the area, and no routine use of PAPR (see revised Tables A.1 and A.3 below).*

**IR-187 (CNSC).** Modify the exposure scenarios and assumptions (i.e., remove the use of a respirator) for the workers in the drying area and the packaging/loading area of the processing facility. Assess the resultant exposures against CNSC regulatory dose limits and the ALARA principle. Identify mitigation measures as per the hierarchy of control for radiological protection.

**Response:** *As described in response to IR-186, a new worker exposure assessment has been completed for drying and packaging areas, using the design estimate for dust levels in the main room, a revised time spent in the area, and no routine use of PAPR (see revised Tables A.1 and A.3 below). The in-design engineering controls will include negative pressure enclosure of source equipment and exhaust, as well as ventilation controls in the main rooms (drying and packaging areas). Administrative controls will include area and individual monitoring and time-exposure management. It is shown that CNSC regulatory dose limits can be met without PAPR. This will be confirmed by air and dose monitoring during the commissioning phase as the control system is optimized. PAPR will be available as needed for non-routine situations, such as any necessary work within the enclosures.*

#### **Changes to the Worker Dose Calculations and Report:**

The Worker Dose Assessment (Appendix 10-C of the EIS) will be revised to reflect the information provided in Responses to IRs above. References to routine use of PAPR as an exposure control will be deleted. The primary engineering controls on dust exposure in the drying and packaging areas will be explained. Section 6.0 (Radiation Protection Strategies) will be updated to reflect the hierarchy of controls – elimination > substitution > engineering > administrative > PPE. Neither elimination nor substitution of the hazard are feasible controls for the Project, given its purpose to produce uranium

concentrate, and given the radioactive nature of uranium. Elimination of an exposure pathway would typically involve engineering controls. Engineering controls will be utilized as a first line of defense.

As noted in the responses, a design estimate has been obtained for dust levels in the main room for the drying area and the packaging/loading area. This value of 0.5 mg/m<sup>3</sup> is a conservative representation of potential dust levels for workers under normal operations. It translates to a respirable dust value of 0.4 mg/m<sup>3</sup> and a U-238 activity of 3.9 Bq/m<sup>3</sup>. This value has been used in revised calculations of the dust inhalation dose (presented herein). In addition, time spent in the room has been reduced from 8 to 4 hours per day. The revised dose calculations show that the CNSC regulatory dose limits can be met without use of PAPR.

Because the dust sources (dryer and calciner in the drying area; drum loader in the packaging area) will be fully enclosed under negative pressure, workers will not be in the enclosure, and time spent at 1 m from source will be zero. The time at distance allocation has been revised to:

0 h/d at 1 m, 3 h/d at 5 m, and 1 h/d at 10 m

This time at distance allocation is relevant to the external dose, which is a minor dose component for the drying and packaging/loading areas.

To accommodate these new assumptions, the worker dose calculations have been revised. In addition, several typos in the tables of the June 2022 Worker Dose Assessment have been corrected. For completeness, all the tables from the report that have any changes are provided below, including the example calculations from Appendix A of the Worker Dose Assessment. Any word or numeric value that has changed is shown in red font.

The revised effective dose from dust inhalation, in both drying and packaging areas, without use of PAPR, is calculated to be 11.7 mSv/a (Table 5.1 and Table A.1) well below the 5-year average effective dose limit of 20 mSv/a. Actual dust levels will be confirmed during the commissioning phase, using both area monitoring and sampling pumps worn by workers, and the control system will be optimized to ensure that doses are ALARA. Monitoring will continue through the operations phase, in accordance with the Radiation Protection Program.

**Section 2.0 of the Worker Dose Assessment** (on Regulatory Context) will be updated to align with the Radiation Protection Regulations, by deleting the following text:

~~“In addition, the CNSC has proposed a 100 mSv 5-year equivalent dose to lens of eye, in accordance with recent recommendations of the International Commission for Radiological Protection (ICRP, 2012a). This implies an average annual equivalent dose to lens of 20 mSv/a and will be considered as an applicable dose limit for workers.”~~

**Section 6.0 of the Worker Dose Assessment** (on Radiation Protection Strategies) will be updated to describe the planned mitigations, consistent with the hierarchy of controls. Text in this section relevant to dust exposure will be revised as follows:

“Doses to workers at the Wheeler River Project are expected to be maintained below the average annual dose limit of 20 mSv/a for NEWs. Several mitigations have been assumed and will be important

in keeping doses ALARA. For the drying and packaging/loading areas of the ISR Plant, ~~the engineering controls will include negative pressure enclosures around source equipment and exhaust, as well as ventilation controls in the main rooms (beyond enclosures). Administrative controls will include area and individual monitoring and time-exposure management. Actual dust levels will be confirmed during the commissioning phase and the control system will be optimized to ensure that doses are ALARA. Use of PAPR has been assumed. It will be needed in these areas, and it has been planned in these areas to substantially reduce dose from inhalation of uranium dust. Dust levels in these areas should be monitored and kept as low as reasonably achievable.”~~

~~“Powered Air Purifying Respirators (PAPR) should be available in these areas in case of need for any non-routine work that may involve high dust exposures. However, PAPR is a control of last resort. Under the Radiation Protection Program, a radiation work permit process will be in place for any non-routine work that may involve unusually high exposures, ensuring that risks are assessed and exposure controls are optimized in accordance with the ALARA principle. protection factor of 1000 is provided by several types of respirators such as Powered Air Purifying Respirators (PAPR) with a full facepiece or hood, and Supplied-Air Respirators (SAR) in positive-pressure mode or continuous flow mode. Alternatively, a Self-Contained Breathing Apparatus will provide protection factors over 10,000 if used in positive-pressure mode. It should be noted that Air Purifying Respirators will not offer protection against radioactive gases such as radon.”~~

~~“Dust inhalation is also a potentially significant component of dose at the core shack. At this location, PAPR will not be required; however, dust levels should be monitored here too. An administrative level of respirable dust equal to ¼ of the ACGIH TLV of 0.27 mg/m<sup>3</sup> has been assumed. Again, dust levels will be confirmed during the commissioning phase and the control system will be optimized to ensure that doses are ALARA. It may be possible to increase air exchange in the core shack, above the planned 6 exchanges per hour, should this be necessary. This would help also with radon exposure in the core shack.”~~

Radiation Protection Program documents, now in preparation, to be completed during licensing, will provide more detail regarding radiation protection processes and procedures.

**Tables of the Worker Dose Assessment** (in Section 3, Section 5, and Appendix A) will be revised as discussed above. The revised tables are shown below.

Annex 1 – FIRT IR Table – Technical Review of the **Wheeler River Project** draft EIS  
Denison Response – August 18<sup>th</sup>, 2023

Core Shack	3 cores	Geologist/Geotech Loggers	11	2	8	1	6
------------	---------	------------------------------	----	---	---	---	---

(a) When there are several sources in one work area, the worker is assumed to divide his time roughly equally among those sources (see Appendix Table A.3).

Table 3.11: Geometries for External Exposure Scenarios Modelled in MicroShield for Sources in the ISR Plant

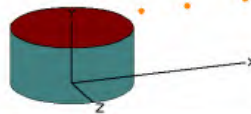

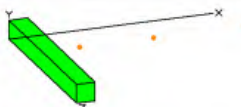

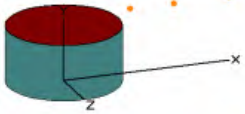

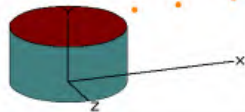

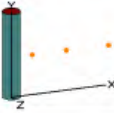

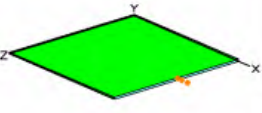

Source	Geometry	Source Type	MicroShield Geometry	Volume (m <sup>3</sup> )	Shielding Thickness (mm)	Shielding material	Source form	Density (kg/m <sup>3</sup> )
UBS Feed Tank	Height: 5.2m, diameter: 3.3m	UBS Feed		4.45E+01	6.35	Steel	Liquid	1.00E+03
Totes of Filter Cake	3 totes of filter cake, each 1m height, 1m diameter	Process Precipitates		3.00E+00	6.35	PET	Cake	1.88E+03
Precipitate Thickener	Height: 5m, Diameter: 10m, drum 1.7m above the floor	Process Precipitates		3.93E+02	6.35	Steel	Slurry	1.30E+03
Precipitation Tank	Height: 5.2m, Diameter: 3.3m	Yellowcake Precipitation Solution		4.45E+01	6.35	Steel	Liquid	1.00E+03
Yellowcake in Screw conveyor	Height: 1m, Length: 10m, Width: 1m	UO <sub>4</sub>		1.00E+01	6.35	Steel	Cake	2.40E+03

Table 3.11: Geometries for External Exposure Scenarios Modelled in MicroShield for Sources in the ISR Plant (continued)

Source	Geometry	Source Type	MicroShield Geometry	Volume (m <sup>3</sup> )	Shielding Thickness (mm)	Shielding material	Source form	Density (kg/m <sup>3</sup> )
Yellowcake Thickener	Height: 5m, Diameter: 10m, drum 1.7m above the floor	UO <sub>4</sub>		3.93E+02	6.35	Steel	Slurry	1.30E+03
WTP Clarifier	Height: 5m, Diameter: 10m, drum 1.7m above the floor	NA		3.93E+02	6.35	Steel	Slurry	1.00E+03
Dryer	Horizontal cylinder, Length: 10m, Diameter: 2m	UO <sub>4</sub>		3.14E+01	6.35	Steel	powder	2.03E+03
Calciner	Horizontal cylinder, Length: 20m, Diameter: 2m	UO <sub>4</sub>		6.28E+01	6.35	Steel	powder	2.03E+03
Drum Storage	350 barrels on a pad, each height: 0.89m, diameter: 0.58m	UO <sub>4</sub>		1.08E+02	1.20	Steel	powder	1.71E+03

**Table 5.1: Internal Annual Dose from Dust Inhalation**

Work Area	Worker	Effective Dose from Inhalation U-238 <sup>+</sup> (mSv/a)	Effective Dose from Inhalation Ra-226 <sup>+</sup> (mSv/a)	Total Effective Dose (mSv/a)
Wellfield	Driller 1	5.21E-03	-	5.21E-03 <sup>a</sup>
Wellfield	Wellfield Operator 1, 2	5.68E-03	-	5.68E-03 <sup>a</sup>
Process Precipitate Removal Area	Plant Operator 1	2.04E-02	-	2.04E-02 <sup>a</sup>
Yellowcake Precip Area	Plant Operator 2	2.04E-02	-	2.04E-02 <sup>a</sup>
Water Treatment Area	Plant Operator 3	2.04E-02	-	2.04E-02 <sup>a</sup>
Drying Area	Plant Operator 4	1.17E+01	-	1.17E+01 <sup>b</sup>
Packaging Loading Area	Plant Operator 5	1.17E+01	-	1.17E+01 <sup>b</sup>
Special Waste Pad	Equipment Operator 1	1.02E-02	-	1.02E-02 <sup>ac</sup>
Process Precipitate Pond	Equipment Operator 1	2.98E-03	-	2.98E-03 <sup>ac</sup>
Contaminated Landfill	Equipment Operator 1	9.54E-04	-	9.54E-04 <sup>ac</sup>
Core Shack	Geologist/	5.63E+00	1.02E+00	6.65E-00 <sup>d</sup>
	Geotech Logger			

(a) Based on outdoor concentration of U dust from IEC (2022); U-238<sup>+</sup> DCF 2.60E-06 Sv/Bq from ICRP 137 includes U-238+U-234

(b) Based on indoor concentration of U dust, which dominates; U-238<sup>+</sup> DCF 2.60E-06 Sv/Bq from ICRP 137 includes U-238+U-234

(c) Equipment Operator 1 frequents 3 locations; the 3 doses must be added for this worker

(d) Based on indoor concentration of ore dust, which dominates; U-238<sup>+</sup> DCF 2.08E-05 Sv/Bq from ICRP 137 includes the entire U-238 series; doses shown for U-238<sup>+</sup> and Ra-226<sup>+</sup> reflect the portions from U-238 to Th-230, and from Ra-226 to Po-210, respectively.

Table 5.2: Internal Annual Dose from Radon Inhalation

Work Area	Worker	Source	Dose from Radon in Air (mSv/a)	Total Radon Dose for Worker (mSv/a)
Wellfield	Driller 1	Outdoor	9.44E-02 <sup>a</sup>	9.44E-02
Wellfield	Wellfield Operator 1, 2	Outdoor	1.03E-01 <sup>a</sup>	1.03E-01
Process Precipitate Removal Area	Plant Operator 1	Outdoor	1.78E-01 <sup>a</sup>	2.27E+00
		Cake	7.47E-02 <sup>b</sup>

Industrial Landfill	Equipment Operator 1	4.25E-04	720	2.60E-06	9.54E-04
Core Shack	Geologist/	2.02E-01	1320	2.08E-05	6.65E+00
	Geotech Logger				

Total Effective Dose (mSv/a) = C<sub>air</sub> (Bq/m<sup>3</sup>) x I (m<sup>3</sup>/h) x ET (h/a) x DCF (Sv/Bq) x 1000 (mSv/Sv)

### Notes:

Concentrations from indoor sources for Drying/Packaging and Core Shack

Concentrations in Drying and Packaging are respirable activity based on a design value for dust in the main room of the drying area (0.5 mg/m<sup>3</sup> total)

DCFs (Sv/Bq) from ICRP 137: U238+U234 (2.60E-6); U238 to Po-210 (2.08E-5)

Inhalation Rate (I) from ICRP 119 is 1.2 m<sup>3</sup>/h

**Table A.2: Radon Dose Calculation**

Work Area	Worker	Source	Radon in Air (Bq/m <sup>3</sup> )	Exposure Time (h/a)	Equilibrium Factor F	Radon Dose (mSv/a)	Total (mSv/a)

External Dose (mSv/a) = [  $\Sigma$  ET (h/d) x Max Effective Dose (mSv/h) ] x ED (d/a)

Dose to Lens (mSv/a) = [  $\Sigma$  ET (h/d) x Max Lens Dose (mSv/h) ] x ED (d/a)

**Notes:**

Maximum dose rates at distance (mSv/h) are output from Microshield scenarios; highest value considering all possible orientations.

Skin dose was less than or equal to lens dose, depending on the scenario.

## Attachment: IR-195

Number	IR-195
Dept.	ECCC
Project effects link	Change to an environmental component due to hazardous contaminants
Reference to EIS, appendices, or supporting documentation	Appendix 10-A (ERA), Section 3.1.2.1
Context and Rationale	<p><b>Context:</b> Figure 3-2 depicts modelled concentrations of COPCs in the receiving environment surface water during all Project phases. Effluent discharge rates during Operations and Decommissioning are not anticipated to differ significantly. However, COPC concentrations seem to decrease rapidly after the end of the operations period despite effluent releases continuing into the decommissioning phase.</p> <p><b>Rationale:</b> There has been no information provided on predicted changes in effluent COPC concentrations and discharge rates during the decommissioning phase. It remains unclear how COPC concentrations would decrease so quickly following the end of operations.</p>
Information Requirement	<ol style="list-style-type: none"> <li>1. Provide further information on modelled maximum COPC concentrations for each individual Project phase with estimated timing for peak concentrations to appear in the receiving environment.</li> <li>2. Provide further information on predicted effluent quality during the Project decommissioning phase.</li> <li>3. Update ERA figures and conclusions as needed.</li> </ol>

Figures and tables to support response in IR table:

## Attachment: IR-196

Number	IR-196
Dept.	ECCC
Project effects link	Change to an environmental component due to hazardous contaminants
Reference to EIS, appendices, or supporting documentation	Appendix 10-A (ERA), Section 3.1.2.3
Context and Rationale	<p><b>Context:</b> Table 3-6 provides predicted maximum sediment concentrations of COPCs compared to sediment quality guidelines. Several selected sediment screening values are not the most stringent sediment quality guidelines, with no justification provided. Additionally, copper and lead appear to be missing guidelines that are available from the Burnett-Seidel and Liber (2013) study.</p> <p><b>Rationale:</b> The most stringent guidelines should be used for the sediment quality risk assessment in the ERA. Use of the most stringent guidelines will allow the most protective assessment to analyze risks to the receiving environment, aquatic and terrestrial biota.</p>
Information Requirement	<ol style="list-style-type: none"> <li>1. Provide further information and justification for the selection of less stringent thresholds.</li> <li>2. Update the ERA as needed.</li> </ol>

Updated Appendix 10-A Table 3-6 below (red text indicates a change from the existing table in the draft EIS) to support response in IR table:

Constituent	Units	Maximum – Whitefish Lake (LA-5)	Sediment Quality Guidelines						Selected Sediment Screening Value	Is Concentration Greater than Selected Screening Value? (Y/N)

Project effects link	Change to an environmental component due to radiological contaminants
Reference to EIS, appendices, or supporting documentation	Appendix 10-A (ERA) Appendix B, Tables B.7 and B.8 Ref. 19-2638  Appendix 10-A (ERA), Table 4-3 Ref. 19-2638 (p. 4.17)
Context and Rationale	Context: Section 10 Appendix 10-A (ERA) contains Table 4-3 (p. 4.17), which lists ingestion rates for traditional foods and includes the category “organs” for Mammals. Tables B.7 and Table B.8 in Section 10 Appendix 10-A (ERA) Ref. 19-2638 provide the predicted concentrations of radionuclides for ecological receptors during the project phases and during future centuries, respectively. They list the concentrations of radionuclides in moose and in moose organs, which is presented as a single cumulative organ value. Other terrestrial and aquatic animals (such as the black bear and woodland caribou) that are a part of the traditional diet of nearby Indigenous communities have higher concentrations of radionuclides than moose, yet concentrations are not provided for organs of these species. Rationale: While Health Canada is not aware of transfer factors to individual organs, or to organs in animals that are not ruminants, it would be beneficial to have a better understanding of radionuclide concentrations in the organs of other animals that may be consumed by local Indigenous communities.
Information Requirement	1. Provide more clarification on how the mammalian organ ingestion rates are calculated (which animals and relative contribution percentages).  2. Provide a rationale for why concentrations of radionuclides were not assessed in organs of animals (other than moose) that are consumed as country foods by Indigenous people harvesting in the area.

### Response:

#### **1. Mammalian Organ Ingestion Rates**

The derivation of the Traditional Foods diet is explained in detail in Section 4.2.4.2 of Appendix 10-A (ERA), which states: “A dietary study was performed for residents of Patuanak and La Plonge to understand which traditional foods were consumed by each community and the approximate amounts consumed. The results of the survey were summarized in CanNorth (2017) by average daily intake in grams (fresh weight) of country foods by species and season, for Patuanak, La Plonge, and an average. A summary of the ERFN traditional food ingestion rates by food type is shown in Table 4-3 and the proportions of food types are shown in Figure 4-3.”

As shown in Table 4-3 in Appendix 10-A the mammalian organ ingestion rate was 6.2 g/d for La Plonge, and 16.2 g/d for Patuanak, and the average was 12.8 g/d for both areas combined. A more detailed breakdown of organ types is provided in IR-198 Table 1 below which indicates that organs are consumed from moose, woodland caribou, and barren-ground caribou. As shown in IR-198 Table 1 below, the greatest contribution to the total organ ingestion rate is from moose organs. Looking at the total organ ingestion rate, approximately 80% of the contribution is from moose liver, kidney, and other parts (see IR-198 Figure 1 below); therefore, it was decided for the ERA to assign the total organ ingestion rate to moose organs.

## **2. Rationale for Concentrations of Radionuclides in Moose Organs Only**

The reviewer also requested rationale for why concentrations of radionuclides are not provided for organs of animals other than moose. The reviewer acknowledges that they are “not aware of transfer factors to individual organs or to organs that are not ruminants, it would be beneficial to have a better understanding of radionuclide concentrations in the organs of other animals that may be consumed by local Indigenous communities.” The transfer factor for moose organs was scaled based on the beef organs transfer factor from CSA N288.1-20 (see Table 3-15 in Appendix A to Appendix 10-A). Limited literature data is available for transfer factors for organs. It was decided to represent organs with moose organs based on the results from the ERFN diet explained above.

Denison acknowledges that the ingestion transfer factors for woodland caribou organs would be higher than the transfer factors for moose. These ingestion transfer factors are summarized in IR-198 Table 2 below for the relevant radionuclides, and the resulting tissue concentrations based on predicted concentrations at McGowan Lake are summarized in IR-198 Table 3. The predicted tissue concentrations for woodland caribou organs ranges from about 0.6 to 6.9 times higher than the predicted tissue concentrations for moose organs for radionuclides in the U-238 decay chain. However, based on the breakdown of organ ingestion rates shown in IR-198 Table 1 below, the caribou organ intake rate is ¼ of the moose organ intake rate, which roughly offsets the higher concentrations in caribou organs. Therefore, representing the organ intake as 100% moose organs is a reasonable approximation.

No changes to the EIS or ERA (Appendix 10-A) were made based on the response to this IR.

**IR-198 Table 1: Breakdown of Contribution of Organ Types to Total Organ Ingestion Rate**

Organ Types	La Plonge g/d	Patuanak g/d	All g/d	La Plonge % of Organs	Patuanak % of Organs	All % of Organs
Moose (other parts)	2.4	5.7	4.6	39%	35%	36%

## Attachment: IR-213

Number	IR-217
Dept.	CNSC
Project effects link	Accidents and Malfunctions
Reference to EIS, appendices, or supporting documentation	Sections 14.6.1 and 14.6.2
Context and Rationale	<p><b>Context:</b> Highway 914 crosses the Wheeler River 10 km southwest of the access road junction. A vehicle accident, including a rollover, collision, or run off road, at or near the bridge could potentially result in a release of uranium concentrate and release of fuels and chemicals into the surface water at this location. Denison believes that a release of uranium concentrate and a release of fuels and chemicals at this location would bound the releases at any other water crossing along the transportation corridor. However, no information on what other water crossings along the transportation corridor exist and how bounding scenarios 1 and 2 would bound the risk of releasing uranium concentrate and fuels and chemicals at other crossings.</p> <p><b>Rationale:</b> The release of uranium concentrate and fuels and chemicals at water crossings would contaminate the water body at the crossings and pose a risk to the environment and public health.</p>
Information Requirement	Please provide information on all water crossings along the transportation corridor and justification why bounding scenarios 1 and 2 would bound the effects of the accidental releases of uranium concentrate and fuels and chemicals at these crossings.

Table to support response in IR table:

Table 3-2 in Appendix A of Appendix 14-A will be updated in the final EIS to include (new) Scenario 2.4 Well Casing Yield and/or Damage:

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
2.4	Scenario 2.4 Well Casing Yield and/or Damage	Co / Op	Loss of lixiviant into the groundwater within freeze wall containment	Occupational health and safety plan Personnel training and orientation Personal protection equipment Spill management and response Secondary containment via freeze wall	2	3	Low	Risk level is low, moderate consequence event (assume localized event to ground where clean up is possible), no further assessment

Notes: "Co" is construction  
"Op" is operations  
"De" is Decommissioning  
"L" is likelihood  
"S" is severity  
"RR" is risk ranking

## Attachment: IR-214

Number	IR-214
Dept.	CNSC
Project effects link	Accidents and Malfunctions
Reference to EIS, appendices, or supporting documentation	Section 14.5.3 Appendix 14-A, section 3.2.3
Context and Rationale	<p><b>Context:</b> Hazard scenarios were identified using a systematic approach that considered the existence of sources of hazards and initiating events for the Project in consideration of Project activities and components. Details for how each of these project components and activities are considered in the initial hazard scenario identification process are provided in the accidents and malfunctions TSD (see Appendix 14-A; Ecometrix 2022).</p> <p>However, in Table 3-1 to Table 3-14 in Appendix A of Appendix 14-A, the following inconsistencies were identified:</p> <ul style="list-style-type: none"> <li>i. consequences for the hazards ID# 1.1, 1.5, 1.7, 14.2 include occupational major injuries; however, the severity (S) is denoted as number 2 that appears to be inconsistent with consequence rating number in Figure 14.5-2</li> <li>ii. Hazard ID# 1.5 has a L=2, but it is described as a highly unlikely event, which is inconsistent with the term in Figure 14.5-2</li> <li>iii. Hazards ID# 3.6 and 3.7 have a L=1, but they are described as low probability event that is inconsistent with the term in Figure 14.5-2</li> <li>iv. Hazards ID# 8.2, 8.3, 9.1, 10.1 to 10.5, 11.1, 11.5 have a L=1, but they are described as unlikely events, which are inconsistent with the term in Figure 14.5-2. Rationale needs to be provided how stockpile erosion is considered to have a L=1</li> <li>v. Hazard ID# 12.1 has a L=2 and S=3, but it's risk ranking is moderate, which is inconsistent with the term in Figure 14.5-2</li> <li>vi. Hazard ID# 13.3 has a L=2. Based on the operation experience in the similar projects in the northern Saskatchewan, ponds lining failure and leakage is a very likely event. Rationale needs to be provided to support L=2 or change the number for L.</li> </ul> <p><b>Rationale:</b> Inconsistent or inaccurate/incorrect information was included in Accidents and Malfunctions assessment.</p>

Information Requirement	Please clarify or correct all inconsistent and/or inaccurate information in Tables 3-1 to 3-14 in Appendix A of Appendix 14-A.
-------------------------	--

Tables to support response to IR-214:

The updated hazard screening tables on the following pages are provided in support of the response to IR-214.

It is noted that the revisions highlighted do not affect the outcome of the screening evaluation and do not necessitate consideration of additional bounding scenarios by way or more detailed analyses.

Site Works - Summary – Nine potential scenarios have been identified. Risks have been characterized as low to moderate as it concerns environmental risks. No scenarios carried forward for quantitative assessment.

Table 3-1: Hazard Identification Evaluation – Site Works

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
1.1	Fall / slip	Co / Op / De	Occupational major injuries	Occupational health and safety plan Personnel training and orientation Personal protection equipment	5	23	ALARP, moderate	Best practice in worker health and safety program resulting in ALARP, no further assessment
1.2	Fall / slip	Co / Op / De	Occupational fatalities	Occupational health and safety plan Personnel training and orientation Personal protection equipment	2	5	ALARP, High	Best practice in worker health and safety program resulting in high but ALARP, no further assessment
1.3	Refuelling accident	Co / Op / De	Hydrocarbon release	Occupational health and safety plan Personnel training and orientation Personal protection equipment Spill management and response Secondary containment	4	2	Low	Overall Risk level is low, low-minor consequence event, no further assessment
1.4	Fuel storage failure	Co / Op / De	Hydrocarbon release	Occupational health and safety plan Personnel training and orientation Personal protection equipment Spill management and response Secondary containment	1	3	Low	Overall Risk level is low, highly unlikely event, no further assessment
1.5	Fuel storage and transfer fire and explosion	Co / Op / De	Occupational major injuries	Occupational health and safety plan Personnel training and orientation Personal protection equipment Fire safety plan and firefighting system	2	23	Low	Overall Risk level is low, highly-unlikely event, no further assessment
1.6	Fuel storage and transfer fire and explosion	Co / Op / De	Occupational fatalities	Occupational health and safety plan Personnel training and orientation Personal protection equipment Fire safety plan and firefighting system	1	5	ALARP, moderate	Best practice in worker health and safety program resulting in ALARP, no further assessment
1.7	Vehicle and construction equipment accident	Co / Op / De	Occupational major injuries	Occupational health and safety plan Personnel training and orientation Preventive and routine maintenance Onsite traffic control (speed limits, signage)	4	2	ALARP, moderate	Best practice in worker health and safety program resulting in ALARP, no further assessment
1.8	Vehicle and construction equipment accident	Co / Op / De	Occupational fatalities	Occupational health and safety plan Personnel training and orientation Preventive and routine maintenance Onsite traffic control	2	5	ALARP, High	Best practice in worker health and safety program resulting in high but ALARP, no further assessment
1.9	Vehicle accident	Co / Op / De	Hazardous materials spill	Occupational health and safety plan Personnel training and orientation Preventive and routine maintenance Onsite traffic control (speed limits, signage) Spill management and response	4	2	Low	Overall Risk level is low, minor consequence events, no further assessment

Notes: "Co" is construction  
"Op" is operations  
"De" is Decommissioning  
"L" is likelihood  
"S" is severity  
"RR" is risk ranking

Wellfield - Summary – Three potential scenarios have been identified. Risks have been characterized as low to moderate as it concerns environmental risks. No scenarios carried forward for quantitative assessment.

Table 3-2: Hazard Identification Evaluation – Drilling

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
2.1	Drilling mud spill	Co / Op	Material spill to ground, including contaminated drill muds	Occupational health and safety plan Personnel training and orientation Personal protection equipment Spill management and response Primary and secondary containment for drilling mud	4	2	Low	Overall risk level is low, <u>low-minor</u> consequence event (assumes containment and clean up), no further assessment
2.2	Piping failure in the well field	Co / Op	Loss of lixiviant, UBS, and/or regents to ground	Occupational health and safety plan Personnel training and orientation Personal protection equipment Spill management and response Secondary containment via freeze wall	2	3	Low	Overall risk level is low, moderate consequence event (assume localized event to ground where clean up is possible prior to groundwater contamination), no further assessment
2.3	Surface flood	Co / Op	Potential for groundwater contamination	Lined collection points Site grading to collection areas Collection pond sized to accommodate PMP	2	2	Low	Overall risk level is low, <u>low-minor</u> consequence event, no further assessment
2.4	Well casing yield and/or damage	Co / Op	Loss of lixiviant into the groundwater within freeze wall containment	Occupational health and safety plan Personnel training and orientation Personal protection equipment Spill management and response Secondary containment via freeze wall	2	3	Low	Overall risk level is low, moderate consequence event (assume localized event to groundwater where cleanup is possible), no further assessment

Access Road / Land Transportation - Summary – Eight potential scenarios have been identified. Risks have been characterized as low to high as it concerns environmental risks. Two scenarios carried forward for quantitative assessment.

Table 3-3: Hazard Identification Evaluation – Access Road / Land Transportation (shaded rows are those recommended for further assessment)

ID#	Accident / Malfunction	Phase	Consequences	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
3.1	Vehicle accident including rollover, collision, run off road	Op	Aquatic release of radioactivity	Occupational health and safety plan Personnel training and orientation Traffic control measures Travel management plan Spill management and emergency response plan	3	5	High	Further Assessment Recommended
3.2	Vehicle accident including rollover, collision, run off road	Co / Op / De	Terrestrial release of radioactivity	Occupational health and safety plan Personnel training and orientation Traffic control measures Travel management plan Spill management and emergency response plan	3	4	ALARP, moderate	Best practice in terrestrial spill containment and cleanup resulting in ALARP, no further assessment
3.3	Vehicle accident including rollover, collision, run off road	Co / Op / De	Aquatic release of fuel, hazardous chemicals and reagents	Occupational health and safety plan Personnel training and orientation Traffic control measures Travel management plan Spill management and emergency response plan	3	5	High	Further Assessment Recommended
3.4	Vehicle accident including rollover, collision, run off road	Co / Op / De	Terrestrial release of fuel, hazardous chemicals and reagents	Occupational health and safety plan Personnel training and orientation Traffic control measures Travel management plan Spill management and emergency response plan	3	4	ALARP, moderate	Best practice in terrestrial spill containment and cleanup resulting in ALARP; Further Assessment Recommended to address interested party concerns (includes consideration of radioactivity)
3.5	Vehicle fire	Co / Op / De	Terrestrial release of hydrocarbons and fuel	Occupational health and safety plan Personnel training and orientation Travel management plan Spill and emergency response plan Spill management and emergency response plan	1	4	ALARP, moderate	Best practice in terrestrial spill containment and cleanup resulting in ALARP, no further assessment
3.6	Vehicle fire	Co / Op / De	Release of radioactivity to air	Occupational health and safety plan Personnel training and orientation Travel management plan Spill and emergency response plan Spill management and emergency response plan	1	4	ALARP, moderate	<u>Overall moderate (ALARP) low-risk, low-probability</u> highly unlikely event. Reversible and transient effect. No further assessment
3.7	Vehicle fire	Co / Op / De	Atmospheric release of particulate and combustion by-products	Occupational health and safety plan Personnel training and orientation Travel management plan Spill management and emergency response plan Fire safety plan and firefighting systems Ambient air monitoring	1	3	Low	<u>Overall low-low risk, highly unlikely-low-probability</u> event. Reversible and transient effect. No further assessment
3.8	Vehicle – Wildlife collision	Co / Op / De	Wildlife fatality	Occupational health and safety plan Personnel training and orientation Traffic control measures Travel management plan	4	2	Low	<u>Overall low risk</u> . Individual (not population) level <u>minor</u> effect, reversible and nonsignificant effect, no further assessment

Notes: "Co" is construction  
"Op" is operations  
"De" is Decommissioning  
"L" is likelihood  
"S" is severity  
"RR" is risk ranking

Airstrip - Summary – Four potential scenarios have been identified. Risks have been characterized as low to moderate as it concerns environmental risks. No scenarios carried forward for quantitative assessment.

Table 3-4: Hazard Identification Evaluation – Airstrip

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
4.1	Fuel storage failure	Co / Op / De	Hydrocarbon release	Occupational health and safety plan Personnel training and orientation Storage inspection, maintenance Secondary containment Spill and emergency response plan	1	3	Low	<del>Overall r</del> Risk level is low, highly unlikely event, no further assessment
4.2	Refuelling accident	Co / Op / De	Hydrocarbon release	Occupational health and safety plan Personnel training and orientation Secondary containment Spill and emergency response plan	4	2	Low	<del>Overall Risk</del> risk level is low, <del>low-minor</del> consequence event, no further assessment
4.3	Plane de-icing chemical release	Co / Op / De	Terrestrial release of reagent; possible aquatic release of reagent	Personnel training Containment Spill and emergency response plan	3	2	Low	<del>Overall r</del> Risk level is low, <del>low-minor</del> consequence event, no further assessment
4.4	<u>Air plane</u> crash	Co / Op / De	Occupational major injuries / fatality Atmospheric release of particulate and combustion by-products Release of hydrocarbons and fuel Damage to mine infrastructure structure	Travel management plan Air traffic control Spill and emergency response plan Fire safety plan and firefighting systems Personnel training	1	5	ALARP, moderate	<del>Low-likelihood</del> Highly unlikely event, best practice in air traffic control resulting in ALARP, no further assessment
4.5	Ground vehicle – <u>air plane</u> collision	Co / Op / De	Occupational major injuries / fatality Atmospheric release of particulate and combustion by-products Release of hydrocarbons and fuel Damage to mine infrastructure structure	Travel management plan Air traffic control Ground traffic control Spill and emergency response plan Fire safety plan and firefighting systems Personnel training	1	5	ALARP, moderate	<del>Low-Highly unlikely</del> likelihood event, best practice in air / ground traffic control resulting in ALARP, no further assessment

Freeze plant - Summary – Five potential scenarios have been identified. Risks have been characterized as low to high as it concerns environmental risks. One scenario is carried forward for quantitative assessment.

Table 3-5: Hazard Identification Evaluation – Freeze plant (shaded rows are those recommended for further assessment)

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
5.1	Ammonia storage and piping failure	Co / Op	Material spill	Occupational health and safety plan Personnel training and orientation Storage inspection, maintenance Secondary containment Spill and emergency response plan	3	2	Low	<del>Overall risk</del> Risk level is low, <del>low</del> <u>minor</u> consequence event, no further assessment
5.2	Loss of freeze capacity	Op	Loss of freeze wall and secondary underground containment	Freeze wall monitoring Monitoring wells outside of the freeze wall – temp, pressure Back up gensets	1	5	Moderate	Loss of containment of lixiviant outside mining chamber - Further Assessment Recommended. Denison does not believe a leak would occur however public perception of a loss of containment is of high concern and should assessed. In practice, the mechanical failure of refrigeration system can be addressed and mitigated well before the thawing of the freeze wall which would take months.
5.3	Cooling line break	Co / Op	Release of brine below ground and potential for groundwater contamination	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Remote monitoring system Spill and emergency response plan	2	4	ALARP, moderate	<del>Low likelihood</del> <u>Unlikely</u> event, best practice resulting in ALARP, no further assessment
5.4	Cooling line break	Co / Op	Release of brine on surface – <del>potential</del> <u>potential</u> for ground and groundwater contamination	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Remote monitoring system Pipes in trenches and secondary containment Spill and emergency response plan	2	2	Low	<del>Overall Risk-risk</del> level is low, <del>low</del> <u>minor</u> consequence event with appropriate response and mitigation, no further assessment
5.5	Pumps failure	Co / Op	Release of brine on surface - potential for surface and groundwater contamination	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Remote monitoring system No open drain from pumphouse Spill and emergency response plan	2	2	Low	<del>Overall Risk-risk</del> level is low, <del>low</del> <u>minor</u> consequence event with appropriate response and mitigation, no further assessment

Notes: “Co” is construction  
“Op” is operations

Production Plant - Summary – Seven potential scenarios have been identified. Risks have been characterized as low to high as it concerns environmental risks. Two scenarios are carried forward for quantitative assessment.

Table 3-7: Hazard Identification Evaluation – Production Plant (shaded rows are those recommended for further assessment)

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
7.1	Process vessel and piping system failure	Op	Release of sulphuric acid	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Spill and emergency response plan Secondary containment Process sumps Production building is contained	3	2	Low	Overall low Moderate-risk, low-minor consequence event, no further assessment
7.2	Process vessel and piping system failure	Op	Release of hydrogen peroxide and potential for fire	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Spill and emergency response plan Secondary containment Process sumps Production building is contained	3	2	Low	Overall low Moderate-risk, low-minor consequence event, no further assessment
7.3	Process vessel and piping system failure	Op	Release of magnesium hydroxide	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Spill and emergency response plan Secondary containment Process sumps Production building is contained	3	2	Low	Overall low Moderate-risk, low-minor consequence event, no further assessment
7.4	Process vessel and piping system failure, Thickener overflow	Op	Release of aqueous solution	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Spill and emergency response plan Secondary containment Process sumps Production building is contained Detectable signs of exposure e.g., irritation	3	2	Low	Overall low Moderate-risk, low-minor consequence event, no further assessment. ALARP
7.5	Process vessel and piping system failure	Op	Release of acidic fume from storage tank	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Availability of respirators Emergency response plan will implement medical response to acute exposure to acidic fumes. Ambient monitoring Building ventilation	3	2	Low	Overall low Moderate-risk, low-minor consequence event, no further assessment
7.6	Process vessel and piping system failure	Op	Release of radon from storage tank	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Emergency response plan Ambient monitoring Building ventilation	3	3	Moderate	Overall moderate risk, moderate consequence event - Further Assessment Recommended
7.7	Facility fire / explosion	Op	Release of radioactivity and yellowcake powder to atmosphere	Occupational health and safety plan Personnel training and orientation Inspection and maintenance Fire safety plan and firefighting systems Emergency response plan Ambient air monitoring	2	5	High	Further Assessment Recommended. It is also noted that this scenario could be an outcome of many initiating events – the specific details associated with the event will be determined based on the most current inventory of combustible and flammable materials associated with the production plant when the analysis is completed.
7.8	Process containment and gas cleaning and filtration system failure	Op	Release of yellowcake powder to atmosphere	Inspection, testing, and maintenance program Ambient air monitoring	3	4	ALARP, moderate	The consequence is bounded by scenario 7.7.

EcoMetrix  
Though not captured by the FIRT IR the Likelihood rating of Scenarios 8.1 and 8.2 were inadvertently reversed. That's has been corrected and the revised Likelihood rating for Scenario 8.1 is "highly unlikely", score 1 and the revised Likelihood rating for Scenario 8.2 is "unlikely", score 2.  
With Specific reference FIRT IR 214(IV) it is believed that that the revised scoring "unlikely" better reflects the event likelihood. Stockpile erosion may not be uncommon but stockpile erosion that would lead to an environmental release as envisioned by the scenario in consideration of the design basis is deemed unlikely.

Ponds and Retention Berms - Summary – Five potential scenarios have been identified. Risks have been characterized as low to moderate as it concerns environmental risks. No scenarios are carried forward for quantitative assessment.

Table 3-13: Hazard Identification Evaluation – Ponds and Retention Berms

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
13.1	Pond overtopping	Op / De	Contaminant and radioactivity release	Personnel training and orientation Inspection and maintenance Surface water management Ponds designed for PMP/PMF Spill and emergency response plan Monitoring	2	3	Low	Overall low risk, <del>low-probability</del> unlikely event, no further assessment
13.2	Ponds containment or embankment failure	Op / De	Contaminant and radioactivity release	Personnel training and orientation Inspection and maintenance Surface water management Ponds designed for PMP/PMF Spill and emergency response plan Monitoring	1	5	ALARP, moderate	Best engineering practice in maintenance and inspection of the containment systems and berms. No further assessment
13.3	Ponds lining failure and leakage	Op / De	Contaminant and radioactivity release to groundwater	Personnel training and orientation Inspection and maintenance Groundwater monitoring Response plan	2	3	ALARP, moderate	Overall moderate risk, <del>low-probability</del> likely event with moderate consequence. Overall risk considered ALARP given engineering design and other safeguards. No further assessment recommended.
13.4	Surface flooding	Op / De	Contaminant and radioactivity release	Personnel training and orientation Inspection and maintenance Surface water management Ponds designed for PMP/PMF Spill and emergency response plan Monitoring	1	3	Low	Overall low risk, <del>low-probability</del> highly unlikely event, no further assessment
13.5	Wildlife entering pond	Op/De	Exposure to contaminants, drowning	Wildlife management plan Inspection Fencing	1	2	Low	Overall low risk, <del>low-probability</del> highly unlikely event, no further assessment

Notes: "Co" is construction  
"Op" is operations  
"De" is Decommissioning  
"L" is likelihood  
"S" is severity  
"RR" is risk ranking

**EcoMetrix**  
Editorial changes made to make terminology consistent with the hazard risk analysis matrix.  
@mention or reply

**EcoMetrix**  
Per FIRT IR 214 the likelihood score has been revised from L=2 (unlikely) to L=3 (likely) and therefore overall risk has been updated to ALARP, moderate from Low.  
Based on information received from manufactures and the project team's own experience it is thought the L=3 (≤1 occurrence in 10 years and >1 occurrence in 100 years) may better reflect liner performance, assuming the liner is installed based on appropriate design criteria and used as intended.

Electrical System and Power Plant - Summary – Three potential scenarios have been identified. Risks have been characterized as low to moderate as it concerns environmental risks. No scenarios are carried forward for quantitative assessment.

Table 3-14: Hazard Identification Evaluation – Electrical System and Power Plant

ID#	Accident / Malfunction	Phase	Consequence	Existing Safeguards / Design Features	L	S	RR / Significance	Screening Decision / Rationale
14.1	Substation transformer leak	Co / Op / De	Release of mineral oil and potential for groundwater contamination	Personnel training and orientation Inspection and maintenance Spill and emergency response plan Secondary containment	3	2	Low	Overall low risk, low-minor consequence, no further assessment
14.2	Transformer, turbine, generator fire / explosion	Co / Op / De	Occupational major injuries	Personnel training and orientation Occupational health and safety program Personal protection equipment Inspection and maintenance Emergency response plan Fire safety plan and firefighting systems	2	23	ALARP, moderate/low	Best practice in worker health and safety program resulting in ALARP, no further assessment
14.3	Transformer, turbine, generator fire / explosion	Co / Op / De	Occupational fatalities	Personnel training and orientation Occupational health and safety program Personal protection equipment Inspection and maintenance Emergency response plan Fire safety plan and firefighting systems	1	5	ALARP, moderate	Best practice in worker health and safety program resulting in ALARP, no further assessment

Notes: "Co" is construction  
"Op" is operations  
"De" is Decommissioning  
"L" is likelihood  
"S" is severity  
"RR" is risk ranking

**EcoMetrix** ...  
Per FIRT IR 214, updated severity to 3 (from 2) to reflect occupational injury.  
Also, originally the overall risk ranking was ALARP, moderate - this has been revised to ALARP, low consistent with the hazard analysis risk matrix.

## Attachment: IR-217

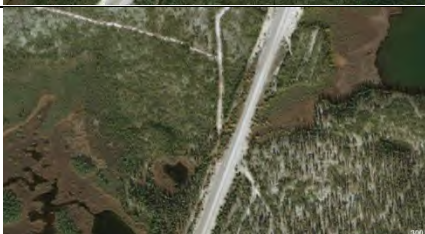

Number	IR-217
Dept.	CNSC
Project effects link	Accidents and Malfunctions
Reference to EIS, appendices, or supporting documentation	Sections 14.6.1 and 14.6.2
Context and Rationale	<p><b>Context:</b> Highway 914 crosses the Wheeler River 10 km southwest of the access road junction. A vehicle accident, including a rollover, collision, or run off road, at or near the bridge could potentially result in a release of uranium concentrate and release of fuels and chemicals into the surface water at this location. Denison believes that a release of uranium concentrate and a release of fuels and chemicals at this location would bound the releases at any other water crossing along the transportation corridor. However, no information on what other water crossings along the transportation corridor exist and how bounding scenarios 1 and 2 would bound the risk of releasing uranium concentrate and fuels and chemicals at other crossings.</p> <p><b>Rationale:</b> The release of uranium concentrate and fuels and chemicals at water crossings would contaminate the water body at the crossings and pose a risk to the environment and public health.</p>
Information Requirement	Please provide information on all water crossings along the transportation corridor and justification why bounding scenarios 1 and 2 would bound the effects of the accidental releases of uranium concentrate and fuels and chemicals at these crossings.

### Response:

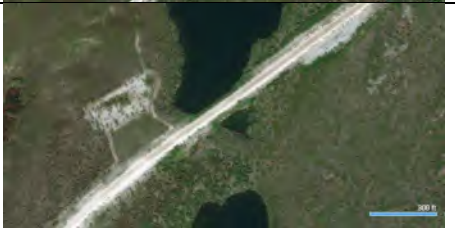

As recommended by the reviewer a review of water crossings associated with the transportation route have been identified. For reference, the analysis considers Hwy 914 south from the project site to its junction with Hwy 165. Hwy 165 was further considered east to Hwy 2 and west to Hwy 155. A total of 66 water crossings were identified as shown in Table IR-217-1, below. Coordinates (lat., long.; are provided for each of the crossings along with a basic description of each and a corresponding satellite image. For reference, in the table the designation “Highway 165W” means the location of the crossing is on Hwy 165 west of Hwy 914, beginning at the Hwy 165/155 and travelling east and the designation “Highway 165E” means the crossing is east of Hwy 914, travelling east toward Hwy 2. It is noted that most crossings are not identifiable by a specific name and are thus identified as “Unnamed creek”.

As noted by the reviewer, the potential aquatic environment release scenarios focused on the Wheeler River crossing location. This location was chosen as it represents an important location to resource users in the study area. The scenarios provide examples of the consequences of such releases to local receptors. That is, the results of the assessment of the releases at this location would be expected to be representative of crossings along the transport route since the key endpoint in the assessment is overall risk, as defined for the assessment process as probability multiplied by consequence. For reference, the crossing analysis reference above and presented in the technical memorandum has identified in excess of 100 water crossings along the transportation route as described. It is not practical to assess each of these crossings. While the specific conditions at these crossings may differ in size or nature, the results of the analysis presented can generally be applied more broadly as indicated above. The approach used is consistent with past practice for comparable assessments for uranium projects in the province.

## Attachment: IR-218

Number	IR-218
Dept.	CNSC
Project effects link	Accidents and Malfunctions
Reference to EIS, appendices, or supporting documentation	Sections 14.6.1.1 and 14.6.1.4
Context and Rationale	<p><b>Context:</b> Table 14.6-1 indicates that the average flow of Wheeler River south of Russel Lake is 17,340 L/s or 17.34 m<sup>3</sup>/s. This rate is used for uranium dissolution rate calculation. However, in section 14.6.1.4, it states that the average annual flow is 24.3 m<sup>3</sup>/s. In Table 14.6-3, the last two rows appear to be added wrongly.</p> <p>It also states that sediment quality results are shown in Table 14.6-5 for post-remediation conditions. During minimum flow conditions, the affected volume is expected to be smaller, resulting in a higher sediment concentration. In comparison, higher flow conditions are expected to result in a greater footprint and lower concentrations. However, in Table 14.6-5, the average sediments concentration and porewater concentration appear to be incorrect and switched between average flow and maximum flow.</p> <p><b>Rationale:</b> Inconsistent/inaccurate information provided in the EIS.</p>
Information Requirement	Please clarify and correct the inconsistent information on average flow rate of Wheeler River at the crossing and incorrect information in Table 14.6-3, and average sediment concentration and porewater concentration under average and maximum flow conditions in Table 14.6-5.

Updated EIS tables to support response:

Table 14.6-5 to be revised as shown below:

Flow	Affected Distance (m)	Average Sediment Concentration (µg/g)	Porewater Concentration (µg/L)
Minimum	21	3,461	12
Average	33	3,309 <del>2,535</del>	129
Maximum	47	2,535 <del>3,309</del>	912

Table 8-5 to be revised as shown below:

Flow	Affected Distance (m)	Average Sediment Concentration (µg/g)	Porewater Concentration (µg/L)
Minimum	21	3,461	12
Average	33	<u>3,309</u> <del>2,535</del>	<u>129</u>
Maximum	47	<u>2,535</u> <del>3,309</del>	<u>912</u>

## Attachment: IR-236

Number	IR-236
Dept.	ECCC
Project effects link	Fish and fish habitat
Reference to EIS, appendices, or supporting documentation	Section 15.5.2, Expected Environmental Conditions
Context and Rationale	<p>Context: It is stated that, “Table 15.5-1 and Table 15.5-2 summarize the predicted mean values of the climate variables for the Tomblin Lake regional grid unit...”</p> <p>As per the Proponent’s description, Tomblin Lake was chosen as representative location for Wheeler when Climate Atlas was used as data source.</p> <p>Rationale: In those two tables, for the “Max 1-Day Precipitation (mm)” the historical average is given as 24.1mm. Local time series analysis for the climatic region in which Wheeler Project is located provide averages (for 1-day max precipitation) of approximately 30+ mm.</p> <p>It is the Proponent’s responsibility to keep the required database current and up to date, because the length of the time series influences all derived statistics.</p> <p>Statistical analysis of extreme events is highly dependent of the mean with extreme values reaching values 3 to 4 times higher than the mean.</p>
Information Requirement	<p>1. Provide a clear explanation on how the historical mean for 1-Day Max Precipitation was calculated.</p> <p>2. Compare the values obtained via various means (ex: copied from the internet, modeled via some online algorithm, derived from specialty literature), against time series analysis based on observations.</p> <p>Technical Discussion Required: Yes</p>

### Response:

During the EIS review by the FIRT, there were information requirements (IRs; mainly IR-235 and IR-236, and to a lesser extent IR-103 and IR-104) related to current and future climate precipitation, as well as the probable maximum precipitation. The information in Attachment IR-236 will be added as *Appendix D Summary of Precipitation Values Presented in the EIS* to Appendix 6-C in the final EIS. The Project design and site drainage plan are more closely linked to detailed design to support the licensing process and the precipitation information provided in the draft EIS to support an EA decision is adequate. This new appendix to Appendix 6-C serves to provide clarifications only.

The probable maximum precipitation (PMP) event used for feasibility engineering designs is 493 mm. The PMP value has been extrapolated from Key Lake data presented in the Canadian Climate Program

(1994). Denison reviewed the update to the Canadian Climate Program (1994) report provided in Atmospheric Environment Branch (1999) which shows PMP at the approximate Wheeler River Project location at 489.3 mm. Denison retained the higher of the two PMP values, i.e., 493 mm, for design purposes. As an example, during a PMP, water requiring management will report to the wellfield runoff pond which will be sized to accommodate a PMP event at the site. This pond has been sized to 38,200 m<sup>3</sup> (*excluding a freeboard of 1 meter*). From the wellfield runoff pond, water will then be sent to the process water pond for treatment if required. In EIS Section 2.8 Project Design Features, Denison notes that “Ponds will be designed to maintain a minimum freeboard of at least 1.0 m to allow for continued functioning during a probable maximum precipitation (PMP) event.”

Tables 1 to 4 below provide a summary of precipitation information for both current / existing climate and future climate under different emissions scenarios, in order to 1) summarize precipitation data from various sections of the EIS (Section 6 including Appendix 6-C, Section 8, and Section 15) and 2) provide context on the PMP of 493 mm in comparison to precipitation values (annual precipitation, maximum 1-day precipitation, and 1:100 year, 24 hour return).

Table 1: Precipitation - Existing Climate – Comparisons of Observed Annual Average Precipitation and Maximum 24-hour Precipitation to PMP

Precipitation-related metric	Value	Notes on Source of Data	Location in EIS and comment on how this information was used in the EIS	Commentary on metric compared to PMP (493 mm)
Annual average precipitation	456 mm	Recorded from Key Lake in the period from 2011-2020, ECCC station 4063753 Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>PMP is similar to annual precipitation</i></b>
Annual average precipitation	483 mm	Canadian Climate Normals 1981-2010 Station Data, Key Lake, Saskatchewan. Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>PMP is similar to annual precipitation</i></b>
Maximum 24-hour precipitation	45.9 mm	Occurred on August 8, 2020.  Recorded from Key Lake in the period from 2011-2020, ECCC station 4063753 Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>24-hr event is 10.7 x lower than PMP</i></b>
Maximum 24-hour precipitation	72 mm	Occurred July 12, 1998. Canadian Climate Normals 1981-2010 Station Data, Key Lake, Saskatchewan. Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>24-hr event is 6.8 x lower than PMP</i></b>

Precipitation-related metric	Value	Notes on Source of Data	Location in EIS and comment on how this information was used in the EIS	Commentary on metric compared to PMP (493 mm)
1 in 100 year, 24 hour return	79.9 mm	Calculated using IDF_CC Tool for the Wheeler River Project. Available at: <a href="http://www.idf-cc-uwo.ca">www.idf-cc-uwo.ca</a>	8.1.3.4 Climate Change Influenced Extreme Events and Appendix 8-B. Provides point of comparison for water management design and understanding rainfall associated with 1:100-year storms.	<b>1:100 is 6.2 x lower than PMP</b>
1 in 100 year, 24 hour return	56.4 mm	Return Period Estimate based on data from the Key Lake Mine using the IDF_CC Tool (~32 km away from Wheeler River Project). Available at: <a href="http://www.idf-cc-uwo.ca">www.idf-cc-uwo.ca</a>	8.1.3.4 Climate Change Influenced Extreme Events and Appendix 8-B. Provides point of comparison for water management design and understanding rainfall associated with 1:100-year storms.	<b>1:100 is 8.7 x lower than PMP</b>

Table 2: Precipitation – Future Climate - Existing and Predicted Precipitation Data for Key Lake (provided in EIS, Appendix 6-C, Table 10)

Year	Total Annual (mm)				Maximum 1-day (mm)			
	Measured	RCP 2.6	RCP 4.5	RCP 8.5	Measured	RCP 2.6	RCP 4.5	RCP 8.5

## Attachment: IR-237

Number	IR-237
Dept.	CNSC
Project effects link	EA follow-up and monitoring program
Reference to EIS, appendices, or supporting documentation	Appendix 16-C throughout, including Table 1.5-1: Wheeler River Monitoring and Follow-up Program Summary (p. 8-15)
Context and Rationale	<p><b>Context:</b> CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> state: “The EIS should provide discussion on the follow-up program’s requirements, and include:</p> <ul style="list-style-type: none"> <li>objectives and structure of the follow-up program and the VCs targeted by the program</li> <li>tabular summary and explanatory text of the main components of the program including: <ul style="list-style-type: none"> <li>a description of each monitoring activity under that component</li> <li><u>which of the two generic program objectives the activity is relevant to (e.g., verify EA predictions, determine effectiveness of mitigation measures)</u></li> <li>the specific statement from the EA that goes along with that generic objective and will be the focus for that activity (e.g., program objective: verify predicted effects; environmental assessment effect: no potential adverse effects)</li> <li>the specific monitoring objective for that activity</li> <li>planned schedule</li> </ul> </li> <li><u>roles and responsibilities to be played by the proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the program results</u></li> <li><u>possible involvement of independent researchers</u></li> <li><u>program funding sources</u></li> <li>information management and reporting (reporting frequency, methods and format)</li> <li><u>possible opportunities for the proponent to include the participation of the public and Indigenous groups, during the development and implementation of the program</u></li> </ul> <p><u>The follow-up program plan should be sufficiently described in the EIS to allow independent judgment as to the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures.”</u> (Section 11)</p> <p><b>Rationale:</b> The Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information, and while some of the aspects detailed in the Generic EIS Guidelines are included, the aspects underlined are missing or appear incomplete.</p> <p>Further, all information from throughout the EIS should be incorporated into this Summary. For example, the EIS notes that: “Groundwater samples will be collected at least monthly and semi-annually in the wells within the freeze wall and on the freeze wall perimeter, respectively” (p. 7-109) and that “At least five to seven multi-well clusters are proposed across the mined area (Figure 7.8-2). Sampling will include KI parameters or the full suite of COPC at different times in the remediation process” (p. 7-111).</p> <p>These details (only examples) are not included in Appendix 16-C.</p>

Information Requirement	<p>It is recognized that this document will evolve over the planning process and be finalized prior to the EA Decision; however, as plans are developed and revised, CNSC staff expect that updates will be made to this document and provided with any future versions of the EIS.</p> <p>Appendix 16-C Summary of Monitoring and Follow-up Programs must include sufficient details to allow CNSC staff to determine the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures. This includes concrete monitoring plans (sampling locations, frequency, etc.).</p> <p>Additionally, please incorporate any relevant information included in the EIS into this Summary.</p>
-------------------------	--

Response:

Denison concurs that follow-up program documentation will evolve over the planning process and is committed to providing complete and up to date documentation as the EIS is finalized and prior to the EA Decision. Per the March 20, 2023 letter from the CNSC to Denison (Subject: Results of the Federal-Indigenous Review Team technical review of the October 21st, 2022 Draft Environmental Impact Statement Submission for the proposed Wheeler River Project), the company will be providing, as part of the final EIS documentation, a Commitments Report in order to capture all the mitigation measures, follow-up program measures and commitments that have been referenced in the EA documentation in a single location for completeness and traceability. The Commitments Report will be scoped so that it also fulfils the obligations of the commitments registry required by the Saskatchewan Ministry of Environment.

Notwithstanding the above, Denison believes that section 16-C, Summary of Monitoring and Follow-up Programs, in the draft EIS generally meets the requirements outlined in the EIS guidelines but agrees that some additional information can be provided to clarify select aspects. Specific notes per the EIS Guidelines are provided below to provide context the remainder of the response. For reference text in *italics* is taken from the EIS Guidelines; whereas text in **bold** is commentary provide by Denison. Additionally, bold text that is underlined indicates where Denison commits to revising or adding information into the EIS.

*The EIS shall include a framework or preliminary program upon which EA follow-up actions will be managed throughout the life of the project.* **Note from Denison – Table 1-5.1 in Appendix 16-C identifies a framework or preliminary program upon which EA follow-up actions will be managed, as well as all phases of the Project in which the proposed individual follow up programs will be executed.**

*The EIS should provide discussion on the follow-up program's requirements, and include:*

- *objectives and structure of the follow-up program and the VCs targeted by the program* - **Note from Denison - Table 1-5.1 in Appendix 16-C identifies the objectives of the proposed individual follow up programs, provides an overall program structure and identifies the VCs targeted by the program.**
- *tabular summary and explanatory text of the main components of the program including:*
  - o *a description of each monitoring activity under that component* - **Note from Denison - Table 1-5.1 in Appendix 16-C identifies each proposed monitoring activity for the various technical disciplines within which the environment assessment has been organized.**
  - o *which of the two generic program objectives the activity is relevant to (e.g., verify EA predictions, determine effectiveness of mitigation measures)* - **Note from**

**Denison - Table 1-5.1 in Appendix 16-C generally identifies whether the proposed follow up activities are related to verifying EA predictions and/or determine effectiveness of mitigation measures (see column “Monitoring Program Objective(s)”; however, it is agreed that further clarity can be provided in this regard. In the updated version of Table 1-5.1 a further column will be added to indicate specifically whether the proposed follow up activities are related to verifying EA predictions and/or determine effectiveness of mitigation measures with rational.**

- o *the specific statement from the EA that goes along with that generic objective and will be the focus for that activity (e.g., program objective: verify predicted effects; environmental assessment effect: no potential adverse effects) – Note from Denison - Table 1-5.1 in Appendix 16-C identifies the relevant section of the EIS to which each proposed follow up activity refers. however, it is agreed that further clarity can be provided in this regard. In the updated version of Table 1-5.1 a further, more specific reference to the section / subsection / statement (as appropriate) will be added to the “EIS Reference” column for greater traceability between the assessment section of the EIS for each of the technical disciplines and the proposed follow activities.*
- o *the specific monitoring objective for that activity- Note from Denison - Table 1-5.1 in Appendix 16-C identifies the objectives of the proposed individual follow up programs.*
- o *planned schedule - Note from Denison -Table 1-5.1 in Appendix 16-C identifies the phases of the Project in which the proposed individual follow up programs will be executed. It is premature in Denison’s view to develop specific “schedule” associated with all follow-up activities that are proposed. As noted in draft EIS Section 1.7.5, Licensing and Permitting, as well as in other responses to FIRT IRs, the Project is proceeding through sequential EA and licensing process. Given the sequential process to which Denison has committed it is planned that further detail will be developed to align with detailed engineering design through licensing and permitting and that this information will be available for review at that time. Denison understands that the Project cannot move forward until the appropriate Program / Plan / Procedure documentation is in place and has received approval through the regulatory process.*

*roles and responsibilities to be played by the proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the program results - Note from Denison – At this time and commensurate with the level of detail (i.e. concept) at which the follow up activities have been defined the proponent assumes responsibility for execution of all proposed activities. This may change as the program details are developed, and Denison presumes this is likely as it continues to work with the key Indigenous groups. It is noted however that provisions for follow up activities and monitoring are expected to be included in agreements developed between Denison and its key Indigenous partners and therefore it is inappropriate (and may remain so) that specific details regarding follow up activities be shared without the expressed consent of the agreement signatories. Regulatory agencies at the provincial and federal levels are expected to largely play a review/approval role consistent with their responsibilities under various laws/acts/licenses/permits under which the Project, and follow up activities, will be executed. At this time there are no specific plans with local and regional organizations as it pertains to the design, implementation and evaluation of the program results; but this may change in the future. Per the above, Denison will add additional detail into Table 1-5.1 in Appendix 16-C with respect to roles and responsibilities consistent with the information provided in this IR response. As noted full disclosure of such information may not be possible as it would be*

**subject to non-disclosure covenants between Denison and its key Indigenous partners; nevertheless more specific information will be provided as is available.**

- *possible involvement of independent researchers* – **Note from Denison** – Involvement of independent researchers in follow up activities has not been identified at this time, nor has need for such been specifically flagged. This does not preclude possible involvement of independent researchers in the future; however, need for such has not been specifically flagged. As noted above, provisions for follow up activities and monitoring are expected to be included in agreements developed between Denison and its key Indigenous partners, and such follow up activities and monitoring could include independent research. The sharing of information related to this type of independent research can and would only be shared with the expressed consent of the agreement signatories. **Per the above, Denison will add narrative to the text of Appendix 16-C clarifying the role of independent research that is consistent with the understanding of such at the time the final EIS is published.**
- *program funding sources* – **Note from Denison** – As noted above, the proponent assumes responsibility for execution of all proposed follow up activities that have been identified and therefore the funding of such. Also as noted above, provisions for follow up activities and monitoring that may be included in agreements developed between Denison and its key Indigenous partners will be subject to non-disclosure covenants in those agreements. This would include information concerning any funding that may be associated with these programs. It would be inappropriate (and may remain so) that specific details regarding any funding that may be provided for follow up activities be shared without the expressed consent of the agreement signatories.
- *information management and reporting (reporting frequency, methods and format)* – **Note from Denison** – A framework for information management and reporting is provided in Section 1.2 of Appendix 16-C. As described in Section 1.2 of Appendix 16-C specific information management and reporting structures associated with follow up activities are proposed to be developed as part of the development of the Project Environmental Management System (EMS). The Project EMS will be developed during licensing and permitting and that this information, including more detailed information regarding information management and reporting (e.g., reporting frequency, methods and format) will be available for review at that time. Denison understands that the Project cannot move forward until the appropriate Program / Plan / Procedure documentation is in place and has received approval through the regulatory process.
- *possible opportunities for the proponent to include the participation of the public and Indigenous groups, during the development and implementation of the program* – **Note from Denison** – As noted above, Denison is committed to continuing the ongoing process of identifying opportunities the participation of the public and Indigenous groups as follow up activity programs evolve. There is nothing specific to share at this time but it is expected that further clarity in this respect will be provided in the near to medium terms. It is also understood that any information that can be shared only represents a snapshot in time. Since follow up activities will span the full lifecycle of the Project identification of potential opportunities for involvement is an ongoing process that will also span the full lifecycle of the Project.

Denison anticipates that the lengthy and evolving EIS review process, and consideration of the public comments received by Denison on June 27<sup>th</sup>, 2023, will bring forward additional mitigation and follow up activities. Denison will update Section 16-C, Summary of Monitoring and Follow-up Programs, per the commentary provided in response to IR-237 and will also include changes resulting from the FIRT review process and the Saskatchewan Ministry of Environment review process. This section will align with the Project's Commitment Report which will be provided as part of the final EIS documentation.

Responses to Advice to Proponent

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-01	Canadian Nuclear Safety Commission (CNSC)	Glossary sections	<p>There are terms used throughout the EIS that may either need defining, or inclusion in the glossary.</p> <ul style="list-style-type: none"><li>· “Bounding”, “bounding case” and “bound” are used frequently throughout the EIS to describe the scope of the assessment. For example, p. 2-6 the EIS States: “Denison has bound the environmental assessment above the deposit...”</li><li>· “Laydown”. P. 2-54 states: “During Construction, Denison plans to create a laydown area next to the future domestic landfill to temporarily store construction waste. Examples of materials include clean wood, plastics, metal, and concrete. The construction laydown area will not be lined, but it will have a berm surrounding the area to minimize run-on and runoff.”</li><li>· “Deflagration” (p. 2-22)</li><li>· “Speed of sound” The EIS states: “Deflagration means the material burns slower than the speed of sound, thus no shock waves are generated. Propellant permeability enhancement methods reach injection pressures of up to 8,000 psi and are near instantaneous over periods of milli seconds...” (p. 2-22) - Explain briefly what is meant by “speed of sound”</li><li>· “Dries” (p. 2-65): “the main dries will be located in the processing plant”</li><li>· “Scarified” 2-84 Laydown areas will be scarified, covered with 0.5 to 1.0 m of stockpiled overburden, and vegetated with native, self-sustaining species.</li><li>· “Furblock” (p. 4-29)</li><li>· “Cutlines” (p. 4-101)</li></ul>	<p>Add this terminology to either one of the early glossaries, or when describing the methodology, in order to help readers understand these terms (particularly non-technical readers, such as Indigenous peoples and members of the public).</p>	<p>Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.</p>
AD-02	CNSC	General	<p>Mining solution and lixiviant are used interchangeably throughout the EIS. When both are used periodically, may be difficult for a member of the public to recognize that these are one in the same (mining fluid seems more often used).</p>	<p>Be consistent in how this is referred to, in order to ensure it’s clear to readers that these are one and the same.</p>	<p>Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.</p>
AD-03	CNSC	Throughout the Executive Summary (ES) and draft EIS	<p>Errors in formatting and grammar were identified throughout ES and EIS. Some examples are underlined below:</p>	<p>Please correct these and any other formatting, spelling or grammatical errors.</p>	<p>Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.</p>
AD-04	CNSC	Section 2.2.1 Mining (p. 2-4 to 2-5)	<p>An arial view could be useful to help a reader understand the proposed freeze wall earlier in section 2 (e.g., The shape, whether it surrounds the deposit). This is unclear but there are good images further down in the EIS (i.e., Figure 2.3-1 on p. 2-78).</p>	<p>Consider adding image to Section 2.2.1, similar to or containing aspects of Figure 2.3-1.</p>	<p>Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-05	Transport Canada (TC)	Sections 2.2.3.2, 2.2.3.10, 2.2.5.1, 2.3.1.6, 8.3.4.2.2, 11.1.4.4.2,	The two water crossings over Kratchkowsky Creek and Hart Creek and the water intake and effluent discharge/intake pipeline and diffuser at Whitefish Lake may be subject to the <i>Canadian Navigable Waters Act</i> (CNWA). However, these works may be exempt from the CNWA, if they meet the requirements of the Minor Works Order.	<p>*This advice pertains to the regulatory phase.*</p> <p>It is recommended that the Proponent self-assess each work using TC’s Project Review Tool as follows: <a href="https://npp-submissions-demandes-ppn.tc.canada.ca/projectreview-outildexamenduprojet">https://npp-submissions-demandes-ppn.tc.canada.ca/projectreview-outildexamenduprojet</a></p> <p>If the works do not fit the Minor Works Order, the Proponent has the option to either submit an application for approval to the NPP, or use the public resolution process, as these are all unscheduled waterways. The full text of the Minor Works Order is available here: <a href="https://laws-lois.justice.gc.ca/eng/regulations/SOR-2021-170/page-1.html">https://laws-lois.justice.gc.ca/eng/regulations/SOR-2021-170/page-1.html</a>.</p> <p>Background information on the NPP, the Minor Works Order, the application for approval process and the public resolution process are available here: <a href="https://tc.canada.ca/en/programs/navigation-protection-program/apply-npp">https://tc.canada.ca/en/programs/navigation-protection-program/apply-npp</a></p>	Acknowledged and Denison will address this in the regulatory phase as highlighted.
AD-06	Environment and Climate Change Canada (ECCC)	Section 2.2.3.8, Project Description	<p>In this section it is stated that: “The third step of the Industrial Wastewater Treatment Plant (IWWTP) is anticipated to further neutralize and improve the remaining water quality proposed to be achieved with further pH adjustments through agitated tanks and a clarifier with negligible solids generation expected at this stage. Several additional technologies including ion exchange are being evaluated as part of an ongoing Best Available Technology Study to be complete as part of future permitting.” ECCC would be interested in reviewing this study when it becomes available.</p> <p>Considering that the third step of the effluent treatment process in the IWWTP is still undergoing development, ECCC cannot make final conclusions regarding the efficacy of the treatment process. When final treatment technologies have been evaluated and selected, ECCC would like to review this information to allow for release to the environment.</p>	ECCC requests the opportunity to review the Best Available Technology Study and selected treatment technologies for the IWWTP when the report becomes available.	The BATEA information for the IWWTP will be included in Denison’s application to the CNSC for a license to operate. As such, ECCC can direct their review request for review to the CNSC.
AD-07	TC	Section 2.2.5.3	With respect to the proposed airstrip, under the <i>Aeronautics Act</i> , the proposed airstrip would be considered an “aerodrome”, which is defined as: “aerodrome means any area of land, water (including the frozen surface thereof) or other supporting surface used, designed, prepared, equipped or set apart for use either in whole or in part for the arrival, departure, movement or servicing of aircraft and includes any buildings, installations and equipment situated thereon or associated therewith.” Aerodromes, including the one proposed by Denison, are subject to the <i>Aeronautics Act</i> and the Canadian Aviation Regulations (CARs).	<p>*This advice pertains to the regulatory phase.*</p> <p>The proponent must notify the Minister of Transport of the proposed airstrip (aerodrome). This notification, being a summary report to the Minister of Transport, is required by section 307 of the CARs (CARs 307). CARs 307 also requires Denison to undertake consultation in the prescribed manner before it constructs the proposed aerodrome at the mine site. Details of the consultation are to be included in the above-mentioned summary report to the Minister of Transport.</p> <p>CARs 307 identifies the requirement to consult to include anyone seeking to undertake a prescribed aerodrome work at a certified or non-certified aerodrome, whether it is the creation of a new aerodrome or, at an existing aerodrome, lengthening an existing runway or making a</p>	Acknowledged and Denison will address this in the regulatory phase as highlighted.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
				<p>new one. The Regulation also provides minimum expectations for how the consultation should be conducted, including timelines, who to notify and under what circumstances. The intent of the Regulation is to compel consultation in advance of an aerodrome work that will result in sustained and regular impact on interested parties as identified in the Regulation. As the proposed aerodrome will not be within 4 kilometres of a city or built-up area, under CARs 307, the proponent is required to consult the following interested parties:</p> <ul style="list-style-type: none"><li>(i) the Minister of Transport,</li><li>(ii) the providers of air navigation services,</li><li>(iii) the operator of a certified or registered aerodrome located within a radius of 30 nautical miles from the location of the proposed aerodrome work,</li><li>(iv) the authority responsible for a protected area located within a radius of 4 000 m from the location of the proposed aerodrome work,</li><li>(v) any local land use authority where the proposed aerodrome work is to be carried out, and</li><li>(vi) the owner of any land bordering the land on which the proposed aerodrome work is to be carried out.</li></ul> <p>Proponents are encouraged to share their plans with the local land use authority before the consultation period. The local land use authority may have information about other nearby projects or developments that could impact on the proponent's plans.</p> <p>In summary, regarding the airstrip (aerodrome), the proponent must complete the consultation and file the summary report with the Minister of Transport, prior to commencing construction of the aerodrome.</p> <p>Further details can be found at: <a href="https://laws-lois.justice.gc.ca/eng/regulations/SOR-96-433/FullText.html#s-307.01">https://laws-lois.justice.gc.ca/eng/regulations/SOR-96-433/FullText.html#s-307.01</a>.</p> <p>TC recommends that the proponent contact TC's Aerodromes Group at CASPNR- SACRPN@tc.gc.ca before starting the consultation, to ensure it is completed in accordance with CARs 307.</p>	
AD-08	CNSC	Figs. 3.4-1, 4.3. 1, and where applicable throughout the EIS	Some maps in the EIS do not contain highway numbers.	Please consider including the highway numbers on the maps early in the Draft EIS when laying out the project location so the reader can become familiar with road network within northern Saskatchewan when discussions take place.	Thank you for the advice comment. This will be addressed once the EIS is updated following the conclusion of the information requirement (IR) process.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-09	CNSC	Section 4, including Figures 4.3.1 and/or 4.3.2 and where applicable throughout the EIS.	The maps included in the EIS in sections do not have any Treaty boundaries. First Nation Treaties should be included on the map. Not all First Nations reserves, and boundaries are included on the map such as Cree Lake and Slush Lake, please include on map and consider adding others from the NAD.	It is recommended that Denison update the maps in these sections to include Treaty Boundaries and community locations are included on the Project location map in Figure 4.3.2 and other maps throughout the entire EIS where applicable.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-10	CNSC	Section 4	Overall, CNSC believes that Denison is abiding by the communications strategies and products identified in their PIDP, but would be interested in additional information that is available.	While CNSC staff are satisfied that the proponent meets the requirements with this EIS, further clarity and detail on the strategic planning behind these communications activities would be beneficial and would further support the overall goals of the Project’s engagement activities.	Acknowledged. Further details on the Public Information Program and Public Disclosure will form part of the documentation submitted in support of the CNSC licensing for the Project.
AD-11	CNSC	Section 4 Indigenous Engagement Report (IER)	There is a summary of what engagement activities will occur moving forward. However, it is not clear which engagement activities/meetings will occur during the different stages of the EA/ project life cycle. Please provide additional details upon submission of the Final EIS.	Denison should consider clarifying in the updated IER which engagement activities will occur during each stage of the project moving forward as per Reg Doc 3.2.2 before submitting the Final EIS.	<p>The engagement activities as outlined in the draft EIS are reflective of the iterative nature of engagement with respect to the Project.</p> <p>At the time of the filing of the final EIS, Denison will describe the status of engagement and future expected engagement activities to occur, which will continue to be aligned with the requirements of Reg Doc 3.2.2.</p>
AD-12	CNSC	Section 4 IER	Information included in the EIS Section 4 and IER regarding engagement activities, communication and issues and concerns raised will need to be updated when the next version of the EIS is submitted. The EIS and IER will need to be updated to include information from Fall of 2022 until approximately two months prior to the submission date of the next EIS.	When re-submitting the EIS, ensure that the engagement log, issues and concerns tables and information about engagement activities done to date have been updated. No action needed only advice to update this section before submission with most up to date engagement activities including any that take place with other Indigenous Nations and communities not included in the Draft EIS.	Acknowledged.
AD-13	CNSC	Section 4 IER	Denison states that validation of VC selection was completed with ERFN, the Northern Village of Beauval, the Northern Village of Pinehouse Lake, and the Northern Hamlet of Patuanak (hereafter Beauval, Pinehouse, and Hamlet of Patuanak, respectively). The EIS states that this was completed through a shared online survey. The EIS also indicates that YNLR was also included in this process.	How has Denison validated VC selection with the other Indigenous Nations and communities that have showed interest and if so, by what methods (survey’s, engagement, meetings, review of Draft sections etc.?) Did Indigenous Nations and communities select any VC’s that were not included in the EIS and if so why not? Please elaborate and provide more details in the EIS on any other methods used including engagement sessions that were completed with Indigenous Nations and communities, through in-person community workshops, VC selection approval through early review of Draft EIS sections.	<p>Section 4 of the draft EIS describes the approach taken related to the Indigenous and non-Indigenous Communities of Interest in relation to the Wheeler River Project. Denison has engaged with these entities regarding the validation of the VC selection.</p> <p>Denison has not undertaken VC validation activities with other Indigenous Nations or communities that have shown interest in the Project, owing to the systematic approach to engagement Denison has been following. This approach is consistent with the methodology presented to the CNSC by Denison in early 2020, for which confirmation was received in mid-2020 and reflected in the draft EIS.</p> <p>All activities undertaken in relation to engagement on VCs are currently described in the EIS; there are no additional details to add.</p> <p>Denison can confirm that it is unaware of additional or new VCs brought forward by other Indigenous Nations or communities that are not suitably captured within the current draft EA approach.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-14	CNSC	Section 4.3.1, Pg 246	On this page, Denison states that MN-S is “currently structured with a President, an Executive, a Provincial Metis Council, Regional Presidents, and Local Presidents. The wording of ‘Regional President’ is incorrect and should be changed to say, ‘Regional Director’.	Please update all wording of “Regional President” to “Regional Director” when referring to MN-S.	Thank you for the advice comment. This will be corrected in the final EIS.
AD-15	ECCC	Sections 5.3.4 (Table 5.3-3); 8.1.3.3 Climate Change; 8.1.3.4 Climate Change Influenced Extreme Events; Table 15.4-1: Summary of Potential Effects of Short-term Extreme Weather  Events on the Project and Associated Mitigation; Section 15.5 Climate Change.	<p>The Proponent indicates that the Project’s full lifetime is roughly 40 years (including the post- decommissioning phase) and that climate conditions are important design considerations for a number of sensitive aspects of the Project. Potential future climate changes and their potential effects on the Project and Valued Components (VCs) are described in various sections of the draft EIS. Notably, in Section 15.5.2, ensemble mean projections are provided for several climate variables for two future time periods and emissions scenarios (RCP 4.5 and 8.5). In Section 8.1.3.4, the Proponent describes possible future changes in short-duration precipitation extremes (based on Intensity Duration Frequency or IDF curves from the IDF_CC tool) and indicates that an increase in their frequency and magnitude may occur over the Project lifetime “... and may require consideration for greater storage and conveyance capacity for Project water management infrastructure” (p.8-41).</p> <p>The Proponent indicates that aspects of the Project are being designed to meet standards based on design values that appear to be derived from observed (i.e. historical) climate conditions (e.g. water management infrastructure; see Table 15.4-1). In Section 15.5.3, they indicate that an adaptive management approach will be used to address some aspects of future climate change as necessary. For example, page 15-19 of the draft EIS states that: “Denison will develop an Emergency Preparedness and Response Program for the Project to address forest fires and extreme weather that may occur. If unforeseen effects on the Project occur from longer and more severe forest fire seasons associated with climate change, or increased frequency or severity of extreme weather (e.g., ice storms, snowstorms, flooding), Denison will apply adaptive management that includes monitoring climate factors so that they can proactively mitigate or prevent adverse climate effects on the Project.” (Emphasis added).</p>	<p>ECCC recommends that when considering potential future climate change and relevant effects on the Project, the Proponent consider the range of variability from the ensemble of models (not just the ensemble mean). ECCC also recommends that the Proponent consult the 2019 Canadian Standards Association Guidance on Intensity Duration Frequency for Canadian Water Resources practitioners , which provides examples of alternative methodologies to estimate future return values for design as needed.</p> <p>In terms of adaptive management, ECCC recommends that the Proponent clearly outline what climate factors will be monitored to mitigate or prevent adverse climate-related effects. This should include information on when and how the climate factors would be monitored and under what circumstances particular adaptive management approaches would be applied.</p>	<p>Please see response to IR-15, IR-103, IR-104, IR-235, and IR-236.</p> <p>The probable maximum precipitation (PMP) value of 493 mm selected for design of water management infrastructure, such as ponds, is similar to total annual precipitation (456 mm from Key Lake station, and 483 mm from 1981-2020 climate normals).</p> <p>The selected PMP is well above (&gt;5 times higher): 1) current/measured 24-hour maximum precipitation, 2) modelled 1 in 100 year 24-hour return for current conditions, 3) modelled 1:100 year 24 hour return for a future (2020-2050) period, 4) the predicted maximum 1-day precipitation under different emissions scenarios for the future (including RCP8.5 in the 2021-2050 period).</p> <p>For comparison to the <b>design PMP of 493 mm</b>:</p> <ul style="list-style-type: none"><li>- the measured maximum 24-hour precipitation from Key Lake station was <b>42.9 mm</b> and <b>72 mm</b> from 1981-2020 climate normals.</li><li>- the modelled existing/current 1 in 100 year, 24 hour return using the IDF_CC Tool for the Wheeler River Project site was <b>79.9 mm</b> and at the Key Lake area was <b>56.4 mm</b>.</li><li>- the modelled future (2020-2050) climate 1 in 100 year, 24 hour return using the IDF_CC Tool for the Wheeler River Project site was <b>88.6 mm</b> and at the Key Lake area was <b>62.0 mm</b>.</li><li>- the predicted future climate (2021-2050) under the highest CO2e emissions scenario (RCP 8.5) shows maximum 1-day precipitation of <b>25.9 mm</b>.</li></ul> <p>The PMP is much higher (&gt; 5 times higher) than the observed and predicted 24-hour maximum precipitation and the 1:100 year 24 hour return. Completing the design using a large PMP provides confidence that the water management infrastructure will be sufficient and function under future climates as it relates to potential changes in precipitation.</p>
AD-16	CNSC	Section 5.10 (p.70) and throughout the EIS	<p>In section 5.10 of the ES, where the seven scenarios are listed, formatting is inconsistent. Likelihood is in quotes in some places, but not in all.</p> <p><b>Not significant</b> is bolded inconsistently throughout the EIS. As well, in many cases noted as “not significant”, where others note “are not expected to have a significant effect”.</p>	<p>Suggest making formatting consistent if going to use quotes and bolding to highlight sections of the text. Also, validate that use of “not significant” and “are not expected to have a significant effect” are consistently used (where appropriate).</p>	<p>Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-17	ECCC	Appendix 6-A Air Quality Technical Supporting Document A.10	Some of the off-road vehicles have an emission rating of Tier 2 but in Appendix 6-A Section A.10 the Proponent claims that “for non-road diesel combustion, Tier 4 emission factors were assumed”. Choosing an engine with a lower Tier will increase emissions in NOx significantly and the Proponent should be using the best available technologies to minimize environmental impacts.	ECCC recommends that the Proponent choose engines that meet the most stringent emission standards to the extent possible, which are Tier 4 for the compression-ignition engines, during all phases of the Project.	Please see response to IR-139.
AD-18	ECCC	Appendix 6-C, Climate Baseline and GHG Emissions Report	Understanding Project emissions is important to inform analysis of a Project’s potential impact on Canada’s emissions targets and climate change commitments. ECCC notes that Section 4.0 and Appendix C: Greenhouse Gas Emissions Calculations of Appendix 6-C identifies the source of emissions and quantifies them in the construction, operation, and decommissioning phases of the Project, in accordance with the Draft Technical Guide Related to the SACC (Draft Technical Guide). While ECCC recognizes that the emissions will be relatively small in the post-decommissioning phase, the identification and quantification of the emissions in this phase is not found in the draft Environmental Impact Statement (EIS). The post- decommissioning phase is expected to last 15 years, likely going past 2050. The draft EIS does not discuss emission intensities of the Project, only the grid electricity. The draft EIS also does not discuss the Project’s potential impacts on Canada’s climate targets.	ECCC recommends that the identification of the sources of Greenhouse Gas (GHG) emissions and quantification of these emissions be described for the post-decommissioning phase, as done for the other phases. ECCC recommends the Proponent include discussion on the emission intensities of the mining of the product, following the guidance of the SACC and the Draft Technical Guide. ECCC recommends that the Proponent discuss the potential impacts that the Project may have on Canada’s ability to meet its climate-related targets, following the guidance of the SACC and the Draft Technical Guide.	The Post-Decommissioning phase only includes monitoring (physical, chemical, and biological) and regulatory site inspections. These activities are not expected to generate any significant GHG releases. Notwithstanding, the calculated GHG emissions estimates for Construction, Operation and Decommissioning are expected to be sufficiently conservative to capture any incidental GHG releases during monitoring and inspection activities.  The EIS anticipated an annual average production rate of approximately 4,082 metric tonnes of U <sub>3</sub> O <sub>8</sub> and an annual net GHG releases of 30,702 metric tonnes CO <sub>2</sub> e over the operations phase of the project. The annualized GHG intensity during operations is estimated at 7.5 tonnes of CO <sub>2</sub> e / tonnes of U <sub>3</sub> O <sub>8</sub> .  Section 2.5 of the EIS provides a summary of the anticipated GHG releases and a comparison to the nation- and province-wide GHG emissions. The project is expected to contribute less than 0.0043% to the nation-wide annual average. Given this very low contribution, the project is not expected to impact Canada’s ability to meet its climate-related objectives and targets.  Also see response for AD-19 (second paragraph).
AD-19	ECCC	Appendix 6-C, Climate Baseline and GHG Emissions Report	The draft EIS lacks information related to estimates of impact on carbon sinks and emissions from land-use changes. As land use shifts from a vegetated site prior to development, to an industrialized site, removal of vegetation and peat will have impacts on carbon sinks and construction emissions. Section 6, Appendix 6-C, 4.1.2 Land Use Change states that site-specific information of above- ground mass of vegetation was not available and default data from Table 20 of the Draft Technical Guide were applied. The default data is contained in this table is not applicable in this case, as they represent aboveground woody vegetation in cropland systems. ECCC recognizes that the usage of the median value of 0.51 for the carbon content is reasonable. From the information given in the draft EIS, it does not seem that the soil carbon was taken into account. In the absence of detailed information, the Proponent assumed that the area cleared would also be excavated (and drained in the case of wetland areas) which would create significant additional emissions from soil disturbances and drainage. Section 4.1.2 also states the Project involves clearing an area of	Land Use Change Regarding the lack of site-specific information of above-ground mass of vegetation, an initial site survey on-site using basic information such as site class and species would assist in determining the above-ground biomass. More specific data, such as regional data from provinces, forest companies, or literature may be available, and generic national data is available (e.g., Fo148-1-2E.pdf (publications.gc.ca), 4775.pdf (nrcan.gc.ca)). ECCC recommends that the Proponent also consider biomass that are not aboveground and confirm whether soil carbon is taken into account, as well as wetlands. Carbon Sinks ECCC recommends that the Proponent provide a quantitative and qualitative description of the Project’s impact on carbon sinks, following the guidance of the SACC and the Draft Technical Guide.	Limited site-specific data were available to characterize land use change and impacts on carbon sinks. As such, the use of default values from the SACC/IPCC in conjunction with some limited habitat/vegetation data (extracted from Chapter 9.2 Terrestrial Environment – Vegetation and Ecosystems, Listed Plant Species and Wetlands) was employed and is considered reasonable at this stage of the assessment. Please note that additional information on the land use change GHG calculations can be found in Appendix 6-C Climate Baseline and Greenhouse Gas Emissions Report.  In accordance with our discussions with the CNSC, Denison is committed to re-assessing the GHG and climate change components of the EIS and other elements of the SACC once more detailed, site-specific data becomes available (i.e., detailed feasibility and engineering studies). This is expected to include more detailed study around overall GHG emissions, carbon sinks

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
			approximately 169.6 hectares. There are no estimates on the impact on carbon sinks related to the Project.		and mitigation options, best available technologies / best environmental practices, climate resiliency, net-zero carbon planning and offsetting.
AD-20	NRCan	Section 7.3.1, Physical Geography	Drumlins and eskers in the region trend Northeast to Southwest as opposed to northwest to southeast as written on page 7, line 18. Correct orientations are used on page 7, line 23.	NRCan recommends revising the text. Please refer to 250 000 scale Surficial Geology Lines from Quaternary mapping, CSRS NAD83 Zone 13, Saskatchewan Geological Survey 2017.	Acknowledged. The typo in the draft EIS, Section 7.3.1 will be corrected in the final EIS. In Section 7.3.1. the text will be updated to say the following: “The most important associated topographic features in the region are the northeast to southwest trending drumlins and eskers...” See also response to IR-54.
AD-21	NRCan	Section 7.3.2.3, Metacrystalline Basement Rock	Pegmatite missing from list of basement rock types.	NRCan suggests addition of pegmatite to the list of basement rock types as shown on Figure 7.3-6.	Denison will update the final EIS per NRCan’s suggestion.
AD-22	NRCan	Section 7.3.3.1, Aquifer Properties, Section 7.3.2.3, Metacrystalline Basement Rock, Appendix 7A, 2.0, 2.3.1, 2.3.2	The terms “metacrystalline” and “metagranitic gneiss” are not frequently used terms in scientific literature. Gneiss is, by definition, a metamorphic rock.	NRCan suggests revision to “Crystalline Basement rocks” or “Basement metamorphic rocks”, and “granitic gneiss” as used in Figure 7.3-6. Please refer to Oxford Dictionary of Earth Sciences.	Denison will update the final EIS per NRCan’s suggestion.
AD-23	NRCan	Appendix 7A, 2.3.1, Metacrystalline basement rock	Orogeny is the process, orogen (or orogenic belt) is the feature produced by orogeny.	NRCan suggests replacing “Tran Hudson Orogeny” with Trans Hudson Orogen”.	Denison will update the final EIS per NRCan’s suggestion.
AD-24	NRCan	Appendix 7A, 2.3.1, Metacrystalline basement rock	Quartzite is by definition a metamorphic rock, and the term is used later without the meta- prefix.	NRCan suggests replacement of the term “meta-quartzite” with “quartzite”.	Denison will update the final EIS per NRCan’s suggestion.
AD-25	NRCan	Appendix 7A, 2.3.4, Athabasca Group Sandstones and Conglomerates	Sands are unlithified, whereas you are referring to grain sizes in this case.	In Table 2-1, NRCan suggests replacing the term “sands” with “grain sizes” under MFc and MFb descriptions.	Denison will update the final EIS per NRCan’s suggestion.
AD-26	NRCan	Appendix 7A, 2.3.5, Overburden	Typo on page 2, line 7: “A grain size sample was collected in GWR-033 from approximately 9 m below ground surface, and the same consisted of 8.8% clay (less than 4 µm).	NRCan suggests revision of “same” to “sample” and clay to “clay-sized” grains.	Denison will update the final EIS per NRCan’s suggestion.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-27	CNSC	Section 8.2.1.3 – Spatial and Temporal Boundaries	It is noted that McGowan Lake is an identified reference lake for the Key Lake Mill site. With the establishment of the Wheeler River mine, effluent would be flowing into McGowan Lake, which could potentially interfere with Key Lake’s environmental monitoring program by compromising McGowan Lake’s baseline conditions. Depending on the loading of COPC’s into McGowan Lake and resultant water concentrations, it may no longer be accepted as an acceptable reference lake for use by Key Lake. This would require Cameco to modify their monitoring program at the Key Lake Mill.	The CNSC advises Denison to communicate with Cameco to ensure they are aware of this situation. Coordination between the two companies may be necessary to ensure Key Lakes environmental monitoring program is not compromised. It is recommended to discuss this potential issue with Cameco ahead of time to determine the best path forward.	<p>Denison will communicate with Cameco through the Saskatchewan Mining Association to highlight the timing of the start of the Project as it may relate to Cameco's use of regional lakes for reference lake purposes. McGowan Lake will no longer be suitable as a reference lake for Cameco once the Wheeler River Project starts operating, since it will be downstream of treated effluent release. Alpha Lake (LA-9 in Denison's aquatic baseline studies) will likely be outside of any influence from Denison's activities.</p> <p>Please note that Denison has previously been in communication with the Saskatchewan Ministry of Environment, Environmental Protection Branch regarding the baseline study work Denison completed as part of the Environmental Assessment process and the potential changes to McGowan lake (a Cameco's reference lake) from the proposed Wheeler Project. Reference: Email from Janna Switzer (Denison) to George Bihun (MOE) on May 12, 2020.</p>
AD-28	ECCC	Section 8.2.4.2.3 Appendix 10-A, Section 3.1.1.2	Tables 8.2-9 and 8.2-10 in Section 8.2.4.2.3 Part II_S8 Aquatic Environment and Table 3-1 in Appendix 10-A Section 3.1.1.2 demonstrate predicted maximum effluent concentrations of Constituents of Potential Concern (COPCs) and maximum predicted receiving environment concentrations. The final effluent quality discharge target for uranium is 0.057 mg/L. However, the Canadian Council of Ministers of the Environment (CCME) water short-term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guideline, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe. While uranium is not a Schedule 4 substance with prescribed concentration limits under the Metal and Diamond Mining Effluent Regulations (MDMER), the MDMER requires the characterization of uranium concentrations in effluent under Schedule 5, and requires that all mine effluent released from final discharge points be non-acutely lethal. Under Schedule 5 Section 9(d) of the MDMER, the Proponent will likely be required to conduct selenium fish tissue sampling if average annual concentrations of selenium in effluent equals or exceeds 5 ug/L.	Discharges from the proposed Project will alter water quality in the immediate receiving area, and this may include some sublethal effects on aquatic biota, which must be minimized. It remains the Proponent’s responsibility to adhere to the MDMER to ensure that effluent at the end-of-pipe from all final discharge points be non-acutely lethal and meet requirements for prescribed deleterious substances under Schedule 4 of the regulations.	Denison fully understands its obligations with respect to the MDMER and will comply with the MDMER end of pipe effluent discharge criteria.
AD-29	CNSC	Section 8.3.3 Figures 8.3.5 etc. 8.5-4	It does not appear that aquatic baseline sampling maps for Russell Lake have LAB 1 and 2 locations showing the baseline sampling locations within Russell Lake. (Figures 8.3.5). Please update the Figures throughout aquatic environment section to include of the baseline sampling studies/ locations within Russell Lake.	Please update maps and sections in EIS to reflect aquatic baseline studies that were completed.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-30	CNSC	EIS sections 8.4.3.2.4 Benthic Invertebrate Community and 8.4.7.6 Climate Change Considerations	<p>ECCC EEM guidance recommends the use of multiple reference areas as it offers the greatest statistical power to detect a meaningful difference between a reference area and an exposure area and can also give an indication of variability among reference areas. It is also important to incorporate multiple reference locations into the study design to aid in designing against spatial confounding factors.</p> <p>Section 3 of the Aquatic Environment Baseline Study Report details the similarities between benthic invertebrate communities by using the mean Bray-Curtis index between sampling locations and the median reference condition for the lake group size. It's not clear in the EIS if there are any issues expected to be able to use this data to compare project effect locations to references sites into the future, as some sampling locations are currently not very similar to the reference sites. In addition, climate change could affect the sediment and benthic communities in the future. The EIS states “the frequency and magnitude of extreme precipitation events have the potential to change water levels and flows in the RSA, which may affect sediment transport, deposition, and therefore benthic invertebrate habitat. Changes to average and upper and lower bounds of ambient temperatures may also affect aquatic habitat, which in turn may affect benthic invertebrate communities. Climate change over the life of the Project (i.e., 35 to 40 years) will be monitored as part of the Project’s environmental monitoring programs, and influences on water quality, sediment quality, and benthic invertebrates will require adaptive management to mitigate any potential effects of the Project that may be exacerbated by climate-related changes on the aquatic environment”. It is recommended to ensure that appropriate number/location of reference sites are sampled to enable any changes to sediment or benthic invertebrate communities that may be due to climate changes, and not project effects, are able to be assessed.</p>	<p>Considering climate change may change the lake conditions from baseline conditions, and that there is already natural variability between lakes that will be used as reference lakes and exposure lakes, it could become difficult to show changes to sediment/benthic invertebrates are not due to project activities, therefore there is a recommendation to ensure the current baseline data is adequate, and to consider if additional data, and addition of additional reference stations, will be needed moving forward.</p>	<p>Changes in landscape influence and lake conditions are not limited to those brought about by climate change. The preparation of a study design under the MDMER EEM program strives to ensure that a single reference area or multiple reference areas are as representative of a control condition as possible. Best practice is to undertake an analysis of candidate reference areas using the existing baseline information and investigate their utility as controls prior to project development. A preliminary EEM study can be completed that will allow for a Before-After-Control-Impact study design, that will provide the ability to monitor change not only in the exposure areas, but in the reference areas, thereby allowing for a reasonable assessment of potential mine related impacts.</p>
AD-31	CNSC	Section 8.4.6.1, Residual Effects Characterization	<p>The EIS states “Local Indigenous communities have expressed direct concern with respect to mercury. Mercury has not been identified as a COPC for the Project as it is currently not present in the receiving environment (i.e., background condition) at detectable concentrations and will not be produced as part of the mine process; therefore, it will not be discharged to the aquatic environment. However, it is understood that potential nutrient enrichment-related effects are possible and can be linked to increases in mercury in the environment.” Based off concerns from Indigenous communities, and the fact that phosphate is a COPC in the effluent, and elevated concentrations of mercury were measured near the</p>	<p>Please consider adding methylmercury to the environment sampling plans (such as fish dorsal muscle) in order to confirm there are no unexpected effects of the project on levels, and to satisfy stakeholder concerns.</p>	<p>Refer to response to IR-100.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
			Kratchkowsky Lake bottom, adding methylmercury to the environment sampling plans may be beneficial.		
AD-32	CNSC	Section 9.1.8.3, Appendix 10-A (ERA) section 3.2.1.5	<p>It appears there is no consistency between the assessment of soil quality in the ERA and the baseline soil sampling program presented in the EIS. The baseline program includes 10 soil permanent sampling locations (Appendix 9-B, section 2.5). Sampling at these locations is proposed to be continued during the Operation Phase, and monitoring data will be compiled and reported annually/periodically (EIS section 9.1.8.3). Conversely, the ERA estimates and predicts concentrations of COPC in soil based on atmospheric deposition. Furthermore, the location of ecological receptors in the ERA (Figure 5-2) is different from the permanent soil sampling plot locations (Appendix 9-B, Figure 2.5-1). It is unclear why measured baseline soil quality data were not discussed in the ERA and whether future monitoring data will be considered in the ERA to verify accuracy of predicted COPC concentrations</p>	<p>Please clarify how baseline measured data on COPC concentrations in soil is considered in the current and future iterations of the ERA.</p>	<p>Baseline measured soil data were used in the ERA to characterize the existing environment. The IMPACT model was used to predict the Project contributions for the Project phases above baseline. The baseline soil concentrations used in the model are provided in Section 3.5.1 and Table 3-8 of Appendix A in Appendix 10-A (ERA).</p> <p>The ERA will be revised according to the periodic review requirements in CSA N288.6-22 which will reflect ongoing data collected from monitoring programs.</p>
AD-33	CNSC	Section 9.3.3.1.2	<p>Indigenous knowledge is summarized with regard to moose, including:</p> <ul style="list-style-type: none"><li>· Calving sites close to the Wheeler River, with lots of muskeg in the area. A moose calving area is located in the Terrestrial RSA, southwest of the Project Area.</li><li>· A wildlife corridor is used by moose, running between Cree Lake (outside and to the west of the Terrestrial RSA) and Russel Lake (in the southern portion of the Terrestrial RSA).</li></ul> <p>It is unclear how this information is incorporated into the residual effects assessment.</p>	<p>Please clarify how Indigenous knowledge on moose calving sites and corridors in the RSA is incorporated into the residual effects assessment for the key indicator “moose”.</p>	<p>The sites identified by IK were explicitly considered in the impact assessment as indicated by their identification as overlapping with the Terrestrial RSA as noted in the question. However, the areas were not expressly discussed in the residual effects assessment because there is no anticipated spatial overlap of those areas with direct or indirect Project effects.</p> <p>The Indigenous Knowledge provided by ERFN and SVS (2022) identifies a moose calving site (Feature 1001-08) ~ 2 km southwest, and a wildlife corridor ~6 km south of the Project Area (as depicted in Figure 4. Map B, page 16 of ERFN and SVS 2022). Both areas are within the Terrestrial RSA but outside the Wildlife LSA. The reference to “Calving sites close to the Wheeler River...” refers to a broad area that is 45 km east of the Project Area, well beyond interactions with the Project Area.</p> <p>The presence of the areas identified through IK was acknowledged in Section 9.3.3.1.2 (Information from Indigenous Knowledge, Local Knowledge, and Engagement) in Part II, Sec. 9 of the Draft EIS. The assessment (Sec. 9.3.4.2) considered alteration and/or habitat loss at the LSA and RSA scale. Section 9.3.4.2.1 (pg. 9-210) summarizes the effects on moose habitat as follows: “Habitat alteration through sensory disturbance effects (such as noise, dust deposition, and artificial light) is expected to result in reduced habitat quality and effectiveness near Project components and infrastructure reaching beyond the Project Area into the Wildlife LSA....”</p> <p>Further, Sec. 9.3.6.2.1 (Alteration and/or Loss of Habitat, pg. 9-230) identifies that an area within a 500 m radius of the Project Area will be influenced by the Project and likely make the habitat within that area less suitable for use by moose. Therefore, the effects of the Project on moose calving have been appropriately assessed and are expected to be contained within the Wildlife</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
					LSA. That affected area does not overlap with the moose calving site or the wildlife corridor identified by IK.
AD-34	CNSC	Appendix 9-B	Baseline studies for birds are restricted to short time frames in one year only, for example: <ul style="list-style-type: none"><li>· Breeding Songbird Point Count Call Survey (June 7 and 17, 2017)</li><li>· Aerial Waterfowl and Raptor Stick Nest Survey (June 15 and 16, 2017)</li></ul> The Canadian Wildlife Service (2022) recommends: <ul style="list-style-type: none"><li>· Consider the potential effects of projects on birds throughout the year and document the distribution and abundance of birds in all seasons. Some species may be under-represented in existing data bases due to temporally restricted periods of detectability.</li><li>· Explicitly target species at risk and other focal species.</li><li>· Conduct at least two years of field surveys as a national standard for major projects, so that temporal variability can be considered in future comparisons to baseline data.</li></ul> <b>Reference:</b> Canadian Wildlife Service. 2022. Guidance Regarding Data Needed to Support Assessment of Project Effects on Birds. Environment and Climate Change Canada, Gatineau, Quebec. 80 p.	Please consider conducting surveys following CWS’s recommendations or provide an explanation as to how current baseline data for birds is sufficient to characterize the existing environment.	The data collected as part of the baseline studies for birds was focused on the habitat types and areas most likely to be disturbed as a result of the Project. Conducting additional baseline surveys for waterfowl, raptors, and breeding birds is not anticipated to result in changes to the assessment outcomes and predictions made as part of the effects assessment, which was habitat-based, for avian species. The assessment methods used a conservative approach with the assumption that following the implementation of site-specific mitigation measures, the proposed Project activities would have a residual effect on these species guilds regardless of species presence on site. However, to supplement the species data that were collected as part of the baseline field program, Denison is willing to acquire additional information on species presence in the RSA from existing sources, specifically from the Saskatchewan Breeding Bird Atlas (Birds Canada). However, collection and consideration of this information is not expected to affect the findings and/or conclusions stated in the draft EIS as the assessment was habitat-based to address all species.
AD-35	CNSC	Section 10, IMPACT MODEL	Denison discusses details of the IMPACT model but has not provided scenario(s) used to facilitate review.	Please consider providing CNSC with the IMPACT model scenario file(s) in the spirit of regulatory cooperation.	The intent of Appendix A to Appendix 10-A is to provide the inputs used for the IMPACT model as well as all of the characteristics for human and ecological receptors. Where site-specific data were not used in the model it can be assumed that default values from CSA N288.1-20 were used in the IMPACT model. As such, Denison does not intend to provide the scenario files.
AD-36	English River First Nation (ERFN)	Section 10.1.3.2, Traditional Foods Diet (p. 10-15)	The EIS States: "The ERFN is comprised of seven reserve lands across Saskatchewan" (p. 10-15). While this is accurately reflecting a source document, the source document is incorrect.	Please update to "The ERFN is comprised of seven historical settlements that have now grown into 19 different reserves across Saskatchewan"	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-37	CNSC	Section 10.1.9, Human Health Summary and Appendix 10-A – 4.4.1 Risk Estimation	The Human Health section of the EIS, as well as the ERA, indicates that there is an exceedance for selenium for the fisher/trapper receptor, with the Project estimated to contribute to the majority of this exceedance (0.93 of the HQ). While the assessment is conservative by assuming an increase intake rate of fish solely sourced from Russel Lake, the precautionary principle should be considered to ensure in reality the HQ for selenium remains below 1, even under conservative assumptions.	Please conduct of effluent, water, and aquatic organism monitoring (as already suggested in EIS) to confirm HQ's are highly conservative in the EIS modelling and receptors remain protected. Should it be determined Se concentrations are increasing in the environment at such a rate as there may be in impact to the environment or human health, installation of a selenium removal circuit into the effluent treatment process should be considered. The proponent should ensure that the proposed wastewater treatment system design incorporates the capability for expansion or upgrades in alignment with the precautionary approach, pollution prevention, and continuous improvement.	Denison acknowledges that a robust effluent and environmental monitoring program will be developed to confirm all EIS modelling predictions. The ERA will be revised according to the periodic review requirements in CSA N288.6-22 which will reflect ongoing data collected from monitoring programs.
AD-38	CNSC	Appendix 10-A (ERA)	It is unclear if measured or modelled COPC concentrations in blueberry were used in the calculations of human receptor dose. Similarly, it is unclear if measured or modelled COPC concentrations in lichen and blueberry were used in the calculations of ecological receptor dose. CSA N288.6-22, Clause 7.3.6 states that "Measured concentrations of COPCs should be used, where possible, in the exposure assessment." Please see the Clause for further information.	Please clarify if measured or modelled COPC concentrations in blueberry / lichen were used in the calculations of human and ecological receptor dose.	Measured baseline lichen data were used in the ERA to characterize the existing environment. The IMPACT model was used to predict the Project contributions for the Project phases above baseline. Measured baseline blueberry data were used for model calibration to determine if there was good agreement between measured data and modelled data. The IMPACT model was used to predict both baseline and Project contributions for blueberries. The ERA will be revised according to the periodic review requirements in CSA N288.6-22 which will reflect ongoing data collected from monitoring programs.
AD-39	CNSC	Appendix 10-A (ERA), Table 2-2	Table 2-2: Estimated Home Ranges of Selected Terrestrial Ecological Receptors Based on the reference McLoughlin et al. (2016), the Home Range for Woodland Caribou is indicated as "Expected = 80 km2" which represents the mean range sizes pooled over the two study years for calving/post-calving. The indicated Minimum (67 km2) and Maximum (267 km2), however, do not relate to the calving/post-calving stage, which is not clearly stated in Table 2-2. In contrast, these values are actually mean range size values for autumn/rut and early winter, respectively, as described in the source document on Page 83 (McLoughlin et al., 2016). It should be noted that in terms of true minimum and maximum, the source document states that individual home ranges, based on up to two years of GPS locations, varied in size from 16.2 km2 to 1363.9 km2 (Page 82 of McLoughlin et al., 2016). Reference: McLoughlin et al. 2016. Population dynamics and critical habitat of woodland caribou in the Saskatchewan Boreal Shield. Interim Project Report, 2013–2016. Department of Biology, University of Saskatchewan, Saskatoon. 162 pp. Available online at <a href="http://mcloughlinlab.ca/lab/wp-content/uploads/2019/06/2013-2016-SK-Boreal-Shield-Caribou-Project-Interim-Report-Nov-18-2016.pdf">http://mcloughlinlab.ca/lab/wp-content/uploads/2019/06/2013-2016-SK-Boreal-Shield-Caribou-Project-Interim-Report-Nov-18-2016.pdf</a>	Please provide clear details on the source of the home range values listed in Table 2-2.	Denison acknowledges the comment and will add clarification in Table 2-2 of Appendix A in Appendix 10-A that the minimum represents the autumn/rut and the maximum represents the early winter.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-40	CNSC	Appendix 10-A (ERA) section 3.2.1.5	Although the soil type selected in the ERA for modeling of atmospheric deposition to soil is sandy soil, organic soils have been delineated and characterized (section 9.1.3.3 of the EIS) as valued component (i.e., “Organic Matter/Peat”). It is unclear if the soil quality modeling performed in the ERA is protective for soil types other than sandy soil.	Please clarify if COPC modeling based on sandy soil is protective of organic/peaty soil and provide justification.	The majority of the soil in the Project Area and LSA is considered sandy soil. Section 9.1.3.2 of the EIS states "Mineral soils are associated with upland sites and (in all likelihood) anthropogenically disturbed land that, together, correspond with >99% of the Project Area and 91.5% of the LSA (Figure 9.1-8). The predominate mineral soils within the RSA have been classified as Sandy Dystric Brunisols (Smith et al. 2011)." Organic matter/peat was included as a VC in the EIS because of the concern regarding drying and losing biological function through groundwater interactions, and not in terms of assessment of soil quality. Additionally, Section 9.1.3.3 of the EIS acknowledges that organic soils is limited in the Project Area. As such, this comment is considered not applicable.
AD-41	CNSC	Appendix 10-A (ERA), Table 5-5	Table 5-5: Complete Exposure Pathways for All Selected Ecological Receptors to be Assessed using the IMPACT Model The exposure pathway for phytoplankton is stated as “direct contact in sediment”, however, phytoplankton live suspended in the water column. It is acknowledged that in the IMPACT modelling report, phytoplankton is described with an occupancy factor of 1 in water (Table 2-5).	Please add the pathway “direct contact in water” to Table 5-5 and revise all calculations accordingly.	Table 5-5 will be revised to state “direct contact in water” for phytoplankton. No calculation changes are needed.
AD-42	CNSC	Appendix 10-A (ERA), Table B.12	Table B.12: Sample Calculation – Adult Recreational Fisher/Hunter (McGowan Lake) Dose and Risk Calculations for Selenium  The source for the Terrestrial Plant Ingestion Dose for Labrador tea and blueberry is stated as “Table C.5”, however, this table could not be located.	Please provide the referred-to Table C.5 or an alternate source of information for the Terrestrial Plant Ingestion Dose for Labrador tea and blueberry.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.
AD-43	CNSC	Appendix 10-A (ERA), Environmental Risk Assessment for Wheeler River Technical Support Document	The ERA is prepared by Ecometrix and submitted to Denison Mines. It is unclear if the ERA submitted has been reviewed and accepted by the proponent (Denison Mines).  CSA N286-12 clause 9.5.5 specifies that “the selected supplier’s technical documents that are required to be submitted shall be reviewed and accepted”.  Meeting these CSA N286-12 requirements will ensure that the proponent has control of the purchased services as a future licensee applicant.	Provide clarifications if ERA documents have been reviewed and accepted by the proponent.	See response to IR-202 which indicates that Denison reviewed and accepted the ERA. This text will be added to Appendix 10-A.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-44	CNSC	Section 11	It is not clear whether all of the interested Indigenous Nations and communities were engaged on the results and findings of the Heritage Resources Impact Assessments (HHRIA) or just ERFN?	CNSC staff would appreciate an update on any engagement activities that have taken place with regards to any of the HHRIAs for the Project, or any site or thing that is of historical, archaeological, paleontological or architectural significance as requested by other Indigenous Nations and communities to date.	<p>Denison confirms that the results of the Project-related HRIAs were discussed with ERFN, as they expressed interest in further understanding the nature of the work undertaken.</p> <p>The Saskatchewan Ministry of Parks, Culture and Sport, Heritage Conservation Branch (HCB) administers The Heritage Property Act. Regulatory approval as per section 63 of The Heritage Property Act (GS 80) was granted for the Project for the two separate HRIAs (HCB File No. 16-2102, December 14, 2017 and HCB File No. 19-933 February 12th, 2020).</p> <p>The results of the HRIAs were included and formed part of the draft EIS. Comments made by Indigenous communities on this section of the EIS will therefore be responded to accordingly by Denison, where appropriate.</p> <p>Additionally, as noted in Section 11.3.2, “The Heritage Resource Management Plan (HRMP) was informed by engagement with ERFN, who recommended that the HRMP should include a mechanism to involve Indigenous communities where appropriate (21-EN-ERFN-591.1; 21-EN-ERFN-591.2) (see Appendix 11-B).”</p> <p>The mechanism to involve Indigenous communities has been included in the HRMP and allows for general notification to Indigenous communities should an artefact be found, which provides flexibility to engage all appropriate Indigenous nations accordingly.</p>
AD-45	CNSC	Section 11.1.4.5.2. Perceived Suitability/Safe Use of Resources (p. 11-59)	The EIS States: “Section 2.6.1 in Section 2 describes the extensive review of mining methods that led to the decision to adopt the ISR mining method.” (p. 11-59). This reference is not correct, as this section does not contain a review of the mining methods.	Please update this to reflect the appropriate section.	Thank you for the advice comment. This will be addressed, as possible, once the EIS is updated following the conclusion of the information requirement (IR) process.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-46	TC	Section 14.6.7.2	<p>Transport Canada would like to clarify that although the proponent may use a third party to assist in developing emergency response assistance plans (ERAPs), it is the proponent’s responsibility to submit the ERAP application(s) to Transport Canada, per Section 7(1) of the <i>Transportation of Dangerous Goods Act, 1992</i> as follows:</p> <p>Emergency response assistance plan</p> <p>7 (1) No person shall import, offer for transport, handle or transport dangerous goods in a quantity or concentration that is specified by regulation — or that is within a range of quantities or concentrations that is specified by regulation — unless the person has an emergency response assistance plan that is approved under this section before</p> <p>(a) importing the dangerous goods;</p> <p>(b) offering the dangerous goods for transport; or</p> <p>(c) handling or transporting the dangerous goods, in the case where no other person is required to have an emergency response assistance plan under paragraph (a) or (b) in respect of that handling or transporting.</p>	<p>*This advice pertains to the regulatory phase.*</p> <p>Transport Canada notes that the sentence highlighted in yellow below is incorrect and should be revised or removed. While a contractor could assist the proponent to develop the ERAP(s), it is the responsibility of the proponent to apply to Transport Canada for approval of the plan(s).</p> <p>14.6.7.2 Design and Mitigation Considerations Principal traffic risk mitigation measures include:</p> <ul style="list-style-type: none"><li>• traffic control measures such as speed limits;</li><li>• travel management plans;</li><li>• spill and emergency response planning; and</li><li>• driver training.</li></ul> <p>Additionally, Denison considered several provisions to make sure that the effects of a terrestrial release of hazardous materials are as low as practicable. In addition to transportation mitigations listed for Scenarios 1 and 2, the following provisions were considered.</p> <ul style="list-style-type: none"><li>• The Transportation of Dangerous Goods Act, 1992 (Government of Canada 2019) outlines the requirements for entities that transport dangerous goods to establish emergency response assistance plans. These plans list specialized personnel and equipment that are required for responding to an incident. <b><i>It is expected that a contractor responsible for the transportation of uranium concentrate, fuel, and hazardous chemicals would develop these plans.</i></b></li></ul>	<p>Acknowledged. Section 14 will be updated in the final EIS to clearly state that while a contractor could assist Denison to develop the ERAP(s), it is Denison’s responsibility to apply to Transport Canada for approval of the plan(s).</p>
AD-47	Health Canada (HC)	Appendix 14-A (p. 8-9)	<p><b>Context:</b> No emergency response plan has been provided within the draft EIS, which states that emergency response plans will be developed in the future (Section 14 Appendix 14-A, p.8-9).</p> <p><b>Rationale:</b> For any emergency event, Health Canada considers the protection of human health as a primary consideration in the development of emergency preparedness and response plans.</p> <p>This includes monitoring for human health impacts and the provision of health-related guidance. Further, this will be a requirement of the licensing process.</p> <p>The proponent should ensure that the emergency response plans consider the protection of all relevant potential human receptors that could be impacted by an onsite or project-related off- site accident involving the release of chemical and/or radiological substances.</p>	<p>It is recommended that Denison develop an emergency response plan in consultation with potentially affected communities and stakeholders that includes, but is not limited to, the following:</p> <ol style="list-style-type: none"><li>1. All relevant contact information of the communities, especially related to km 160 of Hwy 914, which is the location of a cultural camp that has been established by the English River First Nation and km 67 of Hwy 914 that is a gathering location for the Kineepik Metis Local associated with the Northern Village of Pinehouse.</li><li>2. Description of the mechanisms for communication with communities in case of an emergency.</li><li>3. Description of the partnership with and the training of local communities and local responders (see Section 14 Appendix 14-B, p.1).</li><li>4. Description of mutual aid agreements with neighboring industries/municipalities, where appropriate.</li></ol>	<p>Denison acknowledges the comment and thanks Health Canada for the recommendations as to the development of its Emergency Response Plan.</p> <p>As noted in the draft EIS, Denison has committed to the development of an Emergency Preparedness and Response Program as a component of its Environmental Management System (EMS). The objectives of the program are generically consistent with the recommendations that have been provided and Denison, as it has demonstrated to date, is committed to meaningful engagement with communities of interest and will solicit input and advice during all aspects of program development.</p> <p>For reference it is noted that as it concerns its EMS framework documentation hierarchy it is expected that three levels of documentation will be developed – Programs, Plans and Procedures. The emergency preparedness and response documentation will follow this hierarchy and input from interested parties will be solicited during all phase of program/plan/procedure development. Denison intends to develop this documentation as it advances through the licensing phase of Project realization.</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Advice to the Proponent	Denison Response
AD-48	ECCC	Appendix 16-C, Summary of Monitoring and Follow-up Programs	Appendix 16-C does not include consideration of any monitoring and follow-up programs regarding GHGs.	ECCC recommends that the Proponent consider developing a GHG follow-up program to measure and compare actual GHG emissions against the draft EIS estimates, including reporting the Project’s actual emissions and updating the emissions estimates as needed.	Denison anticipates being subject to ECCC’s reporting requirements for emitters over 10,000 tonnes CO2e and the information is collected under section 26 of the Canadian Environmental Protection Act. This was noted in the draft EIS, Section 2.5 Greenhouse Gas Emissions.
AD-49	ECCC	Appendix 16-A Summary of Residual Effects Appendix 16-B Summary of Cumulative Effects	ECCC notes that GHG mitigation measures have not been considered for the Project. Furthermore, the Project’s lifetime is expected to extend into 2050 and beyond. Consistent with the information requirements of the SACC, and aligning with Canada’s commitment to achieve net-zero GHG emissions by 2050, the Proponent should provide a credible plan that describes how the Project will achieve net-zero emissions by 2050.	ECCC recommends that the draft EIS include an assessment of potential GHG mitigation measures throughout all phases of the Project. This could include a Best Available Technologies / Best Environmental Practices (BAT/BEP) Determination, as described in Section 3.2 of the Draft Technical Guide. ECCC also recommends that the Proponent provide a credible Net-Zero Plan on how to achieve the target of 0 kt CO2 eq/year, for the year 2050 and beyond, following the guidance of the SACC and the Draft Technical Guide.	<p>GHGs were not included as a VC or KI in the draft EIS and as such, there are no specific GHG-related mitigation measures in Appendix 16. However, many of the mitigation measures for the VC Air Quality related to combustion products would also be associated with a reduction in the Project’s Scope 1 emissions. As noted in the draft EIS, Section 2.5, at this stage in the Project Denison will look for opportunities to optimize energy management and improve the energy intensity of the Project where practical. Also see response for AD-19 (second paragraph).</p> <p>Denison will consider the option of preparing a climate resiliency assessment with consideration to best available technologies / environmental practices (BAT/BEP) as well as a net-zero plan as the Project advances. Section 2.5 of the EIS provides a summary of the anticipated GHG releases and a comparison to the nation- and province-wide GHG emissions. The project is expected to contribute less than 0.0043% to the nation-wide annual average. Given this very low contribution, the project is not expected to impact Canada’s ability to meet its climate-related objectives and targets.</p>

**Information Requirement (IR) Response Table – Denison’s Response to December 2023 FIRT Comments, February 2024**

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
IR-06	-	CNSC	Geology and groundwater	Section 2.2.1.4, Wellfield for In Situ Recovery Mining	<p><b>Context:</b> This Section of the EIS indicates that a tracer test was completed in 2021 and a feasibility field test was initiated in 2022. No information from these tests is included in the EIS and no reporting timelines are provided.</p> <p><b>Rationale:</b> Guidance from the IAEA (2001) and best practices highlighted by regulatory regimes in other countries such as the United States (IAEA, 2016) and Australia (Geoscience Australia, 2010) indicates that single and multi-well trial (feasibility) testing for mining and remediation techniques should be carried out before a licence for full-scale operations can be granted. This is part of the requirement for Proponents to demonstrate to government authorities that all potential risks have been considered during the life of operation and post-remediation of the mine.</p> <p>Additionally, Section 8.5.2 of the Generic EIS Guidelines states: “Units may be characterized as aquifers or aquitards, and unit descriptions should include their geochemical characteristics, vertical and lateral permeabilities, transport mechanism (diffusion versus advection) and the directions of groundwater flow”,</p> <p>And that “The applicant or licensee should present a conceptual and numerical hydrogeological model that discusses the hydrostratigraphy and groundwater flow systems”.</p> <p>Outcomes from the tracer test inform model parameters such as effective porosity (see IR-78), dispersion, and dispersivity (see IR-96). The wellfield leach tests and remediation trails ultimately inform environmental monitoring during site activities, and the source term for the groundwater model. This source term represents the contaminants which flow through the desilicified zone into Whitefish Lake, which represents a source of contamination considered in the ERA.</p> <p><b>References:</b> [1] International Atomic Energy Agency (IAEA). 2001. Manual of Acid in Site Leach Uranium Mining Technology. IAEA-TECDOC-1239. Vienna. 283 p. [2] International Atomic Energy Agency (IAEA). 2016. In Situ Leach Uranium Mining: An Overview of Operations. IAEA Nuclear Energy Series No. NF-T-1.4. Vienna. 76 p. [3] Commonwealth of Australia (Geoscience Australia). 2010.</p>	<p>1. Please provide a summary of the results of field tests (i.e., tracer tests, wellfield leach tests, and remediation trials) in the EIS, or provide a technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS.</p> <p>2. Please indicate how outcomes from these field tests inform the design of In Situ Recovery. This information should include:</p> <ul style="list-style-type: none"><li>• feasibility of meeting remediation targets.</li><li>• groundwater flow conditions and validation of flow models.</li><li>• mobilization of contaminants (e.g., Al, Se or V).</li><li>• potential for free gas evolution/two-phase flow.</li><li>• identifying composition of lixiviant and production solutions.</li><li>• success despite presence of &gt;2% carbonate minerals (siderite, FeCO3) in the ore zone (see Table 4-3 of Appendix 7-A).</li><li>• site-specific data to parameterize, validate, and refine solute transport models (hydraulic conductivity, effective porosity, dispersivity, diffusion, etc.).</li></ul> <p>3. Please provide further information of proposed operations including % recovery, uranium concentrations, optimal</p>	<p>This response has not been accepted.</p> <p>The mining area decommissioning objectives shown in Table 2.3-3 of the original EIS (Section 2.3.3.1.1) show different numerical values when compared to those shown in Table IR-06-1 of Denison's response to IR-06. Notably, allowable proportions of Al, As, Cd, Cr, Cu, Fe, Mo, SO4, Se, U, V, and Zn are increased over the IR-159 nitial decommissioning objectives. Denison's Final Proposed EIS update for IR-06 does not include any text regarding alteration of decommissioning objectives for the mining area.</p> <p>Please also see follow-up IR-06-R1.</p>	<p>Denison acknowledges that the presentation of information in Table IR-06-1 of Attachment IR-06 has created some confusion; for clarity, Table IR-06-1 of Attachment IR-06 was never meant to replace Table 2.3-3 of the draft EIS.</p> <p>The information provided in Table IR-06-1 of Attachment IR-06 (Annex 1, Attachment IR-06 on page 90/419) was from Denison's Feasibility Field Test (FFT). The FFT was an ISR pilot program permitted by SK ENV and completed under a CNSC nuclear substances license. The purpose of the FFT was to validate previous field and laboratory testing and determine the feasibility of the ISR mining methodology. The leaching and neutralization phases of the FFT were completed in 2022. The leaching phase was designed to assess the effectiveness of the ISR mining method. This phase included controlled injection of an acidic solution into the mineralized zone with recovery of the solution through existing test wells. The neutralization phase involved the injection of a mild alkaline (basic) solution into the leaching zone to neutralize the area and verify the groundwater in the area is returned to acceptable, permitted conditions. Table IR-06-1 was included at the request of the CNSC during the 1<sup>st</sup> round of IRs and provides context to the reviewer on restoration of the leaching zone to permitted pH conditions.</p> <p>Based on the above, there are no proposed changes to the mining area decommissioning objectives shown in Table 2.3-3 of the draft EIS.</p>	No

IR-12	-	ECCC	Change to an environmental component due to hazardous contaminants Change to an environmental component due to hazardous contaminants	Section 2.2.3, Project Description	<p>Context: There is not enough information provided within the draft EIS and site water infrastructure designs to determine if the infrastructure will sufficiently contain mine site contact and non-contact water runoff. It is unclear how water management will occur during all proposed Project stages at the Project airstrip, which is located away from the main Project site. No information has been provided regarding water that may come into contact with fuels and oils from machinery on the air strip, how and where that contaminated water will be treated, and how surface runoff around the airstrip will be managed. Additionally, it is unclear if contaminants from heavy machinery on roads have been considered during runoff collection plans throughout the mine Project site. Water management at the airstrip and roads can have impacts on surface water quality and sediment quality and contaminants (e.g., Hydrocarbons) from these sources should be considered in overall site water management plans.</p> <p>In Section 2.2.3.1 a site drainage plan for contact and non-contact water has been provided in Figure 2.2-17, and water balances have been provided for the different Project phases in Figures 2.2-14 to 2.2-16. In Section 2.2.3.4 a volume of 30,000m3 for the process water pond is provided, and it is stated that the process water pond has the capacity to contain Probable Maximum Precipitation (PMP) event estimated to be 483.3mm while allowing for 1.0m of freeboard. However, there are no estimates on the total volume of water that may be drained from the overall site infrastructure (i.e., the well field,</p>	<ol style="list-style-type: none"><li>1. Provide information on how contact and non-contact water from the site airstrip will be managed. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</li><li>2. Provide further information on how potential contaminants in runoff from roads have been considered in the site water management. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</li><li>3. Provide estimated volumes of water to be drained from overall site infrastructure (such as the mine terrace, airstrip, camp area etc.), during a 24-hr PMP event.</li><li>4. Provide additional information on culvert designs and conveyance capacity for PMP events.</li></ol>	<p>This response has not been accepted, for the following reasons (numbers correspond with original IR):</p> <p>1-2. In Figure 2.2-17 (Site Drainage Plan with Flow Direction and Culvert Locations) of EIS, site drainage or water management layout is not included for the access road to the airport and the airport area although they constitute part of the Project site. Although surface run off from airstrip or site road are mainly expected to be clean or non-contact water, CNSC expects Denison to provide information on water management system to mitigate risk of flooding and erosion at the airport and the access road. In addition, the access road connecting the mining site with airport crosses two streams (Kratchkowsky Creek and Hart Creek) that flow into Whitefish Lake, CNSC staff expects Denison to ascertain that culverts or crossings will be designed in such a manner that the flood hazard does not increase. Therefore, CNSC staff request that Decision provide information on how the surface runoff generated at airstrip and airport access road would be managed.</p> <p>3. CNSC accepts estimated total volume of runoff from the wellfield area to Wellfield Pond however the PMP value of 489.3mm is obtained from 1999</p>	<p>1-2. The water management design information presented in the draft EIS is considered appropriate at the EA stage and for this stage of the Project and fit-for-purpose to support the assessment of potential effects. The detailed design information on site water management infrastructure and runoff management requested in this IR and related IRs (i.e., IR-12-R1A and IR-12-R1B) will be provided to the CNSC and province as part of licensing and permitting.</p> <p>Nevertheless, and building on information provided previously, additional information and context regarding site water management and design concepts is provided as follows:</p> <ul style="list-style-type: none"><li>• Conceptual site drainage maps spanning the full Project Area scale has been provided in Attachment IR-12 to this IR response table as context for the reviewer.</li><li>• Design for the access roads and airstrip will in general be such that runoff will be encouraged through appropriate grading to drain away and not pond on or near the road or airstrip.</li><li>• The overall vision for non-contact water along the access roads and airstrip is to use shallow ditching to dissipate the energy of runoff, to promote settling of suspended solids and allow the runoff to report to ground via natural grades that flow away from the infrastructure and into the natural drainage systems.</li><li>• The condition of the airstrip and roads would be inspected and maintained routinely. For example, should unexpected water pooling be observed at the airstrip or site roads during Operation, temporary water removal means such as vac trucks or sump pumps could be employed, and the areas would be re-graded to minimize water accumulation.</li><li>• Infrastructure features that are within 50 to 100 m (depending on grade) of waterbodies and that are associated with cleared land where there is no vegetated buffer may require additional erosion management / controls to ensure protection of the waterbodies from unmitigated suspended solids inputs.</li></ul>	No																																																																																												

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>processing areas, etc.) during a 24-hr PMP event. Additionally, in Figure 2.2.17 culvert locations are provided, however there is no further information on culvert designs, flow ratings and capacity for PMP events.</p> <p>Rationale: In order to be able to understand site water management and flood risk potential, more information needs to be provided regarding the site water infrastructure designs and capture volumes during PMP events. This information will aid ECCC in understanding how contact and non-contact water will be conveyed throughout the site. Runoff from roads and the site airstrip will contain contaminants from vehicles, heavy machinery, aircrafts and de-icing practices. Additional information on the runoff collection systems and expected contaminant concentrations for the site airstrip and roads is needed to determine if the receiving environment and aquatic and terrestrial receptors are protected.</p>		<p>study [A.1], based on historical rainfall data pre-1998, which appears to require updated PMP value.</p> <p>CNSC requests that Denison use a PMP value that is estimated using historical rainfall data that includes the most up to date meteorological data or provide justification on the validity of the current PMP.</p> <p>Further, the site infrastructure runoff water has not been considered in the water management infrastructure. Site water management planning should consider the capture of noncontact water to understand the potential effects of contaminants from non-contact water on the surrounding environment.</p> <p>Please also see follow-up IR-12-R1A and IR-12-R1B, related to this IR.</p> <p>Reference: [A.1] Atmospheric &amp; Hydrologic Sciences Division – Atmospheric Environment Branch. 1999. Environment Canada Prairie &amp; Northern Region – Point Probable Maximum Precipitation for the Prairie Provinces. Regina, Saskatchewan. Report No. AHSD – R99 – 01.</p>	<p>A map showing the distance of Project components to waterbodies is available in Attachment IR-12 as context for the reviewer. The map shows for example, that four waterbodies (waterbody numbers 1, 16, 23, and 86) are within 100 m of the Project footprint where potential erosion protection measures may be employed. The details of erosion control measures at these locations will be outlined in the Environmental Management System to support licensing.</p> <ul style="list-style-type: none"><li>Conceptually, minimizing changes in surface drainage patterns and watersheds is an important mitigation measure in the surface water quantity assessment. Collecting and managing non-contact water along roads and at the airstrip would result in a larger potential Project effect on surface water quantity associated with changes in surface drainage patterns and is not preferred.</li><li>As described in the draft EIS, the proposed crossings at Kratchkowsky Creek and Hart Creek are not culverts, but clear span bridges. Clear span bridges are designed to completely span a watercourse without interfering with the channel bed and banks.</li><li>As a reminder to ECCC that the road to the Project’s proposed airstrip follows an existing, decommissioned road, the Fox Lake Road.</li><li>The Project is located within the Wheeler Upland Landscape Area of the Athabasca Plain Ecoregion within the Boreal Shield Ecozone of Saskatchewan. The area is characterized by Brunisolic soils which are typically sandy, well-drained soil. Standing water is not a common occurrence and the well-drained characteristics of the region support the plans to divert non-contact water to ground, and as noted made surfaces would be graded to promote drainage and discourage pooling.</li><li>Please refer to our initial response to IR-12 (refer to Annex 1, IR-12 on page 6/419) for additional context on best practice and mitigation measures related to water management and also the scoping and evaluation of accident and malfunction scenarios in the draft EIS.</li><li>Importantly, the conceptual management scheme outlined above for non-contact water runoff is consistent with other roads and airstrips in the region – that is, runoff is not currently captured from other roads and airstrips in the region as envisioned by the review comment. This includes infrastructure associated with Saskatchewan Ministry of Highways and Infrastructure, existing uranium mines and mills, and communities including First Nation communities. It is not practical to do so and collection of non-contact water is not needed based on risk and moreover as noted above is to be avoided so as not to necessarily affect water quantity in local drainages and sub-drainages.</li></ul> <p>3. The reviewer is referred to the response to IR-103 for a discussion regarding the PMP and its suitability and relevance given available data and different methods of calculation included that provided by CSA guidance. Notwithstanding the information provided in response to IR-103 Denison is committed to revisiting this issued as per CNSC’s recommendations, as applicable, for the licensing phase of the Project.</p> <p>To reiterate, Denison believes it has fulfilled its information requirements for the EIS as outlined in the EA guidance provided by the province and federal government, including CEAA 2012, and that the FIRT has been provided with the appropriate level of detail on the water management topic for drawing conclusions on the EA process. Notwithstanding</p>	

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								that, Denison recognizes that further information will be required as the Project moves past the EA and into the licensing and permitting phases. It is Denison's opinion that this comment is not an IR related to the EIS. A request for clarification or additional information on a detailed design aspect would need to be responded to by the Denison as part of the licensing process; however, this level of detail is not necessary for drawing conclusions on the EA process.	
IR-12	IR-12-R1A	ECCC	Change to an environmental component due to hazardous contaminants	Section 2.2.3, Project Description  Proponent response to IR-12	<p>Context: Runoff water from site infrastructure such as the airstrip and roads may be categorized as non-contact water because it does not come into contact with contaminants of potential concern (COPCs) directly from mining operations infrastructure. However, it still has the potential to contain deleterious substances from mine-related activities such as operation of vehicles, including heavy machinery and aircraft, spills, fire management practices, and snow removal practices. The Metal and Diamond Mining Effluent Regulations (MDMER) pursuant to the Fisheries Act requires all mine effluent and seepage from the mine site that contains deleterious substances be discharged through a final discharge point. This includes deleterious substances in non-contact water from all site infrastructure including the airstrip, roads, and camp area.</p> <p>Rationale: All mine effluent and seepage that contains deleterious substances must be discharged through a final discharge point. This includes site non-contact water which has the potential to contain deleterious substances such as those released from vehicles, machinery, aircrafts, spills, and de-icing practices. The Proponent has not included how non-contact water runoff from site infrastructure will be captured within site water management planning. To understand the potential effects of contaminants from non-contact water on the surrounding environment, site water management planning needs to be updated to include the capture of non-contact water.</p>	<p>1.Update site water management plans to include management of potentially deleterious substances contained in non-contact water from all site infrastructure.</p> <p>2. Provide updated estimates of water volumes to be drained and managed from overall site infrastructure (including runoff from roads, airstrip, camp area, etc.) during the different Project phases. Include updated information on water treatment flows, capacity and effluent discharge during normal operations, and a 24-hr Probable Maximum Precipitation (PMP) Event.</p>		<p>1 and 2.</p> <p>Denison understands the prohibition related to deleterious substances under Section 36 of the Fisheries Act and Denison affirms its commitment to ensuring no such events occur. However, in the context of this IR, we interpret ECCC is connecting the concept of deleterious substances under MDMER (those constituents identified in Part 1(3) i.e., arsenic; copper; cyanide; lead; nickel; zinc; suspended solids; radium 226; and un-ionized ammonia.) with the general concept of deleterious substance per the Fisheries Act. Mine effluent associated with MDMER defined deleterious substances will be discharged through a final discharge point to Whitefish Lake, and this has been reflected in the water management information presented in the draft EIS, including Section 2.2.3.</p> <p>The IR is suggesting Denison collects runoff water from the airstrip and roads with the rationale that this is needed in order to collect potential contact water associated with hydrocarbons spills (the text in rationale notes: <i>This includes site non-contact water which has the potential to contain deleterious substances such as those released from vehicles, machinery, aircrafts, spills, and de-icing practices</i>). As indicated in the draft EIS and in our initial response to IR-12 (refer to Annex 1, IR-12 on page 6/419), should a spill occur, the spill response plan will be followed. The details of Denison’s response plans will be developed to support licensing as part of the Waste Management and Emergency Management and Fire Protection programs. Importantly, hydrocarbons are not mine waste-related deleterious substances perm MDMER definition. Collecting and treating non-contact runoff throughout the life of the Project would mean Denison collects an extremely large volume of clean water to protect against infrequent hydrocarbon spills which will be cleaned up in the appropriately scaled process (spill response), in terms of cost and risk to the environment. No other roads or airstrips in the region (including those associated with uranium mine and mill operations) requires the collection and treatment of runoff water from infrastructure such as roads and airstrips. It is not practical to do so and based on risk, the collection of non-contact water is not required.</p> <p>The road or trail to the airstrip is currently an unmaintained road: the decommissioned Fox Lake Road. For road upgrades and airstrip construction, Denison will be using material from the borrow area. Borrow pit area selection was based on geotechnical program completed in 2021 which did not identify any potential for ARD/ML. Further works are ongoing part of engineering activities and with confirmation of characterization through assays of representative samples. As such, the material used to upgrade roads and construct the airstrip will not be a source of metals or ARD.</p> <p>Denison will implement erosion control measures at infrastructure locations within 50 to 100 m of a waterbody (refer to response to IR-12 above and to Attachment IR-12, Figure</p>	No

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<p>IR-12-5: Distance from Project Footprint to Waterbodies) where required (i.e., at locations where there is no vegetated buffer adjacent to the waterbodies).</p> <p>In consideration of the above, Denison maintains that the runoff at the airstrip and roads are non-contact water. The water management mandate for the Wheeler River Project is to keep clean water clean and minimize the total volume of water requiring management, treatment, and discharge.</p> <p>In the draft and revised draft EIS, Denison has evaluated potential Project effects on surface drainage in Section 8.1, as part of the Project-surface water quantity interaction of Project overprinting of drainage areas. As noted in the draft EIS, Section 8.4.1.4.2.1, this assessment was appropriately focused on areas of active water collection. It was noted that the road and airstrip were not considered to affect hydrology materially. Both may potentially redirect some flow and have a small influence on the timing of concentration of runoff and infiltration rates; however, in general, they are anticipated to have a very small influence and are not expected to change runoff volumes at assessment nodes.</p>	
IR-12	IR-12-R1B	ECCC	Water Quality - Change to an environmental component due to hazardous contaminants	Section 2.2.3, Project Description  Proponent response to IR-12	<p>Context: The Proponent has clarified that there is no infrastructure in place for management of non-contact water from site infrastructure that may contain COPCs, including but not limited to roads, the airstrip, and the campground.</p> <p>Rationale: To understand the potential effects of contaminants from non-contact water on the surrounding environment, site water management planning needs to be updated to include the type of infrastructure and its location for the capture of non-contact water.</p>	Provide a map marking the locations of proposed surface drainage structures for runoff collection including collection ditches, culverts, diversion ditches, perimeter berms, collection ponds and other similar structures.		<p>It is Denison's opinion that this comment is not an IR related to the EIS. A request for clarification or additional information on a detailed design aspect would need to be responded to by Denison as part of the permitting and licensing process; however, this level of detail is not necessary for drawing conclusions on the EA process.</p> <p>In the draft and revised draft EIS, Denison has evaluated potential Project effects on surface drainage in Section 8.1, as part of the Project-surface water quantity interaction of Project overprinting of drainage areas. As noted in the draft EIS, Section 8.4.1.4.2.1, this assessment was appropriately focused on areas of active water collection. It was noted that the road and airstrip were not considered to affect hydrology materially. Both may potentially redirect some flow and have a small influence on the timing of concentration of runoff and infiltration rates; however, in general, they are anticipated to have a very small influence and are not expected to change runoff volumes at assessment nodes.</p> <p>Notwithstanding the above, Denson has provided the reviewer with additional, conceptual site drainage maps in Attachment IR-12, Figures IR-12-1, IR-12-2, IR-12-3, and IR-12-4; these are supplemental to the site drainage map provided in the draft EIS Figure 2.2-17.</p>	No
IR-13	-	ECCC  CNSC	Fish and fish habitat	Section 2.2.4, Waste Management  Section 2.2.7.7, Borrow Area  Section 2.3.1.3 Site Preparation and Earthworks	Context: The Proponent indicates that a borrow area is planned for an area northeast of the processing plant. The borrow material or overburden will be used during construction for roads, airstrip, pads, and in the batch plant for concrete production needs, during Operation for ongoing maintenance of various Project components and during decommissioning for fill and cover material. Suitable construction fill material will be sourced from the proposed borrow area and any suitable clean sandstone generated during freeze wall and well drilling (Section 2.2.7.7).	Please provide: 1. Information on whether the waste rock from the basement rock is potentially acid generating and metal leaching; a. Confirm that any borrow material to be used for construction will be characterized for potential ARD/ML. b. Confirm that the part of waste rock recovered	This response has not been accepted.  In the response, Denison expected that portion of basement rock will be potentially acid generating and stated that all basement rock will be stored on the special waste pad. Waste rock from the sandstone will also be characterized primarily based on geological and geochemical characteristics, and if a portion of the waste rock is potentially acid generating, it will also be stored on the special waste pad. However, criteria for	The commitment for waste rock segregation provided in the draft EIS in combination with Denison’s previous response to IR-13 (refer to Annex 1, IR-13 on page 7/419) is considered appropriate for this stage of the Project and fit-for-purpose to support the assessment of potential effects. We remind the reviewer that since (1) there is no release of effluent during construction, and (2) contact water from both the clean and special waste rock pads will be collected and eventually treated in the IWWTP during operation, the details of the waste rock segregation are not required to support the assessment of potential project effects on the environment. It is further noted that Denison has committed to developing a lined storage pad for potentially acid generating (PAG) material that is of sufficient capacity to store all the waste rock that is expected to be removed from the drill holes through life of mine. From an operational risk perspective there is more than ample contingency to manage the risk that may be associated with PAG material. Due to the	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>It was also noted in Sections 2.2.1.3 and 2.2.14 that the freeze wall will be established by drilling over 300 vertical holes from surface to the basement rock. The freeze holes will extend 30 m into the basement rock and will produce waste rock from basement rock (Figure 2.2-6). However, there is no information whether the waste rock from basement rock would potentially be acid generating and/or metal leaching. This means that all the extra 30 m of basement rock should also be characterized for potential ARD/ML to determine use or appropriate disposal.</p> <p>Rationale: ECCC notes that the Proponent did not indicate whether the borrow material and the drill out part of the sandstone layers and basement rock will be tested for Acid rock drainage/metal leaching (ARD/ML) potential before they will be used during construction, operation and decommissioning. ARD/ML is an environmental hazard that will have an adverse effect on waterbodies frequented by fish.</p> <p>Potential acid generating and metal leaching waste rock could pose negative impacts on the environment if they are not managed adequately.</p>	<p>from the basement rock, will also be tested for potential ARD/ML.</p> <p>2. Criteria for segregating the potential acid generating and metal leaching waste rock, if it exists, from clean waste rock; and,</p> <p>3. A plan to manage the potential acid generating and metal leaching waste rock, if it exists.</p>	<p>segregating the potential acid generating waste rock from the clean waste rock are not provided.</p> <p>Denison will examine opportunities to reprocess the mineralized core and cuttings by either recovering uranium or placing the materials underground into the mining area at the end of a well’s production. However, it is not clear how the potentially acid generating waste rock will be disposed of in the long term.</p>	<p>relatively small volume of PAG material that is anticipated to be brought to surface through the ISR method, details for the permanent disposal will be developed as part of decommissioning plan updates. The small PAG volume and short mine life allows a number of decommissioning options; PAG rock could be decommissioned in place, moved to the industrial landfill or IWWTP precipitate pond, and/ or added to grout for well backfilling and closure.</p> <p>Despite the above, Denison continues to work towards defining waste segregation criteria. In December 2023, Denison completed an Acid Base Accounting (ABA) testing program on 34 composite samples derived from 372 individual pulp samples at the Saskatchewan Research Council (SRC). The testing was done to further the understanding of the geochemical nature of material that would be generated by ISR wellfield drilling, specifically as it concerns expectations with respect to the quantities of PAG and non-PAG material and the derivation of appropriate segregation criteria. Individual pulp samples were selected from representative drill core samples taken throughout the entire length of drillholes throughout the deposit footprint area. Samples were composited along the length of each drill hole to represent the major horizons of the sandstone and the different basement lithologies (refer to Attachment IR-13 for a figure showing the major horizons). The horizons were selected to identify horizon-specific geochemistry, and as such the composites were developed so as to not straddle between different horizons, which could influence the representativeness of the horizon-specific ABA results. The different lithologies sampled represent all of the overlying and underlying horizons at the site, and include the overlying Upper Aquifer, Intermediate Aquitard, and Lower Aquifer. The underlying horizons include the Graphitic Pelite (GFPL), Quartzite (QZIT), and Garnetiferous Pelite (GTPL).</p> <p>Samples were analyzed for:</p> <ul style="list-style-type: none"><li>• Paste pH (pH units)</li><li>• Acid Neutralizing (g CaCO3/kg)</li><li>• Acid Producing (g CaCO3/kg)</li><li>• Net Acid Generation (g CaCO3/kg)</li><li>• Sulfate, Acid soluble (%)</li><li>• Sulfide (ug/g)</li><li>• Sulfur (%)</li></ul> <p>Though definite criteria have not yet been defined, initial consideration of results suggest the following:</p> <ul style="list-style-type: none"><li>• SANDSTONE<ul style="list-style-type: none"><li>○ all upper aquifer and intermediate aquitard samples were not acid generating (non-PAG); and</li><li>○ 2 out of 8 lower aquifer samples were acid generating, and the rest were not acid generating (non-PAG).</li></ul></li><li>• BASEMENT<ul style="list-style-type: none"><li>○ Quartzite samples (n=2) are not acid generating (non-PAG); and,</li><li>○ Garnetiferous and graphitic pelite samples (n=8) range from being acid consuming to acid generating, but overall are acid generating.</li></ul></li></ul>	

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<p>Based on these test results, the lower sandstone aquifer (MFa) and basement would likely be PAG and stored on the special waste pad, but the balance of waste rock is expected to be non-PAG and placed on the clean waste rock pad.</p> <p>Specific waste rock segregation criteria (e.g., for distinction of PAG vs non-PAG material) will be defined using the data referenced above, as well as previous test data, in procedure level documentation that support the Waste Management Program documents that are part of initial licensing with CNSC. The program and plan documents define the overall strategies for minimizing waste generation, improving waste segregation, and implementing sustainable waste management techniques and the means to systematically and effectively manage the generation, handling, storage, disposal, and recycling of waste streams generated during by the Project, respectively, whereas the procedure level documentation is focused on operationalization of high-level strategies. The detailed waste rock segregation criteria will be provided to the CNSC and part of the licensing process and with the province as part of permitting at the appropriate time.</p> <p>While appropriate management of waste rock is important at all mining operations, we note that for context in relation to management and risk to the environment that through the selection of the ISR mining method, the Wheeler River Project is unique in that it is expected to generate a fraction of waste rock (clean, mineralized, and PAG) compared to other mining methods. For the reviewer’s context and consideration, refer to Attachment IR-13 for a summary of the Wheeler River Project’s expected waste rock volumes compared to a proposed underground uranium mining project in the Athabasca Basin (NexGen’s Rook I Project), an underground mining project which recently completed the Saskatchewan EA process (Foran’s McIlvenna Bay Project), and an open pit mining project which recently completed the federal EA process (Generation PGM’s Marathon Palladium Project); Table IR-13-1, Figure IR-13-2, and Figure IR-13-3 in Attachment IR-13.</p>	
IR-14	-	CNSC	Wastes and Decommissioning	<p>Section 2.3.3.1.3 Decontamination, Demolition, and Disposal (p. 2-82)</p> <p>Table 4.3-2: Key Issues and Concerns from English River First Nation (p. 4-33)</p>	<p>Context: The EIS states “Concrete foundations will be left in place. Any portions of concrete foundations remaining above grade will be levelled and rebar will be cut-off at grade. Large slabs will be perforated on a 2-m grid to permit drainage. Concrete slabs will be covered with 0.5 m of development rock or locally stockpiled till.” (p. 2-82)</p> <p>Further, Denison notes that “Concern about responsible authority for restoring the environment, including contaminants when mining concludes. How long will it take to have the environment fully restored and, if Denison is no longer the operator, how will this be completed?” (p. 4-33). This comment status is noted as Complete.</p> <p>Rationale: Permanent structures will remain following decommissioning, according to the excerpt above. It’s unclear how engagement activities influenced Denison’s planned decommissioning approach, or how the comment above has been addressed or received.</p>	<p>How has the proposal to leave these foundations in place been received by the Indigenous Nations and communities during engagement sessions? Have engagement activities influenced Denison’s planned decommissioning approach? Describe in additional detail how the comment from p. 4-33 has been addressed and how this has been received by those who expressed this concern?</p>	<p>This response has not been accepted.</p> <p>The response provided in IR-28 indicates that responses will be updated in the final EIS and future iterations of the IER. Although Denison commits to provide a PDP at a later date, the commitment does not include incorporating or addressing Indigenous concerns. The current response also does not address the concerns raised by Indigenous Nations and communities regarding restoration of the environment or indicate that it was brought to their awareness).</p> <p>Additionally, IR-28 highlights examples of how engagement will be captured in future iterations of the IER and “final EIS”. Please provide proposed text for the revised EIS, for subject matter expert (SME) review and acceptance.</p>	<p>Denison will incorporate or address Indigenous concerns into decommissioning plans as the plans are developed. This was noted to in the round 1 response to IR-14; see Annex 1, IR-14 on page 8/419 and excerpt here (emphasis added): “The PDP will be submitted to regulators as part of Project licensing and permitting and will provide additional detailed information with respect to site decommissioning. The PDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission. Prior to executing decommissioning activities, Denison shall prepare and submit a detailed decommissioning plan (DDP) to regulators for acceptance, which builds on the PDP. In this case the DDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission and would also be informed by conditions on the ground at the site at that time, operational experience that has been gained and the regulatory landscape at that time. As is highlighted above, the decommissioning plan will evolve over time and the plan will become more refined as the Project advances. Denison is committed to continue to engage with Indigenous Nations and communities to solicit input.” It is consistent with engagement aspects of REGDOC-2.11.2, Decommissioning and also Denison’s commitment to conducting meaningful engagement with Indigenous communities and organizations potentially affected by the Project, and to maintain relationships with these communities and organizations throughout all phases of the Project.</p>	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<p>Denison’s is of the opinion that ‘input’ can refer to a wide range of comments, issues, concerns, advice, observations, etc. We believe the information provided in the EIS is sufficient for this stage of the Project and the conceptual decommissioning plan. Future decommissioning plan updates will be overseen by both the province and the CNSC and provide ample opportunity for the review of how Indigenous input has been incorporated into decommissioning plans.</p> <p>While the CDP outlined plans to keep small area of concrete foundations in place the specifics of the decommissioning plan may change. From the revised draft EIS Section 2.3.3.1.3 “Concrete foundations will be left in place. Any portions of concrete foundations remaining above grade will be levelled and rebar will be cut-off at grade. Large slabs will be perforated on a 2-m grid to permit drainage. Concrete slabs will be covered with 0.5 m of development rock or locally stockpiled till.” This detail will in no way influence Denison’s decommissioning commitment to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure.</p> <p>Denison has not asked for specific feedback by Indigenous groups on concrete foundations remaining in place as outlined in CDP. The draft EIS was reviewed by several Indigenous groups through the public review process and by ERFN in advance of submission to the CNSC. To date, no concerns have been raised regarding concrete foundations. Despite the above context for the reviewer on when Project decommissioning details will be available and when the related engagement on these details would be conducted, Denison commits to specifically engaging with ERFN and KML on details of the decommissioning plans related to concrete foundations. Denison will incorporate and address engagement related to decommissioning, including plans for structures to be left in place such as concrete foundations, into the appropriate version of the decommissioning plan updates.</p> <p>Please refer to Appendix 4B - Key Issue and Concern No 18 outlining the resolution of ERFN concern noted by the reviewer in IR-14.</p>	
IR-18	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 2.2.3.9, Project Description  Appendix 8-E	Context: In Table 2.2-1 the upper bound Industrial Wastewater Treatment Plant (IWWTP) effluent quality final discharge targets for Constituents of Potential Concern (COPCs) are provided. General parameters (e.g., temperature, pH, etc.), and several Schedule 4 Substances with maximum authorized concentrations (lead, nickel, suspended solids, and un-ionized ammonia) under the Metal and Diamond Mining Effluent Regulations (MDMER) have not been provided in this table. There are several COPCs (aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese) for effluent characterization under Schedule 5 Section 4 of the MDMER that have not been provided in this table. Additionally, no information on water quality guidelines has been provided in this table.	1. Update Table 2.2-1 and Appendix 8-E to include all general parameters required for environmental effects monitoring: pH, temperature, hardness, alkalinity, and conductivity.  2. Update Table 2.2-1 and Appendix 8-E to include missing Schedule 4 Substances under the MDMER with maximum authorized concentrations: lead, nickel, suspended solids, and un-ionized ammonia.  3. Update Table 2.2-1 and	This response has not been accepted.  ECCC requested that the Proponent update Table 2.2-1 and Appendix 8-E to include all general water quality parameters required for environmental effects monitoring, including pH, temperature, hardness, alkalinity and conductivity. This information was not provided in the updated table in the Proponent’s response. ECCC also requested that the Proponent Update Table 2.2-1 and Appendix 8-E to include missing Schedule 5 Section 4 parameters required for effluent characterization under the Metal and Diamond Mining Effluent Regulations (MDMER) including aluminum, iron, nitrate, thallium and manganese. The Proponent has not provided the requested information for	<p>The effluent modelling work presented in the draft EIS focused on COPCs which were predicted based on expected Project activities and water treatment processes and selected following CSA N288.6 Environmental Risk Assessments At Class I Nuclear Facilities And Uranium Mines And Mills. The CNSC participates in CSA documents and endorses use of this document.</p> <p>Schedule 5 of the MDMER outlines the various requirements of Environmental Effects Monitoring (EEM) Studies once a mine is subject to the regulation. The MDMER requires EEM as a condition for the authorization to deposit effluent into waters frequented by fish. Environmental effects monitoring involves assessing whether effluents are having an effect on receiver water quality, fish, fish habitat, and use of fish by humans. Schedule 5 of the MDMER is not a predictive section of the regulation to be used to direct EA scope. It is applicable to operational metal mines.</p> <p>Many MDMER parameters including those in Schedule 5, Section 4 identified by ECCC were not selected for analysis during lab studies completed by Denison to support the EIS,</p>	Yes  Revised Draft EIS, Table 2.2-1 in Section 2  Appendix 8-E, Table 15.

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>Furthermore, it is stated that the final effluent quality discharge target for uranium is 0.057 mg/L. However, the Canadian Council of Ministers of the Environment (CCME) water short term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe.</p> <p>Rationale: ECCC requests the Proponent include the general water quality parameters that influence water quality thresholds, parameters in Schedule 4 and Schedule 5 Section 4 of the MDMER, and their respective water quality guidelines for consideration and transparency.</p> <p>Discharges from the proposed Project will alter water quality in the immediate receiving area, and this may include some sublethal effects on aquatic biota, which must be minimized. It remains the Proponent’s responsibility to adhere to the MDMER to ensure that effluent at the end-of-pipe from all final discharge points be non- acutely lethal and meet requirements for prescribed deleterious substances under Schedule 4 of the regulations.</p>	<p>Appendix 8-E to include missing Schedule 5 Section 4 parameters required for effluent characterization under the MDMER: aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese.</p> <p>4. Include all acute and chronic water quality thresholds for each parameter in Table 2.2-1 and Appendix 8-E.</p> <p>5. Describe additional mitigation measures that can be considered to minimize impacts to aquatic biota from uranium concentrations in effluent.</p>	<p>aluminum, iron, nitrate, thallium and manganese. In the Proponent’s response it is stated that, “Schedule 5 parameters are included where available.” However, it is unclear if this means that the requested effluent characterization concentrations for these parameters is currently unknown, or if these parameters are expected to have negligible concentrations in the effluent. Furthermore, ECCC requested that the Proponent include all acute and chronic water quality thresholds under the most stringent of the MDMER, CCME, and/or Provincial Guidelines for each parameter in Table 2.2-1 and Appendix 8-E. This information has not been provided as only chronic toxicity guidelines have been provided.</p> <p>The Proponent is legally required to meet MDMER release targets and intends to continue to refine effluent quality predictions as part of the BATEA assessment and licensing phase of the Project. ECCC must advise the CNSC of predicted effects of COPCs to surface water quality and recognize the Proponent’s legal requirement to comply with the MDMER. Therefore, proposed and draft effluent targets must be reviewed against the requirements of the regulations and with an eye to any potential effects to the receiving environment for both regulated and other effluent parameters. It is necessary for ECCC to review effluent targets for general water quality parameters and MDMER Schedule 5 Section 4 parameters required for effluent characterization and environmental effects monitoring to determine if effluent at the end-of-pipe from all final discharge points is not predicted to be acutely lethal. Additionally, the predicted uranium effluent concentration currently exceeds the acute water quality guidelines for the protection of aquatic life. Table 2.2-1 does not currently provide the information necessary to verify acute and chronic thresholds.</p> <p>Therefore, please see the following reiterated requests:</p> <p>1. Update Table 2.2-1 and Appendix 8-E to include all general parameters required for environmental</p>	<p>since they were not COPCs associated with IWWTP design. Information from laboratory tests is not available at this stage for all of the MDMER parameters. Further, MDMER Schedule 5 Section 4 include a list of parameters to be monitored (not modelled) and many of the 'missing' parameters have no associated limits under MDMER. Denison is committed to meet all requirements of MDMER, which includes future EEM programs.</p> <p>With respect to the bullet items in the IR the following is noted.</p> <p>1) Table 2.2-1 and Appendix 8-E have been updated to include all general water quality parameters required for environmental effects monitoring, including pH, temperature, hardness, alkalinity and conductivity.</p> <p>2) Table 2.2-1 and Appendix 8-E have been updated to include the following missing Schedule 5 Section 4 parameters required for effluent characterization: aluminum, iron, nitrate, thallium, and manganese.</p> <p>1) Updates to Table 2.2-1 and Appendix 8-E Include all acute and chronic water quality thresholds for each parameter as well as information on the concentrations of modifying environmental factors (i.e. pH, hardness, etc.) used to calculate these guidelines as footnotes.</p> <p>Denison is committed to meet the requirements of the MDMER as previously stated. Denison is also committed to working through the process of identifying discharge criteria as stipulated under Provincial legislation for mine effluent discharge as part of the application for an approval to operate a pollutant control facility as well as per the requirements and conditions of the CNSC, the licensing body for the Project. Denison will follow the advice of the CNSC with regard to requirements for further consultation with ECCC.</p>	

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
							effects monitoring: pH, temperature, hardness, alkalinity, and conductivity.  2. Update Table 2.2-1 and Appendix 8-E to include the following missing Schedule 5 Section 4 parameters required for effluent characterization: aluminum, iron, nitrate, thallium, and manganese. Provide further explanation if this information is not available.  3. Include all acute and chronic water quality thresholds for each parameter in Table 2.2-1 and Appendix 8-E. Include information on the concentrations of modifying environmental factors (i.e. pH, hardness, etc.) used to calculate these guidelines as footnotes.  4. Provide a clear commitment to ECCC for continued consultation on developing effluent discharge targets including a review of final predicted effluent discharge targets once available.		
IR-23	-	CNSC	Alternative Means	Section 2.10.2 Alternative Means  Appendix 2-A PD Engagement Tables  Appendix 2-C Alternative Means Assessment (p. 3)	Context: There are multiple rows in the Indigenous Tables for Appendix 2-A where comments and concerns raised by Indigenous Nations and communities and other members of the public were taken into consideration in the Alternative Means Assessment. However, it is unclear how these were considered.  A few examples: <ul style="list-style-type: none"><li>16-EN-DesNd-101.1: Interested in any future business opportunities that may be available as Denison advances their Wheeler River Project.</li><li>16-EN-ERFN-100.15: In that territory near the Wheeler River there are a lot of spawning and calving areas for moose, caribou; those creeks are for whitefish spawning. There’s lots of heavy muskeg there. A lot of us have been there, and we’d like to know there’ll still be access to the area.</li><li>6-EN-ERFN-100.17: Today because of climate change, things are starting to happen that normally didn’t happen. Even the permafrost is now further down. In the Wheeler River area, where there’s some permafrost, have your environment guys seen a change? Will there be a change? These are some of the questions that need to be answered in order to come out with a positive spin.</li></ul> Rationale: Appendix 2-C, Alternative Means assessment, states (p.3): “Engagement with Interested Parties naturally included	Please explain how comments and concerns collected during Denison’s engagement sessions were considered or influenced the alternative means assessment. Please include this information in the EIS and/or it’s appendices.	This response has not been accepted.  The response and additional Annex (Table 2.10-1) provided in the draft EIS submission do not address concerns listed in the examples requested by CNSC staff.  The additional row in Table 2.10-3 meant to address input received from interested parties does not clearly demonstrate how comments received regarding alternative means were incorporated into the evaluation factor. Additionally, references provided in this row are not in the submission package or the original EIS.	The reviewer is referred to the revised Draft EIS, Appendix 2-A. The column titled “Denison’s Response to Question/Concern (where applicable)” outlines additional context on how the comment was considered in the EIS. This includes the specific comments listed by the reviewer, i.e., 16-EN-DesNd-101.1, 16-EN-ERFN-100.15 and 16-EN-ERFN-100.17.  For additional context, the previous IR response (Annex 1, IR-23 on page 13/419) provided a narrative on how the comments included in Appendix 2-C were part of the fulsome consideration of alternative means. The alternative means assessment is largely a screening level exercise to identify more versus less preferred options. The fact that it is carried out at the screening level is appropriate for this stage of the Project, given the level of design that was available at the time many of the engagement discussion occurred and that is typical for such resource development projects. The alternative means assessment is conducted across a range of criteria including biophysical environment, human environment, technical factors, cost factors, and any engagement comments specific to the options or more generally on importance of environmental protection, economic/business opportunities or concern about climate change. The alternative means assessment process is outlined in Appendix 2-C and summarized in Section 2.10 of the Project Description.  In response to the second part of this comment, we would like to clarify that the tables presented in Attachment IR-24 (Annex 1, IR-24 on page 13/419; and a reminder that Attachment IR-24 is now included in the revised draft EIS as part of updates to Section 2.10 Project Alternatives) were directly from the draft EIS Appendix 2-C. Specifically, Table 2.10-3 in Attachment IR-24 is a direct copy of Table 6 from Appendix 2-C and this is stated directly in the table title. There was no new information contained in the Attachment IR-	Yes  Appendix 2-A (Updated includes a column titled “Denison’s Response to Question/Concern (where applicable)”)

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>alternatives means and the engagement input was included in the evaluation of alternative means. Refer to the references list below and Appendix 2-A Engagement Database Summary – Project Description for details of engagement information referenced in this alternative means assessment.”</p> <p>It is unclear in section 2.10.2 of the EIS, Appendix 2-A or Appendix 2C how the comments documented by Denison have been considered or influenced the alternative means assessment.</p>			<p>24 (Annex 1, IR-24 on page 13/419) tables compared to what was provided in the draft EIS, specifically Appendix 2-C.</p> <p>Denison has committed to undertaking engagement with Indigenous Communities of Interest and Communities of Interest, which if they desire it, may include discussion of project alternatives in the context of licensing, as may be appropriate.</p>	
IR-25	-	CNSC	Current use of lands and resources for traditional purposes Current use of lands and resources for traditional purposes	Section 3, Sections 4, Section 5, Section 11 (and all other applicable once Métis Knowledge Use Study is completed)	<p>Context: The EIS states that Denison is currently negotiating an agreement with MN-S and no traditional land use information is included throughout the EIS given no agreement was signed or Traditional land use information was shared at the time the EIS was being drafted.</p> <p>As noted in the EIS Denison has committed that: “As information becomes available from the agreed-upon process between the Métis Nation – Saskatchewan and Denison, it will be incorporated into the final EIS.” (p. 11-36)</p> <p>Rationale: More information is required to better understand the issues and concerns, valued components, and current use of lands and resources for traditional purposes by MN-S near the Project area.</p> <p>Requirements are detailed in CNSC’s Generic EIS Guidelines, section 8.9: Indigenous land and resource use.</p>	<p>Please update the revised Draft EIS to reflect the integration of the Métis Use and Knowledge Study in the Draft EIS where applicable, when this study is completed and provided to Denison.</p> <p>In addition, please include an updated Issues and Concerns table that includes relevant information from the MN-S as a result of engagement activities and relevant MN-S studies in the next version of the EIS, as appropriate.</p> <p>Should this information not be made available to Denison at the time of revising the draft EIS, the next version of the EIS and the response to this IR should provide a status update on discussions and engagement with MN-S and next steps.</p>	<p>This response has not been accepted.</p> <p>As the information from MN-S has not yet been incorporated into a version of the EIS for review, CNSC cannot accept this response as complete. MN-S has provided new information to Denison and this should be reflected in Denison’s assessment.</p> <p>CNSC requires that Denison provide additional information within the revised version of the EIS. The response should include the newly revised text within the EIS and the page numbers of where staff can find the information.</p>	<p>The information from the MN-S has been updated in the revised draft EIS in track changes form, for ease of review. The following sections have updates:</p> <ul style="list-style-type: none"><li>• 3.3.2</li><li>• 3.4.2.3</li><li>• 3.4.4</li><li>• 3.4.8</li><li>• 11.1.1.1</li><li>• 11.1.1.2</li><li>• 11.1.2.3</li><li>• 11.1.3.1.2</li><li>• 11.1.3.2.2</li><li>• 11.1.4.3.1</li><li>• 11.1.4.5.1</li><li>• 11.2.1.1</li><li>• 11.2.2</li><li>• 11.2.3.2</li><li>• 11.2.3.3.1</li><li>• 11.2.3.9</li><li>• 11.2.4.4.1</li><li>• 12.1.1.1</li><li>• 12.1.1.3.1</li><li>• 12.1.2.4</li><li>• 12.1.3.2.3</li><li>• 12.1.4.2.1</li><li>• 12.2.1.1</li><li>• 12.2.1.3.1</li><li>• 12.2.2</li><li>• 12.2.3.2</li><li>• 12.2.3.3</li><li>• 12.2.4.2.2</li><li>• 12.2.4.2.3</li><li>• 12.3.1.1</li><li>• 12.3.2</li><li>• 13.1.1</li><li>• 13.1.2</li></ul>	<p>Yes</p> <p>Revised Draft EIS sections:</p> <ul style="list-style-type: none"><li>• 3.3.2</li><li>• 3.4.2.3</li><li>• 3.4.4</li><li>• 3.4.8</li><li>• 11.1.1.1</li><li>• 11.1.1.2</li><li>• 11.1.2.3</li><li>• 11.1.3.1.2</li><li>• 11.1.3.2.2</li><li>• 11.1.4.3.1</li><li>• 11.1.4.5.1</li><li>• 11.2.1.1</li><li>• 11.2.2</li><li>• 11.2.3.2</li><li>• 11.2.3.3.1</li><li>• 11.2.3.9</li><li>• 11.2.4.4.1</li><li>• 12.1.1.1</li><li>• 12.1.1.3.1</li><li>• 12.1.2.4</li><li>• 12.1.3.2.3</li><li>• 12.1.4.2.1</li><li>• 12.2.1.1</li><li>• 12.2.1.3.1</li><li>• 12.2.2</li><li>• 12.2.3.2</li><li>• 12.2.3.3</li><li>• 12.2.4.2.2</li><li>• 12.2.4.2.3</li><li>• 12.3.1.1</li><li>• 12.3.2</li><li>• 13.1.1</li></ul>

IR-28	-	CNSC	Current use of lands and resources for traditional purposes Current use of lands and resources for traditional purposes	Section 4, IER and engagement appendices, including: Appendix 2-A Appendix 6-B Appendix 7-B Appendix 8-A Appendix 9-A Appendix 10-B Appendix 11-A Appendix 12-A Appendix 13-A Appendix 14-B	<p>Context: The summary of issues tables do not appear to include all of the key issues identified by the Indigenous Nations and communities.</p> <p>For example, some Indigenous Nations and communities have shared concerns with respect to accident prevention and overall safety on the Key Lake road (Highway 914) due to increased traffic, impacts on treaty rights and section 35 rights due to cumulative impacts, and decommissioning, that were not captured in the issues and concerns and summary tables in Section 4.3.2 and in the IER.</p> <p>The tables in the engagement appendices include a column titled “Response (From Denison)”. The “Response” column does not include responses, but instead points the reader to where this comment or concern was considered. When navigating to the sections referenced, it is often unclear how this information was considered or influenced the assessment.</p> <p>Rationale: Additional detail is required in order to ensure the key issues are all identified and to understand the status of validation for each issue raised and the response provided.</p>	<p>1. Update the summary of issues and concerns tables to include all relevant issues and concerns raised by each of the Indigenous Nations and communities to date, including concerns raised in the Indigenous Knowledge studies provided, additional engagement, and Draft EIS comments.</p> <p>2. Please include a column in the issues and concerns tables to clearly articulate the specific mitigation/monitoring measures that Denison have committed to, or any other measures, in order to address the concerns raised by each Indigenous Nation and community during the engagement process to date.</p> <p>3. Denison must demonstrate that each Indigenous Nation and community has validated that the summary of issues and concerns table reflects their understanding or agreement, and/or a path forward to complete the validation throughout the EIS and the updated IER.</p> <p>Validation must be complete by the time the technical review is complete, prior to submission of a final EIS. Should Denison not be able to fully address issues, concerns or feedback raised by any Indigenous Nation or community,</p>	<p>This response has not been accepted.</p> <p>Denison provided information about the verification process for KML with an example chart that CNSC staff deem acceptable. CNSC requires that Denison complete this process with all identified Indigenous Nations and communities.</p> <p>It will be expected that a fully updated IER and issues and concerns tables for each Nation as per the original IR, in a future version of the revised EIS for SME review and acceptance.</p> <p>For part 3 of the IR, Denison must have validation from all Nations and Communities. Validation from ERFN, YNLRO and other Nations with interest in the Project should also be obtained. Alternatively, a path forward to complete the validation can also be provided.</p>	<p>Section 4 of the EIS and the IER have been fully updated with engagement information as recent as January 2024.</p> <p>The Interests, Issues and Concerns tables have been fully updated with responses from Denison to the items identified, including whether or not the Denison responses have been deemed acceptable and validated, or whether or not the engagement efforts in this regard are ongoing. Where engagement efforts are ongoing, if possible, a definitive indication of next steps is provided in respect of the resolution process. Denison notes that it is not always possible to specifically outline next steps with respect to validation, but the commitment to working toward a resolution should also be acceptable, as Denison alone cannot determine an engagement process for Indigenous nations; the Indigenous nations and communities may wish an alternative course of action.</p> <p>It is also important to note that Denison’s engagement efforts may not yield positive validation on all Interests, Issues and Concerns raised by all Indigenous Nations and Communities (i.e., consensus on every topic may not be achieved), but wherever possible, Denison’s efforts to be transparent about what those issues are, and the process associated with the attempts to find positive resolution will be identified.</p>	<p>Yes</p> <p>Revised Draft EIS, Section 4</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
						through mitigation and monitoring measures, this should be documented, and a rationale provided.  4. Update the response column of the Engagement tables to describe how these were considered in the sections referenced. Consider renaming this column to reflect the nature of the content (i.e., how the information was considered).			
IR-35	-	CNSC	Change to an environmental component due to hazardous contaminants	Section 6, Chemicals of Potential Concern	Context: The use of petroleum products (e.g., propane, gasoline, and diesel) at the Denison Mines Wheeler River site is associated with vehicles and periodic operational testing of emergency generators as well as stationary pumps for emergency power or fire water systems. Thus, the air emissions will contain acrolein.  Rationale: This chemical of potential concern (COPC) poses potential risks to human health via inhalation, but acrolein appears to have been missed or deemed insignificant. However, its consideration in the assessment will provide information on the significance of the associated risk.	Please consider acrolein in the assessment or provide a rationale for its exclusion.	This response has not been accepted.  Although the requested assessment is provided in response to IR-35, this information also needs to be reflected in a revised version of the EIS. Please provide proposed text for the revised EIS, for SME review and acceptance.  Please also see follow-up IR-35-R1.	The quantitative screening analysis of acrolein has been included in the revised Draft EIS as Appendix D to Appendix 6-A to support the conclusion that acrolein is not a COPC. A summary of this analysis is also provided in Section 6.1.1.2 in the revised Draft EIS. Tables 3-10 and 3-11 in Appendix 10-A were also updated to be consistent with the changes made in Section 6.  The assessment includes estimated concentrations of 1-hour and 24-hour acrolein compared to Ontario Ambient Air Quality Criteria. It has also been updated to include estimated annual acrolein concentrations. The annual concentrations are predicted to be below the Tolerable Concentration (0.4 µg/m3) from Environment and Climate Change Canada and Health Canada’s Priority Substances List Assessment Report as well as the chronic reference concentration (0.02 µg/m3) from the US EPA. As such, acrolein can be screened out as a COPC from further assessment.	Yes  Revised Draft EIS Section 6.1.1.2, and Appendix 6-A  Revised Draft EIS Appendix 10-A, Table 3-10 and Table 3-11
IR-35	IR-35-R1	Health Canada (HC)	Change to an environmental component due to hazardous contaminants  IR-35 Response from Denison	Section 6, Chemicals of Potential Concern	Context: Potential health risks from long-term exposure to acrolein were not considered in the Proponent’s response to IR-35.  Rationale: No annual predicted concentrations for acrolein were provided in the draft EIS or in the response to IR-35. Concentrations were modelled for short-term exposure (1h and 24h) only in the draft EIS and compared to the 1-hour and 24-hour Ontario Ambient Air Quality Criteria for acrolein. It is Health Canada (HC) guidance to assess both potential short and long-term health effects. The predicted annual concentrations for acrolein should be compared against chronic reference concentrations (e.g., the USEPA Reference Concentration (RfC) <sup>1</sup> (0.02 µg/m3) and the Tolerable Concentration (TC) from Environment and Climate Change Canada and Health Canada’s Priority Substances List Assessment Report <sup>2</sup> (0.4 µg/m3)).	Use predicted annual concentrations and available chronic reference concentrations to account for potential health risks from long-term exposure to acrolein to support the decision to screen out acrolein as a COPC from further assessment.		See response to IR-35.	See response to IR-35

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
IR-37	-	CNSC	Air Quality	Section 6.1.1.1, CALPUFF model	<p>Context: "The Saskatchewan Ministry of Environment (SK MOE) has developed the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) to assist Proponents in conducting air dispersion modelling assessments in a consistent manner. The guideline defines the recommended approach for dispersion modelling assessments in Saskatchewan, including model selection, emission source characterization, and the determination of compliance criteria to apply."</p> <p>Rationale: Saskatchewan air quality guideline requires consultation on use of CALPUFF model, where it states" The ministry acknowledges that there will be situations where specialized air dispersion models such as CALPUFF, CALQ3HCR and others may be applicable. The use of specialized models requires consultation with the ministry” OR “Pre-consultation with the ministry must be undertaken prior to the facility conducting specialized modelling (p. 3)." It is not clear if Denison Mines consulted with Saskatchewan MOE on use of CALPUFF model.</p> <p>Noted that Section 6.1.4.2 is again referring to Saskatchewan MOE guidance for justification, but no indication that they consulted with them (a requirement).</p>	Please confirm and provide a summary of the consultation with the Saskatchewan MOE on the use of CALPUFF model for the Wheeler River EIS as per provincial air quality guidelines.	<p>This response has not been accepted.</p> <p>Although a summary is provided in response to IR-37, this also needs to be reflected in revised version of EIS. Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	A summary of consultation described in the previous IR response (Annex 1, IR-37 on page 17/419) has been added to the revised Draft EIS in Section 6.1.4.2. The references in Appendix 6-A have also been revised for consistency with the EIS.	Yes  Revised Draft EIS Section 6.1.4.2 and Appendix 6-A
IR-41	-	CNSC	Air Quality	Section 6.1.6.2.2, Background concentrations	<p>Context: The EIS states that "Conservative regional background concentrations from the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) and based on the La Loche monitoring station were used for particulate matter, NO2, SO2, and CO. The La Loche monitoring station is located near anthropogenic sources, while the Project is in a remote area removed from anthropogenic sources."</p> <p>Rationale: If La Loche monitoring station is located near anthropogenic sources and the Project is not, use of this data is not a conservative or realistic representation of background.</p> <p>For a realistic approach, background data considered should be upper 95th percentile (or max if n&lt;10) from an area representative of project location</p> <p>For a conservative approach, background data from an area located even further from anthropogenic sources (if this exists) should be used, or an upper limit of background less than upper 95th should be applied as the background.</p> <p>Upper limit of background is used to screen out COPCs or often subtracted from total to ascertain relative contribution / impact</p>	Please provide additional rationale to justify the appropriateness of La Loche monitoring station concentrations as background for project location.	<p>This response has not been accepted.</p> <p>Please propose a more suitable background site to use as background subtraction. La Loche is not a suitable background site as it is potentially impacted from other industrial sources; it is expected that another background site removed from other industrial sources be identified and used.</p>	<p>Denison and its SME restate its assertion that the La Loche station provides data that suit the intended purpose of the EIS. For context, the rationale for using the Saskatchewan Ministry of Environment regional air quality data set (which is derived from the La Loche station data) has been included in the revised draft EIS. La Loche is a small village and Clearwater River Dene Nation community in northwest Saskatchewan with a population of around 3,600 people. While the regional air quality data set was described as being ‘near anthropogenic sources’ we would like to clarify that there are no major industries with emissions in the community. The anthropogenic sources would be expected to be associated with vehicles and dust from gravel roads.</p> <p>The regional air quality data set was applied in the air quality modelling assessment to meet the requirements of the Saskatchewan Air Quality Modelling Guideline. This approach is used so that worst-case concentrations in air are predicted and evaluated against applicable air quality standards. We also note that northern Saskatchewan does not have an abundance of stations where parameters relevant to this assessment are measured and no stations are in truly remote areas (e.g., located away from small communities). For instance, the next closest station after La Loche is at Buffalo Narrows. which is about 200km away from the Project and would be expected to have similar air quality to La Loche as the communities are somewhat comparable in terms of size and industries, or lack thereof.</p> <p>Denison commits that it will consider and evaluate the potential use of alternative data sets that may be representative of baseline conditions in northern Saskatchewan, should</p>	Yes  Revised Draft EIS 6.1.3.2.7

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					from source, so using a higher upper limit may result in COPCs screening out or appear to have a lower relative contribution. If background was added to source, then approach used would be conservative. If this is the case, confirmation and reference to where this is discussed in methodology should be provided.			such be available, for future measurement programs and air quality modelling. Denison notes again, however, that use of the La Loche station data was appropriate and fit for purpose.	
IR-44	-	HC	Physical stressors (noise and vibration)	Section 6.2.8, (p. 6-71)	<p>The noise complaints resolution and response procedure is not sufficiently described in the EIS.</p> <p>Context: Section 6.2.8 discusses Monitoring and Follow- up. The Proponent indicates: “The EMS will also include a community complaints and response procedure” (p. 6-71).</p> <p>Rationale: Details have not been provided regarding how the complaints would be received, addressed or what the timelines will be for providing a response or resolution. It is important to provide information to potentially affected communities in advance of particularly noisy activities. Community consultation and advanced notification of noisy activities has been shown to reduce complaints (see Health Canada, 2017).</p>	<p>1. Provide the details of the noise complaints resolution and response procedure as per Health Canada (2017).</p> <p>2. Consider conducting community consultations and/or implementing an advanced community notification system to pro-actively reduce the probability noise-related impacts and complaints.</p>	<p>This response has not been accepted as preliminary details for mitigation and monitoring plans for noise impacts and complaints resolution process were not provided.</p> <p>The response partially addresses IR-44 through the commitment to developing the complaints resolution process. However, CNSC expects that the noise complaint resolution and response procedure will be included for review in the EIS.</p> <p>Section 9 (p. 44) of the EIS Guidelines state that the EIS “Shall present an outline of the preliminary environmental monitoring program, including:</p> <ul style="list-style-type: none"><li>the description of the characteristics of the monitoring program where foreseeable (e.g., location of interventions, planned protocols, list of measured parameters, analytical methods employed, schedule, human and financial resources required),</li><li>plans to engage Indigenous groups in monitoring, where appropriate.”</li></ul> <p>Please provide proposed text for the revised EIS, for SME review and CNSC acceptance.</p>	<p>Denison notes that it believes the specific the request for the Noise Complaint Resolution and Response Procedure is beyond the scope of the requirements of an EA of a designated project under the Canadian Environmental Assessment Act, 2012. This request is also outside the scope of the Project Terms of Reference (Draft EIS, Appendix 1-A). Denison will submit management system documentation (procedures, plans) as part of the future licensing process; however, this level of detail is not necessary for drawing conclusions on the EA process. As noted previously, Denison has committed to developing a community complaints and response procedure and the response procedure will be consistent with the appropriate Health Canada guidance. It would be premature to define the details of such a procedure without having engaged with the Indigenous Communities of Interest first. To this, it is also relevant to provide some spatial context that will inform engagement and the nature of the procedure. The Project is located on crown land in a remote area of Saskatchewan’s boreal forest. No communities are located within the immediate proximity of the Wheeler River property. Travelling by existing roads, the closest community to the Project is approximately 260 km away. Calculated using a straight line, the closest communities are approximately 150 km from the site and Saskatoon is 600 km south. The majority of crown land leases in the LSA are assumed to contain rustic, remote cabins which are typically used seasonally.</p> <p>Notwithstanding the above, we have provided additional details for Health Canada's consideration and the details, along with Denison’s commitment to developing a community complaints and response procedure consistent with the appropriate Health Canada guidance, will be added to Section 6.2.8 of the revised Draft EIS and Appendix 6-E. Prior to the commencement of the first routine noise monitoring campaign during Construction, Indigenous Groups and other Interested Parties will be notified of the monitoring schedule and planned locations. Initially, the proposed locations will be the same locations as were used in the baseline program for direct comparison of the data to the baseline conditions. These locations may be revised or expanded upon to include other locations based on feedback received. At the same time, Indigenous Groups and other Interested Parties will also be notified of how noise complaints may be registered. If a noise complaint is received, the associated monitoring would then take place at the location of the complainant. Upon receiving a noise complaint, the responsible Denison environmental staff will implement a complaints response and resolution process, documented using a complaints management form. The information to be recorded during the registration of the complaint will include the name and contact details of the complainant, the nature of the complaint, a description of the possible source(s) at the site associated with the complaint. Sound levels will then be monitored at the location of the complainant according to the description below, and a recommended action will be identified within two days with a timeline for implementation. Follow-up with the complainant will then take place to ensure that the issue has been resolved and follow-up monitoring will be completed where appropriate. Once the complainant is satisfied that that the issue has been resolved, the complaint will be formally closed out and a summary report will be completed by Denison and kept on file.</p>	<p>Yes</p> <p>Revised Draft EIS, 6.2.8</p> <p>Appendix 6-E</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
IR-48	-	HC	Physical stressors (noise and vibration)	Appendix 6-E, Figure 6.2.3, p. 6-57	<p>Noise-sensitive receptors are not included on noise contour maps.</p> <p>Context: Noise-sensitive receptors are identified in the acoustic model report in Section 6 Appendix 6-E but not presented on any maps in the atmospheric and acoustic sections of the main report (Figure 6.2-3).</p> <p>Rationale: The noise assessment typically includes a map illustrating modelled noise levels from the Project at receptor locations in the study area.</p> <p>Certainty regarding the presence of human receptors in the regional study area is also recommended in order to assess cumulative impacts.</p>	1. For more clarity, identify noise-sensitive receptors on Figure 6.2-3: Noise Assessment Study Area as well as on contour maps showing the baseline and predicted noise levels.	<p>This response has not been accepted.</p> <p>The map provided in the response did not include the contour lines requested in IR-48 to illustrate the maximum baseline and predicted noise levels. Furthermore, the map does not provide labels for receptor locations that appropriately describe the type of noise-sensitive receptor.</p> <p>HC requests that a map showing the following be provided:</p> <ol style="list-style-type: none"><li>1. Contour lines representing the maximum baselines and predicted noise levels at the location of the receptors;</li><li>2. Labels for receptor locations that are more descriptive of receptor type (e.g., hunting camp, ceremonial area).</li></ol> <p>It was also noted that the receptor location of Risk 2 (i.e., Trapper/Intensive Land User) in the provided map was not consistent with other receptor location maps in the Draft EIS (e.g. Section 10, Figure 10.1-7 Human Receptor Locations for the Project Human Health Risk Assessment). These differences included both the receptor location (i.e., opposite sides of McGowen Lake) and type (i.e. Trapper/Intensive Land User vs. Seasonal Resident). The receptor locations and types should be confirmed and consistently used throughout the EIS, and any discrepancies should be explained.</p> <p>Finally, a portion of Figure 8 – Adjusted Ldn (p.19 – appendix 6-E) is cut off from the page, preventing proper review. HC requests that the full/complete version adjusted to fit the page be provided.</p>	<p>We remind the reviewer that the Project is located on crown land in a remote area of Saskatchewan’s boreal forest. No communities are located within the immediate proximity of the Wheeler River property. Travelling by existing roads, the closest community to the Project is approximately 260 km away. Calculated using a straight line, the closest communities are approximately 150 km from the site and Saskatoon is 600 km south. The majority of crown land leases in the LSA are assumed to contain rustic, remote cabins which are typically used seasonally in the summer.</p> <p>The figure provided with the previous IR response (Annex 1, IR-48 on page 21/419) is included in the revised draft EIS as Figure 6.2-4. The purpose of this figure was to introduce the study areas and receptors. This figure is not meant to present results of the noise assessment and as such, the request to include contour lines representing the maximum baselines and predicted noise levels at the location of the receptors is not appropriate. Denison has included the receptor locations on the contour maps with the predicted noise levels (Appendix 6-E, Figures 8 to 15). Denison and its SME believe it is appropriate to have the detailed figures contained in Appendix 6-E, and there is no need to repeat them within Section 6.</p> <p>In response to this IR, we have completed the following revisions in Section 6 of the revised draft EIS:</p> <ul style="list-style-type: none"><li>• Updated Section 6.2.4.2 to include reference to specific Appendix 6-E figures for cross-referencing ease.</li><li>• Added a summary table that describes the sensitive noise receptors (Table 6.2-3) which may provide additional context to Figure 6.2-4.</li><li>• Updated the human risk receptor names for Risk 2 and Risk 4 as we recognize the earlier version of the names may have caused some confusion when compared to the HHRA receptors in Section 10.<ul style="list-style-type: none"><li>○ “Risk 2 - trapper” is now “Risk 2 - seasonal resident at McGowan Lake.”</li><li>○ “Risk 4 - seasonal resident” is now “Risk 2 - seasonal resident at Russell Lake.”</li></ul></li><li>• Adjusted Figure 8 in Appendix 6-E to fit the page.</li></ul> <p>We thank the reviewer for highlighting a mapping error in the Section 10 receptor locations. In the revised draft EIS Section 10, Figure 10.1-7 has been updated to correct the location of the McGowan recreational fisher/hunter. The location was incorrectly shown on the east side of the lake in the draft EIS when it should have been placed on the west side of the lake. Please note this was a mapping error only and the location and assessment of the receptor within the HHRA was correct and matches the updated figure in the revised draft EIS.</p> <p>It is noted that this IR response does not change the outcome of the noise assessment. Information added to the EIS documentation as noted above is for editorial purposes.</p>	<p>Yes</p> <p>Revised Draft EIS, 6.2.4.2.1, Appendix 6-E</p> <p>Revised Draft EIS, Section 10, Figure 10.1-7 was updated and the corresponding Appendix 10-A figure (Figure 4-2)</p>
IR-52	-	ECCC	Fish and fish habitat	Section 7, Geology and Groundwater	Context: According to the Proponent, “an acidic or low pH mining solution will be used to leach uranium ores from the ground. Mining solution may be a mixture of sulphuric acid,	1. Explain why 3D hydrogeology and contaminant transport numerical modelling of the	This response has not been accepted as the Proponent did not provide the information that	Containment of mining solution during operation will be confirmed by a robust groundwater monitoring network comprised of numerous wells located at various vertical depth horizons above the mineralized zone. Data generated from the groundwater	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
				Appendix 7	<p>hydrogen peroxide, ferric sulphate, and freshwater (from shallow groundwater well or surface waterbody) or recycled water.</p> <p>Wellfield will consist of a combination of injection and recovery wells, in the general the arrangement of one recovery well in the center surrounded by four injection wells (5-spot pattern) with about 5 to 10 m between wells. The final wellfield is expected to include approximately 300 wells over an area measuring 90 m wide x 750 m long’’. </p> <p>As the components/contaminants mentioned in the description of the hydrogeologic contaminant transport processes above may be transported to Whitesfish Lake through groundwater, the injection and recovery wells should be included in the model.</p> <p>Rationale: The hydrogeologic contaminant transport processes described above are an important part of the proposed Project and it is not clear why numerical modelling results and a sensitivity analysis for the above processes was not presented.</p>	<p>injection and extraction wells was not presented.</p> <p>2. Alternatively, provide simulation results and a sensitivity analysis for the injection and extraction of the acidic solution in the mining area.</p>	<p>would allow validation of the conclusion that hydraulic containment was successful.</p> <p>Hydraulic containment is to be utilized as a process to prevent the migration of contaminants away from injection well locations by groundwater. The Proponent indicated that tracer testing demonstrated hydraulic containment of the injected solution (as per the response to IR-6).</p> <p>Hydraulic containment is an important process as part of a multi-pronged approach to preventing the migration of contaminants to Whitefish Lake by groundwater migration. Consideration of all field test data will allow ECCC to review the Proponent’s conclusions about hydraulic containment.</p> <p>Provide all field test data to allow ECCC to review the conclusion that hydraulic containment was successful.</p>	<p>monitoring plan would serve various purposes, such as to assess performance and the controls associated with the ISR process. Denison provided the CNSC with the results of the tracer test (“Hydrologic Report, Summary of Findings, 2019 to 2021” prepared by Petrotek) as part of the response to the first round of IRs. The first-round response to IR-06 (Annex 1, IR-06, starting at page 90/419) summarized the results of the tracer test pertaining to hydraulic control of the injected solutions. Hydraulic control of the injected solution was demonstrated through analysis of groundwater samples from monitoring wells surrounding the test well pattern. No elevated values of the tracer were observed in the monitoring wells.</p> <p>To eliminate potential excursion of mining solutions to the regional groundwater Denison will engineer and create an artificial freeze wall to encompass the uranium deposit and isolate the mining area; the freeze wall will extend vertically approximately 400 m from the basement rock up to surface (details in EIS Section 2.2.1.3, 2.2.1.4.2.3, and 2.3.2). The freeze wall is a no flow boundary and will prevent the mining solutions from travelling out of the mining area and into the regional groundwater system. Denison reiterates that contaminants will not be able to migrate to Whitefish Lake during Operations and into the Decommissioning period until mining area remediation objectives are met and the freeze wall is allowed to thaw. The inclusion of a freeze wall isolates the mining area from the regional groundwater system and this design feature provides a high level of protection to groundwater resources.</p> <p>Denison believes it has fulfilled its requirements for the EIS as outlined in the EA guidance provided by the province and federal government, including CEAA 2012, and that the FIRT has been provided with the appropriate level of detail on this topic for concluding the EA process. Notwithstanding that, Denison recognizes that further information may be required as the Project moves past the EA and into the licensing and permitting phases.</p> <p>The ISR mining model for the Wheeler River Phoenix deposit and the hydraulic containment on the mining solutions within the assessed area has been validated and signed off by a Qualified Professional, a legal requirement of a 43-101 Feasibility Study. The detailed data is not available publicly however, should the CSNC wish to further discuss the details with the Qualified Professional to support licensing requirements, Denison will arrange such a meeting.</p>	
IR-53	-	CNSC	Geology and Groundwater	Section 7.3, Table 7.3.-2  Appendix 7-C	<p>Context: The field-based hydraulic conductivity values (referred to as K values hereafter) in Table 7.3-2 (p. 7-32, main EIS report) indicate that the K value ranges of upper and lower sandstone aquifers have a significant overlap with those of the intermediate sandstone aquitard.</p> <p>However, the calibrated K value in Table 2-2 (p. 2.7, Appendix 7-C)) for the intermediate sandstone aquitard is close to the lower end of the field-based K value range, while the calibrated K values for the upper and lower sandstone aquifers are close to the upper end of the field-based K value range.</p> <p>Rationale: It is not clear how representative the calibrated K</p>	<p>Please provide additional information to support the representativeness of the calibrated K values (for example, use graph to present the measured K values and the calibrated K values).</p>	<p>This response has not been accepted.</p> <p>Please include figure(s) (y axis representing depth below ground, x axis representing K, different length of vertical line segment representing different packer testing intervals, etc.) showing the field measured K values, as well as the calibrated K value for the upper sandstone aquifer, intermediate aquitard, and lower sandstone aquifer. This would help demonstrate the distribution of field measured K values and representativeness of calibrated K values.</p>	<p>All hydraulic conductivity (K) values for the intermediate sandstone aquitard considered in developing the regional model are presented in Appendix C of Appendix 7-A of the draft EIS. This Appendix includes the depth range for all packer intervals. Note that when reviewing these data, any K values that are prefixed with "&lt;" (e.g., &lt; 1.0e-7), indicate that the fractured rock has very low hydraulic conductivity. Denison does not feel a figure illustrating the data included in the table would add additional value to the information presented (as it would be redundant to the information provided) and the K values selected for the used in the model in Appendix 7-C of the Draft EIS.</p> <p>Note that hydraulic conductivity values applied in the numerical modelling reflect not only the packer tests, but also our conceptual model, which is based on core logging, lithology and mineral contents, and geochemistry sampling. Further the interpretation of the lower</p>	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>values are of the field-based K values for each hydro-stratigraphic unit, and if the significant difference between the K values for the upper and lower sandstone aquifers and those for the intermediate sandstone aquitard is supported by the geological properties of the corresponding stratigraphy units.</p> <p>It is stated in the report (p. 7-36, main EIS report) that “Vertical fracture or fault zones that hydraulically connect the Local (upper) and Semi-Regional (lower) groundwater flow regimes are present throughout the Athabasca Basin”. But fractures and fault zones are not explicitly considered in the model. There is possibility that these features could increase the hydraulic connection between the upper and lower sandstone aquifer.</p>			hydraulic conductivity for the Intermediate Sandstone is consistent with the AECL published interpretation at Cigar Lake (i.e., a very similar setting).	
IR-55	-	NRCan	Fish and fish habitat	Section 7.3.3.1;  Appendix 7-A, sections 3.4, 3.5, 3.8, 4.2;  Appendix 7-C, section 2.8	Context: According to the Proponent's conceptual hydrogeological model (EIS, sec 7.3.3, Figure 7.3-7, Table 7.3-2; Appendix 7-A, sec. 3.4, Table 3-4), the horizontal hydraulic conductivity of the Intermediate Sandstone (Iss) aquitard is 8.4 E-09 m/s based on field measurements. The Proponent further assumes a 10:1 anisotropy ratio for the unit (Appendix 7-A, sec. 3.5.1) such that its estimated vertical conductivity is 8.4 E- 10 m/s. Based on this information, structural geology and groundwater quality data, the Proponent concludes that the connectivity between the Upper sandstone aquifer and the Intermediate Sandstone aquifer (sic) is limited (EIS sec. 7.3.3.3; Appendix 7-A, sec. 4.4). While acknowledging the paucity of conductivity data and the Proponent's attempt to mitigate this by leveraging collateral information on fracture frequency and clay content (Appendix 7-A, sec. 3.3.1), NRCan considers that the hydraulic conductivity assigned to the Iss aquitard is unrealistically low and inconsistent with the following lines of evidence: a) The conductivity value for the Iss is based on the geometric mean of 18 field measurements, 12 of which are from the same borehole (WR-695) located in the Gryphon zone, beyond the domain of the numerical model (Appendix 7-A, Appendix C, Table C-1). If the conductivity data were weighted equally, with one value per borehole, the geometric mean would be approximately 1.5 E-07 m/s, or two orders of magnitude higher; b) The Proponent notes that vertical fracture or fault zones that hydraulically connect Upper and Lower aquifer systems are present throughout the Athabasca Basin including in the Phoenix area (EIS, sec. 7.3.3.2.2; Appendix 7-A, sec.3.8.1); c) The Proponent notes that groundwater chemistry data (major ions) corroborate the presence of structurally controlled vertical hydraulic connections between the Upper and Lower aquifer systems (EIS, sec. 7.3.3.2.2, sec. 7.3.3.3; Appendix 7-A, 4.3.3); d) Groundwater chemistry data (Appendix 7-A, sec. 4.2, Table 4-1) also indicate the presence of detectable levels of "bomb" tritium (indicating recharge waters < 50 years old) in the Lower	In the "Parameter Uncertainty Assessment" for the numerical groundwater flow model (Appendix 7-C, sec. 2.8), NRCan requests that the Proponent develop a calibrated numerical model with an alternate conceptualization of the Intermediate sandstone as a "leaky" aquitard with a horizontal hydraulic conductivity on the order of 1 E-07 m/s and a much lower anisotropy ratio. This should involve modifying the model lateral boundary conditions to allow for groundwater inflow/outflow across the entire thickness of the Athabasca Sandstone Group rather than just the Lower Sandstone aquifer.	This response has not been accepted.  In response to IR-55, the Proponent states “The viewpoint from the third party assessment team does not align with the conceptual model proposed by the reviewer; however, an alternative calibrated groundwater flow model with a hydraulic conductivity of 1.0E-7 for the Intermediate Sandstone unit has been developed.”  If the alternative model requested in IR-55 has been developed by the Proponent, NRCan requests that full details of this model be provided in an attachment.	Additional documentation has been provided in Attachment IR-55 for the groundwater flow system that results from a calibrated condition where the Intermediate Sandstone Aquitard has a hydraulic conductivity of 1.0E-7.  An acceptable calibration was able to be achieved with the higher hydraulic conductivity in the Intermediate Sandstone Aquitard. As is appropriate to maintain a calibrated condition, the hydraulic conductivity within other hydrogeologic units were also varied. The match to the observation data is not as good as the base case calibrated model, but it is within acceptable limits. The alternative calibrated groundwater flow model, with a higher hydraulic conductivity in the Intermediate Sandstone Aquitard, results in higher volumes of groundwater flow converging upon Whitefish Lake, resulting in a decreased contribution of flow from the deep aquifers to the total volumetric groundwater flow to the lake.  Geochemical reactive transport of COPCs is further discussed as part of IR-89-R1, including for the groundwater flow conditions described in IR-55. Reflecting the smaller relative contribution of deep groundwater to flow to Whitefish Lake, there is an overall reduction in peak COPC concentrations in groundwater beneath the lake.	No

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>Sandstone Aquifer (GWR-025, GWR-008, GWR-033) and in the Iss (GWR-009, GWR-034), outside the area of U mineralization. This is also evidence of vertical hydraulic connection through the Iss. In summary, whereas the Proponent conceptualizes the Iss as a very low-permeability unit with localized vertical hydraulic connection (WS Shear), NRCan interprets the Iss as a "leaky" aquitard with pervasive fracture-controlled and much higher vertical hydraulic conductivity.</p> <p>Rationale: The significance of NRCan's alternative interpretation of the Iss hydrostratigraphic unit is that deep groundwaters, including mining-impacted waters, may represent a greater proportion of baseflow discharge to Whitefish Lake than the 1% currently estimated in the Proponent's groundwater flow model (EIS, sec. 7.4.2.1, p.7-51; Appendix 7-C, sec. 2.6.3).</p>				
IR-56	-	CNSC	Geology and Groundwater	Section 7.3.3.2	<p>Context: It is stated in Section 7.3.3.2 (p. 7-37, main EIS report) that “Exploration boreholes drilled in the Phoenix area, where left unplugged, have the potential to provide preferential flow paths between the Overburden and Upper and Lower Sandstone Aquifers. Exploration holes were reportedly grouted approximately 10 to 20 m above and below the ore zone, resulting in open holes remaining throughout the overlying materials. These portions of the open holes may act as open conduits for groundwater flow through the 400 m of Athabasca Group Sandstone.”</p> <p>Rationale: It is not clear why the exploration boreholes have not been decommissioned.</p>	Please clarify why the exploration boreholes have not been decommissioned and the timeline to decommission the boreholes according to appropriate guidelines/procedures. If it is not decommissioned before the ISR operation, what is the potential impact of the unplugged boreholes on the mining solution migration?	<p>This response has not been accepted.</p> <p>Although Denison’s response is acceptable, in order for the response to be accepted the following text should be incorporated in the EIS:</p> <p>“During Operation, select exploration boreholes will be re-utilized for narrow diameter injection wells that will be developed with monitoring devices for the determination of excursions and water levels. Exploration boreholes not selected for the use of narrow injection wells will be grouted to surface to seal off any remaining conduit.”</p>	The requested text has been added to Section 7.3.3.2 of the revised draft EIS.	Yes  Revised Draft EIS, Section 7.3.3.2.
IR-57	-	NRCan	Fish and fish habitat	Section 7.3.3.2  Appendix 7-A, sections 3.1.2 and 3.7  Appendix 7-C, section 2.5.2	<p>Context: The Proponent's conceptual model of groundwater flow in the Local Study Area (EIS, sec 7.3.3, Figure 7.3-7) involves an unconfined Upper system hosted by overburden and the Upper sandstone aquifer, and a Lower confined system hosted by the Lower Sandstone Aquifer. The Intermediate Sandstone aquitard acts as a confining unit. Vertical heads gradients are directed downwards west of the Phoenix deposit and upwards beneath surface water receptors including Whitefish Lake (EIS, sec. 7.3.3.2).</p> <p>Using head data from nested monitoring wells (Appendix 7-A, sec. 3.1.2, Table 3-1) the Proponent calculates upward gradients in cluster WR-607, between the Lower Sandstone aquifer and the Upper Sandstone aquifer. In cluster LA-5, an upward gradient is calculated between the Upper Sandstone and the overburden unit (Appendix 7-A, Table 3-5). In areas west and south-west of the Phoenix deposit, groundwater is estimated to</p>	In section 2.5.2 of Appendix 7-C (Calibration Results), the Proponent should demonstrate that the numerical groundwater flow model reproduces quantitatively or at least qualitatively the vertical head gradients calculated from observations in the nested monitoring well clusters (Appendix 7-A, Table 3-1).	<p>This response has not been accepted.</p> <p>Using data provided in Attachment #57 (observed and simulated static water levels, screen mid-point elevations), NRCan was unable to reproduce the head gradient values reported by the Proponent in their table.The Proponent should check the gradient calculations.</p>	Denison thanks NRCan for their careful review of the information provided. Gradient calculations have been checked and corrections made. The calculation error does not affect the discussion however, as the same formula was used for observed and simulated gradient calculations. The technical contents of the original response (Annex 1, IR-57, starting at page 200/419) have been added to Appendix 7-C as Section 2.5.2.4., including a Table (Table 2-7) with the calculated gradients shown.	Yes,  Appendix 7-C, Section 2.5.2.4

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>flow downward under a vertical gradient of approximately 0.015 m/m (Appendix 7-A, p.3-15).</p> <p>Rationale: In NRCan's opinion, the Proponent's interpretation of vertical head gradients in the LSA is not fully accurate. For the "Up-Gradient" monitoring well cluster, the tabulated head data (Appendix 7-A, Table 3-1) and data logger hydrographs (Appendix 7-A, Appendix B) indicate a downward gradient (0.014 m/m) from the overburden unit to the Intermediate Sandstone and an upward gradient (0.056 m/m) from the Lower Sandstone to the Intermediate Sandstone. Head data from the "NW" monitoring well cluster indicate a similar pattern of downward (0.016 m/m) and upward (0.014 m/m) gradients converging in the Intermediate Sandstone. In the "Downgradient" and "SE" monitoring well clusters, head observations and data logger hydrographs indicate downward gradients from the shallow aquifer system but essentially equal heads in the Intermediate and Lower Sandstones. This more complex picture of groundwater flow systems in the LSA does not appear to have been captured in the Proponent's conceptual model. Given the importance of the baseline hydrogeological regime for predicting the transport and fate of COPCs in the post-decommissioning period, the Proponent needs to demonstrate that the numerical groundwater flow model accounts for observed vertical head gradients.</p>				
IR-61	-	CNSC	Geology and Groundwater	Section 7.4.2	<p>Context: There is no discussion of potential induced seismicity from mining processes.</p> <p>Rationale: Induced seismicity may lead to a loss of process as identified for natural seismicity.</p>	Please provide information on the potential mining-induced seismicity.	<p>This response has not been accepted.</p> <p>CNSC staff expect a discussion of the occurrence of mining-induced seismicity in general in Saskatchewan, and the inclusion of a summary of potential sources of induced seismicity related to ISR mining (such as the response that Denison provided for IR-61) and the corresponding mitigation measures in the EIS. The paucity of records of seismicity in northern Saskatchewan (as stated in EIS Section 15.2) does not necessarily indicate a lower potential for future induced seismicity. It should be noted that earthquakes of up to magnitude (ML) 4.4 are spatially correlated with locations of extractive industries with ongoing activity.</p> <p>Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	<p>The following has been added to Section 7.4.2.4 of the revised Draft EIS:</p> <p>“Within the broader context of terrain stability, it is noted that natural seismic activity in Northern Saskatchewan is quite rare with no significant events in recorded history (refer to Section 15.2 Seismic Events).</p> <p>Mining induced seismicity has been of interest for some time, with mining-induced seismicity reported in Canadian hard-rock mines since the 1920s (Hudyma et al, 2017) and the first formal Canadian research on the problem starting in the 1930s (Hedley, 1992). Hasegawa et al. (1989) and Ortlepp (1992) describe several mechanisms by which induced seismicity may be capable of occurring in relation to underground (excavation based) mining; though, those mechanisms generally relate to discrete, large-scale rockmass failures whereas more than 90% of seismic events can be categorized as micro seismic events with moment magnitude &lt; 0 (Hudyma, 2008).</p> <p>In Saskatchewan, investigations of inducted seismic have been completed in association with potash mining and uranium operations. Sedghizadeh et al. (2023) applied statistical methods to investigate the nature of micro seismicity in a potash mine. Clustering analysis of micro seismicity indicated that the majority of events could be treated as independent background events mostly driven by underground mining operations; however, there is some clustering of seismicity and the formation of limited aftershock sequences of the “burst-type” (i.e., those that have only one parent event and many children). For example,</p>	<p>Yes</p> <p>Revised Draft EIS, Section 7.4.2.4</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<p>with respect to uranium mining (Barghwal and van der Baan) investigated the source mechanisms and possible causes of micro seismicity recorded in an underground Uranium mine for a period of one month in January 2011. The events occurred near the main working level at 480 m depth and show some temporal correlation with the daily rate of rock removal. The study concluded the observed micro seismicity occurred due to reactivation of pre-existing faults that were favourably oriented in the static stress state created by the extensive horizontal tunnel network and due to dynamic stress due to rock crushing activities.</p> <p>Despite the above noted link between seismicity and conventional hard-rock mining techniques / operations, as well as compared to high pressure liquid injection processes, the potential for mining-induced seismicity from the nature of the ISR mining that is proposed by the Project is interpreted as being quite low, given that the mechanisms that are purported to create or induce seismicity will not occur. Nevertheless, potential for mining-induced events for the Project that could be postulated to occur as the result of a few sources are discussed below for completeness: 1) collapse of cavity voids from leaching, 2) hydraulic fracturing, and 3) use of permeability enhancement techniques.</p> <p>1. Collapse of cavity voids. To clarify, the portion of the deposit being mined is never truly a void (as in a large empty underground cavern); rather, what remains will be a honeycomb textured environment with water filled interstices. The mined area is filled with a fluid at all times, whether it be a mining solution, groundwater, or the neutralizing solution. This is different from a more traditional underground operation such as Cigar Lake where there is physical excavation of the orebody, leaving a temporary air-filled space. Although the uranium ore is high-grade by global standards it is not entirely massive in nature. As such, the uranium will be leached in a 'honeycomb' texture leaving behind a structure of partial intact rock mass with the remaining area being filled by fluid. This retains the pressure balance of the mining zone with the adjacent water-saturated rock masses. In terms of void space creation and collapse of the overlying strata, modelling has demonstrated that only 0.05% by volume of desilicified material immediately overlies the ore zone and would be subject to collapse (Appendix 7C, Attachment K). This low volume and percentage are determined to not be of significant seismic concern.</p> <p>2. Hydraulic fracturing. EIS Section 2.2.1.4.2 Wellfield Operation provides a comparison of ISR mining pressures to conventional fracking pressures used in the oil and gas industry. Conventional fracking pressures used in the oil and gas industry can vary; however, common pressures to induce fracturing can range up to 15,000 psi and require injection of fracking fluids of up to 16,000 liter per minute over periods of three to four days. Fracking fluids are comprised of a slurry of water, proppant (generally silica sand), and chemical additives to support and maintain the open fracture system after fracking is conducted. Conversely, ISR mining for the Project is planned at nominal pressures of 100 psi, intermittent pressures of up 250 psi, and average flow rates of 30 liters per minute within a recovery well. The ISR mining method proposed for the Project is markedly different than fracking. For example, looking at intermittent pressures alone, ISR pressures are anticipated to be 60 times lower than fracking pressures.</p>	

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<p>3. Permeability enhancement techniques. EIS Section 2.2.1.4.3 Permeability Enhancement outlines the three types of techniques being considered for the Project: mechanical, Propellant, and hydraulic options. Propellants are classified as a low hazard explosive (S.1 special-purpose explosives, low hazard explosives, per Explosive Regulations, section 36). Propellants technically do not explode (like classic mine explosives which detonate) but rather burn through a process called deflagration. Deflagration means the material burns slower than the speed of sound, thus no shock waves are generated. Propellant permeability enhancement methods reach injection pressures of up to 8,000 psi and are near instantaneous over periods of milli seconds. Neither ISR mining or permeability enhancement is expected to produce mining-induced seismicity.</p> <p>Under normal operating conditions there is no expected mining-induced seismicity. IR-64	-	ECCC  CNSC	Fish and fish habitat	Section: 7.4.2.2, Potential Effect #2: Terrain Morphology and Stability – Operation	Context: The Proponent stated that the geological assessment predicted maximum vertical displacement in altered sandstone immediately above the mining area (17.5 cm). A very minor change in elevation at ground surface (of less than 7.5 cm) was predicted within a discrete and localized area overlying the ore body. The modelling work is considered to provide a worst-case	Explain: <ul style="list-style-type: none"><li>Will this be revisited with updated data based on extraction feasibility results?</li><li>How will the surface expression of a subsidence will</li></ul>	This response has not been accepted.  CNSC staff expect Denison to include within the EIS a summary of the results of RESPEC’s most recent numerical modelling study that suggests negligible ground subsidence associated with the proposed	<p>Additional geomechanical modelling undertaken by Denison subsequent to the filing of the draft EIS, with refined, more granular inputs is included as Appendix K (RESPEC, 2024) to Appendix 7-A of the EIS. This report replaces earlier reporting.</p> <p>A brief summary of the RESPEC (2024) approach and results has been included in Section 7.4.2.2 of the revised Draft EIS. In summary, based on the modelling results presented</p>	Yes  Revised Draft EIS Executive Summary, Section 7, Section 9 and Section 16

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
				Appendix 7-A, Appendix K (p. 12)	<p>bounding scenario. If subsidence were to occur over the lifetime of the Project, or in the years following mining, the extent of vertical displacement is not expected to exceed that predicted in the modelling, which is based on an assumed volume extraction.</p> <p>Rationale: ECCC notes that the thickness of the ore zone has an average thickness of 5 m with a range of 2 to 17 m, and is 25-50 m wide and that the overburden rock above the ore zone measures about 400 m. Therefore, it is not clear how the Proponent determined that the surface expression of a subsidence on the surface if it occurs will be limited to 7.5 cm and localized. A subsidence greater than 7.5 cm, implies that the void in the ore zone will be narrower, and will affect the amount of water migrating through the zone.</p> <p>It was the recommendation of the consultant who conducted the work in Appendix K that more accurate material properties should be used for future modelling.</p>	<p>be limited to 7.5 cm and localized?</p> <p>Suggestions for mitigation and follow-up measures: ECCC recommends that the Proponent consider implementing remediation measures immediately after mining to prevent subsidence from occurring in the first place.</p>	<p>volumetric extraction as this is an important consideration for designing an appropriate implementation plan for subsidence control and remediation measures.</p>	<p>therein, Denison does not anticipate the need for remediation measures, with the surface subsidence being negligible (on the order of millimetres) within the context of changes in terrain as it relates to decommissioning objectives.</p> <p>For clarity, the text added to Section 7.4.2.2 of the revised Draft EIS is as follows:</p> <p>“To aid in advancing the Project, a study was undertaken to evaluate the geomechanical stability of rock mass within the Phoenix deposit, overlying sandstones, and underlying basement rock following ore extraction with ISR and including the presence of the proposed freeze wall. The geomechanical study is presented as Appendix K of Appendix 7-A. Specifically, a full-scale 3D model of northeast extent of the ore zone, and specifically the northern half-length of Zone A shown in Figure 7.3-3, was developed to evaluate stress redistribution in the case of failure of remnant rock from rock mass removal. Average material properties were assumed for hydrostratigraphic units in the Pheonix deposit and surrounding rock, including hydrostratigraphic units shown in Figure 7.3-3. In the numerical model, instantaneous and random rock removal representing 30% by volume and 3% by volume for the high-grade ore zone and low-grade ore zone, respectively, was assumed.</p> <p>Quantified in the model was the competency of the remnant rock based on the predicted stress field and the potential for tensile fracturing of the rock. The modelling results indicated that the highest predicted failure volumes in remnant rock are associated with the ore zone (41%), but that predicted failure volumes decrease substantively to 8-26% in the immediately surrounding clay zones, and are very limited (0.02%) in the overlying sandstones, including within the desilicified zone, and underlying basement rock. In addition, no (0%) failure was predicted within the freeze wall itself. Importantly, associated vertical displacement of host rock into the mined cavity is predicted to be limited to values of no more than 49 cm in the ore zone and decrease to 0-7 cm only 4-5 m from the low-grade ore zone. Overall, predicted failure conditions are limited to 5-8 m of the extent of the low-grade ore zone and there is limited potential instability in the freeze wall.</p> <p>Subsidence at ground surface from displacement of host rock was predicted to be negligible. The average vertical displacement at ground surface is 2.5 mm.”</p> <p>Additionally, and for consistency with the information presented in the updated Appendix K of Appendix 7-A, surface subsidence estimates have been updated in the Executive Summary, Sections 7, 9 and 16 of the revised draft EIS from “7.5 cm” to “2.4 to 2.8 mm”.</p>	<p>(subsidence estimate clarification)</p> <p>Revised Draft EIS Section 7.4.2.2.</p> <p>Appendix K, Appendix 7-A.</p>
IR-65	-	CNSC	Geology and Groundwater	Section 7.4.2.2	<p>Context: It is stated the maximum subsidence is 7.5cm based on modeling with an assumed volume extraction. Has subsidence from dewatering/pumping and from lack of inflow of groundwater due to freeze wall been considered?</p> <p>Rationale: Surface facilities and wells may be impacted if there is unaccounted for subsidence.</p>	<p>Please provide additional details for any dewatering/pumping induced subsidence.</p>	<p>This response has not been accepted.</p> <p>CNSC staff expect Denison to include within the EIS a summary of their response to IR-65 to establish their basis for a low probability of pumping and/or dewatering subsidence. Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	<p>Per the comment the following text has been added to Section 7.4.2.2 of the revised Draft EIS.</p> <p>The potential for subsidence related to changes in fluid balance within the freeze wall during Operation was also considered. The freeze wall will provide hydraulic containment between the internal wellfield and the external regional groundwater system with each well pattern maintaining a 1.7% 'bleed' to maintain hydraulic gradients towards recovery wells. This results in an isolated hydrogeological environment within the freeze wall, separate from the regional groundwater system but considered an unconfined aquifer within the freeze wall, being open to atmosphere. The "extra" water pumped (i.e., the water pumped in excess of injection) will be derived from stored groundwater within the</p>	<p>Yes</p> <p>Revised Draft EIS, Section 7.4.2.2</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<p>sandstone units above the ore zone, and from the underlying paleoweathered zone, within each phase of Operation that is surrounded by freeze walls. The volume of stored water was estimated using the calibrated groundwater flow model (Appendix 7-C), which contains 3D volumes for the saturated soil and rock within each of the walled phases, including appropriate porosity values. These volumes of stored water were compared to the volume pumped within each phase of operation, over the expected period of extraction based on the mining plan. The stored volume of water was calculated to be 3.4 (Phase 1) to 9.7 (Phase 4) times the estimated excess pumped volume. In other words, there is ample stored water within each walled phase to supply the excess pumped volume. The excess pumping creates a hydraulic gradient toward the ore zone within each walled phase and help vertical spreading of the UBS during operations. If monitoring during operations indicates water levels are falling quicker than anticipated, additional water could be added within the walled phase, within the Upper Sandstone Aquifer.</p> <p>Given the above, a fluid balance (or flow rate balance) was conducted as part of wellfield planning to inform Feasibility Study production rates within the mining zone contained within the confines of the freeze wall. Freeze studies concluded a no flow boundary once closure of the freeze wall is established along the perimeter of the mining area. Additional modelling within the mining area, including groundwater (FEFLOW) and production (Goldsim) modelling, were applied and although a net increase in volume is anticipated over the life of mine, a net draw is maintained on a well pattern basis to maintain 'bleed' and inward hydraulic gradient during active mining operations. To maintain fluid balance and not draw down the water table in the overlying sandstone units, additional sources of water from groundwater wells outside the freeze wall will be injected inside of the freeze wall as part of normal drilling operations during wellfield development and will be accounted for in the balance. This ensures potential for subsidence related to water table drawdown in the upper sandstone units is mitigated. Operating parameters rely on a relative net water balance for successful operations and would not support a significant drawdown of the water table owing to ground subsidence concerns.</p>	
IR-66	-	CNSC	Geology and Groundwater	Section 7, Table 7.5-1, Row 1, Column 6	<p>Context: Column 6 in Table 7.5-1 indicates the mitigation measures for a valued component. For Row 1, Geology, there is no description of mitigation measures but only that contingency plans will be developed if based on monitoring.</p> <p>Rationale: Subsidence may impact wells and surface infrastructure.</p>	Please provide additional details on monitoring and contingency plans related to the geological environment (e.g., subsidence), including triggers for implementing such plans.	<p>This response has not been accepted.</p> <p>Denison claims that the expected risk from subsidence is negligible. Granted that updated models by RESPEC indicate negligible ground subsidence, in practice, modelled and actual subsidence measurements usually vary. Therefore, CNSC staff still deem it necessary to include additional details on subsidence monitoring and contingency plans (including triggers for implementing these). Moreover, since Denison plans to survey well collar elevations notwithstanding the negligible ground subsidence modelled by RESPEC, they might as well discuss the techniques that they plan to employ. Currently, it is not clear what method they plan to utilize to potentially detect elevation changes in well collars that cannot also be used to detect subsidence of</p>	<p>The response below has been added to Section 7.8.1 of the revised Draft EIS, and a reference to these details added to Section 7.4.2.2.</p> <p>“Initial wellfield construction primarily consisting of earthworks to level the pertinent wellfield phases will be guided by Lidar surveys to provide a consistent datum prior to the installation of any well type (monitoring, injection, recovery, freeze) within the wellfield.</p> <p>The subsequent installation of any well type is located on a ‘easting’ and ‘northing’ basis guided by a differential global positioning system (DGPS) with accuracy of within 5 cm. Although DGPS systems can measure a point in the vertical or ‘Y’ direction with a comparable level of accuracy to the ‘X’ and ‘Y’, the vertical datum of any installed well will be further validated by use of stadia rods, which have accuracy to within 5 mm.</p> <p>The top of collar elevation of all newly installed wells will be measured to a known datum located off the wellfield. As part of annual inspections well collar elevations will be measured on a regular basis and recorded relative to the prior years’ measurements to determine the degree (if any) subsidence occurring within the well itself that may be attributable to sloughing or shifting of a well at depth. Measurements of the well collar</p>	<p>Yes</p> <p>Revised Draft EIS, Sections 7.8.1, 7.4.2.2, and 16.2.1, and Executive Summary Section 5.3.1.</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
							the overall terrain. Denison has discussed the limitations (i.e., resolution) of Lidar, which is a good start. However, it must be noted that vertical accuracy and precision are more important considerations than spatial resolution for evaluating the applicability of subsidence monitoring techniques for this project, especially considering the size of the study area. CNSC staff also recommend that Denison further explore the applicability of methods such as DGPS, InSAR, and UAV-based Lidar change detection for their monitoring plan.	<p>elevations are a surveying industry standard tool for determination of any vertical movement within a well itself.</p> <p>Satellite system’s such as InSAR may be utilized to complement the stadia rod measurements on an as needed basis; however, due to the negligible subsidence (&lt;10 mm) anticipated the system is envisioned to have its limitations with emphasis and reliance placed on site specific measurements.</p> <p>The proposed monitoring program, as conceptually described above, will be documented more formally as part of the overall operations management program prior to establishment of the well field. The monitoring program will include a contingency plan whose objective would be to facilitate the timely identification of, and response(s) to, potentially emerging conditions whereby routine monitoring data indicate performance is not meeting expectations (e.g., levels of subsidence are outside the range of expectations). The contingency plan conceptually would identify performance objectives, key performance indicators and measurement endpoints, triggers that would describe conditions, when met, where a response is required and a tiered-response plan in which an emerging issue would be confirmed (or not), with successive levels of response, including investigation of cause and risk, investigation of strategies to mitigate risk and implementation of preferred risk mitigation."</p>	
IR-67	-	CNSC	Geology and groundwater	Section 7.6.2.1 (Remediation Objectives)	<p>Context: Metallurgical testing, including batch reaction, coreflood testing and column tests are mentioned frequently throughout Sections 2 and 7 of the EIS. Outside of the composition of restored solutions from coreflood tests #2B and 3C, results from these various tests are not reported in the EIS or any associated Appendices.</p> <p>Rationale: The results from metallurgical testing are important to a number of items discussed in the EIS, including (but not limited to): evolution of hydrochemistry during remediation, source of salts in Lower Sandstone Aquifer porewaters, process plans, industrial wastewater treatment, estimating composition and volume of process precipitates, and composition of mining fluids and leachate. In particular, the EIS posits that mining area decommissioning objectives are achievable based on metallurgical testing and provides these objectives in Table 2.3-3. CNSC staff need to understand the specifics of this metallurgical testing, given its importance for the development and justification for mining and remediation activities. Denison must also provide information demonstrating that the proposed restoration actions and remediation targets are As Low As Reasonably Achievable (ALARA).</p>	<p>1. Please provide a summary of the results and the analysis of results of the metallurgical tests within the EIS, or provide the technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS. This should include sample information for cores (e.g., mineralogy, location, U content, depth), test conditions (e.g., duration, # of iterations, column length, flow rate, temperature, pressure, sample frequency, influent/effluent composition), as well as results and how they are pertinent to the development of ISR activities.</p> <p>2. Please provide further clarification/justification on how results from two singular coreflood tests (i.e., Coreflood #2B and Coreflood #3C) can justify large-scale remediation activities and targets following solution mining.</p>	<p>This response has not been accepted, as this information should be provided in the EIS.</p> <p>CNSC staff request that Denison either include a high-level summary of the results of the metallurgical tests (including the data) or include appendices to the EIS that contain the data provided in attachments IR-20, IR-67, IR-69 and cite these within the EIS.</p> <p>Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	<p>The response to IR-67 from the initial round of FIRT review comments that included consideration of issues raised in IR-20, IR-67 and IR-69 has been included as Appendix F to Appendix 7-C of the revised Draft EIS. References to the new appendix (Appendix F of Appendix 7-C) have been made in Appendix 7-C and Section 7 of the EIS as appropriate. Appendix F of Appendix 7-C has been included within the revised Draft EIS documentation provided as part of the overall response to the second round of FIRT review comments.</p>	<p>Yes</p> <p>Appendix F (a new appendix) has been added to Appendix 7-C.</p>

						3. Please provide material demonstrating that the proposed restoration actions and remediation targets are ALARA.			
IR-70	-	CNSC  ECCC	Fish and fish habitat  Geology and groundwater	Section 7.6.2.2.3, Evaluation of Geochemical Reactive Transport  Appendix 7-C, Section 4.4.2, Sub-Domain Model Hydrogeologic Parameters	<p>Context: The EIS indicates that “changes to hydrogeological conditions within the mining area were considered during development of the 3D sub-domain model. Dissolution of ore within the active mining area is expected to enhance ... hydraulic conductivity”.</p> <p>In Section 4.7 (Prediction Uncertainty Analysis), predictive uncertainty scenarios are provided. For scenario 7, the hydraulic conductivity (K) of the ore zone was increased even further than initial model assumptions. The value used is not indicated in the text.</p> <p>Rationale: A hydraulic conductivity (K) value of 5x10-6 m/s, which is a factor of five (5) greater than the value assumed for the ore zone, was applied in the base case numerical model to account for this impact. It is unclear from the information provided in Section 7 of the EIS or associated Appendices what the basis of this five-fold increase in K value for the ore zone, and how this was judged to be conservative, or to adequately represent anticipated conditions. This parameter is important as it impacts the rate at which contaminants flow from the ore zone following mining activities. Due to of the dissolution of uranium, larger voids will likely be created, and the hydraulic conductivity may increase by more than a factor of 5 compared to pre-project material. Therefore, a variation of at least one or two orders of magnitude for hydraulic conductivity should be used in the sensitivity analysis. Having a representative, conservative value for hydraulic conductivity is essential for understanding groundwater as a pathway of contaminant transport to Whitefish Lake and potential impacts to aquatic life. The K value used in the predictive uncertainty analysis should be reported.</p>	<p>Please provide a more fulsome discussion on the anticipated impacts of mining on permeability of the ore zone due to mining activities in the EIS or in an Appendix. The value used for scenario 7 of the prediction uncertainty analysis should be provided. The scientific rationale for the use of a K value only a factor of five greater than the value assumed for the ore zone in the 3D regional model should be provided, alternatively, provide simulation results for a more conservative scenario. Specifically, this discussion should address the potential effects of mechanical permeability enhancement with tools, dissolution of ore, gas plugging, chemical plugging, plugging due to ion exchange, and mechanical plugging.</p>	<p>This response has not been accepted.</p> <p>In the discussion of K values for the Ore Zone in Section 2.3.1.7 of Appendix 7-C, Denison notes that available measurements are derived from permeameters and likely underestimate actual conditions because they do not account for macro-scale fracture flow in the ore zone. Section 4.4.2 of Appendix 7-C indicates that a hydraulic conductivity value of 5E-06 m/s (5 times greater than value assumed for the ore zone in the 3D regional-scale model) was assigned to represent mining post-decommissioning for the base case scenario. The description for Scenario #7 of the sensitivity analysis reads "higher hydraulic conductivity within the ore zone". In their response to IR-70, Denison states that for Scenario #7, "the hydraulic conductivity in the ore zone was raised to be a uniform value of 2E-07 m/s to represent the effective dissolution of any clay cap minerals". No information relating to permeability or hydraulic conductivity is provided in the IR-20/IR-67/IR-69 attachment outside of qualitative observations of increased permeability following leaching with lixiviant. The information provided to CNSC staff thus far indicates that hydraulic conductivity (K) values for the base case scenario was 5E-06 m/s, and 2E-07 m/s for the higher ore zone hydraulic conductivity scenario (Scenario #7). Clearly this interpretation is not logical given that 2E-07 &lt; 5E-06. Furthermore, Denison's assertion that the post-mining conductivity of the ore zone is unimportant relative to the hydraulic conductivity of lower sediments and desilicified zone is not supported by the data presented in Table 4-6 of Appendix 7-C. The table below provides a summary of predicted groundwater concentrations for key COPCs (As, Se, U) for Scenarios 5, 6, and 7, as well as the relative percent difference to values predicted by the base case scenario. For these COPCs, it appears that increased ore zone hydraulic conductivity brings about the same order of magnitude changes as does varying K values for the lower sandstone (LSS). As such, it is important that the</p>	<p>There are a number of second round IRs associated with the theme of 'failure scenarios' related to well breakage, hydraulic containment, and GW model parameters. Denison and its SMEs have interpreted these IRs to be asking effectively how far outside the bounds of the design basis will failure occur. Within that context, Denison and its SMEs believe the work done adequately describes expected effects for design basis, has sufficiently considered appropriate levels of conservatism and has tested assumptions with sensitivity cases so as to render the need for such failure analysis as envisioned by the review comment as unnecessary. Such analyses would be based on assumptions that would not be defensible and in Denison and its SMEs view would cause confusion.</p> <p>Our earlier responses to this and related IRs referred to the ore zone as being a relatively small portion of the Draft EIS-characterized source volume as being part of our rational for not considering it a critical element. As stated in the Draft EIS, the source volume was conservatively estimated assuming a flare zone above and below the ore zone, within the confines of the freeze-walled zones. To further expand on that, as described in Draft EIS, the source volume includes the ore zone (core and barrier layers), the underlying paleo-weathered zone, and the overlying Lower Sandstone Aquifer (i.e., the restored solution extends 50 m above and below the ore zone). As such, the ore zone represents 2.75% of the source zone fluid volume, and less than 6% of the source mass of uranium, for example. As such, mass contained within the ore zone represents a relatively small portion of the overall source.</p> <p>Further, the most transmissive portion of the source zone is within the lower sandstone aquifer, and the most persistent portion of the source zone is within the paleo-weathered bedrock horizons where matrix diffusion is expected to result in source persistence.</p> <p>The hydraulic conductivity varied within prediction uncertainty scenario #7, reflects a higher hydraulic conductivity for the barrier layers of the ore zone, rather than the ore zone core. This was considered the most relevant parameter to vary to reflect a higher potential for ore zone mass to enter the overlying altered and desilicified units.</p> <p>To further demonstrate the robust nature of this hydrogeologic setting, an additional sensitivity scenario was run in direct response to the IR. This transport simulation was performed with the conductivity of the ore zone set to 5e-5 m/s (10 times higher than the overlying lower sandstone aquifer and desilicified zone). Under this scenario, similar peak COPC concentrations reaching Whitefish Lake to the base case scenario are predicted. COPC concentrations in groundwater remain below groundwater quality screening criteria at Whitefish Lake and do not change the conclusions of the original analyses. Details of this additional scenario are included in Attachment IR-89-R1.</p> <p>The table produced by the reviewer highlights changes of up to 200% between scenarios; however, that is to be expected since the results as presented simply reflect the variation between the scenarios based on scenario assumptions. All peak COPC concentrations in</p>	No

IR-71	-	CNSC	Geology and groundwater	Section 7.7.1, Climate Change Considerations	Context: The report states that in a scenario of increased precipitation and decreased/constant evaporation, climate change may result in greater flows in the Wheeler River drainage system and increased recharge to groundwater, which would	Please provide a discussion on potential effects of increased evapotranspiration, as well as decreased groundwater recharge	<p>This response has not been accepted.</p> <p>The effect of climate change on groundwater recharge in Prairies or Canada is generally</p>	In response to the comment, the following text has been added to the revised Draft EIS, Section 7.7.1.	<p>Yes</p> <p>Revised Draft EIS Section 7.7.1.</p>																								

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>correspond to increased groundwater discharge to Whitefish Lake. Additionally, it is also stated that climate change was evaluated qualitatively.</p> <p>Rationale: It is not clear why the impacts of increased evapotranspiration associated with higher average temperatures were not considered, even though these are likely outcomes of temperature increases due to climate change in areas such as the Prairies (Climate trends and projections - Canada.ca). It is also not clear why climate change considerations were not assessed quantitatively.</p>	<p>for the study area. Provide justification for performing qualitative assessment of impacts of climate change rather than a quantitative one.</p>	<p>uncertain due to the large degree of uncertainty in the modelling of future recharge although future changes in temperature and precipitation are expected to alter groundwater recharge (through changes to runoff, evapotranspiration, and snow accumulation). While CNSC staff accepts the response on potential effects of increased evapotranspiration, as well as decreased groundwater recharge for the study area, no justification has been provided on why quantitative analysis was not completed to address the effect of climate change on groundwater recharge.</p>	<p>“Quantification of the effects of climate change were not specifically addressed because the case of reduced groundwater recharge (i.e., the most relevant parameter which could change within the groundwater flow system), and thus a lower driving force for transport, was considered less conservative than the scenarios tested.”</p> <p>The text above has been added to Section 7.7.1 of the revised Draft EIS based on the following. To confirm this assumption, (two) additional modelling sensitivity scenarios were run where groundwater recharge was varied by +/- 20%, which recognizes the uncertainty in future climatic conditions. The 20% range of recharge variability is conservatively estimated based on predictions from Environment Canada (climatedata.ca – Key Lake; Precipitation will increase by 11 to 15%, and temperature will increase by 2.5 to 4.6°C) and is consistent with the range of variability that others (e.g., Erler et. al, 2019) have found for the foreseeable future (i.e., end of century). Details of these additional scenarios are included with Attachment IR-89-R1.</p> <p>Both scenarios did not appreciably change peak COPC concentrations in groundwater reaching Whitefish Lake relative to the base case conditions, and all constituent concentrations remain below groundwater quality screening criteria. Consequently, climate change is not considered to change the overall groundwater risk as presented in the EIS documentation provided to date.</p> <p><b>References:</b></p> <p><i>Erler, A. R., Frey, S. K., Khader, O., d’Orgeville, M., Park, Y.J., Hwang, H. T., et al.</i> (2019). Evaluating climate change impacts on soil moisture and groundwater resources within a Lake affected region. <i>Water Resources Research</i>, 55, 8142–8163. <a href="https://doi.org/10.1029/2018WR023822">https://doi.org/10.1029/2018WR023822</a></p>	
IR-72	-	CNSC	Geology and groundwater	Section 7.8.2, Groundwater Monitoring	<p>Context: Monitoring seems to consider COPCs from surface facilities, and excursion of pumped mine fluid in the Lower Sandstone Aquifer. There does not appear any discussion on how the proposed monitoring program considers potential excursions of brine from freeze wells.</p> <p>Rationale: It is unclear how potential excursions of brine from freeze wells will be monitored. Would this be through the fiber optic cables installed within the freeze well network? Or would it be achieved in the monitoring well clusters? If this is the case, how would an excursion of brine from a freeze well be differentiated from an excursion of mining solution?</p>	<p>Please provide further information regarding how potential excursions of brine from freeze wells will be monitored as part of the proposed groundwater monitoring program.</p>	<p>This response has not been accepted.</p> <p>CNSC staff request that Denison discuss the potential for excursions of brine from freeze wells and that they include a summary of plans to monitor these using key indicators of freeze wall brine migration, such as electrical conductivity (EC) and chloride (CaCl2), in the EIS (even at a high level if these are still being currently developed).</p> <p>Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	<p>In consideration of the review comment, the following text has been added to the revised draft EIS to address this IR.</p> <p>Section 7.8.2: “One additional parameter, chloride, has been included as a key parameter. It is possible that mobilized chloride concentrations are higher in the injected fluids than in groundwater; however, this is not the primary intent of including this parameter in the routine monitoring. Rather, calcium chloride brine makes up fluids that maintain the freeze wall. Thus, a change in the concentration of chloride - and EC - may indicate that a loss of freezing capacity has occurred in the freeze wall, representing an excursion, and delineate the extent of brine migration. However, loss of freezing is considered as an accident and malfunction, and loss of freezing is expected to be signaled much earlier by operational monitoring (e.g., pressure changes in the cooling circuit) than through monitoring of water quality.”</p> <p>Section 7.8.2.2.2: (The text in italics has been added)</p>	<p>Yes.</p> <p>Revised Draft EIS, Sections 7.8.2 and 7.8.2.2.2, Executive Summary Section 3.4.2.1.</p>

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								“The groundwater monitoring network during Operation will focus on groundwater conditions within and on the outside perimeter of the freeze wall, and evaluation of changes in groundwater quality including detection of excursions from potential loss of freezing capacity.”	
IR-75	-	CNSC	Geology and Groundwater	Appendix 7-A, Appendix K	<p>Context: The geomechanical study showed that the stability of the remnant ore zone and surrounding rock mass is highly sensitive to the magnitude of the material properties. To quantify this risk, the Proponent conducted a sensitivity analysis to assess the influence that material properties have on the stability of key stratigraphic layers. The results of the sensitivity analyses suggest that small variations in the cohesion magnitude and angle of internal friction may significantly influence the stability of the altered sandstone, ore zone, and upper and lower clays.</p> <p>Rationale: By considering the potential uncertainties and risks in association with the geomechanical study and the empirically derived rock mass strength parameters and the non-site specific physical parameters of different rock formations used for the modeling, the Proponent’s consultant suggests to define a laboratory testing program to address data gaps in the current geotechnical data and increase confidence in the material properties, and use more accurate material properties to model the phased extraction of uranium-enriched rock and assess the associated risks for cavity collapse and failure in the steel casing. CNSC staff concurs with these suggestions.</p>	Please provide a plan to implement recommendations for further detailed geomechanical studies to reduce the uncertainties and risks in association with the stability and deformation analyses of ore zone rock matrix and its overlying rock mass formations and assess their impacts on the mine operation.	<p>This response has not been accepted.</p> <p>As stated in the original comment, the geomechanical study (Appendix K of Appendix 7-A of EIS, RESPEC 2021) showed that the stability of the remnant ore zone and surrounding rock mass is highly sensitive to the magnitude of the material properties. The results of the sensitivity analyses suggest that small variations in the cohesion magnitude and angle of internal friction may significantly influence the stability of the altered sandstone, ore zone, and upper and lower clays. Although the Proponent has conducted additional numerical modelling by adding the desilicified sandstone into the model with conservative mechanical properties for this zone, the mechanical properties of other materials are basically same as the original modelling (i.e., empirically derived average material properties of key stratigraphic layers). The new modelling (RESPEC 2023, i.e., Attachment IR-21) does not address the uncertainties associated with the non-site specific physical and mechanical parameters of different rock formations used for the modeling. Some mechanical parameters used appear to be inadequate, e.g., the mechanical properties of overburden and rock-mass modulus of desilicified sandstone. The use of isotropic in-situ stress state is non-conservative. No sufficient justification/rationale is provided on the excavation of 30 percent of rock by volume from the high-grade ore zone to which 50% was used in the RESPEC (2021), which could have significant impact on the modelling results. In addition, Figure 2 of Attachment IR-21 does not show the desilicified sandstone although it is stated that the desilicified sandstone is considered in the modeling. Also see CNSC’s disposition to Denison’s response to IR-83.</p>	<p>There are a number of second round IRs on the theme of effectively 'failure scenarios' related to well breakage, hydraulic containment, and GW model parameters. Denison and its SMEs have interpreted these IRs to be asking effectively how far outside the bounds of the design basis will failure occur. Within that context, Denison and its SMEs believe the work done adequately describes expected effects for design basis, has sufficiently considered appropriate levels of conservatism and has tested assumptions with sensitivity cases so as to render the need for such failure analysis as envisioned by the review comment as unnecessary. Such analyses would be based on assumptions that would not be defensible and in Denison and its SMEs view would cause confusion.</p> <p><u>Material Properties and the Desilicified Sandstone:</u> An update to the geomechanical study (RESPEC, 2024) is presented as Appendix K to Appendix 7-A, that clearly shows the Desilicified Sandstone in Figure 2a and 2b (versus the previous version of the report; Annex 1, Attachment IR-21 starting on page 134/419). In the modelling, sandstone that has been hydrothermally altered includes the Altered Sandstone and Desilicified Sandstone. Details on how the Altered and Desilicified Sandstones were delineated is provided as part of IR-83. The Desilicified Sandstone was included in the updated modelling to provide a more conservative approach from prior models. Cohesion values were set to ‘0’ to demonstrate a conservative approach. Material properties for the Altered Sandstone and other stratigraphy remained unchanged from prior models as these values are deemed appropriate based on site-specific knowledge and comparable to other Athabasca Basin uranium deposits of similar settings.</p> <p><u>Excavation of rock mass:</u> Random rock removal was adopted to represent the in-situ leaching process in the numerical model and included the instantaneous removal of 30% of the rock mass by volume from the high grade zone and 3% volume from the low grade zone. The volume of rock removed in the model is consistent with values achieved through site specific long-term testing of high and low grades cores at an accredited lab facility. As the high and low grade zones of the deposit encompass several stratigraphic layers, these values incorporated into the model represent a conservative approach.</p> <p>Denison believes it has fulfilled its requirements for the EIS as outlined in the EA guidance provided by the province and federal government, including CEAA 2012, and that the FIRT has been provided with the appropriate level of detail on this topic for concluding the EA process. Notwithstanding that, Denison recognizes that further information may be required as the Project moves past the EA and into the licensing and permitting phases. To support licensing, Denison will provide further detailed geomechanical studies to reduce the uncertainties and risks in association with the stability and deformation analyses of ore zone rock matrix and its overlying rock mass formations and assess their potential impacts on the mine operation and closure.</p>	No

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								We also highlight the role of the Project's decommissioning plan and associated cost estimate as a core document guiding Project aspects in the post-decommissioning period in general, and the mining area decommissioning objectives in particular. As the Project advances, the details of the decommissioning plan will naturally become more refined and will build on experience gained during operations, including mining, monitoring, and additional laboratory studies. The decommissioning plans are built on a 'decommission tomorrow' scenario and the financial guarantees will be developed in consideration of potential well breakages.	
IR-76	-	CNSC	Geology and Groundwater	Appendix 7-A, Appendix K (p. 12)	<p>Context: Based on the consultant’s report, the modeled vertical strain is approaching or exceeding the tensile and compressive yield limits for steel casing.</p> <p>Rationale: Failure of steel casing may result in process loss or alter groundwater flow and quality.</p>	Please provide additional details on how casing integrity will be monitored and potential effects mitigated.	<p>This response has not been accepted.</p> <p>CNSC staff request that Denison include summary of the potential for steel casing failure and plans for monitoring and mitigating its effects (such as the response to IR-76) within the EIS, for SME review and acceptance.</p>	<p>With regards to steel casing failure and plans for monitoring and mitigating its effects, the following is noted:</p> <p>Mitigation of steel casing failure is accomplished by the injection and recovery well designs and operational monitoring of the wellfield. The well design is already described in the revised draft EIS in Sections 2.2.1.4.1 and 2.2.1.4.2. Each well will have double containment: mining solution will travel inside an inner casing with the outer casing acting as secondary containment for the mining fluids. See below for operational monitoring discussion.</p> <p>Potential for steel casing failure: Conditions with respect to the potential for steel casing failure are addressed in IR-75. An additional hazard scenario has been added to the revised Draft EIS (Annex 1, IR-213 on page 76/419), to further address the potential for failure conditions associated with the steel piping. The new hazard scenario was added to Table 3-2 in Appendix A of Appendix 14-A (Accidents and Malfunctions Assessment) as Scenario 2.4 Well Casing Yield and/or Damage. For reference and based on hazard screening analysis provided in Appendix A of Appendic 14-A, this scenario is evaluated to be a low likelihood scenario (2) with moderate consequence (score 3) for an overall risk ranking of low, and accordingly was not advanced for further more detailed analysis beyond initial risk screening. The scenario is viewed as a low likelihood scenario due to the proposed multilayer design of the injection / recovery well design.</p> <p>Monitoring: The following details of monitoring of injection and recovery wells will be added to Section 2.8 of the revised Draft EIS: “Well casing integrity will be monitored in a rigorous fashion, thereby allowing Denison to respond to any steel casing failures in a timely manner. A network of monitoring wells installed within the freeze wall area will be equipped with pressure instrumentation for the determination of the vertical strain/stresses placed on the formation. This monitoring network is designed to detect if these strains may be deviating from their acceptable levels and beyond the design tolerance prior to failure. The injection and recovery wells will also be equipped with continuous monitoring devices for pressure and temperature that can detect a breach in the well casing if one were to occur. These data will be transmitted to the processing plant for remote monitoring through a master control system. Through the master control system, operators will be capable of controlling pumphouse production lines remotely. Wellfield monitoring will facilitate detection of any issues with the injection and recovery wells. As a further preventative measure, annual mechanical integrity testing is conducted on the wells to ensure their containment and compliancy. Active monitoring will allow for operational shutdown of the individual well in</p>	<p>Yes</p> <p>Revised Draft EIS, Section 2.8</p>

								the instance that conditions that could lead to a failure are indicated to prevent loss of process related chemicals into the freeze wall area”.	
IR-78	-	CNSC  ECCC	Fish and fish habitat  Geology and groundwater	Appendix 7-A, Section 3.5.2, Porosity  Appendix 7-C, Section 2.3.2.1, Porosity Values	<p>Context: This section of the report outlines the estimated/assumed effective porosity values. The only reference provided is for permeameter testing on rock core samples (Scibek, 2019).</p> <p>Additionally, the report states that “As tracer test results to estimate effective porosity were unavailable at the time of modelling, effective porosity values for the sandstone bedrock and basement units were sourced from literature values”, where literature values are effective porosities from the Cigar Lake study (AECL, 1994), situated approximately 40 km NE of Wheeler River. No on-site Wheeler River field data was used to justify this value. Additionally,, in the Cigar Lake study, the authors reported that, because results from tracer tests and pumping tests were unavailable, “a practical approach was adopted, i.e., to use the porosity values obtained from laboratory measurements made on core samples, and to assume that those numbers were close to the average field kinematic (effective) porosity values”.</p> <p>Rationale: The source of reported effective porosity values is unclear from Section 3.5.2 in Appendix A (e.g. literature review, field work, laboratory work).</p> <p>In Section 2.3.2.1 of Appendix 7-C, there is a lack of clarity regarding the effective porosity data used in the numerical model. It appears that no site-specific data derived from tracer tests or pumping tests is used in the numerical model. Given that effective porosity directly correlates to seepage velocity and by extension transport time and distribution of COPCs in groundwater, it is an important parameter. Given its relative importance for contaminant fate and transport, effective porosity should be based on field measurements, or at the very least accounted for in the sensitivity analysis.</p>	<p>1. Please provide the reference for the data substantiating the assumed effective porosity values reported in Appendix 7-A and used in the numerical model in Appendix 7-C.</p> <p>2. Please provide information on how the site-specific effective porosity values from tracer tests or pumping tests, were considered in the numerical models. Section 2.2.1.4 of the EIS asserts that tracer tests were carried out in 2021 – this information should thus be available for improving/updating models. Alternatively, provide a sensitivity analysis for the effective porosity in the Desilicified Zone, or contaminant transport simulation results with more conservative effective porosity values.</p>	<p>This response has not been accepted.</p> <p>Effective porosity is an important parameter to understanding groundwater flow and contaminant transport. The Proponent states that “As tracer test results to estimate effective porosity were unavailable at the time of modelling, effective porosity values for the sandstone bedrock and basement units were sourced from literature values”, including porosities from the Cigar Lake study (AECL, 1994), situated approximately 40 km NE of Wheeler River. No on-site Wheeler River field data was used to explain this value. Additionally, in the Cigar Lake study, the authors reported that, because results from tracer tests and pumping tests were unavailable, “a practical approach was adopted, i.e., to use the porosity values obtained from laboratory measurements made on core samples, and to assume that those numbers were close to the average field kinematic (effective) porosity values”.</p> <p>In response to the IR, the Proponent explained and supported their methodology for selecting a value for effective porosity. This method included consideration of literature values and a regional analogue at Cigar Lake. ECCC notes that a tracer test was conducted, the results of which were not considered in the selection of the effective porosity parameter.</p> <p>If field test data is available that is potentially relevant to determining effective porosity, it should be included in the EIS when discussing effective porosity. The field test data should also be made available for ECCC to review, to confirm the conclusions reached by the Proponent. ECCC acknowledges that other sources of information can be useful when explaining the most appropriate value for effective porosity such as literature values and regional analogues, as per the Proponent’s IR response. However, field test results should be presented in the EIS and considered as a part of such an explanation. If the</p>	<p>There are a number of second round IRs associated with the theme of 'failure scenarios' related to well breakage, hydraulic containment, and GW model parameters. Denison and its SMEs have interpreted these IRs to be asking effectively how far outside the bounds of the design basis will failure occur. Within that context, Denison and its SMEs believe the work done to date adequately describes expected effects for design basis, has sufficiently considered appropriate levels of conservatism and has tested assumptions with sensitivity cases so as to render the need for such failure analysis as envisioned by the review comment as unnecessary. Such analyses would be based on assumptions that would not be defensible and in Denison and its SMEs view would cause confusion.</p> <p>The forced gradient tracer test undertaken by Petrotek (2022) was designed to evaluate the degree of capture that could be achieved using injection and extraction wells oriented in a star pattern within a relatively small (i.e., 5 to 10 m radius surrounding GWR-040) portion of the ore zone. Based on the purpose and relatively small scale of the test, Denison and its SMEs do not consider the test conditions/results to be representative of groundwater migration pathways post-decommissioning. Further, the tracer test was performed after permeability enhancement efforts (e.g., MaxPerf, Gas Gun and Kraken tools) which are designed to enhance the effective porosity beyond the natural state. Effective porosity values from this testing were never published and were not considered relevant to the scale of the EA modelling based on the small scale of the evaluation, and the impact of permeability enhancement measures. However, effective porosity values derived from the peak arrival time at extraction wells were computed to range from 1 to 7%, which is in line with the effective porosity value assigned for the ore zone pre-mining (i.e., 1%); higher values are expected within the ore zone post-mining which will result in increased travel times.</p> <p>The discussion above has been summarized in the revised Draft EIS, in Section 4.5. Additionally, it is noted that effective porosity values applied in the groundwater flow and transport models were selected to be consistent with the available literature, including those applied by AECL at Cigar Lake (AECL, 1994).</p> <p>Despite the above, and in consideration of the review comment, an additional conservative sensitivity geochemical reactive transport scenario was performed to evaluate a lower effective porosity within the paleo-weathered zone (PWZ). The PWZ is simulated to be the area wherein mass is most persistent and so reducing the effective porosity within this zone allows initial source mass to migrate out of the paleoweathered zone toward receptors faster. For this scenario, the effective porosity was lowered by a factor of 10 for this unit to reflect a more fracture-dominated transport condition, with limited matrix diffusion. Slightly higher peak concentrations were simulated for a number of COPCs (including As, Cd, Co, Cu, Ra-226, Se, and Zn) relative to base case concentrations, but all peak concentrations remained below groundwater quality screening criteria beneath Whitefish Lake. Details of the scenario are provided in Attachment IR-89-R1 for reference.</p>	Yes,  Appendix 7-C, Section 4.5

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
							<p>Proponent feels that not utilizing field test data is the most accurate approach when selecting an effective porosity value, then this conclusion should be reached with consideration of the field test data as a part of the evaluation.</p> <p>Provide a discussion of how the effective porosity values are selected, including a discussion of how field test results were considered. This information is necessary to confirm that the selected effective porosity values are valid. This also relates to IR-52.</p>	<p>The results of the additional simulation confirm our understanding that uncertainty in effective porosity does not change the outcome of the scenarios already reported within the EIS documentation, nor in conclusions based thereon.</p>	
IR-81	-	CNSC	Geology and groundwater	Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit	<p>Context: The report states in the description of hydrochemistry of the Lower Sandstone Aquifer that, “On the basis of groundwater chemistry and tritium values in that groundwater, the authors (of the Cigar Lake analogue study in 1994) concluded that the groundwater reflected a younger water component that had penetrated to depth along hydraulically active fractures/faults. The same conclusion is made here (in the Wheeler River EIS) for the Phoenix study area – meaning that fracture/fault conditions are such that some areas of the MFa are characterized by younger/recharge groundwaters”.</p> <p>Rationale: Tritium results for most wells in the Lower Sandstone Aquifer (MFa) reported in Table 4-1 of Appendix 7-A exhibit tritium concentrations &lt;15 Bq/L for the 2020 sample, and 0.1 or &lt;0.1 Bq/L for the 2021 sample. Tritium in modern precipitation typically varies from 1 – 3 Bq/L. Conclusions made in the text are not supported by data, especially given that tritium values are not reported in the EIS for local precipitation or surface water. This is important in reinforcing the assumption from the conceptual model that modern meteoric water circulates at depth in the Lower Sandstone Aquifer.</p>	<p>Provide a further discussion on the interpretation of tritium in groundwater, rather than echoing conclusions from the Cigar Lake analogue study. Consideration should be given to the assertion that modern meteoric water circulates at depth in the Lower Sandstone Aquifer. Collection and analysis of stable isotope (e.g., <math>\delta^2\text{H}</math>, <math>\delta^{18}\text{O}</math>) samples is a cost-effective solution which would greatly improve understanding of groundwater hydrology and support the development of a conceptual model.</p>	<p>This response has not been accepted.</p> <p>CNSC staff agree with the interpretations drawn from the information presented in the response to IR-81. However, it remains that the EIS does not contain an assessment of the tritium data presented, aside from the text quoted in the original IR-81 relating to Section 4.3.3 of Appendix 7-A. As such, CNSC staff request that Denison revise the EIS to include a high-level summary of the tritium data presented in the response to IR-81, being (i) the data is limited in value to conceptual model development, (ii) conclusions from tritium data at Cigar Lake at not reproducible with the current dataset, and (iii) Denison will continue to monitor tritium to further evaluate the usefulness in refining the conceptual model.</p> <p>Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	<p>The discussion of tritium has been added as Appendix L of Appendix 7-A of the revised Draft EIS. Text referring to Appendix L of Appendix 7-A has been updated in the following Sections:</p> <p>Section 4.2.2. of Appendix 7-A: “Groundwater Ageing: Tritium Values”.</p> <p>This new subsection has the following text, summarizing what is presented in Appendix L to Appendix 7-A</p> <p>“The potential for analysis of tritium concentrations in groundwater to support ageing of groundwater and the development of the CSM for the Wheeler River program was evaluated using the available analytical data and information on tritium concentrations in precipitation. The analysis is presented in Appendix L. It was concluded that, beyond supporting recent groundwater recharge in the overburden and the upper sandstone aquifer – discussed further below (Section 4.3.3) - tritium concentrations in groundwater do not provide a robust means of ageing groundwater in the subsurface for the Wheeler River Project. Tritium concentrations in groundwater will continue to be measured as part of the routine groundwater sampling, to further evaluate the usefulness of this approach for refining the conceptual site model developed for the Wheeler River Project.”</p> <p>Section 4.3.3 of Appendix 7-A, subsection: “Local Groundwater Flow System”. The following text has been added:</p> <p>“Recharge Conditions: Analysis of tritium values in groundwater from the Local Groundwater flow system is presented in Appendix L. Results suggest that groundwater in this flow system has been recently recharged, in the last approximately 12-25 years, but that residence times can be longer in localized areas of the flow system”.</p> <p>Revised draft EIS Section 7.8.2:</p> <p>“In addition to the above parameters, tritium concentrations will also be measured in groundwater to further analyze the potential to age groundwater in the subsurface.”</p>	<p>Yes</p> <p>Appendix L of Appendix 7-A.</p> <p>Appendix 7-A Section 4.2.2 and 4.3.3</p> <p>Revised Draft EIS, Section 7.8.2</p>
IR-83	-	CNSC	Geology and Groundwater	Appendix 7-A, Section 7.4.2.2 and Appendix K	<p>Context: Leaching of uranium from the ore zone will generate voids within the ore zone, which could fail and collapse. Failure of the voids would cause displacement in overlying rocks, which will lead to the eventual ground subsidence. Based on the</p>	<p>Please provide details whether and how the desilicified zone is considered in the geomechanical modeling of the detailed strip</p>	<p>This response has not been accepted.</p> <p>As stated in the CNSC’s disposition to Denison’s response to IR-75, Figure 2 of Attachment IR-21</p>	<p>The RESPEC (2024) study is provided as Appendix K to Appendix 7-A and has been updated to show the desilicified zone in Figures 2a) and 2b). The material properties of the</p>	<p>Yes</p> <p>Appendix K to Appendix 7-A.</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>developed geological model, a geomechanical study was conducted to assess potential maximum vertical displacement in the overlying rock formations and predict the ground subsidence. While a layer of altered sandstone is modeled above the ore zone, the desilicified zone, a zone that is comprised of completely to partially unconsolidated sands and has very low rock quality, high fracture intensity, and high friability, and low strength in the area overlying and east of the Phoenix deposit, appears not to have been included in the model for geomechanical modeling. The evaluated displacement/deformation in the overlying rock formation and the resulted ground subsidence would not be conservative without including the desilicified zone.</p> <p>Rationale: Stability of the ore zone rock matrix and the potential displacement/deformation in the overlying rock formations when voids in the extracted ore zone collapse are critical for protecting the overlying aquifers, preventing substantial ground subsidence, safeguarding casing integrity, and mitigating plug-off of the remaining ore as well as efficiently mining extraction. The deformed zone in the overlying rock formations will change in hydraulic conductivity that will impact on the assessment of potential effects on groundwater flow and contaminant transport in the zone. Therefore, the rock mass behavior including and above the ore zone should be adequately understood and the potential displacement/deformation should be assessed and quantified with adequately defined geological model.</p>	<p>model. Such details should include figures and the linkage between the geomechanical model including the determination of strength parameters of the desilicified zone and the geological model including information on the core delineation of the desilicified zone.</p>	<p>(RESPEC 2023) does not show the desilicified sandstone although it is stated that the desilicified sandstone is considered in the numerical modeling. Therefore, the extent of desilicified sandstone modelled is not clear. It is also not clear where the vertical plane represented by Figure 2 is cut from Figure 1. The linkage between the geomechanical model represented by Figure 2 in RESPEC (2023) and the geological model in EIS S07 is not provided.</p> <p>Please provide the requested information.</p>	<p>desilicified zone are given in Table 1 of Appendix K, and represent conservative values for the purpose of collapse / subsidence analysis.</p> <p>The vertical plane represented in Figure 2a) is now explicitly shown as part of Figure 2a).</p> <p>To clarify the linkage between the models presented in the geomechanical study and the regional hydrogeology Conceptual Site Model (CSM) developed in Appendix 7-A and associated groundwater flow and transport model presented in Appendix 7-C, the following text was added to the revised Draft EIS as a preface to Appendix K of Appendix 7-A (page K.1 of Appendix 7-A).</p> <p>“The information presented in Appendix K was based on the same geologic information as was used herein to develop the regional hydrogeology CSM for the Project. A clarification is provided, however, on differences in terminology for the desilicified zone used between the two reports.</p> <p>Herein, the desilicified zone was delineated using rock core RQD, friability and fracture frequency (Section 3.4.4). Specifically, to delineate the desilicified zone in the hydrogeology CSM, core with a friability of 3 or greater was interpreted to be hydrothermally altered sandstone of high relative porosity and permeability in comparison to the unaltered Athabasca Supergroup Sandstones, through substantive loss of matrix silica content (10% or more; Sorba and Tetland, Personal Communication).</p> <p>In the RESPEC (2024) report, differentiation was made with respect to the level of desilicification of the altered sandstones using the terms “Altered Sandstone” and “Desilicified Zone”. The “Altered Sandstone” was delineated using the same friability criteria as was used in the hydrogeology CSM to define the desilicified zone (i.e., a friability of 3 or more). The “Desilicified Zone” was delineated in RESPEC (2024) using a friability of 4, which represents extreme desilicification of the rock matrix (loss of matrix silica of up to 30% or more; Sorba and Tetland, Personal Communication). The zones of extreme desilicification were differentiated from the rest of the Altered Sandstone and ascribed very conservative average material properties presented in Table 1 of Appendix K. These average material properties included zero cohesion. As the objective of the geomechanical study was to evaluate the potential for bedrock collapse within the freeze wall above the ore zone, it was important to differentiate these zones of no cohesion for a worst-case scenario assessment.</p> <p>Thus, the linkage between the two studies is as follows: the combined Altered Sandstone and Desilicified Zones shown in Figure 2a and 2b of Appendix K correspond to the “Desilicified Zone” shown in this report as Figures 9, 10, 12, and 29.”</p> <p><b>References:</b></p> <p>Sorba, C. and Tetland, M. Discussion of Project geology and minerals in once open fractures. Oral communication, Chad Sorba and Mikkel Tetland, Denison Mines to the Ecometrix team.”</p>	
IR-84	-	CNSC	Geology and Groundwater	Appendix 7-C	<b>Context:</b> It is stated in Section 2.5.2.4 (p. 2.35, Appendix 7-C) that “In addition to calibrating to water level elevations targets, the model was calibrated to estimates of groundwater discharge	1. Please clarify in Figure 2-10 where the point streamflow measurements were conducted	This response has not been accepted, as the issue has not been sufficiently clarified.	The reviewer is perhaps confused about what is being referred to as Whitefish Lake in the reporting, and this may be due to the placement of the label for the lake on the referenced figures. Whitefish Lake consists of two lobes. A northern lobe and southern	Yes

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>to Whitefish Lake. A match between simulated and observed flows helps to support that groundwater recharge rates are reasonable, and to provide validation for water budget assessments. Baseflow calibration targets were developed using point streamflow measurements collected upstream and downstream of Whitefish Lake. Figure 2-10 (p. 2.26, Appendix 7-C) shows the locations of the baseflow calibration targets, and Table 2-7 (p. 2.35, Appendix 7-C) illustrates the model-simulated groundwater discharge rates in relation to the estimated range of baseflow from stream measurements. The simulated baseflow to Whitefish Lake is in good agreement with the estimated representative baseflow”.</p> <p><b>Rationale:</b> It is not clear in Figure 2-10 (p. 2.26, Appendix 7-C) where the point streamflow measurements were conducted upstream and downstream of Whitefish Lake. Additionally, it is not clear how the groundwater discharge to Whitefish Lake is simulated, since the model domain does not cover the whole Whitefish Lake.</p>	<p>upstream and downstream of Whitefish Lake.</p> <p>2. Please clarify how the groundwater discharge to Whitefish Lake is simulated considering that the model domain does not cover the whole Whitefish Lake.</p>	<p>1. In Appendix 7-C of the EIS, Figure 2-10 shows that Whitefish Lake is between SA-5 and SA-6, not SA-2 and SA-6. Additionally, under the heading "Surface Water Stations" of Table 2-7 are “SA-6 <b>to</b> SA-2”, not “SA-6 <b>and</b> SA-2”.</p> <p>2. Figure 2-10 does not show SA-7. Surface water flow direction should be illustrated to help understand the relative location of upstream and downstream. Additionally, under the heading of “feature monitored” of Table 2-7 is “flow from LA-6 to Whitefish Lake”. Figure 2-10 shows LA-2, but no LA-6.</p>	<p>lobe, separated by a narrow segment where station SA-6 is located. To avoid the label for Whitefish Lake interfering with information presented on multiple figures, the label appears overlying the northern portion Whitefish Lake. However, the northern portion of the lake is upstream and distant from the ore zone. There is no discharge of groundwater from the ore zone to the northern portion of Whitefish Lake, and that is why it is not discussed within the EIS.</p> <p>Conversely, the southern portion of Whitefish Lake (i.e., between SA-6 and SA-2) is the area of primary interest with respect to potential environmental effects due to groundwater discharge, as that portion overlies the interpreted desilicified zone. The southern portion of the lake is entirely within the groundwater model domain and receives groundwater discharge from both the east and west directions. As such, simulated discharge to the lake can be directly compared to the measured increase in stream baseflow between the monitoring station upstream (SA-6) and downstream (SA-2) of the portion of Whitefish Lake which is of interest.</p> <p>For brevity, we have referred to the southern portion (i.e., also referred to as LA-5) as “Whitefish Lake” in the modelling assessment (Appendix 7-C).</p> <p>The revised draft EIS has been revised by updating the label location for Whitefish Lake on the figure, and adding a bold outline of the portion of the lake we are referring to as “Whitefish Lake”. In addition, have updated the text within Table 2-7 to clarify that the “Feature Monitored” is the “Flow through the Southern portion of Whitefish Lake as indicated on Figure 2-10”.</p>	Appendix 7-C, Section 2.5.2.5 (Table 2-7) and Figure 2-10
IR-86	-	CNSC	Geology and Groundwater	Appendix 7-C	<p><b>Context:</b> It is stated in Section 2.7.3 (p. 2.41, Appendix 7-C) that “Both the pumping demand and the recharge changes were incorporated into a transient simulation performed using the calibrated groundwater flow model. The model simulation was started at the beginning of mine construction, with initial conditions taken from the calibrated model. The simulation period was extended for 40 years to include the entire period of construction, operation, and decommissioning, and extending through 17 years post decommissioning”.</p> <p><b>Rationale:</b> It is not clear what is the difference between the calibrated model and transient model in terms of parameters (such as the K values for the mining zone), boundary conditions, etc.</p>	<p>Please clarify the parameters, boundary conditions and any other aspects as used in the transient model that are different from the calibrated model.</p>	<p>This response has not been accepted.</p> <p>The response is acceptable, but the information as explained in the response should be incorporated in the appropriate sections of Appendix 7-C.</p> <p>Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	<p>The text in Appendix 7-C, Section 2.7.2, of the draft EIS has been updated with the following paragraph:</p> <p>“The calibrated, steady-state model was used as the basis for the transient model used to evaluate drawdown during operations. Only conditions immediately at the mining zone were altered within the transient model to reflect the proposed changes during mine operation. All boundary conditions that drive regional groundwater flow were unchanged for the transient model, and all hydrogeologic properties outside of the mining area were left unchanged. Changes made to the hydrogeologic properties were implemented transiently to represent the phased implementation of the freeze wall. Groundwater recharge changes were made to reflect alterations to surficial land use and the implication to groundwater recharge, and transient pumping boundary conditions were added to simulate the planned pumping demand for camp and ISR water requirements. The transient version of the model was used to evaluate changes to the groundwater discharge occurring at Whitefish Lake.”</p>	Yes  Appendix 7-C, Section 2.7.2
IR-88	-	CNSC	Geology and Groundwater	Appendix 7-C	<p><b>Context:</b> The conceptual hydrogeological model includes upper sandstone aquifer, intermediate sandstone aquitard, and lower sandstone aquifer. The desilicified zone above the ore zone have enhanced hydraulic conductivity. The boundary condition for the lower sandstone aquifer on the west (upstream) side was assigned to have specified head, which provide source of water</p>	<p>It is recommended to conduct the following work to demonstrate if the mined-out zone is hydraulically active:</p> <ol style="list-style-type: none"><li>Determine the groundwater residence</li></ol>	<p>This response has not been accepted, as the following point was not adequately addressed:</p> <p>1. It is recommended that groundwater residence time in the lower sandstone aquifer be estimated and compared with the simulated residence time in</p>	<p>We believe that the reviewers’ question on residence time is a function of a misunderstanding of the figures presenting the groundwater plume evolution, and the portions of the model which represent the lower sandstone, ore zone, and paleoweathered zone on Figures 4-6, 4-7, 4-8, and 4-9 of Appendix 7C. This includes an apparent misunderstanding of the conservative distribution of the source area assumed to contain “Restored solution” post-decommissioning (see Figure 4-1, Appendix 7-C).</p>	Yes  Revised Draft EIS, Section 7.6.2.2.3

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>for the lower sandstone aquifer.</p> <p>As a result of the conceptual model setup, the upper sandstone aquifer is hydraulically active and the groundwater residence time within the upper sandstone aquifer is relative short. In contrast, the lower sandstone aquifer (and the ore zone) is hydraulically inactive, and the groundwater residence time in the lower sandstone aquifer is relatively long (as shown in the particle tracking results in Figure 7.6-2 (p. 7-71, main EIS report), and the simulated plume for chloride in Figure 7.6-7(p. 7-86, main EIS report)).</p> <p>It is stated in Section 2.6.4 (Appendix 7-C) that “As noted above in section 2.6.3, it is estimated that 99% of the groundwater discharge to Whitefish Lake is derived from groundwater that has only flowed through shallow deposits (i.e., Overburden and Upper Sandstone Aquifers). Contribution of deep groundwater flow through the Desilicified Zone within the Intermediate Sandstone Aquitard is estimated to be &lt; 1% of the groundwater discharging to Whitefish Lake”. This simulation result is reflective of the conceptual model.</p> <p>Section 7.3.3.3 (p. 7-42) states that “The Lower Sandstone Aquifer is characterized spatially by two types of groundwater. The first groundwater type is most like that observed in the Local Flow System. This reflects hydraulically active fractures and fault systems that allow fresh recharge water to penetrate and mix with deeper waters in the aquifer. The second type of groundwater is within the zone of thermal alteration around the ore zone .....”.</p> <p>The hydraulic connectivity of the ore zone with the upper sandstone aquifer has important implication on the groundwater restoration. The ore zone is not hydraulically active locally because it is enclosed by a clay zone before the mining operation. But if it is located within a hydraulically active area, or on a groundwater flow pathway that is hydraulically active, the mined-out zone (with much larger porosity and hydraulic conductivity) could become active hydraulically after mining operation is finished.</p> <p>Figure 7.6-7 (p. 7-86, main EIS report) shows that the chloride plume is most persistent within the mined-out mining area. This seems to indicate the mined-out zone is hydraulically inactive after the mining operation is finished.</p> <p>It is stated in Section 7.3.3.2 (p. 7-37, main EIS report) that “Exploration boreholes drilled in the Phoenix area, where left</p>	<p>time in the lower sandstone aquifer and compare it with the simulated residence time in the numerical model.</p> <p>2. Conduct additional particle tracking to demonstrate where groundwater originating from the mined-out zone flow towards (forward tracking) and where groundwater flowing towards the mined-out zone originates from. This would help determine why groundwater in the mined-out zone is not hydraulically active.</p> <p>3. Conduct sensitivity analysis to investigate the effect of higher K values for the intermediate sandstone aquitard and the K and porosity values of the mined-out zone on the plume migration.</p>	<p>the numerical model. Otherwise further justification should be provided why this is not possible.</p> <p>Groundwater residence time can be estimated using isotopes (the reference below is an example paper in this regard).</p> <p>Reference: Martin Kralik (2015), How to Estimate Mean Residence Times of Groundwater. Procedia Earth and Planetary Science, Volume 13, Pages 301-306.</p>	<p>To avoid cluttering the time-snapshot sequence figures (Figures 4-6 to 4-9), the location of the hydrogeologic units is labelled on Figure 4-6 only. As indicated on this figure, the most persistent portion of the source area for all constituents is contained within the paleoweathered zone (PWZ). The source is persistent within the PWZ due to the lower hydraulic conductivity of this weathered basement rock. The portions of the source area containing restored solution (refer to Figure 4-1) overlying the PWZ in Figures 4-6 to 4-9, are shown to contain significantly lower concentrations over time and eventually return to inflowing background concentrations.</p> <p>To clarify the above within the revised Draft EIS, the following has been added to Section 7.6.2.2.3:</p> <p>“The area simulated to be a source of contaminant mass Post-Decommissioning includes the Ore Zone, the overlying Lower Sandstone Aquifer (i.e., 50 m above the Ore Zone), and the underlying Paleoweathered bedrock (Section 7.6.2.1). As indicated in Figure 7.6-7, elevated concentrations of even conservative COPCs persist within the Paleoweathered zone due to its lower hydraulic conductivity (i.e., it takes longer for COPCs to be flushed out of this zone).”</p> <p>For addition reference the following are noted.</p> <p>Isolation of Ore Zone: There is no simulated isolation of the ore zone or the lower sandstone aquifer. In contrast, the mass contained within the ore zone is simulated to freely exit that zone and migrate through the overlying desilicified zone, as is the source mass that originates within the overlying lower sandstone units.</p> <p>Residence times within the lower sandstone aquifer include both the time for advective transport as well as the time for sorbed mass to de-sorb and re-join the advective-dispersive transport. The desorption process continues over time, with the mass of a given constituent partitioned to groundwater from this process continually decreasing (i.e., as sorbed mass overall decreases), resulting in a source tail effect within the lower sandstone, ore zone and within underlying PWZ.</p> <p>Regardless, to demonstrate the robust nature of the hydrogeologic setting, an additional transport simulation was performed wherein the effective porosity of the paleoweathered zone was reduced by an order of magnitude to allow the initial source mass to migrate out of the paleoweathered zone toward receptors 10-times faster. The results of that simulation are discussed as part of the response to IR-78 and do not change the outcome of the scenarios already reported within the EIS documentation, nor in conclusions based thereon. Details of the scenario are presented as part of Attachment IR-89-R1.</p> <p>With respect to the use of isotopes, although potentially informative, the isotope methods presented in Kralik (2015), are for the most part impractical, in that they require substantive volumes of water (e.g.&gt; 200 L of water), and thus would be required to be applied in a very targeted fashion to address very specific matters. This is worthy of consideration, but outside of the scope of the EIS. The use of stable isotopes of oxygen and hydrogen in water (<math>\delta^2\text{H}</math>, <math>\delta^{18}\text{O}</math>) were determined to offer little value for CSM</p>	

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>unplugged, have the potential to provide preferential flow paths between the Overburden and Upper and Lower Sandstone Aquifers. Exploration holes were reportedly grouted approximately 10 to 20 m above and below the ore zone, resulting in open holes remaining throughout the overlying materials. These portions of the open holes may act as open conduits for groundwater flow through the 400 m of Athabasca Group Sandstone.” So, there is possibility that the unplugged borehole could increase the hydraulic connection between the upper and lower sandstone aquifer.</p> <p><b>Rationale:</b> It is important to understand if the larger area containing ore zone is hydraulically active. Additional confidence would be gained if there is any other evidence that support that the area containing the ore zone is not hydraulically active, and groundwater residence time in the lower sandstone aquifer surrounding the ore zone is comparable with the simulated results.</p> <p>Table 2-4 (p. 2.16, Appendix 7-C) shows the effective porosity (0.01-0.05) of the ore body. Figure B7 (p. B.8, Appendix 7-C) shows that the calibrated K values for the mined-out zone is 1x10-6 m/s. Section 3.5.2 (p. 3.24, Appendix 7-C) states that “The same average linear velocity was assumed for the mining area (source zone), following from the discussion in Section 4.4.2, where the hydraulic conductivity value in this zone following mining was set to 5x10-6 m/s, and a porosity of 0.2 is assumed for the ore zone (Table 4-2)”. It is not clear what the justification is for the selection of the porosity and K values for the mined-out area, and whether they are conservative. It is also not clear, what the potential impact on the groundwater flow and COPCs transport would be If the mined-out zones collapse.</p>			<p>development for the Project in terms of source of groundwater. Determining water source and groundwater ageing in the study area was discussed in the first-round response to IR-81 (Annex 1, IR-81 starting on page 216/419). Tritium concentrations in groundwater are considered potentially informative to the CSM and will be measured as part of ongoing groundwater monitoring for the Project as outlined for IR-81.</p>	
IR-89	-	ECCC	Fish and fish habitat	Appendix 7-C, Numerical Modelling: Post-Decommissioning Evaluation, Section 2.3.1.4, Desilicified Zone	<p><b>Context:</b> The Proponent states that a hydraulic conductivity value of 5x10-6 m/s was uniformly assigned to the model layers representing the Desilicified Zone. They additionally state that this value is consistent with packer and pumping tests screened in this unit that have interpreted hydraulic conductivity values ranging from 1x10-6 to 3x10-5 m/s (Appendix C), with a geomean of 6.0x10-6 m/s.</p> <p>Considering that the Desilicified Zone is of particular interest because it is the main pathway for the COPC to reach Whitefish lake, and that hydraulic conductivities are not entirely understood, ECCC recommends that a larger range of hydraulic conductivities be simulated to understand potential effects on fish and fish habitat.</p>	<p>1. Provide an in-depth rationale for choosing a value of 5x10-6 m/s as the base case for the hydraulic conductivity, in both the PH REdox EQUilibrium (PHREEQC) and Finite-Element Ground Water Flow (FEFLOW) models.</p> <p>2. Provide a rationale for keeping the sensitivity analysis within one order of magnitude considering the lack of physical data on the Desilicified Zone. Alternatively, provide contaminant transport simulation results with more</p>	<p>This response has not been accepted.</p> <p>The Proponent used calibration-constrained uncertainty analysis to establish boundaries when conducting sensitivity analysis of hydraulic conductivity in the groundwater model.</p> <p>For sensitivity analysis to adequately manage uncertainty, parameter values that are outside of those determined by calibration-constrained uncertainty analysis should be used. There always exists some degree of uncertainty in using hydrogeologic data as a complete representation of a regional groundwater system. This uncertainty can be accounted for by broadening parameter</p>	<p>In our SME’s experience, traditional “sensitivity analysis” where individual parameters are arbitrarily varied by within a subjective range can produce simulations which are inconsistent with the field-observed data. Such simulations should not be part of an EIS, as they can provide misleading results.</p> <p>Calibration-constrained uncertainty approach does not assume the data or the representation of the system are perfect or complete. Calibration-constrained models do not require a perfect fit to all the observed data, which is a recognition that there is measurement noise and structural noise present in every model. In addition, potential error in that data was accounted for by rounding the observed water levels to the nearest 0.1m (i.e., the data were not considered “perfect”) and allowing a general fit to all data (i.e., residuals are present at each observation point). Further, the analysis does not consider the data provide a “complete representation of the broader groundwater system” nor does it imply the data provides a “perfect and complete representation of the broader groundwater system”. Instead, the calibration-constrained approach tests sets of</p>	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<b>Rationale:</b> The Desilicified Zone is a critical layer in the hydrogeological model as it represents a key potential pathway of contaminants to Whitefish Lake. The base case hydraulic conductivity value (5x10-6 m/s) is even lower than the geometric mean, not to mention the highest value found. When simulating geochemical processes and contaminant transport within this important pathway a more conservative approach should be employed. Modifying this parameter will affect travel times and distribution of COPC in the subsurface.	conservative hydraulic conductivity (e.g., more than 3x10-5 m/s) values in the Desilicified Zone.  See also related: IR-96.	ranges in a sensitivity analysis. Limiting sensitivity analysis to calibration-constrained values implies that available field data is a perfect and complete representation of the broader groundwater system, which may not be an accurate assumption.  Considering the limitations of available physical data in the Desilicified Zone, a more conservative sensitivity analysis is required in order to adequately assess how contaminants may flow towards Whitefish Lake.  Please also see follow-IR-89-R1, and AD-66 in the Advice to Proponent table.	parameters within a broad range, wherein only parameters which are well informed by available observation data are constrained, while parameters not constrained by calibration data are allowed to vary more freely (i.e., to the degree that they do not otherwise impact the well-informed parameters).  For the uncertainty assessment presented in the draft EIS, hydraulic conductivity parameters along the flow path between the ore zone and Whitefish Lake were allowed to vary within a 4-order of magnitude range (i.e., 1x10 <sup>-8</sup> to 1x10 <sup>-4</sup> m/s) to find alternative parameter sets that achieve a reasonable match to observation data. With this approach, values are not varied independently, but rather parameter combinations are sought that explore the potential 4-order of magnitude range for parameters, while maintaining a match to field-observed conditions.  The most conservative of the calibrated scenarios obtained through the calibration-constrained approach presented within the EIS (i.e., those which achieved acceptable calibration statistics) were chosen for additional transport simulations. The scenarios tested hydraulic conductivity values for the desilicified zone as high as 3.7x10 <sup>-5</sup> m/s (realization 7 – predictive uncertainty case 5), which is two times higher than any measured value within this hydrogeologic unit, and 7.4 times higher than the base case calibration. Hydraulic conductivity values as high as 8.1x10 <sup>-5</sup> m/s were also tested within portions of the lower sandstone aquifer. In addition, the simulation documented as part of IR-55 presents a model wherein the hydraulic conductivity of the desilicified zone is 1x10 <sup>-4</sup> m/s, which is 20 times higher than the base case.  In summary, we reaffirm that we have already provided an ample demonstration of the potential range of outcomes which are supported by the observation data at the site.	
IR-89	IR-89-R1	ECCC	Fish and fish habitat	Appendix 7-C, Numerical Modelling: Post-Decommissioning Evaluation, Section 2.3.1.4, Desilicified Zone  IR-89 Response from Denison	<b>Context:</b> The Proponent states that the range of hydraulic conductivities considered in sensitivity analysis was limited to values that fit within a calibration constrained uncertainty analysis of the model.  Considering that the Desilicified Zone is of particular interest because it is the main pathway for the COPC to reach Whitefish lake, and that hydraulic conductivities are not entirely understood, ECCC recommends that a larger range of hydraulic conductivities be simulated to understand potential effects on the aquatic environment.  The Proponent clarified the details of the calibration-constrained uncertainty analysis that was used for parameter bounding within the model, with hydraulic conductivity sensitivity bounds determined based on model calibration values that were supported by the available physical data.  <b>Rationale:</b> ECCC agrees that calibration constrained uncertainty analysis using hydraulic head field data is useful to	Expand the sensitivity analysis of hydraulic conductivity outside of calibration constrained parameters to account for the lack of physical data in the Desilicified Zone.		See the Response to IR-89 for discussion regarding the calibration-constrained uncertainty analysis approach. As stated, we believe that asking for scenarios outside of the range supported by the available monitoring data is inappropriate as it suggests that unrepresentative, potentially misleading scenarios should be tested, documented, and presented as potential outcomes. We do not believe that should be part of an EIS.  While we do not support development of un-calibrated scenarios for inclusion within the EIS, additional scenarios that did not violate field observation data were evaluated as part of this response and presented as Attachment IR-89-R1. These scenarios further demonstrate the robust nature of the hydrogeologic setting, which has been shown to have a high assimilative capacity.  Additional groundwater flow and transport modelling scenarios were performed in response to:  <ol style="list-style-type: none"><li>IR-55, wherein the hydraulic conductivity of the Intermediate Sandstone Aquitard was increased to a maximum value of 1.0E-7 m/s, and other parameter values, including the hydraulic conductivity of the Desilicified Zone, were increased to maintain a calibrated condition.</li></ol>	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					determine probable upper limits of K values. However, there is always some degree of uncertainty in groundwater data and models. Sources of such uncertainty may include errors, lack of complete and representative field data to determine key parameters, or any number of heterogeneities associated with groundwater systems over large scales. Such uncertainties will always exist and can be accounted for by conducting a sensitivity analysis that accounts for the lack of physical data in the Desilicified Zone by running modelling scenarios using parameters that are outside of the calibration constrained values.			<div>2. IR-70, wherein a higher hydraulic conductivity within the Ore Zone post-decommissioning was tested. This is an uncertain parameter which is unconstrained by calibration data.</div> <div>3. IR-71, wherein uncertainty in future groundwater recharge rates were evaluated by varying rates by +/- 20%. Future groundwater recharge is an uncertain parameter which is unconstrained by calibration data.</div> <div>4. IRs 78 &amp; 88, wherein the effective porosity of the Paleoweathered zone was reduced by an order of magnitude to allow the initial source mass to migrate toward receptors 10-times faster. Effective porosity of the Paleoweathered zone is an uncertain parameter which is unconstrained by calibration data.</div> <div>5. IR-96, wherein the transverse dispersivity was reduced to 1m to be consistent with ratios of longitudinal-to-transverse dispersivity published in the literature (e.g., Gelhar et al.; 1992) based on anisotropic settings. Transverse dispersivity is an uncertain parameter which is unconstrained by calibration data.</div> <div>The results of these simulations are presented as part of an attachment, however in summary all scenarios produced concentrations of primary COPCs at Whitefish Lake that are below the Groundwater Quality Screening Criteria established. Exceptions include pH, iron and manganese due to naturally high background levels, as reported within the EIS.</div> <div>The scenarios presented do not change the outcome of the scenarios already reported within the EIS documentation, nor in conclusions based thereon. Thus, we did not see the need to modify the EIS.</div>	
IR-96	-	CNSC	Geology and groundwater	Appendix 7-C, Section 4.4.4, Sub-Domain Model Transport Boundary Conditions	<p><b>Context:</b> From the text, “Transport parameters were specified for diffusion (1x10-9 m2/s), longitudinal dispersivity (10 m along the plume trajectory), and transverse dispersivity (5 m)” . The source of this information is not provided in Appendix 7-C. It is unclear if the values used are defaults in the modelling software, from literature, from small-scale laboratory tests, or are site-specific values determined through tracer tests.</p> <p><b>Rationale:</b> The use of a calibrated flow model does not imply that the solute transport model is calibrated. The transport parameters (such as effective porosity, dispersivity and reactive transport parameters) can only be calibrated by matching simulated and observed spatial and/or temporal distributions of a solute. Sensitivity analysis indicates that decreasing longitudinal and transverse dispersivities by a factor of two resulted in exceedances of groundwater criteria for both selenium (Se) and cobalt (Co). Given the clear influence of these values on contaminant transport, it is important that transfer parameter values are justified in the solute transport model. In addition, the influence of large-scale heterogeneity on dispersion and solute transport predictions should be discussed, to identify any uncertainty in the model predictions, and provide confidence that the applied model is adequately representing groundwater flow and solute transport.</p>	<div>1. Please provide the source of the numerical value used for diffusion and longitudinal and transverse dispersivity, and provide justification if default values by the model code were used.</div> <div>2. Please provide a discussion on the influence of large-scale heterogeneity on dispersion and solute transport predictions in the modelling report.</div> <div>See also related: IR-89.</div>	<div>This response has not been accepted.</div> <div>CNSC staff appreciate the comprehensive information provided relating to longitudinal dispersivity and variation based on scale. However, it should be noted that guidance from Gelhar et al. (1992) and the BC MOE (2012) indicate that horizontal transverse dispersivity values should be approximately 1 order of magnitude lower than longitudinal dispersivity values, and vertical transverse dispersivity values should be approximately 2 orders of magnitude lower than longitudinal dispersivity. For the model presented in the EIS, transverse dispersivity is represented by a singular value of 5 meters, with the supporting rationale that the Gelhar et al. (1992) identified 5 meters as a representative value. It is important to note that the Gelhar et al. (1992) paper considered 5 meters to be representative for horizontal transverse dispersivity and identified that vertical transverse dispersivity is smaller than horizontal transverse dispersivity. Additionally, it is important to note that Petrotek (2021) used a transverse dispersivity of 1 m in their numerical models of the</div>	<div>As with all parameters, the values applied in the modelling analyses were intended to provide appropriate, but conservative transport predictions. It is the opinion of Denison and its SME that the dispersivity values applied are appropriate, conservative and supported by the literature values, as highlighted within the previous response to this IR (Annex 1, Attachment IR-96 starting on page 251/419). We acknowledge that Gelhar et al. (1992) recommend a 1 order of magnitude lower horizontal transverse dispersivity value, and a 2-order-of-magnitude lower vertical transverse dispersivity value, but note that such recommendation was based on observations of horizontal plume migration within overburden sand aquifers with highly anisotropic conditions (i.e., Borden and Cape Cod), which is <b>not</b> representative of the current setting. In their paper they state: “The vertical transverse dispersivity is seen to be much smaller than the horizontal transverse dispersivity, apparently reflecting the roughly horizontal stratification of hydraulic conductivity encountered in permeable sedimentary materials“. The BC MOE Guidance (2012) is considered to be a derivative of the Gelhar paper and does not add any further value.</div> <div><b>Transverse</b> dispersivity refers to spreading of the plume in the directions perpendicular to the primary advective (i.e., groundwater flow) direction. As noted in the previous response to this IR (Annex 1, Attachment IR-96 starting on page 251/419)., the transverse dispersivity value of 5 m is supported by Gelhar et al. (1992) for the scale of this site. If a 10:1 ratio of longitudinal to transverse dispersivity were implemented, a much higher longitudinal dispersion coefficient would be suggested (and supported by Gelhar et al. (1992)), which would result in even lower breakthrough concentrations at Whitefish Lake.</div>	<div>Yes</div> <div>Appendix 7-C, Section 4.4.4</div>

					<p>Further guidance on solute transport modelling can be found in BC MOE (2012) [1].</p> <p><b>Reference:</b> [1] British Columbia Ministry of the Environment (BC MOE). 2012. Guidelines for Groundwater Modelling to Assess Impacts of Proposed Natural Resource Development Activities. Report no. 194001, 385 p.</p>		<p>ore zone aquifer. CNSC staff thus request that Denison provide further information relating to why horizontal and vertical transverse dispersivity are represented using a singular value, and how this value is considered appropriate to represent both dimensions.</p> <p><b>Reference:</b> Petrotek 2021. Groundwater Model Report Phase 1, Phoenix Deposit Wheeler River Project. Prepared for Denison Mines. December 2021.</p>	<p>Recognizing this, we submit that the values applied within the scenarios documented as part of the EIS are already conservative.</p> <p><b>Vertical and Horizontal transverse</b> dispersion were treated as being equivalent (i.e., as having the same value) for this site as the dominant plume transport occurs within the desilicified zone, which is interpreted to be, and simulated, as isotropic. In isotropic media, transverse spreading should be allowed to occur equally in any transverse direction; this differs in anisotropic media, where vertical transverse spreading of the plume is lower than horizontal transverse spreading due to restricted vertical connections (i.e., joints in fractured rock, or sediment layers in sedimentary media). Further, during the vertical migration through the desilicified zone, transverse dispersion is in the X, and Y cartesian coordinates; we have no reason to expect dispersion in either of these directions is preferential, and therefore the horizontal and vertical transverse dispersivity values should be the same.</p> <p>The above discussion, supporting the dispersivity values used in the numerical modelling for the EIS, has been summarized (and references provided) in Section 4.4.4 of Appendix 7-C of the revised Draft EIS.</p> <p>Regardless, to demonstrate the robust nature of the hydrogeologic setting, an additional geochemical reactive transport simulation was performed with a longitudinal dispersivity of 10, and a transverse dispersivity of 1 for both the horizontal and vertical directions. The results of that simulation indicate that with lower transverse dispersion the concentrations reaching Whitefish Lake would be higher than the base case for some COPCs. All simulation constituents were below the groundwater quality screening criteria within the 10,000 year simulation. Details of the scenario are presented as part of Attachment IR-89-R1.</p>	
IR-100	-	HC	Indigenous Peoples' health / Socio- economic conditions	<p>Section 8, (p. 8-195)</p> <p>Section 8.5.3, Table 8.5-2, (p. 8-226)</p>	<p>Mercury is excluded as a COPC in the assessment. Inadequate consideration of mercury and methylmercury in fish and other country foods, and use of incorrect Hg-related health guideline values can underestimate the risks to human health among country food consumers.</p> <p><b>Context:</b> Section 8 states “Mercury has not been identified as a COPC for the Project as it is currently not present in the receiving environment (i.e., background condition) at detectable concentrations and will not be produced as part of the mine process; therefore, it will not be discharged to the aquatic environment.</p> <p>However, it is understood that potential nutrient enrichment-related effects are possible and can be linked to increases in mercury in the environment” (p. 8-195).</p> <p>Table 8.5-2 shows that there is mercury present in the tissues of Northern Pike and White Sucker sampled in the waterbodies</p>	<p>1. Include mercury (including methylmercury) as a COPC in the assessment given the baseline presence of mercury in sampled fish, the potential increase of methylmercury in receiving waters due to nutrient enrichment resulting from the Project, the significant fish consumption by the local population and that country foods, particularly fish, are an important source of dietary exposure to mercury.</p> <p>2. Assess health risks from fish consumption by calculating hazard quotients for baseline and predicted methylmercury levels in country foods using Health</p>	<p>This response has not been accepted.</p> <p>Health Canada does not support the responses to points 1 and 2 of IR-100.</p> <p>1. The response to IR-100 point 1 indicates that mercury (including methylmercury) was not included as a COPC in the assessment because mercury is not associated with the local geology and therefore not expected to be released in the effluent at measurable levels, and because prediction of methylmercury production, based on a variety factors, is not practical. Health Canada continues to recommend that mercury (including methylmercury) be included in the assessment given</p> <p>1) the detected presence of mercury in fish under baseline conditions, and</p> <p>2) the high consumption rates of fish and other country foods by Indigenous land</p>	<p>1. The EA scope does not include quantifying current risks that don’t have project activity connections. Per CSA N288.6 <i>Environmental Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills</i>, Section 6.2.5.4 "<b><u>The goal is to identify and describe the contaminants and physical stressors that are relevant to the site and operations and that require further quantitative evaluation</u></b>". The contaminants identified for further evaluation are then referred to as COPCs. These decisions are based on information gathered during site characterization."</p> <p>Mercury was not identified as a project issue based on mining and milling methods and though it is understood that mercury is a ubiquitous earth element at trace levels it is not identified as uniquely being associated with the local geology; as such, Denison does not believe it is appropriate to quantify existing risk when there is no incremental project risk. Public or existing concerns about mercury do not make this topic an EA question. At this time there is no way to accurately predict potential methylation rates.</p> <p>While the draft EIS (Section 8) highlights increased sulphate concentrations downstream of the Site during period of effluent discharge as a potential factor related to increased methylation (in the presence sulphate reducing bacteria in sediment), it is one of several factors in combination that would need to occur. For example, the IR highlights nutrient enrichment as a contributing factor –significantly increased primary productivity via enrich</p>	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>within the local study area and in Russell Lake. These fish are regularly consumed by nearby communities according to the ERFN 2017 dietary survey.</p> <p>In Section 8.5.3, fish tissue concentrations are compared to Health Canada’s human health risk- based maximum permissible mercury concentration (0.5 µg/g wet weight), which is applicable to most species of commercially sold fish rather than country foods.</p> <p><b>Rationale:</b> It is recommended that mercury be listed as a COPC considering it is in fact present in fish tissue under existing conditions, the significant consumption of fish by the local Indigenous communities, and its toxicological significance to human health.</p> <p>Further, the Health Canada provisional tolerable daily intake (pTDI) value of 0.2 µg/kg/bw/day (<a href="#">Health Canada, 2007</a>) is a more appropriate reference level when evaluating consumption of mercury in fish by Indigenous people, as it allows for the consideration of food consumption patterns in the risk assessment that differ from the general population and is protective of the most sensitive sub-group (i.e., developing fetus).</p> <p>It is important to note that methylmercury, rather than inorganic mercury, is generally the predominant mercury species present in fish and is also the most toxicologically significant form. The assumption of 100% of mercury in fish and other country food items being present as methylmercury ensures that the potential health risks are not underestimated. It is unclear, however, if the mercury data presented throughout the EIS represent total mercury, inorganic mercury or methylmercury.</p>	<p>Canada’s pTDI for methylmercury (<a href="#">Health Canada, 2007</a>).</p> <p>3. Clarify whether mercury data represented throughout the EIS represents total mercury, inorganic mercury or methylmercury.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> Health Canada recommends including methylmercury in the list of COPCs to be monitored in fish throughout all project phases.</p> <p>See also related Advice to the Proponent: AD-31.</p>	<p>users, particularly intensive land users such as the Trapper receptor.</p> <p>2. The response to IR-100 point 2 continues to state that the HC maximum level (ML) for mercury of 0.5 µg/g (or 0.5 ppm) will be used to assess risks to human health from fish consumption during monitoring. The use of the HC ML for mercury is not appropriate in this case as it was developed for retail fish using consumption rates for the Canadian general population. Health Canada’s provisional tolerable daily intake (pTDI) values of 0.20 µg/kg bw/day day for young children and women of childbearing age (<a href="#">Health Canada, 2007</a>) are more appropriate reference levels when evaluating consumption of mercury in fish by Indigenous people, as it allows for the consideration of food consumption patterns in the risk assessment that differ from those used to develop the ML for retail fish and is protective of the most sensitive sub-group (i.e., developing fetus).</p> <p>For instance, the HC Human Health Risk Assessment of Mercury in Fish and Health Benefits of Fish Consumption (<a href="#">Health Canada, 2007</a>) currently employs 40 g as an estimate of daily fish intake by adults who are at the high end of fish intake. This rate is below the rate of consumption for intensive land users for the Project, which is ~500g of fish per day, meaning that the HC ML may not be protective of all land users/receptors.</p> <p>Health Canada reiterates its recommendation to assess health risks from fish consumption by calculating hazard quotients for baseline and predicted methylmercury levels in country foods using Health Canada’s pTDI values for methylmercury (<a href="#">Health Canada, 2007</a>).</p>	<p>resulting in high levels of organic carbon in sediments (through algal senescence, deposition, decomposition). This could in fact be a contributing factor, but no such nutrient enrichment has been predicted in the draft EIS as no incremental Project-related nutrient source has been identified. Additionally, the draft EIS does not raise a concern that the Project would cause anoxia in study area lakes, another prerequisite for methylation driven by sulphate reducing bacteria. Denison and its SME’s believe that the treatment of mercury in the draft EIS is appropriate given the level of risk related to the Project. Denison acknowledges the concerns that have been raised by the Indigenous Communities of Concern through its engagement process, as well as those by the FIRT, and in response to those concerns has committed to implementing a mercury monitoring program.</p> <p>In addition to Denison's future monitoring programs, there are provincial fish consumption guidelines for consumers available at: <a href="https://pubsaskdev.blob.core.windows.net/pubsask-prod/76439/76439-Mercury_in_SK_Fish_-_Guidelines_for_Consumption_-_2015.pdf">https://pubsaskdev.blob.core.windows.net/pubsask-prod/76439/76439-Mercury_in_SK_Fish_-_Guidelines_for_Consumption_-_2015.pdf</a>. The guidelines in Saskatchewan for Russell Lake indicate the recommended number of meals per month for northern pike for the general and sensitive population. Further, the Eastern Athabasca Regional Monitoring Program (<a href="https://www.earmp.ca/">https://www.earmp.ca/</a>) provides information on community monitoring programs which includes analysis of mercury in fish tissue. In the most recent 2022 EARMF report mercury was measured in lake trout and lake whitefish and the conclusions were that mercury levels were low (ranging from &lt;0.01 mg/L to 0.5 mg/kg) and it was concluded that fish are safe to eat. Monitoring will continue as part of the program (<a href="#">EARMF+2022+2023+Community+Report.pdf (squarespace.com)</a>). The results of the Wheeler River baseline fish tissue sampling program showed measured fish tissue concentrations near the Project in the range of 0.01 to 0.48 mg/kg, which is consistent with that observed in the EARMF. This would indicate that based on baseline conditions fish are considered safe to eat, and no further baseline assessment is warranted.</p> <p>2. As previously indicated, it is currently not practical to calculate hazard quotients for baseline and predicted methylmercury levels in country foods as there is no information on baseline methylmercury and no way to realistically predict the project related methylmercury. Denison has previously committed to a mercury monitoring program which will include assessment of mercury and methylmercury in fish tissue. That information can feed into future hazard quotient calculations if warranted. Denison agrees to use Health Canada’s 2007 provisional tolerable daily intake (pTDI) values of 0.20 µg/kg bw/day for young children and women of childbearing age for future assessments, or the relevant updated value at that time. Denison has committed to a monitoring and follow-up program, which will include measurements of fish health for comparison to baseline data and regulatory criteria (i.e., Canadian Tissue Residue Guidelines for the Protection of Wildlife Consumers of Aquatic Biota [e.g., CCME 2000], MDMER [Government of Canada 2022], CSA N288.4-19 (CSA Group 2019), and applicable United States Environmental Protection Agency criteria (e.g., US EPA 2021). At a minimum, this will include collection of representative fish species from multiple trophic levels and size classes to investigate the bioaccumulation potential of non-radiological (e.g., molybdenum, selenium, mercury, methyl mercury and other metals) and radiological parameters. Fish will also be assessed for their general health condition</p>

IR-101	-	ECCC CNSC	Fish and fish habitat Fish and fish habitat	Section 8.1.1.3, Section 8.2.1.3 Aquatic Environment	<p><b>Context:</b> In Section 8.1.1.3 Spatial and Temporal Boundaries the Project Area, Local Study Area (LSA) and Regional Study Area (RSA) are established as they pertain to surface water quantity. The same is done in Section 8.2.1.3 for surface water quality. In Section 8.1.1.3 Figure 8.1-4, the locations of the Project Area, LSA, RSA and surface water features and monitoring stations are provided.</p> <p>However, the locations of wetlands located near the Project area and within the LSA and RSA have not been provided. The location of wetlands within or near the Project footprint, as well as the other wetlands existing within the LSA can be confirmed from Part II_S9 Terrestrial Environment, Section 9.2.3.3 Figure 9.2.-8, including the wetland classifications. There appears to be at least one shallow open water wetland and several bogs located within the Project Area. There is no consideration of wetlands or potential effects to wetland hydrology, surface water or sediment quality throughout the aquatic environment assessments. There is no baseline information regarding wetlands and their status as fish habitat and ecological function, or assessment of potential effects to flow rates, water levels, water quality, sediment quality, or biota.</p> <p><b>Rationale:</b> There is currently not enough information provided for ECCC to provide advice on the potential risks of the proposed Project to wetland hydrology, surface water and sediment quality within the LSA. This pathway of effects is important to assess in terms of potential effects to wetland habitat availability and quality due to changes in flow rates, water levels, water quality, sediment transport, sediment quality and potential effects to terrestrial and aquatic receptors. It is necessary to evaluate if changes in groundwater and surface water runoff flows and routing will affect water levels and habitat availability within wetlands. Potential effects from COPCs and radionuclides to surface water and sediment, or potential effects to ecological receptors within wetlands have not been evaluated.</p>	<p>1. Provide baseline information regarding wetland characterization within the Project Area and LSA, including: locations, wetland type, size, water surface elevation, depth, water flow pathways, and the presence of wildlife receptors including presence of fish/fish habitat within the Aquatic Environment section of the draft EIS. If this information is available in annexes or baseline studies, summarize it within the main body of the Aquatic Environment section of the draft EIS with references to respective documents for review.</p> <p>2. Provide baseline information on wetland surface water and sediment quality characterization for wetlands within the Project footprint.</p> <p>3. Provide an assessment of potential effects to wetlands within the LSA and potential effects to ecological receptors during all phases of the proposed Project.</p> <p>4. Provide further information on mitigation measures and monitoring that would be applied for the protection of wetlands.</p>	<p>This response has not been accepted for the following reasons:</p> <p>1. The response (#1(d)) by the proponent states that “Surface elevations for the wetland have been assessed and the information is summarized below and in the Attachment IR-101 Figure 1 Elevations of wetland features in the LSA” but it is not indicated that this information will be placed in the EIS. CNSC staff requests proponent to include the information provided in response #1(d) and Attachment IR-101 Figure 1 (Elevations of Wetland Features in the LSA) and Attachment IR-101 Figure 2: (Denison Wheeler River Project SSA and Wetland Feature Distribution) in the EIS.</p> <p>2. The Proponent stated in response #2 (a) and (b) that “surface water quality and sediment quality in wetlands were not specifically sampled in the wetland complexes adjacent to the Project footprint during the original baseline assessment.” CNSC staff requests the proponent to provide justification why they have relied on measurements upstream and downstream of the wetlands over direct measurements in the wetland areas. It is recommended to conduct direct measurements in the wetland areas.</p> <p>3. The information provided did not satisfy the IR. Additional information regarding the potential impacts to wetlands due to changes in surface water quality and sediment quality should be included within Section 8.3 of the main EIS. This is needed to fully understand the scope of potential effects to the aquatic environment.</p> <p>a. Update Section 8.3 to include additional information on predicted water and sediment quality impacts to wetlands from the</p>	<p>1. This information has been incorporated into the EIS as Appendix 8-F.</p> <p>2. Denison is committed to conducting surface water quality and sediment quality in wetlands within the LSA and specifically in wetlands directly adjacent to the Operation prior to construction commencing for the purposes of collecting baseline to further assess the effectiveness of mitigation measures.</p> <p>3(a). Section 8.3 has been updated and specifically sections 8.3.1, 8.3.1.2, 8.3.3, 8.3.4.1, 8.3.4.2 (8.3.4.2.2 and 8.3.4.2.3, 8.3.4.2.5), 8.3.5, 8.3.7, 8.3.9 to include consideration of wetlands as aquatic habitat features within the context of their potential to provide fish and fish habitat. Sections 9.2.4.2.1, 9.2.6.2.1, 9.2.6.4.1, 9.2.7.3, and 9.2.9 have been updated to be aligned with Section 8.</p> <p>3(b). Section 8.3 has been updated and specifically sections 8.3.1, 8.3.1.2, 8.3.3, 8.3.4.1, 8.3.4.2 (8.3.4.2.2 and 8.3.4.2.3, 8.3.4.2.5), 8.3.5, 8.3.7, 8.3.9 to include consideration of wetlands as aquatic habitat features within the context of changes to water quality and sediment quality within the LSA due to the Project. Sections 9.2.4.2.1, 9.2.6.2.1, 9.2.6.4.1, 9.2.7.3, and 9.2.9 have been updated to be aligned with Section 8.</p> <p>4. Denison is committed to conducting surface water quality and sediment quality in wetlands within the LSA and specifically in wetlands directly adjacent to the Operation prior to construction commencing for the purposes of collecting baseline to further assess the success of mitigative measures.</p>	<p>Yes</p> <p>Appendix 8-F (added as a new appendix in support of Section 8 of the revised Draft EIS)</p> <p>Revised Draft EIS, updates to sections 8.3.1, 8.3.1.2, 8.3.3, 8.3.4.1, 8.3.4.2 (8.3.4.2.2 and 8.3.4.2.3, 8.3.4.2.5), 8.3.5, 8.3.7, 8.3.9, Sections 9.2.4.2.1, 9.2.6.2.1, 9.2.6.4.1, 9.2.7.3, and 9.2.9 for alignment with Section 8.</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
							<p>Proponent’s response to directly consider wetlands as fish and fish habitat for the purpose of assessing water quality impacts.</p> <p>b. Update Section 8.3 to provide an assessment of potential effects to wetlands from water and sediment quality changes within the LSA.</p> <p>4. It is stated in response #4 that “[...] Updated baseline information on wetland depths and water-levels may be useful in providing a frame of comparative reference to potential changes during the operation, decommissioning and post-decommissioning phases of the project” and CNSC staff agrees with the proponent and recommend collection of monitoring information on the wetland areas.</p>		
IR-102	-	ECCC CNSC	Fish and fish habitat Fish and fish habitat	Section 8.1.3.1  Appendix 8-C, including Appendix II, Table 1 (p. 2)	<p><b>Context:</b> Only one measured-results dataset for baseline stream flow exists that is relevant to the Project data from the Water Survey of Canada (WSC) station for Wheeler River (06DA005), and the Proponent used constructed records. The Proponent states that data from 06DA005 was used to extend local hydrometric station records and calculate baseline water quantity metrics. However, this was done through a complex combination of daily data correlation or monthly unit area runoff relationship, with or without offset, where some stations were based off constructed records instead of the real long-term dataset at 06DA005 (see Section 8.1.3.1 and Appendix II of Appendix 8-C, Table 1, p.2 (PDF p. 569)). Appendix 8-C references previous reports in its own appendices, but no equations are shown and there is no description of the accuracy of the fit, or explanation for not referring back to the one dataset (WSC station). Subsequent statistics calculated from these constructed records (e.g., 7Q10 needed for SK water licenses) would be affected by this uncertainty.</p> <p><b>Rationale:</b> Fish habitat can be altered by changes to depositional and erosional patterns in streams. Confidence in the Proponent’s estimate of baseline water quantity, and by extension Project effects to fish habitat, cannot be established without a complete description of the method applied, as well as a discussion of its accuracy.</p>	<p>1. Provide more information on the extension of Project hydrometric station data using WSC station 06DA005.</p> <p>2. Discuss the accuracy of any correlations/relationships and justify any deviations from simple unit area runoff relationships in the estimation of baseline water quantity values for the Project hydrometric stations. Constructing records from records that are themselves constructed is not recommended.</p> <p>3. If baseline water quantity metrics need to be revised, discuss (if any) resulting changes to the effects assessment.</p>	<p>This response has not been accepted for the following reasons:</p> <p>1. Given the limitation of data availability extension of flow records based on the nearest active WSC hydrometric station (Wheeler River (06DA005)) is acceptable although other methods are not shown to be explored by the proponent including rainfall-runoff modelling techniques (such model can be calibrated at 06DA005 thus computed flow at subbasins or sub watershed can be estimated with good degree of confidence), drainage area ratio method, etc. CNSC staff recommends proponent to consider aforementioned methods or similar or provide justification why other methods were not considered.</p> <p>2. In Attachment IR-102 Figure 1 to 7 show the plots of measured versus the estimated daily flows using the relationship developed for extension of daily flows at SA-1, SA-2, SA-3, SA-4, SA-5, SA-6, SB-3, LA-1 and LA-5. CNSC staff however finds it difficult to determine the predictive accuracy of the relationships based on visual comparisons. Therefore, CNSC staff requests that the proponent provide quantitative measures of prediction accuracy, for example in the form of Root Mean Square Error, correlation coefficient, etc., for the Equations presented in Table 1 of Attachment IR-102.</p>	This response is provided in Attachment IR-102	Yes  Appendix 8-C – the Attachment IR-102 added as Appendix III.

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
							<p>In addition, CNSC staff requests that the proponent provide clarification on whether the current relationships are only limited to baseline characterization or will also be considered for estimation of design flows at SA-4 and SA-5 for culvert/crossing design for the access road.</p> <p>3. Response to third part of the IR to be re-assessed when proponent addresses the above two comments ([1] and [2]).</p>		
IR-103	-	ECCC CNSC	Fish and fish habitat Fish and fish habitat	Section 8.1.3.4 Climate Change Influenced Extreme Events	<p><b>Context:</b> The Proponent notes that Intensity duration frequency (IDF) curves are used to estimate the size of water management structures around a site and that the IDF curves are often specific to climate monitoring stations.</p> <p>The Proponent used the IDF_CC Tool 5.0 developed by the Institute for Catastrophic Loss Reduction (2021) which generates Intensity Duration Frequency (IDF) curves at ungauged locations in order to estimate future IDF curve values under influences of climate change. This tool generates sub-daily values at ungauged locations by interpolation and distance weighing from gauged locations.</p> <p><b>Rationale:</b> IDF trends exhibit random behavior at some locations and correlated behavior at other locations. The choice of gauged locations will infer the statistics for the ungauged locations, including the IDF trends. Without identification of the gauged locations, it is not possible to assess if the modelled data is realistic or not. If the modelled data is not accurate the design of water management structures on the site may not be sufficient resulting in the potential for impacts to the Project from flooding or extreme weather events.</p>	Provide the gauged stations used to generate the sub daily duration values found in Table 8.1-6: Baseline of Intensity Duration Frequency data.	<p>This response has not been accepted.</p> <p>In the Context and Rationale of AD-15 in the Annex 1 – Denison Response, ECCC recommends that the Proponent consult CSA PLUS 4013:19 (2019) <i>Technical guide: Development, interpretation and use of rainfall intensity-duration-frequency (IDF) information: Guideline for Canadian water resources practitioners</i> regarding the consideration of future changes in short-duration precipitation extremes. In IR-103, ECCC indicated that in order to assess the accuracy of the Intensity duration frequency (IDF) curves, ECCC required that the Proponent provide the gauged stations generating the values for the modelled data. The Proponent provided the closest gauged stations, however, the future short duration precipitation values were based on statistical relationships fitted between local scale observed extreme precipitation and modelled simulations extremes.</p> <p>Additionally, on page 15-19 of the draft EIS states that: “Denison will apply adaptive management that includes monitoring climate factors so that they can proactively mitigate or prevent adverse climate effects on the Project.” Denison did not provide details on how climate factors will be considered within their adaptive management plans.</p> <p><b>Rationale:</b> Estimates of future short duration precipitation that are based on statistical relationships fitted between local scale observed extreme precipitation and modelled simulations extremes, such as the approach used by the</p>	Please see Attachment IR-103	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
							<p>Proponent, are unlikely to provide reliable projections. This is because the amount of information regarding changes in local-scale observed extreme precipitation contained in short records is not sufficient to constrain a regression (model the statistical relationship) between local and larger scale simulations (Li et al., 2019; ECCC 2022). An alternative approach is to base future projections on a comprehensive assessment that integrates climate science understanding and model projections over a large region. The recent Canadian Standards Association (CSA 2019) guidance on IDF for Canadian Water Resources practitioners provides such an assessment.</p> <p>In terms of adaptive management, the Proponent should clearly outline what climate factors will be monitored to mitigate or prevent adverse climate-related effects. This should include information on when and how the climate factors would be monitored and under what circumstances particular adaptive management approaches would be applied.</p> <p>In order to assess the Proponent’s adaptive management strategies for future extreme precipitation events, ECCC requests that the Proponent consult the CSA (2019) guidance when using future IDF projections in the Project design and provide revised estimates of the potential future changes in short-duration precipitation extremes over the Project’s duration.</p> <p>1. Provide revised estimates of the potential future changes in short-duration precipitation extremes over the Project’s duration as relevant to the Project design.</p> <p>2. Demonstrate how the CSA (2019) guidance will be incorporated in the Project design when developing and considering future IDF projections and estimates of the potential future changes in short-duration precipitation extremes.</p> <p><b>References</b> CSA Group. (2019). Technical guide: Development, interpretation and use of rainfall</p>

IR-104	-	ECCC	Fish and fish habitat Fish and fish habitat	Section 8.1.3.4.2 Probable Maximum Precipitation (PMP) Events  Appendix 8C	<p><b>Context and Rationale:</b> The Proponent notes: “The probable maximum precipitation (PMP) event is a design standard value for an extreme rainfall event. The PMP event does not have an estimated return period but is instead based on the theoretical maximum amount of water that a storm could produce based on the maximum persisting dew point.”</p> <p>The Proponent provides a PMP value of 489.3 mm, which is based on data and methodologies available in 1999, taken from the <a href="#">Atmospheric Environment Branch Report (1999), Report Number AHSD-R99-01</a>. The Proponent references Appendix 8C for details. Appendix 8C contains no supplementary information other than what is already provided in Section 8.1.3.4.2.</p> <p>The assumptions and methodologies presented in the report are the results of time series analyses available in 1999. As time series evolve so do the derived statistics. In order to assess potential flood risks and impacts to the Project from flooding, data that is current and representative of the changing climate is needed. The Proponent should explain why they’ve used data from 1999 rather than using up to date data, describe what alternative methods for determining PMP they have considered, and describe how they will support their use of 489.3 mm as a PMP, or describe how they will generate a refreshed PMP. The main factor that influences the statistical data output is the length of the time series hence the reason to keep the statistical data. The PMP values can be substantially (&gt;10%) different if two decades of data is used in the statistical analysis.</p>	<p>1. Provide a revised PMP value (using up to date data) or justify the use of a PMP that is based on data and methodologies from 1999 as opposed to a more recent time series analysis.</p> <p>2. Describe the alternative methods for determining PMP values that were considered. Include descriptions of both “statistical” outcomes and “rational” outcomes as applicable.</p> <p><b>Technical Discussion Required:</b> Yes</p>	<p>This response to part 1. has not been accepted.</p> <p>There are an additional 24 years of meteorological datasets since the 1999 study thus all historical rainfall extremes including those since 1999 study should be considered to estimate up to date PMP at the Project site The proponent’s justification on whether the 1999 or 1994 PMP estimates are current and conservative should be substantiated based on meteorological data analysis. An estimation of updated PMP is achievable by the proponent as meteorological data is freely available and accessible from ECCC and the proponent should provide a revised PMP.</p> <p>The Proponent should also clarify how recent the data used to calculate the PMP or the time series is and explain the use of an older data set that will not produce as accurate of a PMP value as a more recent data set would produce, even when estimates are conservative.</p> <p>Specifically, a. Explain the rationale for the use of the data set which was used to derive the PMP. B. Clarify if the PMP and/or the time series was calculated using more recent data.</p> <p>This will allow for an accurate evaluation of the validity of results derived from the data sets selected by the Proponent.</p>	<p>To provide comfort to the reviewer that the PMP of 493 that was retained for design purposes is appropriate, we have undertaken an analysis of the available empirical data available for the Max 1-day precipitation annual average historical data for Tomblin Lake, high carbon (RCP8.5) is provided with 90% confidence intervals. The data set used is from 1950 to 2016 and is historical measured precipitation data (<a href="https://climateatlas.ca/data/grid50k/074H06/maxdaypr_2030_85/line">https://climateatlas.ca/data/grid50k/074H06/maxdaypr_2030_85/line</a>) . The period of 2023 to 2065 is considered a good representation of the period of mine life from construction through to early post-decommissioning (i.e. &gt; 40 years).</p> <p>As shown in Table 1, the maximum 1-day precipitation event from historical records for the area is 52 mm. This average is based on empirical collected data and not a simulated or predicted hindcast value. As, such the PMP that has been adopted for design basis measures is 9.6 x the maximum 1-day precipitation event that has been recorded since 1950 and is inclusive of data up to 2016. The predicted Ensemble data shows a reduction in the maximum 1-day precipitation event. Therefore, we assessed the maximum value of all 24 models that make up the ensemble values. For Tomblin Lake grid, the greatest maximum 1-day value was shown for the period of 2023 to 2065 was 96.1 mm, which is 5.2x less than the design basis PMP. Denison feels strongly that the presentation of this historical data provides clear indication that the design basis PMP is of a magnitude that will be reasonable for water management at the site during in the short-term and for the life of the mine.</p> <table><tr><th colspan="4">Table 1: Maximum 1-Day Precipitation for the Tomblin</th></tr><tr><th rowspan="2">Statistic</th><th colspan="3">Maximum 1-Day Precipitation Event (mm)</th></tr><tr><th>Historical (1950-2013)</th><th>Predicted Ensemble (2023 to 2065)</th><th>Predicted (2023 to 2065)</th></tr><tr><td>Mean</td><td>23.82</td><td>25.91</td><td>32.35</td></tr><tr><td>SD</td><td>8.75</td><td>2.09</td><td>14.90</td></tr><tr><td>Min</td><td>9.40</td><td>21.00</td><td>13.20</td></tr><tr><td>Max</td><td>52.00</td><td>31.00</td><td>96.10</td></tr><tr><td>10% Confidence Interval</td><td>22.06</td><td>25.38</td><td>31.82</td></tr></table>	Table 1: Maximum 1-Day Precipitation for the Tomblin				Statistic	Maximum 1-Day Precipitation Event (mm)			Historical (1950-2013)	Predicted Ensemble (2023 to 2065)	Predicted (2023 to 2065)	Mean	23.82	25.91	32.35	SD	8.75	2.09	14.90	Min	9.40	21.00	13.20	Max	52.00	31.00	96.10	10% Confidence Interval	22.06	25.38	31.82	No

								90% Confidence Interval	25.57	26.44	32.88		
								Despite Denison’s reiteration that the PMP is adequate for the EA level design basis, Denison is committed to revisiting the estimates per CNSC’s recommendations, as applicable, for the licensing phase of the Project.					
IR-107	-	CNSC  ECCC	Aquatic environment	Section 8.2.3.3, Existing Surface Water Quality	<p><b>Context:</b> Under the methodology and metrics section (8.2.3.1) it is stated baseline water quality was sampled in 2016, 2018, and 2019. Looking at the data in Appendix A of Appendix 8D it seems that some waterbodies have little data available for baseline characterization. For example, Whitefish Lake only has 3 and 5 samples taken between its two sample stations, with sampling frequency seeming intermittent.</p> <p><b>Rationale:</b> The amount of data available for baseline water quality characterization does not seem sufficient to adequately characterize the baseline and the variation it would experience. An effective baseline characterization is vital to ensure water quality is indeed not being affected by the Project. In addition, it is not clear if data quality objectives were applied to determine baseline information was adequate.</p> <p>To meet CEAA 2012 requirements, and CNSC expectations outlined in REGDOC 2.9.1, Environmental Principles Assessments and Protection Measures, the applicant is required to complete a characterization of the baseline environment.</p> <p>As described in REGDOC 2.9.1 Appendix B.2, Characterization of the Baseline Environment for Environmental Assessment Under CEAA 2012, the “baseline information should be sufficient to support the use of an aquatic dispersion model to conduct the site-specific ERA and to support an assessment of the effects of the environment on the facility or activity”</p> <p>In addition, the “applicant or licensee should include an assessment of any limitations or gaps in the quality and extent of baseline data and methods, as well as the method(s) by which they have been addressed.”</p>	<p>Please clarify which data quality objectives were used for the baseline characterization data. Please provide justification whether the number of datapoints collected with inconsistent frequency in baseline surface water characterization is sufficient to meet data quality objectives and to adequately characterize the baseline, and whether Denison is confident that the data collected is enough for a robust water quality baseline characterization.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> CNSC recommends that additional water samples are collected and analyzed at a consistent frequency to ensure a robust baseline</p>	<p>This response has not been accepted.</p> <p>From the baseline water quality data table (Table A-1 of Appendix 8D) it remains unclear that water quality was sampled on a monthly basis in 2016, 2018, and 2019, mainly due to Table A-1 referring to specific sampling dates, instead of an mean value of 12 samples/year. It is also unclear which federal requirements Denison is referring to using in their response. Staff are supportive of continued baseline monitoring to maintain an accurate dataset of baseline conditions.</p> <p>CNSC and ECCC staff have the following expectations:</p> <ol style="list-style-type: none"><li>1. Provide the monthly monitoring data referenced in the response or indicate where it can be found within the EIS and its appendices.</li><li>2. Confirm which federal requirements were used when assessing potential impacts through EA.</li><li>3. Confirm which data quality objectives were used to establish the baseline, provide references if available</li><li>4. Incorporate the additional available baseline data collected into the analysis and conclusions of the finalized EIS and ERA to increase the robustness of the established baseline.</li></ol>	The response to this IR is provided in Attachment IR-107.					No
IR-108	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.2.3.3 Aquatic Environment	<p><b>Context:</b> Tables 8.2-2 and 8.2-3 provide summaries of the baseline surface water quality in the LSA. No justifications for the selection of water quality guidelines have been provided. COPCs that require calculations based on other parameters such as hardness, pH, or temperature to derive guidelines (i.e., ammonia, cobalt, zinc, etc.) should be indicated within the table, with a note specifying the parameter values used in the calculations, so that thresholds may be confirmed. No baseline data for un-ionized ammonia has been provided, which is a Schedule 4 substance</p>	<ol style="list-style-type: none"><li>1. Update Tables 8.2-2 and 8.2-3 to include all COPCs that require effluent characterization and receiving environment monitoring under the MDMER.</li><li>2. Update Tables 8.2-2 and 8.2-3 to include missing or corrected water quality guidance thresholds,</li></ol>	<p>This response has not been accepted.</p> <p>There are incorrect guidelines remaining in the updated tables, and the supporting information on parameter values used to derive benchmarks has not been provided. This information is required to understand potential changes to surface water quality from Project related activities and facilitate threshold confirmation. Use of the incorrect</p>	The response to this IR is provided as Attachment IR-108 and details can be found therein. Briefly, Tables 8.2-2 and 8.2-3 in Section 8 of the revised Draft EIS have been updated as requested.					Yes  Revised Draft EIS, Section 8.2.3.3, Tables 8.2-2 and 8.2-3.

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>requiring monitoring under the MDMER. For cobalt, manganese, and vanadium, Federal Environmental Quality Guidelines (FEQGs) and/or CCME Canadian Water Quality Guidelines (CWQGs) for the Protection of Aquatic Life have not been included. A guideline of 26 mg/L has been provided for molybdenum as a Saskatchewan Environmental Quality Guidelines (SEQG), however the actual SEQG is 31 mg/L and the CCME CWQG is 0.073 mg/L.</p> <p><b>Rationale:</b> In order to assess potential changes to surface water quality from Project related activities, ECCC requires that data on all parameters that require MDMER effluent and receiving environment monitoring be provided for assessment, including accurate water quality guidelines where available.</p>	<p>and information on values used to derive thresholds for COPCs that are dependent on general parameters.</p>	<p>threshold could allow for effluent to be discharged at concentrations exceeding MDMER limits.</p> <p>See also follow-up IR-108-R1.</p>		
IR-108	IR-108-R1	ECCC	Change to an environmental component due to	<p>Section 8.2.3.3 Aquatic Environment</p> <p>IR-108 Response from Denison</p>	<p><b>Context:</b> Incorrect benchmark environmental quality guidelines and guidelines that cannot be verified remain within the updated Tables 8.2-2 and 8.2-3 provided in the Proponent’s response. The Proponent provided an Aluminum Saskatchewan Environmental Quality Guidelines (SEQG) value of 0.005 mg/L in both tables. This is incorrect and appears to be the guideline for irrigation, not the guideline for protection of aquatic biota. The Proponent provided a Molybdenum SEQG of 26 mg/L in both tables. This value is incorrect. The correct SEQG for Molybdenum is 31 mg/L and the Canadian Water Quality Guideline (CWQG) is 0.073 mg/L. The Proponent provided a Nitrate SEQG of 13.29 mg/L in both tables. This value is incorrect. The correct SEQG for Nitrate is 3 mg/L and the CWQG is 13 mg/L.</p> <p><b>Rationale:</b> In order to verify the benchmark environmental quality guidelines that are calculated based on environmental modifying factors such as pH, hardness and dissolved organic carbon (DOC), the specific concentrations of these environmental modifying parameters used in the calculations must be provided. Additionally, incorrect benchmarks for Aluminum, Molybdenum, and Nitrate remain within the updated tables provided by the Proponent. No benchmark was provided for Manganese. It is not clear if Total Chromium or Hexavalent Chromium was measured as the table does not specify, and the benchmark provided was for Hexavalent Chromium. This information is required to understand potential changes to surface water quality from Project related activities and facilitate threshold confirmation. Use of the incorrect threshold could allow for effluent to be discharged at the wrong concentration.</p>	<p>1. Update Tables 8.2-2 and 8.2-3 to include footnotes with the concentrations of environmental modifying parameters such as pH, hardness and DOC used to derive guidelines for Aluminum, Cadmium, Copper, Lead, Manganese, Nickel and Zinc.</p> <p>2. Update Tables 8.2-2 and 8.2-3 to include the correct benchmark guideline value for Aluminum, Molybdenum and Nitrate. Include the concentrations of environmental modifying parameters needed for deriving guidelines. If the most stringent guideline value is not selected for use, provide a rationale for use of the chosen guideline.</p> <p>3. Update Tables 8.2-2 and 8.2-3 to include the calculated guideline value for manganese and the environmental modifying parameter concentrations used to calculate the guideline. A benchmark environmental quality guideline has not been provided for Manganese, however a chronic CWQG guideline exists that can</p>		<p>Please see response to IR-108 and Attachment IR-108.</p>	<p>Yes</p> <p>Revised Draft EIS, Section 8.2.3.3, Tables 8.2-2 and 8.2-3.</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
						be derived based on environmental modifying parameter concentrations.  Update Tables 8.2-2 and 8.2-3 to specify if Total Chromium or Hexavalent Chromium was measured.  See also related IR-115-R1.			
IR-109	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.2.4.1.1 Aquatic Environment	<p><b>Context:</b> In this section it is stated “Treated water from the IWWTP will be pumped to the three Effluent Monitoring and Release Ponds (each 3,300 m3). These ponds will be designed to hold effluent for 72 hours for testing before discharge to the environment” (p. 8-75). It is unclear what procedure will be followed if effluent in monitoring ponds does not meet discharge requirements following testing.</p> <p>Additionally, it is also stated that “Treated water in the Effluent Monitoring and Release Ponds will be monitored prior to release to a surface waterbody or injected into groundwater via deep well injection.” However, the MDMER pursuant to the Fisheries Act requires all mine effluent and seep. From the mine site that contain deleterious substances be discharged through a final discharge point.</p> <p><b>Rationale:</b> In order to fully understand effluent management, more information is required regarding the procedure for managing effluent in monitoring ponds that does not meet discharge requirements. It is unclear how effluent that does not meet discharge requirements will be managed if it needs re-treatment and re-testing prior to discharge.</p> <p>ECCC reminds the Proponent that Project effluent from all final discharge points must meet federal legislation requirements.</p>	Provide further information regarding management of effluent in monitoring ponds that does not meet the requirements for discharge under the MDMER.	<p>This response has not been accepted.</p> <p>There are statements made throughout the EIS that “Treated water in the Effluent Monitoring and Release Ponds will be monitored prior to release to a surface waterbody or injected into groundwater via deep well injection.” However, the Proponent has confirmed that all treated effluent will be discharged to Whitefish Lake through a final discharge point to ensure it meets <i>Metal and Diamond Mining Effluent Regulations</i> (MDMER) requirements.</p> <p>It is not clear why the above statement regarding effluent release to groundwater via deep well injection has been included in the EIS when this is not part of the confirmed effluent discharge management plan. The Proponent should update the EIS to remove text regarding effluent release to groundwater via deep well injection or provide explanation as to why this information has not been excluded from the EIS to clarify if this is an intentional part of the Project design or if this was an accidental inclusion.</p> <p>The Proponent should update the EIS to remove text regarding effluent release to groundwater via deep well injection or provide additional explanation.</p> <p>Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	Section 8 of the revised Draft EIS has been revised to remove text on effluent release to groundwater via deep well injection.	<p>Yes</p> <p>Revised Draft EIS, Sections 8.2.4.1.1, 8.2.6.1, 8.3.6.1, and 8.4.6.1.</p>
IR-110	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.2.4.1.1 Aquatic Environment	<p><b>Context:</b> It is stated that the diffuser at the final effluent discharge point will be located in approximately 3m of water. However, in Figure 8.2-5 displaying the location of the proposed diffuser and lake bathymetry, the diffuser location seems to be located in 2-2.5m of water. A similar image in Figure 1 Section 2.0</p>	Provide confirmation of the diffuser depth and location.	<p>This response has not been accepted.</p> <p>ECCC requests confirmation that the finalized diffuser design will be available for review once it is completed as reviewing it will be necessary to</p>	It is noted that basic design criteria (e.g., depth, location, port configuration) have been provided in the Draft EIS (Section 8.2) and Appendix 8-E on which modeling was based. While some minor adjustments may be made during preparation of the final diffuser engineering design, the level of mixing predicted in the assessment will be maintained	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
				Appendix 8-E, Section 2.1	<p>of Appendix 8-E also indicates that the diffuser seems to be located in 2-2.5m of water. Additionally, while thermal effects are unlikely, this cannot be confirmed until a more detailed diffuser design is provided for review.</p> <p><b>Updated Rationale:</b> The Proponent should confirm the location and depth of the proposed diffuser in order to confirm that modelling predictions for effluent discharged into the receiving environment are accurate.</p> <p>A review of the final discharge design is necessary to confirm the location and depth of the proposed diffuser and modelling predictions for effluent discharged into the receiving environment.</p>	ECCC requests the opportunity to review the finalized diffuser design once it is available.	confirm the location and depth of the proposed diffuser and modelling predictions for effluent discharged into the receiving environment.	<p>(minimally). The final designs will follow standard engineering practice and be stamped and signed by a professional engineer.</p> <p>As for Denison’s understanding of the regulatory process, the finalized diffuser design information will be included in Denison's license to operate application that will be submitted to the CNSC. Such information will also be provided to the province as part of the provincial approvals process. Should CNSC, or the province, choose to provide this information to ECCC that is their discretion, but Denison doesn’t believe it is within their purview (or appropriate) to make commitments on behalf of others, nor act outside the normal licensing/ approvals processes.</p>	
IR-113	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.2.4.2.3 and Section 8.4.7.6, Aquatic Environment	<p><b>Context:</b> No quantitative assessment of climate change has been conducted. Representative concentration pathways (RPC) projections for climate change have not been integrated with near-and far-field modelling to assess impacts to surface water quality or sediment quality in the future.</p> <p><b>Rationale:</b> Changes in air and water temperatures, precipitation, snow melt, ice formation, etc., due to climate change can all influence COPC concentrations in surface water and sediment. It is not possible to assess the potential impacts from climate change on predicted surface water and sediment COPC concentrations with the current information.</p>	Provide a quantitative analysis of the potential impacts of predicted COPCs from mine effluent to surface water and sediment quality with climate change scenarios for the Project lifespan incorporated into modelling. Include modelling predictions regarding the influence of changes to air and water temperatures, precipitation, snow melt, ice formation, etc., on COPC concentrations in surface water and sediment.	<p>This response has not been accepted.</p> <p>Based on the information provided it is not possible to assess the resiliency of the Project to potential adverse effects from climate change and potential impacts to surface water and sediment quality. The Proponent should review the guidance documents available on the <a href="#">Strategic Assessment of Climate Change</a> (SACC) website with regards to climate change resilience and provide a quantitative analysis of the potential impacts of predicted COPCs from mine effluent to surface water and sediment quality with climate change scenarios for the Project lifespan incorporated into modelling.</p> <p>Include modelling predictions regarding the influence of changes to air and water temperatures, precipitation, lake levels, flow rates, etc., on COPC concentrations in surface water and sediment. The Proponent should refer to the <a href="#">SACC website</a> for guidance on conducting this quantitative analysis.</p> <p>See also follow-up IR-113-R1.</p>	Please refer to Attachment IR-113_IR-113-R1 for the response.	No
IR-113	IR-113-R1	ECCC	Fish and fish habitat	Section 8.2.4.2.3 and Section 8.4.7.6, Aquatic Environment  IR-113 Response from Denison	<p><b>Context:</b> The Proponent states the following, “The PMP is very conservative (e.g., assumes effectively a full year of precipitation in one event) under both existing and future conditions (climate change)”. This statement suggests that the PMP value utilized considers future climate changes such as possible changes in the frequency or intensity of extreme precipitation events.</p>	Clarify if climate change has been considered in the PMP value provided. If it has not been considered, discuss how potential increases in PMP have been and/or need to be considered in the Project design.		Please refer to Attachment IR-113_IR-113-R1 for this response.	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<b>Rationale:</b> As noted by the Proponent, increases in extreme rainfall are anticipated with a warmer climate. For precipitation extremes across Canada, the relative change in event frequency is expected to be larger for more extreme and rarer events. Given that the extreme precipitation is expected to intensify in the future (Kunkel et al. 2013), the Proponent should consider how these potential changes will influence design values such as PMP.	<u>Reference</u> Kunkel, K., Karl, T. R., Easterling, D. R., Redmond, K., Young, J., Yin, X., & Hennon, P. (2020). Probable maximum precipitation and climate change. <i>Geophysical Research Letters</i> , 1402-1408.			
IR-114	-	ECCC  CNSC	Change to an environmental component due to hazardous contaminants	Section 8.2.4.2.3 and Section 8.2.4.2.4	<p><b>Context:</b> Tables 8.2-9, 8.2-10 and 8.2-13 demonstrate predicted maximum effluent concentrations of COPCs and maximum predicted receiving environment concentrations in the near- and far-field. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, TSS and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization.</p> <p>For zinc, it is unclear how guidelines have been calculated when CCME thresholds can only be derived with hardness values &lt;250 mg/L. Additionally, water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations.</p> <p>Mercury has been identified as a COPC of interest to Indigenous groups for the proposed Project. Table 8.2-8 indicates that background concentrations of mercury in LA-5 are low, and predicted effluent concentrations are also low. However, no information has been provided on background methylmercury concentrations or expected atmospheric deposition of mercury from Project related emissions. Predicted effluent concentrations of 3915 mg/L of sulphate are quite high, and sulphate is known to increase mercury methylation rates in aquatic environments.</p> <p><b>Rationale:</b> A review of all modelling results for all COPCs under the MDMER will assist ECCC in understanding the potential risks to the receiving environment. ECCC recommends the use of the most stringent guidelines for the protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds.</p> <p>Increased sulphate availability can lead to increased methylation rates of mercury and methylmercury in sediment and surface</p>	<p>1. Update all tables to include all COPCs with required monitoring under the MDMER including acute and chronic thresholds.</p> <p>2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota.</p> <p>3. Provide baseline data on the concentrations of methylmercury in surface water, sediment and fish tissues (i.e., large-bodied sports fish and small-bodied forage fish) in the LSA and RSA receiving environment to establish a baseline prior to potential Project impacts.</p> <p>4. Provide an assessment of risk from methylmercury to ecological receptors due to changes in sulphate concentrations in effluent, and potential deposition of mercury from Project related atmospheric emissions in the receiving environment.</p>	<p>This response has not been accepted.</p> <p>The Proponent has not updated all tables to include missing data for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate, and phosphorous, all of which are COPCs with monitoring requirements under the MDMER.</p> <p>The Proponent has not updated tables to include predictions of total hardness concentration in effluent and the receiving environment or acute water quality thresholds, and water quality thresholds have not been derived using baseline receiving environment concentrations.</p> <p>All water quality thresholds should be derived from receiving environment parameters to determine if any baseline receiving environment and effluent COPCs exceed water quality thresholds.</p> <p>Please:</p> <p>1. Update all tables to include missing data for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate and phosphorus.</p> <p>2. Update tables to include predictions of total hardness concentrations (in mg/L CaCO<sub>3</sub>) in effluent and the receiving environment.</p> <p>3. Update tables to include acute water quality thresholds to ensure COPCs do not have the potential to be acutely lethal at the end-of-pipe.</p> <p>4. Ensure that all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota.</p>	Please see Attachment IR-114. Briefly, Tables 8.2-9, 8.2-10 and 8.2-13 have been updated in the revised Draft EIS as requested.	Yes  Revised Draft EIS, Sections 8.2.4.2.3 and 8.2.4.2.4, Tables 8.2-9, 8.2-10 and 8.2-13

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>water. Methylmercury is a toxin that can bioaccumulate within the food chain and present risks to aquatic biota and wildlife consuming aquatic biota. Potential changes to methylmercury concentrations in water quality, sediment and fish tissues should be assessed due to the proposed sulphate loadings in effluent.</p> <p>Additionally, in accordance with the MDMERs, Denison will be required to demonstrate that their effluent quality meets the limits in the MDMER. Denison is expected to provide the predicted effluent quality for lead, nickel, and un-ionized ammonia to demonstrate compliance with the MDMERs.</p>				
IR-115	-	ECCC	Fish and fish habitat	Section 8.2.4.2.3 Aquatic Environment  Appendix 10-A (ERA), Section 3.1.1.1	<p><b>Context:</b> Table 8.2-8 demonstrates baseline concentrations of COPCs in LA-5 South Whitefish Lake, their respective water quality guidelines from applicable sources, and proposed Project thresholds. General parameters such as temperature, pH, conductivity, etc. that would require Project thresholds and monitoring under the MDMER have not been provided in this table. Lead, nickel, Total Suspended Solids (TSS) and un-ionized ammonia were not provided, despite all being Schedule 4 substances with maximum monthly concentrations under the MDMER. Aluminum, iron, nitrate, thallium, and manganese have not been provided despite being required parameters under Schedule 5 Section 4 of the MDMER for effluent characterization. Water quality thresholds appear to have been calculated using estimated effluent concentrations rather than receiving environment baseline concentrations. The water quality objective selected for molybdenum is the 31 mg/L SEQG rather than the CCME guideline of 0.073 mg/L.</p> <p><b>Rationale:</b> ECCC recommends the use of guidelines that will ensure the protection of aquatic biota. All water quality thresholds should be derived from receiving environment parameters to determine any baseline receiving environment and effluent COPC exceedances of water quality thresholds.</p>	<ol style="list-style-type: none"><li>1. Update Table 8.2-8 to include all COPCs with required monitoring under the MDMER.</li><li>2. Ensure all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.</li><li>3. Provide additional information to justify the use of the selected water quality guideline for molybdenum.</li></ol>	<p>This response has not been accepted.</p> <p>Items 1. And 3. In the Proponent’s response adequately responded to the IR. However, the water quality thresholds in item two have not been derived using baseline receiving environment concentrations and not all COPCs which require monitoring under the MDMER have been included in the updated table. Additionally, the Proponent did not account for changes in baseline hardness concentrations in the receiving environment due to the deposition of effluent. Water hardness is an environmental modifying factor which can influence the toxicity of COPCs in the aquatic environment, therefore requiring the mentioned COPCs as well as background concentrations of total hardness in the receiving environment to accurately determine potential effects of COPCs upon the receiving aquatic environment. The Proponent should also provide rationale to support that all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.</p> <p>See also follow-up IR-115-R1.</p>	<p>Please see Attachment IR-115_IR115-R1. Briefly, Table 8.2-8 has been updated in the revised Draft EIS as requested.</p>	<p>Yes</p> <p>Revised Draft EIS, Sections 8.2.4.2.3 Table 8.2-8</p>
IR-115	IR-115-R1	ECCC	Fish and fish habitat	Section 8.2.4.2.3 Aquatic Environment  Appendix 10-A (ERA), Section 3.1.1.1	<p><b>Context:</b> In the Proponent’s response to item two, it is mentioned that the derived water quality thresholds used in Table 8.2-8 and in the assessment (Section 8.2.4.2.3, Aquatic Environment; Appendix 10-A (ERA), Section 3.1.1.1) are based on hardness concentrations found in effluent. The Proponent mentions that hardness derived from IWWTP discharge will consider IWWTP discharge on the receiving environment and provide “a reasonable estimate of expected hardness in</p>	<p>1. Update Table 8.2-8 to include the following COPCs: un-ionized ammonia, aluminum, iron, manganese, thallium and total dissolved solids (TDS).</p>		<p>Please see Attachment IR-115_IR115-R1. Briefly, Table 8.2-8 has been updated in the revised Draft EIS as requested.</p>	<p>Yes</p> <p>Revised Draft EIS, Sections 8.2.4.2.3 Table 8.2-8</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
				IR-115 Response from Denison	<p>effluent”. However, this does not consider induced hardness (i.e., hardness concentration increases in the receiving environment over the lifecycle of the Project) from effluent contributions as a Project effect; the receiving environment baseline concentrations of hardness have been altered due to inputs from Project effluent. Providing only one estimate of expected effluent hardness in the receiving environment is not an appropriate means of conducting the effects assessment.</p> <p>Additionally, the following COPCs have not been included in the updated table provided in the Proponent’s response: un-ionized ammonia, aluminum, iron, manganese, thallium and total dissolved solids (TDS). It is noted that these COPCs are also subject to monitoring requirements under the <i>Metal and Diamond Mining Effluent Regulations</i> (MDMER).</p> <p><b>Rationale:</b> Background concentrations of un- ionized ammonia, aluminum, iron, thallium, manganese and TDS are required to determine potential effects to the environment. The Proponent will also require this information to satisfy their obligations under the MDMER.</p> <p>The purpose of the surface water quality assessment is to determine if changes to the receiving environment over the project lifecycle will have significant adverse effects on biota. Changes from baseline in hardness concentrations in the receiving environment due to the deposition of effluent is a Project related effect and therefore providing a single baseline water quality threshold which is applicable only to one set of conditions is not an appropriate method to evaluate impacts across a shifting hardness baseline.</p> <p>Water hardness is an environmental modifying factor, various concentrations of hardness influence the toxicity of other COPCs in the aquatic environment. Using water quality thresholds that have been derived from high effluent hardness concentrations will not be protective of aquatic biota, particularly in the early stages of the project lifecycle when receiving environment water quality will be similar to baseline water quality.</p>	<p>2. Update Table 8.2-8 to include background concentrations of total hardness (in mg/L CaCO<sub>3</sub>) in the receiving environment.</p> <p>3. Provide rationale that all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.</p> <p>See also related IR-108-R1</p>			
IR-124	-	ECCC	Change to an environmental component due to hazardous contaminants	Section 8.4.4.2.3, Aquatic Environment	<b>Context:</b> Table 8.4-7 provides maximum concentrations of surface water COPCs in sediment. The following COPCs, which are required to evaluate the risk from effluent to sediment quality, were not evaluated:	<p>1. Provide the information on baseline exceedances of COPCs in sediment.</p> <p>2. Provide an assessment of risk for any COPCs that have baseline</p>	<p>This response has not been accepted.</p> <p>An updated risk assessment for COPCs that requires monitoring under the MDMER with effluent concentrations that exceed guidelines has not been completed. This information is necessary</p>	<p>1. Section 8.4.3.2.3 of the Draft EIS did not identify any constituents where baseline sediment quality exceeded sediment quality guidelines. Table 8.4-3 and Table 8.4-7 of the revised Draft EIS were updated to include sediment quality guidelines as recommended.</p>	<p>Yes</p> <p>Revised Draft EIS Section 8, Table 8.4-3, Table 8.4-7</p>

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<div><div><div>1. COPCs that have monitoring requirements in receiving environment surface water and effluent under the MDMER,</div><div>2. COPCs that exceed water quality guidelines in effluent, and,</div><div>3. COPCs that have baseline concentrations that exceed sediment quality thresholds in the receiving environment.</div></div><div><b>Rationale:</b> Due to the lack of information on COPCs with baseline concentrations that exceed sediment quality guidelines, and COPCs that require monitoring under the MDMER, a determination on risk to sediment quality and aquatic biota cannot be made.</div></div>	<div>exceedances of sediment quality thresholds in the receiving environment.</div> <div>3. Provide an assessment of risk from any COPCs that require monitoring in the receiving environment and effluent under the MDMER. Please include any COPCs in effluent that will exceed water quality guidelines.</div>	<div>to facilitate the determination on risk to sediment quality and aquatic biota.</div> <div>See also follow-up IR-124-R1.</div>	<div>2. The were no instances where constituent concentrations in the baseline sediment samples were greater than their respective of sediment quality guidelines; therefore, no further action is needed to address this part of the IR.</div> <div>3. This is not applicable. No additional COPCs need to be carried forward in the environmental risk assessment as the concentrations of COPCs in effluent do not exceed water quality guidelines (see Table 3-1 in the ERA in Appendix 10-A). All relevant constituents identified in Schedule 4 and Schedule 5 in MDMER were considered in the ERA screening with the exception of cyanide and mercury which are not identified as present in the effluent (see IR-100 regarding mercury). Phosphorus and nitrate will be present in the effluent at low levels and estimates of these constituents via the near-field water quality model indicate that levels will remain well below criteria protective of aquatic life in the Whitefish Lake environment (see Tables 8.2-10 and 8.2-13 of Section 8).</div>	Appendix 8E
IR-124	IR-124-R1	ECCC	Change to an environmental component due to hazardous contaminants	<div>Section 8.4.4.2.3, Aquatic Environment</div> <div>IR-124 Response from Denison</div>	<div><b>Context:</b> In the Proponent’s response it is stated, “Schedule 5 parameters will be monitored as per the MDMER once under this regulation (i.e., meeting regulated criteria of discharge to the environment [50 m3/day). Please refer to Table 8.2-13 of attachment IR-114. In these cases, COPCs including Schedule 4 parameters were below screening criteria.”</div> <div>If concentrations of Schedule 5 parameters in effluent exceed water quality thresholds, these parameters are necessary for ECCC to examine in the risk assessment to determine the potential for effluent to be acutely lethal and for adverse effects to aquatic biota. These parameters will also be required to be characterized under Section 4, 5 and 7 of the MDMER. As per CSA N288.6-22 Section 7.2.5.2.1, “Screening of environmental concentrations of chemical and radiochemical substances released to the environment should be performed to identify COPCs for further evaluation in the risk assessment. Both measured concentrations and concentrations calculated from release rates may be used in the screening analysis. The screening concentrations should be compared to screening criteria, and chemicals that exceed screening criteria should be identified as COPCs.”</div> <div>As per CSA N288.6-22 Section 7.2.5.4.2, “If COPCs exceed the screening level for one medium, they should be carried forward into the EcoRA for all media that are likely to contribute to exposure. For example, for a given COPC, if a water screening benchmark is exceeded, the same COPC should be carried forward for sediment if its concentration was above the detection limit.”</div> <div>Additionally, updated Table 8.2-13 of attachment IR-114 has been found to be insufficient due to maximum concentrations in</div>	<div>Provide an assessment of risk from any MDMER Schedule 5 parameters that are required to be characterized in effluent and in surface water quality in the receiving environment and that have effluent concentrations that will exceed water quality guidelines derived from environmental baseline conditions.</div>		<div>See response to IR-124 and revised Draft EIS Section 8, Table 8.4-3 and Table 8.4-7 and supporting updated documentation in Appendix 8E.</div>	<div>Yes</div> <div>Revised Draft EIS Section 8, Table 8.4-3, Table 8.4-7</div> <div>Appendix 8E</div>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)																																																							
					surface water for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate and phosphorus being absent and the use of incorrect water quality thresholds.  <b>Rationale:</b> Due to the lack of information on COPCs with concentrations that exceed water quality thresholds in effluent, a determination on risk to sediment quality and aquatic biota cannot be made.																																																											
IR-126	-	ECCC	Aquatic species	Section 8.5.3  Appendix 10-A (ERA), Section 5.3.1.1.8	<b>Context:</b> The Proponent has used the US Environmental Protection Agency (US EPA) guidelines for the assessment of selenium fish tissue concentrations in Section 8.5.3 of the draft EIS and in the Environmental Risk Assessment (ERA) in Appendix 10-A (ERA) of Section 10.  <b>Rationale:</b> ECCC’s Federal Environmental Quality Guidelines of 6.7 ug/g dry weight fish whole body tissue for selenium should be used, as it is more protective than the US EPA guidelines.	Update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA (Appendix 10-A (ERA) in Section 10) as needed using ECCC’s FEQG.	<p>This response has not been accepted.</p> <p>The selenium fish tissue assessment has not been updated to reflect the ECCC Federal Environmental Quality Guidelines (FEQG). A predicted effluent concentration of 0.042 mg/L of selenium has been provided for the Project (updated Tables 8.2-9 and 8.2-10 Attachment IR-114 Denison’s Response). ECCC acknowledges that the Proponent prefers the use of the US EPA guidelines due to the ability to perform fish tissue muscle TRV, however, Environmental Effects Monitoring (EEM) would require a study on fish tissue selenium whole- body or egg-ovary concentrations. The current baseline data will not be comparable to future EEM studies using fish tissue muscle concentrations of selenium and US EPA guideline methodology. There is currently EEM guidance under development for conducting selenium fish tissue sampling in fish populations that will utilize the FEQG which applies to fish tissue egg-ovary and whole-body concentrations of selenium. Additionally, the Proponent has made a commitment to utilize the most stringent guidelines available.</p> <p>Based on the Project’s proposed effluent concentrations of selenium, fish tissue sampling will be required as part of the EEM monitoring for the Project. The ECCC FEQG is the guideline applied to these studies, and the current use of this guideline will facilitate the comparison to future monitoring studies.</p> <p>Furthermore, the Proponent has not provided sufficient explanation in their response for the use of the less stringent US EPA guideline compared to the more conservative FEQG.</p>	<p>The EIS assessed selenium in fish in terms of muscle tissue because the available baseline data were for muscle tissue. Since the review comment highlights the EEM program and the fish tissue selenium study component more specifically we note that the MDMER (2023) allows use of muscle tissue in the EEM study of selenium in fish (see Schedule 5, 12(1)(e)(iv). It is further noted that Denison has committed to a pre-operational EEM study and will conduct that study in accordance with the regulation and available federal guidance. The pre-operational EEM study will include a study respecting selenium in fish tissue.</p> <p>Regarding the EIS, Denison and its SME stand by the current assessment approach, using muscle tissue. Nevertheless, to address the reviewer’s concern, we have calculated whole-body concentrations from the predicted selenium in muscle (Table B.5 of the revised draft EIS Appendix 10-A), using EPA (2021) conversion factors. The resulting whole-body concentrations do not exceed either EPA (2021) or ECCC (2022) guidelines for whole-body tissue, which are 8.5 µg/g dw and 6.7 µg/g dw, respectively, and therefore the conclusions of the risk assessment are unchanged. No change to the EIS is warranted.</p> <table><tr><th>Fish Species</th><th>Lake</th><th>Muscle ug/g fw</th><th>Muscle ug/g dw</th><th>Whole ug/g dw</th></tr><tr><td rowspan="6">N. IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
							<p>The Proponent should explain their use of the US EPA guidelines over the ECCC FEQG or update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA as needed using ECCC’s FEQG.</p> <p>As noted in IR-126, please update the selenium fish tissue assessment in the draft EIS and the Wheeler River ERA (Appendix 10- A (ERA) in Section 10) as needed using ECCC’s FEQG. If the FEQG will not be used, provide further rationalization for the use of the US EPA guidelines when creating the study on fish tissue selenium concentration in the EEM.</p>	<p>EPA. 2021. 2021 Revision to: Aquatic Life Ambient Water Quality Criterion for Selenium 2016. EPA 822-R-21-006. U.S. Environmental Protection Agency.</p> <p>ECCC. 2022. Federal Environmental Quality Guidelines. Selenium. Environment and Climate Change Canada.</p>	
IR-130	-	CNSC	Physical stressors (noise and vibration) on wildlife	Section 9, Terrestrial Environment	<p><b>Context:</b> Sensory disturbances such as noise have been identified as stressors for selected wildlife (Ungulates, Furbearers, and Woodland Caribou), birds and amphibians in the Project area. However, there is no consideration of impacts from vibrations on these species. Also, impacts of noise and vibration on reptiles have not been assessed in the Project area.</p> <p><b>Rationale:</b> While noise has been qualitatively assessed for selected wildlife, birds, and amphibians, there is no consideration of project-related vibrations as a sensory disturbance/physical stressor. Sensitive terrestrial species (specifically, herpetofauna, amphibians, invertebrates, and caribou) can be impacted by vibrations emanating from the operation of heavy machinery, blasting activities, and other anthropogenic activities at the Project site.</p> <p>Also, impacts of physical stressors (noise and vibration) on reptiles were not assessed. These species should be included in this assessment due to their sensitivity to noise and vibrations.</p>	<p>Please provide a discussion of impacts of physical stressors (specifically vibrations) on wildlife, birds, and amphibians in the Project area. Specific mitigation measures and/or monitoring for impacts from project-related vibrations should be considered, as appropriate.</p> <p>Also, include reptiles in the assessment of project-related noise and vibrations as sensory disturbance/physical stressor, or a justification for their exclusion.</p>	<p>This response has not been accepted.</p> <p>Denison has agreed to update the final EIS (Sections 9.3 and 9.4) to include vibration as a physical stressor to fauna in the project area.</p> <p>Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	<p>The text in Section 9 of the attached revised Draft EIS includes vibration as a physical stressor on fauna.</p> <p>Updates can be found in Section 9.3.3.3.2, pages 9-197 and Section 9.3.4.2.1, pages 9-211, 9-212, and 9-274.</p>	<p>Yes</p> <p>Revised Draft EIS, Section 9.3.3.3.2, pages 9-197 and Section 9.3.4.2.1, pages 9-211, 9-212, and 9-274</p>
IR-134	IR-134-R1	ECCC	Wildlife and Wildlife habitat	Section 9, Terrestrial Environment	<p><b>Context:</b> The Proponent has committed to conduct pre-construction and pre-clearing surveys for multiple species, however the timing and methods for the surveys were not provided. Knowing the survey methodology for pre-construction and pre-clearing for little brown myotis and northern myotis is important for assessing cumulative impacts, effectiveness of adaptive management strategies as well as determining how bat species were considered in the EIS.</p> <p><b>Rationale:</b> ECCC can determine whether the methodology the Proponent will use to collect data is appropriate and if the methodology would contribute to a more complete understanding cumulative effects and adaptive management strategies.</p>	<p>The information provided by the Proponent regarding the roosting dates and potential habitat for bats is complete, however, the information related to the pre-construction and pre-clearing surveys is missing details on important habitat features for bat species at risk. As two Species at Risk Act (SARA) schedule 1 listed bat species, little brown myotis (Myotis lucifugus) and northern myotis (Myotis septentrionalis) have been identified in the Project</p>		<p>For clarification, the pre-construction and pre-clearing surveys will consist of wildlife sweeps conducted by qualified biologists within 7 days prior to any clearing activity at a specific location, and a 100 m buffer, within the Project Footprint. The wildlife sweeps will not be species-specific surveys focused on species at risk but will to be based on timing of Project related activities (i.e., will be completed in advance of site clearing activities). These surveys are intended to identify sensitive wildlife features such as hibernacula, dens, nests, cavities, mineral licks, that would require specific mitigation measures to avoid or minimize adverse effects on identified features and are not species-specific. The methods associated with these pre-construction and pre-clearing sweeps will be tailored to species at risk (including myotis species) that may potentially be using habitats at certain times of the year. Depending on the results of these sweeps, appropriate mitigation measures will be developed and implemented. This is a risk-based approach with the intent of reducing the potential of important wildlife features being adversely affected during vegetation or land disturbance activities. The wildlife sweeps would be conducted within 7 days prior to disturbance activities, year-round, so that sensitive features can be identified, and</p>	<p>No</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					A clear outline of how timing has been considered and incorporated into the methodologies is required to understand how sensitive periods for bats, such as roosting, have been considered in the EIS. An understanding of the methodologies and how these sensitive periods are being considered is required to evaluate the effectiveness of mitigation strategies and adaptive management strategies which are being developed by the Proponent.	area, effects need to be identified, avoided, lessened and monitored.		appropriate mitigation measures (e.g., avoidance, timing delay) can be developed and implemented, as appropriate.	
IR-137	-	ECCC	Migratory birds, Wildlife and Wildlife Habitat, Vegetation and Wetlands	<p>Section 9.2.1.3, Spatial and Temporal Boundaries for Vegetation and Ecosystems, Listed Plant Species and Wetlands</p> <p>Section 9.3.1.3.1, Spatial Boundaries for Ungulates, Furbearers and Woodland Caribou</p> <p>9.4.1.3.1, Spatial Boundaries for Raptors, Migratory Breeding Birds, and Bird Species at Risk</p>	<p><b>Context and Rationale:</b> The CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> Pursuant to the Canadian Environmental Assessment Act, 2012 states that: “The EIS will describe the spatial boundaries, including local and regional study areas, for each VC to be used to assess the potential adverse environmental effects of the Project and provide a rationale for each boundary.</p> <p>Spatial boundaries will be defined taking into account the appropriate scale and spatial extent of potential environmental effects, community knowledge and Indigenous knowledge, current or traditional land and resource use by Indigenous groups, ecological, technical, social and cultural considerations.”</p> <p>The information provided in the EIS does not enable a biologically relevant assessment of the Project’s effects.</p> <p>The Proponent did not provide rationale for the selection of study areas for individual vegetation, wildlife or migratory bird valued components (VC). Different VCs may have different spatial boundaries for the LSA and/or RSA. For wildlife and bird VCs, the LSA is defined as a 1.7-km buffer from the Project area, and the RSA is defined as a 6.6-km buffer around the LSA. There is no information on how the spatial boundaries were derived.</p> <p>Specific to Woodland Caribou, boreal population (hereafter referred to as boreal caribou):</p> <p><u>Project Footprint:</u> In a scientific assessment of critical habitat (Environment Canada, 2011) [1] ECCC demonstrated that the application of a 500-m buffer to mapped anthropogenic features best represents the combined effects of increased predation and avoidance on caribou population trends at the national scale. Adding a 500-m buffer to the Project footprint is required to represent functional habitat loss.</p> <p>The draft EIS does not appear to use a buffer for their Project area. The draft EIS (Section 9.3.1.3.1) states: “Project Area: the area within which the Project and all components/activities are located (i.e., the area of maximum physical disturbance). The</p>	<p>Provide a biologically relevant rationale for the delineated study boundaries (LSA and RSA) for all different valued components. Include the following information:</p> <ul style="list-style-type: none"><li>Descriptions of how the RSA and LSA boundaries were derived for all VCs.</li></ul> <p>Specific to boreal caribou:</p> <p><u>Project Footprint:</u></p> <ul style="list-style-type: none"><li>Include a 500-m buffer of area of maximum physical disturbance to represent functional habitat loss for boreal caribou</li></ul> <p><u>LSA:</u></p> <ul style="list-style-type: none"><li>Include a description of how the LSA takes into account boreal caribou avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance to individuals.</li></ul> <p><u>RSA:</u></p> <ul style="list-style-type: none"><li>Include a description of how the RSA used in the draft EIS is an accurate representation of the SK1 boreal caribou range; <b>or</b></li><li>Re-do the assessment with the RSA at the scale of the range</li></ul>	<p>This response has not been accepted.</p> <p>A biologically relevant explanation for the chosen RSA for caribou was not provided. It is not clear if the RSA is representative of the SK1 range for factors such as variability and biophysical features. Describe how the RSA used in the draft EIS is an accurate representation of the SK1 boreal caribou range. This clarification is necessary to ensure the RSA is representative of the entire SK1 Caribou range, including the natural variability of the landscape, and to assess any project effects that may be affected by an inaccurate RSA. It is also required to verify the Proponent’s assessment of cumulative impacts to caribou.</p> <p>See also AD-56 in the Advice to Proponent table.</p>	<p>The SK1 conservation unit as envisioned by the province is not meant to represent a biologically relevant area based on our understanding of this through discussion with the province as implied by the review comment. Per ECCC (2020) information available to delineate boreal caribou ranges varies in certainty and therefore caribou ranges are categorized into three types: conservation units (low certainty), improved conservation units (medium certainty) and local population units (high certainty). ECCC (2020) also recognizes that there will be changes to conservation units and improved conservation units as more information becomes available. The SK1 conservation unit is a conglomerate of various habitats and ecosites types (rocky shield, sandy plains and varying topography of the Athabasca Plain ecoregion in the northwest and Churchill River Upland ecoregion in the southeast). Denison and its SME believe the approach utilize in the analysis provides an appropriate scale on which to consider local caribou populations relative to the Project. The EA guidelines do not require the proponent to do a range-wide assessment, nor does the delineation of the SK1 range imply that such an assessment is an appropriate scale on which to consider effects. As we understand it, the delineation of SK1 and SK2 is a function of the separation of more southern productive habitat types vs more northern ones, and even that distinction (though maybe useful and appropriate from a planning perspective) is arbitrary from a life history point of view since it is known that animals move between the ranges freely.</p> <p>As per accepted environmental assessment methodology, the spatial boundaries were established to capture the extent of the expected/likely adverse effects, both direct and indirect, on the various valued components, that were expected as a result of the Project.</p> <p>The Project Footprint was delineated as the maximum extent of physical, direct disturbance resulting from the Project.</p> <p>The LSA was delineated to capture the extent of all direct, and most indirect effects of the Project on the wildlife VCs, including woodland caribou.</p> <p>The RSA was delineated to capture the extent of all potential Project indirect effects, in consideration of the life-requisites and behavior of the various VCs being assessed (i.e., a habitat-based assessment) including ungulates (e.g., woodland caribou) which are known to have large home ranges. The RSA was also delineated in the context of the cumulative effects assessment. Further the RSA is considered representative, as it includes habitat (ecosite types) that are found throughout the SK1 range. In particular, the habitat (and its potential to support woodland caribou, as classified by the Saskatchewan Ministry of Environment) in the RSA is relatively consistent with the remainder of the habitat in the SK1 range. To help display habitat suitability an appendix to Section 9 of the revised Draft EIS (Appendix 9-F) has been developed and is provided with the IR response package and</p>	<p>Yes</p> <p>Appendix 9-F incorporated (added) into the revised Draft EIS Appendices</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>Project Area covers 169.6 ha and is not VC-specific, but consistent throughout the EA.” (p. 9-168)</p> <p><u>LSA</u>: The defined LSA for boreal caribou has to consider avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance. This required information is not detailed in the draft EIS.</p> <p>Adverse effects of Projects including predator and prey access to undisturbed areas, reduction in connectivity, and sensory disturbance to individual boreal caribou can vary and extend several kilometers depending on Project activities and ecological context. At minimum, the LSA should capture the above-mentioned effects.</p> <p>For boreal caribou, the Project footprint should be defined as the immediate area to be cleared, plus a 500-m buffer to represent functional habitat loss. Following this guidance, the LSA should be defined as a buffer of the Project footprint with the 500-m buffer.</p> <p><u>RSA</u>: The Amended Recovery Strategy for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada states: <i>Mitigation of adverse effects from individual projects/activities will require a coordinated approach and management of cumulative effects within and among ranges. A cumulative effects assessment is essential to position the proposed project/activity in the context of all current and future development activities. The cumulative effects assessment will:</i></p> <ul style="list-style-type: none"><li>• <i>Assess the impact of all disturbances (anthropogenic and natural) at the range-scale;</i></li><li>• <i>Monitor habitat conditions, including the amount of current disturbed and undisturbed habitat, and amount of habitat being restored;</i></li><li>• <i>Account for planned disturbances; and</i></li><li>• <i>Assess the distribution of disturbance in large ranges for risk of range retraction in parts of the range.</i></li></ul> <p>The proposed Project’s cumulative effects for boreal caribou are possible at the scale of the SK1 boreal caribou range. The RSA used for boreal caribou for this Project is only 40,173.6 ha, compared to the SK1 range, which is 18,034,870 ha. As such, it is too small to capture cumulative effects to this species and does not follow the Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada (Environment Canada, 2011) or the Amended Recovery Strategy for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada.</p> <p><b>Reference:</b></p>	See also related IRs: IR-154 and IR-156.		<p>revised Draft EIS submission. The reader is referred specifically to Figure 2-1 in revised Draft EIS Appendix 9-F as it concerns the above reference to habitat in the SK1 range.</p> <p>These study areas are appropriate, in that they capture the extent of the likely adverse effects of the Project on the VCs, to provide an ecologically relevant determination as to the likely adverse effect on the regional population of all assessed VCs, including woodland caribou (i.e., no dilution of the effects over the entire SK1 range – although this has been provided for context).</p> <p>The 500 m buffer around a physical disturbance was considered in the context of the extent of sensory disturbance, to allow Denison to determine the geographical extent of an effect (i.e., limited to the LSA, limited to the RSA) to allow the appropriate characterization of the effect to inform the determination of significance.</p> <p>Cumulative effects occur when the adverse effects of the Project, overlap in time and space, with the adverse effects from other projects and activities. As such, the RSA is the appropriate scale to appropriately conduct a defensible cumulative effects assessment – i.e., the effects of projects that are beyond the RSA spatial extent would not likely result in residual effects that could act cumulatively with the Project’s effects, and consideration of effects that do not overlap spatially or temporally, are not cumulative, by definition.</p> <p>For the reviewer’s context and consideration, refer to Attachment IR-137 for a summary of the Wheeler River Project’s expected direct footprint (74.8 ha) and Project Area (area of maximum disturbance; 169.9 ha) compared to expected landscape disturbances from: a proposed underground uranium mining project in the Athabasca Basin (NexGen’s Rook I Project), an underground mining project which recently completed the Saskatchewan EA process (Foran’s McIlvenna Bay Project), and an open pit mining project which recently completed the federal EA process (Generation PGM’s Marathon Palladium Project). Attachment IR-137 contains Table IR-137-1 and Figure IR-137-1; we also refer the reviewer to Section 2.2.8 Project Area and Figure 2.2-28 in the revised draft EIS for an overview of the Project spatial areas. Denison suggests that the FIRT’s review of terrestrial environment IR responses be framed within the context of the Project’s spatial boundaries.</p> <p><b>References:</b></p> <p>Environment and Climate Change Canada (ECCC). 2020. IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					[1] Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada (Environment Canada, 2011).				
IR-142 IR-159 IR-167	IR-142-159-167-R1	ECCC	Wildlife and Wildlife Habitat	<b>Reference to EIS:</b> Section 9.3.3.3, Baseline Studies Section 9.3.5 Mitigation Measures  IR 142, 159, and 167 Responses from Denison	<b>Context:</b> The Proponent has committed to conduct pre-construction and pre-clearing surveys for multiple species, however the timing and methods for the surveys were not provided.  <b>Rationale:</b> Knowing the survey methodology for pre-construction and pre-clearing surveys across multiple species is important because the Proponent is intending to collect data so that ECCC can determine whether the methodology used to collect the data is appropriate and if the methodology would contribute to understanding cumulative effects and adaptive management. Understanding how timing has been considered and incorporated into the methodologies is required to understand how sensitive periods, such as nesting, breeding, foraging and migration, have been considered in the EIS. An understanding of the methodologies and how these sensitive periods are being considered is required to evaluate the effectiveness of mitigation strategies and adaptive management being developed by the Proponent for each species mentioned in IR-142, IR-159 and IR-167.	Provide survey methodology and timing for all preconstruction and pre-clearing surveys, including avian and species at risk surveys (caribou, wolverine).		<p>As noted in the August 2023 IR responses, site clearing and other works that involve disturbance of vegetation and/or soil will be completed during least-risk timing windows for migratory birds and SAR (i.e., winter), where practical, to avoid disturbance during sensitive time periods.</p> <p>However, in the event that site clearing activities or other works are anticipated to occur during a sensitive timing window for migratory birds and SAR, the pre-disturbance wildlife sweeps would be conducted by qualified biologists at least 7 days prior to any scheduled vegetation/land disturbance. The biologist would search the proposed area to be cleared, plus a 100 m buffer, for sensitive wildlife features that may be used by avian SAR (e.g., nests and/or nesting cavities), woodland caribou, and bats (e.g., roosting sites/cavities). The wildlife sweeps will not be species-specific surveys focused on species at risk per se, but will be based on timing of Project related activities (i.e., will be completed in advance of site clearing activities). These surveys are intended to identify sensitive wildlife features such as hibernacula, dens, nests, cavities, mineral licks, that would require specific mitigation measures to avoid or minimize adverse effects on identified features and are not species-specific. Nevertheless, the methods associated with these pre-construction and pre-clearing sweeps will be tailored to species at risk that may potentially be using habitats at certain times of the year. For example, methods will include searching prominent topographic features such as rock outcropping or downed forest trees and debris where wolverine may establish denning sites. In the event the sweeps are conducted during the winter period, methods related to snow tracking would identify wolverine presence based on tracks and potential denning sites in the snow pack within ravines or drainages within the forested areas within the study areas (as per Resources Inventory Committee 1999). Additionally, methods will include searching for potential roost trees for bat species, as per protocols included in the Wildlife Habitat Features Field Guide (BC Ministry of Environment and Climate Change Strategy, Ecosystems Branch 2019). Depending on the results of these sweeps, appropriate mitigation measures will be developed and implemented.</p> <p>If sensitive wildlife features are found, they will be documented (e.g., photographs, GPS location recorded). The data collected would inform the development and implementation of appropriate mitigation measures (e.g., appropriate set-back distances for Project activities and/or consideration of timing windows as per SK MOE (2017)), in consideration of applicable laws and regulations (e.g., Migratory Birds Conservation Act, Wildlife Act), as appropriate.</p> <p><b>References:</b></p> <p>B.C. Ministry of Environment and Climate Change Strategy Ecosystems Branch. 2019. Wildlife Habitat Features Field Guide (Kootenay Boundary Region). October 2019. Pp. 119</p>	No

IR-143	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.3.3, Baseline Studies	<p><b>Context and Rationale:</b> The baseline caribou data is insufficient to understand potential Project impacts to this species. Presence/absence detection was provided by camera traps, incidental observations, winter track and pellet survey.</p> <p>Additional information and analyses on caribou use of the landscape during all life stages of the Project area is required to assess impacts and to determine significance of impact from the Project to caribou.</p>	<p>Provide details on the baseline caribou data including:</p> <ul style="list-style-type: none"><li>• Revision of map 9.3-8 to include all observations, categorized by type, season and year (see also IR-145); and</li><li>• Description of seasonal use of the LSA, RSA and caribou range.</li><li>• Description of Project areas used by caribou.</li><li>• Description of future studies planned to assess habitat use by caribou. Include specific details on how many additional years of aerial surveys will be completed to assess the caribou baseline conditions.</li></ul> <p>Utilizing additional data noted above and specified in IR-145, explain how caribou use of the area could be affected by the Project throughout all seasons and life stages (e.g., calving, post-calving, rutting, wintering).</p> <p>See also related: IR-152.</p>	<p>This response has not been accepted.</p> <p>The information provided by the Proponent is insufficient to understand potential Project impacts and appropriate mitigation that would be required.</p> <p>Information on important habitat features and how caribou are using the landscape is required to complete an accurate assessment of the Project impacts to caribou habitat and habitat use. In the absence of this information, ECCC will assume a conservative estimate that all habitat features are high value and are used for important life functions.</p> <p>Although the Proponent provided a map showing telemetry points (provided by the Province of Saskatchewan), this map doesn’t have sufficient detail to assess habitat use and important biophysical features of the Project area. These details are necessary to assess habitat use and important biophysical features of the Project area.</p> <p>See follow-up IR-143-144-R1 and IR-143-145-R1.</p>	<p>In the Proponent’s and its SME’s view, the information provided in the habitat-based environmental assessment is considered to adequately describe the baseline conditions of woodland caribou and allow the assessment of likely adverse effects of the Project on woodland caribou, using accepted environmental methods and approaches. To further address the reviewer’s comment, we have prepared additional figures (below) to consider the Project study areas and Project footprint + 500 m area; however, these are provided as supplemental information and will not change the assessment presented in the draft EIS.</p> <p>The baseline data and telemetry points (i.e., best data available at the time) were used to document the habitat use (by type and season) at an appropriate scale and detail to inform the assessment of the Caribou VC in terms of: alteration/loss of habitat; change in movement patterns; and change in mortality – the likely effects selected to inform and focus the assessment.</p> <p>Based on the baseline field data from 2017 to 2021, of the 397 observations recorded, woodland caribou were primarily observed in Jackpine-blueberry/lichen (BS3) ecosite type (n=268 observations) or in association with black spruce treed bog (BS17) ecosite (n=83). In the remaining observations, woodland caribou were found associated with waterbodies/ rush sandy shore (BS26) ecosite (n=17), black spruce-blueberry/lichen (BS7) ecosite (n=10), black spruce-jack pine/feather moss (BS9) ecosite (n=6) , anthropogenic/disturbed (AN) sites (n=6) and Jackpine-blueberry/lichen (BS3) / Black spruce-blueberry/lichen (BS7) ecosite (n=5) followed by Jack pine – black spruce / feathermoss (BS4) ecosite (n=1) and Labrador tea shrubby bog (BS18) ecosite (n=1). These observations within these ecosite types are presented in Figure 9.3-8 in revised Draft EIS.</p> <p>According to the habitat potential classifications of these ecosite types identified by the Saskatchewan Ministry of Environment, these ecosites are considered to have the potential (at some point in time) to develop into moderate/high suitability habitat for woodland caribou (as shown in Figure 3). As defined in the Range Plan for Woodland Caribou in Saskatchewan; Boreal Plain Ecozone- SK2 Central Caribou Administration Unit, habitat potential refers to the ability or capability of a habitat type to support a wildlife species for its various life cycle requirements. Potential does not consider the current state of the habitat (e.g., recently burned, harvested or industrial development), but its optimal state.” (Saskatchewan Ministry of Environment 2019). As is illustrated, the majority of these data points illustrated in Figure 2-2 and Figure 2-3 in revised Draft EIS Appendix 9-F are located beyond the LSA and to the north and east of the Project Area.</p> <p>Figure 2-3, Figure 2-5, and Figure 2-7 in revised Draft EIS Appendix 9-F illustrate the location of caribou observations in relation to the indicates habitat life requisite attributes</p>	<p>Yes</p> <p>Appendix 9-F incorporated (added) into the revised Draft EIS Appendices</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<p>(forage, refuge, and calving) based on the information received from the SK MOE (2024) at the Project Area, LSA, and RSA scales.</p> <p>Figure 2-4, Figure 2-6, and Figure 2-8 in revised Draft EIS Appendix 9-F illustrate the location of caribou observations in relation to the indicates habitat life requisite attributes (forage, refuge, and calving) based on the information received from the SK MOE (2024) at the Project Footprint + 500 m scale.</p> <p>Knowledge holders confirmed that woodland caribou utilize the area and might be encountered in the Terrestrial RSA (19-LK-ERFNTrip-134.149; 19-LK-ERFNTrip-134.151), and that local trappers encounter caribou regularly at their traplines in winter and see them during summer (19-LK-ERFNTrip-134.151). They have not observed any changes in densities and suggest that the same number of caribou have been found in the area over the years (19 -LK-ERFNTrip-134.156). Caribou are reported to calve near the Wheeler River, which has lots of heavy muskeg in the area (16-EN-ERFN-100.15). Knowledge holders identified the area east of Highway 914 and northeast of Russell Lake, between Russell Lake and McDougall Lake (corresponding with Omnia winter tracking transects #5 and #9; see revised draft EIS Appendix 9-B, Omnia Terrestrial Environment Wildlife and Vegetation Baseline Inventory Figure 2.6-1) as an area where caribou are commonly observed in the winter. “There are tall trees here, some small hills with protected valley areas, and it seems sheltered. There is caribou moss in this area” (19-LK-ERFNTrip-134.154). Caribou are known to travel through areas of younger forest and burns to get to preferred habitat types (19-LK-ERFNTrip-134.152), such as more mature forests and areas with abundant lichen growth. “Caribou [...] eat low bush cranberries and lichen; lichen takes many years to grow and recover” (18-EN-ERFN-5.76). Caribou have been observed to use areas of younger forest stands with regenerating pine. In years with deep snow or when there is a hard crust on the snow, they may eat the tips of fresh growth off the younger pine trees (19-LK-ERFNTrip-134.155).</p> <p>We reiterate that the additional information collated and displayed in the maps provided to support this IR response is consistent with and does not contradict anything presented in the draft EIS documentation. The habitat potential for life history use areas summarized here were incorporated in the draft EIS approach of delineating ‘available habitat’ based on ecosite classification for woodland caribou in the Project study areas. In combination with this, in the draft EIS we assumed caribou presence year-round which was assumed to include all life requisite attributes (forage, refuge, calving). The basis for the draft EIS’s assessment of potential project and cumulative effects on woodland caribou was adequate and the additional information provided to the reviewer here does not result in any changes to the conclusions of the EIS.</p> <p>In closing, we note that the Saskatchewan Environmental Assessment Review Panel and Environmental Assessment Branch have completed their review of the Wheeler River Project draft EIS plus Denison’s response to technical review comments and there are no outstanding concerns with the caribou assessment. Denison has been working closely with the Province of Saskatchewan’s, Woodland Caribou Team Lead, Habitat Ecologist and Conservation Specialists and fully anticipates ongoing oversight and approvals from the Ministry of Environment related to caribou through the Caribou Management Framework, EA decision conditions related to offsetting, the broader provincial process for project</p>

								permitting, and the ongoing regulatory role of the Ministry of Environment for mining projects in Saskatchewan. Denison is committed to continuing to work with the province in this regard.	
IR-144	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.3.3, Baseline Studies – map 9.3-8	<p><b>Context and Rationale:</b> The mapping of caribou observations during baseline studies provided in Figure 9.3-8, “Caribou Sign Observations in the Wildlife Study Areas,” is insufficient to enable conclusions to be drawn. ECCC is not able to review the spatial aspect of caribou observations without a map of all available observations. Additional information is available, as stated in Section 9.3.3.3.3: <i>“A total of 200 observations were made between 2017 and 2019 and recorded as either caribou sign (i.e., tracks, pellets, and evidence of feeding activity based on ground feeding craters and arboreal feeding evidence) or photographs (collected through the wildlife camera study) to document caribou presence in the LSA and RSA. Most observations occurred in the Terrestrial RSA, with observations concentrated in the north and southeast portions.</i></p> <p><i>Three observations occurred in the southeast portion of the Wildlife LSA, and no caribou sign was observed in the Project Area. Figure 9.3-8 provides an overview of some caribou sign observed during the baseline studies.”</i></p>	<p>Update map 9.3-8 to show all caribou observations during baseline studies, broken down by type of observation (camera, incidental, pellet, track) and season/year when the observation was made. Include additional data from the Province of Saskatchewan (see also IR-145) to help characterize caribou use on a spatial map.</p>	<p>This response has not been accepted.</p> <p>The information provided by the Proponent is insufficient to understand potential Project impacts to this species and characterize the risk to determine impacts from the Project to caribou and appropriate level of offsetting mitigation that would be required. The revised map 9.3-8 shows seasonal use, however, it is challenging to see the overlapping features. The map does not allow the reader to get a good understanding of the seasonality of the data. Due to the fact that caribou use different habitat types in differing ways over the course of a year, seasonality of the data will allow for a deeper understanding of habitat use.</p> <p>The scale provided on the current map does not allow for a proper assessment of seasonal use, including differentiation of habitat use.</p> <p>Individual maps by season and survey type with larger scale insets that show areas with overlapping points would help to clarify the map and allow for a greater understanding of spatial and temporal features of caribou habitat.</p> <p>See follow-up IR-143-144-R1.</p>	<p>In the Proponent’s and its SME’s view, the baseline surveys in combination with information from other sources related to caribou were appropriate to adequately inform the habitat-based environmental assessment. The data collected and the analysis completed to inform the environmental assessment represent the best-available information on caribou relative to the Project, which has been updated to include up-to-date caribou habitat potential mapping for the SK1 range obtained in December 2023.</p> <p>Based on the baseline field data from 2017 to 2021, of the 397 observations recorded, woodland caribou were primarily observed in Jackpine-blueberry/lichen (BS3) ecosite type (n=268 observations) or in association with black spruce treed bog (BS17) ecosite (n=83). In the remaining observations, woodland caribou were found associated with waterbodies/ rush sandy shore (BS26) ecosite (n=17), black spruce-blueberry/lichen (BS7) ecosite (n=10), black spruce-jack pine/feather moss (BS9) ecosite (n=6) , anthropogenic/disturbed (AN) sites (n=6) and Jackpine-blueberry/lichen (BS3) / Black spruce-blueberry/lichen (BS7) ecosite (n=5) followed by Jack pine – black spruce / feathermoss (BS4) ecosite (n=1) and Labrador tea shrubby bog (BS18) ecosite (n=1). These observations within these ecosite types are presented in Figure 9.3-8 in the revised Draft EIS.</p> <p>According to the habitat potential classifications of these ecosite types identified by the Saskatchewan Ministry of Environment, these ecosites are considered to have the potential (at some point in time) to develop into moderate/high suitability habitat for woodland caribou (as shown Figure 2-2 in revised draft EIS Appendix 9-F). As defined in the Range Plan for Woodland Caribou in Saskatchewan; Boreal Plain Ecozone- SK2 Central Caribou Administration Unit, habitat potential refers to the ability or capability of a habitat type to support a wildlife species for its various life cycle requirements. Potential does not consider the current state of the habitat (e.g., recently burned, harvested or industrial development), but its optimal state.” (Saskatchewan Ministry of Environment, 2019). As is illustrated, the majority of these data points illustrated in Figure 2-2 and Figure 2-3 in revised draft EIS Appendix 9-F are located beyond the LSA and to the north and east of the Project Area.</p> <p>Figure 2-3, Figure 2-5, and Figure 2-7 in revised draft EIS Appendix 9-F illustrate the location of caribou observations in relation to the indicates habitat life requisite attributes (forage, refuge, and calving) based on the information received from the SK MOE (2024) at the Project Area, LSA, and RSA scales.</p> <p>Figure 2-4, Figure 2-6, and Figure 2-8 in revised draft EIS Appendix 9-F illustrate the location of caribou observations in relation to the indicates habitat life requisite attributes (forage, refuge, and calving) based on the information received from the SK MOE (2024) at the Project Footprint + 500 m scale.</p> <p>We reiterate that the additional information collated and displayed in the maps provided to support this IR response is consistent with and does not contradict anything presented</p>	<p>Yes</p> <p>Appendix 9-F incorporated (added) into the revised Draft EIS Appendices</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<p>in the draft EIS documentation. The habitat potential for life history use areas summarized here were incorporated in the draft EIS approach of delineating ‘available habitat’ based on ecosite classification for woodland caribou in the Project study areas. In combination with this, in the draft EIS we assumed caribou presence year-round which was assumed to include all life requisite attributes (forage, refuge, calving). The basis for the draft EIS’s assessment of potential project and cumulative effects on woodland caribou was adequate and the additional information provided to the reviewer here does not result in any changes to the conclusions of the EIS.</p> <p>In closing, we note that the Saskatchewan Environmental Assessment Review Panel and Environmental Assessment Branch have completed their review of the Wheeler River Project draft EIS plus Denison’s response to technical review comments and there are no outstanding concerns with the caribou assessment. Denison has been working closely with the Province of Saskatchewan’s, Woodland Caribou Team Lead, Habitat Ecologist and Conservation Specialists and fully anticipates ongoing oversight and approvals from the Ministry of Environment related to caribou through the Caribou Management Framework, EA decision conditions related to offsetting, the broader provincial process for project permitting, and the ongoing regulatory role of the Ministry of Environment for mining projects in Saskatchewan. Denison is committed to continuing to work with the province in this regard.</p>	
IR-143-144-R1	IR-143-144-R1		Wildlife and Wildlife Habitat	Section 9.3.3.3, Baseline Studies  IR-143 and 144 Responses from Denison	<p><b>Context:</b> In the IR-143 response, the Proponent states: “As described in the EIS, caribou may use open fen and treed bog habitat types for calving during the spring/summer period. Information from Indigenous Knowledge (IK) was included in the EIS, including potential calving areas in the Terrestrial RSA.” The Proponent provided a revised Map 9.3-8 to display these features.</p> <p><b>Rationale:</b> While the revised Map 9.3-8 shows seasonal use, it is challenging to see the overlapping spatial and temporal features. The map is not adequate for fully understanding the seasonality of the data. The scale provided does not allow for a proper assessment of seasonal use, including differentiation of habitat use such as calving, movement or wintering habitats.</p> <p>Some habitats, based on use, may be more used for more critical functions than others and this information cannot be adequately assessed based on the information provided.</p>	Provide individual maps by season and survey type or with larger scale insets that show areas with overlapping spatial and temporal features.		<p>Denison obtained and appropriately considered all publicly available data/information, including information on caribou and habitat in the SK1 range obtained from Saskatchewan Environment, which as updated caribou habitat potential in December 2023, as well as the Recovery Strategy for Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada (ECCC 2020) to adequately inform the environmental assessment to appropriately determine the residual effects and their significance on caribou, as per accepted environmental assessment methodology.</p> <p>The baseline surveys for caribou were appropriate to adequately inform the habitat-based environmental assessment, considering the low suitability of the habitat expected to be disturbed by the Project and the low caribou use indicated. The data collected and the analysis used to inform the environmental assessment represent the best-available information on caribou relative to the Project.</p> <p>Figure 9.3-8 in revised draft EIS shows the EA study areas and the caribou observed within the ecosite types, while Figure 2-2 in revised Draft EIS Appendix 9-F shows the EA study areas and the caribou observed within the ecosite types as classified and delineated by the Ministry of Environment as per their protocol (in terms of the caribou habitat potential; low, moderate, high). These figures include larger scale insets to provide greater detail in relation to the location of the woodland caribou observations in context to the habitat (ecosite) types and the habitat suitability (as classified by Saskatchewan Environment) within the Study Areas.</p> <p>Based on the baseline field data from 2017 to 2021, of the 397 observations recorded, woodland caribou were primarily observed in Jackpine-blueberry/lichen (BS3) ecosite type (n=268 observations) or in association with black spruce treed bog (BS17) ecosite (n=83). Environment and Climate Change Canada, Ottawa. xiii + 143pp.</p>	
IR-145	-	ECCC	Wildlife and Wildlife habitat	<p>Section 9.3.3.3, Woodland Caribou</p>	<p><b>Context and Rationale:</b> The Proponent has not provided sufficient information on how caribou use the landscape, including identification of areas for different life stages of caribou (calving, post-calving, rutting and wintering).</p> <p>The University of Saskatchewan published a report entitled Population and habitat ecology of boreal caribou and their predators in the Saskatchewan Boreal Shield. This report contains information on habitat types that are used during different life stages. Additionally, Appendix H of the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 20202 [1] details habitat characteristics required by boreal caribou to carry out life processes necessary for survival and recovery.</p> <p>The scientific literature review (Section 9.3.3.3.1) on Woodland Caribou states: “While calving areas have not been documented within the SK1 range, it is recognized that caribou may use open fen and treed bog habitat types for calving during the spring/summer period. In Saskatchewan, caribou habitat used during the calving season in the SK2 range demonstrated a strong selection for treed muskegs, but avoidance of jack pine, mixed hardwood stands, and roads (Dyke 2008).”</p> <p>ECCC is not able to verify the Proponent’s effects assessment without sufficient information on important habitat or biophysical attributes for caribou within the study areas.</p> <p>[1] <a href="https://www.canada.ca/en/environment-climate-change/services/species-risk-public-registry/recovery-strategies/woodland-caribou-boreal-2020.html#toc0">https://www.canada.ca/en/environment-climate-change/services/species-risk-public-registry/recovery-strategies/woodland-caribou-boreal-2020.html#toc0</a></p>	<p>1. Provide, based off existing literature or available data and the Amended Recovery Strategy for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada:</p> <ul style="list-style-type: none"><li>information on known important habitat features or biophysical attributes in Project areas for different caribou life stages (calving, post-calving, rutting, wintering),</li><li>a map(s) of the type and spatial extent of important caribou habitat features or biophysical attributes of the study areas as defined in Appendix H of the Recovery Strategy,<ul style="list-style-type: none"><li>mapping should be at the RSA/LSA level as well as larger-scale mapping at the scale of the Project footprint.</li></ul></li></ul> <p>2. Assess the potential direct and indirect effects based on additional information on caribou from bullet A above.</p> <p>See also related IRs: IR-143 and IR-152.</p>	<p>This response has not been accepted.</p> <p>The map provided by the Proponent lacks spatial and temporal details needed to complete an assessment of habitat importance to caribou relative to the Project. The Proponent did not provide information or mapping on known important habitat features, habitat quality or biophysical attributes and mapping was not provided at the different scales as requested in the IR.</p> <p>ECCC recommends that the Proponent provide mapping of important caribou habitat features, such as those used for calving, wintering, and movement to assess how caribou utilize the landscape and assess potential impacts to caribou due to impacts to these areas. Knowing detailed data on caribou habitat use will contribute to identifying mitigation measures and potential offsetting.</p> <p>In the absence of telemetry data, mapping of habitat quality, based on a combination of known ecosites and known important biophysical features will provide a reasonable alternative, where known important caribou habitat features cannot be mapped.</p> <p>The provision of information on habitat use and biophysical features will facilitate the verification of the Proponent’s effects assessment.</p> <p>See follow-up IR-143-145-R1.</p>	<p>Denison obtained and appropriately considered all publicly available data/information, including information on caribou and habitat in the SK1 range obtained from Saskatchewan Environment, which as updated caribou habitat potential in December 2023, as well as the Recovery Strategy for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada (ECCC 2020) to adequately inform the environmental assessment to appropriately determine the residual effects and their significance on caribou, as per accepted environmental assessment methodology.</p> <p>The baseline surveys for caribou were appropriate to adequately inform the habitat-based environmental assessment. The data collected and the analysis used to inform the environmental assessment represent the best-available information on caribou relative to the Project.</p> <p>Based on the baseline field data from 2017 to 2021, of the 397 observations recorded, woodland caribou were primarily observed in Jackpine-blueberry/lichen (BS3) ecosite type (n=268 observations) or in association with black spruce treed bog (BS17) ecosite (n=83). In the remaining observations, woodland caribou were found associated with waterbodies/ rush sandy shore (BS26) ecosite (n=17), black spruce-blueberry/lichen (BS7) ecosite (n=10), black spruce-jack pine/feather moss (BS9) ecosite (n=6) , anthropogenic/disturbed (AN) sites (n=6) and Jackpine-blueberry/lichen (BS3) / Black spruce-blueberry/lichen (BS7) ecosite (n=5) followed by Jack pine – black spruce / feathermoss (BS4) ecosite (n=1) and Labrador tea shrubby bog (BS18) ecosite (n=1). These observations within these ecosite types are presented in Figure 9.3-8 in the revised Draft EIS.</p> <p>According to the habitat potential classifications of these ecosite types identified by the Saskatchewan Ministry of Environment, these ecosites are considered to have the potential (at some point in time) to develop into moderate/high suitability habitat for woodland caribou (as shown in Figure 3). As defined in the Range Plan for Woodland Caribou in Saskatchewan; Boreal Plain Ecozone- SK2 Central Caribou Administration Unit, habitat potential refers to the ability or capability of a habitat type to support a wildlife species for its various life cycle requirements. Potential does not consider the current state of the habitat (e.g., recently burned, harvested or industrial development), but its optimal state.” (Saskatchewan Ministry of Environment 2019). As is illustrated, the</p>	<p>Yes</p> <p>Appendix 9-F incorporated (added) into the revised Draft EIS Appendices</p>

Provide maps at the PDA/LSA/RSA scale showing areas with the appropriate biophysical attributes for calving and other life stages, such as important wintering habitats and</p>		<p>Denison obtained and appropriately considered all publicly available data/information, including information on caribou and habitat in the SK1 range obtained from Saskatchewan Environment, which as updated caribou habitat potential in December 2023, as well as the Recovery Strategy for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada (ECCC 2020) to adequately inform the environmental assessment to appropriately determine the residual effects and their significance on caribou, as per accepted environmental assessment methodology.</p> <p>Figure 9.3-8 in revised Draft EIS shows the study areas and the caribou observed within the ecosite types, while Figure 2-2 in revised Draft EIS Appendix 9-F shows the EA study areas and the caribou observed within the ecosite types as classified and delineated by the Ministry of Environment as per their protocol (in terms of the caribou habitat potential; low,</p>	Yes  Updates to Figure 9.3-8 and Appendix 9-F has been incorporated into the revised Draft EIS Appendices

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>Although the Proponent provided a map showing telemetry points (provided by the Province of Saskatchewan), the map lacked sufficient detail to assess habitat use and important biophysical features of the Project area.</p> <p>The IR-145 response states: “Available habitat was determined as the ecosites in which caribou / caribou sign were detected most frequently during the baseline studies, and the EIS used a precautionary approach by assuming caribou use of these areas during all seasons and life stages.” As a part of the analysis, calving areas are particularly important to delineate if information is available as a key part of all life stages.</p> <p>In the draft EIS, the habitat types that are considered non-habitat for caribou are open bogs (BS20), leatherleaf shrubby fens (BS22), graminoid fens (BS24), open fens (BS25), rush sandy shorelines (BS26), sedge sandy shorelines (BS27) and waterbodies.</p> <p><b>Rationale:</b> Woodland caribou are known to use treed bog and open fen (Section 9.3.3.3.1 of the draft EIS), however open fens and bogs are excluded from the identified available Woodland Caribou habitat, based on not detecting presence or not detecting presence as frequently.</p> <p>Mapping of important caribou habitat features is required to assess important potential impacts to caribou. In the absence of telemetry data, mapping of habitat quality, based on a combination of known ecosites and known important biophysical features will provide a reasonable alternative where known important caribou habitat features cannot be mapped.</p>	<p>movement corridors.</p> <p>Indicate the source of telemetry data (i.e., University of Saskatchewan and/or the Province of Saskatchewan).</p>		<p>moderate, high).</p> <p>Based on the baseline field data from 2017 to 2021, of the 397 observations recorded, woodland caribou were primarily observed in Jackpine-blueberry/lichen (BS3) ecosite type (n=268 observations) or in association with black spruce treed bog (BS17) ecosite (n=83). In the remaining observations, woodland caribou were found associated with waterbodies/ rush sandy shore (BS26) ecosite (n=17), black spruce-blueberry/lichen (BS7) ecosite (n=10), black spruce-jack pine/feather moss (BS9) ecosite (n=6) , anthropogenic/disturbed (AN) sites (n=6) and Jackpine-blueberry/lichen (BS3) / Black spruce-blueberry/lichen (BS7) ecosite (n=5) followed by Jack pine – black spruce / feathermoss (BS4) ecosite (n=1) and Labrador tea shrubby bog (BS18) ecosite (n=1). These observations are presented in Figure 9.3-8 in revised Draft EIS.</p> <p>According to the habitat potential classifications of these ecosite types identified by the Saskatchewan Ministry of Environment, these ecosites are considered to have the potential (at some point in time) to develop into moderate/high suitability habitat for woodland caribou (as shown Figure 2-2 in revised Draft EIS Appendix 9-F). As defined in the Range Plan for Woodland Caribou in Saskatchewan; Boreal Plain Ecozone- SK2 Central Caribou Administration Unit, habitat potential refers to the ability or capability of a habitat type to support a wildlife species for its various life cycle requirements. Potential does not consider the current state of the habitat (e.g., recently burned, harvested or industrial development), but its optimal state.” (Saskatchewan Ministry of Environment 2019). As is illustrated, the majority of these data points illustrated in Figure 2-2 and Figure 2-3 in revised Draft EIS Appendix 9-F are located beyond the LSA and to the north and east of the Project Area.</p> <p>Figure 2-3, Figure 2-5, and Figure 2-7 in revised Draft EIS Appendix 9-F illustrate the location of caribou observations in relation to the indicates habitat life requisite attributes (forage, refuge, and calving) based on the information received from the SK MOE (2024) at the Project Area, LSA, and RSA scales.</p> <p>Figure 2-4, Figure 2-6, and Figure 2-8 in revised Draft EIS Appendix 9-F illustrate the location of caribou observations in relation to the indicates habitat life requisite attributes (forage, refuge, and calving) based on the information received from the SK MOE (2024) at the Project Footprint + 500 m scale.</p> <p>We reiterate that the additional information collated and displayed in the maps provided to support this IR response is consistent with and does not contradict anything presented in the draft EIS documentation. The habitat potential for life history use areas summarized here were incorporated in the draft EIS approach of delineating ‘available habitat’ based on ecosite classification for woodland caribou in the Project study areas. In combination with this, in the draft EIS we assumed caribou presence year-round which was assumed to include all life requisite attributes (forage, refuge, calving). The basis for the draft EIS’s assessment of potential project and cumulative effects on woodland caribou was adequate and the additional information provided to the reviewer here does not result in any changes to the conclusions of the EIS.</p> <p>In closing, we note that the Saskatchewan Environmental Assessment Review Panel and Environmental Assessment Branch have completed their review of the Wheeler River</p>	

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								Project draft EIS plus Denison’s response to technical review comments and there are no outstanding concerns with the caribou assessment. Denison has been working closely with the Province of Saskatchewan’s, Woodland Caribou Team Lead, Habitat Ecologist and Conservation Specialists and fully anticipates ongoing oversight and approvals from the Ministry of Environment related to caribou through the Caribou Management Framework, EA decision conditions related to offsetting, the broader provincial process for project permitting, and the ongoing regulatory role of the Ministry of Environment for mining projects in Saskatchewan. Denison is committed to continuing to work with the province in this regard.	
IR-148	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.4.2.1, Alteration and/or Loss of Habitat	<p><b>Context and Rationale:</b> ECCC analyzes disturbance for caribou at the range level, in this case within the SK1 range. However, the Proponent did not provide an adequate assessment of total disturbance at the range level. The draft EIS (Section 9.3.4.2.1 p. 9-211) reads: “The SK1 Boreal Shield Woodland Caribou Management Unit has relatively low levels of anthropogenic disturbance and was exposed to large fire disturbances in the past 40 years (ECCC 2019). Environment and Climate Change Canada (2019) identified this caribou population as being self-sustaining at a threshold of 40% undisturbed habitat with the total anthropogenic disturbance not exceeding 5% of their habitat. The current anthropogenic disturbance levels (without areas burnt by past forest fires) for the study areas are below this threshold (with the exception of the already disturbed Project Area) and are estimated as: 24.8 ha (14.6%) for the Project Area, 168 ha (3.5%) for the Wildlife LSA, and 599 ha (1.5%) for the Terrestrial RSA.”</p> <p>Analysis of habitat disturbance should be calculated at the range level in order to assess impacts and determine significance.</p> <p>Analysis should be consistent with the methodology described in the document Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada (Environment Canada, 2011) [1].</p> <p>[1]<a href="https://publications.gc.ca/site/eng/401605/publication.html">https://publications.gc.ca/site/eng/401605/publication.html</a>, p. 28/41</p>	<p>Provide the following in order to support analysis of habitat disturbance:</p> <ol style="list-style-type: none"><li>Calculation of total disturbance including natural and anthropogenic disturbance at the range level.</li><li>Description of effects on existing habitat at the scale of the range (for &lt; 40% undisturbed habitat in the SK1). Include:<ul style="list-style-type: none"><li>an account (and GIS file if available) of existing habitat affected, using the following formula: (Project footprint + 500m buffer) – overlapping (permanent alteration(s) + 500m buffer)</li></ul></li><li>A map of the SK1 range showing all disturbed and undisturbed habitat, including predicted disturbance (direct and indirect) resulting from the Project.</li><li>Description of whether the Project is expected to compromise the ability of the range to be restored to the undisturbed habitat threshold, and</li></ol>	<p>This response has not been accepted, due to outstanding information related to #2.</p> <p>ECCC’s role is to provide advice to the CNSC under the Species at Risk Act and/or the Migratory Birds Convention Act to support compliance with these pieces of legislation in their decision making. Having access to project study area shapefiles allows ECCC to do their due diligence in validating any overlapping Critical Habitat, important habitat features, species at risk ranges, migratory birds ranges and other potentially important local or landscape characteristics. Obtaining project shapefiles from proponents is standard practice for our analysis of environmental impacts of projects.</p> <p>ECCC requested for more detailed mapping at the level of the project footprint in order to be able to have higher confidence in our analysis relative to potential effects on caribou Critical Habitat. However, as the requested mapping was not provided by the Proponent, ECCC is required to make assumptions that could impact our determination of potential effects and possible offsetting requirements to mitigate impacts to caribou Critical Habitat (as per the Federal Recovery Strategy for Woodland Caribou). We are aware that the project footprint may change, which may result in changes to the final recommended offset amount. We are prepared to work with a draft file with the understanding that it is still being finalized. The fact that the landscape may change over time based on data available does not negate the fact that baseline analysis is still required to determine impacts on caribou, and we still require the study area shapefiles to continue with our general analysis of the study area, given</p>	<p>Firstly, Denison would like to clarify the chronology associated with this IR for the record.</p> <ul style="list-style-type: none"><li>The GIS files in question were not viewed as a requirement during the first round of comments. The reviewer asked Denison to provide GIS files for all existing habitat affected in SK1 (if available).</li><li></li><li>Denison notes that the direct request for the Project footprint shape files was received from the CSNC via email on November 21, 2023 (email from Way to Switzer); however, the files were requested following a meeting between the Saskatchewan Ministry of Environment and ECCC where Project offsetting was being discussed (i.e., not in relation to the original IR topic).</li><li>Denison acknowledges that there was some confusion regarding the reviewer’s request through the FIRT process versus the requests received to support offsetting and mitigation plans outside of the EA process.</li><li>Denison will provide the Project specific shapefiles to the CNSC separately from this response table.</li></ul> <p>For reference, the relevant data (including field observations in relation to ecosite types) have been collated into new maps. Figure 9.3-8 in the revised Draft EIS shows the EA study areas and the caribou observed within the ecosite types, while Figure 2-2 in Appendix 9-F of the revised Draft EIS shows the EA study areas and the caribou observed within the ecosite types as classified and delineated by the Ministry of Environment as per their protocol (in terms of the caribou habitat potential; low, moderate, high) in relation to the SK1 conservation unit.</p>	<p>Yes</p> <p>Updates to Figure 9.3-8 and Appendix 9-F have been incorporated into the revised Draft EIS Appendices</p>

						provide a rationale for the conclusion.  See also related: IR-154.	the limited data that was provided by the proponent.  Please provide the requested shape files.		
IR-149	-	ECCC  CNSC	Wildlife and Wildlife habitat	Section 9.3.5.2, Additional Wildlife-specific Mitigation Measures	<p><b>Context:</b> The EIS describes that ongoing research is performed to inform the development of a Woodland Caribou Management Plan. This includes studies on the effectiveness of linear disruption features on predator/prey movements, and a field program for long-term reclamation planning. Moreover, it is stated that the Plan will include a detailed assessment of the need for habitat offsets.</p> <p>The draft EIS Section 9.3.5.2 states: “A wildlife monitoring plan and a Woodland Caribou Management Plan will be developed to address wildlife-specific mitigation measures based on proven and accepted mitigation following standard industry guidelines and BMPs. The plans will provide guidance to avoid or minimize potential adverse effects of the Project on wildlife and wildlife habitat, including monitoring and follow-up programs, as appropriate. It will be in place during all phases of the Project and will be subject to ongoing review and revision as required. If monitoring identifies a need for additional or revised mitigation measures, a process of adaptive management (as described in the plan) will be triggered.”</p> <p><b>Rationale:</b> The draft EIS does not present sufficient species-specific mitigation measures for boreal caribou. ECCC is not able to assess potential residual impacts to caribou without specific mitigations.</p> <p>Since the Woodland Caribou Management Plan is still under development, it is difficult to judge whether the measures will be adequate to mitigate and/or offset potential project effects on Woodland caribou and its critical habitat.</p>	<p>Provide the Woodland Caribou Management Plan, to demonstrate effective mitigation of potential project effects, along with wildlife-specific mitigation measures for review.</p> <p>The Plan should be informed by and consistent with the Boreal Caribou Recovery Strategy and demonstrate that avoidance and minimization measures will be applied to mitigate for predicted Project effects to boreal caribou and its critical habitat prior to considering offsetting measures. That is, the Plan should follow the mitigation hierarchy and information should be provided as outlined below:</p> <ol style="list-style-type: none"><li>1. AVOID: Describe all measures that will be taken to avoid effects to boreal caribou and avoid the destruction or alteration boreal caribou critical habitat.</li><li>2. MINIMIZE: Describe all measures that will be taken to minimize the effects to boreal caribou and minimize the destruction of boreal caribou critical habitat.</li><li>3. RESTORE ON-SITE: describe the measures that will be taken to restore disturbed areas of the Project, related to construction, operation and maintenance, on boreal caribou critical habitat, remaining after considering the</li></ol>	<p>This response has not been accepted.</p> <p>The Conceptual Caribou Management Plan does not provide sufficient detail to understand if using the restoration trials as an offset will produce satisfactory habitat compensation to address the Project effects to caribou.</p> <p>Additional clarity on the Proponent’s role in the Developing Eco-restoration Together program is required, such as how the outcomes of these programs will result in mitigation measures and offsetting requirements. Additional clarity on the scope of the program should also be provided so that ECCC can understand the objectives and deliverables of the program.</p> <p>See follow-up IR-149-R1A, IR-149-R1B and AD-71 in the Advice to Proponent table.</p>	<p>For context, the responses that have been provided to caribou IR-related elsewhere in this response table (IRs 37, 143, 143-144-R1, 143-145-R1, 144, 145, 148, 151, 155, 156) have relevance to the this, and other IR responses, and it is recommended that all of this information be considered in its entirety. The afore-referenced IR responses include descriptions of additional data that have been obtained and collated and analyses and interpretation that have been completed in relation to the presence of caribou and suitable habitat in Project study areas. At time therefore, Denison and its SME believe there are no material data/information gaps the prevent or constrain the analysis of Project and cumulative effects, defining the appropriate mitigation measures, and establishing the required offset within the provincial offsetting framework.</p> <p>With respect to data gaps, the following is noted:</p> <ul style="list-style-type: none"><li>• As described herein, additional data have been obtained and presented in Appendix 9-F. These data help to link caribou data, habitat/ecosite data and habitat suitable into the analysis. It is noted based on the new perspectives the overall conclusions of the caribou assessment are unchanged. While it is acknowledged that data may be lacking on the range level, Denison as a Project proponent is not responsible for and need not a complete a range assessment for the purpose of a Project-specific cumulative effects assessment.</li></ul> <p>With respect to mitigation measures, the following is noted:</p> <ul style="list-style-type: none"><li>• Denison and its SME have re-considered the mitigation measures presented in the EIS documentation to date in light of updated caribou-related information and does not see that further mitigation measures are needed at this time.</li></ul> <p>With respect to offset, the following is noted:</p> <ul style="list-style-type: none"><li>• Denison continues to work collaboratively with Saskatchewan Ministry of Environment (MOE) on their requirement for an offset for adverse effects on caribou habitat. Denison has advanced the Project-related Caribou Management Framework within the context of the province’s offsetting framework. The updated document is provided with this second round IR submission.</li></ul> <p>With respect to monitoring, the following is noted:</p> <ul style="list-style-type: none"><li>• Denison has committed to monitor for the presence of woodland caribou primarily within the Project Footprint as well as other areas within the Terrestrial RSA based on accepted methods that will be developed as part of its wildlife monitoring follow-up program as part of the implementation of its Environmental Management System. As it is understood, aerial surveys to document presence and habitat use are not permitted by the Saskatchewan Ministry of Environment at this time, Denison conceptually proposes to document the presence of woodland caribou using remote cameras placed strategically within representative habitat types within the Terrestrial RSA and a wildlife observation tracking log (based on the Project-wide implementation of the current wildlife card system Denison has in place). As Denison works collaboratively with the Saskatchewan Ministry of</li></ul>	No

						<p>avoidance and minimization measures.</p> <p>4. Characterize the risk of the adverse effects that are likely to result from the Project on boreal caribou and its critical habitat after avoidance minimization, and onsite restoration measures have been considered.</p> <p>5. OFFSET: Describe the measures that will be implemented outside the Designated Project area to mitigate adverse effects, destruction or alteration of boreal caribou critical habitat by the Designated Project during construction and operation.</p> <p>6. Characterize the risk of the adverse effects that are likely to result from the Project on boreal caribou and its critical habitat after avoidance, minimization, onsite restoration, and offset measures have been considered.</p> <p>Describe all relevant uncertainties on the effectiveness of the measures to address adverse effects on boreal caribou and the rationale for the selected measure, in light of the mitigation hierarchy.</p> <p>See also related IRs: IR-157.</p>		<p>Environment to finalize the Caribou Management Framework, further details on monitoring in conjunction with the offset commitment will be developed.</p> <p>In direct response to the questions raised in the review comment the following is noted:</p> <ul style="list-style-type: none"><li>Denison continues to work collaboratively with Saskatchewan Ministry of Environment (MOE) on their requirement for an offset for adverse effects on caribou habitat. Denison has advanced the Project-related Caribou Management Framework within the context of the province’s offsetting framework. The MOE has reviewed the draft framework and has provided Denison a notification of their support. Subject to finalization and provincial acceptance, the framework will provide the means to address/offset all residual adverse effects (i.e., those remaining after the application of the proposed mitigation measures) of the Project on caribou that are under provincial jurisdiction.</li><li>We also note that the Eco-restoration Together (ERT) program is no longer considered within the context of the Project-related Caribou Management Framework that outlines the offset plans that Denison has been working closely with Saskatchewan MOE to develop. The ERT program will focus primarily on site restoration techniques for decommissioning. The offset requirements that are being developed are those that will fulfill provincial requirements under their offsetting program scheme.</li><li>Further, Denison has committed to monitoring the effects on wildlife, as per the Wildlife Management Plan. The findings of the monitoring programs are expected to inform Denison, through an adaptive management process, of the need, if any, for additional mitigation measures.</li></ul>	
IR-149	IR-149-R1A	ECCC	Wildlife and Wildlife Habitat	Section 9.3.5.2, Additional Wildlife specific Mitigation Measures Proponent response to IR-149	<b>Context:</b> Much of the information presented in the Conceptual Caribou Management Plan is qualitative in nature and does not present specific details regarding a quantitative assessment of impacts following measures to avoid, minimize, and restore on-site and then assess residual effects and determine the offset required to counterbalance the remaining impacts. This is	1. Provide a quantitative assessment of impacts following measures to avoid, minimize and restore on-site and then assess residual effects and determine the offset required to		<p>Please see response to IR-149.</p> <p>In addition, in direct response to IR-149-R1A the following is noted.</p> <p>1. Denison continues to work collaboratively with Saskatchewan Ministry of Environment (MOE) on their requirement for an offset for adverse effects on caribou habitat. Denison</p>	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
				IR-149 Response by Denison	<p>required to understand if offsetting is sufficient to address impacts to caribou. The Proponent also does not provide details on methods that will be used for pre- disturbance wildlife clearance surveys. ECCC is aware that that the Proponent will be participating in restoration trials as part of the ‘Developing Eco-restoration Together’ program.</p> <p><b>Rationale:</b> ECCC requires the quantitative details on the assessment of impacts to be included within the Conceptual Caribou Management Plan to adequately assess how the Proponent has applied the mitigation hierarchy. Details on the methods that will be used for pre- disturbance wildlife clearance surveys will also be required to verify that the Proponent has adequately considered how they have avoided, mitigated, or restored impacts to caribou.</p> <p>While ECCC understands that the Proponent will be participating in restoration trials as part of the ‘Developing Eco-restoration Together’ program, however, more clarity on the Proponent’s role in the program and the scope of the program is required. Details such as how the outcomes of these programs will result in mitigation measures and offsetting requirements and additional clarity on the scope of the program should also be provided so that ECCC can understand the objectives and deliverables of the program.</p>	<p>counterbalance the remaining impacts.</p> <p>2. Provide details on methods to be used for pre- disturbance wildlife clearance surveys.</p> <p>3. Provide details on the Proponent’s role in the Developing Eco-restoration Together program and how that work may be used in offsetting requirements.</p> <p>4. Provide the scope (i.e., quantitative habitat amount) of the Eco-restoration Together program.</p>		<p>has advanced the Project-related Caribou Management Framework within the context of the province’s offsetting framework. The MOE has reviewed the draft framework and has provided Denison a notification of their support. Subject to finalization and provincial acceptance, the framework will provide the means to address/offset all residual adverse effects (i.e., those remaining after the application of the proposed mitigation measures) of the Project on caribou that are under provincial jurisdiction.</p> <p>2. For clarification, the pre-construction and pre-clearing surveys will consist of wildlife sweeps conducted by qualified biologists within 7 days prior to any clearing activity at a specific location, and a 100 m buffer, within the Project Footprint. The wildlife sweeps are intended to identify sensitive wildlife features such as hibernacula, dens, nests, cavities, mineral licks, that would require specific mitigation measures to avoid or minimize adverse effects on identified features and are not species-specific but will be based on timing of Project related activities (i.e., will be completed in advance of site clearing activities). This is a risk-based approach with the intent of reducing the potential of important wildlife features being adversely affected during vegetation or land disturbance activities. The methods associated with these pre-construction and pre-clearing sweeps will be tailored to species at risk (including woodland caribou) that may potentially be using habitats at certain times of the year. For example, in the event the sweeps are conducted during the winter period, methods would include snow tracking to identify woodland caribou presence based on tracks and feeding craters observed within the study areas, based on survey protocols provided by the Government of Saskatchewan (2014). This effort would also be combined with use of remote cameras that have been in place throughout the Terrestrial RSA for the past several years, and the photos captured from the cameras can be used to further verify caribou presence with the study areas. The wildlife sweeps would be conducted within 7 days prior to disturbance activities, year-round, so that sensitive features can be identified, and appropriate mitigation measures (e.g., avoidance, timing delay) can be developed and implemented, as appropriate.</p> <p>Further, Denison has committed to monitoring the effects on wildlife, as per the Wildlife Management Plan. The findings of the monitoring programs are expected to inform Denison, through an adaptive management process, of the need, if any, for additional mitigation measures.</p> <p>3. The Eco-restoration Together program is no longer considered within the context of the Project-related Caribou Management Framework that outlines the offset plans that Denison has been working closely with Saskatchewan MOE to develop. The offset requirements that are being developed are those that will fulfill provincial requirements under their offsetting program scheme.</p> <p>4. The Eco-restoration Together program is no longer considered within the context of the Project-related Caribou Management Framework that outlines the offset plans that Denison has been working closely with Saskatchewan MOE to develop. 								Government of Saskatchewan. 2014. Snow Track Survey Protocol. Fish and Wildlife Branch, Ministry of Environment. 8 pp.	
IR-149	IR-149-R1B	ECCC	Wildlife and Wildlife Habitat	Section 9.3.5.2, Additional Wildlife specific Mitigation Measures Proponent response to IR-149  IR-149 Response by Denison	<b>Context:</b> Section 4.2.2 of the Conceptual Caribou Mitigation plan states: “locating excessive noise generating activities such as the concrete batching operation as far away from sensitive wildlife locations as possible;”. However, no specific mitigation measures are mentioned for impacts to caribou due to noise generated from the Project air strip.  <b>Rationale:</b> Noise from the air traffic using the air strip will also generate excessive noise that can impact caribou. Additional information on the timing and frequency of air traffic, as well as specific mitigations related to impacts from air traffic, including mitigations related to frequency and timing of flights, will be necessary to evaluate impacts to caribou due to air strip noise.	1. Provide additional information on the timing and frequency of air traffic using the Project air strip.  2. Provide specific mitigations related to impacts from air traffic, including mitigations related to frequency and timing of flights.		Please see response to IR-149.  In addition, in direct response to IR-149-R1B the following is noted.  The flight schedules have not yet been determined at this relatively early stage of planning for the Project.  Mitigation measures likely to be incorporated into the operation of the airstrip, with respect to air traffic, would include, as safety allows, maintaining as direct approach and departure flight paths as possible, and obtaining appropriate altitudes, and leaving the LSA and RSA, as quickly as is safely reasonable.	No
IR-151	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.6.4	<b>Context and Rationale:</b> In the analysis of residual and cumulative effects for woodland caribou, information and analyses on impacts to connectivity and movement across the landscape is lacking.	1. Using available reports and data, provide an analysis of impacts to landscape connectivity for woodland caribou at the LSA and Range scales.  2. Determine whether the Project is expected to result in a reduction of connectivity within or between the ranges and provide a rationale for the conclusion. Describe how movement corridor(s) may be affected by Project activities and infrastructure.	This response has not been accepted.  There is insufficient information to support the Proponent’s conclusion that there are no impacts to landscape connectivity. Additional information on habitat quality, caribou use of the landscape for different life stages, and important habitat features within the study area is required to understand effects of the Project on habitat connectivity.  Provide maps of caribou habitat quality and an assessment of Project impacts to high quality habitat including habitat that may be associated with landscape connectivity.	The woodland caribou found in the SK1 range are non-migratory, in the sense that barren-ground caribou are. Rather based on information received from the Saskatchewan Ministry of Environment it is understood that they utilize a variety of habitat types across both the SK1 and SK2 ranges and are distributed and move broadly across the landscape. To date, western science has not identified any known “corridors” used specifically by woodland caribou in the SK1 range. As such, the Project will not hinder or exclude woodland caribou from moving across the landscape within the SK1 range; rather, they will be able to move around the Project Footprint unimpeded through the habitat types that are available.  Knowledge holders confirmed that woodland caribou occur in the Terrestrial RSA (19-LK-ERFNTrip-134.149; 19-LK-ERFNTrip-134.151), and that local trappers encounter caribou regularly at their traplines in winter and see them during summer (19-LK-ERFNTrip-134.151). They have not observed any changes in densities and suggest that the same number of caribou have been found in the RSA over the years (19 -LK-ERFNTrip-134.156). Caribou are reported to calve near the Wheeler River, which has lots of heavy muskeg in the area (16-EN-ERFN-100.15). Knowledge holders identified the area east of Highway 914 and northeast of Russell Lake, between Russell Lake and McDougall Lake (corresponding with Omnia winter tracking transects #5 and #9; see revised draft EIS Appendix 9-B, Omnia Terrestrial Environment Wildlife and Vegetation Baseline Inventory Figure 2.6-1) as an area where caribou are commonly observed in the winter. “There are tall trees here, some small hills with protected valley areas, and it seems sheltered. There is caribou moss in this area” (19-LK-ERFNTrip-134.154). Caribou are known to travel through areas of younger forest and burns to get to preferred habitat types (19-LK-ERFNTrip-134.152), such as more mature forests and areas with abundant lichen growth. “Caribou [...] eat low bush cranberries and lichen; lichen takes many years to grow and recover” (18-EN-ERFN-5.76). Caribou have been observed to use areas of younger forest stands with regenerating pine. In years with deep snow or when there is a hard crust on the snow, they may eat the tips of fresh growth off the younger pine trees (19-LK-ERFNTrip-134.155).	Yes  Appendix 9-F incorporated (added) into revised Draft EIS Appendices

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<p>English River First Nation and SVS (2022) compiled an IK study documenting current and past land use, knowledge of the land, and participants’ perspectives on potential Project effects, as well as cumulative effects from past mining and other developments. The report identified a wildlife corridor used by several species, including woodland caribou. The corridor runs between Cree Lake (approximately 40km southwest of the Terrestrial RSA and Russell Lake (in the southern portion of the Terrestrial RSA (Feature 1001-09; ERFN and SVS 2022). The report identified a caribou calving area: Feature 1009-07 covering large portions of the Terrestrial RSA with the exception of the most western, northern, and eastern extents. This area is also described as offering good caribou habitat year-round (ERFN and SVS 2022).</p> <p>In September 2011, Environment Canada gathered Aboriginal Traditional Knowledge from Indigenous groups across Canada to support their recovery efforts for boreal woodland caribou (ERFN 2011). In the report, most interviewees stated that caribou lost their calving areas to fires and they moved elsewhere to have their calves. It is more difficult to find the caribou now (ERFN 2011).</p> <p>Figure 2-2 in revised Draft EIS Appendix 9-F shows the location of woodland caribou observed during the baseline field program in association with the ecosite types classified by the Saskatchewan Ministry of Environment as having the potential to develop into low, moderate or high quality habitat to support woodland caribou. As shown in the figure, the majority of the caribou location data points are located beyond the Project Footprint and to the northern and eastern portions of the RSA.</p> <p>Based on the information presented in Figures 2-3 to Figure 2-8 provided in Appendix 9-F, related to the life requisite habitat potential for calving, forage and refuge habitat, as characterized by the SK MOE (2023), the majority of the ecosite types within the RSA are relatively uniform with no discernable differences in habitat quality across the region. As such, there are no definitive differences in habitat quality (i.e., these ecosite types provide the same quality of habitat for use by woodland caribou). Further, there are no barriers preventing woodland caribou from moving throughout the Terrestrial RSA through the habitat types that offer a similar level of quality for the various life requisites for this species. In this context, potential Project-related effects on connectivity are not expected.</p> <p><b>References:</b></p> <p>English River First Nation (ERFN). 2011. 					<p>the Project Area, Wildlife Local Study Area, and the Terrestrial Regional Study Area.</p> <p>The Proponent does not provide a biologically relevant explanation on the ecosites that are considered available woodland caribou habitat.</p> <p>According to the amended recovery strategy for Caribou, all habitat within SK1 range has been designated as critical habitat. To align with best current knowledge and the amended recovery strategy, the map and table should show the biophysical attributes, as outlined in Appendix H of the recovery strategy.</p>	<p>on new data from the province of Saskatchewan (See IR-145).</p> <p>2. Consider referencing Appendix H <a href="#">of the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020</a> to define important biophysical features.</p>	<p>in the draft EIS to comprise the ecosites with observations of caribou and caribou sign during the baseline studies. This was done without seasonal differentiation because it was assumed that caribou may use these ecosites during all seasons and life stages.” The methodology used to determine available caribou habitat does not accurately represent use of the documented habitat.</p> <p>The trail camera and pellet survey methods used do not satisfy the IR as they may lead to an underestimation of available caribou habitat.</p> <p>Trail camera and pellet surveys are not normally used to determine available habitat, as they only show presence. Using observations within ecosites to determine what is available habitat for caribou may lead to an underestimation of available habitat. Some smaller or rare ecosites may not have been sampled, leading to their exclusion as available habitat.</p> <p>Additionally, trail cameras were only placed on linear features, which are not representative of the whole landscape. Survey locations and camera trap placement may not provide an accurate representation of the study area or the SK1 range.</p> <p>To adequately determine available caribou habitat, ECCC requires a new habitat-based analysis that captures important biophysical features outlined in Appendix H of the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020.</p>	<p>Figure 2-2 in Appendix 9-F of the revised draft EIS shows the location of woodland caribou observed during the baseline field program in association with the ecosite types as classified by the Saskatchewan Ministry of Environment as having the potential to develop into low, moderate or high quality habitat to support woodland caribou. These habitat potential categories are based on the overall habitat suitability ranking for the life history requirements, including forage, refuge, and calving habitat (Saskatchewan Ministry of Environment 2019).</p> <p>Figures 2-3, Figure 2-5, and Figure 2-7 in the revised draft EIS Appendix 9-F illustrate the location of caribou observations in relation to the indicates habitat life requisite attributes (forage, refuge, and calving) based on the information received from the SK MOE (2024) at the Project Area, LSA, and RSA scales.</p> <p>Figures 2-4, Figure 2-6, and Figure 2-8 in the revised draft EIS Appendix 9-F illustrate the location of caribou observations in relation to the indicates habitat life requisite attributes (forage, refuge, and calving) based on the information received from the SK MOE (2024) at the Project Footprint + 500 m scale.</p>	<p>(added) into the revised Draft EIS Appendices</p>
IR-156	-	ECCC	Wildlife and Wildlife habitat	Section 9.3.6.4.1 Section 9.3.7.3.1	<p><b>Context and Rationale:</b> In Section 9.3.6.4.1 of the draft EIS, the Proponent identified that 142 ha of available caribou habitat within the Project footprint will be directly impacted or lost, while an additional 1,165 ha will be indirectly impacted by Project activities such as sensory disturbance. They assessed the residual and cumulative effect of alteration to habitat for woodland caribou as not significant: “The residual effect of alteration and/or loss of available woodland caribou habitat is not expected to result in a change that will alter caribou habitat integrity to the point where it would not be able to sustain the regional woodland caribou population. Therefore, the effect is assessed as not significant.”</p>	<p>Provide a revised assessment of residual and cumulative effects, taking into consideration that the disturbance within the SK1 range is above the disturbance management threshold required for survival and recovery of the species.</p> <p>See also related IRs: IR-137 and IR-154.</p>	<p>This response has not been accepted.</p> <p>Based on the Amended Recovery Strategy for the Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada 2020, the SK1 range is currently at its disturbance threshold. All remaining habitat in this range is considered to be critical habitat.</p> <p>As the development of this Project will result in loss of critical habitat for boreal caribou, the Project will have an impact on boreal caribou.</p>	<p>It is Denison’s and its SME’s understanding that the SK1 range is not at its disturbance threshold (60% undisturbed) based on the most recent information that we are aware of from the province that was confirmed in November of 2023. As at that date, it was estimated that the disturbance, almost exclusively due to natural factors (fire), was at 53% (SK ENV 2023). This is material to the consideration of both potential Project-related and cumulative effects that are reviewed below.</p> <p>Denison used a conservative approach in that the EA assumed that all habitat types were suitable and available to caribou and were used by caribou during all seasons in support of caribou life requisites - which is highly conservative considering the indicated low caribou population levels within the LSA and RSA.</p>	<p>Yes</p> <p>Appendix 9-F incorporated (added) into the revised Draft EIS Appendices</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>Section 9.3.7.3.1 of the draft EIS states: “It is not expected that the cumulative effects of alteration and/or loss of habitat will alter the integrity of woodland caribou habitat within the Terrestrial RSA to the point where it is not sustainable or available to contribute to ecological functions. Therefore, the cumulative effects resulting from the Project’s residual effect interacting with residual effects from other projects and activities is predicted to be not significant.”</p> <p>For the residual effect of alteration and/or loss of available caribou habitat (Section 9.3.6.4.1, Table 9.3-24), the Proponent assessed the magnitude as low, the geographic extent as local, the duration as long-term, the frequency as frequent, the reversibility as fully reversible, the context as high and the likelihood as likely. The rationale provided by the Proponent is insufficient to determine the accuracy of these assessments, given the lack of data and the small size of the assessment area. ECCC does not support the residual effects assessment of low magnitude, given the uncertainties related to seasonal use by caribou in the Project area and the current level of disturbance in the SK1 range.</p> <p>For the cumulative effect of alteration and/or loss of available caribou habitat (Section 9.3.7.3.3 , Table 9.3-30), the Proponent assessed the magnitude as moderate, the geographic extent as beyond the RSA, the duration as long-term, the frequency as frequent, the reversibility as fully reversible, the context as high, the likelihood as likely, the significance as not significant and the level of confidence as moderate. The rationale provided by the Proponent is insufficient to determine the accuracy of these assessments, given the lack to data presented for caribou and the small size of the RSA, compared to the SK1 region. ECCC does not support the conclusion of the cumulative effects assessments or for the level of confidence.</p> <p>The Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020 states that the range is currently at the 60% disturbance management threshold. Therefore, any activity likely to result in the alteration or destruction of critical habitat may impact on the species survival and recovery. In addition, the Proponent’s assessment was based on information that was lacking data on calving, wintering and rutting areas, and connectivity and caribou movements. The absence of considerations of the regional context of disturbance does not provide a conclusion based on best available information.</p>		<p>The assessment does not contain adequate information on habitat quality or representativeness of the RSA to the SK1 range. The Proponent did not consider disturbance in the regional context, therefore their conclusions are not based on the best available information. Considerations of disturbance in a regional context is required to accurately represent residual and cumulative effects to caribou within the SK1 range.</p> <p>The Proponent has not provided sufficient information to support their conclusion of a “not significant” impact to boreal caribou as the Recovery Strategy wasn’t fully considered. Since all remaining habitat in this range is critical habitat, the Project will negatively affect critical habitat necessary for the survival and recovery of the species. The Proponent should provide a revised assessment of residual and cumulative effects, taking into consideration the Recovery Strategy and that the disturbance within the SK1 range is at the disturbance management threshold, and Projects impacts to critical habitat.</p>	<p>The EA for the Project considered that the habitat types in the Project Footprint and the RSA have largely been disturbed, primarily by past fire events. This has been acknowledged and documented by local knowledge keepers. In September 2011, Environment Canada gathered Aboriginal Traditional Knowledge from Indigenous groups across Canada to support their recovery efforts of boreal woodland caribou (ERFN 2011). Forest fires are considered the main threat to woodland caribou in the English River area, and most interviewees stated that caribou lost their calving areas to fires and they moved elsewhere to have their calves. It is more difficult to find the caribou now (ERFN 2011).</p> <p>Figure 2-1 in revised Draft EIS Appendix 9-F shows the location of woodland caribou observed during the baseline field program in association with the ecosite types as classified by the Saskatchewan Ministry of Environment as having the potential to develop into low, moderate or high quality habitat to support woodland caribou in relation to the SK1 range. These habitat potential categories are based on the overall habitat suitability ranking for the life history requirements, including forage, refuge, and calving habitat for caribou (Saskatchewan Ministry of Environment 2019).</p> <p>The disturbance of the SK1 conservation unit has little relevance to the LSA and RSA, which were selected to inform and focus the EA for the Project, as per accepted EA methodology. As described in Section 9.3.7, existing habitat disturbances due to past and ongoing anthropogenic development have altered the Terrestrial RSA resulting currently in 1.5% of habitat loss in the Terrestrial RSA. The Project is likely to add another 0.4% of anthropogenic disturbance (considering the Project Area of 169.6 ha) to the disturbance resulting in up to 1.9% of total anthropogenic disturbance in the Terrestrial RSA. While the Terrestrial RSA currently provides 30,541.63 ha (76.1%) of habitat that are currently available for woodland caribou (Section 9.3.7), which is located within the SK1 Boreal Shield Woodland Caribou Management Unit. Environment and Climate Change Canada (2020) identified the caribou population in the SK1 conservation unit as being self-sustaining at a threshold of 40% undisturbed habitat and recommended that total anthropogenic disturbance in the SK1 Boreal Shield range should not exceed 5% with the remainder (i.e., 55%) being attributed to natural disturbance (while maintaining a minimum of 40% undisturbed habitat in the range). Based on 2010-2015 mapping, Environment and Climate Change Canada (2020) calculated that approximately 58% of the SK1 Boreal Shield range is currently affected by past forest fires and 3% of the range is affected by anthropogenic disturbances. Based on the federal assessment and recent preliminary disturbance assessment from ENV, an estimated 53% of SK1 is considered disturbed, with 47% undisturbed (ENV 2023), indicating that the land use and overall disturbance in the conservation unit remains below the recovery strategy disturbance threshold.</p> <p>The size of the SK1 Boreal Shield range is estimated at 18,034,870 ha (ECCC 2020), resulting in an estimated additional Project-related disturbance of 0.001% at the scale of the SK1 Boreal Shield Woodland Caribou Management Unit. The incremental increase of the disturbance at the SK1 Range is 0.001%, but for context that habitat is primarily disturbed and regenerating as a result of past fire disturbance, which is not anticipated to be suitable habitat for caribou in the next 40-50 years. As such, the contribution of the Project effects to the cumulative effects on woodland caribou within the SK1 conservation unit are deemed to be negligible.</p>

IR-157	-	ECCC	Wildlife and Wildlife habitat	<p>Section 9.3.9 Ungulates, Furbearer and Woodland Caribou Summary</p>	<p><b>Context and Rationale:</b> The Proponent has committed to developing a Woodland Caribou Management Plan, which will include a “detailed assessment for the need for habitat offsets.” The Woodland Caribou Management Plan will support ECCC’s review of the Proponent’s assessment of residual effects following mitigation and offsetting.</p> <p>This plan should consider ECCC’s Operational Framework for Use of Conservation Allowances (ECCC, 2012). ECCC is available to assist the Proponent in the determination of appropriate offsets that would balance against Project adverse effects after the application of measures to avoid, minimize and restore on-site are adopted.</p> <p>Based on the Amended Recovery Strategy for the Woodland Caribou (Rangifer tarandus caribou), Boreal Population, in Canada 2020, anthropogenic impacts to local caribou populations experience a lag effect, which occurs over extended periods. This lag effect needs to be adequately considered when proposing offsets. ECCC is available to assist the Proponent in understanding how critical habitat is described in the Recovery Strategy and the determination of appropriate offsets that would balance against Project effects based on the predicted impacts to caribou habitat.</p>	<p>Provide the Woodland Caribou Management Plan for review. The plan should clearly demonstrate efforts to avoid and minimize any Project effects and restore on-site any disturbed areas prior to the consideration of offsetting. Details on how severity of disturbance and vulnerability of the species were considered should be explained.</p> <p>See also related: IR-149.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> ECCC notes that the Woodland Caribou Management Plan should clearly explain efforts to address Project effects, including any contribution to cumulative adverse effects, after it has been determined that all options in the previous steps of the mitigation hierarchy (i.e., avoidance, and minimization,) have been fully considered and applied.</p> <p>In the Woodland Caribou Management Plan, provide details on how the factors outlined in the Operational Framework for Use of Conservation Allowances (ECCC, 2012) were considered in determining the offsetting amounts, including the severity of disturbance and vulnerability of</p>	<p>This response has not been accepted.</p> <p>The Proponent provided a conceptual Woodland Caribou Monitoring Plan, however, this plan does not include an assessment of the Proponent’s determination of the required amount of habitat offset.</p> <p>ECCC currently recommends a minimum offset multiplier of 4:1 (offset outcome: residual adverse effect) for a project that has a low severity impact of adversely affecting a low vulnerability ecological component. This is a benchmark ratio applied to a project that is in the lower end of the risk spectrum; for example, for a project with a low severity impact adversely affecting a low vulnerability ecological component. In general, the minimum 4:1 multiplier accounts for time-lags to restoration, uncertainty in outcomes, a precautionary approach, and the adverse impact itself in its specific context.</p> <p>Offset multipliers are variable and determined by project-specific circumstances and associated risks and uncertainties.</p> <p>The Proponent provided a conceptual Woodland Caribou Monitoring Plan, however, this plan does not include an assessment of the Proponent’s determination of the required amount of habitat offset.</p> <p>ECCC currently recommends a minimum offset multiplier of 4:1 (offset outcome: residual adverse effect) for a project that has a low severity impact of adversely affecting a low vulnerability ecological component. This is a benchmark ratio applied to a</p>	<p>Please see response to IR-149.</p> <p>In addition, in direct response to IR-157 the following is noted.</p> <p>Denison continues to work collaboratively with Saskatchewan Ministry of Environment (MOE) on their requirement for an offset for adverse effects on caribou habitat. Denison has advanced the Project-related Caribou Management Framework within the context of the province’s offsetting framework. The MOE has reviewed the draft framework and has provided Denison a notification of their support. Subject to finalization and provincial acceptance, the framework will provide the means to address/offset all residual adverse effects (i.e., those remaining after the application of the proposed mitigation measures) of the Project on caribou that are under provincial jurisdiction.</p> <p>Further, Denison has committed to monitoring the effects on wildlife, as per the Wildlife Management Plan. The findings of the monitoring programs are expected to inform Denison, through an adaptive management process, of the need, if any, for additional mitigation measures.</p>	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
						<p>the caribou population. Important factors including time lag (the amount of time from restoration work to when the habitat would be considered caribou habitat) would also need to be considered.</p> <p>ECCC typically recommends a minimum offset multiplier of 4:1 (offset outcome: area disturbed). This is a benchmark ratio applied to a project that is in the lower end of the risk spectrum, such as one with a low severity impact adversely affecting a low vulnerability ecological component. In general, the minimum 4:1 multiplier accounts for time-lags to restoration, uncertainty in outcomes, a precautionary approach, and the adverse impact itself in its specific context. Offset multipliers are variable and determined by project-specific circumstances and associated risks and uncertainties.</p>	<p>project that is in the lower end of the risk spectrum; for example, for a project with a low severity impact adversely affecting a low vulnerability ecological component. In general, the minimum 4:1 multiplier accounts for time-lags to restoration, uncertainty in outcomes, a precautionary approach, and the adverse impact itself in its specific context.</p> <p>Offset multipliers are variable and determined by project-specific circumstances and associated risks and uncertainties.</p> <p>Based on the Amended Recovery Strategy for the Woodland Caribou (<i>Rangifer tarandus caribou</i>), Boreal Population, in Canada 2020, anthropogenic impacts to local caribou populations experience a lag effect, which occurs over extended periods. This lag effect needs to be adequately considered when proposing offsets.</p> <p>In the absence of sufficient data or information required to validate the level of risk that this Project is likely to have on the species recovery, the implementation of the mitigation hierarchy and offsetting measures to address Project adverse effects, ECCC’s views are based on the precautionary approach.</p> <p>Thus, ECCC preliminary analysis regarding the likelihood of this Project having an adverse effect on boreal caribou recovery is identified as moderate to high, resulting in a precautionary offsetting requirement that should be in terms of amount, much greater than 4:1. The assumptions of ECCC’s risk assessment include:</p> <ul style="list-style-type: none"><li>• The biophysical attributes required for boreal caribou recovery (i.e. habitat for calving, post-calving, rutting, winter and travel) are present within the study area and will be directly or functionally lost,</li><li>• Sensory disturbance arising from project activities (e.g. air traffic) will cause functional habitat loss for boreal caribou within important habitat areas required for different life stages.</li></ul>		

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
							<p>Additionally, lack of information supporting the Proponent’s offsetting plans creates uncertainty and thereby warrants a higher offset ratio.</p> <p>ECCC is available to provide information to the Proponent on how critical habitat is described in the Recovery Strategy and the determination of appropriate offsets that would balance against Project effects based on the predicted impacts to caribou habitat.</p>		
IR-158	-	ECCC	Migratory birds	Section 9.4.1.2, Key Indicators and Measurable Parameters	<p><b>Context and Rationale:</b> In Section 9.4.1.2 the Proponent outlined key indicators for “Migratory Breeding Birds” which includes Waterbirds and Waterfowl, Upland Game Birds and Migratory Songbirds. These are broad categories, which do not allow for assessment of the variation in habitat requirements or ecology of individual species or guilds.</p> <p><b>Updated Rationale:</b> The Proponent should identify additional focal species that can serve as indicator species by representing anticipated impacts to a broader guild of species. Indicator species should be demonstrably sensitive to the potential effect of interest, and suitable for inferring effects on other species.</p> <p>Species may be grouped into guilds for assessment based on similarities in ecology or vulnerability to Project effects, such as species at elevated risk of collision with vehicle traffic.</p> <p>By identifying focal species or guilds for each key indicator species within the Migratory Breeding Birds Valued Components (VCs), ECCC would be able to accurately review the Proponent’s assessment of impacts and mitigation measures in order to assess the accuracy of the Proponent’s conclusions and provide expert advice on the mitigation measures.</p>	Identify focal species/guilds for each key indicator species within the Migratory Breeding Birds valued components. Provide an updated analysis of Project effects on migratory birds.	<p>This response has not been accepted.</p> <p>The Proponent did not identify focal species for each key indicator species within the Migratory Breeding Birds valued components. This information is needed to accurately review the Proponent’s assessment of impacts and mitigation measures in order to assess the accuracy of the Proponent’s conclusions and provide expert advice on the mitigation measures.</p>	<p>The information provided in the Draft EIS did include a discussion of bird guilds/focal species in the Existing Environment, see Section 9.4.3.2 Migratory Breeding Birds. Section 9.4.6.3.1 in the revised Draft EIS has been updated so that discussion regarding guilds/focal species was carried forward within the effects assessment and specifically within the context of the habitat-based assessment to link habitat related effects to bird species identified in the study areas.</p> <p>For reference it is noted that no focal species/guilds were initially included as part of the VC determination as the approach used in the EA was focused on the key habitat types (i.e., habitat-based assessment) that all migratory bird species, regardless of guild, would be expected to use on a seasonal or year-round basis depending on the species. For example, it is recognized that waterbirds and waterfowl use different habitat types as part of their individual life requisites, in that they all require open water for foraging but may nest in either upland or wet meadow or aquatic habitats. Upland game birds typically use a variety of upland forest ecosite types, whereas migratory songbirds will be found in all ecosite types throughout the RSA. As such, the EA considered the potential effects on all available habitat types used by these key indicator species and appropriate mitigation measures have been proposed and will be implemented which will address all migratory bird species regardless of focal species/guild. Nevertheless, as indicated above, discussion of focal species/guilds has been carried forward more directly into the effects assessment. It is noted that this discussion does not change the mitigation measures proposed, nor the conclusions of the assessment.</p>	<p>Yes</p> <p>Section 9.4.6.3.1</p>
IR-159	-	ECCC	Migratory birds	9.4.3.2.3 Baseline Studies – Migratory Songbirds  Appendix 9-B, Section 2.10.2, Results	<p><b>Context and Rationale:</b> Information presented in the draft EIS is insufficient to accurately predict Project impacts to breeding birds. The Proponent collected a single year of breeding songbird point counts and aerial waterfowl surveys (including avian species at risk). A single year of surveys in which birds may be unusually scarce or abundant could severely compromise interpretation of post-construction monitoring data.</p> <p>Additionally, data presented in the draft EIS is from 2017 and ECCC advises that more recent data is needed for a comprehensive baseline to verify Project impacts.</p> <p>Data from the Saskatchewan Conservation Data Centre (HABISask), the Saskatchewan Breeding Bird Atlas and the Boreal</p>	Supplement breeding bird point count data and aerial waterfowl data collected during 2017 with additional pre-construction field data or existing post-2017 data/modelling to provide a comprehensive baseline that can be used to verify Project impacts during construction and operational phases.	<p>This response has not been accepted.</p> <p>The Proponent’s response indicated that their opinion is that the data presented in the draft EIS is sufficient and that no updates to the draft EIS are needed.</p> <p>However, a single year of baseline data from 2017 is insufficient to assess Project impacts during the follow-up and monitoring program. Although pre-construction surveys prior to clearing can give a very localized picture of the avian community, it does not provide a baseline within the Regional Study Area (RSA) of the bird community and will be</p>	<p>Denison and its SME continue to be of the opinion that the data on which the effects assessment is based are sufficient and fit for purpose as it concerns the EA process. The effects assessment was not based on the 2017 field survey data alone. The EA used an accepted, proven habitat-based EA approach to address the variability of population surveys. Further, the EA used all available, recent/relevant survey data collected in appropriately timed and executed methodologies, including IK. The supplemental avian data received from records from the Saskatchewan Breeding Bird Atlas downloaded through the NatureCounts web portal (Saskatchewan Breeding Bird Atlas 2017), which also includes data received as part of the Saskatchewan Boreal Monitoring Strategy program. These data represent bird observations from 24-point counts conducted on June 7 and June 9, 2019. Nine point-counts are located approximately 6.5 km east of the Project footprint, the majority of which are located in the BS3 ecosite type; 15 point-counts are located approximately 7.7 km south of the Project footprint, the majority of which are located in the BS3/BS7 ecosite type. During this survey effort, 24 migratory</p>	<p>Yes</p> <p>Appendix 9-F incorporated (added) into the revised Draft EIS Appendices</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>avian Modelling project contain information on avian densities and avian species at risk that could supplement field data.</p> <p>The national standard for major projects recommends a minimum of two years of field surveys to be provided, so that temporal variability can be considered when comparing post-construction against baseline records and other available data.</p> <p><b>Updated Rationale:</b> ECCC recommends that for major projects, a minimum of two years of field surveys should be provided so that temporal variability can be considered when comparing post-construction against baseline records and other available data. More recent data is needed due to landscape changes that may have occurred since 2017 as well as cumulative effects that have occurred in that time. Additionally, if there was an unusually high population density of birds in 2017 due to extraneous circumstances, Project effects may be attributed to a non-existent decline in the population when the discrepancy can be due to natural variability.</p> <p>A more recent baseline will account for interannual variation and any regional effects and will allow for a more accurate review of mitigation and follow-up measures. Data from the Saskatchewan Conservation Data Centre (HABISask), the Saskatchewan Breeding Bird Atlas and the Boreal Avian Modelling project contain information on avian densities and avian species at risk that could supplement field data.</p>		<p>of limited use for comparing construction and operational monitoring data to baseline conditions. Use of more recent data or supplemental data can account for interannual variation and any regional effects and will allow for a more accurate review of mitigation and follow-up measures.</p> <p>See follow-up IR-142-159-167-R1.</p>	<p>songbird species were documented. A summary of the total number of individuals observed for each species across all plots is provided in Appendix 9-F of the revised Draft EIS. While the supplemental data do provide further context for the RSA, they would not be expected to alter the findings or the mitigation measures proposed, nor the conclusions reached in the EA.</p> <p>The above does not preclude the implementation of further breeding bird surveys prior to site development and operations. Denison accepts the comment that additional, more recent information, as well as supplemental data as available, and will provide the basis for a more effective review of mitigation and follow-up measures as the Project moves forward. The details of such follow-up monitoring will be defined as part of the further consideration of planning related to follow up programs.</p> <p>For clarification the pre-clearance wildlife sweeps are intended to identify sensitive wildlife features (e.g., hibernacula, roosting habitat, dens, nests, mineral licks) that would require site-specific mitigation measures to limit or avoid adverse effects. The spatial scale of where these pre-construction sweeps would be completed could be expanded to include other areas beyond the Project Area but within the RSA.</p>	
IR-160	-	ECCC	Migratory birds	Section 9.4.3.2.3 Baseline Studies – Migratory Songbirds	<p><b>Context and Rationale:</b> ECCC advises that the results of the field studies need to be interpreted/analyzed in the context of the study area. The Proponent presents results on areas with highest richness and diversity but does not make a link to habitat that will be lost or experience indirect effects.</p> <p><b>Updated Rationale:</b> Results regarding the effects of the Project, including a discussion on habitat types that will be lost or indirectly impacted during the life of the Project, and a discussion on the overall impact on the avian community including results from baseline studies as well as other supplemental information as per IR-159 are required to assess the validity of the Proponent’s conclusions and should be used in effects assessment.</p>	<p>Provide results interpreted in the context of Project direct and indirect effects. Include discussion on the habitat types that will be lost or indirectly impacted during the Project and the overall impact on the avian community, using results from the analysis of baseline studies and other supplemental data (as per IR-159).</p> <p>Discussion should support the conclusions of the effects assessment.</p> <p>See also related IRs: IR-161 and IR-162.</p>	<p>This response has not been accepted.</p> <p>The Proponent did not provide the information requested in IR-159. This information is required to assess the accuracy of the effects assessment.</p>	<p>Table 9.4-15: Summary of Available Habitat for Migratory Songbirds in the Project Study Areas provides an overview of the ecosite types that are present with the Project Area, Wildlife LSA, and Terrestrial RSA that are available for use by all migratory bird species.</p> <p>Direct effects, specifically habitat loss, are calculated as the area of available habitat for migratory songbirds expected to be lost due to site clearing within the Project Area. Direct habitat loss has been mitigated by reducing the size of the Project Area to the extent practicable during Project design; however, available habitat is still predicted to be cleared during the Construction Phase. In the Project Area, 113.5 ha or 100% of available habitat is assumed to be removed and will not be available to the migratory songbird species for the duration of the Project. This represents the removal of 4.5% of available habitat within the Wildlife LSA and of 0.6% within the Terrestrial RSA (Table 9.4 16: Summary of Available Habitat for Migratory Songbirds, Direct Habitat Loss, and Habitat Alteration in the Study Areas). Further, revisions included in Figure 9.4-11: Available Habitat for Migratory Songbirds provides further context as to the habitat (ecosite) types within the Project Area that will be affected by Project activities.</p> <p>An additional 28.5% (719.4 ha) of available habitat for migratory songbirds in the Wildlife LSA may experience habitat alteration resulting from indirect Project effects, such as sensory disturbance. In the Terrestrial RSA, 3.5% of available habitat may experience habitat alteration (Table 9.4 16: Summary of Available Habitat for Migratory Songbirds,</p>	<p>Yes</p> <p>Revised Draft EIS, Table 9.4-15, Table 9.4-16 and Figure 9.4-11 have been updated</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								Direct Habitat Loss, and Habitat Alteration in the Study Areas). Mitigation measures outlined in Section 9.4.5 are anticipated to reduce the effects of alteration and/or loss of habitat on migratory songbirds, but not eliminate them.	
IR-162	-	ECCC	Migratory birds	Section 9.4.3.3, Bird Species at Risk	<p><b>Context and Rationale:</b> Not all avian species at risk present in the study area were included as Key Indicators in the avian species at risk (SAR) valued component (VC). Barn swallow and horned grebe were recorded in the study area, but not included as VCs. Additionally, bank swallow may inhabit the Project area. Impacts to Species at Risk Act Schedule 1 listed species need to be identified, avoided, lessened and monitored.</p> <p>In Section 9.4.3.3. the Proponent states: “It is acknowledged that the listed Barn Swallow (<i>Hirundo rustica</i>) and Horned Grebe (<i>Podiceps auratus</i>) could potentially occur in the Terrestrial RSA. Incidental observations occurred during the baseline studies (Appendix 9-B). To focus the effects assessment on a few key species (described in the following) it was decided to use Olive-sided Flycatcher and Common Nighthawk to represent Barn Swallow as well, and to use Yellow Rail and Rusty Blackbird as a substitute for Horned Grebe. Unlike Horned Grebe, Yellow Rail and Rusty Blackbird are also listed provincially.”</p> <p>Barn swallow, bank swallow and horned grebe may have different nesting habitat requirements than the representative species discussed in the draft EIS. An explanation of how differing species are representative of one another is required, or if an explanation cannot be provided, the species should be assessed individually.</p> <p><b>Updated Rationale:</b> The management plans for these three species demonstrate the variability in their habitat selection.</p> <p>The Management Plan for the Yellow Rail (<i>Coturnicops noveboracensis</i>) in Canada (Environment Canada, 2013) states “Yellow Rails inhabit shallow wetlands and other wet areas with grass-like vegetation. They breed in wetlands such as damp hay fields or meadows, floodplains, bogs, upper levels of estuaries, salt marshes (Bookhout 1995, Alvo and Robert 1999, COSEWIC 2009), shallow prairie wetlands, and wet montane meadows (Peabody 1922, Sherrington 1994, Popper and Stern 2000). “</p> <p>The Management Plan for the Rusty blackbird (<i>Euphagus carolinus</i>) in Canada (Environment Canada 2015), states: “Rusty Blackbirds tend to select breeding sites with a combination of freshwater bodies with shallow water and emergent vegetation for foraging that are adjacent to wetlands with conifers or tall shrubs with cover for nesting (Matsuoka et al. 2010a, Matsuoka et al. 2010b, Greenberg et al. 2011).”</p>	<p>1. Explain how nesting habitat requirements of barn swallow is represented by common nighthawk and olive-sided flycatcher as a VC or assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>2. Explain how nesting habitat requirements of horned grebe are represented by yellow rail and rusty blackbird as a VC, or assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>3. Assess individually each SAR that overlaps with the Project and is likely to be affected.</p> <p>See also related IRs: IR-160 and IR-161.</p>	<p>This response has not been accepted.</p> <p>Part 1. Of the IR was accepted, however the answer for part 2. And 3. Of the IR are insufficient in order to understand the Proponent’s rationale for using yellow rail and rusty blackbird to represent horned grebe. These species are all associated with wetlands, however, their specific habitat requirements and wetland types differ.</p> <p>Due to differing habitat selection and use, ECCC recommends that each selected VC is given an individual assessment with specific mitigation measures to allow for a more accurate review of the chosen mitigation measures.</p>	<p>As noted elsewhere in the IR responses, per accepted, proven EA methodology, Denison used a habitat-based methodology to determine the Project’s effects on VCs, using an accepted Key Indicator methodology, and not every species, to focus and inform the EA.</p> <p>Nesting habitat requirements of the horned grebe are similar at a landscape level to those represented by yellow rail and rusty blackbird in that they are typically found associated with northern waterbodies and watercourses with various forms of emergent vegetation. At a site-specific scale, there are subtle differences in nesting habitat requirements, as summarized previously by ECCC in the Context and Rationale response.</p> <p>Given the nesting habitat requirements of these species, the available habitat types within the Denison study areas (e.g., Project Area, Wildlife Local Study Area, and the Terrestrial Regional Study Area) for use by these species include the following ecosite types: Labrador tea shrubby bog (BS18), graminoid bog (BS 19), graminoid bog/graminoid fen (BS19/BS24), open bog (BS 20), leatherleaf shrubby poor fen (BS22), willow shrubby rich fen (BS23), graminoid fen (BS24), open fen (BS25), and waterbodies and lakes. The habitat-based methodology of the environmental assessment adequately and appropriately addresses effects on these habitat types and the associated migratory bird species that could potentially use these habitat types. Further assessment of each species would not be expected to affect or alter the findings of the habitat-based environmental assessment.</p> <p>The characterization of the alteration and/or habitat loss residual effect considers the Project effects on available habitat used by these three migratory breeding birds within the Wildlife LSA and Terrestrial RSA. As outlined in Table 9.3 18, 0.05% of the Project Area, 11.5% of the Wildlife LSA, and 24.2% of the Terrestrial RSA provide habitat types that are potentially available to these three migratory breeding bird species.</p> <p>Direct habitat loss is calculated as the area of available habitat lost due to site clearing within the Project Area. Direct habitat loss has been mitigated by reducing the size of the Project Area to the extent practicable during Project design; however, available habitat is still predicted to be cleared during Construction. In the Project Area, 0.09 ha or 100% of available habitat is assumed to be removed and will not be available to these species for the duration of the Project (Table 9.3 19). This considers that the Project Area has previously been disturbed (i.e., almost 15% of the Project Area is disturbed by anthropogenic activities) and includes only 0.02 ha (0.01%) of landscape covered by waterbodies. This relates to a removal of 0.02% of available habitat within the Wildlife LSA and 0.001% in the Terrestrial RSA.</p> <p>An additional 93.9 ha (17.0%) of available habitat in the Wildlife LSA may experience habitat alteration resulting from indirect Project effects, such as sensory disturbance (Table 9.3 19). This area of indirect effect represents 1.0% of available habitat in the Terrestrial RSA that may experience habitat alteration.</p>	No

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>The Management Plan for the Horned Grebe (<i>Podiceps auritus</i>), Western population, in Canada (ECCC, 2022) states: “The Horned Grebe breeds in small (generally 0.5 to 2 ha, but ranging from 0.24 to 18.2 ha), shallow (at least 20 cm deep, but on average 40 cm), and usually fishless, perennial wetlands, but they can also nest on larger lakes with shallow edges and sufficient emergent vegetation. Breeding sites usually contain at least 40% open water with beds of emergent vegetation, such as sedges (<i>Carex</i> spp.), rushes (<i>Juncus</i> spp.) and cattails (<i>Typha</i> spp.) (Faaborg 1976, Kuczynski et al. 2012, Routhier 2012, Stedman 2018).”</p> <p>Due to differing habitat selection and use, ECCC recommends that each selected VC is given an individual assessment with specific mitigation measures. This will allow for a more accurate review of the chosen mitigation measures.</p>				
IR-164	-	ECCC	Migratory birds	Section 9.4.4.2.1, Alteration and/or Loss of Habitat – Migratory Breeding Birds	<p><b>Context and Rationale:</b> The discussion on impacts to migratory songbirds presented by the Proponent is not sufficient to understand the impacts on various guilds of birds (e.g., aerial insectivores, forest birds, wetland birds, habitat specialists).</p> <p>As per IR-158, focal representative species/guilds should be used as key indicators (KI) in the Migratory Breeding Birds Valued Component. A greater level of detail on Project impacts to migratory songbirds with differing habitat requirements is needed for a fulsome assessment of effects.</p> <p><b>Updated Rationale:</b> A greater level of detail, including a discussion on impacts to different focal species and/or guilds within the Migratory Breeding Birds Valued Component, is required for a more fulsome assessment of effects and identification of mitigation measures. Additionally, mapping detailing important features or habitat types that will be lost due to the Project for different guilds of migratory birds will be required to assess Project effects. This information will be required in order for the Proponent to apply adaptive management, and for ECCC to review the adequacy of these management plans.</p>	<p>1. Provide further discussion on impacts to different focal species/guilds within the Migratory Breeding Birds Valued Component.</p> <p>2. Provide mapping of important features or habitat types that will be lost due to the Project for different guilds of migratory birds.</p>	<p>This response has not been accepted.</p> <p>The Proponent did not provide the information requested in the previous Information Requirement. The discussion of impacts to different focal species/guilds within the Migratory Breeding Birds VC and mapping of important features or habitat types lost for these guilds of birds is required for the Proponent to apply adaptive management, and for ECCC to review the adequacy of these management plans.</p>	<p>As noted elsewhere in the IR responses, as per accepted, proven EA methodology, Denison used a habitat-based methodology to determine the Project’s effects on VCs, using an accepted Key Indicator methodology, and not every species, to focus and inform the EA. Further, the approach used in the EA was focused on the key habitat types that all migratory bird species, regardless of guild, would use. The EA considered the potential effects on all available habitat types used by these key indicator species and appropriate mitigation measures have been proposed and will be implemented which considered all migratory bird species regardless of focal species/guild.</p> <p>Direct habitat loss is based on the removal of habitat (ecosites) during site clearing within the Project Area. Direct habitat loss has been mitigated by reducing the size of the Project Area to the extent practicable during Project design; however, available habitat is still predicted to be cleared during the Construction Phase. In the Project Area, 113.5 ha or 100% of available habitat is assumed to be removed and will not be available to the migratory songbird species for the duration of the Project. This represents the removal of 4.5% of available habitat within the Wildlife LSA and of 0.6% within the Terrestrial RSA (Table 9.4 16: Summary of Available Habitat for Migratory Songbirds, Direct Habitat Loss, and Habitat Alteration in the Study Areas). Further, revisions have been made to Figure 9.4-11 in the revised draft EIS provides further context as to the habitat (ecosite) types within the Project Area that will be affected by Project activities.</p> <p>No important wildlife features were identified within the Project Area during the baseline surveys, although several raptor nests were found within the Wildlife LSA and Terrestrial RSA (see Figure 9.4-6 in the revised draft EIS:). The pre-clearance wildlife sweeps will be completed to identify important wildlife features (e.g., hibernacula, roosting habitat, dens, nests, mineral licks) that would require site-specific mitigation measures to limit or avoid adverse effects.</p>	<p>Yes</p> <p>Revised Draft EIS, updates to Figure 9.4-6 and Figure 9.4-11</p>
IR-165	-	CNSC ECCC	Birds (all species)	Section 9.4.4.2.2	<p><b>Context:</b> On p. 9-364 of the EIS, it is stated that exposure to hazardous materials through contact with contaminated waste ponds could affect avian health and contribute to mortality.</p>	<p>Please perform an ecological risk assessment with avian receptors</p>	<p>This response has not been accepted.</p>	<p>The CCME livestock guidelines are intended to protect both birds and mammals. As per the CCME “Protocols for Deriving Water Quality Guidelines for the Protection of Agricultural Water Uses (Irrigation and Livestock Water)”, the livestock guidelines are</p>	<p>No</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
				Section 9.4.5.2.4, Avian Deterrence and Prevention of Entrapment  Appendix 10-A (ERA)	<p>However, the ERA places the avian receptors only in waterbodies and locations outside of the Project area (see Figure 5-2 in the ERA), i.e., Whitefish Lake, McGowan Lake, the inlet to Russell Lake, and Kratchkowsky Lake.</p> <p>Further, there are insufficient details on the potential effects of the water quality in the water management and treatment facilities on birds, species at risk, and other wildlife, including the risk of bioaccumulation of contaminants. The Proponent should assess potential effects of water quality from these areas using applicable CCME guidelines.</p> <p><b>Rationale:</b> It is unclear whether the ecological risk assessment based on the chosen exposure locations is protective and conservative for avian species potentially exposed to contaminated waste ponds on the Project site.</p> <p>While mitigation measures such as physical, visual, and/or auditory deterrents are proposed in Section 9.4.5.2.4, the possibility of avian species coming into contact with waste ponds cannot be excluded based on the available information in the EIS. The possibility of birds, species at risk, and other wildlife accessing the water management and treatment facilities for drinking water or other purposes is not discussed in the draft EIS.</p>	<p>located at the contaminated waste ponds, including:</p> <ol style="list-style-type: none"><li>1. Describe and analyze the possibility of birds, species at risk and other wildlife using the water or waste management facilities and provide an analysis to determine if there is a risk to wildlife that may access these areas.</li><li>2. Identify the potential toxicity of water management ponds to aquatic migratory birds and species at risk (SAR).</li><li>3. Describe what measures will be taken if the waters are found to be toxic to migratory birds and SAR.</li></ol> <p><b>Suggestions for mitigation and follow-up measures:</b> CNSC recommends that Denison ensure adequate mitigation measures are implemented to minimize the potential for avian exposure to pond waters.</p>	<p>Please provide an explanation for the appropriateness and conservatism of using the Canadian Council of Ministers of the Environment (CCME) water quality guidelines (WQG) for the protection of livestock for avian receptors, or update the tables provided in Attachment IR-165 using the CCME Water Quality Guidelines for the Protection of Aquatic Life.</p> <p>In order to protect migratory birds from the quality of water in the water management pond, it is recommended that the use of the CCME water quality guidelines for the protection of aquatic life to assess potential impacts to aquatic birds from water management facilities because they are more protective than the CCME water quality guidelines for livestock with lower acceptable levels for contaminants. The water quality guidelines for the protection of aquatic life should also be used to compare predicted contaminant concentrations in water management ponds. The FIRT is unable to verify predicted Project impacts to migratory birds using water management ponds as the selected CCME Water Quality Guidelines for livestock do not accurately reflect the exposure levels and pathways experienced by waterfowl and shorebirds.</p>	<p>based on toxicological datasets and follows toxicological dataset requirements for derivation of the guidelines. Livestock are defined in the Protocol as “any terrestrial animal kept for economic profit or personal use (e.g., cattle, pigs, poultry, waterfowl, etc.)”. The Protocol identifies that aquatic organisms such as fish should be addressed by the water quality guidelines for protection of aquatic life. The IR is asking about avian receptors located at the water management ponds . It is not appropriate to assess avian receptors (which are considered riparian and/or terrestrial) against guidelines for the protection of aquatic life (which are considered to be fish, aquatic plants, aquatic invertebrates, etc.). As identified in the Protocol, the livestock guidelines consider the potential for bioaccumulation in the animal. Additionally, for each species, the livestock guidelines are based on the data from the most sensitive livestock species, and the sensitivities of life stages are considered as well. As such, the livestock guidelines are considered sufficiently protective in the unlikely case that avian birds land on and drink from the process water pond or the effluent monitoring and release ponds. The previous response to IR-165 (Attachment IR-165) outlined the numerous mitigation measures Denison plans to implement to minimize the potential for avian exposure to pond water, as well as additional visual and auditory deterrent techniques. As such, no additional changes are needed to address this IR.</p> <p><b>References:</b></p> <p>CCME. 1999. Protocols for Deriving Water Quality Guidelines for the Protection of Agricultural Water Uses (Irrigation and Livestock Water).</p>	
IR-169	-	ECCC	Migratory birds	Section 9.4.6.3, Residual Effects Evaluation for Migratory Birds, Table 9.4-15 and Map 9.4-11	<p><b>Context and Rationale:</b> The analysis of available habitat types for migratory songbirds appears incorrect.</p> <p>In their interpreted ecosite mapping, the Proponent identified 25 different ecosite types. In their table 9.4-15 and map 9.4-11, the Proponent only lists 8 ecosite types that are available migratory songbird habitat. Section 9.4.6 Residual Effects Evaluation for Migratory Songbirds reads: “Considering the baseline data (Appendix 9-B), migratory songbird habitat is described in the following text without species-specific differentiation and referred to as available habitat for migratory songbirds. Based on the baseline study results, 66.8%, 52.2%, and 50.7% of the Project Area, Wildlife LSA, and Terrestrial RSA, respectively, are assumed to provide available habitat for migratory songbirds (Table 9.4-15).”</p> <p>All Project areas, except some anthropogenic features and open water, would be considered available habitat for migratory songbirds. Although some ecosite types may have lower density</p>	<ol style="list-style-type: none"><li>1. Explain how information in Table 9.4-15 and map 9.4-11 were derived.</li><li>2. Explain why other habitat types were not considered as available habitat for migratory songbirds.</li></ol>	<p>This response has not been accepted.</p> <p>In their response to IR-169, the Proponent states, “As per accepted methodology, to appropriately focus the habitat- based effects assessment, as per accepted EA methodology, the most frequently used habitat types (i.e., the ecosites experiencing the highest species richness, highest mean number of breeding songbird pairs, and highest species diversity) within the Project study areas were included as “available habitat” as shown in draft EIS Table 9.4-15 Summary of Available Habitat for Migratory Songbirds in the Project Study Areas and Figure 9.4-11 Available Habitat for Migratory Songbirds.”</p> <p>The methodology used to determine available habitat is not appropriate. The methodology used</p>	<p>Updates to Table 9.4-15 and 9.4-16, as well as Figure 9.4-11 have been completed in the revised Draft EIS to include all habitat (ecosite) types. See separate response to IR-169: Available Habitat for Migratory Songbirds. Figure 9.4-11 will be replaced in the EIS with a revised figure that includes all ecosite types.</p> <p>Although of interest, these observations with the RSA would not be expected to alter the findings or the mitigation measures proposed, nor the conclusions reached in the EA.</p>	<p>Yes</p> <p>Revised Draft EIS, updates to Table 9.4-15 and Table 9.4-16, as well as updates to Figure 9.4-11.</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					and diversity, it is expected that all ecosites provide migratory songbird habitat.		<p>by the Proponent would be appropriate for the identification of higher quality habitat, but not as a representation of all available habitat. The methods used to determine available habitat may underrepresent rare ecosite types that were not sampled or were sparsely sampled, including ecosite types that may be important for species at risk. Avian habitat mapping/analyses should be corrected to reflect all available habitat to understand the location of habitat and the presence/absence of species.</p> <p>Repeat the analysis of available habitat to include all habitats used by birds, or</p> <p>a. Change mapping and analyses to indicate that areas identified are ecosites with the highest frequency of use, or</p> <p>b. Change mapping and analyses to show relative habitat use.</p>		
IR-170	-	ECCC	Migratory birds	Section 9.4.6.4, Residual Effects Evaluation for Bird SAR, Table 9.4-19	<p><b>Context and Rationale:</b> The table and map presented by the Proponent do not appear representative of all available habitat for common nighthawk (CONI). Although CONI do preferentially use open areas such as gravel (often an anthropogenic disturbance) and regenerating forest, as identified in the draft EIS, they also use rock outcrops that can be within forested areas. As this area lies within the pre- Cambrian shield, there are likely rock outcrops that are also available habitat.</p> <p>As aerial insectivores, CONI select nesting areas in close proximity to wetlands or lakes where there is abundant forage.</p> <p><b>Rationale:</b> Habitat requirements and preferences for all species at risk is required for developing effective mitigations and adaptive management.</p>	<p>1. Provide an updated table and map that considers all available habitat for common nighthawk.</p> <p>2. Additionally, as part of environmental management plans the Proponent should include species-specific mitigations that are biologically relevant to all the species at risk for all Project phases and components.</p>	<p>This response has not been accepted.</p> <p>Part 1 of the IR was addressed, however, part 2 has not been addressed. ECCC requires this information to properly assess potential the mitigations and adaptive management for Common Nighthawk.</p>	<p>Based on the baseline field survey observations (n=38) for common nighthawk, the majority of observations (n=20) were in association with anthropogenic (disturbed) ecosite types, while the remainder (n=10) were associated with the jack pine-blueberry/black spruce-blueberry/lich (BS3/BS7) ecosite.</p> <p>Updates to Figure 9.4-7, Figure 9.4-12 and Table 9.4-19 of the revised draft EIS have been completed to include all habitat (ecosite) types. See separate response to IR-170: Available Habitat for Common Nighthawk. Figure 9.4-12 in the revised draft EIS has been replaced in the EIS with a revised figure that includes all ecosite types.</p> <p>Mitigation measures that would pertain to common nighthawks are included in Section 9.4.5.2.1 Work Timing Windows and Habitat Disturbance, which state that site clearing and other works that involve disturbance of vegetation and/or soil will be conducted outside of the nesting season, whenever practicable. The nesting season for the Raptors, Migratory Breeding Birds, and Bird Species at Risk VCs in Saskatchewan spans a period from March 15 to August 31.</p> <p>Further, in the event site clearing is necessary within this time frame, pre-clearance wildlife sweeps will be completed where common nighthawks are suspected of nesting; if an occupied nest is found, applicable activity restriction guidelines would be implemented (as per SK MOE 2017).</p> <p><b>References:</b></p> <p>Saskatchewan Ministry of Environment (SK MOE). 2017. Saskatchewan Activity Restriction Guidelines for Sensitive Species. <a href="https://publications.saskatchewan.ca/api/v1/products/79242/formats/89555/download">https://publications.saskatchewan.ca/api/v1/products/79242/formats/89555/download</a> (accessed July 2021).</p>	<p>Yes</p> <p>Revised Draft EIS, updates to Figure 9.4-7, Figure 9.4-12, and Table 9.4-19</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
IR-174	-	ECCC	SAR – Bats	Appendix 9-B, Denison Mines Corporation Wheeler River Project, Terrestrial Environment, Wildlife and Vegetation Baseline Inventory, Section 2.1.4 Acoustic Bat Surveys	<p><b>Context:</b> The Proponent conducted acoustic surveys for bats and confirmed presence of two Species at Risk Act (SARA) schedule 1 listed bat species in the Project area, little brown myotis (Myotis lucifugus) and northern myotis (Myotis septentrionalis). However, the Proponent did not do an effects assessment of either of these bat species.</p> <p><b>Rationale:</b> Although bats are present in the study area, no work was done to identify hibernaculum or maternal roosting sites. All species at risk that are expected to be present in the Project area should be assessed and species-specific mitigations detailed.</p>	<p>1. Conduct an effects assessment for little brown myotis and northern myotis, including the likelihood that tree clearing during the bat roosting period, is likely to ‘kill’, ‘harm’, or ‘harass’ Little Brown Myotis and Northern Myotis and its ability to carry out its life processes.</p> <p>2. Describe and map locations of suitable myotis hibernacula and/or maternal roost habitat within the Local Study Area and Regional Study Area and explain how these habitats may be affected by Project activities.</p> <p>3. Describe what mitigation measures will be taken to avoid the breeding period for bats.</p> <p>4. Describe any pre-construction/pre-clearing surveys will be conducted to identify any hibernaculum and maternal roosting sites. Describe how monitoring will support adaptive management.</p>	<p>This response has not been accepted.</p> <p>Items 1., 3. And 4. of IR-174 are accepted, however, item 2. Of IR-174, which asked for mapping of suitable myotis habitat, was not addressed.</p> <p>Mapping of suitable habitat or results from baseline studies is required to understand Project impacts to Species At Risk (SAR) bat species. This may include providing mapping of bat acoustic results, including locations along with frequency of detections.</p> <p>See also IR-134 and follow-up 134-R1.</p>	<p>Acoustic bat surveys were completed between July 22 and 23, 2019 with 61 survey points sampled across five ecosite types. The location of the survey points, species detected, and frequency of detections are included in Figure 2.9 of Appendix 9-F of the revised draft EIS.</p> <p>The EA used a habitat-based approach to predict the effects of the Project on bat species. Further, in the event that site clearing is necessary, pre-clearance wildlife sweeps will be completed and appropriate mitigation will be developed and implemented.</p> <p>The pre-construction and pre-clearing surveys will consist of wildlife sweeps conducted by qualified biologists within 7 days prior to any clearing activity at a specific location, and a 100 m buffer, within the Project Footprint. The wildlife sweeps will not be species-specific surveys focused on species at risk but will be based on timing of Project related activities (i.e., will be completed in advance of site clearing activities). These sweeps are intended to identify sensitive wildlife features (including hibernacula or potential roosting sites for myotis species) that would require specific mitigation measures to avoid or minimize adverse effects on identified features and are not species-specific. The methods associated with these pre-construction and pre-clearing sweeps will be tailored to species at risk (including myotis species) that may potentially be using habitats at certain times of the year. Depending on the results of these surveys, appropriate mitigation measures will be developed and implemented. This is a risk-based approach with the intent of reducing the potential of important wildlife features being adversely affected during vegetation or land disturbance activities. The wildlife sweeps would be conducted within 7 days prior to disturbance activities, year-round, so that sensitive features can be identified, and appropriate mitigation measures (e.g., avoidance, timing delay) can be developed and implemented, as appropriate.</p>	<p>Yes</p> <p>Appendix 9-F incorporated (added) into the revised Draft EIS Appendices</p>
IR-189	-	CNSC	Woodland Caribou Ecological Model	Appendix 10-A (ERA)	<p><b>Context:</b> In the ERA (p. C.12, section 2.3.6 Woodland Caribou) it is stated: “For the ecological model a diet comprised of 50% browse, 20% lichen and 30% macrophytes is assumed for the woodland caribou.”</p> <p>In the EIS, section 9.3.3.3.1, it is stated: “Research has shown that up to 70% of the year-round diet of caribou may consist of ground and arboreal lichens.”</p> <p><b>Rationale:</b> It is unclear whether the assumptions in the ecological model in the ERA regarding Woodland caribou diet are conservative, given only 20% lichen intake in the model. Lichen is known to accumulate COPC such as metals and dust from the atmosphere.</p>	<p>Please provide additional evidence to support that those Woodland Caribou who may have higher consumption rates of lichen as part of their diet, will remain protected. This can be provided through including a second model that assumes 70% lichen in the diet.</p> <p>See also related: IR-138.</p>	<p>This response has not been accepted. Please:</p> <p>1. Provide a summary table of all hazard quotients for the second woodland caribou model assuming a diet of 70% lichen, 20% browse, and 10% macrophytes, for completeness.</p> <p>2. Clarify if the Appendix 10-A (ERA) will be updated to include the second woodland caribou model.</p>	<p>1. Summary tables of all hazard quotients (HQs) and the maximum radiological dose for the second woodland caribou model assuming a high lichen diet (HLD) of 70% lichen, 20% browse, and 10% macrophytes (woodland caribou HLD) and the woodland caribou assuming a low lichen diet (LLD) of 50% browse, 20% lichen and 30% macrophytes (woodland caribou LLD) are provided below.</p>	<p>Yes</p> <p>Appendix 10-A, New Section 6.2.1 added</p>

However, all HQs for woodland caribou HLD are below the benchmark of 1 for all non-radiological COPCs. The predicted maximum total radiological dose for the woodland caribou HLD increased by 65% compared to that for the woodland caribou LLD. However, the total dose for woodland caribou HLD is still far below the radiation dose benchmark of 2.4 mGy/d for terrestrial biota, as recommended in CSA N288.6-22.</p> <p>2. Appendix 10-A (ERA) was updated to include the second woodland caribou model as part of the sensitivity analysis presented in Section 6.2, “Section 6.2.1 Woodland Caribou Diet”. Additional text in this updated section is as follows: “The food source for the woodland caribou in the winter is terrestrial or arboreal lichens; terrestrial and aquatic vegetation are also food sources in the remainder of the year. For the ecological risk assessment, a low lichen diet (LLD) comprised of 50% browse, 20% lichen and 30% macrophytes was assumed to represent the year-round diet for woodland caribou (woodland caribou LLD). Research has noted that arboreal lichen could make up 70% of the caribou’s winter diet (MNRW, 2006). To make sure that woodland caribou who may have higher consumption rates of lichen remains protected, a high lichen diet (HLD) comprised of 70% lichen, 20% browse and 10% macrophytes was assumed as a sensitivity scenario for woodland caribou who may have higher consumption rates of lichen (woodland caribou HLD).”</p>	Biota	Location	Maximum HQs during Project Phases					Arsenic	Cadmium	Cobalt	Chromium	Copper	WoodLand Caribou LLD	Reference (Kratchkowsky Lake)	3.70E-04	2.79E-04	1.62E-04	2.30E-04	2.74E-02	Whitefish Lake	3.85E-04	2.84E-04	1.66E-04	2.33E-04	2.83E-02	WoodLand Caribou HLD	Reference (Kratchkowsky Lake)	3.90E-04	3.28E-04	2.00E-04	3.72E-04	2.15E-02	Whitefish Lake	4.06E-04	3.33E-04	2.04E-04	3.76E-04	2.29E-02	Biota	Location	Molybdenum	Selenium	Uranium	Vanadium	Zinc	WoodLand Caribou LLD	Reference (Kratchkowsky Lake)	3.30E-04	4.63E-03	3.10E-04	7.79E-03	2.80E-03	Whitefish Lake	2.54E-03	7.65E-03	9.19E-03	8.98E-03	2.82E-03	WoodLand Caribou HLD	Reference (Kratchkowsky Lake)	4.50E-04	6.41E-03	4.20E-04	9.97E-03	3.53E-03	Whitefish Lake	2.43E-03	8.40E-03	1.66E-02	1.10E-02	3.54E-03	Biota	Location	Maximum Radiological Dose During Project Phases (mGy/d)							Uranium-238	Uranium-234	Thorium-230	Radium-226	Lead-210	Polonium-210	Total Dose	WoodLand Caribou LLD	Reference (Kratchkowsky Lake)	3.34E-06	3.81E-06	6.25E-06	6.81E-04	1.20E-05	6.24E-03	<b>6.95E-03</b>	Whitefish Lake	8.19E-05	9.32E-05	7.30E-06	6.86E-04	1.20E-05	6.26E-03	<b>7.14E-03</b>	WoodLand Caribou HLD	Reference (Kratchkowsky Lake)	3.61E-06	4.12E-06	4.44E-06	6.05E-04	1.99E-05	1.09E-02	<b>1.15E-02</b>	Whitefish Lake	1.43E-04	1.62E-04	4.74E-06	6.09E-04	1.99E-05	1.09E-02	<b>1.18E-02</b>

								For reference, the modelled results (shown above) have been included as Table 6-1 and Table 6-2 in Section 6.2.1.  <b>References:</b> Ministry of Natural Resources and Wildlife (MNRW) Quebec Wildlife Sector, 2006. Gaspésie Woodland Caribou Recovery Plan (2002-2012). <a href="https://www.registrelep-sararegistry.gc.ca/virtual_sara/files/plans/rs_gaspesie_woodland_caribou_final_1007_e.pdf">https://www.registrelep-sararegistry.gc.ca/virtual_sara/files/plans/rs_gaspesie_woodland_caribou_final_1007_e.pdf</a>	
IR-190	-	HC	Change to an environmental component due to hazardous contaminants	Appendix 10-A (ERA), Table 3-8 (p. 3.31) and Table 3-9 (p. 3.36)  Appendix 6, Table 5 (p. 16)	NO2 criteria is not being consistently compared.  <b>Context:</b> Provincial and federal air quality criteria/screening values for NO2 have been used inconsistently.  Table 3-9 in Appendix 10-A (ERA) uses the 2015 Saskatchewan Ambient Air Quality Standards (SAAQS) value of 300 µg/m3 to compare the maximum concentrations of NO2 at receptor locations for the 1-hour average period, while Table 5 of Appendix 6 uses the 2025 Canadian Ambient Air Quality Standards (CAAQS) of 79µg/m3 for the same average period time.  <b>Rationale:</b> By utilizing the SAAQS screening value for NO2, the maximum concentrations at receptor locations exceed the 1-hour threshold solely during the decommissioning stage (Table 3-9). However, if the 2025 CAAQS are applied, the screening values would be exceeded at receptor locations for all project phases. It is best practice to use the more protective air quality standards to evaluate potential human health risks associated with project activities.	1. Compare the predicted maximum concentrations to the most protective applicable air quality standards available. Alternatively, provide a rationale as to why the SAAQS for NO2 were used rather than the more protective 2025 CAAQS to determine potential exceedances and screen for the need for additional mitigation measures.  <b>Suggestions for mitigation and follow-up measures:</b> Health Canada recommends use of the standards from the 2025 CAAQS for NO2 in future mitigation and follow-up plans.	This response has not been accepted, as the rationale for not applying the CAAQS in the assessment is not accurate.  Health Canada acknowledges the commitment to use the 2025 CAAQS for NO <sub>2</sub> in future mitigation and follow-up plans. However, the response to IR-190 did not compare the predicted maximum concentrations to the most protective applicable air quality standards available (i.e., CAAQS), and included the following rationale:  <i>The CAAQS are applicable to measured ambient air concentrations over a three-year period and are not applicable to modelled results from a single facility; and, Use of the CAAQCs would require a three-year site specific data set.</i>  The statement is incorrect. The CAAQS are national air quality standards, but they are not restricted to applications within the context of the Air Quality Management System (AQMS). The comparison with CAAQS may be considered in determining the nature and severity of the Project’s impact on air quality levels and the resulting mitigation measures that may be required to maintain good air quality levels or to prevent an exceedance of the CAAQS.  The CAAQS are generally calculated for specific multi-year averages and for a particular statistical form so that extreme and unpredictable events do not drive risk management. However, if the data is not available for comparison to a full CAAQS timeframe, Health Canada suggests using model results for at least one calendar year to allow for a basic comparison with the CAAQS statistical form. The modelling results should be able to indicate the frequency of CAAQS exceedances, which can	Table 3-9 and Table 3-10 in the ERA (Appendix 10-A) have been updated to use the available Federal CAAQS for NO <sub>2</sub> and SO <sub>2</sub> as the screening criteria instead of the Provincial SAAQS. Accompanying text was also updated to acknowledge exceedances of the NO <sub>2</sub> 1-hour CAAQS during all project phases instead of just during decommissioning. Additional text was added to Section 3.2.1.3.1 to acknowledge the number of hours in a year where exceedances of the CAAQS may occur.  For reference purposes the following further information is noted. While Denison is committed to applying the CAAQS in future monitoring and mitigation programs, it is important to note that the CAAQS are not legally binding or enforceable standards under federal law. The AQMS (Air Quality Management System) that underpins CAAQS is not a regulation, but merely a cooperative arrangement between the federal and provincial governments that informs decision-making at the provincial level. As such, the current provincial air quality criteria remain the only legally enforceable standards that are applicable to the Project, until such time that the province chooses to fully adopt the CAAQS.	Yes  Appendix 10-A Table 3-9, Table 3-10, Section 3.2.1.3.1 "Nitrogen Dioxide"

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

							<p>be used in the discussion as to whether any anticipated human health impacts are anticipated.</p> <p>Please see the Advice to the Proponent table for further discussion on the use of CAAQS (AD-69), which also notes that, while being more conservative than the NAAQO, Saskatchewan &amp; Alberta’s screening value do not reflect the most recent science, which indicates that there is no apparent threshold for NO<sub>2</sub>, meaning that health effects may occur at any level of exposure.</p> <p>See also follow-up IR 190-R1.</p>		
IR-190	IR-190-R1	HC	Change to an environmental component due to hazardous contaminants	<p>Section 6.1.3.2.2 (p. 6-21) Table 6.1-8 (p. 6-22); and, Table 6.1-9 (p. 6-22)</p> <p>Section 6.1.8 (p.6-44)</p> <p>IR-190 Response from Denison</p>	<p>Limitations with the proposed use of passive NO<sub>2</sub> monitoring would not allow comparison of measurement results to the 2025 CAAQS for 1-hour NO<sub>2</sub>.</p> <p><b>Context:</b> In response to IR-190, there was agreement to using the 2025 CAAQS for NO<sub>2</sub> in future mitigation and follow-up plans, which Health Canada supports. However, the proposed air quality monitoring and follow-up plans (Chapter 6.1.8) anticipate continued use passive NO<sub>2</sub> samplers, which do not measure hourly (1-hour) concentrations.</p> <p>Section 6.1.3.2.2 indicates that the assessment makes use of passive samplers to measure NO<sub>2</sub> at two sampling locations. The results from those samplers are presented in tables 6.1-8 and 6.1-9, for a ~30-day sampling period (i.e., a total concentrations for NO<sub>2</sub> in ambient air over ~30 days).</p> <p>While passive samplers provide measurement data for comparison to the annual 2025 CAAQS for NO<sub>2</sub>, measurement data for the 1-hour NO<sub>2</sub> standard commonly requires use of an active sampler.</p> <p><b>Rationale:</b> Health Canada encourages the monitoring of air contaminants when exceedances or near-exceedances of air quality criteria, standards and/or guidance values are predicted or reported, to:</p> <ul style="list-style-type: none"><li>• determine the accuracy of predictions;</li><li>• help verify whether standards are being met; and,</li><li>• assist with implementing or modifying mitigation measures.</li></ul>	<p>1.Provide additional details on proposed air quality monitoring for NO<sub>2</sub> that will allow for comparisons to both the 1-hour and annual 2025 CAAQS and how that will be used to support mitigation and follow-up plans. Distinguish between comparisons with measured and modelled monitoring data, as well as use of passive and active samplers.</p> <p>2. If multiple approaches will be used to monitor NO<sub>2</sub> (e.g., use of passive and/or active samplers, modifications due to differences between project phases, etc.), describe their intended contribution to the monitoring objectives and outcomes (e.g., determine the accuracy of predictions; assist with implementing or modifying mitigation measures).</p>		<p>1. Air quality monitoring for NO<sub>2</sub> is proposed as monthly collection using passive samplers, during all Project phases. The objective of the program is to demonstrate compliance with provincial and federal ambient air quality standards including the CAAQSs. Monitoring data will also be compared against the modelled data provided in the EIS. Passive samplers will allow for direct comparison against the annual 2025 CAAQSs. To compare against the 1-hour CAAQSs Denison will use a commonly utilized averaging equation (such as the Ontario MECP averaging equation <a href="#">Air Dispersion Modelling Guideline for Ontario</a>) to allow for conversion from the monitoring period to a 1-hour averaging period. Denison acknowledges that short-term peaks may not be captured through the passive sampling approach; however, Denison plans to first utilize passive sampling during site preparation and will consider based on an adaptive management process whether there is a need to switch to continuous monitoring.</p> <p>2. See response to #1. Denison intends to use passive samplers for NO<sub>2</sub> monitoring.</p> <p><b>References:</b></p> <p>Ontario MECP. 2017. AIR DISPERSION MODELLING GUIDELINE FOR ONTARIO [GUIDELINE A-11] Version 3.0. <a href="#">Air Dispersion Modelling Guideline for Ontario</a>.</p>	No
IR-193	-	ECCC	Change to an environmental component due	Appendix 10-A (ERA), Section 3.1.1.2	<b>Context:</b> Appendix 10-A (ERA) Table 3-1 ‘Screening of Effluent Quality against Surface Water Quality Guidelines for the Wheeler River ERA’ does not include acute water quality thresholds for all	1. Provide acute and chronic water quality thresholds for all required	This response has not been accepted, as the Proponent has not included un-ionized ammonia, mercury and phosphorous in Table 3-1 in Appendix	1.) The ERA in Appendix 10-A is focused on chronic long-term exposure due to routine effluent release during the Project Phases. As such the screening criteria used were chronic criteria. It is acknowledged that effluent quality will not be allowed to exceed	Yes

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
			to hazardous contaminants	Section 8.2.4.2.3	<p>COPCs compared against predicted effluent quality. For example, it is stated that the final effluent quality discharge target for uranium is 0.057 mg/L. However, the CCME water short term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The proposed effluent discharge target for uranium exceeds the acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe.</p> <p>All water quality thresholds should be derived from receiving environment parameters, and there are discrepancies between the values used in Appendix 10-A (ERA) Table 3-1 and the values presented in Tables 8.2-8 and 8.2-10 in Section 8.2.4.2.3 of the draft EIS. No selected screening value for TSS has been calculated from baseline conditions. Un-ionized ammonia, which is a regulated Schedule 4 substance under the MDMER, has not been included.</p> <p><b>Rationale:</b> A review of all modelling results for all COPCs under the MDMER will assist ECCC in understanding the potential risks to the receiving environment.</p>	<p>COPCs with monitoring required under the MDMER.</p> <p>2. Ensure all water quality thresholds are derived from receiving environment baseline parameters and that these thresholds are consistently applied throughout the draft EIS.</p>	<p>10-A or provided acute and chronic water quality thresholds for all COPCs, including those with monitoring required under the MDMER, in Table 3-1 in Appendix 10-A (ERA). Water quality thresholds derived from receiving environment baseline parameters have not been consistently applied throughout the draft EIS. It is unclear from the current information provided if predicted effluent concentrations exceed acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end of pipe.</p> <p>The Proponent should:</p> <p>1. Update Table 3-1 in Appendix 10-A to include un-ionized ammonia, mercury and phosphorous. Update the risk assessment to incorporate these parameters as needed.</p> <p>2. Update Table 3-1 in Appendix 10-A and Tables 8.2-8 and 8.2-10 in Section 8.2.4.2.3 of the draft EIS to include both acute and chronic water quality thresholds derived from receiving environment baseline parameters and in accordance with IR-114.</p>	<p>acute guidelines. Acute guidelines are now provided in the updated Table 8.2-10 as presented in Attachment IR-114 and in the Final Draft EIS. This table (Table 8.2-10) also includes guidelines for unionized ammonia, phosphorous and mercury. Phosphorus will be present in the effluent at low levels and the near-field water quality model indicates that levels will remain well below criteria protective of aquatic life in the Whitefish Lake environment. Mercury is not identified as present in the effluent (see response to IR-100). No updates to Table 3-1 in Appendix 10-A are needed.</p> <p>2.) Tables 8.2-8 and 8.2-10 have been updated as requested. Please refer to Attachment IR-114 and Attachment IR-115 and Section 8.2.4.2.3 of the updated EIS. No updates to Table 3-1 in Appendix 10-A are needed. The guidelines were derived using baseline environmental conditions such as baseline hardness, DOC, pH, etc.</p>	Revised Draft EIS, Section 8, Tables 8.2-8 and 8.2-10
IR-194	-	ECCC	Aquatic species	Appendix 10-A (ERA), Section 3.1.1.2 and Section 3.1.2.3	<p><b>Context:</b> In the ERA, COPCs should be selected for further assessment based upon the following factors:</p> <ol style="list-style-type: none"><li>COPC concentrations in effluent that exceed selected water quality guidelines for the protection of aquatic biota, and</li><li>Baseline COPC concentrations in the LSA that exceed selected surface water and sediment quality guidelines for the protection of aquatic biota.</li></ol> <p>However, only COPCs that had concentrations in effluent that exceeded guidelines were assessed further. Baseline concentrations of COPCs in sediment were not considered. In addition to this, not all COPCs that require monitoring under the MDMER had predicted effluent concentrations. From Section 8.2.3.3 Table 8.2-2 of the Aquatic Environment Report, it appears Aluminum in McGowan Lake and Whitefish Lake South and North, and pH in Whitefish Lake North exceed water quality guidelines. Predicted effluent concentrations or near-field surface water concentrations for Aluminum and pH are not provided.</p> <p><b>Rationale:</b> It is not possible to determine if there is risk from</p>	<p>1. As noted in IR-114, provide the information on predicted effluent quality for COPCs with required monitoring under the MDMER.</p> <p>2. Provide the information on predicted maximum receiving environment surface water concentrations for COPCs with required monitoring under the MDMER in IR-114.</p> <p>3. Update the ERA to assess the risk of any additional MDMER COPC concentrations in effluent that exceed water quality guidelines.</p> <p>4. Update the ERA to assess the risk of COPCs that had elevated baseline water and sediment</p>	<p>This response has not been accepted, as the Proponent has not updated the ERA to assess elevated baseline concentrations to delineate potential Project effects from background conditions.</p> <p>The Proponent’s response states: “The ERA followed the guidance in CSA N288.6-22 which does not require COPCs with elevated baseline concentrations to be considered COPCs for further quantitative assessment in the ERA. Clause 6.2.5.9 indicates that constituents with naturally elevated concentrations should be excluded from further consideration as a COPC.”</p> <p>Section 6.2.5.9 of N288.6-22 is specific to the Human Health Risk Assessment, and this statement does not apply to the Ecological Risk Assessment (EcoRA). Section 7 of N288.6-22 is specific to the development of the EcoRA methodology, and in Section 7.2.5.2.6 of N288.6-22 it states: “In addition to screening of effluent</p>	<p>1. See response to IR-114. Additional information has been provided for COPCs with requirement for monitoring under Schedule 5 of MDMER. Note that predicted effluent quality for all Schedule 5 parameters, with the exception of mercury, nitrate, and phosphorous were provided in Table 3-1 of the ERA in Appendix 10-A (these constituents were not identified as COPCs in the ERA).</p> <p>2. Information on predicted maximum receiving environment surface water concentrations for COPCs with required monitoring under the MDMER is in the updated EIS (Tables 8.2-10 and 8.2-13 and Appendix 8E. Please refer to Attachment IR-115.</p> <p>3. This is not applicable. No additional COPCs need to be carried forward in the ERA as the concentrations of COPCs in effluent do not exceed water quality guidelines (see Table 3-1 in the ERA in Appendix 10-A). All constituents identified in Schedule 4 and Schedule 5 were considered in the ERA screening with the exception of cyanide and mercury which are not identified as present in the effluent (see IR-100 regarding mercury). Phosphorus and nitrate will be present in the effluent at low levels and estimates of these constituents via the near-field water quality model indicate that levels will remain well below criteria protective of aquatic life in the Whitefish Lake environment (see Tables 8.2-10 and 8.2-13 of Section 8).</p> <p>4. The CSA guidance referenced by the reviewer in this IR (Section 7.2.5.2.6 of N288.6-22) is for exposure situations and not for baseline. The text in Section 7.2.5.2.6 of N288.6-22</p>	Yes  Appendix 8E, Table 8.2-9, Table 8.2-10

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					effluent to the receiving environment and aquatic receptors based on the current information provided.	quality concentrations in the receiving environment.	<p>and emissions data, concentrations measured in environmental media should be considered, as determined in the EMPs. Maximum concentrations measured in soil, receiving water, or sediment should be compared to screening criteria.” Therefore, COPCs that had elevated baseline water and sediment quality concentrations in the receiving environment should be assessed in the ERA.</p> <p>Additionally, in Section 7.2.5.4.2 of N288.6-22 it is stated: “If COPCs exceed the screening level for one medium, they should be carried forward into the EcoRA for all media that are likely to contribute to exposure. For example, for a given COPC, if a water screening benchmark is exceeded, the same COPC should be carried forward for sediment if its concentration was above the detection limit.” Therefore, if baseline exceedances occur in one media types, they should be carried forward for all media types in the ERA.</p> <p>It is not possible to determine if there is risk from effluent to the receiving environment and aquatic receptors based on the current information provided. Negative effects to biota from naturally elevated background concentrations of COPCs can be exacerbated by additional input of COPCs from Project effluent into the receiving environment. It is important to characterize and assess those potential effects and delineate potential Project effects from background conditions.</p> <p>Please:</p> <p>1. Update Table 3-1 in Appendix 10-A to include un-ionized ammonia, mercury and phosphorous. Update the risk assessment to incorporate these parameters as needed.</p> <p>2. Update the ERA to assess the risk of COPCs that had elevated baseline water quality concentrations in the receiving environment: aluminum, iron, and lead.</p>	<p>is saying that measured concentrations in environmental media should be screened in addition to effluent and emissions data. This is referring to measured concentrations in the environment since they will reflect the impact from releases from the facility. This is not referring to baseline concentrations without influence from effluent. Section 7.2.5.3.1 and 7.2.5.3.2 of N288.6-22 recommend that the most restrictive of applicable federal or provincial guidelines be used as the screening criteria, and screening criteria should not be below a reasonable upper end of background.</p> <p>Additionally, the reviewer points to Section 7.2.5.4.2 to indicate that if a COPC exceeds screening criterion in one medium it should be assessed for all media that are likely to contribute to exposure. This guidance was followed in the ERA – all COPCs identified in water were also assessed in sediment and vice versa, as well as additional food chain pathways. Again, the intent of this clause is for exposure situations and not specific to baseline conditions.</p> <p>The ERA did consider in the screening assessment constituents that had elevated baseline that were also present in the effluent. Aluminum, cadmium, iron, and lead exceeded water quality guidelines in baseline and were considered in the ERA screening; however, only cadmium was identified for further assessment since its concentration in the effluent exceeded its water quality guideline.</p> <p>Table 8.2-4 in the EIS provides a summary of baseline water quality exceedances. Note that the only iron exceedance was in SA-1 which is downstream of McGowan Lake (see Figure 8.2-4) and outside of the direct influence on the Project. Section 8.4.3.2.3 of the EIS did not identify any constituents where baseline sediment quality exceeded sediment quality guidelines.</p> <p>The screening followed the process identified in Figure 3-1 of the ERA (Appendix 10-A) as well as N288.6-22 guidance. No changes to the ERA or EIS are warranted to address Part 4 of this IR.</p>

IR-195	-	ECCC	Change to an environmental component due to hazardous contaminants	Appendix 10-A (ERA), Section 3.1.2.1	<p><b>Context:</b> Figure 3-2 depicts modelled concentrations of COPCs in the receiving environment surface water during all Project phases. Effluent discharge rates during Operations and Decommissioning are not anticipated to differ significantly. However, COPC concentrations seem to decrease rapidly after the end of the operations period despite effluent releases continuing into the decommissioning phase.</p> <p><b>Rationale:</b> There has been no information provided on predicted changes in effluent COPC concentrations and discharge rates during the decommissioning phase. It remains unclear how COPC concentrations would decrease so quickly following the end of operations.</p>	<p>1. Provide further information on modelled maximum COPC concentrations for each individual Project phase with estimated timing for peak concentrations to appear in the receiving environment.</p> <p>2. Provide further information on predicted effluent quality during the Project decommissioning phase.</p> <p>3. Update ERA figures and conclusions as needed.</p>	<p>This response has not been accepted. Although the Proponent addressed items 2 and 3, further information on maximum predicted concentrations of COPCs in water quality during various Project stages and how hydrological processes affect COPC concentrations from Project effluent is required based on the information provided in the Proponent’s response to validate the Proponent’s predictions.</p> <p>The Proponent has provided updated tables with modelled maximum COPC concentrations in water and sediment by individual Project phase but did not include the environmental quality guidelines for COPCs which were included in the original tables. The Proponent’s response confirmed the predicted effluent quality during the decommissioning phase. In their response the Proponent states: “Therefore, the modelled maximum COPC concentrations in water are the same for operations and decommissioning phases (which is considered conservative), the same peak concentrations appear annually due to the variation of the monthly local inflow. Since COPCs are accumulated in sediment, the modelled maximum COPC concentrations in sediment appear at the end of each individual Project phase, which are year 20 for the operations and year 25 for the decommissioning in Figure 3-3.”</p> <p>The figures provided in the response support this statement, however, maximum predicted concentrations of COPCs in receiving water quality occur within a year of operations commencing. COPC concentrations in water also return to baseline within one year after decommissioning is complete. However, maximum predicted concentrations of COPCs in sediment quality do not occur until the end of the Project lifecycle due to accumulation over time, which is expected.</p> <p><b>Rationale:</b> It is unclear how maximum predicted concentrations of COPCs in water quality occur so quickly and decrease so quickly after Project operations commencement and decommissioning respectively. Further information on the</p>	<p>The maximum predicted concentrations of COPCs in water are seen over a relatively short period on the scale shown in the relevant figures as noted by the reviewer due to the short water retention time of the modelled lakes. As shown in the table below, the modelled lakes (excluding the reference lake) are small in size, with lake areas ranging from 0.10 to 1.49 km² and with average depths ranging from 1.0 to 5.5 m. Based on the area, depth and outflow of the modelled exposure lakes, the calculated retention times of the lakes ranged from 0.88 to 51.61 days. These short retention times explain the relatively rapid increase and subsequent decrease in concentrations of COPCs in the lakes during periods of effluent discharge and periods where there is no effluent discharge, respectively.</p> <table><tr><th>Waterbody</th><th>Average Depth (m)</th><th>Area (km²)</th><th>Average Outflow (L/s)</th><th>Retention Time (day)</th><th>Retention Time (month)</th></tr><tr><td>Reference Kratchkowsky Lake</td><td>2.9</td><td>0.80</td><td>331.2</td><td>80.66</td><td>2.69</td></tr><tr><td>Whitefish Lake North</td><td>1.6</td><td>0.26</td><td>1379.3</td><td>3.53</td><td>0.12</td></tr><tr><td>Whitefish Lake Middle</td><td>1.1</td><td>0.10</td><td>1398.5</td><td>0.88</td><td>0.03</td></tr><tr><td>Whitefish Lake South</td><td>1.0</td><td>0.32</td><td>1414.3</td><td>2.65</td><td>0.09</td></tr><tr><td>McGowan Lake</td><td>5.5</td><td>1.49</td><td>1832.3</td><td>51.61</td><td>1.72</td></tr><tr><td>Russell Lake Inlet</td><td>3.0</td><td>0.75</td><td>2390.3</td><td>10.92</td><td>0.36</td></tr></table> <p>Updated information has been added to Appendix 10-A, including Table 3-3, Table 3-5, Figure 3-2 and Figure 3-3, as well as Table 3-1 of Appendix A of Appendix 10-A.</p> <p>The revised text in Section 3.1.2.1 (Appendix 10-A) is as follows: “The modelled maximum COPC concentrations in water during decommissioning phase were the same as that during operations (Table 3 3). The peak concentrations of arsenic and polonium-210 appear annually in June, and the peak concentrations of all other COPCs appear annually in March due to the variation of the monthly local inflow during the effluent discharge period (Figure 3 2). It is noted that the maximum predicted concentrations of COPCs in water occurred over short periods of effluent discharge and subsequently decrease relatively quickly during periods when there is no effluent discharge. This is related to the short retention time of the modelled lakes. As shown in Table 3-1 in Appendix A, the modelled lakes (excluding the reference lake) are small, with lake areas ranging from 0.10 to 1.49 km² and with average depths ranging from 1.0 to 5.5 m. Based on the area, depth and outflow, the calculated retention times ranged from 0.88 to 51.61 days. As noted, the short retention times result in rapid increases and decreases of concentrations of COPCs in response to effluent discharge and then its cessation. Since COPCs accumulate in sediment, the peak concentrations of all COPCs in sediment appear at the end of each individual Project phase, which are year 20 for the operations and year 25 for the decommissioning phase, as shown in Figure 3 3.”</p>	Waterbody	Average Depth (m)	Area (km²)	Average Outflow (L/s)	Retention Time (day)	Retention Time (month)	Reference Kratchkowsky Lake	2.9	0.80	331.2	80.66	2.69	Whitefish Lake North	1.6	0.26	1379.3	3.53	0.12	Whitefish Lake Middle	1.1	0.10	1398.5	0.88	0.03	Whitefish Lake South	1.0	0.32	1414.3	2.65	0.09	McGowan Lake	5.5	1.49	1832.3	51.61	1.72	Russell Lake Inlet	3.0	0.75	2390.3	10.92	0.36	<p>Yes</p> <p>Appendix 10-A, Section 3.1.2.1, Table 3-3, Figure 3-2, Figure 3-3</p> <p>Appendix 10-A, Section 3.1.2.2, Table 3-5</p> <p>Appendix 10-A, Section 3.1.2.3</p> <p>Appendix 10-A, Appendix A, Table 3-1</p>

							hydrological processes that facilitate this is necessary to validate predictions.  Provide further information regarding maximum predicted concentrations of COPCs in water quality during various Project stages and how hydrological processes (i.e. flows, retention time, etc.) facilitate the fast increase and decrease of COPC concentrations from Project effluent. This information should be included in Appendix 10-A, Section 3.1.2.1.	The revised text in Section 3.1.2.3 (Appendix 10-A) is as follows: “The maximum vanadium concentration in sediment is 37.2 mg/kg dw in Whitefish Lake (LA-5), which exceeds its sediment quality guideline of 35.1 mg/kg dw by approximately 6% (REF value from Burnett-Seidel and Liber, 2013). Therefore, vanadium was identified as a COPC in sediment.”	
IR-197	-	ECCC	Aquatic species	Appendix 10-A (ERA), Section 3.2	<b>Context:</b> It remains unclear if atmospheric deposition from Project related emissions has been incorporated into modelling for the ERA and surface water and sediment quality assessments.  <b>Rationale:</b> While expected Project air emissions are unlikely to have direct impacts on the aquatic receiving environment and aquatic biota, this Project effect pathway may have indirect effects through accumulation of COPCs over time or deposition of contaminants that are not expected in effluent, which should be evaluated with predicted emissions data incorporated into water quality modelling predictions.	Incorporate atmospheric deposition from Project-related emissions into water quality modelling and assess any Project related effects to aquatic receptors from this pathway.	This response has not been accepted, as the Proponent has not provided a valid explanation for not incorporating atmospheric deposition from Project-related air emissions into water quality modelling and assessing Project-related effects to aquatic receptors from this pathway.  In the Proponent’s response it is stated: “Consistent with CSA N288.1-20, Clause 5.1.5, atmospheric depositions to large water bodies such as lakes, are considered negligible; therefore, the air to surface water pathway has been excluded for the ecological risk assessment. The rationale for exclusion of atmospheric deposition to lakes and rivers is explained in detail in Section G9, Appendix G of the COG DRL Guidance Document (Hart, 2019).” However, both of these documents explicitly apply to human dose rate calculations and models for human end-points from radiation effects of radionuclides; they do not cover non- human biota nor non-radionuclide COPCs or chemical toxicity of radionuclides. Atmospheric deposition rates to large water bodies may be negligible for dose rates to human biota as they are not likely to be directly impacted or in the near-field vicinity. However, this may not be the case for aquatic receptors directly within the receiving environment.  A sufficient explanation for exclusion of atmospheric deposition of COPCs to surface water from Project activities has not been provided from an ecological perspective. This Project effect pathway may have effects on the aquatic receiving environment through accumulation of COPCs over	Atmospheric deposition to large waterbodies is explicitly excluded in the CSA N288.1 model. This assumption is valid for both human and ecological assessments. The N288.1 standard indicates in Section 1.5 of the Scope that the models can be used to support dose calculations for non-human biota.  The N288.1 rationale is that atmospheric input to water is very small relative to direct input to water. This conclusion applies to assessment for both human and ecological assessments, as well as radionuclides and non-radionuclides. The rationale in the IR response applies. However, calculations have been done for the Project to confirm the expectation that atmospheric input to water will be negligible.  The following calculation shows for the Project that the atmospheric input of uranium to Whitefish Lake (LA-5) is very small relative to the direct input to water via effluent.	Yes  Appendix 10-A, Appendix A, Section 2.2

IR-198	-	HC	Change to an environmental component due to radiological contaminants	Appendix 10-A (ERA) Appendix B, Tables B.7 and B.8 Ref. 19-2638  Appendix 10-A (ERA), Table 4-3 Ref. 19-2638 (p. 4.17)	<b>Context:</b> Section 10 Appendix 10-A (ERA) contains Table 4-3 (p. 4.17), which lists ingestion rates for traditional foods and includes the category “organs” for Mammals.  Tables B.7 and Table B.8 in Section 10 Appendix 10-A (ERA) Ref. 19-2638 provide the predicted concentrations of radionuclides for ecological receptors during the Project phases and during future centuries, respectively. They list the concentrations of radionuclides in moose and in moose organs, which is presented	1. Provide more clarification on how the mammalian organ ingestion rates are calculated (which animals and relative contribution percentages).  2. Provide a rationale for why concentrations of radionuclides were not assessed in organs of	This response has not been accepted, as the assessment should consider organ meats from different animals if these are consumed by local population, and estimated consumption rates should be confirmed.  The response to IR-198 presents the estimated radionuclide concentrations in moose and caribou organ meats (as mass concentrations), where the	Consistent with the requirements in CSA N288.6:22, the ERA undergoes a periodic review process every 5 years to ensure the assumptions are still valid and to improve modelling and reduce uncertainty. Based on current understanding of the ERFN diet, there is no need to include caribou organs as a separate organ. As indicated in the original IR Response in Attachment IR-198 (See Annex 1), approximately 80% of the organs consumed by ERFN is moose organs, and 20% is caribou organs. Note, that there was a units error in IR-198 Table 3: Estimated Tissue Concentrations of Moose Organs and	No																																																																																																				

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)																																																																																
					<p>as a single cumulative organ value. Other terrestrial and aquatic animals (such as the black bear and woodland caribou) that are a part of the traditional diet of nearby Indigenous communities have higher concentrations of radionuclides than moose, yet concentrations are not provided for organs of these species.</p> <p><b>Rationale:</b> While Health Canada is not aware of transfer factors to individual organs, or to organs in animals that are not ruminants, it would be beneficial to have a better understanding of radionuclide concentrations in the organs of other animals that may be consumed by local Indigenous communities.</p>	<p>animals (other than moose) that are consumed as country foods by Indigenous people harvesting in the area.</p>	<p>concentrations of certain radionuclides (U-238, U-234, Pb-210 and Po-210) in caribou organ meat are indeed estimated to be higher than in moose organ meat. However, the response also indicates that moose organ meat consumption represents the large majority of organ meat consumption (~80%), roughly offsetting the higher concentrations in caribou organs. When calculating tissue concentrations of radionuclides, the higher consumption rate of moose organ meat in comparison to caribou organ meat appears insufficient to compensate for the higher estimated concentrations of U-238, U-234, Pb-210 and Po-210 in caribou meat and as a result, exposures to these radionuclides from organ meat consumption may be underestimated. Health Canada recommends assessing moose and caribou organ meat separately (rather than using moose as a proxy) to confirm that COPCs including radionuclides from organ meat consumption have not been underestimated.</p> <p>IR-198 also includes additional information on organ meat consumption rates for the La Plonge and Patuanak communities to estimate dietary exposure via organ consumption, but it is unclear how these relate to the values used in the Draft EIS and ERA (Appendix 10-A). Specifically, Page 4.16 of Appendix 10-A: <i>Environmental Risk Assessment for Wheeler River</i> (September 9, 2022) states:</p> <p><i>“As a conservative approach for this assessment, the Patuanak diet was selected to represent the average traditional foods consumer in the HHRA”</i></p> <p>However, Table 4-4 (p. 4.19) reports an annual organ meat consumption rate of 4.49 kg for the adult average traditional food consumer while the reported daily Patuanak consumption rate for organ meat is 16.2 g (Table 4-3; p.4.17), which equates to an annual rate of 5.91 kg. Health Canada recommends a rationale be provided for this discrepancy, and if necessary, the correct estimated rate and associated assessment calculations.</p> <p>See also follow-up IR-198-R1.</p>	<p>Woodland Caribou Organs at McGowan Lake. The unit is Bq/kg fw, not mg/kg fw as shown in the table. The numbers in IR-198 Table 3 are correct for Bq/kg fw.</p> <p>The reviewer is asking for clarification on the discrepancy between the annual organ meat consumption rate of 4.49 kg for the adult average traditional food consumer (Table 4-4) versus the reported Patuanak consumption rate for organ meat of 5.91 kg/yr (16.2 g/d) (Table 4-3; p.4.17). The ingestion rates that represent the Patuanak consumption rates from the ERFN study were modified as follows:</p> <ul style="list-style-type: none"><li>- Based on the ERFN study, the total Patuanak organ meat consumption rate was 5.91 kg/year which includes <u>all</u> organs. The ingestion rate was modified to remove organs that were not moose resulting in a moose organ ingestion rate of 4.49 kg/year.</li><li>- The total large mammal meat consumption rate was 12.95 kg/year (35.5 g/d). The ingestion rate for large mammals was increased to 14.38 kg/year to account for caribou organs in the caribou meat ingestion rate (caribou meat = 1.2 kg/year, caribou organ = 1.4 kg/year).</li><li>- The total ingestion rate for all country foods is 72.5 kg/year (199 g/d as per Table 4-3 in Appendix 10-A) which is consistent with the total Patuanak ingestion rate from the ERFN study.</li><li>- Based on the rationale in the above bullets no changes are needed to the diet.</li></ul> <p>As illustrated in the bullets above, caribou organ ingestion was not ignored, but was assessed as part of caribou meat ingestion.</p> <p>To illustrate that the current assumptions used in the HHRA of ingestion of moose organs and caribou as meat only, a comparison is provided in the table below of human dose from moose organs, caribou assessed as meat, and caribou assessed as organs. The total dose to a person eating moose organs is the same order of magnitude as the total dose to a person eating caribou organs (note that this represents total dose, not incremental dose as shown in the ERA and is used for illustrative purposes only). Additionally, there is limited difference in the results whether caribou organ intake is assessed as meat or as organs. For some radionuclides (Ra-226, Po-210) the dose for caribou assessed as meat is higher and for other radionuclides (U-238, U-234, Th-230, Pb-210) the dose for caribou assessed as organs is higher.</p> <table><tr><th>Parameter</th><th>Unit</th><th>U-238</th><th>U-234</th><th>Th-230</th><th>Ra-226</th><th>Pb-210</th><th>Po-210</th></tr><tr><td>Moose organs Concentration</td><td>Bq/kg</td><td>6.13E-02</td><td>6.13E-02</td><td>3.04E+00</td><td>8.77E-02</td><td>7.15E+00</td><td>1.30E-02</td></tr><tr><td>Caribou meat Concentration</td><td>Bq/kg</td><td>1.41E-01</td><td>1.41E-01</td><td>1.11E-02</td><td>1.13E-01</td><td>1.80E+00</td><td>8.58E+00</td></tr><tr><td>Caribou organs Concentration (scaled from meat based on TF)</td><td>Bq/kg</td><td>2.49E-01</td><td>2.49E-01</td><td>3.04E+00</td><td>6.31E-02</td><td>5.66E+01</td><td>8.58E-02</td></tr><tr><td>Dose Coefficient (DCF)</td><td>Sv/Bq</td><td>4.90E-08</td><td>4.90E-08</td><td>2.10E-07</td><td>2.80E-07</td><td>6.70E-07</td><td>1.20E-06</td></tr><tr><td>Human Dose - Moose Organs (a)</td><td>mSv/a</td><td>1.35E-05</td><td>1.35E-05</td><td>2.87E-03</td><td>1.10E-04</td><td>2.16E-02</td><td>7.04E-05</td></tr><tr><td>Human Dose - Caribou Organs as Meat (b)</td><td>mSv/a</td><td>9.84E-06</td><td>9.84E-06</td><td>3.32E-06</td><td>4.50E-05</td><td>1.72E-03</td><td>1.47E-02</td></tr><tr><td>Human Dose - Caribou Organs (b)</td><td>mSv/a</td><td>1.74E-05</td><td>1.74E-05</td><td>9.10E-04</td><td>2.51E-05</td><td>5.40E-02</td><td>1.47E-04</td></tr><tr><td colspan="2">a) based on moose organ ingestion rate of 4.5 kg/a</td><td></td><td></td><td></td><td></td><td></td><td></td></tr><tr><td colspan="2">b) based on caribou organ ingestion rate of 1.4 kg/a</td><td></td><td></td><td></td><td></td><td></td><td></td></tr></table>	Parameter	Unit	U-238	U-234	Th-230	Ra-226	Pb-210	Po-210	Moose organs Concentration	Bq/kg	6.13E-02	6.13E-02	3.04E+00	8.77E-02	7.15E+00	1.30E-02	Caribou meat Concentration	Bq/kg	1.41E-01	1.41E-01	1.11E-02	1.13E-01	1.80E+00	8.58E+00	Caribou organs Concentration (scaled from meat based on TF)	Bq/kg	2.49E-01	2.49E-01	3.04E+00	6.31E-02	5.66E+01	8.58E-02	Dose Coefficient (DCF)	Sv/Bq	4.90E-08	4.90E-08	2.10E-07	2.80E-07	6.70E-07	1.20E-06	Human Dose - Moose Organs (a)	mSv/a	1.35E-05	1.35E-05	2.87E-03	1.10E-04	2.16E-02	7.04E-05	Human Dose - Caribou Organs as Meat (b)	mSv/a	9.84E-06	9.84E-06	3.32E-06	4.50E-05	1.72E-03	1.47E-02	Human Dose - Caribou Organs (b)	mSv/a	1.74E-05	1.74E-05	9.10E-04	2.51E-05	5.40E-02	1.47E-04	a) based on moose organ ingestion rate of 4.5 kg/a								b) based on caribou organ ingestion rate of 1.4 kg/a

								<p>Overall, caribou ingestion is not ignored in the HHRA, and whether or not they are assessed as meat or as organs makes little difference to the total dose from terrestrial animal ingestion, as the dose is dominated by ingestion of mallard as shown in the pie chart below. The caribou contribution to total dose is minimal since the total dose is well below the dose limit of 1 mSv/year; therefore, no changes are made to the ERA at this time.</p> 	
IR-198	IR-198-R1	HC	Change to an environmental component due to radiological contaminants	<p><a href="#">Annex 1 Response to Information Requests (Denison Mining) – August 18, 2023</a></p> <p>IR-198 Response from Denison – COPC Concentrations in Organs (<i>Pages 74, and 354-357 of 419</i>)</p> <p>Appendix 10-A (ERA)</p>	<p><i>Environmental Risk Assessment for Wheeler River</i> (September 9, 2022) does not include an assessment of radionuclides based on their mass concentrations in country foods (the assessment is only based on radionuclide concentrations).</p> <p><b>Context:</b> As part of the response to IR-198 estimated Pb-210 concentrations in moose organ and caribou organ of 7.15 and 49.4 mg/kg (ww) are reported, respectively. However, Appendix 10-A: <i>Environmental Risk Assessment for Wheeler River</i> (September 9, 2022) does not include an assessment of lead among the non-radionuclide COPCs.</p> <p>Using the organ meat consumption figure from the Patuanak community (16.2 g/day), exposure to Pb-210 from caribou organ meat is estimated at over 11 ug/kg bw per day (based on the response to IR-198) which would be close to 10 times greater than the 95<sup>th</sup> percentile dietary lead exposure estimates for the general Canadian population consuming retail foods.</p> <p><b>Rationale:</b> While the abundance of radionuclides may pose a health risk with respect to radioactivity, their presence as chemical contaminants may also have an impact on health. This is demonstrated by the case of Pb-210 described above.</p>	<p>1. Provide a rationale on why radionuclide mass concentrations were not assessed for their impact to human health.</p> <p>2. Provide an assessment of Lead (Pb) as a chemical contaminant (non-radionuclide) COPC to better understand potential health risks and inform management, mitigation, monitoring and/or follow-up planning.</p>		<p>1. Uranium was assessed as both a chemical constituent and a radionuclide constituent. The other radionuclides in the U-238 decay chain were assessed for their radiotoxicity and not their chemical toxicity. This is consistent with the PSL2 Assessment Report which indicates that because of uranium’s relatively low specific activity, uranium is the only radionuclide (in the uranium and thorium decay chains) with greater potential to be more chemotoxic than radiotoxic; therefore, it is important to assess its chemical toxicity (GC &amp; EC, 2006). To illustrate, the effluent quality of Pb-210 (as per Table 3-1 in Appendix 10-A) is 4.19E-01 mg/L. Using a specific activity of 2.86E+12 Bq/g for Pb-210 (<a href="http://www.wise-uranium.org/nucv.html">www.wise-uranium.org/nucv.html</a>), the mass concentration is 1.48E-10 mg/L. This is significantly lower than the lead concentration in the effluent of 3.00E-04 mg/L (as per Table 3-1 in Appendix 10-A) which is based on pilot tests with a safety factor added. As such, consideration of the mass concentration of Pb-210 is not needed.</p> <p>2. The response to IR-198 (Attachment IR-198) erroneously provided the concentrations of Pb-210 in moose organ and caribou organ in units of mg/kg (ww). The corrected units that should have been provided for Pb-210 in moose organ and caribou organ tissues are in Becquerel per kilogram wet weight (<b>Bq/kg ww</b>); that is, the concentrations of Pb-210 in moose and caribou organs are 7.15 Bq/kg ww and 49.4 Bq/kg ww, respectively.</p> <p>The following illustrates that chemical lead (from Pb-210) in organs is not a health concern. The concentrations of Pb-210 in moose organs is 7.15 Bq/kg ww. Using a specific activity of 2.86E+12 Bq/g for Pb-210 (<a href="http://www.wise-uranium.org/nucv.html">www.wise-uranium.org/nucv.html</a>), the lead concentration in moose organs would be 2.5E-09 mg/kg ww. The daily dose for moose organ consumption would be 4.4E-10 µg/kg bw/day.</p>	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					Due to their potential toxicological significance to human health, Health Canada recommends assessing arsenic, cadmium, lead and mercury as part of country food assessment, regardless of the method employed to determine COPCs.			<p>Dose = 4.5kg/yr*yr/365d*2.5E-09mg/kg/70.7kg*1000ug/mg. The estimated lead exposure dose from Pb-210 in moose organs is far below the 95<sup>th</sup> percentile dietary lead exposure estimate for the general Canadian population consuming retail foods, and also well below the provisional lead TRV recommended by Health Canada of 0.5 µg/kg bw/day.</p> <p>Therefore, Pb-210 is expected to contribute a negligible amount of lead metal to total lead exposure. Lead as a non-radiological contaminant was considered in Table 3-1 in the ERA (Appendix 10-A) did not screen into the assessment and therefore it is concluded that the potential risks to consumers of country foods due to lead (and Pb-210) are negligible. The project includes an environmental monitoring program which will include analysis of country foods for trace metals, including lead.</p> <p><b>References:</b></p> <p>Government of Canada, Environment Canada. 2006. IR-199	-	ECCC	Change to an environmental component due to hazardous contaminants	Appendix 10-A (ERA), Sections 3.2.1 and 3.3.1, Wheeler River Project IMPACT Model	<p><b>Context:</b> Model calibrated concentrations of selenium, uranium, and lead- 210 are under-predicted compared to measured baseline concentrations for water quality in the IMPACT modelling based on Figure 3-2. Calibrated concentrations of cobalt are under-predicted and there is poor agreement between model calibrated and measured concentrations of arsenic, lead-210, polonium-210, and radium-226 for sediment quality in Figure 3-3.</p> <p><b>Rationale:</b> It is unclear how poor agreement between model calibrated and measured baseline concentrations of COPCs impacts the near-field and far-field modelling predictions of COPCs during all Project phases. It is also unclear why measured concentrations of COPCS could not be used directly as model inputs when there was poor agreement.</p>	<p>1. Provide justification as to why model calibrated concentration inputs of COPCs were preferable for use in predictive modelling of water and sediment quality over measured baseline concentrations.</p> <p>2. Provide a rationale detailing how under- or over-predicted model calibrated COPC concentration inputs influence IMPACT model predictions and uncertainty for water and sediment quality. Provide specific details on how this may impact the risk analysis for parameters that have been highlighted as having poor agreement between calibrated and measured concentrations (i.e., arsenic, selenium, uranium, lead-210, polonium-210, and radium-226).</p>	<p>This response has not been accepted, as the explanation and rationale provided by the Proponent is not sufficient to validate the model performance.</p> <p>Beyond the figures demonstrating modelled versus measured concentrations of COPCs in water and sediment provided in Appendix A, no quantitative statistical metrics validating model performance have been provided by the Proponent. It is also unclear if the geometric mean for each COPC at each monitoring station was calculated as individual inputs per station or if a single geometric mean for each COPC was calculated using all sampling data. Using a single geometric mean of all samples would result in not capturing the variation in concentrations of COPCs between sampling stations such as variation between different lakes. The Proponent’s response provided no additional information that was not already in the EIS to the information request for specific details on how under- or over-predicted model calibrated COPC concentration inputs influence IMPACT model predictions and uncertainty for water and sediment quality.</p> <p>Without statistical metrics validating model performance, there is no quantitative evidence to</p>	<p>To clarify, the geomean shown for each COPC in Figure 3-2 (water) of the IMPACT Model report is for all the data in a series of lakes downstream of the future mine discharge. The measured data do not suggest any pattern of difference among lakes, nor would any such pattern be expected under baseline conditions. We want a baseline model that predicts a value for the downstream lakes in the range of measured data, as long as the measured data are reliable and not dominated by detection limit values. As discussed in Section 3.2.1 of the IMPACT Model report, the model meets this test. The geomean was considered appropriate as it is more representative of the central value of the data distribution. However, considering the data represents baseline conditions with many values below the detection limit, there is limited difference between the geomean and the arithmetic mean for the majority of constituents (see table below for summary statistics for baseline water concentration). Section 3.2.1 of the IMPACT Model Report (Appendix A to Appendix 10-A) was modified to provide more discussion on the selection of the geomean.</p>	<p>Yes</p> <p>Appendix 10-A, Appendix A, Section 3.2.1</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)																																																																																																																																																																																																				
							<p>support conclusions of model performance regarding the use of model calibrated concentration inputs of COPCs and conclusions on under- and over-predicted COPC concentration inputs influence on risk assessment conclusions. It is also unclear if the methodology for using the geometric mean of all samples for each COPC has eliminated variation between sample sites for modelling, and how this affects the conclusions of risk.</p> <p>ECCC requires further information on how using geometric mean values of the measured baseline data influences variation between sites and model outputs, as well as quantitative statistical metrics validating model performance to verify the Proponent’s conclusions.</p> <p>Please provide:</p> <p>1. Further information on how using geometric mean values of the measured baseline data influences variation between sites and model outputs.</p> <p>2. Quantitative statistical metrics validating model performance to support conclusions on model calibrated concentration inputs of COPCs and risk assessment conclusions, with particular focus on influence of over- and under-predicted COPC concentration inputs. Include model performance benchmarks for comparison.</p>	<table><tr><th rowspan="2">Category</th><th rowspan="2">Parameter</th><th rowspan="2">Units</th><th>Total</th><th>Count</th><th rowspan="2">Minimum</th><th rowspan="2">Percentile_95th</th><th rowspan="2">Maximum</th><th rowspan="2">Arithmetic_Mean(a)</th><th rowspan="2">Geo</th></tr><tr><th>Count</th><th>(&lt;RDL)</th></tr><tr><td rowspan="2">Major Ions</td><td>Chloride</td><td>mg/L</td><td>142</td><td>7</td><td>&lt;0.1</td><td>0.7</td><td>0.9</td><td>3.69E-01</td><td></td></tr><tr><td>Sulphate</td><td>mg/L</td><td>142</td><td>1</td><td>&lt;0.2</td><td>1.1</td><td>8.3</td><td>8.46E-01</td><td></td></tr><tr><td rowspan="12">Metals</td><td>Arsenic</td><td>mg/L</td><td>142</td><td>53</td><td>&lt;0.0001</td><td>0.0001</td><td>0.0003</td><td>1.05E-04</td><td></td></tr><tr><td>Cadmium</td><td>mg/L</td><td>142</td><td>90</td><td>&lt;1.00E-08</td><td>0.00003</td><td>0.00007</td><td>1.34E-05</td><td></td></tr><tr><td>Chromium</td><td>mg/L</td><td>142</td><td>142</td><td>&lt;0.0005</td><td>&lt;0.0005</td><td>&lt;0.0005</td><td>5.00E-04</td><td></td></tr><tr><td>Cobalt</td><td>mg/L</td><td>142</td><td>138</td><td>&lt;0.0001</td><td>&lt;0.0001</td><td>0.0002</td><td>1.01E-04</td><td></td></tr><tr><td>Copper</td><td>mg/L</td><td>142</td><td>139</td><td>&lt;0.0002</td><td>&lt;0.0002</td><td>0.0008</td><td>2.07E-04</td><td></td></tr><tr><td>Lead</td><td>mg/L</td><td>142</td><td>135</td><td>&lt;0.0001</td><td>&lt;0.0001</td><td>0.0012</td><td>1.16E-04</td><td></td></tr><tr><td>Molybdenum</td><td>mg/L</td><td>142</td><td>138</td><td>&lt;0.0001</td><td>&lt;0.0001</td><td>0.0013</td><td>1.23E-04</td><td></td></tr><tr><td>Nickel</td><td>mg/L</td><td>142</td><td>101</td><td>&lt;0.0001</td><td>0.0003</td><td>0.0006</td><td>1.24E-04</td><td></td></tr><tr><td>Selenium</td><td>mg/L</td><td>142</td><td>140</td><td>&lt;0.0001</td><td>&lt;0.0001</td><td>0.0002</td><td>1.01E-04</td><td></td></tr><tr><td>Uranium</td><td>mg/L</td><td>142</td><td>141</td><td>&lt;0.0001</td><td>&lt;0.0001</td><td>0.0002</td><td>1.01E-04</td><td></td></tr><tr><td>Vanadium</td><td>mg/L</td><td>142</td><td>110</td><td>&lt;0.0001</td><td>0.0002</td><td>0.0005</td><td>1.12E-04</td><td></td></tr><tr><td>Zinc</td><td>mg/L</td><td>142</td><td>95</td><td>&lt;0.0005</td><td>0.00278</td><td>0.02</td><td>9.62E-04</td><td></td></tr><tr><td rowspan="2">Nutrients</td><td>Ammonia as N</td><td>mg/L</td><td>142</td><td>104</td><td>&lt;0.01</td><td>0.0596</td><td>1.2</td><td>3.26E-02</td><td></td></tr><tr><td>Nitrate</td><td>mg/L</td><td>103</td><td>70</td><td>&lt;0.04</td><td>0.438</td><td>0.66</td><td>1.15E-01</td><td></td></tr><tr><td rowspan="4">Radionuclides</td><td>Lead-210</td><td>Bq/L</td><td>142</td><td>136</td><td>&lt;0.02</td><td>&lt;0.02</td><td>0.05</td><td>2.06E-02</td><td></td></tr><tr><td>Polonium-210</td><td>Bq/L</td><td>142</td><td>112</td><td>&lt;0.005</td><td>0.008</td><td>0.02</td><td>5.50E-03</td><td></td></tr><tr><td>Radium-226</td><td>Bq/L</td><td>142</td><td>98</td><td>&lt;0.005</td><td>0.00995</td><td>0.01</td><td>5.70E-03</td><td></td></tr><tr><td>Thorium-230</td><td>Bq/L</td><td>142</td><td>138</td><td>&lt;0.01</td><td>&lt;0.01</td><td>0.02</td><td>1.01E-02</td><td></td></tr></table> <p>(a) The majority of the results are less than the detection limit</p> <p>Statistical measures of how individual baseline measurements deviate from the baseline prediction would not be indicative of model performance, since the model is not trying to predict this noise. What matters is how well the model predicts the downstream condition as reflected in the geomean of the data. This can be seen in Figure 3-2.</p> <p>The “underpredictions” seen in Figure 3-2 (Se, U, Pb-210) are to be expected when the measured data are dominated by non-detects. The predicted value is consistent with measured data. There is no implication of any model error that would influence model predictions for the operational phase of the mine. The overpredictions seen in Figure 3-2 (Cd, Cu, V) would imply a conservatism of similar magnitude in the baseline + project predictions for water in the operational phase. As an example, the root mean square error (RMSE) for cadmium of the measured water quality data against the modelled prediction shown in Figure 3-2 is +/-1.31E-05 mg/L which indicates that the modelled concentration is within the range of the geomean of the measured data.</p> <p>Similarly, the geomean shown for each COPC in Figure 3-3 (sediment) of the IMPACT Model report is for all the data in a series of lakes downstream of the future mine discharge. The overpredictions seen in Figure 3-3 (for As and Ra-226) would imply a conservatism of similar magnitude in the baseline + project predictions for sediment in the operational phase.</p> <p>The relationship in the Wheeler River IMPACT model between water and sediment is based on existing operating uranium mines in northern Saskatchewan as described in the IMPACT Model Report (Appendix A to Appendix 10-A). Baseline conditions do not represent impacted conditions; therefore, it is not appropriate to calibrate the model to baseline conditions as we are most interested in impacted conditions. The test of model performance will be as the facility moves into operation and operational data is compared against modelled data.</p>	Category	Parameter	Units	Total	Count	Minimum	Percentile_95th	Maximum	Arithmetic_Mean(a)	Geo	Count	(<RDL)	Major Ions	Chloride	mg/L	142	7	<0.1	0.7	0.9	3.69E-01		Sulphate	mg/L	142	1	<0.2	1.1	8.3	8.46E-01		Metals	Arsenic	mg/L	142	53	<0.0001	0.0001	0.0003	1.05E-04		Cadmium	mg/L	142	90	<1.00E-08	0.00003	0.00007	1.34E-05		Chromium	mg/L	142	142	<0.0005	<0.0005	<0.0005	5.00E-04		Cobalt	mg/L	142	138	<0.0001	<0.0001	0.0002	1.01E-04		Copper	mg/L	142	139	<0.0002	<0.0002	0.0008	2.07E-04		Lead	mg/L	142	135	<0.0001	<0.0001	0.0012	1.16E-04		Molybdenum	mg/L	142	138	<0.0001	<0.0001	0.0013	1.23E-04		Nickel	mg/L	142	101	<0.0001	0.0003	0.0006	1.24E-04		Selenium	mg/L	142	140	<0.0001	<0.0001	0.0002	1.01E-04		Uranium	mg/L	142	141	<0.0001	<0.0001	0.0002	1.01E-04		Vanadium	mg/L	142	110	<0.0001	0.0002	0.0005	1.12E-04		Zinc	mg/L	142	95	<0.0005	0.00278	0.02	9.62E-04		Nutrients	Ammonia as N	mg/L	142	104	<0.01	0.0596	1.2	3.26E-02		Nitrate	mg/L	103	70	<0.04	0.438	0.66	1.15E-01		Radionuclides	Lead-210	Bq/L	142	136	<0.02	<0.02	0.05	2.06E-02		Polonium-210	Bq/L	142	112	<0.005	0.008	0.02	5.50E-03		Radium-226	Bq/L	142	98	<0.005	0.00995	0.01	5.70E-03		Thorium-230	Bq/L	142	138	<0.01	<0.01	0.02	1.01E-02

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
			Socio- economic conditions	Appendix 10-A (ERA), Table 4-4 (p. 4.19)	<p><b>Context:</b> The Proponent obtained country food consumption data through engagement with a single local fisher/trapper and from a dietary survey administered by CanNorth to the English River First Nations (ERFN) in 2017. However, the potential health risks to consumers of traditional food were only assessed using the data obtained from the CanNorth dietary survey. Section 10 of the EIS <i>states the following:</i> “The diet assumptions for the fisher/trapper are conservative and are based on engagement with a local fisher/trapper. The diet of the fisher/trapper is representative of one person, who consumes a unique composition and quantity of traditional foods (e.g., ingestion rate of 175 kg/yr of caribou, equivalent to approximately 2 to 3 servings per day). Most people fishing, hunting, and trapping in the Local Study Area and Regional Study Area would consume traditional foods more consistent with the average traditional foods consumer diet which was developed from the ERFN country foods study. In comparison, the ERFN country foods study in Section 10 Appendix 10-A (ERA) Table 4- 4 indicates a caribou ingestion rate of 2.6 kg/yr (1 to 2 servings per month) and a total game ingestion rate of 21.3 kg/yr” (p. 4.10).</p> <p><b>Rationale:</b> Health Canada is in general agreement that the dietary habits of the local fisher/trapper may be an outlier and not necessarily representative of most of the local population. However, a rationale has not been provided to demonstrate whether and how the 2017 ERFN dietary survey results are representative of consumption patterns of local Indigenous communities. Also, it is unclear whether or how the ERFN dietary survey results account for the consumption patterns of vulnerable or more sensitive subgroups (e.g., heavy consumers, children and women of child-bearing age)</p>	<p>consider surveying additional community members (such as local hunters/trappers) to obtain more representative country food consumption rates for use in the traditional foods risk assessment, and for communicating the results to the communities.</p> <p>2. Additionally, consider evaluating consumption patterns (and applicable TRVs) of sensitive or vulnerable populations (e.g., elders, toddlers, women of childbearing age) in the traditional food risk assessment and provide risk levels for these sub-groups separately.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> Health Canada recommends providing the community with the opportunity to validate the ERFN 2017 survey results.</p>	<p>assumption used in the traditional foods risk assessment.</p> <p>The response did state:</p> <p><i>The 2017 report was authored by ERFN and as such there is no need for Denison to ask ERFN to validate their own report.</i></p> <p>The dietary survey administered by CanNorth to the English River First Nations (ERFN) in 2017 was an important resource that contributed to the risk assessment; however, the ERFN’s Information Request (IR-1) raised similar questions about the EIS’s assumptions on Indigenous land use and diet, and the perception that feedback from the local ERFN trapper was not representative of the community’s current and future land use. The response to IR-1 referenced meetings/discussions that were held with the ERFN to better understand how their community uses the area and their diet.</p> <p>The following contradictory clarification was provided in the response to IR-1: [The] <i>ERFN considers the ERFN Trapper’s use of the area as representative of current and future land users and expects that the relationship to the Project area will be continued and strengthened through generations of future use.</i></p> <p>See follow up IR-200-R1.</p>	<p>around the fact that the local land and resource harvester, referred to throughout the EIS as the ERFN Trapper, passed away before the draft EIS filing. The nation was concerned that the land use and occupancy of the ERFN Trapper may be lost or somehow downplayed since he has passed away and no longer resides near the Project site. In response to this, Denison updated text in the revised draft EIS to better reflect the totality of ERFN TK and land use information. The ERFN Trapper’s land and resource use patterns and activities are considered by ERFN as representative of future ERFN uses in the area.</p> <p>We note that in IR-01 ERFN was not suggesting that the ERFN Trapper’s diet was <b>representative</b> of all ERFN land users. The HC reviewer has erroneously connected parts of the response to IR-01 and IR-200 to suggest there is a gap in the EIS; Denison notes there is no contradictory information provided and outline clarifications here and in response to IR-200-R1.</p> <p>ERFN wrote and provided the 2017 dietary study (CanNorth 2017) and requested Denison use this information in the EIS. The CanNorth report is considered as a source of Indigenous Knowledge by the community. Denison has included both an ERFN diet as described in the 2017 report, and the ERFN Trapper’s diet throughout the HHRA. There were five receptors in the human health risk assessment (HHRA): camp worker, seasonal resident, recreational fisher/hunter, fisher/trapper, and future permanent resident. The ERFN 2017 diet was included for a portion of the camp worker, seasonal resident, recreational fisher/hunter, and future permanent resident diets. The fisher/trapper diet was unique and provided by the ERFN Trapper whose trap lines and commercial fishing operations are located in the Project area. Importantly, the ERFN Trapper’s diet was not a scaling up of the ERFN 2017 ingestion rates; rather, it was based on different dietary assumptions. For example, the ERFN Trapper rarely eats any country plants but eats a considerably larger amount of caribou and fish, whereas the ERFN 2017 diet has a wider representation of all food pathways.</p> <p>Other sensitive or vulnerable human health groups are addressed through the use of toxicity reference values (TRVs) that incorporate uncertainty factors to account for sensitive individuals. This is standard practice in development of TRVs for human health risk assessment. As such, differences in health status or subgroups were not considered separately.</p> <p>Denison will work with regulators and Indigenous nations and communities to refine future permanent resident characteristics through regular updates to the ERA as the Project advances as per the review cycle in N288.6.</p> <p>Denison encourages the CNSC to reach out to the ERFN FIRT representative to confirm Denison’s understanding on the scope of IR-01 (Annex 1, IR-01 on page 1/419) and ERFN’s acceptance of Denison’s response to IR-01 and related discussions.</p> <p><b>References:</b></p> <p>CanNorth. 2017. English River First Nation Country Foods Study – Final Report (No. Project No. 2147). Canada North Environmental Services.</p>	

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
IR-200	IR-200-R1	HC	Indigenous People’’ health / Socio- economic conditions	Section 10 (p. 4.10)  Appendix 10-A (ERA), Table 4-4 (p. 4.19)  IR-200 Response from Denison	<p>The traditional foods risk assessment should be updated to include an “Intense Land User” scenario and consider all relevant sub-groups. <b>Context:</b> See ‘Rationale for Status’ in IR-200 <b>Rationale:</b> Health Canada notes that the response to IR-1 confirms that the use, diet and consumption rates used to assess the “Trapper” receptor are representative of “intensive land users” from the ERFN and possibly others. This change in the assumption is significant and should be integrated into the traditional foods risk assessment. Suggestions and follow-up measures have been provided to assist in responding to this information request, which benefits from the clarity provided in response to IR-1.</p> <p>Health Canada also notes that the response to IR-200 did not consider evaluating consumption patterns (and applicable TRVs) of sensitive or vulnerable populations (e.g., elders, toddlers, women of childbearing age) in the traditional food risk assessment and provide risk levels for these sub-groups separately.</p>	<p>1. Update assumptions used in the risk assessment to reflect the new information provided in response to IR-1. (e.g., the <i>ERFN Trapper’s use of the area as <b>representative</b> of current and future land users</i>).</p> <p>2. Update the risk assessment in the EIS and ERA for the “Trapper” receptor (i.e., Intensive Land Users) to account for the <b>representative</b> nature of their described diet (i.e., consumption rates and composition).</p> <p>3. Update the rationale and decisions related to management, mitigation, monitoring and follow-up. Include a specific discussion for those COPCs that contribute to elevated health risks among “intensive land users” and those raised by Indigenous communities (i.e., selenium, mercury &amp; cadmium).</p> <p>4. Revise receptor’s descriptor/title from “Trapper” to “Intensive land users” throughout the EIS and ERA to be consistent with proposed revisions made in response to IR-1.</p> <p>Consider evaluating consumption patterns (and applicable TRVs) of sensitive or vulnerable populations (e.g., elders, toddlers, women of childbearing age) in the traditional food risk assessment and provide risk levels for these sub-groups separately. Alternatively, provide a fulsome rationale to justify their exclusion.</p>		<p>1. Denison would like to clarify to the reviewer that the response to IR-01 does not in fact introduce new information to the EIS. As noted in the above response to IR-200, the intent of IR-01 was to provide updates to the EIS to better reflect the totality of ERFN TK and land use information. Both the ERFN 2017 (CanNorth 2017) and the ERFN Trapper’s traditional food intakes have been included in the HHRA.</p> <p>2. Denison has clearly outlined in the EIS, Section 10 and Appendix 10-A how each HHRA’s receptor diet was derived, including that for the fisher/trapper. We reiterate that the ERFN provided the 2017 dietary study to Denison and requested Denison include this in the EIS.</p> <p>3. The details of the Project’s environmental management system are being developed to support Project permitting and licensing. This will include monitoring for various metals and radionuclides in a variety of media (e.g., fish, water, etc.). No updates to management, mitigation, monitoring and follow-up outlined in the revised draft EIS are required. Based on the criteria set out in Section 4 Table 4.3-1, Denison has committed to collaborating with English River First Nation and Kineepik Metis Local on a monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous community of ERFN and KML will be sharing information in an agreed-upon fashion. Denison expects that important country foods harvested for food and cultural purposes (i.e., moose, fish species, etc.), surface water quality, and other areas of interest will form part of this monitoring program.</p> <p>4. Denison has clearly outlined in the EIS, Section 10 and Appendix 10-A how each HHRA’s receptor diet was derived, including that for the fisher/trapper.</p> <p>As indicated in the response to IR-200 above, other sensitive or vulnerable human health groups are addressed through the use of toxicity reference values (TRVs) that incorporate uncertainty factors to account for sensitive individuals. This is standard practice in development of TRVs for human health risk assessment. As such, differences in health status or subgroups were not considered separately.</p> <p><b>References:</b></p> <p>CanNorth. 2017. English River First Nation Country Foods Study – Final Report (No. Project No. 2147). Canada North Environmental Services.</p>	No
IR-203	-	CNSC	Sediment Quality and Benthic Invertebrates	Appendix 10-A (ERA), Section 6.2 Future Centuries Sensitivity Analysis	<b>Context:</b> This section of the ERA states “If treated effluent was released at the maximum upper bound discharge rate, the modelled concentrations of all COPCs are expected to be below their corresponding sediment quality guidelines.” It appears from	Please provide clarity on if cadmium and vanadium are expected to be over the sediment quality guidelines for the	This response has not been accepted.  Although these potential sediment quality exceedances if treated effluent were to be released	After running the model to include the effluent released during the decommissioning period, the additional constituents that exceed sediment quality guidelines include vanadium for the expected case and cadmium for the upper bound case. Table 3-6 of the ERA (Appendix 10-A) has been updated to include the updated sediment quality	Yes

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>Figure 6-2: “Comparison of maximum concentrations of COPCs in sediment at expected and upper bound discharge rate” that cadmium and vanadium would be over their sediment quality guidelines indicated if maximum upper bound discharge rates are used.</p> <p><b>Rationale:</b> It is not clear which is correct; the statement that no exceedances of sediment quality guidelines when considering the maximum upper limit effluent release, or the figures indicating there could be exceedances for cadmium and vanadium. This discrepancy in the ERA should be explained and corrected.</p>	maximum upper bound discharge rate scenario.	at the maximum upper bound discharge rate are to be documented in the ERA, the response does not address the potential risk to receptors nor propose any mitigation measures. Please provide additional assessment/justification/mitigation measures for these predicted sediment quality exceedances.	<p>predictions and the comparison against sediment quality guidelines. Vanadium was added as a COPC for the ERA since it exceeds a sediment quality guideline in LA-5 (Whitefish Lake). Section 6.2.2 of the ERA, figures and text were updated as well.</p> <p>For cadmium, the sediment quality exceeds the REF value but is below the NE2 value which is also a no-effect value. The predicted concentration of vanadium in sediment in LA-5 at the end of decommissioning is 37.2 mg/kg dw for the expected case and 68.5 mg/kg dw for the upper bound. This is a conservative prediction as it assumes effluent is released during decommissioning at the same flow and quality as during operations. The predicted sediment concentration for vanadium is higher than the REF value from Burnett-Seidel and Liber (2013) of 35.1 mg/kg dw and the LEL from Thompson et al (2005) of 35.2 mg/kg dw. Exceedances of a REF or LEL value are not indicative of adverse effects to aquatic organisms but do suggest that further investigation may be warranted. Exceedance of a REF value indicates that sediment downstream of the proposed discharge is elevated compared to natural background. The LEL represents a concentration in sediment that the majority of benthic organism can tolerate, whereas the SEL represents a concentration in sediment that the majority of benthic organisms cannot tolerate (Persaud et al., 1993). The predicted sediment concentration for vanadium in LA-5 is well below the SEL of 160 mg/kg dw; therefore, adverse effects to benthic organisms are not anticipated. Nevertheless, vanadium was carried forward as a COPC in the ERA and hazard quotients are provided in the updated Draft ERA (Appendix 10-A) for the expected case. No hazard quotients above 1 were identified.</p> <p><b>References:</b></p> <p>Burnett-Seidel, C., Liber, K., 2013. IR-206	-	CNSC	Current use of lands and resources for traditional purposes Current use of lands and resources for traditional purposes	Section 11 Section 12 Section 15 Section 16	<p><b>Context:</b> Impacts to Lands and Resources Use have been identified by Indigenous Nations and communities.</p> <p><b>Rationale:</b> Additional information is required to demonstrate whether Indigenous Nations and communities were engaged directly by Denison regarding the cumulative effects assessment, significance determination and residual effects, and thus the overall conclusions on potential adverse impacts of the Project on the potential or established Indigenous and/or treaty rights and effects of changes to the environment on Indigenous peoples, pursuant to paragraph 5(1)(c) of the CEAA 2012.</p>	Please describe any outstanding or residual issues or concerns raised by Indigenous Nations and communities that Denison was unable to address. In addition, outline any plans to find solutions or continue discussions with the potentially impacted Indigenous Nations and communities.	<p>This response has not been accepted.</p> <p>The IR response directs the FIRT to refer to the response for IR-28. However, this IR response does not directly respond to this IR in question. In IR-28, Denison does discuss how they plan to address the concerns raised by Indigenous Nations and communities, but Denison does not demonstrate whether Indigenous Nations and communities were engaged directly by Denison regarding the cumulative effects assessment, significance determination and residual effects.</p>	<p>In engagement activities in May of 2022 and October of 2023, the conclusions of the EIS inclusive of residual effects, cumulative effects, and significance determination were shared and engaged upon with Indigenous Nations and communities. This includes ERFN and KML.</p> <p>The Indigenous COIs ERFN and KML did not identify any outstanding concerns with these conclusions, or the potential of the Project to adversely affect Indigenous and/or treaty rights that could not be mitigated or accommodated by the Project.</p> <p>Denison has continued to engage with Indigenous Communities of Interest (COIs) along with other Indigenous communities who have expressed interest in the EIS process since filing its draft EIS. This has included engagement specific to the conclusions of the draft EIS</p>	Yes  Revised Draft EIS, Section 4

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
							CNSC requires Denison to provide this information before the response can be accepted.	<p>in May of 2022 and October of 2023. Through the provincial technical review process, the Federal Indigenous Review Team, and the public comments process, Denison has considered and responded to the issues and interests raised. This has included gaining a better understanding of the core issues and concerns of Indigenous communities and their desired involvement in the EIS review process going forward.</p> <p>A list of commitments and/ or mitigation measures arising from these processes, with specific details to each Indigenous Nation (or representative thereof), will be included in the revised EIS. For clarity, this will not include any private, confidential accommodations made under contractual agreements. Where not contained in confidential contractual agreements, any new mitigation or enhancement measures will be updated in the revised EIS. Further to this, Section 4 of the EIS will be updated to include a summary of engagement and associated outcomes, with additional details offered in the Indigenous Engagement Report. Denison has engaged with various Nations (or representatives thereof) in response to the public comment review process and will continue to do so throughout the assessment process.</p>	
IR-209	-	CNSC	Indigenous Peoples' health / Socio-economic conditions	Section 12.1.4.2.1 (p. 12-22)  Section 12.1.5 Section 12.1.6.2	<p><b>Context:</b> KML indicates that working at a mine camp could inhibit community members from participating in cultural activities and sharing them with family and community members, resulting in a loss of cultural knowledge and language, thus impact knowledge transmission (p. 12-22).</p> <p><b>Rationale:</b> Denison addresses this by briefly identifying culturally sensitive policies which would eliminate residual effects (p. 12-30)</p>	Please provide detailed proposed mitigation measure for KML’s concerns related to loss of cultural knowledge and language should they work for Denison.	<p>This response has not been accepted.</p> <p>Please provide validation that this proposed mitigation measure is considered suitable and has been accepted by KML.</p>	<p>Denison has continued to engage with Indigenous Communities of Interest (COIs) along with other Indigenous communities who have expressed interest in the Project process since filing its draft EIS. Through the provincial technical review process, the Federal Indigenous Review Team, and the public comments process, Denison has considered and responded to the issues and interests raised. This has included gaining a better understanding of the core issues and concerns of Indigenous communities and their desired involvement in the EIS review process going forward. Denison and KML are in agreement that all items identified in the FIRT and public comment process are considered as resolved. During the public comments process, KML raised concern for the loss of language, culture, and knowledge related to working at an industrial operation (KML and NVP Public Comment #94).</p> <p>KML has validated the process in which Denison and KML will communicate concerns and agree on appropriate mitigation measures. Specifically, the following response was provided to KML on November 22, 2023, and validated by KML on December 5, 2023. Also see comment No 37 in the Issues and Concerns Table in Appendix 4b.</p> <p>Denison respects the concern raised by KML regarding language and culture related to working at an industrial operation. Denison and KML will be working on specific items of interest to mitigate these types of concerns through private contractual arrangements, which may include specific mitigation and accommodation measures in this respect. Mitigation measures associated with potential effects to cultural continuity (including knowledge transfer and language) are described in Section 12.1.5 of the revised draft EIS and include:</p> <ul style="list-style-type: none"><li>• Working with Indigenous COIs to understand culturally important periods relative to harvest times and cultural camps to facilitate Indigenous employees taking time off to participate in such activities;</li><li>• Implementation of Denison's Indigenous Peoples Policy and advancement of reconciliation</li><li>• Using a commuter rotation system has also shown to be effective in allowing Indigenous employees continued opportunities to spend time on the land, and important factor in</li></ul>	<p>Yes</p> <p>Revised Draft EIS, Section 12.1.5</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<p>the transmission of knowledge and language (see Section 11 of the Draft for a description of potential effects to land use).</p> <p>In discussions with Indigenous Communities of Interest since the filing of the draft EIS, it has become apparent that Denison should add additional commitment / mitigation measure in relation to this area of interest, as follows:</p> <ul style="list-style-type: none"><li>• Encouragement to speak languages of choice while at site, except during safety sensitive situations.</li></ul> <p>Section 12.1.5 of the revised draft EIS was updated to include the additional commitment / mitigation measure in relation to culture and language, as follows:</p> <ul style="list-style-type: none"><li>• Encouragement to speak languages of choice while at site, except during safety sensitive situations.</li></ul>	
IR-212	-	HC	Human health with respect to hazardous contaminants	Section 14 (p. 14-3)  Appendix 16-C (p. 14 & 15)	<p>The follow-up plan does not sufficiently describe how various parties will be engaged in the design, implementation, and review of monitoring programs.</p> <p><b>Context:</b> Section 14 of the EIS states that “The overarching fear of contamination from the mine is woven in to almost every other concern noted by participants in the TK study. It is worth acknowledging this concern separately given the potential for mental health impacts related to people’s experiences of fear and anxiety” (p. 14- 3).</p> <p>The commitment regarding monitoring and follow-up activities appears limited to “<i>shar[ing] information in a transparent manner with the General Public, and specifically those Communities of Interest and Nearby Land Users with whom Denison is regularly engaging about the Project. Such an information-sharing program would consider the involvement of the Regulators to make sure the information available addresses the issues identified as concerns</i>” (p. 14).</p> <p><b>Rationale:</b> Country food safety is not regulated federally unless foods are sold commercially. Certain aspects of country food safety and availability may be covered by provincial regulators. It is unclear whether and how various levels of government and potentially affected communities would be involved in the development of the follow-up and monitoring program. It is also unclear what the information sharing program entails and how it would inform any adaptive management if monitoring results deviated from the prediction</p>	<p>1. Provide details of how local, provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program.</p> <p>2. Describe the steps that will be taken if there are any exceedances of established benchmarks or deviation from predictions.</p> <p><b>Suggestions for mitigation and follow-up measures:</b> Health Canada recommends that the Proponent’s plan for communicating follow-up results (environmental and country foods) aims at, among other things, responding to community concerns regarding country foods to minimize avoidance of this resource. This goes beyond a passive dissemination of information and developing a strategy based on dialogue and the direct involvement of communities in monitoring, surveillance, and risk communication activities.</p>	<p>This response has not been accepted as it does not provide sufficient detail on engagement and adaptive management.</p> <p>The response to IR-212 expresses interest and intent to working with local and Indigenous communities to develop follow-up and monitoring programs, supported by an overview of the intended approach. It also articulates that the detail of follow-up and monitoring plans will be developed as part of the licensing and regulatory phases of the Project’s approval process.</p> <p>As previously indicated, country food safety is not regulated federally unless foods are sold commercially. Certain aspects of country food safety and availability may be covered by provincial regulators. As such, it is unclear whether and how various levels of government and potentially affected communities would be involved in the development of the follow-up and monitoring program for country foods.</p> <p>Additionally, the preliminary monitoring plan should include decision criteria/thresholds/benchmarks for initiating action and what those actions might entail (e.g., inspection of treatment processes, additional sampling, communication with local land users &amp; residents, engagement with interested communities, etc.).</p> <p>HC reiterates its previous IR, with added clarification:</p>	<p>Given the stage of the Project, Denison believes the information provided in response to the original IR comment provided an appropriate level of feedback with respect to modes of engagement with local, provincial and federal authorities, and Indigenous Nations and communities around the sampling / monitoring (including important country foods harvested for food and cultural purposes). Based on the criteria set out in revised Draft EIS Section 4, Table 4.3-1, Denison has committed to collaborating with the Indigenous Communities of Interest English River First Nation and Kineepik Metis Local on a monitoring regime, suited to each of their interests and needs. Within the context of the IR Denison does not feel it is entirely appropriate to provide definitive information with respect to how engagement activities will occur given that a commitment to engage in a manner that best suits the individual communities has been made and that process continues to unfold. Nevertheless, additional information is provided below that Denison believes provides further clarity regarding ongoing and planned engagement. Additionally, concepts concerning decision making related to criteria/thresholds/benchmarks that may be used to trigger follow up actions are also discussed.</p> <p>1. Denison understands the importance of engaging Indigenous Nations and communities with respect to items that matter to them. As recent as October 2023, Denison has engaged with Indigenous Communities of Interest about how the outcomes of the environmental assessment process become key areas of focus by the licensing and approvals regime – including in relation to environmental monitoring. All discussion and materials related to these engagement sessions can be found in Section 4. Further to this, Denison has planned a comprehensive and technical workshop with ERFN in March 2024, and expects to undertake the same for KML soon thereafter, focused very specifically on the aspects of items licensed or approved post-environmental assessment. This will include environmental monitoring and the relationship to country foods, including potential country foods to be monitored as part of monitoring programs. As the lifecycle regulator for the Project, Denison is required to provide information related to the outcome of these discussions into forthcoming updates in the IER to the CNSC.</p> <p>2. Re decision criteria/thresholds/benchmarks – As with any aspect of routine monitoring that would be implemented at the Project site that provides information on operational performance, feedback mechanisms will be developed as part of the monitoring process so that appropriate actions can be taken in response to data as it becomes available (i.e.,</p>	No

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
							<p>1. Provide details of how local, provincial and federal authorities, and Indigenous Nations and communities will be engaged in developing the follow-up and monitoring program, including the information-sharing program, for substances in country foods that may represent a potential health risk and/or are of concern to community members and land users (e.g., Mercury/Methylmercury, Selenium, Cadmium and Lead).</p> <p>2. Describe the decision criteria/thresholds/benchmarks for these substances in country foods and steps that will be taken if there are any exceedances of established benchmarks or deviation from predictions.</p>	<p>routine monitoring will be developed in consideration of the adaptive management concept). Details regarding such feedback mechanisms, the basis of how subsequent actions would be triggered, and those actions would be defined as part of the development of monitoring programs as part of the Environmental Management Program during licensing, and in conjunction with engagement activities. With that in mind, a conceptual trigger-response mechanism framework related to sampling / monitoring of country foods is described for consideration that would be the basis of detailed plans developed in the next phase of Project approvals.</p> <ul style="list-style-type: none"><li>Conceptually, screening criteria would be defined in consideration of increasing trends measured in environmental media relative to background.</li><li>Where a screening criteria/threshold/benchmark was triggered, an investigation would be initiated to verify the result and to determine if the change in concentration is significant relative to background. This could include lab re-analysis, review of QA/QC data and field notes, reconnaissance, re-sampling or additional sampling and/or additional analyses. Potential causes of the increasing trend would be investigated to establish whether the trend was Project related, and the investigation may be informed by mine operations data (e.g., water treatment performance), climatic data, local and Indigenous knowledge, and background data from reference locations in the region.</li><li>If the investigation confirms that the criteria/threshold/benchmark criteria was triggered by the Project, additional analyses such as modelling, toxicity testing, increased sampling may be initiated (as appropriate) or assessment of human health risks may be warranted.</li><li>If, based on the additional investigation, modified or additional mitigation measure(s) are identified, such measures may need to be developed, implemented and monitored to address the specific issue identified as being of concern. Monitoring would be adapted to ensure it was capable of monitoring the performance of any mitigations implemented and to demonstrate the risk identified had been mitigated.</li></ul> <p>It is envisioned that Denison would engage its Indigenous Communities of Interest in all aspects of the process. Members of the public and the provincial and federal governments would be engaged through with the formalized public information program, required by the CNSC.</p>	
IR-216	-	CNSC	Human Health with respect to radiation exposure	Section 14.6.1 Section 14.6.7 Appendix 14-A	<p><b>Context:</b> Radiological doses to human receptors, including workers (i.e., driver(s) of the vehicles), from the Bounding Scenarios 1 (Vehicle Accident Including Rollover, Collision, Run Off Road) and 7 (Vehicle Accident Including Rollover, Collision, Run Off Road) have not been assessed.</p> <p><b>Rationale:</b> An estimate of the effective doses to human receptors, including workers, are required to determine whether</p>	Provide estimates (including calculations) of the potential radiological doses to human receptors, including workers, resulting from Bounding Scenarios 1 and 7.	<p>This response has not been accepted.</p> <p>In order to accept this response, CNSC staff request that the proponent specify in the EIS that worker health, as it relates to accidents and malfunctions, will be addressed independently and part of the licensing process as required. Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	<p>As indicated in the initial response to IR-216 it is Denison's intent to assess radiological dose to workers as part of the licensing process (see also Section 14.2 of the revised Draft EIS). As such Denison confirms that this will include the assessment of radiological dose to workers that may be associated with Bounding Scenarios 1 (Vehicle Accident and Aquatic Release of Radioactivity) and 7 (Vehicle Accident and Terrestrial Release of Radioactivity) of the Accident and Malfunctions Assessment (Section 14 of the revised Draft EIS). For clarity, the last paragraph of Section 14.2 of the revised Draft EIS has been revised as follows, noting that the bolded text is the addition that states the specific commitment requested in the IR.</p>	Yes  EIS Section 14.2

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					the expected doses meet the dose limits set out in the Radiation Protection Regulations.			<p>"It is noted that some hazards related to worker safety were identified; however, worker safety (i.e., risks and consequences) is beyond the scope of this assessment. Consistent with Canadian Standards Association (CSA) N288.6-12 (CSA Group 2012), potential risks to nuclear energy workers will be addressed as part of the license application and will include the results of occupational hazard and exposure assessments and the Radiation Protection Program and Health and Safety Program. <b>Specifically, as it pertains to the consideration of accidents and malfunctions as presented herein, Denison will assess radiological dose to workers that may result from Bounding Scenarios (see definition in Section 14.5.6) involving vehicular accidents resulting in releases of radioactivity to the aquatic (see Section 14.6.1) and terrestrial (see Section 14.6.7) environments."</b></p> <p>It is noted that this IR response does not change the outcome of the accidents and malfunctions assessment in the revised draft EIS and as indicated the additional work to characterize radiological dose to workers will be completed during licensing.</p>	
IR-217	-	CNSC	Accidents and Malfunctions	Sections 14.6.1 and 14.6.2	<p><b>Context:</b> Highway 914 crosses the Wheeler River 10 km southwest of the access road junction. A vehicle accident, including a rollover, collision, or run off road, at or near the bridge could potentially result in a release of uranium concentrate and release of fuels and chemicals into the surface water at this location. Denison believes that a release of uranium concentrate and a release of fuels and chemicals at this location would bound the releases at any other water crossing along the transportation corridor. However, no information on what other water crossings along the transportation corridor exist and how bounding scenarios 1 and 2 would bound the risk of releasing uranium concentrate and fuels and chemicals at other crossings.</p> <p><b>Rationale:</b> The release of uranium concentrate and fuels and chemicals at water crossings would contaminate the water body at the crossings and pose a risk to the environment and public health.</p>	Please provide information on all water crossings along the transportation corridor and justification why bounding scenarios 1 and 2 would bound the effects of the accidental releases of uranium concentrate and fuels and chemicals at these crossings.	<p>This response has not been accepted.</p> <p>The Proponent has provided information on all water crossings along the transportation corridor. However, it is insufficient for the justification why bounding scenarios 1 and 2 would bound the effects of the accidental releases of uranium concentrate and fuels and chemicals at these crossings.</p>	<p>The review comment is acknowledged, but there seems to be some confusion as to the context for the “bounding scenario” terminology used in the accident malfunction analysis. It is the release of the radioactivity (Scenario 1) and chemicals (Scenario 2) that form the basis of these bounding scenarios, and not the specific locations of their occurrence.</p> <p>It would not be possible (nor appropriate) to select a scenario that would necessarily bound all other scenarios in this regard, given the variability of conditions on the transportation route along Hwy 914 south from the project site to its junction with Hwy 165 and then Hwy 165 both east to Hwy 2 and west to Hwy 155. The alternative, that is selecting a host of locations in an attempt to capture such variability in conditions, would not be practical, nor is it necessary in Denison’s and their SME’s view. As noted in the original response, the location selected for the material releases evaluated in accident malfunction Scenarios 1 and 2 was chosen because it represents an important location to Indigenous, local resource users. The analyses of these scenarios provide examples of such releases to local receptors at the crossing identified in the report and contribute to the characterization of overall risk, the key endpoint in the accident and malfunction assessment. From that perspective the analyses would be expected to be generally representative of crossings along the transport route. As noted in the original response to IR 217, the approach in the accident and malfunction assessment is consistent with past practice for comparable assessments for uranium projects in the province.</p> <p>For clarity, the text in the attached revised Draft EIS has been revised as follows:</p> <p><b>For Appendix 14-A:</b></p> <p><b>Section 5.1</b> – to be added to the end of the 4<sup>th</sup> paragraph, “<i>This location was the focus the evaluation as it represents an important location to resource users in the study area. The scenario provides an example of the consequences of such releases to local receptors – that is, the results of the assessment of the releases at this location would be expected to be generally representative of crossings along the transport route since the key endpoint in the assessment is overall risk, as defined for the assessment process as probability</i></p>	<p>Yes</p> <p>Draft EIS Sections 14.6.1.1 and 14.6.4.2.1</p> <p>Appendix 14-A Sections 5.1 and 5.2</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<p><i>multiplied by consequence. Appendix C to this report describes water crossings along the Project-related transportation route on Highway 914 south from the Project site to its junction with Highway 165 and Highway 165 east to Hwy 2 and west to Hwy 155. While the specific conditions at these crossings may differ in size or nature, the results of the analysis presented can generally be applied more broadly as indicated above. The approach used is consistent with past practice for comparable assessments for uranium projects in the province.”</i></p> <p><b>Section 5.2</b> – to be added to the end of first paragraph, “<i>As with Scenario 1, this location was also the focus the evaluation as it represents an important location to resource users in the study area but the results of the analysis presented can generally be applied more broadly to water crossings along the transport route from an overall risk perspective.”</i></p> <p><b>Section 14:</b></p> <p><b>Section 14.6.1.1</b> – to be added to the end of the 4<sup>th</sup> paragraph, “<i>This location was the focus the evaluation as it represents an important location to resource users in the study area. The scenario provides an example of the consequences of such releases to local receptors – that is, the results of the assessment of the releases at this location would be expected to be generally representative of crossings along the transport route since the key endpoint in the assessment is overall risk, as defined for the assessment process as probability multiplied by consequence. Appendix C to this report describes water crossings along the Project-related transportation route on Highway 914 south from the Project site to its junction with Highway 165 and Highway 165 east to Hwy 2 and west to Hwy 155. While the specific conditions at these crossings may differ in size or nature, the results of the analysis presented can generally be applied more broadly as indicated above. The approach used is consistent with past practice for comparable assessments for uranium projects in the province.”</i></p> <p><b>Section 14.6.2.1</b> – to be added to the end of the 1<sup>st</sup> paragraph, “<i>As with Scenario 1, this location was also the focus the evaluation as it represents an important location to resource users in the study area but the results of the analysis presented can generally be applied more broadly to water crossings along the transport route from an overall risk perspective.”</i></p> <p>It is noted that this IR response does not change the outcome of the accidents and malfunctions assessment. Information that will be added to the EIS documentation as noted above is to add clarity to the reporting.</p>	

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
IR-218	-	CNSC	Accidents and Malfunctions	Sections 14.6.1.1 and 14.6.1.4	<p><b>Context:</b> Table 14.6-1 indicates that the average flow of Wheeler River south of Russel Lake is 17,340 L/s or 17.34 m3/s. This rate is used for uranium dissolution rate calculation. However, in section 14.6.1.4, it states that the average annual flow is 24.3 m3/s. In Table 14.6-3, the last two rows appear to be added wrongly.</p> <p>It also states that sediment quality results are shown in Table 14.6-5 for post-remediation conditions. During minimum flow conditions, the affected volume is expected to be smaller, resulting in a higher sediment concentration. In comparison, higher flow conditions are expected to result in a greater footprint and lower concentrations. However, in Table 14.6-5, the average sediments concentration and porewater concentration appear to be incorrect and switched between average flow and maximum flow.</p> <p><b>Rationale:</b> Inconsistent/inaccurate information provided in the EIS.</p>	Please clarify and correct the inconsistent information on average flow rate of Wheeler River at the crossing and incorrect information in Table 14.6-3, and average sediment concentration and porewater concentration under average and maximum flow conditions in Table 14.6-5.	<p>This IR has not been accepted as there are two typos in Denison’s response.</p> <p>In the column: Final EIS Update, the wording “Section 14.6.4.1” appears to be “Section 14.6.1.4”; for the <u>Revisions to Appendix 14-A</u>, the wording “average annual low of 24.3m<sup>3</sup>/s (average flow)” should be “average annual low of 17.3m<sup>3</sup>/s (average flow)”. Please update this text.</p>	<p>Acknowledged. Based on the further comment, confirmation of the editorial revisions for Section 14 of the Draft EIS and Appendix 14-A are highlighted below.</p> <p><b>Revisions to Section 14 of the EIS:</b></p> <p>- The last two rows of Table 14.6-3 will be removed.</p> <p>- From Section 14.6.1.4 (not Section 14.6.4.1 as previously indicated), the second to last sentence in first paragraph to be revised as follows, “<i>The flow rates considered for this assessment were 5th percentile annual flows of 10.9 m3/s (minimum flow), the average annual flow of <del>24.3</del> 17.3 m3/s (average flow), and the 95th percentile annual flow of 24.67 m3/s (maximum flow).</i>”</p> <p>- Table 14.6-5 to be revised as shown in Attachment IR-218 (Annex 1, Attachment IR-218, pages 392/419).</p> <p><b>Revisions to Appendix 14-A:</b></p> <p>- From Section 8.1, second to last sentence in first paragraph to be revised as follows, “<i>The river flows considered for this assessment are the 5th percentile annual flow of 10.9 m3/s (minimum flow), the average annual flow of <del>24.3</del> 17.3 m3/s (average flow), and the 95th percentile annual flow of 24.67 m3/s (maximum flow).</i>”</p> <p>- Table 8-5 to be revised shown in Attachment IR-218 (Annex 1, Attachment IR-218, pages 392/419).</p> <p>It is noted that this IR response does not change the outcome of the accidents and malfunctions assessment. Information that will be added to the EIS documentation as noted above is for editorial purposes.</p>	Yes  Draft EIS Section 14.6.1.4  Appendix 14-A, Section 8.1  Appendix 14-A, Table 8-5
IR-219	-	CNSC	Accidents and Malfunctions	Sections 14.6.1.1.1 and 14.6.1.4.1;  Sections 5.1.1 and 8.1 of Appendix 14-A	<p><b>Context:</b> When assessing the release characterization of Bounding Scenario 1, the Proponent assumed that 95% of the released uranium concentrate can be recovered from the release location without sufficient justification, and that different water column depths, i.e., 10 cm and 5 cm, and average water depth of 1.2 m at the release location were used without explanation.</p> <p><b>Rationale:</b> As the recovery rate of the uranium concentrate would have an impact on the assessment of its potential effects, it is necessary to understand how the recovery rate and water level were selected for assessing this bounding scenario.</p>	Provide further rationale for assuming 95% recovery rate and for using different water column depths for uranium concentrate release characterization.	<p>This response has not been accepted as the Proponent’s response does not include rationale for using different water column depths for uranium concentrate release characterization.</p>	<p>Acknowledged.</p> <p>With respect to water column depth, Denison confirms that only one water column depth was considered with respect to uranium concentrate recovery. The assumption of a 10 cm water column depth (Draft EIS Section 14.6.1.1.1, Appendix 14-A Section 5.1) is in reference to the bottom 10 cm of the water column where uranium concentrate that would be deposited on the river bottom is assumed to interact with the receiving environment (i.e., where uranium concentrate, dissolution is assumed to occur in the Wheeler River). The average depth of 1.2 m (Draft EIS Section 14.6.1.1.1, Appendix 14-A Section 5.1) is in reference to the assumed average depth of the river where the release is postulated to occur. Denison notes that the final sentence of Draft EIS Section 14.6.1.1.1 and Appendix 14-A Section 5.1 state “. . . <i>and a water column depth of 5 cm.</i>”; this statement is erroneous and has been amended in both locations in the revised Draft EIS to state “. . . <i>and a water column depth of 10 cm.</i>”</p> <p>It is noted that this IR response does not change the outcome of the accidents and malfunctions assessment. Information that will be added to the EIS documentation as noted above is for editorial purposes.</p>	Yes  Draft EIS Section 14.6.1.1.1  Appendix 14-A, Section 5.1

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
IR-222	-	CNSC	Accidents and Malfunctions	Section 14.6.2.4	<p><b>Context:</b> Bounding Scenario 2 consists of the aquatic release of fuel and hazardous chemicals due to traffic accidents. The EIS states that amongst the fuels considered for this scenario, the consequences of the release of gasoline and solvents are bounded by the consequences associated with the release of diesel. Both gasoline and solvents are lighter with higher vapour pressure; therefore, they have a shorter half-life in the aquatic environment and a lesser tendency for adsorption to sediments and suspended solids in the water column. There is no other justification provided to show that the release of diesel can bound other chemicals such as sulfuric acid and sodium hydroxide that are heavier than diesel.</p> <p><b>Rationale:</b> The release of either sulfuric acid or sodium hydroxide during accident could change the water PH significantly at the releasing location, which would post a negative impact on the local environment.</p>	Please provide further justification that the consequences of the release of sulfuric acid and sodium hydroxide can be bounded by the consequences associated with the release of diesel.	<p>This response has not been accepted as the Proponent states that: <i>“Through the hazard identification process (see Appendix 14-A Section 3.0 and Appendix A), the overall risk of the release of acids and bases was characterized as “moderate” and “ALARP” and as such consistent with the A&amp;M assessment methodology was not carried forward further evaluation.”</i></p> <p>This is not the case. In Appendix A, Table 3, item 3.3 identifies that aquatic release of fuel, hazardous chemicals and reagents as having a high risk and further assessment is needed. If the Proponent believes the above statement is true, Appendix A in Appendix 14-A should be revised to reflect such a case.</p>	<p>Acknowledged.</p> <p>Table 3, Item 3.3 in Appendix A of Appendix 14-A has been revised to reflect the content of the original response (Annex 1, IR-222, page 82/419) whereby the release of acids and bases (chemicals and reagents) has a lower overall risk screening ranking than the release of diesel fuel. Complementary text has been added to Section 14 of the revised Draft EIS for consistency and clarity.</p> <p>The following revisions have been made in the revised Draft EIS:</p> <p><b>Revisions to Appendix A of Appendix 14-A</b></p> <ul style="list-style-type: none"><li>- Table 3, Item 3.3, the consequence and overall risk ratings for this scenario have been modified to reflect the distinction between the release of acids and bases (chemicals and reagents) and the release of diesel fuel and the following note has been added to the “Screening Decision / Rationale” column in Table, “ As seen in the “S” column two consequence screening rankings were provided and consequently, two overall risk screening ranking are also provided. Acids and bases (chemicals and reagents) released to the aquatic environment are likely to dissolve relatively quickly and effects to local biota can be expected to be experienced on a local basis and over a shorter timeframe resulting in the screening consequence score of “major” (4) and an overall risk screening ranking of “moderate”. There is little likely that mitigation can be applied in that scenario and therefore, the risk mitigation measures are limited to those that prevent accidents or reduce the probability to ALARP (thus the overall ranking of “ALAPRP, moderate”). The release of organic compounds (such as diesel) would have the potential for downstream transport as a compound in liquid phase distinct from that of the water and in this sense, this release produces a greater challenge of potential contamination over a relatively large spatial extent and timespan. For this reason, a screening consequence score of “catastrophic” (5) and an overall risk ranking of “high” was given. Per the rationale provided above, the “high” overall risk release of diesel fuel case was chosen as the representative case for Scenario 3.3 and carried forward for further assessment.”</li></ul> <p><b>Revisions to Section 14.6.2.4:</b></p> <p>The following has been added as the first paragraph of Section 14.6.4.2 of the draft EIS for clarity, <i>“For the purpose of assessing the potential effects on the aquatic environment from a release of fuels and hazardous chemicals the release of diesel fuel was chosen as a representative scenario, rather than other chemicals, such as acids and bases. The release of organic compounds (such as diesel) would have the potential for downstream transport as a compound in liquid phase distinct from that of the water in the receiving environment with potential contamination occurring over a relatively large spatial extent and timespan. In contrast, the release of acids and bases would dissolve in water relatively quickly and effects to local biota can be expected to be experienced on a more local basis and over a shorter timeframe.”</i></p> <p>For reference, similar text has been added to Section 8.2 of Appendix 14-A.</p>	<p>Yes</p> <p>Appendix 14A, Appendix A, Section 3.0, Table 3, Item 3.3</p> <p>EIS Section 14.6.4.2</p> <p>Appendix 14-A, Section 8.2</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								It is noted that this IR response does not change the outcome of the accidents and malfunctions assessment. Information that will be added to the EIS documentation as noted above is to add clarity to the reporting.	
IR-225	-	CNSC	Human Health with respect to radiation exposure	Section 14.6.5.4  Appendix 14-A	<p><b>Context:</b> With the Bounding Scenario 5 (Process System and Piping Failure), the Proponent states that Denison ensures that the process is designed to include control measures to reduce the exposure to both workers and members of the public as low as achievable. The measures would ensure that the processing plant is adequately ventilated, and that spills or leaks are detected by loss of system pressure, observation, or flow imbalance.</p> <p>It is not indicated where these additional measures have been detailed/elaborated within the EIS.</p> <p><b>Rationale:</b> Control measures to reduce the exposure to both workers and members of the public as low as achievable, that are identified in the assessment of Bounding Scenario 5, must be formally documented to ensure that they are carried over into the engineered design of the processing plant.</p>	Provide details on how the control measures to reduce the exposure to both workers and members of the public, identified in the assessment of Bounding Scenario 5, have been formally documented and incorporated in the engineered design of the processing facility.	<p>This response has not been accepted.</p> <p>In order to accept this response, CNSC staff request that the proponent specify in the EIS that any engineering design control measures identified in Bounding Scenario 5 will be included in the detailed design and will be provided for acceptance by the CNSC during Project licensing. Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	<p>As noted in the original response to IR-225 (Annex 1, IR-225, page 83/419), any engineering design control measures identified in Bounding Scenario 5 will be included in the detailed design and will be provided for acceptance by the CNSC during Project licensing. Per this additional FIRT request, this commitment has been included in the text of Section 14.6.5.2 of the revised Draft EIS. It is also noted that additional mitigations have been added to those listed in Section 14.6.5.2 so that the list is consistent with those measures highlighted in Appendix 14-A - that is, these are not new measures; rather the list has been modified for consistency. Section 14.6.5.2 of the Draft EIS is presented below in its entirety for reference, with revised text highlighted in bolded font.</p> <p>"The following principal mitigating measures would be in place to reduce the probability of a release from the process piping and vessels:</p> <ul style="list-style-type: none"><li>• visual inspections;</li><li>• regular and preventive inspection, testing, and maintenance programs;</li><li>• <b>personnel training and orientation;</b></li><li>• <b>development and implementation of the Occupational Health and Safety Program, including specific plans, procedures and PPE;</b></li><li>• emergency response planning;</li><li>• <b>building ventilation;</b> and</li><li>• full containment of the processing plant; and</li><li>• <b>ambient monitoring.</b></li></ul> <p><b>For reference, the engineering design controls identified as mitigating measures above will be included in the detailed design and will be provided for acceptance by the CNSC during Project licensing."</b></p>	Yes  EIS Section 14.6.5.2
IR-229	-	CNSC	Human Health with respect to radiation exposure	Section 14.6.6.4  Appendix 14-A	<p><b>Context:</b> With the Bounding Scenario 6 (Facility Fire and/or Explosion), the Proponent states that Denison would ensure that the design of the plant includes control measures to reduce the exposure to both workers and members of the public to levels that are as low as achievable. The measures would ensure that the processing plant is adequately ventilated.</p> <p>It is not indicated where these additional measures have been detailed/elaborated within the EIS.</p> <p><b>Rationale:</b> Control measures to reduce the exposure to both workers and members of the public as low as achievable, that are identified in the assessment of Bounding Scenario 6, must be formally documented to ensure that they are carried over into the engineered design of the processing plant.</p>	Provide details on how the control measures to reduce the exposure to both workers and members of the public, identified in the assessment of Bounding Scenario 6, have been formally documented and incorporated in the engineered design of the processing facility.	<p>This response has not been accepted.</p> <p>In order to accept this response, CNSC staff request that the Proponent must specify in the EIS that any engineering design control measures identified in Bounding Scenario 6 such as ventilation will be included in the detailed design and will be provided to the CNSC during Project licensing. Please provide proposed text for the revised EIS, for SME review and acceptance.</p>	<p>As noted in the original response to IR-229 (Annex 1, IR-229, page 85/419), any engineering design control measures identified in Bounding Scenario 6 will be included in the detailed design and will be provided for acceptance by the CNSC during Project licensing. Per this additional FIRT request, this commitment has been included in the text of Section 14.6.6.2 of the revised Draft EIS. It is also noted that additional mitigations have been added to those described in Section 14.6.6.2 so that there is consistency between the Draft EIS and Appendix 14-A - that is, these are not new measures; rather the text has been modified for consistency. Section 14.6.6.2 of the Draft EIS is presented below in its entirety for reference, with revised text highlighted in bolded font.</p> <p>"Denison would make sure that the design of the plant includes control measures to reduce exposure levels to workers and members of the public to levels that are as low as achievable. The control measures would work to make sure that the processing plant is adequately ventilated. Emergency response and spill response plans would include procedures for worker protection, details about personnel protection equipment (particularly respiratory equipment), and procedures to evaluate exposures during a release of uranium powder. <b>In addition, the following is noted with respect to mitigation:</b></p>	Yes  EIS Section 14.6.6.2

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
								<ul style="list-style-type: none"><li>• implementation of regular and preventive inspection, testing, and maintenance programs;</li><li>• ventilation design considerations for upset conditions; implementation of personnel training and orientation;</li><li>• development and implementation of the Occupational Health and Safety Program, including specific plans, procedures and PPE;</li><li>• implementation of fire safety plan and firefighting systems; and</li><li>• ambient monitoring.</li></ul> <p><b>For reference, the engineering design controls identified as mitigating measures above will be included in the detailed design and will be provided for acceptance by the CNSC during Project licensing."</b></p> <p>It is noted that this IR response does not change the outcome of the accidents and malfunctions assessment. Information that will be added to the EIS documentation as noted above is to add clarity and consistency to the reporting.</p>	
IR-235	-	ECCC ERAD	Fish and fish habitat Fish and fish habitat	Section 15.5.2, Expected Environmental Conditions	<p><b>Context:</b> In this section it is stated that: “Table 15.5-1 and Table 15.5-2 summarize the predicted mean values of the climate variables for the Tomblin Lake regional grid unit, following the RPC4.5 and RCP8.5 scenarios, respectively, as indicated by the Climate Atlas (PCC 2019).”</p> <p>RCP4.5 represents predicted climate conditions of a moderate carbon future.</p> <p>RCP8.5 represents predicted climate conditions under a high carbon future.</p> <p>The values shown in Tables 15.5-1 and 15.5-2 show averages of 25.9 and 26.7 mm for RCP4.5 and 25.9/27.5 mm for RCP8.5. These values do not correspond to the source indicated by the Proponent.</p> <p><b>Rationale:</b> Based on the Proponent’s description we would expect to find the same values for “Max 1-Day Precipitation (mm)”in the Climate Atlas for RCP4.5 and RCP8.5 scenarios. ECCC was unable to duplicate the results.</p> <p>ECCC queried the Climate Atlas for Tomblin Lake and returned a result of “Region Geikie River.” <a href="https://climateatlas.ca/find-local-data">https://climateatlas.ca/find-local-data</a></p> <p>ECCC then queried the Climate Atlas for Max 1 Day Precipitation (mm). <a href="https://climateatlas.ca/data/grid/782/maxdaypr_2030_85/line">https://climateatlas.ca/data/grid/782/maxdaypr_2030_85/line</a> <a href="https://climateatlas.ca/data/grid/782/maxdaypr_2030_45/line">https://climateatlas.ca/data/grid/782/maxdaypr_2030_45/line</a></p>	<p>1. Provide the source of the data displayed in Max 1-Day Precipitation (mm) category in Tables 15.5.1 and 15.5-2.</p> <p>2. Provide detailed calculations for the following average values:</p> <ul style="list-style-type: none"><li>• 25.9 mm 26.7 mm in Table 15.5-1: Predicted Climate Conditions of a RCP4.5 Moderate Carbon Future</li><li>• 25.9 mm 27.5 mm in Table 15.5-2: Predicted Climate Conditions of a RCP8.5 High Carbon Future</li></ul> <p>3. Explain how the data shown in Tables 15.5.1 and 15.5.2 were used in the precipitation risk assessment.</p> <p>4. Denote the differences between “mean”, “value/max value”, and “fluctuation”, in the calculation of extreme event risk.</p> <p>5. Compare model derived data against:</p>	<p>Although responses 1 to 4 have been accepted, this response has not been accepted for the following reasons:</p> <p>5. although PMP is used for design purposes as indicated in Section 8, presenting the variability of observed versus climate model predicted historical precipitation values would provide understanding on the uncertainties associated with climate model projected or historical precipitation (Max 1-day, seasonal or annual) values. Thus, the proponent is recommended to include more clarification in the revised EIS.</p>	<p>The PMP is similar to annual precipitation and ~6 to 10x higher than measured and predicted future maximum 24-hour precipitation and 1:100 24 hour return events.</p> <p>In terms of Project effects on water quantity, the conservative estimate of water withdrawal would result in a reduction of flow of about 3% at times of low flow and the water level in Whitefish Lake could change by 1cm; this minor change is beyond the ability of monitoring techniques to practically measure and the assessment concluded that the Project would not result in a significant effect on surface water quantity (hydrology). Monitoring, including of water withdrawal rates and of potential effects (e.g., change in water flow, change in lake levels) will be implemented as the Project moves forward.</p> <p>The reviewer has requested information would not change the EA conclusions. However, for the purposes of demonstrating the uncertainties of climate model predicted values vs. observed data, the Max 1-day precipitation annual average historical data for Tomblin Lake, high carbon (RCP8.5) was compared to the predictive model results from the period of 1950 to 2013 (i.e., ensemble high carbon dataset). The predicted model data were hindcast for periods prior to 2006 and these value are then based on the historical data set with the ensemble values derived from 24 CMIP5 global climate models (the complete list of models can be found at <a href="https://climateatlas.ca/data-sources-and-methods">https://climateatlas.ca/data-sources-and-methods</a>) (Climate Atlas of Canada, 2023).</p> <p>A correlation coefficient (R2) value was calculated for these two datasets and the result was a coefficient of 0.36 which indicates the level of uncertainty that can be expected in the forward casting of precipitation data into the future. This information is further included in the EIS to indicate that current climate models are variable in nature and their uncertainty requires continued monitoring.</p>	<p>Yes</p> <p>Revised Draft EIS, Section 15.5.2 (text added to discuss uncertainty in the climate predictions)</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>The results displayed an array of values ranging from 83.6 mm (2050) to 87.3mm (2092) for a Regional Concentration Pathway RCP8.5 scenario and values ranging from 48.9mm (2050) to 89.5 mm (2083) for an RCP4.5 scenario.</p> <p>These values do not match the averages shown in Tables 15.5-1 and 15.5-2.</p>	<p>1. Natural variability of the observed data.</p> <p>2. Variability in the statistics generated via observation based time series.</p> <p><b>Technical Discussion Required:</b> Yes</p>			
IR 236	-	ECCC ERAD	Fish and fish habitat Fish and fish habitat	Section 15.5.2, Expected Environmental Conditions	<p><b>Context:</b> It is stated that, “Table 15.5-1 and Table 15.5-2 summarize the predicted mean values of the climate variables for the Tomblin Lake regional grid unit...”</p> <p>As per the Proponent’s description, Tomblin Lake was chosen as representative location for Wheeler when Climate Atlas was used as data source.</p> <p><b>Rationale:</b> In those two tables, for the “Max 1-Day Precipitation (mm)” the historical average is given as 24.1mm. Local time series analysis for the climatic region in which Wheeler Project is located provide averages (for 1-day max precipitation) of approximately 30+ mm.</p> <p>It is the Proponent’s responsibility to keep the required database current and up to date, because the length of the time series influences all derived statistics. Statistical analysis of extreme events is highly dependent of the mean with extreme values reaching values 3 to 4 times higher than the mean.</p>	<p>1. Provide a clear explanation on how the historical mean for 1-Day Max Precipitation was calculated.</p> <p>2. Compare the values obtained via various means (ex: copied from the internet, modeled via some online algorithm, derived from specialty literature), against time series analysis based on observations.</p> <p><b>Technical Discussion Required:</b> Yes</p>	<p>This response has not been accepted.</p> <p>The Proponent made a correlation between precipitation and the Probable Maximum Precipitation (PMP). However, annual maximum and PMP cannot be correlated as they are two separate concepts that require different statistical methods to verify.</p> <p>The Proponent provided two tables which displayed precipitation data under current, existing, and future climate scenarios for two nearby lakes. These were provided to support the Proponent’s response, however, the calculations used to achieve the table figures within the response or Attachment: IR-236 were not provided. As one value cannot be used to infer the other, reviewing the calculations is required to support the Proponent’s conclusions.</p> <p>Please see the following requests: 1. In Table 3 of Attachment: IR-236, the historical mean value (1976 to 2005) for the Maximum 1-Day Precipitation is 24.1 mm and is indicated as measured. However, this estimate appears to be derived from ensembles of climate modeled historical precipitation. Thus, proponent to insert a footnote at Table 3 that indicate the total annual as well as maximum 1-day are estimates based on ensembles of climate modeled historical precipitation. The Proponent needs to provide the calculations that were used to reach the conclusions found within Tables 2 and 3 of Attachment: IR-236. Reviewing the calculation will allow for verification of the Proponent’s conclusions. If the currently used data sources do not allow for accurate representation of their conclusions, the Proponent should use complete</p>	<p>Please see Attachment IR-236.</p>	<p>Yes</p> <p>IR-236 added as Appendix D of Appendix 6-C</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
							<p>regional observational data sources to support the conclusions in Tables 2 and 3.</p> <p>2. The analysis of mean maximum one day and mean annual total precipitation [1976-2005] based on weather station (Climate ID 4063755) at Key Lake is roughly 32mm and 470mm respectively. Thus, include both modeled and observed historical precipitation statistics in the EIS for context.</p> <p>Measured data should take precedence over modeled data. The Proponent is taking an ensemble of modeled data to "predict" historical data when measured data is available and can validate the models. Without strong justification, it is not appropriate to replace measured data with "predicted" modeled data.</p>		
IR-237		CNSC	EA follow-up and monitoring program	Appendix 16-C throughout, including Table 1.5-1: Wheeler River Monitoring and Follow-up Program Summary (p. 8-15)	<p><b>Context:</b> CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> state: “The EIS should provide discussion on the follow-up program’s requirements, and include:</p> <ul style="list-style-type: none"><li>objectives and structure of the follow-up program and the VCs targeted by the program</li><li>tabular summary and explanatory text of the main components of the program including:<ul style="list-style-type: none"><li>a description of each monitoring activity under that component</li><li><u>which of the two generic program objectives the activity is relevant to (e.g., verify EA predictions, determine effectiveness of mitigation measures)</u></li><li>the specific statement from the EA that goes along with that generic objective and will be the focus for that activity (e.g., program objective: verify predicted effects; environmental assessment effect: no potential adverse effects)</li><li>the specific monitoring objective for that activity</li><li>planned schedule</li></ul></li><li><u>roles and responsibilities to be played by the Proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the program results</u></li><li><u>possible involvement of independent researchers</u></li><li><u>program funding sources</u></li><li>information management and reporting (reporting frequency, methods and format)</li><li><u>possible opportunities for the Proponent to include the participation of the public and Indigenous groups, during the development and implementation of the program</u></li></ul>	<p>It is recognized that this document will evolve over the planning process and be finalized prior to the EA Decision; however, as plans are developed and revised, CNSC staff expect that updates will be made to this document and provided with any future versions of the EIS.</p> <p>Appendix 16-C Summary of Monitoring and Follow-up Programs must include sufficient details to allow CNSC staff to determine the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures. This includes concrete monitoring plans (sampling locations, frequency, etc.).</p> <p>Additionally, please incorporate any relevant information included in the EIS into this Summary.</p>	<p>This response has not been accepted.</p> <p>Denison has indicated they will update the follow-up program in Appendix 16-C, but this information has not been provided. CNSC reminds Denison that there should be no new information in the final EIS, and that we must review this information before accepting the response to this IR.</p> <p>Please provide an updated version of Table 1-5.1 with detailed information proposed by Denison in the IR response for the next iteration of the FIRT technical review, for SME review and acceptance.</p>	<p>See Attachment IR-237. Also see an updated version of Appendix 16-C that has been included in an updated version of Appendix 16-C that is provided with this IR response submission package.</p>	<p>Yes</p> <p>Appendix 16-C (updated)</p>

Original IR#	Follow-Up IR #	SME	Project Effects Link	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Information Requirement (IR)	Rationale for Status	Denison’s Response	EIS Updates (Yes/No; if Yes, provide EIS Section number)
					<p>The follow-up program plan should be sufficiently described in <u>the EIS to allow independent judgment as to the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures.</u>” (Section 11)</p> <p><b>Rationale:</b> The Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information, and while some of the aspects detailed in the Generic EIS Guidelines are included, the aspects underlined are missing or appear incomplete.</p> <p>Further, all information from throughout the EIS should be incorporated into this Summary. For example, the EIS notes that: “Groundwater samples will be collected at least monthly and semi-annually in the wells within the freeze wall and on the freeze wall perimeter, respectively” (p. 7-109) and that “At least five to seven multi-well clusters are proposed across the mined area (Figure 7.8-2). Sampling will include KI parameters or the full suite of COPC at different times in the remediation process” (p. 7-111).</p> <p>These details (only examples) are not included in Appendix 16-C.</p>				
IR-238	-	CNSC	Current use of lands and resources for traditional purposes Current use of lands and resources for traditional purposes	Various sections of the EIS, including: Section 8 Section 9 Section 10 Section 11 Section 12 Section 15 Section 16  Appendix 16-C (p. 3)	<p><b>Context:</b> The EIS indicates that “further detailed [follow-up and monitoring programs] will be developed as Project designs are finalized that may influence the nature, frequency, and locations of monitoring. In addition, input from regulatory agencies, the public and Indigenous Peoples will be considered.” (Appendix 16-C, p.3)</p> <p>It is not clear in several section(s) of the EIS and the Indigenous Engagement Report, whether Denison has provided the interested Indigenous Nations and communities with the opportunity to participate in the development, implementation, and review of monitoring and mitigation measures, as per the guidance of REGDOC-3.2.2 and CNSC’s Generic EIS Guidelines.</p> <p><b>Rational:</b> As outlined in Section 11 of CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a>, please include roles and responsibilities to be played by the Proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the monitoring program results as well as possible opportunities for the Proponent to include the participation of the public and Indigenous Nations and communities, during the development and implementation of the program.</p>	<p>Please provide additional information to demonstrate whether Indigenous Nations and communities were engaged directly on the potential mitigation and monitoring measures to address the concerns raised regarding potential impacts of the Project on the potential or established Indigenous and/or treaty rights.</p> <p>Provide a rationale if this engagement has not been completed. As the Project develops, please provide concrete actions Denison will take in the follow-up and monitoring programs to engage Indigenous Peoples to alleviate concerns and incorporate their interests, and when this engagement is planned to take place.</p>	<p>This response has not been accepted.</p> <p>Please provide additional information and updates on engagement activities to the EIS and IER (to date) that demonstrate whether Indigenous Nations and communities have been engaged directly on the potential mitigation and monitoring measures to address the concerns raised regarding potential impacts of the Project on the potential or established Indigenous and/or treaty rights. See also AD-62 in the Advice to Proponent table.</p>	<p>Denison has continued to engage with Indigenous Communities of Interest (COIs) along with other Indigenous communities who have expressed interest in the Project since filing its Draft EIS. This has included engagement specific to the conclusions of the draft EIS in May of 2022 and October of 2023. Through the provincial technical review process, the Federal Indigenous Review Team, and the public comments process, Denison has considered and responded to the issues and interests raised. This has included gaining a better understanding of the core issues and concerns of Indigenous communities and their desired involvement in the EIS review process going forward.</p> <p>A list of commitments and/ or mitigation measures arising from these processes, with specific details to each Indigenous Nation (or representative thereof), will be included in the final EIS. For clarity, this will not include any private, confidential accommodations made under contractual agreements. Where not contained in confidential contractual agreements, any new mitigation or enhancement measures will be updated in the final EIS. Further to this, Chapter 4 of the revised Draft EIS has been updated to include a summary of engagement and associated outcomes, with additional details offered in the Indigenous Engagement Report. Denison has engaged with various Nations (or representatives thereof) in response to the public comment review process and will continue to do so throughout the assessment process.</p> <p>More specifically to the Indigenous COIs, Denison has worked with ERFN and KML to determine their desired involvement in mitigation and monitoring processes. This has included identifying and agreeing to measures that need to be in place as part of the EIS,</p>	<p>Yes</p> <p>Revised Draft EIS, Section 4 (including appendices)</p>

IR Response Table  
Denison’s Response to December 2023 FIRT Comments  
February 2024

								<p>which topics needs to be carried through the licensing process, and each community's desired role in the process as the Project progresses. Denison and ERFN, and similarly Denison and KML, are in agreement that all items identified in the FIRT and public comment process are considered as resolved. For details, please see the Issues and Concerns table in Appendix 4B in the revised draft EIS</p> <p>Denison is committed to keeping the Indigenous communities who have expressed interest in the Project informed of monitoring and mitigation plans. Any commitments stemming from these processes, so long as they are not contained in confidential contractual arrangements, have been included in the revised Draft EIS.</p>	

## ATTACHMENT IR-12

Original IR Number	IR-12
Follow Up IR Number	-
Dept.	ECCC
Project effects link	Change to an environmental component due to hazardous contaminants
Reference to EIS, appendices, or supporting documentation	Section 2.2.3, Project Description
Context and Rationale (original IR)	<p><b>Context:</b> There is not enough information provided within the draft EIS and site water infrastructure designs to determine if the infrastructure will sufficiently contain mine site contact and non-contact water runoff. It is unclear how water management will occur during all proposed Project stages at the Project airstrip, which is located away from the main Project site. No information has been provided regarding water that may come into contact with fuels and oils from machinery on the air strip, how and where that contaminated water will be treated, and how surface runoff around the airstrip will be managed. Additionally, it is unclear if contaminants from heavy machinery on roads have been considered during runoff collection plans throughout the mine Project site. Water management at the airstrip and roads can have impacts on surface water quality and sediment quality and contaminants (e.g., Hydrocarbons) from these sources should be considered in overall site water management plans.</p> <p>In Section 2.2.3.1 a site drainage plan for contact and non-contact water has been provided in Figure 2.2-17, and water balances have been provided for the different Project phases in Figures 2.2-14 to 2.2-16. In Section 2.2.3.4 a volume of 30,000m<sup>3</sup> for the process water pond is provided, and it is stated that the process water pond has the capacity to contain Probable Maximum Precipitation (PMP) event estimated to be 483.3mm while allowing for 1.0m of freeboard. However, there are no estimates on the total volume of water that may be drained from the overall site infrastructure (i.e., the well field, processing areas, etc.) during a 24-hr PMP event. Additionally, in Figure 2.2.17 culvert locations are provided, however there is no further information on culvert designs, flow ratings and capacity for PMP events.</p> <p><b>Rationale:</b> In order to be able to understand site water management and flood risk potential, more information needs to be provided regarding the site water infrastructure designs and capture volumes during PMP events. This information will aid ECCC in understanding how contact and non-contact water will be conveyed throughout the site. Runoff from roads and the site airstrip will contain contaminants from vehicles, heavy machinery, aircrafts and de-icing practices. Additional information on the runoff collection systems and expected contaminant concentrations for the site airstrip and roads is needed to determine if the receiving environment and aquatic and terrestrial receptors are protected.</p>

<p>Information Requirement (original IR)</p>	<ol style="list-style-type: none"> <li>1. Provide information on how contact and non-contact water from the site airstrip will be managed. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</li> <li>2. Provide further information on how potential contaminants in runoff from roads have been considered in the site water management. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</li> <li>3. Provide estimated volumes of water to be drained from overall site infrastructure (such as the mine terrace, airstrip, camp area etc.), during a 24-hr PMP event.</li> <li>4. Provide additional information on culvert designs and conveyance capacity for PMP events.</li> </ol>
<p>Rationale for Status (for unaccepted original IR) OR Context and Rationale and IR (for Follow Up IR)</p>	<p>This response has not been accepted, for the following reasons (numbers correspond with original IR):</p> <p>1-2. In Figure 2.2-17 (Site Drainage Plan with Flow Direction and Culvert Locations) of EIS, site drainage or water management layout is not included for the access road to the airport and the airport area although they constitute part of the Project site. Although surface run off from airstrip or site road are mainly expected to be clean or non-contact water, CNSC expects Denison to provide information on water management system to mitigate risk of flooding and erosion at the airport and the access road. In addition, the access road connecting the mining site with airport crosses two streams (Kratchkowsky Creek and Hart Creek) that flow into Whitefish Lake, CNSC staff expects Denison to ascertain that culverts or crossings will be designed in such a manner that the flood hazard does not increase. Therefore, CNSC staff request that Decision provide information on how the surface runoff generated at airstrip and airport access road would be managed.</p> <p>3. CNSC accepts estimated total volume of runoff from the wellfield area to Wellfield Pond however the PMP value of 489.3mm is obtained from 1999 study [A.1], based on historical rainfall data pre-1998, which appears to require updated PMP value.</p> <p>CNSC requests that Denison use a PMP value that is estimated using historical rainfall data that includes the most up to date meteorological data or provide justification on the validity of the current PMP.</p> <p>Further, the site infrastructure runoff water has not been considered in the water management infrastructure. Site water management planning should consider the capture of noncontact water to understand the potential effects of contaminants from non-contact water on the surrounding environment.</p> <p>Please also see follow-up IR-12-R1A and IR-12-R1B, related to this IR.</p>

## ATTACHMENT IR-13

Original IR Number	IR-13
Follow Up IR Number	-
Dept.	ECCC CNSC
Project effects link	Fish and fish habitat
Reference to EIS, appendices, or supporting documentation	<p>Section 2.2.4, Waste Management</p> <p>Section 2.2.7.7, Borrow Area</p> <p>Section 2.3.1.3 Site Preparation and Earthworks</p>
Context and Rationale (original IR)	<p>Context: The Proponent indicates that a borrow area is planned for an area northeast of the processing plant. The borrow material or overburden will be used during construction for roads, airstrip, pads, and in the batch plant for concrete production needs, during Operation for ongoing maintenance of various Project components and during decommissioning for fill and cover material. Suitable construction fill material will be sourced from the proposed borrow area and any suitable clean sandstone generated during freeze wall and well drilling (Section 2.2.7.7).</p> <p>It was also noted in Sections 2.2.1.3 and 2.2.14 that the freeze wall will be established by drilling over 300 vertical holes from surface to the basement rock. The freeze holes will extend 30 m into the basement rock and will produce waste rock from basement rock (Figure 2.2-6). However, there is no information whether the waste rock from basement rock would potentially be acid generating and/or metal leaching. This means that all the extra 30 m of basement rock should also be characterized for potential ARD/ML to determine use or appropriate disposal.</p> <p>Rationale: ECCC notes that the Proponent did not indicate whether the borrow material and the drill out part of the sandstone layers and basement rock will be tested for Acid rock drainage/metal leaching (ARD/ML) potential before they will be used during construction, operation and decommissioning. ARD/ML is an environmental hazard that will have an adverse effect on waterbodies frequented by fish.</p> <p>Potential acid generating and metal leaching waste rock could pose negative impacts on the environment if they are not managed adequately.</p>
Information Requirement (original IR)	<p>Please provide:</p> <ol style="list-style-type: none"> <li>1. Information on whether the waste rock from the basement rock is potentially acid generating and metal leaching; <ol style="list-style-type: none"> <li>a. Confirm that any borrow material to be used for construction will be characterized for potential ARD/ML.</li> <li>b. Confirm that the part of waste rock recovered from the basement rock, will also be tested for potential ARD/ML.</li> </ol> </li> </ol>

	<p>2. Criteria for segregating the potential acid generating and metal leaching waste rock, if it exists, from clean waste rock; and,</p> <p>3. A plan to manage the potential acid generating and metal leaching waste rock, if it exists.</p>
Rationale for Status (for unaccepted original IR) OR Context and Rationale and IR (for Follow Up IR)	<p>This response has not been accepted.</p> <p>In the response, Denison expected that portion of basement rock will be potentially acid generating and stated that all basement rock will be stored on the special waste pad. Waste rock from the sandstone will also be characterized primarily based on geological and geochemical characteristics, and if a portion of the waste rock is potentially acid generating, it will also be stored on the special waste pad. However, criteria for segregating the potential acid generating waste rock from the clean waste rock are not provided.</p> <p>Denison will examine opportunities to reprocess the mineralized core and cuttings by either recovering uranium or placing the materials underground into the mining area at the end of a well's production. However, it is not clear how the potentially acid generating waste rock will be disposed of in the long term.</p>

Supporting figure and table to the response provided in the IR table:

Figure IR-13-1: Major horizons of the sandstone (Upper Aquifer, Intermediate Aquitard, Lower Aquifer) and the different basement lithologies (Graphitic Pelite [GFPL], Garnetiferous Pelite [GTPL], Quartzite [QZIT]) associated with December 2023 ABA testing

Table IR-13-1: Comparison of Wheeler River Project waste rock volumes to volumes anticipated at other proposed mines

	Denison's Wheeler River Project (proposed uranium mine in Saskatchewan)	NexGen's Rook I Project (proposed underground uranium mine in Saskatchewan)	Foran's McIlvenna Bay Project (proposed underground copper-zinc mine in Saskatchewan)	Generation PGM's Marathon Palladium Project (proposed open pit platinum group metals and copper mine in Ontario)
Clean waste rock/NPAG	7,800 m <sup>3</sup>	8,000,000 m <sup>3</sup>	787,392 m <sup>3</sup>	183,146,067 m <sup>3</sup>
Mineralized or special waste (for U mines only)	150 m <sup>3</sup>	60,000 m <sup>3</sup>	n/a	n/a
PAG	1,850 m <sup>3</sup>	5,800,000 m <sup>3</sup>	1,823,164 m <sup>3</sup>	20,786,517 m <sup>3</sup>

Note: Volumes are a combination of pad storage capacities and life of mine volumes from publicly available documents including feasibility studies and EIS documentation. Any waste rock volumes presented as tonnes were converted to m3 by dividing by 1.78

## ATTACHMENT IR-55

Original IR Number	IR-55
Follow Up IR Number	IR-55
Dept.	NRCan
Project effects link	Fish and fish habitat
Reference to EIS, appendices, or supporting documentation	Section 7.3.3.1; Appendix 7-A, sections 3.4, 3.5, 3.8, 4.2; Appendix 7-C, section 2.8
Context and Rationale (Original IR)	<p><b>Context:</b> According to the Proponent's conceptual hydrogeological model (EIS, sec 7.3.3, Figure 7.3-7, Table 7.3-2; Appendix 7-A, sec. 3.4, Table 3-4), the horizontal hydraulic conductivity of the Intermediate Sandstone (Iss) aquitard is <math>8.4 \text{ E-}09 \text{ m/s}</math> based on field measurements. The Proponent further assumes a 10:1 anisotropy ratio for the unit (Appendix 7-A, sec. 3.5.1) such that its estimated vertical conductivity is <math>8.4 \text{ E-}10 \text{ m/s}</math>. Based on this information, structural geology and groundwater quality data, the Proponent concludes that the connectivity between the Upper sandstone aquifer and the Intermediate Sandstone aquifer (sic) is limited (EIS sec. 7.3.3.3; Appendix 7-A, sec. 4.4). While acknowledging the paucity of conductivity data and the Proponent's attempt to mitigate this by leveraging collateral information on fracture frequency and clay content (Appendix 7-A, sec. 3.3.1), NRCan considers that the hydraulic conductivity assigned to the Iss aquitard is unrealistically low and inconsistent with the following lines of evidence: a) The conductivity value for the Iss is based on the geometric mean of 18 field measurements, 12 of which are from the same borehole (WR-695) located in the Gryphon zone, beyond the domain of the numerical model (Appendix 7-A, Appendix C, Table C-1). If the conductivity data were weighted equally, with one value per borehole, the geometric mean would be approximately <math>1.5 \text{ E-}07 \text{ m/s}</math>, or two orders of magnitude higher; b) The Proponent notes that vertical fracture or fault zones that hydraulically connect Upper and Lower aquifer systems are present throughout the Athabasca Basin including in the Phoenix area (EIS, sec. 7.3.3.2.2; Appendix 7-A, sec.3.8.1); c) The Proponent notes that groundwater chemistry data (major ions) corroborate the presence of structurally controlled vertical hydraulic connections between the Upper and Lower aquifer systems (EIS, sec. 7.3.3.2.2, sec. 7.3.3.3; Appendix 7-A, 4.3.3); d) Groundwater chemistry data (Appendix 7-A, sec. 4.2, Table 4-1) also indicate the presence of detectable levels of "bomb" tritium (indicating recharge waters &lt; 50 years old) in the Lower Sandstone Aquifer (GWR-025, GWR-008, GWR-033) and in the Iss (GWR-009, GWR-034), outside the area of U mineralization. This is also evidence of vertical hydraulic connection through the Iss. In summary, whereas the Proponent conceptualizes the Iss as a very low-permeability unit with localized vertical hydraulic connection (WS Shear), NRCan interprets the Iss as a "leaky" aquitard with pervasive fracture-controlled and much higher vertical hydraulic conductivity.</p>

	<b>Rationale:</b> The significance of NRCan's alternative interpretation of the Iss hydrostratigraphic unit is that deep groundwaters, including mining-impacted waters, may represent a greater proportion of baseflow discharge to Whitefish Lake than the 1% currently estimated in the Proponent's groundwater flow model (EIS, sec. 7.4.2.1, p.7-51; Appendix 7-C, sec. 2.6.3).
Information Requirement (Original IR)	In the "Parameter Uncertainty Assessment" for the numerical groundwater flow model (Appendix 7-C, sec. 2.8), NRCan requests that the Proponent develop a calibrated numerical model with an alternate conceptualization of the Intermediate sandstone as a "leaky" aquitard with a horizontal hydraulic conductivity on the order of 1 E-07 m/s and a much lower anisotropy ratio. This should involve modifying the model lateral boundary conditions to allow for groundwater inflow/outflow across the entire thickness of the Athabasca Sandstone Group rather than just the Lower Sandstone aquifer.
Rational for Status (unaccepted IR)	<p>This response has not been accepted.</p> <p>In response to IR-55, the Proponent states "The viewpoint from the third party assessment team does not align with the conceptual model proposed by the reviewer; however, an alternative calibrated groundwater flow model with a hydraulic conductivity of 1.0E-7 for the Intermediate Sandstone unit has been developed."</p> <p>If the alternative model requested in IR-55 has been developed by the Proponent, NRCan requests that full details of this model be provided in an attachment.</p>

### **Denison's Response:**

#### **1.0 Introduction**

At request of the third-party reviewers, an alternative calibrated groundwater flow model was developed with a target hydraulic conductivity of  $1 \times 10^{-7}$  m/s within the competent portions of the Intermediate Sandstone Aquitard (ISA). This value was higher than the base case model value of  $1 \times 10^{-8}$  m/s, presented in Appendix 7-C of the revised Draft EIS.

The numerical groundwater flow model presented in Appendix 7-C was developed using the FEFLOW modelling software, and for this exercise, PEST was applied to find an alternative set of hydrogeologic parameters that would satisfy the calibration criteria (i.e., calibration constrained) with this higher hydraulic conductivity within the intermediate sandstone aquitard. The model structure (i.e., domain, mesh, layering, boundary conditions and hydrogeologic zonation) was left unchanged in this re-calibration; only the hydraulic conductivity values were changed. Vertical hydraulic conductivity values were tied to horizontal hydraulic conductivity values, resulting in consistent anisotropy ratios as those within the base case model.

The calibrated hydraulic conductivity values applied in the model, under both the base case and the alternative conceptualization, are presented in Table IR-55-1 alongside the range of field-based hydraulic conductivity values.

The hydraulic conductivity values simulated within the alternative calibrated scenario are considered to be on the high end of potential values for zones along the flow path toward Whitefish Lake, and thus provide a conservative estimate of potential hydrogeologic conditions. However, the model calibration was able to be maintained by combining these higher hydraulic conductivity values with offsetting lower hydraulic conductivity values in other areas.

**Table IR-55-1: Calibrated Hydraulic Conductivity**

Hydrostratigraphic Unit	Field Based Range of Hydraulic Conductivity (m/s)	Base Case Calibrated Horizontal Hydraulic Conductivity Value (m/s)	Alternative Calibrated Horizontal Hydraulic Conductivity Value (m/s)
Overburden Aquifer/Aquitard	$3 \times 10^{-6}$ to $2 \times 10^{-4}$	$5 \times 10^{-7}$ (till) to $8 \times 10^{-5}$ (sand)	$8.2 \times 10^{-8}$ (till) to $1.6 \times 10^{-5}$ (sand)
Upper Sandstone Aquifer	$4 \times 10^{-7}$ to $1 \times 10^{-4}$ (Geomean: $3.7 \times 10^{-6}$ )	$5 \times 10^{-6}$ (competent rock) to $5 \times 10^{-5}$ (desilicified rock)	$1 \times 10^{-5}$ (competent rock) to $1.6 \times 10^{-5}$ (desilicified rock)
Intermediate Sandstone Aquitard	$1 \times 10^{-10}$ to $3.8 \times 10^{-6}$ (Geomean: $8.4 \times 10^{-9}$ )	$1 \times 10^{-8}$ (competent rock) to $5 \times 10^{-6}$ (desilicified rock)	$1.0 \times 10^{-7}$ (competent rock) to $1.4 \times 10^{-4}$ (desilicified rock)
Lower Sandstone Aquifer	$7.8 \times 10^{-8}$ to $3 \times 10^{-5}$ (Geomean: $2.2 \times 10^{-6}$ )	$2 \times 10^{-7}$ to $1 \times 10^{-5}$	$8.5 \times 10^{-9}$ to $4.1 \times 10^{-5}$
Desilicified Zone Aquifer	$1 \times 10^{-6}$ to $2 \times 10^{-5}$ (Geomean: $4.8 \times 10^{-6}$ )	$5 \times 10^{-6}$	$1.4 \times 10^{-4}$
Ore Zone	$7.4 \times 10^{-10}$ to $2.7 \times 10^{-6}$ (5-spot Pumping Test Geomean: $1.0 \times 10^{-7}$ ) (Petrotek, January 2022)	$7 \times 10^{-10}$ to $2 \times 10^{-5}$	$6.2 \times 10^{-7}$
Lower Barrier Zone (underlying Ore Zone)		$1 \times 10^{-9}$	$5.3 \times 10^{-9}$
Basement Aquitards	$1 \times 10^{-11}$ to $1 \times 10^{-5}$ (Geomean : $4.8 \times 10^{-9}$ )	$1 \times 10^{-9}$ to $5 \times 10^{-9}$	$1.6 \times 10^{-9}$ to $4.9 \times 10^{-7}$

Key differences in the hydraulic conductivity values between the base case and alternative calibrated models include:

- 1) The Intermediate Sandstone Aquitard unit is simulated to have a higher hydraulic conductivity value of  $1 \times 10^{-7}$  m/s in the alternative model. It is noted that only 2 of 16 packer tests conducted within this unit produced values above  $1 \times 10^{-7}$  m/s, with the highest potential hydraulic conductivity values recorded near the MFb/MFc interface. As such, this alternative calibrated hydraulic conductivity value is considered conservatively high.
- 2) The Desilicified Zone Aquifer hydraulic conductivity was also simulated to be higher than the base case calibration, and higher than the range of measured hydraulic conductivities. The value of  $1.4 \times 10^{-4}$  m/s is almost 1 order of magnitude higher than the highest packer test value ( $2 \times 10^{-5}$  m/s), and 2 orders of magnitude higher than the most reliable estimates, which were obtained through pumping tests ( $2.7 \times 10^{-6}$  m/s). It is noted that the hydraulic conductivity of both the Desilicified Zone Aquifer and Intermediate Sandstone Aquitard units were increased to maintain calibrated conditions (i.e., the relative difference in hydraulic conductivities is important, which maintains the aquitard / aquifer relation between the two units).

- 3) The high hydraulic conductivity portions of the Lower Sandstone Aquifer were also increased to maintain a preferential flow path within this deeper unit.
- 4) The hydraulic conductivity values of materials surrounding the ore zone (i.e., the Upper and Lower Barrier zones, as well as the underlying paleo-weathered bedrock) were also increased in this simulation.
- 5) To compensate for the increased hydraulic conductivity values of the deeper units along the flow path between the Ore Zone and Whitefish Lake, the hydraulic conductivity values representing shallower units (i.e., the altered portion of the Upper Sandstone Aquifer and the Overburden sand Aquifer) were lowered by a factor of approximately 5. This adjustment was necessary to maintain calibration to observed water levels.

In summary, the hydraulic conductivity of the deeper units along the flow path between the Ore Zone and Whitefish Lake experienced an increase in hydraulic conductivity to maintain the relative ratio of conductivity values between them and the overlying Intermediate Sandstone Aquitard unit. In contrast, the shallow materials along this flow path experienced a lower hydraulic conductivity to maintain a calibrated condition.

## 2.0 Groundwater Model Calibration

### 2.1 Statistical Measures of Calibration to Water Levels

Calibration statistics were calculated as a measure of the statistical goodness of fit between the model-simulated and observed water level elevations for both the base case and alternative calibrated models (Table IR-55-2).

**Table IR-55-2: Water Level Calibration Statistics**

Calibration Statistic	Base Case Calibration	Alternative Calibration
Number of Calibration Targets	191	191
Mean Error (m)	0.23	0.33
Mean Absolute Error (m)	0.61	0.68
Root Mean Squared Error (RMS)	0.81	0.90
Normalized RMS (%)	4.1%	4.5%
Range of Observed Water Levels (m)	20.0	20.0
Baseflow: Observed: 29.3 to 50.6 L/s	40.6	44.5

As is evident from Table IR-55-2, the model calibration under the alternative calibrated conditions with higher hydraulic conductivity values representing the Intermediate Sandstone Aquitard, and Desilicified Zone is not as good as the base case calibration, and as such the model predictions should be viewed as less likely to occur than the base case model predictions. However, the alternative calibrated conditions are within the range of plausible values, given the available calibration data.

## **2.2 3D Groundwater Flow Patterns**

Groundwater elevation contours remained very similar between the calibrated models, as the calibration data constrains the simulated conditions. Under both calibrated conditions, groundwater from the vicinity of the Ore Zone is simulated to flow upward through the Desilicified Zone and discharge to Whitefish Lake.

The advective travel time to Whitefish Lake under the alternative calibration is approximately 250 years, which is similar to the predictions obtained with the base case model.

The alternative calibrated groundwater flow model, results in higher volumes of groundwater flow converging upon Whitefish Lake, which lead to greater dilution potential for flow from depth through the ore zone/mining area.

## **3.0 Summary of Alternative Calibrated Model with Higher Conductivity within the Intermediate Sandstone Aquitard**

An alternative, calibrated groundwater flow model was developed with a hydraulic conductivity value representing the Intermediate Sandstone Aquitard of  $1 \times 10^{-7}$  m/s. While this hydraulic conductivity within the Intermediate Sandstone Aquitard is higher than expected given the geochemistry data and normative clay content observed in monitoring wells and mineralogical analysis of core logs, it is within the range of hydraulic conductivity values reported from packer tests completed within this unit. The alternative calibrated model was developed using PEST, wherein the hydraulic conductivity within other parameter zones were adjusted so that the alternative model was also consistent with the groundwater level and baseflow discharge field observations (i.e., calibration constrained).

The alternative model contains higher hydraulic conductivity values within the deeper portions of the groundwater flow system, including the Intermediate Sandstone Aquitard, the Lower Sandstone Aquifer and the Desilicified Zone. To compensate and maintain calibrated conditions, hydraulic conductivity values within the Upper Sandstone Aquifer and overlying sand (i.e., overburden) were reduced. The alternative model does not fit the field observations as well as the base case calibrated model presented within the EIS, however it is within the acceptable range for calibration metrics.

The resulting hydraulic conductivity distribution produces similar groundwater flow patterns, although with higher groundwater flow rates through the Lower and Intermediate Sandstone units, which are expected to produce greater dilution of COPCs along the flow paths toward Whitefish Lake. Advective groundwater transport timing to Whitefish Lake from the Ore Zone remained relatively consistent with the base case model.

In general, the alternative calibrated model does not fit the observation data as well as the simulations presented within the EIS. As such, it is considered a less-conservative modelled scenario than those already presented within the EIS. The alternative calibrated groundwater flow model results in higher volumes of groundwater flow converging upon Whitefish Lake, which lead to greater dilution potential for flow from depth through the ore zone/mining area.

Analysis of transport of COPCs under this alternative calibrated scenario are presented as part of the response to IR-89.

Context and Rationale (Original IR)	<p><b>Context:</b> The Proponent states that the range of hydraulic conductivities considered in sensitivity analysis was limited to values that fit within a calibration constrained uncertainty analysis of the model.</p> <p>Considering that the Desilicified Zone is of particular interest because it is the main pathway for the COPC to reach Whitefish lake, and that hydraulic conductivities are not entirely understood, ECCC recommends that a larger range of hydraulic conductivities be simulated to understand potential effects on the aquatic environment.</p> <p>The Proponent clarified the details of the calibration-constrained uncertainty analysis that was used for parameter bounding within the model, with hydraulic conductivity sensitivity bounds determined based on model calibration values that were supported by the available physical data.</p> <p><b>Rationale:</b> ECCC agrees that calibration constrained uncertainty analysis using hydraulic head field data is useful to determine probable upper limits of K values. However, there is always some degree of uncertainty in groundwater data and models. Sources of such uncertainty may include errors, lack of complete and representative field data to determine key parameters, or any number of heterogeneities associated with groundwater systems over large scales. Such uncertainties will always exist and can be accounted for by conducting a sensitivity analysis that accounts for the lack of physical data in the Desilicified Zone by running modelling scenarios using parameters that are outside of the calibration constrained values.</p>
Information Requirement (Original IR)	Expand the sensitivity analysis of hydraulic conductivity outside of calibration constrained parameters to account for the lack of physical data in the Desilicified Zone

## **Denison's Response:**

### **1.0 Introduction**

Simulations of conditions that extend beyond the range of conditions supported by the monitoring data (i.e., calibration-constrained conditions) is inappropriate for an EIS as it suggests that unrepresentative, potentially misleading scenarios should be tested, documented, and presented as potential outcomes. In the SME's view this would confuse the groundwater transport and associated risk discussions.

While we do not support development of un-calibrated scenarios for inclusion within the EIS, additional scenarios that did not violate field observation data were evaluated as part of this response. These scenarios further demonstrate the robust nature of the hydrogeologic setting, which has been shown to have a high assimilative capacity.

Additional groundwater flow and geochemical reactive transport modelling scenarios were performed in response to:

1. IR-55, wherein the hydraulic conductivity of the Intermediate Sandstone Aquitard was increased to a maximum value of  $1.0\text{E-}7$  m/s, and other parameter values, including the hydraulic conductivity of the Desilicified Zone, were increased to maintain a calibrated condition.
2. IR-70, wherein a higher hydraulic conductivity within the Ore Zone post-decommissioning was tested. This is an uncertain parameter which is unconstrained by calibration data.
3. IR-71, wherein uncertainty in future groundwater recharge rates were evaluated by varying rates by +/- 20%. Future groundwater recharge is an uncertain parameter which is unconstrained by calibration data.
4. IRs 78 & 88, wherein the effective porosity of the Paleoweathered zone was reduced by an order of magnitude to allow the initial source mass to migrate toward receptors 10-times faster. Effective porosity of the Paleoweathered zone is an uncertain parameter which is unconstrained by calibration data.
5. IR-96, wherein the transverse dispersivity was reduced to 1m to be consistent with ratios of longitudinal-to-transverse dispersivity published in the literature (e.g., Gelhar et al.; 1992) based on anisotropic settings. Transverse dispersivity is an uncertain parameter which is unconstrained by calibration data.

### **2.0 Post-Decommissioning Scenarios: Simulation Approach**

Post-decommissioning reactive transport was evaluated using the same sub-domain model as was used for all other scenarios presented within the EIS. The sub-domain model area and mesh were unchanged from previous simulations.

Where applicable (i.e., for IR-55), groundwater flow boundary condition values were updated to reflect the revised groundwater flow solution, and the hydrogeologic property values were updated to match those within the alternatively calibrated groundwater flow model. For all other simulations, only individual parameter values (e.g., hydraulic conductivity, recharge, porosity or dispersivity) were altered.

Transport boundary conditions and parameters were left unchanged from the Base Case condition. The 3D geochemical reactive transport simulation was completed using FEFLOW coupled with PiChem (i.e.,

the same approach followed for earlier simulations). The PHREEQC database, boundary and initial conditions, and simulation approach were the same as described within the EIS for the Base Case scenario. The full suite of 31 constituents was applied for selected scenarios, however as those simulations can take 3 to 4 weeks to complete, not all scenarios were able to be run with the full suite of constituents.

### **1. IR-55 Scenario: Higher Hydraulic Conductivity - Intermediate Sandstone Aquitard**

The IR-55 scenario documents an alternative calibrated groundwater flow model which was developed with a hydraulic conductivity of  $1.0\text{E-}07$  m/s within the Intermediate Sandstone Aquitard. This scenario also contained higher hydraulic conductivity values within the Desilicified Zone ( $1.4\text{E-}04$  m/s) and Lower Sandstone Aquifer ( $4.1\text{E-}05$  m/s); as such, the deeper units along the flow path between the Ore Zone and Whitefish Lake were all simulated as having increased hydraulic conductivity values. To maintain calibration, shallow materials along the flow path between the Ore Zone and Whitefish Lake were simulated to have a lower hydraulic conductivity than the Base Case (e.g., Overburden and Upper Sandstone Aquifer). For a full list of parameter values see the IR-55 groundwater flow response.

In general, the alternative calibrated model does not fit the observation data as well as the Base Case simulation presented within the EIS; however, the calibration statistics are acceptable. The alternative calibrated groundwater flow model results in higher volumes of groundwater flow converging upon Whitefish Lake, which lead to greater dilution potential for flow from depth, through the Ore Zone/mining area. As such, it is considered a less-conservative modelled scenario than those already presented within the EIS.

### **2. IR-70 Scenario: Higher Hydraulic Conductivity – Ore Zone**

The hydraulic conductivity of the material remaining post mining within the Ore Zone, and the surrounding clay-rich or sulphide cemented units (i.e., natural barriers), is uncertain. Review comments have suggested that the impact of a higher value for hydraulic conductivity within the Ore Zone needs to be evaluated. While the hydraulic conductivity of the Ore Zone is not considered critical to predictions as it is only a small portion of the source area (i.e., 6% of the assumed Post-Decommissioning source mass), an additional scenario was performed to reflect the uncertainty in the post-mining hydraulic conductivity within the Ore Zone and the surrounding barrier zones; for this scenario the Ore Zone and natural barriers were treated as one uniform zone. As this is a future condition after the uranium ore and associated minerals have been removed, this parameter cannot be calibrated with current data. It is expected that the hydraulic conductivity of the Ore Zone and barriers will be enhanced due to mining, and thus a conservatively high hydraulic conductivity value of  $5.0\text{E-}05$  m/s was assigned for this scenario. This value reflects the understanding that the voids created through mining will be infilled with the overlying desilicified sandstone (i.e., the altered sandstone within the Lower Sandstone Aquifer), and may have a higher hydraulic conductivity than currently within the Lower Sandstone Aquifer (i.e.,  $5.0\text{E-}06$  m/s).

### **3. a), b) IR-71 Scenario: Lower / Higher Groundwater Recharge**

Recognizing that future climate conditions are uncertain, and that the predicted timespan of migration of chemical constituents from within the mining area to Whitefish Lake requires centuries to millennia, the future climate is uncertain. A reduction in groundwater recharge is considered most likely due to enhanced evapotranspiration and surface water runoff; such a reduction would reduce groundwater flow rates which is considered to be less conservative than scenarios presented within the EIS. While current groundwater recharge can be calibrated based on field observations (e.g., stream baseflow, water level fluctuations, etc.), groundwater recharge in future centuries cannot be calibrated.

Review of future climate predictions presented by Environment Canada (climatedata.ca – Key Lake) indicates precipitation will increase by 11 to 15%, and temperature will increase by 2.5 to 4.6°C. The future change in groundwater recharge is not specified but based on the range of variability that others (e.g., Erler et. al., 2019) have found for the foreseeable future (i.e., end of century), a range of +/- 20% was selected for future recharge simulations.

### **4. IR-78 & 88 Scenario: Lower Effective Porosity within the Paleoweathered Zone**

Effective porosity within the units where constituents of potential concern (COPCs) will remain post-mining will affect the persistence of COPCs within the source area, and the residence time within deeper units. Simulations within the EIS illustrate that the most persistent portion of the source area is within the Paleoweathered bedrock, and so the uncertainty of the effective porosity within this unit is considered to be most relevant. As noted in Appendix 7-C of the revised Draft EIS (Table 4-2), the effective porosity within the Paleoweathered zone was enhanced to account for potential matrix diffusion effects. The scenario herein presents the change in predicted conditions if the effective porosity of the Paleoweathered zone is reduced by an order of magnitude, as would be consistent with lesser matrix diffusion effects. This value is not constrained by model calibration.

### **5. IR-96 Scenario: Lower Transverse Dispersivity**

Dispersivity values incorporated within geochemical reactive transport calculations impact the degree of mass spreading as hydrogeologic heterogeneities are experienced. A wealth of literature is available to document that longer plumes experience greater dispersion as they flow through larger volumes of heterogeneous subsurface materials. While reviewers agree with the magnitude of dispersivity values applied within the EIS scenarios, the ratio of dispersivity along the flow paths (i.e., longitudinal) to perpendicular from the flow paths (i.e., transverse) was questioned. In settings with high degrees of anisotropy created by depositional variations (e.g., horizontally stratified sediments such as fluvial sands with silt interbeds), the ratio between longitudinal and transverse dispersivity has been shown to be 100:1 (Gelhar et al.; 1992), particularly for the transverse dispersion component across lower conductivity features such as silt interbeds within sand aquifers (i.e., vertical transverse dispersion in a horizontally dominated flow field). For the Denison Mines setting, where the hydrogeologic material of interest is within hydrothermally altered (i.e., desilicified) sandstone, transverse dispersion is expected to be relatively high and isotropic to be consistent with the isotropic hydraulic conductivity of desilicified sediments. Further, as flow is not horizontally dominated (e.g., vertically upward flow through the Desilicified Zone) differentiating transverse components of dispersivity is not appropriate for this setting.

Since this parameter cannot practically be field verified, nor is it constrained through groundwater flow model calibration, an additional scenario with a lower transverse dispersion rate, such that a 10:1 ratio of longitudinal to transverse dispersion was evaluated.

### **3.0 Reactive Transport Predictions at Whitefish Lake**

Table IR-89-R1-1 presents the transport results simulated for the above scenarios; the Base Case conditions are also provided for comparison. In general, the peak concentrations reaching Whitefish Lake were similar to the Base Case simulation and are within the range of simulation results presented within the EIS. As such these simulation results do not further expand the range of potential outcomes already presented. Further, the simulations indicate that groundwater quality screening criteria (GQSC) are only exceeded for dissolved manganese and iron, as was presented within the EIS.

#### **1. IR-55 Scenario: Higher Hydraulic Conductivity - Intermediate Sandstone Aquitard**

For the IR-55 scenario, which had a hydraulic conductivity of  $1.0\text{E-}07$  m/s within the Intermediate Sandstone Aquitard, concentrations were simulated to be lower (i.e., less conservative) than the Base Case scenario. This is expected to be due to enhanced mixing with fresh water as a result of higher volumes of groundwater flow through those zones with higher hydraulic conductivity values. Under the IR-55 alternative calibrated case, the hydraulic gradient remained relatively unchanged to be consistent with the observed water levels, and thus the groundwater flow rates converging on Whitefish Lake were increased (see simulated baseflow: IR-55), resulting in a decreased contribution of flow from the deep aquifers relative to the total volumetric groundwater flow into Whitefish lake. This results in an overall reduction in the peak concentrations of COPCs in groundwater beneath Whitefish Lake.

#### **2. IR-70 Scenario: Higher Hydraulic Conductivity – Ore Zone**

Simulating a higher hydraulic conductivity for the Ore Zone post mining produced similar peak concentrations reaching Whitefish Lake as the Base Case scenario. As an increase of the hydraulic conductivity by more than one order of magnitude did not make an appreciable difference in the simulated peak concentrations reaching Whitefish Lake, we re-affirm that the hydraulic conductivity of the Ore Zone is not a controlling parameter for mass discharge reaching Whitefish Lake. This is consistent with the mass within the Ore Zone being a relatively small percentage (e.g., 6% uranium by mass) of the total dissolved-phase mass in the mining area Post-Decommissioning, as conceptualized in the model.

#### **3. a), b) IR-71 Scenario: Lower / Higher Groundwater Recharge**

The scenarios where future groundwater recharge was varied by +/- 20% due to future climate change did not appreciably change peak concentrations reaching Whitefish Lake. The findings of these simulations also support the IR-71 response wherein climate change was not simulated because it was expected to produce lower peak COPC concentrations at Whitefish Lake than the Base Case. The simulation with lower groundwater recharge is interpreted to produce a lower hydraulic gradient, and thus a lower rate of groundwater flow from the mining area, than the Base Case. Conversely the higher groundwater recharge case provides more a greater volume of water moving through the sub-surface, resulting in a smaller relative contribution from the mining area. Both cases result in similar, but lower peak concentrations reaching Whitefish Lake.

#### 4. **IR-78 & 88 Scenario: Lower Effective Porosity within the Paleoweathered Zone**

Reduction of the effective porosity within the Paleoweathered bedrock was shown to have the largest impact on simulated peak COPC concentrations reaching Whitefish Lake. Slightly higher peak concentrations than the Base Case were simulated for a suite of COPCs (i.e., As, Cd, Co, P, Ra, Se, Sr, U, Zn). This simulation reflects a reduced ability for matrix diffusion to contain mass within the Paleoweathered zone and slowly release it over time. With the exception of dissolved iron (Fe) and manganese (Mn) concentrations, none of the other (relatively) elevated COPC concentrations reached levels above GQSC within the simulated timeframe. Based on simulated trends, showing decreasing concentrations at depth, additional COPC concentrations are not expected to exceed GQSC even further into the future.

#### 5. **IR-96 Scenario: Lower Transverse Dispersivity**

Reduction of the transverse dispersivity to maintain a ratio of 10:1 for the longitudinal to transverse dispersivity values resulted in higher COPC concentrations reaching Whitefish Lake than for the Base Case. For this scenario, the longitudinal dispersivity remained at the Base Case level (i.e., 10 m), while the transverse dispersivity value was reduced to 1m (5m in the Base Case). As in the other simulated cases, with the exception of dissolved iron (Fe) and manganese (Mn) concentrations, none of the other COPC concentrations reached levels above GQSC within the simulated timeframe.

**Table IR-89-R1-1: Peak Groundwater Concentrations Reaching Whitefish Lake: Alternative Scenarios Consistent with Observed Conditions (all concentrations in mg/L)**

COPC	Groundwater Quality Screening Criteria	EIS Base Case	1. IR-55 Alternative Calibration (K <sub>ISA</sub> = 1.0E-7 m/s; K <sub>DSZ</sub> = 4.0E-5 m/s)	2. ## Summary of Additional Simulation Results

Additional long-term predictive simulations of COPC transport were undertaken to evaluate the areas of uncertainty highlighted within the second round IRs. Scenarios tested were limited to those that were consistent with, or did not contradict, available observations. The areas of uncertainty included:

- 1) Hydraulic conductivity of the Intermediate Sandstone Aquitard ( $1.0\text{E-}07$  m/s), Desilicified Zone ( $1.4\text{E-}04$  m/s), and Lower Sandstone Aquifer ( $4.1\text{E-}05$  m/s). The alternative calibrated scenario presented contained higher hydraulic conductivities than the Base Case model for each of these hydrogeologic units with increases of 10, 28, and 4, respectively.
- 2) Hydraulic conductivity of the Ore Zone post-decommissioning was increased to  $5.0\text{E-}05$  m/s, which is a factor of 10 higher than the overlying Lower Sandstone Aquifer. It is considered to reflect a very high value that could result due to the dissolution mining process.
- 3) Groundwater recharge was varied by +/- 20% to evaluate potential future climate change impacts on groundwater flow and subsequent COPC transport.
- 4) The effective porosity of the Paleoweathered zone was lowered by a factor of 10 to evaluate a case where the mass was less persistent within this unit, which is the deepest portion of the source zone.
- 5) The transverse dispersivity value was lowered by a factor of 5 to achieve the requested 10:1 ratio between longitudinal and transverse dispersivity values.

All additional scenarios produced similar predicted peak COPC concentrations reaching Whitefish Lake. All scenarios produced concentrations of primary COPCs at Whitefish Lake that are below the groundwater quality screening criteria established, with the exception of iron and manganese due to naturally high background levels, as reported within the EIS.

The key understanding gained, or further supported, through these simulations is that the natural groundwater system has a high assimilative capacity such that reasonable changes to parameters do not produce concentrations of COPCs at Whitefish Lake that exceed the groundwater quality screening criteria (with the exceptions of dissolved manganese and iron, which naturally occur at elevated concentrations). As the peak concentrations reaching Whitefish Lake do not exceed groundwater quality screening criteria within these additional scenarios, no additional or enhanced risk to the natural environment is expected.

Section # in EIS	8.1.3.1 Appendix 8-C, including Appendix II, Table 1 (p. 2)
Comment	<p>In response to IR-102 issued in first round of IRs: This response has not been accepted for the following reasons:</p> <p>1. Given the limitation of data availability extension of flow records based on the nearest active WSC hydrometric station (Wheeler River (06DA005)) is acceptable although other methods are not shown to be explored by the proponent including rainfall-runoff modelling techniques (such model can be calibrated at 06DA005 thus computed flow at subbasins or sub watershed can be estimated with good degree of confidence), drainage area ratio method, etc. CNSC staff recommends proponent to consider aforementioned methods or similar or provide justification why other methods were not considered.</p> <p>2. In Attachment IR-102 Figure 1 to 7 show the plots of measured versus the estimated daily flows using the relationship developed for extension of daily flows at SA-1, SA-2, SA-3, SA- 4, SA-5, SA-6, SB-3, LA-1 and LA-5. CNSC staff however finds it difficult to determine the predictive accuracy of the relationships based on visual comparisons. Therefore, CNSC staff requests that the proponent provide quantitative measures of prediction accuracy, for example in the form of Root Mean Square Error, correlation coefficient, etc., for the Equations presented in Table 1 of Attachment IR-102.</p> <p>In addition, CNSC staff requests that the proponent provide clarification on whether the current relationships are only limited to baseline characterization or will also be considered for estimation of design flows at SA-4 and SA-5 for culvert/crossing design for the access road.</p> <p>3. Response to third part of the IR to be re-assessed when proponent addresses the above two comments ([1] and [2]).</p>

**Denison Response:**

1. Though other methods exist for extension of flow rates from 06DA005 to the RSA, the Proponent believes it sufficient to rely on the transfer method used in the water quantity (hydrology) component of the EIS. The transfer method is an advanced form of unit area transfer which incorporates additional algorithms to adjust to streamflow response. In some cases, unit area runoff without additional algorithms was used to transfer the record specifically for SA-5, SB-3, LA-1 and LA-5. The transfer method was used for all other nodes in an effort to be most accurate with respect to representing localized flows when using the 06DA005 station as the foundational dataset for extrapolation.

The transfer method employed in the technical assessment (Appendix 8-C) and summarized in the EIS relies on measured data from the LSA and is compared to other measured data within the same watershed. A rainfall-runoff model would rely upon transfer of climate data to site from the closest meteorological station (Key Lake Mine) or interpolated grid data neither of which can be confirmed to accurately reflect site conditions. The transfer method used is the most site specific possible and therefore in our view provides the best level of accuracy and use of empirical data for this time period.

2. To further confirm the viability of the chosen extension method, the Root Mean Square Error (RMSE) between the transfer method and the unit area runoff method was estimated for comparison. Baseline data reported by Ecometrix Incorporated (2019) present hydrometric monitoring data at several of the stations at the Project. These data represent the observed data set against which the synthesized data are checked. The baseline data in some cases are hydrographs from installed sensors and in other cases are point measurements of discharge. The observed and synthesized hydrographs were checked between coincident dates of available data. Two synthesized hydrographs are compared for RMSE, the first hydrographs are those developed using the transfer discussed in the EIS, technical support memo (Appendix 8-C) and previous response to this IR. The second hydrograph is developed using unit area runoff relationships.

As mentioned above, four stations were developed using the unit area runoff method, therefore nullifying the utility of a method comparison for these locations. The remaining five stations include SA-1, SA-2, SA-3, SA-4 and SA-6. RMSE is a comparison of the differences between observed and synthesized data. The squared error is estimated between coincident data points and the RMSE for a dataset is the sum of that error. A perfectly matching data set would have an RMSE of 0 and a negative RMSE is not possible. The following table presents the estimated RMSE values for the two synthesized hydrographs at the relevant stations. For all stations, the reported transfer equation yields a better RMSE than unit area runoff.

**Table 1: Hydrology Station Correlation Coefficients for RMSE Methods as Compared to Historical Data**

Station	Reported Transfer Equation RMSE	Unit Area Runoff RMSE
SA-1	0.252	0.426
SA-2	0.317	0.381
SA-3	0.080	0.345
SA-4	0.090	0.118
SA-6	0.362	0.453

As a result, it is confirmed that the use of the reported transfer equation method is fit for use as part of the hydrology assessment and for the purposes of:

- a) Baseline water quantity characterization
- b) Estimates of change in water quantity as a result of the Operation; and,
- c) Assessment of potential impacts to the environment as part of the EIS including for water quantity and all other components of Section 8 that may be influenced by changes in water quantity.

Therefore, no additional changes to the EIS with regard to this IR are required.

Section # in EIS	Section 8.1.3.4 Climate Change Influenced Extreme Events
Comment	<p>This response has not been accepted.</p> <p>In the Context and Rationale of AD-15 in the Annex 1 – Denison Response, ECCC recommends that the Proponent consult CSA PLUS 4013:19 (2019) <i>Technical guide: Development, interpretation and use of rainfall intensity- duration-frequency (IDF) information: Guideline for Canadian water resources practitioners</i> regarding the consideration of future changes in short-duration precipitation extremes. In IR-103, ECCC indicated that in order to assess the accuracy of the Intensity duration frequency (IDF) curves, ECCC required that the Proponent provide the gauged stations generating the values for the modelled data. The Proponent provided the closest gauged stations; however, the future short duration precipitation values were based on statistical relationships fitted between local scale observed extreme precipitation and modelled simulations extremes.</p> <p>Additionally, on page 15-19 of the draft EIS states that: “Denison will apply adaptive management that includes monitoring climate factors so that they can proactively mitigate or prevent adverse climate effects on the Project.” Denison did not provide details on how climate factors will be considered within their adaptive management plans.</p> <p><b>Rationale:</b> Estimates of future short duration precipitation that are based on statistical relationships fitted between local scale observed extreme precipitation and modelled simulations extremes, such as the approach used by the Proponent, are unlikely to provide reliable projections. This is because the amount of information regarding changes in local-scale observed extreme precipitation contained in short records is not sufficient to constrain a regression (model the statistical relationship) between local and larger scale simulations (Li et al., 2019; ECCC 2022). An alternative approach is to base future projections on a comprehensive assessment that integrates climate science understanding and model projections over a large region. The recent Canadian Standards Association (CSA 2019) guidance on IDF for Canadian Water Resources practitioners provides such an assessment.</p> <p>In terms of adaptive management, the Proponent should clearly outline what climate factors will be monitored to mitigate or prevent adverse climate-related effects. This should include information on when and how the climate factors would be monitored and under what circumstances particular adaptive management approaches would be applied.</p> <p>In order to assess the Proponent’s adaptive management strategies for future extreme precipitation events, ECCC requests that the Proponent consult the CSA (2019) guidance when using future IDF projections in the Project design and provide revised estimates of the potential future changes in short-duration precipitation extremes over the Project’s duration.</p> <p>1. Provide revised estimates of the potential future changes in short-duration precipitation</p>

	<p>extremes over the Project's duration as relevant to the Project design.</p> <p>2. Demonstrate how the CSA (2019) guidance will be incorporated in the Project design when developing and considering future IDF projections and estimates of the potential future changes in short-duration precipitation extremes.</p> <p><b>References</b></p> <p>CSA Group. ### **Denison Response:**

A review of the CSA Group (2019) document was undertaken and an estimate of the IDF using this guidance was undertaken. The result of this estimate for the Key Lake Mine Station 4063753 using data corresponding to the period 2014 to 2023 was 69.6 mm for the 1:100-year 24 hours storm event. This estimate is greater than the estimate provided by ECCC of 67.2 mm at Key Lake Mine for the period 2011 to 2021 by approximately 4% ([https://climate.weather.gc.ca/prods\\_servs/engineering\\_e.html](https://climate.weather.gc.ca/prods_servs/engineering_e.html); [https://collaboration.cmc.ec.gc.ca/cmc/climate/Engineer\\_Climate/IDF/](https://collaboration.cmc.ec.gc.ca/cmc/climate/Engineer_Climate/IDF/)). The calculated estimate is greater than the ECCC estimate likely owing to large rain events occurring in northern Saskatchewan in 2022.

The IDF\_CC tool Version 5.0 (<https://www.idf-cc-uwo.ca/>) was used to estimate design events at the Project. The previous results reported based on generalized extreme value (GEV) distribution (79.9 mm in current scenario and 88.6 mm in a future scenario). IDF\_CC tool Version 7.0 is the new version of the website and now, using GEV, estimates a 79.9 mm current scenario and 94.7 mm future scenario (RCP8.5 for time period 2015-2100). Within IDF\_CC tool Version 7.0, the Gumbel distribution yields 80.9 mm in current scenario and 95.8 mm for future scenario (RCP8.5 and 2015-2100). These data, as well as similar estimates for the Project and Key Lake Mine are summarized in the following table where all estimates reflect a 1:100-year 24 hour precipitation event and all future scenarios assume RCP8.5 for 2015-2100. The Key Lake Mine is approximately 35 km south-southeast of the Project area for reference.

Scenario Description	Statistical Method	Estimated Period	Location	Data Source	Data period (as indicated)	Estimate (mm)
<b>Environment Canada published IDF curves</b>	Gumbel	Current	Key Lake Mine Site	Key Lake climate station (Station 4063753)	2011-2021	67.2
<b>EIS Document</b>	IDF_CC Tool 5.0 – GEV	Current	Project	Interpolated grid data	Not reported	79.9
<b>EIS Document</b>	IDF_CC Tool 5.0 – GEV	Predicted Future	Project	Interpolated grid data	RCP8.5 2015-2100	88.6
<b>Manual Calculation</b>	Gumbel	2014-2023	Key Lake Mine Site	Key Lake climate station (Station 4063753)	2014-2023	69.6
<b>IDF_CC Tool 7.0</b>	GEV	Current	Key Lake Mine	Key Lake climate station (Station 4063753)	2011-2021	56.4
<b>IDF_CC Tool 7.0</b>	GEV	Predicted Future	Key Lake Mine	Key Lake climate station (Station 4063753)	RCP8.5 2015-2100	68.1
<b>IDF_CC Tool 7.0</b>	Gumbel	Current	Key Lake Mine	Key Lake climate station (Station 4063753)	2011-2021	67.2
<b>IDF_CC Tool 7.0</b>	Gumbel	Predicted Future	Key Lake Mine	Key Lake climate station (Station 4063753)	RCP8.5 2015-2100	73.9
<b>IDF_CC Tool 7.0</b>	GEV	Current	Project	Interpolated grid data	2011-2021	79.9
<b>IDF_CC Tool 7.0</b>	GEV	Predicted Future	Project	Interpolated grid data	RCP8.5 2015-2100	94.7
<b>IDF_CC Tool 7.0</b>	Gumbel	Current	Project	Interpolated grid data	2011-2021	80.9
<b>IDF_CC Tool 7.0</b>	Gumbel	Predicted Future	Project	Interpolated grid data	RCP8.5 2015-2100	95.8

As seen in the table, a range of 1:100-year 24 hour rainfall events can be estimated using different methods, data sources and timeframes. The predicted future estimate originally presented using IDF\_CC Tool 5.0 (Scenario 3) is lower only than those future estimates via Gumbel and GEV estimated for the same timeframe using IDF\_CC Tool 7.0. The IDF\_CC tools follows the same methodology as that used by ECCC and recommended by the above-referenced CSA document. The IDF\_CC tool also makes use of a gridded climate data set and, though Key Lake Mine is only 35 km from the Project, the projected change in rainfall values is substantial. As such, the use of the IDF\_CC tool is conservative. Further to that point, site facilities are designed in consideration of the Probable Maximum Precipitation event of 493 mm. That event is more than 5 times higher the largest predicted scenario by any of the above presented methodologies.

Despite Denison's reiteration that the PMP is adequate for the EA level design basis, Denison is committed to revisiting the estimates of the IDF as per CNSC's recommendations, as applicable, for the licensing phase of the Project.

**Attachment IR-107**

Comment From	ECCC
Category	Aquatic Environment
Page # in EIS	
Section # in EIS	Section 8.2.3.3, Existing Surface Water Quality
Comment	<p>In response to IR-107 issued in first round of IRs: This response has not been accepted for the following reasons:</p> <p>From the baseline water quality data table (Table A-1 of Appendix 8D) it remains unclear that water quality was sampled on a monthly basis in 2016, 2018, and 2019, mainly due to Table A-1 referring to specific sampling dates, instead of an mean value of 12 samples/year. It is also unclear which federal requirements Denison is referring to using in their response. Staff are supportive of continued baseline monitoring to maintain an accurate dataset of baseline conditions.</p> <p>CNSC and ECCC staff have the following expectations:</p> <ol style="list-style-type: none"><li>1. Provide the monthly monitoring data referenced in the response or indicate where it can be found within the EIS and its appendices.</li><li>2. Confirm which federal requirements were used when assessing potential impacts through EA.</li><li>3. Confirm which data quality objectives were used to establish the baseline, provide references if available</li><li>4. Incorporate the additional available baseline data collected into the analysis and conclusions of the finalized EIS and ERA to increase the robustness of the established baseline.</li></ol>

**Denison's Response:**

The water quality sampling for baseline was conducted over several years from 2011 to 2019. In years 2015 and 2017 sampling did not occur. Sampling occurred during the open water period and most consistently in May, June, August, September and October. The reviewer is correct in that sampling did not occur on a monthly basis at each of the sampling locations over all years. The table below provides a summary of the periodicity of sampling as it occurred over the described period at each station.

**Table 1: Water Quality Sampling by Year and Location**

Total	11	12	11	17	11	11	11	15	4	17	3	3	6	6	138

- 1.) The table above identifies that monthly sampling was not completed at each station on an annual basis.
- 2.) For the purposes of the EA, a statistical analysis was conducted to identify the correlation between the water quality data for LA-1, LA-5, LA-6, and McGowen Lake and the full dataset for the LSA. Datasets were highly correlated and therefore the full dataset for the LSA was used as background concentrations in the IMPACT model. This approach was taken to meet the criteria of REGDOC 2.9.1 Appendix B.2, Characterization of the Baseline Environment for Environmental

Assessment Under CEAA 2012, the “baseline information should be sufficient to support the use of an aquatic dispersion model to conduct the site-specific ERA and to support an assessment of the effects of the environment on the facility or activity”.

- 3.) Samples were collected following applicable field protocols and analysis was conducted by CALA accredited laboratories. The conceptualization of sampling in this remote location loosely followed the CCME Guidance Manual for Optimizing Water Quality Monitoring Program Design (2015). However, due to the remote nature during the baseline sampling, monthly sampling was not deemed feasible.
- 4.) There are no additional data to add to the analysis at this time for either the near-field or far-field water quality models. It is noted that some additional sampling occurred at Whitefish Lake offshore in the general, vicinity of the proposed discharge (diffuser) location in 2022 and continued in 2023. The concentration of constituents from samples collected in 2022 and 2023 were in the range of those measured previously and as a result no changes to the outcomes of the analyses presented in the Draft EIS and its supporting documents would be expected. Denison agrees that regular water quality data collection at a wider range of sampling stations should be instituted and commits to beginning such periodic sampling prior to construction to provide a more robust dataset and following the CCME Guidance Manual for Optimizing Water Quality Monitoring Program Design (2015). These data would be used to support the licensing process and contribute to the longer term data records for the site.

Number	IR-108 / IR-108-R1
Comment From	ECCC
Category	Change to an environmental component due to hazardous contaminants
Page # in EIS	
Section # in EIS	Section 8.2.3.3 Aquatic Environment
Comment	<p>In response to IR-107 issued in first round of IRs: This response has not been accepted for the following reasons:</p> <p>There are incorrect guidelines remaining in the updated tables, and the supporting information on parameter values used to derive benchmarks has not been provided. This information is required to understand potential changes to surface water quality from Project related activities and facilitate threshold confirmation. Use of the incorrect threshold could allow for effluent to be discharged at concentrations exceeding MDMER limits.</p> <p>See also follow-up IR-108-R1.</p> <ol style="list-style-type: none"><li>1.) Update Tables 8.2-2 and 8.2-3 to include footnotes with the concentrations of environmental modifying parameters such as pH, hardness and DOC used to derive guidelines for Aluminum, Cadmium, Copper, Lead, Manganese, Nickel and Zinc.</li><li>2.) Update Tables 8.2-2 and 8.2-3 to include the correct benchmark guideline value for Aluminum, Molybdenum and Nitrate. Include the concentrations of environmental modifying parameters needed for deriving guidelines. If the most stringent guideline value is not selected for use, provide a rationale for use of the chosen guideline.</li><li>3.) Update Tables 8.2-2 and 8.2-3 to include the calculated guideline value for manganese and the environmental modifying parameter concentrations used to calculate the guideline. A benchmark environmental quality guideline has not been provided for Manganese, however a chronic CWQG guideline exists that can be derived based on environmental modifying parameter concentrations.</li></ol> <p>Update Tables 8.2-2 and 8.2-3 to specify if Total Chromium or Hexavalent Chromium was measured.</p>

**Response:**

Tables 8.2-2 and 8.2-3 have been updated as requested and are provided below and updated in the EIS in their respective sections.

Table 8.2-2: Baseline Surface Water Quality in Local Study Area Lakes and Russell Lake

**Notes:**

- (1) Saskatchewan Water Quality Objectives, SEQG on-line (<https://envrbrportal.crmp.saskatchewan.ca/seqg-search/>), SEQG for the protection of aquatic life were selected, based on total concentrations, a temperature of 15°C and a pH of 7.0.
- (2) Hardness dependent WQOs are for very soft water (hardness <25 mg CaCO<sub>3</sub>/L). Site-specific hardness is 5.26 mg/L (95th percentile of LA-5 and LA-6).
- (3) Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life - Manganese, Appendix B - Canadian Water Quality Guidelines Calculator (pH = 7.5, hardness = 15 mg/L). Guideline is based on dissolved manganese. Benchmark = exp(0.878[ln(hardness)] + 4.76) where the benchmark is expressed in dissolved manganese concentration (µg/L), and hardness is measured as CaCO<sub>3</sub> equivalents in mg/L.
- (4) Total ammonia-N calculated from the total ammonia guideline for a temperature of 15°C and a pH of 7.0, Un-ionized Ammonia from Table 1 of temperature and pH Canadian Water Quality Guidelines for the Protection of Aquatic Life - Ammonia (<https://ccme.ca/en/res/ammonia-en-canadian-water-quality-guidelines-for-the-protection-of-aquatic-life.pdf>)
- (5) Based on a pH of >6.5.
- (6) Based on water hardness >0 to <17 mg/L.
- (7) Based on water hardness >0 to <82 mg/L.
- (8) Based on water hardness >0 to ≤60 mg/L equation used at hardness of 5.26. At hardness >180 mg/L, the CWQG is 7 µg/L
- (9) Guideline is based on dissolved zinc.

(17) Framework - guideline for meso-eutrophic waterbody 20-35 µg/L

(18) Based on water hardness of >0 to <5.3 mg/L

(19) Based on hardness of 5 mg/L (Short-term equation is  $(e^{(0.979123[\ln(\text{hardness})]-8.64497)}) * 1000$  (SEQG via AEP 1996b)

(20) Based on benchmark =  $\exp(0.833[\ln(\text{hardness mg}\cdot\text{L}^{-1})] + 0.240[\ln(\text{DOC mg}\cdot\text{L}^{-1})] + 0.526)$ . Site-specific background hardness is 5.26 mg/L (95th percentile of LA-5 and LA-6). Site-specific DOC is 2.2 (arithmetic mean for LA-5 and LA-6), induced hardness of 250.5 used as upper limit of extrapolation available.

(21) based on water hardness of > 250 mg/L (CaCO<sub>3</sub>)

(251 mg/L)

(22) MDMER Schedule 4 - maximum authorized montly mean concentration

(23) Bold numbers indicate exceedance of long-term criteria

SEQG – Saskatchewan Environmental Quality Guidelines – Water Quality Guidelines for Freshwater Aquatic Life.

CWQG – Canadian Council of Ministers of the Environment – Canadian Water Quality Guidelines for the Protection of Aquatic Life.

SSWQO – Saskatchewan Surface Water Quality Objectives.

DOC – Dissolved organic carbon.

TDS – Total dissolved solids.

TKN – Total Kjeldahl Nitrogen.

TOC – Total organic carbon.

TSS – Total suspended solids.

Table 8.2-3: Baseline Surface Water Quality in Local Study Area Watercourses

Comment From	ECCC
Category	Change to an environmental component due to hazardous contaminants
Page # in EIS	
Section # in EIS	Section 8.2.4.2.3 and Section 8.4.7.6, Aquatic Environment
Comment	<p>In response to <u>IR-113</u> issued in first round of IRs: This response has not been accepted for the following reasons:</p> <p>Based on the information provided it is not possible to assess the resiliency of the Project to potential adverse effects from climate change and potential impacts to surface water and sediment quality. The Proponent should review the guidance documents available on the <a href="#">Strategic Assessment of Climate Change</a> (SACC) website with regards to climate change resilience and provide a quantitative analysis of the potential impacts of predicted COPCs from mine effluent to surface water and sediment quality with climate change scenarios for the Project lifespan incorporated into modelling.</p> <p>Include modelling predictions regarding the influence of changes to air and water temperatures, precipitation, lake levels, flow rates, etc., on COPC concentrations in surface water and sediment. The Proponent should refer to the <a href="#">SACC website</a> for guidance on conducting this quantitative analysis.</p> <p>See also follow-up IR-113-R1.</p> <p><u>IR-113-R1</u> Clarify if climate change has been considered in the PMP value provided. If it has not been considered, discuss how potential increases in PMP have been and/or need to be considered in the Project design.</p> <p>Reference Kunkel, K., Karl, T. R., Easterling, D. R., Redmond, K., Young, J., Yin, X., &amp; Hennon, P. (2020). Probable maximum precipitation and climate change. Geophysical Research Letters, 1402-1408.</p>

**Denison’s Response:**

Prairie province hydrology is dominated by cold regions processes so that snowmelt is the primary hydrological event of the year for both the major rivers that derive from the Rocky Mountains and small streams and rivers that arise in Saskatchewan. Climate change impacts on water resources are therefore focused on changes to snow accumulation, snowmelt and infiltration to frozen soils. Climate change scenarios suggest generally warmer and wetter winters for Saskatchewan. Large scale hydrological models that take these scenarios into account suggest changes in the annual streamflow of the South Saskatchewan River ranging from an 8% increase to a 22% decrease, with an 8.5% decrease being an average prediction. Small scale hydrological models for prairie streams suggest a 24% increase in spring runoff by 2050 followed by a 37% decrease by 2080 as the winter snow cover becomes discontinuous. Both model results suggest that there is not a dramatic drying of the prairies to be anticipated under climate change and that in some cases streamflow will increase for certain scenarios and under moderate degrees of climate change. While prairie runoff should increase in the near term, as climate change progresses later in the 21st C there will be dramatic drops in runoff and the flow of small streams to wetlands and depressions and to small prairie rivers (Sauchyn et al 2009).

Changes in temp (warmest max temp) for the region was referenced from the Climate Atlas of Canada ([https://climateatlas.ca/data/grid/782/maxmax\\_2030\\_45/line0](https://climateatlas.ca/data/grid/782/maxmax_2030_45/line0)) for the Tomblin Lake watershed.

The primary source of climate model data presented in their maps, charts and tables is the Pacific Climate Impacts Consortium (PCIC) . The PCIC has provided downscaled projections of daily temperature and precipitation data from 24 climate models using two carbon emission scenarios.

The Climate Atlas of Canada use PCIC’s statistically downscaled data (Bias Correction with Constructed Analogues and Quantile mapping, Version 2; BCCAQv2) derived from 24 CMIP5 global climate models for two emissions scenarios (RCP4.5 and RCP8.5). The Climate Atlas of Canada call the RCP4.5 and RCP8.5 the “Low Carbon” and “High Carbon” scenarios, respectively. We use PCIC’s statistically downscaled

data (Bias Correction with Constructed Analogues and Quantile mapping, Version 2; BCCAQv2) derived from 24 CMIP5 global climate models (the complete list of models can be found at <https://climateatlas.ca/data-sources-and-methods>) (Climate Atlas of Canada, 2023)

The climate model data presented in the Atlas has been statistically downscaled and bias corrected using a method called Bias-Correction/Constructed Analogues with Quantile mapping reordering, Version 2 (BCCAQv2); the work was done by the Pacific Climate Impacts Consortium (PCIC) . [1] This method has been extensively tested by Murdock et al. (2014) and found to outperform many other statistical downscaling methodologies.

The data indicates an ensemble increase in warmest maximum temperature under the high carbon (RCP8.5) scenario of 2.32 degrees Celsius from the background average of 2.59 (1950 to 2022) to 4.91 (2023 to 2065). Increases in temperature can then influence the rates of evapotranspiration thereby reducing water availability. However, in the case of Saskatchewan, the rate of transpiration on an annual basis is not expected to overbalance the increase in precipitation for the region.

The data indicates an ensemble increase in warmest maximum temperature under the high carbon (RCP8.5) scenario of 2.32 degrees Celsius from the background average of 2.59 (1950 to 2022) to 4.91 (2023 to 2065). Increases in temperature can then influence the rates of evapotranspiration thereby reducing water availability. However, in the case of Saskatchewan, the rate of transpiration on an annual basis is not expected to overbalance the increase in precipitation for the region.

**Table 1: Warmest Maximum Temperature Under High Carbon Scenario Historical to Projected Statistics**

Statistic	Historical (1950 – 2022)			Projected (Ensemble Data 2023 – 2065)		
	Annual Average	10% Confidence Interval	90% Confidence Interval	Annual Average	10% Confidence Interval	90% Confidence Interval
Mean	2.59	1.07	4.17	4.91	3.48	7.14
SD	1.23	0.70	0.72	0.89	0.83	1.17
Min	0.00	-0.45	2.80	3.00	2.05	5.10
Max	5.30	3.00	6.15	7.00	5.25	9.40

The data indicate an ensemble increase in total precipitation under the high carbon (RCP8.5) scenario of 39.21 millimetres from the background average of 454.65 (1950 to 2022) to 493.86 (2023 to 2065). This increase is likely to increase mean annual flows in the Icelander River drainage area thereby increasing the assimilative capacity of the receiving environment of Whitefish Lake.

**Table 2: Total Annual Precipitation Under High Carbon Scenario Historical to Projected Statistics**

Statistic	Historical (1950 – 2022)			Projected (Ensemble Data 2023 – 2065)		
	Annual Average	10% Confidence Interval	90% Confidence Interval	Annual Average	10% Confidence Interval	90% Confidence Interval
Mean	454.65	366.97	558.69	493.86	392.34	603.23
SD	66.85	19.66	28.74	19.35	25.36	31.79
Min	264.60	325.20	506.00	459.00	344.35	555.20
Max	609.20	405.70	626.45	533.00	444.30	672.65

Several uncertainties apply:

- 1) The background water quality conditions of the Icelander River system in future decades may change appreciably as a result of increases in surface run-off, landscape changes and precipitation event intensity and duration. Such changes are not predictable at this time;
- 2) The long-term accuracy of predictive models for precipitation, temperature and evapotranspiration for the region is not such that an estimate of changes to the receiving environment water quality is reasonable at this time. Any estimates would have a large attributed uncertainty. Furthermore, as mine discharge is not expected to increase in volume or constituent concentrations over the mine life, any increase in flows within the Icelander River system would provide for an increase in assimilative capacity.

As a result, quantitative assessment of the potential change in surface water quality at Whitefish Lake under Climate Change is not needed at this time as:

- the design basis PMP is robust and inclusive of projected total annual precipitation under a high carbon scenario
- the level of variability that is likely in future background water quality is high due to changes in precipitation levels and intensity and therefore run-off contributions to the aquatic environment; and,
- predictive models for the future period (2050s) for the region are variable in accuracy.

Rather, the following mitigation measures, monitoring and adaptive management should be employed.

- 1) Changes in water quality in the receiver should be monitored on a consistent basis to understand changes in the background water quality prior to effluent mixing;
- 2) Effluent discharge will be monitored as per the MDMER Schedules 4 and 5;
- 3) Under scenarios of low flow condition, discharge can be limited seasonally or periodically and specific to the assimilative capacity of the receiver (flow proportioned or fixed dilution discharge);
- 4) Adaptive management and adjustment to discharge timing and volume as needed over time to meet criteria based on climate induced changes in flow.

Page # in EIS	
Section # in EIS	Section 8.2.4.2.3 and Section 8.2.4.2.4 - Tables 8.2-9, 8.2-10 and 8.2-13
Comment	<p>The response has not been accepted for IR-114.</p> <p>The Proponent has not updated all tables to include missing data for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate, and phosphorous, all of which are COPCs with monitoring requirements under the MDMER.</p> <p>The Proponent has not updated tables to include predictions of total hardness concentration in effluent and the receiving environment or acute water quality thresholds, and water quality thresholds have not been derived using baseline receiving environment concentrations.</p> <p>All water quality thresholds should be derived from receiving environment parameters to determine if any baseline receiving environment and effluent COPCs exceed water quality thresholds.</p> <p>Please:</p> <ol style="list-style-type: none"><li>1. Update all tables to include missing data for mercury, aluminum, total suspended solids, iron, thallium, manganese, nitrate and phosphorus.</li><li>2. Update tables to include predictions of total hardness concentrations (in mg/L CaCO<sub>3</sub>) in effluent and the receiving environment.</li><li>3. Update tables to include acute water quality thresholds to ensure COPCs do not have the potential to be acutely lethal at the end-of-pipe.</li><li>4. Ensure that all selected water quality thresholds are derived using baseline receiving environment concentrations and use water quality guidelines that are protective of aquatic biota.</li></ol>

**Denison’s Response:**

The requested tables have been updated to include water quality thresholds derived from receiving environment parameters (background) as well as effluent induced concentrations for completeness. Please see the tables below and updated in Section 8 of the EIS.

**Notes:**

- (1) Saskatchewan Water Quality Objectives, SEQG on-line (<https://envrbrportal.crmv.saskatchewan.ca/seqg-search/>), SEQG for the protection of aquatic life were selected, based on total concentrations, a temperature of 15°C and a pH of 7.0.
- (2) Hardness dependent WQOs are for very soft water (hardness <25 mg CaCO<sub>3</sub>/L). Site-specific hardness is 5.26 mg/L (95th percentile of LA-5 and LA-6).
- (3) Scientific Criteria Document for the Development of the Canadian Water Quality Guidelines for the Protection of Aquatic Life - Manganese, Appendix B - Canadian Water Quality Guidelines Calculator (pH = 7.5, hardness = 15 mg/L). Guideline is based on dissolved manganese. Benchmark =  $\exp(0.878[\ln(\text{hardness})] + 4.76)$  where the benchmark is expressed in dissolved manganese concentration (µg/L), and hardness is measured as CaCO<sub>3</sub> equivalents in mg/L.
- (4) Total ammonia-N calculated from the total ammonia guideline for a temperature of 15°C and a pH of 7.0, Un-ionized Ammonia from Table 1 of temperature and pH Canadian Water Quality Guidelines for the Protection of Aquatic Life - Ammonia (<https://ccme.ca/en/res/ammonia-en-canadian-water-quality-guidelines-for-the-protection-of-aquatic-life.pdf>)
- (5) Based on a pH of >6.5.
- (6) Based on water hardness >0 to <17 mg/L.
- (7) Based on water hardness >0 to <82 mg/L.
- (8) Based on water hardness >0 to ≤60 mg/L equation used at hardness of 5.26. At hardness >180 mg/L, the CWQG is 7 µg/L
- (9) Guideline is based on dissolved zinc.
- (10) Environment Canada 2017. Federal Environmental Quality Guidelines, Cobalt, May. Based on equation and site-specific baseline hardness of 15 mg/L.

Attachment IR-115\_IR-115-R1

Number	IR-115 & IR-115-R1
Comment From	ECCC
Category	Fish and fish habitat
Page # in EIS	
Section # in EIS	Section 8.2.4.2.3 Aquatic Environment Appendix 10-A (ERA), Section 3.1.1.1
Comment	<p>This response has not been accepted.</p> <p>Items 1. And 3. In the Proponent’s response adequately responded to the IR. However, the water quality thresholds in item two have not been derived using baseline receiving environment concentrations and not all COPCs which require monitoring under the MDMER have been included in the updated table. Additionally, the Proponent did not account for changes in baseline hardness concentrations in the receiving environment due to the deposition of effluent. Water hardness is an environmental modifying factor which can influence the toxicity of COPCs in the aquatic environment, therefore requiring the mentioned COPCs as well as background concentrations of total hardness in the receiving environment to accurately determine potential effects of COPCs upon the receiving aquatic environment. The Proponent should also provide rationale to support that all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.</p> <p>See also follow-up IR-115-R1.</p> <ol style="list-style-type: none"><li>1. Update Table 8.2-8 to include the following COPCs: un-ionized ammonia, aluminum, iron, manganese, thallium and total dissolved solids (TDS).</li><li>2. Update Table 8.2-8 to include background concentrations of total hardness (in mg/L CaCO<sub>3</sub>) in the receiving environment.</li><li>3. Provide rationale that all selected water quality thresholds are derived using baseline receiving environment concentrations and are at levels protective of aquatic life.</li></ol>

**Denison’s Response:**

Please see the updated Table 8.2-8 below which has also been updated in the EIS. It has been updated to include; un-ionized ammonia, aluminum, iron, manganese, thallium and total dissolved solids (TDS). The background hardness is included and screening criteria for both short-term and long-term criteria are added with notes identifying the rationale for their concentration level based on hardness, pH, temperature and/or other background or effluent induced constituent concentration.

Table 8.2-1: Summary of Background Water Quality Screening Criteria

## ATTACHMENT IR-137

Original IR Number	IR-137
Follow Up IR Number	-
Dept.	ECCC
Project effects link	Migratory birds, Wildlife and Wildlife Habitat, Vegetation and Wetlands
Reference to EIS, appendices, or supporting documentation	<p>Section 9.2.1.3, Spatial and Temporal Boundaries for Vegetation and Ecosystems, Listed Plant Species and Wetlands</p> <p>Section 9.3.1.3.1, Spatial Boundaries for Ungulates, Furbearers and Woodland Caribou</p> <p>9.4.1.3.1, Spatial Boundaries for Raptors, Migratory Breeding Birds, and Bird Species at Risk</p>
Context and Rationale (original IR)	<p>Context and Rationale: The CNSC's Generic Guidelines for the Preparation of an EIS Pursuant to the Canadian Environmental Assessment Act, 2012 states that: "The EIS will describe the spatial boundaries, including local and regional study areas, for each VC to be used to assess the potential adverse environmental effects of the Project and provide a rationale for each boundary.</p> <p>Spatial boundaries will be defined taking into account the appropriate scale and spatial extent of potential environmental effects, community knowledge and Indigenous knowledge, current or traditional land and resource use by Indigenous groups, ecological, technical, social and cultural considerations."</p> <p>The information provided in the EIS does not enable a biologically relevant assessment of the Project's effects.</p> <p>The Proponent did not provide rationale for the selection of study areas for individual vegetation, wildlife or migratory bird valued components (VC). Different VCs may have different spatial boundaries for the LSA and/or RSA. For wildlife and bird VCs, the LSA is defined as a 1.7-km buffer from the Project area, and the RSA is defined as a 6.6-km buffer around the LSA. There is no information on how the spatial boundaries were derived.</p> <p>Specific to Woodland Caribou, boreal population (hereafter referred to as boreal caribou):</p> <p>Project Footprint: In a scientific assessment of critical habitat (Environment Canada, 2011) [1] ECCC demonstrated that the application of a 500-m buffer to mapped anthropogenic features best represents the combined effects of increased predation and avoidance on caribou population trends at the national scale. Adding a 500-m buffer to the Project footprint is required to represent functional habitat loss.</p>

The draft EIS does not appear to use a buffer for their Project area. The draft EIS (Section 9.3.1.3.1) states: "Project Area: the area within which the Project and all components/activities are located (i.e., the area of maximum physical disturbance). The Project Area covers 169.6 ha and is not VC-specific, but consistent throughout the EA." (p. 9-168)

LSA: The defined LSA for boreal caribou has to consider avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance. This required information is not detailed in the draft EIS.

Adverse effects of Projects including predator and prey access to undisturbed areas, reduction in connectivity, and sensory disturbance to individual boreal caribou can vary and extend several kilometers depending on Project activities and ecological context. At minimum, the LSA should capture the above- mentioned effects.

For boreal caribou, the Project footprint should be defined as the immediate area to be cleared, plus a 500-m buffer to represent functional habitat loss. Following this guidance, the LSA should be defined as a buffer of the Project footprint with the 500-m buffer.

RSA: The Amended Recovery Strategy for Woodland Caribou (*Rangifer tarandus caribou*), Boreal Population, in Canada states:

Mitigation of adverse effects from individual projects/activities will require a coordinated approach and management of cumulative effects within and among ranges. A cumulative effects assessment is essential to position the proposed project/activity in the context of all current and future development activities. The cumulative effects assessment will:

- Assess the impact of all disturbances (anthropogenic and natural) at the range-scale;
- Monitor habitat conditions, including the amount of current disturbed and undisturbed habitat, and amount of habitat being restored;
- Account for planned disturbances; and
- Assess the distribution of disturbance in large ranges for risk of range retraction in parts of the range.

The proposed Project's cumulative effects for boreal caribou are possible at the scale of the SK1 boreal caribou range. The RSA used for boreal caribou for this Project is only 40,173.6 ha, compared to the SK1 range, which is 18,034,870 ha. As such, it is too small to capture cumulative effects to this species and does not follow the Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (*Rangifer tarandus caribou*), Boreal Population, in Canada (Environment Canada, 2011) or the Amended Recovery Strategy for Woodland Caribou (*Rangifer tarandus caribou*), Boreal Population, in Canada.

Reference:

[1] Scientific Assessment to Support the Identification of Critical Habitat for Woodland Caribou (*Rangifer tarandus caribou*), Boreal Population, in Canada (Environment Canada, 2011).

Information Requirement (original IR)	<p>Provide a biologically relevant rationale for the delineated study boundaries (LSA and RSA) for all different valued components. Include the following information:</p> <ul style="list-style-type: none"> <li>• Descriptions of how the RSA and LSA boundaries were derived for all VCs.</li> </ul> <p>Specific to boreal caribou:</p> <p>Project Footprint:</p> <ul style="list-style-type: none"> <li>• Include a 500-m buffer of area of maximum physical disturbance to represent functional habitat loss for boreal caribou</li> </ul> <p>LSA:</p> <ul style="list-style-type: none"> <li>• Include a description of how the LSA takes into account boreal caribou avoidance of disturbed areas, predator access to undisturbed areas, reduction in connectivity and sensory disturbance to individuals.</li> </ul> <p>RSA:</p> <ul style="list-style-type: none"> <li>• Include a description of how the RSA used in the draft EIS is an accurate representation of the SK1 boreal caribou range; or</li> <li>• Re-do the assessment with the RSA at the scale of the range</li> </ul> <p>See also related IRs: IR-154 and IR-156.</p>
Rationale for Status (for unaccepted original IR) OR Context and Rationale and IR (for Follow Up IR)	<p>This response has not been accepted.</p> <p>A biologically relevant explanation for the chosen RSA for caribou was not provided. It is not clear if the RSA is representative of the SK1 range for factors such as variability and biophysical features. Describe how the RSA used in the draft EIS is an accurate representation of the SK1 boreal caribou range. This clarification is necessary to ensure the RSA is representative of the entire SK1 Caribou range, including the natural variability of the landscape, and to assess any project effects that may be affected by an inaccurate RSA. It is also required to verify the Proponent's assessment of cumulative impacts to caribou.</p> <p>See also AD-56 in the Advice to Proponent table.</p>

### **Denison's Response:**

#### **Supporting, Contextual Information to Denison's Response in the IR Table**

While appropriate consideration of Project effects on the terrestrial environment is important for all projects undergoing environmental assessment, we highlight that through the selection of the ISR mining method, the Wheeler River Project has a relatively small footprint on the landscape compared to project footprints associated with other more conventional mining methods.

For the reviewer's context and consideration, Table IR-137-1 and Figure IR-137-1 below compare the Wheeler River Project's expected direct footprint (74.8 ha) and Project Area (area of maximum disturbance; 169.9 ha) to expected landscape disturbances associated with:

- a proposed underground uranium mining project in the Athabasca Basin undergoing a joint provincial (Saskatchewan)-federal EA (NexGen's Rook I Project),
- an underground mining project which recently completed the Saskatchewan EA process (Foran's McIlvenna Bay Project), and
- an open pit mining project in Ontario which recently completed the federal EA process (Generation PGM's Marathon Palladium Project).

**Table IR-137-1: Comparison of Wheeler River Project footprint and Project Area to landscape disturbance at other proposed mines**

	Denison's Wheeler River Project (proposed uranium mine in Saskatchewan)	NexGen's Rook I Project (proposed underground uranium mine in Saskatchewan)	Foran's McIlvenna Bay Project (proposed underground copper-zinc mine in Saskatchewan)	Generation PGM's Marathon Palladium Project (proposed open pit platinum group metals and copper mine in Ontario)
Direct Infrastructure Footprint	74.8 ha	228 ha	249.1 ha	1,116 ha
Project Area / Area of Maximum Disturbance	169.9 ha	981 ha	969.9 ha	4,131 ha

ha = hectares

**Figure IR-137-1: Comparison of Wheeler River Project footprint and Project Area to landscape disturbance at other proposed mines**

Attachment IR-236

Number	IR-236
Comment From	ECCC ERAD
Category	Fish and fish habitat
Page # in EIS	
Section # in EIS	Section 8.2.4.2.3 and Section 8.4.7.6, Aquatic Environment
Comment	<p>This response has not been accepted.</p> <p>The Proponent made a correlation between precipitation and the Probable Maximum Precipitation (PMP). However, annual maximum and PMP cannot be correlated as they are two separate concepts that require different statistical methods to verify.</p> <p>The Proponent provided two tables which displayed precipitation data under current, existing, and future climate scenarios for two nearby lakes. These were provided to support the Proponent’s response, however, the calculations used to achieve the table figures within the response or Attachment: IR-236 were not provided. As one value cannot be used to infer the other, reviewing the calculations is required to support the Proponent’s conclusions.</p> <p>Please see the following requests:</p> <p>1. In Table 3 of Attachment: IR-236, the historical mean value (1976 to 2005) for the Maximum 1-Day Precipitation is 24.1 mm and is indicated as measured. However, this estimate appears to be derived from ensembles of climate modeled historical precipitation. Thus, proponent to insert a footnote at Table 3 that indicate the total annual as well as maximum 1-day are estimates based on ensembles of climate modeled historical precipitation. The Proponent needs to provide the calculations that were used to reach the conclusions found within Tables 2 and 3 of Attachment: IR-236. Reviewing the calculation will allow for verification of the Proponent’s conclusions. If the currently used data sources do not allow for accurate representation of their conclusions, the Proponent should use complete regional observational data sources to support the conclusions in Tables 2 and 3.</p> <p>2. The analysis of mean maximum one day and mean annual total precipitation [1976-2005] based on weather station (Climate ID 4063755) at Key Lake is roughly 32mm and 470mm respectively. Thus, include both modeled and observed historical precipitation statistics in the EIS for context.</p> <p>Measured data should take precedence over modeled data. The Proponent is taking an ensemble of modeled data to "predict" historical data when measured data is available and can validate the models. Without strong justification, it is not appropriate to replace measured data with "predicted" modeled data.</p>

**Denison’s Response:**

The original response to IR-236 is provided here in its entirety as well as updates that are required for the second round of IRs from the FIRT. This is for the purposes of adding this IR Attachment as an Appendix to Appendix 6-C of Section 6 of the revised Draft EIS.

During the Draft EIS review by the FIRT, there were information requirements (IRs; mainly IR-235 and IR-236, and to a lesser extent IR-103 and IR-104) related to current and future climate precipitation, as well as the probable maximum precipitation event. The information in Attachment IR-236 will be added as *Appendix D Summary of Precipitation Values Presented in the EIS* to Appendix 6-C in the final EIS. The advancement of Project design and the site drainage plan are more closely linked to detailed design to support the licensing process and the precipitation information provided herein and in the revised Draft EIS to support an EA decision is adequate. This new appendix to Appendix 6-C serves to provide clarifications only.

The probable maximum precipitation (PMP) event used for feasibility engineering designs is 493 mm. The PMP value has been extrapolated from Key Lake data presented in the Canadian Climate Program (1994). Denison reviewed the update to the Canadian Climate Program (1994) report provided in Atmospheric Environment Branch (1999) which shows PMP at the approximate Wheeler River Project location at 489.3 mm. Denison retained the higher of the two PMP values, i.e., 493 mm, for design purposes. As an example, during a PMP, water requiring management will report to the wellfield runoff pond which will be sized to accommodate a PMP event at the site. This pond has been sized to 38,200 m<sup>3</sup> (*excluding a freeboard of 1 meter*). From the wellfield runoff pond, water will then be sent to the process water pond for treatment if required. In EIS Section 2.8 Project Design Features, Denison notes that “Ponds will be designed to maintain a minimum freeboard of at least 1.0 m to allow for continued functioning during a probable maximum precipitation (PMP) event.”

Tables 1 to 4 below provide a summary of precipitation information for both current / existing climate and future climate under different emissions scenarios, in order to 1) summarize precipitation data from various sections of the EIS (Section 6 including Appendix 6-C, Section 8, and Section 15) and 2) provide context on the PMP of 493 mm in comparison to precipitation values (annual precipitation, maximum 1-day precipitation, and 1:100 year, 24 hour return).

With specific reference to the second round IR comments response the following is noted:

- 1) Table 3 has been updated to represent the Total Annual and Maximum 1-Day precipitation event for Tomblin Lake as provided from the Climate Atlas of Canada.
- 2) The information provided in Section 6, Appendix 6-C, Table 10 provides both the historical data (2011 to 2022) and the predicted values for the future periods for both Total Annual Precipitation and Maximum 1-Day Precipitation (see Table 2 below). As such, Denison has used the available measured data from the Key Lake data station for presentation in Appendix 6-C. With the update provided to Table 3 (see #1 above), the information provided for the period from 1976 to 2005 has also been updated to represent measured data.

Denison has used measured data where applicable and this IR will be included as Appendix D in Appendix 6-C of Section 6.

Table 1: Precipitation - Existing Climate – Comparisons of Observed Annual Average Precipitation and Maximum 24-hour Precipitation to PMP

Precipitation-related metric	Value	Notes on Source of Data	Location in EIS and comment on how this information was used in the EIS	Commentary on metric compared to PMP (493 mm)
Annual average precipitation	456 mm	Recorded from Key Lake in the period from 2011-2020, ECCC station 4063753 Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>PMP is similar to annual precipitation</i></b>
Annual average precipitation	483 mm	Canadian Climate Normals 1981-2010 Station Data, Key Lake, Saskatchewan. Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>PMP is similar to annual precipitation</i></b>
Maximum 24-hour precipitation	45.9 mm	Occurred on August 8, 2020.  Recorded from Key Lake in the period from 2011-2020, ECCC station 4063753 Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>24-hr event is 10.7 x lower than PMP</i></b>
Maximum 24-hour precipitation	72 mm	Occurred July 12, 1998. Canadian Climate Normals 1981-2010 Station Data, Key Lake, Saskatchewan. Available at: <a href="http://climate.weather.gc.ca">climate.weather.gc.ca</a>	Presented in 6.1.3.1.2 Precipitation and Appendix 6-C. Provides point of comparison for selected Project PMP.	<b><i>24-hr event is 6.8 x lower than PMP</i></b>
1 in 100 year, 24 hour return	79.9 mm	Calculated using IDF_CC Tool for the Wheeler River Project. Available at: <a href="http://www.idf-cc-uwo.ca">www.idf-cc-uwo.ca</a>	8.1.3.4 Climate Change Influenced Extreme Events and Appendix 8-B. Provides point of comparison for water management design and understanding rainfall associated with 1:100-year storms.	<b><i>1:100 is 6.2 x lower than PMP</i></b>
1 in 100 year, 24 hour return	56.4 mm	Return Period Estimate based on data from the Key Lake Mine using the IDF_CC Tool (~32 km away from Wheeler River Project). Available at: <a href="http://www.idf-cc-uwo.ca">www.idf-cc-uwo.ca</a>	8.1.3.4 Climate Change Influenced Extreme Events and Appendix 8-B. Provides point of comparison for water management design and understanding rainfall associated with 1:100-year storms.	<b><i>1:100 is 8.7 x lower than PMP</i></b>

Table 2: Precipitation – Future Climate - Existing and Predicted Precipitation Data for Key Lake (provided in EIS, Appendix 6-C, Table 10)

Year	Total Annual (mm)				Maximum 1-day (mm)			
	Measured	RCP 2.6	RCP 4.5	RCP 8.5	Measured	RCP 2.6	RCP 4.5	RCP 8.5
2011-2020	455	518	509	508	48	29	27	27
2030		528	503	537		27	24	26

Overall Increase:		28	26	51		-6	-2	1

Table 3: Precipitation – Future Climate - Historical and Future Precipitation Data (Total Annual and Maximum 1-day) for Tomblin Lake, Climate Atlas (provided in EIS, Section 15, Table 15.5-1 and 15.5-2)

Period	Total Annual (mm)			Maximum 1-day (mm)		
	Historical	RCP 4.5	RCP 8.5	Measured	RCP 4.5	RCP 8.5
Historical mean (1976-2005)	495.7			27.9		
Near Term (2021-2050)		484	487		25.9	25.9
Far Term (2051-2080)		500	509		26.7	27.5

Table 4: Precipitation – Future Climate - Predicted Precipitation (1:100 year, 24-hour return) for Key Lake and Wheeler River Project, 2020 to 2050 using IDF\_CC Tool (provided in EIS Section 8)

Location	1:100 year, 24-hour return
Key Lake Mine	62.0
Wheeler River Project	88.6

## Attachment: IR-237

Number	IR-237
Dept.	CNSC
Project effects link	EA follow-up and monitoring program
Reference to EIS, appendices, or supporting documentation	Appendix 16-C throughout, including Table 1.5-1: Wheeler River Monitoring and Follow-up Program Summary (p. 8-15)
Context and Rationale	<p><b>Context:</b> CNSC's <a href="#">Generic Guidelines for the Preparation of an EIS</a> state: "The EIS should provide discussion on the follow-up program's requirements, and include:</p> <ul style="list-style-type: none"> <li>objectives and structure of the follow-up program and the VCs targeted by the program</li> <li>tabular summary and explanatory text of the main components of the program including: <ul style="list-style-type: none"> <li>a description of each monitoring activity under that component</li> <li><u>which of the two generic program objectives the activity is relevant to (e.g., verify EA predictions, determine effectiveness of mitigation measures)</u></li> <li>the specific statement from the EA that goes along with that generic objective and will be the focus for that activity (e.g., program objective: verify predicted effects; environmental assessment effect: no potential adverse effects)</li> <li>the specific monitoring objective for that activity</li> <li>planned schedule</li> </ul> </li> <li><u>roles and responsibilities to be played by the proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the program results</u></li> <li><u>possible involvement of independent researchers</u></li> <li><u>program funding sources</u></li> <li>information management and reporting (reporting frequency, methods and format)</li> <li><u>possible opportunities for the proponent to include the participation of the public and Indigenous groups, during the development and implementation of the program</u></li> </ul> <p><u>The follow-up program plan should be sufficiently described in the EIS to allow independent judgment as to the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures."</u> (Section 11)</p> <p><b>Rationale:</b> The Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information, and while some of the aspects detailed in the Generic EIS Guidelines are included, the aspects underlined are missing or appear incomplete.</p> <p>Further, all information from throughout the EIS should be incorporated into this Summary. For example, the EIS notes that: "Groundwater samples will be collected at least monthly and semi-annually in the wells within the freeze wall and on the freeze wall perimeter, respectively" (p. 7-109) and that "At least five to seven multi-well clusters are proposed across the mined area (Figure 7.8-2). Sampling will include KI parameters or the full suite of COPC at different times in the remediation process" (p. 7-111).</p> <p>These details (only examples) are not included in Appendix 16-C.</p>

Information Requirement	<p>It is recognized that this document will evolve over the planning process and be finalized prior to the EA Decision; however, as plans are developed and revised, CNSC staff expect that updates will be made to this document and provided with any future versions of the EIS.</p> <p>Appendix 16-C Summary of Monitoring and Follow-up Programs must include sufficient details to allow CNSC staff to determine the likelihood that it will deliver the type, quantity and quality of information required to reliably verify predicted effects (or absence of them) and confirm the effectiveness of mitigation measures. This includes concrete monitoring plans (sampling locations, frequency, etc.).</p> <p>Additionally, please incorporate any relevant information included in the EIS into this Summary.</p>
-------------------------	--

### **Denison's Response:**

As noted previously, Denison concurs that follow-up program documentation will evolve over the planning process and is committed to providing complete and up to date documentation as the EIS is finalized and prior to the EA Decision. Per the IR request Appendix 16-C has been updated with the most recently available information concerning follow-up programs. For reference, Table 1.5-1 in Appendix 16-C has only been updated so that references to EIS documentation is consistent with the revised submission that is part of the overall IR response package that is being submitted to CNSC for the second round of FIRT comments. Table 1.5-1 conveys appropriate information of the conceptual level and provides relevant context. An additional table (Table 1.5-2) that provides more detailed monitoring program information has been added to Appendix 16-C.

For ease of review, specific notes per the EIS Guidelines are provided below to provide context to the remainder of the response. Text in *italics* is taken from the EIS Guidelines; whereas text in **bold** is commentary provide by Denison. It is noted that this narrative was provided in the initial response to IR-237 during FIRT first round comments and has been updated accordingly.

*The EIS shall include a framework or preliminary program upon which EA follow-up actions will be managed throughout the life of the project.* **Note from Denison – Table 1.5-1 in Appendix 16-C identifies a framework or preliminary program upon which EA follow-up actions will be managed, as well as all phases of the Project in which the proposed individual follow up programs will be executed. Table 1.5-2 (a new table) provides further specific details as to locations, rationale, duration, frequency, sampling method and constituents.**

*The EIS should provide discussion on the follow-up program's requirements, and include:*

- *objectives and structure of the follow-up program and the VCs targeted by the program -* **Note from Denison - Table 1-5.1 in Appendix 16-C identifies the objectives of the proposed individual follow up programs, provides an overall program structure and identifies the VCs targeted by the program. Table 1.5-2 (a new table) provides further rationale for the proposed sampling specific details as to locations, rationale, duration, frequency, sampling method and constituents.**
- *tabular summary and explanatory text of the main components of the program including:*
  - o *a description of each monitoring activity under that component -* **Note from Denison - Table 1-5.1 in Appendix 16-C identifies each proposed monitoring activity for the various technical disciplines within which the environment assessment has been organized. A new Table 1-5.2 has been added to Appendix 16-C to provide more detail on the environmental monitoring activities, such as locations, rationale, duration, frequency, sampling method**

and constituents. This information is consistent with the current status of the development of the overall Environmental Monitoring Plan.

- o *which of the two generic program objectives the activity is relevant to (e.g., verify EA predictions, determine effectiveness of mitigation measures)* - **Note from Denison** - Table 1-5.1 in Appendix 16-C generally identifies whether the proposed follow up activities are related to verifying EA predictions and/or determine effectiveness of mitigation measures (see column "Monitoring Program Objective(s)"; however, it is agreed that further clarity could be provided in this regard. To this end, in the new Table 1.5-2, there is a column named Rationale, which indicates specifically whether the proposed follow up activities are related to verifying EA predictions and/or to determine effectiveness of mitigation measures with rationale. Requirements regarding compliance with provincial / federal guidelines / standards are also noted in this column.
- o *the specific statement from the EA that goes along with that generic objective and will be the focus for that activity (e.g., program objective: verify predicted effects; environmental assessment effect: no potential adverse effects)* – **Note from Denison** - Table 1-5.1 in Appendix 16-C identifies the relevant section of the EIS to which each proposed follow up activity refers. Further clarity has been provided as requested in this regard. In the updated version of Table 1-5.1 a further, more specific reference to the section / subsection has been added to the "EIS Reference" column for greater traceability between the assessment section of the EIS for each of the technical disciplines and the proposed follow activities. This is generally the Monitoring and Follow-Up subsection of each EIS chapter, where the objectives of the monitoring are listed.
- o *the specific monitoring objective for that activity*- **Note from Denison** - Table 1-5.1 in Appendix 16-C identifies the objectives of the proposed individual follow up programs. Additionally, Table 1.5-2, there is a column named Rationale, which indicates specifically whether the proposed follow up activities are related to verifying EA predictions and/or to determine effectiveness of mitigation measures with rationale. Requirements regarding compliance with provincial / federal guidelines / standards are also noted in this column.
- o *planned schedule* - **Note from Denison** -Table 1-5.1 in Appendix 16-C identifies the phases of the Project in which the proposed individual follow up programs will be executed. It is premature in Denison's view to develop specific "schedule" associated with all follow-up activities that are proposed. As noted in draft EIS Section 1.7.5, Licensing and Permitting, as well as in other responses to FIRT IRs, the Project is proceeding through sequential EA and licensing process. Given the sequential process to which Denison has committed it is planned that further detail will be developed to align with detailed engineering design through licensing and permitting and that this information will be available for review at that time. Denison understands that the Project cannot move forward until the appropriate Program / Plan / Procedure documentation is in place and has received approval through the regulatory process. Notwithstanding the above, the proposed duration of each monitoring program (i.e., applicable project phases) and frequency of monitoring are provided in Table 1.5-2.

*roles and responsibilities to be played by the proponent, regulatory agencies, Indigenous people, local and regional organizations and others in the design, implementation and evaluation of the program results* - **Note from Denison** – At this time and commensurate with the level of detail at which the follow up activities have been defined the proponent assumes responsibility for

execution of all proposed activities. This may change as the program details are developed, and Denison presumes this is likely as it continues to work with the key Indigenous groups. It is noted however that provisions for follow up activities and monitoring are expected to be included in agreements developed between Denison and its key Indigenous partners and therefore it is inappropriate (and may remain so) that specific details regarding follow up activities be shared without the expressed consent of the agreement signatories. Regulatory agencies at the provincial and federal levels are expected to largely play a review/approval role consistent with their responsibilities under various laws/acts/licenses/permits under which the Project, and follow up activities, will be executed. At this time there are no specific plans with local and regional organizations as it pertains to the design, implementation and evaluation of the program results; but this may change in the future. Per the above, Denison has added additional detail into Section 1.5 in Appendix 16-C with respect to roles and responsibilities consistent with the information provided in this IR response. As noted, full disclosure of such information may not be possible as it would be subject to non-disclosure covenants between Denison and its key Indigenous partners; nevertheless, more specific information will be provided as is available.

- *possible involvement of independent researchers* – **Note from Denison** – Involvement of independent researchers in follow up activities has not been identified at this time. This does not preclude possible involvement of independent researchers in the future; however, need for such has not been specifically flagged. As noted above, provisions for follow up activities and monitoring are expected to be included in agreements developed between Denison and its key Indigenous partners, and such follow up activities and monitoring could include independent research. The sharing of information related to this type of independent research can and would only be shared with the expressed consent of the agreement signatories. Per the above, Denison has added narrative to the text of Appendix 16-C in Section 1.5 clarifying the role of independent research that is consistent with our current understanding of such.
- *program funding sources* – **Note from Denison** – As noted above, the proponent assumes responsibility for execution of all proposed follow up activities that have been identified and therefore the funding of such. Also as noted above, provisions for follow up activities and monitoring that may be included in agreements developed between Denison and its key Indigenous partners will be subject to non-disclosure covenants in those agreements. This would include information concerning any funding that may be associated with these programs. It would be inappropriate (and may remain so) that specific details regarding any funding that may be provided for follow up activities be shared without the expressed consent of the agreement signatories. Per the above, Denison has added narrative to the text of Appendix 16-C in Section 1.5 clarifying funding sources that is consistent with our current understanding of such.
- *information management and reporting (reporting frequency, methods and format)* – **Note from Denison** – A framework for information management and reporting is provided in Section 1.2 of Appendix 16-C. As described in Section 1.2 of Appendix 16-C specific information management and reporting structures associated with follow up activities are proposed to be developed as part of the development of the Project Environmental Management System (EMS). The Project EMS will be developed during licensing and permitting and that this information, including more detailed information regarding information management and reporting (e.g., reporting frequency, methods and format) will be available for review at that time. Denison understands that the Project cannot move forward until the appropriate Program / Plan / Procedure documentation is in place and has received approval through the regulatory process.

*possible opportunities for the proponent to include the participation of the public and Indigenous groups, during the development and implementation of the program* – **Note from Denison** – As noted above, Denison is committed to continuing the ongoing process of identifying opportunities for the participation of the public and Indigenous groups through its engagement process. For example, as recent as October 2023, Denison has engaged with Indigenous Communities of Interest about how the outcomes of the environmental assessment process become key areas of focus by the licensing and approvals regime – including in relation to environmental monitoring. All discussion and materials related to these engagement sessions can be found in Section 4 of the revised Draft EIS. Further to this, Denison has planned a comprehensive and technical workshop with ERFN in March, 2024, and expects to undertake the same for KML soon thereafter, focused very specifically on the aspects of items licensed or approved post-environmental assessment. This will include environmental monitoring and among other things the relationship to country foods, including potential country foods to be monitored as part of monitoring programs. As the lifecycle regulator for the Project, Denison is required to provide information related to the outcome of these discussions into forthcoming updates in the IER to the CNSC. Input provided in these meetings, and others as they occur, would be integrated into monitoring program development as appropriate. Per the above, Denison has added narrative to the text of Appendix 16-C in Section 1.4 where consultation and engagement is discussed.

Denison also notes that the information provided herein and in Appendix 16-C represents a snapshot in time. Since follow up activities will span the full lifecycle of the Project, identification of potential opportunities for involvement is an ongoing process that will also span the full lifecycle of the Project.

Advice Response Table – Denison’s Response, February 2024 (Summary Advice Comments where EIS and Supporting Document Revision have been indicated)

Ref. #	Department	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Advice to the Proponent	Denison’s Response
AD-50	Environment and Climate Change Canada (ECCC)	Section 2.2.1.4.2, Wellfield Operation Section 2.2.1.4.2.2, Secondary Containment of Mining Solution – Pumping	Providing a report or memo by the Proponent’s consultant Newmans Geotechnique Inc. as a public record will more effectively explain the “information on the freeze wall integrity and basis for the design, which relies on site field data and lived experience from several exiting [sic] Saskatchewan mining operations”, than a summary (attachment IR-10) of the material presented by Greg Newman during the meeting with the FIRT on April 19, 2023.	The response from the Proponent in IR-10 is accepted based on the meeting between ECCC, Denison and the CNSC, as well as the Proponent’s consultant and the presentation by Greg Newman (Newmans Geotechnique Inc.) as well as the summary of the meeting noted in attachment IR-10. However, the Proponent should provide a public record of the consultant’s memo or a report that explains the details of the freeze wall containment and monitoring that were provided during the April 19, 2023, meeting instead of the summary provided by the Proponent in attachment IR-10.	The April 19, 2023, presentation from Newmans Geotechnique Inc. to the CNSC is provided here as Attachment AD-50.
AD-51	Canadian Nuclear Safety Commission (CNSC)	Section 8.3.3 and 8.5, Aquatic Environment and Fish health	Denison has committed to additional baseline data gather as part of their response to IR-107.	Also related to IR-120 and IR-125, CNSC staff recommend Russell Lake be included in this baseline collection to increase the robustness of the established baseline in the final EIS.	Acknowledged. Denison will consider this request as it develops the plans for additional baseline collections, as well as the monitoring program design documentation for aquatic environment monitoring that is planned to be part of the licensing submission. It is noted that no aquatic environment effects are predicted to accrue in Russell Lake in relation to any phase of the Project and the concentrations of all water quality constituents are predicted to remain below aquatic protection values.
AD-52	CNSC	Section 8.3.3.1, Methodology and Metrics	Denison has indicated that exposure to other pre-existing stressors could result in abnormal conditions or deformation(s) in existing population, but the extent of existing conditions should be evaluated to ascertain whether the rate is increasing as a result of proposed activities once in operation.	Related to IR-121, CNSC staff recommend that Denison add text to EIS to reflect that no gross abnormalities in fish were observed during field work.	The text of revised Draft EIS Section 8.3.3.2 has been revised as recommended to indicate that that no gross abnormalities in fish were observed during baseline field work.
AD-53	CNSC	Section 8.3.8, Monitoring and Follow-up	<p>Section 8.3.8 of the EIS states: "Changes in fish communities/populations will be assessed through comparison of Construction, Operation, and Decommissioning results to pre- development."</p> <p>Tracking changes in fish communities / populations in reference lakes over time should be conducted, as reference lakes can be used to differentiate natural temporal variation with potential project impacts.</p> <p>Denison has committed to inclusion of reference lakes in study designs used to assess changes in fish communities / populations over time.</p>	Related to IR-122, CNSC staff recommend that Denison strengthen discussion of reference lakes, and their use, in EIS.	<p>Additional text (see below) has added to the fifth paragraph of Section 8.3.8 of the revised Draft EIS regarding aquatic environment monitoring program sampling areas and “reference lakes” more specifically, as follows.</p> <p>“Changes in fish communities/populations will be assessed through comparison of Construction, Operation, and Decommissioning results to pre-development conditions, as well as through contemporaneous comparison of “exposure area” versus “reference area” data. In this context an “exposure area” is an area downstream of potential mine influence and a “reference area” is an area outside of potential mine influence. Where possible, the reference area would be located in the same drainage, upstream of mine influence where conditions closely mimic those downstream as is possible and where there is no, or reduced likelihood that exposure and reference fish populations can co-mingle.”</p>
AD-54	CNSC	Section 9  Various pages in section 11.1, Land and Indigenous Resource Use	The increased road traffic (14-18 trucks per day during construction/operations) may have indirect impact on ungulates, furbearers and wood land caribou presence/absence for traditional and subsistence hunting have been raised to CNSC staff when meeting	Related to IR-128, Denison should have follow-up discussions with the Ministry of Saskatchewan Highways, Indigenous Nations and communities (including KML and ERFN) and stakeholders regarding adding additional pull-outs to the highway to ensure safety for northern residents.	Acknowledged. We note that the Ministry of Highways and Infrastructure is responsible for construction and maintenance of highways in the province and Denison has no power or authority to construct pull-outs. However, Denison is committed to ongoing engagement throughout the life of the project and can provide input to Ministry of Highways and Infrastructure as applicable.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Advice to the Proponent	Denison’s Response
		Section 12 Section 14	with Indigenous Nations and communities and are presented in the EIS.		
AD-55	ECCC	Section 9.2.5.2.7, Waste and Hazardous Materials Management	Vehicles and equipment with engines adhering to Tier 4 emission standards should be employed where feasible in order to minimize emissions. Regardless of engine tier used, best management practices should be followed, including proper maintenance of engines and anti-idling measures.	Related to IR-139, the Proponent should commit to following best management practices regarding the use of vehicles and equipment, including proper maintenance of engines and anti-idling measures.	Section 2.8 of the EIS and the commitment register included with this submission outlines Denison’s plan to regularly maintain and inspect equipment and machinery to make sure they are in good working order.
AD-56  IR-137	ECCC	Section 9.3.1.3.1, Spatial Boundaries for Ungulates, Furbearers and Woodland Caribou	The EIS and the IR response did not provide sufficient information to understand how the Regional Study Area (RSA) boundaries for caribou were determined.	<p>Related to IR-137, An assessment typically involves setting a geographic area for the assessment for the direct and indirect effects of a proposed project; this area is sometimes referred to as the Local Study Area (LSA). ECCC advises that the LSA is likely to extend beyond the Project footprint and a 500m buffer. ECCC demonstrated that the application of a 500m buffer to mapped anthropogenic features best represents the combined effects of increased predation and avoidance on caribou population trends at the national scale (Environment Canada, 2011). However, adverse effects of projects including predator and prey access to undisturbed areas, reduction in connectivity, and sensory disturbance to individuals of boreal caribou can vary and extend several kilometers depending on project activities and ecological context. The LSA should at the minimum capture the above-mentioned effects.</p> <p>A Proponent will also set a geographic area for the assessment within which the cumulative effects of the proposed Project are possible; this is sometimes referred to as the RSA. Typically the range(s) is(are) the proper scale to assess cumulative effects. However, assessing cumulative effects may require a different approach for large continuous ranges than for smaller discrete ranges. The impact of disturbance that may be concentrated in part of a large continuous range may be masked given the size of the range. For large continuous range it may be relevant to assess cumulative effects at the scale of the range but also at a smaller scale.</p> <p>The Proponent should consult with experts of the relevant jurisdiction in order to determine the local and regional study area, and provide a justification of the extent of the study areas in the impact statement.</p>	<p>The reviewer is also referred to the response to IR-137 and the response to AD-56 should be read in conjunction with it. The following is provided for reference.</p> <p>As per accepted environmental assessment methodology, the spatial boundaries were established to capture the extent of the expected/likely adverse effects, both direct and indirect, on the various valued components, that were expected as a result of the Project.</p> <p>The Project Footprint was delineated as the maximum extent of physical, direct disturbance resulting from the Project.</p> <p>The LSA was delineated to capture the extent of all direct, and most indirect effects of the Project on the wildlife VCs, including woodland caribou.</p> <p>The RSA was delineated to capture the extent of all likely Project effects, in consideration of the life-requisites and behavior of the various VCs being assessed (i.e., a habitat-based assessment) including ungulates (e.g., woodland caribou) which are known to have large home ranges. The RSA was also delineated in the context of the cumulative effects assessment, as it related to the region. Further the RSA is considered representative, as it includes habitat (ecosite types) that are found throughout the SK1 range. In particular, based on the habitat and its potential to support woodland caribou (as classified by the Saskatchewan Ministry of Environment) within the RSA is relatively consistent with the remainder of the habitat in the SK1 range (see Figure 2.1 in Appendix 9-F of the revised draft EIS).</p> <p>These study areas are appropriate, in that they capture the extent of the likely adverse effects of the Project on the VCs, to provide an ecologically relevant determination as to the likely adverse effect on the regional population of all assessed VCs, including woodland caribou (i.e., no dilution of the effects over the entire SK1 range – although this has been provided for context).</p> <p>The 500 m buffer around a physical disturbance was considered in the context of the extent of sensory disturbance, to allow Denison to determine the geographical extent of an effect (i.e., limited to the LSA, limited to the RSA) to allow the appropriate characterization of the effect to inform the determination of significance.</p> <p>Cumulative effects occur when the adverse effects of the Project, overlap in time and space, with the adverse effects from other projects and activities. As such, the RSA is the appropriate scale to appropriately conduct a defensible cumulative effects assessment – i.e., the effects of projects that are beyond the RSA spatial extent would not likely result</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Advice to the Proponent	Denison’s Response
					<p>in residual effects that could act cumulatively with the Project’s effects, and consideration of effects that do not overlap spatially or temporally, are not cumulative, by definition.</p> <p>The Project is likely to add another 0.4% of anthropogenic disturbance (considering the Project Area of 169.6 ha) resulting in up to 1.9% of total anthropogenic disturbance in the Terrestrial RSA. As such, the Project's contribution to the cumulative effect is 0.001% of additional disturbance in the SK1 range, which is below the accepted threshold level of anthropogenic disturbance based on the SK1 range plan (ECCC 2020). The Ministry of Environment has indicated that the current level of anthropogenic disturbance is 53% within the SK1 range, which is below the accepted threshold level of 55% for anthropogenic disturbance for the SK1 range.</p>
AD-57	ECCC	Section 9.4.5.2.1 Work Timing Windows and Habitat Disturbance	<p>In their response to IR-167, the Proponent states: “Site clearing and other works that involve disturbance of vegetation and/or soil will be completed during least-risk timing windows for migratory birds and SAR (i.e., winter), where practical, to avoid disturbance during sensitive time periods. It is noted that additional information related to timing windows and species as it concerns Project activities has been provided in response to IR-134.</p> <p>Pre-clearing surveys will be conducted and set-back buffers implemented, as needed. The pre- clearance surveys will be completed prior to all clearing events, regardless of the time of year / season when clearing is set to occur. If nests or tree cavities should be encountered during pre- construction surveys or ongoing monitoring activities, any subsequent Project activities will be in accordance with the 2022 Migratory Birds Regulations.”</p> <p>ECCC does not recommend the use of nest searches or pre-clearing surveys for active bird nests during the breeding season as a mitigation. Instead, ECCC recommends that clearing and grubbing activities not be conducted during the breeding bird season.</p> <p>ECCC does not recommend active nest searches in most cases and for most species, in part because there is a great degree of difficulty associated with reliably detecting nests and a high likelihood of disturbing or damaging active nests while searching.</p> <p>Exceptions to the general nesting period exist, and these include interannual variation and nest searches for certain species which may breed outside of these</p>	<p>Related to IR-167, provide details on how vegetation clearing related to site development will be conducted to avoid harm to migratory birds and species at risk (SAR).</p>	<p>The reviewer is also referred to the response to IR-167 and the response to AD-57 should be read in conjunction with it. The following is provided for reference.</p> <p>As noted in the August 2023 IR responses, site clearing and other works that involve disturbance of vegetation and/or soil will be completed during least-risk timing windows for migratory birds and SAR (i.e., winter), where practical, to avoid disturbance during sensitive time periods.</p> <p>However, in the event that site clearing activities or other works are anticipated to occur during a sensitive timing window for migratory birds and SAR, the pre-disturbance wildlife sweeps would be conducted by qualified biologists at least 7 days prior to any scheduled vegetation/land disturbance. The biologist would search the proposed area to be cleared, plus a 100 m buffer, for sensitive wildlife features that may be used by avian SAR (e.g., nests and/or nesting cavities), woodland caribou, and bats (e.g., roosting sites/cavities). The wildlife sweeps will not be species-specific surveys focused on species at risk per se but will be based on timing of Project related activities (i.e., will be completed in advance of site clearing activities). These surveys are intended to identify sensitive wildlife features such as hibernacula, dens, nests, cavities, mineral licks, that would require specific mitigation measures to avoid or minimize adverse effects on identified features and are not species-specific. Nevertheless, the methods associated with these pre-construction and pre-clearing sweeps will be tailored to species at risk that may potentially be using habitats at certain times of the year. For example, methods will include searching prominent topographic features such as rock outcropping or downed forest trees and debris where wolverine may establish denning sites. In the event the sweeps are conducted during the winter period, methods related to snow tracking would identify wolverine presence based on tracks and potential denning sites in the snowpack within ravines or drainages within the forested areas within the study areas (as per Resources Inventory Committee 1999). Additionally, methods will include searching for potential roost trees for bat species, as per protocols included in the Wildlife Habitat Features Field Guide (BC Ministry of Environment and Climate Change Strategy, Ecosystems Branch 2019). Depending on the results of these sweeps, appropriate mitigation measures will be developed and implemented.</p> <p>If sensitive wildlife features are found, they will be documented (e.g., photographs, GPS location recorded). The data collected would inform the development and</p>

Ref. #	Department	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Advice to the Proponent	Denison’s Response
			general periods. Under the MBCA it is prohibited to destroy a nest with a live bird or viable egg, even if this occurs outside of what might be considered a normal nesting period.		implementation of appropriate mitigation measures (e.g., appropriate set-back distances for Project activities and/or consideration of timing windows as per SK MOE (2017), in consideration of applicable laws and regulations (e.g., Migratory Birds Conservation Act, Wildlife Act), as appropriate.  <b>References:</b>  B.C. AD-58	HC	Section 10.1.4.2.1 (p. 10-22)  Appendix 10-A (ERA): Appendix B Table B.9, Ref. 19-2638  Section 6, Table 6.1-1 (p. 6-7)	Section 6 of the Draft EIS contains Table 6.1-1 (p. 6-7), which lists radionuclides as a key indicator for air quality. Only uranium and radon are considered in Section 6, and Section 10 Table B.9 does not include doses from uranium progeny in air.	Related to IR-177, consider rewording Table 6.1-1 to “radon” instead of “radionuclides” to avoid confusion.	Acknowledged. The revision to Table 6.1-1 has been made as suggested.
AD-59	CNSC	Section 10.1.6.1.1, Human Receptors Selection and Characterization	Within the Human Health assessment, offsite receptors during the operation period are only considered downstream of Whitefish Lake. The only identified concern was for Se to the Fisher/Trapper located at Russel Lake. This section cites Indigenous Knowledge as informing the receptor selection and location.  While the assessment is fairly conservative in the assumptions made on intake and receptor habits, it stands to reason that if the trapper receptor was located closer to the operation, such as at McGowan or Whitefish Lakes, this exceedance of Se could be more pronounced.  In terms of maintaining a conservative assessment, if the most vulnerable receptor can be shown to be protected at the point of highest expected COPC concentration, it can be concluded that this receptor would be protected further away from the project. Considering this, why was the hunter/trapper receptor	Denison has addressed IR-180, but has not considered the suggestion for establishment of additional treatment technologies of COPCs.  CNSC staff maintains that there may be the need to establish additional treatment for effluent should environmental monitoring during operation indicate COPC’s are accumulating in the environment beyond what is anticipated in the EIS.  This is a firm reminder that this will be evaluated as part of the licensing phase of the project, should it proceed.	Acknowledged; it is understood that consideration of treatment technologies will be part of the licensing phase of the Project.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Advice to the Proponent	Denison’s Response
			not also assessed at Whitefish or McGowan Lake? Was Indigenous Knowledge specific in mentioning Whitefish or McGowan Lakes were not used for the activities carried out by identified receptors?		
AD-60	CNSC	Section 11, Perceived Risks to Lands and Resources	<p>The EIS states: “Resource users may also experience changes in their perception of the quality of resources for consumption such as the palatability of fish or wildlife or have apprehensions about the safety of resources for consumption. These changes may affect the patterns of ILRU during all Project phases including Post Decommissioning. The ERFN refer to this indicator as a “psycho-social’ effect, meaning that even if people know their fears are “perceived fears, the fear ... is real and has real impacts on ERFN members’ perception of their overall health and well- being” (ERFN and SVS 2022a).” (p. 11-11)</p> <p>CNSC’s Generic Guidelines for the Preparation of an EIS state: “The EIS will document specific suggestions raised by Indigenous groups for mitigating the effects of changes to the environment on Indigenous peoples (section 5(1)(c) of CEAA 2012). For the mitigation measures intended to address the effects of changes to the environment for Indigenous peoples, the Proponent must discuss the residual effects with the Indigenous groups prior to submitting the EIS.” These changes may affect the patterns of ILRU during all Project phases including Post Decommissioning.</p>	<p>Related to IR-207, as Denison continues to work with Indigenous Communities of Interest on community specific monitoring regimes, please provide additional information in the IER on any updates on engagement activities to date that have taken place with KML and ERFN and any other Indigenous Nations and communities who utilize the area, with respect to follow-up monitoring plans that are being developed to support the Project licensing and permitting.</p> <p>If Denison has made commitments with respect to this, this is information that should also be included in the commitments report.</p>	Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a community specific monitoring regime, suited to each of their interests and needs, in an agreed-upon fashion. Updated information regarding engagement activities is provided in the updated IER and updated commitments register included with the IR response package.
AD-61	CNSC	Various sections of the EIS, including: Section 9 Section 10 Section 11, including Section 11.1.4.3.1 (p. 11-46) Section 12 Section 16	<p>ERFN indicated they are concerned about declining moose populations from an influx of hunters; more people may be accessing the area year after year, and worried populations may be affected by the Project (21-EN-ERFN-473.13).</p> <p>Further, the EIS highlights that: “Vehicle collisions are the most likely source of direct mortality for moose. Effective mitigation measures (e.g., breaks in snowbanks; speed limits; and exclusion fencing around contaminated waste pads and ponds) will be implemented to reduce moose mortality.” (p. 11-46)</p> <p>To address potential concerns specific to Project related effects to wildlife species of interest to the Indigenous Communities of Interest, Denison has committed to collaborating with ERFN and KML on a monitoring regime suited to each of their interests and needs.</p>	Related to IR-129, Denison needs to ensure that the proposed monitoring regime with ERFN, KML and other Indigenous Nations who utilize the area are included in the commitments table for future EIS submissions.	Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a community specific monitoring regime, suited to each of their interests and needs, in an agreed-upon fashion. Updated information regarding engagement activities is provided in the updated IER and updated commitments register included with the IR response package.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Advice to the Proponent	Denison’s Response
AD-62	CNSC	Various sections of the EIS, including: Section 8 Section 9 Section 10 Section 11 Section 12 Section 15 Section 16  Appendix 16-C (p. 3)	IR-238 requested that Denison provide additional information to demonstrate whether Indigenous Nations and communities were engaged directly on the potential mitigation and monitoring measures to address the concerns raised regarding potential impacts of the Project on the potential or established Indigenous and/or treaty rights.  As well, it requested that Denison provide a rationale if this engagement has not been completed. As the Project develops, please provide concrete actions Denison will take in the follow-up and monitoring programs to engage Indigenous Peoples to alleviate concerns and incorporate their interests, and when this engagement is planned to take place.	Related to IR-238, If Denison has made commitments with respect to engagement activities with Indigenous Nations and communities on potential, this is information that should be included in the commitments report.	Please see response to IR-238 and as noted previously Denison continues to work with its Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison has committed to collaborating with English River First Nation and Kineepik Métis Local on a community specific monitoring regime, suited to each of their interests and needs, in an agreed-upon fashion. Updated information regarding engagement activities is provided in the updated IER and updated commitments register included with the IR response package.
AD-63	ECCC	Appendix 6-C Climate Baseline and GHG Emissions Report	ECCC recommended that the identification of the sources of GHG emissions and quantification of these emissions be described for the post-decommissioning phase, as was done for the other phases. ECCC recommended that the Proponent discuss the potential impacts that the Project may have on Canada’s ability to meet its climate-related targets, following the guidance of the Strategic Assessment of Climate Change (SACC) and the Draft Technical Guide Related to the Strategic Assessment of Climate Change: Guidance on quantification of net GHG emissions, impact on carbon sinks, mitigation measures, net-zero plan and upstream GHG assessment.	Related to AD-18, ECCC recommends the identification of the sources of GHG emissions and quantification of these emissions be described for the post decommissioning phase. This information will be useful for future development of a net-zero plan.	The Post-Decommissioning phase consists of physical, chemical, and biological monitoring of the site that will be conducted to confirm that the site is chemically and physically stable. Post-Decommissioning extends from the end of physical decommissioning until transfer of the site into the provincial Institutional Control Program or direct release of the land back to the Crown. The Post-Decommissioning monitoring program will be designed and conducted in accordance with the provincial and federal regulations and licence conditions.  For the purpose of the environmental assessment and the stage at which Project development currently stands, Denison believes the information provided on GHG emissions within the EIS documentation is appropriately focused on the Project phases with greatest activity which contribute to Scope 1 and 2 emissions.  As noted previously in response to AD-18, in accordance with our discussions with the CNSC, Denison is committed to re-assessing the GHG and climate change components of the EIS and other elements of the SACC once more detailed, site-specific data become available (i.e., detailed feasibility and engineering studies). This is expected to include more detailed study around overall GHG emissions, carbon sinks and mitigation options, best available technologies / best environmental practices, climate resiliency, net-zero carbon planning and offsetting.
AD-64	ECCC	Appendix 6-C Climate Baseline and Greenhouse Gas Emissions Report	ECCC noted that more specific data, such as regional data from provinces, forest companies, or literature may be available. The use of Table 20 of the draft Technical Guide does not apply.  ECCC recommended that the Proponent also consider biomass that are not aboveground and confirm whether soil carbon is taken into account, as well as wetlands.  ECCC recommended that the Proponent provide a quantitative and qualitative description of the Project’s	Related to AD-19, ECCC recommends that the Proponent revisit the land use calculation provided in the draft Environmental Impact Statement as the use of Table 20 of the draft Technical Guide for the above ground mass of vegetation species is not appropriate. This table is for above-ground woody vegetation in cropland systems which does not apply in this instance. A simple site survey would determine above-ground biomass on site using basic information such as site class and species. More specific data, such as regional data from provinces, forest companies, or literature may be available, while generic national	It is anticipated the GHG and climate change components of the Project will be re-evaluated once more detailed, site-specific data becomes available; this will be done after the EIS process is concluded and possibly as part of sustainability reporting. This analysis is expected to include more detailed study around overall GHG emissions (including land use changes - forest/vegetative biomass, soil carbon, wetlands), carbon sinks and mitigation options, best available technologies / best environmental practices, climate resiliency, net-zero carbon planning and offsetting.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Advice to the Proponent	Denison’s Response
			impact on carbon sinks, following the guidance of the SACC and the draft Technical Guide.	<p>data is available (e.g., Biomass Estimates for Major Boreal Forest Species in West-Central Canada (publications.gc.ca), Canada’s Forest Biomass Resources: Deriving Estimates from Canada’s Forest Inventory (nrcan.gc.ca)).</p> <p>ECCC reiterates the advice that the Proponent provide information regarding the consideration of biomass that are not above ground, specifically whether soil carbon and wetlands are taken into account.</p> <p>ECCC also restates the advice that the Proponent provide a quantitative and qualitative description of the Project’s impact on carbon sinks, following the guidance of the SACC and the draft Technical Guide.</p>	
AD-65	CSNC	Appendix 7-A, Section 4.3.3, Hydrochemistry by Hydrostratigraphic Unit  Appendix 7-C, Section 3.5	In response to IR-82, Denison highlights the importance of the S redox couple (S(2-)/S(6+)) near the ore zone.	Related to IR-82, CNSC staff recommend that Denison consider the inclusion of hydrogen sulfide test kits for in-field measurements of H2S to supplement qualitative interpretations (e.g., absence of "rotten egg" odor associated with sulfide) relating to redox conditions.	Acknowledged and Denison thanks CNSC staff for this recommendation. The recommendation will be considered within the context indicated during future planning.
AD-66	ECCC	Appendix 7-C, Numerical Modelling: Post Decommissioning Evaluation,Section 2.3.1.4, Desilicified Zone	<p>The Proponent states in both the EIS and their response that a hydraulic conductivity value of 5x10-6 m/s was uniformly assigned to the model layers representing the Desilicified Zone. They additionally state that this value is consistent with packer and pumping tests screened in this unit that have interpreted hydraulic conductivity values ranging from 1x10-6 to 3x10-5 m/s (Appendix C), with a geomean of 6.0x10-6 m/s.</p> <p>In their IR response, the Proponent stated that the hydraulic conductivity used as the model base case (5x10-6 m/s) is similar enough to the geometric mean value (6x10-6 m/s) that no consequential change to the model would occur if the geometric mean were to be used. The use of the value of 5x10-6 m/s as the model base case was not substantiated.</p> <p>ECCC accepts the response to Part 1 of the IR as the Proponent has stated that 5x10-6 m/s and 6x10-6 m/s are similar enough hydraulic conductivities that redoing modelling with the geometric mean is not expected to consequentially change outputs for either the PHREEQC orFEFLOW model. However, the reasoning for selecting the value of 5x10-6m/s was not clear.</p>	Related to IR-89, while repeat modelling using the geometric mean hydraulic conductivity of 6x10-6 m/s is not required, include a statement in the EIS to indicate that the geometric mean hydraulic conductivity was not used in the model and providing justification for using the value of 5x10-6 m/s instead.	<p>The revised Draft EIS text (Appendix 7-C, Section 2.3.1.4 has been updated to report the geomean of the desilicified zone will be updated to 4.8x10<sup>-6</sup> m/s. The previously reported value of 6x10<sup>-6</sup> m/s was erroneous.</p> <p>“A hydraulic conductivity value of 5x10<sup>-6</sup> m/s was uniformly assigned to the model layers representing the Desilicified Zone. This value is consistent with packer and pumping tests screened in this unit that have interpreted hydraulic conductivity values ranging from 1x10<sup>-6</sup> to 2x10<sup>-5</sup> m/s, with a geomean of 4.8x10<sup>-6</sup> m/s. As within other units, the geomean value was not applied directly, but rather a rounded value slightly higher than the geomean was applied throughout the entire desilicified zone. The value applied within the desilicified zone is considered conservative as it is a factor of 1.9 higher than the most-reliable hydraulic conductivity estimates (i.e., values obtained through pumping tests measured the conductivity as 2.7x10<sup>-6</sup> m/s) and is equivalent to the geomean value.”</p>
AD-67	Health Canada (HC)	Appendix 10-A, Section 3.2.1.3.1, p.3.43-3.44	<b>Inappropriate use of an outdated standard in assessing health and environmental effect(s) from</b>	The CAAQS are recommended as the most stringent air quality standard for assessing health and	Acknowledged. The reviewer is referred to the response to IR-190 for a discussion of the use / interpretation of the CAAQs in the EIS.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Advice to the Proponent	Denison’s Response
			<p>short-term exposure to nitrogen dioxide (NO2).</p> <p>The Draft EIS technical supporting document (Appendix 10-A) appears to misinterpret Health Canada’s 2016 Human Health Risk Assessment for Ambient Nitrogen Dioxide (NO2) in setting its screening criteria and evaluating the health impacts from exposure to Nitrogen Dioxide. The document states:</p> <p>“Health Canada published a national one-hour maximum acceptable level of 400 µg/m3 for NO2 in ambient air using a risk assessment approach (Health Canada, 2016b). This value considers sensitive human populations.”</p> <p>This statement is inaccurate.</p> <p>As indicated in Health Canada’s 2016 publication, this value (400 µg/m3) refers to the National Ambient Air Quality Objective (NAAQO) for NO2, developed in the 1970s. The Canadian Ambient Air Quality Standards (CAAQS) were later developed in consideration of both human health and the environment to replace existing Canada-wide standards, including the NAAQOs, and in many cases are the most stringent Canadian air quality standard, guideline or objective.</p> <p>The new CAAQS for NO2 also recognizes that there is no population health threshold for human health effects; therefore, any increase in exposure will result in an incremental population risk (Environment Canada and Health Canada, 2012; CCME, 2000). In other words, NO2 is considered to be a non-threshold substances, meaning that health effects may occur at any level of exposure. Therefore, guideline values should not be construed as limits to which polluting up to is allowed.</p>	<p>environmental effect(s) from short-term exposure to NO2 in the project.</p> <p>The CAAQS are generally calculated for specific multi-year averages and for a particular statistical form so that extreme and unpredictable events do not drive risk management. However, if the data is not available for comparison to a full CAAQS timeframe, Health Canada suggests using model results for at least one calendar year to allow for a basic comparison with the CAAQS statistical form. The modelling results should be able to indicate the frequency of CAAQS exceedances, which can be used in the discussion as to whether any anticipated human health impacts are anticipated</p> <p>Modelled predictions within an air quality assessment’s study area should be compared to the most stringent air quality standards, guidelines or objectives applicable to the region that may be affected by project activities. In this case, CAAQS are the most stringent levels and CAAQS are not restricted to applications only within the context of the Air Quality Management System (AQMS). Evaluation against the CAAQS may be considered in determining the nature and severity of the project’s impact on air quality levels and the resulting mitigation measures that may be required to maintain good air quality levels or to prevent an exceedance of the CAAQS.</p> <p>As health effects can occur even at levels of exposure below the limits set out in the CAAQS, they should not be viewed as “pollute-up-to” levels. It should be acknowledgeable that health risks exist below the guidelines. In addition, the principles of keeping clean areas clean and continuous improvement are operative, thus proposed mitigation measures should not be confined to meeting the standards, but should also be targeted towards reducing population exposure to CACs associated with the proposed project.</p> <p>This advice is also relevant to IR-190 and may be of use in responding to that request for a comparison of the predicted maximum concentrations to the most protective applicable air quality standards available (i.e., CAAQS).</p>	

Ref. #	Department	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Advice to the Proponent	Denison’s Response
AD-68	ECCC	Appendix 16-A Summary of Residual Effects Appendix 16-B Summary of Cumulative Effects	<p>ECCC recommended the inclusion of an assessment of potential GHG mitigation measures throughout all phases of the Project including a Best Available Technologies / Best Environmental Practices (BAT/BEP) Determination, as described in Section 3.2 of the draft Technical Guide.</p> <p>ECCC also recommended the development of a credible Net-Zero Plan on how to achieve the target of 0 kt CO2 eq/year, for the year 2050 and beyond, following the guidance of the SACC and the draft Technical Guide.</p>	Related to AD-49, ECCC notes the comment provided by the Proponent stating, “Denison will consider the option of preparing a climate resiliency assessment with consideration to best available technologies / environmental practices (BAT/BEP) as well as a net-zero plan as the Project advances”. ECCC continues to recommend that the Proponent align with best practices by including in the EIS a Best Available Technologies / Best Environmental Practices (BAT/BEP) Determination and a credible Net-Zero Plan on how to achieve the target of 0 kt CO2 eq/year, for the year 2050 and beyond, following the guidance of the SACC and the draft Technical Guide.	The information presented in the Draft EIS meets the requirements of CEAA 2012. Per Denison’s response to AD-49 (Annex 1, page 419/419) the company will consider the option of preparing a climate resiliency assessment with consideration to best available technologies / environmental practices (BAT/BEP) as well as a net-zero plan as the Project advances but is not intending to include this information in the revised Draft or Final EIS.
AD-69	CNSC	Appendix 16-C	<p>The EIS and the Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information. It is not clear which monitoring programs will be employed to demonstrate regulatory compliance, and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders.</p> <p>The CNSC’s Generic Guidelines for the Preparation of an Environmental Impact Statement (EIS), also state: “The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the proponent intends to implement them and the environmental outcome the mitigation is designed to address.</p> <p>CNSC staff requested in the March 2023 letter to Denison (e-Doc 6991467) a Commitments Table for the Wheeler River EIS. This letter requested information of all commitments made by Denison with detailed information such as:</p> <ul style="list-style-type: none"><li>• details of the commitment</li><li>• which phase(s) of the project will the commitment be carried out (e.g., all phases)</li><li>• where the commitment is referenced (which document, table, etc. and where it can be found)</li><li>• how this commitment will be tracked (project EA follow-up program, site-wide programs, etc.)</li></ul> <p>Several commitments to Indigenous Nations and communities from the August 2023 submission appear to be missing from this table and should be included in the next submission.</p>	<p>For the next draft EIS submission, the evergreen Commitments Table should be updated to include:</p> <ul style="list-style-type: none"><li>• which phase(s) of the project will the commitment be carried out (e.g., all phases)</li><li>• how this commitment will be tracked (project EA follow-up program, site- wide programs, etc.) and;</li><li>• all commitments to Indigenous Nations and communities</li></ul>	Please refer to the commitments register included with Denison’s IR response package.

Ref. #	Department	Reference to EIS, appendices, or supporting documentation	Context and Rationale	Advice to the Proponent	Denison’s Response
AD-70	ECCC	Appendix 16-C Summary of Monitoring & Follow-up Programs	ECCC recommended that the Proponent consider developing a GHG follow-up program to measure and compare actual GHG emissions against the EIS estimates, including reporting the Project’s actual emissions and updating the emissions estimates as needed.	Related to AD-48, ECCC acknowledges that the Project will likely be required to report annually per section 46 of the Canadian Environmental Protection Act as the annual emissions are likely to be over 10,000 tonnes of CO2e. However, ECCC’s suggestion incorporates additional components to align with the goal outlined in Appendix 16-C of the draft EIS to “assess the environmental performance of the project relative to the predictive assessment that has been completed in support of the environmental assessment process”. This would involve comparing actual vs. estimated emissions following the terms of the SACC’s net GHG emissions equation and evaluating the effectiveness of GHG-related mitigation measures.	Greenhouse gas emissions (GHGs) were not included as a valued component in the EIS, and as such, Denison is not proposing to add GHG monitoring to the EA follow-up monitoring to remain consistent with the methodology and scope for an EA completed under CEAA 2012. The annual GHG reporting will provide the required and relevant information to regulators per the Canadian Environmental Protection Act. Denison’s ESG reporting framework will be developed as the Project advances and will be scoped beyond the components of the EIS.
AD-71	ECCC	Conceptual Caribou Management Plan	Section 4.2.1 of the Conceptual Caribou Management Plan states that "The Project components are also west of the known home range of woodland caribou (based on tracking data received by the Ministry of Environment; Figure 4-2), although the absence of data does not mean the absence of caribou and Denison has observed caribou in the area." Calculation of home range is normally based on statistical analyses of telemetry data. Home range cannot be inferred from telemetry points and incidental observations from a map	Related to IR-149, the Conceptual Caribou Management Plan should be corrected to remove the reference to caribou home range.	Acknowledged - Version 2 of the Caribou Mitigation Plan (now titled Caribou Management Framework) has been updated to re-word the sentence highlighted by ECCC.  For reference and further information, it is noted that Denison continues to work collaboratively with Saskatchewan Ministry of Environment (MOE) on their requirement for an offset for adverse effects on caribou habitat. Denison has advanced the Project-related Caribou Management Framework within the context of the province’s offsetting framework. The MOE has reviewed the draft framework and has provided Denison a notification of their support. Subject to finalization and provincial acceptance, the framework will provide the means to address/offset all residual adverse effects (i.e., those remaining after the application of the proposed mitigation measures) of the Project on caribou that are under provincial jurisdiction.

Reference to EIS, appendices, or supporting documentation	Section 2.2.1.4.2, Wellfield Operation Section 2.2.1.4.2.2, Secondary Containment of Mining Solution – Pumping
Context and Rationale	Providing a report or memo by the Proponent's consultant Newmans Geotechnique Inc. as a public record will more effectively explain the "information on the freeze wall integrity and basis for the design, which relies on site field data and lived experience from several exiting [sic] Saskatchewan mining operations", than a summary (attachment IR-10) of the material presented by Greg Newman during the meeting with the FIRT on April 19, 2023.
Advice to Proponent	The response from the Proponent in IR-10 is accepted based on the meeting between ECCC, Denison and the CNSC, as well as the Proponent's consultant and the presentation by Greg Newman (Newmans Geotechnique Inc.) as well as the summary of the meeting noted in attachment IR-10. However, the Proponent should provide a public record of the consultant's memo or a report that explains the details of the freeze wall containment and monitoring that were provided during the April 19, 2023 meeting instead of the summary provided by the Proponent in attachment IR-10.

### Denison's Response:

Below are the Newman Geotechnique PowerPoint slides from the April 19, 2023 meeting with the CNSC.

 **ISR Freeze-Wall Queries...**  
PRESENTATION TO CNSC BY NGI  
APRIL 26, 2023

 **Outline**

- NGI qualifications
- Ground freezing basics
- Phoenix deposit freeze-wall
- IR 10 Queries
  - Freeze-wall integrity for containing solution
  - Fluid pressure interaction with freeze-wall
  - Exothermic reaction of solution with freeze-wall

Newmans Geotechnique Inc.  
www.ArtificialGroundFreezing.com

1/15/2024 2

## NGI qualifications

- Newmans Geotechnique Inc. (NGI)
- Freezing engineering since 1995
- Ground Freezing Consulting with focus on
  - Ground water control, ground stabilization using freezing
  - Mine planning, shaft sinking, civil works
  - Construction in natural or artificially frozen ground
- Uranium Mining Freezing Related...
  - Cameco McArthur River freeze-walls
  - Cameco Cigar Lake bulk freezing
  - NexGen Rook I shaft freezing
  - Fission Uranium bulk freezing
  - Cameco Rabbit Lake tailings thawing / consolidation
  - Areva – various studies

Newmans Geotechnique Inc.  
www.ArtificialGroundFreezing.com

1/15/2024

3

## Ground freezing outcomes

- Controls water flow by reducing permeability
- Allows for short and long term strength gain and stability improvement
- Permeability
  - Water freezes over a range of temperatures below 0°C. Once mobile water in pores changes phase, water flow is so impeded it, in effect, ceases.
    - In sand, limited flow when colder than -1°C
    - In clay, limited flow at -2°C, no measureable flow when colder than -5°C
- Strength
  - Freezing strengthens porous materials by increasing cohesion
    - E.g. an unfrozen clay with cohesion of 1.7 MPa is weaker than pure ice with UCS of about 5 MPa
  - Frozen ground can experience plastic deformations (glaciers flow)
  - Mohr-Coulomb analysis shows static plastic yielding
  - Creep analysis shows time dependent elastic-plastic strains

Newmans Geotechnique Inc.  
www.ArtificialGroundFreezing.com

1/15/2024

4

## Ground freezing basics

- Has been used for over 120 years. First project was a 500 ft deep shaft in UK
- Inject chilled  $\text{CaCl}_2$  down poly tubes and it removes heat as it flows back in annulus between poly tube and steel casing.
- Pipes are "keyed" into basement rock to prevent bypass flows below.
- Pipes are installed from surface to create a barrier to flow over all depths.

Newmans Geotechnique Inc.  
[www.ArtificialGroundFreezing.com](http://www.ArtificialGroundFreezing.com)

1/15/2024

5

## Ground freezing basics

- Ground heat is extracted around each pipe
- The frozen columns eventually "close" and water flows are cut off
- Over time, the freeze-wall grows much thicker.
- Deviation in drilling is forgiven over time

Newmans Geotechnique Inc.  
[www.ArtificialGroundFreezing.com](http://www.ArtificialGroundFreezing.com)

1/15/2024

6

## Freeze wall influence on hydraulic conductivity

Temperature is related to hydraulic flow rates

- As temperatures drop below freezing, the flow paths for liquid water to move are closed off
- The amount of reduction in  $K_{hyd}$  depends on ground type and temperature as shown here for a simulated shaft freeze where two pipes have been assumed permanently damaged and off line.

## Freeze wall creating a hydraulic barrier around a high grade ore zone (McArthur River)

Temperature strings installed offset from the wall used to:

- validate the models
- then use the model to understand the bigger picture

## Freeze wall stabilizing ground prior to large shaft excavation (BHP Jansen Mine)

Temperature is quite warm at base of shaft where cutting machine is working

- Shaft opening is 10 m diameter in this case
- Freeze wall is blue in colour and stabilizes the ground to support the open shaft
- Deformations here are much more than anticipated at Phoenix given that freeze wall at Phoenix will be thicker than those used in this conservative model.

## Freeze wall stabilizing ground with Jet Boring mining at Cigar Lake (from CNSC presentation Aug 2013)

Jet boring cavities are 10 m high by 3.5 m diameter

- Ground is frozen
- Creep in frozen ground results in up to 22 cm displacement but corresponding strains are well below failure range

## Phoenix freeze-wall

- Frozen and mined in phases
- Freeze-wall is offset from ISR grid patterns by 27 m
- Freeze-wall grows very thick, wall growth is controlled by cycling on/off active freezing to limit over growing in thickness

Newmans Geotechnique Inc.  
www.ArtificialGroundFreezing.com

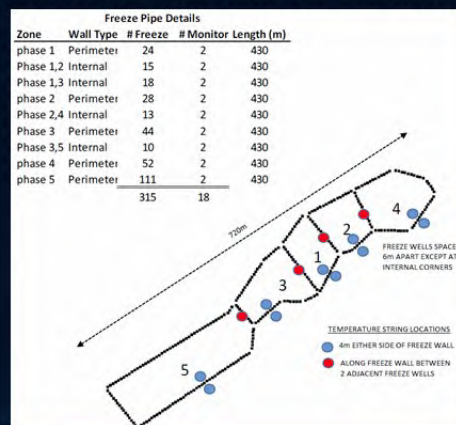

1/15/2024

11

## Phoenix freeze-wall

- Total of 315 freeze pipes and 18 dedicated thermal monitoring wells that have sensors spaced from below ore to surface
- Temperatures are monitored on both sides of the freeze-wall
- Data is used to calibrate the FEM model of the freeze over all ground types

Newmans Geotechnique Inc.  
www.ArtificialGroundFreezing.com

1/15/2024

12

## CNSC IR 10 Queries

### 1 Freeze-wall integrity for containing solution

- Design meets all main criteria for a freeze-wall
- Freeze wall is keyed into basement and extends to surface so no overtopping or underflow
- Fluids are isolated – ground water cant get in, lixiviant cant get out
- Freeze wall is very thick (between 18 and 30 m) and is 27 m away from ISR injection and recovery wells
- Freeze wall temperatures are monitored and checked against thermal models

Newmans Geotechnique Inc.  
www.ArtificialGroundFreezing.com

1/15/2024

13

## CNSC IR 10 Queries

### 2 Fluid pressure interaction with freeze-wall

- In deep shaft freezing or at McArthur River mine (530 to 640 m deep) there are mine openings at atmospheric pressure inside the freeze-wall with 6000 kpa fluid pressure outside the freeze wall.
- The walls at Phoenix will be much thicker than either the above and there will be fluid pressure on both sides of the wall.
- It is very very unlikely that the freeze wall will "see" pressure or stress gradients anywhere close to what it can withstand.
- Even if it did, freeze-walls are plastic and can deform without failing.

Newmans Geotechnique Inc.  
www.ArtificialGroundFreezing.com

1/15/2024

14

## CNSC IR 10 Queries

### 3 Exothermic or other reactions of solution with freeze-wall

#### Freezing point of lixiviant...

- An acid/water strength of 80g/L H<sub>2</sub>SO<sub>4</sub> (~8% w/w) will freeze around -4 °C
- An acid/water strength of 55g/L H<sub>2</sub>SO<sub>4</sub> (~5% w/w) will freeze around -2 °C
- A peroxide/water strength of 15g/L H<sub>2</sub>O<sub>2</sub> (~1.5% w/w) will freeze around -1 °C
- A peroxide/water strength of 5g/L H<sub>2</sub>O<sub>2</sub> (~0.5% w/w) will freeze similar to water
- The freeze-wall will be formed with -30°C coolant. It will immobilize any lixiviant that flows near it. Potash mine shafts are frozen in saline soils with freeze points as low as those noted above.
- If lixiviant freezes off near freeze wall, it cannot bring in more solution to sustain an freeze-wall degradation

Newmans Geotechnique Inc.  
www.ArtificialGroundFreezing.com

1/15/2024

15

## CNSC IR 10 Queries

### 3 Exothermic reactions of solution with freeze-wall

#### Exothermic Reactions...

- The ground at Phoenix is low sulphur content and should not generate much heat
- All design work so far assumed it DID generate heat and the freeze wall is maintained even assuming the entire ore phase region is generating heat.
- The freeze walls at McArthur River routinely withstand the heat of hydration of stope concrete backfilling where temperatures reach in the 50 °C range over the short term.
- The freeze walls in mine shafts routinely withstand ventilation heat in the range of 20 to 30 °C
- The peak temperature is not the sole issue. It is the peak T and the rate of heat generation. The freeze wall continually removes heat on both the ore and non ore sides. Even if the ore side warms due to lixiviant, most of that heat will not flow past the mid-line of the freeze wall so the wall thickness on the non ore side is not significantly impacted.
- If actual temperature monitoring shows the ground near the freeze wall warming more than anticipated, the freeze plant on/off cycling can be changed or the coolant temperature lowered.

Newmans Geotechnique Inc.  
www.ArtificialGroundFreezing.com

## CNSC IR 10 Queries

### 3 Exothermic reactions of solution with freeze-wall

#### Exothermic Reactions...

- "WHAT IF" models were solved

Ore Zone Sustained T	Freeze Plant Cycling?	Freeze wall Status
10 (base design case)	Yes	No impact
30	Yes	Thins but stable
50	Yes	Thins but too thin, possible issues
50	No	Thins but stable

There are controls that can be applied based on field observations

**ANNEX 1 TO FIRT ROUND 2 IR RESPONSE PACKAGE FEBRUARY 2024 (Complete  
Wheeler River Project FIRT IR Round 1 Response Package)**

Annex 1 Responses to Information Requirements

**Federal Indigenous Review Team (FIRT) – Denison’s Responses to Information Requirements for the Wheeler River Project Environmental Impact Statement**

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
IR-01	English River First Nation (ERFN)	Current use of lands and resources for traditional purposes	General	<p><b>Context:</b> Denison has not gone far enough in terms of learning from and incorporating information from ERFN provided in the <i>Traditional Knowledge Study and Health and Socio-Economic Study Report</i>. It appears Denison put a disproportionate amount of reliance on the views and interests of one ERFN land user. While we applaud the efforts of Denison to seek feedback from ERFN land users directly and to work closely with such land users, ERFN’s rights and interests in the region of the Project (and the potential of the Project to adversely impact such rights and interests) extend well beyond that of just one land user.</p> <p><b>Rationale:</b> It is important for the proponent and regulators to understand that while the rights and interests of individual ERFN members are important to consider, the Elders and elected leaders of ERFN represent the collective rights and interests of ERFN as a Nation. The results of the scoping study indicated that ERFN holds firmly established rights to the area where the planned project is located. Numerous studies conducted over several decades have examined ERFN's relationship and connection to land use and occupancy of the region where the proposed mine is located from traditional land use, subsistence harvesting, ecological, and sociocultural and economic perspective.</p>	<p>The draft EIS should be revised to reflect the totality of ERFN TK and land use information.</p> <p>Denison and CNSC must continue to work with ERFN to ensure that impacts on ERFN rights are appropriately and fully considered, mitigated, and accommodated.</p>	<p>Denison has met with ERFN regarding the IR and has gained a better understanding of the specific concern raised in the IR. ERFN's relationship and connection to the land is important. Denison will continue to work with ERFN to refine its understanding of this relationship and will work with ERFN to make sure this is accurately reflected in the final EIS.</p> <p>Despite the passing of the late trapper/resource harvester referred to throughout draft EIS, ERFN has communicated to Denison that ERFN considers his use of the area as representative of current and future land users and expects that the relationship to the Project area will be continued and strengthened through generations of future use. Changes will be made throughout the EIS to reflect that the late ERFN land user is but one of many current and future land users, and should be considered as representative of future land uses and expression of rights.</p> <p>For example, statements about the land being inactive at this time or statements that suggest that other land users are limited or have not provided documented use of the area will be removed and repositioned so as to reflect the importance of the area to ERFN. This may result in the inclusion of additional mitigation and enhancement measures. Denison will continue to work with ERFN on the list of Project elements that ERFN feels required additional refinement or that are sources of concern as the EIS review process continues.</p>	<p>As noted in the IR response, the final EIS will be updated. To support review of the response, a few examples of updates to the draft EIS are provided, with new text in <b>bold</b>, and deleted text in <del>strike</del>through:</p> <p>Example 1:</p> <p><i>10.1.6.1.4 Human Health Risk Assessment Results</i> (excerpt only) The ingestion rate for caribou, based on engagement with a local fisher/trapper, was 175 kg/yr of caribou (equivalent to approximately 2 to 3 servings per day). This ingestion rate is conservative compared to an annual caribou ingestion rate of 2.6 kg/yr (1 to 2 servings per month) from the ERFN’s Country Food Study (CanNorth 2017) and 54.4 kg/yr for the total game diet for a high traditional foods consumer in the Boreal Shield as per the First Nations Food, Nutrition and Environment Study for Saskatchewan (Chan et al. 2018). Thus, the local fisher/trapper <b>represents</b> <del>is relatively extreme</del> <b>an intensive land user</b> with respect to local game consumption. <b>Denison recognizes that ERFN considers the fisher/trapper’s use of the area as representative of current and future land users and expects that the relationship to the Project Area will be continued and strengthened through generations of future use.</b></p> <p>Example 2:</p> <p>10.1.6.2 Residual Effects Characterization (excerpt only)</p> <p>For non-carcinogens, the results of the HHRA predicted no exceedances of the HQ benchmark (HQ&lt;0.2) for human receptors for non-carcinogens (cadmium, copper, chromium, cobalt, molybdenum, uranium, and zinc) during all phases of the Project. The one exception was selenium for the fisher/trapper at Russell Lake, where the incremental Project HQ for the fisher/trapper from fish ingestion (northern pike and white sucker) was predicted to be 0.93. <del>The traditional foods diet assumptions for the fisher/trapper are conservative and are based on engagement with a local fisher/trapper which is representative of one person, who consumes a unique composition and quantity of traditional foods. Most</del> <b>Many</b> people fishing, hunting, and trapping in the Project Area would consume traditional foods more consistent with the average traditional foods consumer diet, which was developed from the ERFN country foods study (CanNorth 2017). <b>Denison recognizes that ERFN considers the fisher/trapper’s use of the area as representative of current and future land users and expects that the relationship to the Project Area will be continued and strengthened through generations of future use.</b></p> <p>Example 3:</p> <p>11.1.2.1 English River First Nation</p> <p>Indigenous Knowledge (referred to as Traditional Knowledge or TK by the ERFN) was provided by ERFN for consideration in the EIS. This included several reports:</p> <ul style="list-style-type: none"><li>• <i>Wheeler River Project – Summary of Health and Socio-Economic Study Results</i>, which summarizes results from 16 interviews that were conducted for the health and socio-economic topics (ERFN and SVS 2022a).</li></ul>

<sup>1</sup> Unless otherwise stated, the section noted refers to the draft EIS.  
<sup>2</sup> Where IR contents note “See also related IR(s)”, responses from Denison may be similar or provided in a single detailed response, but it was preferred to keep original IRs distinct.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
							<ul style="list-style-type: none"><li>• <i>Wheeler River Project - Summary of Traditional Knowledge Study Results</i>, which analyzed and presented results from 21 land use interviews that provided both IK and LK and included details on ERFN’s resource harvesting locations, species harvested, travel routes, cabins and special sites (ERFN and SVS 2022b).</li><li>• <i>The English River First Nation Country Foods Study Final Report</i>, which conducted in 2016 through funding secured from the First Nations Environmental Contaminants Program to complete a country foods study. The study involved three components: a dietary study, a sampling program, and a human health risk evaluation. The overall study objectives were to examine country food usage by ERFN community members and to assess if the country foods are safe to eat. The involvement of ERFN community members was one of the fundamental goals of the study, which relied heavily on TK to identify what and where to sample (CanNorth 2017a).</li><li>• <i>The English River First Nation Aboriginal Traditional Knowledge Summary Report</i>, which was compiled by Environment Canada on behalf of ERFN to summarize information for the purposes of recovery of the Woodland boreal caribou population. Ten individuals (mostly Elders) were selected by ERFN to complete TK interviews to understand boreal Caribou in the English River Traditional Territory (ERFN 2011).</li></ul> <p>Local Knowledge also was provided by an ERFN trapper, fisher, and resource harvester (ERFN Trapper) who resided in and conducted resource use in the Project Area. The ERFN Trapper explained the use of the area by outfitters and cabin lease holders, fish and wildlife abundance and distribution, species harvested for traditional use, and navigation and travel along waterbodies and roads. On October 29, 2019, at Denison’s Project exploration camp, the resource user attended a full-day interview. Notes from this interview were finalized on January 2, 2020, with their approval and are used in most ILRU components herein. Unfortunately, prior to the filing of the EIS, the ERFN Trapper passed away. <b>Despite his passing, ERFN considers the ERFN Trapper’s use of the area as representative of current and future land users and expects that the relationship to the Project area will be continued and strengthened through generations of future use.</b></p>
IR-02	Canadian Nuclear Safety Commission (CNSC)	Mitigation Measures	General  Appendix 16-C	<p><b>Context:</b> Denison’s 2019 Wheeler River Terms of Reference states: “The EIA will also discuss the monitoring programs required to demonstrate regulatory compliance and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders.”</p> <p>The CNSC’s <a href="#">Generic Guidelines for the Preparation of an Environmental Impact Statement (EIS)</a>, also state: “The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the proponent intends to implement them and the environmental outcome the mitigation is designed to address.</p> <p><b>Rationale:</b> The EIS and the Summary of Monitoring and Follow-up Programs provided in Appendix 16-C contains very high-level information. It is not clear which monitoring programs will be employed to demonstrate regulatory compliance, and compliance with the commitments Denison has made to its Indigenous and non-Indigenous Stakeholders.</p>	CNSC staff expect Denison to provide a comprehensive list of commitments along with the next version of the EIS, including any commitments made to Indigenous Nations and communities and other stakeholders (As committed in the Wheeler River Terms of reference, and as noted in the November 28 <sup>th</sup> , 2022 email from CNSC staff to Denison: <i>Future Submission of a Commitments Table for Wheeler River EIS</i> ).	A list of commitments, including specific commitment or mitigation measures related to Project effects as an outcome of engagement, made in the draft EIS, throughout the Federal information request period and the Provincial comment response period, will be included with the submission of the revised draft EIS. For clarity, this would not include any private, confidential accommodations made under contractual agreements.	No EIS updates are anticipated to address this IR at this time.  Denison acknowledges that a comprehensive list of Project-related commitments will be provided for the record as part of the process of finalizing the EIS.
IR-03	CNSC	Site preparation	Section 1.3.2 Temporal Boundaries	<p><b>Context:</b> The EIS and TSD-ERA provide assessment on the project timeframe, including construction, operation, and decommissioning phases.</p> <p><b>Rational:</b> The site preparation phase is not included in the timeframe</p>	Please provide an assessment of those facility characteristics and activities that may interact with the environment during the site preparation phase, along with an assessment of their potential effects, in order to reflect the entire lifecycle or provide a rationale for its exclusion.	The EIS phase 'Construction' includes site preparation activities and as such these site preparation activities have been assessed within the EIS and the supporting documentation, including Appendix 10-A.	Section 5.3.4 of the final EIS will be modified as follows:  Temporal boundaries are based on the different phases of the Project: <b>Construction (including</b>

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
			Appendix 10-A (ERA)	(EIS and TSD-ERA). As per REGDOC 2.9.1, the sub-section 4.1.1 Complexity of the environmental risk assessment requirements states that “The applicant or licensee shall identify facility characteristics and activities that may interact with the environment during the relevant phase of the facility or activity’s lifecycle (for example, site preparation, construction, operation, and decommissioning.”		<p>EIS Section 5 Approach and Methodology of the Assessment, Section 5.3.4 outlines the temporal boundaries for the assessment and the Project activity tables used throughout the EIS include elements of site preparation in the Construction phase. The list of key project activities included in the Construction phase are included below; elements related to site preparation are shown in <b>bold</b>:</p> <p>Construction Activities</p> <ul style="list-style-type: none"><li>• <b>Development of access roads and air strip</b></li><li>• <b>Site preparation and earthworks; clearing, levelling, and grading of the Project Area</b></li><li>• Power generation - generators</li><li>• Installation of main substation and distribution of power around site</li><li>• Wellfield and freeze hole drilling; ground freezing</li><li>• Batch plant operation (concrete); crusher at borrow area</li><li>• Development of surface infrastructure (camp, operations centre, plants, ponds, pads, and support facilities)</li><li>• Waste management (composting, domestic and industrial landfill operation, recycling)</li><li>• Water management (including treatment and site runoff)</li><li>• Groundwater supply</li><li>• Surface water withdrawal</li><li>• Fuel management (e.g., propane for comfort heating; vehicle and aircraft fuel)</li><li>• On-site and off-site operation of vehicles and transport of materials</li><li>• Air transportation for workers</li><li>• Regulatory site inspections</li><li>• Engagement – site visit from Interested Parties</li></ul>	<p><b>site preparation), Operation, Decommissioning, and Post-Decommissioning</b>, as described in Table 5.3-3.</p> <p>Section 1.3.2 of Appendix 10-A will be modified in the final EIS as follows:</p> <p>Consistent with the Wheeler River Project EIS, the temporal boundaries of the assessment include the following Project phases: construction (<b>which includes site preparation</b>), operation, decommissioning, and post-decommissioning (Table 1-1).</p>
IR-04	Environment and Climate Change Canada (ECCC)	Fish and fish habitat	Section 2, Project Description Section: Glossary	<p><b>Context:</b> The Proponent defines ‘clean waste rock’ as “Waste rock generated as sandstone cuttings and core from drilling activities associated with well and freeze hole development that does not have uranium containing materials”.</p> <p>ECCC notes that the use of the term “Clean Waste Rock” could be misunderstood to mean that the waste rock is devoid of any contaminant. Even when the waste rock referred to as “clean waste rock” does not contain uranium materials, it could contain other metals or contaminants that could have adverse environmental effects. It is also not clear whether the “clean waste rock” is characterized for Acid Rock Drainage/Metal Leaching (ARD/ML) given that some portion of the basement rock is to be drilled out to anchor the freeze walls and may have ARD/ML potential.</p> <p><b>Rationale:</b> The current definition of ‘clean waste rock’ in the draft EIS could lead to inappropriate handling and disposal if it is assumed to be devoid of any metals or other contaminants that might negatively affect the environment.</p>	Provide a clear and more detailed definition of the term ‘clean waste rock’.	<p>Clean waste rock is defined as non-mineralized and non-potentially acid generating (PAG) rock. Clean waste rock will be sent to a storage pad (clean waste rock pad) that is proposed to be lined with an impermeable geomembrane collecting precipitation that will be monitored for quality and would allow for treatment if necessary.</p> <p>The clean waste rock pad is expected to hold approximately 7,800 m³ of clean waste rock.</p> <p>Further characterization and test work are ongoing to confirm the ARD/ML characteristics of this waste rock. From the historically completed testing it is recognized that the non-mineralized mine rock is expected to include both non-PAG and PAG mine rock.</p> <p>The clean waste rock pile is being evaluated for potential segregation of the PAG mine rock. However, it is noted that, as observed in the six field barrel tests on Phoenix mine rock, including four bins that were identified as containing PAG mine rock, no net-acidity was observed over at least the first two years of the field barrel testing. In all barrel tests the pH values were greater than 7 and were producing substantial alkalinity (SRK, 2020). This indicates that the potential lag-time to net-acid generation would be on the scale of years and monitoring/collection/potential treatment could be pursued as conditions at the clean rock pile develop.</p> <p>It is noted that the non-mineralized mine rock is expected to have central tendency (i.e., median) solids contents that are generally similar to the average upper continental crustal abundance contents (Rudnick and Gao, 2014).</p> <p>The field barrel tests have all maintained neutral pH conditions and metals concentrations and their respective loading rates have generally either been stable or decreasing over the test duration (SRK 2020). However, further testing is required to confirm the expected behaviour at field-scale over operational-timescales.</p> <p>It is noted that comparing field barrel leachate concentrations are not directly representative of expected contact water within an at-scale storage pad; however, it is recognized that the clean waste rock pad is of a modest size and that loadings to contact water are expected to be directly correlated with the quantity of rock held within a catchment. Further, the barrel tests were performed on materials that were crushed to less than 1mm, field-scale mine rock of larger grain sizes would be expected to have appreciably lower mass loading rates than the unit rates observed in the field cells.</p> <p>Confirmatory sampling of both the waste rock and drainage at the clean waste rock is planned during both construction and operations.</p> <p>References:</p> <p>Rudnick, R.L. and S. Gao. 2014. Composition of the Continental Crust. Treatise on Geochemistry (Second Edition) Volume 4, 2014, Pages 1-51</p> <p>SRK Consulting Inc. (SRK).2020. Wheeler River On-site Kinetic Leach Tests, Progress Update – Draft. Prepared for Denison Mines Corp. January 2020.</p>	<p>Section 2.2.4.8 of the final EIS will be updated as follows:</p> <p>Clean waste rock (<b>non-mineralized and non-potentially acid generating [PAG] rock</b>) will be generated as sandstone cuttings and core from drilling activities. Based on the current wellfield and freeze wall design, approximately 7,800 m³ of clean waste rock will be generated. Clean waste rock will be stored on a 2,500 m2 single geomembrane liner (Figure 2.2-26) and can be used for road construction and/or concrete production. <b>The clean waste rock will be assayed and tested for PAG during Operations to ensure the material can be reused when required.</b></p>
IR-05	CNSC	Change to an environmental component due to hazardous contaminants	Section 2.2.1.2	<p><b>Context:</b> Water volumes for mud/diamond drilling is listed as minimal as the mud will be re-used. The mud is identified as a mixture of water, clay, and environmentally friendly polymers that clean out the cuttings and help to keep the drilling bit cool.</p> <p><b>Rationale:</b> Although the mud for drilling will be re-used, there could be environmental impacts should there be an accident while drilling.</p>	Please identify the components of the environmentally friendly polymers for the drilling mud and potential environmental impacts should the mud not be recovered.	Two primary drilling methodologies are planned for the development of the wellfield that will be comprised of monitor, injection, recovery and freeze wells. The two primary forms of drilling are diamond and mud rotary drilling. Diamond drilling will be used for freeze, monitor and small diameter injection wells. Mud rotary drilling will be used for recovery and larger diameter injection wells. Both methodologies employ similar mud management programs as part of the drilling process in that they both use a combination of light polymer and bentonite products to stabilize the subsurface formation during drilling and well installation.	No EIS updates are anticipated to address this IR at this time.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
						<p>Various products are used at specific depths to stabilize the formation and include Ultra PAC, Sawdust, Prima Seal, Premium Gel, Prairie Drill, KCl, Hyper drill, Hydrated lime, Envirofloc, Caustic Soda, Calcium Chloride, Purevis and bentonite. All products used on the Wheeler River Project are considered environmentally friendly and safe for use for workers as indicated by their respective safety data sheet (SDS) and product data sheet (PDS. The use of drilling muds was addressed within the A&amp;M hazards screening (Table 3-2; in Appendix A of Appendix 14-A) and characterized it as a low risk event.</p> <p>Potential worker safety risks primarily include slipping hazards at the worksite as the products generally create non-adhesive bonds in surfaces that are contacted.</p> <p>All of the products used are routinely landspread on farmer’s fields in the Oil and Gas industry in both Saskatchewan and Alberta at the same quantities or greater proposed for use on the Wheeler River Project. As a vast array and combination of products are used, the specific compositions are not presented herein but are available upon request.</p>	
IR-06	CNSC	Geology and groundwater	Section 2.2.1.4, Wellfield for In Situ Recovery Mining	<p><b>Context:</b> This Section of the EIS indicates that a tracer test was completed in 2021 and a feasibility field test was initiated in 2022. No information from these tests is included in the EIS and no reporting timelines are provided.</p> <p><b>Rationale:</b> Guidance from the IAEA (2001) and best practices highlighted by regulatory regimes in other countries such as the United States (IAEA, 2016) and Australia (Geoscience Australia, 2010) indicates that single and multi-well trial (feasibility) testing for mining and remediation techniques should be carried out before a licence for full-scale operations can be granted. This is part of the requirement for proponents to demonstrate to government authorities that all potential risks have been considered during the life of operation and post-remediation of the mine.</p> <p>Additionally, Section 8.5.2 of the Generic EIS Guidelines states: “Units may be characterized as aquifers or aquitards, and unit descriptions should include their geochemical characteristics, vertical and lateral permeabilities, transport mechanism (diffusion versus advection) and the directions of groundwater flow”,</p> <p>And that “The applicant or licensee should present a conceptual and numerical hydrogeological model that discusses the hydrostratigraphy and groundwater flow systems”.</p> <p>Outcomes from the tracer test inform model parameters such as effective porosity (see IR-78), dispersion, and dispersivity (see IR-96). The wellfield leach tests and remediation trails ultimately inform environmental monitoring during site activities, and the source term for the groundwater model. This source term represents the contaminants which flow through the desilicified zone into Whitefish Lake, which represents a source of contamination considered in the ERA.</p> <p><b>References:</b> [1] International Atomic Energy Agency (IAEA). 2001. Manual of Acid in Site Leach Uranium Mining Technology. IAEA-TECDOC-1239. Vienna. 283 p. [2] International Atomic Energy Agency (IAEA). 2016. In Situ Leach Uranium Mining: An Overview of Operations. ISBN 978-1-921672-95-8. Canberra. 33 p.</p>	<p>1. Please provide a summary of the results of field tests (i.e., tracer tests, wellfield leach tests, and remediation trials) in the EIS, or provide a technical supporting document with this information, and ensure the documentation is appropriately referenced in the EIS.</p> <p>2. Please indicate how outcomes from these field tests inform the design of In Situ Recovery. This information should include:</p> <ul style="list-style-type: none"><li>feasibility of meeting remediation targets.</li><li>groundwater flow conditions and validation of flow models.</li><li>mobilization of contaminants (e.g., Al, Se or V).</li><li>potential for free gas evolution/two-phase flow.</li><li>identifying composition of lixiviant and production solutions.</li><li>success despite presence of &gt;2% carbonate minerals (siderite, FeCO3) in the ore zone (see Table 4-3 of Appendix 7-A).</li><li>site-specific data to parameterize, validate, and refine solute transport models (hydraulic conductivity, effective porosity, dispersivity, diffusion, etc.).</li></ul> <p>3. Please provide further information of proposed operations including % recovery, uranium concentrations, optimal liquid/solid ratios, anticipated reagent consumption, etc.</p>	Please see Attachment IR-06.	<p>The following text will be added to the final EIS, under a new heading, Section 2.2.1.6 ISR Mining-Related Inputs for the EIS:</p> <p>It is important to note that Denison is completing a sequential EA and licensing process for the Project (see Section 1). Detailed ISR mining-related information needed to support licensing and permitting has not been included in the EIS; it will be provided to regulators as part of permitting and licensing.</p> <p>For the EIS, an understanding of ISR design is needed to describe potential effects related to Project activities within the biophysical environment (EIS Part II, Section 6 to 9), human environment (EIS Part III Sections 10 to 13), and accidents and malfunction (Section 14) assessments. Denison used the ISR mine design and the 3D hydrogeology and contaminant transport numerical modelling of the injection and extraction wells to determine the potential interactions between mining activities and the environment. Two key outputs from the ISR mine design and 3D hydrogeology modelling work were used as inputs for the groundwater assessment (Section 7): 1) The extent of mining solution migration away from the injection and recovery well screens, as defined by the mining area (50m above the ore zone and within the freeze wall) and 2) groundwater quality of the mining area following remediation. Monitoring will be completed during operations and decommissioning to confirm these inputs.</p> <p>Importantly, since the mine design includes the freeze wall, movement of mining solution is restricted and contained horizontally during operations. Wellfield pumping provides the hydraulic containment to keep mining solution within the 50 m mining area (see Section 2.2.1.4.2). During the operation phase, and under normal operational conditions there is no interaction between the mining zone and surface water or down gradient groundwater environments, and the groundwater assessment (Section 7) focuses on the post-decommissioning period following removal of the freeze wall, once the groundwater flow paths return to pre-mining conditions. During mining area remediation (see Section 2.3.3.1.1), the freeze wall will remain in place until decommissioning objectives are achieved. Refinement of the mining area decommissioning objectives and associated modelling will be done through updates to the Decommissioning Plan, and will be bounded by the objectives evaluated in the EIS.</p>
IR-07	ECCC	Fish and fish habitat	Section 2.2.1.4.2, Wellfield Operation  Section 2.2.1.4.2.2, Secondary Containment of Mining Solution – Pumping	<p><b>Context:</b> The description in Sections 2.2.1.4.2 and 2.2.1.4.2.2 refer to the differential rates of injection and withdrawal, which implies that more solution will be withdrawn through the recovery well than volume of mining solution injected. According to the description of the site, a freeze wall will create a barrier between the uranium deposit to be mined and outside the isolated area to prevent inflow of groundwater from the sandstone outside the freeze wall. Secondly, it was indicated that the basement rock below the uranium deposit will prevent infusion of groundwater from below.</p> <p>The Proponent stated that inward hydraulic gradient will be created</p>	Clarify where the extra groundwater will come from to sustain this differential rate of injection and withdrawals during operation and if this extra water has been accounted for in the model and the amount of water that ends up in the receiving environment.	<p>The freeze wall will provide hydraulic containment between the internal wellfield and the external regional groundwater system with each well pattern maintaining a minimum 1% 'bleed' to maintain hydraulic gradients towards recovery wells.</p> <p>The "extra" water pumped (i.e., the water pumped in excess of injection) will be derived from stored groundwater within the sandstone units above the ore zone, and from the underlying paleoweathered zone, within each phase of Operation that is surrounded by freeze walls. The volume of stored water was estimated using the calibrated groundwater flow model, which contains 3D volumes for the saturated soil and rock within each of the walled phases, including appropriate porosity values. These volumes of stored water were compared to the volume pumped within each phase of operation, over the expected period of extraction</p>	No EIS updates are anticipated to address this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				<p>by recovering more solution than is being injected. In general, the wellfield will operate to draw a minimum of 1% more solution out of the wellfield compared to solutions injected in. This will help avoid increased subsurface pressures from injection pressure build up within the deposit.</p> <p><b>Rationale:</b> It is not clear where the extra groundwater will come from that will sustain this differential rate of injection and withdrawals as the freeze wall and bedrock basement will isolate the injection well from groundwater.</p> <p>If it is assumed that there is limited amount of groundwater present in the sandstone layer above the uranium deposit, that amount of groundwater in the sandstone layer is finite and will be exhausted at some point. Therefore, it is not clear where the extra groundwater will come from. If the extra volume of water is not accounted for in the modelling, that would ultimately affect the volume of water that ends up in the receiving environment and likewise the amount of contaminants contained.</p>		<p>based on the mining plan. The stored volume of water was calculated to be 3.4 (Phase 1) to 9.7 (Phase 4) times the estimated excess pumped volume. In other words, there is ample stored water within each walled phase to supply the excess pumped volume. The excess pumping creates a hydraulic gradient toward the ore zone within each walled phase, which will help to avoid vertical spreading of the UBS during operations. If monitoring during operations indicates water levels are falling quicker than anticipated, additional water could be added within the walled phase, within the Upper Sandstone Aquifer.</p> <p>The volume of water reduction within each phase of operations was evaluated within model simulations presented in Appendix 7C, Section 2.7. The volume reduction within mined phases was found to be minor compared to the volume of water pumped from the Upper Sandstone Aquifer located outside the freeze wall confines and within the regional groundwater system during decommissioning (i.e., pumping at 35.5 m<sup>3</sup>/hr). The pumping of groundwater for process water results in an order of magnitude more water volume extraction than the estimated volume required to replenish stored water when the freeze walls are thawed.</p>	
IR-08	ECCC	Change to an environmental component due to radiological contaminants	Section 2.2.1.4.2.2 Project Description	<p><b>Context:</b> This section describes how an inward hydraulic gradient will be created within the mining area as a secondary containment method for control of mining solution. While the process is described, there is no information on contingency measures in place for pump failure or system maintenance solutions. There is also no information on how quickly the hydraulic gradient, and therefore secondary containment, would be compromised if any pumps stopped working. It is also unclear how primary containment (i.e., well design) failure, such as physical/mechanical issues compromising casings, would affect the creation of the hydraulic gradient and secondary containment as well.</p> <p><b>Rationale:</b> It is important to have contingency planning in place in the event that there are any issues with the hydraulic gradient and secondary containment system for control of the acidic mining solution.</p> <p>There is no information in this section on how the hydraulic gradient (i.e., secondary containment) would be maintained if a well or pump (i.e., Primary containment) experienced problems.</p>	Provide further information regarding how the inward hydraulic gradient system functions, with particular focus on how the hydraulic gradient and secondary containment will be maintained if any wells or pumps were compromised.	<p>The following highlights the three levels of containment that will be in place to mitigate the potential for loss of containment of the mining solution. Mining solution containment was discussed in the draft EIS, Section 2.2.1.4.2 Wellfield Operation. As noted in the IR, the hydraulic gradient created in the mining zone between injection and recovery wells provides for secondary containment.</p> <p>i. Primary Containment (Well Design) The well configuration is designed to make sure fluids, whether injected or extracted, are confined to set depth locations. In the case of most injection and extraction wells, this would refer to the surface injection point and the screened location at the ore zone depth. The cased and sealed well in all other portions of the well design ensure no interaction with groundwater from other formations from surface to the deposit depth, thus preventing dilution from inward fluid flow of formation waters or outward migration from the well. Well integrity is monitored through live pressure monitoring systems in the annulus of the wells for leak detection and scheduled compliance checks via wireline tools of well integrity.</p> <p>ii. Secondary Containment (Hydraulic Gradient) Hydraulic gradients within the wellfield are maintained initially on a per pattern basis comprising of a single extraction well with four injection wells. In this initial stage of wellfield operations, all solutions from the four injection wells are drawn towards the single extraction well. As wellfield development progresses subsequent adjacent patterns are constructed. In these subsequent stages, the fluid from the injection wells is now drawn toward multiple extraction wells, essentially dividing the recovered solution between the number of operating extraction wells. As subsequent progression of wellfield development evolves, the inward hydraulic gradient of fluids injected will be further divided by adjacent extraction wells.</p> <p>In upset conditions, such as pump failure, or during scheduled pump maintenance when a given extraction well would be shut down purposefully, the fluids that would normally be recovered by a particular extraction well would then temporarily be recovered by one of the adjacent extraction wells within the larger extraction well network. This is a standard approach used in ISR mining. When the upset conditions or scheduled maintenance have been completed, the “normal” mining solution recovery pattern would be restored to the original flow path. In this way, and by design, hydraulic containment is maintained at all times.</p> <p>iii. Tertiary Containment (Freeze Wall) The freeze wall provides two main benefits:</p> <ol style="list-style-type: none"> <li>A defined area for the mining process to occur with the establishment of clear ‘no flow’ boundaries being the freeze wall itself.</li> <li>Essentially removes the effects of the regional groundwater system and regional hydraulic gradient within the confines of the freeze wall. In the event of an upset condition, groundwater velocity is essentially null preventing any migration of fluids up or down gradient. This allows time to recover any fluids in a controlled manner while re-establishing operating conditions in what would otherwise be considered a ‘stagnant’ system.</li> </ol>	<p>The following text will be added to the final EIS in section 2.2.1.4.2.2 Secondary Containment of Mining Solutions.</p> <p>“In the case of an upset condition, such as pump failure, or scheduled pump maintenance when a given extraction well would be shut down purposefully, the fluids that would normally be recovered by a particular extraction well would then temporarily be recovered by one of the adjacent extraction wells within the larger extraction well network. When the upset conditions or scheduled maintenance have been completed, the “normal” mining solution recovery pattern would be restored to the original flow path. In this way, and by design, hydraulic containment is maintained at all times.”</p>
IR-09	CNSC	Geology and Groundwater	Section 2.2.1.4.2.2	<p><b>Context:</b> This section indicates that mining solution within the mining area can primarily be controlled by maintaining an inward hydraulic gradient. The inward hydraulic gradient will be created by recovering more solution than is being injected.</p> <p><b>Rationale:</b> If, for some reason, the recovered solution is much more than that being injected, an excessive drawdown could be created. If, by accident, mining solution is leaking into the upper sandstone aquifer through crack in injection/recovery well casing at the same time, it would be challenging to remediate the upper sandstone aquifer in dry conditions (due to excessive drawdown).</p>	Please clarify if any measure will be implemented to avoid excessive drawdown and develop contingency measures to address such accident.	<p>The measures that will be implemented to avoid excessive drawdown are as follows:</p> <p>Continuous (real-time) water level monitoring will be implemented for hydraulic head measurements in individual wells as well as the surrounding open aquifer system contained within the boundaries of the freeze wall. These monitor wells will be installed at various depths throughout the mining area (i.e., within the freeze wall) ranging from the shallow groundwater system to the deposit depth and further, through the paleoweathered zone, into basement rock below the deposit and mining horizon. The mining methods operational success and efficiencies are benefitted by maintaining a shallow depth to water to reduce the magnitude of hydrostatic head needed to be applied to pump within each recovery well.</p> <p>In the event that excessive drawdown was identified through the monitoring system, it could be mitigated. Water would be pumped into the overburden aquifer to offset such injection and pumping imbalance. Water sources would include those from both groundwater and surface sources previously assessed.</p> <p>It is noted that leakage of “mining solution” into the upper aquifer is a hypothetical accident</p>	No EIS updates are anticipated to address this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
						or malfunction that would not be allowed to persist as it would be identified by monitoring. Individual wells will be monitored for integrity and well operation would stop if a leak were detected to prevent or limit migration of fluid outside of the mining zone. Further, all monitor, injection and recovery wells can be retrofitted with down hole pumps to recover solution that may have leaked or migrated in an upset condition. Additional recovery wells can be installed at select depth to further increase recovery if the need should arise.	
IR-10	ECCC	Fish and fish habitat	Section 2.2.1.4.2.3, Tertiary Containment of Mining Solution - Freeze Wall	<p><b>Context:</b> The Proponent stated that as a tertiary means of containment for the mining area, the uranium deposit is proposed to be surrounded by a freeze wall that extends from the surface to the basement rock, isolating the mining area from regional groundwater. Current plans are for the freeze wall to be a minimum of 10 m thick, be installed 25 m away from the uranium deposit, and extend 30 m into the basement rock (Figure 2.2-6).</p> <p>As explained in Section 2.2.1.4.2.2, mining solution will be injected into the ore zone under pressure and will likely react, not just with the uranium in the ore zone, but also the binding or cementing material in the sandstone. This means that some portion of the sandstone above the uranium layer and perhaps some portions of the freeze wall will dissolve, thereby creating more void than just the thickness of the uranium layer or horizon. The void may affect the integrity of the freeze wall as containment.</p> <p><b>Rationale:</b> It is not clear how the Proponent will monitor the freeze wall to verify whether portions of the freeze wall are being dissolved in the mining process and how it plans to verify the integrity of the freeze wall as a containment for the mining solution. In addition, if the dissolution reaction of the uranium ore is exothermic, then the heat generated may also affect the integrity of the freeze wall.</p>	<p>1. Explain how the integrity of the freeze wall will be maintained as a means of containment that prevents migration of the mining solution out of the ore zone into the receiving environment.</p> <p>2. Demonstrate that the mining solution injected under pressure will not compromise the integrity of the freeze wall as a containment.</p> <p>3. Demonstrate how both exothermic and chemical reactions of the mining solution used to dissolve the uranium ore will not compromise the integrity of the freeze wall as a containment.</p> <p><b>Technical Discussion Required:</b> Yes. ECCC would like to better understand the chemical constituents that compose the mining solution and the chemical reactions that it will cause.</p>	Denison met with the FIRT reviewers on April 19, 2023 to discuss the response to IR-10. Greg Newman, from Newmans Geotechnique Incorporated, attended the meeting to provide information on the freeze wall integrity and basis for the design, which relies on site field data and lived experience from several exiting Saskatchewan mining operations. A written response to IR-10, summarizing the material presented by Greg Newman, is included here as Attachment IR-10.	No EIS updates are anticipated to address this IR.
IR-11	ECCC	Change to an environmental component due to hazardous contaminants	Section 2.2.3 Project Description	<p><b>Context:</b> It is unclear how much contact water may be produced during the drilling of the mine well field during the construction phase of the proposed Project. Figure 2.2-14 indicates that no water will be produced during the drilling process in the construction phase. In Section 2.2.1.2 both mud rotary drilling and diamond drilling are proposed for the creation of wells. Both processes require water, however only mud rotary drilling produces liquid mud that is then reused in the drilling process.</p> <p><b>Rationale:</b> It is unclear if the liquid mud produced during drilling can be reused indefinitely with further water additions, or if this eventually becomes the clean sand grain cutting and how it will be disposed of (i.e., liquid or solid waste). If the mud produced from drilling is classified as liquid waste and disposed of as contact water, it is not clear if this is accounted for in the site water management plan and water balance during the construction phase. Contact water from well drilling during the construction phase has not been quantified or accounted for in Figure 2.2-1, and therefore it is unclear if proposed infrastructure during the construction phase has the capacity to contain this waste stream in addition to the waste streams currently outlined in Figure 2.2-1.</p>	Provide further information on potential wastewater produced during the construction phase from drilling processes, and if proposed infrastructure can contain any water produced.	A centrifuge will be used for separating out solids during both diamond and mud rotary drilling to recycle fluids. Only solid drill cuttings, not wastewater, will be produced and all muds and waters will be recycled as part of the drilling process. Upon completion of a drilling campaign, all remaining mud and water will be stripped of remaining solids, treated with mud zymes to break down polymers, and injected back down into the mineralized horizon. During active drill campaigns clean water will be held in approved tanks as part of the drill program between well drilling.	No EIS updates are anticipated to address this IR.
IR-12	ECCC	Change to an environmental component due to hazardous contaminants	Section 2.2.3, Project Description	<p><b>Context:</b> There is not enough information provided within the draft EIS and site water infrastructure designs to determine if the infrastructure will sufficiently contain mine site contact and non-contact water runoff. It is unclear how water management will occur during all proposed Project stages at the Project airstrip, which is located away from the main Project site. No information has been provided regarding water that may come into contact with fuels and oils from machinery on the air strip, how and where that contaminated water will be treated, and how surface runoff around the airstrip will be managed. Additionally, it is unclear if contaminants from heavy machinery on roads have been considered during runoff collection plans throughout the mine Project site. Water management at the airstrip and roads can have impacts on surface water quality and sediment quality and contaminants (e.g., Hydrocarbons) from these sources should be considered in overall site water management plans.</p> <p>In Section 2.2.3.1 a site drainage plan for contact and non-contact water has been provided in Figure 2.2-17, and water balances have been provided for the different Project phases in Figures 2.2-14 to 2.2-16. In Section 2.2.3.4 a volume of 30,000m3 for the process water pond is provided, and it is stated that the process water pond has the capacity to contain Probable Maximum Precipitation (PMP) event estimated to be 483.3mm while allowing for 1.0m of freeboard. However, there are no estimates on the total volume of water that may be drained from the overall site infrastructure (i.e., the well field, processing areas, etc.) during a 24-hr PMP event. Additionally, in Figure 2.2.17 culvert locations are provided, however there is no further information on culvert designs, flow ratings and capacity for PMP events.</p>	<p>1. Provide information on how contact and non-contact water from the site airstrip will be managed. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</p> <p>2. Provide further information on how potential contaminants in runoff from roads have been considered in the site water management. Include information on potential contaminant characterization and loadings and an assessment of risk to the environment.</p> <p>3. Provide estimated volumes of water to be drained from overall site infrastructure (such as the mine terrace, airstrip, camp area etc.), during a 24-hr PMP event.</p> <p>4. Provide additional information on culvert designs and conveyance capacity for PMP events.</p>	<p>1. and 2. Denison's approach to site water management is keep non-contact water “clean” – that is, the management approach provides that non-contact water does not come into contact with site aspects that may impart constituents/contaminants of concern and that non-contact water mingles with contact water. Contact water is water expected at the wellfield and processing plant terrace (refer to runoff collection arrows shown in draft EIS Figure 2.2-17), and also includes leachate collected from landfills. As such, runoff from the airstrip and site roads is considered non-contact water and will not be actively managed. However, should a spill occur, the spill response plan will be followed. Details of Denison's response plans will be developed to support licensing as part of the Waste Management and Emergency Management and Fire Protection programs.</p> <p>By following best practice and mitigation measures outlined in the EIS, Denison does not anticipate a need to continually manage water at the airstrip or along site roads as the water here will be clean, non-contact runoff. Examples of relevant mitigation measures include:</p> <ul style="list-style-type: none"><li>• Project components including equipment and machinery will be regularly maintained and inspected to make sure they are in good working order.</li><li>• Fuel storage and distribution infrastructure will be constructed in accordance with applicable legislation requirements.</li><li>• Fuels will be stored in approved, above-ground, double-walled storage tank(s) equipped with secondary containment in accordance with provincial regulations and standards.</li><li>• A wash bay will be available to clean items, equipment, and vehicles that may have been in contact with potential contaminants.</li></ul> <p>Refer to Section 14 of the draft EIS for the screening and evaluation of various accident and malfunction scenarios. Should unplanned events or conditions occur, it will be important for Denison to address and respond in an appropriate manner. Details of Denison's response plans will be developed to support licensing as part of the Waste Management and Emergency Management and Fire Protection programs. Additionally, should unexpected water pooling be observed at the airstrip or site roads during Operation, temporary water</p>	No EIS updates are anticipated to address this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				<p><b>Rationale:</b> In order to be able to understand site water management and flood risk potential, more information needs to be provided regarding the site water infrastructure designs and capture volumes during PMP events. This information will aid ECCC in understanding how contact and non-contact water will be conveyed throughout the site. Runoff from roads and the site airstrip will contain contaminants from vehicles, heavy machinery, aircrafts and de-icing practices. Additional information on the runoff collection systems and expected contaminant concentrations for the site airstrip and roads is needed to determine if the receiving environment and aquatic and terrestrial receptors are protected.</p>		<p>removal means such as vac trucks or sump pumps could be employed and the areas would be re-graded to minimize water accumulation.</p> <p>3. As indicated in the response to IR-12, points 1 and 2 above, Denison expects contact water requiring management is at the wellfield and processing plant terrace (refer to runoff collection arrows shown in draft EIS Figure 2.2-17). For this area, the volume of water expected during a 24-hour PMP of 493 mm is approximately 37,240 m<sup>3</sup>. The wellfield runoff pond has been sized appropriately (38,200 m<sup>3</sup> with 1 m of freeboard) to contain this volume of water.</p> <p>4. Details related to culvert design and conveyance capacity are being developed as part of ongoing engineering activities. Culverts will be a designed with a sufficient size and length to convey water around the site during a PMP event.</p>	
IR-13	ECCC  CNSC	Fish and fish habitat	Section 2.2.4, Waste Management  Section 2.2.7.7, Borrow Area  Section 2.3.1.3 Site Preparation and Earthworks	<p><b>Context:</b> The Proponent indicates that a borrow area is planned for an area northeast of the processing plant. The borrow material or overburden will be used during construction for roads, airstrip, pads, and in the batch plant for concrete production needs, during Operation for ongoing maintenance of various Project components and during decommissioning for fill and cover material. Suitable construction fill material will be sourced from the proposed borrow area and any suitable clean sandstone generated during freeze wall and well drilling (Section 2.2.7.7).</p> <p>It was also noted in Sections 2.2.1.3 and 2.2.14 that the freeze wall will be established by drilling over 300 vertical holes from surface to the basement rock. The freeze holes will extend 30 m into the basement rock and will produce waste rock from basement rock (Figure 2.2-6). However, there is no information whether the waste rock from basement rock would potentially be acid generating and/or metal leaching. This means that all the extra 30 m of basement rock should also be characterized for potential ARD/ML to determine use or appropriate disposal.</p> <p><b>Rationale:</b> ECCC notes that the Proponent did not indicate whether the borrow material and the drill out part of the sandstone layers and basement rock will be tested for Acid rock drainage/metal leaching (ARD/ML) potential before they will be used during construction, operation and decommissioning. ARD/ML is an environmental hazard that will have an adverse effect on waterbodies frequented by fish.</p> <p>Potential acid generating and metal leaching waste rock could pose negative impacts on the environment if they are not managed adequately.</p>	<p>Please provide:</p> <p>1. Information on whether the waste rock from the basement rock is potentially acid generating and metal leaching;</p> <p>a. Confirm that any borrow material to be used for construction will be characterized for potential ARD/ML.</p> <p>b. Confirm that the part of waste rock recovered from the basement rock, will also be tested for potential ARD/ML.</p> <p>2. Criteria for segregating the potential acid generating and metal leaching waste rock, if it exists, from clean waste rock; and,</p> <p>3. A plan to manage the potential acid generating and metal leaching waste rock, if it exists.</p>	<p>1. The waste rock from the basement is potentially acid generating due to localized pyrite mineralization. Select and systematic assays are conducted to characterize pyrite distribution throughout the deposit and adjacent geological units. Rock recovered from basement during drilling will be further characterized prior to or during drilling activities.</p> <p>1a. Borrow pit area selection was based on geotechnical program completed in 2021 which did not identify any potential for ARD/ML. Further explorative works are ongoing part of ongoing Engineering activities and with confirmation of characterization through assays of representative samples.</p> <p>1b. Basement rock will be tested for potential for acid generation. It is expected that a portion will be potentially acid generating. Select and systematic assays are conducted to characterize pyrite distribution throughout the deposit and adjacent geological units.</p> <p>2. All basement rock will be stored on the special waste pad. Waste rock from the sandstone will also be characterized primarily based on geological and geochemical characteristics, and if a portion of the waste rock is potentially acid generating, it will also be stored on the special waste pad. See also response to IR-04</p> <p>3. Clean waste rock will be generated as sandstone cuttings from drilling activities. Clean waste rock will be stored on the clean waste rock pad. The clean waste pile will be assayed and tested for Potential Acid Generation (PAG) during operations to ensure the material can be reused when required. Potentially acid generating waste rock will be stored on the special waste pad. Special waste is defined as mineralized materials that cannot be disposed of in the clean waste pile. It is primarily made of drill cores and cuttings from wellfield construction. A double-lined process water pond with leak detection has been designed to capture water from various areas, including the process precipitates storage pad and special waste pad. The pond will be designed to hold up to 30,000 m<sup>3</sup> of water and will be located next to the processing plant. The pond has been designed to hold a probable maximum precipitation event. The pond will be able to receive water from all site ponds and monitoring wells.</p> <p>The ponds that are designed to receive materials recovered during drilling activities are all lined with a leachate collection pond that will be monitored for water quality. The environmental monitoring program that will be presented during licensing will cover characterization of materials placed in the clean and special waste ponds to ensure environmental protection.</p>	<p>Section 2 of the final EIS will be updated per below:</p> <p>2.2.4.7 Special Waste and Special Waste Pad</p> <p>During Operation, the special waste pad is expected to contain special waste that is primarily mineralized core, <del>and</del> cuttings from wellfield development, <b>basement rock, and any waste rock determined to be potentially acid generating (PAG)</b>. Special waste from drilling activities is defined as uranium containing materials that cannot be disposed of in the clean waste pile, <b>including PAG waste rock</b>. Special waste will be determined by Denison geologists based on ore zone intersection expectations, <del>and</del> probe reading taken during wellfield drilling activities, <b>and results of systematic assays to characterize the acid generating potential of the waste rock</b>. Based on the current wellfield and freeze wall design, approximately <del>150</del> <b>2,000</b> m<sup>3</sup> of special waste rock will be generated.</p> <p>Denison will examine opportunities to reprocess the mineralized core and cuttings generated during wellfield development to recover uranium. This reprocessing may be done by placing the material in tanks with mining solution or placing the material underground into the mining area at the end of a well's production.</p> <p>The special waste pad may be used to temporarily store other materials that may be radioactive (e.g., contaminated soil) prior to final disposal in the industrial landfill or a licensed off-site facility.</p> <p>The special waste pad is estimated to be 2,500 m2 in size and will be constructed with a double composite liner system with leak detection capabilities (Figure 2.2-25). Any contact water coming off the special waste pad will be directed to the wellfield runoff pond (Section 2.2.3.5).</p> <p>2.9.1.3.3 Waste Management Program</p> <p>The Waste Management Program would include requirements and processes to ensure that Denison's activities that involve planning for, handling, transporting, processing, storage, and disposal of wastes are performed in a manner that complies with applicable regulatory and licence requirements and protects workers, the public, and the environment.</p> <p>The Waste Management Program would include identification of waste inventory and the characteristics of the waste (radiological and hazardous non-radiological), waste segregation, waste packaging and transfer requirements, and the plan for storage or disposal of the wastes. <b>The Waste Management Program will detail the plans for waste rock segregation based on mineralized content and acid generating potential.</b></p>

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
IR-14	CNSC	Wastes and Decommissioning	<p>Section 2.3.3.1.3 Decontamination, Demolition, and Disposal (p. 2-82)</p> <p>Table 4.3-2: Key Issues and Concerns from English River First Nation (p. 4-33)</p>	<p><b>Context:</b> The EIS states “Concrete foundations will be left in place. Any portions of concrete foundations remaining above grade will be levelled and rebar will be cut-off at grade. Large slabs will be perforated on a 2-m grid to permit drainage. Concrete slabs will be covered with 0.5 m of development rock or locally stockpiled till.” (p. 2-82)</p> <p>Further, Denison notes that “Concern about responsible authority for restoring the environment, including contaminants when mining concludes. How long will it take to have the environment fully restored and, if Denison is no longer the operator, how will this be completed?” (p. 4-33). This comment status is noted as <i>Complete</i>.</p> <p><b>Rationale:</b> Permanent structures will remain following decommissioning, according to the excerpt above. It’s unclear how engagement activities influenced Denison’s planned decommissioning approach, or how the comment above has been addressed or received.</p>	<p>How has the proposal to leave these foundations in place been received by the Indigenous Nations and communities during engagement sessions? Have engagement activities influenced Denison’s planned decommissioning approach? Describe in additional detail how the comment from p. 4-33 has been addressed and how this has been received by those who expressed this concern?</p>	<p>Denison understands the importance of demonstrating to the CNSC how issues and concerns raised by Indigenous nations and communities have been resolved, or where this has not been achieved, how Denison can demonstrate its efforts towards doing so and/or rationale for where agreement has not been reached. Please see response to IR-28 for information on how Denison will provide this information as the EA process advances.</p> <p>The option to leave concrete foundations in place will be discussed with Indigenous Nations and communities as decommissioning plans become more defined.</p> <p>The conceptual decommissioning plan (CDP) included in the draft EIS contains the appropriate level of detail for this stage of the Project. As described in Section 2.3.3, the details of the decommissioning plan will evolve and become more specific as the Project advances. The subsequent iteration of the plan is the preliminary decommissioning plan (PDP). The PDP will be submitted to regulators as part of Project licensing and permitting and will provide additional detailed information with respect to site decommissioning. The PDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission. Prior to executing decommissioning activities, Denison shall prepare and submit a detailed decommissioning plan (DDP) to regulators for acceptance, which builds on the PDP. In this case the DDP would reflect input that will be solicited from Indigenous Nations and communities and others prior to its submission and would also be informed by conditions on the ground at the site at that time, operational experience that has been gained and the regulatory landscape at that time. As is highlighted above, the decommissioning plan will evolve over time and the plan will become more refined as the Project advances. Denison is committed to continue to engage with Indigenous Nations and communities to solicit input.</p> <p>The comment in Section 4 on page 4-33: "Concern about responsible authority for restoring the environment, including contaminants when mining concludes. How long will it take to have the environment fully restored and, if Denison is no longer the operator, how will this be completed?" was addressed in the draft EIS in the following manner:</p> <p>- Concern about responsible authority for restoring the environment, including contaminants when mining concludes: Denison is responsible for decommissioning. Denison’s decommissioning commitment is to return the land back to the Province of Saskatchewan for unrestricted surface land use post-closure.</p> <p>- How long will it take to have the environment fully restored: Based on best practice and technical studies completed for the Project, the active decommissioning phase is anticipated to be 5 years. The Post-Decommissioning phase extends from the end of physical decommissioning until transfer of the site into the provincial Institutional Control Program (Government of Saskatchewan 2009) or direct release of the land back to the Crown. Post-Decommissioning is expected to last 15 years and during this phase, monitoring will be conducted until the site-specific decommissioning and reclamation objectives for the Project are met.</p> <p>- if Denison is no longer the operator, how will this be completed?: The financial assurance process provides certainty that the Project can be decommissioned as planned. The Project will not be issued an approval to operate until the decommissioning plan and associated cost estimate are accepted by the Minister of Environment and the financial assurance is in place. If Denison is unable to complete the decommissioning for any reason (e.g., bankruptcy), the finances are available for the Province of Saskatchewan to complete the activities as planned. The PDP will include an associated estimate for the decommissioning costs and Denison will provide financial assurance to confirm the identified decommissioning activities can be completed as planned. Updates to the financial assurance are done in conjunction with updates to the decommissioning plan, on a frequency of every five years during operations.</p> <p>References: Government of Saskatchewan. 2009. <i>Institutional Control Program: Post Closure Management of Decommissioned Mine/Mill Properties Located on Crown Land in Saskatchewan</i>. Ministry of Energy and Resources. December 2009.</p>	<p>Refer to IR-28 for information on EIS updates related to issues and concerns.</p>
IR-15	ECCC	Fish and fish habitat	<p>Section 2.2.3.4 Project Description</p> <p>Section 8.1.3.4.2, Aquatic Environment</p>	<p><b>Context:</b> In Section 2.2.3.4 it is stated that the estimated PMP event for Project infrastructure planning is 483.3mm. In Section 8.1.3.4.2 it is stated that the PMP is 489.3 mm.</p> <p><b>Rationale:</b> It is unclear which value is the correct PMP value and if Project infrastructure has been planned correctly.</p>	<p>Provide the correct PMP value and verify that Project infrastructure has been designed utilizing the correct value.</p>	<p>The PMP event used for feasibility engineering designs is 493 mm. The PMP value has been extrapolated from Key Lake data presented in the Canadian Climate Program (1994). Denison reviewed the update to the Canadian Climate Program (1994) report provided in Atmospheric Environment Branch (1999) which shows PMP at the approximate Wheeler River Project location at 489.3 mm. Denison retained the higher of the two PMP values, i.e., 493 mm, for design purposes.</p> <p>The PMP value in Section 2 will be updated from 483.3 mm to 493 mm in the final EIS. The PMP value used in Section 8 (489.3 mm) will not be updated because it is less than the design PMP and, as such, was conservative.</p> <p>References:  Canadian Climate Program. 1994. Point Probable Maximum Precipitation in Northern Saskatchewan. R.F. Hopkinson Scientific Services Regina Operations Building, Regina Airport. Regina, Saskatchewan. Report No. CSS – R94 – 01.</p> <p>Atmospheric Environment Branch. 1999. Environment Canada Prairie and Northern Region – Point Probable Maximum Precipitation for the Prairie Provinces. Atmospheric Environment Branch, Atmospheric and Hydrologic Sciences Division. Regina, Saskatchewan. Report No. AHSD – R99 – 01.</p>	<p>Section 2.2.3.4 of the final EIS will be updated as follows: “The pond will be surrounded by a 2.0 m berm, have capacity for 0.5 m storage from a probable maximum precipitation (PMP) event estimated to be <del>483.3 mm</del> 493 mm, and allow for maintenance of 1.0 m of free board.”</p>

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
IR-16	CNSC	Human health with respect to hazardous contaminants	Section 2.2.3.8	<p><b>Context:</b> The EIS and technical supporting documents do not provide sufficient justification for the selection of the proposed wastewater treatment systems for the industrial wastewater treatment plant or the domestic wastewater treatment plant.</p> <p>In addition, it is not clear how the upper bound of the industrial wastewater treatment plant effluent quality was obtained.</p> <p><b>Rationale:</b> Draft REGDOC-2.9.2 formally documents the CNSC’s expectations to licensees for controlling releases to the environment. For proposed new facilities, these expectations include conducting a best available technology and techniques, economically achievable (BATEA) Assessment, and determining key parameters necessary to support the EIS. These include identifying:</p> <ul style="list-style-type: none"> <li>environmental release targets to inform the design of wastewater treatment systems to constrain the quantity and concentration of contaminants and physical stressors released into the environment,</li> <li>the best available technology and techniques through an options analysis; and</li> <li>the anticipated influent characteristics, overall treatment efficiencies, and maximum predicted design release as the output of the assessment.</li> </ul> <p>Consideration of the principle of pollution prevention and BATEA is also a requirement of REGDOC-2.9.1.</p> <p>CNSC staff have met with Denison to discuss the expectations in draft REGDOC-2.9.2.</p>	<p>Please provide a summary of the BATEA assessment to justify the selection of the wastewater treatment plant system.</p> <p>As part of the summary, please identify the anticipated environmental release targets used to inform the design, as well as the maximum predicted design release concentrations and loadings to the receiving environment. The maximum predicted design releases should be used in the ERA to demonstrate protection of people and the environment.</p>	<p>Denison is undertaking a sequential EA and licensing process under the NSCA. For context, the EA process for a Project under CEAA 2012 and the Saskatchewan Environmental Assessment Act is long and complex. As such, the inputs and outputs (e.g., effluent quality) needed for the EIS were developed by Denison’s Project engineers early in the EA process to allow for the biophysical and human assessments to advance. An example of one of these outputs is the IWWTP effluent quality. The effluent quality predictions in the EIS provide a bounding scenario of the basis of the assessment of Project effects.</p> <p>As stated in the Draft REGDOC 2.9.2 Denison understands that a BATEA assessment be conducted to determine the predicted design release characteristics as part of the licence application for a new facility or activity.</p> <p>Outside of the EIS process, the Project detailed engineering is progressing, including the design of the IWWTP and associated refinement of effluent quality predictions. Denison is following Draft REGDOC 2.9.2 to arrive at a treatment option that remains within the bounds of the EA, which ultimately predicts no significant impacts to the receiving environment. The maximum design release characteristics for the IWWTP will be provided as part of Denison’s licence application to the CNSC.</p> <p>Denison met with the CNSC specialist from the Health Sciences and Environmental Compliance Division on December 7, 2022 to discuss the approach associated with a sequential EA and Licensing, and it was agreed that the above approach is acceptable.</p> <p>Denison is committed to completing the BATEA and providing the details to the CNSC.</p>	No EIS updates are anticipated to address this IR.
IR-17	CNSC	Human health with respect to hazardous contaminants	Section 2.2.3.8	<p><b>Context:</b> It is also acknowledged that Denison stated in meetings with CNSC staff that Denison intends to propose final release targets to the CNSC as part of the licence application submission.</p> <p><b>Rationale:</b> It is not clear in the submission whether Denison has considered whether any applicable technology-based performance standards exist in Canada or internationally, and would be relevant as effluent discharge targets, in order to ensure principles of pollution prevention are applied. Consideration of this would help ensure that the proposed effluent discharge targets harmonize with existing federal, provincial/territorial, and/or municipal requirements. For example, there are release limits for radium-226, TSS, and pH outlined in the federal Metal and Diamond Mining Effluent Regulations, which have been demonstrated to be achievable in the uranium mine and mill industry.</p> <p>In addition, countries like the United States, where in-situ recovery has been conducted in the past, have specific technology-based limits. These are known as New Source Performance Standards and are identified in US Code of Federal Regulations (US CFR) 40, Chapter 1, Subchapter N, Part 440 - Ore Mining and Dressing Point Source Category. It is not clear whether these have been considered in Denison’s assessment. These should be considered when identifying suitable achievable technologies.</p>	Denison should harmonize their proposed Effluent Release Targets with the technology-based performance standards that exist in the Metal and Diamond Mining Effluent Regulations where applicable, or other suitable international regulations.	<p>Denison appreciates the comment and is committed to meeting all MDMER release targets.</p> <p>The effluent quality predictions in the EIS provide a bounding scenario of the basis of the assessment of Project effects. Denison is undertaking a sequential EA and licensing process under the NSCA. For context, the EA process for a Project under CEAA 2012 and the Saskatchewan Environmental Assessment Act is long and complex. As such, the inputs and outputs (effluent quality) developed for the IWWTP were necessary and determined by Denison’s Project engineers early in the process to allow for the EIS biophysical and human assessments to advance.</p> <p>Proposed effluent release to the environment starts at Operation phase and BATEA information will come with the application for the license to operate. Please also see response to IR-117.</p> <p>The anticipated effluent quality of constituents of potential concern during normal operations presented in the EIS is based primarily on lab tests conducted by Denison with a safety factor of three added. Section 3.1.1.2 of the ERA (Appendix 10-A) states: "The reasonable upper bound treated effluent was derived using a combination of information available from lab tests conducted by Denison as well as derived effluent quality based on not exceeding water and sediment quality guidelines in Whitefish Lake. Effluent treatment feed solution was prepared by leaching drill core material from the Phoenix deposit, and further processing that solution through two steps (process precipitate removal and yellowcake precipitation) prior to effluent treatment testing. Effluent treatment tests incorporated three stages: low pH, high pH, and neutralization. A combination of reagents (iron sulphate, barium chloride, lime, and sulphuric acid) was used to facilitate precipitation of constituents. After each stage, solid-liquid separation was conducted by mixing flocculant with solution to settle solids to the bottom of the test vessel. The supernatant liquid was used for the following stage. The solids were washed, filtered, and dried to determine solids mass generation for mass balance purposes. For each stage, the liquids and solids were assayed for various COPCs. The reasonable upper bound effluent was usually an expected effluent quality from Denison multiplied by a safety factor of three."</p> <p>Denison intends to continue to refine effluent quality predictions as part of the BATEA assessment and licensing phase of the Project (see IR-16). The effluent quality predictions provided in the EIS will continue to bound the assessment, and provide a conservative representation of risk to human health and the environment.</p>	No EIS updates are anticipated to address this IR.
IR-18	ECCC	Change to an environmental component due to hazardous contaminants	Section 2.2.3.9, Project Description Appendix 8-E	<p><b>Context:</b> In Table 2.2-1 the upper bound Industrial Wastewater Treatment Plant (IWWTP) effluent quality final discharge targets for Constituents of Potential Concern (COPCs) are provided. General parameters (e.g., temperature, pH, etc.), and several Schedule 4 Substances with maximum authorized concentrations (lead, nickel, suspended solids, and un-ionized ammonia) under the Metal and Diamond Mining Effluent Regulations (MDMER) have not been provided in this table. There are several COPCs (aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese) for effluent characterization under Schedule 5 Section 4 of the MDMER that have not been provided in this table. Additionally, no information on water quality guidelines has been provided in this table.</p> <p>Furthermore, it is stated that the final effluent quality discharge target for uranium is 0.057 mg/L. However, the Canadian Council of Ministers of the Environment (CCME) water short term (acute) water quality guidelines for the protection of aquatic life is 0.033 mg/L. The</p>	<ol style="list-style-type: none"> <li>Update Table 2.2-1 and Appendix 8-E to include all general parameters required for environmental effects monitoring: pH, temperature, hardness, alkalinity, and conductivity.</li> <li>Update Table 2.2-1 and Appendix 8-E to include missing Schedule 4 Substances under the MDMER with maximum authorized concentrations: lead, nickel, suspended solids, and un-ionized ammonia.</li> <li>Update Table 2.2-1 and Appendix 8-E to include missing Schedule 5 Section 4 parameters required for effluent characterization under the MDMER: aluminum, mercury, iron, nitrate, thallium, phosphorus and manganese.</li> <li>Include all acute and chronic water quality thresholds for each parameter in Table 2.2-1 and Appendix 8-E.</li> </ol>	<p>Denison fully understands its obligations with respect to the MDMER and will comply with the MDMER end of pipe effluent discharge criteria and other requirements of the regulations. The lack of the MDMER general parameters and Schedule 4 substances in the draft EIS table 2.2-1 should not be misconstrued to mean Denison was not intending to meet these requirements. Rather these tables were developed based on rigorous screening to identify COPCs and then model these in the receiving environment. Table 2.2-1 in the draft EIS is not reflective of the proposed monitoring parameters during effluent release. Regardless, Denison will update the table; please see the response below.</p> <p>1) Please see attachment IR-18 for updated Table 2.2-1 which is consistent with the updated Table 8.2-10 (as updated for IR-114). Parameters specific to Schedule 4 have been assessed and predicted. Schedule 5 parameters are included where available. As Schedule 5 parameters do not have screening criteria, they will be monitored by Denison consistent with the MDMER upon falling under this regulation.</p>	Table 2.2-1 and Appendix 8-E will be updated in the final EIS; the updated version of the table is provided in attachment IR-18.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				<p>proposed effluent discharge target for uranium exceeds the acute water quality guidelines, indicating effluent may pose the risk of being acutely lethal to aquatic biota at end-of-pipe.</p> <p><b>Rationale:</b> ECCC requests the Proponent include the general water quality parameters that influence water quality thresholds, parameters in Schedule 4 and Schedule 5 Section 4 of the MDMER, and their respective water quality guidelines for consideration and transparency.</p> <p>Discharges from the proposed Project will alter water quality in the immediate receiving area, and this may include some sublethal effects on aquatic biota, which must be minimized. It remains the Proponent’s responsibility to adhere to the MDMER to ensure that effluent at the end-of-pipe from all final discharge points be non-acutely lethal and meet requirements for prescribed deleterious substances under Schedule 4 of the regulations.</p>	<p>5. Describe additional mitigation measures that can be considered to minimize impacts to aquatic biota from uranium concentrations in effluent.</p>	<p>2) Please see attachment IR-18 for updated Table 2.2-1 which is consistent with the updated Table 8.2-10 (as updated for IR-114). Parameters specific to Schedule 4 have been assessed and predicted.</p> <p>3) Please see attachment IR-18 for updated Table 2.2-1 which is consistent with the updated Table 8.2-10 (as updated for IR-114). Parameters specific to Schedule 4 have been assessed and predicted. Schedule 5 parameters are included where available. As Schedule 5 parameters do not have screening criteria, they will be monitored by Denison consistent with the MDMER upon falling under this regulation.</p> <p>4) Please see attachment IR-18 for updated Table 2.2-1 which is consistent with the updated Table 8.2-10 (as updated for IR-114). Applicable screening criteria have been updated to identify most applicable acute or chronic thresholds for the protection of aquatic life.</p> <p>5) As noted in response to IR-16 and IR-17 effluent discharge criteria as depicted in the draft EIS provide a bounding scenario of the basis of the assessment of Project effects and final effluent quality will meet prescribe limits developed through licensing and permitting, as informed by the BATEA evaluation process. In that context, it is expected that the uranium concentration in effluent would be lower than assumed for the purpose of the evaluation in the draft EIS and it is understood that uranium concentrations (or concentrations of other constituents) that resulted in acute toxicity would be not be permitted. Accordingly, the need for and types of mitigation measures as might be needed for uranium (or other constituents) would be developed as part of the process of developing final effluent quality limits in the permitting and licensing processes.</p>	
IR-19	ECCC	Change to an environmental component due to radiological contaminants	Section 2.2.4 Project Description	<p><b>Context:</b> In this section, it is proposed that the IWWTP precipitate pond will have a single geosynthetic composite liner system, which is used for ponds/pads that only store non-radioactive materials.</p> <p>However, from Section 2.2.3.9 on industrial wastewater treatment, it is unclear if the precipitates from the stage three neutralization process that are pumped to the IWWTP precipitates pond will have any residual radioactivity.</p> <p><b>Rationale:</b> For the protection of the surrounding environment, it is important that any ponds/pads that are expected to store radiological contaminants be designed to have proper controls (i.e., liners with monitoring systems) in place.</p>	<p>1. Confirm the characterization of the precipitates that are to be stored in the IWWTP precipitate pond.</p> <p>2. If radiological constituents are expected within those precipitates, update the draft EIS to ensure the proposed geosynthetic liner system for the IWWTP precipitate pond will be adequate to ensure the protection of the surrounding environment.</p>	<p>1. The IWWTP precipitate pond will contain non-radiological, gypsum-like material. As outlined in Section 2.2.4.5 and 2.2.4.6, any radioactive precipitates generated during the first stage of the IWWTP will be directed to the process precipitate pond, not the IWWTP precipitate pond.</p> <p>Waste segregation and management will be important for Denison during Operation. The Waste Management Program will be established and approved by the CNSC as part of licensing. Denison will conduct regular assays of slurry sent to the IWWTP precipitate pond during Operation to confirm the quality of these precipitates.</p> <p>2. In consideration of the above, radiological constituents are not expected within the IWWTP precipitate pond.</p>	No EIS updates are anticipated to address this IR.
IR-20	NRCan	Fish and fish habitat	Section 2.3.3.1.1 Appendix 7-C	<p><b>Context:</b> The proponent’s objective for mining area remediation is to restore the groundwater within the confines of the freeze wall to an acceptable remediation target (EIS, sec. 2.3.3.1.1). The proponent’s acceptable decommissioning objectives for groundwater quality are provided in EIS Table 2.3-3 and in Table 3-5 of Appendix 7-C. These objectives were based on laboratory core flood tests performed by flushing samples of ore with groundwater and groundwater amended with sodium hydroxide or sodium bicarbonate. The composition of the remediated groundwater observed in the core flood tests serves as the source term for the post-decommissioning reactive transport modeling presented in section 4 of Appendix 7-C.</p> <p><b>Rationale:</b> In NRCan’s opinion, it is important for reviewers to be able to assess the level of remediation achieved in order to reach the proponent’s decommissioning groundwater quality objectives. Therefore, the proponent should provide complete water quality data for the pregnant lixiviant that remains in the ore zone after the end of mining and prior to any remediation.</p>	<p>NRCan requests that the proponent revise Table 3-5 of Appendix 7-C to show the water quality in lixiviant remaining in the ore zone at the end of mining, prior to remediation activities.</p>	<p>Please see response to Attachment IR-20, IR-67, IR-69.</p>	In the final EIS, Table 3-5 in Appendix 7-C will be updated. The updated table is provided here as Appendix B to Attachment IR-20, IR-67, IR-69.
IR-21	ECCC	Change to an environmental component due to hazardous contaminants	Section 2.3.3.1.3, Project Description	<p><b>Context:</b> The decommissioning process for the wellfield and associated infrastructure is discussed, however there is no information provided on the potential risk for subsidence of the ground above the depleted uranium deposit. After the uranium has been dissolved and pumped to the surface, a cavity will be formed in the area where the uranium used to exist. This could destabilize the overlying substrates, causing the ground at the surface to sink in the future. There is currently no information regarding this risk, and how it may alter the overlying environment, surface water features, runoff, or existing nearby waterbodies.</p> <p><b>Rationale:</b> From a surface water and sediment quality perspective, it is important to understand how potential subsidence in the future post-decommissioning may affect the existing environment. It is currently unclear if there is any risk to the aquatic environment if subsidence were to occur and alter existing waterbodies, create new surface water features, or if there will be any risk to the decommissioned onsite industrial landfill and industrial wastewater treatment plant precipitate pond.</p>	<p>Provide further information on the potential risks from subsidence including the probability of occurrence, how it may affect surface water features, and if there exists any risk to the planned decommissioning of waste management infrastructure.</p>	<p>To clarify, the portion of the deposit being mined is never truly a void and what remains after mining will be a honeycomb texture with water-filled interstices. The mined area is filled with a fluid at all times, whether it be a mining solution, groundwater, or the neutralizing solution. This is different from a more traditional underground operation such as Cigar Lake, where there is physical excavation of the orebody, leaving a temporary air-filled space. Although the uranium ore is high-grade by global standards it is not entirely massive in nature. As such, the uranium will be leached in a 'honeycomb' texture leaving behind a structure of partial intact rock mass with the remaining area being filled by fluid. This retains the pressure balance of the mining zone with the adjacent water-saturated rock masses.</p> <p>Although the above provides context on the absence of true, air-filled voids remaining post-mining, the risk of subsidence has been assessed appropriately (included in the draft EIS as Appendix K to Appendix 7-C; see also draft EIS Section 7 Geology Valued Component - Terrain Morphology and Stability Key Indicator and draft EIS Section 9 Terrain Valued Component - Terrain Morphology Key Indicator and Terrain Stability Key Indicator). The analysis shows there is negligible risk of subsistence and the magnitude of subsistence, if it were to occur, is the range of 7.5 cm at surface. Subsequent to the filing of the draft EIS, Denison undertook additional modelling with refined, more granular inputs including consideration of subunits within the altered zone (RESPEC 2023). With this more refined analysis, the potential surface subsidence has been reduced from 7.5 cm to 2.4 to 2.8 mm (RESPEC 2023 is included here as Attachment: IR-21).</p> <p>Further, this potential subsidence, if it were to occur, would be limited to the footprint directly above the deposit which will not contain any decommissioned waste management infrastructure. Two main Project components containing waste in the Post-Decommissioning</p>	No EIS updates are anticipated to address this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
						<p>period will be the IWWTP precipitate pond (which will contain non-radioactive gypsum-like material) and the Industrial Landfill. All other wastes will be disposed of off-site. Spatially, the mining area is about 500 m from the IWWTP precipitate pond and about 800 m from industrial landfill.</p> <p>Given the negligible risk and magnitude of surface subsidence (2.4 to 2.8 mm) which would be limited to the footprint directly above the deposit, along with the distance from this area to on-site decommissioning wastes, there is negligible risk for effects of subsidence to the planned decommissioning of waste management infrastructure.</p>	
IR-22	NRCan	Fish and fish habitat	Section 2.10  Appendix 2-C, section 1.1.1.4	<p><b>Context:</b> With respect to the choice of In-Situ Recovery (ISR) mining solution, two alternatives were assessed: alkaline and acidic lixivants (Appendix 2-C, sec. 1.1.1.4). In the consideration of technical and economic feasibility of the alternatives (Table 2, Appendix 2-C), the proponent concludes that: Option 1 (alkaline) is not technically feasible based on the uranium deposit geochemistry. Option 2 (acidic) is technically and economically feasible based on the uranium deposit geochemistry and ability to dissolve uranium. Accordingly, the alkaline alternative was not carried forward into the Environmental Assessment (EIS, Table 2.10-1; Appendix 2-C, Table 3).</p> <p>While acidic ISR solutions are widely used internationally (e.g., Kazakhstan), in the United States, where the environmental regulatory regime is more strict, alkaline solutions have been used exclusively since 1970.</p> <p><b>Rationale:</b> In NRCan's opinion, the proponent should provide a more thorough technical justification for adopting an acidic ISR lixiviant.</p>	<p>In the Alternative Means Assessment (Appendix 2-C), NRCan requests that the proponent provides a more thorough technical justification for selecting an acidic ISR lixiviant rather than a less environmentally problematic alkaline leach used exclusively in the USA.</p>	<p>The following additional information will be added to Appendix 2-C Alternative Means Assessment, Section 1.1.1.4 Mining solution:</p> <p>In 2017, Denison completed core testing at a laboratory in the United States that was familiar with in situ recovery (ISR) mining and processing methods. The two lixiviant or leach solutions were 1) an alkaline solution and 2) an acidic solution. The alkaline solution was comprised of 2,000 ppm sodium bicarbonate and 500 ppm hydrogen peroxide. The sodium bicarbonate is a complexing agent and the hydrogen peroxide is an oxidant. This alkaline leach solution used in the laboratory is similar to lixiviant solutions used for ISR mining in the US. The acidic solution was prepared with sulfuric acid and hydrogen peroxide, in varying concentrations as the testing proceeded. After 30 pore volumes, the alkaline leach had recovered less than 1% of the uranium in the core. For comparison, the acidic leach recovered around 30% of the uranium in the core after 30 pore volumes and just under 90% of uranium was recovered after 120 pore volumes.</p> <p>At the Phoenix deposit, carbonate and organic concentrations are quite low, which makes acid leach for uranium much more amenable at reasonable concentrations. Moreover, the ISR test work completed in 2017 highlighted alkaline leach would be ineffective and uneconomical. An excerpt below from the 2017 ISR laboratory report highlights the challenges with alkaline leach, pointing to the deposit specifics (depth, grade, location) which inhibit the ability to leach via alkaline methods:</p> <ul style="list-style-type: none"><li>• “Bicarbonate is limited in practice by the chemical cost and physical ability (chemical addition rates) to increase wellfield concentrations appreciably above 2-3 g/L as HCO<sub>3</sub>.”</li><li>• “Field oxygen additions are limited by injection well depths (i.e., depth to ore) which, along with injection pressures, determines the maximum concentration of O<sub>2</sub>(g) which could be successfully introduced to the wellfield.”</li><li>• “pH control is critical to prevent potential calcium carbonate (Calcite, CaCO<sub>3</sub>) precipitation within the wellbore and/or ore-body.”</li></ul> <p>In 2018, Denison contracted a third-party consultant with expertise in Australia's ISR industry to complete a desktop review of various ISR test work completed for the Phoenix deposit, including the 2017 study described above. The third-party review of the alkaline and acid leach test work noted that for the alkaline bottle roll leach, it was unsurprising that the uranium extraction, 0.8%, was so low. Assuming the formation of the UO<sub>2</sub>(CO<sub>3</sub>)<sub>2</sub>- complex, the sodium bicarbonate consumption by the uranium would be ~188 kg/t, not including any potential bicarbonate consumption by any other phases present in the ore. The amount of sodium bicarbonate added in the test is calculated to be 7.2 kg/t, which was grossly inadequate. It is likely that given sufficient carbonate/bicarbonate and oxidant, alkaline leaching of the ore would technically be feasible, but it is likely in practice that the carbonate consumption would be excessively high. The rate of carbonate leaching is also much slower than acid, and the introduction of oxidant is also more difficult in an alkaline system.</p> <p>Alkaline leach is commonly used in the United States due to the primary components that make up their ore bodies. They are rich in carbonates and organics, which makes uranium quite difficult and costly to mine via acid leach as the acid is consumed by these constituents prior to any uranium being liberated and leached itself. These issues are not of concern with alkaline leach. There is currently one operation in the United States (Lance Uranium Project – Eastern Wyoming) that uses acid leach. The company had switched to acid leach after a failed trial of alkaline leach/mining due to high carbonates in the ore body that were not previously examined in detail.</p> <p>As noted in Table 2 of Appendix 2-C, the alkaline leach option for mining solution was determined to not be technically and economically feasible based on the uranium deposit geochemistry and ability to dissolve uranium.</p>	<p>Appendix 2-C Alternative Means Assessment, Section 1.1.1.4 Mining solution will be updated as follow (additions in <b>bold</b>, deletions in <del>strike through</del>):</p> <p><b>Two options were considered for mining solution: Option 1: alkaline solution and 2. acidic solution.</b></p> <p>Factors determining the choice between acid or alkaline ISR technology are: composition of the host rock and ores, reagent cost and consumption, the degree of uranium recovery, and the intensity of the process (IAEA 2001). The leach intensity is determined as the sum of the leach duration, solution ratio (liquid/solid), and average uranium concentration in the recovery solution.</p> <p><del>1. Alkaline solution</del> Alkaline or high-pH mining solutions are used at a number of uranium ISR operations. The mining solution is typically made with carbonate or bicarbonate. The single most important factor in the process is the rock composition within the productive aquifer, and in particular, the concentration of calcium carbonate. Ores with a higher carbonate content normally require alkaline (bicarbonate) leaching.</p> <p><del>2. Acidic solution</del> Acidic or low-pH mining solutions are used at a number of uranium ISR operations. The acidic mining solution is typically made with dilute sulfuric acid. The single most important factor in the process is the rock composition within the productive aquifer, and in particular, the concentration of calcium carbonate. For economic sulphuric acid leaching, the carbonate content should not exceed 2% CO<sub>2</sub>.</p> <p><b>In 2017, Denison completed core testing at a laboratory in the United States that was familiar with in situ recovery (ISR) mining and processing methods. The two lixiviant or leach solutions were 1) an alkaline solution and 2) an acidic solution. The alkaline solution was comprised of 2,000 ppm sodium bicarbonate and 500 ppm hydrogen peroxide. IR-23	CNSC	Alternative Means	Section 2.10.2 Alternative Means  Appendix 2-A PD Engagement Tables  Appendix 2-C Alternative Means Assessment (p. 3)	<p><b>Context:</b> There are multiple rows in the Indigenous Tables for Appendix 2-A where comments and concerns raised by Indigenous Nations and communities and other members of the public were taken into consideration in the Alternative Means Assessment. However, it is unclear how these were considered.</p> <p>A few examples:</p> <ul style="list-style-type: none"><li>16-EN-DesNd-101.1: Interested in any future business opportunities that may be available as Denison advances their Wheeler River Project.</li><li>16-EN-ERFN-100.15: In that territory near the Wheeler River there are a lot of spawning and calving areas for moose, caribou; those creeks are for whitefish spawning. There's lots of heavy muskeg there. A lot of us have been there, and we'd like to know there'll still be access to the area.</li><li>6-EN-ERFN-100.17: Today because of climate change, things are starting to happen that normally didn't happen. Even the permafrost is now further down. In the Wheeler River area, where there's some permafrost, have your environment guys seen a change? Will there be a change? These are some of the questions that need to be answered in order to come out with a positive spin.</li></ul> <p><b>Rationale:</b> Appendix 2-C, Alternative Means assessment, states (p.3): "Engagement with Interested Parties naturally included alternatives means and the engagement input was included in the evaluation of alternative means. Refer to the references list below and <i>Appendix 2-A Engagement Database Summary – Project Description</i> for details of engagement information referenced in this alternative means assessment."</p> <p>It is unclear in section 2.10.2 of the EIS, Appendix 2-A or Appendix 2C how the comments documented by Denison have been considered or influenced the alternative means assessment.</p>	Please explain how comments and concerns collected during Denison's engagement sessions were considered or influenced the alternative means assessment. Please include this information in the EIS and/or it's appendices.	<p>Denison's specific engagement initiatives on Project alternatives are outlined in Appendix 2-C for the 1) mining method, 2) freeze design for tertiary containment of mining solution, 3) treated effluent discharge location to surface water, and 4) access road alignment. In addition to these targeted engagement topics, information gathered more broadly during engagement was also considered in Project alternatives through the consideration of general concerns or statements. Two main areas where comments and concerns fed into and informed the Alternatives Assessment are: 1) Appendix 2-C, Section 1.2 Consideration of Technical and Economic Feasibility along with Land Use Screening, and 2) Appendix 2-C, Section 1.4 Evaluation of Alternative Means.</p> <p>The comparative evaluation of alternative means is presented in Appendix 2-C, Table 6 to Table 22. The evaluation considered the relative residual effects of each of the technical and economically feasible alternatives for each of the evaluation criteria identified in Appendix 2-C, Table 5, following the application of mitigation measures described in Appendix 2-C, Table 4. In each case, the preferred alternative and rationale for its selection were identified. In addition, specific input received from Indigenous groups and other Interested Parties that contributed to the selection of the preferred option was highlighted, when applicable. The alternative means assessment provided in the tables in this section was conducted at a screening level, appropriate for the stage of the Project when the alternatives were considered. The assessment considered both quantitative (where possible) and qualitative information as available. The comparative evaluation identified more preferred versus less preferred alternatives.</p> <p>To follow-up on one of the examples listed in the context and rationale section of this IR, 16-EN-DesNd-101.1 was a comment related to interest in business opportunities. As noted in Appendix 2-A, this comment factored into the comparative evaluation of alternative means for waste management, domestic waste disposal in the section outlining input received from Interested Parties. For additional background, two options were under evaluation: Option 1 was collection and disposal off-site by a third-party contractor and Option 2 was collection and disposal in an on-site domestic landfill. The following text is available in Appendix 2-C, Table 17: Waste Management – Domestic Waste Disposal - Alternative Means Assessment:</p> <p>During seven years of engagement activities for the Project, Denison has understood the importance of designing a project that minimizes interactions with the biophysical environment and the importance of continued land use by Indigenous groups. Looking at domestic waste disposal options, the option to transport domestic waste off site to a nearby licensed facility may generate a local economic opportunity (16-EN-DesNd-101.1, 19-EN-VB-132.5, 21-ENSUR-446.48). However, the transport of material off site would increase traffic, which may have a negative effect on traditional land use, infrastructure and services, and wildlife (16-EN-ERFN-100.15) (21-EN-SUR-446.68). Increased traffic would also increase greenhouse gas emissions. Concerns related to climate change were raised during engagement and consultation activities completed by Denison (e.g., 22-EN-ERFN-621.15, 22-EN-SUR-652.57). It should be noted that these concerns pertain to climate change rather than GHG emissions specifically. The concerns included observations of climate-related changes that have been noticed by the English River First Nation (e.g., depth of permafrost; 16-EN-ERFN-100.17) and observations by the English River First Nation Trapper who provided local knowledge in support of the EIS (19-LK-ERFNTrap-134.232). While no specific feedback was received on the domestic waste disposal options, the above provides context on how Denison's fulsome engagement activities have influenced the selection of a preferred alternative for domestic waste disposal.</p> <p>Based on the evaluation of alternative means, a preferred alternative means for each respective Project component or activity was selected. Rationale for the selection based on the comparative evaluation of alternatives is provided and input received by Interested Parties is presented. As shown in the above example, the input received from Interested Parties was an important part of the multifaceted evaluation.</p>	See attachment IR-24 for proposed content for final EIS Section 2.10, which, relative to the draft EIS, includes the addition of Section 2.10.3 Summary of Influence of Indigenous Knowledge, Local Knowledge, and Engagement on the Alternative Means Assessment.
IR-24	CNSC	Alternative Means	Section 2.10.2 Alternative Means	<p><b>Context:</b> While Appendix 2-C (Alternative Means Assessment) is detailed and includes all aspects of the Alternative means assessment that are required, the summary of the analysis and conclusions in Section 2.10.2 of the EIS lacks the level of detail required to understand the methodology used, and how Denison arrived at these conclusions.</p> <p><b>Rationale:</b> As noted in the Agency's <a href="#">Operational Policy Statement on Addressing "Purpose of" and "Alternative Means" under the CEAA 2012</a>: "If a preferred means is selected, the analysis and the rationale for the choice should be explained from the perspective of the proponent, and be documented in the EIS in sufficient detail to provide context for public and technical comment periods during the project EA, and ultimately to allow the decision maker to understand the choice."</p>	Please summarize the analysis of the alternative means assessment within the body of the EIS, in sufficient detail that a reader of the EIS has adequate information to understand the methodology used, and how Denison arrived at these conclusions.	Additional details from Appendix 2-C will be provided in Section 2.10 of the final EIS. Also, an example of alternative means evaluated for mining method will be added into Section 2.10.2 in the final EIS. It is noted that no new information would be presented in the final EIS Section 2.10.2 beyond that which was presented in the draft EIS Appendix 2-C.	See Attachment IR-24 for proposed updates to Section 2.10.2.
IR-25	CNSC	Current use of lands and resources for traditional purposes	Section 3, Sections 4, Section 5, Section 11 (and all other applicable once Métis Knowledge Use Study is completed)	<p><b>Context:</b> The EIS states that Denison is currently negotiating an agreement with MN-S and no traditional land use information is included throughout the EIS given no agreement was signed or Traditional land use information was shared at the time the EIS was being drafted.</p> <p>As noted in the EIS Denison has committed that: "As information becomes available from the agreed-upon process between the Métis Nation – Saskatchewan and Denison, it will be incorporated into the final EIS." (p. 11-36)</p>	Please update the revised Draft EIS to reflect the integration of the Métis Use and Knowledge Study in the Draft EIS where applicable, when this study is completed and provided to Denison.	<p>A study agreement was signed with the MN-S to complete a Metis Knowledge Study by the end of October 2023. Denison has met with the MN-S to discuss the next steps and anticipated timeline, however no information has been provided to Denison, to date. When the study is completed within the agreed upon timeframe, Denison will update the final EIS to include relevant information in the assessment.</p> <p>It is important to note that Denison has incorporated Metis land use information and perspectives into the draft EIS, through the funding of the Kineepik Metis Land and Occupancy information along with the KML VEC statement, of which relevant information has been incorporated directly into the draft EIS to determine effects to the human environment.</p>	The final EIS will be updated with applicable information pertaining to the effects assessment from the Metis Knowledge Study when provided within the agreed upon timeframe (end of October 2023).

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				<p><b>Rationale:</b> More information is required to better understand the issues and concerns, valued components, and current use of lands and resources for traditional purposes by MN-S near the project area.</p> <p>Requirements are detailed in CNSC’s Generic EIS Guidelines, section 8.9: Indigenous land and resource use.</p>	Should this information not be made available to Denison at the time of revising the draft EIS, the next version of the EIS and the response to this IR should provide a status update on discussions and engagement with MN-S and next steps.		
IR-26	CNSC	Precautionary principle and approach	Section 3.4.8 Lands Taken Up from an Indigenous Perspective (p. 3-14)	<p><b>Context:</b> Denison states: “Discrepancies among IK and western scientific information provide an opportunity for Denison to take a precautionary approach. Examples of concrete actions to address uncertainty in cases where IK and LK have differing conclusions on predicted Project effects include addressing uncertainty through monitoring and follow-up programs and communicating results of those monitoring and follow-up programs to demonstrate they have been responsive to the IK shared.” (p. 3-14)</p> <p><b>Rationale:</b> CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> state: “In documenting the analyses included in the EIS, the proponent will demonstrate that all aspects of the project have been examined and planned in a careful and precautionary manner in order to avoid significant adverse environmental effects.</p> <p>A document by Canada’s Privy Council Office, <a href="#">A Framework for the Application of Precaution in Science-based Decision Making About Risk, sets out guiding principles for the application of precaution to science-based decision making</a>.” (Section 2.5)</p>	Please clarify how the precautionary principle, and the Privy Council Office’s, <a href="#">A Framework for the Application of Precaution in Science-based Decision Making About Risk, sets out guiding principles for the application of precaution to science-based decision making</a> has been considered and incorporated into the EA described in the EIS.	<p>Page 3-14 of the EIS notes that "Discrepancies among IK and western scientific information provide an opportunity for Denison to take a precautionary approach."</p> <p>The precautionary approach to the evaluation of effects is described in Section 5.8.1.2.2 of the EIS, which specifically deals with the confidence of predictions and states:</p> <p>"In this EA, the precautionary approach to the evaluation of potential effects was adopted, recognizing areas of uncertainty and uses conservative assumptions and approaches within the assessment process. Areas of uncertainty in the process and in predictions for each VC are identified and discussed in each VC-specific section, or on a KI-specific basis as applicable."</p> <p>"Confidence predictions are defined as low, moderate, or high. Where a high degree of uncertainty regarding a residual adverse effect is evident, the confidence level may be low. A high level of confidence is assigned to predictions that have direct, site-specific quantitative data to support the predictions. Low or moderate degrees of uncertainty are manageable through monitoring and follow-up programs to confirm the absence, presence, and extent of residual adverse effects."</p> <p>The Privy Council Office’s, A Framework for the Application of Precaution in Science-based Decision Making About Risk was not specifically referred to in making decisions regarding discrepancies among IK and western scientific knowledge. Rather ERFN, KML/Pinehouse, and the YNLR were offered the opportunity to review select sections of EIS prior to its submission to regulators (see Section 4.3.2.1.4 for ERFN; KML/Pinehouse declined the invitation to review the EIS in advance of filing; Section 4.3.4.2.4 for the YNLR). An example of where greater precaution was exercised is found in the conclusions for effects on Indigenous Land and Resource Use, in which the overall confidence rating was moderate based on the communities’ previous experience with the uranium industry, but could not "be considered as high as the Indigenous COIs lack certainty about ISR mining technique" (Section 11.1.6.4).</p>	No EIS updates are anticipated to address this IR.
IR-27	CNSC	Cumulative Effects Analysis	Section 3.4.8	<p><b>Context:</b> During an outreach and engagement trip by CNSC in October 2022, an abandoned exploration camp adjacent to the proposed Wheeler River site was observed. This site has not been identified within the EIS as part of the cumulative effects assessment. As noted in section 3.4.8, KML has also raised concerns with Denison related to abandoned camps and industrial waste left with no programs for clean-up.</p> <p><b>Rationale:</b> Section 9.4.3 of CNSC’s <a href="#">Generic Guidelines for the Preparation of an EIS</a> states that “The applicant shall assess any residual adverse environmental effects of the project in combination with other past, present or reasonably foreseeable projects and/or activities within the study area.”</p>	Please specify why abandoned exploration camps and industrial waste aren’t taken into consideration when completing cumulative effects assessment.	<p>Section 5.9 outlines the general methods and approach for cumulative effects assessments, while each biophysical and human environment assessment provides details on their Valued Component (VC)-specific approach. The inclusion list in Section 5 does include exploration and mining activities, and options for other projects and activities, as appropriate.</p> <p>With this approach the footprint of the abandoned exploration camp was considered within the terrestrial cumulative effects assessment.</p> <p>Section 11 Land and Resource Use notes that existing projects or activities were not considered as part of the cumulative effects assessment because they were captured and assessed within baseline conditions or existing conditions. This approach would include the abandoned exploration camp adjacent to the proposed Wheeler River site.</p>	No EIS updates are anticipated to address this IR.
IR-28	CNSC	Current use of lands and resources for traditional purposes	Section 4, IER and engagement appendices, including: Appendix 2-A Appendix 6-B Appendix 7-B Appendix 8-A Appendix 9-A Appendix 10-B Appendix 11-A Appendix 12-A Appendix 13-A Appendix 14-B	<p><b>Context:</b> The summary of issues tables do not appear to include all of the key issues identified by the Indigenous Nations and communities.</p> <p>For example, some Indigenous Nations and communities have shared concerns with respect to accident prevention and overall safety on the Key Lake road (Highway 914) due to increased traffic, impacts on treaty rights and section 35 rights due to cumulative impacts, and decommissioning, that were not captured in the issues and concerns and summary tables in Section 4.3.2 and in the IER.</p> <p>The tables in the engagement appendices include a column titled “Response (From Denison)”. The “Response” column does not include responses, but instead points the reader to where this comment or concern was considered. When navigating to the sections referenced, it is often unclear how this information was considered or influenced the assessment.</p> <p><b>Rationale:</b> Additional detail is required in order to ensure the key issues are all identified and to understand the status of validation for each issue raised and the response provided.</p>	<p>1. Update the summary of issues and concerns tables to include all relevant issues and concerns raised by each of the Indigenous Nations and communities to date, including concerns raised in the Indigenous Knowledge studies provided, additional engagement, and Draft EIS comments.</p> <p>2. Please include a column in the issues and concerns tables to clearly articulate the specific mitigation/monitoring measures that Denison have committed to, or any other measures, in order to address the concerns raised by each Indigenous Nation and community during the engagement process to date.</p> <p>3. Denison must demonstrate that each Indigenous Nation and community has validated that the summary of issues and concerns table reflects their understanding or agreement, and/or a path forward to complete the validation throughout the EIS and the updated IER.</p> <p>Validation must be complete by the time the technical review is complete, prior to submission of a final EIS. Should Denison not be able to fully address issues, concerns or feedback raised by any Indigenous Nation or community, through mitigation and monitoring measures, this should be documented, and a rationale provided.</p> <p>3. Update the response column of the Engagement tables to describe how these were considered in the sections referenced. Consider renaming this column to reflect the nature of the content (i.e., how the information was considered).</p>	Please see response in Attachment IR-28.	<ul style="list-style-type: none"><li>• Section 4 general updates since submission of the draft EIS, including updates to clarify the purpose of the Key Issues and Concerns tables and the Engagement Database Summary tables in various appendices</li><li>• Table 4.3-2: Key Issues and Concerns from English River First Nation (and corresponding table in the IER)</li><li>• Table 4.3-3: Key Issues and Concerns from Kineepik Métis Local #9 (and corresponding table in the IER)</li><li>• Table 4.3-4: Key Issues and Concerns from Sipishik Métis Local #37 (and corresponding table in the IER)</li><li>• Table 4.3-5: Key Issues and Concerns from Patuanak Métis Local #82 (and corresponding table in the IER)</li><li>• Table 4.3-6: Key Issues and Concerns from Birch Narrows Dene Nation (and corresponding table in the IER)</li><li>• Table 4.3-7: Key Issues and Concerns from Lac La Ronge Indian Band (and corresponding table in the IER)</li><li>• Table 4.3-8: Key Issues and Concerns from A La Baie Métis Local #21 (and corresponding table in the IER)</li><li>• Table 4.3-9: Key Issues and Concerns from Métis Nation – Saskatchewan (and corresponding table in the IER)</li><li>• Table 4.3-10: Key Issues and Concerns from Ya’thi Néné Lands and Resources Office (and corresponding table in the IER)</li></ul>

IR-29	CNSC	Current use of lands and resources for traditional purposes	Section 4.3.2 and IER	<p><b>Context:</b> In this section, Denison includes the engagement with BNDN and includes a summary of issues and concerns table for the Nation. Within the history of interactions (Section 4.3.3.2.1).</p> <p><b>Rationale:</b> Denison states that they have been providing information on the project to BNDN in 2019, 2021 and again in 2022 and that Denison and BNDN have not responded to date in order to advance further engagement and dialogue.</p>	Please ensure updated information of any additional engagement activities that Denison has completed with BNDN related to understanding their current and traditional land use and potential interests near the proposed project is provided.	<p>Denison is able to provide the following information with respect to engagement with BNDN.</p> <p>Denison had a meeting with BNDN on February 14, 2023, to provide an overview of the Wheeler River Project. During the meeting, BNDN indicated they would share a traditional territory map and land and occupancy information in relation to the Wheeler River Project subject to reaching suitable confidentiality provisions.</p> <p>On April 25, 2023, Denison shared a draft confidentiality agreement with BNDN.</p> <p>On May 10, 2023, Denison met with BNDN again, to discuss a process for engagement going forward. During the meeting, Denison was advised that BNDN had proposed revisions to the confidentiality agreement, which they would provide to Denison. Also identified in the meeting was that Denison’s access to data BNDN previously referenced regarding land use activities in and around the Wheeler River Project would be limited and subject to further funding from Denison to BNDN. Denison continued to request the available site-specific information in order to better understand the potential for adverse impacts to rights from the Wheeler River Project to BNDN in order to potentially adjust engagement approaches with BNDN.</p> <p>On May 11, 2023, Denison was advised to communicate directly with the Chief of BNDN and was provided further information from BNDN that BNDN would connect with Denison in the future to determine next steps together.</p> <p>On June 16, 2023, BNDN contacted Denison to request a meeting toward the latter part of July 2023. Denison responded positively to this request and will be following up with BNDN accordingly.</p> <p>Subject to the development of a specific engagement process between Denison and BNDN, as identified above, Denison is committed to maintaining an open dialogue with BNDN regarding their interests in the Project. Denison will make sure the above information, and any further information in this respect, including potential resolution of issues, will be included in the final EIS and an update to the IER.</p>	Updates will be included in the final EIS Table 4.3-6: Key Issues and Concerns from Birch Narrows Dene Nation (and corresponding table in the IER) as part of response to IR-28.
IR-30	CNSC	Indigenous physical and cultural heritage	Section 4.3.2.1.3, Table 4.3.2	<p><b>Context:</b> Concerns were raised during engagement sessions that “Elders are not being consulted as most of the engagement has been through online means and without a translator”.</p>	How has Denison adapted engagement with Elders from the ERFN since receiving this comment on March 31, 2021?	Since receiving the comment about the challenge with virtual engagement activities and associated translation for those requesting it, Denison has incorporated simultaneous Dene translation into the Zoom virtual meeting feature. This was used in a virtual meeting	No EIS updates are anticipated to address this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				<b>Rationale:</b> There’s no indication that a translator has been employed to engage with Elders since 2021 in the engagement Table 4.3.2.		undertaken for the Athabasca Basin First Nations and Communities, in September 2021. The feedback received was overwhelmingly positive. Going forward, should Denison have to deploy virtual meetings where translations are required, this tool will be deployed again.  For all in person meetings, Denison provides a translator, who can assist with anyone requiring discussion to occur in their language.	
IR-31	CNSC	Indigenous Engagement	Section 4.4.2.1.3, Key Engagement Activities (p. 4-88)	<b>Context and Rationale:</b> Regarding the following: “An open house for the general public was planned to be hosted in 2022 on preliminary effects and mitigation, but due to concerns identified by MN-S about hosting a public open house in a community with a significant Métis population, this meeting was postponed by Denison. Denison looks forward to rescheduling the meeting in collaboration with the MN-S.” (p. 4-88)	Please provide an update on the evolution or progress of this engagement with local communities, following collaboration with MN-S (or otherwise).	Denison continues to respect the delegated Duty to Consult to the Metis Nation - Saskatchewan for a number of communities with strong presence of Metis Citizens for engagement about the Wheeler River Project. As such, Denison will follow the Metis Nation - Saskatchewan direction in this regard until such time as this direction changes.  Denison is pleased to report that on February 11 and 12, 2023, the MN-S coordinated a meeting for Denison, the CNSC, the Province of Saskatchewan and the Metis Locals from Northern Regions 1 and 3 to provide an overview of the Project and respond to questions and concerns.	Updates will be included in the final EIS accordingly.
IR-32	CNSC	Current use of lands and resources for traditional purposes	Section 5.3  Section 9.0 Terrestrial Environment	<b>Context:</b> Some sections of the EIS (such as Fish and Fish Habitat, Indigenous Lands and resource use) indicate that Indigenous and/or local knowledge was considered when defining the spatial boundaries. However, this is not included in other sections, such as Terrestrial Environment.  <b>Rationale:</b> Section 5.2.2 of CNSC’s Generic EIS Guidelines require that spatial boundaries be defined by considering, but not limited to, the following criteria: Community and Indigenous traditional knowledge, ecological and technical considerations.	Please provide any additional details about how any comments or concerns raised were considered in defining the spatial boundaries with Indigenous Nations and communities with respect to spatial boundaries, for the Terrestrial Section and which specific Indigenous Nations and communities were engaged on these topics and how their input and knowledge was incorporated into the EIS.  If already presented in the EIS text body, please indicate where this information can be found or link to Section 4 of the EIS or in the IER.	The rationale for the definition of study areas for the purpose of the assessment of the Terrestrial Environment valued components (VCs) is described in Section 9.1.1 of the draft EIS. The Project Area and Local Study Area (LSA) were delineated based on the expected extent of potential direct (footprint) and indirect (sensory disturbance) Project effects; whereas, the Regional Study Area (RSA) considered an 8 km buffer around the Project Area to provide an appropriate spatial scale upon which potential Project effects could be evaluated at the landscape scale where key Terrestrial Environment VCs reside and move within and upon which cumulative effects could be assessed.  No specific comments or concerns were raised on the spatial scale of the Terrestrial Environment study areas during engagement activities, though considerable input was solicited / received regarding many of the Terrestrial Environment VCs that helped to contribute how the assessment study areas were defined. This is especially true in consideration of the relatively high number of comments received through engagement regarding wildlife (as represented by ungulates, furbearers, woodland caribou, and birds in the draft EIS) and wildlife use by local and Indigenous people/ communities (see Sections 9.3.3.1.2, 9.3.3.2.2, 9.3.3.3.2, 9.4.3.1.2, 9.4.3.2.2, 9.4.3.3.2 in the draft EIS Appendix 9-A for details). Cumulatively, this input puts high importance on and speaks to the broad knowledge of wildlife in the vicinity of the Project, informing the need to define the RSA to an appropriate spatial extent, as was the case on the draft EIS.  In addition, and within the context of the IR, it is appropriate to also consider the assessment of terrestrial environment from the perspective of Land and Resource Use per Section 11 of the draft EIS, since the two (Terrestrial Environment and Land Are Resource Use) are so intimately related. For context the Terrestrial Environment RSA, fits within the Indigenous Land and Resource Use RSA. Section 11 of the EIS is focused on Land and Resource Use and includes consideration for various terrestrial VCs and key indicators (KIs) as resources. With respect to Indigenous Land and Resource Use, the definition of spatial boundaries is offered in Table 11.2-2 which notes that the LSA is inclusive of direct and indirect effects to relevant VCs will occur, including the maximum combined extent of supporting VCs associated with the aquatic, terrestrial, noise, and health LSAs. It is inclusive of trapping, fishing, and travel through and adjacent to the Project Area. The RSA is inclusive of trapping block N-18, which represent a familiar reference for local Indigenous communities and capture the broad land usage patterns of local communities. Trapping blocks are defined regions and have membership that is regulated by a local trapping association and membership is generally only open to local Indigenous community residents though non-Indigenous trappers may also participate as members of the trapping association. If resource use activities were displaced, it is likely this would still occur within the N-18 trapping block area where individual resource users already have familiarity.	No EIS updates are anticipated to address this IR.
IR-33	CNSC	Residual Effect Characterization	Section 5.8.1, Definitions for Residual Effects Characterization and Significance  Section 5.8.1.1, Residual Effects Characteristics  Section 8, Table 8.3-9: Fish and Fish Habitat - Surface Water Quality	<b>Context:</b> Denison uses specific criteria (Residual Effect Characteristics: Direction, magnitude, geographic extent, duration, frequency, reversibility, context and likelihood) and associated ratings (e.g., adverse/positive, low/moderate/high) for the predicted effects assessment. However, it is unclear whether an aggregation method was used in order to determine whether impacts will be significant or not significant, depending on the combination of rating categories (i.e., weightings that were calculated, use of decision rules).  For example, medium term and long term are both used to represent the same time category: “Effects are expected to last between 3 to 38 years (i.e., effects expected during Construction through to the end of post-Decommissioning).” (See table 8.4-13 on p. 8-200 compared to table 8.4-12 on p. 8-199 and table 8.5-9 on p. 8-246).  <b>Rationale:</b> The Generic Guidelines state: “The method used to describe the level of the adverse effect should be transparent and reproducible.”  In Table 8.3-11, duration was moderate, but again uses same rationale. There is no ‘moderate’ in Table 8.3-8, and by the same rationale, this should be medium-term to be consistent with definitions provided and summary Table 8.3-12.  It was noted that all three tables should be deemed medium-term	If an aggregation method was used and ratings (e.g., High, medium, low) were weighted, what weightings were used, how were these calculated? Please also describe any decision rules that informed the determination of significance.  If no aggregation was used, how did Denison ensure that results were consistent, given the varying rankings for each of the key criteria, and varying combination?  Regarding inconsistencies in ratings, please use consistent terminology for same rating.	Denison did not use an aggregation method with weighted ratings. The assessment approach and methodology was outlined in draft EIS Section 5, Approach and Methodology. Please note that Section 5.8 provided a guide for technical leads to conduct residual effects evaluation; however, Section 5.8 also recognizes that the specific definitions and ratings for some characteristics may be developed on a VC-specific basis as presented in each VC-specific section.  Denison reviewed the draft EIS to ensure results were consistent. This included checks on the consistent application of characteristics and ratings along with any supporting rationale. Nevertheless, as pointed out by the CNSC, there appear to be some inconsistencies in Section 8 of the draft EIS. The final EIS will be updated, specifically Section 8 where inconsistencies were highlighted in IR-33 context and rationale text. Importantly, these are effectively editorial issues and do not change the assessment summaries or conclusions.	Ratings for duration and frequency in Section 8 of the final EIS will be updated. Residual effect characteristics and ratings will be consistent between definitions tables and subsequent summary (results) tables within a section.  This will include consistent use of the ratings for the residual effect characteristic of duration, as follows: <ul style="list-style-type: none"><li>• Short-term – Less than 3 years (i.e., effect happens during Construction only).</li><li>• Medium-term – 3 years to 38 years (i.e., effect happens from Construction through to the end of Post-Decommissioning).</li><li>• Long-term – More than 38 years (i.e., effect extends beyond Post-Decommissioning).</li></ul>

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				based on definitions of ratings outlined in Table 8.3-8. Frequency was also showing up as "continuous" and "continuously" in these tables.			<p>This will include consistent use of the ratings for the residual effect characteristic of frequency, as follows:</p> <ul style="list-style-type: none"> <li>Infrequent – Effect occurs several times at sporadic intervals.</li> <li>Frequent – Effect occurs many times on a regular basis.</li> <li>Continuous – Effect occurs continuously.</li> </ul>
IR-34	CNSC	Cumulative Effects Analysis	Section 5.9.2.2 (p. 5-41)	<p><b>Context:</b> Denison identifies the Gryphon deposit as a project that is not reasonably foreseeable. The direct quote from the EIS indicates that the “Development of the Gryphon deposit as an underground mine was evaluated at the prefeasibility level in 2018 but has not advanced to feasibility study or EA. Denison has not announced an intent to proceed with the development of the Gryphon deposit.” (p. 5-41)</p> <p><b>Rationale:</b> The guidance <a href="#">Assessing Cumulative Environmental Effects under the CEAA, 2012</a> defines <i>Reasonably Foreseeable</i> as a “physical activity [that] is expected to proceed, e.g. the proponent has publicly disclosed its intention to seek the necessary EA or other authorizations to proceed.”</p> <p>In a press release by Denison Mines (2018: <a href="#">Denison announces decision to advance Wheeler River Project following positive PFS results</a>), Denison publicly disclosed intention to seek the necessary EA for Gryphon to proceed: “After careful consideration of the risks and opportunities associated with permitting and concurrent advancement of project engineering activities, the Company has decided to submit a PD and initiate the EA process in early 2019 for the Phoenix ISR operation, and to bring the Gryphon operation forward, at a later date, as required to achieve the PFS plan of Gryphon first production by 2030.”</p> <p>Further, Denison’s <a href="#">Wheeler River Webpage</a> references a “start of pre-production activities for the Gryphon operation in 2026”</p>	Please update the cumulative effects assessment in the EIS to include the Gryphon deposit as a Present or Reasonably Foreseeable Project.	<p>Denison has not publicly disclosed its intention to seek the necessary EA or other authorizations to proceed with mining the Gryphon deposit on the Wheeler River property at this time and does not meet any of the criteria for a reasonably foreseeable project as per the guidance for Assessment Cumulative Effects under the CEAA 2012 (below). A future physical activity could be considered reasonably foreseeable and should generally be included in the cumulative effects assessment if one or more of the following criteria are met:</p> <ul style="list-style-type: none"> <li>The intent to proceed is officially announced by a proponent. This information could be found in news media, the proponent’s website or via an announcement from the proponent directly to regulatory agencies.</li> <li>The physical activity is under regulatory review (i.e., the application is in process). This can be known, for example, if information about the review or application is available on a government website, or an EA notice has been made public.</li> <li>The submission for regulatory review is imminent. This could be known if the collection of data has already commenced, regulatory authorities have been contacted about information requirements, or through an announcement from the proponent.</li> <li>The physical activity is identified in a publicly available development plan that is approved or for which approval is anticipated (e.g., a wastewater treatment plant in a city’s long term development plan).</li> <li>The physical activity supports – or is consistent with – the long-term economic or financial assumptions and engineering assumptions made for the project’s planning purposes.</li> <li>A physical activity is required in order for the project to proceed (e.g., rail or port transportation facilities, or a transmission line).</li> <li>The economic feasibility of the project is contingent upon the future development.</li> <li>The completion of the project would facilitate or enable the future development.</li> </ul> <p>The Gryphon deposit is an exploration phase property and is inherently captured as such in the cumulative effects assessment because the levels of disturbance from these activities to date are captured with the characterization of existing conditions. It would be inappropriate to consider mining of the Gryphon deposit within the cumulative effects assessment as a mining operation as Gryphon cannot be considered a reasonably foreseeable activity. As is widely understood, very few exploration phase projects become operating mines.</p> <p>We note that the press release and the prefeasibility study referenced in the IR were from 2018. The Wheeler River Project Provincial Technical Proposal and Federal Project Description used to initiate the provincial and federal EA processes was submitted in February 2019. This represents Denison’s most recent plans for development and the Project scope does not include underground mining of the Gryphon deposit. Denison acknowledges that, if development of the Gryphon deposit as an underground mine is proposed in the future, this would require additional regulatory review and approval.</p>	No EIS updates are anticipated to address this IR.
IR-35	CNSC	Change to an environmental component due to hazardous contaminants	Section 6, Chemicals of Potential Concern	<p><b>Context:</b> The use of petroleum products (e.g., propane, gasoline, and diesel) at the Denison Mines Wheeler River site is associated with vehicles and periodic operational testing of emergency generators as well as stationary pumps for emergency power or fire water systems. Thus, the air emissions will contain acrolein.</p> <p><b>Rationale:</b> This chemical of potential concern (COPC) poses potential risks to human health via inhalation, but acrolein appears to have been missed or deemed insignificant. However, its consideration in the assessment will provide information on the significance of the associated risk.</p>	Please consider acrolein in the assessment or provide a rationale for its exclusion.	An analysis of acrolein risks is provided in Attachment IR-35.	The analysis provided in Attachment IR-35 will be appended in its entirety to Appendix 6-A in the final EIS.
IR-36	CNSC	Other	Section 6, Table 6.1-11 Baseline External Gamma Monitoring	<p><b>Context:</b> For one of the exposures in the summary table for baseline external gamma monitoring (Table 6.1-11), the cell states "Destroyed in Field".</p> <p><b>Rationale:</b> No rationale or indication as to why or how it was destroyed is provided.</p>	Please provide any additional info available as to how equipment was destroyed.	Gamma monitor 8 was destroyed in the field by wildlife.	Table 6.1-11 in the EIS will be updated to say "Destroyed in Field by Wildlife"
IR-37	CNSC	Air Quality	Section 6.1.1.1, CALPUFF model	<p><b>Context:</b> "The Saskatchewan Ministry of Environment (SK MOE) has developed the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) to assist proponents in conducting air dispersion modelling assessments in a consistent manner. The guideline defines the recommended approach for dispersion modelling assessments in Saskatchewan, including model selection, emission source characterization, and the determination of compliance criteria to apply."</p>	Please confirm and provide a summary of the consultation with the Saskatchewan MOE on the use of CALPUFF model for the Wheeler River EIS as per provincial air quality guidelines.	As described in Section B.1 of Appendix 6-A, staff at the Saskatchewan Ministry of Environment (Air Quality Branch) were consulted on the selection of CALPUFF and developing the CALMET meteorological data set, beginning in 2019. The CALMET consultation included an initial discussion about the general approach, and once the CALMET run was completed, two technical memos were produced and reviewed by Ministry staff including: 1) a memo completed in March 2020 summarizing the general CALMET approach and results (e.g., wind roses, temperature data, precipitation data); and 2) a follow-up memo completed in May 2021, which answered specific questions posed by Ministry staff. Ministry staff also completed a review and provided feedback on the CALPUFF model setup in August 2021.	No EIS updates are anticipated to address this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				<p><b>Rationale:</b> Saskatchewan air quality guideline requires consultation on use of CALPUFF model, where it states" The ministry acknowledges that there will be situations where specialized air dispersion models such as CALPUFF, CALQ3HCR and others may be applicable. The use of specialized models requires consultation with the ministry" OR "Pre-consultation with the ministry must be undertaken prior to the facility conducting specialized modelling (p. 3)." It is not clear if Denison Mines consulted with Saskatchewan MOE on use of CALPUFF model.</p> <p>Noted that Section 6.1.4.2 is again referring to Saskatchewan MOE guidance for justification, but no indication that they consulted with them (a requirement).</p>			
IR-38	ECCC	Change to an environmental component due to hazardous contaminants	Section 6.1.4.1, Potential Interactions Between the Project and Valued Component / Key Indicators	<p><b>Context:</b> In this section, the Proponent identifies primary interactions between Project activities and air quality valued components and their associated key indicators. These primary interactions may result in an adverse effect on the valued component. Among the primary interactions are the use of emergency generators in a backup role should there be an interruption of the provincial electrical grid. However, it is not evident what is the anticipated frequency and duration of interruption to grid power.</p> <p><b>Rationale:</b> The Proponent states in the conservative operation scenario that while the site will be powered from the provincial grid at the operations stage, the back-up power generators were assumed to be operating under emergency conditions as a worst-case scenario. ECCC acknowledges the positive impact of extending the electrical grid to the Project site with resultant reduction in generator emissions. The impact of an interruption in grid power would be greatest during the winter months when energy use would be greatest and surface-based temperature inversions, which vertically trap emissions, would be strongest.</p>	Provide an evaluation of a worst-case scenario of grid power interruptions (i.e., average aggregate length of power outages) during the winter months for this section of the electrical power grid.	<p>Denison expects an average of six outages per year based on information provided by SaskPower. An outage would be anticipated to last a few hours per event.</p> <p>The air quality assessment conservatively assumed that the generators would be in operation 24/7 to predict worst-case concentrations in all months of the year, including the winter months. Given the above, Denison can confirm it has evaluated an appropriately conservative worst-case scenario for use of the diesel generators in the air quality assessment.</p>	No EIS updates are anticipated to address this IR.
IR-39	ECCC	Change to an environmental component due to hazardous contaminants	Section 6.1.4.2, Potential Project-Related Effects	<p><b>Context:</b> In this section, the Proponent discusses the approach taken for air dispersion numerical modelling. Using their CALMET data set, the Proponent's CALPUFF model runs indicated exceedances for 24-hour total suspended particulates, 24-hour particulate matter (PM10), 1-hour nitrogen dioxide, and 24-hour uranium concentrations. However, there is no mention of possible diurnal and seasonal occurrences of the exceedances.</p> <p><b>Rationale:</b> Adequate assessment of the modelling results requires knowledge of the temporal characteristics for the exceedances. For example, wintertime exceedances may be due to strong temperature inversions, especially during the overnight to morning hours. These strong inversions are challenging for numerical models to capture. Exceedances during warmer months may be due to specific wind directions, which transport emissions directly to downwind receptors.</p>	Provide additional information on any diurnal and seasonal influences of the modelled exceedances.	Additional information on diurnal and seasonal influences of the modelled exceedances is provided in Attachment IR-39 in this document.	No EIS updates are anticipated to address this IR.
IR-40	CNSC	Air Quality	Section 6.1.6.2.1, Air quality significance determination	<p><b>Context:</b> Significance determination was not conducted for air quality due to interconnectedness with other assessment endpoints.</p> <p><b>Rationale:</b> It is not clear where and how these air quality assessment endpoints were factored into the assessment.</p>	Please provide additional information to demonstrate where and how these air quality assessment endpoints were factored in.	Noted in Section 6.1.1.1 of the draft EIS, Air Quality was identified as an intermediate Valued Component (VC) (i.e., does not have an assessment endpoint). Air quality assessment endpoints and the significance of potential effects of Project-related changes to ambient air quality were considered in Section 9 (Terrestrial Environment), Section 10 (Human Health) and Section 11 (Land and Resource Use). For additional reference, Figure 6.1 2 of the draft EIS is a graphic representation of the main linkages among the Air Quality VC and other VCs, illustrating the flow of assessment information from the Air Quality VC. By way of example, the habitat alteration effects considered for avian and wildlife VC and Key Indicators (KIs) included dust deposition, which could change avian and wildlife use through an indirect effect.	No EIS updates are anticipated to address this IR.
IR-41	CNSC	Air Quality	Section 6.1.6.2.2, Background concentrations	<p><b>Context:</b> The EIS states that "Conservative regional background concentrations from the Saskatchewan Air Quality Modelling Guideline (SK MOE 2012a) and based on the La Loche monitoring station were used for particulate matter, NO2, SO2, and CO. The La Loche monitoring station is located near anthropogenic sources, while the Project is in a remote area removed from anthropogenic sources."</p> <p><b>Rationale:</b> If La Loche monitoring station is located near anthropogenic sources and the project is not, use of this data is not a conservative or realistic representation of background.</p> <p>For a realistic approach, background data considered should be upper 95th percentile (or max if n&lt;10) from an area representative of project location</p> <p>For a conservative approach, background data from an area located even further from anthropogenic sources (if this exists) should be used, or an upper limit of background less than upper 95th should be applied as the background.</p> <p>Upper limit of background is used to screen out COPCs or often subtracted from total to ascertain relative contribution / impact from source, so using a higher upper limit may result in COPCs screening out or appear to have a lower relative contribution. If background was</p>	Please provide additional rationale to justify the appropriateness of La Loche monitoring station concentrations as background for project location.	<p>The Saskatchewan Ministry of Environment requires that background concentration data be added to air model predictions and an accepted set of data is provided in the Saskatchewan Air Quality Modelling Guideline. Following Ministry requirements, the northern regional data set was selected, which is based on monitoring data from the La Loche station. Because the La Loche station is located near anthropogenic sources, the background values are likely higher than background in the Project Area. This means that the total air model predictions (modelled + background) are likely more conservative than would necessarily have been the case had a similar data set been available that was free of any anthropological influence.</p> <p>Further consideration of the use of the La Loche data set is provided in Appendix 6-A, Section 6.0 of the draft EIS.</p>	No EIS updates are anticipated to address this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				added to source, then approach used would be conservative. If this is the case, confirmation and reference to where this is discussed in methodology should be provided.			
IR-42	Health Canada (HC)	Physical stressors (noise and vibration)	Section 6.2.4.2.2, (p. 6-66)  Section 6, Section 6.2.9, (p. 6-72)	<p>Nighttime noise impacts are not adequately considered for human receptors.</p> <p><b>Context:</b> The EIS states in Section 6.2.9 that, “While the predicted sound levels were less than the guideline values, the increase from baseline was predicted to be noticeable” (p. 6-72). No information is provided on individual noise events occurring during the nighttime period.</p> <p><b>Rationale:</b> While the increase from baseline is predicted to be noticeable, it is important to also consider that changes to the characteristics of the sound from baseline (e.g., a change in frequency, changes in sound modulation, increased impulsiveness or tonality, or a shift in noise from the daytime to being more at night) may cause noise to be even more noticeable. Consult <a href="#">ANSI S12.9-2005/Part 4</a>, clause A.1.3 for further information.</p> <p>In particular, consideration should be given to potential impacts on sleep, where adverse impacts are reported to begin when sound levels inside bedrooms exceed 30 dBA for continuous noise sources and 45 dBA LAm<sub>ax</sub> for discrete noise events (<a href="#">WHO, 1999</a>).</p>	<p>1. Provide a description of the project- related nighttime noise sources that may impact human receptors as well as a qualitative discussion of the resulting potential impacts on perception considering not only changes in sound levels but also sound characteristics (e.g., tonality, impulsivity).</p> <p>2. Confirm whether individual nighttime noise events exceeding 45 dBA LAM<sub>ax</sub> outdoors (or 30 dBA indoors) are expected to occur more than 15 times over the nighttime period at any nearby potentially noise-sensitive human receptor location(s). This may be of particular concern if some construction and/or operations activities occur during sleeping hours.</p>	<p>1. During Construction, the nighttime noise sources that are the highest contributors to sound levels at the nearest human receptor location are expected to be construction equipment (bulldozers, trucks, cement mixing and crusher). During Operation, the primary contributors are truck traffic and drilling in the wellfield. As these are not impulse or tonal sources, no adjustments were made to the source sound levels per ANSI S12.9-2005 Part 4.</p> <p>2. For Construction, the crusher was modelled at its maximum sound output. The diesel-powered equipment (dozers, drill rigs) was adjusted for partial operation. When adjusted to provide maximum sound levels instead, the predictions at the nearest human receptors did not exceed 45 dBA L<sub>max</sub> during the nighttime hours for either Construction or Operation.</p> <p>The draft EIS will be updated to include the additional supporting discussion outlined above.</p>	<p>Section 6.2.4.2.2 will be clarified as follows: The nighttime sound levels were not predicted to exceed the PSL of 36 dBA at any of the identified receptors during Construction or Operation. As with the daytime sound levels, the maximum predicted nighttime sound levels were predicted at the property identified as 302586/Risk2. The predictions at this location were 35.9 dBA and 34.0 dBA for Construction and Operation, respectively, and were similarly primarily attributable to drilling activity in the wellfield, concrete batching (during Construction), and movement of trucks on the access road. During Construction, the nighttime noise sources that were the highest contributors to sound levels at the nearest human receptor location consisted of construction equipment (bulldozers, trucks, cement mixing and crusher operation). During Operation, the primary contributors at night were truck traffic and drilling in the wellfield. As these are not impulse or tonal sources, no adjustments were made to the source sound levels. The crusher was modelled at its maximum sound output, while the diesel-powered equipment (e.g., dozers, drill rigs) were adjusted for partial operation over the respective daytime and nighttime periods. To account for potential issues resulting from equipment operating at maximum levels (as opposed to daytime and nighttime averages), the models were run with the partial operation adjustments removed, for comparison to the Health Canada recommended criteria value of 45 dBA L<sub>max</sub> at night. The predictions at the nearest human receptors did not exceed 45 dBA L<sub>max</sub> for either Construction or Operation."</p>
IR-43	HC	Physical stressors (noise and vibration)	Section 6.2.5, (p. 6-66)  Section 6.2.5, (p. 6-71)	<p>Mitigation measures for project-related noise were not identified for the Construction phase.</p> <p><b>Context:</b> The mitigation measures provided in Section 6.2.5, including a complaint management system is also to be implemented as part of the EMS, are only proposed for the operations phase.</p> <p>However, construction activities are predicted to last more than one year. Construction noise will involve the use of equipment operating at the site, construction of surface facilities, drilling, and partial operation of the freeze plant. It will also include regular truck trips and air traffic for personnel changes.</p> <p><b>Rationale:</b> It is unclear if listed mitigation measures also apply to the construction phase (or only to the operations phase).</p>	<p>1. Clarify whether mitigation measures and the proposed EMS apply to the Construction phase. If not, identify mitigation measures for noise impacts related to Construction phase activities, and consider applying the EMS to the Construction phase and implementing the community complaints and response procedure from the beginning of construction activities.</p> <p>2. Health Canada suggests that construction noise lasting longer than 1 year be assessed as operational noise, and that noise mitigation measures be applied also to the construction phase. Special consideration should be given to mitigation measures for construction noise that occurs at night, in order to minimize impacts on sleep (i.e., avoiding tonal or impulsive noise sources at night).</p> <p><b>Suggestions for mitigation and follow-up measures:</b> Health Canada recommends use of Appendix H of Health Canada (2017), which identifies additional construction noise mitigation measures that could also be considered to reduce project- related noise.</p>	<p>1. Mitigation measures and the proposed EMS apply to both Construction and Operation. As the Indigenous Communities of Interest with reserves and residential communities most proximal to the Project, Denison will collaborate with English River First Nation (ERFN) and Kineepik Metis Local (KML) on a community specific monitoring regime, suited to each of their interests and needs. As part of these programs, Denison and the Indigenous communities of ERFN and KML will be sharing information in an agreed-upon fashion. If noise from construction activities form part of the interests for each of these Indigenous communities.</p> <p>2. See response to IR-42 regarding nighttime work and potential for sleep disturbance.</p> <p>The draft EIS will be updated to include the above clarifications.</p>	<p>The first paragraph of Section 6.2.5 will be revised to clarify the applicability of mitigation measures as follows: "Strategies to reduce the likelihood and magnitude of the predicted effects include source elimination and utilizing planning measures to counter the conditions that contributed to the predicted effects. Mitigation measures <b>to be applied during both Construction and Operation</b> include:..."</p> <p>The first paragraph of Section 6.2.8 will be revised to clarify the applicability of the EMS as follows: "An EMS will be implemented and include air quality and noise management and monitoring plans to confirm that the Project is compliant with the federal and provincial guidelines that have been adopted for this assessment <b>during both Construction and Operation.</b>"</p>
IR-44	HC	Physical stressors (noise and vibration)	Section 6.2.8, (p. 6-71)	<p>The noise complaints resolution and response procedure is not sufficiently described in the EIS.</p> <p><b>Context:</b> Section 6.2.8 discusses Monitoring and Follow- up. The proponent indicates: “The EMS will also include a community complaints and response procedure” (p. 6-71).</p> <p><b>Rationale:</b> Details have not been provided regarding how the complaints would be received, addressed or what the timelines will be for providing a response or resolution. It is important to provide information to potentially affected communities in advance of particularly noisy activities. Community consultation and advanced notification of noisy activities has been shown to reduce complaints (see <a href="#">Health Canada, 2017</a>).</p>	<p>1. Provide the details of the noise complaints resolution and response procedure as per <a href="#">Health Canada (2017)</a>.</p> <p>2. Consider conducting community consultations and/or implementing an advanced community notification system to pro-actively reduce the probability noise-related impacts and complaints.</p>	<p>1. Denison is undertaking sequential EA and licensing processes with the CNSC. As such, a detailed management system based on the CNSC’s safety and control areas and focused on anticipated compliance verification criteria will be developed over the upcoming months to support licensing activities.</p> <p>Further to this, a framework for monitoring and follow up was presented for each technical EIS discipline in the respective draft EIS section. Environmental monitoring and follow up will fall within the scope of the Environmental Management System (EMS) for which document preparation is ongoing, and as indicated will be fulfilled during licensing. As noted elsewhere in the IR responses the EMS hierarchy will follow a three-tiered system comprising Program, Plan and Procedure level documentation, with detail associates with each becoming more granular and prescriptive at each successive tier.</p> <p>As noted in Section 6.2.8 of the draft EIS, a commitment to have a community complaints and response procedure for noise has been made by Denison. Consistent with Denison’s approach to sequential EA and licensing and as highlighted above the specific details associated with this complaints and response procedure, consistent with provincial and federal guidelines, will be developed at that time. Nevertheless, further information concerning the framework / approach to the community complaints and response procedure is provided below for reference.</p>	No updates to the EIS in response to this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
						<p>Denison is committed to designing the noise monitoring and follow-up plan and an associated procedure in accordance with provincial and federal guidelines and industry best practice.</p> <p>The plan will identify:</p> <ul style="list-style-type: none"><li>• Project-related noise sources and control measures;</li><li>• How complaints will be filed, acknowledged, investigated, and resolved, including general timeframes for each phase;</li><li>• How confidentiality of a complainant’s identity will be respected, if requested, how anonymous complaints can be filed and how assistance for those who may face barriers to the procedure can be accommodated;</li><li>• How those involved in executing the plan will receive training and be made aware of the plan;</li><li>• How potentially affected communities will be engaged;</li><li>• How complaints and their resolutions will be tracked and recorded;</li><li>• How the performance of the plan will be monitored and evaluated and how this information shall be communicated; and</li><li>• How the plan will be updated.</li></ul> <p>It is anticipated that the following procedure specific to noise complaints is expected to be applied:</p> <ul style="list-style-type: none"><li>• Each complaint would be logged/recorded and include the following information:<ul style="list-style-type: none"><li>○ the name, address and contact information of the complainant (if provided);</li><li>○ the time and date of the complaint;</li><li>○ the nature of the complaint; and</li><li>○ meteorological conditions at the time of complaint (i.e., wind direction).</li></ul></li><li>• Determine the specific cause(s) of the complaint and take short-term and immediate actions to resolve the cause of the complaint;</li><li>• Provide a prompt response to the complainant (within 24-hours) and follow-up as needed based on the required actions to resolve the complaint; and</li><li>• Prepare and retain on-site a written report that:<ul style="list-style-type: none"><li>○ identifies the cause of the complaint;</li><li>○ identifies the actions taken to appropriately deal with the cause of the complaint; and</li><li>○ identifies any recommendations for remedial measures, and managerial or operational changes to reasonably avoid the recurrence of similar incidents.</li></ul></li></ul> <p>2. Denison has committed to working with its Indigenous Communities of Interest with reserves and or / residential communities most proximal to the Project (English River First Nation and Kineepik Metis Local), to understand the issues and concerns they have relative to the Project, and resolution of some specific items of interest or concerns may be resolved through the negotiation process of private contractual arrangements or agreements. The noise complaint mechanism will be one area that will be raised specifically with the Indigenous Communities of Interest with reserves and or / residential communities most proximal to the Project (English River First Nation and Kineepik Metis Local).</p>	
IR-45	HC	Change to an environmental component due to hazardous contaminants	Section 6 Air Quality Technical Supporting Document Section 6.3.1	<p>The carcinogenic risks of diesel exhaust from the project should be assessed.</p> <p><b>Context:</b> Section 6.3.1 discusses modelled predictions of exceedances for Particulate Matter (PM). TSD p. 22 states: “concentrations of 24-hour PM2.5 are also elevated around the standby generators at the freeze plant, which emit fine particulate matter from combustion of diesel fuel”. However, diesel particulate matter is not evaluated for the whole project in the air quality model or the air quality assessment.</p> <p><b>Rationale:</b> Health Canada has determined that diesel exhaust is carcinogenic in humans which is consistent with the conclusion of the International Agency for Research on Cancer (IARC), and that diesel exhaust is associated with significant population health impacts in Canada.</p> <p>To characterize the carcinogenic risk of diesel exhaust from a project, HC has published a report (2022)<sup>1</sup> which provides a quantitative assessment of the relationship between ambient PM2.5 exposure and lung cancer risk. Specifically, this report quantifies the increase in risk of lung cancer mortality (over the baseline rate in the Canadian population) due to PM2.5 exposure.</p> <p>This quantitative assessment is considered appropriate to characterize risks from diesel PM given the contribution of diesel exhaust to ambient PM2.5 in Canada, and that the carcinogenicity of diesel exhaust has generally been evaluated based on the respirable PM fraction<sup>1,2,3</sup>.</p> <p><b>References:</b> [1] HC. 2022. Lung Cancer and Ambient PM2.5 in Canada: A Systematic Review and Meta-analysis. Available at: <a href="https://publications.gc.ca/site/eng/9.907038/publication.html">https://publications.gc.ca/site/eng/9.907038/publication.html</a></p>	1. Evaluate the carcinogenic risk of all potential diesel exhaust from the project based on the approach proposed by Health Canada (2022). Additional guidance ("Additional Lung Cancer Mortality from PM2.5: Recommended Approach and Sample Calculation") is provided as an appendix to this comment table. <sup>1</sup>	An evaluation of carcinogenic risk of all potential diesel exhaust from the project based on the approach proposed by Health Canada (2022) is provided in Attachment IR-45.	No updates to the EIS in response to this IR.

IR-46	HC	Physical stressors (noise and vibration)	Appendix 6-A Table A-1	<p>Low-frequency noise and associated potential human health effects were not assessed.</p> <p><b>Context:</b> Some equipment that may emit low-frequency noise (LFN) have been listed in Table A-1: Assessment Scenarios and Sound Level Data (Section 6 Appendix A); however, no information describing potential impacts of this type of sound on nearby human receptors are presented.</p> <p><b>Rationale:</b> Low frequency noise can be associated with the introduction of noticeable vibrations and rattles in nearby structures. Research indicates that annoyance related to noise is greater when low-frequency noise is present (ISO 1996-1:2003). As sound environments are usually characterized using A-weighted decibel levels (dBA) that reflect the frequencies most audible to the human ear, the impacts of low- frequency noise may need to be assessed separately.</p>	<p>1. Clarify whether any project-related activities (construction, operation and/or decommissioning) may produce LFN that could impact off-site human receptors. Evaluate LFN in the noise assessment, if and where applicable. See Appendix C of <a href="#">Health Canada (2017)</a> for a discussion of LFN.</p>	<p>Appendix C.2 of Health Canada (2017) identifies an approach to assessing LFN from ANSI, which states that the energy sum of the 16-63 Hz octave bands should be less than 70 dBZ to avoid rattles due to LFN. The energy sum of the 16-63 Hz octave bands at the nearest human receptors is expected to be well below 70 dBZ (predictions indicate the values are in the order of 44 dBZ at the nearest human receptor).</p> <p>The draft EIS will be updated to include the additional supporting discussion outlined above.</p>	<p>The following paragraph will be appended to the end of Section 5.1 of Appendix 6-E:</p> <p>"In addition to the Ldn and %HA assessment methods, Health Canada (2017) also recommends assessing the potential for low frequency noise (LFN) impacts such as noise-induced vibration or rattles in building structures. The recommended approach from ANSI is to combine the predicted receptor sound levels in the 16 to 63 Hz octave bands and compare the total to a criterion of 70 dBZ. The maximum prediction for this assessment was 44 dBZ, and, therefore, LFN is not predicted to be a concern for the Project."</p>
IR-47	ECCC	Air Quality	Appendix 6-A, A.1	<p><b>Context and Rationale:</b> Verification of the following calculation is required for assessing predicted emissions of dust from general construction. It appears the result of 0.70 ton/acre/month is incorrect and should instead be 0.314 ton/acre/month.</p> <p>Appendix 6-A, Appendix A, A.1 (p. A4) TSP Emission Factor for General Construction:</p> $EF\ (TSP) = 0.11 \frac{\text{ton}}{\text{acre month}} \times 1.2 \frac{\text{ton}}{\text{acre month}} \div 0.42 \frac{\text{ton}}{\text{acre month}} = 0.70 \frac{\text{ton}}{\text{acre month}}$	<p>Explain how the emission factor total suspended particulates (EF (TSP)) result was obtained or rectify if it is incorrect and update the draft EIS to reflect the correction.</p>	<p>The formula incorrectly displayed the wrong units. It is 0.314 ton/acre/month, which converts to 0.70 tonnes/hectare/month. Denison confirms that this was a typographical error, and the result of the calculation is unchanged.</p>	<p>In Appendix 6-A, the formula will be changed to:</p> $EF\ (TSP) = 0.11 \frac{\text{ton}}{\text{acre month}} \times 1.2 \frac{\text{ton}}{\text{acre month}} \div 0.42 \frac{\text{ton}}{\text{acre month}} = 0.314 \frac{\text{ton}}{\text{acre month}} = 0.70 \frac{\text{tonnes}}{\text{ha month}}$
IR-48	HC	Physical stressors (noise and vibration)	Appendix 6-E, Figure 6.2.3, p. 6-57	<p>Noise-sensitive receptors are not included on noise contour maps.</p> <p><b>Context:</b> Noise-sensitive receptors are identified in the acoustic model report in Section 6 Appendix 6-E but not presented on any maps in the atmospheric and acoustic sections of the main report (Figure 6.2-3).</p> <p><b>Rationale:</b> The noise assessment typically includes a map illustrating modelled noise levels from the project at receptor locations in the study area.</p> <p>Certainty regarding the presence of human receptors in the regional study area is also recommended in order to assess cumulative impacts.</p>	<p>1. For more clarity, identify noise-sensitive receptors on Figure 6.2-3: Noise Assessment Study Area as well as on contour maps showing the baseline and predicted noise levels.</p>	<p>A new figure will be added to Section 6.2 of the final EIS showing the Project Area, Local Study Area, the receptor locations, and nearby land leases (both traditional and recreational). A copy of this new figure has been included with this IR response.</p> <p>As noted in the context and rationale for this IR, Denison included the receptor locations on the contour maps with the predicted noise levels (Appendix 6-E, Figures 8 to 15); as such, no edits to the Appendix 6-E figures are proposed in response to this IR.</p>	<p>A new figure will be added to Section 6.2 and a copy of the figure has been included with this IR response in Attachment: IR-48. The new EIS Figure will be 6.2-4; figure numbering will shift and Figure 6.2.4 Baseline Monitoring Locations for Noise in the draft EIS will become Figure 6.2.5 in the final EIS.</p>
IR-49	HC	Physical stressors (noise and vibration)	Appendix 6-E, 4.0 Table A.1	<p>The Noise Source Characterization is incomplete.</p> <p><b>Context:</b> Section 3.0 of the Draft EIS Section 6 Appendix 6- E discusses Source Characterization. There is no detail regarding potential tonal or impulsive noise sources in Section 3.0.</p> <p><b>Rationale:</b> The draft EIS should include a description of sound source characteristics (e.g., tonal, impulsive, highly impulsive) in order to properly inform the quantitative noise assessment and which assumptions/adjustments need to be applied and to properly evaluate impacts of project noise on health of affected receptors.</p>	<p>1. Identify any tonal, regularly impulsive, highly impulsive, or high-energy impulsive noises likely to be produced during project activities that could be audible at noise sensitive receptors. Furthermore, describe the timing (e.g., hours of night-time activities), frequency and duration of noise events, and their sound characteristics, including frequency spectrum. See <a href="#">Health Canada (2017)</a> for details.</p>	<p>No tonal or impulse sources were identified for either assessment scenario. Construction activity was assumed to occur 24-hours per day as a conservative measure. The frequency spectrum data for each source is included in Table A.1 of Appendix 6-E.</p> <p>Appendix 6-E will be updated to include discussion of ISO 1996-1 adjustments and rational for inapplicability to sources identified.</p>	<p>The following paragraph will be appended to the end of Section 3.0 of Appendix 6-E:</p> <p>"Upon establishing the source sound levels for inclusion in the predictive modelling, the list was reviewed to determine whether there were any sources with special sound characteristics such as tonality or impulse noise. Health Canada (2017) recommends the application of source adjustments in accordance with ISO 1996-1 for such sources as these are associated with increased annoyance. No tonal or impulsive noise sources were identified in the Construction or Operation scenarios."</p>
IR-50	HC	Physical stressors (noise and vibration)	Appendix 6-E, 4.0 Table A.1	<p>The description of noise modelling does not document or justify the use of sound level adjustments.</p> <p><b>Context:</b> ISO Standard 9613-2 has been used for the sound level modelling; however, it is unclear if all applicable adjustments have been considered as per ISO 1996-1:2016 (Table A.1).</p> <p><b>Rationale:</b> When modelling techniques are used to estimate present (baseline) or future (construction and operational) sound levels, these techniques and any accompanying assumptions, including the use of sound level adjustments, it is important to provide appropriate documentation and justification.</p> <p>Note that in situations where more than one source characteristic</p>	<p>1. Clarify whether ISO-1996-1:2016 has been considered in the modelling to account for any applicable sound level adjustments. Adjustments should be considered when calculating Ln (night- time sound level) and Ldn (day-night sound level). In addition, if applicable, adjustments can be applied depending on the noise characteristic (impulsive, highly impulsive, etc.), and because the project location is considered to be in a quiet rural area. See: ISO 1996-1:2016 and Health Canada (2017) for details.</p>	<p>No tonal or impulse sources were identified for the assessment scenario. As discussed in Section 6.2.1.2.1 of the draft EIS, the assessment did include the 10 dBA nighttime penalty inherent in the calculation of Ldn, and also included the HC recommended adjustment of +10 dBA to the Ldn levels to account for the Project location being in a quiet rural area.</p> <p>Appendix 6-E will be updated to include discussion of ISO 1996-1 adjustments and rationale for inapplicability to sources identified. The noted time-of-day and rural adjustments are already discussed in the draft EIS and applied in the assessment.</p>	<p>Appendix 6-E will be updated, per the paragraph outlined in the response to IR-49, which is expected to resolve the comment about tonal and impulse noise.</p> <p>The comment regarding the adjustment to account for the Project being in a quiet rural area was already accounted for in the draft EIS as outlined in Section 6.2.1.2.1.</p>

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				adjustment is applicable (e.g., impulsive or tonal), only the higher of the adjustments is used. However, all time-of-day adjustments and the quiet rural area adjustment are to be added to the highest of the applicable source adjustments.			
IR-51	CNSC	Geology and Groundwater	Section 7, Figure 7.8-1  Appendix 7-C	<b>Context:</b> Figure 7.8-1 (p. 7-107, main EIS report) shows monitoring well cluster outside of the freeze wall.  <b>Rationale:</b> It is not clear what the targeted hydro-stratigraphic units of each monitoring well cluster are. In addition, it is not clear how the establishment of the freeze wall and any leakage from the brine solution will be monitored. If there is any “window” within the freeze wall (i.e., the freeze wall is not continuous), is there any way to identify that?	Please clarify the targeted hydro-stratigraphic units of each monitoring well cluster in Figure 7.8-1 (p. 7-107, main EIS report).  Please clarify how the establishment of a continuous freeze wall will be monitored.	1: The information in the legend of Figure 7.8-1 will be updated to indicate that 2 well clusters target the Lower Sandstone Aquifer and the Intermediate Sandstone Aquitard. The target hydrostratigraphic units for the 4 well clusters are the Lower Sandstone Aquifer, the Intermediate Sandstone Aquitard, the Upper Sandstone Aquifer, and the overburden aquifer.  2: The alignment of the freeze wall is located 25 m offset from the lateral extent of the recoverable ore and the freeze wall will grow in thickness both towards the ore and away from the ore. The freeze wall will solidify all liquid porewater and develop into a contiguous impermeable barrier many metres thick. Ground temperature monitoring will be installed through a series of continuous fiberoptic temperature and pressure wells from surface to the depth of impermeable basement rock below the unconformity. Such monitoring wells/systems will be installed on both the ore (inside) and non-ore (outside) sides of the freeze wall to confirm the thickness of frozen ground. There will be sufficient operational controls in place to verify that the freeze plant is operating, to measure the temperature in the ore zone, and to measure the temperature on opposite sides (inside and outside) of the freeze wall so that early detection of any upset conditions can be identified and addressed. Options for addressing issues include: lowering the temperature of the freeze system to draw more heat out; increasing the freeze coolant flow rates in freeze wells nearer to active ISR cells; and/or to adaptively manage the lixiviant injection and recovery rates in cells located nearest to the freeze wall.	1: Figure 7-8.1 has been provided in Attachment IR-51 and will be updated in the final EIS to provide information in the legend on the hydrostratigraphic units being monitored in each well cluster.  2: The following text will appear in Section 2 (2.2.1.5 Monitoring Well Network) regarding monitoring to demonstrate a continuous freeze wall.  The alignment of the freeze wall is located 25 m offset from the lateral extent of the recoverable ore and the freeze wall will grow in thickness both towards the ore and away from the ore. The freeze wall will solidify all liquid porewater and develop into a contiguous impermeable barrier many metres thick. Ground temperature monitoring will be installed through a series of continuous fiberoptic temperature and pressure wells from surface to the depth of impermeable basement rock below the unconformity. Such monitoring wells/systems will be installed on both the ore (inside) and non-ore (outside) sides of the freeze wall to confirm the thickness of frozen ground. There will be sufficient operational controls in place to verify that the freeze plant is operating, to measure the temperature in the ore zone, and to measure the temperature on opposite sides (inside and outside) of the freeze wall so that early detection of any upset conditions can be identified and addressed. Options for addressing issues include: lowering the temperature of the freeze system to draw more heat out; increasing the freeze coolant flow rates in freeze wells nearer to active ISR cells; and/or to adaptively manage the lixiviant injection and recovery rates in cells located nearest to the freeze wall.
IR-52	ECCC	Fish and fish habitat	Section 7, Geology and Groundwater  Appendix 7	<b>Context:</b> According to the Proponent, “an acidic or low pH mining solution will be used to leach uranium ores from the ground. Mining solution may be a mixture of sulphuric acid, hydrogen peroxide, ferric sulphate, and freshwater (from shallow groundwater well or surface waterbody) or recycled water.  Wellfield will consist of a combination of injection and recovery wells, in the general the arrangement of one recovery well in the centre surrounded by four injection wells (5-spot pattern) with about 5 to 10 m between wells. The final wellfield is expected to include approximately 300 wells over an area measuring 90 m wide x 750 m long”.  As the components/contaminants mentioned in the description of the hydrogeologic contaminant transport processes above may be transported to Whitesfish Lake through groundwater, the injection and recovery wells should be included in the model.  <b>Rationale:</b> The hydrogeologic contaminant transport processes described above are an important part of the proposed Project and it is not clear why numerical modelling results and a sensitivity analysis for the above processes was not presented.	1. Explain why 3D hydrogeology and contaminant transport numerical modelling of the injection and extraction wells was not presented.  2. Alternatively, provide simulation results and a sensitivity analysis for the injection and extraction of the acidic solution in the mining area.	Denison used the ISR mine design and the 3D hydrogeology and contaminant transport numerical modelling of the injection and extraction wells to determine the potential interactions between mining activities and the environment. Two key outputs from the ISR mine design and 3D hydrogeology modelling work were used as inputs for the hydrogeologic assessment in the EA. The extent of mining solution migration away from the injection and recovery well screens, as defined by the mining area (50m above the ore zone and within the freeze wall) and groundwater quality of the mining zone following remediation.  During the operation phase, and under normal operational conditions there is no interaction between the mining zone and surface or down gradient environment, and the assessment focuses on post removal of the freeze wall, once the groundwater flow returns to pre mining conditions.  The injection and recovery wells will be set up such that they are within the confines of the ore itself. Migration of fluids towards the freeze wall and through non ore ground between the ore and freeze wall are minimized because hydraulic gradients will induce preferential flow to recovery wells and away from the freeze wall. If significant excursion of lixiviant were to occur and it were to contact the freeze wall, it is not expected to chemically dissolve the in situ ice and would be contained therein limiting any excursion outside of the mining horizon.  Additionally, continuous 3D modelling has been conducted for the purposes of mining operations beginning in 2019 through 2023, which has successfully demonstrated control of the mining solutions and recovered uranium bearing solution to the ore zone depth and not beyond the mining zone within the confines of the freeze wall. Furthermore, modelling had demonstrated that mining solutions will be maintained within the deposit area laterally and not contact the freeze wall, which is located at a 25 m stand-off distance.  For more information on how Denison’s extensive field testing and lab informed the design of the ISR mine and the mining zone remediation objectives please see the response to IR-6.	No updates to the EIS in response to this IR.
IR-53	CNSC	Geology and Groundwater	Section 7.3, Table 7.3.-2  Appendix 7-C	<b>Context:</b> The field-based hydraulic conductivity values (referred to as K values hereafter) in Table 7.3-2 (p. 7-32, main EIS report) indicate that the K value ranges of upper and lower sandstone aquifers have a significant overlap with those of the intermediate sandstone aquitard.  However, the calibrated K value in Table 2-2 (p. 2.7, Appendix 7-C)) for the intermediate sandstone aquitard is close to the lower end of the field-based K value range, while the calibrated K values for the upper	Please provide additional information to support the representativeness of the calibrated K values (for example, use graph to present the measured K values and the calibrated K values).	The calibrated hydraulic conductivity values are consistent with observed data. The calibrated K value for the intermediate aquitard was 1x10 <sup>-8</sup> m/s, which is in the middle of the range of values reported from point testing within this unit (Range: 10 <sup>-10</sup> to 3.8x10 <sup>-6</sup> m/s), and similar to the geomean value (8.4 x10 <sup>-9</sup> m/s). Thus, the calibrated K value is within a factor of 1.2 of, and higher than, the geomean value. The hydraulic conductivity value for the Intermediate Aquitard is similar to that applied by AECL at Cigar Lake (5x10 <sup>-8</sup> m/s). Similarly, the K values applied for the Upper and Lower Sandstone Aquifer units are consistent with the field measured values, particularly for this fractured rock environment. The high end of the	No updates to the EIS in response to this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				<p>and lower sandstone aquifers are close to the upper end of the field-based K value range.</p> <p><b>Rationale:</b> It is not clear how representative the calibrated K values are of the field-based K values for each hydro-stratigraphic unit, and if the significant difference between the K values for the upper and lower sandstone aquifers and those for the intermediate sandstone aquitard is supported by the geological properties of the corresponding stratigraphy units.</p> <p>It is stated in the report (p. 7-36, main EIS report) that “Vertical fracture or fault zones that hydraulically connect the Local (upper) and Semi-Regional (lower) groundwater flow regimes are present throughout the Athabasca Basin”. But fractures and fault zones are not explicitly considered in the model. There is possibility that these features could increase the hydraulic connection between the upper and lower sandstone aquifer.</p>		<p>packer tested range of K values varied by 2 orders of magnitude between the aquifer and aquitard units, which is consistent with the definition of aquifer / aquitard differentiation. The interpretation of an aquifer-aquitard-aquifer sequence is consistent with the AECL interpretation of the Athabasca Sandstone at the Cigar Lake mine.</p> <p>When packer testing in fractured rock, the hydraulic conductivity associated with any test depends on whether the packed zone contains a continuous fracture set. However, for the unit as a whole, it is important that the model represent the hydraulic conductivity (or transmissivity) representative of the interconnected fracture network. Thus, it is appropriate that the applied hydraulic conductivity values within the aquifers are consistent with the higher end of tested conductivity values within those units. Within aquitard units, having singular higher conductivity fracture values from packer tests that test local fractures only, does not necessarily indicate large-scale transmissivity.</p> <p>A fault feature is suspected along the western perimeter of the Lower Sandstone Aquifer near Kratchkowsky and Williams Lake, located 1.5 km west of the mine site (also as depicted on the Hydrogeological Conceptual Site Model). This feature was interpreted to exist based on the similarity in groundwater levels between deep and shallow aquifers in that particular area (c.f., water levels along the creek south of Williams Lake and within GWR-029, as well as water levels recorded in open boreholes near Kratchkowsky Lake), as well as geochemistry in GWR-029. The geochemistry and water levels show in the vicinity of GWR-029 are different, however, than conditions within the Lower Sandstone aquifer further east of this area, above and east of the Phoenix deposit.</p> <p>The effect of the fault feature along the western edge of the Lower Sandstone aquifer was incorporated within the numerical model both through enhanced hydraulic conductivity parameters, as required to match observed water levels, and boundary conditions applied to introduce as much inflowing water to the Lower Sandstone Aquifer as the water level data suggest is reasonable.</p>	
IR-54	CNSC	Geology and Groundwater	Section 7.3.1	<p><b>Context:</b> EIS states: “The most important associated topographic features in the region are the northwest to southeast trending drumlins and eskers....” This is not the trend shown on the provided maps, nor described elsewhere in the report, e.g., Section 7.3.2.1</p> <p><b>Rationale:</b> Inaccurate information in the EIS</p>	Please update the EIS where required to accurately describe the topographical features.	Acknowledged. The typo in the draft EIS, Section 7.3.1 will be corrected in the final EIS.	<p>In Section 7.3.1. the text will be updated to say the following:</p> <p>“The most important associated topographic features in the region are the northeast to southwest trending drumlins and eskers...”</p>
IR-55	NRCan	Fish and fish habitat	Section 7.3.3.1;  Appendix 7-A, sections 3.4, 3.5, 3.8, 4.2;  Appendix 7-C, section 2.8	<p><b>Context:</b> According to the proponent's conceptual hydrogeological model (EIS, sec 7.3.3, Figure 7.3-7, Table 7.3-2; Appendix 7-A, sec. 3.4, Table 3-4), the horizontal hydraulic conductivity of the Intermediate Sandstone (Iss) aquitard is 8.4 E-09 m/s based on field measurements. The proponent further assumes a 10:1 anisotropy ratio for the unit (Appendix 7-A, sec. 3.5.1) such that its estimated vertical conductivity is 8.4 E- 10 m/s. Based on this information, structural geology and groundwater quality data, the proponent concludes that the connectivity between the Upper sandstone aquifer and the Intermediate Sandstone aquifer (sic) is limited (EIS sec. 7.3.3.3; Appendix 7-A, sec. 4.4). While acknowledging the paucity of conductivity data and the proponent's attempt to mitigate this by leveraging collateral information on fracture frequency and clay content (Appendix 7-A, sec. 3.3.1), NRCan considers that the hydraulic conductivity assigned to the Iss aquitard is unrealistically low and inconsistent with the following lines of evidence: a) The conductivity value for the Iss is based on the geometric mean of 18 field measurements, 12 of which are from the same borehole (WR-695) located in the Gryphon zone, beyond the domain of the numerical model (Appendix 7-A, Appendix C, Table C-1). If the conductivity data were weighted equally, with one value per borehole, the geometric mean would be approximately 1.5 E-07 m/s, or two orders of magnitude higher; b) The proponent notes that vertical fracture or fault zones that hydraulically connect Upper and Lower aquifer systems are present throughout the Athabasca Basin including in the Phoenix area (EIS, sec. 7.3.3.2.2; Appendix 7-A, sec.3.8.1); c) The proponent notes that groundwater chemistry data (major ions) corroborate the presence of structurally controlled vertical hydraulic connections between the Upper and Lower aquifer systems (EIS, sec. 7.3.3.2.2, sec. 7.3.3.3; Appendix 7-A, 4.3.3); d) Groundwater chemistry data (Appendix 7-A, sec. 4.2, Table 4-1) also indicate the presence of detectable levels of "bomb" tritium (indicating recharge waters &lt; 50 years old) in the Lower Sandstone Aquifer (GWR-025, GWR-008, GWR-033) and in the Iss (GWR-009, GWR-034), outside the area of U mineralization. This is also evidence of vertical hydraulic connection through the Iss. In summary, whereas the proponent conceptualizes the Iss as a very low-permeability unit with localized vertical hydraulic connection (WS Shear), NRCan interprets the Iss as a "leaky" aquitard with pervasive fracture-controlled and much higher vertical hydraulic conductivity.</p> <p><b>Rationale:</b> The significance of NRCan's alternative interpretation of the Iss hydrostratigraphic unit is that deep groundwaters, including mining-impacted waters, may represent a greater proportion of baseflow discharge to Whitefish Lake than the 1% currently estimated</p>	In the "Parameter Uncertainty Assessment" for the numerical groundwater flow model (Appendix 7-C, sec. 2.8), NRCan requests that the proponent develop a calibrated numerical model with an alternate conceptualization of the Intermediate sandstone as a "leaky" aquitard with a horizontal hydraulic conductivity on the order of 1 E-07 m/s and a much lower anisotropy ratio. This should involve modifying the model lateral boundary conditions to allow for groundwater inflow/outflow across the entire thickness of the Athabasca Sandstone Group rather than just the Lower Sandstone aquifer.	<p>Denison acknowledges the IR from the review and based on feedback from the assessment team who conducted the hydrogeological modelling for the EA the following is provided in response.</p> <p>The viewpoint from the third-party assessment team does not align with the conceptual model proposed by the reviewer; however, an alternative calibrated groundwater flow model with a hydraulic conductivity of 1.0E-7 for the Intermediate Sandstone unit has been developed. This higher hydraulic conductivity scenario allows more water to flow laterally through the Intermediate Sandstone unit. Specified head values applied at the model boundaries are employed, such that the amount of water entering / leaving the domain is only limited by the simulated transmissivity and hydraulic gradients. Under this revised calibration, the simulated flow to Whitefish Lake from the Lower Sandstone aquifer would be 0.57% (i.e., &lt; 1%, similar to the model presented in the draft EIS) of the discharge to Whitefish Lake, and the simulated travel time from the ore zone to Whitefish Lake is approximately 250 years. The results of this revised calibrated scenario, with a hydraulic conductivity of 1.E-07 within the Intermediate Sandstone unit, are very similar to those obtained in the base calibrated model. This is the case because the higher flow through the Intermediate Sandstone unit migrates laterally until it reaches the desilicified zone, where it merges with flow from the Lower Sandstone Aquifer travelling upward toward Whitefish Lake. The additional flow contribution through the ISS contemplated by the reviewer would enhance dilution within the desilicified zone and thereby reduce concentrations reaching Whitefish Lake.</p>	No updates to the EIS in response to this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				in the proponent's groundwater flow model (EIS, sec. 7.4.2.1, p.7-51; Appendix 7-C, sec. 2.6.3).			
IR-56	CNSC	Geology and Groundwater	Section 7.3.3.2	<p><b>Context:</b> It is stated in Section 7.3.3.2 (p. 7-37, main EIS report) that “Exploration boreholes drilled in the Phoenix area, where left unplugged, have the potential to provide preferential flow paths between the Overburden and Upper and Lower Sandstone Aquifers. Exploration holes were reportedly grouted approximately 10 to 20 m above and below the ore zone, resulting in open holes remaining throughout the overlying materials. These portions of the open holes may act as open conduits for groundwater flow through the 400 m of Athabasca Group Sandstone.”</p> <p><b>Rationale:</b> It is not clear why the exploration boreholes have not been decommissioned.</p>	Please clarify why the exploration boreholes have not been decommissioned and the timeline to decommission the boreholes according to appropriate guidelines/procedures. If it is not decommissioned before the ISR operation, what is the potential impact of the unplugged boreholes on the mining solution migration?	<p>All historic exploration boreholes drilled to date containing a mineralized intersection, with grades higher than 1% U3O8, have been grouted a minimum 25 m above and below the mineralized intersection. The addition of grout to these depths is within the defined depths of the hydrogeologically modelled areas from operational mining scenarios conducted to date. The extent of the mining solution migration (i.e. the mining area) for the purpose on the EA extends 50 meters above the ore zone depth.</p> <p>During Operation, select exploration boreholes will be re-utilized for narrow diameter injection wells that will be developed with monitoring devices for the determination of excursions and water levels. Exploration boreholes not selected for the use of narrow injection wells will be grouted to surface to seal off any remaining conduit. Many of the exploration boreholes previously installed through the desilicified zone that overlies the deposit have collapsed, sealing the zone and acting akin to previous and natural state of the desilicified zone itself.</p> <p>The potential impact of the open, unplugged boreholes was evaluated as part of the numerical model sensitivity simulations performed and presented in Appendix 7-C. In general, while these open boreholes have the potential to create preferential flow paths, they were not found to create a meaningful differences in the groundwater flow paths, or mass transport conditions. This is partially because the simulated groundwater gradients are downward above the ore zone where the open coreholes are most prevalent. Further east, within the desilicified zone, unplugged coreholes are interpreted to have collapsed, such that they do not represent preferential transport pathways in the future</p>	No updates to the EIS in response to this IR.
IR-57	NRCan	Fish and fish habitat	Section 7.3.3.2  Appendix 7-A, sections 3.1.2 and 3.7  Appendix 7-C, section 2.5.2	<p><b>Context:</b> The proponent's conceptual model of groundwater flow in the Local Study Area (EIS, sec 7.3.3, Figure 7.3-7) involves an unconfined Upper system hosted by overburden and the Upper sandstone aquifer, and a Lower confined system hosted by the Lower Sandstone Aquifer. The Intermediate Sandstone aquitard acts as a confining unit. Vertical heads gradients are directed downwards west of the Phoenix deposit and upwards beneath surface water receptors including Whitefish Lake (EIS, sec. 7.3.3.2).</p> <p>Using head data from nested monitoring wells (Appendix 7-A, sec. 3.1.2, Table 3-1) the proponent calculates upward gradients in cluster WR-607, between the Lower Sandstone aquifer and the Upper Sandstone aquifer. In cluster LA-5, an upward gradient is calculated between the Upper Sandstone and the overburden unit (Appendix 7-A, Table 3-5). In areas west and south-west of the Phoenix deposit, groundwater is estimated to flow downward under a vertical gradient of approximately 0.015 m/m (Appendix 7-A, p.3-15).</p> <p><b>Rationale:</b> In NRCan's opinion, the proponent's interpretation of vertical head gradients in the LSA is not fully accurate. For the "Up-Gradient" monitoring well cluster, the tabulated head data (Appendix 7-A, Table 3-1) and data logger hydrographs (Appendix 7-A, Appendix B) indicate a downward gradient (0.014 m/m) from the overburden unit to the Intermediate Sandstone and an upward gradient (0.056 m/m) from the Lower Sandstone to the Intermediate Sandstone. Head data from the "NW" monitoring well cluster indicate a similar pattern of downward (0.016 m/m) and upward (0.014 m/m) gradients converging in the Intermediate Sandstone. In the "Downgradient" and "SE" monitoring well clusters, head observations and data logger hydrographs indicate downward gradients from the shallow aquifer system but essentially equal heads in the Intermediate and Lower Sandstones. This more complex picture of groundwater flow systems in the LSA does not appear to have been captured in the proponent's conceptual model. Given the importance of the baseline hydrogeological regime for predicting the transport and fate of COPCs in the post-decommissioning period, the proponent needs to demonstrate that the numerical groundwater flow model accounts for observed vertical head gradients.</p>	In section 2.5.2 of Appendix 7-C (Calibration Results), the proponent should demonstrate that the numerical groundwater flow model reproduces quantitatively or at least qualitatively the vertical head gradients calculated from observations in the nested monitoring well clusters (Appendix 7-A, Table 3-1).	Please see response in Attachment IR-57.	In the final EIS, Section 2.5.2 of Appendix 7-C will be updated to include information provided in Attachment IR-57.
IR-58	ECCC	Fish and fish habitat	Section 7.3.2.4, Ore Deposit	<p><b>Context:</b> The Proponent states that the Phoenix ore bodies are long and narrow (approximately 25 to 50 m wide) and are located within or near a graphitic pelite unit. Hydrothermal alteration associated with the ore zone is a discontinuous envelope of clay alteration and a sulphide-cemented rock zone that extends into the overlying sandstone and the underlying basement (Figure 7.3-3). This black, clay-rich zone is approximately 3 m thick on average and locally hydraulically isolates the ore zone from the overlying sandstones and underlying weathered basement rock.</p> <p><b>Rationale:</b> As indicated by the Proponent, a 3 m black clay rich zone isolates the ore zone from the overlying sandstones and underlying weathered basement rock. It is, however, unclear whether this discontinuous clay layer will prevent downward migration of uranium-bearing solution into the Paleo-weathered basement rock or horizontal flow along the unconformity surface to escape into the</p>	<p>1. Verify that there will be no downward migration of mining solution into the paleo- weathered basement rock or that there is no flow along the unconformity surface.</p> <p>2. If downward migration of the mining solution occurs, explain how it will be mitigated.</p>	<p>1. A portion of the paleoweathered zone is comprised of high grade mineralization of the deposit and will be subject to mining activities controlled by the inward hydraulic gradient induced by pumping. As is discussed in Section 4.1 of Appendix 7-C, potential exists for downward migration of the solubility enhancing fluids used during mining operation and the UBS because of the density and specific gravity of these fluids (greater than that of sea water). However, the downward migration will be limited by the competent unaltered basement rocks below the paleoweathered zone, which is characterized as having very low hydraulic conductivity (Section 2.3 of Appendix 7-C).</p> <p>2. As discussed above, some migration of mining fluids in the paleoweathered zone is expected and groundwater quality in this zone remediated post-mining. The entire thickness of the paleoweathered zone beneath the ore zone was included in the numerical model (Appendix 7-C) as having water quality represented by the "Restored Solution" (Figure 4-1 of Appendix 7-C). That assumption is inherent in the conservative source zone applied to all mass transport simulations. Further conservatism within the numerical model was exclusion of low permeability natural barrier zones (i.e., clays) identified in the geological model for the</p>	No updates to the EIS in response to this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
				environment. Escape of uranium-bearing solution into the environment will have a negative effect on the receiving environment.		ore zone - meaning, it was not assumed that these zones would serve to mitigate against migration of mining fluids into the paleoweathered zone. If downward migration of the mining solution were to occur this would be under an upset condition where monitoring wells placed below the mining horizon would collect these solutions via installed groundwater pumps preventing further migration away from the mining horizon.	
IR-59	CNSC	Fish and fish habitat	Section 7.4 Assessment of Project-related Effects, Figure 7.4-2 (p. 7-56)	<b>Context:</b> Figure 7.4-2: Simulated Change in Groundwater Discharge and Flow through Whitefish Lake Over the Life of the Project appears to be missing information.  <b>Rationale:</b> Legend is included below the image, but the Legend box is blank. The green dotted line is not represented by anything in the legend.	Please update this Figure to ensure it is complete, and that features are properly indicated in the legend.	Acknowledged. Figure 7-4.2 in the EIS and Figure 2-18 of Appendix 7-C will be replaced for clarity.	The updated figure provided in Attachment IR-59 will replace Figure 7-4.2 in the final EIS and Figure 2-18 of Appendix 7-C.
IR-60	NRCan	Fish and fish habitat	Section 7.4.2.1  Appendix 7-C, section 5.2.1, Appendix B	<b>Context:</b> In the discussion of the limitations of the numerical groundwater flow model (Appendix 7-C, sec. 5.2.1), the proponent invokes the well known modeling principles of "Occam's razor" and "Parsimony" which guided the parametrization of hydraulic conductivity in model layers. The proponent states that hydrogeologic property values were applied uniformly for, among other units, the Lower Sandstone aquifer beyond the immediate area of desilicified materials. However, in the layer parametrization for the Lower Sandstone aquifer (Appendix 7-C, Appendix B, Figure B-5), NRCan notes a large zone of enhanced conductivity (1 E-05 m/s) extending south from Kratchkowsky Lake, which contrasts with the value (2 E-07 m/s) assigned elsewhere outside the desilicified zone. NRCan also notes the extremely detailed parametrization of hydraulic conductivity in the clay cap overlying the ore zone where borehole control is dense (Appendix 7-C, Appendix B, Figure B-6).  <b>Rationale:</b> In NRCan's opinion, these model features appear to violate the principle of "Parsimony" and require greater justification supported by field observations.	NRCan requests that the proponent provide justification based on field evidence for the multiple hydraulic conductivity zones assigned to the Lower Sandstone aquifer and the clay cap above the ore zone.	We reaffirm that the hydraulic conductivity zones applied are consistent with the principles of parsimony and Occam's Razor. The hydraulic conductivity along the western portion of the model area within the Lower Sandstone Aquifer reflects the identified fault zone discussed in IR-53. This zone was added to better represent observed water levels within that portion of the model area. Further, this high hydraulic conductivity zone permits additional water inflow into the Lower Sandstone Aquifer than would otherwise exist if a lower hydraulic conductivity zone were applied here, resulting in conservative modelling predictions of flow through the Lower Sandstone Aquifer (which is consistent with the requests in IR-55).  The high-resolution representation of the clay cap zones is consistent with other contemporaneous work within the ore zone completed by Petrotek (2020) and subsequently by Denison. This resolution of parameter values is consistent with the high data density contained at the Phoenix ore body. Extensive hydrogeologic core logging and permeameter sampling were conducted on over 3,000 mineralized and lower sandstone drill cores to demonstrate and identify the spatial distribution of the various hydrogeologic units contained within the ore zone itself, for purposes of optimizing mining scenarios and flow pathways for recovery. Each hydrogeological unit has specific hydraulic conductivity values based on this extensive test work in addition to various field packer and pump/injection test work.	No updates to the EIS in response to this IR.
IR-61	CNSC	Geology and Groundwater	Section 7.4.2	<b>Context:</b> There is no discussion of potential induced seismicity from mining processes.  <b>Rationale:</b> Induced seismicity may lead to a loss of process as identified for natural seismicity.	Please provide information on the potential mining-induced seismicity.	Natural seismic activity in Northern Saskatchewan is quite rare with no significant events in recorded history (refer to draft EIS Section 15.2 Seismic Events).  Compared to conventional mining techniques, the potential for mining-induced seismicity from ISR mining is quite low. Potential for mining-induced events for the Project could be postulated to occur as the result of a few sources: 1. collapse of cavity voids from leaching, 2. hydraulic fracturing, and, 3. use of permeability enhancement techniques, and each is discussed further below.  <ol style="list-style-type: none"><li><b>Collapse of cavity voids.</b> To clarify, the portion of the deposit being mined is never truly a void (as in a large empty underground cavern); rather, what remains will be a honeycomb textured environment with water filled interstices. The mined area is filled with a fluid at all times, whether it be a mining solution, groundwater, or the neutralizing solution. This is different from a more traditional underground operation such as Cigar Lake where there is physical excavation of the orebody, leaving a temporary air-filled space. Although the uranium ore is high-grade by global standards it is not entirely massive in nature. As such, the uranium will be leached in a 'honeycomb' texture leaving behind a structure of partial intact rock mass with the remaining area being filled by fluid. This retains the pressure balance of the mining zone with the adjacent water-saturated rock masses. In terms of void space creation and collapse of the overlying strata, modelling has demonstrated that only 0.05% by volume of desilicified material immediately overlies the ore zone and would be subject to collapse (RESPEC 2023; included here as Attachment IR-21). This low volume and percentage is determined to not be of significant seismic concern.</li><li><b>Hydraulic fracturing.</b> Draft EIS Section 2.2.1.4.2 Wellfield Operation provides a comparison of ISR mining pressures to conventional fracking pressures used in the oil and gas industry. Conventional fracking pressures used in the oil and gas industry can vary; however, common pressures to induce fracturing can range up to 15,000 psi and require injection of fracking fluids of up to 16,000 liter per minute over periods of three to four days. Fracking fluids are comprised of a slurry of water, proppant (generally silica sand), and chemical additives to support and maintain the open fracture system after fracking is conducted. Conversely, ISR mining for the Project is planned at nominal pressures of 100 psi, intermittent pressures of up to 250 psi, and average flow rates of 30 liters per minute within a recovery well. The ISR mining method proposed for the Project is markedly different than fracking. For example, looking at intermittent pressures alone, ISR pressures are anticipated to be 60 times lower than fracking pressures.</li><li><b>Permeability enhancement techniques.</b> Draft EIS Section 2.2.1.4.3 Permeability Enhancement outlines the three types of techniques being considered for the Project: mechanical, Propellant, and hydraulic options. Propellants are classified as a low hazard explosive (S.1 special-purpose explosives, low hazard explosives, per Explosive Regulations, section 36). Propellants technically do not explode (like classic mine explosives which detonate) but rather burn through a process called deflagration. Deflagration means the material burns slower than the speed of sound, thus no shock waves are generated. Propellant permeability enhancement methods reach injection pressures of up to 8,000 psi and are near instantaneous over periods of milli seconds. Neither ISR mining or permeability enhancement is expected to produce mining-induced seismicity.</li></ol>	No updates to the EIS in response to this IR.

IR-62	ECCC	Fish and fish habitat	Section 7.4.2, Potential Project-related Effects	<p><b>Context:</b> The Proponent indicates that the mining area includes:</p> <ul style="list-style-type: none"> <li>the ‘active mining area’, which is the target ore zone;</li> <li>a zone extending between 11 and 13 m above the active mining area that represents the maximum vertical height over which the injected mining fluids will migrate upwards from the ore zone during active mining; and</li> <li>a zone extending 50 m vertically upwards from the active mining area (that incorporates the active mining area and the 11 to 13 m zone defined in the previous bullet) that was selected to account for potential upset conditions.</li> </ul> <p><b>Rationale:</b> It is not clear to ECCC how the Proponent would be able to limit the mining solution migration within 11 &amp; 13 m above active mining as the maximum vertical height over which the injected mining fluid will migrate. As the mining fluid will be injected under pressure into zones with possible presence of fractures, the pressure may also cause additional fractures and given that the solution is warm/hot will possibly dissolve the other cementing material in the sandstone above, making it difficult to accurately predict where the solution will migrate to.</p>	<p>1. Explain plans to limit the upward migration of mining solution into the overlying layer to 11 and 13m above the ore zone.</p> <p>2. Explain what impacts will occur if the mining solution migrates beyond the predicted height.</p>	<p>1. More detail on engineered controls for containment of mining solution is provided in the draft EIS, Section 2.2.1.4.2 Wellfield Operation; see also the response to IR-08. Continuous monitoring of pump and injection wells will confirm containment of mining solutions to the lower 11 to 13 m above the ore zone during active operations.</p> <p>2. Additional monitoring wells located above this elevation will be installed to make sure this depth is achieved. These monitoring wells can be retrofitted to be pumping wells if needed to provide additional control of mining solutions. Denison has established a conservative mining area of 50 m above the ore zone in the EIS, which will be remediated to acceptable criteria post mining. Additionally, the freeze wall will be in place throughout Operations and will provide horizontal containment of solutions.</p>	No updates to the EIS in response to this IR.
IR-63	CNSC	Geology and groundwater	Section 7.4.2.1, Potential Effect #1: Groundwater Quantity – Construction to Decommissioning  Appendix 7-C, Section 2.7, Groundwater Conditions During Mine Operations	<p><b>Context:</b> The numerical groundwater model described was calibrated to observed water level and stream baseflow data. Table 7.4-3 in the EIS indicates that Denison recognizes the potential for freeze wall operation to impact groundwater quantity. To simulate this impact, the model was adapted to reduce recharge (to 50%) within the freeze wall area, reduce hydraulic conductivity associated with the vertical freeze walls, and simulate pumping within the freeze wall area. Recovery from pumping and effects on discharge to groundwater discharge to Whitefish Lake are discussed in the potential effects section.</p> <p><b>Rationale:</b> Although this assessment considered drawdown of the water table and discharge to Whitefish Lake, the discussion did not address the potential effects of operating the freeze wall on the local and semi-regional groundwater regimes. What would the pathway be for groundwater to pass around the freeze wall? What is the basis for the parameters selected, e.g., 50% recharge and lower hydraulic conductivity for freeze well? These factors need to be considered when evaluating the potential impacts of freeze well operations on groundwater flow conditions and corresponding receptors.</p>	Please provide a more fulsome discussion on the impact of freeze wall operations on local and semi-regional groundwater regimes and potential receptors. Please provide the rationale for assumptions made for key model parameters (e.g., selection of 50% recharge, hydraulic conductivity value used to represent freeze wall). In addition, please discuss the potential pathways for groundwater flow around the freeze wall, complete with figures demonstrating these pathways.	See response in Attachment IR-63.	The information provided in Attachment IR-63 will be attached to Appendix 7-C in the final EIS.
IR-64	ECCC CNSC	Fish and fish habitat	Section: 7.4.2.2, Potential Effect #2: Terrain Morphology and Stability – Operation  Appendix 7-A, Appendix K (p. 12)	<p><b>Context:</b> The Proponent stated that the geological assessment predicted maximum vertical displacement in altered sandstone immediately above the mining area (17.5 cm). A very minor change in elevation at ground surface (of less than 7.5 cm) was predicted within a discrete and localized area overlying the ore body. The modelling work is considered to provide a worst-case bounding scenario. If subsidence were to occur over the lifetime of the Project, or in the years following mining, the extent of vertical displacement is not expected to exceed that predicted in the modelling, which is based on an assumed volume extraction.</p> <p><b>Rationale:</b> ECCC notes that the thickness of the ore zone has an average thickness of 5 m with a range of 2 to 17 m, and is 25-50 m wide and that the overburden rock above the ore zone measures about 400 m. Therefore, it is not clear how the Proponent determined that the surface expression of a subsidence on the surface if it occurs will be limited to 7.5 cm and localized. A subsidence greater than 7.5 cm, implies that the void in the ore zone will be narrower, and will affect the amount of water migrating through the zone.</p> <p>It was the recommendation of the consultant who conducted the work in Appendix K that more accurate material properties should be used for future modelling.</p>	<p>Explain:</p> <ul style="list-style-type: none"> <li>Will this be revisited with updated data based on extraction feasibility results?</li> <li>How will the surface expression of a subsidence will be limited to 7.5 cm and localized?</li> </ul> <p><b>Suggestions for mitigation and follow-up measures:</b> ECCC recommends that the Proponent consider implementing remediation measures immediately after mining to prevent subsidence from occurring in the first place.</p>	Subsequent to the filing of the draft EIS, Denison undertook additional modelling with refined, more granular inputs including subunits within the altered zone (RESPEC 2023; included as Attachment IR-21) and the surface subsidence has been reduced from 7.5 cm to 2.4 to 2.8 mm. Denison is not anticipating the need for remediation measures with the surface subsidence being negligible within the context of changes in terrain as it relates to decommissioning objectives.	No updates to the EIS in response to this IR.
IR-65	CNSC	Geology and Groundwater	Section 7.4.2.2	<p><b>Context:</b> It is stated the maximum subsidence is 7.5cm based on modeling with an assumed volume extraction. Has subsidence from dewatering/pumping and from lack of inflow of groundwater due to freeze wall been considered?</p> <p><b>Rationale:</b> Surface facilities and wells may be impacted if there is unaccounted for subsidence.</p>	Please provide additional details for any dewatering/pumping induced subsidence.	<p>No pumping and/or dewatering subsidence is anticipated to occur as the fluid balance will remain relatively stable during Operation with no additional stresses placed on the mining horizon. Refer also to response to IR-07.</p> <p>To clarify, the portion of the deposit being mined is never truly a void and what remains after mining will be a honeycomb texture with water-filled interstices. The mined area is filled with a fluid at all times, whether it be a mining solution, groundwater, or the neutralizing solution. This is different from a more traditional underground operation such as Cigar Lake, where there is physical excavation of the orebody, leaving a temporary air-filled space. Although the uranium ore is high-grade by global standards it is not entirely massive in nature. As such, the uranium will be leached in a 'honeycomb' texture leaving behind a structure of partial intact rock mass with the remaining area being filled by fluid. This retains the pressure balance of the mining zone with the adjacent water-saturated rock masses.</p>	No updates to the EIS in response to this IR.

Ref. #	Department	Project Effects Link	Reference to EIS, appendices, or supporting documentation <sup>1</sup>	Context and Rationale	Information Requirement (IR) <sup>2</sup>	Denison Response	Final EIS Updates
						<p>Although the above provides context on the absence of true, air-filled voids remaining post-mining, the risk of subsidence has been assessed appropriately (included in the draft EIS as Appendix K to Appendix 7-C; see also draft EIS Section 7 Geology Valued Component - Terrain Morphology and Stability Key Indicator and draft EIS Section 9 Terrain Valued Component - Terrain Morphology Key Indicator and Terrain Stability Key Indicator). The analysis shows there is negligible risk of subsistence and the magnitude of subsistence, if it were to occur, is the range of 7.5 cm at surface.</p> <p>Subsequent to the filing of the draft EIS, Denison undertook additional modelling with refined, more granular inputs including consideration of subunits within the altered zone (RESPEC 2023). With this more refined analysis, the potential surface subsidence has been reduced from 7.5 cm to 2.4 to 2.8 mm (RESPEC 2023 is included here as Attachment: IR-21).</p>
